## SHAFTESBURY, THIRD EARL OF (ANTHONY ASHLEY COOPER)

(1671–1713)

Anthony Ashley Cooper (the Third Earl of Shaftesbury) was born in London in the home of his grandfather, the first earl, a prominent Whig politician, who put his secretary and friend, John Locke, in charge of his grandson's education. Fluent at eleven in both Greek and Latin, Shaftesbury was an avid student of ancient philosophy, particularly Plato and the Stoics. In 1686, accompanied by a tutor, he embarked on a three-year tour of the Continent, learning French and acquiring a sophisticated taste for the arts. He was elected to Parliament in 1695 and served for three years, although asthma prevented him from standing for reelection. In 1698 he moved to Holland, where he met Pierre Bayle, an advocate for religious tolerance and one of the first to argue that it is possible for an atheist to be virtuous. After becoming the Third Earl of Shaftesbury in 1699, he attended meetings of the House of Lords until 1702, but once again ill health prevented him from continuing to serve and being more active in Whig causes. He married Jane Ewer in 1709; they

had one son. His bad health forced him to move in 1711 to Italy, where he died in 1713.

### BACKGROUND

Shaftesbury's first published work was an edited collection of the sermons of the Cambridge Platonist Benjamin Whichcote (1609–1683). In his preface Shaftesbury attacked Thomas Hobbes's conception of morality as a matter of law springing from the will of a sovereign, backed up by sanctions imposed on us to restrain our natural, selfish tendencies. His letters make clear, however, that he thought John Locke was an even greater threat to morality since he made Hobbes's views more respectable. Rejecting Locke's view that moral laws spring from the will of God and that morality requires sanctions, Shaftesbury complained that Locke not only "threw all order and virtue out of the world" but also made moral ideas "unnatural," without any "foundation in the mind" (1900, p. 403). In the Cambridge Platonists, however, he found doctrines that were both congenial to his own outlook and an antidote to those of Hobbes and Locke. Proposing a conception of morality that centered on love, the Cambridge Platonists emphasized the natural goodness and sociability of human beings and our ability to act virtuously without sanctions.

Shaftesbury's chief work is *Characteristicks of Men, Manners, Opinions, Times*, an anthology of his essays. It was first published in 1711 in three volumes; ten more editions were printed by 1790. *Characteristicks* includes "An Inquiry concerning Virtue or Merit," which John Toland originally published in 1699, although there is dispute about whether Shaftesbury authorized that version. He revised the "Inquiry" for inclusion in *Characteristicks*. The other four essays were written between 1705 and 1710 and cover a variety of topics in different genres. He discusses issues in morality, politics, religion, aesthetics, culture, and what he calls "politeness"—the conventions of good manners and refined conversation. The essays take different forms: the traditional treatise, as well as an epistle, a dialogue, and a soliloquy. He includes his own commentaries or "miscellaneous reflections" on each essay, which were written especially for the collection.

### CONCEPTION OF PHILOSOPHY

Shaftesbury's unorthodox writing style goes hand in hand with his conception of philosophy as practical. He laments that philosophy "is no longer active in the world" (1711/1999, p. 232). On his view, philosophy should help people fashion themselves into moral and unified beings. Conceiving of moral self-transformation in Socratic terms as the pursuit of self-knowledge, he suggests that the best way to know yourself is by means of an inner dialogue. Dialogues and soliloquies, rather than lectures and sermons, are therefore the appropriate vehicles for inspiration and edification. His intended audience was cultivated readers rather than philosophers and other academics, so he thought his writing needed to be accessible—easy, smooth, and polite.

Shaftesbury's practical conception of the philosophical enterprise led him to reject metaphysical and epistemological studies on the grounds that they make people "neither better, nor happier, nor wiser" (1900, p. 269). He was largely indifferent to the successes in the natural sciences that were made during this period and opposed mechanistic conceptions of nature. In contrast to many eighteenth-century philosophers, he was uninterested in putting morality on a scientific footing. He preferred ancient philosophy to that of his contemporaries.

Shaftesbury is best read as a transitional figure, a bridge between the philosophical thinking of the ancients and the moderns, as well as between the seventeenth and the eighteenth centuries. Although he rejected the seventeenth-century natural law view of morality, he retained its Stoic conception of the universe as teleologically structured. The natural world is an integrated and harmonious

whole composed of many subsystems, all of which are ordered to good ends. Each subsystem or species, including the human species, is designed to play specific functional roles in still larger systems, which together form the universal nature, the system of all things. The order and harmony in universal nature is a product of God's creative intelligence. As a reflection of God's intelligence, the universe itself embodies rational principles. Shaftesbury's teleological picture of the universe underwrites many of his views on religion, morality, and aesthetics.

### ETHICAL THEORY

As Henry Sidgwick remarks in his *Outlines of the History of Ethics [for English Readers]* (1886), Shaftesbury's *Characteristicks* "marks a turning point" in the history of ethics, since he is the first to take "psychological experience as the basis of ethics" (p. 190). He makes morality dependent on the mind in two ways. First, first-order sentiments—the passions and affections that motivate people to act—and actions expressive of these sentiments—have moral value. Second, what gives these motives their value are reflective, second-order sentiments—sentiments we have about our own or other people's sentiments. Shaftesbury's inward turn was the inspiration for sentimentalist moral theories, especially Francis Hutcheson's and David Hume's, as well as Bishop [Joseph] Butler's electric theory.

Shaftesbury's best-known work today is his most traditional piece of writing, "An Inquiry concerning Virtue or Merit." The question that frames the "Inquiry" is whether virtue is able to support itself without the aid of religion. In the course of answering that question he explains both the nature of virtue and our obligation to it. Distinguishing between natural goodness and moral goodness, he defines natural goodness in a functional or teleological way. To say that something is naturally good is to say that it contributes to the good of the system of which it is a part. Where a subsystem is part of a larger system, judgments of natural goodness are relative to that larger system. He even says that something is "really" good or bad only if it benefits or hinders universal nature. However, when we judge the natural goodness or badness of a sensible creature, our judgments concern the structure or economy of its affections. Sensible creatures are good if their affections are adapted to contribute to the good of their species. Their goodness is a matter of being in a healthy state, one that enables them to realize their natural ends. Not surprisingly, Shaftesbury often equates the good with the natural and evil with the unnatural.

While sensible creatures are capable of natural goodness, Shaftesbury claims that only rational creatures are capable of moral goodness—virtue—because only they have the capacity to make their affections objects of reflection. When affections are “brought into the mind by reflection ... there arises another kind of affection towards those very affections themselves and ... now become the subject of a new liking or disliking” (1711/1999, p. 172). As rational creatures, human beings have second-order, reflective sentiments, sentiments about sentiments. Shaftesbury calls this reflexive capacity a “moral sense.” He conceives of it in aesthetic terms—a sense of what is beautiful or harmonious, foul or dissonant in our sentiments. The harmony and proportion of the affections, like the natural beauty in the universe, is evidence of a creative designing mind: God. In feeling moral approval we are able to share in the divine intelligence that created the beauty in the universe. On Shaftesbury’s view the moral sense is an active, intelligent, and creative power, not the passive faculty that Hutcheson took it to be.

Shaftesbury argues that what the reflective sense approves of, and so makes morally good, is our natural goodness. We are naturally good when our “natural” or social affections and our self-directed affections are balanced in such a way as to promote our own good and the good of our species. While he thinks that our concern for others may be too strong and our self-concern may be too weak, more typically people are vicious when their social affections are too weak or their self-directed affections too strong. Moral evil arises not only from an imbalance between the social and self-interested affections but also from such “unnatural” affections as malice, sadism, and “delight in disorder.”

After explaining the nature of virtue Shaftesbury turns to the question of our obligation to virtue, which he takes to mean “what reason there is to embrace” a virtuous life (1711/1999, p. 192). He then proceeds to show that virtue and self-interest coincide. He begins by arguing that mental pleasures are superior to physical pleasures. He thinks that there are two kinds of mental pleasures: those that consist in the operation of first-order affections and those that result from second-order affections such as those of the moral sense. The first-order affections that are social are a superior source of pleasure since they are pleasant in themselves, never go stale, and enable us to share sympathetically in the pleasures of others. More important, virtuous people experience the pleasures of their own approval as well as the approval of others, while vicious people suffer the tor-

ments and pangs of their own disapproval and those of others. He concludes that what obligates us to the practice of virtue is that being virtuous makes us happy. Being a virtuous person is not only good but also good for you.

Returning to the topic of the relation between morality and religion, Shaftesbury argues that it is possible for an atheist to be virtuous and that superstitious or false religious beliefs do more harm than having none at all. He characterizes theism as the belief that the universe is designed by a benevolent God and ordered “for the best,” whereas atheists deny that there is a natural order and believe that the universe is a product of chance. Theism is the “perfection and height of virtue,” since the theist is attuned to the order and harmony of the universe (1711/1999, p. 192). As moral agents, this is an order and harmony to which we ought to aspire.

## VIEWS ON POLITICS, AGENCY, AND AESTHETICS

In other essays Shaftesbury, like his grandfather, champions religious tolerance and liberty of thought. Tolerance and free discussion are the basis of moral and cultural improvement. The way to disarm religious fanatics or those who are superstitious is with “ridicule,” light-hearted, good-mannered humor, and tolerance, rather than with punishment and persecution. Although highly critical of the enthusiasm that results from fanaticism or superstition, Shaftesbury argues for true or reasonable enthusiasm—a state of mind that raises people beyond their ordinary capacities and enables them to feel the divine presence. Shaftesbury’s conception of reasonable enthusiasm informs his views on nature, religion, morality, and aesthetics.

Some commentators, notably Stephen Darwall, find Shaftesbury’s thoughts on the self, its unity and self-government, to be suggestive even though his ideas on these topics are not developed in a systematical way. Shaftesbury thinks that soliloquy is necessary both for self-government and for an agent’s unity and integrity. He describes soliloquy, a kind of self-analysis, as a process whereby we are able to divide ourselves into “two parties,” an idea that foreshadows Adam Smith’s conception of conscience. One part is the better self, the sage, demon, or genius—an ideal of character to which each person is committed. In dividing ourselves into two, we erect the better part as the “counsellor and governor” (1711/1999, p. 77). Soliloquy enables us to step back and critically assess our desires—scrutinizing their causes and their place in the scheme of our aims and concerns. Likewise,

soliloquy aims to make us unified agents, true to our ideals of character.

Shaftesbury has been described as the first great English aesthete. Not only does he think of moral goodness as a species of the beautiful but he also thinks that moral and aesthetic taste amount to the same thing. Thus, he says that “the science of the virtuosi and that of virtue itself become, in a manner, one and the same.” The real virtuoso understands and appreciates the inner harmony and order that constitute the goodness in works of art and in people’s characters. The source of Beauty and what we ultimately find beautiful is the creative, intelligent mind. Thus, he says that “the beautifying, not the beautiful is the really beautiful” (1711/1999, p. 322). When we admire order and proportion in natural objects, we are really admiring the creator, God. Shaftesbury developed a concept of disinterested pleasure to explain the kind of pleasure we experience in a true apprehension of beauty.

Shaftesbury’s *Characteristicks* was influential both in England and on the Continent during the eighteenth century. It is thought that virtually every educated man in the eighteenth century was acquainted with it. While the sentimentalists, Hutcheson and Hume, kept Shaftesbury’s idea that moral goodness springs from second-order affections, they detached their accounts of natural goodness from his teleological picture of the universe. Thus, Hutcheson identifies natural goodness with pleasure. There has been renewed attention to Shaftesbury’s work since the 1980s, not only by traditional philosophers interested in his moral and aesthetic views but also by those interested in literary theory and gender studies.

## SHAME

Shame is the painful emotion occasioned by the realization that one has fallen far below one’s ideal self—the person that one wants to be. Although shame no doubt originally involves a concern with being observed by others (its link with embarrassment), such observation need no longer be a part of shame once ideals of the self have been internalized.

### SHAME AND GUILT

Shame is perhaps best understood initially by contrasting it with guilt. Both are painful emotions, but the relationship of shame to morality is more complicated than is the case with guilt. Guilt is necessarily a moral emotion, since it is essentially a painful negative self-assessment with a moral basis—namely, the belief that one has done something morally wrong. One may, of course, be mistaken about the actual moral status of what one has done—one may, for example, have mistaken moral beliefs—but this is a moral mistake. Even those feelings of guilt that we classify as irrational or neurotic are typically labeled as such because we believe that the person experiencing the guilt has made a moral mistake—for example, our belief that the conduct is in fact not wrong; or our belief that the person is assuming responsibility when not really responsible; or our belief that, even if the conduct is wrong, the guilt that one feels is radically disproportionate to the nature of the wrong. So we might classify great

guilt over, say, masturbation as irrational or neurotic. We surely would not, however, label as irrational or neurotic the Nazi death camp commandant who comes to feel great guilt over his evil acts.

Although shame may also have a moral dimension, this is not necessarily the case. Shame is best understood as the painful negative self-assessment that arises when it is brought to consciousness that one's actual self is radically at odds with the ideal that one has of oneself—what Freud called one's ego-ideal. Although shame typically involves an ideal self that is at least in part constructed from social norms, these norms are frequently not moral in nature; and thus it is quite common that one may feel great shame over aspects of oneself that are morally innocent and over which one may have little control. Examples are shame over one's appearance, weight, social awkwardness, or poverty. Although such shames can sometimes prompt people to do things that are good for them (e.g., diet), they can also be so destructive of self as to be properly labeled toxic. This does not make them moral, however. Not everything that is important—even very important—is moral in nature.

### MORAL SHAME

Shame becomes a moral emotion when one's ideal self, one's ego ideal, is moral in nature. If one seeks to preserve an image of oneself as a decent person with largeness and generosity of spirit, for example, then one will feel great moral shame when it is brought to consciousness that one has revealed a nature that is in fact petty, grasping, and indifferent to the hurt that one may cause others in pursuit of one's own narrow interest.

The gnawing pain of bad conscience—the *agenbite of inwit*, some medieval writers called it—may be seen as guilt over the wrong that one has done, coupled with shame over something about oneself that the wrong has revealed: the kind of person that one is, and how far this person differs from the moral person one thinks one ought to be. “Shame creeps through guilt and feels like retribution,” as the novelist William Trevor puts it.

Given these important differences between guilt and moral shame—the former directed primarily toward wronging others, the latter directed to flaws of the self—one can see why the agent's healing and restorative responses to the two feelings tend to be quite different as well. Guilt typically engages such responses as apology, atonement, restitution, and even the acceptance of punishment. Moral shame imposes an even more difficult burden, however: the construction of a different and better self.

Because of its potential for moral transformation, moral shame deserves more respect than it often receives. Critics of shame tend to focus on non-moral shame, and they are quite right to stress the potentially toxic nature of some instances of non-moral shame. Some instances can even be toxic, and quite literally so, to the body. Witness the large numbers of young women who get sick and even die of eating disorders (anorexia and bulimia) because they are ashamed of their body image.

### SHAME AND PUNISHMENT

Respect even for moral shame should not lead to uncritical enthusiasm, however. We should be suspicious, for example, of the trendy movement in late twentieth-century American criminal law toward shaming punishments—for example, making prisoners wear signs saying “I molest children” or dressing them in black-and-white striped uniforms and putting them on public chain gang work details. However they may be described, such practices are often merely exercises in cruel and vindictive public humiliation—something more likely to harden the heart rather than transform it in morally admirable ways. (Shaming punishments have been given their most powerful defense by Dan Kahan [1996] and their most powerful critique by Toni Massaro [1991].) As John Braithwaite (1989) has pointed out, some impressive results have been achieved with shaming punishments in small homogeneous societies that provide for rituals of reintegration. The homogeneity guarantees that one is being shamed before a group in which one values membership and whose good opinion one values, and the rituals of reintegration provide a hopeful light at the end of the tunnel. It would be a fantasy to think that modern American criminal law satisfies either condition, however.

## SHAO YONG

(1011–1077)

Shao Yong was a Chinese philosopher, historian, and poet born in 1011 (January 21, 1012, by European dating). He was the scion of a humble but educated family that had resided in northern China, near the modern-day national capital of Beijing, for several generations. However, the border conflicts that pitted the Chinese Song dynasty (960–1279) against various hostile and encroaching non-Chinese peoples forced the Shaos into a series of moves southward toward the safer center of the empire. Thus, in 1049, Shao relocated to nearby Luoyang, the secondary imperial capital and nascent cultural hub, where he lived until his death in 1077.

Shao was influenced early by teachers—among them his father Shao Gu (986–1064) and the scholar and minor official Li Zhicai (1001–1045). But his philosophical development was surely determined much less by any one person than it was by the singular divinatory text that constitutes one of the five works included in the vaunted corpus of ancient Chinese classics—the *Book of Change* or *Yijing*. Shao was unquestionably invested in the *Book of Change*. Nonetheless, he evinced an uncommon independence of mind in how he responded to it. In contrast to others who were similarly inspired by the classic, Shao diverged from his prominent contemporaries by never writing a separate commentary specifically on the *Book of Change*. Instead, one can rightly regard the magnum opus of Shao's own scholarly output—the *Book of Supreme World-ordering Principles* (*Huangji jingshi shu*)—as entirely an expansion on the seminal premises contained in the *Book of Change* and in related writings, including the remaining four classics. Moreover, as was customary among the Chinese educated elite, Shao composed poetry. His poems were collected as *Striking the Earth at Yi River* (*Yichuan jirang ji*); this work is also one in which his cardinal philosophical ideas are exhibited. Thus, the

survival of Shao's only two verifiable writings permits us to divide his thought into its early- and late-emerging components.

### EARLY THOUGHT

Shao is usually accorded a position in the movement called the "Learning of the Way" (*daoxue*, a term that Europeans equate with neo-Confucianism). But he is far more noteworthy for his unique departures from the solutions arrived at by this movement. The early *daoxue* movement was chiefly preoccupied with achieving consensus on a metaphysical "first principle" that would support a cosmogony and yet also account for the assumed ethical endowment of humankind. The concept settled upon was *li* (pattern or principle), which thinkers construed as the fundamental reality underlying both physical and human nature.

Shao, however, was alone in his advocacy of the concept of number (*shu*). For him, number—and not principle—became elemental, the foundation on which the universe rested and thus the key to uncovering its secrets. Shao's faith in the regulative power of number led him to proffer that the natural processes operative in the world were number-dependent—hence, his theme of "world ordering" (*jingshi*). His conviction that number was the basis of reality also led him to advance a kind of predictive knowledge that he promoted as "before Heaven" (*xiantian*) learning. This learning, he contended, is a priori in the sense that it has always existed, even prior to the formation of the universe.

### LATER THOUGHT

The final component to emerge in Shao's philosophy was a concept of methodologically reflexive observation, the chief characteristics of which were its claims to ubiquity of application and the attainment of pure objectivity and gnosis. Shao called this concept the "observation of things" (*guanwu*). Its prescribed procedure of "reverse observation" (*fanguan*) purportedly empowered the observer to know or understand any and all animate or inanimate things objectively and yet also be able to apprehend them from their own distinctly individuated and particularized standpoints. Thus, through its putative capacity to observe each and every object fully in terms of the observed object itself, the "observation of things" promised its practitioners knowledge that was truly objective, universalistic, and omniscient in its perspective.

## SHARIATI, ALI

(1933–1977)

Ali Shariati did not live to see the Islamic Revolution in Iran of 1979, but he was definitely one of its intellectual authors. Like many Iranians in the twentieth century he combined an education in the traditional religious sciences in Iran with more modern ideas from a European context—in his case Paris. His connections with the anti-colonialist movement in Paris led him to argue that Islam is a basically revolutionary and liberating doctrine; Shariati did not abandon religion as many of his fellow radical Iranians did, nor did he accept the reverence for the imam or spiritual leader so prevalent in Shi'i Islam. This set him firmly aside from Khomeini and the ideology of the Islamic Revolution itself.

He was a great borrower of ideas that he then applied in his own way. Thus while he rejected the dialectical materialism of Marxism, he did use the notion of history having a direction and a pattern—albeit one based on divine will and class struggle by individuals progressively perfecting their consciousness. Islam is a religion based on liberation, and Shariati reads the Qur'an as a book representing a community struggling permanently to achieve social justice, a fraternal society, and freedom. Shariati was not impressed with the power of imported ideologies to generate political solidarity among the people against oppressive regimes. Like his distinguished Iranian predecessor, Jalal Al-e Ahmad, he recognized the

importance of politicizing Islam as an ideology of emancipation and liberation of the Iranian people. Unlike another influence on him, Frantz Fanon, Shariati approved of religion, provided it is reinterpreted appropriately.

His version of Shi'ism placed emphasis on Imam 'Ali as a revolutionary leader as well as a religious thinker. This view of Shi'ism is different from that of the religious orthodoxy, especially as it places authority in the opinion of the individual, a vindication of *ijtihad* or independent judgment rather distant from normal understandings of the notion in Islam. Here he was undoubtedly influenced by Jean-Paul Sartre and the existentialist emphasis on the importance of authentic decisions being made by free agents. Shariati argued that Islam could be vindicated as a faith if it is seen as involving autonomous choices by individuals and a genuine progressive direction in both social and personal policies.

## SHELLEY, PERCY BYSSHE

(1792–1822)

Percy Bysshe Shelley is usually thought of as a romantic and lyric poet rather than as a philosophical one. He was, however, the author of a number of polemical prose pamphlets on politics and religion; and both his prose and his poetry reflect a coherent background of social and metaphysical theory.

In general, Shelley's beliefs are those of the radical English intelligentsia of the period immediately before and after the French Revolution, and in particular of William Godwin, who became his father-in-law. It has often been said that Shelley was really antipathetic to Godwin's atheism and determinism and that he gradually threw off Godwin's influence in favor of a more congenial Platonic transcendentalism. This view, however, seems to rest on a misunderstanding of both Godwin and Shelley.

## ATTACK ON CHRISTIANITY

In *The Necessity of Atheism*, for which he was expelled from Oxford in 1811, Shelley argued, on Humean lines, that no argument for the existence of God is convincing. He developed this position in *A Refutation of Deism* (1814), a dialogue that purports to defend Christianity against deism, but which actually presents a strong case against both and in favor of atheism. In both these works, and in some of his essays (many of which were not published in his lifetime), Shelley was concerned with what he later called “that superstition which has disguised itself under the name of the system of Jesus.” In the longer *Essay on Christianity*, published posthumously, he explained what he thought that system really was: an allegorical expression of the virtues of sympathy and tolerance, and of an anarchistic belief in the equality of men and in the wickedness of punishment and all other forms of coercion. Christ, Shelley claimed, had “the imagination of some sublimest and most holy poet”; he was also a reformer who, like most reformers, practiced a little mild deception by pandering to “the prejudices of his auditors.” The doctrine of a personal God, in particular, is not to be taken as “philosophically true,” but as “a metaphor easily understood.”

## THE NATURAL AND THE MORAL ORDER

Shelley explained this coupling of poetry and religion, and the view that both are essentially allegory, in *A Defence of Poetry* (1821). It is the function of both poetry and religion to provide men with a coherent view of the world that will help them to understand both themselves and their fellow men, and to provide it in a form that will kindle the imagination as well as the intellect—that is, through metaphor. There is a natural order in the universe, which science and philosophy reveal; there is also a moral order, which men themselves must impose. The metaphor of a personal God is meant to impress this twofold order on men’s minds. Since this metaphor had, unfortunately, been perverted by a superstitious interpretation, Shelley himself preferred such symbols as the World Soul or the Spirit of Intellectual Beauty.

## ANARCHISM

The details of the moral order itself are made clear in Shelley’s political pamphlets. Shelley began to write these when, as a youth of nineteen, he set out to settle the Irish question by instructing the Irish in the fundamental principles of Godwinian anarchism. Godwin’s main thesis was that social institutions, and particularly the coercive

ones imposed by governments, fasten blinkers on men’s minds which prevent them from seeing their fellows as they really are. The ultimate solution is a community small enough for each member to know the other members as individuals. Such intimate personal knowledge will bring understanding and sympathy, so that men will be prepared to cooperate for the common good, without the coercion of law. As Shelley put it, “no government will be wanted but that of your neighbor’s opinion.” Men will indeed value their neighbors’ opinions, but they will not take their neighbors’ opinions on trust. To do so would be useless, because even a true opinion is of little value unless one understands the grounds for holding it. It is only when men see things as they are, in all their intricate interconnections, that they will feel the right emotions and thus lead happy and virtuous lives.

## POLITICAL PAMPHLETEERING

In accordance with these general principles, Shelley urged the Irish not to seek emancipation by means of violence, but to agitate for freedom of assembly, freedom of the press, and parliamentary representation as the first steps toward the ideal society. It was also in accordance with these principles that Shelley wrote his *Letter to Lord Ellenborough* (1812), in which he protested vehemently against the sentence passed on the publisher of Thomas Paine’s *Age of Reason*. Both this pamphlet and the *Address on the Death of Princess Charlotte* (1817), in which he suggested that Englishmen would do better to mourn for their lost liberties than for even the most beautiful and blameless of princesses, were eloquent attacks on judicial persecution and on the suppression of free speech. In another pamphlet, *On the Punishment of Death* (left unpublished), he opposed capital punishment. In the long essay *A Philosophical View of Reform*, another of the unpublished manuscripts found among Shelley’s journals, he recapitulated the common radical objections to priests, kings, and the aristocracy, and gave his support to such measures as a more democratic suffrage and a capital levy on unearned wealth.

## UNITY OF THE WORLD

Shelley’s writings on politics and religion provide meanings for many of the symbols and metaphors to be found in his poetry. His frequent references to life and the world around us as “a painted veil,” an illusion through which we must penetrate to the reality behind (this reality being the “one” that remains when “the many change and pass”), is probably to be interpreted as a Godwinian allegory. Godwin had said that men see life as if through a

veil—the veil of their own prejudices, which are imposed by social institutions. The constant theme of Godwin's novels was that men must transcend these prejudices in order to understand and love their fellow men. Shelley's idealization of love, which has been taken as a departure from Godwin, is actually his attempt to present this Godwinian theme in a form that will kindle the imagination. It is, moreover, quite in accord with Godwin's views to say that once the veil is removed, the world will be seen as a unity—both in the sense in which science may be said to be a unity (the truth about one field of study cohering with and illuminating the truth about another), and in the sense that a true understanding of our fellow men will give rise to virtuous behavior. This seems to be what Shelley had in mind when he spoke of “the indestructible order” that it is the business of poetry to reveal. There is no need to suppose that he thought of this order as being imposed upon the world by a moral being.

### THE UNIVERSAL MIND

It is true that Shelley was also influenced by Plato, Benedict de Spinoza, George Berkeley, and (in spite of his derogatory remarks about Immanuel Kant in *Peter Bell the Third*) by the newer type of idealism that was beginning to be made fashionable by Samuel Taylor Coleridge. In *On Life* he suggested that there are no distinct individual minds, but one universal mind in which all minds participate. As early as 1812 he had identified this “mass of infinite intelligence” with Deity. In this, Shelley was certainly departing from the doctrine of materialists like Baron d'Holbach; but Godwin, although he was not an idealist, was hardly a materialist either. Godwin would certainly have said that when men see things as they are, they hold the same opinions and, in a sense, think the same thoughts. Each man, seeing things from his own point of view, grasps only part of the truth. He will come nearer to grasping the whole of the truth as he comes to understand and sympathize with the minds of other men. In a sense, the truth as a whole is the property not of any one mind but of the sum of all minds. Probably Shelley himself meant little more than this.

### PROMETHEUS UNBOUND

Shelley's beliefs find expression in his poetry in a way that is seen fairly clearly in *Prometheus Unbound* (1820), which can be interpreted as a Godwinian allegory. Prometheus, chained to his rock, is suffering humankind, and as the discoverer of fire, he is also knowledge and the civilizing arts. These discoveries, in themselves, are not enough to liberate man from the oppressive rule of

Jupiter, which is built “on faith and fear.” Prometheus is freed when, instead of cursing his oppressor, he begins to pity and so to understand him. This reflects the favorite Godwinian theme that the oppressor, no less than the oppressed, is the victim of social institutions. A better order is possible only when men come to understand this fact and substitute mutual sympathy for recrimination and punishment. It is also necessary to understand the secrets of Demogorgon, who personifies the natural forces that control the universe, and to cooperate with the Hours, who, with their chariots, personify Godwin's conviction of the inevitability of gradualism.

## SHEPHERD, MARY

(1777–1847)

Mary Shepherd was born in Scotland at her family's estate on December 31, 1777, the second daughter of Neil Primrose, Earl of Rosebery; she died in London on January 7, 1847. Relatively few details of her life and education are available. She married an English barrister, Henry Shepherd, in 1808. She published at least two works in philosophy, *An Essay upon the Relation of Cause and Effect*

(1824), and *Essays on the Perception of an External Universe and other Subjects Connected with the Doctrine of Causation* (1827). A third work, originally published anonymously in 1819, *Enquiry respecting the Relation of Cause and Effect*, has been credited to her, but it differs so significantly from her other work, both in style and content, as to make this attribution dubious. She was as well a participant in an exchange of views with a contemporary, John Fearn, which appeared in various venues.

Shepherd's work reflects the continued interest in the first quarter of the nineteenth century in developing alternative arguments to those of Hume, conceived largely skeptically. Her first work establishes the line of argument that was to direct her work. In it, she seeks to refute Hume's position on causality by arguing that Hume is mistaken in holding that we lack an intuitive understanding that events have causes. Shepherd reads Hume as holding that we cannot be intuitively certain that everything that begins to exist has a cause, and subjects to criticism the contained concept of a causeless beginning-to-be of some existence. Her argument is that this beginning is itself an action and hence must be a state of something that, by hypothesis, does not as yet exist until it has begun to be. Hence, she claims, the basic assumption of Hume's account is contradictory. Shepherd offers a realist account of cause as the productive principle of effects, themselves not subsequent to causes, but rather coexistent with the productive object. She uses her realist understanding of causation to criticize not only Hume, but also her own contemporaries, Thomas Brown and William Lawrence.

Shepherd's second work, *Essays on the Perception of an External World*, was originally intended as an appendix to her first work and consists primarily, although not exclusively, of an application of her ideas about causation to the question of the existence of an external world. By far the largest part is directed to providing an alternative answer to Hume's question about the sources of our idea of a continuous external existence. Appended are a series of essays about Berkeley, Reid, Stewart, Hume, and what Shepherd terms in the title of her work "various modern atheists." Shepherd argues, against Hume, that the possibility of causal reasoning, as demonstrated in her first book, makes such reasoning available to substantiate the existence of a continuously existing independent world. She feels it necessary, however, to give a different solution from that of Reid. This is because she thinks Reid failed to appreciate the importance of Berkeley's claim that an idea can only be like another idea. Shepherd takes this to mean that Reid is wrong to suppose that we can give content to

our ideas of a mind-independent world. Thanks to the possibility of causal reasoning, however, we are able to assert the existence of causes responsible for our ideas. In particular, because our ideas change, there must be causes for these changes, independent of our ever-present mind. The variety we experience must be due to causes other than ourselves, whose nature, while unknown, must be, she thinks proportional to their effects.

Shepherd develops and clarifies these ideas further in her exchange of views with John Fearn, a retired naval officer and philosophical aficionado. This exchange is unusual as well as interesting, presenting one of the first occasions where a woman's ideas are attacked in print, and illustrating some of the different venues available to ordinary practitioners for publishing philosophy in the early nineteenth century. The first two parts of the exchange appear in 1828 in a volume loosely related to the clergyman, Samuel Parr, called *Parriana*, apparently supplied by Fearn to its compiler, Ernest Barker, and included by him, despite the lack of relevance to Parr. These consist of a four-page paper, critical of Fearn by Shepherd, apparently sent to him privately, and a longer defense of his views against Shepherd by Fearn. Shepherd was sufficiently concerned by this unauthorized use of her work that she published a rebuttal, "Lady Mary Shepherd's Metaphysics" in a well-known literary journal, *Fraser's Magazine*, in July 1832.

The exchange focuses on a disagreement over the idea of extension. It is Fearn's view that the content of the idea of extension is determined by our perception of it. There can be no extended external material cause of such an idea. The only possible cause consists of the energies of an extended mind, analogous to our own. Shepherd maintains that Fearn has not adequately distinguished the idea of extension from its unknown cause. On the one hand, Shepherd holds that extension can only apply to objects considered as causes, for it is as causes that they take up space and move. Ideas, on the other hand, neither move nor take up space, or we would be left with the ridiculous position that the idea of a fat man is itself fat. Shepherd, in defense of this claim, gives a fresh defense of her causal realism. While it is true that the mind perceives internal changes to its own states, it nevertheless reasons to the existence of external unperceived causes of these changes.

## SHESTOV, LEV ISAAKOVICH (1866–1938)

Lev Isaakovich Shestov, the Russian philosopher and religious thinker, was born in Kiev. His real name was Lev Isaakovich Schwarzmann. Shestov studied law at Moscow University but never practiced it. He lived in St. Petersburg from the late 1890s until he migrated to Berlin in 1922; he later settled in Paris. He gave occasional lectures in Berlin, Paris, and Amsterdam and made two lecture tours in Palestine, but he held no regular academic position.

Shestov called William Shakespeare his “first teacher of philosophy”; in his later years he interpreted Hamlet’s enigmatic “the time is out of joint” as a profound existential truth. Shestov apparently turned to philosophy relatively late, perhaps in 1895, when he reportedly underwent a spiritual crisis. He himself never referred to such a crisis; in general, his works are less confessional and autobiographical than those of most existential

thinkers. However, they are neither impersonal nor unimpassioned; intensity and engagement (in a religious and moral rather than a political sense) are hallmarks of his thought.

Shestov was perhaps most strongly influenced by Blaise Pascal, Fëdor Dostoevsky, and Friedrich Nietzsche. He discovered Søren Kierkegaard quite late and found his position highly congenial, but he had worked out his own existentialist position independently of Kierkegaard. Shestov’s philosophical works are written in an aphoristic, ironic, questioning style reminiscent of Pascal’s *Pensées* and Nietzsche’s *Beyond Good and Evil*. Shestov believed, with Kierkegaard, that subjective truth borders on paradox. “People seem shocked,” he once wrote, “when I enunciate two contradictory propositions simultaneously.... But the difference between them and me is that I speak frankly of my contradictions while they prefer to dissimulate theirs, even to themselves.... They seem to think of contradictions as the *puđenda* of the human spirit” (quoted in de Schloezer, “Un penseur russe ...,” pp. 89–90).

Shestov was not a systematic thinker. He attacked the views of others, sometimes massively; but he was content to suggest or sketch his own position. His writings focus positively on the question of religion and morality or religiously based morality; negatively on the critique of theoretical and practical rationalism. Among the rationalists whom he attacked by name are Parmenides, Plato, Aristotle, Plotinus, Benedict de Spinoza, Immanuel Kant, G. W. F. Hegel, and Edmund Husserl.

The basic either/or of Shestov’s thought is suggested by the title of his major work in philosophy of religion: *Afiny i Ierusalim* (Athens and Jerusalem). Athens is the home of reason, of a philosophical rationalism that insists on a neat and knowable cosmos ruled by eternal and unalterable laws. Jerusalem is the home of faith, of an existential irrationalism that stresses contingency, arbitrariness, mystery, and pure possibility. For God “all things are possible,” even what René Descartes had called a logical absurdity, that is, causing what has in fact happened not to have happened.

Sometimes Shestov’s attack on reason took the form of questioning reason’s theoretical competence. Thus, he complained that theorists of biological and cosmic evolution, with their loose talk about “millions and billions of years” and about “eternal nature,” were perpetrating a “monstrous absurdity.”

More frequently Shestov made the rather different claim that rational knowledge neglects what is essential—

the individual, contingent, incomprehensible, and mysterious. “However much we may have attained in science,” he wrote, “we must remember that *science cannot give us truth*.... For truth lies in the singular, uncontrollable, incomprehensible, ... and ‘fortuitous’” (*In Job’s Balances*, p. 193). “We live,” Shestov declared, “surrounded by an infinite multitude of mysteries” (*Afiny i Ierusalim*, p. 25).

Most frequently Shestov attacked the moral consequences of theoretical reason, its erosion and subversion of human values. Reason exhibits necessity and imposes nonfreedom. Faith assumes contingency and makes freedom possible. Rationalists recognize an eternal structure of being, a system of necessary laws that antedates any possible cosmic lawgiver. The necessity of such laws requires obedience. What is nonnecessary, whether contingent or arbitrary, admits of free decision and creativity. Shestov repudiated all obedience to necessity in the sense of acceptance of necessary evil, injustice, and inhumanity. There are scales, he declared, upon which human suffering weighs heavier than all the necessities of theoretical reason; such are “Job’s balances.”

In particular, Shestov rejected the Greek view, which he traced back to Anaximander, that coming to be (*genesis*) is a kind of affront to the gods, a cosmic hubris, justly rewarded by the punishment of passing away (*phthora*). He called this the “dreadful law which inseparably links death to birth.” “In man’s very existence,” Shestov added, “thought has discovered something improper, a defect, a sickness, or sin, and ... has demanded that this be overcome at its root [by] a renunciation of existence” (*Kirkegard ekzistentsial’naia filosofii*, p. 8).

In such passages Shestov may appear to have confused natural (descriptive) laws with moral (prescriptive) ones. However, his point could be made in terms of such a distinction; descriptive laws, insofar as the regularities which they describe are universal and necessary and not merely local or statistical, demand unconditional acceptance and thus in a sense function prescriptively.

In any case, Shestov wished to assert that rationalists, in absolutizing theoretical truth, inevitably relativize human life. In yielding to “self-evidence,” they accept the “horrors of human existence” as something necessary and legitimate. Shestov, in contrast, was quite prepared to relativize theoretical truth if that was the price to be paid for absolutizing moral and religious values and thus “redeeming” the existing individual.

The Nietzschean strain in Shestov’s thought appears most clearly in his denial of the validity of universal norms. Such norms function to limit and repress creativ-

ity. “The fundamental property of life,” he wrote, “is daring; all life is creative daring and thus an eternal mystery, irreducible to anything finished or intelligible” (*In Job’s Balances*, p. 158). Under the tyranny of ethical rationalism (a part of the general tyranny of reason, which develops naturally out of the initial autonomy of reason), we come to fear chaos because it is a loss of order. But “chaos is not a limited possibility; it is an unlimited opportunity” (*ibid.*, p. 226).

For Shestov the decisive either/or—reason and necessity or faith and freedom—is not a choice, as rationalists would claim, between sanity and insanity. It is a choice between two kinds of madness (the distinction is reminiscent of Kierkegaard’s distinction between “objective” and “subjective” madness). The first kind of madness is that of theoretical reason, which takes as ultimate, eternal, and universally obligatory those objective truths which rationalize and legitimize the “horrors of human existence.” The second kind of madness is the Kierkegaardian leap of faith which ventures to take up the struggle against rationalized and legitimized horror at the point where such struggle is “self-evidently” doomed to defeat. Between these two kinds of madness, Shestov’s own choice is clear and final.

## SHESTOV, LEV ISAAKOVICH [ADDENDUM]

Shestov has become the object of academic philosophical attention only since 1968. After the 1917 Russian Revolution Shestov became a significant voice in European philosophical existentialism, in his later life engaging with Blaise Pascal and Søren Kierkegaard, actively influencing the thought of Albert Camus, and corresponding with Martin Buber. Some of these philosophical relationships have received concentrated, though not exhaustive, critical attention (Maia Neto 1995). In addition, Shestov corresponded with and wrote an article on Edmund Husserl, which is the focus of one critical article.

Because of the Soviet ban on research and publication relating to Shestov, scholars inevitably found it difficult to define and establish Shestov as a philosopher. To begin with there was very little criticism outside the Paris émigré community. The two-volume biography on Shestov written by his daughter, Natalie Baranova-Shestova (1983), drew attention to the man and his work. Since the end of the Soviet Union Shestov has won renewed consideration among Russian philosophers.

Existentialist aspects of Shestov's thought have generally garnered the most critical attention and have generated other critical approaches. Some existentialist commentaries focus on the experience of suffering, isolation, and tragedy while others concentrate on the aspect of the absurd. Shestov has received attention as a religious thinker particularly in two contexts. First, scholars have viewed him in the context of the "Russian religious renaissance," a group of Russian religious philosophers of the early twentieth century who brought a personalist, antidogmatic and antirational approach to the question of

religious experience and faith. Second, scholars have seen him as a major modern Jewish thinker. In the late twentieth century, philosophical research focused on two contrasting aspects of Shestov's thought, the paradoxical but invigorating interaction between skepticism and religious faith. His philosophy has been viewed together with that of Pascal and Kierkegaard, as part of the tradition of skeptical thought, Pyrrhonism, that goes beyond pure skepticism to employ reasoned doubt in a positive role within categories of faith.

## SHINRAN (1173–1262)

Shinran, born Hino Arinori, is the foremost proponent of Japanese Pure Land Buddhism and is widely regarded as the founder of Jōdo-Shinshū, more commonly known outside of Japan as Shin Buddhism. Pure Land Buddhism has the largest following in East Asia (China, Korea, and Japan), and the Shin sect is the largest sect of Japanese Buddhism. As a development of Mahayana Buddhism,

the core of Shinran's thought is based on the twofold truth:

Conventional truth	Highest truth
Form	Emptiness
Distinctions	No distinctions
Words	Beyond words
suffering	liberation
samsara	nirvana
defiled world	Pure Land
blind passion	boundless compassion
self-power	other-power
foolish being	Amida Buddha
Namu	Amida Butsu

### TWOFOLD TRUTH

These truths are twofold because they are like the two sides of the same coin. There is an aspect of truth defined conceptually by the discursive intellect, and there is a truth beyond words, beyond the grasp of the discursive intellect. In this view, all conceptual reality is nothing more than agreed on convention, hence the term *conventional truth*. When the mind is emptied of all preconceptions, the truth can be grasped for the first time with one's whole being. This is the highest truth, emptied of the concepts that act like an intervening smoke screen between subject and object. When the conceptual smoke screen is removed, the separation between subject and object also disappears. Paradoxically, this merging of subject and object does not mean the obliteration of perception. Rather, perception becomes more fluid, dynamic, and vivid. For example, when one is viewing a flower and is caught up in trying to determine its genus, species, and variety, one fails to see the vivid dynamism of the beautiful flower unfolding before one. However, when one lets go of one's obsession with grasping the flower taxonomically or conceptually, suddenly one feels that the flower is closer, more intimate, vivid, and fluid in its evanescence.

### WORDS AND BEYOND WORDS

In Buddhism the problem does not lie with the categories or words themselves, such as *flower*, *peony*, and so on. Rather, it is the mind that becomes obsessed or attached to fixed conceptions of reality that causes one to become lost or separated from the dynamic flow of reality. Suffering, defiled perception, and blinded passion all result from this fixation. Conversely, words, properly used, can convey reality beyond words. They are like the words of a love poem. Although the individual words of a love poem

cannot capture love itself, a beautiful love poem can nevertheless convey the sensibility of love. The words are no mere signs; they are vessels of a higher truth.

### THE NAME OF AMIDA BUDDHA

In Shinran's Shin thought, the twofold truth is expressed through the Name of Amida Buddha, the Buddha of Infinite Light and Immeasurable Life. The practitioner of Shin invokes or chants the name *Namu Amida Butsu*. It originates in India and comes from the Sanskrit, *Namas Amitābha Buddha*, meaning, "I entrust myself to the awakening of infinite light." When the practitioner, caught in the net of fixed ideas, is illuminated by the dynamic flow of reality, he or she is released from his or her blind passions and awakens to the light of emptiness, or the boundless oneness of reality.

The highest truth of reality is formless, without shape, definition, color, or scent. However, the experience of release from the ego-bonds of fixation and blind passion is one of illumination or light. This is neither merely symbolic nor merely material or physical. Similar to the experience of being relieved of a heavy mental burden, one's conscious awareness and field of vision become clearer, lighter, and more responsive.

According to Shinran the consciousness of an ego self-enclosed in its own solipsistic world works under the delusion of self-power (Japanese: *jiriki*), as though it sustains itself completely unrelated to the world around it. When the bonds of this delusion are exposed and illuminated by the dynamic unfolding of emptiness/oneness, the self awakens to the working of other-power (Japanese: *tariki*), so-called because it is other than (the delusory) ego.

However, one does not and cannot abandon the foolish delusions of the ego; as long as one lives in this limited body and mind, one will continue to suffer the ego's foolishness. Furthermore, it is this very foolishness, when one recognizes it, that connects the practitioner to his or her deepest humanity and that of others. For it is in the suffering of blind passion and foolishness that one finds the deepest bonds of humanity, and ultimately, with all sentient beings. In the illumination of Amida Buddha, the blind passion of the foolish being becomes the gateway to wisdom and compassion. Thus, *Namu* represents the foolish being who, in his very foolishness, is illuminated by Amida Butsu, infinite light and boundless compassion. The saying of the name *Namu Amida Butsu* embodies the realization of the oneness of foolish being and boundless compassion. Without the *Namu*, Amida Buddha is merely a cold abstraction; only when the practitioner

engages the vivid flow of reality by allowing his or her blindness to be illuminated does the reality of Amida Buddha come to life. For this reason, the real name of Amida Buddha is said to be Namu Amida Butsu.

### SHINRAN'S SOCIAL VISION

Shinran's philosophical thought translated itself into an egalitarian social vision. According to him, no human being, even religious masters, were completely enlightened. Indeed, those who had engaged in intensive religious practice were considered particularly susceptible to the hubris of religious attainment. Shinran abandoned the monastic life, married openly, had four children, and lived among the farmers in outlying districts. Nevertheless, he and his wife, Esshinni, continued to wear religious robes and ministered to peasants and farmers until Shinran was about sixty. He describes himself as "neither monk nor layman" (Hirota, 289 [translation adapted]) and states, "I do not have even a single disciple" (Hirota, 664 [translation adapted]) since the power of compassion comes from Amida as the deepest reality of the self, and not from the finite human being Shinran.

He spent his final thirty years living in his brother's house, writing voluminously on his understanding of the wondrous working of Amida's boundless compassion, mythologically expressed as the working of Amida's Primal Vow. This is a way of expressing the relentless flow of reality that sooner or later breaks down and dissolves the brittle facade of self-power ego.

### SHOEMAKER, SYDNEY

(1931–)

Sydney Shoemaker is the Susan Linn Sage Professor of Philosophy Emeritus at Cornell University. Before joining the Philosophy Department at Cornell in 1961, he taught at Ohio State University and he held the Santayana Fellowship at Harvard University. He also delivered the John Locke Lectures at Oxford University (1972) on "Mind and Behavior" and the Royce Lectures at Brown University (1993) on "Self-Knowledge" and "Inner Sense." He has pioneered work in a variety of areas in metaphysics and the philosophy of mind, particularly on the nature of mind, the nature of the self and of self-knowledge, and the nature of properties. Some of the most important of his contributions in these areas are charted in this entry.

Shoemaker's work on the topic of the self and self-knowledge is informed by a rejection of the Cartesian notion of an immaterial self and the accompanying view that self-knowledge involves a kind of "inner observation" of the contents of one's mind that is perception-like in certain characteristic ways. The nature of the self and self-knowledge forms the subject matter of his seminal *Self-Knowledge and Self-Identity* (1963). In this work Shoemaker conducts a sustained attack on the Cartesian view that the unity of the self, or personal identity, is due to or involves an immaterial unity. Shoemaker argues, against this, that personal identity involves both physical factors concerning persons' bodies and psychological factors concerning their memories and that although the primary criterion for such identity is bodily identity, a memory criterion is also applicable. His arguments make use of a distinctive methodological strategy that has come to be known as "the method of cases" (Johnston 1987), involving the use of thought experiments to determine answers to questions about personal identity (a method that John Locke [1985] used in his discussion of personal identity).

Shoemaker's examples and the style of argumentation in this work have been highly influential in discussions of personal identity. His views in this area are further developed in later work, such as his "Persons and Their Pasts" (1970), *Personal Identity* (1984; with Richard Swinburne), *The First-Person Perspective and Other Essays* (1996), and the Royce Lectures, where he revisits another

important theme found in *Self-Knowledge and Self-Identity*: the Cartesian, “inner sense” view of self-knowledge. In these lectures he argues that if self-knowledge were perception-like, and the object of such knowledge were the self, it would be possible to err in one’s attempt to identify oneself, just as it is possible to err in one’s attempt to identify the objects of ordinary perception. However, he claims, it is not possible to misidentify oneself in this way. He also argues that the “inner sense” model of self-knowledge, being a perceptual one, requires commitment to two conditions that are essential to a “broad” perceptual model, a causal condition and an independence condition, but that knowledge of one’s own mental states does not meet these conditions. His own view is that self-knowledge is not based on evidence of any kind, whether this be from “outer” behavioral facts or from “inner” ones, as the perceptual model encourages one to suppose.

Shoemaker’s arguments involve an appeal to a particular view of the nature of mind known as functionalism, a view that he has developed and defended extensively in several works, notably in “Functionalism and Qualia” (1975), “Some Varieties of Functionalism” (1981a), “Absent Qualia Are Impossible” (1981b), and “The Inverted Spectrum” (1981c). Functionalism in the philosophy of mind is, broadly construed, the doctrine that mental-state types or kinds can be exhaustively characterized and uniquely individuated by their functional properties—by the relations that they are apt to bear to certain characteristic kinds of physical stimuli, other mental states, and behavioral responses. Shoemaker (1981b, 1981c) defends this doctrine against two major objections, known as the inverted qualia and absent qualia objections. The inverted qualia objection supposes that two states—say, perceptual experiences—might vary in their visual qualia (one being reddish, perhaps, while the other is greenish) yet remain invariant with respect to their functional roles. Shoemaker agrees but argues that this possibility is compatible with the truth of functionalism. The absent qualia objection goes further and supposes that two states could be functionally identical yet differ to the extent that one has qualitative content while the other lacks it altogether. Shoemaker concedes that if this were a genuine possibility, it would show that functionalism is false, but it is not a genuine possibility.

A third area in which Shoemaker has done pioneering work, connected with his functionalist view of the nature of mind, concerns the nature of properties. In the case of mental states Shoemaker argues that their nature is causal-functional. In the case of properties Shoemaker

is an advocate of what is known as the causal theory of properties (Armstrong 2000), a view championed in his influential “Causality and Properties” (1980). According to it, properties have causal powers essentially, rather than accidentally, in that it is in the nature of properties to bestow causal capacities on their instances or exemplifications. So, for example, it is in the nature of the property, pain, to confer on its instances, individual pains, the capacity to cause their subjects to believe that they are in pain, to wince, and so on. The view contrasts with a “categoricalist” one (Armstrong 2000), which takes properties to be contingently, rather than essentially, related to the capacities they bestow on their instances.

Although some have construed Shoemaker as holding the view that properties just are dispositions (rather than the weaker view that properties are essentially dispositional), which is a controversial and difficult view to defend, this is a mistake. Shoemaker argues that, strictly speaking, the dispositional/nondispositional distinction only applies to linguistic items, specifically, to predicates such as *soluble*, *fragile*, *round*, and so on. Some predicates (e.g., *soluble* or *fragile*) are dispositional whereas others (e.g., *round* or *red*) are not. But all properties bestow causal capacities on their instances, for it is in their nature to do so. So, for example, the property *round* bestows on its instances in, say, marbles, the capacity to roll into round holes, but not triangular ones. Shoemaker argues that the identity conditions of properties can be given in terms of such capacities, that is, that properties are identical if and only if they bestow on their instances the same causal capacities or powers and that it follows that the relations that hold between properties are necessary rather than contingent, so that, if laws involve relations between properties, such laws are necessary rather than contingent.

## SHPET, GUSTAV GUSTAVOVICH (1879–1937)

In his most important phenomenological work, *Iavlenie i smysl* (Appearance and sense, 1914), Gustav Shpet took up Edmund Husserl’s idea of pure phenomenology and developed it in the direction of a “phenomenology of hermeneutical reason.” In this theoretical framework he formulated, between 1914 and 1918, hermeneutic and semiotic problems, which in the 1920s he elaborated more specifically within the fields of philosophy of language and theory of art. In doing so, he was combining Husserl’s conceptions with ideas from other philosophical movements, particularly Wilhelm Dilthey’s hermeneutics and Wilhelm von Humboldt’s philosophy of language.

Shpet’s reception and transformation of phenomenology must be seen in the context of Russian intellectual and cultural life during the first two decades of the twentieth century. The Platonic “Moscow Metaphysical School” (which included Vladimir Solov’ev and Sergei Trubetskoi) provided the intellectual atmosphere in which Shpet’s turn to Husserl’s phenomenology took place. His ideas on theories of language and signs are close to those of contemporary Russian formalism. His phenomenological and structural theories influenced Prague structuralism through the “Moscow Linguistic

Circle,” and his work is seen as a precursor to Soviet semiotics.

#### SHPET’S LIFE

Gustav Shpet was born in 1879 in Kiev. He studied there at Vladimir University from 1901 to 1905, completing his studies with a monograph entitled *Problema prichinnosti u Iuma i Kanta* (The problem of causality in Hume and Kant). In 1907 he moved to Moscow, and taught at Moscow University from 1910. During a stay in Göttingen (1912–1913), where he studied with Husserl, he turned to Husserl’s transcendental phenomenology. His first phenomenological publication, *Iavlenie i smysl* (Appearance and meaning, 1914) marked the beginning of a productive reception of Husserl’s phenomenology in Russia. In 1916 he defended his master’s thesis *Istoriia kak problema logiki* (History as a problem of logic, Part I). In 1918 he finished *Germenevtika i eë problemy* (Hermeneutics and its problems), in which he discussed the problems of hermeneutics as they have been developed throughout history from antiquity (especially in Origen and Augustine) to modern times, thereby at the same time elaborating the basic outline of his “hermeneutical philosophy”—a philosophy that is caught in the field of tension exerted, on the one side, by Husserl’s “Phenomenology of Reason” and, on the other, by Dilthey’s “Philosophy of Life.”

After the Revolution of 1917, Shpet was active in various fields of cultural and intellectual life. He received a professorship of philosophy at Moscow University. In 1920 he joined the “Moscow Linguistic Circle” (MLK), a center of Russian formalism, and in 1921 he was appointed director of the Institute for Scientific Philosophy, a new research institute at Moscow University. Expelled from the university in 1923 for political reasons, he concentrated his activities on the State Academy of the Arts (GAKhN), where he served as vice president until 1929, and where he temporarily chaired the Department of Philosophy. His most important contributions to the theory of art and language are his *Ėsteticheskie fragmenty* (Aesthetic fragments), published in 1922 and 1923 in Petrograd, and *Vnutrenniaia forma slova* (The internal form of the word) (1927).

*Ėsteticheskie fragmenty* includes a phenomenology of “living discourse” and an analysis of those rules that determine the constitution of meaning in poetic discourse. These phenomenological and structural analyses of language, which aim to construct a poetics, were further developed through a critical assessment of Wilhelm von Humboldt’s philosophy of language in Shpet’s last

substantial work, *The Internal Form of the Word* (1927). Following a “cleansing” of the GAKhN in 1929, Shpet was forced to retire from his academic post, and he subsequently worked as a translator, editor, and critic. It was during this period that he translated Dickens, Byron, and Shakespeare into Russian. In March 1935 he was arrested by the NKVD (People’s Commissariat of Internal Affairs) and was charged with having led an anti-Soviet group during his time at the GAKhN in the 1920s. After a lengthy detention, he was exiled for five years to Eniseisk, and later to Tomsk. There, in 1937, he finished his Russian translation of Hegel’s *Phenomenology of Spirit*. In October of that year he was arrested and shot by the NKVD.

### SHPET’S DEVELOPMENT TOWARD PHENOMENOLOGY

Representative of Shpet’s notion of philosophy before his turn to phenomenology, as well as expectations he held for a reform of philosophy and psychology, is his article *Odin put’ psikhologii i kuda on vedët* (One way of psychology and where it leads), published in 1912. The article criticizes experimental and explanatory psychology for having replaced “living and concrete facts” with “empty schemata and abstractions.” Only a descriptive psychology that focuses on the pure data of consciousness would be able to fathom psychic life in its concreteness and totality. He saw the basis for this new direction in psychological theory in Wilhelm Dilthey’s *Ideas of a Descriptive and Analytical Psychology* (1894). Shpet argued for a philosophy that would take into account the totality of psychic life: a “realistic metaphysics,” whose task it would be to grasp “the real in its true essence and its totality.” Shpet thought that such a philosophy, which draws on the evident facts of “inner experience,” had been realized in important movements of nineteenth- and early twentieth-century Russian philosophy. Philosophers of the “Moscow Metaphysical School” (especially Vladimir Solov’ev and Sergei Trubetskoi) are cited as exponents of this trend in Russian thought.

Another, no less important, influence on Shpet’s reception of Husserl was his interest in the logic of the historical sciences. During his stay in Göttingen (1912–1913) he discovered in Husserl’s phenomenology the theory for which he had been searching, and his hermeneutical interest motivated him to try to develop Husserl’s “Phenomenology of Reason,” as outlined in *Ideas Pertaining to a Pure Phenomenology*, volume 1 (1913), into a theory of hermeneutic reason that focuses on the problem of understanding signs. Although the

ideas Shpet encountered in Göttingen primarily concerned transcendental phenomenology—the seminar on “Nature and Spirit,” which Shpet attended with other influential phenomenologists like Roman Ingarden and Hans Lipps, certainly met his hermeneutical interests—the ontological trend in the intellectual atmosphere among Husserl’s fellow students in Göttingen also should be taken into account.

### SHPET’S VERSION OF PHENOMENOLOGY

Shpet’s encounter with Husserl’s phenomenology, in light of Shpet’s expectation of a reform of philosophy and psychology, leads to a singular notion of phenomenology, which is documented in *Iavlenie i smysl* (Appearance and sense, 1914). On the one hand, Shpet tries to reconstruct Husserl’s noetic-noematic studies within the framework of an ontological inquiry, based on the Neoplatonism of the Moscow Metaphysical School; on the other hand, he demonstrates the incompleteness of Husserl’s analyses of intentional objects, as presented in *Ideas*, volume 1, and completes these analyses with his own. The “noematic sense” intended in acts of consciousness, as presented by Husserl, presupposes for Shpet a class of intentional experiences hardly dealt with in *Ideas*: acts of consciousness through understanding, which play a role in the constitution of all classes of concrete objects. The structure of these “hermeneutic acts” is illustrated by a range of phenomena that are of only minor importance in *Ideas*: the mode of appearance of items of practical use, the specific character of historical sources, and the understanding of linguistic utterances. Thus Husserl’s “Phenomenology of Reason” provides a basis for historical cognition in scientific logic, leading eventually to a grounding of the humanities through an analysis of their conceptual framework and methodology.

Shpet’s ensuing works on hermeneutics, philosophy of language, and theory of art, published or written between 1916 and 1927, can be seen as a further development of his hermeneutical phenomenology, the primary idea of which is the correlation of signs (as a combination of expression and meaning) and sign-interpreting consciousness. Shpet also characterizes his project as a semi-otic “Philosophy of Culture” in which language, art, myths, and manners are to be described as systems of signs. He develops the basic model of a sign out of Husserl’s concept of linguistic expression, which acts as a prototype for all other forms of signs. The idea of a “purely logical grammar,” which formulates laws for the

grammatical meanings of natural languages, should be applied analogously to all other cultural systems.

### HERMENEUTICS, PHILOSOPHY OF LANGUAGE, AND POETICS

The concrete form of Shpet's phenomenology of hermeneutical reason in his philosophy of language and his poetics was also much influenced by Dilthey's "Philosophy of Life." In Shpet's hermeneutical philosophy, as outlined in *Germenevtika i ee problemy* (Hermeneutics and its problems) (1918), he worked with Schleiermacher's, Boeckh's and Dilthey's theories of understanding. Above all, he tried to deepen and refine Dilthey's late grounding of the humanities—then the culmination in the development of hermeneutics—with insights in the domain of semiotic theories, which he found not only in Husserl's first *Logical Investigation on Expression and Meaning*, but also in other semantic works of the Brentano School (particularly Anton Marty and Alexius Meinong). A combination of Husserl's semantics with Dilthey's hermeneutics would be an enrichment for both sides, as Shpet wrote at the end of the manuscript. The theory of understanding could find a new answer to the question of the mutual relation of the different methods of interpretation, whereas semantics would experience in this combination a "philosophically lively and concrete embodiment."

This actualization of Husserl's philosophical semantics, with a hermeneutical intention, has left its traces in Shpet's *Ėsteticheskie fragmenty* (1922–1923), with which he entered contemporary discussions on literary theory, as initiated by Russian formalism. He was particularly concerned with the definition of the specific character of poetical discourse as opposed to others, be they scientific, rhetorical, or everyday discourses. If one puts this question phenomenologically, one has to ask under what conditions a linguistic utterance appears as artistic or poetic to a listener or reader. Since a poetic utterance is experienced only as a contrast to everyday use of language, one must first analyze the reception of everyday language. Shpet follows this procedure in the second part of *Ėsteticheskie fragmenty*. The difference between understanding the message and understanding its author plays a pivotal role in Shpet's description of the various forms and aspects of linguistic consciousness.

In contrast to such a phenomenological analysis of linguistic consciousness, Shpet presents a structural analysis of linguistic expression as "ontology of the word," which he, in turn, subsumed under a general theory of semiotics. In this confrontation between a phenomeno-

logical inquiry, which is confined to the side of experience, and an ontology, which focuses on the object, the ever-increasing influence of Husserl's early concept of phenomenology on Shpet becomes visible. In Shpet's "ontology of the word" a particular concept of structure is of central importance. "The structure is a concrete construction whose individual parts can vary in their extent and even in their quantity, but not a single part of the whole *in potentia* can be removed without destroying this whole." (1922–1923, II, 11). By "structure of the word" Shpet did not mean the morphological, syntactic, or stylistic construction—in short, not the arrangement of linguistic units "in the plane," but "the organic, depth-wise, as it were, arrangement of the word—from the sensually conceivable wording to the eidetic object." The structure of the word, therefore, consists of the relations between phonemes and meaning, as well as of those between the word's meaning and "object," where the latter is ideal and ontologically distinct from concrete individual things.

When Shpet spoke of the structure of the *word*, he took it in the wide sense of the Russian expression for "word" *slovo*, which can mean sentences or combinations of sentences in discourse, as well as literary texts and even natural language in its entirety. Shpet used it with all these different meanings, yet was mainly concerned with the "communicating word": meaningful discourse able to convey something to another person. Thus Shpet took up Plato's definition of predicative statements, as "the shortest and most simple *logos*" (Sophistēs 262c). Shpet described its structure as follows: in a simple predication the subject denotes a concrete, individual object; the predicate indicates a property belonging to this object. In denoting, speakers refer to a thing; in predication, they say something about it. What can be said about this thing, and conversely, which predications are possible, is determined by the species to which the thing belongs. Therefore the act of intending a species, which Shpet called also the "eidetic object," is indispensable for the construction of a meaningful sentence.

With these definitions Shpet outlined the "word's structure," which is common to everyday and scientific communication, as well as to rhetorical and poetic discourse. In order to explain how this general structure manifests itself in the artistic usage of words, sentences, and discourse, Shpet developed a theory of linguistic functions that stems from a critical assessment of Husserl's and Marty's philosophy of language. He started from three different functions of language, each fulfilled by a particular type of discourse. These three communicative functions are the factual—the expressive, and the

poetic, the latter working through the creative formation of language. Depending on which of these three functions is dominant, discourse is either scientific (concerned with factual communication), rhetorical (concerned with influencing other people's emotions), or poetic (primarily concerned with the arrangement of linguistic expressions as such).

The predominance of one of the three functions implies in each case a different mutual relation between the above-mentioned parts of the word structure. Whereas, for example, in everyday language the arrangement on the level of expression aims primarily at structuring the expressed meaning, and thereby at the communication of facts, in poetic discourse all levels gain a relative importance of their own. The rhythmic forms and syntactic peculiarities of this discourse should attract attention as such. At the same time, the meaning expressed in poetic discourse is more dependent on the external forms of language: whereas the meaning of a factual—above all scientific—communication is not affected by each change of wording and syntactic arrangement.

#### FROM HUSSERL TO HUMBOLDT

By giving pure logic, which deals with the condition of the possibility of science, a phenomenological foundation, Husserl excluded important aspects of living discourse from his language analysis. Shpet's project was more extensive than Husserl's in that he analyzed scientific communication merely as one possible form alongside the poetic, rhetorical, and everyday discourses. This widening of the horizon entails a turning away from (not only a modification of) Husserl's concept of language. Shpet questioned, for example, one of the central presuppositions of *Logical Investigations*—that scientific discourse can be marked off from living discourse. These two ways of speaking are only tendencies, as Shpet emphasized; they are not fully realized in any empirical speech sample. "Figurativeness is not only a trait of 'poetry'... it is a general property of language, which belongs to scientific discourse as well." (1922–1923, III, 32).

The thesis of the irreducibility of figurative-ambivalent discourse has to do with Shpet's emphasis on the fact that thought is inseparably bound to language. With this concept of language as the "formative organ of thought," as outlined by Shpet in his interpretation of Humboldt in 1927, he turned away most clearly from Husserl's *Logical Investigations*, according to which "the fact of being expressed is arbitrary for the meaning."

#### SIBLEY, FRANK

(1923–1996)

Frank Sibley was trained as a philosopher in postwar Oxford. His principal teacher was Gilbert Ryle, who, understandably, had a profound influence on Sibley's way of doing philosophical analysis—an influence that is as apparent in his last papers as in his first ones.

Sibley must be credited with inaugurating the renaissance in aesthetics and philosophy of art in the English-speaking world after World War II, a renaissance that is still in full cry. He did it in 1959, in an article that, in the years since, has never ceased being discussed and cited in the literature, and, at the time of its appearance, produced a veritable deluge of essays, and even books in response or defense, that completely reinvigorated the discipline.

“Aesthetic Concepts” (1959a), as Sibley titled his inaugural article, dealt, in a surprisingly few pages, with three of the most basic and difficult issues in the discipline: taste, criticism, and the distinction between the aesthetic and nonaesthetic. He began, with a sensitive ear for “ordinary language” that was to characterize to the end all of his work in aesthetics, by distinguishing between the kinds of things one says about works of art such as “that a novel has a great number of characters and deals with life in a manufacturing town” or “that a painting uses pale colors, predominantly blues and greens,” and such remarks, in contrast, as “that a poem is tightly knit” or “that a picture lacks balance or has a certain serenity and repose.” About these different kinds of remarks, Sibley claims, “It would be natural enough to say that the making of judgments such as these [latter ones] requires the exercise of taste, perceptiveness, or sensitivity of aesthetic discrimination or appreciation; one would not say this of my first group” (pp. 63–64).

Sibley calls the terms that he thinks require a perceptiveness, sensitivity, or taste beyond that of “normal eyes, ears, and intelligence,” aesthetic concepts or terms. And it is the central, most controversial of his claims that aesthetic concepts or terms are, as he puts it, not condition-governed, which is to say, “There are no sufficient conditions, no non-aesthetic features such that the presence of some set or number of them will beyond question logically justify or warrant the application of an aesthetic term” (1959a, p. 67).

Sibley was, throughout his professional life, reticent to publish because of a deeply ingrained perfectionism. Even though his philosophical reputation stems mainly from the groundbreaking “Aesthetic Concepts,” it is not the only one of his publications to have influenced the field. Particularly worthy of mention are “Aesthetics and the Looks of Things” (1959b) and “Aesthetic and Nonaesthetic” (1965), in both of which Sibley further explores the whole question of aesthetic reason-giving. As well, Sibley’s work in aesthetics and philosophy of art is now likely to have a renewed influence on the field through the posthumous publication of essays he was in the process of preparing for the press at the time of his death. The range

of subjects broached in these essays demonstrates that, to the last, Sibley was at the cutting edge of research and is likely to remain a potent philosophical force for many years to come.

## SIDGWICK, HENRY

(1838–1900)

Henry Sidgwick, the English philosopher and educator, was born in Yorkshire and attended Rugby and Trinity College, Cambridge. After a brilliant undergraduate career, he was appointed a fellow at Trinity in 1859. He had already begun to have religious doubts, and in the years following 1860 he studied Hebrew and Arabic intensively, hoping to resolve these doubts through historical research. At the same time Sidgwick was teaching philosophy, and he had for many years been a leading member of the small group that met for philosophical discussions with John Grote. Gradually he came to think that if answers to his religious questions were to be found at all, they would be found through philosophy—but he never fully quieted his doubts. In 1869 he resigned his fellowship because he felt he could no longer honestly subscribe to the Thirty-nine Articles, as fellows were required to do. His college promptly appointed him to a lectureship, and when religious tests were dropped, he was reappointed fellow. In 1876 he married Eleanor Balfour, sister of Arthur Balfour. He succeeded T. R. Birks as Knight-

bridge professor of moral philosophy in 1883, and continued actively teaching in the moral sciences course until his death.

## WORK AND ACTIVITIES

Philosophy was only one of Sidgwick's many interests—he also wrote on education, literature, political theory, and history of political institutions. He was active in the cause of women's education at Cambridge and had a large part in the founding of Newnham College for women, to which he devoted considerable time and money. Another main interest was psychical research—he performed some experiments with F. W. H. Myers as early as 1873, and in 1882 he helped found the Society for Psychical Research. He served twice as the society's president, and investigated and reported on many alleged psychical phenomena, very few of which, however, he believed to be both genuine and significant.

Sidgwick's most important work is *The Methods of Ethics* (1874). His other philosophical writings, although interesting for the light they throw on his moral philosophy, are too slight, too occasional, or too little original to be of independent significance; but the *Methods* has been held by C. D. Broad and other writers to be the greatest single work on ethics in English—and possibly in any language. Sidgwick's work in economics and political science is generally thought not to be of comparable importance.

## PHILOSOPHICAL METHOD

*The Methods of Ethics* exemplifies Sidgwick's views on the nature of philosophy. The philosopher's aim is not to discover new truths; rather, it is to give systematic organization to knowledge that we already possess. Theoretical philosophy attempts to unify the knowledge obtained through the sciences, so that all of it may be seen as a whole and all the methods used in science may be seen as parts of one method. Practical philosophy has a similar task to perform with our common moral knowledge of what ought to be and what ought to be done, and with the methods we use in obtaining this knowledge.

In carrying out the task of practical philosophy, Sidgwick offered a resolution of a perennial controversy that had been particularly sharp in the middle years of the nineteenth century—that between utilitarians, such as J. S. Mill, and intuitionists, such as William Whewell. However, he found himself unable to reach a solution to another central controversy, that between those who held that morality is independent of religious belief and those

who held that without religion no coherent morality is possible.

A brief summary of the course of the argument of *The Methods of Ethics* will make these points plain. Sidgwick took a method of ethics to be a reasoned procedure for reaching specific decisions about what one ought to do. The methods used by common sense, he argued, may be reduced to three. One method takes excellence or perfection as an ultimate goal, and claims that we have intuitive knowledge of a variety of independently valid moral principles and maxims. We reach specific conclusions by subsuming particular cases under the relevant principles. According to the other two methods, we are to infer the rightness or wrongness of acts from the amount of happiness they would cause. According to one method, we calculate the consequences to the agent alone. According to the other, we consider the consequences for everyone affected by the act. Moral rules and principles, for these two methods, are only useful indications of the effects that certain kinds of actions may generally be expected to have. After discussing some basic ethical concepts, Sidgwick examined each method separately and then considered their mutual relations. He concluded that the first method, intuitionism, and the third, utilitarianism, supplement one another, and that their conclusions form a systematic whole. Thus, it is reasonable to act as those conclusions dictate. The remaining method, egoism, can also be systematically developed, and it is reasonable to act according to its conclusions. Either of the two views thus reached dictates obligations that are binding quite independently of any religious sanctions.

However, empirical evidence alone does not show that the conclusions of the egoistic method will always agree with those of the intuitional-utilitarian method. Using methods that are perfectly reasonable, we are sometimes led to serious contradictions. Unless we can find some evidence for the existence of a moral power that will repay self-sacrifice and punish transgression, we will be unable to bring all our practical beliefs and methods into any coherent system. The mere fact that the existence of a power that rewards and punishes behavior is needed to make our practical beliefs coherent does not justify the assertion that there is such a power. Sidgwick personally held that the theistic view is natural for man, but he despaired of finding any evidence to support it and refused to use it in his philosophy. The consequence of the existence of these practical contradictions is (as Sidgwick put it in the melancholy concluding words of the first edition of the *Methods*) that “the prolonged effort of the human intellect to frame a perfect ideal of rational

conduct is seen to have been foredoomed to inevitable failure.”

### BASIS OF CLASSIFICATION

Sidgwick’s classification of the methods implicit in commonsense morality rests on two considerations. First, the methods reflect two sides of human nature. Those taking happiness as the final end reflect the sentient side of man, the capacity for enjoying and suffering, while the method taking excellence as the final end reflects the fact that man is also an active being, with a need to do as well as a need to feel. Second, the classification indicates an epistemological distinction that Sidgwick constantly took as basic, the distinction between propositions that we are entitled to assert only because we have correctly inferred them from others that we know, and propositions that we are entitled to assert because we know them without any inference, directly or “intuitively.” The intuitional method claims that we have noninferential knowledge of moral principles, while the other methods emphasize the ways in which moral rules and maxims are arrived at by inference.

### NONINFERENTIAL TRUTH

If there is inferential knowledge, Sidgwick believed, there must be noninferential knowledge; and since he also held that there are no infallible sources of noninferential knowledge, the problem arises of how to test claims to possess noninferential truth or claims to have found self-evident propositions. Sidgwick proposed four tests that apparently self-evident propositions must pass before we can be justified in accepting them: (1) the terms in which they are stated must be clear and precise; (2) their self-evidence must be very carefully ascertained; (3) they must be mutually consistent; and (4) there must be general agreement of experts on their truth. Sidgwick argued at great length that commonsense moral principles, which according to traditional intuitionism are self-evident, fail to pass these tests. Hence, if they are true principles, as we all take them to be, they must be inferential and dependent, not self-evident and independent.

### SELF-EVIDENT MORAL PRINCIPLES

What do commonsense moral principles depend on? There are four principles that do pass Sidgwick’s tests and that he accepted as self-evident. (1) Whatever action anyone judges right for himself, he implicitly judges to be right for anyone else in similar circumstances. (2) One ought to have as much regard for future good or evil as for present, allowing for differences in certainty. (3) The

good enjoyed by any individual is as important as the good enjoyed by any other. (4) A rational being is bound to aim generally at good.

### PRINCIPLE OF BENEVOLENCE

From the principles that the good of each person is equally important and that a rational being must aim generally at good, Sidgwick deduced an abstract principle of benevolence. Commonsense morality, he argued, appeals to this principle to settle cases in which its usual rules give no answers, and allows its rules to be overridden by the principle if they conflict with it. These facts indicate that common sense considers its rules to depend for their validity on this principle. However, the abstract principle of benevolence is also at the center of utilitarianism, and commonsense morality—the stronghold of traditional intuitionists—is thus seen to be fundamentally utilitarian. The utilitarian, in turn, can have no objection to any of the self-evident principles, and the two methods can thus be completely synthesized. Even the egoist can accept three of the self-evident truths; his rejection of the fourth is an indication of the basic contradiction in the realm of practical reason.

### CRITICISMS OF UTILITARIANISM

Sidgwick is usually considered a utilitarian, and he frequently referred to himself as one. However, his views differ considerably from those of the earlier utilitarians.

**EMPIRICISM.** Sidgwick rejected the empiricist epistemology that J. S. Mill developed and that seemed to underlie Jeremy Bentham’s thought. Empiricism, as Sidgwick understood it, holds that the basic premises from which all knowledge is built are cognitions of particular facts and that these cognitions alone are infallible. Sidgwick argued that these cognitions are not infallible and that empiricism cannot give a satisfactory account of the principles of inference that guide the construction of knowledge from the basic data. Metaphysically, he rejected not only materialism but also the reductive sensationalism to which he believed the empiricist epistemology led. Following Thomas Reid, he held to what he called a commonsense dualism of mind and matter, although he found the connections between the two most obscure.

**DEFINITION OF ETHICAL TERMS.** Sidgwick also rejected what he took to be the traditional utilitarian attempt to define ethical concepts such as “good” and “ought” in terms of nonethical concepts such as “pleas-

ant” or “conducive to most pleasure” and in this way to justify the construction of a purely factual, scientific morality. No reduction of “ought” to “is,” of ideal to actual, had yet been successful, he held, although he hesitated to say that no reduction could possibly succeed. However, he did affirm that it is impossible to make an ethical first principle true by definition. To define “good” as “pleasure” is self-defeating if you wish to hold, as a first principle that the good is pleasure, since what you hold as a principle would then be a tautology, and a tautology cannot be an ethical first principle. Recognition of these points, Sidgwick believed, would force the utilitarian to admit the need of a basic intuition in his philosophy.

**MOTIVATION.** Sidgwick rejected the motivational theories of Bentham and the Mills. He did not think that we always necessarily act to obtain what we take to be our own pleasure or our own good.

**THE RELEVANCE OF PSYCHOLOGY.** Sidgwick strongly objected to the tendency, which he attributed to Mill, to substitute psychological (or perhaps, with Auguste Comte, sociological) investigation into the origins of ideas and beliefs for properly philosophical investigation of their applicability or truth. Quite aside from his doubts as to the adequacy of the associationist psychology that the earlier utilitarians accepted, Sidgwick held that psychological discoveries about the antecedents and concomitants of ideas and beliefs are, in general, irrelevant to questions of their truth and validity—and psychology can tell us only about antecedents and concomitants. It cannot supersede the deliverances of direct introspective awareness on the question of what our ideas now are.

**DETERMINISM.** Sidgwick agreed with the earlier utilitarians that there seems to be overwhelming evidence in support of a deterministic view of human action. However, he held that this evidence must be balanced against the fact that in the moment of choosing between alternative actions we inevitably think ourselves free to choose either alternative. He argued that the issue is, therefore, not yet settled, but he held that it is not important for ethical theory that it should be.

**INDEPENDENCE OF POLITICS.** Sidgwick held that utilitarianism does not necessarily lead to reforming radicalism in politics. He pointed out the strong utilitarian element to such conservative thinkers as David Hume and Edmund Burke, and he argued at great length that a utilitarian would be extremely cautious in recommending important changes.

## AGREEMENTS WITH UTILITARIANISM

Sidgwick’s position was, of course, utilitarian in its major ethical aspects. He held that the only ultimate or intrinsic good is desirable or pleasant states of consciousness; that acts are objectively right only if they produce more good than any other alternative open to the agent; and that moral rules, such as those of truth-telling or promise-keeping, are subordinate to the principle of utility and are dependent on it for whatever validity they possess. He also held that the value of character and motive is derived from, and to be judged in terms of, the consequences of the actions to which they tend to lead. Sidgwick’s disagreements with the traditional forms of utilitarianism are part of his attempt to show that the utilitarian view of morality is independent of metaphysical doctrines, psychological theories, and political platforms and therefore is capable of being what he argued it is—the position toward which commonsense morality in every age and in every society has tended.

## SIDGWICK, HENRY [ADDENDUM]

Henry Sidgwick is renowned for giving classical utilitarianism its most sophisticated dress and greatly advancing substantive ethical theory. Celebrated for his clarity and cool impartiality, he developed an approach to ethical theory that profoundly shaped influential philosophers from G. E. Moore and Bertrand Russell down to R. M. Hare, John Rawls, Marcus Singer, Derek Parfit, and Peter Singer. It was Sidgwick, rather than Moore, who set the course for twentieth-century debates over the ethics and metaethics of the utilitarian view that maximizing happiness is the ultimate normative demand—that is, over such matters as the conflict between egoistic and utilitarian reasons, the distinction between total and average utility, the role of commonsense in utilitarian reasoning, the meaning of *good*, and the moral standing of other beings that are not human. Yet Sidgwick himself had more comprehensive intellectual, religious, and cultural concerns than most of his later analytical admirers. He was haunted by the specter of skepticism in religion and morality, and if he turned utilitarianism into a respectable academic philosophy, he also reluctantly brought it into the crisis of the Enlightenment.

Educated in classics and mathematics at Trinity College, Cambridge, Sidgwick spent his entire adult life at Cambridge, becoming Knightbridge Professor in 1883. Molded by the influential discussion society known as the Cambridge Apostles, he developed serious interests in theology, biblical criticism, poetry, education, ethics, political economy, jurisprudence, political theory, sociology, epistemology, metaphysics, and parapsychology (he was a founder and president of the Society for Psychical

Research). He vastly influenced the Cambridge moral sciences curriculum and was a guiding force in the cause of women's higher education and the founding of Newnham College. In 1876 he married Eleanor Mildred Balfour, a force in her own right in psychical research and educational reform. Moreover, he was deeply involved with the work of his close friend John Addington Symonds, a pioneer of cultural history and gay studies.

Sidgwick's masterpiece, *The Methods of Ethics* (1874), was a sustained effort at independent, secular moral theory resulting from his decade of "storm and stress" over the defense and reform of Christianity. It also reveals that, however indebted Sidgwick was to his chief mentor, J. S. Mill, his hedonism was more consistently Benthamite, whereas his overall position was more eclectic, reconciling utilitarianism with arguments from Plato, Aristotle, Descartes, Immanuel Kant, Joseph Butler, Samuel Clarke, William Whewell, John Grote, F. D. Maurice, and T. H. Green. It rejects the empiricism and reductionism of earlier utilitarianism, and adheres to a sophisticated fallibilist intuitionism involving various tests for reducing the risk of error with respect to basic non-inferentially known propositions:

- 1) clarity and precision.
- 2) ability to withstand careful reflection.
- 3) mutual consistency.
- 4) consensus of experts.

*The Methods of Ethics* is largely a systematic critical comparison of the methods of ethical egoism, common sense or intuitional morality, and utilitarianism—for Sidgwick, the ongoing procedures for determining, on principle, what one ought to do (though he would later devote as much attention to idealism and evolutionism). He takes the notion of *ought* or *right* as fundamental and irreducible and, for the most part, gives an internalist account of moral approbation. But he also holds that it is a plausible and significant (not tautological) proposition that ultimate good is pleasure or desirable consciousness; egoism and utilitarianism hence reduce to egoistic and universalistic hedonism. He then shows that earlier utilitarians exaggerated the conflict with common sense, confused the utilitarian and egoist positions, and failed to give their view rational foundations. His exhaustive examination of commonsense morality, after the manner of Aristotle, reveals time and again that such principles as veracity, fidelity, justice, and benevolence are either too vague and indeterminate, or too conflicting and variably interpreted to form a system of rational intuitions.

Indeed, common sense is even unconsciously utilitarian because it is apt to resort to that view to complete its own system—for example, to settle conflicts between the duty to speak the truth and the duty to keep one's promises.

Thus, commonsense morality ends in utilitarianism, though utilitarianism grounded on philosophical intuitionism, and utilitarianism can in turn rationalize much of commonsense morality as the (indirect) means to the greatest happiness. But no such reconciliation of utilitarianism and egoism is forthcoming, each being, on reflection, equally defensible. Kantian universalizability, the essence of justice, comports with either egoism or utilitarianism and cannot decide between them, though it is another self-evident principle. Sidgwick dismally concludes that there is a dualism of practical reason rendering it incoherent. Without help from epistemology or theology, he has no rational way to settle conflicts between individual self-interest and universal good. Arguably, his demand that these be reconciled in a manner doing justice to the force of both means that his view is better described as dualist, rather than simply utilitarian.

Still, Sidgwick's other intellectual and reformist interests often radiated from his fears about the implications of the dualism of practical reason. His research in parapsychology was largely devoted to seeking evidence of personal survival of death, since such evidence, he believed, might bolster a theism affording the needed reconciliation. And although *The Principles of Political Economy* (1883) and *The Elements of Politics* (1891) tend rather to assume a utilitarian standpoint, they also bespeak his concern that human emotions be shaped in a more deeply altruistic direction, encouraging sympathetic, benevolent sentiments and reigning in narrow or materialistic egoistic ones.

Both his reformism and his philosophical and scientific pursuits were brought to bear on the potential for such societal evolution and the perhaps limited place of reason and religion within it. Never as sanguine as Comte, Mill, or Spencer, his concern for reform was tempered by fear that skepticism and crude egoism would lead to social deterioration. If Sidgwick was as good at defending an agent-relative egoism as an agent-neutral utilitarianism, this was scarcely the result he sought, unless some high-minded reconciliation could be effected as well.

But Sidgwick's views on civilization and its direction suggest both continuities and discontinuities with earlier utilitarianism. It would be hard to deny that troubling racist undercurrents can be found in his work, or that his

educational and political writings and activities, in particular, reflected the pervasive late Victorian culture of imperialism. Sidgwick was a friend and colleague of such imperialist luminaries as Sir John Seeley, and went so far as to edit Seeley's posthumous *Introduction to Political Science*. Arthur Balfour, the future prime minister, was his student, brother-in-law, and colleague in psychical research, and also influenced his politics. Ironically, given the priority of politics in Benthamism, the political and economic dimensions of Sidgwick's utilitarianism have been comparatively neglected. This is doubly ironic because Sidgwick was, in fact, an influential economic and political theorist who shaped the views of Alfred Marshall, F. Y. Edgeworth, and other seminal figures in modern economics.

Only by reading *The Methods of Ethics* in the context of Sidgwick's other work and activities is there some hope of determining whether he was a true "government house" utilitarian, holding that the publicity of moral principles be subject to felicific calculations congenial to paternalistic governments, or a defender of the plain person's capacity for moral self-direction, as his focus on common sense and method might suggest. Still, it is clear that Sidgwick articulated a truly comprehensive practical philosophy, and a sophisticated metaethics and epistemology, one deeply informed by Kantianism and idealism as well as utilitarianism. He was not a naïve encyclopedist lacking any grasp of social theory or the historicity of his own philosophy. But whether he began, in his last decades, to doubt the philosophical quest for certainty enough to approximate the pragmatist via media is a very difficult question that has put Sidgwick back in the middle of debates over the imperialistic origins of contemporary political Liberalism.

## SIGER OF BRABANT

(c. 1240–c. 1281/1284)

Of Siger's life, we know very few facts for certain. His exact place of birth remains unknown, as well as the locale and circumstances of his death. (Did he die peacefully in Liege, Belgium, or was he assassinated in Italy at the Roman curia?) Even the chronology of his works is uncertain. Although they are thought to have been written between 1265 and 1277, the precise dates remain conjectural.

Concerning his university career, facts are again unclear. Although it is certain that he never left the faculty

of arts for one of the higher faculties (theology, medicine, law), his role in the debates that shook the University of Paris and led to the statutes of 1272 remains the subject of discussion (Putallaz and Imbach 1997 versus Bianchi 1999). At the beginning of his career, he was one of Thomas Aquinas's most outspoken adversaries, but the question as to what degree he would have abandoned Averroism to adopt Thomist views remains open. Certain passages seem to support the view that he would have abandoned Averroism, while others are incompatible with this hypothesis (Van Steenberghe and Maurer defend the developmental interpretation, whereas Mandonnet and Bukowski defend the idea that Siger never changed his mind and was the strictest Averroist of his time, a philosopher who could without any guilt subscribe to heretical propositions).

All of these often radical oppositions about the interpretation of Siger's doctrines—whether metaphysical, psychological, ethical, or logical—illustrate the difficulty involved in understanding the complex thought of a Master of Arts who taught in a time as intellectually rich as it was eventful. Siger was influenced by the famous Dominican theologian Albert the Great, was directly attacked by another famous Dominican theologian, Thomas Aquinas, in his *De unitate intellectus*, was singled out by the condemnations of 1277 (although many of their propositions cannot be related to any of his works), was taken as a model for John of Jandun, later became one of the most important Averroists in the fourteenth century, and was placed by Dante in paradise beside Thomas Aquinas. Faced with this abundance of information, one must consider Siger's texts in themselves by situating them in their context, of course, but also by distinguishing what Siger said from what others say he said. It is well known that the opponents of a thesis tend to present it in a less than advantageous light to make it seem absurd and, in the Middle Ages, heretical. It is also important to take into account how Siger expresses his ideas. For example, Imbach (1996) showed clearly that Siger habitually took certain passages from Thomas Aquinas and twisted them from their original meaning to defend a thesis opposed to that of his illustrious opponent. Such a rhetorical procedure should not be surprising in the context of the condemnations. If we follow these methodological principles, we can draw a clearer and more nuanced portrait of Siger.

#### PRINCIPLE PHILOSOPHICAL THESES

Siger sought to be a career philosopher. At the end of the thirteenth century, this involved being autonomous from

theology and being independent from established philosophical authorities. This stance influenced Siger's philosophical thought.

Siger's claim that philosophy is independent of theology does not in any way involve a rejection of faith. Rather, it seeks to confine theology to the domain of revelation, where it is the supreme guarantor of truth, and only to where it applies there (Siger 1981/1983, VI, comm. 1). For example, we know through revelation that the world was created. However, revelation does not tell us whether the world was created in time or out of eternity. To decide this question, we would have to investigate the divine will, which is impossible. So we have a choice: either to believe the first thesis on the authority of Augustine, although it rests on no rational argument, or to believe, contrary to Aristotle, for whom the world was not created, the second thesis, a conclusion arrived at by means of natural reason (1972a, *QTDA*, q. 2; 1972a, *DEM*; 1981/1983, III). Between Aristotle, who opposes faith, and the theologians, who pretend to demonstrate their thesis in a philosophical manner that is false, Siger proposes an intermediary path that conforms to the demands of both faith and philosophy: creation out of eternity.

Siger sought to be independent of philosophical authorities, including Aristotle, as we have just seen, as well as Averroes. Indeed, he held that the philosopher must demonstrate for himself the proofs of his predecessors and oppose or correct them if they prove to be erroneous (1981/1983, IV, q. 34). Thus, even in his first work dedicated to noetic (philosophy-of-mind) questions (1972a, *QTDA*, written before 1270), where he is deeply influenced by Averroes, Siger never supported the monopsychist position that Thomas Aquinas attributed to Averroes, a position according to which all of humanity shares a single intellect. This position would imply that there is no individual thinking, as well as no individual immortality, no corporeal fires of hell, and no resurrection of the body.

The best evidence that Siger rejected monopsychism is Aquinas's introduction to his criticism of Siger's doctrine in the *De unitate intellectus* (On the unity of the intellect; written in 1270): "Some, seeing that on Averroes's position it cannot be sustained that this man understands, take another path and say that intellect is united to body as its mover" (III, sec. 66). This view of Siger's position also explains how, in his last work (1972b, presumably written in 1277), Siger could sincerely declare Averroes's noetic doctrine "absurd and heretical" without abandoning his previous doctrine (1972b, q. 27). Here

too Siger takes a middle path. The intellect is not united to the body like a sailor to his boat (the error of Plato), nor is it united to the body like a mould to wax (the error of Alexander of Aphrodisias). Rather, the intellect functions intrinsically within the body. Siger held that the intellect is not a unique form completely separate from the body (the position of Averroes according to Aquinas, a position similar to Plato's, and a position against faith and individual morality). He also held that the intellect is not a multiple form completely immanent to the body (the position of Aquinas and Albert according to Siger, a position similar to Alexander's, and a position against philosophy). Rather, intellect, according to Siger, is a mixed form, separate from the body in substance, but joined with it in function (1972a, *QTDA*, q. 7; 1972a, *DAI*, III and VII; 1972b, q. 26).

With regard to morality, about which he wrote very little, as well as psychology, Siger resolutely defended the thesis that the intellect holds sway over the will (1974, *Quaestiones morales*; Ryan 1983), a position that many theologians of the time considered to be equivalent to determinism. In metaphysics, Siger held that there is no real distinction between existence and essence (1981/1983, I, qq. 7–8). He also held that universals, as such, are not substances; they exist only in the soul and are acquired by abstraction from the particular natures of things (1981/1983, III, qq. 15 and 28; 1972a, *DEM*).

### Bibliography

Although most significant texts have been critically edited, there are only very few monographs dedicated to Siger's thought. Most studies still more or less depend on Van Steenberghen's evolutionist interpretation and, not surprisingly, concentrate on one of the following subjects: the eternity of the world, the rational soul, and the relation between reason and faith. The most complete bibliography to date is available from <http://www.mapageweb.umontreal.ca/pironetf>.

## SIGWART, CHRISTOPH

(1830–1904)

Christoph Sigwart, the German philosopher and logician, was born and died in Tübingen. He studied philosophy, theology, and mathematics there and taught in Halle from 1852 to 1855, before joining the theological seminar in Tübingen in 1855. He accepted a professorship at Blaubeuren in 1859 and returned to Tübingen as professor of philosophy, a position he held from 1865 to 1903. His doctoral dissertation was on Giovanni Pico della Mirandola. He also wrote on Friedrich Schleiermacher, Benedict de Spinoza, Huldrych Zwingli, and Giordano Bruno, as well as on ethics. His most important work was

the two-volume *Logik*, a comprehensive treatise on the theory of knowledge.

The aim of logic, Sigwart maintained, is normative rather than descriptive. Logic is a regulative science whose aim should be to present a useful methodology for the extension of our knowledge. It is "the ethics rather than the physics of thought" and concerns itself not with an account of psychological processes but with finding the rules in accordance with which thought may achieve objective validity. Like ethics, logic is concerned with the question "What ought I to do?" The adequacy of thought lies not in its correspondence with an antecedently objective reality but in its satisfaction of human purposes. The overriding purpose of reasoning is to reach ideas that are necessary and universal for us, for human beings. Objective validity is essentially a matter of intersubjective agreement. The possibility of discovering the rules for necessary and universally valid thinking, however, depends also on an immediate awareness of self-evidence, a property that is possessed by necessary judgments. The experience of self-evidence is a postulate beyond which we cannot inquire. Logic strives to disclose the conditions under which this feeling occurs.

In Sigwart's philosophy there is a voluntarist element combined with respect for natural science, both of which evidently impressed William James. (James quoted from Sigwart in his essay "The Dilemma of Determinism.") Sigwart held that an activity of free and conscious willing is presupposed not only by ethics and metaphysics but by logic as well. Free will is presupposed by any distinction between correct and incorrect reasoning, since thinking must be a voluntary activity and not necessitated. The will is supreme in the realm of theory as well as in that of practice. The ultimate presupposition of all experience, and therefore of all thinking too, is not merely Immanuel Kant's "I think," which can accompany all ideas, but also "I will," which governs all acts of thought.

Sigwart's classification of the forms of judgments and categories presents judging as the basic cognitive function. Judgments are divided into simple narrative judgments, expressive of an immediate recognition ("This is Socrates"), and complex judgments, presupposing twofold and higher syntheses ("This cloud is red"). The discussion of existential judgments agrees with Kant in denying that existence, or "to be," adds anything to the content of an idea.

Sigwart was also interested in the work of men outside his own country; for example, the *Logik* contains a lengthy discussion of J. S. Mill on induction. Sigwart's ethical and metaphysical views were somewhat conven-

tional: He held that progress in the development of the social order is an inevitable fact of history, and he argued that the attempt to make all our knowledge coherent inevitably leads to the idea of God.

## SIMMEL, GEORG

(1858–1918)

Georg Simmel, the German philosopher and sociologist, was born in Berlin and resided there except for the last four years of his life. He was educated there, and in 1881 he received his doctorate from the University of Berlin. Three years later he began to teach at that university as a *Privatdozent* and from 1900 he was associate professor without faculty status. Although successful as a lecturer and a writer, he was never promoted to a full professorship at Berlin, nor was he able to secure such a position at any other leading German university. Only in 1914, when his career was almost ended, was he offered a chair in philosophy at the provincial University of Strasbourg. However, World War I disrupted university life there, so that Strasbourg benefited little from Simmel's teaching. Just before the end of the war, Simmel died of cancer.

Simmel's failure as an academic was connected with the nature of his interests, his style of lecturing and writing, and his philosophic position. He had many influential friends—he knew and corresponded with Max Weber, Heinrich Rickert, Edmund Husserl, Adolf von Harnack, and Rainer Maria Rilke—and his applications

for openings were always well supported by the testimony of his crowded lecture halls and the success of his many writings, both technical and popular. However, from the straitlaced viewpoint of the German academic hierarchy Simmel was suspect. He seemed to be interested in everything: He wrote books or essays on Rembrandt and Johann Wolfgang von Goethe, on Michelangelo, Auguste Rodin, and Stefan George; on Florence, Rome, Venice, and the Alps; on the philosophy of money, adventure, love, landscapes, and the actor; on ruins, handles, coquetry, and shame; as well as on the more standard philosophic subjects of ethics, philosophy of history, Immanuel Kant, Arthur Schopenhauer, and Friedrich Nietzsche, and, at the end of his life, metaphysics.

Throughout his career Simmel made contributions of lasting importance to sociology, a subject that had not yet achieved academic respectability. His style, too, was not that expected of a professor of philosophy. It was insightful rather than expository; digressive rather than systematic; witty rather than solemn. Because Simmel's position on any particular point was frequently not easy to see, he was often considered to be a critic whose primary impulse was analytic, if not destructive. By some he was thought to have no philosophic position at all.

Other, more sympathetic, readers of his work called him a *Kulturphilosoph*, primarily on the basis of his preoccupation with the objects of culture. Yet because toward the end of his career Simmel began to sketch a philosophic position having a conception of human life at its center, he is also referred to as a *Lebensphilosoph*. Both of these activities, however, are but two sides of the same lifelong dual concern: to illuminate the objects of culture by showing their relation to human experience and to shed light upon the nature of human life by seeing it in relation to its products.

Simmel conceived of human life as being a process and as being, necessarily, productive. By calling life a process (which he expressed by partially defining life as "more-life"), Simmel sought to convey the view that life has the characteristics of what the Greeks called "becoming": It is continuous and continuously changing; strictly speaking, it can only be lived (experienced), not known. However, this same life produces objects that are not in constant flux, that have form and hence are intelligible. (In virtue of this productiveness of human life, Simmel completed his definition by saying that life is "more-than-life.") These products constitute the realm of culture and include not only works of science, history, and art, but social and political institutions and religious theories and practices as well. These objects stand in a twofold rela-

tionship to human life: Their genesis lies in human experience and, once in existence, they are independently subject to being experienced in various ways. Simmel's philosophy dealt in detail with both of these relationships.

To account for the existence of the objects of culture, Simmel made use, in his own particular way, of the categories of form and content. He posited a realm of contents (rather like George Santayana's realm of essences) as the material that enters into all experience. Contents, however, are not experienced as they are in themselves; they are shaped by the experiencing psyche. Experience (Simmel here followed Kant) is formative; to see how form arises thus requires an understanding of the natural history of experience.

Simmel conceived of a stage in human life in which all needs are instantly satisfied, in which there is no gap between desire and fulfillment. Such a stage of life would be prior to experience and hence prior to any differentiation of subject and object. In that stage there would be neither self nor sugar but only sweetness. However, the world is clearly not so organized that life could actually be lived in this way, and in the gap between need and fulfillment both experience and form are born. In becoming conscious, we distinguish between ourselves as subject and that which we experience as objects.

Experience, however, is not all of a piece: We experience in different modes. It is one thing to know an object, another to appreciate it as beautiful, and still another to revere it as an object of worship. In Simmel's view, the contents experienced in each of the three cases may be the same, although they are not the same in experience. The objects of the three experiences differ in that the contents are given shape—are objectified—by means of three different ways of experiencing. The same contents differ in form.

For the most part, people act to fulfill their needs. Their experience gives shape to contents only to the extent to which the immediate requirements of a situation demand it. In the scholastic language Simmel sometimes adopted, both the *terminus a quo* (the origin) and the *terminus ad quem* (the goal) of the objects produced by ordinary experience—of whatever mode—remain within the biography of the individual producing them. As a result of this subservience to the needs of individuals, form in ordinary experience is not pure, and the objects that are formed in this way are not yet properly the objects of culture. As long as life sets the goals of action (characteristic of the phase of life Simmel called teleological or pragmatic), knowledge is tentative and

limited—not yet science; art is homespun and primitive—not yet fully aesthetic; religion is simple and sporadic—not yet embodied in a theology and in institutions. The form is proto-form and the objects are proto-culture.

However, the bonds of the teleology of life can be broken. The *terminus ad quem* of people's actions need not reside within their lives: They can act for the sake of a form, a type of action Simmel called free action. Instead of knowing for the sake of acting, some people act in order to know; instead of seeing for the sake of living, some people—artists—live in order to see. In acting for the sake of a form, experience in the relevant form is refined; the structure inchoate in ordinary experience is made explicit and worked out. Form proper is born and the objects of culture are produced.

There are many kinds of form; there is and can be no definitive list. Knowledge, art, religion, value, and philosophy are among the important forms (or “world forms,” as Simmel called them) by means of which men have shaped the realm of contents. Reality, too, is only one such form and enjoys no privileged status; the objects of reality constitute the world of practice—those objects which we perceive and manipulate in our daily lives. There are other forms and other worlds, however; one of the tasks of the philosopher is to distinguish and analyze them.

Human life is not self-sufficient; it needs things outside itself to exist and to continue to exist. The objects life forms first come into being to meet its needs; but, because they are objects, they continue to exist independently of life and to make their demands upon the race that has produced them. Humans work out the forms implicit in the various modes of ordinary experience; they become artists, historians, philosophers, and scientists. But once works of art, history, philosophy, or science exist, they make a second demand upon humans: they are the objects by whose assimilation individuals become cultivated. Here Simmel saw a source of inevitable conflict. People differ from each other, and the way in which each person can fulfill himself is peculiar to him. Thus, to fulfill himself each person must utilize a different selection of already existing objects of culture. However, not every road, not just any selection, leads to the assimilation of these objects. To properly understand the objects an individual requires in order to become cultivated, he may need to learn to apprehend a vast number of other objects not so required. In order to serve life, his life, an individual may have to make his own needs subservient to those of forms. This is the tragedy of culture.

In his philosophic position Simmel attempted to do justice to the antitheses that have occupied philosophers since the pre-Socratics. Life as a process is the pole of flux and becoming; it can be lived, but not known. Form is stable and has structure; it is the pole of being and is intelligible. Life is one; experience in all modes is the experience of the same subject. Forms and worlds are many; they are severed from the life that produced them and take on existence independent of it. Neither Being nor Becoming, neither the One nor the Many, holds exclusive sway. The tension between the poles of these antitheses is a permanent feature of the world.

This position underlies the greatest part of Simmel's work. His writings in *Kulturphilosophie* are explorations into the nature of different forms and of different works, whether of philosophy or of art. They are investigations into the relationships between the lives and works of men like Rembrandt and Goethe. In sum, his essays in the philosophy of culture are a series of applications of his philosophy of life.

## SIMON, RICHARD (1638–1712)

The French biblical scholar Richard Simon was born in Dieppe, France, and studied with the Oratorians and the

Jesuits and at the Sorbonne, specializing in Hebrew and Near Eastern studies. Before being ordained a priest in 1670, he taught philosophy at an Oratorian college. He soon became one of the foremost experts in Hebrew, Judaism, and Eastern Church history. Influenced by Benedict (Baruch) de Spinoza's critique of the Bible and by the theory of his friend and fellow Oratorian, Isaac La Peyrère, that there were men before Adam, Simon began developing his views about the Bible and church doctrine. His first published work, a defense of the Jews of Metz (1670), attacked Christian anti-Semitism. It was followed by a study of the Eastern Church, another of Jewish ceremonies and customs, and an attack on the monks of Fécamp. His most important and revolutionary work, *Histoire critique du vieux testament*, was printed in 1678. Jacques Bénigne Bossuet caused it to be banned immediately, and almost all copies were destroyed. A few reached England, and the work was published in French with an English translation by Henry Dickinson in 1682. The scandal forced Simon to leave the Oratory and become a simple priest. Thereafter, he argued with various Protestant and Catholic thinkers and wrote many works on the history of religion and on the Bible, which culminated in his translation of the New Testament (1702). Bossuet caused this work to be banned also.

Simon's revolutionary contention was that no original text of the Bible exists, that the texts one possesses have developed and have been altered through the ages, and that it is therefore necessary to apply the method of critical evaluation to biblical materials to establish the most accurate human form of the revelation. This method involves philology, textual study, historical researches, and comparative studies. Protestants saw that Simon's claim that there is no perfect copy of scripture fundamentally challenged their position that truth is found only by examining the Bible. Catholics feared that he was undermining all bases of Judeo-Christianity by raising problems about all its documents and traditions. Simon contended that he was merely trying to clarify religious knowledge by showing its foundations and development and the need for a tradition to interpret and understand it. Whether intentional or not, Simon's method launched the whole enterprise of biblical higher criticism, which was often directed toward undermining confidence in the uniqueness and ultimate truth of the Judeo-Christian revelation.

## SIMON MAGUS

Simon Magus, the earliest Gnostic leader known to us, was a native of the Samaritan village of Gitta. He is first mentioned in Acts (8:4–25), where he appears as a wonder-worker who had gained a considerable following in Samaria and who sought to augment his stock in trade by purchasing the power of conferring the Holy Spirit from the apostles. The identity of the Simon of the book of Acts and the founder of the Gnostic sect has been questioned, but Irenaeus, among others, has no doubt of it. According to Hippolytus, Simon died in Rome when he failed, in an abortive attempt at a miracle, to rise from the pit in which he had been buried alive. In the pseudo-Clementine literature Simon serves as the target for veiled Jewish-Christian attacks on Paul and Marcion. According to Origen, in his time the Simonians numbered only thirty, but Eusebius, years later, still knew of their existence.

The Simonian theory is of special interest not only as one of the earliest Gnostic systems but also as providing an illustration of the ways in which such systems developed and were modified. Assessment of the evidence is complicated by the meagerness of our sources and by various problems of evaluation and interpretation, but in general we may distinguish three main stages. Simon himself appears to have been a "magician" of the common Hellenistic type, who claimed to be a divine incarnation. His teaching would be not so much Gnostic in the

second-century sense (that is, the Gnosticism of the heretical Christian systems) but rather a form of syncretistic gnosis into which he sought to incorporate Christian elements. The accounts of Justin and Irenaeus introduce his companion, the ex-prostitute Helen, whom he declared to be the first conception (*Ennoia*) of his mind, emanating from him like Athena from the head of Zeus. A notable feature here is the blending of biblical elements with elements from Homer and Greek mythology.

Descending to the lower regions, Ennoia generated the angels and powers by whom this world was made but was then detained by them and compelled to suffer a round of incarnations (thus she is, inter alia, Helen of Troy) until Simon himself came to redeem her. The problem here is to know how much can be credited to Simon himself and how much to reflection among his followers.

A third and more philosophical stage is represented by the "Great Affirmation" preserved by Hippolytus, which probably has nothing to do with the original Simon but may be the work of later disciples attributed, as was often the case, to the master himself. Here the primal ground of being is fire, from which emanate three pairs of "roots," or Powers, which are the origin of all existence: Mind and Thought, Voice and Name, Reason and Desire (text in W. Völker, *Quellen zur Geschichte des christlichen Gnosis*, Tübingen, 1932, pp. 3ff.). In this scheme, elements from Greek philosophy (Heraclitus, Plato, Aristotle) are blended with biblical and Homeric elements into a thoroughly Gnostic system. It is of interest to note that Simonianism provides one of the sources of the later Faust legend.

## SIMPLICIUS

(fl. c. 530)

Simplicius of Cilicia (in Asia Minor) tells us that he studied Platonic philosophy in Alexandria under Ammonius the son of Hermias (fl. c. 550). Afterward, he attended the lectures of Damascius, probably in Athens at the original and still flourishing school founded by Plato himself, the Academy. (An earlier scholarly opinion that there were doctrinal differences between the teachings on Plato in Alexandria and Athens is no longer held.)

All these figures were active neoplatonists, and Hermias and Damascius did in fact publish commentaries on various dialogues of Plato. But Ammonius and Simplicius (and to a lesser extent Damascius as well) devoted most of their writings to the explication of Aristotle's works. Simplicius, in addition to a commentary on Epictetus's Handbook (*Enchiridion*), wrote extensive commentaries on five of those works of Aristotle that most challenge philosophers: *Metaphysics* (no longer extant, although fragments are known), *Physics*, *Categories*, *De Anima*, and *De Caelo*, with the four extant commentaries totaling over 2,800 sizable pages in the series *Commentaria in Aristotelem Graeca*. (References in some modern books to a commentary by Simplicius on *Sophistici Elenchi* are mistaken.) In addition to the time obviously needed to complete these commentaries, a brief examination of Simplicius's learned exegeses shows that he also was in need of an extensive philosophical library, one that included not only Plato and Aristotle, their predecessors (the pre-Socratics) but also everything (it seems) ever written by an Academician or Peripatetic, as well as some Stoic texts.

Where could this library have been? An obvious answer is Athens, but one of the few hard facts concerning these philosophers is that, owing to increasing Christian hostility to pagan philosophizing, the emperor

Justinian in 529 forbade teaching by non-Christians, which gave Simplicius time to write his commentary of Epictetus, who as a philosopher struggling under tyranny could serve as a model for Simplicius and his colleagues. Agathias (c. 536–c. 582), the Christian historian (and epigrammatist), states that “Damascius of Syria, Simplicius of Cilicia, Eulamius of Phrygia, Priscian of Lydia, Hermias and Diogenes of Phoenicia, and Isidore of Gaza ... concluded that, since Christianity was not to their liking [a euphemism], Persia was a better place for them.” Unfortunately, the stories about King Chosroes I (reigned 531–579) that made him sound like a Platonic philosopher-king were greatly exaggerated. In time, even Greece, with all its dangers, seemed preferable; “and so all returned home,” trusting in a treaty between Justinian I (483–565) and Chosroes that, among other things, stipulated that the philosophers could return to their homes and live there as long as they wished “on their own,” this last vague phrase probably meaning that the treaty guaranteed them the freedom to congregate as philosophers and conduct themselves (mostly) as before (Agathias *Historiae* 2.30.3–31.4 Keydell).

Thus, although some scholars still believe that Simplicius chose to stay somewhere safe in the Persian Empire, probably in Haran, the explicit evidence of Agathias, who refers to these Academics as his (younger) contemporaries, strongly suggests that Simplicius returned to Athens. There, still denied the right to teach, he dedicated himself to scholarship.

For the most part, Simplicius’s writings are straightforward analyses, lemma by lemma, of Aristotelian passages, a form of commentary designed for readers rather than for the students to whom he no longer could lecture. Here Simplicius not only dispassionately and at great length explains the meaning of selected passages he also attempts to harmonize or minimize the differences between Plato and Aristotle. Indeed, Simplicius often turns Aristotle into a neoplatonist, as when, for example, he argues that Aristotle’s causes were six in number. The lemmas both explicate the meaning and summarize other scholars’ views of the passage in question. In both aspects Simplicius is of immeasurable importance for the history of earlier Greek philosophy, for he, far more than any other commentator on Plato or Aristotle, took the trouble to go back both to the texts Aristotle quotes or alludes to as well as to the texts that comment on Aristotle.

Simplicius is thus the most important source for verbatim quotations of the pre-Socratics, Academics, Peripatetics, Stoics, and others. Time after time, where others comment on Aristotle’s allusion to (say) Parmenides

merely by elaborating on Aristotle’s words, inferring from them what Parmenides meant, Simplicius, explicitly referring to the rarity of Parmenides’ book, says that he will quote from it *in extenso*. By far the vast majority of the fragments of Parmenides, Empedocles, Zeno, Melissus, Anaxagoras, and Diogenes of Apollonia is known thanks to Simplicius alone. Earlier attempts to argue that he found these passages in Theophrastus’s lost doxographical treatise on earlier thought falter when one looks at the extant *Metaphysics* and *De Sensibus* of Theophrastus, whose verbatim quotations of pre-Socratics are infrequent and not of great length, unlike many in Simplicius. In short, present-day knowledge of the actual words of the pre-Socratics would be halved or worse without him. It would doubtless be increased were a copy of his *In Metaphysica* found.

Similarly, Simplicius is now the only source for many of the earlier but now lost Aristotelian commentaries. Much of what is known of Theophrastus’s *Physics* comes from Simplicius’s commentary, and his quotations from John Philoponus’s lost *Against Aristotle, on the Eternity of the World* are so extensive that they have been excerpted and published separately.

Although Simplicius is strictly neutral toward the pre-Socratics, he is capable of criticizing Aristotelian commentators of several centuries earlier, such as Alexander of Aphrodisias, whom he accuses, sometimes ironically, of not having considered all available sources, a virtue he explicitly declares necessary for the serious commentator in the beginning of *In Cat*, along with an ability to make dispassionate judgments. He is naturally more deferential to his teachers Ammonius and Damascius. He reserves his most critical if not contemptuous statements for Philoponus, who was also a student of Ammonius, but whose Christian interpretations, such as that the cosmos had a fixed beginning, he finds most abhorrent.

Since all of Simplicius’s works are in the form of commentaries on two philosophers not of his own school, it is not easy to isolate beliefs and preoccupations that would distinguish him from other neoplatonists. Apart from his almost religious adoration of the Platonic Demiurge (reminiscent of Cleanthes’ *Hymn to Zeus*), Simplicius writes very much in the tradition of Alexandrian and Athenian commentators on Aristotle who in place of sustained argument are more likely merely to state their interpretation of his text. Simplicius, then, a scholar like few before him, read every relevant text that would illuminate Aristotle, who he argued should be seen as a complement to Plato’s noble philosophy.

## SIMULATION THEORY

A prominent part of everyday thought is thought about mental states. We ascribe states like desire, belief, intention, hope, thirst, fear, and disgust both to ourselves and to others. We also use these ascribed mental states to predict how others will behave. Ability to use the language of mental states is normally acquired early in childhood, without special training. This naïve use of mental state concepts is variously called *folk psychology*, *theory of mind*, *mentalizing*, or *mindreading* and is studied in both philosophy and the cognitive sciences, including developmental psychology, social psychology, and cognitive neuroscience. One approach to mindreading holds that mental-state attributors use a naïve psychological "theory" to infer mental states in others from their behavior, the environment, or their other mental states, and to predict their behavior from their mental states. This is called the *theory theory* (TT). A different approach holds that people commonly execute mindreading by trying to simulate, replicate or reproduce in their own minds the same state, or sequence of states, as the target. This is the *simulation theory* (ST).

Another possible label for simulation is *empathy*. In one sense of the term, *empathy* refers to the basic maneuver of feeling one's way into the state of another, by "identifying" with the other, or imaginatively putting oneself in the other's shoes. One does not simply try to depict or represent another's state, but actually to experience or share it. Of course, mental life may feature empathic acts or events that are not deployed for mindreading. But the term *simulation theory* primarily refers to an account of mindreading that accords to empathy, or simulation, a core role in how we understand, or mindread, the states of others.

### HISTORICAL ANTECEDENTS OF THE DEBATE

A historical precursor of the ST/TT debate was the debate between positivists and hermeneutic theorists about the proper methodology for the human sciences. Whereas positivists argued for a single, uniform methodology for the human and natural sciences, early-twentieth-century philosophers like Wilhelm Dilthey and R. G. Collingwood advocated an autonomous method for the social sciences, called *Verstehen*, in which the scientist or historian projects herself into the subjective perspective or viewpoint of the actors being studied. Contemporary ST, however, makes no pronouncements about the proper methodology of social science; it only concerns the prescientific

practice of understanding others. The kernel of this idea has additional historical antecedents. Adam Smith, Immanuel Kant, Arthur Schopenhauer, Friedrich Nietzsche, and W. V. Quine all wrote of the mind's empathic or projective propensities. Kant wrote:

[I]f I wish to represent to myself a thinking being, I must put myself in his place, and thus substitute, as it were, my own subject for the object I am seeking to consider... (Kant 1787/1961, p. 336)

Nietzsche anticipated modern psychology in the following passage:

To understand another person, that is to *imitate his feelings in ourselves*, we ... produce the feeling in ourselves after the *effects* it exerts and displays on the other person by imitating with our own body the expression of his eyes, his voice, his bearing.... Then a similar feeling arises in us in consequence of an ancient association between movement and sensation. (Nietzsche 1881/1977, pp. 156–157....)

Quine (1960) briefly endorsed an empathy account of indirect discourse and propositional attitude ascription. He described attitude ascriptions as an “essentially dramatic idiom” rather than a scientific procedure, and this encouraged him to see the attitudes as disreputable posits that deserve to be eliminated from our ontology.

## THE BEGINNING OF THE DEBATE

It was in the 1980s that three philosophers—Robert Gordon, Jane Heal, and Alvin Goldman—first offered sustained defenses of ST as an account of the method of mindreading. They were reacting partly to functionalist ideas in philosophy of mind and partly to emerging research in psychology. According to analytic functionalism, our understanding of mental states is based on commonsense causal principles that link states of the external world with mental states and mental states with one another. For example, if a person is looking attentively at a round object in ordinary light, he is caused to have a visual experience as of something round. If he is very thirsty and believes there is something potable in a nearby refrigerator, he will decide to walk toward that refrigerator. By using causal platitudes of this sort, attributors can infer mental states from the conditions of an agent's environment or from his previous mental states. One might start with beliefs about a target's initial mental states plus beliefs in certain causal psychological principles, feed this information into one's theoretical

reasoning system, and let the system infer the “final” states that the target went into or will go into. This TT approach assumes that attribution relies on information about causal principles, so TT is said to be a “knowledge rich” approach.

Simulationists typically doubt that ordinary adults and children have as much information, or the kinds of information, that TT posits, even at a tacit or unconscious level. ST offers a different possibility, in which attributors are “knowledge-poor” but engage a special mental skill: the construction of pretend states. To predict an upcoming decision of yours, I can pretend to have your goals and beliefs, feed these pretend goals and beliefs into my own decision-making system, let the system make a pretend decision, and finally predict that you will make this decision. This procedure differs in three respects from the theorizing procedure. First, it involves no reliance on any belief by the attributor in a folk-psychological causal principle. Second, it involves the creation and deployment of pretend, or make-believe, states. Third, it utilizes a mental system, here a decision-making system, for a non-standard purpose, for the purpose of mindreading rather than action. It takes the decision-making system “off-line.”

Daniel Dennett (1987) challenged ST by claiming that simulation collapses into a form of theorizing. If I make believe I am a suspension bridge and wonder what I will do when the wind blows, what comes to mind depends on the sophistication of my knowledge of the physics of suspension bridges. Why shouldn't make-believe mindreading equally depend on theoretical knowledge? Goldman (1989) parried this challenge by distinguishing two kinds of simulation: theory-driven and process-driven simulation. A successful simulation need not be theory driven. If both the initial states of the simulating system and the process driving the simulation are the same as, or relevantly similar to, those of the target system, the simulating system's output should resemble the target's output, enabling the prediction to be accurate.

Heal (1994) also worried about a threat of ST collapsing into TT. If ST holds that one mechanism is used to simulate another mechanism of the same kind, she claimed, then the first mechanism embodies tacit knowledge of theoretical principles of how that type of mechanism operates. Since defenders of TT usually say that folk-psychological theory is known only tacitly, this cognitive science brand of simulation would collapse into a form of TT. This led Heal to reject such empirical claims about sub-personal processes. Instead, she proposed

(1998) that ST is in some sense an a priori truth. When we think about another's thoughts, we "co-cognize" with our target; that is, we use contentful states whose contents match those of the target. Heal has claimed that such co-cognition is simulation, and is an a priori truth about how we mindread.

Martin Davies and Tony Stone (2001) criticize Heal's proposed criterion of tacit knowledge possession. Yet another way to rebut the threat of collapse is to question the assumption that the integrity or robustness of simulation can be sustained only if it is not underpinned by theorizing. The assumption is that simulation is a sham if it is implemented by theorizing; ST implies that no theorizing is used. Against this, Goldman (2006) argues that theorizing at an implementation level need not conflict with higher-level simulation, and the latter is what ST insists upon.

## TRANSFERENCE

According to the standard account, simulational mindreading proceeds by running a simulation that produces an output state (e.g., a decision) and "transferring" that output state to the target. "Transference" consists of two steps: classifying the output state as falling under a certain concept and inferring that the target's state also falls under that concept. Gordon (1995) worries about these putative steps. Classifying one's output state under a mental concept ostensibly requires introspection, a process of which Gordon is leery. Inferring a similarity between one's own state and a target's state sounds like an analogical argument concerning other minds, which Ludwig Wittgenstein and others have criticized. Also, if the analogy rests on theorizing, this undercuts the autonomy of simulation. Given these worrisome features of the standard account, Gordon proposes a construal of simulation without introspection or inference "from me to you."

Gordon replaces transference with "transformation." When I simulate a target, I "recenter" my egocentric map on the target. In my imagination, the target becomes the referent of the first-person pronoun "I" and his time of action, or decision, becomes the referent of "now." The transformation Gordon discusses is modeled on the transformation of an actor into a character he is playing. Once a personal transformation is accomplished, there is no need to "transfer" my state to him or to infer that his state is similar to mine. But there are many puzzling features of Gordon's proposal. He describes the content of what is imagined, but not what literally takes place. Mindreaders are not literally transformed into their targets

(in the way princes are transformed into frogs) and do not literally lose their identity. We still need an account of a mindreader's psychological activities. Unless he identifies the type of his output state and imputes it to the target, how does the activity qualify as mindreading, that is, as believing of the target that she is in state M? Merely being oneself in state M, in imagination, does not constitute the mindreading of another person. One must impute a state to the target, and the state selected for imputation is the output state of the simulation, which must be detected and classified. First-person mental-state detection thereby becomes an important item on the ST agenda, an item on which simulationists differ, some, such as Harris (1992) and Goldman (2006), favoring introspection and others, such as Gordon (1995), resisting it.

Different theorists favor stronger or weaker versions of ST, in which "information" plays no role versus a moderate role. Gordon favors a very pure version of ST, whereas Goldman favors more of a hybrid approach, in which some acts of mindreading may proceed wholly by theorizing, and some acts may have elements of both simulation and theorizing. For example, a decision predictor might use a step of simulation to determine what he himself would do, but then correct that preliminary prediction by adding background information about differences between the target and himself. Some theory theorists have also moved toward a hybrid approach by acknowledging that certain types of mindreading tasks are most naturally executed by a simulation-like procedure (Nichols and Stich 2003).

What exactly does ST mean by the pivotal notion of a "pretend state"? Mental pretense may not be essential for simulational mindreading, for example, for the reading of people's emotional states as discussed at the end of this article. But most formulations of ST appeal to mental pretense. Mental pretense is often linked to imagining, but imagining comes in different varieties. One can imagine that something is the case, for example, that Mars is twice as large as it actually is, without putting oneself in another person's shoes. Goldman (2006) proposes a distinction between two types of imagining: suppositional-imagining and enactive-imagining.

Suppositional imagining is what one does when one supposes, assumes, or hypothesizes something to be the case. It is a purely intellectual posture, though its precise connection to other intellectual attitudes, like belief, is a delicate matter. Enactive imagining is not purely intellectual or doxastic. It is an attempt to produce in oneself a mental state normally produced by other means, where

the mental states might be perceptual, emotional, or purely attitudinal. You can enactively imagine seeing something—you can visualize it—or you can enactively imagine wanting or dreading something. For purposes of ST, the relevant notion of imagination is enactive imagination. To pretend to be in mental state *M* is to enactively imagine being in *M*. If the pretense is undertaken for mindreading, one would imagine being in *M* and “mark” the imaginative state as belonging to the target of the mindreading exercise.

Can a state produced by enactive imagining really resemble its counterpart state, the state it is meant to enact? And what are the respects of resemblance? Gregory Currie (1995) advanced the thesis that visual imagery is the simulation of vision, and Currie and Ian Ravenscroft extended this proposal to motor imagery. They present evidence from cognitive science and cognitive neuroscience to support these ideas, highlighting evidence of behavioral and neural similarity (Currie and Ravenscroft 2002). Successful simulational mindreading would seem to depend on significant similarity between imagination-produced states and their counterparts. However, perfect similarity, including phenomenological similarity, is not required (Goldman 2006).

## PSYCHOLOGICAL EVIDENCE

Gordon’s first paper on ST (1986) appealed to research in developmental psychology to support it. Psychologists Heinz Wimmer and Josef Perner (1983) studied children who watched a puppet show in which a character is outside playing while his chocolate gets moved from the place he put it to another place in the kitchen. Older children, like adults, attribute to the character a false belief about the chocolate’s location; three-year-olds, by contrast, do not ascribe a false belief. Another experiment showed that older autistic children resemble three-year-olds in making mistakes on this false-belief task (Baron-Cohen, Leslie, and Frith 1985). This was interesting because autistic children are known for a striking deficit in their capacity for pretend play. Gordon suggested that the capacity for pretense must be critical for adequate mindreading, just as ST proposes. Most developmental psychologists offered a different account of the phenomena, postulating a theorizing deficit as the source of the poor performances by both three-year-olds and autistic children. It was argued that three-year-olds simply do not possess the full adult concept of belief as a state that can be false, and this conceptual “deficit” is responsible for their poor false-belief task performance.

## ENDOWMENT EFFECT

The conceptual-deficit account, however, appears to have been premature. First, when experimental tasks were simplified, three-year-olds and even younger children sometimes passed false-belief tests. Second, researchers found plausible alternative explanations of poor performance by three-year-olds, explanations in terms of memory or executive control deficiencies rather than conceptual deficiencies. Thus, the idea of conceptual change—assumed to be theoretical change—was undercut. This had been a principal form of evidence for TT and, implicitly, against ST. It has proved difficult to design more direct tests between TT and ST.

Shaun Nichols, Stephen Stich, and Alan Leslie (1995) cite empirical tests that allegedly disconfirm ST. One of these types of empirical tests involves the “endowment effect.” The endowment effect is the finding that when people are given an item, for example, a coffee mug, they come to value it more highly than people who do not possess one. Owners hold out for significantly more money to sell it back than do nonowners who are offered a choice between receiving a mug and receiving a sum of money. When asked to predict what they would do, before being in such a situation, subjects underpredict the price that they themselves subsequently set. Nichols, Stich, and Leslie argue that TT readily explains this underprediction; people simply have a false theory about their own valuations. But ST, they argue, cannot explain it. If simulation is used to predict a choice, there are only two ways it could go wrong. The predictor’s decision-making system might operate differently from that of the target, or the wrong inputs might be fed into the decision-making system. The first explanation does not work here, because it is the very same system. The second explanation also seems implausible because the situation is so transparent. This last point, however, runs contrary to the evidence. Research by George Loewenstein and other investigators reveals countless cases in which self- and other-predictions go wrong because people are unable to project themselves accurately into the shoes of others, or into their own future shoes. The actual current situation constrains their imaginative construction of future or hypothetical states, which can obviously derail a simulation routine (Van Boven, Dunning, and Loewenstein 2000). So ST has clear resources for explaining underpredictions in endowment effect cases.

## EMOTION RECOGNITION

One of the best empirical cases for simulation is found in a domain little studied in the first two decades of empir-

ical research on mindreading. This is the domain of detecting emotions by facial expressions. Goldman and Sripada (2005; also Goldman, 2006) survey findings pertaining to three types of emotions: fear, disgust, and anger. For each of these emotions, brain-damaged patients who are deficient in experiencing a given emotion are also selectively impaired in recognizing the same emotion in others' faces. Their mindreading deficit is specific to the emotion they are impaired in experiencing. ST provides a natural explanation of these "paired deficits": normal recognition proceeds by using the same neural substrate that subserves a tokening of that emotion, but if the substrate is damaged, mindreading should be impaired. TT, by contrast, has no explanation that is not ad hoc. TT is particularly unpromising because the impaired subjects retain conceptual ("theoretical") understanding of the relevant emotions.

By what simulational process could normal face-based emotion recognition take place? One possibility involves facial mimicry followed by feedback that leads to (subthreshold) experience of the observed emotion. In other words, normal people undergo traces of the same emotion as the person they observe. This resembles Nietzsche's idea, now supported by research showing that even unconscious perception of faces produces covert, automatic imitation of facial musculature in the observer, and these mimicked expressions can produce the same emotions in the self.

Another possible explanation of emotion recognition is unmediated mirroring, or resonance, in which the observer undergoes the same emotion experience as the observed person without activation of facial musculature. Such "mirror matching" phenomena have been identified for a variety of mental phenomena, in which the same experience that occurs in one person is also produced in someone who merely observes the first. Such mirror matching occurs for events ranging from action with the hands (Rizzolatti et al., 2001), to somatosensory experiences (Keysers et al., 2004), to pain (Singer et al., 2004). For example, if one observes somebody else acting, the same area of the premotor cortex is activated that controls that kind of action; if one observes somebody being touched on the leg, the same area of somatosensory cortex is activated that is activated in the normal experience of being touched on the leg; the same sort of matching applies to pain. This leads Vittorio Gallese (2003) to speak of a "shared manifold" of intersubjectivity, a possible basis for empathy and social cognition more generally. It is unclear whether mirror matching always yields recognition, or attribution, of the experience in question,

so perhaps mindreading is not always implicated. But the basic occurrence of mental simulation, or mental mimicry, is strikingly instantiated.

## SINGER, PETER

(1946–)

Peter Singer is one of the most influential philosophers of the twentieth century. While other philosophers have been more important in the development of the discipline, none has changed more lives. *Newsweek* magazine observed that the modern animal rights movement may be dated from the publication of *Animal Liberation*. This book has sold more than 500,000 copies in sixteen languages thus far. Altogether Singer is responsible in whole or part for producing thirty-six books, and a vast number of articles and reviews in journals ranging from *The Philosophical Review* to the *New York Times*.

Peter Singer was born in Melbourne, Australia, on July 6th, 1946. His parents were Viennese Jews who escaped in 1938, shortly after the *Anschluss* incorporated

Austria into the German Reich. He went on to Melbourne University, where as an undergraduate he studied law, history, and philosophy. In 1969 he received an MA in philosophy, writing a thesis on *Why Should I Be Moral?* A scholarship allowed Singer to complete his graduate studies in Oxford, where he received his bachelor's in philosophy in 1971 and served as Radcliffe lecturer from 1971 to 1973.

In 1972 Singer published *Famine, Affluence, and Morality* in the first volume of a new journal, *Philosophy and Public Affairs*. This article, which has been reprinted more than two dozen times, is important for several reasons. In terms of style it was an unconventional philosophical essay in that it was written in simple, direct prose, with few references to philosophical texts. Rather than beginning from Immanuel Kant, Aristotle, or a hypothetical moral question, it addressed events that were occurring as Singer was writing. The article began with these words: "As I write this, in November, 1971, people are dying in East Bengal from lack of food, shelter, and medical care." Singer went on to present his readers with a stark moral challenge. On the basis of some apparently simple, plausible premises, he argued that affluent people ought to transfer their resources to those who are worse off until they reach the point at which further transfers would hurt them more than they would benefit others. Singer was asking his readers to give up their opera tickets, their wine cellars, and private schools for their children—the accoutrements of the sophisticated, upper-middle-class life favored by many academics. Furthermore, Singer was completely unapologetic about making such demands: "The whole way we look at moral issues ... needs to be altered, and with it, the way of life that has come to be taken for granted in our society."

In autumn 1973, Singer moved to the United States in order to teach at New York University. He was in America only sixteen months, but his visit had a large impact. He wrote most of *Animal Liberation* during his stay and, while working on the book, Singer presented draft chapters to philosophy departments around the country. Also during his time in New York, Singer wrote "Philosophers Are Back on the Job" for the *New York Times Magazine* (1974). This essay brought the practical ethics movement to the attention of a wide, non-professional audience.

In 1975 Singer returned to Melbourne where he remained until 1999, except to take up various visiting appointments in universities around the world. Since 1999 he has been the Ira W. DeCamp Professor of Bioethics at Princeton University.

Virtually all of Singer's work exemplifies the following three important characteristics. First, it is revisionary. The point of practical ethics is not simply to understand the world, but to change it. A second characteristic of Singer's work is that facts matter. Philosophy may begin where facts run out, as Singer wrote in "Philosophers Are Back on the Job" (p. 20), but it is hard to see what philosophy would be for Singer if it didn't start with a vivid appreciation of the way things are. Finally, Singer's work presupposes that individual action can make a difference. As his work has unfolded, Singer has increasingly addressed social policy dimensions of the problems that he considers, but he usually writes as one person in conversation with another. His goal is to change our attitudes and behavior because that is how one changes the world.

Although he has written widely, Singer is most closely associated with his defense of animals and his attack on the traditional ethic of the sanctity of human life. According to Singer, other things being equal, it is better to experiment on a profoundly brain-damaged human infant than on a normal chimpanzee. The normative theory that underwrites these judgments is utilitarianism. The good to be maximized, in the case of self-conscious creatures (persons), is satisfied preferences; in the case of non-persons, it is pleasure and the absence of suffering. In metaethics, Singer follows the universal prescriptivism of his teacher, R. M. Hare.

Singer's recent writing has ranged from practical ethics to work that is more personal. His most recent book, *The President of Good and Evil* (2004), takes President George W. Bush's moralism at face value, and subjects it to rigorous philosophical examination. His 2002 book, *One World*, is an ethical assessment of the environmental, economic, and legal dimensions of globalization. *Pushing Time Away* (2003) is the most personal of his books. It is a moving biography of Singer's maternal grandfather, David Oppenheim, a Viennese intellectual and teacher, who was murdered in the Holocaust. In recovering the life, thought, and sensibility of Oppenheim, Singer discovers strong affinities with his own thought and intellectual formation, perhaps because of a common source in the *Haskalah* (Jewish Enlightenment). Only in his late-50s as of 2005, Singer is likely to continue to produce important work in all areas of moral philosophy.

## SKEPTICISM

See *Skepticism, Contemporary*; *Skepticism, History of*

## SKEPTICISM, CONTEMPORARY

Skepticism regarding a subject matter is the view that knowledge about the subject matter is not possible. Many subject matters have come under skeptical attack. It has been argued, for example, that it is not possible to obtain knowledge about the external world, about as-yet-unobserved states of affairs, and about minds other than one's own. This entry will focus upon skepticism about knowledge of the external world.

### THE CARTESIAN SKEPTICAL ARGUMENT

The following skeptical argument is suggested by Descartes's first Meditation. Consider the skeptical hypothesis SK: There are no physical objects; all that exists is my mind and that of an evil genius, who causes me to have sense experience just like that which I actually have (sense experience representing a world of physical objects). This hypothesis, says the skeptic, is logically possible and incompatible with propositions implying the existence of the external world, such as that I have hands. The skeptic then claims that (1) if I know that I have hands, then I know that not-SK. To justify premise (1), the skeptic points out that the proposition that I have hands entails not-SK, and he asserts this closure principle: If S knows that  $\phi$  and S knows that  $\phi$  entails  $\psi$ , then S knows that  $\psi$ . The skeptical argument's other premise is that (2) I do not know that not-SK. To justify this prem-

ise, the skeptic points out that, if SK were true, then I would have sense experience exactly similar to that which I actually have. Because my sensory evidence does not discriminate between the hypothesis that SK and the hypothesis that not-SK, this evidence does not justify me in believing not-SK rather than SK. Lacking justification for my belief that not-SK, I do not know that not-SK. From (1) and (2) it follows that I do not know that I have hands. A similar argument may be given for each external-world proposition that I claim to know.

Those who think that minds are physical in nature may well balk at the skeptic's claim that the evil-genius hypothesis is logically possible. Accordingly, the skeptic will replace that hypothesis with this updated version of SK: I am a brain in a vat connected to a computer that is the ultimate cause of my (thoroughly unveridical) sense experience.

To see how the foregoing pattern of skeptical reasoning may be extended to other subject matters, let the target knowledge claim be that there are minds other than my own, and let the skeptical hypothesis be that the complex patterns of bodily behavior that I observe are not accompanied by any states of consciousness. The analogue to premise (2) will in this case be supported by the claim that, if the skeptical hypothesis were true, then I would have behavioral evidence exactly similar to that which I actually have.

#### DENYING THE LOGICAL POSSIBILITY OF SK

Let us consider two radical responses to the Cartesian skeptical argument. The evil-genius and vat hypotheses both depend on the assumption that the external world is mind-independent in such a way that it is logically possible for sense experience to represent there to be a physical world of a certain character even though there is no physical world, or at least no physical world of that character. An idealist denies this assumption of independence. The idealist maintains that facts about physical objects hold simply in virtue of the holding of the right facts about sense experience, then denies that skeptical hypotheses such as SK are logically possible: any world in which the facts of sense experience are as they actually are is a world in which there is an external reality of roughly the sort people take there to be. Thus premise (2) is false: I know that not-SK in virtue of knowing the necessary falsity of SK.

The second radical response to the skeptical argument rests on a verificationist constraint on the meaningfulness of sentences. Like the idealist, the verificationist

holds that the sentence "I am a victim of thoroughgoing sensory deception" fails to express a logically possible hypothesis. Given that the sentence fails to express a proposition for which sense experience could in principle provide confirming or disconfirming evidence, the verificationist counts the sentence as meaningless. Because the sentence expresses no proposition at all, it does not express a proposition that is possibly true.

The antirealist puts forward a similar view, maintaining that one's understanding of a sentence's meaning consists in a recognitional capacity manifestable in one's use of the sentence. Suppose that the conditions under which a sentence X is true transcend people's powers of recognition. Then one's understanding of X's meaning could not be identified with one's grasping of X's recognition-transcendent truth conditions (because such a grasping could not, in turn, be identified with a manifestable recognitional capacity). This conception may be applied to sentences that allegedly express skeptical hypotheses. If people cannot detect the obtaining of their truth conditions, then what is understood when skeptical sentences' meanings are understood must be something other than their truth conditions. Grasping such sentences' meanings must instead consist in grasping the detectable conditions under which they are warrantably assertible. Thus, it would turn out that an allegedly problematic skeptical hypothesis fails to make any coherent claims about putative conditions in the world that outstrip the human capacity for knowledge.

#### ATTACKING PREMISE (1)

Premise (1) has come under attack by those who think that the skeptic has succeeded in stating a hypothesis that is genuinely logically possible and not known to be false. On this strategy the closure principle is denied. This opens up the possibility that I know that I have hands even though I do not know that not-SK. For example, one may deny closure by maintaining that knowing that  $\phi$  requires knowing only that the *relevant* alternative hypotheses to  $\phi$  do not obtain. Skeptical hypotheses, it is then said, are not relevant alternatives to the propositions involved in ordinary knowledge claims.

Another way of denying closure is to hold that S knows that P if and only if (i) S correctly believes that P, and (ii) S would not mistakenly believe that P if P were false. To satisfy the tracking condition (ii), S must not mistakenly believe that P in the possible worlds in which P is false that are *most similar* to the actual world, according to the standard semantics for counterfactuals. (Robert Nozick adds the further tracking requirement that S

believes that P in the possible worlds in which P is true that are most similar to the actual world.) Now suppose that some hypothetical normal believer S satisfies these conditions with respect to the proposition that he has hands (S correctly believes that he has hands and would not mistakenly believe that he has hands in the no-hands possible worlds most similar to his world, worlds in which, say, he has lost his hands in a terrible accident). Then S knows that he has hands. But in all the possible worlds in which not-SK is false (SK worlds), S mistakenly believes that not-SK (he mistakenly believes that he is not in a vat). So S does not know that not-SK, even though this proposition is entailed by the proposition that S has hands. This is a counterexample to the closure principle.

### ATTACKING PREMISE (2)

Let us turn to antiskeptical strategies that do not challenge premise (1) and that accept that SK is indeed logically possible. On these strategies, premise (2) is attacked. For example, Kant tried to show via a transcendental argument that, in allowing knowledge of certain key features of one's own mind, the Cartesian is already committed to the possibility of knowledge of the external world. Kant argued (in "Refutation of Idealism" in *Critique of Pure Reason*) that, in order to have knowledge of one's own temporally-ordered inner states, one must also have knowledge of spatial objects outside one's mind, whose temporal ordering is related to that of one's inner states. A prima facie difficulty for the Kantian strategy is that arguing for a connection between knowledge of one's mind and knowledge of the external world seems to require the assumption of verificationism or idealism, which would render superfluous the rest of the transcendental argument.

The inference to the best explanation strategy relies on the idea that, even if two incompatible explanatory hypotheses are equally supported by the available evidence, I am still justified in rejecting one hypothesis if the other offers a better explanation of the evidence. It might be maintained that the ordinary hypothesis that the world is roughly as I take it to be offers a better explanation of my sensory evidence than does SK, in virtue of its greater simplicity. Thus, I can justifiably reject SK. The proponent of this strategy needs to specify the respect in which SK is more complex than the ordinary hypothesis and to make it plausible that hypotheses that are complex in the specified way are less likely to be true than simpler ones.

Another way to attack premise (2) is to adopt a reliabilist theory of knowledge, according to which knowing

that  $\phi$  is a matter of having a reliably produced true belief that  $\phi$ . If reliabilism is correct, then in arguing that I do not know that not-SK, the skeptic would have the difficult burden of showing that there is in fact some flaw in the belief-producing mechanism that yields my belief that not-SK (thereby precluding that belief's amounting to knowledge).

Let us return to the skeptic's *defense* of his premise (2). To validate the premise, the skeptic needs to appeal to an epistemic principle that is (apparently) distinct from the closure principle. This is the underdetermination principle:

(UP) If S's evidence for  $\Phi$  does not favor  $\Phi$  over a competing incompatible hypothesis  $\Psi$ , then S is not justified in believing  $\Phi$ .

The skeptic maintains that one's perceptual evidence would be the same regardless of whether SK holds or not-SK holds. By (UP), then, one's perceptual evidence fails to justify one in believing that not-SK. Hence, one does not know that not-SK.

According to one response to this line of thought, experiences justify perceptual beliefs (such as that a cat is near) without providing evidence or reasons for these beliefs because evidence and reasons always come in the form of *beliefs* which inferentially justify other beliefs. Thus the skeptic cannot appeal to (UP) in the foregoing way. Some philosophers maintain that perceptual experiences, some philosophers maintain, justify perceptual beliefs in virtue of having *propositional content*, although they are not themselves propositions. A visual perception, say, has the representational content expressible by the sentence "A cat is near," and accordingly justifies an associated perceptual belief's having that same content.

One problem for this view is that it is plausible to suppose that nonhuman animals have perceptual experiences with representational contents that are similar to those of humans (given the physiological similarities between the relevant perceptual systems). But the animals' perceptual representations do not possess *propositional content*. One may reply that experiences nevertheless justify perceptual beliefs by virtue of having *non-propositional* representational content, such as that possessed by maps and pictures. This view is, in one way, less attractive than the propositional view, however, because it is easier to see how a belief-like state with propositional content can justify a perceptual belief than to see how a state with a nonpropositional content can perform the same justifying feat.

Further, both views about perceptual justification have the following difficulty. (UP) can be reformulated as:

(UP\*) If S's putative justifier for  $\Phi$  does not favor  $\Phi$  over a competing incompatible hypothesis  $\Psi$ , then S is not justified in believing  $\Phi$ .

Now the skeptic may hold that one's nonevidential, perceptual putative justifier would be present regardless of whether SK holds or not-SK holds. Thus, one is not justified in believing not-SK, as the skeptic originally claimed.

Against this, it has been held that the perceptual states that one has when not-SK holds differ in their intrinsic nature from those that one has when SK holds. On this view, the veridical perceptual states possessed by a normal perceiver are *object-involving*, in that objects such as cats are constituents of their perceptual contents. This view might be put forward as a direct realist answer to skepticism, according to which our awareness of external objects is not mediated by awareness of our own experiences. But such direct realism has little antiskeptical force: the skeptic may maintain that even if veridical experience, should it occur, involves direct awareness of cats, it is nevertheless possible that all of one's experiences are unveridical, none possessing an object-involving perceptual content. When the object-involving view is put forward a little differently, however, there is a greater payoff. A disjunctive view challenges the skeptic's use of (UP\*). Unlike a veridical perceptual experience of a cat, a nonveridical perceptual state of a brain in a vat is obviously *not* object-involving. The two states, then, are not tokens of a single perceptual state type; there is no common factor between the states. Because it is not true that the same putative perceptual justifier would be present regardless of whether SK holds or not-SK holds, (UP\*) cannot be used to show that one lacks justification for believing not-SK. Thus, on the disjunctivist approach, premise (2) of the skeptical argument is not adequately supported.

One may use considerations from the philosophy of language and the philosophy of mind to argue that SK is in fact false. According to semantic externalism, the Cartesian commits an error in attempting to construct thought experiments involving massive deception. The Cartesian naively assumes that, starting with a subject S of thought and experience who is ensconced in a normal external environment, we may hold fixed the contents of S's thoughts and the meanings of his sentences while varying (in thought) S's external environment in such a way that S's thoughts about his environment come out to

be predominantly false. According to the semantic externalist, the Cartesian fails to realize that the contents of one's thoughts and the meanings of one's sentences depend in certain ways on one's external environment.

For example, Donald Davidson argues that, when we interpret a speaker's sentences as expressing various beliefs that he holds, we are constrained to attribute beliefs to him that are by and large true of the environment with which he interacts (Davidson 1986). This is because there is no rational basis for preferring one interpretation that finds him to be massively mistaken in his beliefs over another such interpretation. It is constitutive of beliefs and of sentential meanings that they are what are correctly attributed in correct interpretation, on Davidson's view. Thus, it follows from the nature of belief and meaning that, contrary to what SK states, one can never be so massively mistaken.

To see another manifestation of this anti-Cartesian line of thought, consider Hilary Putnam's Twin Earth, a planet like Earth except for the circumstances that the clear, thirst-quenching liquid that the Twin Earthians call "water" is composed of XYZ molecules rather than H<sub>2</sub>O molecules. The Twin Earthians' term "water" does not refer to water, but rather to the liquid on Twin Earth with which they interact. Hence, my Twin Earth counterpart's word "water" does not have the same meaning as my word, and when the Twin Earthian says "Water is wet," it is not to thereby express the thought that I think when I think that water is wet. Similarly, the semantic externalist maintains that, when my envatted twin in a treeless world uses the word "tree" in thought, it is not to refer to trees. Instead, the brain in a vat refers to those entities in the external environment that play a causal role with respect to his uses of "tree" analogous to that played by trees with respect to normal uses of "tree" in a tree-filled world. These entities may be states of the computer that systematically cause the brain in a vat to have "tree-like" sense experience. When the brain in the vat thinks the sentence "A tree has fallen," he does not thereby mistakenly express the thought that a tree has fallen. Instead, he expresses a thought about computer states, which may well be true of his environment. In general, then, the brain in a vat is not massively mistaken about the world, contrary to what the Cartesian maintains.

We may use these considerations, together with the assumption that I have knowledge of the contents of my own thoughts, against premise (2) in the following way: I am now thinking that a tree has fallen; if SK is true, then I am not now thinking that a tree has fallen; thus, SK is false. This argument, however, is powerless against ver-

sions of the skeptical hypothesis on which the brain in a vat is indirectly causally linked to ordinary objects. If, for example, there are programmers of the computer who refer to trees, then it becomes plausible to suppose that the brain does so as well. Further, there is a *prima facie* problem as to whether I may claim knowledge of the contents of my own thoughts, given semantic externalism. Such knowledge seems to require independent knowledge of the content-determining causal environment in which I am located, knowledge the antiskeptical argument was meant to provide.

### AMBIVALENCE ABOUT THE SKEPTICAL ARGUMENT

Contextualism is a response to skepticism that is based upon a novel view of the semantics of knowledge-attributing sentences of the form “S knows that P.” According to the contextualist, such sentences are like sentences of the form “X is flat.” The truth value of the latter sort of sentence depends upon both (1) the shape of the pertinent object, and (2) contextually determined standards regarding contour. Relative to one conversational context (in which bicycle racing is under discussion, for instance), “The road is flat” can come out true; relative to another context (where inclined planes are under discussion), the sentence (concerning the same road) can come out false. Similarly, the truth value of an utterance of, say, “John knows that the bank is open this Saturday” depends upon both (1) John’s epistemic situation (e.g., his evidential beliefs, his perceptual experience, whether the bank is indeed open), and (2) contextually determined epistemic standards (set by the interests, intentions, and expectations of the knowledge-attributing conversationalists).

Suppose that John’s basis for claiming that the bank is open this Saturday is that he visited it on a Saturday a month ago. Suppose that my business partner and I wish to deposit a check this Saturday or some time the following week. Then my partner’s utterance of “John knows that the bank is open this Saturday” may well be true, given John’s epistemic situation and given the low stakes in our conversational context. Holding John’s epistemic situation fixed, imagine a different case in which our business will go bankrupt if the check is not deposited on Saturday. In this case, my partner’s utterance of “John knows that the bank is open this Saturday” may well be false, given the higher stakes in this context, in which evidence superior to John’s may well be required for knowledge about the bank.

The contextualist claims that his view both (a) explains why the skeptical argument may seem compelling, and (b) implies that there is much ordinarily-attributed knowledge in the world. When skepticism and skeptical possibilities are under discussion, the conversational context is such that abnormally high epistemic standards are in place. Accordingly, an utterance of the argument’s premise (2)—“I do not know that not-SK”—comes out true. According to the contextualist, utterances of the argument’s closure-based premise (1) are true in all conversational contexts. Thus, relative to a skeptical context, an utterance of the argument’s conclusion is true. However, in an ordinary, nonskeptical conversational context, the epistemic standards are lowered, and utterances of premise (2) are false. Thus, knowledge-attributions in ordinary conversational contexts are not threatened by the skeptical argument.

One problem for contextualism is that it is hard to coherently state the view. For example, I cannot now correctly say that Michael Jordan knows that he has hands, since I am currently involved in a skeptical (written) conversational context. What I must instead say is that neither I, nor anybody else, knows that he has hands. I cannot even justifiably say that some ordinary-context utterances of “Michael Jordan knows that he has hands” are true, relative to the low epistemic standards in effect in such contexts. This is because I, in my present context, do not know whether anyone has hands.

Another problem for contextualism is that it seems to imply that speakers are mistaken about the very meanings of their knowledge-attributing sentences. That is, suppose that I think that the skeptical argument is compelling and yet at the same time find its conclusion to be repugnant: it just can’t be true that I do not know that I have hands. This means that I am failing to realize that the sentence stating the argument’s conclusion is perfectly true as uttered in my current philosophical context. This betrays a misunderstanding of what my sentence means when used in the philosophical context.

## SKEPTICISM, HISTORY OF

Skepticism (also spelled "Scepticism") is the philosophical attitude of doubting knowledge claims set forth in various areas. Sceptics have challenged the adequacy or reliability of these claims by asking what they are based upon or what they actually establish. They have raised the

question whether such claims about the world are either indubitable or necessarily true, and they have challenged the alleged grounds of accepted assumptions. Practically everyone is skeptical about some knowledge claims; but the sceptics have raised doubts about any knowledge beyond the contents of directly felt experience. The original Greek meaning of *skeptikos* was "an inquirer," someone who was unsatisfied and still looking for truth.

From ancient times onward sceptics have developed arguments to undermine the contentions of dogmatic philosophers, scientists, and theologians. The skeptical arguments and their employment against various forms of dogmatism have played an important role in shaping both the problems and the solutions offered in the course of western philosophy. As ancient philosophy and science developed, doubts arose about basic accepted views of the world. In ancient times sceptics challenged the claims of Platonism, Aristotelianism, and Stoicism, and in the Renaissance those of Scholasticism and Calvinism. After René Descartes, sceptics attacked Cartesianism and other theories justifying the "new science." Later, a skeptical offensive was leveled against Kantianism and then against Hegelianism. Each skeptical challenge led to new attempts to resolve the difficulties. Skepticism, especially since the Enlightenment, has come to mean disbelief—primarily religious disbelief—and the skeptic has often been likened to the village atheist.

## VARIOUS SENSES AND APPLICATIONS

Skepticism developed with regard to various disciplines in which men claimed to have knowledge. It was questioned, for example, whether one could gain any certain knowledge in metaphysics (the study of the nature and significance of being as such) or in the sciences. In ancient times a chief form was medical skepticism, which questioned whether one could know with certainty either the causes or cures of diseases. In the area of ethics, doubts were raised about accepting various mores and customs and about claiming any objective basis for making value distinctions. Scepticisms about religion have questioned the doctrines of different traditions. Certain philosophies, like those of David Hume and Immanuel Kant, have seemed to show that no knowledge can be gained beyond the world of experience and that one cannot discover the causes of phenomena. Any attempt to do so, as Kant argued, leads to antinomies, contradictory knowledge claims. A dominant form of skepticism, the subject of this article, concerns knowledge in general, questioning whether anything actually can be known

with complete or adequate certainty. This type is called epistemological skepticism.

Kinds of epistemological skepticism can be distinguished in terms of the areas in which doubts are raised; that is, whether they be directed toward reason, toward the senses, or toward knowledge of things-in-themselves. They can also be distinguished in terms of the motivation of the skeptic—whether he or she is challenging views for ideological reasons or for pragmatic or practical ones to attain certain psychological goals. Among the chief ideological motives have been religious or antireligious concerns. Some skeptics have challenged knowledge claims so that religious ones could be substituted—on faith. Others have challenged religious knowledge claims in order to overthrow some orthodoxy. Kinds of skepticism also can be distinguished in terms of how restricted or how thoroughgoing they are—whether they apply only to certain areas and to certain kinds of knowledge claims or whether they are more general and universal.

#### ANCIENT SKEPTICISM

Historically, skeptical philosophical attitudes began to appear in pre-Socratic thought. In the fifth century BCE, the Eleatic philosophers, known for reducing reality to a static One, questioned the reality of the sensory world, of change and plurality, and denied that reality could be described in the categories of ordinary experience. On the other hand, the Ephesian philosopher of change Heraclitus and his pupil Cratylus thought that the world was in such a state of flux that no permanent, unchangeable truth about it could be found; and Xenophanes, a wandering poet and philosopher, doubted whether man could distinguish true from false knowledge.

A more developed skepticism appeared in some of Socrates' views and in several of the Sophists. Socrates, in the early Platonic dialogues, was always questioning the knowledge claims of others; and in the *Apology*, he said that all that he really knew was that he knew nothing. Socrates' enemy, the Sophist Protagoras, contended that man is the measure of all things. This thesis was taken as a kind of skeptical relativism: no views are ultimately true, but each is merely one man's opinion. Another Sophist, Gorgias, advanced the skeptical-nihilist thesis that nothing exists; and if something did exist, it could not be known; and if it could be known, it could not be communicated.

**ACADEMIC SKEPTICISM.** Academic skepticism, so-called because it was formulated in the Platonic Academy in the third century BCE, developed from the Socratic

observation, "All I know is that I know nothing." Its theoretical formulation is attributed to Arcesilas (c. 315–241 BCE) and Carneades (c. 213–129 BCE), who worked out a series of arguments, directed primarily against the knowledge claims of the Stoic philosophers, to show that nothing could be known. As these arguments have come down to us, especially in the writings of Cicero, Diogenes Laertius, and Saint Augustine, the aim of the Academic skeptical philosophers was to show, by a group of arguments and dialectical puzzles, that the dogmatic philosopher (that is, the philosopher who asserted that he knew *some* truth about the real nature of things), could not know with absolute certainty the propositions he said he knew. The Academics formulated a series of difficulties to show that the information we gain by means of our senses may be unreliable, that we cannot be certain that our reasoning is reliable, and that we possess no guaranteed criterion or standard for determining which of our judgments is true or false.

The basic problem at issue is that any proposition purporting to assert some knowledge about the world contains some claims that go beyond the merely empirical reports about what appears to us to be the case. If we possessed any knowledge, this would mean for the skeptics, that we knew a proposition, asserting some non-empirical, or trans-empirical claim, which we were certain could not possibly be false. If the proposition might be false, then it would not deserve the name of knowledge, but only that of opinion, i.e., that it might be the case. Since the evidence for any such proposition would be based, according to the skeptics, on either sense information or reasoning, and both of these sources are unreliable to some degree, and no guaranteed or ultimate criterion of true knowledge exists, or is known, there is always some doubt that any non-empirical or trans-empirical proposition is absolutely true and hence constitutes real knowledge. As a result, the Academic skeptics said that nothing is certain. The best information we can gain is only probable and is to be judged according to probabilities. Hence, Carneades developed a type of verification theory and a type of probabilism that is somewhat similar to the theory of scientific "knowledge" of present-day pragmatists and positivists.

The skepticism of Arcesilas and Carneades dominated the philosophy of the Platonic Academy until the first century before Christ. In the period of Cicero's studies, the Academy changed from skepticism to the eclecticism of Philo of Larissa and Antiochus of Ascalon. The arguments of the Academics survived mainly through Cicero's presentation of them in his *Academica* and *De*

*Natura Deorum*, and through their refutation in St. Augustine's *Contra Academicos*, as well as in the summary given by Diogenes Laertius. The locus of skeptical activity, however, moved from the Academy to the school of the Pyrrhonian skeptics, which was probably associated with the Methodic school of medicine in Alexandria.

**THE PYRRHONIAN SCHOOL.** The putative father of Greek skepticism is Pyrrho of Elis (c. 360–c. 272 BCE) and his student Timon (c. 315–225 BCE). He avoided committing himself to any views about what was actually going on and acted only according to appearances. In this way he sought happiness or at least mental peace. The stories about Pyrrho that are reported indicate that he was not a theoretician, but rather a living example of the complete doubter, the man who would not commit himself to any judgment that went beyond what seemed to be the case. His interests seem to have been primarily ethical and moral, and in this area he tried to avoid unhappiness that might be due to the acceptance of value theories and to judging according to them. If such value theories were to any degree doubtful, accepting them and using them could only lead to mental anguish.

Pyrrhonism, as a theoretical formulation of skepticism, is attributed to Aenesidemus (c. 100–40 BCE). The Pyrrhonists considered that both the Dogmatists and the Academics asserted too much, one group saying, "Something can be known," the other that "Nothing can be known." Instead, the Pyrrhonians proposed to suspend judgment on all questions on which there seemed to be conflicting evidence, including the question whether or not something could be known.

Building on the type of arguments developed by Arcesilas and Carneades, Aenesidemus and his successors put together a series of "Tropes" or ways of proceeding to bring about suspense of judgment on various questions. In the sole surviving texts from the Pyrrhonian movement, those of Sextus Empiricus, these are presented in groups of ten, eight, five, and two tropes, each set offering reasons why one should suspend judgment about knowledge claims that go beyond appearances. The Pyrrhonian skeptics tried to avoid committing themselves on any and all questions, even as to whether their arguments were sound. Skepticism for them was an ability, or mental attitude, for opposing evidence both pro and con on any question about what was nonevident, so that one would suspend judgment on the question. This state of mind then led to a state of *ataraxia*, quietude, or unperturbedness, in which the skeptic was no longer concerned or worried about matters beyond appearances. Skepticism

was a cure for the disease called Dogmatism or rashness. But, unlike Academic skepticism, which came to a negative dogmatic conclusion from its doubts, Pyrrhonian skepticism made no such assertion, merely saying that skepticism is a purge that eliminates everything including itself. The Pyrrhonist, then, lives undogmatically, following his natural inclinations, the appearances of which he is aware, and the laws and customs of his society, without ever committing himself to any judgment about them.

The Pyrrhonian movement flourished up to about 200 CE, the approximate date of Sextus Empiricus, and flourished mainly in the medical community around Alexandria as an antidote to the dogmatic theories, positive and negative, of other medical groups. The position has come down to us principally in the writings of Sextus Empiricus in his *Hypotyposes* (*Outlines of Pyrrhonism*) and the larger *Adversus mathematicos*, in which all sorts of disciplines from logic and mathematics to astrology and grammar are subjected to skeptical devastation. In his *Outlines of Pyrrhonism* and *Adversus mathematicos*, Sextus presented the tropes developed by previous Pyrrhonists. The ten tropes attributed to Aenesidemus showed the difficulties to be encountered in ascertaining the truth or reliability of judgments based on sense information, owing to the variability and differences of human and animal perceptions.

Other arguments raised difficulties in determining whether there are any reliable criteria or standards—logical, rational, or otherwise—for judging whether anything is true or false. To settle any disagreement, a criterion seems to be required. Any purported criterion, however, would appear to be based on another criterion, thus requiring an infinite regress of criteria, or else it would be based upon itself, which would be circular. Sextus offered arguments to challenge any claims of dogmatic philosophers to know more than what is evident; and in so doing he presented in one form or another practically all of the skeptical arguments that have ever appeared in subsequent philosophy.

Sextus said that his arguments were aimed at leading people to a state of *ataraxia* (unperturbability). People who thought that they could know reality were constantly disturbed and frustrated. If they could be led to suspend judgment, however, they would find peace of mind. In this state of suspension they would neither affirm nor deny the possibility of knowledge but would remain peaceful, still waiting to see what might develop. The Pyrrhonist did not become inactive in this state of suspense but lived undogmatically according to appearances, customs, and natural inclinations.

## MEDIEVAL SKEPTICISM

Pyrrhonism ended as a philosophical movement in the late Roman Empire, as religious concerns became paramount. In the Christian Middle Ages the main surviving form of skepticism was the Academic, described in St. Augustine's *Contra academicos*. Augustine, before his conversion, had found Cicero's views attractive and had overcome them only through revelation. With faith, he could seek understanding. Augustine's account of skepticism and his answer to it provided the basis for medieval discussions.

In Islamic Spain, where there was more contact with ancient learning, a form of antirational skepticism developed among Muslim and Jewish theologians. Al-Ghazālī, an Arab theologian of the eleventh and early twelfth centuries, and his Jewish contemporary Judah ha-Levi (c. 1075/c. 1085–c. 1141), who was a poet and physician as well as a philosopher, offered skeptical challenges (much like those later employed by the occasionalist Nicolas Malebranche and by David Hume) against the contemporary Aristotelians in order to lead people to accept religious truths in mystical faith. This view that truth in religion is ultimately based on faith rather than on reasoning or evidence—what is known as fideism—also appears in the late Middle Ages in the German cardinal and philosopher Nicolaus of Cusa's advocacy of learned ignorance as the way to religious knowledge.

Another line of thinking that includes skeptical elements was that of the followers of William of Ockham (1285–1347) in the fourteenth century, who were exploring the consequences of accepting divine omnipotence and a divine source for all knowledge. They examined puzzles about whether God could deceive mankind, regardless of the evidence, and could make all human reasoning open to question.

## MODERN SKEPTICISM

Modern Skepticism emerged in part from some of the Ockhamite views but mainly from the rediscovery of the skeptical classics. Very little of the Pyrrhonian tradition had been known in the Middle Ages, but in the fifteenth century the texts of Sextus Empiricus in Greek were brought from the Byzantine Empire into Italy. Sextus' *Outlines of Pyrrhonism* was published in Latin in 1562, his *Adversus mathematicos* in 1569, and the Greek texts of both in 1621. Interest in Cicero was revived and his *Academica* and *De natura deorum* were also published in the sixteenth century.

The voyages of exploration; the humanistic rediscovery of the learning of ancient Greece, Rome, and Palestine; and the new science—all combined to undermine confidence in man's accepted picture of the world. The religious controversy between the Protestants and Catholics raised fundamental epistemological issues about the bases and criteria of religious knowledge.

**RENAISSANCE AND REFORMATION.** Toward the end of the fifteenth century, there was a revival of interest in ancient skepticism among Florentine humanists. Politian was lecturing on philosophy using notes from Sextus with which he had recently become acquainted from manuscripts brought from Byzantium. Humanists, including Gianfrancesco Pico della Mirandola, were acquiring and studying Sextus' texts. Some of these manuscripts were deposited in the convent of San Marco where the Dominican friar and prophet Girolamo Savonarola was heading up an exciting intellectual forum in which ancient philosophies were being analyzed. Savonarola, who did not read Greek, asked two of his monks to prepare a Latin translation of Sextus from one of these manuscripts. This apparently was to be used as a weapon against philosophy independent of religion. Before Savonarola's project could be completed the convent was destroyed and he was executed.

Gianfrancesco Pico, one of Savonarola's disciples and the nephew of the great Pico della Mirandola, published the first work using skepticism as a way of challenging all of philosophy. Gianfrancesco Pico's *Examen Vanitatis* (1520) is the first work to present Sextus in Latin for the European audience. In 1562 Henri Estienne (Stephanus) published a Latin translation of the *Pyrrhoniaron Hypotyposes* in Paris, and in 1569 Gentian Hervet published a Latin translation of *Adversus Mathematicos* in Antwerp. The Greek texts were first printed at Cologne, Paris, and Geneva in 1621. Some texts of Sextus appeared in English in 1592 in a work attributed to Sir Walter Raleigh titled "The Skepticke." A full translation of Book One of Sextus appeared in 1659 in Thomas Stanley's *History of Philosophy*; instead of explaining skepticism he just presented the whole book to the readers. A French translation was started by Pierre Gassendi's disciple Samuel Sorbière but was never finished or published. The first complete French translation, by Claude Huart, did not appear until 1725.

**RELIGIOUS CONTROVERSY: ERASMUS AND LUTHER.** The skeptical issue became more central when raised in the debate between Erasmus and Martin Luther. Using Academic skeptical materials, Erasmus insisted that the

issues in dispute could not be resolved and that one should therefore suspend judgment and remain with the church. In 1524, Erasmus finally published a work, *De Libero Arbitrio*, attacking Martin Luther's views on free will. Erasmus' general anti-intellectualism and dislike of rational theological discussions led him to suggest a kind of skeptical basis for remaining within the Catholic Church. This contempt for intellectual endeavor was coupled with his advocacy of a simple, non-theological Christian piety. Theological controversies were not Erasmus' meat, and he states that he would prefer to follow the attitude of the skeptics and suspend judgment, especially where the inviolable authority of Scripture and the decrees of the Church permit. He says he is perfectly willing to submit to the decrees, whether or not he understands them or the reasons for them.

Scripture is not as clear as Luther would have us believe, and there are some places that are just too shadowy for human beings to penetrate. Theologians have argued and argued the question without end. Luther claims he has found the right answer and has understood Scripture correctly. But how can we tell that he really has? Other interpretations can be given that seem much better than Luther's. In view of the difficulty in establishing the true meaning of Scripture concerning the problem of free will, why not accept the traditional solution offered by the Church? Why start such a fuss over something one cannot know with any certainty? For Erasmus, what is important is a simple, basic, Christian piety, a Christian spirit. The rest, the superstructure of the essential belief, is too complex for a man to judge. Hence it is easier to rest in a skeptical attitude, and accept the age-old wisdom of the Church on these matters, than to try to understand and judge for oneself.

This attempt, early in the Reformation, at a skeptical "justification" of the Catholic rule of faith brought forth a furious answer from Luther, the *De Servo Arbitrio* of 1525. Erasmus' book, Luther declared, was shameful and shocking, the more so since it was written so well and with so much eloquence. *De Libero Arbitrio* begins with the announcement that the problem of the freedom of the will is one of the most involved of labyrinths. The central error of Erasmus' book, according to Luther, was that Erasmus did not realize that a Christian cannot be a skeptic. Christianity involves the affirmation of certain truths because one's conscience is completely convinced of their veracity. The content of religious knowledge, according to Luther, is far too important to be taken on trust. One must be absolutely certain of its truth. Hence,

Christianity is the complete denial of skepticism. To find the truths, one only has to consult Scripture.

Of course there are parts that are hard to understand, and there are things about God that we do not, and perhaps shall not, know. But this does not mean that we cannot find the truth in Scripture. The central religious truth can be found in clear and evident terms, and these clarify the more obscure ones. However, if many things remain obscure to some people, it is not the fault of Scripture, but of the blindness of those who have no desire to know the revealed truths. Luther's view, and later that of Calvin, proposed a new criterion—that of inner experience—while the Catholics of the Counter-Reformation employed Pyrrhonian and Academic arguments to undermine the criterion. Following after Erasmus, H. C. Agrippa von Nettesheim, a stormy occult philosopher and physician, employed the skeptical arguments against Scholasticism, Renaissance Naturalism, and many other views to win people to the "true religion."

HERVET. Gentian Hervet, secretary to the Cardinal of Lorraine, and participant at part of the Council of Trent, linked his work on Sextus with what Gianfrancesco Pico had earlier done. During the 1560s, Hervet, a humanist, fought intellectually against the encroachments of Calvinism, challenging various Protestants to debate with him, and publishing many pamphlets against their views. He saw Sextus' work as ideal for demolishing this new form of heretical dogmatism, that of the Reformer. If nothing can be known, then, he insisted, Calvinism cannot be known. The only certainty we can have is God's Revelation. Skepticism, by controverting all human theories, will cure people from dogmatism, give them humility, and prepare them to accept the doctrine of Christ. Hervet's employment of Pyrrhonism against Calvinism was soon to be shaped into a skeptical machine of war for use by the Counter-Reformation. This view of Pyrrhonism, by one of the leaders of French Catholicism, was to set the direction of one of its major influences on the next three-quarters of a century.

MONTAIGNE AND SANCHES. The new concern with skepticism was given a general philosophical formulation by Michel de Montaigne and his cousin Francisco Sanches. Michel de Montaigne was the most significant figure in the sixteenth century revival of ancient skepticism. Not only was he the best writer and thinker of those who were interested in the ideas of the Academics and Pyrrhonians, but he was also the one who felt most fully the impact of the Pyrrhonian arguments of complete doubt—and its relevance to the religious debates of the

time. Montaigne was simultaneously a creature of the Renaissance and the Reformation. He was a thoroughgoing humanist, with a vast interest in, and concern with, the ideas and values of Greece and Rome, and their application to the lives of men in the rapidly changing world of sixteenth-century France. Montaigne was sent to the Collège de Guyenne in 1539 when he was six years old and was there for the next seven years. The college reflected the religious tensions of the time. Two of its leaders were André de Gouvea, a Portuguese New Christian, and George Buchanan, the Scottish Latin poet.

Montaigne's 1576 essay "Apologie of Raimond Sebond" unfolds in his inimitable rambling style as a series of waves of skepticism, with occasional pauses to consider and digest various levels of doubt, but with the overriding theme an advocacy of a new form of fideism—Catholic Pyrrhonism. The essay begins with a probably inaccurate account of how Montaigne came to read and translate the audacious work of the fifteenth century Spanish theologian, Raimond Sebond. Starting from a quibble about the validity of the arguments of Sebond, Montaigne moved to a general skeptical critique of the possibility of human beings understanding anything. In a rather back-handed manner, Montaigne excuses Sebond's theological rationalism by saying that although he, Montaigne, is not versed in theology, it is his view that religion is based solely on faith given to us by the Grace of God; true religion can only be based on faith, and any human foundation for religion is too weak to support divine knowledge. If human beings had the real light of faith, then human means, like the arguments of Sebond, might be of use. Montaigne explored the human epistemological situation and showed that man's knowledge claims in all areas were extremely dubious and so made pure faith the cornerstone of religion. Montaigne recommended living according to nature and custom and accepting whatever God reveals.

Sanches, in *Quod nihil scitur*, also written in 1576, advocated recognizing that nothing can be known and then trying to gain what limited information one can through empirical scientific means. In his book, Sanches develops his skepticism by means of an intellectual critique of Aristotelianism, rather than by an appeal to the history of human stupidity and the variety and contrariety of previous theories. Sanches begins by asserting that he does not even know if he knows nothing. Then he proceeds, step by step, to analyze the Aristotelian conception of knowledge to show why this is the case.

Every science begins with definition and definitions are nothing but names arbitrarily imposed upon things in

a capricious manner, having no relation to the things named. The names keep changing, so that when we think we are saying something about the nature of things by means of combining words and definitions, we are just fooling ourselves. And if the names assigned to an object such as man, like "rational animal," all mean the same thing, then they are superfluous and do not help to explain what the object is. On the other hand, if the names mean something different from the object, then they are not the names of the object. By means of such an analysis, Sanches worked out a thorough-going nominalism.

Sanches' first conclusion was the usual fideistic one of the time—that truth can be gained only by faith. His second conclusion was to play an important role in later thought: just because nothing can be known in an ultimate sense, we should not abandon all attempts at knowledge but should try to gain what knowledge we can, namely, limited, imperfect knowledge of some of those things with which we become acquainted through observation, experience and judgment. The realization that *nihil scitur* ("nothing is known") thus can yield some constructive results. This early formulation of "constructive" or "mitigated" skepticism was to be developed into an important explication of the new science by Marin Mersenne, Pierre Gassendi, and the leaders of the Royal Society.

## THE SEVENTEENTH CENTURY

Montaigne's skepticism was extremely influential in the early seventeenth century. His followers, Pierre Charron in *De la Sagesse* (1601) and Jean-Pierre Camus in *Essay sceptique* (1603), became most popular in the early seventeenth century, especially among the avant-garde intellectuals in Paris. The so-called libertines, including Gabriel Naudé, Mazarin's secretary; Guy Patin, rector of the Sorbonne medical school; and François La Mothe Le Vayer, teacher of the dauphin, espoused Montaigne's attitude and were often accused of being skeptical even of fundamental religious tenets. Others, like François Veron, used the arguments of Sextus and Montaigne to challenge the Calvinist claim of gaining true knowledge from reading Scripture. French Counter-Reformers, by raising skeptical epistemological problems about whether one could determine what book is the Bible, what it actually says, what it means, and so on, forced Calvinists to seek an indisputable basis for knowledge as a prelude to defending their theological views.

**GASSENDI AND MERSENNE.** In the 1620s efforts to refute or mitigate this new skepticism appeared. Some authors simply stated that Aristotle would have resolved the difficulties by applying his theory of sense perception and knowledge to the problems raised. Others, like François Garasse, decried the irreligious tendencies they discerned in all this doubting. Still others, like Francis Bacon, tried to overcome the skeptical difficulties by appealing to new methods and new instruments that might correct errors and yield firm and unquestionable results. Herbert of Cherbury, in *De Veritate* (1624), offered an elaborate scheme for overcoming skepticism which combined Aristotelian and Stoic elements, and ultimately appealed to common notions, or truths known by all men, as the criteria by which reliable and indubitable judgment would be possible.

Perhaps the most forceful presentation of skepticism in the early seventeenth century is Pierre Gassendi's earliest work, *Exercitationes Paradoxicae Adversus Aristoteleos* (1624). A Christian Epicurean, Gassendi, himself originally a skeptic, challenged almost every aspect of Aristotle's view, as well as many other theories. He applied a battery of ancient and Renaissance skeptical arguments, concluding, "No science is possible, least of all in Aristotle's sense." In this work, Gassendi indicated in embryo what became his and Marin Mersenne's constructive solution to the skeptical crisis, the development of an empirical study of the world of appearances rather than an attempt to discover the real nature of things.

Mersenne, one of the most influential figures in the intellectual revolution of the times, while retaining epistemological doubts about knowledge of reality, yet recognized that science provided useful and important information about the world. Mersenne granted that the problems raised by Sextus could not be answered and that, in a fundamental sense, knowledge of the real nature of things cannot be attained. However, he insisted, information about appearances and deductions from hypotheses can provide an adequate guide for living in this world and can be checked by verifying predictions about future experiences. Gassendi, in his later works, developed this constructive skepticism as a *via media* between complete doubt and dogmatism, and offered his atomic theory as the best hypothetical model for interpreting experience. Mersenne and Gassendi combined skepticism about metaphysical knowledge of reality with a way of gaining useful information about experience through a pragmatic scientific method. The constructive skepticisms of Gassendi and Mersenne, and later of members of the Royal Society of England like Bishop John

Wilkins and Joseph Glanvill, thus developed the attitude of Sanches into a hypothetical, empirical interpretation of the new science.

**DESCARTES.** René Descartes offered a fundamental refutation of the new skepticism, contending that, by applying the skeptical method of doubting all beliefs that could possibly be false (due to suffering illusions or being misled by some power), one would discover a truth that is genuinely indubitable, namely, "I think, therefore I am" (*cogito ergo sum*), and that from this truth one could discover the criterion of true knowledge, namely, that whatever is clearly and distinctly conceived is true. Using this criterion, one could then establish: God's existence, that he is not a deceiver, that he guarantees our clear and distinct ideas, and that an external world exists that can be known through mathematical physics. Descartes, starting from skepticism, claimed to have found a new basis for certitude and for knowledge of reality.

**REPLIES TO DESCARTES.** Throughout the seventeenth century skeptical critics—Mersenne, Gassendi, the reviver of Academic philosophy Simon Foucher, and Pierre-Daniel Huet, one of the most learned men of the age—sought to show that Descartes had not succeeded and that, if he sincerely followed his skeptical method, his new system could only lead to complete skepticism. They challenged whether the *cogito* proved anything, or whether it was indubitable; whether Descartes' method could be successfully applied, or whether it was certain; and whether any of the knowledge claims of Cartesianism were *really* true. Nicolas Malebranche, the developer of occasionalism, revised the Cartesian system to meet the skeptical attacks only to find his efforts challenged by the new skeptical criticisms of Foucher and by the contention of the Jansenist philosopher Antoine Arnauld that Malebranchism led to a most dangerous Pyrrhonism.

Huet's *Censura Philosophiae Cartesiana* (1689) and his unpublished defense of it raised doubts about each element of the proposition, "I think, therefore perhaps I may be." Gassendi, Huet, and others questioned whether Descartes' criterion could determine what was true or false. Could we really tell what was clear and distinct, or could we only tell that something appeared clear and distinct to us? Mersenne pointed out that even with the criterion we could not be sure that what was clear and distinct to us, and hence true, was really true for God. Hence, in an ultimate sense, even the most certain Cartesian knowledge might be false. Gassendi, in what Descartes called the "objections of objections," pointed out that for all anyone could ascertain, the whole Carte-

sian system of truths might be only a subjective vision in somebody's mind and not a true picture of reality. Huet argued that since all the fundamental Cartesian data consisted of ideas, and ideas are not real physical things, the Cartesian world of ideas, even if clear and distinct, cannot represent something quite different from itself.

**FOLLOWERS OF DESCARTES.** As Cartesianism was attacked from many sides, adherents modified it in various ways. The radical revision of Nicolas Malebranche, designed partially to avoid skeptical difficulties involved in connecting the world of ideas with reality, was immediately attacked by the skeptic Simon Foucher. The orthodox Cartesian Antoine Arnaud claimed that Malebranchism could only lead to a most dangerous Pyrrhonism. Foucher, who wished to revive Academic skepticism, applied various skeptical gambits to Malebranche's theory, one of which was to be important in subsequent philosophy. He argued that the skeptical difficulties which Descartes and Malebranche used to deny that sense qualities (the so-called secondary qualities—color, sound, heat, taste, smell) were features of real objects, applied as well to the mathematically describable primary qualities like extension and motion, which the Cartesians considered the fundamental properties of things. These mathematical qualities, as perceived, are as variable and as subjective as the others. If the skeptical arguments are sufficient to cause doubt about the ontological status of secondary qualities, Foucher contended, they are also sufficient to lead us to doubt that primary ones are genuine features of reality.

**ENGLISH SKEPTICISM.** Various English philosophers, culminating in John Locke, tried to blunt the force of skepticism by appealing to common sense and to the "reasonable" man's inability to doubt everything. They admitted that there might not be sufficient evidence to support the knowledge claims extending beyond immediate experience. But this did not actually require that everything be doubted; by using standards of common sense, an adequate basis for many beliefs could be found.

This theory of limited certitude was articulated especially by two figures, John Wilkins and Joseph Glanvill. The theory is a development from the earlier solution to the skeptical problems advanced by Sebastian Castillio and William Chillingworth. Wilkins set forth the theory of limited certainty as both an answer to dogmatism and to excessive skepticism. Wilkins completely rejected the dogmatists' outlook, and then offered a way of defusing the potentially disastrous results of complete skepticism. In order to find a moderate skeptical stance from which

religion and science could flourish, Wilkins felt it was necessary to analyze what kind of certainty human beings could actually attain. The highest level of certainty, absolute infallible certainty, which could not possibly be false, is beyond human attainment. Only God has such certainty. The highest human level Wilkins called conditional infallible certainty. This requires that "our faculties be true, and that we do not neglect the exerting of them."

Glanvill saw the reliability of our faculties as central for avoiding any ultimate and overwhelming skepticism. Glanvill, like Wilkins, saw that the kind of certainty we would need to be absolutely sure of our faculties is unattainable—"for it may not be absolutely impossible, but that our Faculties may be so construed, as always to deceive us in the things we judg most certain and assured." We may not be able to attain infallible certitude, but we can attain indubitable certitude—that our faculties are true. This is indubitable in two senses—one, that we find we have to believe them, and, two, that we have no reason or cause for doubting them. In terms of this distinction, Wilkins, Glanvill, and their colleagues built up a theory of empirical science and jurisprudence for studying nature and deciding human problems within the limits of "reasonable doubt." Their limited skepticism appears in the Anglo-American theory of legal evidence and in the theory of science of the early Royal Society. They believed that by applying their probabilistic empirical method to religious questions they could justify a tolerant, latitudinarian form of Christianity.

**OTHER RESOLUTIONS OF SKEPTICISM.** Other answers were offered to the skeptics and to their challenge of some of the basic tenets of the new philosophy. Thomas Hobbes had admitted the force of the problem of finding *the* criterion for judging what was genuinely true, and he insisted that the solution was ultimately political—the sovereign would have to decide. Blaise Pascal in his scientific works gave one of the finest expositions of the hypothetical probabilistic nature of science and mathematics. Pascal, who presented the case for skepticism most forcefully in his *Pensées*, still denied that there can be a complete skepticism; for nature prevents it. Lacking rational answers to complete skepticism, man's only recourse lies in turning to God for help in overcoming doubts. Spinoza, on the other hand, with his completely rational vision of the world, could not regard skepticism as a serious problem. If one had clear and adequate ideas, there would be no need or excuse for doubting. Doubt was only an indication of lack of clarity, not of basic philosophical difficulties.

The philosopher who took the skeptics most seriously was Gottfried Wilhelm von Leibniz, and he was regarded as a closer friend intellectually by the skeptics of his age than any of the other metaphysicians of the period. Leibniz, although certainly not a philosophical skeptic, agrees with some of the major contentions of the skeptics, and is willing to admit, unlike other metaphysicians of the seventeenth century, that there are general, and perhaps unanswerable, objections that can be raised against any philosophical theory. The skeptics and Leibniz could agree on the major failings of Cartesianism, although they were hardly in agreement as to what to do about them. Leibniz and the skeptics were all humanists and found great value in the tradition of man's effort to understand his universe; hence they rejected the Cartesian attitude towards the past. In his discussions, especially with Simon Foucher and Pierre Bayle, Leibniz agreed that there are first principles of philosophical reasoning that have not been satisfactorily demonstrated.

Leibniz was willing to regard metaphysics as a hypothetical enterprise, that is, as an attempt to present theories which agree with the known facts, which avoid certain difficulties in previous theories, and which give a satisfactory or adequate explanation of the world that is experienced. In the debate with Pierre Bayle over the article "Rorarius," in Bayle's *Dictionnaire historique et critique*, Leibniz does not argue for his theory as the true picture of reality, but rather as the most consistent hypothesis to explain the known scientific facts and the general conclusions of the "new philosophers" about the relation of the mind and the body, and to avoid the "unfortunate" complications or conclusions of the views of Descartes, Malebranche, or Spinoza. Leibniz was unwilling to see these limitations on our knowledge as a reason for skeptical despair or to see these points as constituting a radical skepticism that cast whatever knowledge we had in any serious doubt. For Leibniz, whatever merits the skeptical arguments had, they did not have to lead to negative or destructive conclusions. At best, skepticism should be a spur to constructive theorizing, and not a reason for doubting or despairing of the possibility of knowledge.

**BAYLE AND THE ENLIGHTENMENT.** The culmination of seventeenth-century skepticism appears in the writings of Pierre Bayle, especially in his monumental *Dictionnaire historique et critique* (1697–1702). Bayle, a superb dialectician, challenged philosophical, scientific, and theological theories, both ancient and modern, showing that they all led to perplexities, paradoxes, and contradictions. He argued that the theories of Descartes, Spinoza, Leib-

niz, and Malebranche, when skeptically analyzed, cast in doubt all information about the world, even whether a world exists. Bayle skillfully employed skeptical arguments about such things as sense information, human judgments, logical explanations, and the criteria of knowledge in order to undermine confidence in human intellectual activity in all areas. Bayle suggested that man should abandon rational activity and turn blindly to faith and revelation; he can therefore only follow his conscience without any criterion for determining true faith. Bayle showed that the interpretations of religious knowledge were so implausible that even the most heretical views, like Manichaeism—known for its cosmic dualism of good and evil—and Atheism made more sense. As a result Bayle's work became "the arsenal of the Enlightenment," and he was regarded as a major enemy of religion.

Bayle, in his later works, indicated that he held some positive views even though he presented no answers to his skepticism. There is still much scholarly debate as to what his actual position was, but he influenced many people in the eighteenth century. His skeptical arguments were soon applied to traditional religion by Voltaire and others. But in place of Bayle's doubts or his appeal to faith, they offered a new way of understanding man's world—that of Newtonian science—and professed an inordinate optimism about what man could comprehend and accomplish through scientific examination and induction. Though Bayle remained the heroic figure who had launched the Age of Reason by criticizing all the superstitions of past philosophy and theology, the leaders of the Enlightenment, both in France and Britain, felt that his skepticism was *passé* and only represented the summit of human understanding before "God said, Let Newton be, and all was light."

## THE EIGHTEENTH CENTURY

Most eighteenth-century thinkers gave up the quest for metaphysical knowledge after imbibing Bayle's arguments. George Berkeley, an Empiricist and Idealist, fought skeptical doubts by identifying appearance and reality and offering a spiritualistic metaphysics. He was immediately seen as just another skeptic, since he was denying the world beyond experience.

**HUME.** Bayle's chief eighteenth-century successor was David Hume. Combining empirical and skeptical arguments, Hume, in the *Treatise of Human Nature and the Enquiry Concerning Human Understanding*, charged that neither inductive nor deductive evidence could establish the truth of any matter of fact. Knowledge could only

consist of intuitively obvious matters or demonstrable relations of ideas but not of anything beyond experience; the mind can discover no necessary connections within experience nor any root causes of experience. Beliefs about the world are based not upon reason or evidence, nor even upon appeal to the uniformity of nature, but only on habit and custom. Basic beliefs cannot be justified by reasoning. Belief that there is an external world, a self, a God is common; but there is no adequate evidence for it. Although it is natural to hold these convictions, they are inconsistent and epistemologically dubious. “Philosophy would render us entirely Pyrrhonian, were not Nature too strong for it.” The beliefs that a man is forced to hold enable him to describe the world scientifically, but when he tries to justify them he is led to complete skepticism. Before he goes mad with doubts, however, Nature brings him back to common sense, to unjustifiable beliefs. Hume’s fideism was a natural rather than a religious one; it is only animal faith that provides relief from complete doubt. The religious context of skepticism from Montaigne to Bayle had been removed, and man was left with only his natural beliefs, which might be meaningless or valueless.

**THE PHILOSOPHES.** The French Enlightenment philosophers, the *philosophes*, built on the skeptical reading of Locke and Bayle, and on their interpretation of Berkeley as a radical skeptic. While they produced vast accumulations of new forms of knowledge, they also placed this alongside a skepticism about whether one could ever establish that this knowledge was about an external reality. Perhaps the most skeptical of them was the great French mathematician Marquis de Condorcet who held that mathematics, physics, and moral philosophies were all just probable. He also raised the possibility that our present mental faculties by which we judged our knowledge might change over time and, hence, that what we found true today might not be so tomorrow.

**REID AND THE COMMON-SENSE SCHOOL.** The central themes in Hume’s skeptical analysis—the basis of induction and causality, knowledge of the external world and the self, proofs of the existence of God—became the key issues of later philosophy. Hume’s contemporary Thomas Reid hoped to rebut Hume’s skepticism by exposing it as the logical conclusion of the basic assumptions of modern philosophy from Descartes onward. Such disastrous assumptions should be abandoned for commonsensical principles that have to be believed. When the conclusions of philosophy run counter to common sense, there must be something wrong with philos-

ophy. Since nobody could believe and act by complete skepticism, the fact that this skepticism was the consistent issue of the Cartesian and Lockean way of ideas only showed the need to start anew. Reid offered his common-sense realism as a way of avoiding Hume’s skepticism by employing as basic principles the beliefs we are psychologically unable to doubt.

Hume was unimpressed by Reid’s argument. As Hume and Kant saw, Reid had not answered Hume’s skepticism but had only sidestepped the issue by appealing to commonsensical living. This provided, however, neither a theoretical basis for beliefs nor a refutation of the arguments that questioned them. The Scottish common-sense school of Oswald, Beattie, Stewart, Brown, and others kept reiterating its claim to have refuted Hume’s skepticism by appealing to natural belief, while at the same time conceding that Hume’s fundamental arguments could not be answered. Thomas Brown, an early-nineteenth-century disciple of Reid, admitted that Reid and Hume differed more in words than in opinions, saying, “‘Yes,’ Reid bawled out, ‘we must believe in an outward world’: but added in a whisper, ‘we can give no reason for our belief.’ Hume cries out, ‘we can give no reason for such a notion’: and whispers, ‘I own that we cannot get rid of it.’”

**THE GERMAN ENLIGHTENMENT AND KANT.** The Scottish school was perhaps the first to make Hume’s version of modern skepticism the central view to be combated if philosophy was to make coherent sense of man’s universe. The more fundamental attempt, for subsequent philosophy, to deal with Hume’s skepticism was developed in Germany in the second half of the eighteenth century and culminated in Kant’s critical philosophy. Such leaders of the Prussian Academy as Jean Henry Samuel Formey, Johann Bernhard Mérian, and Johann Georg Sulzer had long been arguing against Pyrrhonism. They were among the first to read, translate (into French and German), and criticize Hume’s writings. They saw in the skeptical tradition up to Bayle and Huet, and in Hume’s version of it, a major challenge to all man’s intellectual achievements. Although their answers to skepticism were hardly equal to the threat they saw in it, these writers helped revive interest in and concern with skepticism in an age that thought it had solved, or was about to solve, all problems. Others in Germany contributed to an awareness of the force of skepticism: Johann Christoff Eschenbach by his edition of the arguments of Sextus, Berkeley, and Arthur Collier (Berkeley’s contemporary) against knowledge of an external corporeal world; Ernst Platner by his skeptical aphorisms and his German edi-

tion of Hume's *Dialogues on Natural Religion* (1781); hosts of German professors by dissertations against skepticism; and the translators of the Scottish critics of Hume.

Kant saw that Hume had posed a most fundamental challenge to all human knowledge claims. To answer him, it had to be shown not that knowledge is possible but *how* it is possible. Kant combined a skepticism toward metaphysical knowledge with the contention that certain universal and necessary conditions are involved in having experience and describing it. In terms of these it is possible to have genuine knowledge about the forms of all possible experience, space and time, and about the categories in which all experience is described. Any effort to apply this beyond all possible experience, however, leads into contradictions and skepticism. It is not possible to know about things-in-themselves nor about the causes of experience.

**SKEPTICAL REJOINDERS TO KANT.** Though Kant thought that he had resolved the skeptical problems, some of his contemporaries saw his philosophy as commencing a new skeptical era. G. E. Schulze (or Schulze-Aenesidemus) a notable critic of Kantianism, insisted that, on Kant's theory, no one could know any objective truths about anything; he could only know the subjective necessity of his views. So Schulze, by insisting on the inability of the Kantian analysis to move from subjective data about what people have to believe to any objective claims about reality, contended that Kant had not advanced beyond Hume's skepticism, and that this failure of the Kantian revolution actually constituted a vindication of Hume's views.

Salomon Maimon contended that, though there are such things as a priori concepts, their application to experience is always problematical, and whether they apply can only be found through experience. Hence, the possibility of knowledge can never be established with certainty. Assured truth on the basis of concepts is possible only of human creations, like mathematical ideas, and it is questionable whether these have any objective truth. Thus Maimon developed a mitigated Kantianism (to some extent like that of the Neo-Kantian movement a century later) in which the reality of a priori forms of thought is granted but in which the relation of these forms to matters of fact is always in question. Knowledge (that is, propositions that are universal and necessary, rather than ones that are just psychologically indubitable) is possible in mathematics but not in sciences dealing with the world. Unlike the logical positivists, who were to claim that mathematics was true because it consisted only

of vacuous logical tautologies, Maimon contended that mathematics was true because it was about creations of our mind. Its objective relevance was always problematical.

Maimon's partial skepticism exposed some of the fundamental limitations of Kant's critical philosophy as a solution to the skeptical crisis. Developing the thesis that human creativity is the basis of truth, Johann Georg Hamann posited a new way of transcending skepticism. Hamann accepted Hume's and Kant's arguments as evidence that knowledge of reality cannot be gained by rational means but only by faith. Hamann exploited the skeptical thought of these philosophies to press for a complete antirational fideism. He used Hume's analyses of miracles and of the evidence for religious knowledge to try to convince Kant of the futility of the search for truth by rational means. During the height of nineteenth-century positivism, materialism, and idealism, Hamann's type of fideism was revitalized by Kierkegaard and in France by Catholic opponents of the French Revolution and liberalism—like Joseph de Maistre and H.-F.-R. Lamennais, who used it as a critique of French liberal, empirical, and Enlightenment views and as a new defense of orthodoxy and political conservatism. Kierkegaard brilliantly combined themes from Sextus, Hume, and Hamann to attack the rationalism of the Hegelians, to develop a thoroughgoing skepticism about rational achievements, and to show the need for faith in opposition to reason. Fideism has become a major element in twentieth-century neo-orthodox and existentialist theology, which tries to show that the traditional skeptical problems still prevent us from finding an ultimate basis for our beliefs except by faith.

**IDEALISM.** In the mainstream of philosophy after Kant, although skepticism continues to play a vital role, few philosophers have been willing to call themselves skeptics. The German metaphysicians, from Fichte and Hegel onward, sought to escape from the skeptical impasse produced by Hume and Kant and to reach knowledge of reality through the creative process and the recognition of historical development. They attempted to portray skepticism as a stage in the awareness and understanding of the process of events. For Fichte, skepticism made one recognize the need for commitment to a fundamental outlook about the world. The commitment to see the world in terms of creative thought processes led to a revelation of the structure of the universe as an aspect of the Absolute Ego.

For Hegel skepticism was the nadir of philosophy, actually its antithesis. According to Hegel, human knowledge is a historically developing process. At each stage of the process both our knowledge and the world itself are limited and contain contradictions, which are overcome at the next stage. Only the final, Absolute stage, when no further contradictions can be developed, permits genuine knowledge that is not partly true and partly false. Then, presumably, skepticism is no longer possible. The English Hegelian F. H. Bradley, in his *Appearance and Reality* (1893), used the traditional skeptical arguments to show that the world was unintelligible in terms of empirical or materialistic categories, and hence that one had to go beyond the world appearance to find true knowledge.

### RECENT AND CONTEMPORARY PHILOSOPHY

Irrational skepticism was developed into Existentialism by Søren Kierkegaard in the nineteenth century. Using traditional skeptical themes to attack Hegelianism and liberal Christianity, Kierkegaard stressed the need for faith. Only by an unjustified and unjustifiable “leap into faith” could certainty be found—which would then be entirely subjective rather than objective. Modern neo-orthodox and Existentialist theologians have argued that skepticism highlights man’s inability to find any ultimate truth except through faith and commitment. Nonreligious forms of this view have been developed by Existentialist writers like Albert Camus, combining the epistemological skepticism of Kierkegaard and Leon Shestov with the skepticism regarding religion and objective values of Friedrich Nietzsche.

In his *Myth of Sisyphus*, Camus portrays man as trying to measure the nature and meaning of an essentially absurd universe by means of questionable rational and scientific criteria. Camus regards the skeptical arguments used by Kierkegaard and Shestov as showing decisively the contradictory nature of human rational attempts to understand the world, but he rejects their fideistic solution: overcoming the skeptical crisis by “a leap into faith.” Instead, he accepts Nietzsche’s picture of the ultimate meaninglessness of the world because “God is dead.” The rational and scientific examination of the world shows it to be unintelligible and absurd but it is necessary to struggle with it. It is thus through action and commitment that one finds whatever personal meaning one can, though it has no objective significance. The mythological Sisyphus, eternally pushing a huge rock uphill, only to have to fall to the bottom again, typifies the human situation. He does not expect to find truth, nor does he

expect to end his struggle. He finds no ultimate point or value in his situation, but he perseveres with a “silent joy,” realizing that his struggle has meaning only for him, in terms of his human condition. The struggle is neither sterile nor futile for him, though it is meaningless in terms of understanding or possible achievement.

George Santayana, an American critical Realist, in *Scepticism and Animal Faith*, presented a naturalistic skepticism. Any interpretation of immediate or intuited experience is open to question. To make life meaningful, however, men make interpretations by “animal faith,” according to biological and social factors. The resulting beliefs, though unjustified and perhaps illusory, enable them to persevere and find the richness of life. When the full force of complete skepticism is realized, Santayana claimed, one can appreciate what is in fact absolutely indubitable, the immediately experienced or intuited qualities that Santayana called “essences.” The interpretation of these essences leads to various questionable metaphysical systems. A thoroughgoing skepticism makes one realize the unjustifiable assumptions involved in interpreting the realm of essences, and also that we do interpret them and thereby construct meaningful pictures of the world. Santayana called the process of interpretation “animal faith,” which is consistent with complete skepticism and involves following natural and social tendencies and inclinations.

Types of skepticism also appear in logical positivism and various forms of linguistic philosophy. The attack on speculative metaphysics developed by the physicist and early Positivist Ernst Mach, Bertrand Russell, and Rudolf Carnap, a leader in the Vienna Circle, where logical positivism was nourished, incorporated a skepticism about the possibility of gaining knowledge beyond experience or logical tautologies. Russell and the important philosopher of science Karl Popper have further stressed the unjustifiability of the principle of induction, and Popper has criticized theories of knowledge based upon empirical verification. A founder of linguistic analysis, Fritz Mauthner, has set forth a skepticism in which any language is merely relative to its users and thus subjective. Every attempt to tell what is true just leads one back to linguistic formulations, not to objective states of affairs. The result is a complete skepticism about reality—a reality that cannot even be expressed except in terms of what he called godless mystical contemplation. Mauthner’s linguistic skepticism bears some affinities to the views expressed in Ludwig Wittgenstein’s *Tractatus Logico-Philosophicus*.

A different way of dealing with skepticism was set forth by the English philosopher, G. E. Moore at Cambridge. He contended that no matter what skeptical arguments may be they do not eliminate people's certitude about what they immediately perceive. There is a kind of "certain knowledge" that each of us has and can build on even though we know that it can be questioned in some theoretical way. Wittgenstein explored this kind of resolution in his essay *On Certainty* and sought to get beyond what Moore had done. Many contemporary philosophers are still writing and arguing about what constitutes knowledge and whether, in some way, we can find any basis for certainty.

### POSTMODERNISM

A new, radical form of skepticism has developed in the last half century: postmodernism. This view challenges whether there can be any rational framework for discussing intellectual problems or whether the frameworks that people use are related to their life situations. Developing out of literary criticism and psychological investigations, the postmodernists have been undermining confidence in the investigation of the world in which we live by showing that the investigations are part of what needs to be scrutinized. Using ideas from Martin Heidegger, Michel Foucault, Jacques Derrida, Jean-François Lyotard, and Richard Rorty, they see philosophy and science as human activities to be judged in terms of their role in human life, rather than by some standard that can be said to be true or false. Rather than attempting to find a holistic truth or set of truths that are knowable and eternal, Postmodernists stress reflexivity, fragmentation, discontinuity, and ambiguity. Critics see this as a most dangerous development in that there will be no objective standpoint for evaluating theories. But that, of course, is part of the postmodernist outlook. Psychologists and sociologists have been adding to this view by stressing how intellectual outlooks vary according to sexual orientation, racial background, gender, and other fundamental features of human outlooks. Skepticism results from seeing that there is no objective standpoint from which to sort out the better or worse of these points of view.

**CRITICISM AND EVALUATION.** In Western thought, skepticism has raised basic epistemological issues. In view of the varieties of human experience, it has questioned whether it is possible to tell which are veridical. The variations that occur in different perceptions of what is presumed to be one object raise the question of which is the correct view. The occurrence of illusory experiences raises the question of whether it is really possible to dis-

tinguish illusions and dreams from reality. The criteria employed can be questioned and require justification. On what basis does one tell whether one has the right criteria? By other criteria? Then, are these correct? On what standards? The attempt to justify criteria seems either to lead to an infinite regress or to just stop arbitrarily. If an attempt is made to justify knowledge claims by starting with first principles, what are these based upon? Can it be established that these principles cannot possibly be false? If so, is the proof itself such that it cannot be questioned? If it is claimed that the principles are self-evident, can one be sure of this, sure that one is not deceived? And can one be sure that one can recognize and apply the principles correctly? Through such questioning, skeptics have indicated the basic problems that an investigator would have to resolve before he could be certain of possessing knowledge; that is, information that could not possibly be false.

Critics have contended that skepticism is both a logically and a humanly untenable view. Any attempt to formulate the position will be self-refuting since it will assert at least some knowledge claims about what is supposed to be dubious. Montaigne suggested that the skeptics needed a nonassertive language, reflecting the claim of Sextus that the skeptic does not make assertions but only chronicles his feelings. The strength of skepticism lies not in whether it can be stated consistently but upon the effects of its arguments on dogmatic philosophers. As Hume said, skepticism may be self-refuting, but in the process of refuting itself it undermines dogmatism. Skepticism, Sextus said, is like a purge that eliminates itself as well as everything else.

Critics have claimed that anyone who tried to be a complete skeptic, denying or suspending all judgments about ordinary beliefs, would soon be driven insane. Even Hume thought that the complete skeptic would have to starve to death and would walk into walls or out of windows. Hume, therefore, separated the doubting activity from natural practical activities in the world. Skeptical philosophizing went on in theory, while believing occurred in practice. Sextus and the contemporary Norwegian skeptic Arne Naess have said, on the other hand, that skepticism is a form of mental health. Instead of going mad, the skeptic—without commitment to fixed positions—can function better than the dogmatist.

Some thinkers like A. J. Ayer and J. L. Austin have contended that skepticism is unnecessary. If knowledge is defined in terms of satisfying meaningful criteria, then knowledge is open to all. The skeptics have raised false problems, because it is, as a matter of fact, possible to tell that some experiences are illusory since we have criteria

for distinguishing them from actual events. We do resolve doubts and reach a state of knowledge through various verification procedures, after which doubt is meaningless. Naess, in his book *Scepticism*, has sought to show, however, that, on the standards offered by Ayer and Austin, one can still ask if knowledge claims may not turn out to be false and hence that skepticism has still to be overcome.

Skepticism throughout history has played a dynamic role in forcing dogmatic philosophers to find better or stronger bases for their views and to find answers to the skeptical attacks. It has forced a continued reexamination of previous knowledge claims and has stimulated creative thinkers to work out new theories to meet the skeptical problems. The history of philosophy can be seen, in part, as a struggle with skepticism. The attacks of the skeptics also have served as a check on rash speculation; the various forms of modern skepticism have gradually eroded the metaphysical and theological bases of European thought. Most contemporary thinkers have been sufficiently affected by skepticism to abandon the search for certain and indubitable foundations of human knowledge. Instead, they have sought ways of living with the unresolved skeptical problems through various forms of naturalistic, scientific, or religious faiths.

## SKINNER, B. F. (1904–1990)

The name of B. F. (Burrhus Frederic) Skinner has become virtually synonymous with behaviorism. By introducing the concept of "operant conditioning" (in the late 1930s), Skinner fundamentally transformed behaviorist approaches to experimental psychology. Operant conditioning is based on the fact that the behavior of organisms (including people) typically has environmental consequences and is explained in important part by reference to them. Its fundamental principle is that the probability of occurrence of a specified kind of behavior is a function of the environmental consequences of previous occurrences of behavior of the same type, most notably, that the probability increases if the previous occurrences have been followed by "reinforcement." Skinner, surpassing older behaviorist "stimulus-response" approaches, inaugurated an experimental research program aiming to discover the laws of operant conditioning

and, thus, generalizations concerning the three-term relation: discriminative stimulus-behavior-reinforcement.

The earliest laws of operant conditioning include generalizations about the relationship of the probability of a behavior's occurrence to its "schedule of reinforcement"—for example, to the conditions (discriminative stimulus) of its occurrence, the temporal duration between behavior and reinforcement, the proportion of behaviors that are followed by reinforcement, and whether these durations and proportions are fixed or variable. Later developments include generalizations about behavior that occurs under multiple schedules of reinforcement. The research program of operant conditioning constitutes Skinner's definitive and most lasting contribution. It also informs an applied program (of "behavioral technology"), based on the notion that behavior can be controlled by appropriate arrangement of the contingencies of reinforcement. The journals, *Journal of the Experimental Analysis of Behavior* (1958–) and *Journal of Applied Behavior Analysis* (1968–) are principally devoted, respectively, to publishing results of these and related programs.

Skinner considered his research program to underlie "radical behaviorism," a viewpoint that is distinct from the better-known (among philosophers) "logical behaviorism" and "methodological behaviorism." Unlike logical behaviorism, radical behaviorism does not hold that "mentalistic" terms—terms that may be taken to designate mental states or events (e.g., sensations, thoughts, memories, beliefs)—can be analyzed in terms of relations between behavior and the environment, or as referring to dispositions to behave in certain ways under specified environmental conditions. Unlike methodological behaviorism, it does not hold that any knowledge we may have about mental states and events is gained by means of inference (e.g., hypothetico-deductive) from knowledge of observed behavior, or that mental phenomena may be investigated by way of the behavioral phenomena causally linked with them. Radical behaviorism is not a philosophical thesis about meaning or about the epistemological primacy of behavior. It is a program aiming to "interpret" voluntary behavior (intentional action) in the light of the principle (in the most general terms) that voluntary behavior is under the control of environmental variables and the history of their relations with a person's behavior; or (more specifically) that it is explicable in terms of the history of contingencies of reinforcement to which a person has been exposed and the general laws (identified in the experimental program) of operant conditioning governing these contingencies. The philosophi-

cal journal *Behaviorism* (1972–1989) provided a forum for extensive discussion of radical behaviorism.

For Skinner, the philosophical impact of the program of radical behaviorism becomes apparent in the light of two proposals: (a) that adopting the program has the backing of scientific authority, and (b) that it is from science—rather than, say, from deploying ordinary intentional idiom—that we gain the best understanding of human phenomena. Regarding (a), he wrote a series of methodological articles (reprinted in Skinner 1969, 1972) arguing that the methodological and theoretical resources of the experimental program of operant (combined with respondent) conditioning at least match, and usually surpass, those of programs guided by methodological behaviorism. Thus, he concluded that theories that deploy mentalistic terms are unnecessary, and that a more complete account of behavior can be obtained within the framework of radical behaviorism. Regarding (b), in order to deal with the fact that language is integral to human behavior and that, in ordinary speech and communication acts, mentalistic terms are indispensable, he offered in *Verbal Behavior* (1957) a series of “interpretations” (speculative hypotheses) attempting to make it plausible that utterances containing these terms may be treated simply as instances of “verbal behavior,” whose occurrences and other causal roles, can be explained (predicted and controlled) in terms of the principles of operant conditioning.

Radical behaviorism, applied to linguistic phenomena, had some influence on philosophical developments—for example, on the form of behaviorism adopted in W. V. Quine’s *Word and Object* (1960), and on Quine’s endorsement of “naturalistic epistemology.” For the most part, however, philosophers are aware of *Verbal Behavior* mainly by way of Noam Chomsky’s (1959) scathing review. Chomsky’s most important criticism was that radical behaviorist “interpretations” are unable to encompass a number of fundamental aspects of linguistic phenomena: (e.g., the “creative” use of language, the rapidity and ease of the acquisition of language by children, and certain specific features of grammar, such as embedding of clauses). Furthermore, the linguistic phenomena cited by Chomsky became focal points of rival programs of experimental and theoretical psychology (psycholinguistics, cognitive psychology), which were designed to possess the theoretical resources needed to encompass them and to bypass Skinner’s methodological objections. Chomsky, thus, rejected claim (a), that Skinner’s program has the backing of scientific authority. Not so well known are behaviorist responses to Chomsky’s

arguments and further elaborations (and modifications) of Skinner’s program (in, e.g., Place 1981), so much so that many philosophers consider Chomsky’s review to have sounded the death knell of behaviorism.

Other critics questioned claim (b), that it is from experimentally based science that we get the best understanding of human phenomena. Barry Schwartz and Hugh Lacey (1982, 1987) argued against Skinner: (1) that his methodological criticism of the use of mentalistic terms in psychological theories does not apply at all to the use of intentional idiom in ordinary language; (2) that in fact human action cannot be reduced to behavior that is explicable in terms of laws (behaviorist or otherwise); and (3) that, using arguments that are formulated irreducibly in intentional idiom, the limits of applicability of radical behaviorist principles can be identified (Schwartz and Lacey 1982; Lacey and Schwartz 1987). These limits are ignored in *Verbal Behavior*, and also in Skinner’s most controversial book *Beyond Freedom and Dignity* (1971). In the latter Skinner argued that fundamental notions of liberal democracy (freedom, dignity, autonomy) that are integral to standard defenses of civil rights are ill-founded and in conflict with the best scientifically grounded view of human nature. Such arguments suggested to his critics that the primary motivation for engaging in the program of radical behaviorism comes from commitment to the social value of the control of human behavior.

Although radical behaviorism ceased to have many high-profile adherents after the 1980s, and programs of cognitive psychology have become much more prominent than Skinner’s experimental program in major universities, the residue of Skinner’s contribution is deeply entrenched. The experimental program of operant conditioning continues at a high level of (increasingly mathematical) sophistication, exploring, for example, choices made under the influence of multiple contingencies of reinforcement in accord with the “matching law”; and Skinner’s central theoretical term “reinforcement” has become a staple in practices that range from education to clinical psychology. In addition, newer behaviorist programs that are in continuity with Skinner’s have emerged—for example, Howard Rachlin’s (1994) “teleological behaviorism” and John Staddon’s (1993) “theoretical behaviorism.”

## SKOVORODA, HRYHORII SAVYCH (GRIGORII SAVVICH)

(1722–1794)

Grigorii (Hryhorii) Savvich Skovoroda, the Ukrainian poet, fabulist, philosopher, and religious thinker, was educated at the Kiev Theological Academy. As a young man he traveled in eastern and western Europe and paid brief visits to St. Petersburg and Moscow, but eighteenth-century European culture left few traces on his thought. He taught, mainly literature, at Pereiaslav' (Pereiaslav'-Khmel'nitskii) about 1755 and at the Khar'kov (Khar'kiv) Collegium from about 1759 to 1765, but he fell out with his ecclesiastical superiors and was dismissed. He spent his last thirty years as a mendicant scholar and "teacher of the people."

Skovoroda's disciple, M. I. Kovalinski, has left an engaging account of Skovoroda's manner of life:

He dressed decently but simply; ... he did not eat meat or fish, not from superstitious belief but because of his own inner constitution; ... he allowed himself no more than four [hours a day] for sleep; ... he was always gay, good-natured, easy-going, quick, restrained, abstemious, and content with all things, benign, humble before all men, willing to speak so long as he was not required to ...; he visited the sick, consoled the grieving, shared his last crust with the needy, chose and loved his friends for the qualities of their hearts, was pious without superstition, learned without ostentation, complaisant without flattery. ("The Life of Gregory Skovoroda," translated by G. L. Kline, in *Russian Philosophy*, Vol. I, p. 20)

Skovoroda aspired to be a "Socrates in Russia" both as a moralist, a gadfly provoking thoughtless and selfish men to scrutinize their lives, and as an intellectual forerunner, clearing the path for the more profound and systematic philosophizing of a future "Russian Plato." In many ways he was not only the last, but also the first, of the medievals in Russia. His metaphysics and philosophical anthropology are explicitly Christian and Neoplatonic, and his philosophical idiom is studded with Greek and Church Slavonic terms and constructions. He knew both German and Latin (he left over a hundred Latin letters and poems) and had some knowledge of Greek and Hebrew, but he wrote all of his philosophical works in Russian. As it happened, few of his own philosophic coinages were accepted by later Russian thinkers.

All of Skovoroda's philosophical and theological writings are in dialogue form. They are Socratic in method and in theme, genuinely dramatic and dialogic, written with wit, imagination, and moral intensity. They offer an acute critique of both ontological materialism and sense-datum empiricism, and they outline a dualistic cosmology with a pantheistic (or "panentheistic") and mystical coloring. One of Skovoroda's favorite metaphors for the relation of appearance to reality is that of a tree's many passive, shifting shadows to the firm, single, living tree itself.

In deliberate opposition to the Baconian summons to "know nature in order to master it," Skovoroda urged individuals to "know themselves in order to master themselves" and to put aside desires for comfort, security, fame, and knowledge. His position is thus Stoic as well as Socratic. Seneca, no less than Socrates, would have

savored the epitaph which Skovoroda wrote for himself: “The world set a trap for me, but it did not catch me.”

## SKOVORODA, HRYHORII SAVYCH (GRIGORII SAVVICH) [ADDENDUM]

Hryhorii Savych Skovoroda’s outdated language and literary style make it difficult to grasp his philosophical thought. He expresses his ideas mostly through images, symbols, proverbs, and stories instead of philosophical concepts and propositions, and he does not organize them logically into a system. Because of this he has been subject to many conflicting interpretations: He has been called both an eclectic and a strict rationalist, a mystic and a materialist, a theologian and a moral teacher. While some of his doctrines are obscure (the heart in man, personal immortality, the nature of matter), his ideas do fall into a logically coherent system that is intended to serve a practical purpose.

The aim of philosophy, according to Skovoroda, is to show people the way to happiness. This is why his moral teachings are articulated more fully than the other parts

of his philosophy. His metaphysical, epistemological, and anthropological teachings are developed only to the extent that is necessary for grounding his moral principles. For Skovoroda happiness is not merely the absence of pain or a state of inner peace, but joy and gaiety, which are not free of tension. To attain happiness two things are necessary: to be content with everything and to fulfill one’s true self. The first rests on a belief in a providential order that supplies each creature with whatever is necessary for its happiness. The Epicurean doctrine that what is necessary is easy and what is difficult is unnecessary liberates us from fear and anxiety. The other condition for happiness is the pursuit of one’s God-given, innate, congenial task (*srodnyi trud*) in life. To work at one’s natural task brings joy, while to work at an unnatural task brings misery regardless of the accompanying external rewards such as wealth and fame. Every congenial task corresponds to a necessary social role (e.g., ruler, teacher, soldier, farmer, and so on); hence, by fulfilling their natural potential people also ensure the harmonious and efficient functioning of society.

This moral teaching rests on a dualistic metaphysics. Skovoroda divides reality into three isomorphic worlds: the macrocosm or the all-encompassing universe, the human microcosm or man, and the symbolical microcosm or Bible. All three worlds have an inner and outer, spiritual and material, intelligible and sensible nature: in the macrocosm the two natures are called God and the physical universe; in man soul and body; and in the Bible the true and the apparent meaning. The inner principle in each world is the more important one: It sustains and rules the outer one and is eternal and immutable. Self-knowledge is the foundation of all knowledge: By delving into oneself one discovers the essential truths not only about one’s own nature and one’s congenial task, but also about the other two worlds. Skovoroda considered the Bible, his favorite book, to be a treasury of universal wisdom and a source of false beliefs for those who take its statements at their face value. His dialogues are largely discussions of its symbolic meaning.

Skovoroda’s poetry, composed in a language close to the Ukrainian vernacular, became popular among the common people, while his dialogues circulated in manuscript within the narrow circle of his friends. The first collection of his works to appear in print (1861) contained only half of his dialogues. Fuller collections came out in 1894, 1912, and 1961 and the first complete collection did not appear until 1973. Skovoroda’s ideas began to attract the attention of philosophers only at the end of the nineteenth century. Although Skovoroda’s influence in Russ-

ian and Ukrainian philosophy has been negligible, his colorful and independent personality has served as an inspiration to Ukrainian writers during the cultural revival of the 1920s and 1960s.

## SMART, JOHN JAMIESON CARSWELL (1920–)

John Jamieson Carswell Smart was born into an academic Scottish family on September 16, 1920. His father, W. M. Smart, was an astronomer in Cambridge until 1937 when the family moved to Glasgow. J. J. C. Smart entered the University of Glasgow in 1938.

War service interrupted Smart's education from 1940 to 1945, after which he rapidly completed his degrees at Glasgow, then proceeded to the University of Oxford, where he read for the newly established BPhil degree and came under the influence of Gilbert Ryle. After a short period at Corpus Christi College, he accepted, at the age of twenty-nine, the Hughes Professorship of Philosophy at the University of Adelaide.

Smart spent twenty-two years at the University of Adelaide, moving to La Trobe University in Melbourne in 1972. In 1976 he was appointed to a Chair in the Research

School of Social Sciences of the Australian National University, which he held until his retirement in 1985. Since then he has continued to be active in philosophy at the Australian National University and in Melbourne.

Soon after his arrival in Australia Smart's thought moved away from its linguistic, Oxford orientation and began to take on its characteristic science-based form. Showing the influence of both eighteenth-century Scot David Hume and twentieth-century American W. V. Quine, Smart's mature philosophy has been consistently empiricist, taking human experience as the wellspring and touchstone of knowledge, giving primacy to statements of actual fact and treating modal claims regarding necessity or mere possibility as human artifacts, and embracing nominalism concerning universals. In the philosophy of science, he has upheld regularity views of causation and natural law. Unlike many empiricists, however—who regard imperceptible entities as human constructs—Smart has always been staunchly realist in his account of some theoretical entities, claiming that electrons, for example, are straightforwardly real components of the world.

Smart's ethics has been similarly consistent: He has defended a rather pure act-utilitarian consequentialism throughout. His major contributions to philosophy have involved three themes: in cosmology, four-dimensional physical realism; in the philosophy of mind, materialism; and in ethics, utilitarianism.

For forty years, culminating with *Our Place in the Universe* (1989), Smart has argued that the four-dimensional conception of space-time introduced by Minkowski for the interpretation of the theory of special relativity is superior to all others. This conception implies the equal reality of past, present, and future and rejects as unreal the flow of time that seems to underpin the human experience of time passing.

Smart's second major theme is materialism, the claim that there are no spiritual realities, and that in particular human minds are not spiritual. The mind—the organ with which one thinks—proves to be the brain. All the various states of mind are states, processes, or functions of the brain and its associated nervous system. This *central state materialism* emerged in its contemporary form from two landmark papers: Smart's colleague U. T. Place published his "Is Consciousness a Brain Process?" in the *British Journal of Psychology* in 1956; Smart's "Sensations and Brain Processes," which appeared in *The Philosophical Review* in 1959 (reprinted in *Essays, Metaphysical and Moral* [1987]), gave the view wide notoriety. The importance of Smart's paper consisted in his exposing the

inadequacy of the reasons then prevalent for holding that the mental and the physical belong to essentially incompatible categories. Smart expanded and defended materialism in subsequent discussions both of the general issue and of its implications for the secondary qualities, particularly color.

From *An Outline of a System of Utilitarian Ethics* (1961) onward, Smart has presented a utilitarian theory of moral judgment and action: What matters is not people's intentions, or character, nor any fixed set of moral rules, but the actual consequences of behavior. The consequences to be considered concern the happiness of all sentient beings, as judged from a natural, secular point of view. To adhere to a social or traditional rule of conduct, even in those cases where doing so would result in increased misery, Smart deprecates as "rule worship." He recognizes the notorious difficulties that questions of justice generate for any rigorously utilitarian theory; in *Ethics, Persuasion and Truth* (1984) discussing the enormity of accepting the idyllic happiness of many at the cost of the continuing torture of one lost soul. There is no definitive resolution in his ethical thought of this conflict between the claims of happiness and of justice.

*Philosophy and Scientific Realism* (1963) marked the first appearance of a line of thinking that continues through *Our Place in the Universe* (1989) and subsequent pieces: what is now known as the Argument to the Best Explanation. The issue is realism over theoretical entities such as electrons and quarks, which must forever be beyond any direct observational validation. Smart's position is that the complex, interlocking set of experimental results that have been obtained and validated about electrons, for instance, would constitute an incredible set of interlocking coincidences for which there could be no intelligible accounting, unless electron theory were (close to being) literally referentially correct.

In *Ethics, Persuasion, and Truth* (1984) Smart argues for a sophisticated subjectivist theory in metaethics. As an empiricist, Smart rejects the idea that moral judgments state some special kind of "moral fact," and develops a preference semantics and pragmatics for them. *Our Place in the Universe* (1989) presents a coherent naturalistic vision of the physical world and life on earth, suffused with a kind of natural piety or philosophic awe.

Since 1990, Smart has continued to write on all the major themes of his philosophy. In 1996 he joined with J. J. Haldane in a debate on the issue of atheism. In all his work, Smart argues for firmly held views with the calm, well-informed courtesy and candor that have made him

one of the best loved, as well as most respected, of contemporary philosophers.

## SMITH, ADAM (1723–1790)

Adam Smith, one of the most influential political economists of Western society, first became known as a moral philosopher. Smith was born in Kirkcaldy, Scotland. His father died shortly before he was born, and his mother's loss doubtless explains the lifelong attachment that flourished between her and her son. Smith entered the University of Glasgow in 1737, where he attended Francis Hutcheson's lectures. In 1740 he entered Balliol College, Oxford, as a Snell exhibitioner. He remained at Oxford for seven years and then returned to Kirkcaldy. In 1748 he moved to Edinburgh, where he became the friend of David Hume and Lord Kames (Henry Home). In 1751 he was elected professor of logic at the University of Glas-

gow, and in the next year he exchanged logic for the professorship in moral philosophy, an appointment that he held for the next ten years.

The *Theory of Moral Sentiments*, drawn from his course of lectures, was published in 1759. The work received wide acclaim and so impressed the stepfather of the young duke of Buccleuch that he invited Smith to become the duke's tutor, with the promise of a pension for life. Smith resigned his professorship at Glasgow and accompanied the duke on a visit to the Continent that lasted from 1764 to 1766. His tutoring duties ended, he returned again to Kirkcaldy, where he spent the next ten years in retirement at work on *The Wealth of Nations*, which was published in 1776 and for which he became famous. In 1778 he was appointed a commissioner of customs for Scotland. He died in 1790 and was buried in the Canongate churchyard, Edinburgh.

The greater part of the *Theory of Moral Sentiments* is an account of moral psychology. Only after he has settled the psychological questions does Smith turn, in the last seventh of the work, to moral philosophy. The mainstay of Smith's moral psychology is sympathy. Sympathy is our fellow feeling with the passions or affections of another person. Smith characterizes the mechanism of sympathy in this way: "Whatever is the passion which arises from any object in the person principally concerned, *an analogous emotion* springs up at the thought of his situation, in the breast of every attentive spectator." The important phrase here is "at the thought of his situation." Sympathetic feelings may seem to arise from our seeing the expression of a certain emotion in another person, but Smith argues that if the appearance of grief or joy, for example, arouses similar feelings in us, it is because these feelings suggest to us the general idea of some good or evil that has befallen the person in whom we observe them. What is more, there are some passions whose expression excites disgust rather than sympathy until we are acquainted with their cause. The furious behavior of an angry man, for example, is more likely to exasperate us against him than against his enemies. Thus, Smith concludes that sympathy does not arise so much from the view of the passion as from the view of the situation that excites it, and he reinforces this claim by noting that we sometimes feel for another a passion that he himself seems to be altogether incapable of, as when we feel embarrassed at someone's behaving rudely although he has no sense of the impropriety of his behavior.

Sympathy is the basis for our judgments of both the propriety and the merit of other people's feelings and the actions that follow from them. When the original pas-

sions of the principal person are in perfect accord with the sympathetic emotions of the spectator, the passions of the principal appear to the spectator as just and proper. Smith even goes as far as to say that to approve of the passions of another as suitable to their objects is the same as to observe that we entirely sympathize with them. Indeed, even though our own emotions may make it impossible for us to have on occasion a certain sympathetic emotion, we may "by general rules" recognize the appropriateness of some person's having a given emotion because, for example, we could sympathize with the other person's joy but for our own grief.

Although our sense of the propriety of some piece of conduct arises from our sympathy with the affections and motives of the agent, our sense of merit (that is, our sense of a certain action's making the agent worthy of a reward) stems from our sympathy with the gratitude of the person affected by the action. When we see someone aided by another, our sympathy with his joy at the receipt of the aid animates our fellow feeling with his gratitude toward his benefactor.

Having shown how sympathy gives rise to the senses of propriety and of merit in our judgment of the passions and conduct of others, Smith turns to showing how these sentimental mechanisms may be employed in our judgment of ourselves. We must take care to avoid a self-interested partiality in our judgments. According to Smith, impartiality can be achieved only if we look at our own behavior as though it were someone else's. Thus, we may judge ourselves from the same point of view that we judge others, and our approval or disapproval of our own conduct will depend on whether we can sympathize with the sentiments from which our actions flow. Conscience, "the judge within us," enables us to make a proper comparison between our own interests and the interests of others. With its aid we may approach the ideal of the man of perfect virtue, who is possessed of both a command of his own feelings and a sensibility for the feelings of others.

We may guard against self-deceit by keeping before us the general rules for what is appropriate in human conduct. These rules have their basis in the sentiments that certain kinds of behavior evoke, and our own respect for the rules should follow from the correspondence between them and our own feelings as we observe the conduct of others. Smith stresses that the rules are generalizations from particular instances in which conduct has excited the sense of propriety and merit in humankind. A just regard for these general rules is a sense of duty. By acting from a sense of duty, one can make up for any lack of the appropriate sentiment on a given occasion. Of all

the general rules, those that define justice have the greatest exactness.

Throughout his discussion of our moral psychology, Smith assumes the general acceptance of beneficence and justice as social virtues. He glides quickly over the problem of their description, and he introduces sympathy into his moral psychology as a kind of absolute without considering whether someone might sympathize with “wrong” affections.

In his moral philosophy Smith treats of two questions: Wherein does virtue consist? What power or faculty of the mind recommends virtue to us?

The different accounts of virtue may be reduced to three principles. First, virtue is the proper government and direction of all our affections (propriety). Second, virtue is the judicious pursuit of our own private interest (prudence). Third, virtue lies in the exercise of only those affections that aim at the happiness of others (benevolence). These principles make it evident either that virtue may be ascribed to all our affections when properly governed (as the principle of propriety implies) or that virtue is limited to one of two classes of our affections, either the prudent ones or the benevolent ones.

After surveying the various systems of morals, Smith offers the following conclusions. The systems based on propriety give no precise measure of it. Smith remedies this defect by pointing out that the standard of what is appropriate in sentiments and motives can be found nowhere but in the sympathetic feelings of the impartial spectator. The most that can be claimed for the definition of virtue as propriety is that there is no virtue without propriety, and where there is propriety, some approbation is due. But those who make propriety the sole criterion of virtue can be refuted by the single consideration that they cannot account for the superior esteem granted to benevolent actions. However, neither prudence nor benevolence can be allowed to be the sole criterion of virtue, for whichever we choose, we make it impossible to explain our approbation of the other. Smith’s implied conclusion is that there can be no single criterion of virtue and that each of the three principles that he notes must be allowed its just scope.

When Smith turns to the question of what power or faculty of the mind recommends virtue to us, he remarks that this question is of purely speculative interest and has no practical importance whatsoever. Several candidates had been proposed by Smith’s predecessors as the source of virtue, notably self-love, reason, or some sentiment. Smith rejects self-love as the ultimate basis of behavior,

and hence as the basis of virtue, on the ground that its proponents have neglected sympathy as a cause of action. For Smith, sympathy is not a selfish principle. Smith also rejects reason as a source of the distinction between virtue and vice because reason cannot render any action either agreeable or disagreeable to the mind for its own sake. The first perceptions of right and wrong must be derived from an immediate sense of the agreeableness or disagreeableness of actions. Thus, Smith is left with the conclusion that there must be some sentiment that recommends virtue to us.

Smith considers the proposal that there is a special sense of virtue, the moral sense, as proposed by his former teacher Hutcheson. But Smith regards the moral sense as objectionable on two counts. First, no one seemed to be aware that he had a moral sense before the moral philosophers began to talk about it; and if the moral sense is a genuine sense, this state of affairs seems very odd indeed. Second, Smith finds that sympathy, a recognized human phenomenon, is the source of a range of feelings that provide a foundation for virtue. Therefore, since a sentimental basis for virtue is already provided by nature, there is no need to invent one in the form of a moral sense.

*An Inquiry into the Nature and Causes of the Wealth of Nations* is partly a description of the actual conditions of manufacture and trade in Smith’s own time, partly a history of European economics, and partly recommendations to governments. Smith opposes the mercantilist beliefs that money is wealth and that the best economic policy for a country is the retention within its borders of as much gold and silver as possible. He argues, rather, that wealth is consumable goods and that the wealthiest country is one that either produces itself or can command from others the greatest quantity of consumable goods.

The development of a full-blown economic system requires some people in a society to possess a supply of either raw materials or manufactured goods greater than is required to fulfill their own immediate needs. The surplus stocks provide the opportunity for trade among people with various needs. Where the demand for a certain kind of thing is great enough to assure a producer that his other wants may be supplied in exchange for producing this certain good, he will specialize in its production. This kind of division of labor will continue, according to Smith, until some laborers are producing a very small part of a manufactured product because the master finds that a division of labor enables his workers to produce a greater quantity of goods in a shorter time.

Smith believes that the general welfare will be best served by permitting each person to pursue his own interest. Sympathy, which figured largely in Smith's account of moral psychology, is not mentioned in his economics. Self-interest is the motive required to explain economic action. Smith argues, "Every individual is continually exerting himself to find out the most advantageous employment for whatever capital he can command." Since the most advantageous employment of capital is to be found in producing and selling the goods that satisfy the greatest needs of a people, the capitalist is bound to work to satisfy those needs. Intending only his own gain, he contributes nonetheless to the general welfare. Thus, the capitalist is "led by an invisible hand to promote an end which was no part of his intention."

Smith was instrumental in bringing his contemporaries to see the modern European economic system for the first time, and we are the heirs of their vision. Of course, Smith is guilty of oversimplifications and omissions, but his work is nonetheless a model of both observation and systematization in the social sciences.

## SMITH, ADAM [ADDENDUM]

Adam Smith's claim on the history of aesthetics lies in his essay, "Of the Nature of that Imitation which takes place in what are called the Imitative Arts," arguably the most logically acute and penetrating discussion of what one would call pictorial representation that eighteenth-century Britain produced. It was first published, posthumously, in 1795, in Smith's *Essays on Philosophical Subjects*.

The main thesis of Smith's account is that "the disparity between the imitating and the imitated object is the foundation of the beauty of imitation. It is because the one object does not naturally resemble the other, that we are so much pleased by it, when by art it is made to do so" (1795, p. 144).

Smith's most elaborately worked-out example concerns the contrast between painting and sculpture, much discussed in the eighteenth century. The idea is that statues represent three-dimensional objects in a three-dimensional medium, whereas paintings represent three-dimensional objects in two dimensions. Hence a higher level of resemblance would be required of a statue to its represented object than would be required of a painting to its, to achieve the same level of representational beauty. "The disparity between the object imitating, and the object imitated," Smith wrote, "is much greater in the one art than in the other; and the pleasure arising from the imitation seems to be greater in proportion as this disparity is greater" (1795, p. 137). Smith pays considerable attention in his essay, as well, to music and dance, concluding that "the imitative powers of Dancing are much superior to those of instrumental Music, and are at least equal, perhaps superior, to those of any other art" (Smith, p. 175).

## SMITH, JOHN (c. 1616–1652)

John Smith, the moral and religious philosopher of the Cambridge Platonist school, was born at Achurch, near Oundle, in Northamptonshire. Very little is known with certainty about his origins. It would seem that his father was a locally respected small farmer, that both of his parents were elderly when he was born, that he lost his mother in his early childhood and his father soon after. His short life was a continual struggle against poverty and ill health. In 1636 he was somehow enabled to enter Emmanuel College, where he came under the influence of Benjamin Whichcote. Although he was about the same age as his fellow Platonist Ralph Cudworth, Cudworth was already a fellow of Emmanuel before Smith took his

BA in 1640; Smith was very likely his pupil and certainly came under his influence. The influence may have been in some measure reciprocal.

Smith took his MA degree in 1644; the same year he was elected a fellow of Queen's College, Cambridge, having been declared by the London Assembly of Divines a suitable person to replace one of the fellows who had been ejected by the Puritan Parliament. He taught Greek, Hebrew, and mathematics. Like his master Whichcote he had gifts of character and personal warmth, which won for him not only the respect but also the affection of pupils and friends. The funeral sermon preached by Simon Patrick on his death on August 7, 1652, is, even allowing for the extravagance of phrase common to such occasions, an impressive tribute to his intellectual and personal gifts. He published nothing, but after his death a series of *Discourses* that he had delivered as dean of his college in the chapel of Queen's was collected, edited, and published by John Worthington. Another volume was promised but never appeared.

Matthew Arnold described Smith's *Discourses* as "the most admirable work left to us by the Cambridge School." This is the judgment of a man whose interests lay in religion and culture rather than in philosophy. As a philosopher Smith will not stand comparison with Cudworth or Henry More. Basically, he was an eloquent apologist for the liberal theology of the Cambridge school. The flow of that eloquence, however, is interrupted, in the Cambridge Platonist manner, by quotations in a variety of tongues from Plato, especially the *Phaedo* and the *Republic*, and the Neoplatonists, the Hebrew Scriptures, the Talmud, and, the sole contemporary, René Descartes. Smith's reasoning is by no means close. "It is but a thin, airy knowledge," he writes in the first *Discourse*, "that is got by mere speculation, which is ushered in by syllogisms and demonstrations." God's nature, he thinks, is to be understood by "spiritual sensation" rather than by verbal description; Smith's object is to arouse such a "spiritual sensation" in human souls, and philosophy is only ancillary to that task.

## THOUGHT

The first six of the *Discourses* Smith composed as a continuous essay. They were to be the first segment of a book that he did not live to complete. As editor, Worthington broke up the essay into chapters and added, from Smith's papers, four sermons to act as a substitute for the unwritten segments of the essay. Smith's general thesis is the Platonic one that goodness and knowledge are intimately united; only the purified soul can achieve true knowl-

edge. Every soul, he thought, has within it innate concepts of religion and morality. Ordinarily obscured by sensuality, they nevertheless act as a guide to the direction in which purification is to be sought. Such principles Smith thinks of as innate ideas. Knowledge, in his view, is derived by reflection of the character of our souls; it does not arise out of sensory experience. One can see why he admired the Neoplatonists and welcomed the teachings of Descartes. He did not live long enough to share in the revulsion against Descartes's teachings as mechanistic, which More and Cudworth were to exhibit; indeed, in his *Discourses* he draws on Descartes's physiology.

According to Smith, the three great enemies of religion are superstition, legalism, and atheism. Superstition consists of treating God as a capricious power who has to be cajoled by flattery, bribery, or magical spells. Legalism conceives of religion as laying down doctrines that have simply to be accepted as rules for governing our conduct. It can take a variety of forms, "Scripture-Christianity" is quite as legalistic as Jewish formalism if it consists of picking out of the Scriptures a set of doctrines on the acceptance of which salvation is supposed to depend. Smith attacks this sort of Christianity with particular vigor, especially in his Sermon "Pharisaical Righteousness" (*Discourses* VIII).

As for atheism, Smith, unlike Cudworth and More, did not have Thomas Hobbes to contend with. He knew of atheism only as it appears in the writings of the Epicureans; much of his (very brief) argument against atheism is directed against the Epicurean version of atomism. He regards the belief in God as a "natural belief" that scarcely needs to be defended. He is much more preoccupied with the belief in immortality, perhaps because Richard Overton in a notorious pamphlet, *Man's Mortality* (1643), published in London although as if from Amsterdam, had denied that humans are by nature immortal, arguing that the soul and the body are so compounded that they die and are resurrected together. Smith defends what Overton had rejected—the traditional distinction between soul and body—calling upon Descartes for support.

If people are led to doubt the immortality of their souls, Smith argues, this is only because they are conscious that their souls do not deserve to be immortalized. Once they improve the quality of their lives, they will come to be conscious of their souls as exhibiting a kind of goodness that is obviously destined to be eternal. Similarly, if questions arise about God's nature, these can be settled, as Plotinus had suggested, only by reflection on the workings of our own souls in their most godlike

moments. God is the perfect soul, the perfectly loving soul, the perfectly rational soul; that this is God's nature we see by reflection upon our own perfections and imperfections.

It is easy to see why men as different as John Wesley and Matthew Arnold expressed admiration for Smith and sought to introduce his writings to a wider audience. Smith's appeal to inwardness, to the capture of the soul by God, recommends him to the evangelical; his rejection of merely creedal religions, the moral emphasis of his teaching, recommends him to the liberal theologian.

### Bibliography

The *Select Discourses* were first published and edited by John Worthington in 1660 (London). The best edition is that edited by Henry Griffin Williams for the Cambridge University Press in 1859. Various extracts have been published, for example, by John Wesley in Vol. XI of his *Christian Library* (London, 1819–1827). A selection with the title *The Natural Truth of Christianity*, edited by W. M. Metcalfe (Paisley, U.K., 1882), includes an introductory commendation by Matthew Arnold.

For works on Smith, see bibliography to the “Cambridge Platonists” entry; Rufus Matthew Jones, *Spiritual Reformers in the Sixteenth and Seventeenth Centuries* (London: Macmillan, 1914), Ch. 16; the Address to the Reader prefixed to John Worthington's edition of the *Discourses* (reprinted in the 1859 edition); John K. Ryan, “John Smith, Platonist and Mystic,” in *New Scholasticism* 20 (1) (1946): 1–25; J. E. Saveson, “Descartes' Influence on John Smith, Cambridge Platonist,” in *Journal of the History of Ideas* 20 (2) (1959): 258–263; C. A. ## SMUTS, JAN CHRISTIAAN (1870–1950)

Jan Christiaan Smuts, the South African statesman, soldier, and scholar, introduced the concept of “holism” into philosophy. Smuts was born on a farm near Riebeeck West, Cape Colony (now Western Cape Province). He was graduated from Victoria College, Stellenbosch, in 1891 and from Cambridge in 1894, where he studied law. At both places his record was brilliant, but he had the reputation of being a bookish recluse who made few friends. Returning home in 1895, he was admitted to the bar, entered

political life, and during the Boer War commanded a force against the British with the rank of general. However, when World War I broke out in 1914 he became a staunch defender of the Allied cause. In 1918 he published a pamphlet titled *The League of Nations: A Practical Suggestion*, which helped to form President Woodrow Wilson's ideas. From 1919 to 1924, and again from 1939 to 1948, he was prime minister of South Africa. In the intervening period he completed his only philosophical work, *Holism and Evolution* (New York, 1926). Smuts was a dominant figure in the politics of his country for over half a century and an influential figure on the world scene. His enemies considered him arrogant and ruthless, more interested in ideas than in people. Yet the theme of his politics, as of his philosophy, was the integration of parts into wholes.

This theme is central to *Holism and Evolution*, where it is used to integrate the results of the sciences, especially the biological sciences, and where it becomes the basis of “a new *Weltanschauung* within the general framework of Science.” The background was supplied by the theory of evolution, so interpreted as to preclude mechanistic or materialistic formulations of it. Such formulations, Smuts held, are incompatible with the fact that evolution is creative, having successively brought into existence items that are genuinely novel and that were not even potentially existent before they appeared on the scene. These items he called “wholes.” Their appearance was explained by postulating a primordial whole-making, or “holistic,” factor in the universe. This factor he also called a “creative tendency or principle” operative throughout the history of nature.

Smuts apparently wished to distinguish wholes in the strict sense from mere aggregates, mechanical systems, and chemical compounds. In a true whole the parts lose forever their prior identity. In aggregates, mechanical systems, and chemical compounds, however, the identity of the parts or elements is not lost but is always recoverable. There are certain entities, such as biochemical systems, which appear to have an intermediate status. For they display “a mixture of mechanism and holism.” These systems form “the vast ladder of life.” At the bottom of the ladder, mechanistic features predominate; at the top, holistic features predominate. True wholes, free of any admixture of mechanism, are exemplified in minds or psychic structures, which first appear among higher organisms, and in human personality, “the supreme embodiment of Holism.”

Smuts sometimes spoke of atoms and molecules as wholes, presumably using the term in other than the

strict sense he had defined. The broader use allowed him to affirm that the factor of holism is “responsible for the total course of evolution, inorganic as well as organic. All the great main types of existence are due to it.” Long before organisms or minds arose, the holistic factor was producing elementary wholes of a purely physical kind. Later, through a series of “creative leaps,” it became more fully embodied in biological structures, minds, and persons. Indeed, “it is in the sphere of spiritual values that Holism finds its clearest embodiment,” for in this sphere love, beauty, goodness, and truth have their source.

Smuts nowhere attributed to the holistic factor any teleological orientation. Nor did he apply to it any personal or spiritual categories. It was represented as an ultimate principle, metaphysical rather than religious, at work and still working in the cosmos.

There is a considerable resemblance between Smuts’s philosophical views and those of Henri Bergson and C. Lloyd Morgan. All three philosophers stressed the creativity of evolution, its engendering of novelties whose presence invalidates mechanistic materialism. All were critical of Darwinism and opposed it with arguments and assertions couched in highly general terms. Smuts differed from the other two philosophers in refusing to state explicitly that the holistic factor is spiritual or akin to mind. But at bottom it remains as inscrutable as Bergson’s *élan vital* or Morgan’s directing Activity.

## SOCIAL AND POLITICAL PHILOSOPHY

It is generally agreed that the central task of social and political philosophy is to provide a justification for coercive institutions. Coercive institutions range in size from the family to the nation-state and world organizations, like the United Nations, with their narrower and broader agendas for action. Yet essentially, they are institutions that at least sometimes employ force or the threat of force

to control the behavior of their members to achieve either minimal or wide-ranging goals. To justify such coercive institutions, we need to show that the authorities within these institutions have a right to be obeyed and that their members have a corresponding duty to obey them. In other words, we need to show that these institutions have legitimate authority over their members.

In philosophical debate at the beginning of the twenty-first century, a number of competing justifications for coercive institutions have been defended: (1) a libertarian justification, which appeals to an ideal of liberty; (2) a socialist justification, which appeals to an ideal of equality; (3) a welfare liberal justification, which appeals to an ideal of contractual fairness; (4) a communitarian justification, which appeals to an ideal of the common good; and (5) a feminist justification, which appeals to an ideal of a gender-free society. Each of these justifications needs to be examined in order to determine which, if any, are morally defensible.

### LIBERTARIANISM

Libertarians frequently cite the work of F. A. Hayek, particularly his *Constitution of Liberty* (1960), as an intellectual source of their view. Hayek argues that the libertarian ideal of liberty requires “equality before the law” and “reward according to market value” but not “substantial equality” or “reward according to merit.” Hayek further argues that the inequalities due to upbringing, inheritance, and education that are permitted by an ideal of liberty actually tend to benefit society as a whole.

In basic accord with Hayek, contemporary libertarians, like John Hospers (1971), Robert Nozick (1974), Tibor Machan (2004), and Jan Narveson (1998), define liberty negatively as “the state of being unconstrained by other persons from doing what one wants” rather than positively as “the state of being assisted by other persons in doing what one wants.” Libertarians go on to characterize their social and political ideal as requiring that each person should have the greatest amount of liberty commensurate with the same liberty for all. From this ideal, libertarians claim that a number of more specific requirements, in particular a right to life, a right to freedom of speech, press, and assembly, and a right to property, can be derived.

The libertarian’s right to life is not a right to receive from others the goods and resources necessary for preserving one’s life; it is simply a right not to be killed. So understood, the right to life is not a right to receive welfare. In fact, there are no welfare rights according to the libertarian view. Correspondingly, the libertarian’s

understanding of the right to property is not a right to receive from others the goods and resources necessary for one's welfare, but rather a right to acquire goods and resources either by initial acquisition or by voluntary agreement. By defending rights such as these, libertarians support only a limited role for coercive institutions. That role is simply to prevent and punish initial acts of coercion—the only wrongful actions for libertarians. Thus, libertarians are opposed to all forms of censorship and paternalism, unless they can be supported by their ideal of liberty.

Libertarians do not deny that it is a good thing for people to have sufficient goods and resources to meet their basic nutritional needs, but libertarians do deny that coercive institutions should be used to provide for such needs. Some good things, such as the provision of welfare to the needy, are requirements of charity rather than justice, libertarians claim. Accordingly, failure to make such provisions is neither blameworthy nor punishable.

## SOCIALISM

In contrast with libertarians, socialists take equality to be the ultimate social and political ideal. In the *Communist Manifesto* (1848), Karl Marx and Friedrich Engels maintain that the abolition of bourgeois property and bourgeois family structure is a necessary first requirement for building a society that accords with the political ideal of equality. In *Critique of the Gotha Program*, Marx provides a much more positive account of what is required to build a society based upon the political ideal of equality. In such a society, Marx claims that the distribution of social goods must conform, at least initially, to the principle “from each according to his ability, to each according to his contribution.” But when the highest stage of communist society has been reached, Marx adds, distribution will conform to the principle “from each according to his ability, to each according to his need.” Contemporary socialists like Kai Nielson and Carol Gould continue to endorse these tenets of Marxism.

At first hearing, these tenets of Marxism might sound ridiculous to someone brought up in a capitalist society. The obvious objection is, how can you get persons to contribute according to their ability if income is distributed on the basis of their needs and not on the basis of their contributions? The answer, according to socialists, is to make the work that must be done in a society as much as possible enjoyable in itself. As a result, people will want to do the work they are capable of doing because they find it intrinsically rewarding. For a start, socialists might try to get people to accept presently exist-

ing, intrinsically rewarding jobs at lower salaries—top executives, for example, to work for \$300,000, rather than \$900,000 or more, a year. Yet ultimately, socialists hope to make all jobs as intrinsically rewarding as possible, so that after people are no longer working primarily for external rewards, while making their best contributions to society, distribution can proceed on the basis of need.

Socialists propose to implement their egalitarian ideal by giving workers democratic control over the workplace. They believe that if workers have more to say about how they do their work, they will find their work intrinsically more rewarding. As a consequence, they will be more motivated to work, because their work itself will be meeting their needs. Socialists believe that extending democracy to the workplace will necessarily lead to socialization of the means of production and the end of private property. By making jobs intrinsically as rewarding as possible, in part through democratic control of the workplace and an equitable assignment of unrewarding tasks, socialists believe people will contribute according to their ability even when distribution proceeds according to need. Liberation theology has also provided an interpretation of Christianity that is sympathetic to this socialist ideal.

Nor are contemporary socialists disillusioned by the collapse of the Soviet Union and the transformation of the countries in Eastern Europe. Judging the acceptability of the socialist ideal of equality by what took place in these countries would be as unfair as judging the acceptability of the libertarian ideal of liberty by what takes place in countries like Guatemala or Singapore, where there is a free market but very little political liberty. By analogy, it would be like judging the merits of college football by the way Vanderbilt's or Columbia's team play rather than by the way Florida's or USC's team play. Actually, a fairer comparison would be to judge the socialist ideal of equality by what takes place in countries like Sweden and to judge the libertarian ideal of liberty by what takes place in the United States. Even these comparisons, however, are not wholly appropriate because none of these countries fully conforms to those ideals.

## WELFARE LIBERALISM

Finding merit in both the libertarian's ideal of liberty and the socialist's ideal of equality, welfare liberals attempt to combine both liberty and equality into one political ideal that can be characterized by contractual fairness. A classical example of this contractual approach is found in the political works of Immanuel Kant. Kant claims that a civil state ought to be founded on an original contract satisfy-

ing the requirements of freedom, equality, and independence. According to Kant, it suffices that the laws of a civil state are such that people would agree to them under conditions in which the requirements of freedom, equality, and independence obtain.

The Kantian ideal of a hypothetical contract as the moral foundation for coercive institutions has been further developed by John Rawls in *A Theory of Justice* (1971). Rawls, like Kant, argues that principles of justice are those principles that free and rational persons who are concerned to advance their own interests would accept in an initial position of equality. Yet Rawls goes beyond Kant by interpreting the conditions of his “original position” to explicitly require a “veil of ignorance.” This veil of ignorance, Rawls claims, has the effect of depriving persons in the original position of the knowledge they would need to advance their own interests in ways that are morally arbitrary.

According to Rawls, the principles of justice that would be derived in the original position are the following: (1) a principle of equal political liberty; (2) a principle of equal opportunity; (3) a principle requiring that the distribution of economic goods work to the greatest advantage of the least advantaged. Rawls holds that these principles would be chosen in the original position because persons so situated would find it reasonable to follow the conservative dictates of the “maximin” strategy and maximize the minimum), thereby securing for themselves the highest minimum payoff. In his *Political Liberalism* (1993), Rawls explains how these principles could be supported by an overlapping consensus, and thus would be compatible with a pluralistic society whose members endorse diverse comprehensive conceptions of the good, and in his *The Law of Peoples* (1999), Rawls attempts to extend his theory of justice to the international realm.

## COMMUNITARIANISM

Another prominent social and political ideal defended by contemporary philosophers is the communitarian ideal of the common good. As one might expect, many contemporary defenders of a communitarian social and political ideal regard their conception as rooted in Aristotelian moral theory. Alasdair MacIntyre in *After Virtue* (1981) sees his social and political theory as rooted in Aristotelian moral theory, but it is an Aristotelian moral theory that has been refurbished in certain respects. Specifically, MacIntyre claims that Aristotelian moral theory must, first of all, reject any reliance on a metaphysical biology. Instead of appealing to a metaphysical biology,

MacIntyre proposes to ground Aristotelian moral theory on a conception of a practice. A practice, for MacIntyre, is “any coherent and complex form of socially established cooperative human activity through which goods internal to that form of activity are realized in the course of trying to achieve those standards of excellence which are appropriate to and partially definitive of that form of activity, with the result that human powers to achieve excellence, and human conceptions of the ends and goods involved are systematically extended” (1981, p.175). As examples of practices, MacIntyre cites arts, sciences, games, and the making and sustaining of family life.

MacIntyre then partially defines the virtues in terms of practices. A virtue, such as courage, justice or honesty, is “an acquired human quality the possession and exercise of which tends to enable us to achieve those goods which are internal to practices and the lack of which prevents us from achieving any such goods” (1981, p.178). However, MacIntyre admits that the virtues which sustain practices can conflict (e.g., courage can conflict with justice) and that practices so defined are not themselves above moral criticism.

Accordingly, to further ground his account, MacIntyre introduces the conception of a telos, or good of a whole human life conceived as a unity. It is by means of this conception that MacIntyre proposes to morally evaluate practices and resolve conflicts between virtues. For MacIntyre, the telos of a whole human life is a life spent in seeking that telos; it is a quest for the good human life and it proceeds with only partial knowledge of what is sought. Nevertheless, this quest is never undertaken in isolation but always within some shared tradition. Moreover, such a tradition provides additional resources for evaluating practices and for resolving conflicts while remaining open to moral criticism itself.

MacIntyre’s characterization of the human telos in terms of a quest undertaken within a tradition marks a second respect in which he wants to depart from Aristotle’s view. This historical dimension to the human telos that MacIntyre contends is essential for a rationally acceptable communitarian account is absent from Aristotle’s view. A third respect in which MacIntyre’s account departs from that of Aristotle concerns the possibility of tragic moral conflicts. As MacIntyre points out, Aristotle only recognized moral conflicts that are the outcome of wrongful or mistaken action. Yet MacIntyre, following Sophocles, wants to recognize the possibility of additional conflicts between rival moral goods that are rooted in the very nature of things.

Initially, rather than draw out the particular requirements of his own social and political theory, MacIntyre defended his theory by attacking rival theories, and, by and large, he focused his attacks on liberal social and political theories; in this respect he shares common ground with contemporary deconstructionists. Thus, MacIntyre argues in his “Privatization of the Good” that virtually all forms of liberalism attempt to separate rules defining right action from conceptions of the human good. MacIntyre contends that these forms of liberalism not only fail but have to fail because the rules defining right action cannot be adequately grounded apart from a conception of the good. For this reason, MacIntyre claims, only some refurbished Aristotelian theory that grounds rules supporting right action in a complete conception of the good can ever hope to be adequate.

In his most recent book, *Rational Dependent Animals* (1999), however, MacIntyre’s defense of the communitarian ideal of the common good has now moved in a socialist or Marxist direction. In this book, MacIntyre argues that for independent practical reasoners, Marx’s principle for a socialist society—to each according to his or her contribution—is appropriate, but between those capable of giving and those most dependent, it is Marx’s principle for a communist society—from each according to his or her ability, to each according to his or her need—that is appropriate.

## FEMINISM

Defenders of a feminist social and political ideal present a distinctive challenging critique to defenders of other social and political ideals. In *The Subjection of Women* (1869), John Stuart Mill, one of the earliest male defenders of women’s liberation, argues that the subjection of women was never justified but was imposed upon women because they were physically weaker than men; later this subjection was confirmed by law. Mill argues that society must remove the legal restrictions that deny women the same opportunities enjoyed by men. However, Mill does not consider whether, because of past discrimination against women, it may be necessary to do more than simply remove legal restrictions: he does not consider whether positive assistance may also be required.

Usually it is not enough simply to remove unequal restrictions to make a competition fair among those who have been participating. Positive assistance to those who have been disadvantaged in the past may also be required, as would be the case in a race in which some were unfairly impeded by having to carry ten-pound weights for part of the race. To render the outcome of such a race fair, we

might want to transfer the ten-pound weights to the other runners in the race, and thereby advantage the previously disadvantaged runners for an equal period of time. Similarly, positive assistance, such as affirmative action or preferential treatment programs, may be necessary if women who have been disadvantaged in the past by sexism are now going to be able to compete fairly with men. According to feminists, the argument for using affirmative action or preferential treatment to overcome sexism in society is perfectly analogous to the argument for using affirmative action or preferential treatment to overcome racism in society.

In *Justice, Gender and the Family* (1989), Susan Okin argues for the feminist ideal of a gender-free society. A gender-free society is a society in which basic rights and duties are not assigned on the basis of a person’s biological sex. Being male or female is not the grounds for determining what basic rights and duties a person has in a gender-free society. Since a conception of justice is usually thought to provide the ultimate grounds for the assignment of rights and duties, we can refer to this ideal of a gender-free society as “feminist justice.”

Okin goes on to consider whether John Rawls’s welfare liberal conception of justice can support the ideal of a gender-free society. Noting Rawls’s initial failure to apply his “original position” concept to family structures, Okin is skeptical about the possibility of using a welfare liberal ideal to support feminist justice. She contends that in a gender-structured society like our own, male philosophers cannot achieve the sympathetic imagination required to see things from the standpoint of women. In a gender-structured society, Okin claims, male philosophers cannot do the “original position-type thinking” required by the welfare liberal ideal because they lack the ability to put themselves in the position of women. According to Okin, the “original position” can only really be achieved in a gender-free society.

Yet at the same time that Okin despairs of doing “original position-type thinking” in a gender-structured society, like our own, she herself purportedly does a considerable amount of just that type of thinking. For example, she claims that Rawls’s principles of justice “would seem to require a radical rethinking not only of the division of labor within families but also of all the nonfamily institutions that assume it.” She also claims that “the abolition of gender seems essential for the fulfillment of Rawls’s criterion of political justice” (1989, p. 104).

## PRACTICAL REQUIREMENTS

Unfortunately, unless we can show that either libertarianism, socialism, welfare liberalism, communitarianism, or feminism, or some combination of these ideals is most morally defensible, it will be difficult to know which practical requirements one should endorse. However, assuming we have obligations to distant peoples and future generations, it may be possible to show that the libertarian's own ideal of liberty leads to a right to welfare that is acceptable to welfare liberals, and that when this right is extended to distant peoples and future generations, it requires something like the equality that socialists endorse. This would effect a practical reconciliation of sorts among seemingly opposing social and political ideals.

There is also the question of whether we have obligations to animals and other nonhuman living beings. Until recently, there was very little discussion of whether humans have such obligations. It was widely assumed, without much argument, that we have obligations only to humans. However, this lack of argument has recently been challenged by defenders of animal rights on grounds of speciesism. Speciesism, they claim, is the prejudicial favoring of the interests of members of one's own species over the interests of other species. Obviously, determining whether this charge of speciesism can be sustained is vital to providing a justification of coercive institutions, particularly the coercive institutions of animal experimentation and factory farming, and thus it is vital to fulfilling the central task of social and political philosophy as well.

## SOCIAL CONSTRUCTIONISM

Social constructionism (sometimes "constructivism") is a version of constructivism. The idea that human beings in some measure construct the reality they perceive can be found in many philosophical traditions. The pre-Socratic philosopher Xenophanes, for instance, argued that humans construct gods in their own image (Fragment 16), a possibility that is also criticized in the Jewish, Christian, and Islamic religious traditions (among others). But the idea that human beings epistemologically construct the reality they perceive is first given extended philosophical articulation in the work of Immanuel Kant (1724–1804). In the nineteenth century a constructivism of sorts emerged as political theory in the work of Karl Marx (1818–1883) and others. Then, in the twentieth century, constructivism took new forms in psychology, in sociology, and in science, technology, and society (STS) studies.

## CONSTRUCTIVISM IN PSYCHOLOGY

A root form of social constructionism is found in psychological constructivism. Illuminating research by the British psychologist Frederick Bartlett (1886–1969) revealed how humans use prior knowledge to make sense of new phenomena. In his landmark study *Remembering* (1932), Bartlett presented an unfamiliar indigenous American folk tale to students at Cambridge University. Later each subject was asked to recall the story in as much detail as possible. Bartlett was able to show how each retelling was a unique *reconstruction* of the story rather than a *reproduction* of the original. Subjects tended to replace unfamiliar elements of the story with objects drawn from their own experience. Bartlett concluded that in coming to understand the story, his students tended to make use of pre-existing mental structures or *schemata*, which proved essential both for originally comprehending the story and for subsequent recall.

The notion of schemata is central as well to Jean Piaget's (1896–1980) theory of intelligence. The Swiss psychologist undertook pioneering work on childhood intellectual development. From years of careful observations of and conversations with children and watching them function in problem-solving activities, Piaget argued that cognitive development is an adaptive process of schema correction by means of assimilation and accommodation. We assimilate new information by fitting it within existing cognitive structures. Where pre-existing schema cannot incorporate a new experience, we adjust our mental structures to accommodate them. For Piaget, learning is not a passive activity of replication and data storage but an active process of invention and creation. Piaget's resultant genetic epistemology describes how increasingly complex intellectual processes are built on top of more primitive structures in regularly occurring stages.

Lev Semyonovitch Vygotsky (1896–1934), a Piaget contemporary, also studied the cognitive development of children in Soviet Russia during the Stalin years and noted how children engaged in a problem-solving activity invariably speak about what they are doing. This led to his theory of speech as a means for making sense of the activity. Although children's use of tools during their pre-verbal period is comparable to that of apes, as soon as speech and signs are incorporated into any action, the action becomes transformed and organized along entirely new lines.

Language is thus central to complex reasoning and higher order thinking. Intelligence is the readiness to use culturally transmitted knowledge and practice as pro-

theses of the mind, and learning is inherently social; learned social speech becomes inner speech through development. Vygotsky came to believe that speech precedes thought and that human thought is a social phenomenon that develops from society to the individual. The idea that cognition emerges out of social activity is central to Vygotsky's work. This is also a view that has become at once widely adopted—being applied especially in educational theory—and controversial, especially various forms of cognitive psychology.

## SOCIAL CONSTRUCTIONISM IN SOCIAL THEORY

The American social philosopher George Herbert Mead (1863–1931) took constructivism into sociology with a theory of self consciousness as originating from social interaction. In his posthumously published *Mind, Self, and Society* (1934), Mead argued that personal identity is constructed through social relationships. In the context of play, for instance, children take on the roles of others, eventually learning to view themselves from the standpoint of a “generalized other.” Children's games thus function as instruments for personal and social development, especially when children adopt attitudes of those who in some sense control them or on whom they depend. For Mead the self is a dialectical conversation between the “me” and the “I”—“me” being the social self and “I” the creative self that responds to the “me” in multiple contexts to form, over time, the ontogenic, historical image of one's self.

The theorists Peter Berger and Thomas Luckmann cite Mead as a major source for their seminal sociological text *The Social Construction of Reality* (1966). In this treatise, Berger and Luckmann extend Mead's ontogenetic observations on the self to include all phenomena that we encounter in a social world. They describe the dialectic relationship between the subjective reality of the individual and the objective reality of society that emerges in a universe of discourse that is continuously under construction. Through interaction and conversation with others, knowledge is internalized, then externalized, becoming at once a subjective perception and an objective reality. From such a process of socialization we construct our daily lives.

Much social constructionism implies some degree of subjectivism. From an analysis of intentionality and how it plays out in a social context, however, the philosopher John Searle (1995) has argued that socially constructed reality exhibits its own distinctive type of objectivity. Searle's realism distinguishes between “brute facts” that

exist independently of what any humans think and “social facts” that depend on human thinking while being independent of what any one human thinks. Human beings construct a social reality through common intentions that assign functions to physical objects, as when a certain type of paper comes to be treated as money.

### SOCIAL CONSTRUCTIONISM IN SCIENCE AND TECHNOLOGY

Epistemological constructivism has taken special forms in the development of cybernetics, evolutionary epistemology, and the philosophy of mathematics. But insofar as cybernetics moved from analyses of interactions between organisms and their physical environments to consideration of communication in a social environment, social cybernetics offered as well a science and a technology of social interactive constructions. Yet the cybernetic approach has been only marginally influential on social constructionism in general.

One of the most contested areas of social constructionism is not in science and technology but in studies about science and technology. Ludwik Fleck (1979) first proposed, in a controversial interpretation of the medical conceptualization of disease, that even some supposedly brute facts of science were socially constructed. This idea was picked up and developed by Thomas Kuhn (1962), which subsequently led to the development of a research program in the sociology of scientific knowledge (SSK). The sociology of scientific institutions, as initiated by Robert K. Merton (1910–2003) in the 1930s, came under increasing criticism in the 1970s for its idealization of science and its failures to treat the production of scientific truth and falsity in a symmetrical manner. Drawing on the ideas from the later Ludwig Wittgenstein about the influence of language games and forms of life on human understanding, David Bloor (1983) and others proposed that social factors influenced not only the production of falsehood (a weak SSK program) but also any consensus about truth (the strong SSK program).

The SSK program in conceptual and analytic criticism was quickly complemented by empirical studies of laboratory practices and how such practices themselves contribute to the production of scientific knowledge. Employing ethnographic approaches, Bruno Latour and Steve Woolgar (1979) and Karin Knorr Cetina (1981) argued that knowledge production is seldom the rational, linear process of hypothesis testing leading to article publication found in the standard image of science. Behind the scenes science is a mangle of practical skills, instrumental jiggering, personal relationships, interpretative

debates, and consensus building that deploys a variety of rhetorical strategies to frame both problems and experimental results.

The full extent to which scientific knowledge is a social construction or laboratory production—and what this might imply for science, scientists, as science as a social institution—has been subject to extensive debate in the so-called “science wars” between scientists and their social scientific critics. Among the most philosophically astute assessments of this research program and ensuing debate has been Ian Hacking’s *Social Construction of What?* (1995).

The program for a parallel analysis of the social construction of technology (SCOT) has been almost as controversial as social constructivism applied to science, but for different reasons. As Louis Bucciarelli (1994) has shown with his ethnographic examination of the engineering design process, social and personal factors of all sorts readily influence engineering products, processes, and systems. The question is whether this means that those such as Jacques Ellul (1954) or Hans Jonas (1984) who have raised ethical and political questions about the dominance of modern technology in human affairs are simply mistaken in their worries. For proponents of SCOT or one of its related programs such as actor-network theory, critics have too often criticized technology as a kind of “black box” that they failed to examine in sufficient detail. But critics such as Langdon Winner (1994) have responded that “opening the black box” can also be an exercise in avoidance of more fundamental questions.

Relations between social constructivism in psychology, sociology, and STS deserve further examination. Moreover, arguments concerning the social construction of science and technology exhibit unexplored affinities with the pragmatic epistemologies of the “fixation of belief” (C. S. Peirce), the merger of science and technology in the general category of tools (John Dewey), and criticisms of strict empiricism (Willard van Orman Quine). Indeed, social constructivism presents a broad philosophical interpretation of personal and public life, from the epistemological to the ethical, in ways that will likely continue to exercise considerable influence in twenty-first century thought.

## SOCIAL CONTRACT

"Social contract" is the name given to a group of related and overlapping concepts and traditions in political the-

ory. Like other such aggregations in philosophy and intellectual history, it has at its center an extremely simple conceptual model, in this case that the collectivity is an agreement between the individuals who make it up. This model suggests that it is proper to ask whether the agreement was or is voluntary in character and whether, therefore, the individual can decide to withdraw either because he no longer agrees or because the conditions that are or were understood in the agreement are not being maintained. It suggests furthermore that the individual should be thought of as logically prior to the state or to society, and that it is meaningful to speculate on situations in which individuals existed but no collectivity was in being. From a historical point of view, it is therefore relevant to discuss periods during which no collectivity existed, when what is traditionally called a "state of nature" prevailed, and to contrast these periods with times when by agreement the collectivity had come into existence, that is, with what is traditionally called a "state of society."

The concept of a prepolitical state of nature that can be brought to an end by agreement can thus be applied to geographical areas of human society as well as to periods of time. Individuals in such areas must be considered, as Thomas Hobbes himself said, "to have no government at all and to live at this day in that brutish manner." Although this may seem to be the least persuasive of the elements belonging to the social contract, its parallel in relationships between politically constituted societies or states, that is to say, in the international state of nature, is perhaps the most useful and persistent. It seems still to command allegiance in the study of international relations. The actual process of agreeing ("contracting," "compacting," "covenanting") to end the state of nature and establish a state of society has been the subject of extensive analysis and elaboration by political and social theorists. Distinctions have been drawn, more precisely perhaps by academic commentators in modern times than by contractarian writers themselves, between a social contract and a governmental contract.

The social contract proper (*pactum societatis*, *pacte d'association*, *Gesellschaftsvertrag*) is thought of as bringing individuals together in society, and the governmental contract (*pactum subjectionis*, *pacte du gouvernement*, *Herrschaftsvertrag*) as establishing a formal government. As might be expected, the nature and form of the contract or contracts has been thought of in a variety of ways. In some systems the contract is a once-and-for-all, irrevocable act understood to have been performed in the remote past (Richard Hooker), but in others it appears as a continuing understanding that is perpetually being

renewed and is regarded rather as a trust than as a contract (John Locke). The parties to the various contracts differ also: Sometimes agreements are made between individuals only, sometimes between individuals and governments or sovereigns, sometimes between a body of individuals acting as a fictitious person (*persona ficta*) and either the sovereign or a member of the body. In such ways as these a whole set and succession of interrelated contractual agreements have occasionally been presumed, as in the case of the seventeenth-century German political theorist Samuel Pufendorf and his followers in the eighteenth century.

The theory of a social contract belongs with the individualist attitude to state and society; indeed the simple conceptual model of agreement for the collectivity in all its possible shapes seems to inform the entire individualistic outlook. Contractual political theory is, therefore, universally associated with the rights of the individual person, with consent as the basis of government, and with democratic, republican, or constitutional institutions. It has also been regarded as a part of early capitalist individualism, and in Victorian England a great watershed was held to exist between a condition in which status ruled relationships and one in which contract ruled them. Notwithstanding this assumption, the social contract is perfectly reconcilable with the most absolute of despotic rule and with the complete negation of constitutionalism or the rule of law. Hobbes is the classic case here, for his two alternative accounts of how society and government came simultaneously into being are designed to tie every citizen to unquestioning obedience to a supreme, irresistible, indivisible sovereign whose dictates are the law. Benedict de Spinoza makes a rather similar use of contractual principles, but the political theory of Jean-Jacques Rousseau, although expounded in contractual form, has collectivist tendencies, since it endows political society with the capacity to make people moral. Rousseau's major political work, *Du Contrat social*, must be looked upon as the point of departure of the quite separate and traditionally quite irreconcilable outlook whose model is the theory of the general will.

#### EXPLANATORY VALUE

If the collectivity is understood as embodying agreement, it does not necessarily follow that any such agreement between parties ever actually took place in historical time. Nor does it follow that there may be people in the world still living in a prepolitical, precontractual situation or that those now within constituted society could ever revert to the nonpolitical condition. A contractarian

political theory, therefore, can be entirely hypothetical, analyzing state and society as if agreement must always be presumed. Such an argument can provide a penetrating critique of existing arrangements and of their rationale: It can be used in a reformist direction, to suggest what ought to be the aims and ends of statesmen. No reversion to a literal state of nature need be implied by criticism of this kind, only that this or that action or abuse requires a remedy in accordance with the suggested criterion of an assumed agreement.

In this hypothetical form the contract theory is still of importance to political philosophy. It has recently been used by John Rawls in his articles "Justice as Fairness" and "Distributive Justice" to develop an account of justice alternative to the utilitarian (previously assumed to have outmoded contractarianism). Contemporary appreciations of the great contractarian writers (for example, by Howard Warrender, C. B. Macpherson, and A. G. Wernham), especially of Hobbes but also of Locke, Spinoza, and David Hume, and even of Rousseau, have tended to insist that the classic theories are hypothetical, which makes it possible to free the theories to a surprising extent from the lumber that had attached to them—the unacceptable histories of the human race, the fanciful anthropology and sociology. Moreover, the assumptions of natural law can thus be put aside.

#### NATURAL LAW

The reinterpretation of social contract theory is an important example of the way in which past political theory can enter into present theoretical analysis independently of chains of influence and continuous traditions. Still, the reinterpretation may lead to a serious distortion of the truth about the actual contents of contractarian treatises on politics. All the many members of the school of natural law, including those named above, did in fact assume that their contractual claims were literal as well as hypothetical. They all made dogmatic statements about the history of humanity and the condition of savages. Moreover all of them, though here writers like Hobbes and Hume are in special categories, subscribed to the general system of natural law in one form or another.

The concept of natural law provided the fixed and enduring framework within which the contract ending the state of nature could be concluded, and subsequent breaches or revisions of the contract could be related to the original act. Therefore, natural law had to be assumed if the contract was to be taken at all literally. The duty to keep promises, on which any contract rests, could hardly come into being with the contract itself, and this duty

must persist should the contract be broken, if only to make a new one possible. When the Commons of England in January 1689 accused their former king, James II, of “breaking the original contract betwixt King and people,” they did so in the secure belief that this was an offense that was and always would be punishable under natural law. It is understandable, then, that the history of the idea of a social contract has been largely the same as that of natural law itself.

## HISTORY

The origins of social contract theory and of natural law can be sought in the Roman Stoicism of Cicero and in the system of Roman law. The development of social contract into a standard feature of the Western Christian attitude can be seen in the Middle Ages, and its apotheosis can be observed in the period between the Reformation and the eighteenth century. It is usual in fact to insist that the rise of the contractarian attitude to predominance in European political thought came about because of the Reformation. Certainly the justification of the right of a Protestant minority in a Catholic country, and of that of a Catholic minority in a Protestant country, to its own form of religious worship came about because of the gradual acceptance of contractarian notions by Reformation and post-Reformation political and legal thinkers and even by some politicians and sovereigns. The slow and hesitant growth of religious toleration would undoubtedly have been even more retarded if natural law and the social contract had not been at hand to provide a definition of the individual citizen, his individual rights, and the nature of his relationship to political authority. Accordingly, we find that the French religious wars of the 1560s, 1570s, and 1580s, together with the revolt of the Dutch against the throne of Spain, which began in 1568, brought about the elaboration of contractarian ideas. In both these cases embattled Calvinists were asserting their political as well as their religious rights against Catholic authorities, but in England at the same time it was the Catholics who needed contractarian justification for their rights, even finally their rights to resist government.

The *Monarchomachi* (“bearers of the sword against monarchs”), as the French writers were called, developed the contract between people and sovereign in various directions, and in the famous *Vindiciae Contra Tyrannos* (1579) it justified a recognizably revolutionary doctrine. In Holland the contract was codified further and became in the works of Johannes Althusius and Hugo Grotius an informing principle of political life as well as of the relations between sovereign and people. (Grotius’s great

work, however, the *De Jure Belli ac Pacis* of 1625, acquired and retains its fame because of its application of natural law and contractarian principles to international law.)

All these ideas and all these experiences—particularly the experience of religious separatism developing into civil war—can be seen at work in Hobbes, the most impressive of all contractarian theorists. In Hobbes’s *Leviathan* (1651), the state of nature was a state of war, a propertyless anarchy brought to an end only by the contract of absolute submission. Hobbes made such devastating use of the destructive potentialities of the social contract in criticism of the conventional thinking about natural law that all succeeding systems can be looked upon to some extent as commentaries upon him. This is truest of Spinoza (*Tractatus Theologico-Politicus*, 1670; *Tractatus Politicus*, 1677) and until recently was thought to be true of Hobbes’s eminent and enormously influential successor in England, Locke.

Locke’s *Two Treatises of Government* (written 1679–1683, published 1689) are now known to have been written as an attack on Robert Filmer, not on Hobbes, and Locke’s relatively peaceful and sociable state of nature, brought to an end by a very limited contract, has only a somewhat distant relationship with Hobbes’s “war of all against all.” It is interesting that Filmer should have been the most effective critic of the concept of a state of nature and of the possibility and relevance of contract and that his traditional, patriarchal authoritarianism was to a large extent immune from contractarian notions.

It was not traditionalism, however, which broke down contractarian assumptions within a generation of the death of Locke in 1704, but rather the rapid defeat of the natural law outlook by utilitarian criticism in England and by general will notions in France and elsewhere. Contract lost its persuasiveness as the rationalist outlook on the nature of law gave way to the historical outlook early in the nineteenth century. The development of observational anthropology and empirical sociology in more recent times makes it entirely unlikely that contract in anything but a strictly hypothetical form will ever be adopted again by political theorists.

This conventional account of the history of contract could be corrected and extended by reference to the simple model of the collectivity as agreement with which this entry began. This is so obvious an image that it can be found in some form in any political system, even in the refusal of Socrates to escape from his prison and avoid the poison on the ground that he owed obedience to his native city because of the benefits he had received as a citizen. It seems likely that every political theory must be

contractual, at least to some degree, in this very wide sense.

Nevertheless, since contract proceeds by abstracting the individual from society, and then by reassembling individuals again as society although they are by definition asocial abstractions, the general contractual social and political scheme seems incurably faulty, quite apart from the empirical objections to it on the part of contemporary social scientists.

### **Bibliography**

The standard account in English is J. W. Gough, *The Social Contract* (1st ed., Oxford: Clarendon Press, 1936; rev. ed., 1957). Ernest Barker analyzes classical notions of contract very succinctly in a compilation he edited for the World's Classics series titled *Social Contract: Essays by Locke, Hume, and Rousseau* (New York: Oxford University Press, 1948); he has also translated the relevant part of Otto Gierke's monumental general treatise, *Das Deutsche Genossenschaftsrecht* (1913), as *Natural Law and the Theory of Society*, 2 vols. (Cambridge, U.K.: Cambridge University Press, 1934). In addition, see A. G. Wernham, ed., *Spinoza, Political Works* (Oxford: Clarendon Press, 1958); Peter Laslett, ed., *John Locke, Two Treatises of Government* (Cambridge, U.K.: Cambridge University Press, 1960); Howard Warrender, *Political Philosophy of Hobbes* (Oxford: Clarendon Press, 1957); and C. B. Macpherson, *Political Theory of Possessive Individualism: Hobbes to Locke* (Oxford: Clarendon Press, 1962).

More recent theoretical analyses of contract are Margaret Macdonald, "The Language of Political Theory," in *Logic and Language*, edited by Antony Flew, first series (Oxford, 1956), and the essays in the collection *Philosophy, Politics and Society*, edited by Peter Laslett and W. S. Runciman (Oxford: Blackwell, 1957–), especially those by John Rawls.

*Peter Laslett (1967)*

## SOCIAL CONTRACT [ADDENDUM]

Contemporary social contract theory is practically identified with the work of John Rawls (1921–2002). In his best known book, *A Theory of Justice*, Rawls attempts to

generalize and carry to a higher level of abstraction the social contract theory of Locke, Rousseau, and Kant. In Rawls's version of social contract theory, people are to select the principles of justice they are to live by in imagined ignorance of whether natural or social contingencies have worked in their favor. His theory requires that we should choose as though we were standing behind an imaginary "veil of ignorance" with respect to most particular facts about ourselves, anything that would bias our choice or stand in the way of unanimous agreement. Rawls calls this choice situation "the original position" because it is the position we should start from when determining what principles of justice we should live by. Rawls explicitly argues that the principles of justice that would be selected are significantly different from the classical or average principle of utility.

Almost immediately, there was a utilitarian challenge to Rawls's theory led by R.M. Hare (2003) and Richard Brandt (1972), which maintained that the theory had the same practical consequences as utilitarianism. Soon after, there was a libertarian challenge led by Robert Nozick (1974), which claimed that Rawls's theory conflicted with an ideal of liberty, and later a communitarian challenge led by Michael Sandel (1982) and Michael Walzer (1983) contended that the theory ignored the situatedness of human beings, along with an Aristotelian challenge led by Alistair MacIntyre (1981) which objected to Rawls's theory for denying the priority of the good.

There was also a feminist challenge led by Susan Okin (1989), who, among others, maintained that Rawls's theory was biased against women, and a multicultural challenge led by a diverse array of Western and non-Western philosophers who maintained that the theory was biased against non-Western cultures. Since Rawls was reluctant to respond directly to his critics, these challenges created opportunities for others to step in and respond to them or to suggest ways in which Rawls's work needed to be modified to address these criticisms.

There was also the important question of the practical implications of Rawls's work for how we should live our lives individually and collectively. Rawls had always claimed to be developing primarily an ideal moral theory. *A Theory of Justice* only touched briefly on nonideal theory to provide an account of civil disobedience. But the farther removed one's society is from ideally just institutions, the greater is the need to spell out the practical requirements of justice for one's time, lest one stand accused of legitimating existing unjust institutions and practices. By deciding to focus his work on ideal moral theory, Rawls created opportunities for others either to

work out the practical implications of views developed in opposition or as a corrective to Rawls's view for the non-ideal world in which we live.

Rawls's second book, *Political Liberalism*, was written to correct a fundamental problem that Rawls perceived in *A Theory of Justice*. Rawls believed that his earlier book assumed a relatively complete Kantian conception of the good. In *Political Liberalism*, Rawls tries to ground his same theory of justice on a more minimal foundation—an overlapping consensus of reasonable comprehensive conceptions of the good. According to Rawls, citizens are to conduct their fundamental discussions within a framework of a conception of justice that everyone, irrespective of one's particular comprehensive conceptions of the good, could be reasonably expected to endorse. An important implication of Rawls's view is that religious considerations are generally excluded from public debate over fundamental issues in society. This feature of Rawls's view has engendered considerable debate, not only among philosophers, but also among theologians, political scientists, and lawyers, but it has not had any discernible effect on public policy, at least in the United States, where religious considerations continue to have an impact on public policy beyond anything that could be justified by a reasonable overlapping consensus.

Rawls's third major book, *The Law of Peoples*, attempts to extend his theory of justice to the international realm. Rejecting any straightforward application of his principles of justice to the international realm, Rawls favors more minimal obligations to other peoples. According to Rawls, there is virtually "no society anywhere in the world ... with resources so scarce that it could not, were it reasonably organized and governed, become well-ordered." Rawls also allows for exceptions to international principles of justice, specifically a requirement of noncombatant immunity, in order to attain "some substantial good." At the same time he disallows any comparable exceptions to intersocietal principles of justice. Here again, Rawls's views have given rise to a wide-ranging discussion over possible exceptions to principles of justice, which has become even more important given the connection that exists between terrorism and international justice.

## SOCIAL EPISTEMOLOGY

Since the early 1980s, social epistemology has become an important field in Anglo-American philosophy. It encompasses a wide variety of approaches, all of which regard the investigation of social aspects of inquiry to be relevant to discussions of justification and knowledge. The approaches range from the conservative acknowledgment that individual thinkers are aided by others in their pursuits of truth to the radical view that both the goals of inquiry and the manner in which those goals are attained are profoundly social.

Individualistic rather than social epistemologies have dominated philosophical discourse since at least the time of Descartes. The writings of Mill, Peirce, Marx, Dewey, and Wittgenstein, which began to develop social epistemologies, are among a few exceptions to individualistic approaches. They had little effect on epistemological work at the time they were published. Even the move to naturalism, taken by many epistemologists after W. V. Quine's polemics in its favor, persisted—quite unnecessarily—in individualistic assumptions about the nature of knowledge and justification. Quine argued in "Epistemology Naturalized" that epistemologists should attend to actual, rather than ideal, conditions of production of knowledge but he concluded that "epistemology ... falls into place as a chapter of psychology," ignoring the sociology of knowledge altogether.

Movements outside of epistemology motivated and cleared the way for social epistemology. First and most

important, the proliferation of interdisciplinary research on social aspects of scientific change following the publication of Kuhn's *The Structure of Scientific Revolutions* pressured naturalistic epistemologists to take sociology of knowledge seriously. In particular, the skeptical and relativistic conclusions of sociologists and anthropologists of science—among them Barry Barnes, David Bloor, Steven Shapin, Simon Schaffer, Bruno Latour, Steve Woolgar, Harry Collins, Karin Knorr-Cetina, and Andrew Pickering—moved naturalistic epistemologists of science—including Ronald Giere, Larry Laudan, Philip Kitcher, and Paul Thagard—to take social accounts of scientific change seriously yet to draw their own epistemic conclusions. Second, influential work during the late 1970s in the philosophy of language and philosophy of mind—core fields of philosophy—by Hilary Putnam, Tyler Burge, and others eschewed individualism and began producing social accounts. A more general openness to social approaches in philosophy followed.

#### RANGE OF SOCIAL EPISTEMOLOGIES

Social epistemologies vary along several dimensions. First, they may emphasize either the *procedures* or the *goals* of inquiry. Whether the emphasis is on procedures or goals, the range here is as large as the range in epistemology as a whole: from consensus practices to critical engagement to truth to pragmatic success to socially constituted goals. Second, attempts to follow the procedures or attain the goals are evaluated for different units of inquiry. Some social epistemologists evaluate the attempts of individual human beings, assessing the influence of social processes on individual reasoning and decision making. Others evaluate the aggregate efforts of groups of people who may work together or separately.

Social epistemologies also tend to investigate particular domains and/or to work at particular levels of generality. Many (for example, Giere, David Hull, Kitcher, Helen Longino, Miriam Solomon, and Thagard) are social epistemologists of science rather than of ordinary knowledge or some other area of specialized knowledge. Feminist epistemologists (for example, Donna Haraway, Lynn Hankinson Nelson, and Naomi Scheman) look at the gender-relatedness of methodologies or assumptions in several fields, not only those explicitly dealing with sex or sex roles. Alvin Goldman (1992, 1999, 2002) works in the widest range of domains—from science to law to education to politics—and moves from the most general considerations of epistemics (in which he argues that truth is the ultimate epistemic goal) to the most concrete practical considerations (in which, for example, he argues

that the common-law system is veritistically inferior to the Continental civil law system). Many social epistemologists work primarily at the general (abstract) level in their studies of areas such as testimony (Coady 1992), trust (Hardwig 1991), and knowledge (Kusch 2002).

Two journals are devoted to publishing material in social epistemology, *Social Epistemology* (1986–) and *Episteme* (2004–); many other journals publish special issues and individual articles in the area.

#### PROCEDURES OR GOALS OF INQUIRY

Longino's normative approach is to evaluate the procedures of a knowledge community. Her "critical contextual empiricism" (2002) evaluates four features of the knowledge community: the "tempered" equality of intellectual authority (equality moderated by deference for expertise), presence of forums for criticism, some shared norms (including empirical success in a scientific community), and responsiveness to criticism. Normative judgments will be of epistemic communities rather than of individuals and will be positive for communities following the appropriate procedures, irrespective of outcome.

Goldman, Kitcher, and Hilary Kornblith all take truth (or significant truth) to be the central goal of all kinds of inquiry. They assess various social processes and practices for their conduciveness to truth attainment. For example, Goldman (1992) shows that in some situations, such as some legal contexts, groups reach the truth more reliably when some true information is deliberately withheld from them—for example, misleading prejudicial information. So Goldman concludes that social epistemologists need to think about communication control, for paternalistic epistemic reasons. Goldman (1992, 1999) and Kitcher (1993) explore the consequences of intellectual rivalry and credit seeking in science. They both conclude that rivalry and credit seeking can lead scientists to distribute their cognitive effort well over the available research approaches, coming to a veritistic conclusion more quickly than they otherwise would. Kornblith (in Schmitt 1994) argues that the widespread practice of deference to experts may be reliable in one social setting and unreliable in another, depending on the institutions through which a society confers the title of "expert."

Some hold that, although truth is the ultimate epistemic goal, it is mediated by coherence of belief. They examine social processes for their conduciveness to coherence. For example, Keith Lehrer (1990) argues that individual reasoning yields more coherent belief if it makes use of all the information residing in a commu-

nity; Thagard (1993) argues that delays in the transmission of information across a community can be conducive to a good distribution of cognitive labor and thereby eventually to maximal explanatory coherence and truth.

Although most social epistemologists who employ normative goals regard truth as the most important epistemic goal, there is a range of other, less traditional, positions. Giere (1988), for example, claims that the goal of scientific inquiry is theories that model the world rather than directly correspond to it and that social practices such as credit seeking should be assessed for their conduciveness to producing good models. Solomon (2001) argues that scientific theories aim for empirical success. Steve Fuller (2002) writes of a range of epistemic goals espoused by scientific communities and argues that those goals should themselves be debated by scientists.

The most radical position on epistemic goals is one that claims that our social epistemic practices *construct* truths rather than discover them and, furthermore, negotiate the goals of inquiry rather than set them in some nonarbitrary manner. Work in the “strong program” in sociology of science during the 1970s and 1980s—notably by Barnes and Bloor, Latour and Woolgar, Shapin and Schaffer, Latour and Woolgar, and Collins and Trevor Pinch—was frequently guided by such social constructivism. (Recent work in the sociology of science is usually more philosophically sophisticated: See, for example, Shapin [1994].) Most contemporary social epistemologists in the Anglo-American philosophical tradition are motivated by their disagreement with the social constructivist tradition, and they argue for the less radical positions just described.

## THE DISTRIBUTION OF COGNITIVE LABOR

The distribution of cognitive labor is a common theme in social epistemology and is a link between social epistemology and evolutionary epistemology. It is wasteful to duplicate the efforts of others, beyond the minimum required to check robustness of results. It is most efficient to have different individuals or research groups pursue different avenues of inquiry, especially when, as is usually the case, there is more than one promising direction to follow. Hull (1988), following the founder of evolutionary epistemology, Donald Campbell, was one of the first to apply this idea in the social epistemology of science, where he argued that new theories are like new organisms—produced by random variation on past theories—

where only the fittest survive. And there is no way of knowing in advance which theory will be the fittest.

Others have also given accounts of how cognitive labor is distributed, although they have not emphasized the evolutionary analogy. Kitcher (1993) and Goldman (1992, 1999) have argued that the desire for credit leads to an effective division of cognitive labor; Thagard (1993) has argued that the same result is achieved by delays in dissemination of information; Giere (1988) thinks that interests and variation in cognitive resources distribute research effort; Solomon (2001) has argued that cognitive biases such as salience, availability, and representativeness can result in effective distribution of belief and thereby of research effort. (Not all these stories are, of course, true; some combination of them may be.) For all of the aforementioned thinkers, it is the *distribution* of cognitive labor across a community that is epistemically valuable rather than the decisions of any particular individual.

Cognitive labor can be divided not only for discovery and development of new ideas but also for storage of facts, theories, and techniques that are widely accepted. Just as books contain information that no individual could retain, information is also stored in communities in ways that are accessible to most or all members of that community but could not be duplicated within each head. One important way in which this is brought about is when people with expertise on different subjects—or with different experiences or techniques—increase the knowledge within a community. Knowledge and expertise is thus socially distributed. Edwin Hutchins’s account of navigation (1995), in which skills and knowledge are distributed across the officers and enlisted men on board a naval vessel, is an example of this process.

A final way in which cognitive labor can be distributed is for the process of coming to consensus. In traditional philosophies of science, consensus is presented as the outcome of the identical decision of each member of a scientific community: A good consensus is the result of each scientist choosing the best theory through the same process, and a bad consensus is the result of each scientist choosing the wrong theory through the same inappropriate process. Of course, this is just the simplest model of group consensus formation, and it presumes the same starting point, the same endpoint, and the same processes of change. The only time that the members of the group may differ is during the period of dissent, when, as Hull (1998, p. 521) would say, a thousand theories may bloom. Giere, Hull, Kitcher, and others would also say that, when coming to consensus, each scientist picks the same theory for the same overriding good reasons. Other accounts of

consensus formation in which cognitive labor is distributed include that of Hussein Sarkar (1983), who finds that different scientists may select the same theory for different good reasons, and Solomon (2001), who finds that, although individual scientists may make biased and idiosyncratic decisions, there is a social perspective from which to evaluate the overall normativity of the decisions.

### THE UNITS OF INQUIRY

Who knows? And who is justified in his or her knowledge? Nelson (1990) argues provocatively that only societies can really know. Some social epistemologists consider the outcomes of social epistemic processes for individuals and some for communities. The most conservative social epistemologies look only at the effects of social processes on individual reasoning and knowledge. For example, Kornblith (in Schmitt 1994) looks at those circumstances under which one scientist can judge that it is reasonable to rely on the expertise of another scientist. Coady's work on the role of testimony (1992) argues that individuals are typically justified in relying on the word of others. The claim is that individual human beings reason better when placed in favorable epistemic social situations. Epistemic terms such as "knows" and "is justified" are applied to individual human beings.

More radically, social groups can be understood as having emergent epistemic qualities that are due to something other than the epistemic properties of their members. Gilbert (1989) argues that group knowledge need have no coincidences with the knowledge ascribed to individual members of the group. Longino (1990, 2002) presents four conditions for objective knowledge that are satisfied by (some) knowledge societies rather than by individuals: tempered equality of intellectual authority, forums for criticism, responsiveness to criticism, and some shared values of inquiry. Nelson (1990) argues that communities set the standards of evidence and are the primary knowers. Kusch's "communitarian epistemology" (2002) argues for a similar conclusion through a performative analysis of testimony. Goldman (1999) shows that some kinds of social organization (for example, that of the American justice system) lead to poorer results than other kinds (for example, the Continental justice system). Schmitt (1994) argues that group justificatory processes can achieve, through interactions, more than the sum of individual justifications. Solomon (2001) shows that differently organized scientific communities make better and worse scientific decisions.

### CONCLUSION

It is not surprising to find that the wide variety of social epistemologies is connected to work in other disciplines. Economics, artificial intelligence (especially distributed computation), race and gender studies, sociology of science, anthropology, and European philosophical traditions (for example, Foucault and Habermas) are frequently cited, either for the data or for the methodologies that they supply.

When epistemologies are deeply social, recommendations for inquiry will often be applicable to communities or institutions rather than to individuals. Social epistemologists, especially those who are both naturalistic and applied, have begun to spell out these recommendations. The traditional focus on individual epistemic responsibility is being transformed by the addition of new, socially informed directions of inquiry.

**Miriam Solomon (1996, 2005)**

## SOCIALISM

This entry is concerned with “socialism” from the time at which, so far as anyone knows, the word was first used in print to describe a view of what human society should be like. This was in 1827, in the English *Co-operative Magazine*, a periodical aimed at expounding and furthering the views of Robert Owen of New Lanark, generally regarded as the father and founder of the cooperative movement. (Owenite cooperation, incidentally, was an institution different from, and far more idealistic than, the distributive stores which in the Victorian age took over the name.) Some historians have traced the ancestry of socialism much further back: For example, to primitive communist societies, to the Jesuits of Paraguay, to the ideal communities described by Thomas More and others, to the Diggers of Cromwell’s army, and even to Plato’s *Republic*. Although there are elements of socialism to be found in all these, particularly in More’s *Utopia*, the scope of this article is limited to socialism in modern times and to the sense in which the word is normally used, omitting both distant possible origins and, of course, bastard movements such as the National Socialism (Nazism) of twentieth-century Germany and Austria which, save for

the bare fact that they enforced central control of social policy, had nothing of socialism in them.

## ORIGIN OF SOCIALISM

The seedbed of socialism, as of so much else in modern thought, was the French Revolution and the revolutionary French thinkers who preceded it—Voltaire, Jean-Jacques Rousseau, and the Encyclopedists. Rousseau was no socialist, but from his cornucopia of seminal though sometimes unclear and inconsistent thought socialists drew the ideas of people born free but everywhere in chains, of a “general will” making for perfection in society, of the importance of education, and a host of others. From the Encyclopedists they learned to question all institutions in the light of reason and justice, and even from “Gracchus” Babeuf to demand equality for the downtrodden and to seek it by means of dedicated conspirators. Owen himself was no revolutionary; insofar as his ideas can be traced to anyone but himself, they probably came from early reading of the William Godwin who wrote *Political Justice*; Owen envisaged a society consisting of small, self-governing, cooperating communities, established by the free and rational consent of all, of whatever class or station. Originally, the word *socialism* appears to have laid particular emphasis on communal cooperation in contrast to the more-or-less liberalism that was coming to be the creed of the industrial revolution—hence Owen’s rather contemptuous dismissal of Jeremy Bentham and the utilitarians. The idea of socialism came rapidly to fit the aspirations of the working classes and their radical champions not only in its country of origin but far beyond it.

## SOCIALIST TENETS

Since its beginnings in the early 1800s, a period that has seen vast changes not merely in the industrial and political organization of society but also in people’s minds, their modes of thought, and their interpretation both of themselves and of what they have seen around them, “socialism” has naturally borne many meanings, and dozens of views have been held and expressed about the form of society that socialists hope to see and about the means by which it should be attained and secured. Long before Karl Marx and Friedrich Engels introduced the great schism between what they called utopian and scientific socialism, there were wide differences of opinion; and the differences are no less wide today. George Bernard Shaw, for example, in *The Intelligent Woman’s Guide to Socialism and Capitalism*, laid down absolute equality of money incomes as a *sine qua non*—a dictum

accepted by few of his fellow socialists, and not by Shaw himself in any practical sense. There are many other definitions that could be quoted. Nevertheless, the word is certainly not meaningless. It describes a living thing that grows and changes as it lives; and it is possible to discern certain beliefs that are fundamental to all who can be called socialists, as well as to note the divergences in what may be called secondary beliefs and to relate these, in part at least, to the conditions of the time.

**CRITIQUE OF EXISTING SOCIETY.** The first of the fundamental beliefs of socialists is that the existing system of society and its institutions should be condemned as unjust, as morally unsound. The institutions that are thus condemned vary from time to time and from place to place according to circumstances, the greatest stress being laid sometimes on landlordism, sometimes on factory industry, on the churches, the law, or the political government, or a combination of these (as William Cobbett, in an earlier century, denounced “The Thing”), depending on what seems to be the most potent engine or engines of oppression. This condemnation may be associated with the values of revealed religion, as in the case of the various forms of Christian socialism, or may positively repudiate those values, as Marx did; in either case the emphasis is on injustice. Pierre-Joseph Proudhon’s dictum, “Property is theft,” expresses this condemnation most concisely.

Many socialist movements, such as the Saint-Simoniens in the 1830s and the Fabians half a century later, attacked the existing system for its economic and social inefficiency as well; but this criticism was less fundamental. Socialists such as François Marie Charles Fourier in France and William Morris in England laid much more stress on freedom, happiness, and beauty than on material wealth. Even the economists among them, however, long asserted that granted decent (that is, socialist) distribution of the product of industry and agriculture, there would easily be “enough to go round” and to provide everyone with a standard of living recognized to be reasonable. By the mid-twentieth century the enormous multiplication of potential demand, coupled with realization of the existence of hundreds of millions living far below European standards of life, had referred that type of prophecy to the far-distant future.

**A NEW AND BETTER SOCIETY.** The second fundamental of socialism is the belief that there can be created a different form of society with different institutions, based on moral values, which will tend to improve humankind instead of, as now, to corrupt it. Since it is living men who

are to create the new institutions—men who must, therefore, recognize and follow the appeal of moral value—this belief is in effect an assertion of the perfectibility, or at least near-perfectibility, of man. It was most dogmatically stated by Owen, in books such as *A New View of Society*; and the history of socialism shows that it can survive innumerable disappointments. It is not the same as a belief in “progress,” which has been held by many who were not socialists; it is more like *Magna est veritas et praevalabit* (“The truth is great and will prevail”)—truth being here equated with justice.

Does justice, in social institutions, imply equality? Does it also imply democracy? For socialists, the answer to both these questions has generally been positive but the answer has not been absolute. Equality of rights—yes; equality before the law—yes, again. We have already observed, however, that complete equality of income was not a universal socialist tenet; and from the very earliest days there were sharp differences among socialists on the relationship between work and income. On the dictum “From each according to his ability” they more or less agreed. But some added “to each according to his needs”; others countered with “to each according to his effort—or his product.” This debate, in which sides were taken, on the whole, in accordance with the temperament and/or environment of the individual and in which many intermediate positions were adopted, remained unresolved throughout the history of socialism—not surprisingly, since the problem of controlling the level of incomes has defeated all except completely static societies. On the question of democracy, again, the great majority of socialists have been democrats in the ordinarily accepted sense of the word. But some rejected any formal democratic process in favor of a communal consensus resembling the Quaker “sense of the meeting” (or Rousseau’s general will). Owen, in practice, was an autocratic egalitarian; and post-Marxist socialism has evolved a procedure known as democratic centralism, which bears little relation to what any pre-Marxist would recognize as democracy.

Deep differences arose early on the kind of institution which would be best suited for a world devoted to justice. There was one main difference at first: Some put their faith in small communities of neighbors, as far as possible self-sufficient, cooperating freely with other similar communities in such functions as exchange of goods, and relying to the minimum on any regional or central authority for such necessities as defense and the supply of credit; others looked rather to a development of science, technology, and large-scale industrial production and

banking to increase rapidly the supply of material goods and thereby the prosperity of a socialist economy through centralized planning techniques. Of these two schools—whose views have necessarily been greatly simplified for the compass of this article—the first, or “utopian,” is best known from the writings of Owen, Fourier, and Proudhon, and the second, or “scientific,” from those of the Comte de Saint-Simon and his followers. The first clearly derived from rural society: Owen’s villages of cooperation and Fourier’s phalansteries were based upon small-scale agriculture, with such industrial and craft production as could conveniently be carried on in villages or small communities. This was the kind of society envisaged, much later, in William Morris’s *News from Nowhere*; and much later still, there were curious echoes of it in V. I. Lenin’s dreams of cheap electricity transforming the life of the Russian peasantry and even in the Chinese “great leap forward,” with a piece of factory in every backyard.

The weakness of this school is that its fear of size, of external authority, and of the apparatus of the state and of central government, whatever concessions it may in theory make to “natural necessities,” such as the conduct of a national railway system, are liable to lead in practice as well as in theory to anarchism and the repudiation of any government at all—which in the modern world means chaos. The second school, that of large-scale production and planning, was, from the beginning, in harmony with the way the world was tending. Its dangers are today only too obvious, and the recurrent malaise of large-scale industry in times of prosperity, the demands for “shares in control,” and the like, show the vacuum created by the nonfulfillment of the utopian ideals of a just society.

**REVOLUTION.** Whatever form of institution the several schools of socialism envisaged for the future, all agreed that what was required was a fundamental transformation of society amounting to revolution, a program of action to effect such a transformation, and a revolutionary will so to transform it existing in the members of present-day society. This is the third fundamental socialist assumption; how it is to be put into effect has been the subject of much division of opinion. As socialism was generally believed to have a strong rational basis, it was natural that all schools of socialists should set great store by education, persuasion, and propaganda; Owen, indeed, carried the trust in rationality so far that he could not believe that anyone, whatever his condition or his preconceived opinions, could fail to be converted by “Mr. Owen’s powers of persuasion,” if only Mr. Owen could employ them sufficiently often and at sufficient length.

Others, less confident, sought to achieve their end by preaching to and working upon groups already conditioned by the circumstances of their working lives to accept the whole or a part of the socialist gospel—the most obvious of these being, of course, the trade unions and other organizations of the working class. In this spirit Marx looked upon the British trade unions that supported the International Working Men’s Association (the “First International”) as “a lever for the proletarian revolution.” Strikes, threats of strikes, and other forms of what much later came to be known as “direct action,” supplemented persuasion by inducing the ruling classes to make concessions which could not otherwise have been wrung from them.

The practicability, either of persuasion or of group action, depended very largely on the political conditions of time and place. And although there was a running argument between gradualists, who believed that revolutionary change could be brought about peacefully and piecemeal, and revolutionaries, who thought head-on collision between the holders of power and their victims was inevitable in the long run if not immediately, the difference was not as absolute as was often supposed. In Britain, after the defeat of Chartism had registered the end of insurrectionism in any form, after the press had been freed and the franchise widened, the organizations of the working class leaned to peaceful evolution far more than to violence—the “inevitability of gradualism” was an accepted belief long before Sidney Webb put it into words in the 1920s. In tsarist Russia, at the other extreme, a generally authoritarian government, operating a police state, appeared to bar the door to anything but physical revolution. There were many possible in-between positions; and the role of the convinced individual socialist varied similarly, from that of open persuader, adviser, and organizer, like Keir Hardie at the end of the nineteenth century, to that of secret conspirator, like Auguste Blanqui in France after 1848 and organizers of communist cells in the twentieth century.

**INTERNATIONALISM.** One other characteristic should briefly be mentioned. Socialism was initially a world philosophy, not concerning itself with race or nation, not advocating the brotherhood of man so much as assuming it. The opening of the *Communist Manifesto*, “Workers of the world, unite,” crystallized this into words; the nationalism of Poles, Irish, Italians, Hungarians, was only an aspect of the struggle against corrupt institutions. Later, of course, nationalism grew so strong that it clashed, sometimes violently, with other fundamentals of socialism; nevertheless, the idea remained potent for genera-

tions, and it may still be suggested that socialist movements that have become exclusively nationalist have ceased to be socialist at all.

### MARXIAN SOCIALISM

The *Communist Manifesto* marks a great divide between pre-Marxian and post-Marxian socialism. Marx and Engels dismissed all their predecessors as utopians and formulated a system of socialism that they claimed was “scientific.” There is no room here to expound Marxist philosophy or Marxist economics; but it must be pointed out that neither “utopian” nor “scientific” is an accurate description. Marxist socialism accepted the fundamentals as set out above; it differed from most of its forerunners in that it did not, save in a few very vague allusions, seek to describe the new, uncorrupt institutions that would appear after the revolution; it assumed—and what could be more utopian?—that after the proletariat had conquered, it would make all anew and “the government of man be replaced by the administration of things.”

“Scientific,” in Marxist language, meant not so much acceptance of technology and large-scale production—although this was included—as the proving, by logical argument and study of history, of two quite simple propositions: First, that under the existing capitalist system, the proletariat, the laboring class, is systematically and continuously robbed of its just share of the fruits of production; second, that “changes in the modes of production and exchange,” and not any other factor, such as “man’s insight into eternal truth and justice,” are leading inevitably to a reversal of the system that will remove the bourgeois capitalist class from the seats of power and replace it by the organs of the proletariat. This is the base on which the whole enormous superstructure of Marxism is founded; it is not science, but messianic prophecy. It is easy to understand, however, the compelling effect that this fundamentally simple appeal had to the downtrodden at various times and in various places. At the same time, Marx’s powerful and penetrating analysis, which discredited a great deal of current economic and historical theory, profoundly attracted many of the best brains among those who were dissatisfied with the human results of the existing system, and the teaching of the Marxists that morality in action was relative to the needs of the time, even if slightly inconsistent with their denunciation, on grounds of injustice, of slavery and wage slavery, gave their followers both the inspiration of those who were fighting a continuing battle and the sanction to use any and every method that could advance

their cause. Marx did not invent the conception of classes, but Marxists fought the class war.

The work of Marx and Engels has had as great and lasting an effect on the thinking of non-Marxists, particularly after the Russian Revolution, as has that of Sigmund Freud on non-Freudians. This entry cannot deal with the developments in socialist thought, Marxist or non-Marxist, in the post-Marxian era. These are of enormous importance for the study of history and present-day politics; but they are concerned principally with method and strategy. The fundamental tenets of socialism as a view of society have remained substantially unaltered, although the process of translating them has been far more lengthy and complicated than the nineteenth century ever foresaw.

### Bibliography

By far the most complete work on socialism is G. D. H. Cole, *History of Socialist Thought*. 7 vols. (London, 1953–1960), last volume published posthumously. Each volume except the last has a full bibliography for every chapter.

Earlier books are Max Beer, *History of British Socialism* (London: G. Bell, 1929); Édouard Dolléans, *Histoire du mouvement ouvrier*, 2 vols. (Paris: A. Colin, 1936–1939); Sir Alexander Gray, *The Socialist Tradition: Moses to Lenin* (London: Longmans, Green, 1946); Élie Halévy, *Histoire du socialisme européen* (Paris: Gallimard, 1948); Thomas Kirkup, *History of Socialism*, rev. ed. by E. R. Pease (London: A. and C. Black, 1913); H. W. Laidler, *Social Economic Movements* (New York: Thomas Y. Crowell, 1944), first issued as *History of Socialist Thought* (New York: Thomas Y. Crowell, 1927); and Paul Louis, *Histoire du socialisme en France*, rev. ed. (Paris, 1950).

For documents, see Raymond Postgate, *Revolution from 1789 to 1906*, reissued, with a new introduction (Gloucester, MA: P. Smith, 1969).

*Margaret Cole (1967)*

### SOCIALISM [ADDENDUM]

Socialism has seen enormous changes since the above entry was written. Its cachet has gone up and down and, after an all-time low during the early 1990s, is now per-

haps going to go up again. The socialist ideal fell on hard times when “actually existing socialism” collapsed in the Soviet Union and its satellite states in 1989 and somewhat later in Yugoslavia. The headlong rush of China towards free-market development has further deepened the crisis of contemporary socialism. Only Cuba, North Korea, and perhaps Vietnam and Laos remain as “actually existing socialisms.”

There have been similar upheavals in socialist theory. Most Western socialists, including most Marxists, while not being cold warriors, did not regard these “actually existing socialisms” as genuinely socialist but as statist noncapitalist societies that were authoritarian, nondemocratic and excessively bureaucratic regimes parading as paradigms of socialist societies. Instead of the dictatorship of the proletariat (what was supposed to be the mass but democratic governing of the working class by the working class in the interim before “the withering away of the state” and the attaining of a classless society), there were what anarchist socialists (most notably Mikhail Bakunin) called the dictatorship *over* the proletariat, namely the rule over the proletariat by a small elite calling themselves communists.

Among most Western socialist theoreticians something like the following view became prevalent: The Soviet Union was not even a flawed socialism but an authoritarian statist postcapitalist society that had betrayed many of the most fundamental beliefs of socialism. Others, including Noam Chomsky, denied that it even had a somewhat progressive “postcapitalist” character at all, but actually the Soviet Union became a form of state capitalism; this latter claim is disputable as it is not for contemporary China. But state capitalist or postcapitalist, it became an authoritarian clumsily bureaucratic regime that betrayed many of the ideals of socialism. Both sorts of socialist intellectuals sought to reinvigorate socialist thought and to help create a way to reinvigorate socialist practice. For them, in a standard sense of the word *democratic*, the term “democratic socialism” was a pleonasm.

In light of these historical realities, what it is to be a socialist has become more ambiguous than it was at the high tide of Marxism. Andrew Levine has well used “socialism” to designate those political tendencies and movements that, since the beginning of the nineteenth century, sought to deepen what the most radical of the French revolutionists began. Like the liberals, their tamer confreres on the Left, socialists always have been steadfast in their dedication to “liberty, equality, and fraternity.” But, like their revolutionary forebears—and unlike

liberals—they have usually favored radical, structural transformations, at least in principle. This broad characterization allows us to regard the more radical social democrats (for example, Jürgen Habermas), some anarchists (for example, Noam Chomsky), and Orthodox Marxists (for example, Bertell Ollman) as all socialists. Whether there is a spectrum here or some fundamental cleavage is a much debated matter.

The more Orthodox Marxists would take it to be axiomatic that a socialist of any sort is someone who favors public or social ownership, and at least indirect control, of at least the principal means of production. In such a society there would be no one because of this public and shared ownership who *simply* has to sell his or her labor. Public ownership in different forms of socialism can mean different things. For some it has meant state ownership and for others various schemes of worker ownership and control. For some social democrats socialism has meant a mixed-economy containing small-scale private ownership of the means of production but with larger-scale ownership being firmly public. Others would move so far from traditional conceptions of socialism as to not identify socialism necessarily with a distinctive form of ownership at all but with radical democracy and a thoroughly egalitarian-solidaristic conception of justice.

Some orthodox socialists would not regard a mixed economy at all; nor would they regard as socialist normative conceptions of socialism that identify it with radical democracy and egalitarian-solidaristic justice. They would classify the latter as social democratic and not genuinely socialist at all. A socialist society, on this view, must be a society without capitalism (or at least on the way to abolishing it). It would be a society in which everyone is either a worker, a potential worker (children), a former worker or person incapable of work (such as the retired or disabled), or someone soon destined to become a worker in a social order in transition to a classless society. Many Marxists believe that such a development would have to be global to be sustained.

Others would respond that contemporary society has too many strata doing various kinds of work to make “worker” a very useful category or class analysis the trenchant critical tool that Marxists took it to be. Others insist on the centrality of a class analysis while arguing that in contemporary society classes have become more ramified than in Marx’s time (Wright 1989).

Although the foregoing characterizations of socialism are matters of definition, they are not simply that. Each vision of a socialist future bears different implica-

tions for social policy and for the society and the world as a whole. At the far end of the social democratic spectrum capitalism would remain in place, but with much of its power curbed (or so the plan goes); on the more robustly socialist end of the spectrum, capitalism would have to be replaced with socialism either by the ballot box or by some form of revolution. And where socialism is identified with the ownership and control of the means of production, it matters considerably whether public ownership takes the form of state ownership or direct workers' ownership and control or some combination of both.

Socialism, taken in the more robust sense, is commonly thought to be tyrannical or authoritarian. But that claim has little merit. Contemporary socialists in the West have, like liberals, a commitment to liberty and democratic procedures, as did Marx and Engels, although the latter two seemed to have an unrealistically simplistic view of the implementation of radical democracy and paid little attention to procedures or to constitutional matters of protecting human rights. They thought that, as the dust of the socialist revolution settled, society would evolve in an ever more democratic direction. But contemporary socialists do not think that. Moreover, Marx and Engels thought that the socialist revolution would start in advanced capitalist societies, but when it arose in Russia instead, Rosa Luxemburg argued perceptively that if it did not quickly spread to the wealthy capitalist West, it would be doomed. But socialism did not spread westward from the Soviet Union; it originated in a backward authoritarian state with little in the way of a democratic tradition and without much in the way of developed productive forces.

Marxist socialists of whatever stripe are historical materialists and anticipated that socialism would piggyback on developed capitalism. No socialist society can succeed, they claim, without highly developed forces of production and a democratic tradition. Where those are absent, a socialist revolution will sour or collapse. But where these conditions obtain, Marxists claim, there is no fear of a socialist society succumbing to authoritarianism.

Another issue for contemporary socialist thought is whether socialism can work efficiently in the absence of markets. Only market societies have had a successful track record of providing consumer goods and services swiftly to a large portion of the population. The response by many contemporary socialists has been to propose market socialism. Alec Nove, John Roemer, and David Schweikart have proposed carefully worked out diverse models about how this hybrid could work. Market socialists (as in reality contemporary capitalists do) work with

both market and plan. They disdain the Soviet command model, which regards markets (except in very limited domains) as dysfunctional, and are cautious about central planning.

Market socialism has been resisted by some Orthodox Marxists (for example, Mandel and Ollman). They believe that any market socialism will reproduce the inequalities and instabilities of large-scale capitalism. But Roemer responds that if markets are used solely to guide allocation, there is no reason why market socialism will lead to a society addicted to consumerism. Indeed some socialists believe that it might even surpass concentrated capitalist enterprises in meeting people's needs. The problem for others is rather a worry about what appears at least to be its *political* impossibility. A major worry is whether such an alternative could ever gain a serious hearing in societies dominated by capitalist states and by large capitalist media conglomerates.

## SOCIETY

A group of perennial problems in social philosophy arises from the concept “society” itself and from its relation to the “individual.” What is the ontological status of a society? When one speaks of it as having members, is that to recognize it as a whole with parts, or is the relation of some different kind? Or is this a case of what Alfred North Whitehead called the fallacy of misplaced concreteness?

### SOCIAL ACTION AND SOCIAL RELATIONS

“Society” is used both abstractly and to refer to entities that can be particularized, identified, and distinguished from each other as social systems or organizations. The phrase “man in society” is an instance of the more abstract use, for it refers neither to some particular form of association nor to a particular collectivity in which individuals find themselves. It refers, rather, to the social dimension of human action—to a certain generalized type of human relationship. Purely spatial or physical relations between human beings, like contiguity, are not social; for social relations give to human actions a dimen-

sion possessed neither by the mere behavior of things nor, indeed, of animals.

Max Weber defined a social action as one which, “by virtue of the subjective meaning attached to it by the acting individual (or individuals), ... takes account of the behavior of others and is thereby oriented in its course” (*Theory of Social and Economic Organization*, p. 88). That is to say, the agent understands his own action as having a particular point, which in turn depends on an understanding of what another individual or other individuals have done in the past (as, for instance, in an act of vengeance), are doing now, or are expected to do in the future (as, for instance, in a proposal of marriage). So, said Weber, the efforts of two cyclists to avoid hitting one another would have a social character, whereas the collision between them would not.

An action would not be social merely because it was the effect on an individual of the existence of a crowd as such. For instance, laughing less inhibitedly in a crowd than one would when alone would not be an action oriented to the fact of the existence of the crowd “on the level of meaning”; while the crowd may be one of the causes of the action, the point or meaning of the action does not presuppose some conception of, say, the crowd’s purposes or the reasons for its presence. Nor would merely imitative behavior be social; one could learn to whistle by imitating a man, a bird, or a whistling kettle. Learning and performance need neither an understanding of what is imitated as an action nor an orientation toward expected future action of the model. Nevertheless, says Weber, if the action is imitated because it is “fashionable, or traditional, or exemplary, or lends social distinction ... it is meaningfully oriented either to the behavior of the source of imitation or of third persons or of both” (pp. 112–114). Weber then goes on to define “social relationship.” This would exist wherever, among a number of actors, there existed a probability that their actions would be social actions.

Weber’s concept of the “meaning” of an action is rather obscure. It may be a meaning “imputed to the parties in a given concrete case,” or it may be what the action means “on the average, or in a theoretically formulated pure type—it is never a normatively ‘correct’ or metaphysically ‘true’ meaning” (p. 118). This concept is connected with Weber’s much criticized conception of empathic understanding (*Verstehen*). But this connection is not strictly necessary, for the meaning we give to the actions of others depends not so much on an attempted reconstruction of what is in their minds as on a knowledge of the norms and standards regulating their behav-

ior in a given context. Thus I know what a man is about when he presents a bank teller with a signed paper of a certain size, shape, and color, not because I can reconstruct his state of mind in imagination but because I can recognize the procedures for cashing checks.

Weber insists that it is the probability itself of a course of social action that constitutes the social relation, not any particular basis for the probability. Yet we can rely on situational responses (like the bank teller's, for instance) very largely because we expect them to conform to norms and procedures, by which such responses are deemed appropriate or otherwise. Assuming, as many sociologists would, that even war is a social relation, the acts of opposing commanders are mutually oriented by an understanding of the aims and practices of warfare and by the supposition that the other's actions will be appropriate, not only in terms of means and ends but also in consideration of whatever rules of war may be current. Thus we can move from the concept of social relations as frameworks for interaction to Talcott Parsons's conception of a social system constituted by differentiated statuses and roles.

### SOCIETIES AS ORGANIZATIONS

The concept of "a society" implies a system of more or less settled statuses, to each of which correspond particular patterns of actions appropriate to a range of situations. By virtue of qualifying conditions a man enjoys a status; in virtue of that status he has a role to play. These concepts, however, are meaningful only in the context of rules or norms of conduct—a man's role is not simply what he habitually does (for this may be no more socially significant than a tic), nor even what he is expected to do, if an expectation is only what one might predict about his future conduct from a knowledge of his past. His role is what is expected of him, in the sense of what is required of him by some standard. The role of secretary to an association, for instance, requires that he read the minutes of the last meeting, because the rules of procedure assign this action to whosoever enjoys this status. Less formally, a father's role may be to provide the family with an income, and failure to do so will be regarded not merely as falsifying predictions but also as disappointing reasonable or legitimate expectations—reasonable, because grounded on an understanding of the norms constituting the structure of the family. Indeed, though what we knew of some particular father might give us good grounds for predicting that he would neglect his role, that would not mean that its requirements did not apply to him. Of course, when we speak of "the family" or "the modern

state," we commonly have in mind ideal types or paradigms. There may be significant deviations from these in practice. Any particular family may have its own standards, deviant from the social norm, according to which the role of father does not include providing the family income.

Looked at in these terms, a society is an aggregate of interacting individuals whose relations are governed by role-conferring rules and practices which give their actions their characteristic significance. Thus, to demand money with menaces is one thing if done by a common blackmailer or footpad, another if done by a tax collector.

Nevertheless, the act of John Smith, tax collector, is still the act of John Smith, who acts also in different roles in other situations—as father, member of Rotary, and so forth. So one may take two views of a society. On the one hand, one may see it, as a biographer might, as an aggregate of life histories of its individual members, each, in the course of his life, acting in a variety of roles that explain (but only partially) what he does. Or one may adopt the sociological standpoint. A society is then a pattern of roles, and what President Brown does is less important than that it instantiates the role of president.

### INDIVIDUALIST AND HOLISTIC ACCOUNTS

Are there any statements about societies, or what Émile Durkheim termed "social facts," that are not ultimately reducible to statements about individuals? According to an extreme individualist or nominalist, such as Thomas Hobbes, social wholes have no substantial reality; propositions attributing properties or actions to a collectivity can be reduced, without residue, to a series of propositions about the relations and actions of individuals: "A multitude of men are made one person, when they are by one man, or one person, represented.... and *unity*, can not otherwise be understood in multitude" (*Leviathan*, edited by Michael Oakeshott, Ch. 16, p. 107). Karl Popper's methodological individualism is as uncompromising. So-called social wholes, he declares, are theoretical constructs; "social phenomena, including collectives, should be analysed in terms of individuals and their actions and relations" (*Conjectures and Refutations*, p. 341).

There is no agreement, however, on whether such analysis is possible. Some philosophers, while admitting that every action is the action of an individual, nevertheless deny that "statements which contain societal terms" can be reduced "to a conjunction of statements which only include terms referring to the thoughts and actions

of specific individuals” (Maurice Mandelbaum, “Societal Facts,” p. 482). While the “societal fact” of cashing a check can be expressed in terms of what individuals do, nevertheless the description will always contain such societal terms as *bank* and *money*, which cannot themselves be translated without remainder into wholly individual terms. Furthermore, such societal facts, it is said, interact with individual behavior; a banking system can have an effect on a concrete individual. For it is clearly true that for every individual, the institutions and mores of his society present themselves as independent and external facts, just as much as his physical environment does. And if that is true for every individual, it is true for the totality of individuals composing the society. That is not to say that a totality is a thing independent of individuals or that it has a group mind; it is only to say that for any participant or for any observer of an individual’s actions, it makes sense to talk of him confronting and confronted by independent social facts (Ernest Gellner elaborates this point). Moreover, the principle that social action can ultimately be explained by referring to the dispositions of individuals to behave in certain ways in given circumstances overlooks the possibility that these dispositions may themselves depend on social facts.

The view that social facts are not reducible to individual facts is commonly called holism. In its more extreme forms it relies heavily on biological organic analogies. An organism, it is said, is prior to its constituent parts in the sense that any understanding of their nature and function presupposes an understanding of the whole organism. The whole organism is more than the mere sum of its parts, since no account in terms of the parts considered separately could add up to some of the things that could be said about the whole. (The same might be said, however, of some of the properties of a triangle that arise from the three sides considered in relation to one another.) Just as the liver is a more significant object considered as an organ of a working body than as a detached piece of tissue, so the acts of individuals are significant or intelligible only when considered as the acts of role-bearers or as manifesting characteristics of their social or cultural environment. So drinking wine has a different range of social meaning in England from the one it has in France. The thought-experiment of the social contract theorists, who put man into an asocial state of nature the better to understand his real purposes in society, was radically misconceived, precisely because it abstracted man from the very context in which alone he would be a man but still attributed human properties to him.

According to the Hegelians (Bernard Bosanquet, for example), so far are we from being able to reduce social facts to individual facts that it is the individual himself who must be explained as an expression of the concrete social universal—an idea manifesting itself organically in its differentiated parts, as the idea of an oak tree is differentially but organically manifest in its leaves, bark, trunk, and so forth, all in a sense different from one another yet all linked by the idea of the oak and collectively differentiated thereby from the corresponding parts of an elm. “Man” is an abstraction—we are men as we are Germans, Englishmen, Frenchmen; that is, we instantiate the spirit of our own society.

Holistic organicism of this kind has laid great stress on history. Social wholes, it is said (by Friedrich Karl von Savigny, for instance), are not like mechanical wholes. Mechanical wholes can be understood by reducing them to their smallest constituent parts that conform in their behavior to general laws from which the varying behavior of the aggregates can be deduced. A social whole, on the contrary, is *sui generis*, to be understood not by analysis but by studying it *as a developing whole*. Consequently, there can be no general theory of social action, and history is the only legitimate mode of sociological inquiry.

According to Popper, these arguments are totally misconceived. There is simply no way of studying wholes as wholes; any attempt at understanding implies abstracting from a particular configuration of properties and circumstances those that seem significant for the particular study and relating them to general laws and hypotheses that are valid for all cases, irrespective of time, in which the stated initial conditions are satisfied. A law of development could be a statement about the general tendencies of certain types of society, given certain initial conditions; but it is a misunderstanding of the nature of both scientific and historical inquiry to propose a study of a society as a whole, partly because a social whole is a theoretical construct and partly because to attribute to it its own peculiar law of growth, in some sense true regardless of, or despite, any initial conditions whatsoever, is to make any explanatory statement about its behavior impossible.

## COMMUNITY AND ASSOCIATION

The individualist account of social action is most persuasive when the form of social organization under consideration is a joint-stock corporation or a trade association. There is little temptation to attribute group personalities to such bodies, except in a strictly legal sense, and therefore little resistance to treating them as nothing but pro-

cedural forms. Their members and officials are clearly identified individuals with limited common interests. These interests explain their interaction, without suggesting that the association is anything more than a means for promoting them. Moreover, such interests remain intelligible even abstracted from the context of the society.

Ferdinand Tönnies distinguished this type of organization, which he called a *Gesellschaft* (association), from its polar opposite, the *Gemeinschaft* (community). Paradigms of the latter type are the family, the village, the tribe, and the nation. These are much less formally organized than a joint-stock company. They have no clearly defined, limited aim; qualifications for membership may be poorly defined, depending very largely on subjective criteria. Yet individuals do not deliberately join such bodies—more usually they are born into them or acquire membership by residence. At the same time, membership in such a community may mean much more to the individual. So far from his using the organization as a means for the pursuit of personal interest, privately conceived, what he conceives to be his interest may depend very much on the influence of the collectivity upon him. He may feel bound to it by ties and responsibilities not of his own choosing which nevertheless demand his respect. Moreover, such communities appear to have a lifespan greater than that of any generation of individual members, which cannot be explained, as might that of a corporation, by the continuities of constitutional procedures. It is, rather, that from generation to generation there passes an attachment to a common set of symbols and a common history, a participation in what Durkheim termed “collective representations” in a collective consciousness—a common culture, in short—which enables members to identify one another where other criteria are uncertain, which gives the society its cohesion, and which provides the standards by which its members’ actions are regulated and assessed.

#### A FUNCTIONALLY INCLUSIVE COLLECTIVITY

“Boundary maintenance,” to use Talcott Parsons’s term, is a necessity for every society. To possess an identity, a society must furnish criteria whereby its members can identify one another, since their actions and attitudes toward one another will be different from those toward outsiders. But Parsons also conceives of boundary maintenance by social subsystems within a broader system. Thus he defines “a society” as a collectivity “which is the primary bearer of a distinctive institutionalized culture and which cannot be said to be a differentiated subsystem of

a higher-order collectivity oriented to most of the functional exigencies of a social system” (*Theories of Society*, Vol. I, p. 44). Such a collectivity is organized by political, economic, familial, and similar subsystems. Parsons distinguishes polity and society, but he asserts that “the boundaries of a society tend to coincide with the territorial jurisdiction of the highest-order units of political organization” (p. 46). For, in Parsons’s view, a society’s existence depends so crucially on commitment to common values and on the maintenance of order between its individual and collective components that the political boundary tends to settle automatically the limits of the society.

The relation between state and society presented no problems for the Greeks. Political, religious, cultural, and athletic activities were largely undifferentiated and occurred within the single organizational structure of the polis. The first serious problems in this respect emerged with the Christian dichotomies between God and Caesar, church and state, the *Civitas Dei* and the *Civitas Terrena*. The medieval view was that, ideally, there was one universal community of humankind with two modes of organization, or “subsystems,” church and empire. Reality never corresponded very closely to this ideal. It became irretrievably divorced from it with the rise of the nation-state and the Reformation. Since then, when people have talked of the society to which they belong, they have thought primarily (like Parsons) of the social order contained within the boundaries of a state and sustained by its organized power.

Nevertheless, liberal thinkers have striven hard to maintain the conceptual distinction between state, or polity, and society. One reason has been to resist the claim that the state could be the only focus of loyalty, competent by virtue of an overriding authority to lay down the terms on which other associations might function. On the other hand, there has emerged a new totalitarianism which identifies state and society. Every form of economic, religious, artistic, or scientific activity thereby acquires a political dimension, promoting or impeding the public good as embodied in state policy. G. W. F. Hegel provided a metaphysical justification for this kind of doctrine when he distinguished between, on one hand, civil society—a level of social organization including the market economy and the forces of civil order—and, on the other, the transcendent state—“the realized ethical idea or ethical spirit,” “the true meaning and ground” of lower forms of social organization like the family and civil society (*Philosophy of Right*, Secs. 257, 256). By contrast, not only do liberals insist on the subordination of

the state to society; they have also tended, according to Sheldon S. Wolin, to depreciate the political and to attach increasingly to other social subsystems, like the business corporation or the voluntary association, concepts like statesmanship, authority, and legitimacy, which have been considered hitherto characteristic of the state. Meanwhile, Wolin argues, the concept of an organization directed to the most general interests of the community tends to get lost, to be replaced by a model of conflicting pressure groups operating within a very nebulously defined arena. If Parsons is right, our notion of a society as the most inclusive framework of social interaction depends on the political not only for its boundary maintenance but also for its very identity. There may be a danger that in pressing the antitotalitarian, pluralistic account so far that it dissolves the state, it will lose thereby its capacity to define the society.

## SOCIETY [ADDENDUM]

Toward the end of the twentieth century, while earlier discussions of holism *versus* individualism did not die out, the interplay among three different but related notions of society—civil society, the corporation, and cosmopolitan society or the society of nations—an interplay adumbrated in the last two paragraphs above, began increasingly to dominate philosophical inquiry. The development that, more than any other, propelled the notion of civil society back into greater prominence late in that century was an ever more publicly articulated dissatisfaction with the totalitarian nature of the political regimes and their corresponding societies in Eastern Europe. It was widely contended that the suppressed elements of "civil society" in those countries needed to be regenerated

and kept independent of the state. Hence the eventual, generally peaceful dissolution of the governments in question was seen as a triumph of the ideals of civil society.

As in the past, so in the late twentieth and early twenty-first centuries, understandings of the meaning of “civil society” (as well as of “society”) have varied widely. Some philosophers, such as Jürgen Habermas, have wished to exclude from the scope of civil society important aspects of the economic institutions that were so central to Hegel’s use of the term and to focus on its informal, less easily quantifiable “life-world” elements. For others, the increasing power, in a world characterized by ever-accelerating “globalization,” of transnational corporations—“*sociétés anonymes à responsabilité limitée*” in French or “*Gesellschaften mit beschränkter Haftung*” in German—with their essentially capitalist economic purposes and typically nondemocratic structures poses a threat to the viability of political, cultural, and other components of individual (national) civil societies; therefore, according to this line of thinking, corporations need to be treated as focal points in the philosophical analysis of the concepts of both “society” and “civil society.” In addition, some have identified, and found great significance in, an emerging *global* civil society, exemplified especially by large transnational nongovernmental organizations (NGOs) that are not essentially profit-oriented, as well as by more informal institutions and practices with similar global concerns.

## GLOBAL SOCIETY?

The idea of a global civil society implies that of a global, or cosmopolitan, society as such, contrary to the previously mentioned Parsonian insistence on “boundary maintenance.” Resistance to the idea of a global society stems from both methodological and ethicopolitical considerations. John Rawls, for instance, explicitly took the self-contained “closed society”—that is, the nation-state or something similar—as the appropriate abstract entity within which to develop his original theory of justice, which advocates unequal distribution of goods only to the extent to which such distribution will benefit the least advantaged member of that society. This intentional limitation of scope was a methodological preference of his, as it had been of so many of his predecessors in social theory; but it also helped enable him, when he later undertook to analyze international issues in his *The Law of Peoples* (1999), to reject the application of his principles of justice to the world as a whole and to refrain from endorsing cosmopolitanism as a desirable or viable

ethicopolitical ideal. (Rawls did, however, introduce the somewhat novel term “Society of Peoples” to refer to those existing “peoples,” by no means all, who observe the principles and ideals specified in his book.) Others have used Rawls’s theoretical framework in order to develop a more cosmopolitan viewpoint than his own, one that regards “global society” as the name of an emerging contemporary reality, its parts linked by the Internet and other technological innovations, its fate bound up with newly identified shared risks, such as global warming, that some of these innovations have exacerbated, and its extreme imbalances of wealth and poverty perpetuating injustice and instability.

In sharpest reaction to globalizing tendencies and their corresponding theories have been ideologies of resurgent nationalism and religious fundamentalism. The former have, by definition, insisted on the preeminence of individual societies characterized, most frequently, by a perceived common ethnic identity. But considerations of history and genetics alike indicate to how great a measure such perceptions are the products of a particular, time-limited collective imagination, rather than reflections of some underlying truths of social ontology. As for the religious fundamentalist notion that “societies” can be differentiated according to common religious beliefs, a notion shared by some Western writers who subscribe to the vague notion (with constantly shifting boundary definitions), of a global “clash of civilizations,” the existence of numerous “warring sects” within the major world religions, combined with basic questions of hermeneutics (that is, how are the sacred scriptures to be interpreted?), casts strong doubt on this way of viewing and intellectually segmenting the world.

It was a British Prime Minister, Margaret Thatcher, rather than a professional philosopher, who is famously reported to have asserted, “There is no such thing as society.” This seems a rather extreme claim concerning a supposed reality with references to which so many conversations in ordinary language are replete. It is rather the case, it would seem, that “society” is an exceptionally complex and multivocal term, the complexity and multivocality of which analyses by sociologists, such as Habermas’s formalist, structuralist opponent in the broad Parsonian tradition, Niklas Luhmann, and by life-world- and *praxis*-oriented philosophers such as Habermas himself, the phenomenologist Alfred Schutz, and Jean-Paul Sartre in his late-life contribution to social theory, *Critique of Dialectical Reason* (1976), have served to underscore and articulate.

## SOCINIANISM

“Socinianism,” an evangelical rationalist movement, was one of the forerunners of modern Unitarianism. Three phases can be distinguished: (1) the thought of Laelius Socinus (1525–1562) and his nephew Faustus Socinus (1539–1604); (2) the thought and institutions of the Minor (Reformed) Church of Poland, especially as embodied in the Racovian Catechism (1605), which represented a fusion of Faustus’s theology with that of the local anti-Trinitarian and partly Anabaptist Minor Church; and (3) the rationalist theology of the Socinianized Minor Church. This last phase was especially important after the Socinianized Minor Church was crushed in Poland in 1658 and the spirit of Socinianism became influential in the Netherlands among the Remonstrants; in the British Isles, in the seventeenth century, among certain Anglican divines and nonconformist intellectuals; and, in the eighteenth century, among the Arminian divines of New England, who were forerunners of the Unitarian congregationalists.

Socinian evangelical rationalism originated from an amalgam of the rationalist humanism of Juan de Valdés,

Florentine Platonism, and Paduan Aristotelianism; in Poland it was augmented by certain Calvinist and Anabaptist ingredients. In all three phases Socinianism was characterized by (1) a rationalist interpretation of Scripture (which was nevertheless accepted as true and authoritative), with a predilection for the pre-Mosaic and the New Covenantal parts of the Bible; (2) an acceptance of Jesus as the definitive word or revelation of God but nevertheless solely a man, not divine but chosen by God to rule as king, priest, and prophet over the world and the church; (3) belief in the principle of pacific separation of church and state; (4) acceptance of the doctrine of the death of the soul with the body with, however, selective resurrection and immortality for all those who persevered “through the power of the Spirit” in observing all of Jesus’ earthly commandments.

### LAELIUS AND FAUSTUS SOCINUS

Laelius Socinus, born in Siena, was a well-to-do student with a wide and critical interest in theology. He established contact and became friendly with several reformers, notably Philipp Melancthon, John Calvin, and Johann Bullinger, and also with the Rhaetian heretic Camillo Renato. Himself suspected of heresy, Laelius was obliged to prepare a Confession of Faith (in which, however, he reserved the right to further inquiry), one of the few extant documents from his hand. At his death he left his library, and perhaps some unpublished papers, to his nephew.

Faustus Socinus, born in Siena, was a student of logic and law, a member of the local academy, and an indifferent poet. He first clearly manifested his rejection of traditional Christian doctrines in a letter of 1563, in which he argued against the postulate of natural immortality. In 1570 he wrote his first major work, *De Auctoritate Sacrae Scripturae*, and in 1578 he issued his basic treatise on Christology and soteriology, *De Jesu Christu Salvatore*. Because of the latter work he was invited to Transylvania to defend the legitimacy of prayer addressed to the ascended Christ against the faction in the Unitarian Reformed Church led by Francis Dávid. On the journey he was persuaded to make Poland his permanent home. There he became a major defender of the Minor Church, although he declined on principle to become a communicant member of it, refusing to submit to believers’ baptism by immersion. Socinus was cocommissioned with local pastors to revise the Latin *Catechesis* (1574) of Racov, the communitarian settlement and spiritual center of the Minor Church, northeast of Kraków. The radical revision was published in Polish in 1605, a year after Soci-

nus's death, as the *Racovian Catechism*, the first Latin edition of which (1609) was dedicated to James I of England.

### THE SOCINIANIZED MINOR CHURCH

The Socinianized Minor Church, centered in Racov, had an academy that at one time attracted a thousand students and a publishing house that turned out tracts and books in a score of languages; it became in fact more a school than a church. Among the faculty of the academy and the pastorate of the synod, which met annually in Racov, the most prominent were Socinus's own grandson, Andreas Wiszowaty (d. 1678), who wrote *Religio Rationalis*; Stanislas Lubieniecki (d. 1675), who wrote *Historia Reformationis Polonicae*; Samuel Przytkowski (d. 1670), who wrote *Vita Fausti Socini*; and quite a few converts from German Protestantism who resettled in Poland and were rebaptized: Christoph Ostorodt (d. 1611); Johann Völkel, who wrote *De Vera Religione* (1630); Johann Crell (d. 1631), who wrote *De Uno Deo Patre* and a defense of Socinus against Hugo Grotius, *De Satisfactione*; and Christoph Sand (d. 1680), who compiled the *Bibliotheca Antitrinitariorum*.

### SPREAD OF SOCINIANISM

Well before the crushing of the Minor Church in 1658, Socinians were established in the Netherlands. At Amsterdam the basic works of the movement, the eight-volume *Bibliotheca Fratrum Polonorum*, edited by Wiszowaty, were printed in 1688. In England, Socinian rationality, latitudinarianism, Unitarianism, and mortalism (psychopannychism) variously appealed to Arminian prelates, Oxford rationalists (such as William Chillingworth), Cambridge Platonists (such as Benjamin Whichcote), philosophers and scientists (such as Isaac Newton and John Locke), and to the first avowed native Socinians, Paul Best, John Biddle ("the father of English Unitarianism"), and Stephen Nye, whose *History of Unitarianism commonly called Socinianism* set off the Trinitarian controversy in the Established church in 1687.

## SOCIOLOGY OF KNOWLEDGE

The "sociology of knowledge" is concerned with determining whether human participation in social life has any influence on human knowledge, thought, and culture and, if it does, what sort of influence it is.

### DEVELOPMENT

Although the term *sociology of knowledge* was coined in the twentieth century, the origins of the discipline date back to classical antiquity. Plato, for instance, asserted that the lower classes are unfit to pursue the higher kinds of knowledge, because their mechanical crafts not only deform their bodies but also confuse their souls. Plato also held the more refined doctrine of the correspondence of the knower (or more precisely, the faculties and activities of the knower's mind, which are in part determined by society) and the known. This latter theory became part of the Platonic tradition and ultimately stimulated some modern pioneers in the sociology of

knowledge, notably Max Scheler. Both theories anticipated an essential claim of the sociology of knowledge—that social circumstances, by shaping the subject of knowing, also determine the objects that come to be known.

In the Middle Ages, patterns of life were fixed and defined, and patterns of thought tended to be equally so; ideas appeared as absolute, and the factors that conditioned them remained hidden. As soon, however, as rifts developed in the social fabric, awareness of these factors reemerged. Niccolò Machiavelli's remark in the *Discourses* that the thought of the palace was one thing, the thought of the market place quite another, revealed this new awareness.

In the following centuries, the stream of ideas that was to lead to the modern sociology of knowledge was divided between rationalism and empiricism. The rationalists regarded mathematical propositions as the archetype of truth. As mathematical propositions do not change in content from age to age and from country to country, the rationalists could not concede that different societies might have different systems of knowledge, all equally valid. But if truth was one, error could be multi-form, and its roots could be sought in social life—for instance, in the machinations of privileged classes in whose interest it was to keep the people in ignorance. Francis Bacon's doctrine of "idols," or sources of delusion, set forth in his *Novum Organum*, illustrates this tendency. The rationalists thus became the first "unmaskers" of "ideologies."

According to the empiricists, the contents of the mind depend on the basic life experiences, and as these are manifestly dissimilar in dissimilarly circumstanced societies, they almost had to assume that reality would offer a different face in each society. Thus, Giambattista Vico asserted that every phase of history has its own style of thought which provides it with a specific and appropriate cultural mentality. The treatment of the biblical account of creation by the two schools shows their contrast. Voltaire called it a piece of stultifying priestcraft that no rational person anywhere would accept: How could the light exist before the sun? Johann Gottfried Herder answered that for a desert nation like the ancient Hebrews the dawn breaks before the solar disk appears above the horizon. For them, therefore, the light *was* before the sun.

Though the problems of the genesis of error and the genesis of truth should be kept apart, the overly sharp distinction between them and the partisan handling of them before the end of the eighteenth century prevented

any tangible progress. And even though Immanuel Kant achieved a synthesis of rationalism and empiricism, the sociology of knowledge failed to gain from his advances. Kant's whole approach prevented such a gain: The problem of knowledge arose for Kant from the meeting of the individual mind with the physical world. The social element was missing at either pole. The sociology of knowledge explains Kant's narrowness itself as socially determined. The decay of feudal society and the emergence of a class of independent producers (peasants and artisans) had created the desire to "liberate" man from the "artificial restrictions" of social life. A presocial, asocial, or antisocial type of man was thought possible and even superior to social man. The primacy of being was ascribed to the individual, and society was considered to be no more than a collection of individuals linked by contract. In these circumstances, no one could see the influence of social forces on the human mind.

The nineteenth century brought a strong reaction against this radical individualism. As the forces of social control reasserted themselves, man was once again conceived of as essentially a social creature. The result of this new trend was Karl Marx's mislabeled "materialistic interpretation of history." Marx wrote in his *Introduction to the Critique of Political Economy*: "It is not men's consciousness which determines their existence, but on the contrary their social existence which determines their consciousness." For Marx, the real "substructure" upon which the intellectual "superstructure" rests is a special set of human relationships. Though his definition of these relationships is too narrow, and though he has been variously interpreted, Marx's formulation provided the starting point in the development of the modern sociology of knowledge.

## SOCIAL ORIGIN OF IDEAS

While there is general agreement among scholars in the field that social relationships provide the key to the understanding of the genesis of ideas, there are also far-reaching disagreements among several distinct schools, within which there are again individual differences. An attempt will be made here only to characterize the three most important basic attitudes.

**MATERIALIST SCHOOL.** A materialist group of writers emphasizes that human beings are creatures of nature before they are creatures of society and tends to see human beings as dominated by certain genetic drives, with decisive consequences for their emergent mentalities. Friedrich Nietzsche, for instance, ascribed to man an

elementary will to power; if this will is frustrated by a barrier, self-consolatory ideas are apt to appear. Christianity is one such idea; it is essentially a philosophy of “sour grapes,” a “slave morality.” It assures the defeated that they are really superior to those who have defeated them.

Vilfredo Pareto's *Trattato di sociologia generale* is the most elaborate statement of this position. According to Pareto, people act first and think of reasons for their action only afterward. These reasons he calls “derivations” because they are derived from, or secondary to, the “residues,” or quasi instincts, which in fact determine human modes of conduct and, through them, human modes of thought as well. This school continued the line initiated by the rationalists. Theirs is a doctrine of ideologies that devalues thought while it accounts for its formation.

**IDEALIST SCHOOL.** A second group of writers asserts that every society has to come to some decision about the Absolute and that this decision will act as a basic premise that determines the content of the culture. Juan Donoso Cortés tried to explain the classical Greek worldview as the product of heathen preconceptions about the Absolute, and the medieval worldview as the product of Christian-Catholic preconceptions. An ambitious presentation of this theory is Pitirim Sorokin's *Social and Cultural Dynamics*. He distinguishes three basic metaphysics that, prevailing in given societies, color all their thinking. If a realm beyond space and time is posited as the Absolute, as in ancient India, an “ideational” mentality will spring up; if the realm inside space and time is posited as the Absolute, as in the modern West, a “sensitive” mentality will come into being; and if, finally, reality is ascribed both to the here and now and to the beyond, as in the high Middle Ages, an “idealistic” mentality will be the result. Sorokin's doctrine is itself idealistic in character and finds its ultimate inspiration in a religious attitude.

**SOCIOLOGISTS OF KNOWLEDGE.** The third group of writers occupies the middle ground. These writers do not go beyond the human sphere but divide it into a primary and conditioning half and a secondary and conditioned one. There is, however, great diversity of opinion over exactly which social facts should be regarded as conditioning thought. Marx, for instance, held that relations of production, which themselves reflect still more basic property relations, were primary, but many other factors, such as power relations, have been singled out by other thinkers. Still others regard the social constitution as a whole as the substructure of knowledge, thought, and

culture. A typical representative of this numerous group is W. G. Sumner. In his classic *Folkways*, he suggested that wherever individuals try to live together, they develop mutual adjustments that harden into a set of customs, supported and secured by social sanctions, which permanently coordinate and control their conduct. These habits of action have as their concomitants habits of the mind, a generalized ethos that permeates the mental life of the society concerned. This theory can be sharpened by formulating it in axiological terms. A society is a society because, and insofar as, it is attuned to certain selected and hierarchically ordered values. These values determine what lines of endeavor will be pursued both in practice and in theory.

This third group represents the sociology of knowledge in the narrower and proper sense of the word. The theory just summed up has received some empirical confirmation through the discovery that societies do gain mental consistency to the degree that they achieve better human coordination and integration.

#### RELATION OF A SOCIETY TO IDEAS EXPRESSED IN IT

The problem next in importance to the identification of the substructure of knowledge is the explanation of its relation to the superstructure. Here again there are three schools that may, but do not always, correspond to those already discussed. One tendency is toward causalism. The positivists Gustav Ratzenhofer and Hippolyte Taine, for example, expected of the future a science of culture no less deterministic than the sciences of matter. But though the term *determination* is frequently and generally used in all the literature of this school, it hardly ever means strict determination. While this first school concedes, in principle, no independence to the mind and its contents, a second, Platonic tendency ascribes complete independence to the mind. To Scheler, Florian Znaniecki, and others, thinking means participating in eternal preexistent ideas. If these ideas are to become active in the world, they must ally themselves to a social movement seeking appropriate ideas. Max Weber has called this doctrine the doctrine of elective affinity. The third theory argues in terms of interdependence and appears regularly in connection with functionalism. If society is to function as a unity, its modes of acting and thinking must be in, or on the way to, agreement. Neither substructure nor superstructure is given ontological priority, but there is a tendency to see thought in action as prior to thought as theory.

**EXTENT OF INFLUENCE.** Another problem concerns the extent of the influence of social factors on ideas. Here opinions range from the view that these factors influence only a few political slogans to the view that their influence is all-pervading. An important systematic dividing line separates the authors who assert that the categories of thought themselves are socially determined from those who deny that they are.

### EPISTEMOLOGICAL SIGNIFICANCE

The main philosophical importance of the sociology of knowledge consists in its claim to supplement, if not to replace, traditional epistemology. If society partially or totally determines knowing and thinking, how does this affect their validity? All sociologists of knowledge are inclined to stress that initially the human mind is never aware of more than a sector of reality and that the selection of a sector to be investigated is dependent on the axiological system that a given society has made its own. From this point they diverge once again into three schools, and once more there is no simple correlation with the tendencies previously identified.

**EFFECT OF SOCIAL FACTORS ON THOUGHT.** Some writers, such as Pareto, hold that, in the last analysis, only the senses are reliable sources of knowledge. They tend to split the mental universe into a scientific and a nonscientific department and accord the ideas belonging to the latter at best conventional status, but no truth-value in the narrower sense of the term. The axiological system of society, insofar as it is not taken up with scientific and technological pursuits, appears as an opaque and distorting medium that interposes itself between the intellect and reality. The effect of society on the mind is thus something negative, to be regretted and, if possible, overcome.

Whereas this group denigrates the social element in human beings, and hence in human knowledge, another, including Émile Durkheim and Karl Mannheim, sees it as supreme. The latter group conceives the individual as the most likely source of error and society as the most reliable source of truth, if for no other reason than because personal blunders are neutralized in a common attitude. They regard society as the test of the validity of a belief: It is valid if those who hold it manage to operate smoothly within their social system. But if the true is what works and if different societies work differently (as manifestly they do), then truth is once again merely convention. At any rate, there can be no general truths.

The third group, including Weber and Scheler, considers that the social influence on mental activity consists essentially in giving directions. What knowledge will be sought in a society depends on the axiological system that reigns in that society. In its most radical form, this doctrine sees our very awareness of facts as socially determined: Only those aspects of reality that are marked by their possession of some value, social in origin, will be noticed and enter into the canon of knowledge. There appears, however, no cogent reason why a person should not see a thing thus selected for study on an axiological basis as what it really is. It can therefore be said that every society has its own truth, without giving the word a relativistic tinge. Any human being who integrates himself, factually or intellectually, with a certain society and accepts its constitutive values will have to agree that, from the chosen angle, the world does, and must, look as it is described by the searchers and thinkers of that society. Hence sociality is neither a truth-destroying nor a truth-guaranteeing, but merely a truth-limiting factor. The resulting limitations can, in principle, be overcome by combining the valid "aspectual" insights of all societies into a comprehensive whole.

### KNOWLEDGE OF NATURE AND KNOWLEDGE OF CULTURE

An important distinction sometimes made is that between knowledge of nature and knowledge of culture. The facts of nature do not change from age to age and from country to country; the facts of culture do. Knowledge of the former, therefore, need not be marked by relativity. The Paretian theory, by making physical knowledge the model of all knowledge, does less than justice to the study of cultures; the theory of Mannheim and Durkheim, by making cultural knowledge the model of all knowledge, is apt to fall into the opposite mistake (though its best protagonists have managed to avoid this). The theory of Weber and Scheler escapes both weaknesses. In every society's axiological system, some interest in nature, especially in methods of dominating nature, will be present, and insights gained in the pursuit of this domination will be comparable, transferable, and absolute in the sense of binding on all human beings. Other values will vary from society to society; insights gained in pursuit of them will be correspondingly incomparable, nontransferable, and relative (even though they can all be fitted together as alternative actualized possibilities inherent in one creature, man).

Because people must take the facts of nature as they find them, while the facts of culture are their own work,

the social determination of knowledge will be different in the two instances. In scientific research, only the origin of an insight will be determined by the social factor (say, a pressing social need); in cultural studies, however, both the origin and the content will be socially determined. In the case of science, tendencies arising from the social sphere induce a person to open his eyes and see; in the case of cultural studies, they induce him to open his eyes and decide what he shall see. These considerations go far toward overcoming the conflict between the unduly negative and the unduly positive epistemological versions of the sociology of knowledge and show the superiority of the third approach.

### SOCIOLOGY OF KNOWLEDGE AS A SCIENCE

In conclusion, it should be emphasized that the sociology of knowledge is not only a substantive philosophical discipline but also an analytical tool that can be used by the descriptive sciences concerned with the observable products of the mind. Because it can throw light on the genesis, and often on the content, of concrete thought structures, the sociology of knowledge may enable the historian or the anthropologist to achieve a deeper understanding of the facts before him. Considered from this angle, the sociology of knowledge appears, above all, as a hermeneutic method and need not become involved in the difficult ontological problems that the social "determination" of knowledge, thought, and culture is otherwise bound to raise.

## SOCRATES

(c. 470–399 BCE)

Socrates is the first Western philosopher to have left to posterity any sense of his individual personality, and he is a central figure in the subsequent development of philosophy. Both of these aspects are due primarily to Plato. It is via his portrayal by Plato's literary genius that Socrates is a living figure for subsequent generations, and thereby an exemplar of the ideals of philosophy, above all dedication to truth and intellectual integrity. It was under the influence of Socrates that Plato applied systematic techniques of argument pioneered by Socrates and his contemporaries, the Sophists, to the fundamental questions of human nature and conduct that primarily interested Socrates, thereby placing ethics and psychology at the center of the philosophical agenda. But while Plato brings Socrates to center stage he also hides him; because

Socrates wrote nothing himself we depend on others for our knowledge of him, and it is above all Plato's representation of Socrates that constitutes the figure of perennial philosophical significance. But that representation was itself the expression of Plato's understanding of an actual historical individual and the events of his life. It is necessary, therefore, to begin with a brief account of the little that is known of that individual and those events.

## LIFE

Socrates was born in Athens around 470 BCE and lived in the city all his life, apart from military service abroad. Little is known of the circumstances of his life. His father, Sophroniscus, is said by some ancient sources to have been a stonemason, and in Plato's *Theaetetus* (149a) Socrates says that his mother, Phainarete, was a midwife. That may indeed be true, though the fact that the name literally means "revealing excellence" suggests the possibility that Plato has invented the story in allusion to Socrates' role as midwife to the ideas of others (*Theaetetus* 149–151). Because Socrates served in the infantry, who had to provide their own arms and equipment, his circumstances, at least initially, must have been reasonably prosperous, but Plato and other writers emphasize his poverty in later life, which they attribute to his spending all his time in philosophical discussion. The same sources stress that, unlike the Sophists, he never took payment for his philosophical activity, and he may have depended largely on support from wealthier friends. During his lifetime Athens became the principal center of intellectual and cultural life in Greece, attracting from all over the Greek world intellectuals who developed and popularized the tradition of natural philosophy begun by the Ionian philosophers of the previous century, together with exciting new argumentative techniques and radical questioning of traditional beliefs about theology, morals, and society.

Socrates was actively interested in most of these areas. Plato and others attest to his interest at one stage in questions of cosmology and physiology, though the sources agree that his interests subsequently shifted to fundamental questions of conduct. Socrates never engaged in formal philosophical instruction, or set up any school; his philosophical activity consisted in informal conversation, partly with a circle of mainly younger associates whom he attracted by the force of his intellect and personality, but also with others, including Sophists and prominent citizens. Some of his associates, including Plato and some of his relations, were opposed to the

Athenian democratic system, and it may be that Socrates shared that attitude to some extent.

Socrates married relatively late in life; at the time of his death at about the age of seventy his eldest son was an adolescent, and he had two more small sons, the younger probably a baby. His wife (who must have been at least thirty years younger than he) was Xanthippe. Her bad temper (attested by Xenophon and others, but not by Plato) became legendary; stories of her abuse of Socrates, and his equanimity in putting up with it, were a stock comic theme from antiquity to modern times. Thus Chaucer's *Wife of Bath* describes in the Prologue to her tale (727–732) how Socrates sat quietly while Xanthippe “caste pisse upon his heed,” merely remarking mildly, “Before the thunder stops it comes on to rain.” (The story goes back to Diogenes Laertius's life of Socrates, *Lives of the Philosophers* 2.36.) One element in this comic tradition is the story that Socrates had another wife, or possibly a concubine, while married to Xanthippe; stories of how the two women switched from quarrelling with one another to concerted assaults on Socrates afforded rich material. Ancient sources attribute the origin of this tale to Aristotle, but the supposed original source is lost, and the historical basis extremely dubious.

Nothing is known of specific events in Socrates' life till after the outbreak of the Peloponnesian War with Sparta in 432. He served with distinction in various campaigns, most notably the Battle of Delium in 424, where it was said (Plato, *Laches* 181b) that if everyone had behaved like Socrates the battle would not have been lost. By the 420s he had become sufficiently well known to be caricatured in several comic dramas. In the single example to survive complete, the *Clouds* of Aristophanes, first produced in 423, he appears as a representative of subversive contemporary tendencies, the head of a disreputable academy whose curriculum combines training in argumentative trickery with atheistic natural philosophy. Later, in his *Apology* (Defense of Socrates), Plato represents this portrayal as the origin of prejudice against Socrates that culminated in his condemnation on charges of impiety and corruption of the young (19a–19d); there is no reason to discount that evidence.

The only occasion on which Socrates is known to have intervened in public life took place in 406. After a naval engagement the Athenian commanders had failed to pick up survivors, and the popular assembly voted to try them collectively, instead of individually as required by law. At that period most civic offices were assigned by lot, and Socrates happened to be a member of the executive committee whose function was to prepare business

for the assembly. In that capacity he was the only one to oppose the illegal proposal. A few years later when, after final defeat in the war, the democracy was temporarily overthrown by a junta known as the Thirty Tyrants, he showed the same adherence to legality and morality by refusing, at the risk of his own life, to obey an order from the tyrants to take part in the arrest of an innocent man. It is likely that he remained neutral during the civil war in which the tyranny was overthrown, because he had friends in both camps; in particular, two of the most prominent among the tyrants, Critias and Charmides, both relatives of Plato, were among his close associates.

It is probable that this was at least a contributory factor in the accusation brought against him under the restored democracy. The explicit charges were failure to recognize (or perhaps “to believe in”) the gods of the state religion and the introduction of new divinities, coupled with corruption of the young. The case was tried early in 399, and the prosecution demanded the death penalty. There is no evidence of the detail of the prosecution's case. On the religious aspect the prosecutors may have sought to represent Socrates as the leader of an illegal private cult, and may have used his claim, amply attested by Plato, to be guided by a private divine sign or voice in support of that charge. It is highly likely that the charge of corruption centered on his associations with notorious enemies of the state, particularly the tyrants mentioned above, as well as Alcibiades, an intimate of Socrates who had instigated a disastrous invasion of Sicily in 415 and had later defected to Sparta. Knowledge of the trial is based on two versions of Socrates' defense, by Plato and Xenophon, each of whom, while preserving a core of fact, presents the defense in the light of his own agenda; Xenophon relies wholly on Socrates' adherence to conventional piety and morality, whereas Plato gives a radically unconventional picture of Socrates' philosophical activity as the fulfillment of a divine mission to perfect the souls of his fellow citizens by subjecting their basic beliefs and values to philosophical criticism.

Socrates was condemned to death. Plato's *Phaedo* gives a moving picture of his last hours, spent among his followers in discussion of the immortality of the soul and the task of philosophy to free it from the trammels of the body, followed by his tranquil death from self-administration of hemlock. While there is dispute about the relative degrees of realism and idealization in the description of the effects of the poison, there is little doubt that the primary aim of the whole work is less historical accuracy than depiction of the ideal philosophical death.

## SOCRATIC LITERATURE

Besides Plato and Xenophon no fewer than nine associates of Socrates are reported by various ancient sources as having written imaginative accounts of Socrates' conversations, creating a body of literature collectively known as "Socratic conversations" (or "discourses") (*Sokratikoi logoi*). For the most part only the titles of these works survive, indicating that Socrates' relations with certain individuals, especially Alcibiades, who figures prominently in some Platonic dialogues—notably *Alcibiades* and *Symposium*—were a theme common to Plato and the other Socratic writers. Apart from Plato and Xenophon, the only Socratic writer of whose works any significant fragments survive is Aeschines of Sphettus; the fragments of his *Alcibiades* show Socrates using his characteristic critical method (see below) to convince Alcibiades of the vanity of his political ambitions. They thus provide evidence that the program of defending Socrates against the slanders occasioned by his associations with political undesirables was not confined to Plato and Xenophon, but they provide no evidence for Socrates' thought to complement those sources.

For information specifically about the thought of Socrates scholars are in fact almost wholly dependent on Plato, because the other principal source, Xenophon, focuses on the practical and moral import of Socrates' conversations, with comparatively little theoretical content, in keeping with his overall purpose (see above) of portraying Socrates as a good man and sound citizen. There is a systematic difficulty in determining which of the views attributed to Socrates in Plato's dialogues were actually held by the historical person, and scholarly opinion has embraced all possible positions. In the nineteenth century the dominant consensus (primarily on the part of German scholars) divided the Platonic writings into three broad groups, distinguished both chronologically and doctrinally. The first "early" group, including *Laches*, *Charmides*, *Protagoras*, and those dialogues dealing directly with the trial of Socrates (*Euthyphro*, *Apology*, and *Crito*), was generally held to give a veridical account of the personality, views, and philosophical activity of the historical Socrates.

Thereafter Plato's philosophy developed in directions independent of Socrates, and the importance of the dramatic figure of Socrates in the dialogues correspondingly declined, until its virtual disappearance in works such as the *Sophist* and the *Statesman* (which were taken to be late), and its total disappearance from the *Laws* (unfinished on Plato's death and generally regarded as his last work). This "developmental" model was supported by the

stylo-metric studies of the later nineteenth century, in which a number of scholars, working largely independently of one another, converged on the identification of six dialogues—*Sophist*, *Statesman*, *Timaeus*, *Critias*, *Philebus*, and *Laws*—as a group distinct in various features of style and vocabulary from the rest of the Platonic corpus; these dialogues were fixed as late by the presence of the *Laws*. *Parmenides*, *Phaedrus*, *Republic*, and *Theaetetus*, which are by the same criteria closer in style to the late group than the rest of the dialogues, were identified as "middle" dialogues, and the remainder as "early."

While this developmental model, with its assumption that the early dialogues accurately represent the historical Socrates, is still highly significant in the twenty-first century, notably in the influential work of Gregory Vlastos and others, it has undergone challenge from two opposite extremes, on the one side the thesis maintained by John Burnet and A. E. Taylor in the early twentieth century that all the doctrines attributed by Plato to Socrates in the dialogues were actually maintained by the historical Socrates, and on the other side the views of those who, stressing that all information about Socrates derives from sources with their own literary and philosophical agenda, urge that the historical Socrates is inaccessible and should therefore disappear from the history of philosophy.

The Burnet/Taylor thesis has few if any adherents in the twenty-first century; not only does it present an implausible picture of a Plato who devoted the great part of his literary career to recounting the views of someone else, but it rests on an assumption about the nature of Plato's attitude to Socrates, namely that it would have been disrespectful to Socrates for Plato to do other than represent his views with historical accuracy, which seems totally foreign to the character of the dialogues themselves. It is clear from the dialogues that Plato's attitude to Socrates was that the latter's life and activity represented the paradigm of philosophy, and it is totally in keeping with that attitude that Plato should ascribe to Socrates what he (Plato) regards as the philosophical truth, whether or not Socrates himself had maintained it. What we may call the skeptical view of Socrates, however, is widely accepted today, and while its extreme versions are exaggerated and oversimplified, it is based on an important insight into the nature of our sources.

The insight is simply that all knowledge of Socrates is based on sources in which historical veridicality is at best one among the author's concerns, and generally not the principal concern. Oversimplification consists in the characterization of these sources as fiction, as opposed to

factual biography, and exaggeration in the conclusion that the historical Socrates is inaccessible. The dichotomy between biography and fiction seems inapplicable to the Socratic literature, including Plato's Socratic dialogues (and indeed this author doubts its appropriateness to most ancient biographical writing); Socratic conversation is a form of biography, but biography whose factual constraints are looser than is standardly the case in the modern world.

That is not to say that there are no factual constraints; Plato's dialogues do present an actual historical individual, some of the events in whose life are known, and they are no doubt faithful to the spirit and nature of the philosophical conversation that was that individual's principal activity. But when it comes to specific doctrines, while there are some doctrines found maintained by Plato's Socrates that it is virtually certain the historical Socrates did not maintain, there are none that is certain that he did. In the first class the paradigm case is the theory of separate Forms, (i.e., intelligible universal natures existing separately from their sensible instances) which we find maintained by Socrates in several dialogues, but which Aristotle (whose evidence this author regards as independent of the dialogues on this point) explicitly says Socrates did not hold (*Metaphysics* 1078b27–1078b32).

However, theses characteristically regarded as "Socratic"—for example, that Virtue is Knowledge (see below)—are not ascribed to Socrates by sources that are clearly independent of their appearance in the Platonic dialogues. They may in fact have been maintained by Socrates, or they may have been suggested to Plato, in the form in which they appear in the dialogues, by things that Socrates said. We cannot be sure, and in any case it is not of the first importance, because the philosophical significance of these doctrines consists in the role that they play, and the arguments by which they are supported, in the dialogues in which they appear. The brief account of Socrates' thought that follows is to be understood as based on that assumption. It identifies some central themes in the portrayal of Socrates in those dialogues, generally considered comparatively early compositions, in which the personality and argumentative style of Socrates are more prominent than in dialogues devoted to the more systematic exposition of Plato's own thought (see above). The attribution of any specific doctrine to the historical Socrates must be correspondingly tentative.

## THOUGHT

**DISAVOWAL OF WISDOM.** In these dialogues Socrates is presented for the most part not as a systematic or

authoritative teacher, but as a questioner and enquirer. His enquiries are all focused on questions of conduct, broadly understood, and frequently consist of attempts to reach an agreed definition of some fundamental value, such as courage, or goodness in general. Typically Socrates is depicted as engaged with one or more people in conversation on some specific, often practical topic, which leads on to the more general issues just mentioned. Socrates elicits the views of his interlocutors on these issues and subjects them to critical examination, conducted with a minimum of philosophical technicality, and utilizing other assumptions, usually of a common-sense kind, which the parties to the discussion agree on. Usually this procedure reveals inconsistency among the set of beliefs (including the general thesis or proposed definition) that the person examined holds, which is taken as requiring the abandonment of the thesis or definition. Frequently the dialogue ends with the acknowledgement by Socrates and the others that, having failed to settle the general issue raised, they are unable to proceed further; they thus end up in a state of *aporia*—that is, a state with no way out. This procedure of enquiry, rather than instruction, and its frequent aporetic outcome are in keeping with Socrates' denial (*Apology* 21b) that he possesses any wisdom (i.e., expertise). It is the mark of an expert to be able to define the concepts in the area of his expertise and to expound that area systematically, neither of which Socrates can do.

In later antiquity Socrates was regularly reported as having said that he knew nothing, or, paradoxically, that he knew nothing except that he knew nothing. Either formulation goes beyond anything found in Plato. Though Socrates frequently says in the dialogues that he does not know the answer to this or that particular question, he never says that he knows nothing, and occasionally makes emphatic claims to knowledge, most notably in the *Apology*, where he twice claims to know that abandoning his divine mission to philosophize would be bad and disgraceful (29b, 37b).

What he does disavow is having any wisdom. He seems to apply the notion of wisdom firstly to divine wisdom, a complete and perspicuous understanding of everything, that belongs to the gods alone, and is consequently unavailable to humans, and then to human expertise of the sort possessed by craftsmen such as builders and shoemakers, a systematic mastery of a technique that enables its possessor to apply it successfully and to expound and pass it on to others. The Sophists claimed to possess, and to teach to others, a practical expertise applying not to any specialized area of human

activity but to human life as such, mastery of which guaranteed overall success in personal and political life; this was “the political craft” (*Apology* 19d–20c, *Protagoras* 319a). Socrates rejects that claim, not on the ground that such expertise is not available to humans; but because the Sophists’ activity fails to meet the ordinary criteria for human expertise, particularly that of being systematically learned and taught (*Protagoras* 319d–320b, *Meno* 89c–94e). He denies that he possesses this expertise himself (*Apology* 20c), but does not say that it is impossible that he, or any human being, should possess it.

This disavowal of expertise is not incompatible with the claim to know particular things. The nonexpert can know some particular things, but not in the way the expert knows them; specifically the nonexpert is not able, as the expert is, to relate his or her particular items of knowledge to a comprehensive system that provides explanations of their truth by relating them to other items of knowledge and to the system as a whole. But that raises the problem of the source of Socrates’ nonexpert knowledge of moral truths. Usually, nonexperts know some particular things because they have been told by an expert, or because they have picked them up from some intermediate source whose authority is ultimately derived from that of the expert. But Socrates does not recognize any moral experts, among human beings at any rate. So what is the source of his nonexpert knowledge? The dialogues provide no clear or uniform answer to this question. Sometimes he suggests that the application of his critical method is sufficient, not merely to reveal inconsistency in his interlocutor’s beliefs, but to prove that some are false, and hence that their negations are true. Thus at the end of the argument with Callicles in the *Gorgias* he claims (508e–509a) that the conclusion that it is always better to suffer wrong than to do it has been established by “arguments of iron and adamant” (i.e., of irresistible force), while conjoining that claim with a disavowal of knowledge: “I do not know how these things are, but no-one I have ever met, as in the present case, has been able to deny them without making himself ridiculous.”

This presents a contrast between expert knowledge, which Socrates disclaims, and a favorable epistemic position produced by repeated application of Socrates’ critical method of argument. There are some propositions that repeated experiment shows no one capable of denying without self-contradiction. While it is always theoretically possible that someone might come up with a way of escape from this position, realistically the arguments establishing those propositions are so firmly entrenched

as to be irresistible. While it is an attractive suggestion that Socrates considers the moral truths that he nonexpertly knows to be of this kind, it receives no clear confirmation from the dialogues. There is, for instance, no indication in the *Crito* that Socrates’ unshakable commitment to the fundamental principle that one must never act unjustly (49a) is based on critical examination of his and Crito’s moral beliefs. It has to be acknowledged that while Socrates indicates that critical examination is sometimes capable of establishing truth beyond at least the practical possibility of rebuttal, and sometimes suggests that he knows some moral truths on the strength of good arguments for them, he gives no general account of the grounds of his nonexpert moral knowledge.

RELIGION. One might perhaps speculate that the source of Socrates’ nonexpert moral knowledge is supposed to be divine revelation, but though Socrates’ attitudes to the divine are an important element in his portrayal by both Plato and Xenophon, neither in fact suggests that Socrates believed that his moral beliefs were divinely inspired. What he did believe, according to both writers, is that throughout his life he was guided by a private sign or voice that he accepted, apparently without question, as being of divine origin, but the content of that guidance appears to have been, not moral principles, but day-to-day practical affairs, and it had the peculiar feature that its guidance was always negative, warning Socrates against some course of action that he might otherwise have undertaken (Plato, *Apology* 31c–31d). Thus Xenophon reports him (*Apology* 4) as explaining his failure to prepare his defense because the divine sign had told him not to, while in Plato’s *Apology* (40a–40b) he says that he is confident that his conduct at his trial has been correct because the divine sign has not opposed it.

Such a claim to continuous private divine guidance (as opposed to occasional private revelations, e.g., in dreams) was certainly unusual, and, as suggested above, it is likely that it at least contributed to the charge of religious unorthodoxy that was one of the grounds of his condemnation. The actual stance of the historical Socrates toward conventional religion is not altogether easy to reconstruct from the sources. Xenophon, as pointed out above, stresses his conventional piety, as measured by public observance and private conversation; for example, his demonstration to an irreligious acquaintance of the providential ordering of the world, down to such details as the design of the eyelashes to shield the eyes from the wind (*Memorabilia* 1.4). On that account it is difficult to see how the charge of impiety could have been brought at all.

Plato's presentation is more complex. He does indeed represent Socrates as concerned on occasion with prophetic dreams (*Crito* 44a–44b; *Phaedo* 60e–61b) and with ritual, most famously in his report of Socrates' last words: "Crito, we owe a cock to Asclepius; pay it and don't forget" (*Phaedo* 118a). But it is notable that all of these instances arise in the context of Socrates' imminent death. When Plato represents Socrates as praying on various occasions throughout his life he almost always makes him pray for nothing but wisdom and virtue, while in his most extensive discussion of piety, in *Euthyphro*, he suggests that Socrates thinks that what the gods require from humans is nothing other than moral virtue. That fits well with his *Apology*, where Socrates' rebuttal of the charge of impiety has nothing at all to say about ritual, consisting wholly in the claim that Socrates' life has been the fulfillment of a divine mission to promote the welfare, identified with the moral virtue, of his fellow citizens.

Plato's view of Socratic religion seems then to be that the essence of service to the gods is moral virtue, and that ritual fills its proper role, as in Socrates' life and death, as a complement to the fulfillment of that primary task. If that reflects Socrates' own view, then it is possible that it was seen by conservatively minded contemporaries as presenting a radical challenge to traditional ideas of the relations between gods and humans, which were founded on the belief that divine favor and protection for individuals and the community were secured by performance of the appropriate prayers and rituals, and thereby as justifying his condemnation for neglecting the state religion in favor of a new religion of his own.

**DEFINITIONS.** In the procedure of enquiry sketched in (i) above, the search for general definitions is central. This arises naturally from Socrates' search for expertise; the expert knows about his or her subject, and according to Socrates the primary knowledge concerning any subject is precisely knowledge of what that subject is. The general pattern of argument in the dialogues is that some specific question about a subject—for example, how is one to acquire goodness—is problematic in the absence of an agreed conception of what that subject is. Hence before the problematic question can be pursued, the definition of the subject must first be sought. The problematic question may be of various kinds; it may be, as in the example above (from the *Meno*) how goodness as such is to be acquired, or how a specific virtue is to be acquired (courage in the *Laches*), or whether a virtue is advantageous to its possessor (justice in the *Republic*). The *Euthyphro* exemplifies another pattern; it is disputed whether a particular action, Euthyphro's prosecution of his father

for homicide, is an instance of piety or holiness, and Socrates maintains that the question will be settled when, and only when, the definition of piety is arrived at. This pattern has given rise to the accusation that Socrates is guilty of the "Socratic fallacy" of maintaining that in general it is impossible to tell whether anything is an instance of a property unless one already possesses a general definition of that property.

That general position would be methodologically disastrous for Socrates, because his approved strategy for reaching a definition is to consider what instances of the kind or property in question have in common, and it is impossible to do that if a person has to know the definition before he or she can even identify the instances from which the definition is to be derived. In fact the argument of the *Euthyphro* does not involve that fallacy; even if it is granted that there are some disputed cases where the question "Is this an instance of F?" cannot be settled without answering the prior question "What is F?" it does not follow that there are no undisputed cases where instances of F can be recognized without a definition. In the *Hippias Major*, however, Socrates does argue (286c–286e) that people cannot tell whether anything is fine or beautiful (*kalon*) unless they know—that is, can give a definition of—what fineness or beauty is; so though the Socratic fallacy is not a pervasive defect of Socrates' argumentative method, there does seem to be one instance of it in the dialogues.

The question "What is F?" can itself be understood in various ways; it may be a request for an elucidation of the linguistic meaning of the term "F," or a request for a substantive account of what the property of F-ness consists in, including, where appropriate, the decomposition of a complex property into its components (e.g., goodness consists of justice, self-control, etc.) and explanatory accounts of properties (e.g., self-control consists of the control of the bodily appetites by reason). The practical nature of the questions that often give rise to the search for definitions suggests that the latter kind of definition is what is sought. Someone who wants to know how virtue is to be acquired will not be helped by a specification of the meaning of "virtue" as "a property contributing to overall success in life"; what they are looking for is precisely an account of what it is that constitutes or guarantees success in life. That is confirmed by the fact that *Laches*, *Meno*, and *Protagoras*, all of which start from the practical question of how either a specific virtue or goodness in general is to be acquired, converge on the suggestion that courage (in *Laches*) and goodness (in *Meno* and *Protagoras*) are identical with knowledge, which is itself

part of a substantive theory of the nature of goodness (see next section). It must, however, be acknowledged that Plato shows no awareness of the theoretical distinction between a purely conceptual definition and the kind of substantive account that is favored by the structure of the dialogues just mentioned. Even in the *Meno*, the dialogue in which definition is treated in the greatest detail, he gives model definitions of either kind without any explicit differentiation. Substantive accounts are favored over conceptual definitions by his practice, not in the light of any theoretical discrimination between the two.

**ETHICS.** The picture of Socrates as a nonexpert enquirer outlined above needs to be qualified to this extent, that in some dialogues, specifically *Protagoras*, *Gorgias*, and *Meno*, he is represented as arguing positively, though not conclusively, in favor of certain propositions that amount to at least the outline of a theory of human nature and of human good. The basic theses of this theory are:

- (1) Every agent has a single overall aim, the achievement of a completely satisfactory life for him or herself.
- (2) Knowledge of what constitutes such a life is both necessary and sufficient for the achievement of it.
- (3) Such a life consists in the practice of the virtues of justice, self-control, courage, and holiness, which are identical with one another in that they are the application to different kinds of situation of the fundamental virtue of knowledge (of what the good for humans is and how it is to be achieved).

Thesis 2 is the famous thesis that “Virtue is knowledge,” from which together with thesis 1 follows the still more famous thesis that “No-one does wrong willingly” (the latter two often referred to as “The Socratic Paradoxes”). The idea expressed in the second paradox is that, because everyone necessarily has the single aim of achieving the best life for him or herself, any action that does not in fact promote that aim must be explained by the agent’s mistaken belief that it does promote it. Socrates is thus the first of a succession of philosophers throughout the ages to deny the possibility of acting against one’s better judgment (often ascribed to weakness of will); that position remains as controversial in the twenty-first century as it was in antiquity. The identification of the conventional moral and social virtues as applications of the fundamental knowledge of what the human good is (with the implication that the virtues are identical with one another, conventionally labeled “The Unity of the Virtues”), though central to the prototheory, is never adequately argued for. It is supported at *Crito* (47e) by an

analogy between virtue of soul and health of body; justice and injustice are respectively the health and sickness of the soul. So, just as it is not worth living with a diseased and corrupted body, it is not worth living with a diseased and corrupted soul. But that is not an argument. Even granted that health is an intrinsically desirable and disease an intrinsically undesirable state, the crucial claims that justice is the health of the soul and injustice its disease require defense, not mere assertion.

Plato supplies some arguments in the *Gorgias*, but they are weak. Socrates first argues that successful tyrants, who manifest the extreme of injustice, do not get what they really want—that is, the best life for themselves—because their injustice is bad for them. The crucial argument for that conclusion (473a–475c) starts from the premise, conceded by Socrates’ opponent Polus, that acting unjustly, while good (i.e., advantageous) for the agent, is disgraceful. It is next agreed that whatever is disgraceful is so either because it is unpleasant or because it is harmful. Because acting unjustly is clearly not unpleasant, it must therefore be harmful. Hence the life of injustice is harmful to the unjust agent. This argument fails because it ignores the relativity of the concepts of unpleasantness and harmfulness. To be acceptable the first premise must be read as “Whatever is disgraceful to anyone is so either because it is unpleasant to someone or because it is harmful to someone.” From that premise it clearly does not follow that because injustice is not unpleasant to the unjust person it must be harmful to that person. It could be harmful to someone else, and its being so could be the ground of its being disgraceful to the unjust person (as indeed people ordinarily think).

Later in the dialogue (503e–504d) Socrates argues against Callicles that because the goodness of anything, such as a boat or a house, depends on the proper proportion and order of its components, the goodness of body and soul alike depend on the proper proportion and order of their components, respectively health in the case of the body and justice and self-control in the case of the soul. The analogy of health and virtue, simply asserted in the *Crito*, is here supported by the general principle that goodness depends on the organization of components, but that principle is insufficient to ground the analogy, because the proper organization of components is determined by the function, point, or aim of the thing that those components make up. So in order to know which organization of psychic components is the appropriate one for humans we need a prior conception of what our aims in life should be. One conception of these aims may indeed identify the optimum organization as that defined

by the conventional moral virtues, but another may identify as optimum a different organization, say one that affords the maximum scope to certain kinds of self-expression, as exemplified by a figure such as the Nietzschean Superman. Socrates provides no argument to exclude that possibility.

In addition to the failure to establish that virtue is always in the agent's interest, the prototheory is more deeply flawed, in that it proves to be incoherent. This emerges when we consider Proposition 2, "Virtue Is Knowledge," and ask what virtue is knowledge of. The answer suggested by *Meno* and *Protagoras* is that virtue is knowledge of the best life for the agent; given the standing motivation to achieve that life, knowledge of what it consists in will be necessary if one is to pursue it reliably, and sufficient to guarantee success in that pursuit. But that requires that the best life for the agent is something distinct from the knowledge which guarantees that one will achieve that life. "Virtue is knowledge of the best life for the agent" will be parallel to "Medicine is knowledge of health," and the value of that knowledge will be purely instrumental and derivative from the intrinsic value of the success in life which it guarantees. But Socrates, as we have seen, treats virtue as analogous, not to medicine, but to health itself, and hence as intrinsically, not merely instrumentally valuable. Virtue is not, then, a means to some independently specifiable condition of life which we can identify as the best life, well-being, or happiness (in Greek, *eudaimonia*); rather it is a constituent of such a life, and one of the most difficult questions about Socratic ethics is whether Socrates recognizes any other constituents. That is to say, for Socrates a life is worth living either solely or at least primarily in virtue of the fact that it is a life of virtue.

The incoherence of the prototheory thus consists in the fact that Socrates maintains both that virtue is knowledge of what the agent's good is and that it is that good itself, whereas these two theses are inconsistent with one another. It could indeed be the case both that virtue is knowledge of what the agent's good is and that the agent's good is knowledge, but in that case the knowledge which is the agent's good has to be a distinct item or body of knowledge from the knowledge of what the agent's good is. So if Socrates is to maintain that virtue is knowledge, he must either specify that knowledge as knowledge of something other than what the agent's good is, or he must abandon the thesis that virtue is the agent's good. There are indications in the dialogues that Plato was conscious of this difficulty. In the *Euthydemus* he represents Socrates as grappling inconclusively with the problem,

and in the *Republic* he offers a solution in a conception of human good as consisting in a state of the personality in which the nonrational impulses are directed by the intellect, informed indeed by knowledge, but by knowledge not of human good, but of goodness itself, a universal principle of rationality. This conception retains from the prototheory the thesis that human good is virtue, but abandons the claim that knowledge is virtue, because virtue is not identical with knowledge but directed by it, the knowledge in question being knowledge of the universal good.

*Protagoras* may plausibly be seen as exploring another solution to this puzzle, because in that dialogue Socrates sets out an account of goodness whose central theses are (i) virtue is knowledge of human good, and (ii) human good is a life in which pleasure predominates over distress. Whether Socrates is represented as adopting this solution in his own person, or merely as proposing it as a theory that ordinary people and Sophists such as Protagoras ought to accept (a question on which there has been much dispute), it represents a way out of the impasse that blocks the prototheory, though not a way that Plato was himself to adopt. Having experimented with this solution, which retains the identity of virtue with knowledge while abandoning the identity of virtue with human good, he settled instead for the *Republic's* solution, which maintains the latter identity while abandoning the former.

The prototheory is not strictly inconsistent with Socrates' disavowal of wisdom or expertise, because it is presented in outline only, not established by conclusive argument as expertise requires. But the presentation of Socrates as even a prototheorist has at least a different emphasis from the depiction of him simply as a questioner and generator of *aporiai*. This author believes that it is impossible to tell how much of this theory is Plato's own and how much was actually held by Socrates; that it was at least suggested to Plato by certain ideas that had emerged in Socrates' conversations seems highly likely, but we are not justified in asserting more than that.

## LATER INFLUENCE

The prototheory just sketched was an important element in the development of Plato's own ethical theory, and via Plato on those of Aristotle and the post-Aristotelian philosophical schools. With the exception of the Epicureans, each of the main schools adopted Socrates as, in effect, a patron saint, stressing aspects of his thought and personality congenial to its particular philosophical standpoint; the skeptics, especially those in the Platonic

Academy, which was converted to skepticism by Arcesilaus just over a century after its foundation and remained skeptical for two centuries, stressed Socrates' disavowal of wisdom and the undogmatic character of his questioning technique. The Cynics, whose doctrines and way of life derived from Antisthenes, one of Socrates' associates, claimed to emulate the austerity of his lifestyle and to accept his doctrine that virtue is sufficient for happiness. Via the Cynics, Socrates became a major influence on Stoicism, which combined the Cynic doctrine that happiness consists in living according to nature with the doctrine that for rational beings the life according to nature is the life in accordance with rationality. Accepting the essentials of the prototheory outlined above they drew the conclusion that moral virtue is the only good, everything else being indifferent—that is, neither good nor bad. A particularly significant figure in the Stoics' canonization of Socrates is Epictetus, who adopted Socrates at the exemplar of the philosophical life and reproduced in his protreptic discourses features of Socratic method such as elenctic and inductive arguments.

The influence of Socrates was not confined to the ancient philosophical schools. The second-century Christian apologist Justin claimed him as a forerunner of Christianity, a characterization that was revived by Renaissance Neoplatonists such as Marsilio Ficino. In Medieval Islam he was revered, though not well understood, as a sage and a defender of (and martyr for) monotheism against idolatry. In the Enlightenment era he was appropriated by rationalists such as Voltaire as an exemplar of natural virtue and a martyr in the struggle of rationality against superstition. In the nineteenth century Hegel, Kierkegaard, and Nietzsche identified him as a central figure in developments in the history of philosophy to which their own respective theories responded, and in the last quarter of the twentieth century he was a major influence on the later thought of Foucault.

The perennial fascination of Socrates owes less, however, to any specific doctrines than to Plato's portrayal of him as the exemplar of a philosophical life—that is, a life dedicated to following the argument wherever it might lead, even when it in fact led to hardship, poverty, judicial condemnation, and consequent death. Plato's depiction of how Socrates lived for philosophy would in any case have made him immortal; his presentation of how he died for it has given him a unique status in its history.

## Bibliography

### ANCIENT SOURCES

- Aristophanes. *Clouds*, edited by K. J. Dover. Oxford: Clarendon Press, 1968. Translated by B. B. Rogers. London and Cambridge, MA: Loeb, 1924.
- Diogenes Laertius. *Lives of Eminent Philosophers: Diogenes Laertius*. Loeb Classical Library. Translated by R. D. Hicks. Cambridge, MA: Harvard University Press, 1925. All volumes in the Loeb Classical Library contain the text in the original language with facing English translation.
- Ferguson, John. *Socrates: A Source Book*. London: Macmillan for the Open University Press, 1970. This book contains a comprehensive collection of passages of ancient works (in English translation) referring to Socrates.
- Plato. *Platonis Opera*, edited by John Burnet. 5 vols. Oxford: Clarendon Press, 1902–1906. Often called the Oxford Classical Text. New edition of Vol. 1, edited by E. A. Duke et al. (New York: Oxford University Press, 1995). New edition of *Republic*, edited by S. Slings (New York: Oxford University Press, 2003).
- All the dialogues are available in numerous English translations.
- Xenophon. *Apology*. Loeb Classical Library, edited by O. J. Todd. Cambridge, MA: Harvard University Press, 1961.
- Xenophon. *Memorabilia*. Loeb Classical Library, edited by E. C. Marchant. London: Heinemann, 1923. Greek with facing English translation.
- Xenophon. *Symposium*. Loeb Classical Library, edited by O. J. Todd. Cambridge, MA: Harvard University Press, 1961.
- Xenophon, *Conversations of Socrates*, Translated by Hugh Tredennick and Robin Waterfield. Harmondsworth: Penguin Classics, 1990.
- Minor Socratic writers. *Socratis et Socraticorum Reliquiae*. Edited by Gabriele Giannantoni. 4 vols. Naples: Bibliopolis, 1990. English translation of the principal fragments of Aeschines in *Plato and His Contemporaries*, by G. C. Field, chap. 11. London: Methuen, 1930.

## SOLGER, KARL WILHELM FERDINAND

(1780–1819)

Karl Wilhelm Ferdinand Solger, the German romantic philosopher, was born in Schwedt. He studied jurisprudence, philology, and philosophy at the University of Halle and at Jena, where he heard Friedrich von Schelling lecture. After some time in the Prussian civil service, he lectured on philosophy at the University of Frankfurt an der Oder (1809), where he met Ludwig Tieck, the writer. From 1811 until his death he was a professor at the University of Berlin.

Like many romantics, Solger was preoccupied with the polarity of the finite and the infinite. Man is finite but filled with a desire for the infinite. The world in which he finds himself is fragmented. Grasping splinters of reality, common understanding operates in terms of polarities—concrete and universal, appearance and concept, body and soul, individual and nature. Only in the infinite Idea are polarities reconciled. Common understanding is tied to the finite. Man must escape from its rule if he is to recognize the infinite Idea. God made a sacrifice of himself to create the finite, and man must sacrifice himself and the phenomenal to return to the infinite. In this annihilation the Godhead reveals itself. The reconciliation of the finite and the infinite is the goal of the philosopher when he tries to capture truth in his systems; it is the duty of the moral man who confronts it as a task; it is achieved by the artist who, in creating the beautiful, reveals the Idea in the phenomenal.

The philosophy of art was at the center of Solger's philosophical program. Enthusiasm and irony are the two mainsprings of artistic creation. Enthusiasm, like Plato's Eros, ties man to the reality in which he has his ground. The enthusiast is possessed by the Idea. Irony recognizes the negativity of phenomenal reality and negates it. Thus it pushes away the veil that normally hides the Idea from us.

For Solger, as for Plato, philosophy is fundamentally conversation. It is a joint struggle for something that is

dimly apprehended and yet escapes adequate articulation. Truth is never a possession; it only reveals itself in the process of striving for it. Thus, the most adequate vehicle for the expression of philosophical thought is the dialogue.

## SOLIPSISM

There are a number of importantly different views associated with the term *solipsism*. Its Latin roots—*solus*, meaning “alone,” and *ipse*, meaning “self”—suggest the rough idea that a solipsistic doctrine is going to put some sort of emphasis on the self standing alone, but there are radically different ways in which a philosopher might develop that emphasis. In particular, we must distinguish

an extreme metaphysical thesis, a view about the nature of mental states (sometimes misleadingly referred to as methodological solipsism), an epistemological/methodological thesis, and an ethical thesis.

### METAPHYSICAL SOLIPSISM

The simplest and most radical of doctrines associated with solipsism is the puzzling doctrine that only the self exists. Stated in these terms, the doctrine is scarcely intelligible. The obvious question concerns whose self precisely it is that is supposed to be the only existing thing. It is easiest to state the doctrine from the first-person perspective. If I embrace solipsism, I am endorsing the view that I am the only existing thing. If you embrace solipsism, then you are endorsing the view that you are the only existing thing. If we both endorse solipsism, therefore, then we are both wrong. In asserting solipsism, the solipsist is usually not trying to deny the existence of *properties* exemplified by the self. So the self that exists may believe, fear, hope, plan, and so on. We can also distinguish the solipsist who intends only to deny the existence of other minds from the solipsist who denies the existence of all other objects, for example, physical objects. It would be odd, however, to hold the former without the latter for, as we shall see, the epistemological position that drives one to a skepticism about other selves often involves a skepticism with respect to the external world.

There is almost a comical aspect to the most extreme form of solipsism. It is certainly odd to hear any philosopher defending (to whom?) the view. One could certainly never take comfort in the fact that one succeeded in convincing anyone of the truth of the view. But in this respect solipsism is probably no worse off than any other extreme form of skepticism—say skepticism with respect to the past, the future, or the external world. In fact, solipsism is probably a view that one starts to take seriously precisely in the context of more general epistemological concerns. So, for example, while Descartes was no solipsist, he came perilously close to painting himself into a solipsistic corner.

In the *Meditations*, Descartes famously sought secure foundations for knowledge. To find those foundations he employed what is sometimes called the method of doubt. He tried to strip from his belief system all those beliefs that admit of the possibility of error. So, for example, he thought that no belief about the physical world belongs in the foundations of knowledge because our evidence for believing what we do about that world never gets any better than vivid sense experience. But the kind of sense

experience upon which we must rely is always compatible with our dreaming, or our being the victims of massive demon-induced hallucination. Since our knowledge of the existence of other people seems to rest critically on our knowledge of other bodies, skepticism with respect to the physical world might seem to entail a skepticism with respect to the existence of other selves. After rejecting a number of candidates for foundational truth, Descartes finally hit upon his own existence as one truth that he could not rationally doubt. No matter how hard he tried to convince himself that he did not exist, such efforts merely reinforced for him the fact that he did exist. One can only doubt one's own existence if one exists to do the doubting. "Cogito, ergo sum," Descartes concluded—I think, therefore I am.

While the exact nature of the evidence or justification to which Descartes appeals in claiming foundational knowledge of his own existence is a matter of some controversy, his attempt to begin a reconstruction of the rest of what he knows from this foundation is one that could have easily led him to a solipsistic conclusion. Descartes thought that he could find a way of legitimately inferring the rest of what he believes from knowledge of his own thoughts and experiences, but it is an understatement to suggest that his efforts did not meet with universal acceptance. Indeed, many contemporary philosophers are convinced that if we restrict ourselves to premises describing our own existence and the conscious states exemplified there, there is no path to knowledge of, or even justified belief in, the rest of what we commonsensically think we know.

The kind of radical foundationalism that Descartes embraced might naturally lead, then, to the conclusion that we can only know of our own existence and the perceptions and thoughts that reside there. And if one restricts one's metaphysical positions to what is licensed by knowledge, then one might be left affirming only one's own existence. Again, that claim is usually expanded, even by the solipsist, to include the conscious mental states exemplified by that self. When we discuss epistemological solipsism, we will say more about the epistemological assumptions that might lead one to take seriously the position of metaphysical solipsism. But let us first examine some influential criticisms leveled at the view.

**CRITICISMS.** One charge often leveled against metaphysical solipsism is the charge of self-refutation. There are a number of different ways in which a view might be self-refuting. The strongest form of self-refutation is logical—a self-refuting view entails that it is itself false. So,

for example, the proposition that all claims are false is self-refuting in this sense. The claim entails its own falsehood. On the face of it, it is difficult to see how the solipsist's claim can be self-refuting in this way. Nevertheless, critics have claimed that for the solipsist's claim to be *meaningful* it must be false. Inspired by Wittgenstein, for example, some philosophers claim that language and meaning are essentially social; there can be no such thing as a private language or a private linguist.

Unfortunately, it is by no means easy to figure out just what the basis for this claim is. One crude characterization of the argument emphasizes the importance of rules in determining meaning. One uses a term meaningfully only if one uses it in accord with a rule that determines when the term is used correctly or incorrectly. If one is the sole arbiter of when a term is used correctly, the argument goes, one will be unable to make a mistake. But if one cannot make a mistake using the term, then it makes no sense to suppose that one is using the term correctly; correct use makes sense only against the possibility of incorrect use. It is only when there is a community of language users that one can understand the distinction between correct and incorrect use of language; incorrect use can be identified with divergence from standard or common use.

So to illustrate with an example, suppose that I see a creature I have never seen before and resolve to call it and anything relevantly like it a "gretl." One might initially suppose that I have successfully introduced a word into my own private language. Tomorrow, I see another creature—somewhat like the first, but also in many ways dissimilar. Is it a "gretl" or not? It seems that if I am the only one deciding whether it is enough like the first creature to count as a "gretl," then I cannot get it wrong—whatever I decide goes. Again, the Wittgensteinian will claim that where there is no possibility of error, there is no possibility of truth.

There are no uncontroversial interpretations of the private language argument, and a full evaluation of it would take us far afield. All versions of the argument, however, rest on highly controversial assumptions. It is not clear, for example, that judgment involves comparison to a paradigm. In any event, one must surely worry that the version stated above would rule out even the possibility of a *solitary* linguist—a sole language user. But it is hard to see how it could be impossible for there to exist one and only one person who was capable of both thought and language. We can imagine, for example, an infant who is the sole human survivor of a worldwide natural disaster and who, adopted by apes, somehow

manages to mature into an adult. In such a world, if that human being could formulate the thought that there are no other people, he or she would have formulated a true thought. And do we really want to argue that in the situation described it would be metaphysically impossible for the person to formulate either the thought or a language that could express the thought? If we reflect on the scenario just described, we might become suspicious of any argument that purports to show that the solipsist's doctrine that there exists only one self is in some sense unintelligible or necessarily false.

There is a more recent philosophical claim about the nature of thought that, like the earlier arguments inspired by Wittgenstein, might seek to cast doubt on the intelligibility of metaphysical solipsism. It is sometimes called semantic, psychological, or content externalism. The basic idea behind the view is encapsulated in Putnam's famous slogan that meanings are not "in the head," and its proponents sometimes seem to claim that one can only have thoughts about certain kinds of things if those kinds of things exist. If the view were true, one might be able to infer from the fact that one can form thoughts about physical objects (even the thought that there are no physical objects) that physical objects exist. Similarly, one might be able to infer from the fact that one can form thoughts about other people (even the thought that there are no other people) that other people exist. The view underlying this criticism of metaphysical solipsism is held in opposition to another thesis associated with solipsism, a thesis sometimes called "methodological solipsism."

### METHODOLOGICAL SOLIPSISM

The term *methodological solipsism* was introduced by Hilary Putnam and made more familiar by Jerry Fodor. It is precisely the view rejected by the content externalist. The methodological solipsist (or internalist in the philosophy of mind) is convinced that psychological states (beliefs, desires, fears, pains, etc.) are entirely constituted by internal features of the person in those states. Two people cannot be in identical internal states while one of them has a certain desire, say, and the other does not. The externalist argues, somewhat paradoxically perhaps, that at least some of the conditions that constitute or determine your psychological states are factors that lie outside you—factors that include, for example, the causal origin of your internal states. So Putnam famously argued that two people could be in precisely the same internal states while one is thinking about water (the stuff with molecular structure H<sub>2</sub>O) and the other is thinking about "twa-

ter" (something with an entirely different molecular structure). The difference in the content of their thoughts would be a function of the environments in which the respective internal states arise. In a much-discussed attempt to extend these considerations to issues involving skepticism, Putnam (1981) appeared to argue that if one were a brain in a vat whose experiences were produced by the machinations of some mad neurophysiologist, one could not even entertain that hypothesis. His idea is that without some sort of sensory interaction with the physical world, one could not even form a thought that was about a physical object like a brain or a vat.

If such an argument were successful it would not be hard to extend it as an attack on the intelligibility of the more extreme forms of metaphysical solipsism. When the solipsists make clear their views about what does not exist, their ability to form the thought, for example the thought that there is no external world, presupposes that there is one. Without interaction with external reality, no thought could be about such reality and one thus could not even coherently deny its existence. Since skepticism about the existence of others typically runs through skepticism about the external world, one will have undercut an argument for solipsism.

**CRITICISMS.** Content externalism is no less controversial than the various presuppositions Wittgenstein and others brought to their philosophical views about meaning. But even if we grant some of the basic tenets of the externalist's conception of the conditions necessary for thought, *careful* statements of the view will not take one very far toward interesting metaphysical conclusions about what there is. For one thing, the careful content externalist is going to radically restrict the view to a subclass of thoughts. No one thinks, for example, that in order for one to have thoughts about mermaids, one must have interacted in some way (or be connected with someone else who has interacted in some way) with actual mermaids. The most natural move, borrowed from the earlier empiricists who thought that all ideas are "copies" of prior impressions, is to make a distinction between complex ideas and simple ideas. The earlier empiricist conceded that the idea of a mermaid is not a copy of some prior impression or experience of a mermaid, but went on to claim that the idea is complex (the idea of woman's torso combined with a fish's tail), and the ideas out of which the complex idea is composed *are* copies of prior impressions. Of course, the idea of a torso itself might be complex, composed of still simpler ideas. The natural thought for both the earlier empiricist and

the content externalist is to restrict their thesis to the simple ideas that are the “building blocks” of other ideas.

The difficulty is that it is not clear what the best candidates are for the simple ideas out of which others are built. Suppose, for example, that I have the idea of a sensation. I might also be able to form the idea of causation. I can put those two ideas together to form the idea of that which causes the sensation. Arguably, in this way I can form the complex idea of an external object. But I have formed the idea in such a way that it might not correspond to anything—the sensation in question might have no cause. There seems to be nothing in the externalist’s view that blocks the possibility of forming thoughts of this sort, thoughts that might well not correspond to anything. Consequently, it is not at all clear that the metaphysical solipsist would face any problems of self-refutation in framing various radical views about what does not exist.

### EPISTEMOLOGICAL SOLIPSISM

The first two theses discussed above are metaphysical claims—claims about what exists. As we have just seen, one use of the expression “methodological solipsism” involves a claim about the nature of mental states. There was, however, an earlier use of the term “methodological solipsism” (by Hans Driesch, Rudolph Carnap, and others) expressing an epistemological thesis. Indeed, that earlier use of the expression is a much more natural way to describe what these philosophers had in mind—a *method* for arriving at truth. To avoid confusion, it is best to describe the view that I have in mind as epistemological solipsism.

The fundamental idea behind epistemological solipsism is the claim that in reaching conclusions about what exists, each of us is restricted to a foundation of knowledge about our own mental states. The foundationalist in epistemology is convinced that there must be some truths that are known or justifiably believed without their needing to be inferred from other different truths that are known or justifiably believed. This foundational knowledge is needed to block a vicious epistemological regress. To justifiably believe *P* by inferring it from *E1*, one would need, the argument goes, justification for believing *E1*. Some would argue that one would also need justification for believing that *E1* confirms *P*. But if the only way to justifiably believe something is to infer it from something else, then to justifiably believe *E1*, one would need to infer it from something else *E2*, which one would need to infer from something else *E3*, and so on, ad infinitum. Finite minds cannot complete infinitely long chains of reason-

ing. It is not even clear that infinite minds can complete infinitely long chains of reasoning. So if we are to justifiably believe anything at all, some of our beliefs must be non-inferentially justified—justified without inference.

The radical empiricist/epistemological solipsist is convinced that the only contingent truths that one can know without inference are truths about one’s own existence and the thoughts and experiences contained there. Arguments for restricting the foundations of knowledge in this way depend, typically, on specific presuppositions about the nature of foundational knowledge. As we saw earlier, Descartes sought foundations in beliefs that are infallible. If one’s justification for believing something is compatible with the belief’s being false, then the belief is not a candidate for non-inferential knowledge. The radical empiricist was convinced that beliefs about the external world, the past, other minds, and the future, all fail this test for foundational knowledge. By contrast, one’s beliefs that one exists, that one is in pain (when one is), that one has thoughts, all were supposed to pass the test.

A closely related version of foundationalism seeks to identify foundational knowledge with belief accompanied by direct acquaintance with facts that are the truth-makers for the belief. On this view, when one is in pain, for example, one’s non-inferential justification consists in the fact that the pain itself is directly present to consciousness. Again, the claim is that objects in the physical world, other minds, facts about the past, and facts about the future, are never directly presented to consciousness in this way. Their existence must be inferred from what is known directly about present conscious states.

The epistemological solipsist’s position was probably almost taken for granted by most prominent philosophers in the history of philosophy. The task of the philosopher is essentially egocentric. If one is to avoid begging questions, one has no choice but to begin one’s search for truth with the various ways that things appear. This epistemological position does not entail metaphysical solipsism, but as we saw, there is the danger that one will be unable to reason oneself out from behind this “veil” of subjective appearance.

**CRITICISMS.** The version of foundationalism endorsed by the epistemological solipsist has come under sustained attack in the last several decades. In discussing metaphysical solipsism, we have already had occasion to examine Wittgenstein’s worries about the possibility of a private language. To the extent that judgment involves categorizing things, categorizing things involves appeal to the correctness of following certain rules, and knowledge of

what rules sanction involves facts about communities of rule followers, one will have difficulty finding the kind of foundations sought by the epistemological solipsist. But as we saw, this criticism of private language and thought is by no means uncontroversial.

In the previous section, we also discussed a view about the nature of mental states that might also cast doubt on the radical version of foundationalism endorsed by many empiricists. If external reality is literally partially constitutive of mental states like belief, then it might seem to follow that our knowledge of mental states could be no more secure than the knowledge of that external reality upon which their content depends. That this follows from psychological externalism, however, is a matter of great dispute, and among those who take it to be an implication of externalism in the philosophy of mind, there are many who take this consequence of the view to be a *reductio* of the view. In any event, as we also noted, psychological externalism is no more uncontroversial than the presuppositions of Wittgenstein's argument against the possibility of knowing truths about a "private" experience.

There are other efforts to cast doubt on the claim that empirical knowledge begins (and perhaps even ends) with knowledge of one's inner mental states. In a famous attack on the radical empiricist's doctrine of what is "given," Wilfred Sellars (1963) claimed that it is an illusion to suppose that we can form thoughts about appearances that are independent of thoughts about objective reality. So suppose, for example, that the epistemological solipsist claims to know that something looks red to him, or that it appears as if something is red. That epistemological solipsist claims that knowledge that there actually is a physical object that is red is more tenuous, less secure, than knowledge of the subjective appearance presented by such an object. But Sellars wants to know precisely what it means to say that it looks as if something is red. Sometimes we use "seems"/ "appears" language to indicate tentative belief—R. M. Chisholm (1957) called this the epistemic use of "appears." But in its epistemic sense, the judgment that it appears as if *X* is red is just the tentative judgment that *X* is red—it is not a truth about an appearance to which one might appeal as evidence for the claim that there exists before one a red object.

There is another use of "appears," however—the comparative use. But it will not be of any use to the philosopher intent on restricting a knowledge claim to subjective experience. In the comparative sense, to judge that it appears to me as if *X* is red is just to judge that I am having the kind of experience that is usually caused by

red things under normal conditions. It takes but a moment's reflection to realize that this thought about how things appear is not a thought confined to subjective reality at all. To know that it looks as if something is red, I would have to know something about objective reality—I would have to know how red things look under normal conditions—something that presupposes that I have had epistemic access to how things have been, not just how things appear.

If the only way that we could conceptualize experience was comparatively in the above sense, then it would be folly to suggest that our knowledge of reality begins with knowledge of subjective appearance. But, of course, it is not difficult to see how the epistemological solipsist should respond to the above criticism. The very characterization of the comparative use of "appears" seems to make reference to a "way" that red things look and the radical empiricist/epistemological solipsist thinks that we have no difficulty conceptualizing that way in terms of its intrinsic character. However the word "appears" is normally used, the epistemological solipsist can borrow that term to describe what Chisholm called the noncomparative intrinsic character of the experience (1957).

There are countless other attacks on the radical foundationalist's idea that all empirical knowledge rests on a foundation of knowledge about the character of subjective experience. Some, for example, argue that we must reject such a view because it will ultimately lead to a radical skepticism—perhaps even the metaphysical solipsism discussed earlier. The charge is that the foundations countenanced by such a view coupled with available epistemic principles simply will not allow us to get back the knowledge that we commonsensically take ourselves to have. To determine whether epistemological solipsism does lead to skepticism would take us too far afield, but one might wonder whether a commitment to the falsity of skepticism should rule philosophical thought.

Still others complain that the epistemological solipsist radically overintellectualizes the nature of our thought about external reality. Not only do we not *always* infer objective reality from subjective experience, we rarely pay attention to how things appear. As anyone who has tried to paint soon realizes, it takes a certain amount of learning and sophistication to see the world as it appears instead of as we take it to be objectively. But it is not clear what relevance this observation has for the epistemological solipsist's central thesis. To be sure, if the solipsist makes a claim about what we actually do know, the above observations might cast doubt on that claim by casting doubt on the question of whether we typically

form the required thoughts. But the careful epistemological solipsist might make a claim only about the possibility of knowledge. That epistemological solipsist might argue that whatever we think we know or justifiably believe, the only truths that *can* be known, at least directly and without inference, are truths about the character of subjective experience.

Just as there is an internalism/externalism controversy concerning the nature of mental states, so also there is an internalism/externalism controversy in epistemology. Many epistemological externalists argue that whether or not a belief is justified depends critically on the causal history of the belief—the way in which the belief was produced. Alvin Goldman (1979) advances one version of such a view—reliabilism. The reliabilist is a kind of foundationalist but argues that foundationally justified beliefs are just beliefs produced by reliable belief-producing processes that take as their input something other than beliefs. A belief-producing process of this sort is reliable when it does or would produce mostly true beliefs. Reflection on the reliabilist's criterion for non-inferential justification reveals that there can be no *a priori* restrictions on which beliefs might turn out to be non-inferentially justified. Against the traditional foundationalists, the reliabilist will argue that non-inferential justification has nothing to do with infallibility. A belief can be non-inferentially justified if it is just barely more likely to be true than false. Beliefs about the past, the physical world, and other minds all might be non-inferentially justified according to the reliabilist. Whether they are or not depends on empirical facts about the way in which such beliefs are caused.

It is certainly true that arguments for epistemological solipsism are challenged by contemporary versions of epistemological externalism. It is hardly the case, however, that philosophers agree on the success of externalist analyses of epistemic concepts. The epistemological solipsists have an array of weapons ready to deploy against the externalist. But underlying their criticism is often the common theme that the externalist's analysis of epistemic concepts has stripped them of their philosophical interest. The epistemological solipsist is likely to be convinced that satisfying the externalist's epistemic concepts does nothing to provide assurance of the sort the philosopher seeks. I may have a reliably produced belief. I may be evolutionarily programmed to believe reliably various truths about the world around me. But unless I have some reason to believe that the way in which my beliefs are formed is reliable, the mere fact of reliability

does nothing to give me the kind of assurance I was looking for when I was interested in having justified beliefs.

## EGOISM

Another quite different sort of doctrine that might be associated with the idea of the self standing alone is the ethical theory or theory of rational behavior known as egoism. A crude version of the theory is that rational people have only one goal or end in acting—their own happiness or well-being. Egoists can certainly take into account the well-being of others but only insofar as they have some reason to believe that the well-being of others impacts their own well-being.

Like other versions of solipsism, egoism has been accused by some of internal incoherence. As a theory, one argument goes, egoism must enjoin everyone to achieve his or her own well-being. But we can easily imagine a case in which my doing *X* maximizes my well-being, while *R*'s preventing me from doing *X* will maximize *R*'s well-being. I cannot coherently recommend, exhort, or want *R* to prevent me from doing what I want to do.

The above criticism presupposes that a principle of morality or rationality must be universalizable in certain respects. More specifically, it presupposes that if someone accepts the principle that everyone ought to seek only his or her own well-being, that commits that person to recommending such behavior to others, or acquiescing in such behavior on the part of others, or wanting others to behave in such ways. Such presuppositions are not uncontroversial even in the domain of morality, but are arguably downright implausible if the “ought” judgment in question is intended to assert only the rationality of egoistic behavior. There seems nothing at all inconsistent in my believing that it would be rational for all people to act egoistically while encouraging them not to so act and doing what I can to prevent them from acting that way. I know all too well what people ought to do to beat me in a game of tennis, but I never advise them concerning how to do it; I never want them to do it, and I do whatever I can to thwart them from behaving as they ought to.

As an ethical theory, the plausibility of egoism might in the end depend on metaphysical issues concerning the nature of ethical properties. G. E. Moore (1912) famously argued that if my happiness is objectively good, it is so in virtue of the property of being happy that I exemplify. But if objective goodness “supervenes” in this sense on the property of being happy, then it supervenes on that property no matter whose happiness we are talking about. An ethical egoist cannot recognize the goodness of his or her own happiness without recognizing the value

inherent in another person's being happy. But most egoists are not objectivists about value. On one view, diametrically opposed to ethical objectivism, something has intrinsic value for a person *S* only insofar as *S* subjectively values that thing for its own sake. And it is just a brute fact about most human beings, the egoist claims, that people care more about their own happiness than they do about the happiness of others.

That alleged empirical truth, however, is not uncontroversial. It might not be all that difficult for most parents, for example, to conclude that they value intrinsically the happiness of their children—perhaps even more than they value their own happiness. If they do, and if subjective valuing confers intrinsic value on that which is valued, then the egoist's view that rational people concern themselves only with their own well-being is implausible. It is worth noting, however, that the view according to which a thing's intrinsic value for a person is determined by that person's valuing it is itself a kind of solipsistic view. It is not egoism, because we might find ourselves valuing intrinsically the well-being of others, but it is still a view that makes the individual person the creator of the goals or ends that partially define for that person how life ought to be lived.

## SOLOV'ĖV (SOLOVYOV), VLADIMIR SERGEEVICH (1853–1900)

Vladimir Sergeevich Solov'ev was a Russian philosopher, poet, polemical essayist, and literary critic. His father, S. M. Solov'ev, was an eminent historian and professor at Moscow University.

After graduating in 1873 from the historico-philological department of Moscow University, Solov'ev studied for a year at the Moscow Theological Academy. In 1874 he defended his master's dissertation, *Krizis zapadnoi filosofii. Protiv pozitivistov* (The crisis of western philosophy: Against positivists) and was elected a docent of philosophy at Moscow University. During 1875–1876 he conducted research at the British Library, where he concentrated on mystical and Gnostic literature, including Jakob Boehme, Paracelsus, Emanuel Swedenborg, and the kabbalah.

Having a poetic and impressionable nature, Solov'ev apparently possessed mediumistic gifts. Several times he had visions of Sophia, or the Eternal Feminine; he tells about one such vision, which he had in Egypt in 1875, in his poem "Three Meetings." After his return to Russia, he resumed lecturing at Moscow University; but in 1877, because of conflicts among the professors, he left the university and went to Petersburg to serve on the Scholarly Committee of the Ministry of National Education, meanwhile giving lectures at Petersburg University and at the Higher Courses for Women.

In 1877 he published the essay "Filosofskie nachala tsel'nogo znaniia" (Philosophical principles of integral knowledge); during 1877–1880 he wrote the study *Kritika otvlechennykh nachal* (Critique of abstract principles);

and in 1878 he began reading the cycle of *Chteniia o bogochelovechestve* (Lectures on godmanhood).

On March 28, 1881, after the assassination of Tsar Alexander II, Solov'ev, in a public lecture on the incompatibility of capital punishment with Christian morality, called on the new tsar to refrain from executing the assassins. His lecture provoked a fierce reaction; the relations between the philosopher and the authorities were ruined, and he left public and academic service, becoming a professional writer.

In the 1880s his attention was focused on sociopolitical and religious questions. His most important works of this period were *Dukhovnye osnovy zhizni* (Spiritual foundations of life; 1882–1884), *Velikii spor i khristianskaia politika* (The great dispute and Christian politics; 1883), *Istoriia i budushchnost' teokratii* (The history and the future of theocracy; Zagreb, 1886), *Tri rechi v pamiat' Dostoevskogo* (Three speeches in memory of Dostoevsky; 1881–1883), *La Russie et l'Eglise Universelle* (Paris, 1889; Russian translation, 1911), and the cycle of essays *Natsional'nyi vopros v Rossii* (The national question in Russia; 1883–1891).

In the 1890s Solov'ev returned to philosophical work proper. He wrote the essay "Smysl liubvi" (The meaning of love; 1892–1894) and the treatise on ethics *Opravdanie dobra* (The justification of the good; 1894–1895); he proposed a new interpretation of the theory of knowledge in essays unified under the title *Pervoe nachalo teoreticheskoi filosofii* (The first principle of theoretical philosophy; 1897–1899); and his last significant work, *Tri razgovora* (Three conversations; 1899–1900), was devoted to the problem of evil. Excessive work and unsettled life ruined Solov'ev's health, which had always been poor. He died near Moscow as a guest on the estate of his friends, the Princes Trubetskoi.

In his spiritual development, Solov'ev experienced many influences that determined the orientation and character of his thought. In early youth he assimilated socialist ideas: the quest for social truth and faith in progress, which were characteristic for Russian thought and in fact for the nineteenth century in general. From the Slavophiles Solov'ev assimilated the idea of "integral knowledge," which offered an answer to the question of the meaning of human existence, as well as to that of the goal of the cosmic and historical process. According to Solov'ev the subject of this process is humanity as a single organism, a concept borrowed from Auguste Comte. This approach is based on Solov'ev's belief in the reality of the universal, a belief formed under the influence of

Benedict (Baruch) de Spinoza and of German idealism, especially Georg Wilhelm Friedrich Hegel.

Solov'ev was also greatly influenced by thinkers who attributed a metaphysical significance to the concept of the will: Immanuel Kant, Arthur Schopenhauer, Eduard von Hartmann, and especially Friedrich Wilhelm Joseph von Schelling. If Solov'ev owes his dialectical method primarily to Hegel, his theology, metaphysics, and aesthetics bear the stamp of the influence of voluntaristic metaphysics. Solov'ev converges with Schelling in his romantic aesthetic approach to problems of religion and in his erotic mysticism that culminates in the cult of the Eternal Feminine, the world soul. A significant role in the formation of Solov'ev's views belonged to the Christian Platonism of P. D. Iurkevich, especially the latter's doctrine of the heart as the center of spiritual life. Solov'ev creatively transformed these multifarious influences in his doctrine by developing a systematic philosophy, which, however, was not free of a number of difficulties and contradictions. In his works one finds a sober assessment and constructive critique of many philosophical conceptions that had previously contributed to forming his worldview.

## BEING AND EXISTENCE

Solov'ev constructs his philosophical system according to a schema of history as the development of the world spirit, that is, as a theo-cosmo-historical process. He rejects the secularism that permeates modern European philosophy and, following the early Slavophiles, seeks to attain integral knowledge that presupposes the unity of theory and practical activity. His goal is "to introduce the eternal content of Christianity into a new rational unconditional form proper to this content" (1908–1923, p. 2:89).

In other words, his goal is to justify this content by means of "theosophy," an investigation of the nature of God. Like the Slavophiles, Solov'ev critiques abstract thought (particularly Hegel's idealism) from the vantage point of spiritualistic realism, which requires that thought, the thinking subject, and the thought content be separated into distinct elements—elements that coincide for Hegel in the absolute idea. According to Solov'ev, that which genuinely exists is not a concept or an empirical given but a real spiritual entity, the subject of will, existent (*sushchee*). The bearers of power and volition, spirits and souls alone possess reality; following Kant and Schopenhauer, Solov'ev considers the empirical world to be only a phenomenon and describes it as being, in contradistinction to existent. The first and supreme "existent," God, is defined by Solov'ev in the spirit of neoplatonism and the

kabbalah as a positive nothingness, which is the direct opposite of Hegel's negative nothingness—pure being obtained by abstraction from all positive definitions. Having defined existence as that which appears, and being as a phenomenon, Solov'ev thus interprets the connection between God and the world as the connection between essence and phenomenon, establishing a relation of necessity between the transcendent foundation of the world and the world itself, which can be known by means of reason—with the aid of so-called organic logic.

However, there is a certain contradiction between Solov'ev's mystical realism and his rationalistic method: If that which is, is a transcendent spiritual entity, one can have knowledge of it only on the basis of revelation. It is inaccessible to rational knowledge. However, Solov'ev is convinced that the rationally unfathomable existent can be an object of mystical contemplation, of intellectual intuition understood in a special manner and identified by Solov'ev with the state of inspiration. Following Schelling and the Romantics, Solov'ev takes intellectual intuition to be akin to the productive capacity of the imagination and, accordingly, he takes philosophy to be akin to artistic creation, interpreting here the creative act by analogy with the passively mediumistic trance state. Solov'ev considers the ecstatic inspired state to be the origin of philosophical knowledge:

The action upon us of ideal entities, producing in us the intellectual or contemplative knowledge (and creation) of their ideal forms or ideas, is what is called inspiration. This action takes us out of our ordinary natural center and raises us to a higher sphere, thereby producing ecstasy. Thus ... the directly defining principle of true philosophical knowledge is inspiration. (1911–1914, p. 1:294)

By identifying the direct action of transcendent entities on people with the intellectual contemplation of ideas, Solov'ev removes the boundary between rational thought and mystical vision; and the removal of the distinction between mystically interpreted intellectual intuition and the productive capacity of the imagination leads to the confusion of artistic imagination with religious revelation and to a magical and occultist interpretation of art, characteristic not only of Solov'ev but also of the symbolists whom he influenced. It is precisely in this manner that Solov'ev understands the synthesis of philosophy, religion, and art. According to Solov'ev the divine "That Which Is" is revealed directly, with the aid of sensation or emotion; and therefore no proofs of the existence of God are required: His reality cannot be logically derived from

pure reason but is given only by an act of faith. Nevertheless, the content of the divine "Existent" is revealed with the aid of reason.

### ALL-UNITY

Solov'ëv describes the Absolute as the "eternal all-one" (1911–1914, p. 3:234), or as the "One and all." This means that all that which exists is contained in the Absolute: The all-unity is unity in multiplicity. According to Solov'ëv the one is independent of the all (the term *absolute* means "detached," "liberated"), and consequently it is defined negatively in relation to the other. But since it cannot have anything outside itself, it is defined positively in relation to the other. Thus, two poles or centers are eternally present in it: (1) independence of all forms, of all manifestation; and (2) the power that produces being, that is, the multiplicity of forms. The first pole is the One; the second is the potency of being, or the first matter, which, as in Boehme, is included in the Absolute as "its other," as the first substrate, or the "ground" of God.

Solov'ëv clarifies the concept of the first matter in terms of Schellingian-Schopenhauerean definitions—as power, attracting, striving, and originating in Boehme's doctrine of the "dark nature" in God, the doctrine of the unconscious depths of Divinity as the principle of evil. The inseparability of the two poles of That Which Exists signifies that the Absolute cannot appear except as actualized in matter, and matter cannot appear except as idea, as the actualized image of the One. In his *Critique of Abstract Principles* Solov'ëv describes the second pole of the all-unity, that is, the first matter (which is idea, or nature), as the becoming all-one, in contrast to the first pole, which is the existent all-one (1911–1914, p. 2:299). This means that the Absolute cannot exist except as actualized in its other. The pantheistic basis of this conception is obvious: This view of the relation between God and the world differs from the Christian idea of creation. The becoming all-one is the world soul, which, being the foundation of the entire cosmic process, only "in man first receives its proper inner activity, finds itself, is conscious of itself" (pp. 2:302–303).

### SOPHIOLOGY

In his *Lectures on Godmanhood* Solov'ëv attempts to translate the self-sundering of the Absolute into the language of Christian theology, giving his own interpretation of the dogma of the Trinity. He distinguishes God as the absolute existent from His content (essence or idea), which appears in the person of the Son, or the Logos. The incarnation of this content is realized in the world soul,

Sophia, the third person of the divine Trinity—the Holy Spirit. Distinguishing in God the active unity of the creative Word (Logos) and the actualized unity, His organic body, Solov'ëv views the latter as "the produced unity to which we have given the mystical name Sophia" (1911–1914, p. 3:111); it "is the principle of humanity, the ideal or normal man" (p. 3:111). Perfect humanity is not an empirical individual or man as a generic concept, but an eternal idea, a special kind of universal individuality, "the universal form of the union of material nature with Divinity ... God-man-hood and Divine matter" (1911–1914, p. 8:231). The empirical world, where people appear as individuals, is "the somber and excruciating dream of a separate egotistical existence" (1911–1914, p. 3:120), an illusory and inauthentic world.

For Solov'ëv, as well as for Schopenhauer, the cause of this world is "the sin of individuation," producing the external, material existence of separateness and enmity. But if individuality is the source of evil and suffering, then in no wise can it be immortal: Salvation lies in the liberation from individual existence, not in its eternal continuation. Solov'ëv's philosophy of the last period is impersonalistic; it is not by chance that, on this question, there arose a polemic between him and Lev Mikhailovich Lopatin, who was convinced of the substantiality of the human self and of the immortality of the individual soul.

Solov'ëv sees the source of world evil in the meonic foundation of the divine all-unity. The world soul, Sophia, falls away from God, seeking to ground herself outside of Him, and "falls out of the all-one center of Divine being into the multiple periphery of creation, losing her freedom and her power over this creation" (1911–1914, p. 3:131). Meanwhile, the Divine Universe falls apart into a multiplicity of separate elements. The central personage of the theocosmic process—the eternally feminine principle in God, the body of Christ, the ideal humanity—acquires demonic characteristics. The image of the Eternal Feminine becomes dual. To eliminate this duality, Solov'ëv, in *Russia and the Universal Church*, introduces the distinction between Sophia on the one hand and the world soul on the other hand. The latter now appears as the antipode of Sophia, the Wisdom of God, who is a "radiant and heavenly entity." The essence of the cosmic process is the battle between the Divine Word and the infernal principle for power over the world soul, a battle that must end with the reunification of the fallen world soul with God and the restoration of the divine all-unity. The historical process leads with internal necessity to the triumph of good, to the victory of unity and love over disintegration and enmity. Solov'ëv's theodicy converges

not only with Hegel's teleological determinism but also with the evolutionism of the natural sciences.

### PHILOSOPHY OF HISTORY

Solov'ev's philosophy of history is an attempt to understand cosmic history as a series of free acts on the way to the restoration of the unity of God and humanity. At the first stage, that of natural revelation, humanity knows God as a natural entity: Such are the pagan beliefs of the ancient world and the materialistic doctrines of the modern period. At the second stage, God is revealed as the transcendent, extranatural principle; such are the Asian ascetic-pessimistic religions, especially Buddhism, which seek to overcome the active, personal principle. Finally, in the religion of the Old Testament, humanity received a positive revelation, whose full meaning was disclosed in Christianity. In Christ was manifested the synthesis of the religiously contemplative principle of Russia and the personal and human principle, which developed in the bosom of European culture.

However, the schism between the Eastern and Western Churches marked the epoch of a new disintegration, which now affected the Christian world because of the imperfection of "historical Christianity." Triumphant in Russia was the supra-individual divine principle that left no room for human freedom; whereas Europe was marked by excessive individualism and by freedom in its negative sense, which led to capitalism atheistic egotism. Russia had a messianic calling to unify the two separated sides and to realize the final act of the cosmic historical drama in which humanity will be reunited with God. In the 1880s Solov'ev's philosophy of history takes the form of a utopian doctrine about a universal theocracy in which the secular power of the Russian tsar is joined with the spiritual power of the pope in Rome. The first step toward this theocracy was supposed to take place as the reunification of the Eastern and Western Churches.

### ETHICS

Solov'ev touched on the problems of ethics in many works, but he has one work that is specially devoted to moral philosophy: *The Justification of the Good*. In this work he critiques two extreme points of view: moral subjectivism, which asserts that only the person can be the bearer of good; and objectivism, which recognizes only social institutions as guarantors of moral conduct. According to Solov'ev these two elements must complement each other. Here, he underscores the importance of the objective forms of moral life, taking as his point of departure the belief in the reality of the universal, that is,

of Godmanhood as one organism. If in his early works Solov'ev emphasized the dependence of ethics on religious metaphysics, he now insists on the autonomy of ethics, because as "in creating a moral philosophy, reason does nothing more than develop, on the basis of experience, the idea of the good that is originally inherent in it" (1911–1914, p. 7:29). Nevertheless, even if it is autonomous the philosophy of morality cannot be fully separated from metaphysics and religion, because only the doctrine of the cosmic divine-human process and of the final victory of the divine all-unity grounds morality—the reality of superhuman good.

Solov'ev gives a deep analysis of moral emotions: shame, pity, piety, or veneration. Man is ashamed of that which constitutes his lower nature; characteristic in this respect is sexual shame. Human experience pity, that is, they empathize with the suffering of all living beings; as the source of altruism, pity is the basis of social relationships. Shame represents individual chastity, whereas pity represents social chastity. Finally, the sense of piety, that is, veneration of the supreme principle, is the moral foundation of religion. Examining the problem of the relation between morality and law, Solov'ev sees their distinction in the fact that, in contrast to legal obligations, moral ones are unlimited, as well as in the coercive character of juridical laws. Law is the lower bound or minimum of morality, which is realized by means of compulsion. However, contrary to the common opinion, there is no contradiction between moral and juridical laws.

Although Solov'ev does not have a work specially devoted to aesthetics, the theme of beauty permeates all of his works. For Solov'ev, philosophical intuition converges, in the spirit of romanticism, with artistic creativity; and he sees in the latter a kinship with mystical experience and considers art to be a real power, illuminating and regenerating the world (see 1911–1914, p. 3:189). The supreme goal of art is theurgy, that is, the transformation of everyday reality into ideal, transfigured corporeality. Solov'ev's aesthetics is connected with his sophiology and with his doctrine of Eros, to which his treatise *The Meaning of Love* is devoted. His aesthetic ideas were also expressed in his essays in the field of literary criticism devoted to the poetry of Aleksandr Pushkin, Fedor Tiutchev, Mikhail Lermontov, and Afanasy Fet.

Not long before his death, Solov'ev became disenchanted with theocratic utopia and, in general, with the idea of progress. In his final work, *Three Conversations*, the central plane is occupied by the eschatological theme: The coming of the Kingdom of God is now conceived as the end of history. Solov'ev had a powerful influence on

philosophical thought in Russia. The religious philosophy of the end of the nineteenth century and of the beginning of the twentieth century developed under his influence; this is true, in particular, of Sergei Trubetskoi and Evgenii Trubetskoi, Nikolai Losskii, S. L. Frank, Sergei Bulgakov, Pavel Florenskii, Nikolai Berdiaev, and so on. Just as significant was Solov'ev's influence on Russian literature, especially on the symbolists Aleksandr Blok, Andrei Belyi, Viacheslav Ivanov, and so on. It is precisely from Solov'ev that the Russian silver age got its mystical and Gnostic tendency, which was characteristic for the atmosphere of the spiritual life of the pre-Revolutionary period in Russia.

## SOMBART, WERNER

(1863–1941)

Werner Sombart, the German economic and social theorist, was born in Ermsleben near the Harz Mountains. He was professor of economics at the University of Breslau from 1890 to 1906 and at Berlin University from 1906 to 1931. Sombart made a strong impact on German economic thought and policies; he played a leading role in the Verein für Sozialpolitik and the Deutsche Soziologische Gesellschaft, and he was joint editor with Max Weber and Edgar Jaffe of the journal *Archiv für Sozialwissenschaft und Sozialpolitik*.

Sombart's interests covered economic and social history and theory, sociology, and the methodology of the social sciences, although his contributions to methodology were more polemical than constructive. Together with Wilhelm Dilthey, Heinrich Rickert, Karl Jaspers, and Max and Alfred Weber, he helped to establish modern German historical and cultural sociology. Sombart was a highly prolific writer, and few of his writings are free from marks of careless workmanship, though nearly all sparkle with suggestive ideas.

### STUDY OF CAPITALISM

Sombart concentrated on the study of the development and the structural makeup of European industrial society and in particular on the development of capitalism and the transition from capitalism to socialism. In his early work he was influenced by Karl Marx, but in his mature

period he sought to go beyond Marx's theoretical and historical edifice and fundamentally to undermine the Marxist weltanschauung.

Sombart's magnum opus was *Der moderne Kapitalismus*, whose first and second versions (1902 and 1916–1927) both demonstrated methodological and substantive advances. In contrast to Max Weber's comparative-institutional approach, Sombart conceived of the European capitalist system as a "historical individual," that is, the collective expression of the values of the expansive "Faustian" spirit of enterprise and the acquisitive bourgeois spirit. He traced the development of capitalism through early, high (mature), and late periods, each representing different cultural attitudes and styles. The basic qualities of each period were seen as determined by its system of economic values (*Wirtschaftsgesinnung*)—which he understood as being in continuous interpenetration with the other areas of cultural and social activity; by the forms of its legal and social organization; and by its technology and methods. In a dialectical process of transition, one period generates another as its antithesis. His emphasis on the concrete historical elements caused Sombart to neglect the theoretical and analytical structure of economics, which he regarded as supplementary to his own kind of investigation. Thus, economists tend to regard Sombart's work as history, but historians do not.

Sombart supported his study of capitalism by a large number of sociological monographs on such subjects as the city, precious metals, the location of industry, Jews, fashion, advertising, the bourgeois, the proletariat, war and capitalism, and luxury and capitalism. Following the Russian and German revolutions at the end of World War I, Sombart sharply dissociated himself from Marxian socialism, which, like capitalism, he regarded as "uninhibited Mammonism," the victory of evil forces (utilitarianism and hatred) over idealism and love. He advocated "German socialism" or "anticapitalism," based on the rejection of materialism, "technomania," and belief in progress. His specific prescriptions became increasingly totalitarian.

### SOCIAL PHILOSOPHY

In social and cultural philosophy Sombart stressed the idea of an "economic system" (*Wirtschaftssystem*) whose forms and organization are the creation of the mind and reflect the clusters of cultural values (*Wirtschaftsgesinnungen*) mentioned above. The concept of *Wirtschaftssystem* is related to that of structure and to Max Weber's "ideal types." Originally Sombart conceived of this con-

cept in terms of the early psychology of Dilthey and, like Weber, took account of the subjective intentions of historical agents. Later, however, he turned to an almost phenomenological interpretation of the “objective” meaning of cultural systems. Like Weber, Sombart regarded the “ideal type” both as a conceptual tool for evaluating historical processes and as a reflection of the essential structure of historicocultural reality. Sombart, however, emphasized the “realist” function and interpreted history as an expression of the national spirit rather than a multicausal sequence. In the first edition of *Der moderne Kapitalismus* this attitude led him to a naturalistic confusion of theory and history, which was assailed by Weber. Though Sombart was an economist by profession, he regarded economic laws as determined by the exigencies of the spirit of the age, and like Auguste Comte and the German historical school, he rejected the claim of economics to be an independent discipline. In his *Die drei Nationaloekonomien*, which he regarded as the theoretical key to his work, he distinguished between ethical (*richtende*), analytical (*ordnende*), and interpretive (*verstehende*) economics. He rejected the first because science should be ethically neutral, the second because it fastened on applied science only and opened the door to the mechanical methods of the natural sciences, which cannot lead to the required understanding of meanings, of cultural institutions, and of motivations (*Sinn-, Sach-, and Seelverstehen*). His insistence on the exclusion of value judgments, on the one hand, and on an intuition of essences, on the other hand, led Sombart into unresolved intellectual difficulties and caused him finally to stress the superiority of biased observation over the limited vistas of scientific thought. Sombart came to regard the dispute over methods as a contest between German (heroic-spiritual) and Western (utilitarian-mercenary) thought. He reproached Western philosophy for the “deconsecration of the mind,” a destructive tendency to resolve the spiritual realm of ideas into their psychological and sociological elements.

Accordingly, Sombart saw sociology as more than a limited specialized discipline; to him, it was a universal discipline whose aim is to explain the whole of human relationships and cultural categories. He viewed society as a creation of the mind, and accordingly, his “noo-sociology” embraced religion, art, the law, and the state, as well as economics. In his final work, *Vom Menschen*, Sombart assigned the same universal function to philosophical (*geistwissenschaftliche*) anthropology, which was to be developed into a “basic science” coordinating all knowledge concerning human groups and peoples, both their

structures and their origins. This work, a bitter indictment of civilization, was, however, merely programmatic.

Sombart exerted considerable influence upon a generation of German economists and sociologists, but his chief significance lies in his suggestive contributions to the morphology and genesis of capitalism and to the history of economic and social ideas.

## SOPHIA

See Appendix, Vol. 10

## SOPHISTS

In English, the term *sophist* is most often used pejoratively, for one who argues with devious abuses of logic. The Greek *Sophistês* took on a similar sense in the fifth century BCE., but its original meaning is simply *expert* or *wise person*. In the study of Greek philosophy, the sophists denote a group of teachers and intellectuals of the fifth and fourth century BCE (the term is also used for later practitioners of their profession; this soon comes to be interchangeable with rhetoric or public speaking, as in the so-called Second Sophistic movement of the second century CE).

The sophists are perennially ambiguous and controversial figures, and it has long been debated whether they should be deemed philosophers. Two central points seem clear: First, the sophists did not constitute a philosophical school with a shared set of metaphysical and ethical positions; second, a number of them did develop serious, innovative, and influential ideas and arguments on a wide range of topics, and so demand inclusion in the history of ancient philosophy.

The sophists are best seen as an intellectual movement, comparable to the philosophies of the eighteenth century or the progressive thinkers of Victorian England (some of whom, such as George Grote, were champions of the ancient sophists). As always with such movements, it is debatable who should be counted as a member, and membership is in any case more a matter of shared interests and tendencies than common doctrines. The leading figures of the sophistic movement so understood include Protagoras, Gorgias, Hippias, Antiphon, and Prodicus.

Gorgias was primarily a rhetorician (i.e., an expert in and teacher of public speaking), but the two professions must have overlapped widely, and his surviving texts are among the most important for reconstructing sophistic ideas. Socrates was often counted among the sophists by his contemporaries, and is used to represent the whole movement in Aristophanes' *Clouds*; in a number of dialogues Plato aims to show that he differs from them radically.

Sophistic ideas have also come from some important anonymous texts, such as the *Dissoi Logoi* and the *Anonymus Iamblichii* (a long discussion of virtue, apparently of sophistic origin, inserted by the Neoplatonist Iamblichus in his *Protrepticus*), or of contested authorship (notably the fragment on religion from the satyr play *Sisyphus*, attributed to both Critias and Euripides).

They can also be found in contemporary historical and medical texts (e.g., Thucydides' *Melian Dialogues*, the Hippocratic *On the Art*), as well as comedy and tragedy (especially Euripides). So there is no firm dividing line between sophistic thought and the broader fifth-century Greek culture around them, which was marked by a vigorous questioning of tradition and empirical, naturalistic researches into many subjects (*historiê*).

Sociologically, the sophists were professional teachers, the first in Greece to offer a higher education in the liberal arts. Sophists (who came from all over the Greek world) traveled from city to city presenting themselves to prospective students through public displays; this could involve giving a set speech (*epideixis*), performing feats of memory, undertaking to answer any question the audience might pose, or offering question-and-answer refutations of others. This practice of refutation, usually given the pejorative name *eristic*, is formally identical to the Socratic *elenchus*; to differentiate the two, Plato emphasizes that Socrates argues in pursuit of the truth and moral improvement, whereas sophists argue for victory and for money. Some sophists gave displays at the Olympic games, and the sophistic practices themselves were intensely agonistic.

Plato's *Protagoras* gives a vivid depiction of a gathering of sophists engaged in argument, banter, and competitive intellectual showing-off. Such sessions served as advertisements to the wealthy young men who made up the audience, encouraging them to sign on for further teaching. This would be an expensive proposition: The sophists (and above all Protagoras) seem to have charged far more than any other contemporary professionals, and became enormously rich from their teaching. Sophists also served on embassies for their native cities, drafted laws, and wrote books; they were famous and influen-

tial—and bitterly controversial—public intellectuals as well as teachers.

Most sophists are said to have claimed to teach virtue (*arête*), but their curricula and teaching methods varied. In the *Protagoras*, Protagoras chides Hippias for forcing students to study subjects like mathematics and astronomy; he himself claims to teach them good judgment (*euboulia*), enabling them both to manage their private affairs and to succeed in politics, and accepts that this amounts to the teaching of virtue. He also claims that the greatest part of education is the ability to analyze and criticize poetry. So the sophistic teaching of virtue was not a matter of moralistic indoctrination; rather, the sophists taught their students to reflect on traditional values, to analyze and criticize the literary texts that discussed them, and to apply this learning in a political career.

In practice, their teaching seems to have centered on rhetoric or public speaking (hence the blurriness of the line between rhetorician and sophist), which was the key skill for a political career. The connection between teaching rhetoric and teaching virtue is easier to understand if we bear in mind the traditional, Homeric sense of *arête* as excellence—that is, the skills and personal qualities that make a gentleman successful in his career and a valuable asset to his community. By teaching the arts of political success, the sophists *were* teaching virtue in a quite traditional sense. In doing so they prompted debate about just what virtue or excellence really consists in, and in particular about the status of qualities such as justice, *dikaio-sunê*, which seem to benefit the community at the expense of their possessor.

The evidence for sophistic ideas is uneven and very defective. There are several brief, but substantial, works by Gorgias (*On Not Being*; *Defense of Helen*), and a few pages worth of Antiphon's *On Truth*; but for Protagoras, the leading figure of the movement, only a handful of brief fragments (that is, trustworthy-looking quotations in later authors) survive. Moreover, many of our texts are ambiguous or difficult to interpret. For instance, both the *Dissoi Logoi* and Antiphon's discussion of justice seem to argue for contradictory conclusions; perhaps they are exercises in *antilogikê*, opposing arguments, a sophistic genre associated with Protagoras. Gorgias's *On Not Being* and the *Defense of Helen* both seem to be exercises in defending the indefensible; whether they also have serious philosophical agendas is still debated.

A further difficulty is posed by the all-important evidence of Plato, who fixed forever the stereotype of the Sophist. Plato vividly depicts sophists in a number of dia-

logues (*Protagoras*, *Gorgias*, *Republic* [Thrasymachus], *Hippias Major* and *Minor*, and *Euthydemus*), and the *Sophist* is devoted to defining their nature. But Plato's evidence is not consistent: For instance, the *Protagoras* and the *Euthydemus* give very different pictures of sophistic argument, and the *Protagoras* and *Theaetetus* seem to give conflicting accounts of Protagoras's ethical views. Moreover, Plato's presentation of the sophists is sometimes warped by hostile prejudice (though, as Grote [1865] and T.H. Irwin [1995] have noted, he is not as uniformly hostile as scholars sometimes assume), and by his anxiety to distinguish them as sharply as possible from Socrates.

Unsurprisingly, given the focus of their teaching, sophistic thought seems to have centered on ethical and political topics. However, sophistic interests varied greatly; in some cases they were very broad, and several sophists are associated with ideas in mathematics or natural science. So the traditional scholarly contrast between the sophists and the pre-socratics, with their researches into natural science, is probably misguided or at least overstated. The sophists also were founders of what are now called the social sciences; they offered theories of the origins of human institutions such as law and religion, and took a particular scientific interest in language and the norms applicable to it. Here in the social realm, the closest thing to a unifying pattern in sophistic thought is found—their concern to distinguish *phusis* and *nomos* (i.e., the natural and the merely conventional or, as one might now say, socially constructed).

Surviving sophistic texts analyze a wide range of human institutions and values—above all, justice—in these terms, with the assumption that nature represents a deeper or more binding norm than convention. Combined with the sophists' recognition of the differing norms of various cultures (see the *Dissoi Logoi*) and their skepticism about traditional religion, this privileging of the natural could be seen as undermining the authority of moral tradition. However, hostility toward the sophists probably had less to do with their particular theories than with their teaching to all comers the ability to speak persuasively, and with it the power to manipulate both political assemblies and legal proceedings.

It is now generally recognized that it is wrong to describe the sophists collectively as moral skeptics, immoralists, or relativists (Bett 1989, 2002). Protagoras is presented as a relativist in Plato's *Theaetetus*, but not in his earlier and probably more historically accurate *Protagoras*. The *Dissoi Logoi* presents a wealth of evidence for the cultural relativity of values, but argues against relativistic conclusions as well as for them. Sophistic uses of

*nomos* and *phusis* were often in the service of conflicting ethical and political theories, and attempts to pin the sophists down to any common moral theory are doomed by the sheer diversity of sophistic thought. If anything, the sophists (as one would expect given the competitive character of their profession) tended to take up positions in opposition to each other—even if the battle lines are often now blurred by the incompleteness of evidence available.

On matters of natural science, metaphysics, and epistemology, it is still more difficult to identify shared sophistic positions. Antiphon's *On Truth* seems to have offered a complete cosmogony on natural science: Aristotle, in *Physics*, reports him as claiming that the true essence of a wooden bed is wood because if planted it would reproduce a tree rather than another bed. Presumably the force of the scientific part of the work was to spell out this kind of distinction between the underlying natures of things (the realm of *phusis*) and merely superficial human arrangements and projections, (*nomos*).

Gorgias's *On Not Being* seems intended to support a skeptical conclusion, at least as a critique of metaphysicians like Parmenides. His main criticism was: If beings do have a real nature independent of humans, it can neither be known or communicated. Plato's *Theaetetus* attributes a sophisticated relativism or subjectivism in epistemology (and ethics) to Protagoras: its slogan, "Man is the measure of all things," must go back to Protagoras's work *Truth*, but how much of the detailed theory presented by Plato that is genuinely Protagorean is uncertain. Even setting aside other sophistic views (where evidence is even scantier), the most these positions could be said to share is a critical orientation—a tendency to diagnose beliefs and perceptions (both everyday and scientific, or philosophical) as irreducibly subjective.

In keeping with their activities as teachers and writers, and their interest in the analysis of human conventions, the sophists were noted for their researches into language. Prodicus was celebrated for drawing fine distinctions in the meanings of words. It is thought that Protagoras analyzed the parts of speech, and claimed that the words for *wrath* and *helmet*, feminine in Greek, were properly masculine. The sophists are often associated with claims that falsehood and contradiction are impossible, but the evidence for this is unclear and confusing, and these claims are hard to square with the eristic practice of inducing contradictions in others. One might suspect that distinctive views about the nature of truth were entailed by Protagoras's *Measure Thesis*, and lay behind his practice of argument on both sides of a question

(*antilogikê*); but attempts to reconstruct sophistic ideas on these questions are highly speculative.

## SOREL, GEORGES

(1847–1922)

Georges Sorel, the French pragmatist philosopher and social theorist, was born in Cherbourg and was trained at the *École Polytechnique*. He served as an engineer with the French roads and bridges department for twenty-five years in Corsica, the Alps, Algeria, and Perpignan before retiring at the age of forty-five to devote himself to scholarship. In the following thirty years he produced a series of highly curious books on the philosophy of science, the history of ideas, social theory, and Marxism, of which one, *Réflexions sur la violence* (1908; *Reflections on Violence*), immediately became world famous. Before and after his retirement Sorel's life was quite uneventful, for despite his hatred of the bourgeois, his conduct was a model of provincial respectability. Nevertheless, he never married his lifelong companion, Marie David, to whom he dedicated his work after her death in 1897. Sorel's Roman ideas on the importance of chastity, marriage, and the family were no match for his family's objections to Marie's proletarian origins.

### ECONOMICS AND POLITICAL VIEWS

Sorel's first books, on the Bible and the trial of Socrates, were written while he was still in charge of irrigation around Perpignan. They are works of erudition, marked by a streak of passionate eccentricity. Soon after retiring to the suburbs of Paris, Sorel discovered the work of Karl Marx and edited (1895–1897) a magazine, *Le devenir social*, that introduced theoretical Marxism to France. At the same time Sorel collaborated with Benedetto Croce and Antonio Labriola in propagating Marx's ideas in Italy. (Italy was always Sorel's second intellectual home, although he never visited it or even left French territory, and much of his work has been published only in Italian.) Sorel soon became dissatisfied with Marxism's scientific pretensions and joined with Croce, Eduard Bernstein, Tomáš Masaryk, and Saverio Merlino in precipitating the revisionist crisis. The other revisionists drew reformist conclusions from their critique of Marxism and abandoned revolutionary activity, but Sorel did the opposite. He transferred his interest from orthodox socialism to the most revolutionary wing of the French labor movement, the anarchosyndicalists. He argued that this was consistent because the syndicalists did not use Marxism as science but as myth. It was to account for this mythical character of extremist social doctrines that Sorel elaborated one of his most influential theories.

By the eve of World War I, Sorel had lost faith in syndicalism, and for a time he associated with such extreme right-wing groups as the monarchists and ultranationalists, as well as with groups of Catholic revivalists. Silent during the war, Sorel emerged after the Bolshevik Revolution to devote his last energies to the defense of the cause of V. I. Lenin, as he understood it. He supposed that it meant transfer of power away from central authority to the workers' and peasants' soviets and thus that it was in the federalist spirit of Pierre-Joseph Proudhon rather than in the spirit of Marx.

Years earlier, Sorel had predicted an important political career for Benito Mussolini, who, in turn, called *Reflections on Violence* his bedside book. Yet despite tenacious legend, Sorel had no influence over either fascism or communism. He himself disclaimed any part in Mussolini's nationalist doctrines, and Lenin denied drawing ideas from "that confusionist." Apologists of later revolutionary movements, notably African and Asian nationalism, have echoed Sorel's doctrines, and students of all such movements still find useful his conceptions of myth and violence. Croce said that Sorel and Marx were the only original thinkers socialism ever had.

### PHILOSOPHY OF SCIENCE

Sorel accepted Jean-Joseph-Marie-Auguste Jaurès's scornful description of him as "the metaphysician of socialism," for he thought of himself as primarily a philosopher, though not of socialism alone. Socialism engaged no more of his attention than the philosophy of science or the history of Christianity. Sorel's philosophy of science was technological rationalism: Scientific laws were accounts of the working of experimental machinery into which a part of nature, after being purified to make it homogeneous with the manmade mechanism, had been incorporated. There was no cause to suppose that such machines were models of nature's hidden mechanisms, and in fact there was no sign that determinism of any sort operated in nature left to herself. Determinism existed only where men created it, in machines that did violence to nature by shutting out chance interference. Thus, science is concerned with "artificial nature," the manmade phenomena of experiment and industry. It has nothing to say about "natural nature," where hazard, waste, and entropy are uncontrolled, where our knowledge is limited to statistical probability and our intervention to rule of thumb. Sorel accepted the pessimistic conclusions often drawn at that time from the second law of thermodynamics, to the effect that there was absolute

chance in nature and that the universe was “running down” to heat-death.

It was against that malevolent nature of chance and waste that humanity struggled in a hopeless effort of “dis-entropy,” seeking to establish regions of determinism (experimental science) and of economy of forces (productive industry). Being a professional engineer, Sorel could work out these ideas in great technical detail. He even applied them to mathematics, saying that geometry was about architecture, not nature.

## SOCIAL THEORY

Sorel’s social theory derived from his philosophy of science. There are “entropic” trends in society comparable to those in nature. Culture is constantly threatened by a relapse into barbarism and disorder that would make history sheer meaningless succession. Against perpetual decadence men struggle heroically to establish limited zones of law, order, and cultural significance. To succeed in this for a time, they must do violence to their own natures by imposing on themselves a hard discipline and accepting moral isolation amid their mediocre fellows. This means living in conformity to “the ethic of the producers” and seeing the good life to be a cooperative creative enterprise carried on in a self-reliant spirit. Against this ethic stands “the ethic of the consumers,” which takes the good to be things to be obtained rather than a way of acting. In the consumers’ view typical goods are welfare, prosperity, distributive justice, and the classless society, things to be aimed at for the future and enjoyed if secured. Sorel replied that enterprises undertaken in that spirit were based on envy and inevitably fell under the control of adventurers (usually intellectuals) who duped the masses. He cited as instances slave revolts, peasant wars, Jacobinism, anti-Semitism, and contemporary welfare-state socialism.

In contrast, producers’ movements concentrated on building the independent institutions that embodied their morality of productivity and solidarity. Such movements might be concerned with religious, artistic, scientific, or industrial activities, and Sorel took capitalism and syndicalist socialism as successive and equally admirable types of an industrial producers’ movement. The workers were in revolt against capitalism not because of exploitation or inequality of riches (such matters concerned consumers only) but because the bourgeoisie had become unenterprising, cowardly, hypocritical—in a word, decadent. Until some more youthful, vigorous movement wrested social preeminence from the bourgeoisie (and Sorel did not think that socialism was the only con-

tender), Western history would be a meaningless sequence of parliamentary deals and predatory wars. All movements “ran down” in the end, as their nerve failed, even (or especially) without challenge from a new movement. This succession of periods of heroic creativity and decadent barbarism did not constitute a true historical cycle, but Sorel adopted the accounts of the heroic and decadent phases of society given by Giambattista Vico in his cyclical theory. Sorel and Croce stimulated the revival of interest in Vico, and Sorel regarded his own social theory as a Viconian revision of Marxism.

## VIOLENCE

Sorel is remembered less for his general philosophical system than for two notions lifted from it, violence and myth. Sorel found the syndicalists using violence during industrial strikes, and he set out to answer the common charge that a movement that resorted to violence was ipso facto evil and retrograde. He pointed out that Christianity and French republicanism, for example, had welcomed violent confrontations in order to mark clearly their rejection of the social milieu and their refusal to compromise. In such cases violence was a sign of moral health that frightened away lukewarm supporters and gave notice of earnest determination to adopt a new way of life. Physical violence—head breaking and bloodshed—was only one extreme of a range of vehement attitudes of which the other extreme was “a violence of principles,” such as parading the least acceptable part of one’s doctrines (in the Christian religion, miracles) to discourage one’s “reasonable” friends. Sorel’s theory of violence was intended to cover that whole range of attitudes, and the only special stress on physical violence was the statement that without being at all typical of social relationships, physical violence is a logical extreme from which no rising movement will shrink in certain unfavorable circumstances. Such circumstances would be confrontation with the armed force of a state that preached pacifism and social unity while it sought to smother a rebellious minority. The classic case was primitive Christianity, which could have secured tolerance within Roman polytheism but enthusiastically courted violent persecution to mark its unbridgeable differences with paganism. Parliamentary democracy was an even greater threat to independent social movements than polytheism had been to Christianity, because it claimed to have devised, in parliament, a perfect market where all social demands could be reconciled by elected representatives, thus ensuring social harmony. A movement that refused to come to that market because it wanted things other

than parliamentary seats and budget subsidies would have to be unequivocal, vehement, and even violent to escape from the nets of democratic prejudice. Most shocking of all, violence might be exercised not only against supposed enemies but against the men of good will, the peacemakers sent to befriend the minority and corrupt it into conformity.

Sorel's theory of violence caused scandalized misunderstanding among respectable people and some morbid enthusiasm among profascists. Yet Sorel had not defended indiscriminate violence. He had said that since violence is ubiquitous in society, in the form of war and the enforcement of law and order, one could not selectively deplore violence on the part of an opposition without first looking to see who that opposition was. One should ask if it were associated, as so often in the past, with a progressive and heroic morality obliged to be ruthless to force recognition of its independence and to signify its rejection of mediocrity. Sorel noted that such movements built up sanguinary legends about how much violence they had known. Just as strikers exaggerated police brutalities committed on "our martyred dead," so the early Christians had endured far too little persecution to justify the tradition that the church was nourished by the blood of martyrs. Such violent tales were only symbolically true; a few clashes that proved a willingness to go to extremes had revealed the Christian community to itself and its enemies.

Last, Sorel argued (in 1908, when the seeds of world war, Bolshevism, and fascism were germinating) that Edwardian democrats were deluding themselves in thinking that civilized men had progressed beyond the stage at which they would use violence to promote or oppose causes. Violence would never be outgrown (and if it were, that would not be progress) because it was not, absolutely and in itself, brutish. It could be lucid, noble, and applied to the defense of high purposes; it could mark the birth of a new civilizing agency. Of course, it could also be bestial and oppressive, in which case Sorel called it force.

## MYTH

Sorel found that myth was being used by the syndicalists, and he recalled similar uses from history. In no sense did he urge political activists to adopt extremist beliefs they knew to be false. That ambiguity, of which Sorel was accused, was really in the sociological facts themselves, he said. One found movements uttering views about the future without trying to establish their prophecies as scientifically plausible, without even caring to argue whether the forecasts were sound. They cared for those

visions of the future passionately, but they cared for them only as inspiring pictures of what the world would be like if the new morality won all men's hearts. Such visions were myths, a present morality stated in the future tense. The case in point was the general strike. Syndicalists said socialism would come if all workers went on strike at once, whereupon the capitalist state would be paralyzed. Parliamentary socialists replied, reasonably enough, that for the workers to strike all at once and successfully defy the state, they would have to be ardent socialists to a man and the regime ripe for overthrow. But in that event socialism would already have arrived, and the general strike would not be needed. It was not a means to anything because it presupposed that all the problems were solved. Precisely this, answered Sorel, is the social function of the general strike. It is the dramatic picture of a morality triumphant. It is not a plan or scientific forecast, and therefore rational criticism of it is pointless. Besides, intellect has nothing better to put in its place, because the future is radically unpredictable and there is no science of the unknowable. A myth, being the expression of the aspirations of an enthusiastic mass of men and women, could well foreshadow something like itself, at least something equally sublime, whereas scientific blueprints for the future foreshadowed nothing but disappointment, the rule of intellectual planners, and the spread of the consumer outlook among those who waited for the planned good time to start. Granted that prevision is impossible, there are only two sorts of attitude toward the future—myths and utopias. Myths command respect as the product of intense social wills that could achieve something in history; utopias deserve scorn as the divagations of solitary intellectuals.

Sorel's tolerant view of myths and his anxiety to protect their improbabilities from rational examination were dependent on his conviction (drawn from Henri Bergson's philosophy) that the future is undetermined and thus totally unknowable. Few philosophers accept that position, and they would thus feel entitled to be more critical of myths than Sorel allowed. Yet he provided social theory with a valuable new concept—the galvanizing mass faith about which even its own believers are ambivalent, half admitting it to be improbable and yet clinging to it as the dramatic epitome of the cause they live for.

## SOSA, ERNEST

(1940–)

Ernest Sosa is Romeo Elton Professor of Natural Theology and Professor of Philosophy at Brown University and regular Distinguished Visiting Professor at Rutgers University. He received his Ph.D. from the University of Pittsburgh and has taught at Brown since 1964. Since 1983, he has been the editor of *Philosophy and Phenomenological Research* and since 1999, with Jaegwon Kim, the co-editor of *Nous*. Sosa has published essays on issues in a wide variety of philosophical areas such as metaphysics, logic, philosophy of mind, theory of action, and philosophy of language, but he has been most influential in epistemology, where he is known for advocating a virtue-based approach to the analysis of knowledge and justification with an emphasis on the importance of a reflective perspective.

What is distinctive of virtue epistemology is the order of explanation: A belief's epistemic status is to be understood in terms of the epistemic properties of the subject, which in turn are to be captured by employing the concept of an intellectual virtue. How is this concept to be understood? In pure virtue epistemology, construed in analogy to pure virtue ethics, the concept of an intellectual virtue is basic (Foley 1994). Sosa, however, conceives of an intellectual virtue as a stable disposition to form true beliefs in a certain field of propositions, E, under suitable circumstances, C. Thus his brand of virtue epistemology, which he has labeled virtue perspectivism,

is not an example of the pure kind but may be viewed as a form of reliabilism.

The two main elements of Sosa's virtue perspectivism are the concepts of an intellectual virtue and an epistemic perspective. As already indicated, Sosa conceives of intellectual virtues in terms of reliability. Reliably functioning faculties, such as vision, hearing, introspection, and memory are examples of intellectual virtues. Sosa calls beliefs that are grounded in the exercise of such virtues apt. Apt beliefs, if true, qualify as knowledge, or, more precisely, as animal knowledge, to be distinguished from reflective knowledge. With the distinction between these two kinds of knowledge, the second main element of virtue perspectivism comes to the fore: the concept of an epistemic perspective.

Let S refer to the subject whose beliefs we wish to evaluate. Suppose S's visual belief that p is true and, due to the reliability of S's vision, apt. Hence by employing her faculty of vision, S acquires animal knowledge that p. For S's belief to rise to the level of reflective knowledge, a further condition must be met: S must form a meta-belief to the effect that her belief and its being true have their origin in a reliable faculty. In general terms, if from S's epistemic perspective, a faculty is coherently viewed as reliable within field F and circumstances C, then by employing this faculty S can acquire reflective knowledge within field F and circumstances C.

Animal knowledge, then, results from external aptness: the exercise of faculties that are in fact reliable. Reflective knowledge also requires aptness, but, in addition, the adoption of an internally coherent perspective with respect to the reliability of one's faculties. Sosa's virtue perspectivism, then, combines both an externalist and an internalist element.

In the large body of work in which Sosa articulates and defends his approach to the philosophical explanation of knowledge and justification, he has addressed various problems that arise for virtue perspectivism. First, there is the problem of what a reliabilist should say about what are referred to as *evil demon victims*: subjects whose beliefs seem justified although, due to the massive deception to which the victims are subjected, their beliefs are grounded in unreliable faculties. Sosa responds that, whereas the demon victims' beliefs are *actual world* justified (as the victims' faculties would be reliable in the actual world, they are *same world* unjustified because the faculties the victims employ are unreliable in their own world (1994a). In more recent terminology, Sosa classifies the victims' beliefs as adroit though not apt (Sosa 2003).

Second, Sosa's reliability-grounded virtue perspectivism is challenged by what Sosa calls the *problem of meta-incoherence*, which arises from cases in which a subject's beliefs are produced by a faculty whose de facto reliability is not (or at least not yet) recognized by the subject. Since such subjects do not meet the perspectival condition of having formed reliability-attributing meta-beliefs about the relevant belief sources, Sosa judges that the beliefs in question are unjustified, or not reflectively justified (Sosa 1991).

Third, there is the generality problem, which for Sosa amounts to the challenge of finding the right level of specificity in describing field and circumstances. Here, Sosa's solution is to require that the relevant descriptions be useful within the subject's epistemic community and to the subject herself (Sosa 1991). Three further, important problems to which Sosa has articulated detailed solutions are the following: First, how can we distinguish between accidental and non-accidental reliability? Second, what justifies reliability-attributing perspectival meta-beliefs (Sosa 1994a)? Third, why is the process by which reliability-attributing meta-beliefs are formed (using, for example, perception to attest to the reliability of our perceptual faculties) not viciously circular (1994b and 1997)?

Recently, Sosa has also contributed important work on the following question: If a belief is to be an instance of knowledge, what modal link must there exist between the belief and its truth? According to some, knowledge requires sensitivity: S would not believe that p if p were false. Viewing this condition as too demanding, Sosa objects to it on the basis of the following case: Having dropped a trash bag in the garbage shoot, you believe the bag will momentarily reach its destination in the basement. This belief, Sosa suggests, amounts to knowledge even though it is not sensitive: if p (the bag will land momentarily) were false (because, say, the bag snagged in the shoot), you would still believe p. As an alternative, Sosa proposes safety: If S were to believe p, p would be true (or: Not easily would S believe incorrectly in believing that p). Though your belief that the bag will land momentarily is not sensitive, it is indeed safe, for possible worlds in which S believes that the bag will shortly arrive downstairs, but believes this mistakenly, are indeed remote (Sosa 1999).

The distinction between safety and sensitivity assumes particular significance for Sosa, for he appeals to it for the purpose of rejecting the contextualist solution to the puzzle of skepticism. Contextualists have argued that, when confronted with a skeptical argument, we face

a paradox because, although we find the premises plausible, we wish to reject the conclusion. According to the contextualist response, the puzzle is to be solved by appeal to the context-sensitivity of the word *know*. Sosa suggests an alternative solution: Skeptical arguments may (misleadingly) seem cogent because we fail to recognize that knowledge requires not sensitivity, but merely safety (Sosa 1999 and 2003).

## SOTO, DOMINIC DE (1494–1560)

Dominic de Soto, the Dominican scholastic theologian, was born at Segovia, Spain, and died at Salamanca. He studied at Alcalá de Henares and became a professor of philosophy there after advanced studies at the University

of Paris. Entering the Dominican order in 1524, Soto taught theology from 1525 onward at the University of Salamanca. He was very active in the deliberations of the Council of Trent. Soto's writings include two commentaries on Aristotle (*In Dialecticam Aristotelis*, Salamanca, 1543; *In Libros Physicorum*, Salamanca, 1545). Theological works containing some philosophical thought are *Summulae* (4 vols., Burgos, 1529); *De Natura et Gratia* (Venice, 1547); and the treatise *De Justitia et Jure* (Justice and the law; Salamanca, 1556).

One of the founders of the school of Spanish Thomism, Soto had his own opinions on many philosophical questions. Like John Duns Scotus, he denied the usual Thomistic distinction between essence and existence. In theory of knowledge, he also showed the influence of Scotism, teaching that the primary object of human understanding is indeterminate being in general. His psychology followed that of Thomas Aquinas, with strong emphasis on the intellectual functions: the intellect is a nobler power than the will. Soto is an important figure in the philosophy of law and politics. He violently criticized the theory of the state of pure human nature, as popularized by Cardinal Cajetan and Francisco Suárez. Unlike his teacher, Francisco de Vitoria, Soto taught that law stems from the understanding rather than from the will of the legislator; he clearly differentiated natural law, which depends on the real natures and relations of things, from positive law, which results from a decision of the legislator (*De Justitia* I, 1, 1). In political philosophy he represents a growing tendency toward democratic thinking in Renaissance scholasticism: Both civil and ecclesiastical power derive ultimately from God, but the civil power proceeds through the medium of society; the people concretize the authority received from God in the persons whom they designate as rulers. Soto is also regarded as one of the founders of the general theory of international law.

## SOUND

“Sound” according to Aristotle’s *De Anima* (418a12) and George Berkeley’s *First Dialogue*, is the special, or proper, object of hearing. G. J. Warnock, in his *Berkeley*, interprets this as meaning that sound is the “tautological accusative” of hearing: Sounds can only be heard and must be heard if anything is heard.

Hearing receives attention in philosophy mainly for its differences from seeing. Two respects in which listening and hearing differ from looking and seeing are (1) that there is nothing analogous, in seeing, to hearing the sound of something, and (2) that, in telling where something is, there is nothing analogous, in listening, to our having to look in the right direction.

Warnock’s explanation of the first of these differences is that we establish the presence and existence of an object by sight and touch, and then proceed to distinguish the object thus established from its smell and taste and the noises it makes. He mentions, as reasons for not ascribing such primacy to hearing, that inanimate objects often do not make any noises, that animate ones make them only intermittently, and that it is often difficult to tell where a sound is coming from. There would be a further reason if, as P. F. Strawson maintains (in *Individuals*, p. 65), a universe in which experience was exclusively auditory would have no place at all for spatial concepts. This reason would be decisive if in a nonspatial world there could be no concept of an object (*Individuals*, Ch. 2). Strawson asserts that we can discover some spatial features of things by listening (for instance, sounds seem to come from the left or right), but denies that such expressions as “to the left of” have any intrinsically auditory significance. In accordance with this, G. N. A. Vesey labels knowing where a sound comes from by listening “borrowed-meaning” knowledge. Berkeley makes use of the fact that we talk of hearing sounds caused by things, together with the principle that “the senses perceive nothing which they do not perceive immediately: for they

make no inferences,” to gain acceptance of the view that we cannot properly be said to hear the causes of sounds.

We can see directly (otherwise than by reflection) only what is on the same side of our heads as our eyes. Knowing in what position we have had to put our heads—in what direction we have had to look—to see an object, we know in what direction the object is. Hearing is not limited in this fashion, and so we identify the position of a merely seen object and a merely heard object very differently. Furthermore, if Strawson and Vesey are right about spatial expressions not having an intrinsically auditory significance, we cannot hear that one object is to the left of another as we can see that one object is to the left of another. It might be concluded that knowledge that the source of a sound is to one’s left, gained by listening, must be mediated knowledge—that is, must have involved the making of an inference. To be valid, this conclusion would require the further premise that acquiring a perceptual capacity is invariably a matter of learning to interpret one thing as a sign of another. An alternative hypothesis would be that the only interpretation involved is at the physiological level; that is, that differences in the stimuli to the two ears which, in a person whose experience was exclusively auditory, would have no counterpart in experience, would, in a person who knew what it was to see and feel things as being on his left or right, subserve his hearing things as being on his left or right.

B. O’Shaughnessy (“The Location of Sound”) asserts that hearing where a sound comes from is noninferential and immediate. He contends that the seeming mysteriousness of the fact that listening can tell us where a sound is coming from is the result of our thinking of what is heard as a complex of two elements, “the sound itself” and “its coming from the left” (defining “the sound itself” as what is auditory—evidence of a “metaphysical theory of the sensory substratum”), and then having to think of its coming from the left either as “part and parcel of the sound” or as something we experience “other than and additional to the sound itself” but somehow related to it. That the sound is coming from the left, O’Shaughnessy holds, is neither part of the sound, nor something else we experience; nor is it something “we simply know.” The mistake lies in our thinking of what is heard as a complex, and O’Shaughnessy sees this as a result of our having “the idea that a thought or meaning is a complexity.”

Sound is a Lockean secondary quality. Hylas, in Berkeley’s *First Dialogue*, accordingly distinguishes between sound as it is perceived by us (“a particular kind of sensation”) and sound as it is in itself (“merely a vibrative or undulatory motion in the air”). Consideration of this

philosophical position would not seem to raise issues peculiar to sound.

## SOVEREIGNTY

Analysis of "sovereignty" brings one into contact with nearly all the major problems in political philosophy. At least seven related concepts may be distinguished:

(1) A person or an institution may be said to be sovereign if he or it exercises authority (as a matter of right) over every other person or institution in the legal system, there being no authority competent to override him or it. For some writers, though not for all, this concept also implies unlimited legal competence; for, it is said, an authority competent to determine the limits of its own competence must be omnicompetent. (2) Difficulties arising from the first concept have led some writers to ascribe sovereignty to a constitution or basic norm from which all other rules of a system derive validity. (3) Sovereignty is sometimes ascribed to a person, or a body or a

class of persons, said to exercise supreme power in a state, as distinct from authority, in the sense that their wills can usually be expected to prevail against any likely opposition.

The state itself is often said to be sovereign. This may mean any of at least four distinct (though possibly related) things: (4) that the state as an organized association will in fact prevail in conflict with any person or any other association in its territory; (5) that the rights of all such associations and persons derive from the legal order that is supported by the state or that (according to Hans Kelsen) *is* the state; (6) that the state is a moral order with claims to obedience and loyalty which have precedence over all others; (7) that the state is autonomous vis-à-vis other states; according to some theories, the state has only such obligations, whether in law or in morals, as it chooses to recognize.

### CLASSICAL AND MEDIEVAL THEORIES

Aristotle regarded legislative authority as supreme in a state and classified states according to whether it was located in a monarch, in an oligarchical assembly, or in an assembly of the whole people. But to speak of a "supreme legislative authority" is a little misleading here; for the Greeks, legislation was the local application of a divinely ordained order, rather than the authoritative creation of new laws. The Roman concept of imperium was nearer sovereignty: The princeps (ruler) personally embodied the supreme authority of the Roman people. He was *legibus solutus* (not bound by the laws), at least in the sense that no one could question his enactments. Still, there were strong elements of natural law in Roman jurisprudence; the emperor was supreme because his function was to command what was *right* and for the public good.

There was rather less room for sovereignty in medieval political thought. According to Thomas Aquinas, for instance, the king was not only subject to divine and natural law but for most purposes to the custom of his realm as well. Medieval statutes commonly purported to restore laws that had been abused, rather than to innovate. In Thomas's view the Roman maxim *Quod principi placuit legis habet vigorem* (What pleases the prince has the force of law) was valid only if the prince's command was reasonable. According to Henry de Bracton, "the king ought to have no equal in his realm ... [but] he ought to be subject to God and the law, since law makes the king ... there is no king where will rules and not the law" (*De Legibus et Consuetudinibus Angliae*, edited by G. Woodbine, New Haven, CT, 1915–1942, Vol. II, pp. 32–33). Similarly, the *plenitudo potestatis* ascribed

to the pope usually meant that supreme ecclesiastical authority was undivided, or that he held a reserve jurisdiction in secular matters—not that he was *legibus solutus*.

Alongside the doctrine of royal supremacy was another that derived royal authority from the people corporately. According to Marsilius of Padua, supreme authority rested in the *legislator*, which was either the whole organized community or an assembly (not necessarily elected) that spoke for it. Marsilius's stress on legislation as the will of a supreme authority brought him closer than his predecessors to Jean Bodin and Thomas Hobbes.

### BODIN: PARADOX OF LAWFUL SOVEREIGNTY EGOISM

Bodin's *Six livres de la république* (1576) is generally considered the first statement of the modern theory that within every state there must be a determinate sovereign authority. Writing during the French religious wars, he insisted that an ordered commonwealth must have a sovereign competent to overrule customary and subordinate authorities. Sovereignty is "a supreme power over citizens and subjects unrestrained by law"; it is "the right to impose laws generally on all subjects regardless of their consent." Law is "nothing else than the command of the sovereign in the exercise of his sovereign power." Accordingly the sovereign could be subject to no one else, for he makes the law, amends it, and abrogates it for everyone. Nevertheless, he is subject to the laws of God and of nature. For instance, he may not seize his subjects' property without reasonable cause and must keep his promises to them. Moreover, he must respect the fundamental laws of the constitution, like the succession law, for sovereignty, as a *legal* authority, stems from these.

In defining sovereignty as a supreme power unrestrained by law, while yet admitting these limitations, Bodin is not as inconsistent as he is commonly said to be. Within the legal system, sovereignty may be unlimited; yet the sovereign may be bound in morals and religion to respect the laws of God and nature. Bodin's suggestion that sovereignty can be limited by constitutional laws raises more serious difficulties; for if "law is nothing else than the command of the sovereign, in the exercise of his sovereign power," how can any law be beyond his power to amend? The qualification, "in the exercise of sovereign power," may be important. Constitutional laws seem to be what H. L. A. Hart calls "rules of recognition" (see his *Concept of Law*), that is, they are rules that lay down the criteria of validity for rules of substance; they constitute

the sovereign office, designate who shall occupy it, and identify his acts as those of a sovereign authority. For the sovereign to interfere with them, Bodin said, would be for him to undermine his own authority. If the acts of the sovereign are those done "in the exercise of sovereign power," that is, in accordance with the rules of recognition, it would be logically impossible to act in a valid sovereign way inconsistently with these rules. Nevertheless, the sovereign could still amend them so long as he used the unamended procedures to do so. Yet Bodin regarded the rules constituting the sovereign office as unamendable in principle; should the prince infringe them, "his successor can always annul any act prejudicial to the traditional form of the monarchy since on this is founded and sustained his very claim to sovereign majesty" (all quotations from *Six Books*, Bk. I, Ch. 8).

Bodin's reasoning, though confused, bears closely on certain twentieth-century constitutional controversies in the United Kingdom and Commonwealth countries, which have hinged on the contention that a sovereign legislature, though admittedly competent to prescribe its own powers and procedures, must yet do so only by the procedures currently laid down. Such procedures, it is argued, are among the criteria for identifying the legislature and for determining what constitutes one of its acts. Bodin's analysis of sovereignty also suggests how an omnicompetent authority like the British Parliament can yet limit its omnicompetence, as it purported to do in the Statute of Westminster of 1931. In that statute it renounced supreme authority over the dominions by making their advice and consent part of the procedure for any future legislative acts affecting them.

### HOBBS: SOVEREIGNTY AND SUPREME POWER

Where Bodin was concerned mainly with supreme legal authority, Hobbes was more concerned to show a necessary relation between order, political power, sovereign authority, and political obligation. Hobbes argued that since no man can safely rely on his own strength or wits alone, men's obligations under the law of nature to forbear from harming one another must be subject to mutual guarantees; otherwise, for anyone to forbear in the competitive struggle would be to endanger his life. There is no reliable guarantee unless all parties agree not to exercise their "natural right to all things," but to submit unconditionally to a sovereign authorized to act on behalf of each of them, with the power to make them keep their agreements. Mutual forbearance would then be a duty. Sovereignty, therefore, is necessary for a social order

among equals. Sovereignty cannot be made effectively subject to conditions without depriving it of its point; for on whom could be conferred the authority to judge whether such conditions had been violated? If on the individual subjects, no one individual could rely on the submission of any other. If on the sovereign, the conditions themselves would be merely formal. And there could be no independent arbiter, for any independent arbiter who could impose his ruling would himself be sovereign. Sovereignty is likewise indivisible, for if anyone had the power to mediate effectively in conflicts of authority, he would be sovereign. The united strength of all is therefore the sovereign's to use as he thinks fit. His duties under God and natural law are strictly God's business. The subject, having freely surrendered the right to interpret the law of nature for himself, must accept the sovereign's pronouncements on what is right and wrong. He could, however, be under no obligation to take his own life or to submit willingly if the sovereign should seek to kill him. Both commitments would be unnatural, being contrary to the supreme end, which is to avoid sudden death; and having no sanction in reserve, the sovereign would have no way of enforcing either obligation.

The sovereign remains one only so long as "the power lasteth, by which he is able to protect" his subjects. The purpose of submission is protection; protection requires overwhelming power; so overwhelming power is the actual condition for supreme authority. Conversely, supreme authority, brooking no rivals, commanding the power of everyone, wields supreme power. Further, natural law enjoins us to keep our covenants, above all the covenant establishing the civil order. In its concrete political expression, natural law is identical with the command of the sovereign and therefore with the civil law. So the sovereign authority is also the supreme moral authority.

### JOHN AUSTIN AND THE IMPERATIVE THEORY OF LAW

The imperative theory of law expounded by Hobbes was developed by Jeremy Bentham to disarm opponents of legal reform who treated natural law and morality as built-in justifications of the unreformed common law. For if, as Bentham argued, law were simply whatever the sovereign commanded, or, in the case of the common law, what he chose not to rescind, then it might be reformed by command in accordance with rational principles of utility. In the hands of Bentham's disciple John Austin the theory of sovereignty became a tool for juristic analysis. "Law properly so-called" was distinguished from rules of other kinds as a "rule laid down for the guidance of an

intelligent being by an intelligent being having power over him." Within any legal system there must be one supreme power, "a *determinate* human superior, *not* in a habit of obedience to a like superior (receiving) *habitual* obedience from the *bulk* of the society" (*Province*). His will was the ultimate validating principle of law; otherwise the quest for validity would lead to an infinite regress. Austin avoided it by resting sovereignty on the sociological fact of obedience.

The English Parliament, which is subject to legal limitation or restraint by no other authority is, *prima facie*, the paradigm of a sovereign legislature. Yet if its will is law, that is because law makes it so. Moreover, it is the law that defines the conditions for determining what that will is. For an institution has a will only by analogy; it is constituted by the decisions of individuals playing roles defined by rules. A change in the rules might change the will, though the individual decisions remained the same. Austin himself falters, admitting that to identify the members of the sovereign Parliament would require a knowledge of the British constitution. Habitual obedience, in short, may be rendered not to *determinate* individuals but to an institution, which is a legal creation. In the United States supreme legislative authority rests in the constitutional amending organ—composed of the two houses of Congress, each acting by a two-thirds majority, plus three-quarters of the states, acting through their legislatures or by conventions. So complex, discontinuous, and impersonal an authority cannot enjoy habitual obedience; its authority, like its very being, presupposes the law. To say that the law is what it commands, simply because it is formally competent to annul any rule, is to use "command" in a very strained sense.

In any case, there could be a constitution without an amending organ that nevertheless could allocate areas of competence to a number of organs. All authorities would then be limited. If one could still speak of sovereignty, it would be divided among them, with no "determinate human superior"; each would be supreme in its own sphere. The notion that sovereignty must be indivisible and omniscient is a corollary, then, of the false theory that every law is an enforceable command. Federal states retain their character not because their component institutions obey a sovereign authority able to enforce its will but because there is a general disposition to conform to accepted rules and in cases of dispute to accept the arbitration of the courts. The latter, however, being formally incompetent to legislate, cannot themselves be the requisite Austinian common superior.

The imperative theory was in part an attempt to determine the conditions that a legal system must satisfy if rules valid within the system are to be identifiable and conflicts of rules resolved. An alternative answer, however, is that every system must have what Hans Kelsen called a *Grundnorm* (a basic law), which is “the supreme reason of validity of the whole legal order” and which gives it its systematic unity. In these schematic analyses of legal systems, the basic law (usually a constitution) and the Austinian sovereign have very similar functions. Some writers indeed have transferred the concept of sovereignty from rulers to constitutions, thus abandoning the imperative theory. This either leaves a purely structural analysis of a legal order or it substitutes for Austin’s “habitual obedience” respect for the constitution as the sociological starting point.

### SOVEREIGNTY AND POLITICAL POWER

As Austinian analyses of sovereignty became metalegal and remote from political facts, attempts were made to split, not indeed the sovereign, but the concept of sovereignty into two types: legal and political (or practical). The first would be attributable to the supreme legislature; the second to the class or body in the society that “could make [its] will prevail whether with or against the law” (James Bryce) or “the will of which is ultimately obeyed by the citizens” (A. V. Dicey). In a democracy this would normally be the people, or the electorate.

The notion of sovereignty as supreme power in the latter sense, however, suggests certain problems. First, one must generally take account not only of what one can do by oneself but also of other people’s possible resistance or cooperation. No one can ever do just what he wants; even the supreme army commander must keep the troops loyal. Every social choice is between only those alternatives that the powers of other men leave open. Political decisions reflect not only actual pressures but also those that might be anticipated were things decided differently. Again, a group may exercise very great power in that policy sphere in which it has an interest as a group; but in others its members’ interests may be diverse and conflicting, and there may be quite different configurations of interests and pressures. This does not mean that there could never be a particular group strong enough to get its way regardless of counterpressures, and with group interests spanning most of the important areas of policy. Even so, many political scientists see decisions emerging not from the domination of any one particular will or group interest but rather from an interplay of interests and pres-

ures. In their view, the concept of supreme power simply suggests the wrong model. At best the concept would mean that in the search for explanations one need not look outside the internal politics of the supreme group; other groups could safely be ignored.

### SOVEREIGNTY AS MORAL SUPREMACY: ROUSSEAU

The transposition of the concept of sovereignty from the context of seventeenth-century and eighteenth-century despotisms to the modern, popularly based state accounts for many of the perplexing features of the concept. The sovereign was then a king by divine right who at his strongest was subject to very few restraints and no legal limitations and to whom, it was said, his subjects owed unconditional obedience as a moral and religious duty.

Jean-Jacques Rousseau shifted sovereignty from the king to the people, which was now to exercise supreme power, somewhat paradoxically, over itself. For Rousseau, the citizens of a state had put themselves freely but unconditionally “under the supreme direction of the general will.” And he radically altered the emphasis of the old doctrine that the people is the source of supreme authority by suggesting that the general will would be authentic and binding only if every citizen participated equally in expressing it. Moreover, since its object was the common good, there could be no higher claim on the citizen; he realized his own highest ends in total submission to it. As a legislating participant and a beneficiary of the moral order sustained by the general will, he attained freedom, not in the unrestricted slavery of impulse and appetite, but in obedience to a moral law that he prescribed to himself. It is true that Rousseau did not identify the will of all with the general will. The latter would be expressed only if the citizens addressed themselves to the question Wherein does the common good lie?, not to the question What would suit me personally? Democracy, too, can be corrupt, and the state in decay.

From Rousseau on, to ascribe sovereignty to the people was not (or not only) to state a political fact or a legal theory but to make a moral claim. Moreover, Rousseau reshaped the whole conceptual order of politics when he wrote that “the public person” created by the act of political association “is called by its members *State* when passive, *Sovereign* when active, and *Power* when compared with others like itself. Those who are associated in it take collectively the name of *people*, and severally are called *citizens*, as sharing in the sovereign power, and *subjects*, as being under the laws of the state” (*Social Contract*, Bk. I, Ch. 7). It was the citizen, not the king, who might say,

henceforth, *L'état, c'est moi*. Consequently, the object of the state, if not corrupted by tyrants or by selfish sectional interests, was a good in which all its members might participate on terms of justice and equality. Its sovereignty amounted to a claim to override, in the name of the public interest, all lesser associations and interests.

### THE STATE OF HEGELIAN IDEALISM

Rousseau was hostile to sectional associations as rivals to the general will; G. W. F. Hegel accepted them as partial expressions of, or vehicles for, the more inclusive Idea that was the state. The state's sovereignty lay in its moral pre-eminence over all other forms of human association. As the highest stage in the moral evolution of man, the state embodied concretely, as a living institution, man's autonomous, rational will. Man progressed dialectically through the conflict of states, the most vigorous and forward-looking state taking the leadership of humanity from the aging and debilitated and setting its own mark on a new age. The state was sovereign, therefore, in its relations with other states because it owed them nothing; its highest moral commitment was to its own survival as the agent of history, which alone could judge its works.

**CRITICS.** The Hegelian view of sovereignty was challenged early in the twentieth century by political and legal theorists and historians, such as Otto von Gierke, Hugo Krabbe, Léon Duguit, F. W. Maitland, J. N. Figgis, and H. J. Laski. They substituted a pluralistic for the monistic model of the state. They held that state and society must be distinguished; that society is made up of many associations, each serving its own range of human needs and interests. They denied that the state's moral purpose, whether ideal or actual, gives it a special claim on the allegiance of its members, overriding the churches' claim on those of them who are believers, or the unions' on those of them who are workers. In a given situation, a church might mean even more to believers than the state. Moreover, the suggestion that the corporate legal status and existence of associations depends on state recognition was vigorously repudiated. Associations came into existence to fulfill needs the state could not satisfy.

According to Duguit, the existence and corporate rights of associations and, indeed, law itself were social facts that the state simply registered; it did not create them. According to Figgis and Laski, the state's claim to regulate the constitutions, aims, and internal relations of other associations was an invasion of their corporate moral autonomy. Each was strictly sovereign in its own sphere. The pluralists conceded that the state must con-

tinue, but as an umpire, maintaining the minimal conditions of order, determining conflicts of jurisdiction, and protecting members of one association from the encroachments of another. Hobbes would certainly have interpreted this as an admission of the need for a single sovereign authority; for as arbiter, the state must have the power to judge what is an encroachment and therefore the powers of review and disallowance. Enjoying an overriding authority, the state could not be merely one among others. Despite Duguit, the law must ultimately be determined by state officials. For Kelsen, who identified state and law, corporations are necessarily subsystems within the state system, since their rules have legal effect only by the state's extending recognition to them. But, of course, the same could conceivably be said, in reverse, of other associations. For instance, the state could just as well be seen from a religious standpoint as encapsulated within the greater religious and moral order sustained by the church.

### SOVEREIGNTY IN INTERNATIONAL RELATIONS

Is state sovereignty consistent with international law? In Hobbes's view, states confront one another in the posture of gladiators—lacking a common superior, they could not be subject to any law. Austin regarded international law as a kind of positive morality; without a sovereign, it could not be “law properly so-called.” Attempts have been made to get around this difficulty by what Georg Jellinek termed *auto-limitation*: International law is binding because sovereign states have imposed it on themselves. The relation between international law and a municipal legal order can be expressed, in Kelsen's terms, as follows: Seen from the standpoint of a municipal legal order, international law is validated in a self-subsistent municipal legal system by the *Grundnorm* of that system, in other words, by being received into the system. Kelsen repudiated this conclusion, however, because he wanted to maintain that there is one all-inclusive world of law and that international law itself provides the principles validating the laws of so-called sovereign states as subsystems. But one could as well describe the one world of law from the standpoint of any legal system one chose, on the condition that it recognized other legal systems. For each system could encapsulate the rest, including international law.

Article 2 of the United Nations Charter claims that the organization is based on the sovereign equality of all members. This must surely mean that states are sovereign if, unlike colonies or trust territories, they are not liable to

have any binding obligations laid upon them by other states without their consent. If international law is really a legal system, however, it cannot mean that a state has obligations only if, and for as long as, it chooses. For then there is no law. The notions of unlimited competence or overriding authority associated with “sovereignty” in a state’s internal relations are out of place here. A sovereign state in international law must therefore be a particular kind of legal personality, like corporations in municipal law, with characteristic powers, rights, immunities, and obligations, including those implied in the principle of equality—namely, freedom from interference in its domestic jurisdiction, and, in the absence of an international legislature, immunity from new obligations except by consent. Nevertheless, states are considered bound by the established law and custom of nations, and the obligations of new states date from their inception and do not wait upon any consent or deliberate act of acceptance.

Finally, the alleged equality of sovereign states is not, of course, equality in power. Sovereignty in law is consistent with a large measure of actual control over a state from outside, though a minimum of independence might be a qualifying condition for sovereign status. Even the most powerful state, however, cannot ignore altogether the need to placate its friends and to avoid provoking its foes to the point of inconvenient obstruction. Freedom to act is relative in international as in internal affairs.

## SOVEREIGNTY [ADDENDUM]

Sovereignty is one of the central organizing concepts of modern Western political thought. To say that it is a concept central to the organization of political thought is not to say that it is one of the concepts on which political theorists have lavished the greatest amount of explicit attention. But it is to say that certain claims about sovereignty are crucial to the way philosophers in the modern period have modeled or pictured the political world about which they are theorizing. That way of picturing the political world gained currency following the Peace of Westphalia, which was brokered to end the wars of religion that wracked Europe after the Protestant Reformation. It can therefore be called the post-Westphalian model.

The Peace of Westphalia gave impetus and sanction to the emergence of national states in Europe. The post-Westphalian model is a model of the world of states as philosophers such as Thomas Hobbes and Jean Bodin thought that world should be. The most important claims made by proponents of the post-Westphalian model are that the world is (a) divided into states that (b) should be ruled by agents who exercise sovereignty within the boundaries of the states they govern, and (c) are themselves sovereign with respect to one another. Recall that according to (1) and (3) in Stanley Benn's entry above, to

say that an agent exercises sovereignty is to say that that agent exercises political authority or power, and that there is no agent who is authorized to override the decisions of the agent to whom sovereignty is ascribed, or who can generally be expected to prevail against that agent. According to the post-Westphalian model, then, the political world (a) consists of states (b) each of which is ruled by an agent exercising supreme power or authority within that state's borders, and (c) those states are not themselves subject to an agent who exercises such authority or power over international relations.

The central elements of the post-Westphalian model raise a number of interesting and important philosophical questions. That the European political world seemed increasingly to conform to the post-Westphalian model in the modern period guaranteed that the questions raised by (a), (b), and (c) would have a high place on the agenda of Western political theory. It is because these questions are raised by the claims about sovereignty that lie at the heart of the post-Westphalian model that sovereignty has become a central organizing concept of political philosophy—a concept the analysis of which, as Benn said, brings one into contact with nearly all the major problems of the discipline.

While political philosophers continue to debate the details of the post-Westphalian model, it is widely agreed that the sovereignty, which the model ascribes to rulers and states, confers on the sovereign a presumption of control over a state's people, territory, and boundaries. To question the presumption of such control—by, for example, asserting that other states may interfere in a state's internal affairs at will—is to question the sovereignty of the ruler or the state in question. Contemporary developments in politics and philosophy have led to criticism of the post-Westphalian model. Critics proceed by questioning whether states are the only corporate agents of interest in the political world and whether rulers and states can or should enjoy the presumption of control—hence the sovereignty—the model is generally taken to imply.

Why question whether states can exercise the control presupposed by the post-Westphalian model? The increasing importance of non-state actors in international affairs, and the various processes that constitute what is often called globalization, make it increasingly difficult for governments to control their own affairs or their political agenda. The rise of international terrorism in the early twenty-first century clearly makes it difficult for states to pursue their security interests or to identify rival states that threaten them. The ability of individuals and private organizations to move goods, services, infor-

mation, and capital across national borders makes it increasingly difficult for contemporary nations to manage their own economies. The liability of some states to the environmental consequences of actions undertaken by other states and the corporations they house implies that there are important parts of a state—the quality of its air and water—that some governments cannot be presumed control.

Even when states are able significantly to control their economies or their environmental quality, they may think it wise to cede a certain amount of control over their economies, their environments, or the pursuit of their national security interests to multinational unions such as NATO and the European Union. Such surrender of control is a surrender of some of the powers of sovereignty. Thus are the increasing importance of non-state actors, globalization, and the emergence of economic, political, and military unions all thought to erode the sovereignty the post-Westphalian model ascribes to states.

Why question whether states should enjoy the sovereignty the post-Westphalian model ascribes to them? The sovereignty of a state is usually taken to imply that it has a very strong presumption of control over the natural resources that lie within its borders. According to this view, a state can extract, consume, or conserve those resources as it sees fit. But it is surely open to question whether states are morally entitled to deplete a resource the rest of the world needs, to control a river on which citizens of another state downstream depend, or to exacerbate global inequalities of wealth by profiting excessively from a resource it happens to possess. Furthermore, it is open to question whether states are morally entitled to control access to its resources and opportunities by forbidding or restricting the movement of people across its borders. So-called “failed states” may lack the capacity to address humanitarian crises that affect their citizens. They can also harbor terrorist and criminal organizations that threaten international order. The incapacities of failed states, and the dangers they pose, are sometimes thought to license foreign intervention even if such intervention entails a violation of state sovereignty.

Perhaps the most profound challenge to the post-Westphalian model is posed by growing international recognition of human rights. These rights are rights that people enjoy simply in virtue of their humanity. While the list and the philosophical foundations of human rights remains disputed, it is increasingly accepted that there are such rights, that they limit what governments may do to their people and that the gross and widespread

violation of such rights by a government may give non-governmental organizations, other states, and international bodies the right to intervene. The easier it is to defeat the presumption of non-intervention in such cases, the greater the challenge a global regime of human rights poses to the post-Westphalian model and to the forms of sovereignty that model implies. With the rejection of the post-Westphalian model as descriptively or normatively inadequate, its displacement by another model of the political world, or the loosening of its hold on the imagination of political theorists, sovereignty would cease to be the central organizing concept it long has been.

## SPACE

When men began to think about the nature of “space,” they thought of it as an all-pervading ether or as some sort of container. Since a thing can move from one part of space to another, it seemed that there was something, a place or a part of space, to be distinguished from the material objects that occupy space. For this reason places might be thought of as different parts of a very subtle jellylike medium within which material bodies are located.

### HISTORY OF THE CONCEPT OF SPACE

Some of the Pythagoreans seem to have identified empty space with air. For more special metaphysical reasons Parmenides and Melissus also denied that there could be truly empty space. They thought that empty space would be nothing at all, and it seemed to them a contradiction to assert that a nothing could exist. On the other hand,

there seems to be something wrong with treating space as though it were a material, which, however subtle, would still itself have to be *in* space. Democritus and the atomists clearly distinguished between the atoms and the void that separated them. However, the temptation to think of space as a material entity persisted, and Lucretius, who held that space was infinite, nevertheless wrote of space as though it were a container. Yet he seems to have been clear on the fact that space is unlike a receptacle in that it is a pure void. Since material bodies, in his view, consist of atoms, there must be chinks of empty space even between the atoms in what appear to be continuous bodies.

Plato's views on space have to be gotten mainly from the obscure metaphors of the *Timaeus*; he, too, appears to have thought of space as a receptacle and of the matter in this receptacle as itself mere empty space, limited by geometrical surfaces. If so, he anticipated the view of René Descartes, where the problem arises of how empty space can be distinguished from nonempty space. Even if, like Lucretius and other atomists, we make a distinction between the atoms and the void, what is this void or empty space? Is it a thing or not a thing?

ARISTOTLE. Aristotle tried to dodge the difficulty by treating the concept of space in terms of place, which he defined as the adjacent boundary of the containing body. For two things to interchange places *exactly*, they would have to be identical in volume and shape. Consider two exactly similar apples that are interchanged in this way. The *places* are not interchanged; rather, the first apple is now at the very same place at which the second apple was and vice versa. We seem, therefore, to be back at the notion of space as a substratum or ether, but it is probable that Aristotle was trying to avoid this and that he meant to define place by reference to the cosmos as a whole. Aristotle thought of the cosmos as a system of concentric spheres, and the outermost sphere of the cosmos would, on his view, define all other places in relation to itself. In the Aristotelian cosmology each of the various "elements" tends toward its own place. Thus, heavy bodies tend toward the center of Earth, and fire goes away from it. This is not, however, for any other reason than that the center of Earth happens to be the center of the universe; the places toward which the elements tend are independent of what particular bodies occupy what places. In more recent times we view these as two different and seemingly irreconcilable ways of thought—the notions of space as a stuff and of space as a system of relations between bodies.

DESCARTES AND LEIBNIZ. Descartes held that the essence of matter is extension, and so, on his view, space and stuff are identical, for if the essence of matter is to be extended, then any volume of space must be a portion of matter, and there can be no such thing as a vacuum. This raises the question of how we can distinguish one material object (in the ordinary sense of these words) from another. How, on Descartes's view, can we elucidate such a statement as that one bit of matter has moved relative to another one? In what sense, if matter just *is* extension, can one part of space be more densely occupied by matter than another? Descartes considered these objections but lacked the mathematical concepts necessary to answer them satisfactorily. We shall see that a reply to these objections can be made by denying that space is the same everywhere, and this can be done by introducing the Riemannian concept of a space of variable curvature.

As against Descartes, Gottfried Wilhelm Leibniz held a relational theory of space, whereby space is in no sense a stuff or substance but is merely a system of relations in which indivisible substances, or "monads," stand to one another. Few philosophers have followed Leibniz in his theory of monads, but in a slightly different form the relational theory of space has continued to rival the Cartesian, or "absolute," theory. The issue between the two theories has by no means been decisively settled, at least if we consider not space but space-time. It is still doubtful whether the general theory of relativity can be stated in such a way that it does not require absolute space-time.

KANT. In his *Prolegomena*, Immanuel Kant produced a curious argument in favor of an absolute theory of space. Suppose that the universe consisted of only one human hand. Would it be a left hand or a right hand? According to Kant it must be one or the other, yet if the relational theory is correct it cannot be either. The relations between the parts of a left hand are exactly the same as those between corresponding parts of a right hand, so if there were nothing else to introduce an asymmetry, there could be no distinction between the case of a universe consisting only of a left hand and that of a universe consisting only of a right hand. Kant, however, begged the question; in order to define "left" and "right" we need the notions of clockwise and counterclockwise rotations or of the bodily asymmetry which is expressed by saying that one's heart is on the left side of one's body. If there were only one hand in the world, there would be no way of applying such a concept as left or clockwise. The relationist could therefore quite consistently reply to Kant that if there were only one thing in the universe, a human hand,

it could not *meaningfully* be described as either a right one or a left one. (The discovery in physics that parity is not conserved suggests that the universe is not symmetrical with respect to mirror reflection, so there is probably, in fact, something significant in nature analogous to the difference between a left and a right hand.)

Later, in his *Critique of Pure Reason*, Kant argued against both a naive absolute theory of space and a relational view. He held that space is something merely subjective (or “phenomenal”) wherein in thought we arrange nonspatial “things-in-themselves.” He was led to this view partly by the thought that certain antinomies or contradictions are unavoidable as long as we think of space and time as objectively real. However, since the work of such mathematicians as Karl Theodor Wilhelm Weierstrass, Augustin-Louis Cauchy, Julius Wilhelm Richard Dedekind, and Georg Cantor, we possess concepts of the infinite which should enable us to deal with Kant’s antinomies and, indeed, also to resolve the much earlier, yet more subtle, paradoxes of Zeno of Elea.

#### NEWTON’S CONCEPTION OF SPACE

Isaac Newton held absolute theories of space and time—metaphysical views that are strictly irrelevant to his dynamical theory. What is important in Newtonian dynamics is not the notion of absolute space but that of an inertial system. Consider a system of particles acting on one another with certain forces, such as those of gravitational or electrostatic attraction, together with a system of coordinate axes. This is called an inertial system if the various accelerations of the particles can be resolved in such a way that they all occur in pairs whose members are equal and lie in opposite directions in the same straight line. Finding an inertial system thus comes down to finding the right set of coordinate axes. This notion of an inertial system, not the metaphysical notion of absolute space, is what is essential in Newtonian dynamics, and as Ernst Mach and others were able to show, we can analyze the notion of an inertial system from the point of view of a relational theory of space. Psychologically, no doubt, it was convenient for Newton to think of inertial axes as though they were embedded in some sort of ethereal jelly—absolute space. Nevertheless, much of the charm of this vanishes when we reflect that, as Newton well knew, any system of axes that is moving with uniform velocity relative to some inertial system is also an inertial system. There is reason to suppose, however, that in postulating absolute space Newton may have been partly influenced by theological considerations that go back to Henry More and, through More, to cabalistic doctrines.

We can remove the metaphysical trappings with which Newton clothed his idea of an inertial system if we consider how in mechanics we determine such a system. But even before we consider how we can define an inertial system of axes, it is interesting to consider how it is possible for us to define any system of axes and spatial positions at all. As Émile Borel has remarked, how hard it would be for a fish, however intelligent, which never perceived the shore or the bottom of the sea to develop a system of geometrical concepts. The fish might perceive other fish in the shoal, for example, but the mutual spatial relations of these would be continually shifting in a haphazard manner. It is obviously of great assistance to us to live on the surface of an earth that, if not quite rigid, is rigid to a first order of approximation. Geometry arose after a system of land surveying had been developed by the Egyptians, who every year needed to survey the land boundaries obliterated by the flooding of the Nile. That such systems of surveying were possible depended on certain physical facts, such as the properties of matter (the nonextensibility of chains, for example) and the rectilinear propagation of light. They also depended on certain geodetic facts, such as that the tides, which affect even the solid crust of Earth, were negligible. The snags that arise when we go beyond a certain order of approximation were unknown to the Egyptians, who were therefore able to get started in a fairly simple way.

It might be tempting to say that it was fortunate that the Egyptians were unaware of these snags, but of course in their rudimentary state of knowledge they could not have ascertained these awkward facts anyway. When, however, we consider geodetic measurements over a wide area of the globe we need to be more sophisticated. For example, the exact shape of Earth, which is not quite spherical, needs to be taken into account. Moreover, in determining the relative positions of points that are far apart from one another it is useful to make observations of the heavenly bodies as seen simultaneously from the different points. This involves us at once in chronometry. There is thus a continual feedback from physics and astronomy. Increasingly accurate geodetic measurements result in more accurate astronomy and physics, and more accurate astronomy and physics result in a more accurate geodesy.

Such a geodetic system of references is, however, by no means an inertial one. An inertial system is one in which there are no accelerations of the heavenly bodies except those which can be accounted for by the mutual gravitational attractions of these bodies. It follows, therefore, that the directions of the fixed stars must not be

rotating with respect to these axes. In principle we should be able to determine a set of inertial axes from dynamical considerations, even if we lived in a dense cloud, as on Venus, and were unaware of the existence of the fixed stars. This may have influenced Newton to think of space as absolute. However, Newton was not on Venus, and he could see the fixed stars. It is therefore a little surprising that he did not take the less metaphysical course of supposing an inertial system to be determined by the general distribution of matter in the universe. This was the line taken in the nineteenth century by Mach and is referred to (after Albert Einstein) as Mach's principle. It is still a controversial issue in cosmology and general relativity.

Mach's principle clearly invites, though it does not compel, a relational theory of space, such as Mach held. The origin of the axes of an inertial system in Newtonian mechanics was naturally taken to be the center of gravity of the solar system, which is nearly, but not quite, at the center of the sun. In fact, it is continually changing its position with reference to the center of the sun. Now that the rotation of the galaxy has been discovered, we have to consider the sun as moving around a distant center. We shall here neglect the possibility that our galaxy is accelerating relative to other galaxies. In any case, once we pass to cosmological considerations on this scale we need to abandon Newtonian theory in favor of the general theory of relativity.

The philosophical significance of the foregoing discussion is as follows: When we look to see how inertial axes are in fact determined we find no need to suppose any absolute space. Because such a space would be unobservable, it could never be of assistance in defining a set of inertial axes. On the other hand, the complexities in the determination of inertial axes are such that it is perhaps psychologically comforting to think of inertial axes, or rather some one preferred set of such axes, as embedded in an absolute space. But Newton could equally have taken up the position, later adopted by Mach, that inertial systems are determined not by absolute space but by the large-scale distribution of matter in the universe.

## SPACE AND TIME IN THE SPECIAL THEORY OF RELATIVITY

We have already noticed the dependence of space measurements on time measurements which sometimes obtains in geodesy. This situation is accentuated in astronomy because of the finite velocity of light. In order to determine the position of a heavenly body we have to make allowance for the fact that we see it in the position it was in some time ago. For example, an observation of a

star that is ten light-years away is the observation of it in its position years ago. Indeed, it was the discrepancy between the predicted and observed times at which eclipses of the satellites of Jupiter should occur that led Olaus Rømer to assign a finite, and approximately correct, value to the velocity of light. The correction of position and time on account of the finite velocity of light presupposes in any particular case our knowing what this velocity is, relative to Earth. This would seem to depend not only on the velocity of light relative to absolute space (or to some preferred set of inertial axes) but also on Earth's velocity relative to absolute space (or to the preferred set of inertial axes). The experiment of Albert Abraham Michelson and Edward Williams Morley showed, however, that the velocity of light relative to an observer is independent of the velocity of the observer. This led to the special theory of relativity, which brings space and time into intimate relation with one another. For present purposes it is necessary to recall only that according to the special theory of relativity events that are simultaneous with reference to one inertial set of axes are not simultaneous with reference to another inertial frame. The total set of point-instants can be arranged in a four-dimensional space-time. Observers in different inertial frames will partition this four-dimensional space-time into a "space" and a "time," but they will do so in different ways.

Before proceeding further it is necessary to clear up a certain ambiguity in the word *space*. So far in this entry space has been thought of as a continuant. In this sense of the word *space* it is possible for things to continue to occupy space and to move from one point of space to another and for regions of space to begin or cease to be occupied or to stay occupied or unoccupied. Here space is something that endures through time. On the other hand, there is a different, timeless use of the word *space*. In solid geometry a three-dimensional space is thought of as timeless. Thus, if a geometer said that a sphere had changed into a cube, he would no longer be thinking within the conceptual scheme of solid geometry. In geometry all verbs must be tenseless. In this tenseless way let us conceive of a four-dimensional space-time, three of whose dimensions correspond roughly to the space of our ordinary thought whereas the other corresponds to what we ordinarily call time. What we commonly think of as the state of space at an instant of time is a three-dimensional cross section of this four-dimensional space-time.

Taking one second to be equivalent to 186,300 miles, which is the distance light travels in that time, any physical object, such as a man or a star, would be rather like a

four-dimensional worm—its length in a timelike direction would be very much greater than its spacelike cross section. Thinking in terms of space-time, then, two stars that are in uniform velocity with respect to each other and also with respect to our frame of reference will appear as two straight worms, each at a small angle to the other. An observer on either star will regard himself as at rest, so he will take his own world line—the line in space-time along which his star lies—as the time axis. He will take his space axes as (in a certain sense) perpendicular to the time axis. It follows that observers on stars that move relative to one another will slice space-time into spacelike cross sections at different angles. This makes the relativity of simultaneity look very plausible and no longer paradoxical. As Hermann Minkowski observed, the relativity of simultaneity could almost have been predicted from considerations of mathematical elegance even before the experimental observations that led to the special theory of relativity. Indeed, Minkowski showed that the Lorentz transformations of the theory of relativity can be understood as simply a rotation of axes in space-time. (In trying to picture such a rotation of axes it is important to remember that Minkowski space-time is not Euclidean but semi-Euclidean.) In Minkowski's words, "Henceforth space by itself, and time by itself, are doomed to fade away into mere shadows, and only a kind of union of the two will preserve an independent reality." We must not forget that space-time is a space in the mathematical sense of the word *space*, not in the sense in which space is a continuant. Thus, certain objectionable locutions are often used in popular expositions. For example, we sometimes hear it said that a light signal is propagated from one part of space-time to another. The correct way to put the matter is to say that the light signal *lies* (tenselessly) along a line between these two parts of space-time. Space-time is not a continuant and is not susceptible of change or of staying the same.

#### EUCLIDEAN AND NON-EUCLIDEAN SPACE

Geometry, as we observed earlier, developed out of experiences of surveying, such as those of the ancient Egyptians. The assumptions underlying the surveying operations were codified by Greek mathematicians, whose interests were mainly theoretical. This codification was developed by Euclid in the form of an axiomatic system. Euclid's presentation of geometry shows a high degree of sophistication, though it falls considerably short of modern standards of rigor. Euclid's geometry was a metrical one. There are, of course, geometries that

are more abstract than metrical geometry. The most abstract of all is topology, which deals with those properties of a space that remain unchanged when the space is distorted, as by stretching. Thus, from the point of view of topology a sphere, an ellipsoid, and a parallelepiped are identical with one another and are different from a torus. Metrical geometry uses a bigger battery of concepts—not only such notions as those of betweenness and of being longer than (which itself goes beyond topology) but also those of being, say, twice or three and a half times as long as.

Euclid regarded one of his axioms as more doubtful than the others. This is the axiom that is equivalent to the so-called axiom of parallels. It will be more convenient to discuss the axiom of parallels than Euclid's own axiom. The axiom of parallels states that if  $C$  is a point not on an infinite straight line  $AB$ , then there is one and only one straight line through  $C$  and in the plane of  $AB$  that does not intersect  $AB$ . Geometers made many efforts to deduce the axiom of parallels from the other, more evident ones. In the seventeenth and eighteenth centuries Gerolamo Saccheri and J. H. Lambert each tried to prove the axiom by means of a *reductio ad absurdum* proof. By assuming the falsity of the axiom of parallels they hoped to derive a contradiction. They did not succeed; in fact, Saccheri and Lambert proved a number of perfectly valid theorems of non-Euclidean geometry, though they were not bold enough to assert that this was what they were doing.

János Bolyai and N. I. Lobachevski replaced the axiom of parallels with the postulate that *more than one* parallel can be drawn. The type of geometry that results is called hyperbolic. Another way to deny the axiom of parallels is to say that *no* parallel can be drawn. This yields elliptic geometry. (Some adjustments have to be made in the other axioms. For instance, straight lines become finite, and two points do not necessarily determine a straight line.) It is easy to prove (by giving a non-Euclidean geometry an interpretation within Euclidean geometry) that both hyperbolic and elliptic geometries are consistent if Euclidean geometry is. (And all can easily be shown to be consistent if the theory of the real-number continuum is.) A priori, therefore, there is nothing objectionable about non-Euclidean geometries. Unfortunately, many philosophers followed Kant in supposing that they had an intuition that space was Euclidean, and mathematicians had to free themselves from this conservative climate of opinion.

The question then arose whether our actual space is Euclidean or non-Euclidean. In order to give sense to this question we must give a physical interpretation to our

geometric notions, such as that of a straight line. One way of defining a straight line is as follows: Suppose that rigid bodies  $A, B, C$  have surfaces  $S_A, S_B, S_C$ , such that when  $A$  is applied to  $B$ , then  $S_A$  and  $S_B$  fit; when  $B$  is applied to  $C$ , then  $S_B$  and  $S_C$  fit; and when  $C$  is applied to  $A$ , then  $S_C$  and  $S_A$  fit. Suppose also that  $S_A, S_B, S_C$  can all be slid and twisted over one another—that is, that they are not like cogged gears, for example. Then  $S_A, S_B, S_C$  are all by definition plane surfaces. The intersection of two planes is a straight line. (In the above we have used the notion of a rigid body, but this can easily be defined without circularity.) With the above definition of a straight line and the like we can make measurements to tell whether the angles of a triangle add up to two right angles. If they make more than two right angles, space is elliptic; if less than two right angles, space is hyperbolic; and if exactly two right angles, space is Euclidean. However, such experiments could not determine the question to any high degree of accuracy. All that this method shows is that, as every schoolchild knows, physical space is *approximately* Euclidean.

To make measurements that could settle the question to any high degree of accuracy we should have to make them on an astronomical scale. On this scale, however, it is not physically possible to define straight lines by means of the application of rigid bodies to one another. An obvious suggestion is that we should define a straight line as the path of a light ray in empty space. One test of the geometry of space might then come from observations of stellar parallax. On the assumption that space is Euclidean, the directions of a not very distant star observed from two diametrically opposite points on Earth's journey round the sun will be at a small but observable angle. If space is hyperbolic, this angle, which is called the parallax, will be somewhat greater. If space is elliptic, the parallax will be less or even negative. If we knew the distance of the star, we could compare the observed parallax with the theoretical parallax, on various assumptions about the geometry. But we cannot know the distances of the stars except from parallax measurements. However, if space were markedly non-Euclidean, we might get some hint of this because the distribution of stars in space, calculated from parallax observations on Euclidean assumptions, would be an improbable one. Indeed, at the beginning of the twentieth century Karl Schwarzschild made a statistical analysis of parallaxes of stars and was able to assign an upper limit to the extent to which physical space deviates from the Euclidean.

A good indication that space, on the scale of the solar system at least, is very nearly Euclidean is the fact that

geometrical calculations based on Euclidean assumptions are used to make those predictions of the positions of the planets that have so strongly confirmed Newtonian mechanics. This consideration points an important moral, which is that it is impossible to test geometry apart from physics; we must regard geometry as a part of physics. In 1903, Jules Henri Poincaré remarked that Euclidean geometry would never be given up no matter what the observational evidence was; he thought that the greater simplicity of Euclidean, as against non-Euclidean, geometry would ensure our always adopting some physical hypothesis, such as that light does not always travel in straight lines, to account for our observations. We shall not consider whether—and if so, in what sense—non-Euclidean geometry is necessarily less simple than Euclidean geometry. Let us concede this point to Poincaré. What he failed to notice was that the greater simplicity of the geometry might be bought at the expense of the greater complexity of the physics. The total theory, geometry plus physics, might be made more simple even though the geometrical part of it was more complicated. It is ironical that not many years after Poincaré made his remark about the relations between geometry and physics he was proved wrong by the adoption of Einstein's general theory of relativity, in which overall theoretical simplicity is achieved by means of a rather complicated space-time geometry.

In three-dimensional Euclidean space let us have three mutually perpendicular axes,  $Ox_1, Ox_2, Ox_3$ . Let  $P$  be the point with coordinates  $(x_1, x_2, x_3)$ , and let  $Q$  be a nearby point with coordinates  $(x_1 + dx_1, x_2 + dx_2, x_3 + dx_3)$ . Then if  $ds$  is the distance  $PQ$ , the Pythagorean theorem

$$ds^2 = dx_1^2 + dx_2^2 + dx_3^2$$

holds. In a "curved," or non-Euclidean, region of space this Pythagorean equation has to be replaced by a more general one. But before considering this let us move to four dimensions, so that we have an additional axis,  $Ox_4$ . This four-dimensional space would be Euclidean if

$$ds^2 = dx_1^2 + dx_2^2 + dx_3^2 + dx_4^2.$$

In the general case

$$\begin{aligned} ds^2 = & g_{11}dx_1^2 + g_{22}dx_2^2 + g_{33}dx_3^2 + g_{44}dx_4^2 \\ & + 2g_{12}dx_1dx_2 + 2g_{13}dx_1dx_3 + 2g_{14}dx_1dx_4 \\ & + 2g_{23}dx_2dx_3 + 2g_{24}dx_2dx_4 + 2g_{34}dx_3dx_4. \end{aligned}$$

The  $g$ 's are not necessarily constants but may be functions of  $x_1, x_2, x_3, x_4$ . That it is impossible to choose a coordinate system such that for a certain region  $g_{12}, g_{13}, g_{14}, g_{23},$

$g_{24}$ ,  $g_{34}$  are all zero is what is meant by saying that the region of space in question is curved. That a region of space is curved can therefore in principle always be ascertained by making physical measurements in that region—for instance, by testing whether the Pythagorean theorem holds. There is, therefore, nothing obscure or metaphysical about the concept of curvature of space. The space-time of special relativity, it is worth mentioning, is semi-Euclidean and of zero curvature. In it we have

$$g_{11} = g_{22} = g_{33} = -1, \quad g_{44} = +1,$$

and  $g_{12}$ ,  $g_{13}$ ,  $g_{14}$ ,  $g_{23}$ ,  $g_{24}$ ,  $g_{34}$  are all zero.

According to the general theory of relativity, space-time is curved in the neighborhood of matter. (More precisely, it has a curvature over and above the very small curvature that, for cosmological reasons, is postulated for empty space.) A light wave or any free body, such as a space satellite, is assumed in the general theory to lie along a geodesic in space-time. A geodesic is either the longest or the shortest distance between two points. In Euclidean plane geometry it is the shortest, whereas in the geometry of space-time it happens to be the longest. Owing to the appreciable curvature of space-time near any heavy body, a light ray that passes near the sun should appear to us to be slightly bent—that is, there should be an apparent displacement of the direction of a star whose light passes very near the sun. During an eclipse of the sun it is possible to observe stars very near to the sun's disk, since the glare of the sun is blacked out by the moon. In the solar eclipse of 1919, Sir Arthur Stanley Eddington and his colleagues carried out such an observation that gave results in good quantitative accord with the predictions of relativity. In a similar way, also, the general theory of relativity accounted for the anomalous motion of the perihelion of Mercury, the one planetary phenomenon that had defied Newtonian dynamics. In other cases the predictions of Newtonian theory and of general relativity are identical, and general relativity is, on the whole, important only in cosmology (unlike the special theory, which has countless verifications and is an indispensable tool of theoretical physics).

### IS SPACE ABSOLUTE OR RELATIVE?

The theory of relativity certainly forces us to reject an absolute theory of space, if by this is meant one in which space is taken as quite separate from time. Observers in relative motion to one another will take their space and time axes at different angles to one another; they will, so to speak, slice space-time at different angles. The *special* theory of relativity, at least, is quite consistent with either

an absolute or a relational philosophical account of space-time, for the fact that space-time can be sliced at different angles does not imply that it is not something on its own account.

It might be thought that the *general* theory of relativity forces us to a relational theory of space-time, on the grounds that according to it the curvature of any portion of space-time is produced by the matter in it. But if anything the reverse would seem to be the case. If we accept a relational theory of space-time, we have to suppose that the inertia of any given portion of matter is determined wholly by the total matter in the universe. Consider a rotating body. If we suppose it to be fixed and everything else rotating, then we must say that some distant bodies are moving with transitional velocities greater than that of light, contrary to the assumptions of relativity. Hence, it is hard to avoid the conclusion that the inertia of a body is partly determined by the local metrical field, not by the total mass in the universe. But if we think of the local metrical field as efficacious in this way, we are back to an absolute theory of space-time. Furthermore, most forms of general relativity predict that there would be a curvature (and hence a structure) of space-time even if there were a total absence of matter. Indeed, relativistic cosmology often gives a picture of matter as consisting simply of regions of special curvature of space-time. (Whether this curvature is the cause of the existence of matter or whether the occurrence of matter produces the curvature of space-time is unclear in the general theory itself.) The variations of curvature of space-time enable us to rebut the objection to Descartes's theory that it cannot differentiate between more and less densely occupied regions of space.

Nevertheless, there are difficulties about accepting such a neo-Cartesianism. We must remember that quantum mechanics is essentially a particle physics, and it is not easy to see how to harmonize it with the field theory of general relativity. One day we may know whether a particle theory will have absorbed a geometrical field theory or vice versa. Until this issue is decided we cannot decide the question whether space (or space-time) is absolute or relational—in other words, whether particles are to be thought of as singularities (perhaps like the ends of J. A. Wheeler's "wormholes" in a multiply connected space) or whether space-time is to be understood as a system of relations between particles. This issue can be put neatly if we accept W. V. Quine's criterion of ontological commitment. Should our scientific theory quantify over point-instants of space-time, or should we, on the other hand, quantify over material particles, classes of them,

classes of classes of them, and so on? The latter involves a commitment to particle physics, but if a unified field theory is successful, our ontology may consist simply of point-instants, classes of them, classes of classes of them, and so on, and physical objects will be definable in terms of all of these. So far neither Descartes nor Leibniz has won an enduring victory.

### Bibliography

An excellent, mainly historical, account of the philosophy of space is given in Max Jammer, *Concepts of Space* (Cambridge, MA: Harvard University Press, 1954; rev. ed., New York, 1960). Ch. 1, "The Concept of Space in Antiquity," is particularly valuable as a guide to the very scattered and obscure references to space in Greek philosophy. Also useful is John Burnet, *Early Greek Philosophy*, 3rd ed. (London: A. and C. Black, 1920). For Descartes, see his *Principles of Philosophy*, Part II, Secs. 4–21. For Leibniz, see especially his correspondence with Clarke, third paper, Secs. 3–6, and fifth paper, Secs. 32–124. The Leibniz-Clarke correspondence has been edited, with introduction and notes, by H. G. Alexander (Manchester, U.K., 1956). See also Bertrand Russell's *The Philosophy of Leibniz* (London, 1900). Newton's metaphysical views on space are to be found in the Scholium to the definitions of the *Principia* (*Mathematical Principles of Natural Philosophy*, translated by Florian Cajori, Berkeley: University of California Press, 1934). For Kant's example of the left hand and the right hand, see his *Prolegomena to Any Future Metaphysics*, translated by P. G. Lucas (Manchester, U.K., 1953), Sec. 13. Kant's most characteristic doctrines about space are to be found in his *Critique of Pure Reason*, in Secs. 2–7 of the "Transcendental Aesthetic" and in the "First Antinomy." In N. Kemp Smith's translation (London, 1929) these passages will be found on pp. 67–82 and 396–402. A criticism of Kant, Zeno, and other philosophers is to be found in Bertrand Russell's *Our Knowledge of the External World*, Lecture VI, "The Problem of Infinity Considered Historically" (London: Allen and Unwin, 1914). See also Adolf Grünbaum, "A Consistent Conception of the Extended Linear Continuum as an Aggregate of Unextended Elements," in *Philosophy of Science* 19 (1952): 288–306. For Mach's criticism of Newton, see especially Secs. 2–6 of his *Science of Mechanics*, translated by J. T. McCormack, 6th ed. (La Salle, IL: Open Court, 1960).

On a fairly elementary level, and although somewhat out of date in places, Émile Borel, *Space and Time* (New York: Dover, 1960)—a translation, by Angelo S. Rappoport and John Dougall, of the French edition published in 1922—can be recommended. So can the more difficult *Philosophy of Space and Time*, by Hans Reichenbach (New York, 1958), and *Philosophical Problems of Space and Time*, by Adolf Grünbaum (New York: Knopf, 1963). See also Grünbaum's paper "Geometry, Chronometry and Empiricism," in *Minnesota Studies in the Philosophy of Science*, edited by Herbert Feigl and Grover Maxwell, Vol. III (Minneapolis: University of Minnesota Press, 1962). A criticism of Grünbaum's views is given by Hilary Putnam in his paper "An Examination of Grünbaum's Philosophy of Geometry," in *Philosophy of Science, the Delaware Seminar*, edited by Bernard Baumrin, Vol. II (1962–1963; published New York: Interscience, 1963). Chs. 8 and 9 of Ernest Nagel's *Structure of Science* (New York: Harcourt Brace, 1961) are very useful. An interesting dialogue by A. S. Eddington, "What Is Geometry?," is a prologue to his *Space, Time and Gravitation* (Cambridge, U.K.: Cambridge University Press, 1920). On relativity, see Hermann Minkowski, "Space and Time," in *The Principle of Relativity*, by Albert Einstein, et al. (London: Methuen, 1923); Hans Reichenbach, "The Philosophical Significance of Relativity," and H. P. Robertson, "Geometry as a Branch of Physics," both in *Albert Einstein: Philosopher-Scientist*, edited by P. A. Schilpp, 2nd ed. (New York: Tudor, 1951); and Adolf Grünbaum, "The Philosophical Retention of Absolute Space in Einstein's General Theory of Relativity," in *Philosophical Review* 66 (1957): 525–534 (a revised version appears in *Problems of Space and Time*, edited by J. J. C. Smart, New York: Macmillan, 1963). See also J. A. Wheeler, "Curved Empty Space-Time as the Building Material of the Physical World: An Assessment," in *Logic, Methodology, and Philosophy of Science* edited by Ernest Nagel, Patrick Suppes, and Alfred Tarski (Stanford, CA: Stanford University Press, 1962), pp. 361–374.

For a discussion of the asymmetry between clockwise and counterclockwise rotations in relation to the nonconservation of parity, which has some relevance to Kant's problem of the left and right hands, see the brilliant popular exposition by O. R. Frisch, "Parity Is Not Conserved, a New Twist to Physics?," in *Universities Quarterly* 11 (1957): 235–244, and the article by Philip Morrison, "Overthrow of Parity," in *Scientific American* 196 (April 1957). For Poincaré's views, see *Science and Hypothesis* (New York: Dover, 1952), especially pp. 72–73. In connection with the sharpening of the issue between absolute and relational theories of space and time into an issue of ontology, see W. V. Quine, *Word and Object* (Cambridge, MA: Technology Press of the Massachusetts Institute of Technology, 1960), especially Sec. 52, "Geometrical Objects." A book of readings on space and time is *Problems of Space and Time*, edited by J. J. C. Smart (New York: Macmillan, 1964).

I should like to thank Professor B. C. Rennie, who read an earlier draft of this entry and made helpful comments.

J. J. C. Smart (1967)

## SPACE IN PHYSICAL THEORIES

*Space* here means the space of the science of mechanics, which encompasses planetary and celestial (i.e., “outer”) space, but is presupposed by the motion—spatial change—of any bodies whatsoever, from the tiniest particles through human-sized bodies to the whole universe. The investigation of space has been perhaps the most fruitful interaction between physics and philosophy. Physics endows space with specific properties playing a crucial role in determining the motions of bodies, but, despite being omnipresent, space (prerelativistically) is frustratingly inert—not having even the indirect causal effects of subatomic particles, say. Thus physics ascribes substantive properties to space on the basis of indirect evidence, allowing metaphysical bias to influence understanding, and calling (in part) for philosophical clarification.

One of the main strands of this clarification involves the “absolute-relative” debate. In fact a number of (interconnected) debates go under this title, of which two are focused on in the historical development of mechanics: Of all the motions a body has (relative to different frames of reference), which if any are privileged or “absolute”? Are such absolute motions determined by the motions of bodies relative to one another, or by motions with respect to space itself: is space a real, substantial entity in addition to bodies? (A third important strand: Are all spatial properties extrinsic—that is, “relative”—or intrinsic?)

### SPACE IN ARISTOTELIAN PHYSICS

In the European tradition, Eudoxus’s (408–355 BCE) account of the motions of the heavens—which was later significantly extended by Ptolemy (c. 85–165 CE)—is probably the first “physical theory” (in anything like a modern sense) in which space plays a significant role. According to this theory the Earth is at rest at the center of the universe, surrounded by a series of concentric spheres, interconnected along their axes. The moon, sun, planets, and totality of fixed stars are each located on their own sphere, with the stars farthest out. The daily apparent motions of the heavens are explained by a daily rotation of the stellar sphere, which carries all the other spheres with it; the “wanderings” of the other bodies through the fixed stars are explained by the additional, slower rotations of the other spheres about their axes. Aristotle (384–322 BCE) provided the philosophical interpretation of this system: a finite, spherical universe with an absolute center (which Aristotle suggests is deter-

mined by its position relative to the circumference). Thus bodies do have an absolute motion, namely relative to the center, which is essential for Aristotle’s mechanics: heavy bodies move naturally toward the center, light bodies away, and the heavenly element, ether, around circularly. (Note that Aristotle denied the existence of space separate from body: no vacuum and no pure extension.)

Although astronomers often took this model instrumentally, Aristotle’s account was the context of debate over the nature of space until the eighteenth century, even after Nicolaus Copernicus (1473–1543) proposed that the earth moved around the sun. Questions seen as important during this period that had bearing on later developments include the possibility of the vacuum and whether God could move the entire universe.

### SPACE IN CARTESIAN PHYSICS

In the Early Modern period, René Descartes (1596–1650) is a logical place to start despite numerous important predecessors, especially Galileo Galilei (1564–1642), because of his influence on both physics and its philosophy. Notable contributions include the development of mechanical explanation, conservation laws, and, with Pierre Gassendi (1592–1655), the correct “law of inertia”: Bodies experiencing no net forces move at constant speeds along straight paths. According to Descartes, because matter and space have the same essence—“extension”—they are one and the same (Plato’s *Timaeus* describes a similar view). This identification poses a problem: As a body moves, so does the matter that composes it and hence the space it occupies, but if it does not change with respect to space then it does not move! In his *Principles of Philosophy* (1644), Descartes’s first solution is to relativize to reference bodies (selected arbitrarily): In thought people identify a relatively moving piece of matter=space as the same body, while they identify as the same spatial region those different pieces of matter=space that bear some fixed relations to the reference bodies. However, in addition to this “ordinary” concept of motion, Descartes defines motion “properly speaking” as displacement of a body from the bodies in contact with it (in accord with Aristotle’s *Physics*, Book IV Chapter 4). Why there are dual accounts is a subject of dispute.

According to one interpretation, Descartes took relative motion to be fundamental, but sought to avoid the heretical denial of the earth’s rest; because he wrote only a decade after Galileo was condemned (1633), such concern was real. Descartes claimed that the universe was a plenum in constant agitation, and explained the motions of the planets (including the earth) by postulating a giant

vortex of fine matter carrying them around the sun, like leaves in a whirlpool. Hence the earth is in relative motion around the sun and roughly at rest with its surroundings, and so both Copernicus and Aristotle were correct—in the “ordinary” and “proper” senses, respectively. The second interpretation claims that Descartes took proper motion more seriously, as the correct, “true” sense of motion in physics; in particular, his laws of collision are blatantly contradictory if taken to concern relative motion, but not if they concern proper motion, because it is “absolute” in the sense of being privileged over all other relative motions. (As Christiaan Huygens [1629–1695] realized, Descartes should have changed the laws to make them consistently describe relative motions, not relied on his absolute notion.)

### SPACE IN NEWTONIAN PHYSICS

Although Descartes’s views were influential, Isaac Newton’s (1643–1727) physics and philosophy (arguably his epistemology as well as his metaphysics) were infinitely more successful. In his *Principia* (1687) and in an unpublished essay, *De Gravitatione* (undated), he attacks Descartes’s views concerning space and motion and lays out his own. Newton claims that space is three-dimensional and Euclidean, persists through time, and is neither a substance such as mind or matter (because it has no causal powers—the law of inertia holds because space does not act on bodies) nor a property of substances (because in a vacuum there is space but no substance): Space is outside of the categories of traditional metaphysics. He takes it to be a pseudosubstance, causally inert, but metaphysically necessary for the existence of anything, including God, because everything exists somewhere. Commentators often stretch metaphysical categories, and count Newton’s “absolute space” as a nonmaterial, nonmental substance, regions of which may be occupied by other substances: they rather inaccurately ascribe “substantivalism” to Newton.

Newton famously argues against the Cartesian view of space using the example of a bucket of water, though it is only one of a series of arguments he gives. If bucket and water, initially at rest, are set spinning about their axis, initially the water will remain at rest, and hence be in motion relative to its contiguous surroundings (the side of the bucket); the water will be rotating properly speaking. Later, friction with the sides of the bucket will have set the water rotating at the same rate as the bucket, and so it will be at “proper” rest, according to Descartes. In the first instance, because it is not yet rotating, the surface of the water will be flat, whereas in the second it will be con-

cave (just like tea stirred in a cup). By Descartes’s and Newton’s (and most of their contemporaries’) explicit principles, it follows that only in the second case is the water “truly,” physically rotating. And so in the experiment the water has physical motion if and only if it has no motion properly speaking. Cartesian “ordinary” motion fares no better: The water spins at a unique height in the bucket, indicating a unique rate of rotation, while it moves at different rates relative to different reference bodies. Newton concludes that because true motion is neither kind of Cartesian motion, it must be the only other option on the table: motion relative to absolute space (which he calls “absolute motion,” though it was seen above that proper motion too is “absolute” in the sense of being privileged).

### LEIBNIZ’S RELATIONIST RESPONSE

Gottfried Leibniz’s (1646–1716) position is complex: He argued persuasively against substantivalism, but was motivated by idiosyncratic metaphysics; and he gave a sophisticated account of “relationism”—space is not a substance, and all spatial properties and motions are determined by relations—but it conflicted with his theory of collisions (the so-called “Newtonian” or “classical” theory of elastic collisions). At the end of his life Leibniz arguably held: (1) that every body possesses a unique quantity of “living force” or “*vis viva*”, measured by  $mass \times speed^2$  (basically kinetic energy), and hence a unique speed; (2) that living force and pure Cartesian extension are “form” and “substance” in an updated Aristotelian metaphysics; (3) that force entails the laws of mechanics (living force and momentum are conserved in elastic collisions); (4) to avoid being an occult power, the actual force must have no detectable effects, so the laws must satisfy the “equivalence of hypotheses” and hold in all frames (Leibniz was mistaken to think this was true of his laws); and (5) that space is not only merely relative, so bodies and their relations exhaust all spatial facts, but also ideal (not a “well-founded phenomenon” in his terms), arguing in part that because no two things can literally stand in the same relation to a third, only a mental identification allows two things to stand in the same relative place one after the other. Thus Leibniz opposes both Descartes and Newton: Against Descartes he rejects the claims that space is matter (space is ideal, whereas matter is well-founded) and that “proper” motion is privileged (Descartes also held that *vis viva* was  $mass \times speed$ ); against Newton he rejects the view that space is absolute.

In his *Correspondence* (1715–1716) with Samuel Clarke (1675–1729), Leibniz gives relativity arguments

against Newton. He argues that because two systems differing only in their absolute positions or velocities cannot be told apart, they must not differ at all: that absolute locations and velocities, and absolute space itself, are unreal. While this argument impressed later empiricists, Leibniz himself argued from the theological “principle of sufficient reason.” Leibniz claims that his relationism avoids Newton’s arguments, but this is highly doubtful: He only hints at (in his *Specimen of Dynamics*, 1695) a relational account of rotating bodies (such as the bucket), and fails to see that Newton’s arguments disprove the relativity of his own mechanics.

### MODERN ARGUMENTS

In his *Science of Mechanics* (1893) Ernst Mach (1836–1916) criticized Newton for making a non sequitur: Rotation relative to the bucket fails to explain the curvature of the water, but it does not follow that the water must be rotating relative to absolute space—could not the curvature show motion relative to some other body? Mach’s reading fails to understand how Newton refuted Descartes, and ignores his attack on relative (“ordinary”) motion, but asks a reasonable question as a non-Cartesian relationist. Mach proposed that sufficiently massive bodies act to cause distant bodies to move in constant, linear relative motion unless acted on by forces: in particular, that the fixed stars determine which motions are inertial, not absolute space. (Newton considered this idea, but dismissed it because it involved action at a distance—a questionable argument given his theory of gravity.) Mach’s arguments were influential on contemporary physicists who were developing the idea of an “inertial frame”: a frame in which Newton’s laws hold, and in particular in which bodies experiencing no net forces move inertially. In practice, physicists have since taken inertial frames to be sufficient, and viewed absolute space (if at all) as an early formulation of that idea, though whether this approach amounts to relationism is debatable.

Mach was also a hero of empiricist philosophers, however; beginning in the 1960s, a reappraisal of Newton led to a defense of absolute space (simultaneous with a general philosophical turn from strict empiricism toward realism). In the late twentieth and early twenty-first centuries, Newton is often taken to argue abductively that his theory gives the best explanation of the bucket; better than Descartes’s, and by extension, because he offered no real theory, better than Mach’s. It is (arguably) no non sequitur to infer that motion is absolute because Newtonian mechanics in absolute space explains better than

any relational theory. Note that although Newton might have endorsed this argument as a response to Mach, it is weaker than Newton’s demonstration of the inconsistency of Descartes.

A major innovation has been to transfer the arguments into the context of (nonrelativistic) spacetime. One can then distinguish (a) “Newtonian spacetime” with a preferred standard of rest—geometrically speaking, a “rigging” that picks out stationary trajectories—from (b) “Galilean spacetime” with only a preferred standard of constant motion—no rigging but an “affine connection” that picks out nonaccelerated, inertial trajectories. In (a) both velocity and acceleration are well defined and hence “absolute,” but in (b) only acceleration is, avoiding (part of) Leibniz’s relativity argument. Thus, plausibly, Newtonian mechanics—which distinguishes different states of absolute acceleration but not velocity—in Galilean spacetime offers the best mechanical explanations.

Modern substantialists infer first from the need for well-defined accelerations in Newtonian mechanics, to spacetimes with “absolute structures” such as a connection, and then further to the substantiality of those spacetimes, particularly of Galilean spacetime. Several relationists have responded by arguing that acceleration can be understood without substantial spacetime: that Newtonian mechanics has a relational interpretation. Other relationists have attempted to construct a theory that does explain this as well as Newton: Most attempts rely on the fact that if it is postulated that the total angular momentum of a system (such as the whole universe) is zero, then Newtonian mechanics determines a well-defined evolution for the relative state of the system.

### RELATIVITY

How does the absolute-relative debate change in relativity theory? Consider the special theory of relativity (henceforth “STR”). First distinguish “relativity” from relationism. Broadly speaking, a theory is relativistic if it admits no unmeasurable quantities. Then Newtonian mechanics in absolute space or Newtonian spacetime is not relativistic, because it admits absolute velocity, whereas Newtonian mechanics in Galilean spacetime and electromagnetism in Minkowski spacetime are relativistic. The relativity of STR is thus of a specific kind: So that no body can be said to be at rest, all must agree on the speed of light. Thus the difference between the relativity of STR and Newtonian mechanics lies in whether one takes account of electromagnetic phenomena, a difference that has no immediate bearing on whether space is absolute or relative. Indeed, Minkowski spacetime has an affine con-

nection, so acceleration is as absolute as in Galilean spacetime, thus the same question of whether a connection provides evidence for the substantiality of spacetime arises.

In the general theory of relativity (“GTR”) spacetime is not a fixed background but is acted on by matter and has more robust causal powers. For example, rapidly rotating bodies (e.g., a black hole) can produce gravitational waves with the power to stretch and squeeze bodies as they pass through them. The causal powers of spacetime are a serious problem for relational interpretations of GTR: If a gravitational wave knocks a person down it would be odd to say that person’s body merely moved relative to the ground “as if” a wave were present. Thus only a strictly relational theory in agreement with the evidence for GTR will suffice for the relationist. However, the causal nature of the spacetime of GTR makes it metaphysically different from Newton’s, and so hardly vindicates prerelativistic substantivalism either.

GTR is sometimes mistakenly claimed to be relational. First, the action of matter on space means that the affine connection, and hence inertial motion, is dependent on the distribution of matter in distant regions (in the causal past), as Mach claimed. However, the distribution does not determine inertial motion, because the connection also depends on the geometry of spacetime in the causal past: for instance, even if there is no matter at all, the connection in a region is not fixed. Thus Mach’s relationism is not vindicated by GTR. Second, the theory is “generally covariant”: Its equations take the same form in every frame. Thus, unlike Newtonian mechanics, one cannot define absolute acceleration as acceleration in some privileged class of frames, and any relative frame will do for formulating the theory. But these points do not settle the absolute-relative debate: GTR has an affine connection, and every body still has an absolute acceleration. Further, Newtonian mechanics can be formulated generally covariantly too, so arguably general covariance shows nothing.

It is true, however, that, unlike Newtonian mechanics and STR, the dynamic nature of spacetime in GTR makes general covariance necessary: Intuitively, how can spacetime have privileged frames if spacetime is not independently given? More or less equivalently, GTR is “diffeomorphism invariant”: If all the dynamical quantities in a model (the distribution of matter and the geometry of spacetime) are continuously rearranged over the points of spacetime then the result is still a model. (Spacetime theories with static geometries are also “diffeomorphism invariant” in the weaker sense that the dif-

feomorphism of a model is also a model if the dynamical quantities and the nondynamical geometry are permuted.) Diffeomorphism invariance drives the “hole argument” against substantivalism, because it entails a kind of indeterminism if the spacetime of GTR has a substantialist interpretation. That antisubstantialists and some substantialists avoid such indeterminism by claiming that distinct diffeomorphic models represent the same physical world, which is to say that the physical content of the models is captured by the relation between matter and the geometry of space, because this is what the models have in common. If so, GTR is a theory of the relations between dynamical quantities, which is what the prerelativistic relationists sought, though in terms of different dynamic quantities, namely relative distances. Thus it can be argued that GTR is as sympathetic to prerelativistic relationism as to prerelativistic substantivalism (note that physicists tend to emphasize the relational nature of GTR far more than philosophers).

## QUANTUM GRAVITY

What of the absolute-relative debate in a sought-after quantum theory of gravity, such as string theory? First, the interpretation of diffeomorphism invariance is important for certain approaches to quantizing general relativity, which some argue gives physical import to the philosophical debate concerning the hole argument. Second, space is likely to be an “effective” notion, which does not appear as a fundamental element of the theory, but only phenomenologically in particular circumstances. If so, then neither relationism nor substantivalism will be correct interpretations of quantum gravity, and the debate may seem doomed. However, quantum gravity could shed new light on the matter in the following sense. One could ask what quantities count as observables in the effective context: If the theory can be given completely in terms of observables relating bodies then effective space could be said to be relational, whereas if the theory contains observables concerning points of space, then it seems that effective space is substantial.

## SPANN, OTHMAR (1878–1950)

Othmar Spann, the Austrian philosopher and sociologist, was born in Vienna and educated at the universities of Vienna, Zürich, and Tübingen. He was a professor at Brünn from 1909 to 1919, when he was appointed to a chair of economics and sociology at Vienna.

Spann contrasted his "neoromantic universalism"—called neoromantic by Spann to indicate his debt to Adam Müller—with "individualism," that is, with the doctrine that society derives its character from the independently existing qualities of the individual men composing it. He classified as individualist such allegedly erroneous doctrines as the economic liberalism of Adam Smith and David Ricardo, utilitarianism, the various "social contract" theories, "natural law" theories of social life, egalitarianism, anarchism, Machiavellianism, and Marxism. As this heterogeneous grouping suggests, Spann was less interested in discussing the individual merits and faults of these doctrines than in placing them with respect to his total intellectual system. Such an aim

was entirely consistent with his universalistic tenet that wholes are logically prior to and more real than their parts. Particular intellectual doctrines, on this view, can be understood only in relation to the total worldview to which they belong.

Spann's main application of universalism was in his theory of society, widely acclaimed by fascists. What is spiritual (*das Geistige*) in an individual is never due to himself alone but is always "an echo of what another spirit excites in him." The development and persistence of spirituality must be understood in the context of personal relations falling under the heading of what Spann called *Gezweiung*. Individuals so related form a genuine whole, the reality of which is presupposed by, rather than a result of, the spiritual characteristics of the related individuals. Examples of *Gezweiung* are the relations between artist and public, mother and child, teacher and pupil. Spann was not merely making the formal logical point that if, for instance, one calls a man "a teacher," one implies that he has a pupil, and vice versa. He was saying something about the quality of the teacher's and the pupil's experiences; the teacher "learns by teaching," and the pupil incorporates some of the teacher's spiritual qualities into his own soul.

Spann held that it is the prior existence of such institutions as art, the family, and education that makes possible relations of *Gezweiung*. These institutions have both a higher degree of reality and a higher value than do individuals. One does not understand what education is unless one understands that there can be more and less satisfactory instances of the teacher-pupil relationship and that there could be no actual instance beyond conceivable improvement. Therefore, a knowledge of the ideal must precede understanding of particular cases, and the study of social institutions must be normative.

An institution is itself only a partial whole (*Teilganz*) belonging to a higher reality, society. Society, too, has a normative aspect; it involves a hierarchy of values in terms of which the *Teilgänze* are mutually related. There must be a corresponding hierarchy among the social sciences; particular social institutions and aspects can be studied only in the context of a general theory of society.

Spann's emphasis on hierarchy was reinforced by his insistence that all *Gezweiung* involves a relation between a leader and one who is led. It belongs to the nature of society that there should be "obedience of those low in the spiritual scale toward those more highly developed." In Spann's theory distributive justice, based on the idea of inequality of function, replaces liberty as the fundamental social value.

Spann's stress on inequality is reflected in his political program. His doctrine of estates (*Stände*) was intended to combine decentralization with a strengthening of authority in order to check socially deleterious individualist tendencies. Each industry would be directed by the "mentally most highly developed individuals" from labor unions and employers' unions, which would send representatives to a central representative *Ständehaus*. Property would be owned communally by the various estates, and each industry's legal problems would be handled by its own special courts.

## SPAVENTA, BERTRANDO

(1817–1883)

Bertrando Spaventa, the Italian Hegelian philosopher, was born at Bomba in Abruzzo, educated in the seminary at Chieti, and taught for a time in the seminary at Monte Cassino before moving to Naples in 1840. There he became one of a small circle of liberal students associated with Ottavio Colecchi (1773–1847), who taught privately in opposition to the "official" philosophy of Pasquale Galluppi. Colecchi was himself a devotee of Immanuel Kant, but he read all the German idealists carefully and in the original. Spaventa, like the other young men in Colecchi's circle, was convinced that the real meaning of Kant's work was to be found in the later idealists, especially in G. W. F. Hegel, and the Hegelian interpretation of the *Critique of Pure Reason* always remained the nodal point of his own speculations.

Spaventa's younger brother, Silvio, was imprisoned at Naples for his part in the revolution of 1848, and Bertrando was forced to take refuge at Turin for ten years. This was the period during which most of his ideas took shape. By 1850 he had renounced the priestly office to which he had, with great reluctance, been ordained some years earlier in the hope that by preferment he could relieve the poverty of his family. In Turin he turned his hand to political journalism, writing philosophical and historical polemics against the church and particularly against the Jesuits. He was already an enthusiastic student of Giordano Bruno and Tommaso Campanella.

### THE "CIRCULATION OF ITALIAN PHILOSOPHY"

The first fruits of Spaventa's labors were his "Studi sopra la filosofia di Hegel" (in *Rivista italiana*, n.s., [November 1850]: 1–30, and [December 1850]: 31–78) and his "I principî della filosofia pratica di Giordano Bruno" (in *Saggi di filosofia civile*, Genoa, 1851). His studies of Hegel were specifically concerned with the *Phenomenology*, but they contained the germ of Spaventa's most original and fruitful conception, which he termed "circulation of Italian philosophy." This germ was the claim, first voiced by Silvio Spaventa about 1844, that the real tradition of Italian philosophy had been cut off and driven into exile by the Counter-Reformation, so that "Not our own philosophers of the last two centuries, but Spinoza, Kant, Fichte, Schelling, and Hegel, have been the real disciples of Bruno, Vanini, Campanella, Vico and other great thinkers." In this view of the history of philosophy Spaventa's patriotism was neatly reconciled with his

political and intellectual liberalism. He could use it both against the defenders of the status quo and against the patriotic chauvinism of Antonio Rosmini-Serbati and Vincenzo Gioberti, who believed that their native tradition enshrined a truth that had become corrupted in the rest of Europe. Spaventa himself held at this time that, on the contrary, nothing of value had survived in contemporary Italian philosophy.

He began to shift from this position toward his doctrine of a completed circle when he studied Rosmini's work in connection with an article on Kant that he wrote in 1855. He decided then that everything good in Rosmini's theory of knowledge had been stolen from Kant. This unjust judgment at least involved the admission that there were valuable elements in Rosmini's thought. When Spaventa began, in 1857, to work on a critical survey of Galluppi and Gioberti in connection with a projected study of Hegel's *Phenomenology*, his attitude changed dramatically, and he ended by writing in 1858 one massive volume of a planned two-volume work, *La filosofia di Gioberti* (Naples, 1863). The view that he now took was that all the fruits of European speculation from René Descartes to Kant were to be found in the work of Galluppi and Rosmini when it was rightly understood, and that Gioberti was even moving at the end of his life toward a critical reconstruction of his system that would have made it clearly the culmination of post-Kantian speculation.

Thus, in its fully developed form, the thesis that Spaventa proclaimed to the new nation when he returned as professor at Bologna in 1860, and at Naples from 1861 onward, was that the metaphysics of modern idealism was born in Bruno, that Campanella's theory of knowledge foreshadowed all the problems of rationalism and empiricism which were finally resolved by Kant, and that the achievement of the Germans had been anticipated by Giambattista Vico and had at last returned to be integrated with its sources in Galluppi, Rosmini, and Gioberti. As history, this thesis becomes more dubious with every succeeding clause. It must be taken rather as an account of the historical genesis of Spaventa's own idealism and as a model of how an idealist of the Hegelian type must strive, in studying the history of philosophy, to integrate different aspects of the truth as they appear. From this standpoint we can see how the emphasis on concrete experience that Spaventa found in Bruno and Campanella led him to feel that the rather abstract formalism of Kant's transcendental unity of apperception must be integrated with Rosmini's theory of the self as rooted in a "fundamental feeling"; once this was done, the

Rosminian-Giobertian doctrine of knowledge as the intellectual intuition of Being could be jettisoned. Spaventa's most fundamental philosophical insight is to be found in his critical analysis of the difficulties that arise from an intuitive theory of knowledge.

## LATER STUDIES

The "circulation of Italian philosophy" and the critical reconstruction of Gioberti is, properly speaking, a sort of Italian version of the coming to consciousness of the Absolute in Hegel's *Phenomenology*; Spaventa is remarkable among the Hegelians of his generation in that he regarded the *Phenomenology* as being of equal importance with the *Logic* in Hegel's system and as the key to a right interpretation of the system. He always rejected the religious interpretation of Hegel given by the "Right" and defended at Naples by his better-known colleague Augusto Vera. To admit that the Idea was really superior to and independent of the laborious progress of the Spirit in history would have entailed falling back into just the sort of Platonic intuitionism that Spaventa had so trenchantly criticized. The Being from which Hegel's *Logic* begins must therefore be taken as the thinking being of the Absolute Spirit itself that emerges at the end of the *Phenomenology*. Thus a completely human or immanent interpretation of the *Logic* as an actual process of thinking, rather than as an ideal pattern of thought, can be given.

Just how the *Philosophy of Nature* fits into Hegel's system thereby becomes even more obscure; Spaventa did not concern himself with this problem as such, but his ready acceptance of the Darwinian theory forced it on him in another way when the positivists began to produce evolutionary explanations of the Kantian a priori. Pointing to the vicious circle involved in a causal explanation of our belief in causes, Spaventa began in his last years to work out a phenomenalist account of experience that would do justice to the positivist claims while remaining firmly founded on Kant's first *Critique*. He died, however, before his work was finished. *Esperienza e metafisica* was published at Turin in 1888.

Spaventa was never widely understood or appreciated in his own lifetime. His most sympathetic follower was Donato Jaja (1839–1914), who inspired Giovanni Gentile to collect and republish Spaventa's scattered essays, along with some unpublished manuscripts. As a result of Gentile's work, Spaventa's true stature and importance have been recognized; and in Gentile's own "actual idealism" the three distinct strands of Spaventa's thought—the Italian tradition, the Hegelian dialectic,

and critical phenomenalism—are woven into a single synthesis.

## SPECIAL SCIENCES

The special sciences are generally taken to include all the sciences above physics, including biochemistry, genetics and the various biological sciences, the brain sciences, cognitive science, psychology, and economics, amongst many others. Because of their growing success over the last century, the special sciences, and their results, play an increasingly central role in philosophy. This is true of issues in the philosophy of mind and psychology, such as the mind-body problem or the nature of emotion, but also in central debates in ethics concerning a person's moral psychology and its implications, in metaphysics, for instance in discussions of personal identity and the possibility of freewill, and in epistemology, through the manifold issues affected by the nature of human cognitive capabilities. Consequently, debates over the nature, and status, of special sciences are understandably vigorous, though unfortunately they are also especially challenging because of the wide range of issues they incorporate, the often technical formulations of positions, and the implicit nature of many of their commitments. Given these difficulties, one must, first, illuminate the key ques-

tions about special sciences and then, second, provide a road map to the major positions and ongoing areas of dispute.

There have arguably been two primary, and hard-fought, foundational issues about the nature of special sciences, though for historical reasons only one of these questions has received widespread explicit discussion. First, there is the issue of the dispensability of the various special sciences themselves. That is, whether humans will be able to completely replace the special sciences, their theories, explanations, laws, and, ultimately, predicates (i.e., words or terms), with the predicates, laws, explanations, and theories of physics. Because there is clearly no practical opportunity of actually dispensing with the special sciences in the foreseeable future, the contested question is whether *in principle* special sciences, at some future point, could be dispensed with in favor of a more fully developed physics. Can humans, in principle, dispense with the special sciences, their predicates, such as *neuron* or *diabetic*, and the explanations couched in terms of them? (In discussing this issue, the *in principle* dispensability of special science predicates will be referred to for simplicity). On one side, the inter-theoretic reductionist argues that in order to fully explain and understand the natural world one ultimately only needs physics and its predicates, whereas, on the other side, the inter-theoretic anti-reductionist argues that humans cannot do without the special sciences and their proprietary vocabulary.

In contrast, rather than focusing upon words or explanations, the second foundational topic asks which entities, for example properties and individuals such as neurons and being diabetic, should be accepted as the truth makers of the best scientific explanations and theories. In this debate, in one corner is the ontological reductionist who argues that, when properly understood, the sole truth makers for scientific theories and explanations are the entities of physics—thus, really, only individuals like quarks and their properties of spin, charm, and charge should be taken to exist. In the other corner is the ontological non-reductivist who argues that, in addition to the entities of physics, it must also be accepted that the world contains the properties and individuals apparently posited by the special sciences—for example, individuals such as neurons and properties such as being diabetic.

Given the thoroughly ontological nature of this second question, it must be carefully noted that some philosophers accept the existence of only one genuine issue—the first. For example, many scientific anti-realists, such as the positivists and their intellectual descendents, take broad ontological questions to be, in some sense, ille-

gitimate and argue that one must rest simply with the first kind of question about theories, explanations, and predicates. However, since the mid-1970s, scientific realism has reemerged and argues that the best scientific theories allow humans to know about entities in the world. As a consequence, many scientific realist philosophers now accept the legitimacy of both questions about what scientific predicates are in principle indispensable and the consequent issue of which worldly entities should be taken to be the truth makers of the true, and in principle indispensable, scientific theories and explanations using such predicates.

Bearing these two issues in mind, modern discussions of special sciences can be examined and arguably start, in the 1950s, with the positivists' account of special sciences, which grows from Ernest Nagel's (1961) model of inter-theoretic reduction. In its most plausible version, Nagel provided machinery that putatively allowed the laws of special sciences to be explained by using identity statements relating special science predicates and predicates of lower level sciences, in combination with the law statements of lower level sciences, to derive the law statements of special sciences. For this entry's purposes, what is important is that it was claimed that, in principle, one could consequently derive, and explain, all the laws of the special sciences from the laws of physics. Thus it was concluded that special sciences and their predicates are in principle dispensable. As a result, the Nagelian picture of special sciences takes them to be analogous to the line chefs who are needed in restaurants to speedily prep difficult and complex subject matter, but where ultimately the master chef, in physics and its predicates, would, in principle, suffice to get the job done (i.e., to explain and understand all phenomena).

As befits positivism's suspicion of ontology, the Nagelian picture is focused upon the relations of predicates, law statements, theories, and other semantic entities. However, obvious ontological conclusions flow from the Nagelian account, though, for the ideological reasons noted earlier, these implications were rarely made explicit. When one establishes identity statements, then one shows that there is only one entity referred to by two predicates, rather than two entities as was previously supposed. Through such identity statements one thus plausibly reduces one's ontology. Furthermore, if as a result of such identity statements one only needs physics and its predicates in order to account, in principle, for everything about the natural world, then, at least intuitively, parsimony considerations suggest that the entities of physics are the only entities that actually exist. In this

manner, the Nagelian view of special sciences provides the background to recent debates with a trenchant defense of inter-theoretic reductionism, and the in principle dispensability of special sciences and their predicates, implicitly combined with a thorough ontological reductionism that merely accepts the existence of the entities of physics, such as quarks and their properties.

During the 1960s, 1970s, and 1980s, philosophers of science more closely examined the actual nature of particular special sciences, primarily psychology and biology, to show that, contrary to the Nagelian claims, such disciplines and their predicates are in principle indispensable. Though a range of evidence was used to defend this conclusion, Jerry Fodor's (1974) so-called Multiple Realization Argument was the most prominent of these defenses. The latter argument's crucial premise is the observation that the predicates of the special sciences refer to properties that are composed, or multiply realized, by heterogeneous combinations of the properties studied by physics. For example, the economic predicate "has monetary value" refers to the properties composed by the physically heterogeneous combinations of properties found in paper, metal, plastic, and even shells. Such multiple realization means that there is a failure in getting the identity claims necessary to drive the Nagelian program—having monetary value, and other special science properties, simply are not identical to any particular combination of physical properties.

As well as undermining the Nagelian's key argument for the dispensability of special sciences and their predicates, multiple realization was also used to provide positive arguments for the in principle indispensability of such predicates by Fodor, William Wimsatt (1976), Philip Kitcher (1984), and others. Though differing in their details, these positive arguments putatively show that—given the physical heterogeneity of the combinations of physical properties that realize special science properties—the predicates of physics will fail to articulate the commonalities between the multiply realized properties, like having monetary value, studied by the special sciences. For the predicates of physics simply frame the physical differences amongst the heterogeneous realizers of special science properties. Consequently, it is argued in various ways that the proprietary predicates of the special sciences are also necessary, in principle, to fully account for the multiply realized properties these disciplines study.

Though many philosophers of science have worked to articulate this position, for simplicity the latter account of special sciences will be referred to as the Fodorian

view; and, as well as its claims about predicates, this position again lends itself to further ontological conclusions. In fact, the realization of special sciences properties by the properties of physics is explicitly combined by Fodor, and others, with the idea of the implementation of special science mechanisms by mechanisms of physics (and implicitly with the constitution of individuals of the special sciences by the individuals of physics).

As a result, the Fodorian view is apparently a version of ontological non-reductivism, for it assumes that the world is a compositional hierarchy containing many levels of distinct properties, individuals, and mechanisms bearing complex compositional relations to other levels of entities until one bottoms out (so far as we now know) with the entities studied by physics. The Fodorian picture thus takes a diametrically opposed view of the special sciences than the Nagelian account, arguing that, rather than leaving too many cooks preparing the broth, the special sciences and their proprietary predicates are, in principle, necessary in order to fully understand and explain the variegated levels of multiply realized properties, multiply constituted individuals, and multiply implemented mechanisms that the special sciences take as their objects of inquiry.

As the dominant position, the Fodorian view has received sustained critical attention and two tendencies are worth noting here. First, there is a significant, and continuing body of work that follows various strands of the Nagelian view, either by seeking to provide technical machinery that establishes the in principle dispensability of special science predicates, or by looking at a wider range of scientific cases to drive such machinery, or both (Hooker 1981, Bickle 1998). However, Jaegwon Kim has recently pioneered a second approach that diverges radically from the Nagelian framework's semantic focus. As a response to the Fodorian view, Kim (1998) instead champions what might be dubbed the "metaphysics of science"—the careful examination of ontological issues as they arise in sciences. The resulting strategy proceeds, first, by more carefully examining the nature of an ontological claim about the special sciences central to the Fodorian picture, and then, second, by seeking to show that when the metaphysics of this notion is properly understood it fails to support the conclusions claimed by the Fodorians.

Perhaps the most important of these critical arguments focuses on the realization relation itself. Crudely put, certain property instances, the realizers, realize another property instance only if the causal powers contributed by the realizers non-causally suffice for the pow-

ers individuating of the realized property, but not vice versa. Kim (1998) has consequently argued that, given this core feature of the realization relation, considerations of ontological parsimony make it *prima facie* plausible that it should only be accepted that there are realizer property instances. This grounds a new form of ontological reductionism, what Kim terms the functionalization model, which uses the Fodorian view's own commitment to realization relations in the special sciences to reduce the ontology of the sciences simply to the ultimate realizers—the properties of physics. Other important examples of such arguments driven by work in the metaphysics of science are found in Kim (1992) and Lawrence Shapiro (2000), which each use more precise metaphysical examinations of multiple realization to attack the scientific legitimacy of multiply realized properties, as well as explanations using predicates referring to them and any science that seeks to study them—again turning the Fodorian account of special sciences against itself.

Naturally, there have been responses to such critical arguments focused on the metaphysics of science (see, for instance, Fodor [1997] and Gillett [2003]) and, as yet, it is far from clear where this renewed ontological focus will finally lead. However, ongoing debates over special sciences have arguably changed in a fundamental way, not least by the range of new questions faced. Can the ontological non-reductivism, the levels position, which many assume is the backbone of the Fodorian view, be sustained or does it collapse upon itself as Kim's functionalizing reductionism seeks to show? And is there space for a third, previously unappreciated, type of view about special sciences that combines ontological reductionism, driven by the metaphysical argument underpinning Kim's functionalizing reduction, and a commitment to the in principle indispensability of special sciences, founded upon the Fodorian's reasoning that complex aggregates can only be fully understood using special science predicates? As well as these concerns about global views of special sciences, one also now confronts a prior set of more specific issues about the foundations of the special sciences. For example, what is the nature of composition generally in the special sciences, as well as particular compositional relations such as the realization relations between properties in the sciences?

The answers to the more particular questions in the metaphysics of science are important because, as has been seen, they underpin many of the ongoing disputes between proponents of competing global accounts of the special science themselves. Moreover, all of these questions about the foundations of the special sciences will

only become more pressing. For as humans increasingly look to the sciences to understand their own nature, then what is said about special sciences, like genetics, neurophysiology, and psychology, will also have more and more obvious implications for what they must consequently conclude about themselves.

## SPECIESISM

"Speciesism" is the name of a form of bias or discrimination that is much discussed in the contemporary debates over the moral status of animals. It amounts to discriminating on the basis of species; that is, it takes the fact that, say, baboons and humans belong to different species as a reason in itself to draw moral differences between them and on several counts.

First, speciesism sometimes manifests itself in consideration of who or what may be members of the moral community, of who or what is morally considerable (see Clark, Frey, Regan, Singer). For example, it is sometimes

said that creatures who have experiences or are sentient count morally; to go on to affirm that (some) animals have experiences and are sentient but to deny that they count morally solely because they are not of the right species is a form of speciesism. If it really is the fact that creatures have experiences and are sentient that matters, then animals count; what has to be shown is why the fact that it is a baboon and not a human who has these characteristics matters morally.

Second, speciesism sometimes manifests itself in claims about pain and suffering. For instance, we usually take pain and suffering to be evils, to be things that blight a life and lower its quality, and animals can feel pain and suffer. Thus, suppose one pours scalding water on a child and on a cat: It seems odd to say that it would be wrong to scald the child but not wrong to scald the cat, since both feel pain and suffer, both have the quality of their lives diminished, and both instinctively reveal pain-avoidance behavior. To claim that scalding the child is wrong, but that scalding the cat is not wrong solely on the basis of the species to which each belongs is not in itself to give a reason why or how species-membership is morally relevant, let alone morally decisive (see Rachels 1990, Sapontzis 1987).

Third, speciesism sometimes manifests itself in claims about the value of life. Most of us think human life is more valuable than animal life; yet to think this solely on the basis of species exposes one to an obvious problem. If it is true that normal adult human life is more valuable than animal life, it by no means follows that all human life is more valuable than animal life, since it is by no means the case that all human lives are even remotely approximate in their quality. Thus, some human lives have a quality so low that those who are currently living those lives seek to end them; this, of course, is what the contemporary concern with euthanasia and physician-assisted suicide is all about. Indeed, some humans live in permanently vegetative states, where, as best we can judge, all talk of the quality of life seems beside the point. Are even these human lives more valuable than the lives of perfectly healthy baboons? To say that they are solely because they are human lives, lives lived by members of the species *Homo sapiens*, even though it is true that healthy baboons can do all manner of things, can have all manner of experiences, is in effect to say that species-membership makes the crucial difference in value. It is not apparent exactly how it does this (see Frey). Of course, certain religions and cultural traditions may hold that humans have greater value than do animals, no matter what the quality or kind of lives lived: But these very

same religions have put forward moral views that many today do not endorse, and these very same cultural traditions have held that, for example, whites are superior to blacks.

## SPENGLER, OSWALD

(1880–1936)

The German writer Oswald Spengler was born at Blankenburg, Germany. Spengler is known almost entirely for his contribution to philosophy of history. After studying at the universities of Munich, Berlin, and Halle—chiefly natural science and mathematics, although he also read widely in history, literature, and philosophy—Spengler obtained a doctorate in 1904, with a thesis on Heraclitus, and embarked upon a career as a high school teacher. In 1911 he abandoned teaching to take up the penurious life of a private scholar in Munich,

where the first volume of his only considerable work, *Der Untergang des Abendlandes (The Decline of the West)*, gradually took shape. This volume was published in 1918 at the moment of his country's defeat in World War I. Its pessimistic conclusions so exactly suited the prevailing mood that its author rocketed to instant but short-lived fame.

An ardent nationalist, Spengler has sometimes been accused, especially because of his reactionary and quite undistinguished political writings after 1923, of having helped to prepare the way intellectually for fascism. He actually opposed Adolf Hitler's rise, but chiefly on the ground (as he put it) that what Germany needed was a hero, not a heroic tenor. He died in Munich in 1936, bitterly resentful of the drastic decline his reputation had suffered. It is doubtful that Spengler would have been greatly mollified by the revival of interest in his work that followed World War II, for this was due as much to the general stimulus given to speculation about history by Arnold Toynbee's popular *A Study of History* as to any belated recognition of the independent merits of Spengler's views.

### HISTORY AS COMPARATIVE MORPHOLOGY

*The Decline of the West*, although fascinating in stretches, is an unsystematic, repetitive, obscurely written book. Its style is oracular rather than analytical; it offers more "insights" than arguments. Yet its major claims are reasonably clear. From the outset it calls for a "Copernican revolution" in our way of viewing human history that will at once undermine both the traditional ancient–medieval–modern framework generally employed by empirical historians (a framework that Spengler finds provincial) and the prevailing linear interpretation of most Western philosophers of history, whether progressive or regressive (which he finds naive). According to Spengler, history, steadily and objectively regarded, will be seen to be without center or ultimate point of reference. It is the story of an indefinite number of cultural configurations, of which western Europe is only one, that "grow with the same superb aimlessness as the flowers of the field." The careers of such cultures, he contends, constitute the only meaning to be found in the course of history as a whole; they are pockets of unconnected significance in a wilderness of human life, most of which is "historyless." All that philosophical study of history can attempt is a "comparative morphology of cultures"—an inquiry into the typical form of their life, their rhythms, and possibly their laws—aimed at giving cate-

gories and an interpretative framework to empirical historiography. In outline at least, this is the aim of Spengler's two massive volumes.

But what exactly are the cultures that provide subject matter for the morphological approach to history? In view of the common complaint that Spengler "biologizes" history, it should be noted that he represents cultures as spiritual phenomena, although rooted in a definite "natural landscape." A culture is the spiritual orientation of a group of people who have achieved some unitary conception of their world that informs all their activities—their art, religion, and philosophy, their politics and economics, even their warfare—and which is expressible in a distinctive concept of the space in which they are to live and act. This concept of space functions as the culture's "prime symbol" and is the key to the understanding of its history.

Thus, classical man, to whom Spengler applies Friedrich Nietzsche's term *Apollinian*, is said to have conceived of himself as living in a local, finite space, a visible, tangible here-and-now, of which the life-sized nude statue and the small columned temple are eminent expressions. The concept shows itself equally in such things as the circumscribed political life of the city-state and the practice of burning rather than burying the dead, as if the idea of eternity could not be squarely faced. By contrast, modern Western man conceives of himself as living in a space of boundless extent, his whole culture expressing a Faustian urge to reach out and fill it with his activity. Thus, the spires of Gothic cathedrals soar skyward, Western painting develops distant perspectives, music produces the expansive form of the fugue. Also typically Faustian are long-distance sailing and long-range weapons, the conquest of space by telephone, and the insatiable ambitions of Western statesmen (for whom, like Cecil Rhodes, "expansion is everything").

Other cultures each have their characteristic space concept. The ancient Egyptians saw their world in one dimension, and their architecture, which assumed the basic form of a corridor enclosed in masonry, expressed the notion of "moving down a narrow and inexorably prescribed life-path." The Russians, whom Spengler classifies as non-Western, have a "flat plane" culture, which, when free to do so, expresses itself in low-lying buildings and an ethics of indiscriminating brotherhood. The Arabian culture of the Middle East, which Spengler calls Magian, views the world mysteriously, as a cavern in which "light ... battles against the darkness." Its architecture is consequently interior-oriented; its religion, magical and dualistic. Altogether, Spengler claims to identify

nine (possibly ten) such cultures, which have emerged at various times from "the proto-spirituality of ever-childish humanity." But he does not rule out the possibility of others being discovered.

Spengler's concept of human cultures has some affinity with G. W. F. Hegel's concept of the state. Both envisage an organic unity of human attitudes and activities that express a definite form of the human spirit. Spengler never wrote the promised metaphysical work that might have made clearer the general status of "spirit" in his philosophy of history. But his concept of it certainly differs from Hegel's, for he denies that the spirituality of successive historical units taken together reveals the developing nature of spirit itself. The units have no rational connection with one another, Spengler maintains, denying categorically that one culture can ever really understand, learn from, or (strictly speaking) be influenced by another. The divergence of his approach from Hegel's is even greater in his account of the typical career of a culture. Whereas Hegel attempted to represent not only the succession of historical units, but also the succession of stages within each unit, as a rationally (that is, dialectically) ordered sequence, Spengler finds, instead, a pattern analogous to the life cycle of a plant or animal. Like biological organisms, cultures grow old. The qualitative changes that accompany the "aging" will be as apparent, to a historian possessing "physiognomic tact," as is a culture's original orientation.

## CULTURAL CYCLE

Spengler often speaks of the aging of cultures in terms of the succession of the four seasons. They have their spring in an early heroic period when life is rural, agricultural, and feudal. In the Apollinian culture this was the Homeric period; in the Faustian it was the high Middle Ages. This is a time of seminal myths, of inspiring epic and saga, and of powerful mystical religion. With summer comes the rise of towns not yet alienated from the countryside, an aristocracy of manners growing up beside an older, lustier leadership, and great individual artists succeeding their anonymous predecessors. In the Apollinian culture this was the period of the early city-states; in the Faustian it was the time of the Renaissance, of William Shakespeare and Michelangelo, and of the Galilean triumphs of the uncorrupted intellect.

Autumn witnesses the full ripening of the culture's spiritual resources and the first hints of possible exhaustion; it is a time of growing cities, spreading commerce, and centralizing monarchies, with religion being challenged by philosophy and tradition undermined by

“enlightenment.” In the classical world this was the age of the Sophists, of Socrates and Plato; in the West it was the eighteenth century, which reached the apogee of creative maturity in the music of Mozart, the poetry of Johann Wolfgang von Goethe, and the philosophy of Immanuel Kant. Transition to winter is characterized by the appearance of the megalopolis, the world city, with its rootless proletariat, plutocracy, esoteric art, and growing skepticism and materialism. It is an age, furthermore, of imperialism, of increasing political tyranny, and of almost constant warfare, as political adventurers skirmish for world empire. In general, culture loses its soul and hardens into mere “civilization,” the highest works of which are feats of administration and the application of science to industry.

Faustian culture is, according to Spengler, currently well into its autumn period, at a point roughly equivalent to 200 BCE in the Apollinian culture. An early sign of our advanced cultural age is the career of Napoleon Bonaparte, who is morphologically contemporary with Alexander the Great; our Julius Caesar is yet to come. The moral is plain.

We are civilized, not Gothic or Rococo, people; we have to reckon with the hard cold facts of *late* life, to which the parallel is to be found not in Pericles’ Athens but in Caesar’s Rome. Of great painting or great music there can no longer be, for Western people, any question.... Only *extensive* possibilities are open to them.

Young Faustians who wish to play a significant role in the gathering winter should, in other words, either join the army or enroll in a technological institute. Spengler hopes that enough of his countrymen will heed his advice to ensure that the Faustian equivalent of the Roman Empire will be German.

**CULTURAL CYCLE AND DETERMINISM.** Clearly, Spengler regards comparative morphology as a basis for predicting the future of a culture, given the stage it has reached. Spengler, in fact, represents his study as the first serious attempt to “predetermine history,” and he offers comparative charts in support of his claim that the life cycle of a culture takes about one thousand years to work itself through.

It is nevertheless misleading to call Spengler’s account of history deterministic without qualification. Unlike Toynbee’s, for example, it offers no explanation of the origin of cultures; the sudden rise of a new “world experience” is left a cosmic mystery. Nor do Spengler’s cultures disappear on schedule after reaching the stage of

civilization; civilizations may last indefinitely, as the examples of India and China show. Even while alive, the working out of a culture’s “destiny” leaves open many alternative possibilities; the themes, Spengler says, are given, but not the modulations, which “depend on the character and capacities of individual players.” Thus, Germany was bound to be united in the nineteenth century; how it would be united depended on what Frederick William IV would do in 1848 and Otto von Bismarck in 1870. Spengler’s historical “laws” are thus not envisaged as determining, but only as limiting, the actions of individuals. This is part of the rationale of his political activism.

The notion, furthermore, of a developing culture’s being a *self*-determining system is qualified by Spengler’s recognition of two ways in which its normal development may be frustrated. Thus, he claims that the Mexican culture had perished through external assault, “like a sunflower whose head is struck off by one passing.” Spengler also concedes that a culture can sustain spiritual damage from too close proximity to a stronger one, resulting in what he calls pseudomorphosis. What originally led him to elaborate this idea was the confused development of the Magian culture, which came to life on the ground of the Apollinian before the older culture had passed away. In such cases, Spengler observes, the younger culture “cannot get its breath, and fails not only to achieve pure and specific expression-forms, but even to develop fully its own self-consciousness.” The Russian culture—which, according to Spengler, was “prematurely born”—has similarly been deformed by intrusions of the Faustian culture, first in the “reforms” of Peter the Great and again in the Bolshevik Revolution. Since weaker cultures take on only certain outer forms of dominant ones, however, Spengler would deny that the doctrine of pseudomorphosis contradicts his claim that one culture never really influences another.

## DIFFICULTIES IN SPENGLER’S THEORY

Like all large synoptic systems, Spengler’s theory of history has been criticized for rearing its speculative superstructure on too shaky an empirical foundation. Even Toynbee has not escaped this charge, and in breadth of historical knowledge (if not always in perceptiveness) Spengler is vastly the inferior of the two. His knowledge of his cultures is much more uneven; all he really knows well is the Apollinian and Faustian. More important, what he does say at the detailed level all too often gives the appearance of special pleading. In some cases his morphological judgments are just a bit too ingenious to

be convincing, as when he declares that Rembrandt's brown is the color of Ludwig van Beethoven's string quartets. In other cases dubious value judgments seem to be traceable chiefly to the requirements of the overarching thesis, as when the Roman Empire, being a winter phenomenon, is represented as culturally sterile, in spite of Vergil, Horace, and Ovid. In still other cases critics have suspected Spengler, if not of falsifying, then at least of suppressing, known historical facts, as when he claims that classical man, by contrast with Magian man, was polytheistic, ignoring the almost uniform monotheism of the great Greek philosophers. Highhanded treatment of the details is made easier by the fact that what passes for empirical verification in Spengler's work is really only casual exemplification of his general ideas; he makes no attempt to test systematically, and possibly to falsify, a precisely articulated hypothesis about cultural development. And when the details become intransigent, much can be explained away as pseudomorphosis. Thus, high-rise buildings in Russia are called Western-inspired, and Hadrian's Pantheon (the "first mosque") is labeled an irruption of the Magian.

Even if Spengler's actual procedure were scientifically more acceptable, there would remain the basic weakness of any attempt to generalize about the whole of history from a mere eight to ten instances of cultural development, two of which are conceded in any case to be abnormal. Spengler's defenders, of course, have often denied the relevance of this sort of criticism. What he attempted, they claim, was not social science, not even philosophy of history in the sense of arguing to general conclusions from philosophical premises in the manner of Kant and Hegel. It was, rather, a vision of events, whose truth is the truth of poetry. From this standpoint Spengler's charts and tables are an unfortunate lapse that should not be taken too seriously; part of the value of his work lies in its imaginative imprecision. Certainly, Spengler himself declared that whereas nature should be studied scientifically, history should be studied poetically. As a defense against the empirical objection, however, this will not do. For poetry is not predictive. Spengler's theory is distinctive in insisting that the significant features of history are those that are focused by the historian's aesthetic judgment. But classification and simple induction of the sort characteristic of the underdeveloped sciences is as essential to his final conclusions as is aesthetic insight.

The weakness of Spengler's inductions might not have been so serious had he not been an uncompromising holist as well. He offers no explanation of the changes his cultures undergo; he makes no attempt to isolate the

factors that might throw light on their "mechanism" and that might have afforded reasons for expecting such developments to continue. In fact, part of the function of the puzzling contrast he draws between the "causality" of nature and the "destiny" of history is to persuade us not to look for this sort of thing. Spengler seems to think of causality rather narrowly as a matter of physical interaction. His own model for historical development is the biological destiny of a seed, its tendency to grow into a plant of a definite kind, barring accidents and in spite of deformations—it being assumed that this is not explicable mechanistically. It is ironical that although Spengler himself, in elaborating this concept of explanation, claimed to be resisting inappropriate scientific approaches to history, it is precisely because of this approach that some critics have charged him with scientism. Idealist philosophers of history, for example, have regarded Spengler as a cryptopositivist because, in searching out the life cycle of cultures without trying to understand in detail and from the inside why the human participants acted as they did, he treats what he originally defined spiritualistically as if it were part of nature. The causation of action by human reason, these critics would say, is central to all explanations of historical change. By ignoring this, Spengler's theory falls into incompatible parts.

Many critics have held that an even more obvious contradiction vitiates much of what Spengler had to say about specifically historical understanding. According to him, the reason cultures never really influence one another is that they are never able to grasp one another's prime symbol—a doctrine of cultural isolation that Spengler extended even to such apparently recalcitrant subjects as mathematics (to Apollinians and Faustians, he says, number means entirely different things). But the notion that we can never understand what is culturally alien to us surely raises barriers to the sort of understanding claimed by Spengler himself; comparative morphology presupposes a correct grasp of what is being compared. Spengler tries to meet this difficulty with the ad hoc claim that a few intuitive geniuses may rise above the barrier of cultural relativism. Yet the fact that he offered his book to the general public surely betrays confidence in a rather wider distribution of transcultural insight than is strictly compatible with the impossibility of cultures' learning from one another. Nor is it helpful to suggest that cultures may learn without being influenced, for the reason for denying influence was the impossibility of understanding. The difficulty is compounded by Spengler's sometimes also denying that we can understand what is culturally "out of phase" with us, even though it

belongs to the past of our own culture. Thus, we are told that although Tacitus knew of the revolution of Tiberius Gracchus two and a half centuries earlier, he no longer found it meaningful. Together, Spengler's two limitations on the understanding lead to the conclusion that we can understand only ourselves. This is scarcely a promising position from which to develop a theory of historical inquiry.

### **Bibliography**

The first volume of Spengler's *Der Untergang des Abendlandes*, subtitled *Gestalt und Wirklichkeit* (Munich: Beck, 1918), was revised in the definitive Munich edition of 1923. The second volume, *Welthistorische Perspektiven*, had been published there the previous year. A good English translation by C. F. Atkinson is available under the title *The Decline of the West* (London: Allen and Unwin, 1932), and there is an abridged edition of this prepared by Helmut Werner and Arthur Helps (New York: Knopf, 1962).

For an introductory discussion of the background and influence of Spengler's work, as well as a select bibliography, see H. S. Hughes, *Oswald Spengler: A Critical Estimate* (New York: Scribners, 1952). For further references see Patrick Gardiner, ed., *Theories of History* (Glencoe, IL: Free Press, 1959), p. 524. For criticism from the standpoint of both idealist philosophy of history and empirical historiography, see R. G. Collingwood, "Oswald Spengler and the Theory of Historical Cycles," in *Antiquity* 1 (1927): 311–325, 435–446.

**W. H. Dray (1967)**

## SPINOZA, BENEDICT (BARUCH) DE (1632–1677)

Dutch Jewish philosopher Benedict de Spinoza was best known for his *Ethics* (1677), which laid out in geometric form arguments for the existence of an impersonal God, the identity of mind and body, determinism, and a way of overcoming the dominance of the passions and achieving freedom and blessedness. His *Theological-Political Treatise* (1670) was a landmark in the history of biblical criticism. He was also, in that work, the first major philosopher in the Western tradition to argue for democracy and for freedom of thought and expression.

## IN THE PORT OF AMSTERDAM (1632–1656)

Spinoza was born into the Portuguese Jewish community in Amsterdam in the same year Galileo published his *Dialogue Concerning the Two Chief World Systems*. His father, Michael, was an immigrant who had fled Portugal, with other members of his family, to escape the persecution of the Inquisition. At that time the Dutch Republic was one of the few places in Europe where Jews could worship freely. In Amsterdam Michael became a fairly prosperous merchant in the import-export business and a prominent member of the Portuguese synagogue.

But Baruch, as Benedict was first called, encountered his own problems with religious intolerance. In 1656, when he was twenty-three, the synagogue expelled him for what the sentence of excommunication described as "abominable heresies" and "monstrous deeds." Although Spinoza had received an orthodox religious education in his congregation's school, he rebelled early on against central tenets of Judaism and began to take an interest in the new philosophy of Descartes, Hobbes, and Galileo. After his excommunication he was known by the Latin version of his name, Benedict (which means "blessed" in Latin, as Baruch does in Hebrew).

Excommunication was a common form of discipline in the Amsterdam synagogue, often imposed for minor offenses and for short periods, with a provision that the sentence could be lifted if the offender performed some penance. Spinoza's excommunication was unconditional and quite harsh. The elders cursed him with exceptional severity; no one in the Jewish community (including members of his own family) could associate with him. For a long time historians did not know exactly what heresies he was accused of. But in the mid-twentieth century, research in the archives of the Inquisition disclosed a report from a Spanish priest who had spent several months in Amsterdam. His report revealed that the main doctrinal charges against Spinoza were: (1) that he held that God exists "only philosophically"; (2) that he maintained that the soul dies with the body; and (3) that he denied that the law of Moses was a true law. The "monstrous deeds" probably included his unrepentant resistance to authority when threatened with excommunication.

## BECOMING A PHILOSOPHER (1656–1661)

Michael de Spinoza died two years before the excommunication. At that time Baruch took over the family busi-

ness in partnership with his younger brother, Gabriel. But the punishment prescribed for his heresy made it impossible for Benedict to continue running his father's firm (which was, in any case, in financial trouble as a result of the first Anglo-Dutch war). There is little definite information about Spinoza's life during the years immediately after his excommunication. Probably he remained in Amsterdam for most of this period, and began working as a lens grinder, a craft in which he earned a reputation for excellence. Perhaps he lodged at first with Francis van den Enden, a former Jesuit at whose school he had been learning Latin. Van den Enden may also have helped to shape his inclinations toward the new philosophy, religious heterodoxy, and democratic politics. Perhaps Spinoza earned room and board by assisting Van den Enden in teaching Latin. Very probably he played parts in the comedies of Terence, which Van den Enden had his students perform in 1657 and 1658. Possibly he assisted the Quakers in their attempts to convert the Jews by translating some of their literature into Hebrew.

Sometime between 1656 and 1661 it appears that Spinoza did some formal study of philosophy at the University of Leiden. The Dutch Republic was the first place where Cartesianism took hold, having been introduced in 1640 by Regius, a professor of medicine at the University of Utrecht. Cartesianism was highly controversial. Voetius, a professor of theology at Utrecht, challenged Regius's doctrine that the union of soul and body is one of two separate substances, defending the scholastic-Aristotelian doctrine that the soul is the substantial form of the body. In 1642 the university forbade the teaching of Cartesianism. Later in the 1640s there were similar controversies at the University of Leiden. In 1646 Heereboord, a professor of logic at that university, defended the Cartesian method of doubt as a way of achieving certainty. Revis, a professor of theology at Leiden, replied that the method of doubt would lead to atheism and accused Descartes of Pelagianism. In 1647 their controversy led the university to ban the discussion of Descartes' philosophy, pro or con. Nevertheless, in the late 1650s Leiden was a place where one could study Cartesian philosophy.

By the end of the 1650s, Spinoza had established a circle of friends, the most notable of whom were Jan Rieuwertsz, a bookseller and publisher of Dutch translations of Descartes' works, who was later to become Spinoza's publisher; Jan Glazemaker, translator into Dutch of Descartes' works, who was later to translate most of Spinoza's works into Dutch; Peter Balling, the Amsterdam agent of various Spanish merchants, who was to translate

Spinoza's first published work, an exposition of Descartes, into Dutch; the brothers Jan and Adriaan Koerbagh, the latter of whom died in prison for publishing Spinozistic views; and Lodewijk Meyer, a prominent member of Amsterdam literary circles, who wrote, in 1666, a work entitled *Philosophy, Interpreter of Holy Scripture*.

Meyer's work anticipates some of the themes of Spinoza's *Theological-Political Treatise* (TPT), though it differs from Spinoza in the solution it proposes. Meyer complains that theologians try to settle their controversies by appeals to scripture but that their interpretations of scripture are so insecurely based that the controversies never end. Meyer thinks Descartes' work holds the key to ending these debates. He proposes to doubt everything alleged to be the teaching of scripture if it is not based on a solid foundation. Accepting the Cartesian doctrine that God is not a deceiver, and assuming that the books of the Old and New Testaments are the word of God, Meyer concludes that if a proposed interpretation of scripture conflicts with what philosophy shows to be the truth, we can reject that interpretation as false. This is a modernized version of the Maimonidean approach to scripture that Spinoza rejected in the TPT.

Spinoza's friends in Amsterdam shared an interest in Cartesian philosophy and in a religion which involves minimal theological doctrine, emphasizing the love of God and neighbor. Many were affiliated with the Collegiants, a liberal protestant group which had broken away from the Reformed Church after the Synod of Dort in 1618, and which had neither a clergy nor a creed. Many of Spinoza's friends also had a connection with the University of Leiden.

Evidently Spinoza began writing his earliest philosophical works during this period: almost certainly the never-finished *Treatise on the Emendation of the Intellect*; probably his *Short Treatise on God, Man, and his Well-Being*, a systematic presentation of his philosophy, foreshadowing his *Ethics*, but never put into final form; and an early version of the *Theological-Political Treatise*, which may have developed out of a defense of his religious opinions he wrote in Spanish, addressed to the synagogue. The *Treatise on the Intellect* was first published in his *Opera posthuma*; the *Short Treatise* was not discovered until the nineteenth century, in two manuscripts which apparently stem from a Dutch translation of a lost Latin original. The defense to the synagogue has never been found, though it seems possible to infer some of its likely content from the version of the *Theological-Political Treatise* published in 1670.

## THE TREATISE ON THE EMENDATION OF THE INTELLECT

The order of composition of Spinoza's earliest works has been debated, but there now seems to be a consensus that the *Treatise on the Emendation of the Intellect* (TEI) is the earliest of his surviving works. It is a good place to start the exposition of Spinoza's philosophy, since it explains his motivation for becoming a philosopher. Spinoza begins the TEI by writing that experience had taught him that all the things men commonly pursue—wealth, honor and sensual pleasure—are empty and futile. The pursuit of these supposed goods does not lead to true peace of mind. Sensual pleasure is transitory and, when past, is followed by great sadness. The desires for honor and wealth are never satisfied; when we achieve some measure of them, our success leads only to a never-ending quest for more of the same. When we are unsuccessful, we experience great sadness. The pursuit of honor has the special disadvantage that it puts us at the mercy of others' opinion.

The pursuit of wealth is subject to the uncertainties of fortune, as Spinoza might have learned from his experience as a merchant during the first Anglo-Dutch war. So Spinoza says he finally resolved to seek a good which would give him a joy unalloyed with sadness and which he thought could be found in love for something eternal and infinite. Achieving that highest good, he concluded, would involve perfecting his own nature by acquiring knowledge of the union the mind has with the whole of nature. This decision evidently came only after the excommunication, though it probably culminated a period of reflection which began several years earlier.

Spinoza's primary purpose in this work is to develop a theory of knowledge which will enable him—"with others if possible"—to attain the knowledge which is the highest good. He conceives that project as requiring a healing and purification of the intellect. To this end he offers a classification of the different ways we can 'perceive' things so that he can choose the best. He enumerates four ways by which he has been lead to affirm something without doubt: (1) because someone has told him so; (2) because he has come to believe it by random experience; (3) because he has inferred the essence of a thing from something else (but not adequately); and (4) because he has come to perceive the thing through its essence alone or through knowledge of its proximate cause.

Of the numerous examples Spinoza gives of things he has come to believe in these ways, one must suffice here. Suppose we are given three numbers,  $a$ ,  $b$ , and  $c$ , and

wish to find a fourth number,  $d$ , which is to  $c$  as  $b$  is to  $a$ . (1) Some will be able to find  $d$  because they have been taught a rule which tells them to multiply  $b$  and  $c$ , and divide the product by  $a$ . (2) Others will construct that rule for themselves by generalizing from simple cases where the answer is obvious. (3) Still others will have learned the rule by working through its demonstration in Euclid's *Elements*. And finally, (4), some will simply see, intuitively, the answer to the problem, without going through any inferential process. Surprisingly, given his fondness for demonstration in the *Ethics*, Spinoza rejects *all* of the first three paths to knowledge, and he claims that only the fourth way of affirming things will lead us to the perfection we seek. But, he says ruefully, the things he has so far been able to understand by this kind of knowledge are very few.

The middle portion of the TEI is a search for a method of acquiring knowledge in this fourth way. The reasoning here is obscure and seems to present difficulties which may explain why Spinoza never finished this work. For example, he claims that truth needs no sign and that having a true idea is sufficient to remove all doubt. But the method is supposed to teach us what a true idea is and how to distinguish it from other perceptions. That quest seems to assume that we do need a sign to recognize a true idea.

The concluding sections of the work, however, contain suggestive hints about Spinoza's metaphysical views during this period. A proper application of the method, it seems, will require us to order our ideas in a way which reflects the order of things in nature, reflects, that is, the causal structure of nature. This in turn requires that we begin by understanding what he calls "the source and origin of Nature," which he identifies with "the first elements of the whole of nature." He then makes a distinction between 'uncreated' things that "require nothing but their own being for their explanation" and 'created' things, which depend on a cause (other than their own nature) for their existence. The first elements of the whole of nature would evidently be uncreated things which exist in themselves, independently of anything else. Spinoza explains that if something exists in itself, it is its own cause. Everything else in nature presumably would depend in some way on the first elements. But how do 'created' things depend on 'uncreated' things? And how can something be its own cause?

Toward the end of the TEI Spinoza makes another distinction, which may help to answer these questions. He distinguishes between what he calls the series of fixed and eternal things and the series of singular, changeable

things. The singular changeable things are apparently the particular, finite things we encounter in our daily experience. The fixed and eternal things are said to be present everywhere, to be the causes of all things, and to have laws “inscribed in them,” according to which the singular, changeable things come to be and are ordered. There are, it appears, two causal orders, one of which relates singular, changeable things to other singular, changeable things, the other of which relates them to fixed and eternal things. The true progress of the intellect requires understanding how singular, changeable things are related to the series of fixed and eternal things. To trace their connection with the series of other singular, changeable things would be impossible, because of the infinity of that series. But it would also not give us insight into the essences of the singular changeable things.

What does this mean? In particular, what are these fixed and eternal things? One plausible conjecture is this: central to Descartes’ philosophy is the claim that philosophy is like a tree whose roots are metaphysics, whose trunk is physics, and whose branches are all the other sciences. What underlies this metaphor is Descartes’ idea—present both in his cosmological treatise, *The World*, and in his *Principles of Philosophy*—that the fundamental laws of physics—such as the principle of inertia and the principle of conservation of motion—can be deduced from the attributes of God (in particular, from his immutability). From these fundamental laws of physics, which apply to all bodies, we can deduce other, more specific laws which apply to particular kinds of bodies (such as magnets) and which are the subjects of the special sciences (such as medicine and mechanics). In principle it should be possible to deduce all the laws governing the operations of physical objects from the fundamental laws of physics. And everything which happens in the physical world (except insofar as it involves the intervention of mental acts, which are outside the causal network) is governed by scientific laws.

Suppose Spinoza accepted the broad outlines of this Cartesian vision of a unified science. He would not have accepted the idea that minds can operate as uncaused causes, interfering with what would otherwise be the course of physical nature. And he would not have accepted the idea that the will of a personal God is the ultimate cause of the fundamental laws of physics. But he does seem to have accepted the idea that there are fundamental laws of physics, from which all the other laws of physical nature can in principle be deduced, and that all the operations of physical objects can be understood in terms of these laws. On this hypothesis, the first elements

of the whole of nature, which are among the fixed and eternal things, would be those general features of extended nature which the fundamental laws of physics describe. The other fixed and eternal things, which are connected in a finite series running between the first elements and the singular changeable things, would be the general features of nature which the derivative laws of physics describe. And the singular, changeable things would be the particular physical objects whose operations are explained by these laws. The order of ideal science reflects the causal structure of nature.

This account may give the impression that Spinoza thought of science as a wholly a priori enterprise which proceeds by the intuition of first principles and deduction of theorems from those first principles. But the final sections of the TEI make it clear that Spinoza recognized that achieving knowledge of singular, changeable things would require some appeal to experience. The laws of nature describe general, unchanging facts, which hold at all times and places. They are not sufficient by themselves to explain why events in the physical world happen at the particular times and places they do. To understand that, Spinoza thinks, we must appeal to “other aids,” to experiments which will enable us to determine by what laws of eternal things the particular event occurred. But before we can conduct fruitful experiments, we must first come to understand the nature of our senses so that we will know how to use them. Since that would appear to require knowledge of singular things, there seems to be a problem of circularity here, which may be one reason why Spinoza never succeeded in finishing this treatise.

One puzzle about the TEI, not resolved by the above interpretation, is what the relation is between the “first elements of the whole of nature” and Spinoza’s later metaphysical categories. In the TEI Spinoza never uses the terms “substance,” “attribute,” and “mode,” which are fundamental to the metaphysics of the *Ethics*. If the first elements are the uncreated things Spinoza mentions in the TEI’s theory of definition, then we might be inclined to identify them with the one substance, God. The uncreated things exist in themselves, or are their own cause, and the concept of existing in itself is one Spinoza later used to define substance. Moreover, the first elements are supposed to be “the source and origin of Nature.” Although Spinoza does not refer to them as God, it is natural to think that “the source and origin of Nature” must be God in any philosophy which acknowledges the existence of God. The problem is that there is, evidently, a plurality of first elements, and only one substance, only

one God. The next work we consider may provide a solution to this puzzle.

### THE SHORT TREATISE ON GOD, MAN, AND HIS WELL-BEING

It is clear that Spinoza intended the *Treatise on the Emendation of the Intellect* as a prelude to a systematic exposition of his philosophy; from the correspondence it seems almost certain that some version of *The Short Treatise on God, Man, and His Well-being* (ST) was the systematic exposition the TEI was intended to introduce. Spinoza probably began writing it while he was still living in Amsterdam, but he must have finished it after he moved to Rijnsburg in the summer of 1661, when he apparently sent a copy of the Latin manuscript back to his friends in Amsterdam. This manuscript would then have been translated into Dutch for the members of his circle who could not read Latin. It is that Dutch manuscript, or manuscripts descended from it, which provides the basis for our knowledge of the ST.

Spinoza was still uncertain about publishing the ST as late as April 1662, when he had already made a start on expounding his philosophy in the geometric style of his *Ethics*. He had initially written the ST at the request of his friends, but only for private circulation, not publication. It appears that he sent them the manuscript some time after he moved to Rijnsburg. He hesitated to publish this work because he knew it was theologically unorthodox and he was reluctant to invite the attacks he knew would come from the conservative Calvinist clergy.

The surviving manuscripts present many textual difficulties. Frequently we do not know whether what we are reading is originally from Spinoza's hand, an addition by an early reader, a mistranslation of the Latin original, or a copyist's error. It appears that even in those portions of the manuscripts we can confidently ascribe to Spinoza, the views he holds, or the ways he expresses or argues for those views, reflect an early, formative stage of his thought. There also seem to be different strata in the manuscripts themselves, reflecting different stages in his thought. Often the argument is quite obscure.

In spite of these difficulties, the ST can be very instructive. Many of the central theses of the *Ethics* are already present in this work; it is interesting to see the form they take here. Like Descartes, Spinoza holds that God exists necessarily. He accepts versions of the ontological and causal arguments Descartes had used to prove this in the *Meditations*. The work does not yet have the distinctively Spinozistic arguments used in the *Ethics*. He defines God as a being consisting of infinite attributes,

each perfect in its kind. This is not a definition Descartes had explicitly given, though it is one he might have accepted. From the correspondence we know Spinoza thought it followed from the definition Descartes did give, that God is by definition a supremely perfect being.

Unlike Descartes, and anticipating the *Ethics* (though often with different arguments), Spinoza contends that no substance can be finite; that there are no two substances of the same kind; that one substance cannot produce another; that God is an immanent cause; that both thought and extension are attributes of God; that man is not a substance, but a mode of substance; that the human soul (or mind) is a mode of thought, the idea of its body, which is, a mode of extension. Spinoza also argues in this work for theses which appear in the *Ethics* without argument, such as the identification of God with Nature. Early in the ST he contends that, because no attributes can exist in the divine intellect which do not exist in Nature, Nature must be a being which consists of infinite attributes, each perfect in its kind. So Nature satisfies the definition of God.

The identification of God with Nature and the claim that God is an extended substance are only two of several claims Spinoza makes in this work which he might have expected to arouse theological opposition. Also provocative are his contentions that because God is supremely perfect, he could not omit doing what he does; and that the properties of God commonly included in lists of his attributes—omnipotence, omniscience, eternity, simplicity, and so on—are not, strictly speaking, divine *attributes*, which tell us what God is in himself, but only modes, which can be attributed to him in virtue of some or all of his attributes. Omniscience, for example, presupposes thought; so it must be a mode, not an attribute; but it applies to God only in virtue of the attribute of thought, not in virtue of the attribute of extension. Eternity, on the other hand, would apply to God in virtue of all of his attributes. But it is not an attribute, because it does not tell us *what* God is. It only tells us something about the manner of God's existence, that he exists timelessly and immutably. Spinoza also argues that, because God is omnipotent, he does not give laws to men which they are capable of breaking (who could disobey the will of an omnipotent being?); that he does not love or hate his creatures; and that he does not make himself known to man through words, miracles, or any other finite things.

The God of the ST, like the God of the *Ethics*, is a philosopher's God, an eternal first cause of all things, quite remote from the God who revealed himself to the Jews through his prophets, chose them as his people, per-

formed miracles on their behalf, rewarded them when they obeyed his laws, and punished them when they disobeyed. Presumably something like this is what Spinoza meant when he said to the elders of the synagogue that God exists “only philosophically” and that the law of Moses is not a true law, that it does not, as Judaism supposes, represent a divine command which people may either obey or disobey at their peril.

If there is no divine law which is binding on us, how, then, should we conduct ourselves? Here Spinoza develops at considerable length a theme he only hinted at in the TEI: that we must set aside worldly goods to seek a good which can give us joy unmixed with sadness, transferring our love for finite, transitory things to something eternal and infinite, perfecting our nature by acquiring knowledge of “the union the mind has with the whole of nature.” Progressing towards this perfection requires us to rid ourselves of irrational passions, which depend on the lowest form of cognition, opinion.

Like the *Ethics*, the ST (normally) counts three forms of cognition, not the four counted in the TEI. The first, opinion, combines the first two forms of perception enumerated in the TEI: beliefs we form on the basis of what others have told us and beliefs based on what the TEI called “random experience.” As an example of an irrational passion based on opinion, Spinoza offers the hatred which Jews, Christians, and Muslims often have for one another, based on unreliable reports about the others’ religions and customs, and/or hasty generalizations from an inadequate acquaintance with members of the other religion. ‘Opinion’ in the ST corresponds to what Spinoza calls ‘imagination’ in the *Ethics*.

We can make progress towards overcoming these irrational passions if we pass from opinion to what the ST sometimes calls ‘belief’ and sometimes calls ‘true belief.’ However designated, this stage of cognition involves more than what the phrases suggest: in Spinoza’s usage ‘true belief’ implies not only that the belief is true but that the believer has a firm rational basis for it. True belief, the second of three modes of cognition in the ST, is equivalent to the third of the four modes of cognition in the TEI (and to what Spinoza calls ‘reason’ in the *Ethics*). So it would involve rational demonstration from certain premises.

How does true belief enable us to overcome our irrational passions? Partly, it seems, by eliminating beliefs formed through unreliable ways of perceiving things, but partly also by enabling us to recognize that man is a part of nature (where this implies that man must follow the laws of nature, that his actions are as necessary as those of

any other thing in nature) and partly by teaching us that good and evil are not something inherent in the things we judge to be good and evil, but that they are related to human nature. The good is what helps us to attain what our intellect conceives to be perfection for a human being; evil is what hinders our attaining it (or does not assist it).

But as in the TEI, Spinoza does not think this form of cognition can take us all the way to our goal. That requires the highest form, which this work usually calls ‘clear knowledge,’ or ‘science,’ which we achieve when we are not merely convinced by reasons but are aware of and enjoy the thing itself. If we achieve this kind of knowledge of God, we will come to love Him and be united with Him, as we now love and are united with the body. In our union with Him, we will be released from the body and achieve an eternal and immutable constancy.

This affirmation that we can achieve immortality looks like a startling departure from one of the views for which Spinoza was condemned by the synagogue—that the soul dies with the body. In other respects the ST seems to remain committed to the early heresies and to enable us to understand Spinoza’s reasons for holding them. In this instance, it looks as though Spinoza has reverted to what his community regarded as orthodox belief. But as we will see when we come to the *Ethics*, it does not appear that the ‘immortality’ Spinoza allows is a personal immortality.

In the preceding section we noted a puzzle about Spinoza’s early metaphysics: How are the “first elements of the whole of nature,” which the TEI said were the “source and origin of nature,” related to the categories of Spinoza’s later metaphysics? If the first elements are “uncreated things,” then Spinoza’s theory of definition in the TEI implies that they exist in themselves, which would mean that they are substances. But the first elements are evidently many; and there is supposed to be only one substance.

In the ST the answer appears to be that the first elements of nature are the attributes, which Spinoza defines as existing through themselves and known through themselves, in contrast with the modes, which exist through and are understood through the attributes of which they are modes. So the attributes taken individually satisfy the definition of substance that Spinoza will give in the *Ethics*. The reason there is nevertheless only one substance is that the many attributes are attributes of one being, God or Nature.

The ST also tells us what the other “fixed and eternal” things of the TEI might be. Here for the first time Spinoza makes his distinction between *natura naturans*, defined as a being we conceive clearly and distinctly through itself (all the attributes, or God), and *natura naturata*, the modes which depend on and are understood through God. He divides *natura naturata* into universal and particular modes, identifying only one universal mode in each attribute: motion in extension and intellect in thought. These he describes as infinite, eternal, and immutable, proceeding immediately from God, and in turn the cause of the particular modes, which are ‘corruptible’: they are changeable, have a beginning, and will have an end. The idea underlying the identification of motion as a “universal” mode of extension is that, in accordance with the mechanistic program of the new philosophy, the particular properties of individual extended objects are a function of the different degrees of motion of their component parts.

#### RIJNSBURG YEARS (1661–1663)

By mid-summer of 1661 Spinoza had moved to Rijnsburg, a quiet village near Leiden, which had been the center of the Collegiant sect. The extant correspondence begins during this period, so we are much better informed about these years in Spinoza’s life. Much of the correspondence is with his Amsterdam friends, but his correspondents also include Henry Oldenburg, who became the first secretary of the nascent Royal Society, and Robert Boyle, the British chemist and advocate of the mechanical philosophy. By the fall Spinoza had begun to put his philosophy into geometric form. An early experiment with a geometric presentation appears as an appendix to the ST; another version can be reconstructed from the correspondence with Oldenburg, whom Spinoza had sent a draft which improved on the draft in the appendix of the ST.

In the following year, Spinoza undertook to teach Cartesian philosophy to a student named Casarius. He prepared for Casarius a geometric presentation of Part II of Descartes’ *Principles of Philosophy*, which deals with the foundations of Cartesian physics, along with some thoughts on topics in metaphysics. When his friends learned of this work, they urged him to add to it a geometric presentation of Part I of Descartes’ *Principles*; Lodewijk Meyer offered to write a preface for the work and help him polish it for publication. Spinoza agreed, hoping that by establishing himself as an expert in Cartesian philosophy, he would ease the way toward the publication of his own ideas.

#### PARTS I AND II OF DESCARTES’ PRINCIPLES OF PHILOSOPHY DEMONSTRATED GEOMETRICALLY (1663)

Although the preface Meyer wrote for this work proclaimed that Spinoza’s work was no more than an exposition of Descartes’ *Principles*—and that this was true even for the appendix, which Spinoza called *Metaphysical Thoughts*—in fact his work is more than that. For one thing, Spinoza also draws on other Cartesian works in constructing his account of Descartes’ philosophy. Sometimes his reconstruction implies a criticism of the way Descartes himself argued for his positions. Sometimes he is openly critical of Descartes’ assumptions. And sometimes (particularly in the appendix) he uses this venue to develop his own ideas, independently of Descartes. An interesting example involves the question of miracles. He offers a reason for doubting them along the lines he subsequently published in the TPT. But in this work he does not endorse the argument; he merely leaves it as a problem for the theologians.

Perhaps his most important differences with Descartes in this mainly expository work are those he asked Meyer to call attention to in his preface: that he does not think the will is distinct from the intellect, or endowed with the freedom Descartes attributed to it; and that he does not think the human mind is a substance, any more than the human body is a substance. Just as the human body is “extension determined in a certain way, according to the laws of extended nature, by motion and rest, so also the human mind, or soul, is . . . thought determined in a certain way, according to the laws of thinking nature, by ideas” (Gebhardt I, 132). He also disassociates himself from the Cartesian claim that some things—such as the nature of the infinite—surpass human understanding. He claims that these and many other things can be conceived clearly and distinctly, provided the intellect is guided in the search for truth along a different path from the one Descartes followed. He does not say precisely how that path would have to differ, but he does say that the foundations of the sciences Descartes laid are not sufficient to solve all the problems arise in metaphysics. We need to find different foundations for the sciences.

#### VOORBURG (1663–C.1670)

In April 1663, shortly before the publication of his exposition of Descartes, Spinoza moved from Rijnsburg to Voorburg, a village outside the Hague. During his first two years in Voorburg, Spinoza must have worked intensively on his *Ethics*, for by the summer of 1665 he had a draft far

enough advanced that he was thinking about finding someone to translate it into Dutch. Having grown up in a community whose main languages were Spanish, Portuguese, and Hebrew, Spinoza did not feel entirely comfortable writing philosophy in Dutch. In 1665 he seems to have conceived the *Ethics* as being divided into three parts, the last of which would probably have corresponded roughly to the last three parts of the final version.

During this period he also entered into a correspondence with a Dutch merchant and would-be philosopher, Willem van Blijenbergh, who had read his exposition of Descartes and had many questions for the author. Van Blijenbergh wondered about the existence of evil, and about how, if evil existed, this fact could be reconciled with the creation of the world by God—and indeed, its continuous creation, from one moment to the next. He wanted to know what it meant to say that evil is only a negation in relation to God, and how he could distinguish which portions of *Descartes' Principles* merely articulated Descartes' views and which ones expressed Spinoza's views. He wondered what Spinoza's view of the relation between mind and body implied about the immortality of the soul.

Van Blijenbergh was a committed Christian who believed that scripture was the ultimate authority on any philosophical question it addressed. His approach to scripture was the opposite of Meyer's: If his reason persuaded him of something contrary to what scripture taught, he would mistrust his reason rather than scripture. This was not a promising basis for a dialogue with Spinoza. Spinoza found the exchange of letters an unproductive use of his time and broke it off as soon as he could. But the correspondence with Van Blijenbergh seems to have persuaded him that he must diminish the authority of scripture before he could get a fair hearing for his own philosophy. By the fall of that year he had set the *Ethics* aside to return to work on his *Theological-Political Treatise*, which he intended to “expose the prejudices of the theologians,” clear himself of the charge of atheism, and argue for freedom of thought and expression, which he saw as threatened by the authority of the preachers.

Another stimulus for this shift in his writing may have been an incident involving his landlord, Daniel Tydeman, a painter and member of the Reformed Church. The minister of the local church had died, and Tydeman was on the committee appointed to select his successor. Tydeman seems to have been a theological liberal, perhaps with Collegiant inclinations. The committee nominated a man they found sympathetic theologically but encountered opposition from conservatives in the

congregation, who sought to discredit the committee's candidate by claiming, among other things, that Tydeman had living in his house a former Jew, now turned atheist, who “mocked all religions” and was “a disgraceful element in the republic.” The committee's candidate was rejected.

These were difficult years for the Dutch Republic. The plague had returned to Europe in 1663 and had been so virulent that Spinoza felt it necessary to leave Voorburg to spend several months of the winter of 1664 at the country house of relatives of a friend. Competition between the Dutch and the English for control of maritime trade led to war between the two countries from 1664 to 1667, the second such war in a little over a decade. No sooner had that war ended than there were threats of a new war with France, whose king, Louis XIV, had expansionist ambitions. And there was tension between the leaders of the Republic and the princes of the house of Orange.

This tension went back to the early days of the Republic. In the mid-sixteenth century the area now occupied by the independent nations of the Netherlands, Belgium, and Luxemburg was a unit within the Holy Roman Empire, ruled by the King of Spain. Toward the end of the century, the seven northern provinces (the modern Netherlands) succeeded in breaking away from Spanish rule, largely under the leadership of William I, Prince of Orange and Stadholder of the provinces of Holland, Utrecht, and Zeeland, though his son, Maurice of Nassau, also played a key role. The Stadholders were originally governors of the provinces, representing the Spanish crown and charged with the administration of justice. During the revolt against Spain, the Stadholders of the house of Orange sided with the rebels and provided the military leadership the provinces needed. Sometimes they worked in collaboration with the States-General, an assembly representing all the provinces. Sometimes they competed with the leadership of the States-General for power. Later princes of Orange developed monarchic ambitions.

In the late 1640s the Prince of Orange was William II, who unsuccessfully opposed the Treaty of Westphalia (1648), which ended the eighty-year war for Dutch independence from Spain (as well as the Thirty Years War, which had embroiled most of Europe since before Spinoza was born). The States-General, dominated by the province of Holland and Dutch mercantile interests, favored the treaty. When William died unexpectedly in 1650, the position of the Orange party was weakened. His son, William III, was not born until just after his father's death. For

many years the minority of the young prince provided the leaders of the States-General with an excuse to leave the office of Stadholder vacant. The functions the Stadholder had performed fell to the States-General, under the leadership of Jan de Witt, who generally had great success in defending his country against many challenges. But as William III neared adulthood, the tensions between the De Witt party and the Orange party increased, particularly when the affairs of the Republic were not going well, as was the case at the end of the 1660s.

Spinoza was sympathetic to the De Witt regime, strongly preferring it to the Orangist alternative. But some historians have exaggerated his closeness to De Witt, trusting too much to contemporary accounts. De Witt's political enemies, bent on discrediting him, sometimes claimed a close association between him and Spinoza—suggesting, for example, that De Witt had assisted in the editing and publishing of the TPT. And Spinoza's friends sometimes told similar stories—for example, that De Witt had often visited Spinoza to discuss affairs of state—apparently with the intention of magnifying Spinoza's reputation by associating him with a political leader whom many regarded as a hero. Though De Witt and Spinoza would have agreed in opposing the monarchic ambitions of the Prince of Orange, Spinoza was a democrat, whereas De Witt favored an oligarchic republic. They would have agreed in opposing the desire of the more conservative members of the clergy, in alliance with the princes of Orange, to enforce a strict Calvinist orthodoxy. But Spinoza favored a very expansive freedom of thought, whereas De Witt recognized the necessity, if only as a matter of practical politics, of making accommodations to the Reformed Church.

In the *Theological-Political Treatise* (TPT) Spinoza speaks in glowing terms about the freedom of the Dutch Republic:

Since we happen to have that rare good fortune, that we live in a Republic in which everyone is granted complete freedom of judgment, and is permitted to worship God according to his understanding, and in which nothing is thought to be dearer or sweeter than freedom, I believed I would be doing something neither unwelcome, nor useless, if I showed not only that this freedom can be granted without harm to piety and the peace of the Republic, but also that it cannot be abolished unless piety and the Peace of the Republic are abolished.

(GEBHART III, 7)

But Spinoza knew all too well that the Republic was not as free as he claimed.

In 1668 his friend Adriaan Koerbagh had published *A Flower Garden of All Kinds of Loveliness*, ostensibly a treatise explaining the meanings of foreign words which had become part of Dutch but in fact a critique of all the organized religions known in the Dutch Republic. In this acerbically written book, Koerbagh anticipated a number of the claims Spinoza made two years later in the TPT: He denied that the books of the Bible were written by the men to whom they were traditionally ascribed; he proposed that Ezra, the postexilic priest and scribe who wrote the book of Ezra, was responsible for the existing form of the Hebrew Bible, having compiled and attempted to reconcile the inconsistent manuscripts which had come down to him; and he argued that a proper interpretation of the Bible would require a thorough knowledge of the languages it was written in and the historical contexts its authors wrote in. Like Spinoza, he did not deny that there was something solid and consistent with reason in scripture; but that solid element in scripture was not its theology.

Koerbagh was arrested—along with his brother, Jan, who was suspected of complicity in the work—and, with the encouragement of the Reformed clergy, tried for blasphemy by the civil authorities in Amsterdam. Jan was released after a few weeks, but Adriaan was found guilty after a lengthy inquest, during which he was questioned about his association with Spinoza and Van den Enden. Sentenced to a fine of 4,000 guilders and ten years in prison, to be followed by ten years' exile, he died a little more than a year after his imprisonment from the harsh conditions in the prison.

The influence of the Reformed clergy on Dutch politics perhaps explains why Spinoza and the other members of his circle showed the interest they did in the work of Hobbes. Probably Spinoza had known some of Hobbes' work for years, since Hobbes' first published work of political philosophy, *De cive* (On the Citizen), had been available in a language he could read since 1642. It is likely that this would have been one of the works Van den Enden called to his attention when he was encouraging his interest in the new philosophy. But before 1667, Spinoza's inability to read English would have prevented him from gaining first-hand knowledge of *Leviathan*, which developed Hobbes' religious views more fully than *De cive* had. Two events in the late 1660s changed that: in 1667 Abraham van Berckel, a friend of Spinoza's (and of the Koerbagh brothers), translated *Leviathan* into Dutch; and in 1668 an edition of Hobbes' complete Latin works

(including a Latin translation of *Leviathan*) was published in the Netherlands. Although it may seem paradoxical to Anglophone readers of Hobbes, who think of him primarily as a defender of absolute monarchy, Hobbes' theory was attractive to republicans in the United Provinces because of his advocacy of state control over religion. In Holland in the 1660s conservative Christianity was a problem for them, much as it had been for the royalists in England in the 1640s.

### THE THEOLOGICAL-POLITICAL TREATISE (1670)

It is no accident that Spinoza treats religion and politics in one work. The preface to the TPT illustrates one way in which these subjects are linked. Spinoza begins with reflections on the psychological origin of superstition, which he attributes to the uncertainty of our lives and the role fortune plays in them. Much of what happens to us depends on circumstances over which we have no control. We do not know whether things will go well or badly for us, and we fear what may happen if they go badly. So we would like to believe in some story which offers us the hope of gaining control over our lives. In this mood we may believe that the future can be predicted from the entrails of birds or affected by prayer and the performance of rituals. That belief puts us at the mercy of unscrupulous priests and the politicians who use them. "The greatest secret of monarchic rule," Spinoza writes in the preface, "is to keep men deceived, and to cloak in the specious name of religion the fear by which they must be checked, so that they will fight for slavery as they would for salvation, and will think it not shameful, but a most honorable achievement, to give their life and blood that one man may have a ground for boasting."

If the politicians use the priests to provide divine authority for their rule, the priests also use the politicians, trading their support for the enactment of laws condemning opinions contrary to those they endorse. These condemnations enhance their authority, giving official sanction to the idea that the priests have a special expertise in matters of religion. Spinoza speaks with respect of Christianity, which he sees as a religion whose true spirit calls for love, peace, restraint, and honesty toward all. But he deplores the fact that the Christians of his day are no more prone to display these virtues than the members of any other religion, a fact he attributes to the wealth, honor, and power accorded to its clergy. These incentives attract the worst kind of men to the ministry, men who for their personal ends are willing to exploit the credulity of the people for personal gain, to teach them contempt

for reason, and to stir up hatred of those who disagree with them.

Spinoza proposes to remedy this evil by challenging the assumptions with which the priests approach scripture. They assume as a principle of interpretation that scripture is, in every passage, true and divine. Since scripture often appears to be inconsistent, they invent forced, reconciling interpretations whose only value is their apparent smoothing over of contradictions. And because scripture often appears to be contrary to reason in other ways, they are prone to invent metaphorical readings of scripture to make it conform to their beliefs. This procedure reverses the proper order of things. We should seek first to determine the meaning of scripture and only after that should we make a judgment about its truth and divinity.

But how should we determine the meaning of scripture? Spinoza's fundamental rule is that we should attribute to scripture as its teaching nothing we have not clearly understood from its history. By a "history of scripture" Spinoza understands, first, an account of the vocabulary and grammar of the language in which its books were written and which its authors spoke. This will tell us what meanings its words can have in ordinary usage and what ways of combining those words are legitimate. Second, a history of scripture must organize what scripture says topically, so that we can easily find all the passages bearing on the same subject; it must also note any passages which seem ambiguous or obscure or inconsistent with one another. Next, it must describe the circumstances under which the book was written, who its author was, what his character was, when he wrote and for what reason, for what audience, and in what language. And, finally, it must tell us how the book was first received, into whose hands it fell, how many different readings there are of various passages, and how it came to be accepted as sacred. What Spinoza is proposing here is that we apply to the interpretation of scripture the scholarly criteria Renaissance humanists had applied to the classics of pagan antiquity (with the exception that for the pagan works the question of their acceptance as sacred does not arise).

The result of applying these rules does not inspire confidence in the historical accuracy of scripture: the historical books were not written by the authors to whom tradition ascribed them—Moses, Joshua, Samuel, and so on—but were compiled by a much later editor, whose knowledge of the events these books described was based on manuscripts which had come into his possession but are now lost. Spinoza conjectures that this editor was

Ezra. Moreover, not only was Ezra's knowledge of the early history of the Jews second-hand knowledge of long-ago events, but he also reworked the texts to smooth out inconsistencies and make them tell the story he wanted to tell: that when the people of Israel obeyed God's laws, they prospered, whereas evil befell them when they disobeyed.

Not all of Spinoza's conclusions about the Bible were radically new. In the twelfth century Abraham ibn Ezra had hinted in his commentary on the Torah that the first five books of the Bible, in the form in which we have them, were written much later than the events they described. In the 1650s Isaac de la Peyrère and Thomas Hobbes had drawn similar conclusions more openly. But Spinoza was more systematic, thorough, and blunt than any of these predecessors. Unlike La Peyrère and Hobbes, he had the advantage of knowing the texts well in the original Hebrew, of knowing the medieval Jewish interpretive tradition, and of having a well-developed theory of interpretation, a theory which set a new standard for Biblical scholarship. Unlike Ibn Ezra, he did not pull his punches:

Those who consider the Bible, as it is, as a letter God has sent men from heaven, will doubtless cry out that I have committed a sin against the Holy Ghost, because I have maintained that the word of God is faulty, mutilated, corrupted and inconsistent, which we have only fragments of it, and finally, which the original text of the covenant God made with the Jews has been lost.

(GEBHARDT III, 138)

It's hardly surprising that when Hobbes read the TPT, he commented that he had not dared to write so boldly.

Spinoza did not object only that our knowledge of biblical history was based on unreliable texts, he also criticized biblical theology as embodying the opinions of men whose conception of God was based on the imagination rather than the intellect. The prophets, he argued, were outstanding for their personalities, their moral qualities, and their knack for expressing themselves in powerful language. But they were not philosophers. They thought of God as the maker of all things, existing at all times, who surpassed all other beings in power; but they did not understand that God was omniscient and omnipresent, or that He directed all human actions by his decree. They imagined that He had a body, which was visible (though you would die if you looked upon it), and that He had emotions, like compassion, kindness, and jealousy. Moreover, they were not strict monotheists.

They believed that there were other Gods who were subordinate to the God of Israel and that He had entrusted the care of other nations to these lesser Gods. So their conceptions of God were very inadequate. And they often accommodated their theology to the even more primitive capacities of their audience.

In his rejection of Biblical theology, Spinoza even goes so far as to suggest that it is anthropomorphism to think of God as having a mind. What, then, can God be? Spinoza never answers that question directly, but he does say that God's guidance is "the fixed and immutable order of nature." When we say that all things are ordered according to the decree and guidance of God, this is the same as saying that all things happen according to the laws of nature. It is a natural consequence of this view that there can be no miracles, no divine interventions in the order of nature. If there were an event contrary to the laws of nature, that would be an event contrary to divine decree. If God is omnipotent, this is impossible.

God's omnipotence also makes it irrational to conceive of God as a lawgiver of the kind portrayed in the Bible. The biblical God is conceived as being like a king who issues commands which his subjects have the power to obey or disobey. They will prosper if they obey and suffer if they disobey. But the laws which are truly divine are principles of natural necessity—like the laws according to which motion is transferred from one body to another in a collision. No one has any choice but to "obey" these laws; it is not a contingent matter whether someone acts in accordance with them. (Nevertheless, even after stating this conclusion quite clearly early in the TPT, Spinoza regularly adopts some of this anthropomorphic language himself, later in his work, when he argues that the primary purpose of scripture is to encourage obedience to God, not to inculcate correct beliefs about God.)

Although Spinoza questions much of the history and theology of the Hebrew Bible—and delicately avoids any extended discussion of the Christian New Testament—he denies that he has spoken unworthily of scripture. Scripture is divine and sacred when it moves men toward devotion toward God, as it can do and often does. But it is not inherently sacred. If men neglect it, or interpret it superstitiously, as they can and often do, it is no more sacred than any other writing. There is a core ethical teaching in scripture which is so pervasive that it cannot have been corrupted by any misinterpretation: that we should love God above all else, and love our neighbors as ourselves; that we should practice justice, aid the poor, kill no one, covet no one's possessions, and so on. These prescriptions deserve our utmost respect. If we seek to

follow them wholeheartedly, we will be treating scripture as sacred, whether we think of those prescriptions as the commands of a heavenly king or regard them (in the manner of Hobbes) as theorems about what is conducive to our self-preservation and to living in the best way possible.

Spinoza does not endorse only the ethical teachings of scripture. He also thinks there are core theological teachings which are central to scripture and which are in some sense true: for example, that God exists; that he provides for all; that he is omnipotent; that things go well for those who observe their religious duties but badly for the unprincipled; that our salvation depends only on God's grace; and so on. In his way, he does endorse these teachings. But his approval of them is hedged. There is a popular way of understanding them which assumes that the God of whom they speak is a changeable personal agent who acts from freedom of the will, who prescribes laws as a prince does, and who has desires which humans will frustrate if they disobey his commands. And there is a philosophical way of understanding them, according to which God is the fixed and immutable order of nature who acts from the necessity of his own nature and whose "laws" are eternal truths, the violation of which is followed only by natural punishments, not supernatural ones. Presumably the philosophical way of understanding these doctrines is the right way to understand them from the standpoint of truth. But the popular way of understanding them is not to be despised *if* it produces conduct in accordance with the ethical teachings of scripture. If it does, it is to be respected, honored, and encouraged.

Insofar as Spinoza endorses a minimalist theology, which avoids most controversial doctrines, concentrating on those which elicit broad agreement and which emphasizes the importance of works as the path to salvation, the TPT is in the tradition of Erasmian liberalism. This outlook provides him with a religious argument for tolerating diversity of opinion in the realm of religion. Philosophy and theology are separate areas, neither of which should be the handmaiden of the other. Theology is concerned with revelation, which in turn is concerned with obedience, not with speculative truth. In judging whether or not a person's faith is pious, we must look only to his works. If they are good, his faith is as it should be.

In the political portions of the TPT, Spinoza supplements this religious argument for freedom of thought and expression with a political argument. He seeks to show, from fundamental political principles, that allowing this freedom is compatible, not only with religion, but

also with the well-being of the state. Indeed, he will go further and argue that the well-being of the state *requires* freedom of thought and expression.

The foundations of his political thought look very Hobbesian; the liberal conclusions he draws from them seem rather un-Hobbesian. Like Hobbes, Spinoza believes that the condition of man in the state of nature—that is, in any state where there is no effective government—is wretched and insecure. Human beings are very egoistic. Everyone seeks what considerations he would develop to be to his own advantage, with little concern for the well-being of others or the long-term consequences of his actions or the moral repercussions for civil society. Moreover, humans generally have an impoverished understanding of what is in their interest, valuing such goods as wealth, honor, and sensual pleasure more than they should, and knowledge and the control of their passions less than they should. If they did not have laws to restrain them, laws which alter their calculations of self-interest, they would not practice justice and loving-kindness; their lives would be full of conflict, hatred, anger, deception, and misery. In the state of nature there is, by definition, no human law to restrain them. And Spinoza takes himself to have shown that God cannot be conceived as a lawgiver. It follows that in the state of nature, though each person is permitted to do whatever he has the power to do, he has no joy from this freedom.

But, like Hobbes, Spinoza also assumes that people are smart enough to see that their condition in the state of nature is wretched and to see what they must do to escape it: create a civil society by agreeing with other people to transfer their power to defend themselves to society, creating a collective entity which will have sufficient power to make and enforce laws for the common protection and advantage. Not only will this arrangement provide them with security, but it will also make possible cooperative enterprises which improve the lives of everyone in the state, enabling them to seek the highest good: the knowledge of things through their first causes, that is, the knowledge of God, which leads to the love of God. (Positing this—or anything else—as our highest good is very un-Hobbesian.)

In some respects, Spinoza goes further than Hobbes in his conception of what the creation of the state involves. He thinks that when individuals agree to form a civil society, they must surrender to it whatever rights they possessed in the state of nature. If they wanted to reserve certain rights to themselves, they would have to establish some means of protecting those rights; establishing these means would divide and consequently

destroy the sovereignty of the state. (Although Hobbes favored absolute sovereignty, he argued that some rights, like the right to defend oneself against attack, were inalienable.) Just as Spinoza thinks that the right of individuals in the state of nature is limited only by their power, so the right of the state is limited only by its power. Since it is not, and cannot be, bound by any laws, what it can do, it may do.

Is the formation of the state, then, really as rational an act as Spinoza presents it as being? The state, which can call upon the collective might of all (or at least, most) of its members, seems potentially much more dangerous to each of its members than any individual in the state of nature. As Locke wrote in response to the similar views of Hobbes, “this is to think that men are so foolish that they take care to avoid what mischiefs may be done them by polecats, or foxes, but are content, nay think it safety, to be devoured by lions.” But Spinoza thinks people can rationally run this risk because he thinks that even in a monarchy or aristocracy the state will normally avoid commanding things contrary to the interests of the people. If it did, it would risk losing its power and hence its right to command.

Moreover, in the TPT Spinoza is mainly thinking of the state which emerges from this process as a democratic one, that is, one in which decisions of the state are to be made by a general assembly of all the people. He acknowledges that in certain circumstances other forms of political organization may be desirable. In his posthumously published *Political Treatise* (PT) he recommended ways of structuring monarchies and aristocracies which provide the citizens with protection from their rulers. But in the TPT he focuses most of his attention on democracy, which he regards as the most natural form of government.

In the state of nature all men were equal; they retain that equality in civil society when the state is a democracy because no one in a democracy is subject to his equals. In the state of nature, all people are free because they are subject to no laws; they retain their freedom in civil society insofar as they are subject only to laws in whose formation they have participated—laws, moreover, guided by the principle that the well-being of the people is the supreme law, not the well-being of the ruler. A man can be free even when he is acting according to a command, if the command is rationally aimed at his advantage. Indeed, he is truly free only when he is acting wholeheartedly according to the guidance of reason. (Unlike Hobbes, Spinoza favors a positive conception of liberty, not a negative one which regards it merely as the absence

of impediments to the agent’s preferred actions.) Rule by one man, or by a few men, might be justifiable if that man (or those men) had some ability which went beyond ordinary human nature. But Spinoza seems to think that this is not normally the case. And, like Machiavelli, Spinoza thinks that the people are less prone to unwise actions than are autocratic rulers.

To those of us who are accustomed to a system in which the actions of government are constrained by a written constitution which provides protection for individual liberties, it may seem that a political theory that calls for men to give up all their rights to the state is an unpromising basis for a defense of freedom of thought and expression—even if the state is a democratic one. Spinoza may have thought, as Rousseau did, that if the legislators are making laws which bind themselves as much as they do others, that fact will provide a sufficient incentive for them not to impose undue burdens. But this thought seems to ignore the possibility that a majority will make decisions that it believes to be for the common good, even if the minority regards them as tyrannical.

In the TPT Spinoza’s primary remedy for this problem is not an institutional one. He relies on the facts that in his theory the right of the state is limited by its power and that its power is inevitably limited by the recalcitrance of human nature. Some of the things a state might wish to command are things its citizens cannot change at will, such as their beliefs and their emotions. The threat of punishment for believing or loving as a person does cannot cause that person to believe or love otherwise. But if the state lacks the power to control its citizens’ beliefs and actions, then it also lacks the right to control these things.

The fact that the state lacks the right to control what it lacks the power to control, in itself, is no protection. But Spinoza emphasizes that it is impossible for people to surrender their right (or transfer their power) to the state in such a way that they are not feared by the people to whom they have surrendered their right. Any government is in greater danger from its own citizens than it is from any external enemy, for its control over its citizens and its ability to respond to enemies both depend ultimately on the voluntary obedience of a substantial number of its own citizens. Hobbes put the point well in *Behemoth*, his history of the English Civil War: “The power of the mighty hath no foundation but in the opinion and belief of the people.... If men know not their duty, what is there that can force them to obey the laws? An army, you will say? But what shall force the army?” Spinoza would almost certainly not have known *Behemoth*—which was finished in 1668 but first published in a pirated edition in

1679, and then only in English—but he might have come to appreciate the basic point by reading and reflection on Hobbesian works he did know, or by reflection on the works of classical historians like Tacitus and Quintus Curtius, whose writings may also have helped Hobbes see this point.

If all governments are vulnerable to destruction from within, those which seek to rule by violence are the most vulnerable. And no rulers are more violent than those which make it a crime to hold controversial opinions, since they criminalize behavior the citizen cannot change at will. When the government seeks to do what it cannot do, not only does it exceed its right, it also creates resentment among those citizens who feel they are being treated unjustly. It cannot do this without harm to its own power to maintain itself. The most the government can accomplish is to suppress the expression of opinion, not the opinions themselves. But to the extent that it succeeds in suppressing expression, it creates a culture in which people think one thing and say another. It destroys the honesty necessary to the well-being of the state, encouraging deception, flattery and treachery, all of which are destructive of the social order.

What is particularly pernicious about this result is that it makes enemies of just those citizens whose education, integrity of character, and virtue would make them most useful to the state. Spinoza is sometimes portrayed as the epitome of cool rationality, but on this subject he is passionate:

What greater evil can be imagined for the State than that honorable men should be exiled as unprincipled because they hold different opinions and do not know how to pretend to be what they are not? What, I ask, can be more fatal than that men should be considered enemies and condemned to death, not because of any wickedness or crime, but because they have a mind worthy of a free man? Or that the gallows, the scourge of the evil, should become the noblest stage for displaying the utmost endurance and a model of virtue, to the conspicuous shame of the authorities?

(GEBHARDT III, 245)

Spinoza may be thinking here of cases like that of Judah the Faithful, whom he refers to in his correspondence. Judah was a Spanish *converso* (that is, a Jew forcibly converted to Christianity) who reverted to Judaism. Burned at the stake by the Inquisition when Spinoza was twelve, his case was well-known in the Amsterdam Jewish community. As the flames roared up

around him, he sang a hymn which begins “I offer up my soul to you, Oh Lord.” He died still singing this hymn. Spinoza cites this case in response to a Christian correspondent who tried to persuade him of the truth of Christianity by citing the many martyrs who had died for their faith. Spinoza’s reply was that Judaism claimed, with justice, to count many more martyrs to its faith.

#### THE HAGUE (C. 1670–1677)

Sometime during the winter of 1669–1670, Spinoza moved to the Hague, first renting a room from a widow and, after about a year, relocating to the home of the painter Hendrik van der Spycck, where he was to live for the rest of his life. In early 1670 the TPT was published in Amsterdam by Jan Rieuwertsz, but with a title page claiming publication in Hamburg, by a fictitious publisher named Heinrich Künraht. Reaction was immediate and vehement. In June the ecclesiastic court of the Reformed Church in Amsterdam condemned the work as “blasphemous and dangerous.” Similar denunciations followed from church groups in The Hague, Leiden, and Utrecht. Nor was it only conservative Calvinists who were shocked by his work. Theological liberals, including those sympathetic to the new philosophy, such as Frans Burman and Philip van Limborch, also opposed it. Burman called it an “utterly pestilential book” which must be attacked and destroyed. Between 1670 and 1672 the church authorities repeatedly called for the suppression of the TPT, along with Meyer’s *Philosophy, the Interpreter of Holy Scripture* and Hobbes’ *Leviathan*.

Nevertheless, there was no formal prohibition of the TPT until 1674, and it did in fact circulate widely among the learned audience to whom it was addressed. This does not mean that the civil authorities tolerated it. De Witt’s position seems to have been that the city governments had ample authority, under anti-Socinian legislation passed in 1653, to confiscate copies of Spinoza’s book. There was no need to increase the notoriety of this book, and its sales, by calling special attention to it. In many parts of the Republic the civil authorities did make efforts to suppress it, as they did in the other countries to which it spread. That these efforts did not prevent the work from being widely read was due to the ingenuity and dedication of Spinoza’s publisher. However, when Spinoza learned that Rieuwertsz had commissioned a Dutch translation of the TPT which would have made it available to a wider audience, he asked that it be withheld, as it was until sixteen years after his death.

1672 has been called a “year of disaster” in the history of the Dutch Republic. In March, England resumed its

naval war with the Republic, attacking a Dutch convoy. In April France declared war. In May the French army began its invasion, followed quickly by two German armies, under the Prince-Bishop of Münster and the Elector of Cologne. The overwhelming forces of the invaders quickly conquered most of the Dutch provinces. Only by opening the dykes to flood a large swath of land, from the Zuider Zee in the north to the river Waal in the south, was the government able to prevent the invaders from occupying the province of Holland.

These were extreme and unpopular measures. The people were deeply divided between those who wanted to surrender and those who wanted to resist. In June, Jan de Witt, wounded in an assassination attempt, resigned his position as Grand Pensionary, leader of the States of Holland. William III had been appointed captain-general of the army in February; in July he became Stadholder of the provinces of Zeeland and Holland, and the dominant political power in the Republic. In August De Witt's brother, Cornelis, who had been imprisoned on a charge of plotting against the Stadholder's life, was acquitted. When an angry mob gathered outside the prison where he was being held, Jan went to the prison to escort his brother to safety. The mob murdered both brothers, dismembering their bodies, roasting them and eating them. When Spinoza learned of this, he tried to rush into the street, carrying a sign reading *ultimi barbarorum*, "the worst of barbarians." Fortunately, his landlord prevented him from carrying out this act of protest.

In 1673 Spinoza had an opportunity to leave the Netherlands when the University of Heidelberg offered him a professorship. It appears that the Elector Palatine, who was responsible for the offer, knew Spinoza as the author of a highly regarded exposition of Descartes but not as the author of the TPT. He charged a professor at the university, Louis Fabritius, with the task of making the offer. Fabritius knew that Spinoza was the author of the TPT. He couched his offer in terms which he probably knew Spinoza would refuse, assuring him that he would have "complete freedom to philosophize" but noting that the Elector assumed Spinoza would not "misuse that freedom to disturb the publicly established religion." In declining, Spinoza gave two reasons: first, he feared that teaching would interfere with his research, and second, he did not know what limits he would have to impose on himself to avoid appearing to disturb the established religion.

By 1675 Spinoza was satisfied enough with his revisions of the *Ethics* that he visited Amsterdam to give the manuscript to Rieuwertsz for publication. But the theo-

gians learned of his plans and complained to the civil authorities. So Spinoza gave up on this attempt to publish his masterwork, leaving it to appear in his *Opera posthuma*.

In his last years Spinoza began two additional works which he did not live to finish: his *Compendium of Hebrew Grammar* and his *Political Treatise*. Both these works are in some sense byproducts of the TPT. The biblical criticism of the TPT had emphasized that to understand scripture it was essential to understand the language in which it was originally written. But Spinoza believed no existing grammar explained it adequately. The *Hebrew Grammar* was intended to fill that gap. And although the TPT had provided foundations for political philosophy, it had not dealt with practical questions about the merits of the different forms of government and the best ways of organizing them. The *Political Treatise* aimed to remedy that lack.

In February 1677 Spinoza died of a debilitating lung disease, probably aggravated by inhaling the glass dust produced by grinding lenses. By December his posthumous works were published in nearly simultaneous Latin and Dutch editions, the *Opera posthuma* and the *Nagelate schriften*. Because the Dutch translations must have been done from manuscripts rather than from the printed text of the Latin edition, the Dutch translations provide a check on the proofreading of the editors of the *Opera posthuma*, a fact which has aided recent critical editions of Spinoza's works. The Latin edition included the *Ethics*, the correspondence (originally seventy-five letters to and from Spinoza), and three unfinished works, the *Treatise on the Intellect*, the *Political Treatise*, and the *Hebrew Grammar*. Neither edition included the *Short Treatise*, manuscripts of which were not discovered until the nineteenth century. Subsequent scholarship has also added twelve letters to the correspondence. We'll conclude with an account of the works which first appeared posthumously, beginning with the *Political Treatise*.

### THE POLITICAL TREATISE (1677)

Though Spinoza expressed a strong preference for democracy in the TPT, he also recognized that it might not be the most suitable form of government for all situations. Like Machiavelli, whose work he studied closely, he thought it was not an easy matter to impose a new form of government on people who had become accustomed to a different form. So part of what he seeks to do in the *Political Treatise* (PT) is to work out principles for organizing the alternatives he regards as inherently less desirable. He offers detailed proposals for the best way to

organize a monarchy or an aristocracy so that it can be stable and serve the interests of its citizens as well as possible.

The sensible design of any form of government must take into account the known features of human nature. For example, because no one has so powerful a mind that he always sees the good and never yields to his passions, and because “kings are not Gods, but men, who are often captivated by the Sirens’ song,” even in a monarchy it is unwise to put all decision-making power in the hands of one man. If it is necessary to have a monarchy, the king should be guided in his decisions by a large, broadly based council of advisors. Indeed, Spinoza proposes that the king be required to choose from among the proposals recommended by his council. He does not explain how this requirement is to be enforced.

Similarly, he thinks an aristocracy will work best if the power to make and repeal laws, and to appoint ministers of state, is granted to a large council drawn from the patrician class. He regards the size of that council as critical to its proper functioning, on the theory that the larger the deliberative body, the more apt it is to have in it some men outstanding for their wisdom, and the less apt it is to favor irrational policies. But he would provide a smaller council of syndics, also drawn from the patrician class, to insure that the legislative council follows the prescribed procedures and that the ministers faithfully execute the laws.

Spinoza intended to add a discussion of democracy to this work but lived to complete only a few paragraphs on that topic. What he does say about democracy has embarrassed many of his modern admirers because he excludes women from the political process on the ground that they are naturally unequal to men (and because men are apt to overrate the intelligence of beautiful women). We can only speculate about what else he might have said, but it seems likely that he would have acknowledged that even democracy—understood as a form of government in which all adult males who are neither servants nor criminals nor men of ill repute are entitled to vote in the legislative assembly and to hold political offices—has inherent problems that require some form of constitutional protections.

#### THE COMPENDIUM OF HEBREW GRAMMAR (1677)

As indicated above, Spinoza undertook this work because he believed that a thorough understanding of biblical Hebrew was essential for interpreting scripture, that no existing Hebrew grammar provided an adequate under-

standing of the language, and that he could succeed where his predecessors had failed. The first of these reasons would generally be acknowledged as valid. The second may have been true in Spinoza’s day but is probably not true now. To what extent Spinoza’s grammar has contributed to our improved understanding of the Hebrew language and the Bible is a matter for historians of Hebrew linguistics and biblical scholarship to judge. The primary question here is whether this work contributes anything to our understanding of Spinoza’s philosophy. Regrettably the answer to that question seems to be “no.”

#### ETHICS (1677)

The most important work included in the *Opera posthuma* is the *Ethics*, a systematic account of Spinoza’s philosophy written in a style modeled on Euclidean geometry, beginning with a set of axioms and definitions, and attempting to show, by formal demonstrations, what conclusions these assumptions lead to. From time to time Spinoza interrupts the construction of proofs to elaborate on particularly important topics, in prefaces, scholia, and appendices. These tend to contain his most accessible and memorable passages. But the bulk of the work is written in a format which increases its difficulty for many readers, however much they may admire the commitment to rigor. The formal definitions Spinoza gives of his key terms sometimes raise more questions than they answer. The axioms are not always intuitively obvious. And the demonstrations are not always perspicuous. The forbidding style of the work may explain why, for the first hundred years after Spinoza’s death, the TPT was the most influential of his main works. It was only toward the end of the eighteenth century that the *Ethics* began to find an appreciative audience.

Some of the difficulty of the work may be alleviated by recognizing that Spinoza does not expect his readers to find all the axioms obvious or all the demonstrations compelling. He arrived at his final set of axioms only by trying out different axiomatizations on his correspondents and modifying them in response to criticism, supplying arguments for assumptions the correspondents questioned. Often he provides more than one demonstration of a proposition, recognizing that his readers may not be convinced by the first demonstration. And at one point, having come to a conclusion he expects his readers to find particularly surprising, he implores them to refrain from judgment until they have followed the argument carefully to its conclusion. The implication seems to be that the system is to be judged partly by its ability to

explain, comprehensively and consistently, a wide range of data.

The work is divided into five parts. The first attempts to demonstrate the existence of God and determine his properties; the second explores the nature of the mind, with particular attention to the human mind; the third gives an account of man's emotional nature, systematizing what Spinoza takes to be the laws of human psychology; the fourth seeks to explain why we are so often the victims of self-destructive passions and propounds an ideal of human nature we can and should strive to attain; the fifth part tries to show how we can control our passions and achieve blessedness.

In the Appendix to Part I, Spinoza provides a useful summary of its main conclusions: that God, defined as a substance consisting of infinite attributes, exists necessarily; that God is the only substance, everything else being a mode of God; that God is the free cause of all things; that everything else is so dependent on God that it cannot be or be conceived without him; and that God has predetermined all things, not from freedom of the will, but from the necessity of his nature.

To this we might add that Spinoza also claims to show in Part I that infinitely many modes follow from the necessity of the divine nature. Some of these modes follow from God's *absolute* nature—that is, follow from God's nature unconditionally—and hence are themselves infinite and eternal. Other things—particular, finite things—express God's attributes in a determinate way, and do not follow from God's absolute nature, but from one of God's attributes insofar as it is modified by another modification which is also finite. So each finite mode has as part of its causal history an infinite series of other prior, particular, finite things.

Spinoza is often referred to as a pantheist, a term usually taken to mean that God is identical with nature, understood as the totality of things. But Spinoza identifies God with nature only in the sense that he identifies God with His attributes, those eternal elements in nature which exist in themselves and are conceived through themselves. When Spinoza identifies God with Nature, it is with what he calls *Natura naturans* (active or productive nature). The modes which follow from and express God's attributes he calls *Natura naturata* (passive or produced nature) (*Ethics* I, Prop. 29, Schol.). They are not God. Their defining properties are logically opposed to God's: they exist in another, through which they are conceived. Nor are they a part of God, since it is incompatible with God's nature to have parts (*Ethics* I, Prop. 29, Schol.).

Because everything which exists is either an attribute, whose existence is absolutely necessary, or a mode, and because all modes either follow from God unconditionally or else are necessary in relation to other modes of God, Spinoza concludes that there is nothing contingent in nature. All things are determined by the necessity of the divine nature to exist and act as they do. God could not have produced them in any other way than He did.

This is what Spinoza says. What does it mean? From the seventeenth century to the twenty-first many interpreters have understood the doctrine that there is only one substance, of which everything else is a mode—Spinoza's monism, in effect—as implying that there is only one ultimate subject of predication and that everything else is in some way a predicate of that one subject. This is a *prima facie* plausible way to understand his monism, given the close historical connection between the idea of substance and the idea of an ultimate subject of predication. But it is not obviously an attractive way of understanding Spinoza's monism on reflection. In what sense might a particular thing, like a human being, for example, be predicated of God?

When Pierre Bayle advanced this line of interpretation in the seventeenth century, he took it to imply that the properties of finite things must really be properties of God. And he understandably thought Spinoza's monism, so interpreted, was absurd. God would be constantly changing his properties as the properties of finite things changed (though Spinoza insists that God is immutable). He would have unseemly human properties, insofar as people behaved improperly or criminally (though Spinoza is resolutely opposed to anthropomorphism). And he would have contradictory properties at the same time, as one finite thing had one property and another had its opposite.

In the late twentieth century Jonathan Bennett (1985) advanced a variation on Bayle's interpretation which avoids some but not all of these unhappy consequences. He suggested that when we say of a finite thing that it has a certain property, what we are really saying is that the universe, conceived under one of God's attributes, has some property at a certain location. That property is not necessarily the one we ascribe to the finite thing. For example, when we attribute a property to a physical object, we are saying that the universe, conceived under the attribute of extension—that is, space itself—has some property at that particular point. If I say that the peach I am about to peel is ripe, I am saying that space has, in that region, some quality I conceptualize as

ripeness; I am not attributing ripeness either to that region of space or to space as a whole.

This interpretation avoids the problem of ascribing contradictory properties to God by understanding apparently contradictory predications as applying to the universe *at different locations*: Space is qualified here by whatever property I conceptualize as ripeness; it is qualified there by whatever property I conceptualize as unripeness. (How this works for modes of attributes other than extension is unclear.) It avoids the problem of ascribing human properties to God by remaining agnostic about the properties of space which underlie the properties we ascribe to humans and other finite things. (We do not know what properties of the universe underlie the fact that I love someone whom you do not love, but they are evidently not human properties.) But it does not avoid the problem that, on this view, God is constantly changing. Whenever some finite thing changes, God is changing at that location.

The main alternative interpretation (Curley 1969, 1988) emphasizes the equally strong traditional connection between the idea of substance and the idea of independent existence. When the TEI first introduced the contrast between things which exist in themselves and things which exist in something else, Spinoza glossed that contrast as one between things which are their own cause and things which are caused by something other than themselves. He did not explain it in terms of predication. The things which exist in themselves—the first elements of the whole of nature—were supposed to be fixed and eternal and to have laws “inscribed in them.” If we identify the first elements of the whole of nature with the attributes, then we can infer that Spinoza conceived attributes like thought and extension as eternal entities involving laws of nature so fundamental that they do not admit of explanation in terms of anything more basic. On this reading Spinoza dreamed of a final scientific theory whose most basic principles would be, and could be seen to be, absolutely necessary. That is why the attributes exist in themselves and are conceived through themselves.

According to this interpretation, some things follow from the fundamental laws without the aid of any other propositions. These are the eternal, immutable things which follow from God’s *absolute* nature, the infinite modes of the *Ethics* (or universal modes in the ST). They are those general features of reality corresponding to the derived laws of nature, like motion and rest, which involve laws pertaining to anything possessing motion or rest. They follow from the attributes because the lower level laws can be deduced from and hence explained by

the most fundamental laws. (Spinoza provides us with a sketch of such a deduction in Part II of the *Ethics*.) Although these modes themselves are infinite (in the sense that the laws they involve apply throughout nature) and eternal (in the sense that the laws are immutable), the series of causes which produces them is finite. Explanation of one law by another deduces the less general law (say, a law governing the transfer of motion in a particular kind of impact) from more general laws (say, the law that motion is conserved in all causal interactions). The series of general causes must come to an end because there is a logical limit to the generality of laws. Once you have formulated a law so general that it applies to everything which possesses a certain attribute, no more general law is possible. It is thus in the nature of the attributes that they cannot be explained through anything else.

Other things—the finite modes of the *Ethics*, the singular changeable things of the TEI—do not follow from the *absolute* nature of God’s attributes but do follow from God’s attributes as modified by the infinite modes *and* other finite modes. This is a reflection of the fact that particular events cannot be explained by laws alone but require information about other particular events for their explanation. Their necessity is not absolute but relative to the existence of the other events essential to their explanation.

Something of this sort must be true if Spinoza’s system is to allow for the reality of change. Spinoza insists that things follow from God’s nature with the same necessity with which the properties of a triangle follow from its nature. This is why he is often criticized for assimilating the causal relation to that of entailment. If *everything* followed logically from the *absolute* nature of God, which is eternal and immutable, nothing could fail to share in that eternity and immutability. Because the infinite modes *do* follow from God’s absolute nature, they share the eternity and infinitude of their cause. But not everything follows from God’s absolute nature. Specifically, the particular finite things do not follow unconditionally from the infinite and eternal things. So its members are not infinite and eternal. This is why change is possible.

This dependence of the finite on other finite things also explains why the world must have no beginning. It contains particular things whose behavior can only be explained if we add information about antecedent conditions to the general facts we appeal to in our explanation. Those particular things constitute a series which cannot have an end, because each member of the series must have an explanation and can only be explained by the

existence of some particular thing(s) prior to it (plus the laws of nature).

This reading of Spinoza's metaphysics has the advantage of identifying something in nature—the first elements of nature, or the attributes—which can plausibly be thought to be eternal, immutable, ultimate principles of explanation for everything else in the universe. Because Spinoza's system requires something eternal and infinite as an object of the love which is supposed to provide us with pure joy, this seems an important consideration. This reading also has the advantage of identifying something in nature which can plausibly be thought to follow logically from the first elements alone and to function as an intermediate between the ultimate principles of explanation and the finite things whose behavior is to be explained. The idea that there is a series of infinite and eternal things intermediate between God and finite things is one of the most distinctive features of Spinoza's metaphysics in contrast to Cartesianism.

This reading also has what may be thought to be a disadvantage: it implies that not everything in nature is absolutely necessary. The finite modes are portrayed here as not following unconditionally from the fixed and eternal things but as requiring other finite modes for their explanation and as being necessary only in relation to those other finite modes and the infinite modes. But this feature of the interpretation may not really be a disadvantage; Spinoza's discussion of necessity suggests that he thought things are necessary in two very different ways (*Ethics* I, Prop. 33, Schol. 1). Some are necessary in virtue of their own nature; others are necessary in virtue of their cause. Particular finite things, such as this or that human being, do not involve any inherent necessity (*Ethics* II, Ax. 1). They are necessary just insofar as the order of nature (the series of prior finite causes) makes them necessary.

The theory of mind-body identity in Part II of the *Ethics* is best approached by viewing it as a subversion of Cartesian dualism. Descartes sought to make belief in personal immortality rational by showing that the mind and the body are really distinct from one another. His strategy was to set up a thought experiment in which we clearly and distinctly conceive the possibility of the mind's existing without the body. We can, he claimed, find reasonable grounds for doubting the existence of the whole physical world by reflecting on the powers of God. An omnipotent being could, if he chose, create in us representations of physical objects without creating any physical objects. But we cannot find reasonable grounds for doubting our own existence as thinking things. Any hypothesis we entertain to cast doubt on our existence,

such as deception by God, will entail that we think, and hence, that we exist. So we are compelled to affirm our existence as thinking things but not compelled to affirm the existence of our body (or any other extended object).

If we can clearly and distinctly conceive of the mind as existing without the body, then it is logically possible for it to exist without the body. If it is logically possible for it exist without the body, then it *could* exist without the body. (If it is logically possible for two things to exist separately, then an omnipotent being could cause them to exist separately. And Descartes thinks he has shown that there is an omnipotent being. So the possibility of their existing separately is not merely a logical one. There is a being which has the power to bring this about, if he wishes.) But if two things are such that one can exist without the other, they are really distinct. This entails that the mind is not necessarily destroyed when the body is destroyed, and that establishes the *possibility* of immortality. Whether that possibility is realized depends on the inscrutable will of God. So Descartes makes no serious attempt to prove actual immortality.

Descartes did, however, modify the strictness of this dualism when he added that the mind is not present in the body "as a sailor is present in his ship," that it is, instead, closely united to it, so that mind and body together constitute one thing and are "substantially united." What seems to have motivated this doctrine of substantial union—which is not obviously consistent with the dualism—was Descartes' recognition that there is a particularly intimate connection between the human mind and the human body. When something happens in my body, normally I am not aware of it in the external way in which I am aware of things which happen in bodies not mine. I feel my body's need for food as hunger, its need for drink as thirst, damage done to it as pain, and so on. These interested, action-motivating bodily sensations are what make this particular body peculiarly mine.

Spinoza, too, seems to have been deeply impressed by the intimacy of the relationship Descartes described, and particularly by the facts that the mind's capacities are a function of those of the body and that changes in the mind strictly parallel those in the body. For example, my mind's capacity for higher-level thought seems to be a function of my brain's complexity; its ability to think clearly and its mood are both closely correlated with my body's blood alcohol level. A Cartesian might dismiss some of these phenomena as mere coincidences. Others he might regard as examples of the body acting on the mind. But Spinoza thinks that because mind and body belong to such fundamentally disparate conceptual cate-

gories, we cannot posit a causal relationship between them. And he would not dismiss any such regularity in nature as a coincidence. What we should say instead is that the mind and the body are one and the same thing conceived under different attributes.

Spinoza has a metaphysical argument for supposing that this identity of modes of thought with modes of extension exists not only in human beings but also runs throughout the whole of nature. Suppose that God is an infinite, perfect substance who possesses the attributes of thought and of extension. As an infinite and perfect thinking thing, he must have in his intellect an idea of every existing mode of extension. If he did not, there would be gaps in his knowledge. Equally, as an infinite and perfect thinking thing, he cannot have in his intellect an idea of a mode of extension as existing if no such mode exists. If he did, he would be in error. So in God there must be a one-to-one correspondence between the modes of extension which exist and their representations in God. Moreover, since this correspondence is necessary, it is not possible for the modes of thought to exist without their corresponding modes of extension. The converse is also impossible. This entails that the modes of thought and the modes of extension are not, in Cartesian terms, really distinct from one another. They are conceptually distinct, insofar as they are conceived under different attributes. This is why there can be no causal relation between them. But they are not capable of existing apart from one another.

This argument leads to some surprising conclusions from which Spinoza does not shrink. For example, it entails that every extended thing in nature corresponds to a mode of thought which is, in some sense, its “mind.” This doctrine is known as panpsychism. Spinoza clearly does think that all finite physical things other than humans have something *like* the minds humans have. Insofar as he affirms a continuity between humans and other animals, his panpsychism seems quite reasonable, much more reasonable than the Cartesian view that non-human animals are merely machines without any sensations. Moreover, other philosophers before Spinoza—like Montaigne—had argued that animals were capable of displaying intelligence and emotions. What is puzzling about Spinoza’s panpsychism is its apparent implication that even the simplest material objects have something like a mind. We can diminish the shock of this claim to some degree by recollecting that Spinoza would probably not think that the minds of the simplest material objects are *very much like* human minds. If our capacity for higher-order thinking depends on our having a very

complex brain, then presumably a carbon atom does not have the capacity to solve quadratic equations. But it is still unclear what the ascription of mentality to very simple physical objects comes to.

One unsurprising consequence of this view of the relation between mind and body is that Spinoza denies that the mind is capable of acting freely in the way Descartes tended to understand freedom. Descartes was quite ambiguous about the kind of freedom he wanted to claim for us. In the Fourth Meditation he seemed, initially, to interpret freedom of the will indeterministically, as a power to either do something or not do it, independently of any external causes. Then he reflected that there were two cases where he might not, in fact, be able to act otherwise, though he did not want to deny that he was free in those cases: one is the case where he sees something so clearly that he cannot help but assent to it; the other is the case where God, in an act of grace, disposes his inmost thoughts in a certain way. So he revised his initial definition, adding a clause which would make freedom compatible with certain kinds of determinism: we can be free if our intellect presents something so clearly to the will that it cannot judge otherwise; and we can be free even if God is determining our actions, so long as we are not aware of that determination, so long as we seem to ourselves to be the initiators of our actions. But this was another area where he was unable to maintain consistency. In the *Principles of Philosophy* he reverted to an indeterminist conception of freedom and pronounced the problem of reconciling human freedom with God’s preordination of all things insoluble.

Spinoza rejects any indeterminist conception of freedom. This was evident already in Part I of the *Ethics*, where he held that all finite things are determined to exist and act the way they do by an infinite series of prior finite things. But his acceptance of mind-body identity provides an additional reason for denying indeterminism in humans. Descartes would have allowed that determinism reigned in the physical world except insofar as minds were capable of intervening in it to cause events which would have gone differently but for that intervention. If the mind and the body are one and the same thing, conceived in different ways, then the mind will not be able to intervene in the physical world as an uncaused cause. The decisions of the mind are just the appetites of the body, conceived under a different attribute. When they are conceived under the attribute of extension, they are conceived as part of a causal network which determines their character. Since the order and connection of ideas mirrors the order and connection of extended things, modes

of thought must also be part of a causal network that determines their character, a network whose members are conceptually distinct from, but really identical with, the corresponding modes of extension. Spinoza concedes that it often seems to us that our acts of will have no antecedent causes; but he thinks all this shows is the inadequacy of our self-knowledge.

Consistently with this deterministic picture of things, Spinoza turns in Part III of the *Ethics* to an attempt to provide a systematic human psychology, explaining the laws according to which the human mind operates. He writes in the Preface to Part III,

Nothing happens in nature which can be attributed to any defect in it, for nature [read *Natura naturans*] is always the same, and its virtue and power of acting are everywhere one and the same, i.e., the laws and rules of nature, according to which all things happen, and change from one form to another, are always and everywhere the same.

(GEBHARDT II, 138)

So, if we are to understand anything, we must understand it in terms of the universal laws of nature. When we understand human actions and emotions in this way, we will no longer be disposed to curse them or find them ridiculous. We will see them as an inevitable result of the circumstances under which they occurred.

Like Hobbes, Spinoza makes the striving to persevere in existence the fundamental law of human behavior. He sees an analogy between that striving and the principle of inertia which was fundamental in the new physics and treats it as constituting the essence of each individual. His conviction that there is this analogy leads him to a revised understanding of what constitutes human activity: We should think of ourselves as active just to the extent that our actions can be adequately understood in terms of our striving to persevere in being. But he also thinks of the striving as encompassing more than just continuation in existence. In addition, it seeks to increase our perfection, or power of action. When we succeed in doing that, we experience the increase as joy; when our power of acting is diminished, we experience the decrease as sadness. In a way, Spinoza is a hedonist. We seek to maximize our joy and minimize our sadness. But the underlying changes in perfection, or power of action, are really at the core of these strivings.

Spinoza's psychology is generally egoistic in the sense that he thinks what we basically seek, insofar as we are active or self-determined (that is, insofar as what we do is determined by our own nature) is something we imagine

to be good for ourselves (that is, to involve or lead to our joy). But his egoism does not exclude our taking an interest in the interests of others. If we conceive an external object—a person, or an institution, say—as a cause of joy in us, we will love that object and seek our own good by seeking its good. Similarly, if something in itself neutral is associated in our experience with something either positive or negative, we will come to have positive or negative feelings toward the inherently neutral thing. And to the extent that a thing is like us in some degree, we will tend to share its feelings: to feel sadness when it is sad, and joy when it is joyful. This is the psychological basis for pity and benevolence. We can minimize our own sadness and maximize our own joy by seeking to minimize the sadness of others like us and maximizing their joy.

These are fairly simple and benign cases. But the same psychological laws which explain pity and benevolence also explain, less happily, racial and religious hatred. We are less apt to feel sympathy for those we think of as unlike us. And we are apt to generalize to a whole group the negative emotions we have experienced toward some members of that group. What interests Spinoza most in human psychology is the complexity of our emotions and the psychological conflicts we regularly experience. If something affects us with both joy and sadness, we will feel conflicting emotions of love and hatred; a similar process will unfold if we imagine that something which usually affects us with sadness is like another thing that usually affects us with joy. The uncertainty of our knowledge of human affairs makes us prey to both hope and fear, which are inseparable from each other. But we are subject to wishful thinking, which inclines us to believe the things which give us hope. That is the root cause of superstition. And acting on irrational beliefs is a recipe for disappointment and despondency. Hatred, envy, and jealousy are as natural to us as love, benevolence, and friendship. These conflicting emotions are constantly fluctuating as external circumstances change, with the result that “we toss about, like waves on the sea, driven by contrary winds.” For the most part we are not the masters of our fate.

Because Spinoza is a determinist who takes his doctrine to imply that we should bear calmly both good fortune and bad and condemn no one for his behavior, and because he frequently embraces subjectivist-sounding theories of ethical language—as when he writes that good and evil are nothing positive in things, considered in themselves, but just modes of thinking—it has often been thought that he has no ethical theory—or at least that he cannot consistently have one. But Spinoza called his mas-

terwork *Ethics*, and Part IV of that work is full of what look like ethical judgments. He tells us that the knowledge of God is the mind's greatest good, that joy in itself is good and sadness evil, that pleasure can be excessive and evil, that pain can be good, that love can be excessive, that hatred can never be good, and so on. How can these judgments be true if good and evil are only "modes of thinking"?

The answer seems to be that Spinoza makes a distinction between the ordinary, nonphilosophical use of ethical terms, which is highly subjective and undisciplined, and the philosophical use of the same language. If we reflect on the use of terms like *good* and *evil* in connection with members of a natural kind, like man, we will recognize that they signify varying degrees of approximation to an ideal of perfection or completeness. Unaided by philosophy, we are apt to have varying conceptions of that ideal. But there is a way of conceiving the ideal human being which will necessarily attract us as soon as we form a clear idea of it. Spinoza uses the term "free man" as a label for that ideal and the term "good" as a label for those things we know will help to achieve our goal.

The free person is defined as one who is led by reason alone and characterized by his disregard of death and concentration on life; by his willingness to accept risks, when that is called for, and his wisdom in determining when it is not called for; by his determination to avoid the favors of the ignorant, when accepting them might compromise his integrity; by his gratitude to other free men for their acts of genuine love and friendship; by his honesty; and by his obedience to the laws of the state, not from fear of punishment but from his commitment to the common good.

The psychology of Part III holds that all men, to the extent that they determine their own actions and are not the slaves of fortune, pursue what they take to be their own good. The ethical theory of Part IV holds out the ideal of the free man as an enlightened egoist. Freedom is not mere self-determination but informed self-determination. The free man recognizes that, left to himself, he would lead a miserable life, that achieving his optimal state requires the cooperation of other men, that nothing is more useful to him than his fellow men, and that they are the more useful the more they share his dedication to the pursuit of knowledge, a noncompetitive good which is only increased, not diminished, by being shared. He is not an ascetic. He knows that his body requires the moderate use of pleasant food and drink, and that beautiful natural objects and works of art, music,

theater, and other such things are goods anyone can enjoy without detriment to others. He understands that the greater the joy with which we are affected, the greater the perfection to which we gravitate, and the more we participate in the divine nature. Spinoza is apprehensive about human sexuality, knowing how easily sexual desire can become obsessive and self-destructive.

The central problem of ethics for Spinoza is not that of knowing what is good but that of pursuing it single-mindedly. "I see and approve the better," he writes, quoting Ovid, "but I follow the worse." Parts III and IV are concerned with explaining why we are often unable to pursue the good we clearly see. Part V tries to help us overcome the unhealthy dominance of the passions which underlies this weakness of the will. Descartes, whose moral philosophy was heavily influenced by the Renaissance revival of stoicism, thought that the mind could exercise an absolute control over the passions. Spinoza is not so optimistic. But he does think that we can increase our power over them and make them less harmful to us.

One promising remedy for our harmful passions is to correct the false beliefs they often involve. Most of the emotions Spinoza analyzes in Part III incorporate some cognitive element. He defines hatred, for example, as sadness accompanied by the idea of something external to us as the cause of our sadness. Indignation is hatred toward someone whom we imagine as having done evil to someone (or something) else. If we come to understand that the person we hate or toward whom we feel indignation is at most a partial cause of those negative consequences, that his actions are no more than the most recent link in a chain of causes which extends into the infinite past, this will diminish our negative emotions toward that individual, redirecting them toward the prior causes and diffusing them over those causes. This process may not immediately diminish our overall level of negative emotions. But if it diminishes the negative feelings we have toward the proximate cause of our sadness, it may make it easier for us to behave well toward that person and break the vicious circle of harm and retaliation which is the cause of so much human misery.

Part V of the *Ethics* concludes with a puzzling series of propositions dealing with the eternity of the mind. Astonishingly, given his earlier doctrine that the mind and body are one and the same thing, conceived under different attributes, Spinoza now maintains that the human mind is not entirely destroyed with the body but that something of it remains which is eternal. The eternal portion of the mind is apparently the part which under-

stands things “under a species of eternity,” that is, that sees them as necessary by understanding them under the second or third of the three kinds of cognition which the *Ethics* assumes, reason or intuitive science. Because Spinoza assumes that it is possible to increase our understanding of things by the second and third kinds of cognition—understanding more things in those ways at one time than we do at another—this implies that we can increase the portion of our mind which is eternal, even though eternity is supposed to entail that whatever is eternal has no relation to time. We can make sense of much of Spinoza’s philosophy, but so far this part of the *Ethics* has resisted the best efforts of sympathetic interpreters. It is clear that it is not a doctrine of personal immortality, for Spinoza regards memory of the individual’s past as essential to personal identity, and he is quite emphatic that the portion of the mind which is eternal has no memory of any past. Perhaps the best thing we can say is that Spinoza thought that there was some truth, badly articulated, in the traditional doctrine of personal immortality and thought (wrongly) that his philosophy could give a coherent explanation of that truth.

In another way, however, Spinoza may achieve some reconciliation with traditional religion in these final portions of the *Ethics*. Because he identifies God with nature (*natura naturans*), he can claim that the more we understand Nature, the more we understand God. When we understand nature by the third kind of cognition, intuitive science, we not only have the highest form of cognition we can have, but we also experience the greatest possible satisfaction. We then experience joy accompanied by the idea of God as the cause of our joy. This means that we love God. Together the knowledge of God and the love which is inseparable from that knowledge constitute our highest good, not because God is a king who will reward us with a happiness extrinsic to our love for him but because the knowledge and love of God inherently involve the highest happiness we can know.

This attempt at an accommodation with traditional religion may not succeed. It is true that Spinoza’s “God” has many of the properties of God, as the concept of God came to be developed by philosophically minded theologians in Judaism and Christianity: He is a perfect being, infinite, eternal, the first cause of all things, himself neither needing nor being susceptible of any explanation. Because, in Spinoza’s view, knowledge of God can be the cause of the greatest joy we can experience, he can be the object of a love which surpasses any love we can have for finite things. But because, according to Spinoza, God is supremely perfect, he is as incapable of joy (passage to a

greater perfection) as he is of sadness (passage to a lesser perfection). So he is also incapable of love or hate, which are species of joy and sadness. We cannot rationally expect Spinoza’s God to return our love. Nor can we expect him to watch over us like a loving father. Spinoza’s God, being perfect, has no goals, no states he desires to reach (or maintain). To ascribe desire to Spinoza’s God would be to conceive him as imperfect, a contradiction in terms. A fortiori, he is not seeking our welfare and cannot provide a refuge from the uncertainty of fortune. He cannot be affected by prayer or ritual. He does not issue laws accompanied by promises of reward for obedience and threats of punishment for disobedience. His laws are ones we cannot break.

Because Spinoza’s God differs in so many respects from the God of traditional religion, even in its most philosophical forms, it is understandable that many religious-minded critics have regarded his philosophy as a form of atheism. But from Spinoza’s point of view these criticisms only show a misunderstanding of the nature of God. The founders of the traditional religions, he thinks, were in a position like that of the first students of geometry, when geometry was still an empirical science. Relying on what Spinoza would call imagination, the early geometers had only very crude ideas of the objects they were studying. They could not have given a properly scientific definition of a triangle or a circle from which they could demonstrate precise theorems about the nature of these objects. So they made mistakes about them, thinking, for example, that the ratio of the circumference of a circle, to its diameter is 3:1.

But though they may not have had the same definitions of these objects as later geometers, they were still attempting to develop a theory of the same objects. They were just handicapped by the inadequate ideas they had about those things. Similarly handicapped by their reliance on imagination—on the dreams of prophets and reports of revelation passed down through tradition—the philosophers and theologians of the organized religions got some things right and many things wrong. They saw the truth, not clearly, but as if through a cloud. Spinoza’s claim not to be an atheist depends on whether he was, as he believed, the Euclid of theology. Spinoza’s admirers have inclined to the view that he was.

On the two hundredth anniversary of his death a collection was taken to erect a statue to Spinoza in the Hague. When the statue was unveiled in 1882, Ernest Renan concluded his address with words which sum up the feelings of those admirers: “Woe to him who in passing should hurl an insult at this gentle and pensive

head... This man, from his granite pedestal, will point out to all men the way of blessedness which he found; and ages hence, the cultivated traveler, passing by this spot, will say in his heart, 'The truest vision ever had of God came, perhaps, here.'"

## Bibliography

### WORKS BY SPINOZA

*The Collected Works of Spinoza*. Vol. 1. Edited and Translated by Edwin Curley. Princeton, NJ: Princeton University Press, 1985. The second and final volume is in progress.

*Spinoza Opera*. 4 vols. Edited by Carl Gebhardt. Heidelberg: Carl Winters Universitäts-buchhandlung, 1925. This is the current standard original-language edition, which will eventually be superseded by Moreau's edition.

*Spinoza Oeuvres*. Edited by Pierre-François Moreau. Paris: Presses Universitaires de France. As of June 2005 only one volume had appeared (in 1999), containing the *Theological-Political Treatise*, with a critical edition of the text by Fokke Akkerman and a translation by Moreau and Jacqueline Lagrée. A comprehensive edition is planned, with critically edited versions of the original language texts and French translations on the facing pages.

*Spinoza, Complete Works*. Edited by Michael L. Morgan and translated by Samuel Shirley. Indianapolis: Hackett, 2002. This is the only complete English-language edition.

### WORKS ABOUT SPINOZA

Allison, Henry. *Benedict de Spinoza: An Introduction*. New Haven, CT: Yale University Press, 1987.

Edwin Curley (2005)

## SPINOZISM

The term *Spinozism* has almost invariably been used, by both defenders and detractors, to refer to doctrines held or allegedly held by Benedict de Spinoza. Unlike “Platonism,” for example, it has not generally been used to refer to a developing doctrine arising out of Spinoza’s philosophy. In the seventeenth and eighteenth centuries the term was frequently used to disparage various types of atheistic doctrines that were held to be attributable to Spinoza. For almost a century after his death, his work was neglected by philosophers, execrated by orthodox theologians of diverse denominations, and slighted even by freethinkers. It is not always possible, however, to distinguish between those genuinely opposed to Spinoza’s alleged atheism and those who really espoused atheism while pretending to disparage it.

### BAYLE AND THE “PHILOSOPHES”

Spinoza’s early reputation rested almost entirely on the long article in Pierre Bayle’s *Dictionnaire philosophique* (1697), for some time the only readily accessible account of Spinoza’s system. Bayle, like many others, admired Spinoza’s life but abhorred his doctrine. In Spinoza he saw an application of his own thesis that atheism may coexist with the highest moral excellence. All agree, he wrote, that Spinoza was a “sociable, affable, friendly, and thoroughly good man. This may be strange, but no stranger than to see a man lead an evil life even though he is fully persuaded of the truth of the Gospel.” But Bayle described Spinoza’s philosophy as “the most absurd and monstrous hypothesis that can be envisaged, contrary to the most evident notions of our mind.” Bayle’s antagonism to Spinoza’s philosophy arose primarily from his dissatisfaction with monism as a solution to the problem of evil. That such an extreme evil as war could exist among men who are but modes of one and the same infinite, eternal, and self-sufficient substance seemed particularly outrageous to him.

Voltaire, like Bayle, expressed esteem for Spinoza’s life but had misgivings about his philosophy, although he did accord a measure of praise to the *Tractatus Theologico-Politicus*. Voltaire’s understanding of Spinoza’s *Ethics*, however, may be questionable, for he quoted from the inaccurate, popularized version by the Count de Boulainvilliers, published under the title *Réfutation de Spinoza* (Brussels, 1731). According to Voltaire, Spinoza’s system was built on complete ignorance of physics and was the most monstrous abuse of metaphysics. In regarding the universe as a single substance Spinoza was, as he

put it in his *Le philosophe ignorant* (Geneva, 1766), “the dupe of his geometrical spirit.”

Denis Diderot, in the *Encyclopédie*, also closely followed Bayle’s article in his criticism of Spinoza’s philosophy, yet his own views unmistakably reveal Spinozist elements in denying the existence of a being outside, or separate from, the material universe. “There is,” he wrote in *Entretiens entre d’Alembert et Diderot*, “no more than one substance in the universe, in man or in animal.” Diderot’s monism was not quite the same as Spinoza’s metaphysical monism, for it was more pragmatic in nature. His “one substance” was merely material substance, not substance in Spinoza’s sense of “that which is in itself, and conceived through itself . . . (and) of which a conception can be formed independently of any other conception (*Ethics*, Part I, Definition 3). The universe, for Diderot, was monistic in its material unity. Nonetheless, Spinoza’s metaphysical monism could be considered as the logical basis for Diderot’s materialist monism.

### GERMANY

While Voltaire’s and the Encyclopedists’ interpretation of Spinoza was gaining currency in France, attempts were being made in Germany to reappraise his philosophy. This reexamination was an integral part of the German Enlightenment that, while sharing with its French and English counterparts the affirmation of the individual’s right to question established truths, also sought to link this affirmation with religious faith rather than with skeptical disbelief. In the course of this quest Spinoza’s image underwent a distinct change. From David Hume’s ironically labeled “universally infamous” atheist, Spinoza became Novalis’s *gottbetrunkenener Mensch*. A number of leading German thinkers came increasingly to see in Spinoza’s pantheism a profoundly religious conception and interpretation of the cosmos.

To some extent, the reversal in Spinoza’s fortunes was also a corollary of the developments in science. Few of Spinoza’s contemporaries who accepted the new scientific theories realized their theological implications. The intellectual reorientation in eighteenth-century Germany, on the other hand, was accompanied by a corresponding change in theological thinking. In the light of these changes Spinoza’s philosophy appeared much less inimical to the essential truths of religion.

**PANTHEISMUSSTREIT.** Probably the strongest factor contributing toward the revival of interest in Spinoza’s thought was the controversy that raged over Gotthold Lessing’s alleged Spinozism. This dispute, sparked by the

disagreement between Moses Mendelssohn and F. H. Jacobi, came to involve almost every notable figure in the German literary world. Jacobi, in his account of a conversation with Lessing, claimed that the latter had been a Spinozist. According to this account Lessing said that the orthodox conceptions of deity were no longer satisfactory for him and that, if he were to call himself after any master, he knew of no other than Spinoza. Although Jacobi conceded that Spinoza's philosophy was logically unanswerable, he found it unacceptable on religious grounds; in religion, he felt, he had to take refuge in an act of faith, a "salto mortale" as he called it. Lessing sardonically replied that he was unable to trust his old limbs and heavy head for such a leap.

It should not, however, be inferred that Lessing's philosophical outlook was in every detail or even in essentials merely a reflection of Spinozist ideas. Lessing was far too independent a thinker to be subject to any single pervasive influence. He was also far less metaphysically oriented than Spinoza, and his faith in man's perfectibility was tempered by a shrewder realization of man's limitations than that of his world-shunning precursor. Nor must it be assumed that Lessing's exchanges with Jacobi can be taken at their face value. Lessing was fully aware of Jacobi's misconceptions in his approach to Spinoza and hardly took him seriously. He may have been speaking with tongue in cheek, and it would therefore be unwise to attach too great an importance to the views he espoused.

Lessing did succeed in eliciting Jacobi's admission that Spinoza's philosophy was the most rigorous and consistent intellectual enterprise ever attempted and in inducing him to study it more deeply. Although Jacobi's further studies did little to alter his conviction that Spinoza was an atheist and that final truths were to be found in the philosophy of the heart rather than in that of the understanding, they nonetheless helped to focus attention on Spinoza to an unprecedented degree. Two men in particular, Johann Gottfried Herder and Johann Wolfgang von Goethe, who were both on intimate terms with Jacobi, were the most directly affected. Herder openly called himself a Spinozist, although his ontology and cosmology had much more in common with the Earl of Shaftesbury's and Gottfried Wilhelm Leibniz's than with Spinoza's. Yet he insisted that by substituting his concept of *Kraft* for Spinoza's substance he was not fundamentally departing from Spinozist premises. Herder clearly did not realize how very different were his metaphysical presuppositions in postulating an ever-changing *Kraft* in place of Spinoza's unchanging substance and hence how pro-

foundly at variance was his brand of monism with that of his great precursor, despite superficial similarities. Goethe, too, in his autobiography and in his correspondence with Jacobi, acknowledged a far greater debt to Spinoza than he really owed. In Book XIV of his *Dichtung und Wahrheit* he paid his eloquent tribute to Spinoza's influence:

After I had looked around the whole world in vain for a means of developing my strange nature, I finally hit upon the *Ethics* of this man.... Here I found the serenity to calm my passions; a wide and free view over the material and moral world seemed to open before me. Above all, I was fascinated by the boundless disinterestedness that emanated from him. That wonderful sentence "he who truly loves God must not desire God to love him in return" with all the propositions on which it rests, with all the consequences that spring from it, filled my whole subsequent thought.

Yet Goethe's pantheism had far greater affinity with Herder's—and thus with Shaftesbury's and Leibniz'—than with Spinoza's. Like Herder's confessed Spinozism, Goethe's was much more the result of a poetical imagination and of an emotional craving than of logical analysis and philosophical understanding. Indeed, although G. W. F. Hegel regarded Spinoza's philosophy as philosophy par excellence and although Johann Gottlieb Fichte and Friedrich von Schelling took it as their starting points, the general nature of the Spinozist revival in Germany was literary rather than philosophical.

## ENGLAND

Much the same was true of the Spinozist renaissance in England and to a lesser extent in France during the nineteenth century. Admittedly, deism in England had already displayed marked Spinozist characteristics, even if one cannot agree with Leslie Stephen that the "whole essence of the deist position may be found in Spinoza's *Tractatus*." Few deists were consciously aware of the Spinozist heritage, and it was not until German thought had begun to make itself felt in the English literary world that Spinozism acquired significance as a subject of intellectual discourse.

Samuel Taylor Coleridge was undoubtedly the chief link in this transmission. To judge from Henry Crabb Robinson's account, Coleridge, when receiving from him Spinoza's *Ethics*, kissed Spinoza's face on the title page, said the book was his gospel, but—almost in the same

breath—proclaimed his philosophy false and hence incapable of affecting in the slightest his faith “in all the doctrines of Christianity, even of the Trinity.” The ambivalence in Coleridge’s attitude toward Spinoza, whom he praised as the “Hercules’ pillar of human reason” and simultaneously assailed for his moral and religious views, followed a pattern characteristic of many Spinozists before him, most notably Jacobi. Like Jacobi, Coleridge paid tribute to the rigor of Spinoza’s logic and commended his works as “medicinal” reading, while deploring their inadequacy as a philosophical basis of religious belief. Spinoza’s *unica substantia*, Coleridge maintained, was not an object at all but a mere notion, a subject, of the mind. Spinoza committed the “most grievous error” of seeing God “in his *Might* alone ... and not likewise in his moral, intellectual, existential and personal Godhead.” In the *Biographia Literaria* Coleridge related that he had talked much to William Wordsworth about Spinoza, which would help to account for the undeniably Spinozist elements in Wordsworth’s poetry. But like Coleridge and other English writers of this period, Wordsworth added nothing new to the conception of Spinozism.

#### NINETEENTH-CENTURY FRANCE

The reception of Spinoza in nineteenth-century France also witnessed no startling reinterpretations except that, as in Germany, the charge of atheism appeared to many to be quite unfounded. Like Lessing, Herder, and Goethe, Victor Cousin and his followers decisively dismissed the accusations to which Spinoza’s *Ethics* had been subjected by orthodox Christians. Nonetheless, Théodore Jouffroy and Émile Saisset, both disciples of Cousin, had serious misgivings about Spinoza’s pantheism, for it seemed to absorb the individual in too determinate a manner in the cosmic forces of the whole and thus to threaten the very possibility of human freedom. Paul Janet echoed these misgivings and declared that “the genius of Spinoza was therefore not well adapted to the French mind.” But Jouffroy’s detailed attention in his lectures at the Sorbonne to Spinoza’s thought, and Saisset’s publication of a French translation of Spinoza’s works, helped to create an intellectual climate in which Spinoza’s philosophy could no longer be ignored or lightly dismissed. Thenceforth very many French writers of note, from Edgar Quinet, Alphonse-Marie-Louis de Prat de Lamartine, and Jules Michelet to Georges Sand, Ernest Renan, and the Saint-Simonians felt impelled to grapple with Spinozist ideas.

#### RUSSIA

The spread and proliferation of interest in Spinozism could not help making its imprint on Russia, a country whose thinkers had for some time been increasingly fascinated by Western philosophical thought. Even more remarkable is the extent to which Russia maintained its preoccupation with Spinoza despite—or perhaps because of—the Bolshevik Revolution. No other pre-Marxian philosopher, with the possible exception of Hegel, has received as much attention in the Soviet Union. From 1917 to 1938, 55,200 copies of Spinoza’s works were published in the Soviet Union, compared to 8,000 in the period from 1897 to 1916. Prerevolutionary literature on Spinoza had for the most part been critical and negative, but what non-Marxists considered Spinoza’s chief philosophical defects later appeared to many Soviet writers as his strong points. Spinoza’s political doctrines particularly appealed to the Marxists. Georgi Plekhanov came to see in Spinozism, when freed from its theological wrappings, a historical forebear of dialectical materialism, and he spoke of Marxism as a “variety of Spinozism.” Following Marx and Engels, many Soviet writers credited Spinoza with having correctly solved the fundamental ontological problem concerning the relation of consciousness to being, and of thought to things. Indeed, admiration for Spinoza prompted some to call him “Marx without a beard.” Spinoza’s rejection of an act of creation, his denial of a continuing intervention in the governance of the world by a supernatural being, his acceptance of nature as something ultimate, self-caused, and “given,” without limits of time or space, were all features not lost upon dialectical materialists. No less congenial was the determinism and naturalism of Spinoza’s ethical and social philosophy that, while insisting on the possibility of arriving at objective and absolute truth, had analyzed the moral concepts of good and evil in terms of human desire and judgment. Finally, and most important, the allegedly passive role of thought in Spinoza’s system, which several prerevolutionary writers had critically commented upon, was regarded in the Soviet Union as the most convincing proof of Spinoza’s profound understanding of the historical process. Even if it is conceded that the Marxists revealed as many differences of emphasis in their positive appraisal of Spinoza’s thought as did the non-Marxists in their negative approaches, the essentials of Spinoza’s doctrines substantially engaged Russian philosophical thinking since the nineteenth century.

Spinozism, then, embodies no single consistent school of thought. Many who professed to admire and accept Spinoza’s philosophical premises were as apt to

misunderstand and misinterpret them as those who despised them. Yet despite the diversity of meaning that the term underwent in different intellectual contexts and periods, its catalytic significance cannot be gainsaid.

## SPIR, AFRIKAN ALEXANDROVICH

(1837–1890)

Afrikan Alexandrovich Spir, the Russian metaphysician was born in Elizavetgrad (present-day Kirovohrad) in the Ukraine, the son of a Russian doctor and a mother of Greek descent. Spir became interested in philosophy when, at the age of sixteen, he read Immanuel Kant's *Critique of Pure Reason*, a work that was to have a profound influence on him. He received no formal education in philosophy, however, and consequently never gained entry into philosophical circles, either in his native country or in Germany, where he settled in 1867. Spir attended a naval cadet school. He received both the Order of St. George and the Order of St. Andrew for his services as a naval officer. Before leaving Russia, he freed all his serfs and gave them land and lodging. He also gave away most of his money and lived on the income from the remainder. In 1869 Spir wrote that only two human activities have real worth—socially useful work and intimate discourse among people who think alike, yet in his lifetime Spir was denied both of these; indeed, few philosophers have been so isolated or ignored.

During the fifteen years Spir lived in Germany he published many articles and several books, including his major philosophical work, *Denken und Wirklichkeit* (Thought and reality; Leipzig, 1873), but notices and reviews were few. Bad health cut him off even further from the world. Hoping for a more receptive audience among French-speaking readers, Spir moved to Switzerland in 1882, but his work remained unknown and his views not understood. He died in Geneva, a Swiss citizen, just as his writing was beginning to attract attention.

Spir's later writings are on the whole restatements and clarifications of the metaphysical views presented in *Denken und Wirklichkeit*, which he felt might have been neglected because of its difficulty. In *Denken und Wirklichkeit* Spir argued that the task of philosophy is to seek absolutely true knowledge. In order to carry out this task, two immediately certain facts must be recognized: consciousness and the supreme law of thought, the principle of identity. This principle is the expression of a norm, of the a priori concept of the unconditioned, that is, of an object that is its own essence and is self-identical. To deny this concept is to deny that it can be conceived and, hence, that it can be denied. The principle of identity is seen to be the one synthetic a priori principle.

To the subjective necessity of this norm is added an objective proof: All our experience disagrees with it and,

therefore, it cannot be a mere generalization from experience. Finally, the principle of identity adds something to experience: All phenomena are organized as if they were self-identical; therefore the principle of identity is the condition of all the regularity of experience.

The unconditioned is, then, the norm, true essence, or God. The unconditioned, however, is not the source or ground of the conditioned: The norm cannot be the source of the abnormal, which contains elements of falsity foreign to the absolute. The relation of the absolute to the phenomenal can best be described analogously, as the relation of an object to its false idea. Having no relation to true being, the phenomenal world simply cannot be explained, its principle can only be thought of as its very abnormality, as its nonself-identity, as becoming. Hence the phenomenal world has no beginning and no end. At the same time, since it is conditioned by becoming, it strives for and evolves to what it is not, the normal. In man, empirical nature has evolved to consciousness, to the awareness of its abnormality. In this awareness man recognizes a norm. Thus he rises above empirical nature and sees the law of his true being as the law not of nature but of the norm, as the laws of morality and logic. Thus morality rises above natural science and, since the moral law is the norm, morality becomes religion.

## SPIRITO, UGO

(1896–1979)

Ugo Spirito, the Italian idealist philosopher, was born in Arezzo. He began his academic career as assistant to Giovanni Gentile at Rome and first established his reputation as an acute interpreter and trenchant defender of "actual idealism." He was also one of the founders of "corporative" economic studies in fascist Italy and always maintained an active interest in economics and in political and social science.

Spirito held that Gentile's "pure act" was not merely a philosophical concept but was also necessarily a concept of philosophy itself as an activity. This belief led Spirito in 1929 to proclaim the identity of philosophy and science, because all actual knowledge must be the solution of a determinate historical problem and neither philosophy nor science as they occur in actual experience can claim an absolute status independent of the history of their genesis and of the progress of further research. According to Spirito, the actual unity of philosophy and science is what is realized in the process of scientific research; his claim that the "pure act" is the conscious achievement of this unity led to the conception of life as research, set forth in his best-known book *La vita come ricerca*. In this work the absolute philosophical knowledge of traditional metaphysics was presented as the ideal limit toward which scientific research must forever tend but which it can never attain.

In later works, Spirito was led to an ever more strictly negative or critical conception of the task of philosophy because of the difficulty of defining this ideal goal and the paradox involved in discussing it without knowledge of it (which could only come from the secure possession of an eternal standpoint). The philosopher must confine himself to the task of identifying and exposing all claims to absolute knowledge and all forms of antihistorical dogmatism or superhistorical metaphysics wherever they occur. Such claims will otherwise impede the free advance of positive research, which includes all types of inquiry leading to the acquisition of knowledge, whether theoretical or practical. In aesthetics, for example, the philosopher must concentrate on removing prejudices created by definitions and philosophies of art; he must leave to artists, critics, and competent students the construction of the positive science of aesthetics.

This negative conception of the philosopher's task necessarily presupposes a positive philosophy of scientific research itself as a cooperative and progressive solution of problems that organized social groups of researchers

define for themselves. Theoretical problems are solved when science replaces personal opinion. Similarly, practical disagreements will be properly resolved only when scientific planning replaces the selfish initiatives of private individuals. The ideal of social competence must replace the ideal of personal culture in ethics and education, for only through commitment to membership in the community of positive research can an objective criterion of moral and practical values be found without recourse to any metaphysical or religious absolutes. Thus, Spirito inverted the conception of the relation between philosophy and science and between technical competence and general culture, which he found in Benedetto Croce and Gentile. He became one of the leaders of a new Hegelian left in Italy.

## SPRANGER, (FRANZ ERNST) EDUARD (1882–1963)

Eduard Spranger, the German philosopher and educator, was born in Grosslichterfelde, Berlin. He studied both mathematics and science at a *Realschule* and the humanities at a classical *Gymnasium*. At the University of Berlin

he studied under Wilhelm Dilthey and Friedrich Paulsen and earned his right to lecture with *Wilhelm von Humboldt und die Humanitätsidee* (Berlin, 1909), a classic in the history of German humanism. He was called to the University of Leipzig as professor of philosophy in 1911 and to Berlin as professor of philosophy and pedagogy in 1920. He spent the most creative years of his career and exercised his greatest influence on the *Geisteswissenschaften* and on all levels of German education while at Berlin. In 1933 he submitted his resignation in protest against interference with university freedom by the new National Socialist government but was persuaded by many followers to retain his influential university position. In 1937/1938 he lectured in Japan. He was arrested and imprisoned in 1944 but was released upon the intercession of the Japanese ambassador. Appointed rector of the University of Berlin by the Allied military government in 1945, he found it impossible to accept interference by the East Berlin authorities and in 1946 accepted a professorship in philosophy at Tübingen, where he lectured until his retirement.

Spranger sought to further two projects begun by his teacher, Dilthey. One was an “understanding” (*verstehende*) psychology that would approach human life not with scientific abstractions but perceptively and with an appreciation of cultural values; the other was an attempt to provide a normative interpretation of the *Geisteswissenschaften*. The interdependence of these two problems led Spranger to a Hegelian position (toward which Dilthey himself had begun to turn before his death), and he became a leading figure of the German neo-Hegelian revival of the 1920s.

In his chief work, *Die Lebensformen* (Halle, 1914; translated by J. W. Pipers as *Types of Men*, Halle, 1928), Spranger undertook a typological analysis of personality through the use of the method of *Verstehen*. He held this method to be empirical in that it results in “an at least minimally categorized after-experience.” It is essentially an aesthetic perception of cultural forms in individual life and is motivated by a Platonic *eros*—a love for the personal values involved; this, Spranger insisted, does not interfere with its objectivity. Six forms of value—all of which are objectively rooted in the historical and cultural order, and each of which may dominate a person’s life and evoke a reordering of the others in subordination to itself—determine six types of personality in modern culture—the theoretical, economic, aesthetic, social, political, and religious—which center, respectively, in the values of truth, utility, beauty, love; power, and, in religion, in the devotion to a vital totality of value. The moral

is not a distinct type of value but enters into all valuations. Spranger schematized these types into an ideal order without denying individual freedom in value selection.

Spranger's *Psychologie des Jugendalters* (Leipzig, 1924; 8th ed., 1926) applied his method and conclusions to the problems of youth. Four important attainments mark the sound growth of the adolescent: the discovery of self, the development of a life plan, the ordering of the self into the different spheres of human relations, and the awakening of the sexual life and *eros*. The six personality types developed in the *Lebensformen* can serve as a schema for comprehending the individual person in exploring these critical developments.

Spranger's analysis of the *Geisteswissenschaften* found application in his discussions of the ethical bases of modern culture and education. It combined criticism of the historical philosophies of society and culture with the development of a modified Hegelian theory of objective spirit. Subjective and objective spirit are in close interaction within every historically relative situation. To them Spranger added a third dimension of spirit, the normative. This, the relativized absolute spirit of G. W. F. Hegel, comprised the factors that serve a regulative role in history through art, religion, and philosophy. Responsibility for the actualization of the normative, however, lies in the individual; no cultural content becomes meaningful except "insofar as it is again and again created out of the attitude and the conscience of the individual soul."

After World War II Spranger turned to religious themes, particularly in *Die Magie der Seele* (Tübingen, 1947). This "magic of the soul," which is essential to the life of a culture, is constituted by the religious consciousness and serves not to meet immediate external goals but to augment the powers of the person himself. Faith is a "withdrawal into inwardness."

Spranger's work in the philosophy of education kept the classical humanistic ideal alive and exercised a liberating effect on all levels and dimensions of education. It found notable expression in classic studies of great figures in education—Wilhelm von Humboldt, Jean-Jacques Rousseau, Friedrich Froebel, Johann Heinrich Pestalozzi, and Johann Wolfgang von Goethe. Spranger was also involved in most of the ethical and cultural problems of German life, addressing himself to such challenges as labor education, vocational education, personal and vocational guidance, and juvenile delinquency. The eloquence of Spranger's lectures and writings, his personal warmth, felt by a wide circle of friends of all ages, and his combination of keen perception with deep moral con-

cern made him one of the most admired and influential of German thinkers. His deep sense of the German tragedy, and his long preoccupation with its moral and historical causes and the moral cost of redemption, won for him, before he died, the most distinguished honors that his country could bestow.

### Bibliography

Among Spranger's other works are *Wilhelm von Humboldt und die Reform des Bildungswesen* (Berlin, 1910); *Goethes Weltanschauung. Reden und Aufsätze* (Leipzig and Wiesbaden, 1942); *Gibt es ein Kulturpathologie?* (Tübingen, 1947); and *Aus Friedrich Froebels Gedankenwelt* (Heidelberg, 1951).

For a complete bibliography of Spranger's works, see Theodore Neu, *Bibliographie Eduard Spranger* (Tübingen: Niemeyer, 1958).

For discussions of Spranger's thought and influence, see *Erziehung zur Menschlichkeit—Festschrift für Eduard Spranger zum 75. Geburtstag*, edited by H. W. Bähr (Tübingen: Niemeyer, 1957); and *Eduard Spranger, Bildnis eines geistigen Menschen unserer Zeit*, edited by Hans Wenke (Heidelberg: Quelle and Meyer, 1957).

L. E. Loemker (1967)

## STACE, WALTER TERENCE (1886–1967)

Walter Terence Stace, the Anglo American empiricist philosopher, was born in London. He was graduated from Trinity College, Dublin, in 1908 and from 1910 to 1932 served in the civil service in Ceylon. During this period he published *A Critical History of Greek Philosophy* (London, 1920) and *The Philosophy of Hegel* (London, 1924). In 1932 he retired from the civil service to teach philosophy at Princeton University, where he remained until his academic retirement in 1955. He was president of the American Philosophical Association in 1949.

Stace's *The Theory of Knowledge and Existence* (Oxford, 1932) is the definitive statement of his general position on philosophical method. His argument rests on the claim that on strict empirical grounds the solipsist position is logically unassailable. Whereas philosophers such as George Santayana, starting with the same claim, appealed to a doctrine of "animal faith" and emphasized

the irrational element in belief in an external world, Stace carefully and in detail offered an analysis of the steps whereby we construct our conception of an external physical world out of the available data. He often spoke of his doctrine as a theory of *fictions*, but in print he preferred the word *constructions*. The point is that the construction of the fiction of an external world is neither irrational nor animal. It is a step-by-step inference that, although it fails to provide a logical answer to solipsism's claims, does satisfy human demands for reasons for belief. Ultimately our reasons for belief rest, according to Stace, upon two general claims that can be empirically supported—the claims that human minds are similar and that they labor together in common. These two empirical facts, and not logical proofs, support our commonsense beliefs. This thesis lies at the heart of most of Stace's later work.

Stace in this earlier period was an advocate of the sense-datum theory. In spite of continued association of his name with G. W. F. Hegel, he was chiefly indebted to David Hume, G. E. Moore, and Bertrand Russell. His main object of attack was Russell's *Our Knowledge of the External World*, which, according to Stace, constantly violates the principle of empiricism. In 1934 he published one of his best-known articles, "The Refutation of Realism" (*Mind* 43 [1934]: 145–155), in response to Moore's influential "The Refutation of Idealism." Moore's argument was based upon a distinction between sense data and our awareness of them. Stace replied that one can grant the distinction and still deny any force to the claim that sense data exist when not being perceived. He generalized the claim that there can be no good reason for believing any version of the proposition that entities exist unperceived. They may so exist, but it is absurd to claim that this can be empirically proved. It follows that where "such proof is impossible, the belief ought not to be entertained."

This argument seems, on the face of it, to contradict the thesis of *The Theory of Knowledge and Existence*. Stace always subsequently maintained, however, that his article had been misunderstood because it was not recognized as irony. He also insisted that Moore's article had been intended as humorous. The irony of his own consisted in showing that the simplest natural belief cannot be supported by strict logical proofs.

Stace's next major work was *The Concept of Morals* (New York, 1937). In one sense the main argument of the book might be, and has been, characterized as a version of subjectivism because it associates a general theory of the meaning of moral judgments with a general theory of

man's wants and approvals. Perhaps the most permanently valuable aspect of the argument, however, is the attempt to disassociate the view he is defending from the label "subjectivist." Stace held that the proper contrast between subjectivism and objectivism is between views which make reasoned adjudication of ethical disputes impossible, and views which provide rational grounds for holding that one moral claim can be correct and its rivals mistaken. According to Stace, what makes his view objectivist in this significant sense is the connection between it and a general theory of man's nature, including his desires, wants, and approvals. The result is a modified version of utilitarianism based upon the same two principles emphasized in the theory of knowledge, the similarity of men's minds and the fact that they labor together in common.

In two articles ("Positivism," *Mind* 53 [1944]: 215–237; and "Some Misinterpretations of Empiricism," *Mind* 67 [1958]: 465–484) Stace distinguished empiricism from recent positivistic tendencies. The intention of both is to attack the attempt on the part of more recent logical empiricists, who, Stace claimed, associate empiricism with the demand for strict logical proofs.

In September 1948 Stace published in the *Atlantic Monthly* (pp. 53–58) an article titled "Man against Darkness." The thesis of the article, which Stace considered neither very original nor very shocking, was that the worldview endorsed by the physical sciences since the time of Galileo Galilei is incompatible with Christianity's traditional worldview. The violent reaction to this article stunned him. There followed *The Gate of Silence* (Boston, 1952), a book-length poem; *Philosophy and the Modern Mind* (New York, 1952), a careful historical study of the thesis that had been popularly stated in "Man against Darkness"; and *Time and Eternity* (Princeton, NJ, 1952), an essay in the philosophy of religion which many consider his most profound work.

No doubt partially because of the years he had lived in Ceylon, Stace was attracted to Hinayana Buddhism, and both *The Gate of Silence* and *Time and Eternity* reveal the extent of that influence on his later metaphysical thought. The theme of paradox runs throughout these works: "Men have always found that, in their search for the Ultimate, contradiction and paradox lie all around them.... Either God is a Mystery or He is nothing at all" (*Time and Eternity*, p. 8).

Thus, Stace now held that belief must transcend the confines of strict logic, and the rigorous empiricist ended by courting mysticism. Fully aware of this fact, Stace set himself to what he conceived to be his final philosophical

task—the reconciliation of empiricism and mysticism. The result was *Mysticism and Philosophy* (New York, 1960). He claimed (1) that the mystical experience is a fact, is unique, and is the same in all cultures; (2) that the interpretations of the mystical experience vary widely from culture to culture; and (3) that a genuine empiricism cannot ignore the mystical experience simply because it is logically paradoxical.

Throughout the somewhat otherworldly philosophical reflection of his later life, Stace retained an interest in practical problems. His *The Destiny of Western Man* (New York, 1942) was an expression of horror against the irrational totalitarianism that swept Europe in the 1930s. In February 1947 he published an article in the *Atlantic Monthly*, vigorously attacking the legal basis of Zionism arguments. In early 1960s he was concerned with the universal condemnation of colonialism, insisting that high generalizations be checked against the evidence. In a letter to the *New York Times* (February 4, 1964), he wrote that colonialism “civilized half the world at the cost of the loss of some *amour propre*, of some snobbishness, of some arrogance, of some hard feeling, but—in the case of the Romans and British, at any rate—of very little real cruelty, injustice or tyranny.”

## STAËL-HOLSTEIN, ANNE LOUISE GERMAINE NECKER, BARONNE DE (1766–1817)

Anne Louise Germaine Necker Baronne de Staël-Holstein, the French novelist and essayist, was born in Paris, the daughter of Suzanne Curchot and Jacques Necker, finance minister to Louis XVI. In 1786 she married Eric Magnus, baron of Stäel-Holstein, the Swedish ambassador to France, from whom she separated in 1797. In the year of her marriage she published her first novel, *Sophie*, and four years later a tragedy, *Jeanne Grey*.

Her interest in philosophy began with a study of Jean-Jacques Rousseau, whose fervent admirer she remained throughout her life. She incurred the hostility of Napoleon Bonaparte both by her frank criticism and by her liberalism, and her advocacy of a constitutional monarchy led to her being exiled in 1802. She made her first trip to Germany at this time, a trip that was the occasion of her book *De l’Allemagne*. This work was sent to the printer in 1810, but it was condemned by the censor and did not appear until 1813. After years of traveling, Mme. de Staël returned to Paris, where she remained until her death.

The philosophical ideas of Mme. de Staël are to be found mainly in two books, *De la littérature considérée dans ses rapports avec les institutions sociales* (1800) and *De l’Allemagne*. In the former she attempted to show the influence of religion, morals, and laws on literature and that of literature upon religion, morals, and laws. This book presupposed the perfectibility of man, as Mme. de Staël admitted, but human progress was not automatic; to come into being it required the constant and deliberate aid of education (*les lumières*), which could be provided only through literature. A second premise was that of national characters, the Greek being given to art, emulation, and amusement; the Roman, to dignity, gravity of speech, and rational deliberation. Later she contrasted the Northerner and the Southerner, in *De l’Allemagne* exemplified respectively by the German and the Frenchman.

Nevertheless, there is nowhere in Mme. de Staël's writings the notion of national souls or collective spirits (*Geister*). People to her were individuals, and whatever community of interests and talents they showed was to be attributed to the influence of other individuals.

Mme. de Staël never questioned the absolute value of personal liberty. This belief she attributed to Protestantism, her family religion. To her, Protestantism rested on the principle of personal interpretation, and the source of one's convictions was to be looked for in the heart, just as it was in the teachings of Rousseau's Savoyard vicar. She held that individual differences in temperament were irreconcilable, and believed that only statistics could help a statesman solve his people's ethical problems. It may have been this firmly rooted idea that made her fear the natural scientist as the tool of despots. The scientist, who rejects everything that cannot be reduced to mathematics, is always willing to pursue his own ends, regardless of the vital interests of his fellow men.

The chief contribution of *De l'Allemagne* to philosophy was that it acquainted Mme. de Staël's countrymen with the works of Immanuel Kant, Johann Gottlieb Fichte, Friedrich von Schelling, and Friedrich Schlegel. She presented their ideas simply and sketchily but on the whole correctly. In this way she helped break the hold that the sensationalism of the school of Étienne Bonnot de Condillac had had upon the French. Mme. de Staël wrote no book that can be considered as technical philosophy, but she represents the mind that has absorbed a philosophy as a technique of thinking and as a corrective to authoritarianism.

## STAHL, GEORG ERNST

(1660–1734)

Georg Ernst Stahl was a leading German medical scientist and chemist of his day. Stahl was appointed professor of medicine at the University of Halle in 1694, and from 1716 until his death he served as personal physician to Frederick William I of Prussia. His numerous medical writings had a strongly doctrinal tendency, which made them the source of lively, often bitter, controversy. His famous phlogiston theory, an erroneous explanation of the nature of combustion and calcination, was nonetheless, before Antoine Lavoisier's discoveries, instrumental in placing chemistry on a scientific basis. The same may be said of his studies concerning the properties and composition of acids, alkalis, and salts.

Led by his medical, rather than chemical, interests to philosophy, Stahl elaborated (particularly in his *Theoria Medica Vera*, 1707) a rigorous position of animism, affirming that the animal organism was formed, governed, and preserved by an immaterial principle, or soul. If Stahl's thought was indebted to the *archei* of J. B. van Helmont's occultist biology, and more broadly to both neo-Aristotelian and Neoplatonic versions of animism in the late Renaissance, his notion of soul, reflecting the impact of post-Cartesian dualism, was typical of his own period. He conceived of it as essentially a rational and spiritual substance distinct from matter, but simultaneously he assigned to it the ability to control the organism by an "unconscious" mode of activity. Thus, the soul not only thinks and wills but, having constructed its body, also excites, regulates, and sustains all involuntary and vital processes. It does so by the intermediary of movement, which Stahl regarded as an immaterial entity, for matter itself is held to be essentially passive and inert. The soul, by a specific energy, is supposed to communicate the "spiritual act" of movement to the organism in pursuance of its own aims.

This rather obscure view of things (which Gottfried Wilhelm Leibniz, among others, criticized) was not improved by Stahl's manner of expression, a mixture of dogmatic haughtiness and repetitious turgidity. If he

failed, moreover, to consider properly the various contradictions and difficulties peculiar to his position, this was due largely to his lack of interest in metaphysics as such. His animism was intended less as a philosophical contribution than as a theoretical standpoint from which to perceive and evaluate the phenomena of disease and health in accordance with an expectative approach to therapeutics. Even more significantly, it represented a protest against the dominant iatromechanist and iatrochemical schools, which at the time tended to see animate beings too naively and rigidly in terms of facile mechanical analogies and unexplained chemical reactions. But although Stahl's animism had the merit of emphasizing the presence of an irreducible "life force" having no equivalent in the machine, the omnipresent role allowed to this life force at the expense of a purely organic dynamism proved untenable.

The influence of Stahlism was checked during the first half of the eighteenth century by the success of the mechanistic and empirical doctrines of Hermann Boerhaave and Friedrich Hoffmann. Subsequently, Stahl's medical philosophy was reinterpreted at the important Faculty of Montpellier, with the general result that its spiritualist aspect was abandoned as unscientific while its insistence on a metamechanical "vital principle" in the organism was adopted as profoundly valid. Stahl thereby came to be recognized as the founder of the vitalistic school of modern biology.

## STAMMLER, RUDOLF

(1856–1938)

Rudolf Stammler was a German neo-Kantian legal philosopher. His first major work, *Die Lehre vom richtigen Recht*, outlined his philosophy of law, which was elaborated in subsequent works. Stammler sought to apply Immanuel Kant's distinction between pure and practical reason to the law. The embodiment of pure reason in legal theory is the concept of law, which Stammler defined as "combining sovereign and inviolable volition." The counterpart of practical reason is the idea of law, that is, the realm of purposes realized by volition. But whereas for Kant practical reason was not, like pure reason, a matter of intellectual perception, but of morality, Stammler sought to formulate a theoretically valid idea of justice. He based it on the community of purposes and the fact that man is a reasonable being, an end in himself. From this he derived two "principles of respect" and two "maxims of participation." The former are that no one's volition must be subject to the arbitrary desire of another and that any legal demand must be of such a nature that the addressee could be his own neighbor. The latter are that no member of a legal community must be arbitrarily excluded from the community and that a legal power may be exclusive only insofar as the excluded person can still be his own neighbor.

For Stammler these were not merely formal principles; they could be used to solve actual legal problems. He attempted, for example, to apply them to the legality of cartels and to the solution of disputes between upper and lower riparian owners over the use of water. His solutions were generally those of a moderate liberal.

Max Weber has shown in "Rudolf Stammlers Überwindung des materialistischen Geschichtsauffassung" (*Gesammelte Aufsätze zur Wissenschaftslehre*, Tübingen, 1922, pp. 291–359) that Stammler's alleged formal categories are in fact categories of progressive generalizations, the more general being relatively more formal than the less general. Stammler's main error was his attempt to make the idea of justice a matter of theoretical knowledge; it was therefore inevitable that he should confuse principles generally acceptable to a moderate liberal with universally valid principles of justice. His idea of justice is therefore a cross between a formal proposition and a definite social ideal, kept abstract and rather vague by the desire to remain formal. Stammler's chief merit remains his reintroduction of legal philosophy as a vital aspect of the study of law.

## STATE

Before the sixteenth century the word *state* was used to refer to the *estates* of the realm or to kingly office or dignity, but not to an independent political community. Niccolò Machiavelli was largely responsible for establishing this modern usage. The change, however, was not in words only but also in ways of thinking about political organization and political relations. In feudal society a man figured in a network of quasi-contractual relations in which his political rights and duties were closely linked to land tenure and fealty. He was his lord's man and his king's man. The powers of kingship were only with difficulty distinguished from property rights. From the twelfth century on, the conceptions of Roman law began once more to influence political thought. Public authority was more sharply distinguished from private rights; the peculiar position of the king among his barons, which feudal writers recognized but found difficult to conceptualize, came to be expressed in Roman terms—the *princeps* was said to speak on behalf of the whole people and to exercise *imperium*, as distinct from a feudal privilege, because his care was for the whole *respublica*.

However, so long as barons could still simultaneously hold fiefs from different kings in different lands, the notion could not develop of the territorially defined state, making an exclusive claim to the allegiance of all who

resided within its borders. The idea that men could be not only subjects of their king but also citizens of their state became possible with the consolidation of national monarchies in England, France, and Spain. Its development was assisted in the thirteenth century by the quickening of interest in Aristotle's ideas about the city-state and, in the early sixteenth century, by the Renaissance interest in the ancient Roman republic. Classical elements, then, were grafted onto the late medieval stock to produce the Renaissance state.

With the declining influence of such customary forms of regulation as feudal and manorial ties, the guild, and the family, the state became an indispensable category for any kind of speculative thought about society. Moreover, as the grip of custom slackened, men came to think that law might be made by an authoritative will rather than discovered by the understanding or known by tradition. The political order, as the authority structure through which law was created and which therefore conferred legal status and rights on all other forms of association, gained a corresponding preeminence. Out of the split in the universal church and the consequent alliance for mutual survival between protestant princes and religious reformers, there emerged the idea of a national church closely related to the state, further stressing that the state was a community or polity and not simply an aggregation of men who happened to owe allegiance to a common overlord. The consolidation of national states created a new state of nature—a world peopled by sovereign states recognizing no overriding authority and only tenuously subject, if at all, to a common law. Francisco Suárez, Francisco de Vitoria, Hugo Grotius, and Samuel von Pufendorf, the pioneers of international law, explored the relations between states in such a world; what was implied for the internal structure of a state was worked out by Jean Bodin and Thomas Hobbes.

### IDENTITY OF THE STATE

Since the seventeenth century, political philosophers have been largely preoccupied with the relations of the state and the individual, with the citizen's rights, if any, against the state, with the right of the state to punish, to promote morality, or to regulate the affairs of other associations such as families, trade unions, and churches. These matters have been all the more troublesome because there is disagreement about the proper analysis of propositions about the state. For instance, what does it mean to say that a state has acted in a certain way, made a decision, adopted a policy, assumed responsibility, and so on? These are not statements about every one of its citizens,

nor are they simply statements about the acts of certain individuals who govern the state; for not all the actions of the person who for the time being is president are acts of the United States, nor is an act of the state always attributable to one person in particular. Hobbes was certainly mistaken when he argued that what made an aggregate of many men into one corporate person was that one man acted for the rest: “The *unity* of the representer, not the *unity* of the represented ... maketh the person *one*” (*Leviathan* I, 16).

Again, what kind of sustained identity has the state, that one can speak of its enduring through many generations of natural lives? It is tempting to meet such a question with an organic analogy: Although the cells die and are replaced, the organism survives; although an action of an organism requires nothing more than the coordinated operations of its organs, it is not identical with the actions of any one or of all of them (unless their functions as elements in an organism are presupposed in the descriptions of their actions). The organism, it is often said, is a form of life transcending its parts; purposes are attributed to it that are not the purposes of any one of its parts or of all of them taken severally. Many writers, notably the Hegelians, have described the state in this way, exalting the interests of the state at the expense of the interests of its members considered as individuals.

A quite different account of the state has been given by writers who have employed atomic or contractual models, with explanatory analogies drawn from joint-stock corporations, clubs, or perhaps from mechanical contrivances. Thus, Hobbes talks of the state as an *artificial* man, contrived by an agreement of self-determining individuals. It can have no purposes not ultimately reducible to the purposes of individuals; its acts are those of a sovereign authorized to act on their behalf. The contractual analogy in Hobbes and John Locke is a device for explaining how and under what conditions the acts of one or a few ruling individuals could be attributed to a body composed of a multitude of free and autonomous persons, all with their own separate interests, yet each committed by his own consent to a public interest in which he has a personal stake.

The problem of meaning, however, must be distinguished from the moral problem of obligation. The notion of corporate action does not necessarily entail consent or authorization on the part of individual members, although it could be argued that without consent the individual could have no moral commitment or responsibility. Acts of the state are acts of persons in an official capacity, acting according to procedures and

within the competence prescribed by the rules of its constitution. A president’s actions are those of the United States only when they form part of a particular procedural routine; they then indicate appropriate responses by other officials. When the president acts in nonofficial roles—as father or as member of his golf club—his actions are incidents in what a Wittgensteinian would call different “games” and therefore have appropriately different implications. The enduring identity of a state can be correspondingly analyzed in terms of the endurance of its procedural order. The Constitution of the United States has had an unbroken history since its adoption in 1788; the changes it has suffered have all been valid according to the criteria it prescribes for itself.

This sort of analysis explains the personality and life of a state without resorting to organic analogies or to metaphysical notions of an order of being where a whole is greater than the sum of its parts. However, it does not deal with all the problems. Despite several revolutions since 1789, there is a sense in which the French state has a continuous history, unlike the Austro-Hungarian state that was destroyed after World War I and replaced by a number of successor states. If the population of an area continues to be governed undivided, as an independent political unit, there seem to be grounds for saying that it remains the same state, despite changes in regime. In the case of France, although formal continuity of legitimization broke down between, for instance, the Second Empire and the Third Republic, there is a continuity of tradition and, despite deep cleavages, a sense that however bitterly rival groups contend, they are nevertheless committed by their awareness of history and common culture to remaining in political association. A struggle to control or reconstruct the machinery of government is not necessarily, then, an attempt to break up the political association, as it was in the Austro-Hungarian Empire.

## THE STATE AS AN ASSOCIATION

To call the state an association is to put it on the same footing as clubs, churches, and trade unions. There are features of the state, however, which, although no one of them is peculiar to the state alone, together make it a rather special case. For instance, because people do not usually become or remain members of a state by choice, and because a state exercises exclusive authority over everyone in a given territory, the concept of membership is hazier than in the case of voluntary associations. The state insists that not only its citizens but also everyone else in its territorial jurisdiction shall conform to its rules. Indeed, the notion of a citizen suggests a certain mini-

mum degree of active participation. This may be restricted, as it was in Athens, to a relatively small number of the resident native population. In that case, would the association include only the citizens? Are the rest outsiders on whom the state imposes its will, much as a trade union might insist that nonunionists shall not work for lower wages than its members? Or are citizens and noncitizens merely two classes of members, one with rights of participation, such as the right to vote, the others with private rights only?

Unlike trade unions, literary societies, joint-stock corporations, and guilds, the state's range of interests is very wide and, in principle, unlimited. This, too, is connected with its nonvoluntary character. Even allowing for migration and naturalization, people do not easily join or leave a state, and when they do, it is usually only with its permission. And whether they join it or not, they are subject to it if they reside in its territory. Consequently, the state does not need to define the terms and aims of their membership. Neither is there any higher authority which can rule, as the state's judicial authorities may do in relation to other associations, that a proposed act falls outside its terms of association and therefore infringes its members' rights. This indeterminacy of scope is a characteristic that the state shares with the family and even with some churches. Such associations have no defined set of aims: The behavior norms they sustain may govern a very wide, if fluctuating, segment of the social life of their members. And since the mid-1800s the effective sphere of the state has encroached increasingly on the spheres of other associations.

## THE STATE AND CONFLICTS OF INTEREST

The state's territorial inclusiveness and the uncertain limits to its concern have led many political philosophers to assign to it a unique role among the forms of human association. Plato's *Republic* sketched an ideal state in which men's conflicting interests and energies were harnessed and reconciled by philosopher-rulers who would integrate them into a single-minded unity, the principles of which could be discovered by a philosophical insight. Aristotle claimed that, at its best, the Greek *polis* was the most perfect association because, while including lesser associations like the family and the village, it was large enough to provide within itself everything necessary for the good life. For Aristotle, citizenship was a matter not of passively enjoying rights but of participating energetically in the many-sided life of the *polis*. The Greek writers had in mind a small state, a face-to-face community capable

of satisfying emotional needs that the impersonal mass state of the twenty-first century cannot. Nevertheless, the same completeness that Aristotle found in the *polis* has often been attributed to the modern state.

Jean-Jacques Rousseau, though tempted to identify the modern state with the *polis*, hesitated to do so unconditionally. He believed that the state was sufficient for the expression of all human excellencies. The vocation of the citizen was the highest to which a man could aspire. Participating in the expression of the general will for the common good of the whole association, the citizen rose above private interest and became a moral person, "substituting justice for instinct in his conduct.... man, who so far had considered only himself, finds that he is forced ... to consult his reason before listening to his inclination" (*Social Contract* I, 8). Membership of the state was for Rousseau, as for Plato and Aristotle, a moral education; bad laws corrupted nature, good laws provided conditions for moral development and nobility of soul. Not only was nothing needed beyond the state but also, Rousseau suspected, lesser associations, by setting up partial or sectional interests as objects of loyalty, frustrated the public interest and corrupted the state. Nevertheless, the ideal state of Rousseau's *Social Contract* remained a city-state, small enough for everyone to know everyone else. The attempt by others to extend the conception to the nation-state led to confusion in theory and, in practice, to Jacobin totalitarianism.

G. W. F. Hegel transformed Rousseau's doctrine by substituting for personal, face-to-face relations a metaphysical dependence of parts on the whole. The state was the concrete universal, the individual a mere partial expression of it. Sectional associations had a function in organizing human interests. They operated, however, on a lower plane of reality than the state, a plane that Hegel termed "civil society." This was not a different order from the state but the same social organization viewed from the standpoint of the subjective ends that individuals set themselves. It was the plane of the free market economy motivated by the pursuit of profit and sectional advantage, where competitive conflicts are checked, ordered, and adjusted by the police. Nevertheless, unknowingly and despite themselves, individuals promoted ideal ends. Interests that from the subjective point of view of civil society were sectional and egoistic appeared objectively in the state as moments or partial expressions or functions of the greater whole. The state would then rightly regulate although not supplant such interests. For Plato and Rousseau the conflict of interests was a pathological symptom in a state; for Hegel it was an unreality masking

a fundamental unity that the state would safeguard if necessary. For all three there was a transcendent public interest in which the apparent interests of individuals are dissolved and fused.

There is, however, another view that takes the conflict of interests as a fundamental fact of nature; it can be controlled but never finally superseded. Machiavelli, Hobbes, and Jeremy Bentham were in this tradition. The state existed to regulate competition, since without it individual objectives would be mutually frustrating. The harmony it achieved, however, was artificial; the state remedied a desperate situation by altering the conditions under which men sought their own interests, deflecting them from antisocial ends by fear of punishment. Karl Marx and Friedrich Engels, agreeing that the state suppressed conflict, saw it as a strictly coercive instrument maintained by the dominant economic class to safeguard its privileges. But they believed that with the advent of a classless society, scarcity would give way to abundance, and conflict to harmony. The state would then wither away, to be replaced by a new administrative order without organized violence. The state, then, was a response to a pathological although historically necessary condition. Ultimately, however, the evolution of society would bring about the changes that would make Rousseau's vision possible. For Augustine the earthly state was the palliative for sin; for Marx it was the palliative for class conflict. But for both there was a condition of ultimate redemption, where the coercive state would have no place.

For John Locke civil society (equivalent in Locke's terms to the state) existed to safeguard the natural rights of individuals, which they could not successfully preserve in the state of nature. Nevertheless, because Locke considered people rational by nature and therefore ideally capable of living in peace according to the law of nature, the condition of conflict was pathological, not natural. However, the norm was not participation in a transcendent good but a condition in which everyone enjoyed their own area of legitimate privacy, troubled by neither private nor public intrusions. For Locke, as for Hobbes, the state's ends were reducible to those of individuals. Bentham put this quite unequivocally: "This public interest ... is only an abstract term; it represents only the mass of the interests of individuals" (*Principles of the Civil Code, Works*, Vol. I, p. 321). The state had and could have no moral function except to arrange that as many people as possible should obtain as much as possible of whatever it was that they wanted. For some purposes all that was needed was for the state to uphold property and the sanctity of contract; economic motives in a free market would

do the rest. But Benthamite utilitarianism was committed to active state policies wherever, as in public health, laissez-faire would not work. The Benthamite state was readily convertible to a Fabian policy of social engineering. But the objective would still be, in Roscoe Pound's phrase, "such an adjustment of relations and ordering of conduct as will make the goods of existence ... go round as far as possible with the least friction and waste" (*Social Control through Law*, New Haven, CT, 1942, p. 65).

The view that politics is a matter of who gets what is substantially that of the group theorists in political science, such as A. E. Bentley and, more recently, Harold Lasswell, David Truman, and Robert Dahl. In their accounts, the state is dissolved into a "political process" which can be analyzed without residue in terms of the competitive pressures of interests. Whereas Locke and Rousseau would have agreed that the public interest was the proper end of state action (although possibly disagreeing in their accounts of it), many modern political scientists, Glendon Schubert, for instance, have rejected the concept of public interest as being so vague as to be useless or as being a device of politicians for advocating policies actually pursued for quite other reasons. Policy decisions, they argue, are the resultants of competing interests—there is no single interest that everyone would acknowledge, nor one that would be to everyone's advantage. Thus, there can be no public interest that the state ought to pursue.

An analysis like Schubert's depends, on the one hand, on the identification of interest and desire and, on the other hand, on interpreting "public" to mean "enjoyed by everyone." This was clearly not Rousseau's meaning. A citizen's interest was in being a person of a certain kind with characteristic excellences, attainable only in a healthy state. One might misguidedly desire what was not in his interest; so might all the citizens, for the will of all was not necessarily the same as the general will. But as long as their vision was clear, conflict was impossible because the public interest was whatever would be to *anyone's* advantage, insofar as he was capable of human excellence.

Political scientists mistrust such a theory, partly because it tends to describe the actual state as if it were the ideal and partly because it is evaluative, whereas they want theories to be descriptive and explanatory. What is in a man's interest, they say, is simply what he strives to get, irrespective of why he does so or with what wisdom. However, treating the state as simply an arena for sectional pressures has the drawback of disregarding or misconstruing the widespread opinion that to act in the

public interest is to be impartial between competing groups—that the state (or its rulers) is therefore in a special position as arbiter between group interests. This frequently gives state decisions a moral authority that a mere political barometer, responding to the greatest pressures, could never enjoy, and it provides politicians and public servants, potentially at least, with a range of motives that are quite unlike interests as usually understood.

Sheldon S. Wolin, in *Politics and Vision*, advanced the somewhat paradoxical thesis that despite the vast extension of governmental activity, there has been a steady depreciation of politics and the political order since the seventeenth century. This has been matched, he asserts, by a corresponding heightening of regard for nonpolitical institutions and associations—for society as distinct from the state. This “groupism” is regrettable, in Wolin’s view, because the specialized roles adopted by the individual are no substitute for citizenship. Citizenship, as the individual’s most general role, calls on him to choose regardless of special interests. As a member of a society bounded for most purposes by the state’s frontiers, he is confronted with this demand only as a member of the state. As a trade unionist, for instance, he shares sectional loyalties with coworkers and is led to strive for advantages at the expense of other groups. To be conscious of oneself as a citizen, however, is to enjoy an integrative experience, which “demands that the separate roles be surveyed from a more general point of view.” The political art, in Wolin’s opinion, is that “which strives for an integrative form of direction, one that is broader than that supplied by any group or organization.” Wolin comes close indeed to the view of Rousseau and Hegel that there is a concrete morality in the state. As a citizen one is asked to judge what would be to the advantage of *anyone*, their special circumstances aside. In this manner one approaches a moral judgment, an impartial assessment of claims in matters of general concern.

A further disadvantage of a fragmented vision of the political process is its tendency to miss the influence of the state, both as an idea and as a tradition, on the life of the society. As a trade union or a church is not simply an arena for its own sectional interests, so each state embodies a set of values and objects of loyalty which may greatly influence what its members consider their interests to be. Its manners and traditions leave their mark on them. Associations that participate in its political processes reflect its style, its modes of organization, and its procedures. Moreover, the state lays down terms on which its members deal with one another and with foreigners,

establishing an area within its borders in which trade, communications, and movement are free, and regulating traffic that crosses them. Because of its regulative power, the texture of social relations is far closer within its boundaries than across them. It thus supplies not only a legal but also a general conceptual framework for much of our social thought and action. Thus, where we speak of Australian primary producers’ associations, Australian football teams, and the Australian Political Studies Association, we speak not of the Australian state but of Australia.

This seems to support the Hegelian view of the state as a national community within which certain particular functions are promoted by sectional associations operating within it. But then one must distinguish the state in this sense from its governmental authority structure, which would be but one of its organs alongside trade unions, graziers’ associations, and the like. For voluntary and sectional associations are not, like departments of state, of the navy, or of the post office, subordinate parts of the governmental structure, nor are their actions the acts of the state. This distinction would be quite consistent with a generalized although conditional duty on the part of sectional associations to submit to governmental authority. However, it would not be a duty owed by subordinate agencies to a superior but rather one owed by members of a society in which an authority is recognized as arbiter and coordinator of interests and as initiator of policies of general concern. This would also be consistent with the moral right of associations to defy the government should these functions be abused. The fact that the government is the executive agent of the politically organized state does not mean that its own views of the public interest or of a just settlement of conflicting claims must always and necessarily prevail.

The word *nation* is often used to refer to the state-community; so, in slightly different contexts, is the word *country*. Both words, however, have other meanings and overtones, *nation* being used of cultural groups which can transcend state frontiers or which may be minorities within a state, *country* referring more particularly to the state’s territory or to the state as an international personality.

## LIMITS OF STATE ACTION

Liberal political philosophers have tried to define necessary limits beyond which the activities of the state must not extend. Some, like Locke, account for the existence of the state in terms of some specific function, such as the safeguarding of natural rights. They then infer, by

analogy with the statement of aims in the articles of association of a club or joint-stock company, that the state would be exceeding its competence if it did more than that. Others have tried to define an area of private action that the state ought not invade. According to J. S. Mill, for instance, the state is never justified in restraining the action of a normal adult solely on the grounds that it is in his interests that it should. Some, like T. H. Green and Ernest Barker and, in a more sophisticated form, F. A. Hayek, have claimed that the state as a coercive organization has intrinsic limitations. Although it can hinder hindrances to the good life, it cannot force people to live that life; any form of activity, such as religion, art, or science, whose value lies in spontaneity or freedom of belief must therefore fall outside its scope. Barker argued that because the state's essential mode of action was through general rules, it was not apt for any field that, like industry, required ad hoc discretionary decisions. Such an argument depends, however, on a very doubtful kind of essentialism. The state has no one *modus operandi*. For the varied range of activities that states have undertaken since the mid-1800s, they have devised an equally varied range of techniques. They encourage the arts as well as censoring them. Nearly all modern states have very extensive responsibilities in education, industrial management, health insurance, and medical services, all of which have at one time been private undertakings and none of which involves coercion except in very remote or indirect ways. It does not follow from the state's monopoly of legitimate coercion that it can do nothing for which coercion is inappropriate. Nor need we suppose that, if there are indeed forms of social activity that the state has at present no satisfactory means of regulating, encouraging, or promoting, it may not yet invent them. Therefore, one cannot say in advance whether a given task would be more properly left to individual initiative or organized by governmental agencies. That depends on what can be done with the techniques available.

Urbana: University of Illinois Press, 1960. The views of the official philosopher of Italian fascism from the standpoint of "actual idealism."

*Stanley I. Benn (1967)*

## STATE [ADDENDUM]

In the past three centuries, states have replaced empires and tribes as the dominant form of political organization. But one clear lesson of the twentieth century is that the vast powers of states can be put to disastrous as well as beneficent ends.

Philosophical reflection about states often begins with Thomas Hobbes and the rational justification of

social order as mutually advantageous. Many more contemporary philosophers have ignored the state, however, focusing instead on justice and the rights and liberties that states should respect. Indeed, the most important work in political philosophy in the twentieth century (Rawls 1972) does not discuss the state—it lacks even one entry for "the state" in its index.

In recent years there has, however, been a renewed interest in the state that has developed along several lines. Some have used modern game theory to pursue Hobbes's question of the possibility of a rational justification of the state. Others have studied the nature of the state itself and its relationship with other forms of social control, while some have questioned both the authority and the legitimacy of states. Another topic is the impact on states of global economic, social, and legal transformations.

Questions about the nature of states can be addressed either by considering the similarities and differences among states, nations and governments or by comparing states with other ways of maintaining social order. Nations and peoples are distinct from states, as evidenced by the fact that we often speak of "stateless" peoples such as Kurds and Palestinians. Nations and peoples are marked by common cultures and histories that provide the basis of a shared identity. Governments are also distinct from states: the head of the government in the United Kingdom (the prime minister) is not the head of state (the monarch is), just as the U.S. president is the head of state but not of the government as a whole. What, then, are states?

Unlike both ancient empires and the overlapping allegiances of feudal Europe, states claim sovereignty, and of a specific sort. Empires lacked clear territorial boundaries and often shared sovereignty with local rulers. In feudal Europe political power was fragmented among different and often overlapping jurisdictions that encompassed kings, lords, local rulers, bishops, and popes who demanded allegiance or taxes or both. Sovereign states differ from these forms of political control because they have a centralized and hierarchical organization ruling over a defined territory with established boundaries. A state also claims to be the ultimate source of legal authority and demands loyalty from all permanent inhabitants within its territory.

Although many assume that states' claims to authority and legitimacy could be vindicated—that states could be made just—anarchists have questioned both claims. Robert Paul Wolff (1976) attacked the state's authority by attacking authority in general. He argued that because people are responsible for their own decisions based on

reasons that they understand to be relevant, the claimed authority of states is illegitimate. One cannot both accept responsibility for one's own actions and submit to the authority of the state, said Wolff. This claim has spurred Joseph Raz (1979) and others to look more closely at authority. Raz agrees that authority involves a type of surrender or acquiescence of judgment, though he denies that this is always contrary to reason. He explains by distinguishing first-order reasons (where we weigh competing reasons and act accordingly) from second-order reasons that "preempt" first-order reasons. The eclipsing of first-order reasons by the authority's judgment suggests that Wolf is right in casting doubt on the state's claim that it is always an authority, although it also implies that it is sometimes not a violation of autonomy to decide to act for second-order reasons.

Robert Nozick (1974) raised questions not only about the state's authority but also about the widely presumed legitimacy of the state's use of coercive power. The only legitimate exercise of coercive power, he argued, would be vastly different from powers states commonly claim. A legitimate state's power is limited, for example, by people's rights to refuse to join the state or to join only on terms that are voluntarily. While Nozick defends the state's use of coercion to protect rights to property and life, he questions whether the many other, familiar coercive measures are legitimate—measures ranging from paternalistic efforts to protect people against themselves to laws preventing self-regarding but immoral acts to taxes aimed at redistributing wealth and providing social services. In painting an attractive and purportedly workable picture of an anarchist society, both Wolff and Nozick have encouraged a fresh look at states' claims to authority and legitimacy as well as at alternative methods of maintaining social order.

Economic, legal, and social forces are also affecting states. States traditionally claim both internal sovereign control over populations and immunity from external power, yet both ideas have come under increasing pressure from many different angles. As the world has become smaller and more integrated and corporations do business in different states, it is often important for states to harmonize laws governing commerce and immigration. Adding to these pressures for more cooperation has come a need to meet growing international problems such as environmental degradation and terrorism—neither of which can be effectively addressed without the cooperation of other states. This greater interdependence of states, and their mutual vulnerability, has even sparked

renewed interest in possible preemptive actions against states as a form of self-defense.

Alongside these challenges to the external sovereignty of states has come greater emphasis on human rights, further weakening states' claims of internal sovereignty over their own populations. International tribunals, nongovernment aid organizations, and sometimes unilateral military action in the name of helping citizens or protecting them from their own states have all challenged the supremacy of state power. Yet despite all these forces working to limit states' sovereignty, terrorism has also brought home the importance of avoiding "failed states" in which terrorists can train and plan. So although states are losing authority and sovereignty because of globalization, mutual interdependence, and growing legal limits on their power, the prospect of failed states breeding terrorists abroad and anarchy at home has strengthened the case of defenders of the state power.

## STATISTICAL MECHANICS, PHILOSOPHY OF

*See Philosophy of Statistical Mechanics*

# STATISTICS, FOUNDATIONS OF

Thorny conceptual issues arise at every turn in the ongoing debate between the three major schools of statistical theory: the Bayesian (B), likelihood (L), and frequentist (F). (F) rather uneasily combines the Neyman-Pearson-Wald conception of statistics as “the science of decision making under uncertainty” with Ronald A. Fisher’s theories of estimation and significance testing, viewed by him as inferential. However, in keeping with his frequentist conception of probability, Fisher viewed the inferential theory of Thomas Bayes and Pierre Simon de Laplace as applicable only where the needed prior probability inputs are grounded in observed relative frequencies. Maximum likelihood estimates and significance tests were intended as substitutes for Bayesian inference in all other cases. (F), (B) and (L) all provide a framework for comparatively appraising statistical hypotheses, but Fisher questioned whether one can fruitfully assimilate the weighing of evidence to decision making.

Given the response probabilities for a diagnostic test shown in Table 1:

**TABLE 1**

	Positive	Negative
Infected (h)	0.95	0.05
Uninfected (k)	0.02	0.98

one may, following Richard M. Royall (1997, p. 2), usefully distinguish three questions of evidence, belief, and decision when a subject (S) tests positive:

- Q1. Is this result evidence that S has the disease?
- Q2. What degree of belief that S has the disease is warranted?
- Q3. Should S be treated for the disease?

(L) addresses only Q1 and does so by what Ian Hacking (1965) dubs the law of likelihood (LL):

evidence  $e$  supports hypothesis  $h$  over  $k$  if and only if  $P(e|h) > P(e|k)$ ; moreover, the *likelihood ratio* (LR),  $P(e|h) : P(e|k)$ , measures the strength of the support  $e$  accords  $h$  over  $k$ .

The LL follows from Bayes’s fundamental rule for revising a probability assignment given new data. Indeed, Laplace arrived (independently) at this rule by appeal to the intuition that the updated odds in favor of  $h$  against  $k$

in light of  $e$  should be the product of the initial odds by the LR (Hald 1998, p. 158):

$$(1) \quad P(h|e) : P(k|e) = \frac{P(e|h)}{P(e|k)} \times \frac{P(h)}{P(k)}$$

If the rival (mutually exclusive) hypotheses  $h$  and  $k$  are treated as exhaustive, so that their probabilities sum to one, then (1) yields the usual form of Bayes’s rule:

$$(2) \quad P(h|e) = \frac{P(e|h)P(h)}{P(e)}$$

with  $P(e)$  usually given in the general case by the partitioning formula:

$$(3) \quad P(e) = P(e|h_1)P(h_1) + \dots + P(e|h_n)P(h_n)$$

with the (mutually exclusive) considered hypotheses  $h_1, \dots, h_n$  treated as exhaustive.

One also sees how (B) answers Q2 by multiplying the initial odds, based on what is known about the incidence of the disease, by the LR of 95/2 provided by a positive reaction. If the incidence of the disease is even as low as 1 per 1,000, the posttest (or “posterior”) probability of infection may still lie well below 50 percent. Notice, too, that knowledge of the infection rate may rest on the same sort of empirical frequency data that underwrites the conditional probabilities of Table 1. When this is true, (L) and (F) have no qualms about applying (2) to answer Q2. They do not question the validity of (2), only whether the initial probabilities needed to apply it can be freed of the taint of subjectivism.

## THE LIKELIHOOD PRINCIPLE

Statistical hypotheses typically assign values to one or more parameters of an assumed probability model of the experiment, for example, to the mean of a normal distribution or the probability of success in a sequence of Bernoulli trials. If  $\theta$  is such a parameter and  $X$  the experimental random variable then

$$P(x|\theta)$$

is called the sampling distribution when considered as a function of the observation  $x$  and the likelihood function qua function of  $\theta$ .

The case of randomly sampling an urn with replacement, with  $p$  the population proportion of white balls, affords a simple illustration. Then the probability of  $x$  white and  $n-x$  black in a sample of  $n$  is given by the binomial (sampling) distribution:

$$P(x | n, p) = \binom{n}{x} p^x (1 - p)^{n-x}$$

For comparing two hypotheses about  $p$  by the LR, the binomial coefficients cancel and so one may ignore them and define the likelihood function for this experiment by:

$$L(p) = p^x (1 - p)^{n-x}$$

The value of  $p$ , which maximizes  $L(p)$ , is called the maximum likelihood (ML) estimate of  $p$  and is easily found, by calculus, to be  $x/n$ , the observed sample proportion (of white balls) or successes.

Consider, next, a second experiment in which one samples until the first success is observed. This happens on trial  $n$  with probability,  $p(1 - p)^{n-1}$ , since  $n - 1$  failures must precede the first success. More generally, if one samples until the  $r$ th success is observed, this happens on trial  $n$  with probability:

$$P(r | n, p) = \binom{n-1}{r-1} p^r (1 - p)^{n-r}$$

which reduces to  $p(1 - p)^{n-1}$  when  $r = 1$ . This sampling distribution is called the negative binomial (or waiting time) distribution; it gives rise to the same likelihood function as the first experiment.

Now suppose Jay elects to observe  $n = 30$  trials and finds  $x = 12$  successes, while May elects to sample until she finds  $r = 12$  successes but that happens to occur on the thirtieth trial. In a literal sense, both experimenters have observed the same thing: twelve successes in thirty Bernoulli trials. One would think they would then draw the same conclusions. (F) violates this prescription, called the likelihood principle (LP). In so doing (F) allows the experimenter's intentions when to stop sampling to influence the evidential import of what is observed. It also makes the import of the outcome observed dependent on the entire sample space, hence, on outcomes that might have been but were not observed (see de Groot 1986, p. 417). By the same token, the unbiased estimators favored by (F), those centered on the true value of the parameter, violate the LP (p. 417), since this concept depends on all possible values of the estimator. Thus, the unbiased estimates of  $p$  are, respectively,  $k/n$  and  $(k - 1)/(n - 1)$  for the two previous experiments. The LP virtually defines the difference between (B) and (L), on the one hand, and (F), on the other.

In effect, (B) and (L) charge (F) with inconsistency, with basing different assessments of the evidence (or different decisions to accept or reject hypotheses) on equiv-

alent outcomes, for two outcomes are accounted equivalent by the LP if they define the same likelihood function. This charge of inconsistency can be carried to a higher metalevel since (F) accepts Bayes's rule (2), and with it the LP, when the prior probabilities are known from past frequency data. Hence (F) finds itself in the odd position of accepting or rejecting the LP according as the prior probabilities are "known" or "unknown." Charges of inconsistency are the weapon of choice in the ongoing battles between the three schools, beginning with the charge that Bayes's postulate for assigning a uniform distribution to a parameter about which nothing is known leads to inconsistent assignments. In the sequel, one will explore how consistency may be used instead to forge agreement.

### FISHERIAN SIGNIFICANCE TESTS

Fisher (1935, chapter 2, the *locus classicus*) presented significance tests as analogues of the logicians' *modus tollens*: if A then B, not-B/ ∴ not-A. When the probability,  $P(e|h_0)$ , falls below  $\alpha$ , one counts  $e$  as evidence against  $h_0$ , the smaller  $\alpha$ , the stronger the evidence. As Fisher describes it, the logic is "that of a simple disjunction: Either an exceedingly rare chance has occurred, or the theory is not true." Using (2), the probabilistic analogue of *modus tollens* is:

$$P(A | \bar{B}) = P(A) \left[ \frac{P(\bar{B} | A)}{P(\bar{B})} \right]$$

which shows that for not-B to seriously infirm A requires, not merely that  $P(\bar{B}|A)$  be small, but small relative to  $P(\bar{B})$ , so that some alternative to A must accord not-B a higher probability.

Much of Fisher's practice conforms to this precept. In his famous example of the tea-tasting lady (1935), the lady claims that she can tell whether tea or milk was infused first in a mixture of the two. To test her claim she is asked to classify eight cups of which four are tea-first and the other four milk-first, but, of course, she does not know which four. The relevant statistic is the number R of correct classifications and its sampling distribution on the null hypothesis that she lacks such ability is:

$$P(R = r | h_0) = \frac{\binom{4}{r} \binom{4}{4-r}}{\binom{8}{4}}$$

Notice, the probability that  $R = r$  on the alternative hypothesis of skill cannot be computed so that likelihood

ratios do not exist. All that one has to work with is an intuitive rank ordering of the outcomes with larger values of  $R$  more indicative of skill. What  $P(R \geq r^* | h_0)$  measures may be verbalized as “the probability of obtaining, by chance, agreement with the hypothesis of skill as good as that observed” (Fisher 1935, p.13). Although Fisher rejected the implication that by “disproving” the null hypothesis one “demonstrates” the alternative (p. 16), he also says that “we should admit that the lady had made good her claim” (p. 14) if she classified all eight cups correctly. He argues that one can (effectively) disprove the null hypothesis because it is “exact,” while the alternative of skill is vague. However, this does not preclude one from adopting the natural view of most researchers that a significant result is evidence in favor of the alternative hypothesis. The null hypothesis is then cast in the subtly different role of a fixed point of comparison that permits computation of the relevant chance probability (Rosenkrantz 1977, chapter 9).

This is, in fact, the logic of most nonparametric tests, the Wilcoxon rank sum test for comparing two treatments being paradigmatic (see Hodges and Lehmann 1970, §§12.3–12.4, especially p. 333). Table 2 compares the survival times (in years) following a heart attack of  $t = 6$  patients receiving a new treatment and  $s = 4$  controls receiving the standard treatment, with their ranks in parentheses.

**TABLE 2**

Treated	7.3 (4)	17.2 (1)	6.1 (6)	11.4 (3)	15.8 (2)	5.2 (7)
Controls	1.4 (9)	0.6 (10)	5.0 (8)	6.7 (5)		

The sum,  $W_t$ , of the ranks of the  $t$ -treated patients is a suitable test statistic, and under the null hypothesis that the new treatment is no better than the old, all  $\binom{10}{6} = 210$  assignments of ranks 1 through 10 to the six treated patients are equiprobable. Hence, the paucity of possible rank sums as small as the observed value,  $W_t = 1 + 2 + 3 + 4 + 6 + 7 = 23$ , measures the strength of the evidence, the smaller this proportion the stronger the evidence of improved efficacy. Since only three other possible rank sums are as small as the observed value of  $W_t$ , the relevant proportion is  $4/210 = .019$ , or about 2 percent.

This same form of argument also enjoys widespread currency in the sciences, as when an anthropologist maintains that certain cultural commonalities are too

numerous and striking to be ascribed to parallel development and point instead to contact between two civilizations, or when an evolutionist argues that the structural similarities between two organs that do not even perform the same function in two species are homologous and not merely analogous, hence indicative of common ancestry. Indeed, the rationale behind the principle of parsimony—that a phylogeny is more plausible if it requires fewer evolutionary changes—is this same piling up of otherwise improbable coincidences. And how improbable that various methods of reconstructing a phylogeny—for example, the ordering of fish, amphibians, reptiles, and mammals—based on the fossil record, homologies, serology, or DNA and protein sequencing should all agree if the phyla in question were separately created?

Fisher’s foremost contribution to the design of experiments, randomization, also fits this logic (Fisher 1935, pp. 17–21, 41–44, 62–66). If, for example, the treated subjects of Table 2 were all younger than the controls, they might be expected to live longer in any case. However if, after controlling for such plainly relevant differences, the patients were assigned at random to the two

groups, the chances are just one in  $\binom{s+t}{t}$  that all treated

subjects will share some hidden trait conducive to longevity that is lacking in the controls, thus removing any suspicion of selection bias. In addition, randomization underwrites the probability model of the experiment from which the sampling distribution of the chosen test statistic,  $W_T$ , is deduced (for a more leisurely discussion of randomization, see Hodges and Lehmann 1970, §12.1).

Since significance tests apply, on this reading, only when the likelihood function does not exist, they can be viewed as complements rather than alternatives to the methods of (B) or (L). Seen in this positive light, significance tests have a deeper Bayesian rationale. For the paucity of possible outcomes a model with zero or more adjustable parameters accommodates measures the support in its favor when the observed outcome belongs to this set (Rosenkrantz 1977, chapter 5). Echoing I. J. Good (who echoed Fisher), to garner support requires not just accuracy but improbable accuracy.

Moreover, the present formulation resolves many of the controversies that have swirled about significance testing (see Morrison and Henkel 1970), above all, the question whether a significant outcome with a small sample constitutes stronger evidence against null than one with a large sample (see Royall 1997, pp. 70–71). If, in

fact, the chance probability of agreement with the causal hypothesis of interest is the same in both cases, the evidence in favor of that causal hypothesis is also equally strong.

All these advantages notwithstanding, significant test results are still most widely viewed as evidence against the null hypothesis and, indeed, without reference to alternative hypotheses (see Fisher 1935, pp. 15–16; 1956, pp. 40–42; and for a critique of this viewpoint, Royall 1997, chapter 3). Thus, one classifies the observed outcome as evidence for or against  $h_0$  not by comparing its probability on  $h_0$  to its probability on alternative hypotheses but by comparing its probability on  $h_0$  with that of other possible outcomes.

### NEYMAN-PEARSON THEORY

In the late 1920s Jerzy Neyman and Egon S. Pearson (henceforth, NP) set forth a new approach to the testing of statistical hypotheses. Although initially presented as a refinement of Fisherian significance testing, NP actually addressed the different problem of testing one hypothesis against one or more alternatives in situations where the likelihoods do exist. In such cases, Fisher's practice, in accord with (L), was to compare the relevant hypotheses by their likelihoods. NP proposed, instead, to lay down in advance a rule of rejection, that is, a critical region  $R$  of the space of outcomes such that the tested hypothesis is rejected just in case the outcome actually observed falls in  $R$ .

In the simplest case of testing one point hypothesis,  $h_0 : \theta = \theta_0$  against another,  $h_1 : \theta = \theta_1$ , called simple dichotomy, one can err not only by rejecting  $h_0$  when it is true but also by accepting  $h_0$  when the alternative hypothesis,  $h_1$ , is true. Plainly, one cannot reduce both these error probabilities,

$$\alpha = P(X \in R | h_0)$$

and

$$\beta = P(X \notin R | h_1)$$

without increasing the sample size. NP's recommended procedure was to so label the hypotheses that rejecting  $h_0$  is the more serious error, fix  $\alpha$  at a tolerable level,  $\alpha_0$ , called the size or significance level of the test, and then among all tests of this size,  $\alpha \leq \alpha_0$ , choose the one that minimizes  $\beta$ , or, equivalently, maximizes the power  $1 - \beta$ . The test is thus chosen as the solution of a well-defined optimization problem, a feature modeled on Fisher's approach to estimation. The fundamental lemma of NP theory then affirms the existence of a unique solution,

that is, the existence of a most powerful test of a given size. Finally, test statistics could then be compared in terms of their power. The overall effect was to unify point estimation, interval estimation (confidence intervals), and testing under the broader rubric of "decision making under uncertainty," a viewpoint made explicit in the later work of Abraham Wald. In this scheme of things, estimates, confidence intervals, and tests are to be judged solely in terms of such performance characteristics as their mean squared error or their error probabilities. That is, arguably, the feature of the approach that continues to exercise the most powerful influence on the orthodox (i.e., frequentist) school (see Hodges and Lehmann 1970, chapters 11–13; de Groot 1986, chapter 7).

These developments occurred in such rapid succession that they have yet to be fully digested. NP had uppermost in mind massed tests like screening a population for a disease, testing a new drug, or industrial sampling inspection where the same practical decision, such as classifying a patient as infected or uninfected, must be faced repeatedly. For such situations, a reliable rule that controls for the probability of error seemed preferable to an explicitly (Bayesian) decision theoretic treatment that would require prior probabilities that the statistician could not base on any objective rule, as well as on loss or utility functions that would vary even more from one policy maker to another. To be sure, one might know the distribution of the proportion of defectives from past experience with a manufacturing process and be able to supply objective cost functions, but such cases would be uncommon.

But even in cases where an assembly line approach seems appropriate, NP's recommended procedure is open to question. If the more serious type 1 error is deemed, say, a hundred times more serious than the less serious type 2 error, should one not prefer a test whose probability of committing the more serious error is correspondingly less than its probability of committing the less serious error? In short, why not minimize the weighted sum,  $100\alpha + \beta$ ? After all, the result of fixing  $\alpha$  at some tolerable level, then minimizing  $\beta$ , might be to drive  $\beta$  much lower than  $\alpha$ , which is wasteful, or else to drive  $\beta$  so high as to render the test powerless. This point is not merely academic, for a random sample of some seventy-one clinical trials revealed that overemphasis on controlling type 1 error probability led to a 10 percent risk of missing a 50 percent therapeutic improvement (Good 1983, p. 144).

To minimize the total risk,  $a\alpha + b\beta$ , one finds, writing  $f_i(x) = P(X = x_i | h_i)$ ,  $i = 1, 2$ , that

$$\begin{aligned} a\alpha + b\beta &= aP(X \in R | h_0) + bP(X \notin R | h_1) \\ &= aP(X \in R | h_0) + b[1 - P(X \in R | h_1)] \\ &= b + \sum_{x \in R} [af_0(x) - bf_1(x)] \end{aligned}$$

Hence, the total risk is minimized by making  $af_0(x) - bf_1(x) < 0$  for all  $x \in R$ . Then  $h_0$  is rejected when

$$f_1(x):f_0(x) > a:b$$

which says: Reject  $h_0$  (in favor of  $h_1$ ) when the LR in favor of  $h_1$  exceeds the relative seriousness,  $a:b$ , of the two kinds of error. More advanced readers will recognize this as a Bayesian decision rule for the special case of constant regret functions, appropriate in situations where “a miss is as good as a mile,” and equal prior probabilities. In the general case, one may interpret  $a:b$  as the product of the prior odds by the ratio of the regrets. The fundamental lemma then drops out as an easy corollary (de Groot 1986, p. 444), where the most powerful test of size  $\alpha$  has critical region,  $R = \{x:f_1(x):f_0(x) > k\}$ , with  $k$  the least number for which  $P(X \in R|h_0) \leq \alpha$ . The main virtue of this approach, however, is that it allows one to adjust the sample size so as to achieve a tolerable level of overall risk. Roughly speaking, one goes on sampling until the marginal cost of one more item exceeds the marginal risk reduction.

NP’s decision theoretic formulation notwithstanding, users of statistical tests have continued to interpret them as evidence and to view NP tests as a refinement of Fisher’s significance tests. One reason for this is that NP continued to use the language of hypothesis testing, of accepting or rejecting hypotheses. A more important reason is that in many, if not most, scientific inquiries, practical decisions are nowhere in view. Even where questions of public policy impinge, as in the smoking-cancer or charter school controversies, it is deemed necessary to first weigh the evidence before deciding what policy or legislation to adopt. The tendency of NP is to subsume the individual test under a rule of specifiable reliability. Rejection of  $h_0$  at a 5 percent level does not mean that the probability is 0.05 that a type 1 error was committed in this case, much less that  $h_0$  has probability 0.05 given the outcome. The error probability refers to the procedure, not the result. However, this raises new concerns.

Consider a test of normal means of common (unknown) variance,  $\sigma^2$ ,  $h_0:\mu = \mu_0$  versus  $h_1:\mu = \mu_1$ . The optimal 5 percent test rejects  $h_0$  when  $\bar{x} \geq \mu_0 + 1.64\sigma/\sqrt{n}$ , where  $n$  is the sample size and  $\bar{x} = (x_1 + \dots + x_n)/n$  is the sample mean. For as Carl Friedrich Gauss first showed,

$\bar{x} \sim N(\mu, \sigma^2/n)$ , that is, the sample mean for independent and identically distributed normal variates,  $X_i \sim N(\mu, \sigma^2/n)$ , is normally distributed about their common mean,  $\mu$ , with variance,  $\sigma^2/n$ , or precision,  $n/\sigma^2$ ,  $n$  times that of a single measurement. For example, if  $\mu_0 = 0$ ,  $\mu_1 = \sigma^2 = 1$ , and  $n = 30$  so that  $\sigma^2/n = 0.18$ , then  $h_0$  is rejected when  $\bar{x} \geq .30$ . However,  $\bar{x} = .30$  is  $.70/.18 = 3.89$  standard deviation units below the mean of  $\mu = 1$  posited by  $h_1$ , and thus much closer to  $\mu_0 = 0$ . It is strange that such an observation should be interpreted as strong evidence against  $h_0$ . Indeed, the LR given a random sample of  $n$  measurements is:

$$\frac{(2\pi\sigma^2)^{-n/2} \prod \exp(-\frac{1}{2\sigma^2}(x_i - \mu_0)^2)}{(2\pi\sigma^2)^{-n/2} \prod \exp(-\frac{1}{2\sigma^2}(x_i - \mu_1)^2)} = \exp\{-\frac{1}{2\sigma^2} \sum [(x_i - \mu_0)^2 - (x_i - \mu_1)^2]\}$$

which, using  $\sum x_i = n\bar{x}$ , simplifies further to:

$$(4) \quad f_0 / f_1 = \exp\left\{\frac{n(\mu_1 - \mu_0)}{\sigma^2} \left(\bar{x} - \frac{\mu_0 + \mu_1}{2}\right)\right\}$$

And with the values chosen, this specializes at the boundary point,  $\bar{x} = 1.645\sigma/\sqrt{n}$ , to

$$f_0/f_1 = \exp(1.645\sqrt{n} - 0.5n)$$

which tends to zero as  $n \rightarrow \infty$ . Even at a modest  $n = 30$  one finds:

$$f_0/f_1 = \exp(1.645(\sqrt{30}) - 15) = 0.0025 = 1/400$$

or an LR in favor of the rejected  $h_0$  of roughly 400:1.

Thus, one has a recognizable subset of the critical region, namely outcomes at or near the boundary, which more and more strongly favor the rejected hypothesis. The 5 percent significance level is achieved by a surreptitious averaging, for the critical region is built up by incorporating outcomes that give LR’s greater than a critical value, starting with the largest LR and continuing until the size of the test is .05. Those first included give evidence against  $h_0$  stronger than the significance level indicates, but the last few included often favor  $h_0$ . Better disguised examples of this phenomenon drawn from actual frequentist practice are given in chapter 9 of Jaynes (1983, especially pp. 182f), a critical comparison of orthodox and Bayesian methods that focuses on actual performance. For other criticisms of NP along these lines, see Fisher (1959, chapter 4), and John Kalbfleisch and D.A. Sprott, both of which repay careful study.

It is clear as well that NP violates the LP. In the example of binomial versus negative binomial given earlier,

Jay's most powerful 5 percent test of  $h_0:p = 1/4$  against  $h_1:p = 3/4$  rejects  $h_0$  when  $X \geq 12$  successes occur in the  $n = 30$  trials, while May's best 5 percent test rejects  $h_0$  when  $n_0 \leq 29$ , that is, when the twelfth success occurs on or before the twenty-ninth trial. Hence, they reach opposite conclusions when Jay records twelve successes and May obtains the twelfth success on the thirtieth trial. Notice, too, the outcomes 12 and 13 of Jay's experiment both favor  $h_0$ , even though the error probabilities of Jay's test are eminently satisfactory, with  $\alpha \leq .05$  and  $\beta = .0001$ .

In keeping with the LP, it seems perfectly permissible to stop sampling as soon as the accumulated data are deemed sufficiently strong evidence for or against the tested hypothesis. This is, after all, the idea behind Wald's extension of NP theory to sequential tests (see Hodges and Lehmann 1970, §6.10). Could it really make a difference whether one had planned beforehand to stop when the sample proportion of defectives exceeds B or falls below A or decided this on the spur of the moment? To continue sampling till the bitter end in keeping with a preset sample size may place experimental subjects in needless jeopardy or even cause their death (for a chilling real-life example, see Royall 1997, §4.6). Thus, the ongoing debate over optional stopping raises serious ethical, as well as methodological, concerns.

(B) and (L) also permit enlarging a promising study to solidify the evidence, but because this can only increase the type 1 error probabilities, NP disallows it. This further points to the need to separate the presampling design of an experiment from the postsampling analysis of the resulting data.

But what about the fraud who resolves to go on sampling until some targeted null hypothesis is rejected? The reply to this objection to optional stopping is that while such deception is, indeed, possible using standard NP tests, for the power of such a test, as illustrated earlier, approaches one as the sample size increases, the chances of such deception using a likelihood criterion are remote. Using the familiar mathematics of gambler's ruin (de Groot 1986, §2.4), one can show, for example, that the probability of achieving an LR of 32 in favor of a cure rate of 75 percent for a new drug against the 25 percent rate of the drug currently in use, which requires an excess of  $s - t \geq 4$  cures over noncures, is given by:

$$\frac{(q/p)^m - 1}{(q/p)^{m+4} - 1} = \frac{3^m - 1}{3^{m+4} - 1}$$

with  $q = 1 - p$ , which increases rapidly to its limit of  $1/81$  as  $m \rightarrow \infty$ .

In espousing an evidential interpretation of NP, Egon S. Pearson speaks of "a class of results which makes us more and more inclined . . . to reject the hypothesis tested in favor of alternatives which differ from it by increasing amounts" (1966, p. 173). Deborah G. Mayo, who defends an evidential version of NP, remarks that "one plausible measure of this inclination is the likelihood" (1996, p. 389), but Pearson rejects this on the grounds that "if we accept the criterion suggested by the method of likelihood it is still necessary to determine its sampling distribution in order to control the error involved in rejecting a true hypothesis" (quoted by Mayo 1996, p. 393). What Pearson, Mayo, and others fail to appreciate, however, is the possibility of retaining the law of likelihood while still assessing and controlling beforehand the probability of obtaining misleading results.

If a LR,  $L = f_1/f_0$  greater than  $L^*$  is accounted strong evidence in favor of  $h_1$  against  $h_0$ , then one may compute  $P(f_1/f_0 \geq L^* | h_0)$  as readily as one computes  $\alpha = P(X \in R | h_0)$ , and in place of  $\beta = P(X \notin R | h_1)$  one may compute  $P(f_1/f_0 < L^* | h_1)$ , which is the probability of misleading evidence against  $h_1$ . (It should be emphasized that it is the evidence itself that is misleading, not one's interpretation of it.)

An important general result, noted independently by C. A. B. Smith and Alan Birnbaum, affirms that the probability of obtaining an LR of at least  $k$  in favor of  $h_0$  when  $h_1$  holds is at most  $1/k$ :

$$(5) \quad P(f_1/f_0 \geq k | h_0) \leq k^{-1}$$

For if  $S$  is the subset of outcomes for which the LR is at least  $k$ , then

$$P(L \geq k | h_0) = \sum_{x \in S} P(x | h_0) \leq k^{-1} \sum_{x \in S} P(x | h_1) \leq k^{-1}$$

Naturally, this universal bound can be considerably sharpened in special cases, as in the example of a would-be fraud. A specially important case is that of testing hypotheses about a normal mean of known variance with LR given by (4). If the distance  $\Delta = |\mu_1 - \mu_0|$  is measured in units of the standard deviation of  $\bar{x}$ ,  $\Delta = c\sigma/\sqrt{n}$ , one finds:

$$f_1 / f_0 \geq k \Leftrightarrow n \frac{\Delta}{\sigma^2} \left( \bar{x} - \frac{\mu_0 + \mu_1}{2} \right) \geq \ln k$$

$$\Leftrightarrow \bar{x} \geq \frac{\sigma^2}{n\Delta} \ln k + \frac{\mu_0 + \mu_1}{2}$$

$$\Leftrightarrow \frac{\bar{x} - \mu_0}{\sigma / \sqrt{n}} \geq \frac{\ln k}{c} + \frac{c}{2}$$

whence

$$P(f_1 / f_0 \geq k | h_0) = 1 - \Phi\left(\frac{\ln k}{c} + \frac{c}{2}\right) = \Phi\left(-\frac{c}{2} - \frac{\ln k}{c}\right)$$

with  $\Phi(x)$  the (cumulative) normal distribution. Hence, the probability of misleading evidence in this case is a maximum when  $c/2 + \ln k/c$  is a minimum. By calculus this happens when  $c = \sqrt{2 \ln k}$ , in which case  $c = c/2 + \ln k/c$ . Thus,

$$(6) \quad \max P(f_1 / f_0 \geq k | h_0) = \Phi(-\sqrt{2 \ln k})$$

For example, for  $k = 8$ ,  $\Phi(-\sqrt{2 \ln 8}) = .021$ , while for  $k = 32$ ,  $\Phi(-\sqrt{2 \ln 32}) = .0043$ , which improve considerably on the universal bounds of  $1/8$  and  $1/32$ . In fact, the ratio,  $\Phi(-\sqrt{2 \ln k})/k^{-1}$  is easily seen to be decreasing, so that the relative improvement over the universal bound is greater for larger  $k$ . Royall (1997) greatly extends the reach of (6) by invoking the fact that the log-likelihood is asymptotically normal about its maximum (the ML estimate of the parameter) with precision given by the Fisher information, with an analogous result for the multiparameter case (Lindley 1965, §7.1; Hald 1998, p. 694).

The upshot is that one can retain the law of likelihood and the likelihood principle and still control for the probability of misleading evidence, the feature that lent NP so much of its initial appeal. This “Royall road” opens the way to further reconciliation of (F) with (B) and (L) and to the removal of many perplexing features of NP significance tests (Royall 1997, chapter 5). In retrospect, one sees that the significance level was made to play a dual role in NP theory as both an index of the evidence against null (Fisher’s interpretation) and the relative frequency of erroneous rejections of the tested hypothesis. Fisher vigorously rejected the latter interpretation of significance levels and offered a pertinent counterexample (1956, pp. 93–96). He even says, “[T]he infrequency with which, in particular circumstances, decisive evidence is obtained, should not be confused with the force, or cogency, of such evidence” (p. 96).

NP’s ban on optional stopping as well as on what Pearson brands “the dangerous practice of basing the choice of test . . . on inspection of the observations” (1966, p. 127) is rooted in a conception of testing as subsumption under a reliable rule. One’s particular experiment is viewed as one trial of a repeatable sequence of identical experiments in which the considered hypotheses

and a division of the outcomes into those supporting and those not supporting the tested hypothesis are specified in advance (compare Fisher 1956, pp. 81–82, who rejects this formulation in no uncertain terms). Thus, it is considered cheating to publish the error probabilities computed for a *post facto* test as if that test had been predesignated. See Mayo (1996, chapter 9) for numerous statements and illustrations of this stance, especially when she maintains, “Using the computed significance level in post-designated cases . . . conflicts with the intended interpretation and use of significance levels (as error probabilities)” (p. 317). Most textbooks are curiously silent on this issue (see Hodges and Lehmann 1970, chapters 11, 13; de Groot 1986, chapter 8), but Mayo’s strictures seem to be widely shared by users of statistical tests. The question is whether a statistician, even an orthodox statistician, can function within the confines of such a strict predesignationism.

From Fisher on, modern statisticians have emphasized the importance of checking the assumptions of one’s model, and, of course, these are not the object of one’s test. Moreover, the most sensitive test of such common assumptions as independence, normality, or equality of variances, is often suggested by the deviations observed in one’s data, thus violating Pearson’s proscription. But, ironically, the most telling counterexamples come from the bible of NP theory, Erich Lehmann’s classic, *Testing Statistical Hypotheses* (1959, p. 7). In testing a hypothesis about a normal mean of unknown variance, one cannot tell how large a sample is needed for a sharp result until one has estimated the variance. Or, again, if  $X$  is uniformly distributed in a unit interval of unknown location, one can stop sampling if the first two observations are (very nearly) a unit distance apart, but if the first  $n$  observations all lie within a tiny distance of each other, no more has been learned than the first two observations convey and one must go on sampling. In these workaday examples of Lehmann’s, optional stopping is not optional; it is the only option.

Obviously, the issue just raised has strong links to the philosophy of science that holds that “evidence predicted by a hypothesis counts more in its support than evidence that accords with a hypothesis constructed after the fact” (Mayo 1996, p. 251). It would be digressive to enter into this issue here, so one must refer to Mayo (chapter 8) for further discussion and references, and to Stephen G. Brush (1994).

GOODNESS-OF-FIT TESTS

Karl Pearson’s goodness-of-fit test (de Groot 1986, §§9.1–4; Hodges and Lehmann 1970, §11.3) rejects a multinomial model  $h_0$  of categorical data when the deviation between observed ( $n_i$ ) and predicted category counts ( $np_i$ ) is improbably large conditional on  $h_0$ . The measure of deviation employed by Pearson is the chi-squared measure:

$$(7) \quad X^2 = \sum_{i=1}^k \frac{(n_i - np_i)^2}{np_i} = n \sum_{i=1}^k \frac{(f_i - p_i)^2}{p_i}$$

with  $f_i = n_i/n$ . Pearson showed that if  $h_0$  is true,  $X^2$  has, asymptotically, a chi-squared distribution with  $\nu = k - 1$  degrees of freedom. The mean and variance are  $\nu$  and  $2\nu$  and a rule of thumb is that roughly 90 to 95 percent of the probability mass of the chi-squared distribution lies to the left of the mean plus two standard deviations. These and other mathematically convenient features are, essentially, the only thing that recommends this particular measure of deviation (see the two texts just cited and Jaynes 2003, p. 299).

On the surface, Pearson’s chi-squared test appears to test the goodness-of-fit of a model without reference to alternatives. (B) offers a less well known test whose rationale is best brought out by considering Jaynes’s example of a thick coin (2003, p. 300) that may land on its edge with a probability of .002 and is otherwise balanced ( $h_0$ ). In  $n = 29$  tosses,  $D = (n_1, n_2, n_3) = (14, 14, 1)$  is observed, that is, the coin lands on its edge once and lands heads and tails equally often, in an almost “best possible” agreement with  $h_0$ . However,  $X^2 = 15.33$ , which is more than seven standard deviations beyond the mean of 2. Defenders of the test will be quick to point out that the chi-square approximation to the distribution of  $X^2$  breaks down when one or more of the expected counts is less than 5, but that is not the problem here. For one can use brute force to compute  $P(X^2 \geq 15.33|h_0)$  exactly, since the only outcomes that give a smaller value of  $X^2$  are  $(l, 29 - l, 0)$  and  $(29 - l, l, 0)$  with  $4 \leq l \leq 14$ . The sum of their probabilities on  $h_0$  is 0.9435, whence  $P(X^2 \geq 15.33|h_0) = 0.0565$ . Hence, Pearson’s test just fails by a whisker to reject  $h_0$  at the 5 percent significance level conventionally associated with strong evidence against  $h_0$ . The source of the trouble is that  $X^2$  wrongly orders the possible outcomes; some accounted less deviant than  $(14, 14, 1)$  are actually less probable on  $h_0$ . Ideally, outcomes less probable on  $h_0$  should be accounted more deviant.

Given data  $D = (n_1, \dots, n_k)$ , one might ask a somewhat different question than the one Pearson asked,

namely: How much support is apt to be gained in passing to some alternative hypothesis? For as Fisher and others emphasize, before rejecting a model as ill fitting one should attempt to find a plausible alternative that fits the data better. Plausibility aside, there is always one alternative hypothesis—call it the tailored hypothesis—that fits  $D$  better than  $h_0$  by positing the observed relative frequencies,  $f_i = n_i/n$ , as its category probabilities. In effect, one wants to test the given model against the ideally best-fitting alternative, and this prompts one to look at the LR in favor of  $F = (f_1, \dots, f_2)$  against the probability distribution  $P = (p_1, \dots, p_2)$  of  $h_0$ , namely,  $\prod_{i=1}^k \frac{f_i^{n_i}}{p_i^{n_i}}$ , or, better,

at its logarithm,  $\sum_{i=1}^k n_i \ln(f_i / p_i)$ , which is additive in independent samples. This proves to be  $n$  times

$$(8) \quad H(F, P) = \sum_{i=1}^k f_i \ln(f_i / p_i)$$

which may be viewed as a measure of the nearness of  $F$  to  $P$ . Though (8) was used by Alan Turing and his chief statistical assistant, I. J. Good during World War II, Solomon Kullback, another wartime code breaker, was the first to publish a systematic treatment of its properties and applications to statistics, dubbing it discrimination information (see the entry on information theory). Since  $F$  is tailored to achieve perfect fit,  $H(F, P)$  sets an upper limit to how much one can improve the fit to the data by scrapping  $h_0$  in favor of a simple or composite alternative hypothesis (Jaynes 2003, pp. 293–297).

Happily,  $\psi = 2nH(F, P)$  is also asymptotically distributed as  $\chi_{k-1}^2$ , the chi-square variate with  $k - 1$  d.f. (degrees of freedom). This hints that Pearson’s  $X^2$  approximates  $\psi$  (Jaynes 1983, pp. 262–263). For example, Mendel’s predicted phenotypic ratios of  $AB:Ab:aB:ab = 9:3:3:1$  for a hybrid cross,  $AaBb \times AaBb$ , gave rise to counts of 315, 101, 108, and 32 among  $n = 556$  offspring. This gives  $X^2 = .4700$  and  $\psi = .4754$ . But when the expected category counts include a small value or the deviations are large, the approximation degrades, and with it the performance of Pearson’s test. Thus, in Jaynes’s (2003) thick coin example,  $X^2$  rates the outcomes  $(l, 29 - l, 0)$  and  $(29 - l, l, 0)$  for  $4 \leq l \leq 8$  as less deviant than  $(14, 14, 1)$  even though they are also less probable on  $h_0$ ; by contrast,  $\psi$  errs only in failing to count  $(9, 20, 0)$  and  $(20, 9, 0)$  as less deviant than  $(14, 14, 1)$ . Hence, the exact probability that  $\psi$  is less than its value of 3.84 at  $(14, 14, 1)$  is twice the sum of the probabilities (on  $h_0$ ) of the outcomes  $(l, 29 - l, 0)$  for  $10 \leq l \leq 14$ , or 0.7640, whence  $P(\psi \geq 3.84|h_0) = .2360$ . Clearly,

the  $\psi$ -test gives no reason to believe support can be much increased by passing to an alternative hypothesis, but it will be instructive to carry the analysis a step further.

The only plausible alternative that presents itself is the composite hypothesis,  $H: p_1 = p_2 = \frac{1}{2}(1 - \theta)$ ,  $p_3 = \theta$  ( $0 < \theta < 1$ ), which includes  $h_0$  as the special case  $\theta = .002$ . Since one d.f. is lost for each parameter estimated from the data in using Pearson's test (de Groot 1986, §9.2), this is one way of trading off the improved accuracy that results when a parameter is added against the loss of simplicity. It is insensitive, however, to whatever constraints may govern the parameters. A Bayesian treatment tests  $h_0$  against the composite alternative  $H - h_0$  (i.e.,  $H$  exclusive of the value  $\theta = .002$ ) and goes by averaging the likelihoods of the special cases of  $H - h_0$  against a uniform prior of  $\theta$  over its allowed range—unless more specific knowledge of  $\theta$  is available. (The affect is to exact a maximum penalty for the given complication of  $h_0$ .) On canceling the multinomial coefficient and using the beta integral (*v.s.*), the ratio of the likelihoods reduces to:

$$P(D | h_0) : P(D | H - h_0) = .499^{28} (.002) : \int_0^1 [\frac{1}{2}(1 - \theta)]^{28} \theta d\theta$$

$$= 30 \cdot 29 \cdot 2^{28} (.499^{28}) (.002) = 1.645$$

Thus, the data  $D = (14, 14, 1)$  favors  $h_0$  over the composite alternative, and this remains true, albeit less strongly, if one integrates, say, from 0 to 0.1. By contrast, the chi-square test favors  $H - h_0$  over  $h_0$  by mere dint of the fact that the composite hypothesis includes the tailored hypothesis as a special case, namely,  $\theta = 1/29$ , for then the value of  $X^2$  is zero. Thus, any complication of an original model that happens to include the tailored hypothesis will be preferred to the original model.

Notice, the parameter distribution must reflect only what is known before sampling. Unfortunately, more cannot be said about the different ways (F) and (L) handle the problem of trading off the improved accuracy gained in complicating a model, retaining the original model as a special case, against the loss of simplicity as compared to the Bayesian method just illustrated of averaging the likelihoods. For more on this, see Roger D. Rosenkrantz (1977, chapters 5, 7, and 11) and Arnold Zellner, Hugo A. Keuzenkamp, and Michael McAleer (2001) for other approaches.

**PROBABILITY AS LOGIC**

Bayesians view probability as the primary (or primitive) concept and induction or inference as derived (see Finetti 1938/1980, p. 194). They emphasize that their methods,

properly applied, have never been rejected on the basis of their actual performance (Jaynes 1983, chapter 9; 2003, p. 143). As a corollary, they maintain that the canons of scientific method and inductive reasoning have a Bayesian rationale, while this is vigorously contested by frequentists (e.g., Mayo 1996, chapters 3 and 11). In particular, Bayesians evolved a mathematical analysis of inductive reasoning with its source in the original memoir of Thomas Bayes that includes purported solutions of the notorious problem of induction by Laplace (see Hald 1998, chapter 15) and de Finetti (1937/1981), as well as the equally notorious paradoxes of confirmation (see Good 1983, chapter 11; Rosenkrantz 1977, chapter 2).

Plainly, one's view of statistics is highly colored by one's interpretation of probability. The approaches of Fisher, Neyman, and Pearson, as well as that of most (L) proponents, like Royall, are grounded in a frequency interpretation that equates probabilities with asymptotically stable relative frequencies. The criticisms of the frequency theory, nicely summed up by L. J. Savage (1954, pp. 61–62), are, first, that it is limited (and limiting) in refusing to treat as meaningful the probabilities of singular or historical events, or (in most cases) scientific theories or hypotheses, like the hypothesis that smoking causes lung cancer, and, second, that it is circular. The model of random independent (Bernoulli) trials considered earlier is often held to justify the definition of probability as a limiting relative frequency, but all that theorem does is assign a high probability to the proposition that the observed relative frequency will lie within any preassigned error of the true probability of success in a sufficiently long sequence of such trials.

Savage's criticism along these lines is more subtle. Bayes saw that a distinctly inverse or inductive inference is needed to infer probabilities from observed frequency behavior. Thus, even Bayesians, like Good or Rudolf Carnap, who admit physical probabilities, insist that epistemic probabilities are needed to measure or infer the values of physical probabilities. A more sophisticated view is that physical probabilities arise from the absence of microscopic control over the outcome of one's experiment (see the final section).

Modern Bayesians have sought deeper foundations for probability qua degree of belief and the rules governing it in the bedrock of consistency. It is not merely "common sense reduced to a calculus" (Laplace) but a "logic of consistency" (F. P. Ramsey). Needed, in particular, is a warrant for (2), for it is in Bayesian eyes the basic (not to say the "bayesian") mode of learning from experience. Epistemologists of the naturalist school seriously ques-

tion this, as when Ronald N. Giere contends that “there are many different logically possible ways of ‘conditionalizing’ on the evidence, and no *a priori* way of singling out one way as uniquely rational” (1985, p. 336). Rather than multiply one’s initial odds by the LR, why not by some positive power of the LR? At any rate, this marks a major parting of the ways in contemporary epistemology.

One Bayesian response has been to argue that alternatives to the usual rules of probability open one to sure loss in a betting context, to a so-called Dutch book. However, this justification imports strategic or game theoretic considerations of doubtful relevance, which is why Bruno de Finetti (1972), an early sponsor of the argument, turns, instead, to the concept of a proper scoring rule, a means of evaluating the accuracy of a probabilistic forecast that offers forecasters no incentive to announce degrees of prediction different from their actual degrees of belief. (It is rumored that some weather forecasters overstate the probability of a storm, for example, to guard against blame for leaving the citizenry unwarned and unprepared.) This move to scoring rules opens the way to a means-end justification of (2) as the rule that leaves one, on average, closest to the truth after sampling.

By far the most direct way of sustaining Ramsey’s declaration that “the laws of probability are laws of consistency” is that developed by the physicist Richard T. Cox (1946). Besides a minimal requirement of agreement with common sense, his main appeal is to a requirement of consistency (CON), that two ways of doing a calculation permitted by the rules must yield the same result. In particular, one must assign a given proposition the same probability in two equivalent versions of a problem.

In a nutshell, Cox’s argument for the product rule,  $P(AB|C) = P(A|BC)P(B|C)$ , from which (2) is immediate, exploits the associativity of conjunction.

First phase: Letting  $AB|C$  denote the plausibility of the conjunction  $AB$  supposing that  $C$ , show that  $AB|C$  depends on (and only on)  $A|BC$  and  $B|C$ , so that

$$(i) \quad AB|C = F(A|BC, B|C)$$

Moreover, by the requirement of agreement with qualitative common sense, the function  $F(x, y)$  must be continuous and monotonically increasing in both arguments,  $x$  and  $y$ .

Second phase: Using first one side then the other of the equivalence of  $(AB)D$  and  $A(BD)$ :

$$ABD|C = F(AB|DC, D|C) = F(F(A|BDC, B|DC), D|C)$$

$$ABD|C = F(A|BDC, BD|C) = F(F(A|BDC, F(B|DC, D|C))$$

leading by (CON) to the associativity functional equation first studied by Niels Henrik Abel in 1826:

$$(ii) \quad F(F(x, y), z) = F(x, F(y, z))$$

Cox solved (ii) by assuming that, in addition,  $F(x, y)$  is differentiable. An elementary approach sketched by C. Ray Smith and Gary J. Erickson (1990) based on functional iteration, due to J. Aczel, dispenses with this assumption and leads to the solution:  $w(F(x, y)) = w(x)w(y)$ , with  $w$  continuous and monotonic, hence to

$$(iii) \quad w(AB|C) = w(A|BC)w(B|C)$$

Third phase: Specializing (iii) to the cases where  $A$  is certain or impossible given  $C$ , one deduces that  $w(A|A) = 1$  and  $w(A|\bar{A}) = 0$  or  $\infty$ . But these two choices lead to equivalent theories, so one may as well assume that  $w(A|\bar{A}) = 0$  in line with the usual convention.

Cox (1946) gives a similar derivation of the negation rule.  $P(A) + P(\bar{A}) = 1$ , and in conjunction with the product rule just derived, this yields the sum rule as follows:

$$P(A \vee B | C) = 1 - P(\bar{A}\bar{B} | C)$$

$$= 1 - P(\bar{A} | \bar{B}C)P(\bar{B} | C)$$

$$= 1 - [1 - P(A | \bar{B}C)]P(\bar{B} | C)$$

$$= P(B | C) + P(A | \bar{B}C)P(\bar{B} | C)$$

$$= P(B | C) + P(\bar{A}\bar{B} | C)$$

$$= P(B | C) + P(A | C)[1 - P(B | AC)]$$

$$= P(A | C) + P(B | C) - P(AB | C)$$

Notice, Cox’s derivation is restricted to finite algebras of sets, though not to finite sample spaces.

Non-Bayesian methods (or surrogates) of inference, which *ipso facto* violate one or more of Cox’s desiderata, tend to break down in extreme cases. For example, unbiased estimates can yield values of the estimated parameter that are deductively excluded and frequentist confidence intervals can include impossible values of the parameter. A weaker but more general result to account for this affirms that one maximizes one’s expected score after sampling (under any proper scoring rule) with (2) in preference to any other inductive rule (Rosenkrantz 1992, p. 535). This optimality theorem, which seems to have many discoverers, affords a purely cognitive justification of (2) as the optimally efficient means to one’s cognitive end of making inferences that leave one as close to the truth as possible. This rationale has been extended by inductive logicians to the justification of more specialized

predictive rules that are seen as optimal for universes or populations of specifiable orderliness (see Festa 1993).

An interesting implication of the optimality theorem is that it pays to sample, or that informed forecasts are better than those that lack or waste given information. To see this, compare (2) to the impervious rule that fixes updated probabilities at their initial values. Moreover, since the utility scoring rule,  $S(R, h_i) = U(a_{R_i}, h_i)$ , is proper, where  $a_R$  maximizes expected utility against the probability distribution,  $R = (r_1, \dots, r_n)$ , over states of nature, one can expect higher utility after sampling as well, a result first given by Good (1983, chapter 17). Thus, both cognitive and utilitarian ends are encompassed.

The optimality theorem presents Bayesian conditioning as the solution of a well-defined optimization problem, thus connecting it to related results on optimal searching and sorting and continuing the tradition of Fisher, Neyman, Pearson, and Wald of viewing rules of estimation, statistical tests, and decision functions (strategies) as solutions of well-posed optimization problems.

### THE CONTROVERSIAL STATUS OF PRIOR PROBABILITIES

Objections to (B) center on the alleged impossibility of objectively representing complete ignorance by a uniform probability distribution (Fisher 1956, chapter 2; Mayo 1996, pp. 72ff; Royall 1997, chapter 8). For if one is ignorant of  $V$  (volume), then, equally, one is ignorant of  $D = 1/V$  (density), but a uniform distribution of  $V$  entails a nonuniform distribution of  $D$  and vice versa, since equal intervals of  $V$  correspond to unequal intervals of  $D$ , so it appears one is landed in a contradiction (for some of the tangled history of this charge of noninvariance, see Hald 1998, §15.6; Zabell 1988).

Bayesian subjectivists also deny that any precise meaning can be attached to ignorance (Savage 1954, pp. 64–66), but often avail themselves of uniform priors when the prior information is diffuse (e.g., Lindley 1965, p. 18). This affords a reasonably good approximation to any prior that is relatively flat in the region of high likelihood and not too large outside that region, provided there is such a region (or, in other words, that the evidence is not equally diffuse). For a precise statement, proof, and discussion of this so-called principle of stable estimation, see Ward Edwards, Harold Lindman and Leonard J. Savage (1965, pp. 527–534), as well as Dennis V. Lindley (1965, §5.2) for the important special case of sampling a normal population.

Bayesians have also used Harold Jeffreys's log-uniform prior with density

$$(9) \quad p(\theta|I_0) \propto \theta^{-1}$$

for a positive variate or parameter,  $\theta > 0$ , where  $I_0$  represents a diffuse state of prior knowledge. (9) is equivalent to assigning  $\ln \theta$  a uniform distribution, whence the name *log-uniform*. If  $\theta$  is known to lie within finite bounds,  $a \leq \theta \leq b$ , the density (9) becomes

$$(9a) \quad p(\theta)d\theta = \frac{1}{\theta \ln R_\theta}$$

where  $R_\theta = b/a$ , hence, the probability that  $\theta$  lies in a subinterval,  $[c, d]$  of  $[a, b]$  is given by:

$$(9b) \quad P(c \leq \theta \leq d | I_0) = \frac{\ln d - \ln c}{\ln b - \ln a}$$

It follows that  $\theta$  is log-uniformly distributed in  $[a, b]$  if and only if, for any integer  $k$ ,  $\theta^k$  is log-uniformly distributed in  $[a^k, b^k]$ , since

$$\begin{aligned} P(c \leq \theta^k \leq d | I_0) &= P(c^{1/k} \leq \theta \leq d^{1/k} | I_0) \\ &= \frac{\ln d^{1/k} - \ln c^{1/k}}{\ln b - \ln a} \\ &= \frac{\ln d - \ln c}{k[\ln b - \ln a]} \\ &= \frac{\ln d - \ln c}{\ln b^k - \ln a^k} \end{aligned}$$

This at once resolves the objection from the (alleged) arbitrariness of parameterization mentioned at the outset. For  $V$  (volume) is a positive quantity, hence, the appropriate prior is, not uniform, but log-uniform, and it satisfies the required invariance: all (positive or negative) powers of  $V$ , including  $V^{-1}$ , have the same (log-uniform) distribution.

Its invariance would be enough to recommend (9), but Jeffreys provided further justifications (for his interesting derivation of 1932, see Jaynes 2003, p. 498). He did not, however, derive (9) from a basic principle clearly capable of broad generalization (Kendall and Stuart 1967, p. 152). Nevertheless, his insistence that parameters with the same formal properties be assigned the same prior distribution hinted at a *Tieferlegung*. And while the leaders of the Bayesian revival of the 1950s, Savage, Good, and Lindley, did not find in Jeffreys's assorted derivations of (9) a principle definite enough to qualify as a postulate of

rationality, they did clearly believe that given states of partial knowledge are better represented by some priors than by others they denigrated as pig-headed (Lindley 1965, p. 18) or highly opinionated (e.g., Zbell 1988, p. 157). Such out-of-court priors might be highly concentrated in the face of meager information or import a dependence between two parameters (de Groot 1986, p. 405). There matters stood when Jaynes published his fundamental paper, “Prior Probabilities” in 1968 (chapter 7 of Jaynes 1983).

Bayesian subjectivists are as committed to consistency as Bayesian objectivists, and to assign different probabilities to equivalent propositions or to the same proposition in two equivalent formulations of a problem is to commit the most obvious inconsistency. Savage (1954, p. 57), for one, viewed it as unreasonable to not remove an inconsistency, once detected.

Consider a horse race about which one knows only the numbers—better, the labels—of the entries. Since the labels convey no information (or so one is assuming), any relabeling of the horses leads to an equivalent problem, and the only distribution invariant under all permutations of the labels is, of course, the uniform distribution. Thus reinvented as an equivalence principle, Laplace’s hoary principle of indifference is given a new lease on life: The vague notion of indifference between events or possibilities gives way to the relatively precise notion of indifference between problems (Jaynes 1983, p. 144). Two versions of a problem that differ only in details left unspecified in the statement of the problem are *ipso facto* equivalent (p. 144). In this restricted form Laplace’s principle can be applied to the data or sampling distributions to which (F) and (L) are confined as well as to the prior distributions on which (B) relies. Indeed, from this point of view, “exactly the same principles are needed to assign either sampling distributions or prior probabilities, and one man’s sampling probability is another man’s prior probability” (Jaynes 2003, p. 89).

Invariance also plays a leading role in frequentist accounts of estimation and testing (Lehmann 1959, chapter 6). In testing a bivariate distribution of shots at a target for central symmetry, Lehmann notes, the test itself should exhibit such symmetry, for if not, “acceptance or rejection will depend on the choice of [one’s coordinate] system, which under the assumptions made is quite arbitrary and has no bearing on the problem” (p. 213).

To see how the principle can be used to arrive at a sampling distribution, consider, again, Frank Wilcoxon’s statistic,  $W_t$ , for the sum of the ranks of the  $t$  treated subjects, with  $W_c$  the corresponding statistic for the  $c$  con-

trols, where  $t + c = N$ . Clearly, it is a matter of arbitrary convention whether subjects who show a greater response are assigned a higher or lower number as rank. In Table 2, the inverse ranks of the  $t = 8$  treated subjects are, respectively, 10, 13, 8, 11, 12, and 7, where each rank and its inverse sum to  $N + 1 = 14$ . This inversion of the ranks leaves the problem unchanged. On the null hypothesis,  $h_0$ , that the treatment is without affect, both  $W_t$  and the corresponding statistic,  $W'_t$ , for the sum of the inverse ranks, are sums of  $t$  numbers picked at random from the numbers 1 through  $N$ . Hence,  $W_t$  and  $W'_t$  have the same distribution, which we write as:

$$W_t \approx W'_t$$

This is the invariance step where the Jaynesian principle of indifference is applied. Furthermore, since  $W_t + W'_t = t(N + 1)$ , it follows that

$$E(W_t) = E(W'_t) = t \frac{N + 1}{2}$$

whence

$$W_t - t \frac{N + 1}{2} = - \left[ W'_t - t \frac{N + 1}{2} \right] \approx - \left[ W'_t - t \frac{N + 1}{2} \right]$$

which implies that  $W_t$  is symmetrically distributed about its mean. Next, recenter the distribution by subtracting the minimum rank sum of  $1 + 2 + \dots + t = t(t + 1)/2$  from  $W_t$ , that is, define:

$$U_t = W_t - t \frac{t + 1}{2}$$

and, similarly,

$$U_c = W_c - c \frac{c + 1}{2}$$

for the controls. Then both  $U_t$  and  $U_c$  range from 0 to  $tc$ , have mean  $\frac{1}{2}tc$ , and inherit the symmetry of  $W_t$  and  $W'_t$  about their mean, which suggests, but does not prove, that  $U_t \approx U_c$ . This follows from

$$W_c - c \frac{N + 1}{2} \approx W_t - t \frac{N + 1}{2}$$

using

$$W_c - c \frac{N + 1}{2} = - \left[ W'_t - t \frac{N + 1}{2} \right]$$

and the symmetry of  $W_t$ , while at the same time,

$$W_i - t \frac{N+1}{2} = U_i - \frac{tc}{2}$$

and

$$W_c - c \frac{N+1}{2} = U_c - \frac{tc}{2}$$

so that  $U_i - \frac{1}{2}tc \approx U_c - \frac{1}{2}tc$ , or  $U_i \approx U_c$ . Finally, from the common distribution of  $U_i$  and  $U_c$ , which is easily tabulated for small values of  $t$  and  $c$  using an obvious recurrence, and for large values using a normal approximation (Hodges and Lehmann 1970, chapter 12, especially p. 349), the distributions of  $W_i$  and  $W_c$ , with either convention governing the ranks, can be obtained.

Consider, next, Jaynes's (1983, p.126) derivation of the distribution of the rate parameter,  $\lambda$ , of the Poisson distribution (POIS):

$$p(n | \lambda, t) = e^{-\lambda t} \frac{(\lambda t)^n}{n!}$$

which gives the probability that  $n$  events (e.g., accidents, cell divisions, or arrivals of customers) occur in an interval of time of length  $t$ . Nothing being said about the time scale, two versions of the problem that differ in their units of time are equivalent. Then the times  $t$  and  $t'$  in the two versions are related by

(i)  $t = qt'$

so that corresponding pairs  $(\lambda, t)$  and  $(\lambda', t')$  satisfy  $\lambda t = \lambda' t'$ , or

(ii)  $\lambda' = q\lambda$

Indeed, (ii) is what defines  $\lambda$  as a scale parameter. Then  $d\lambda' = qd\lambda$ , that is, corresponding intervals of time also differ by the scale conversion factor. Hence, if  $f(\lambda)d\lambda$  and  $g(\lambda')d\lambda'$  are the probabilities of lying in corresponding small intervals,  $d\lambda$  and  $d\lambda'$ , then (step 1):

(iii)  $f(\lambda)d\lambda = g(\lambda')d\lambda'$

since one is observing the same process in the two time frames, or, using (ii),

(iv)  $f(\lambda) = qg(q\lambda)$

Now (step 2) invoke the consistency requirement to affirm that  $f = g$ , leading to the functional equation

$$f(\lambda) = qf(q\lambda)$$

whose (unique) solution (step 3) is readily seen to be  $f(\lambda) \propto 1/\lambda$ , the log-uniform distribution of Jeffreys. Thus, if all

one knows about a parameter is that it is a scale parameter, then consistency demands that one assigns it a scale-invariant distribution. Following Jaynes (2003, §17.3), it is instructive to compare the estimates of  $\lambda$  and powers thereof to which the log-uniform distribution leads with the unbiased estimates favored by frequentist theory.

Using the gamma integral,

$$\int_0^\infty \lambda^{k-1} e^{-\lambda} d\lambda = \Gamma(k) = (k-1)!$$

for integers  $k = 1, 2, 3, \dots$ , one sees that the rate parameter,  $\lambda$ , is also the mean and variance of POIS. Hence, the mean of any (integer) power of  $\lambda$  after observing  $n$  incidents in a chosen unit interval of time (used now in place of an interval of length  $t$ ) is given by:

$$E(\lambda^k) = \frac{(n+k)!}{n!}$$

In particular, the posterior mean of  $\lambda$  is  $n+1$ , that of  $\lambda^{-1}$  is  $n^{-1}$ , and that of  $\lambda^2$  is  $(n+2)(n+1)$ , so that the variance of the posterior distribution is equal to  $n+1$ , the same as that of  $\lambda$ , itself a kind of invariance. (F) favors using unbiased statistics (estimators) to estimate a parameter and then among them, choosing the one of minimum variance. That is, on the analogy to target shooting, one uses statistics centered on the bull's eye and most tightly concentrated there (Hodges and Lehmann 1970, chapter 8; de Groot 1986, §7.7). However, as Jaynes shows (2003, §17.3) this "nice property" is not so nice. For while the unbiased estimator of  $\lambda$  is  $n$ , which is reasonable and close to its (B) counterpart, the only unbiased estimator  $f(n)$  of  $\lambda^2$  when  $n$  is the number of incidents recorded in the unit of time, is

$$f(n) = n(n-1)$$

and  $f(n) = 0$  otherwise. Thus, when  $n = 1$  incident is observed, the unbiased estimate of  $\lambda^2$  is zero, which entails that  $\lambda = 0$ . That is, one is led to an estimate of  $\lambda^2$  that is deductively excluded by the observation. (It only gets better—or worse!—when one looks at higher powers of  $\lambda$ .) Moreover, no unbiased estimator of  $\lambda^{-1}$  exists. In essence, unbiased estimators are seen to be strongly dependent on which power of the unknown parameter one chooses to estimate, Bayes estimators (equating these with the mean of the posterior distribution) only weakly so.

It is also well known that, for any distribution, the sample variance,  $n^{-1} \sum_{i=1}^n (x_i - \bar{x})^2$ , is a biased estimator of

the population variance,  $\sigma^2$ , while  $(n-1)^{-1} \sum_{i=1}^n (x_i - \bar{x})^2$  is unbiased. If, however, one's goal is to minimize the mean-squared error,  $E_\theta[(\hat{\theta} - \theta)^2]$ , of one's estimate  $\hat{\theta}$  of  $\theta$  (de Groot 1986, p. 412), the avowed goal of (F), then it can be shown that the biased estimator,  $(n+1)^{-1} \sum_{i=1}^n (x_i - \bar{x})^2$ , of a normal population variance has, for every value of  $\sigma^2$ , a smaller MSE than either of the two cases of the class  $c \sum_{i=1}^n (x_i - \bar{x})^2$  given earlier (de Groot 1986, pp. 414–415).

Hence, the unbiased sample variance is dominated by a biased one; it is, in this precise sense of decision theory, inadmissible. Thus, the two leading (F) criteria of unbiasedness and admissibility are seen to conflict. This insight of Charles Stein's shows, too, that an unbiased estimator is by no means certain to have lower MSE than a biased one, for the MSE is a sum of two terms, the bias and the variance, and in the case at hand, the biased sample variance more than makes up in its smaller variance what it gives up in bias (for more on this, including the waste of information that often accompanies unbiased estimation, see Jaynes 2003, pp. 511ff).

If the density of a variate,  $X$ , can be written:

$$(10) \quad f(x | \mu, \sigma) = g\left(\frac{x - \mu}{\sigma}\right)$$

then  $\mu$  is called a location parameter and  $\sigma$  a scale parameter of the distribution. For changes in  $\mu$  translate the density curve along the x-axis without changing its shape, while changes in  $\sigma$  alter the shape (or spread) without changing the location. The exemplars are, of course, the mean and standard deviation of a normal distribution. Pretty clearly, Jaynes's derivation of the log-uniform distribution of a Poisson rate applies to any scale parameter (1983, pp. 125–127). That is the justification Jeffreys lacked, though anticipating it in his requirement that formally identical parameters should have the same distribution. The essential point is that not every transformation of a parameter leads to an equivalent problem. Even a subjectivist with no prior information about the population proportion  $p$  of some trait would balk at having his or her beliefs represented by a uniform prior of some high power of  $p$ .

Notice, the range of  $\ln \sigma$  for  $0 < \sigma < \infty$  is the whole real line, as is that of a uniform prior of a variate that can assume any real value. Such functions are, of course, non-integrable (nonnormalizable) and are termed *improper*. They cause no trouble—lead to a normalizable posterior

density—when the likelihood function tails off sufficiently fast, as it will when the sample information is non-negligible. In sampling a normal population of known precision,  $h = \sigma^2$ , a normal prior,  $N(\mu_0, h_0)$ , of the unknown mean,  $\mu$ , combines with the normal likelihood based on a random sample of size  $n$  to yield a normal posterior density,  $N(\mu_1, h_1)$  with precision given by  $h_1 = h_0 + nh$ , the sum of the prior and the sample precision, and mean:

$$(11) \quad \mu_1 = \frac{h_0 \mu_0 + nh \bar{x}}{h_0 + nh}$$

a precision-weighted average of the prior mean and the sample mean (Lindley 1965, §5.1; Edwards, Lindman, and Savage 1965, pp. 535–538). Small prior precision,  $h_0$ , represents a poverty of prior information about the mean, and letting it approach zero yields a uniform prior as a limiting case. Then the posterior mean,  $\mu_1$ , becomes the sample mean. This is a way of realizing Fisher's ideal of "allowing the data to speak for themselves" and can be applied in the spirit of the "jury principle" when the experimenter is privy to prior information not widely shared by the relevant research community. Priors that achieve this neutrality are termed *uninformative* or *reference priors* (see Loredo 1990, p. 119).

This example of closure—a normal prior combining with the (normal) likelihood to yield a normal postsampling distribution—is prototypic and one speaks of the relevant distribution as conjugate to the given likelihood function or data distribution. Other examples (de Groot 1986, pp. 321–327) include the beta:

$$f_\beta(p|a, b)dp = B(a, b)^{-1} p^{a-1} (1-p)^{b-1}$$

with  $B(a, b) = \int_0^1 p^{a-1} (1-p)^{b-1} dp = \frac{\Gamma(a)\Gamma(b)}{\Gamma(a+b)}$  and  $\Gamma(n) = (n-1)!$  when  $n$  is an integer, which combines with a binomial likelihood,  $L(p) = p^r (1-p)^s$ , to yield a beta posterior density,  $f_\beta(p|a+r, b+s)$ ; or, again, the gamma distribution with density

$$f_\gamma(\lambda | a, b)d\lambda = \frac{b^a}{\Gamma(a)} \lambda^{a-1} e^{-b\lambda}$$

which combines with a Poisson likelihood to yield a gamma posterior density (de Groot 1986, p. 323). In general, any (one-parameter) data distribution of the form:

$$(12) \quad f(x|\theta) = F(x)G(\theta)\exp[u(x)\phi(\theta)]$$

will combine with a prior of the form,  $p(\theta)I d\theta \propto G(\theta)^a \exp(b\phi(\theta))$ , to yield a density of the same so-called Koop-

man-Darmois form (Lindley 1965, p. 55). These are precisely the data distributions that admit a fixed set of sufficient statistics, namely, estimators of the unknown parameter(s) that yield the same posterior distribution as the raw data (Lindley 1965, §5.5; de Groot 1986, §6.7; or, for more advanced readers, Jaynes 2003, chapter 8).

The parameters of a conjugate prior represent a quantity of information. For example, for the beta prior,  $a + b$  may be the size of a pilot sample or a virtual sample. By letting these parameters approach zero, one obtains an uninformed prior in the limit that represents, so to speak, the empty state of prior knowledge. The log-uniform prior (9) of a normal variance can be obtained in this way from the conjugate chi-squared prior (Lindley 1965, §5.3, p. 32), thus complementing its derivation as the distribution of a scale parameter about which nothing else is assumed.

In all the cases considered, the improper prior arises as a well-defined limit of proper priors. When this finite sets policy, which Jaynes traces to Gauss, is violated, paradoxes result, that is, in Jaynesian parlance, “errors so pervasive as to become institutionalized” (2003, p. 485). Such paradoxes can be manufactured at will in accordance with the following prescription:

- (1) Start with a mathematically well-defined problem involving a finite set, a discrete or a normalizable distribution, where the correct solution is not in doubt;
- (2) Pass to a limit without specifying how the limit is approached;
- (3) Ask a question whose answer depends on how that limit is approached.

Jaynes adds that “as long as we look only at the limit, and not the limiting process, the source of the error is concealed from view” (p. 485).

Jaynes launches his deep-probing analysis of these paradoxes with the following exemplar, a proof that an infinite series,  $S = \sum a_n$ , converges to any real number  $x$  one cares to name. Denoting the partial sums,  $s_n = a_1 + a_2 + \dots + a_n$  with  $s_0 = 0$ , one has for  $n \geq 1$ :

$$a_n = (s_n - x) - (s_{n-1} - x)$$

and so the series becomes

$$S = (s_1 - x) + (s_2 - x) + (s_3 - x) + \dots$$

$$-(s_0 - s) - (s_1 - x) - (s_2 - x) - \dots$$

Since the terms  $s_1 - x, s_2 - x, \dots$  all cancel out, one arrives at  $S = -(s_0 - x) = x$ .

Apart from assuming convergence, the fallacy here lies in treating the series as if it were a finite sum. The nonconglomerability paradox, which purports to show that the average,  $P(A|I)$ , of a bounded infinite set of conditional probabilities,  $P(A|C_jI)$ , can lie outside those bounds, also turns on the misguided attempt to assign these probabilities directly on an infinite matrix rather than approaching them as well-defined limits of the same probabilities on finite submatrices (Jaynes 2003, §15.3). Jaynes goes on to consider countable additivity, the Borel-Kolmogorov paradox, which involves conditioning on a set of measure zero, and the marginalization paradoxes aimed at discrediting improper priors. These paradoxes have little to do with prior probabilities *per se* and everything to do with ambiguities in the foundations of continuous probability theory.

Leaving these subtle fallacies to one side, one can apply Jaynes’s policy of starting with finite sets and then passing to well-defined limits to another old chestnut, the water-and-wine paradox in which one is told only that the ratio of water (H) to wine (W) in a mixture lies between 1 and 2. Then the inverse ratio of wine to water lies between  $\frac{1}{2}$  and 1, and, in the usual way, a uniform distribution of one ratio induces a nonuniform distribution of the other. One can eliminate ambiguity, however, by quantizing the problem. There are, after all, just a finite number  $N$  of molecules of liquid, of which  $N_H$  are water molecules and  $N_W$  are wine molecules. Then the inequality,  $1 \leq N_H:N_W \leq 2$ , is equivalent to  $N_W \leq N_H \leq 2N_W$ , and so the admissible pairs  $(N_H, N_W)$  are:

$$\{(N_H, N - N_H) : \frac{1}{2}N \leq N_H \leq \frac{2}{3}N\}$$

Moreover, this remains true when one starts with the other (equivalent) version of the problem in which the given is the inequality,  $\frac{1}{2} \leq N_W:N_H \leq 1$ , governing the inverse ratio. One then assigns equal probabilities to these  $(\frac{2}{3} - \frac{1}{2})N = \frac{1}{6}N$  allowed pairs. Then to find, for example, the probability that  $\frac{1}{2} \leq N_W:N_H \leq \frac{3}{4}$ , one takes the ratio of the allowed pairs meeting this condition, which is equivalent to

$$\frac{1}{6}N \leq N_H \leq \frac{3}{4}N$$

to the total number,  $N/6$ , of allowed pairs to find, not  $1/2$ , but

$$\left(\frac{2}{3} - \frac{4}{7}\right) / \frac{1}{6} = \frac{2/21}{1/6} = \frac{4}{7}$$

which is surprisingly close to:

$$\frac{\ln \frac{3}{4} - \ln \frac{1}{2}}{\ln 1 - \ln \frac{1}{2}} = \frac{\ln 3 - \ln 2}{\ln 2} = .58496$$

Or, again, the probability that  $N_W:N_H$  lies between  $\frac{5}{8}$  and  $\frac{11}{16}$  is found to be  $23/52 = .442$ , which is close to  $(\ln \frac{11}{16} - \ln \frac{5}{8})/\ln 2 = .437$ . Thus, by assigning equal probabilities in a discrete version of the problem—the only invariant assignment—one appears to be led once more to the log-uniform prior.

Another familiar puzzle of geometric probability is Joseph Bertrand’s chord paradox, which asks for the probability that a chord of a circle of radius  $R$  drawn at random exceeds the side  $s = \sqrt{3}R$  of the inscribed equilateral triangle. Depending on how one defines “drawn at random,” different answers result, and Bertrand himself seems to have attached no deeper significance to the example than that “la question est mal posee.”

Like the water-and-wine example, this puzzle is more redolent of the faculty lounge than the laboratory, so following Jaynes (1983, chapter 8; 2003, §12.4.4), one can connect it to the real world by giving it a physical embodiment in which broom straws are dropped onto a circular target from a great enough height to preclude skill. Nothing being said about the exact size or location of the target circle, the implied translation and scale invariance uniquely determine a density:

$$(13) \quad f(r, \theta) = \frac{1}{2\pi r R}$$

for the center  $(r, \theta)$  of the chord in polar coordinates. And since

$$\int_{r_1}^{r_2} f(r, \theta) dr = (2\pi R)^{-1} \ln(r_2 / r_1)$$

it follows that annuli whose inner and outer radii,  $r_1$  and  $r_2$ , stand in the same ratio should experience the same frequency of hits by the center of a chord. With  $L = 2\sqrt{R^2 - r^2}$  the length of a chord whose center is at  $(r, \theta)$ , the relative length,  $x = L/2R$ , of a chord has the induced density:

$$(13a) \quad p(x)dx = \frac{x}{\sqrt{1-x^2}}$$

Finally, since  $L = \sqrt{3}R$  is the side-length of the inscribed equilateral triangle, the probability sought is:

$$\int_{\sqrt{3}/2}^1 p(x)dx = \frac{1}{2} \int_0^{\frac{1}{4}} u^{-1/2} du = \frac{1}{2}$$

with  $u = 1 - x^2$ .

All these predictions of Jaynes’s solution can be put to the test (for one such test and its outcome, see Jaynes 1983, p. 143). In particular, (13) tells one to which hypothesis space a uniform distribution should be assigned to get an empirically correct result, namely, to the linear distance between the centers of the chord and circle. There is no claim, however, to be able to derive empirically correct distributions *a priori*, much less to conjure them out of ignorance. All that has been shown is that any distribution other than (13) must violate one or more of the posited invariances. If, for example, the target circle is slightly displaced in the grid of straight lines defined by a rain of straws, then the proportion of hits predicted by that other distribution will be different for the two circles. However if, Jaynes argues (p. 142), the straws are tossed in a manner that precludes even the skill needed to make them fall across the circle, then, surely, the thrower will lack the microscopic control needed to produce a different distribution on two circles that differ just slightly in size or location.

The broom straw experiment, which readers are urged to repeat for themselves, is highly typical of those to which one is tempted to ascribe physical probabilities or objective chances, for example, the chance of 1/2 that the chord fixed by a straw that falls across the circle exceeds the side of the inscribed triangle. However, as Zabell (1988, pp. 156–157) asks, if there is a “propensity” or “dispositional property” present, of what is it a property? Surely not of the straws, nor, he argues, of the manner in which they are tossed. A skilled practitioner of these arts can make a coin or a die show a predominance of heads or sixes (see Jaynes 2003, chapter 10). Nor is it at all helpful to speak of identical trials of the experiment, for if truly identical, they will yield the same result every time. Zabell concludes that “the suggested chance setup is in fact nothing other than a sequence of objectively differing trials which we are subjectively unable to distinguish between.” However, one may well be able to distinguish between different throws of a dart in terms of how tightly one gripped it, for example, without being able to produce different distributions on slightly differing targets. It is the absence of such skill that seems to matter, and that feature of the chance setup is objective. On this basis, Jaynes is led to characterize the resulting invariant distribution as “by far the most likely to be observed experimentally in the sense that it requires by far the least skill” (1983, p. 133).

For a different example, consider the law of first digits. Naive application of the principle of indifference at the level of events leads to an assignment of equal proba-

bilities to the hypotheses,  $h_d, d = 1, 2, \dots, 9$ , that  $d$  is the first significant digit of an entry,  $X$ , in a table of numerical data. Nothing being said about the scale units employed, the implied scale invariance implies a log-uniform distribution of  $X$  with normalization constant,  $1/\ln 10$ , since  $a = 10^k \leq X < 10^{k+1} = b$  forces  $1 = \int_a^b \frac{dx}{x} = \ln(b/a) = \ln 10$  (which is independent of  $k$ ).

Hence,  $d$  is the first significant digit with probability:

$$(14) \quad p_d = \int_{da}^{(d+1)a} \frac{dx}{x \ln 10} = \frac{1}{\ln 10} \ln(1 + d^{-1}) = \log_{10}(1 + d^{-1})$$

so that  $p_1 = \log_{10} 2 = .301, \dots, p_9 = 1 - \log_{10} 9 = .046$ . Known earlier to Simon Newcomb, (14) was rediscovered in 1938, though not explained, by Frank Benford, who tested it against twenty tables ranging from the surface areas of rivers and lakes to the specific heats of thousands of compounds. Surprisingly, Benford found that (14) even applies to populations of towns or to street addresses, which are certainly not ratio scaled. The explanation lies in the recent discovery of T. P. Hill (1995) that “base invariance implies Benford’s law.” That is, (14) is invariant under any change of the base  $b > 1$  of the number system. Moreover, since scale invariance implies base invariance—but not conversely—the scale-invariant tables for which (14) holds are a proper subset of the base-invariant ones. Indeed, Hill derives a more general form of (14) that applies to initial blocks of  $k \geq 1$  digits of real numbers expressed in any base, namely:

$$(14a) \quad P\left(\bigcap_{i=1}^k \{D_b^{(i)} = d_i\}\right) = \log_b \left[ 1 + \left( \sum_{i=1}^k b^{k-i} d_i \right)^{-1} \right]$$

where  $D_b^{(i)}(x)$  is the  $i$ th significant digit of  $x$  in base  $b$ . For example, for base ten, and  $k = 2$ , the probability that the first two digits are 3 and 7 is  $\log_{10}[1 + (37)^{-1}] = .01158$ , while, as one may verify, the probability that the second digit is  $d$  is given by:

$$(14b) \quad \sum_{k=1}^9 p_{kd} = \sum_{k=1}^9 \log_{10}[1 + (10k + d)^{-1}]$$

Hill’s derivation of (14) is a beautiful and instructive exercise in measure theoretic probability, but the main point to register here is that (14) is not the chance distribution of any readily conceivable physical process or random experiment. One can be just as certain, though, that any list or table of numbers that violates (14) must yield different frequencies of first (second, . . .) digits when the

scale or number system is changed. More generally, the output of a deterministic process, like that which generates the digits of  $\pi$  or random numbers, for that matter, can be as random as one likes under the most stringent criterion or definition of randomness. These categories, so commonly contrasted, are not mutually exclusive. However, it is far from clear how to characterize an intrinsically random physical process in a way that is free of circularity and amenable to experimental confirmation (Jaynes 2003, §10.5). Jaynes views such random processes as mythic products of what he labels the “Mind Projection Fallacy.”

### BAYES EQUIVALENCE

Part of the motivation of the frequency theory was to develop objective means of assessing the evidence from an experiment, leaving readers of the report free to supply their own priors or utility functions. However, this ideal of separating evidence from opinion is unrealizable because, first, the support of a composite hypothesis or model with adjustable parameters depends on the weights assigned its various simple components, and, second, because of the presence of so-called nuisance parameters.

For an example of the former (Royall 1997, pp. 18–19), one can compare the hypothesis ( $H$ ) that the proportion  $p$  of red balls in an urn is either  $\frac{1}{4}$  or  $\frac{3}{4}$  with the simple hypothesis ( $k$ ) that  $p = \frac{1}{2}$ , given that a ball drawn at random is red. The bearing of this outcome is wholly dependent on the relative weights assigned the two simple components of  $H$ , namely,  $p = \frac{1}{4}$  and  $p = \frac{3}{4}$ . Or, again, how does drawing an ace of clubs bear on the hypothesis that the deck is a trick deck (fifty-two copies of the same card) versus the hypothesis that it is a normal deck? If one’s intuition is that a single card can tell one nothing, then one is implicitly assigning equal probabilities to all fifty-two components of the trick deck hypothesis, but if, for example, one has information that most trick decks are composed of aces or picture cards, then drawing that ace of clubs will favor (for one) the trick deck hypothesis by a factor ranging from 1 to 52.

In practice, (F) resorts to comparing two models by the ratios of their maximum likelihoods, as in the orthodox t-test for comparing two normal means (de Groot 1986, §8.6). This is often a good approximation to the Bayes factor, the ratio of average likelihoods, when the two models are of roughly equal simplicity (Rosenkrantz 1977, p. 99), but this practice is otherwise highly biased (in the colloquial sense) in favor of the more complicated hypothesis, as in the trick deck example.

An equally formidable bar to the separation of sample information and prior information is the presence of parameters other than the one of interest. In testing the equality of two normal means, the difference,  $\bar{x} - \bar{y}$ , of the sample means *means* different things depending on one's beliefs about the variances of the two populations. An even simpler example is random sampling of an urn of size  $N$  without replacement. If interest centers on the number  $R$  of red balls in the urn and  $N$  is also unknown, then an outcome,  $D = (n, r)$ , of  $r$  red in a sample of  $n$ , will mean different things depending on one's prior beliefs about the relationship, if any, between  $R$  and  $N$ . If, for example, extensive previous experience renders it almost certain that the incidence of a certain birth defect lies well below one in a thousand, then a sample of modest size in which such a defect occurs, for example,  $(n, r) = (500, 1)$ , tells one not merely that  $N \geq 500$ , the sample size, but (almost surely) that  $N \geq 1,000$ . Even so simple a problem as this appears to lie entirely beyond the scope of (F) or (L), but as Jaynes amply demonstrates, this shopworn topic of introductory probability-statistics courses takes on a rich new life when the inverse problem of basing inferences about  $N$  and  $R$  on observed samples is considered and different kinds of prior information are incorporated in the resulting data analysis (2003, chapters 3 and 6).

In general, (B) handles nuisance parameters by marginalization, that is, by finding the joint posterior density, say,  $p(\theta_1, \theta_2|DI)$  for the case of two parameters, and then integrating with respect to  $\theta_2$ :

$$p(\theta_1 | DI) = \int p(\theta_1, \theta_2 | DI) d\theta_2$$

the discrete analogue being  $P(A|DI) = \sum P(AB_i|DI)$  for mutually exclusive and exhaustive  $B_i$ 's. Thus, intuition expects that a more focused belief state will result when there is prior knowledge of  $\theta_2$  than when its value is completely unknown before sampling.

Consider the case of sampling a normal population when nothing is known about  $\theta_1 = \mu$  and  $\theta_2 = \sigma^2$ , so that their joint prior is the Jeffreys prior:

$$p(\theta_1, \theta_2|I) = p(\theta_1|I)p(\theta_2|I) = \theta_2^{-1}$$

while the (normal) likelihood is

$$L(\theta_1, \theta_2) = (2\pi\theta_2)^{-\frac{n}{2}} \exp\left[-\frac{1}{2\theta_2} \sum (x_i - \theta_1)^2\right] \\ \propto \theta_2^{-\frac{n}{2}} \exp[-\{vs^2 + n(\bar{x} - \theta_1)^2\} / 2\theta_2]$$

using the obvious identity,  $\sum (x_i - \theta_1)^2 = \sum (x_i - \bar{x} + \bar{x} - \theta_1)^2 = \sum (x_i - \bar{x})^2 + n(\bar{x} - \theta_1)^2$ , with  $s^2 = \sum_{i=1}^n (x_i - \bar{x})^2 / v$  and  $v = n - 1$ . Multiplying this by the prior yields the joint postsampling density

$$p(\theta_1, \theta_2 | DI) \propto \theta_2^{-\left(\frac{n-2}{2}\right)} \exp[-\{vs^2 + n(\bar{x} - \theta_1)^2\} / 2\theta_2]$$

up to a normalization constant. Then using

$$(*) \quad \int_0^\infty e^{-A/\theta} \theta^{-u} d\theta = \frac{\Gamma(u-1)}{A^{u-1}}$$

obtained from  $\Gamma(u) = \int_0^\infty x^{u-1} e^{-x} dx$  by the substitution,  $x = A/\theta$ , the marginal posterior density of  $\theta_1$  is:

$$p(\theta_1 | DI) \propto \int_0^\infty \theta_2^{-\left(\frac{n+2}{2}\right)} \exp[-\{vs^2 + n(\bar{x} - \theta_1)^2\} / 2\theta_2] d\theta_2 \\ \propto \{vs^2 + n(\bar{x} - \theta_1)^2\}^{-v/2}$$

using (\*) with  $A = vs^2 + n(\bar{x} - \theta_1)^2$  and  $u = (n + 2)/2$ , whence

$$p(\theta_1|DI) \propto (1 + t^2/v)^{\frac{1}{2}(v+1)}$$

with  $t = n^{1/2}(x - \theta_1)/s$ . To find the normalization constant, one integrates on the right using the substitution,

$$t = v^{1/2} \left[ \frac{x}{1-x} \right]^{1/2}, \text{ with } dt = \frac{1}{2} v^{1/2} x^{-1/2} (1-x)^{-3/2} dx \text{ and } 1 + \frac{t^2}{v} = \frac{1}{1-x} \text{ to obtain:}$$

$$2 \int_0^\infty (1 + t^2/v)^{-\frac{1}{2}(v+1)} dt = v^{1/2} \int_0^1 x^{-\frac{1}{2}} (1-x)^{\frac{v-1}{2}} dx \\ = v^{\frac{1}{2}} \Gamma\left(\frac{1}{2}\right) \Gamma\left(\frac{v}{2}\right) / \Gamma\left(\frac{v+1}{2}\right)$$

using the beta integral,

$$\int_0^1 x^{a-1} (1-x)^{b-1} dx = \Gamma(a)\Gamma(b) / \Gamma(a+b).$$

Hence, the posterior density of the mean, using  $\Gamma(1/2) = \sqrt{\pi}$ , is given by:

$$(15) \quad p(\theta_1 | DI) = \frac{\Gamma\left(\frac{v+1}{2}\right)}{\sqrt{\pi v} \Gamma\left(\frac{v}{2}\right)} \frac{1}{\left(1 + \frac{t^2}{v}\right)^{\frac{1}{2}(v+1)}}$$

which is the density of the t-distribution with  $\nu = n - 1$  degrees of freedom.

Thus, one has arrived in a few lines of routine calculation at the posterior (marginal) density of the mean when the variance is (completely) unknown. Were the variance known, the uniform prior of the mean leads, as was seen earlier, to a normal posterior distribution about the sample mean,  $\bar{x}$ , with variance  $\sigma^2/n$ , or in symbols:

$$n^{1/2}(\theta_1 - \bar{x})\sigma \sim N(0, 1)$$

while the result,  $n^{1/2}(\theta_1 - \bar{x})/s$ , of replacing the population s.d.,  $\sigma$ , by the sample s.d.,  $s$  when the former is unknown, has the t-distribution with  $\nu = n - 1$  d.f. The density (15) is, like the normal density, bell-shaped and symmetric, but has larger tails (i.e., does not approach its asymptote, the x-axis, as rapidly as the normal curve) and is thus less concentrated. For example, for  $\nu = 10$  degrees of freedom (d.f.), the 95 percent central region of the t-distribution is  $(-2.228, 2.228)$  while that of the normal is  $(-1.96, 1.96) \approx (-2, 2)$ . Thus, Bayesian updating confirms one's intuition that the postsampling belief function should be less concentrated when the variance is (completely) unknown than when it is known. Moreover, the t-distribution approaches normality rather rapidly as  $\nu \rightarrow \infty$ , and so the difference in the two states of prior knowledge is quickly swamped by a large sample. Already at  $\nu = 20$ , the 95 percent central region of (15) is  $(-1.98, 1.98)$ , which is almost indistinguishable from the normal.

Because of a mathematical quirk, (F) interval estimates (confidence intervals) for a normal mean with variance unknown are numerically indistinguishable from (B) interval estimates (credence intervals) obtained from the posterior density, although their interpretation is radically different. For a normal distribution, the sample mean,  $\bar{x}$ , and sample variance,  $s_n^2 = n^{-1} \sum_{i=1}^n (x_i - \bar{x})^2$ , are independent (for a proof, see de Groot 1986, §7.3). As the normal distribution is the only one for which this independence of sample mean and sample variance obtains, it may justly be called a quirk. One shows, next, that if  $Y \sim N(0, 1)$  and  $Z \sim \chi_{(n-1)}^2$ , then

$$X = \frac{Y}{\left(\frac{Z}{n}\right)^{1/2}}$$

has the t-distribution (15) with  $n$  degrees of freedom (§7.4). Now  $Y = n^{1/2}(\bar{x} - \mu)/\sigma \sim N(0, 1)$  is standard normal, and it can be shown (de Groot 1986, pp. 391–392) that  $Z = s_n^2 / \sigma^2 \sim \chi_{(n-1)}^2$ , hence

$$U = \frac{Y}{\left(\frac{Z}{n-1}\right)^{1/2}}$$

has the t-distribution with  $n - 1$  d.f. The crucial point is that  $\sigma^2$  cancels out when one divides  $Y$  by  $Z^{1/2}$  and so the distribution of  $U$  does not depend on the unknown variance. The nuisance is literally eliminated. Finally, (F) estimates of  $\mu$  can be obtained from the distribution of  $U$  since  $-c \leq U \leq c$  just in case  $\bar{x} - c\sigma'/\sqrt{n} \leq \mu \leq \bar{x} + c\sigma'/\sqrt{n}$ ,

writing  $\sigma' = \left(\frac{s_n^2}{n-1}\right)^{1/2}$ . Notice, however, the different interpretation. One thinks of  $(\bar{x} - c\sigma', \bar{x} + c\sigma')$  as a random interval that contains  $\mu$  with the specified probability, or long-run relative frequency in an imagined sequence of repetitions of the experiment.

The first thing that strikes one is how much more complicated this derivation of the sampling distribution of the relevant statistic is than the (B) derivation of the postsampling distribution (15) of  $\mu$ . Even the modern streamlined derivation given in de Groot's (1986) text occupies nearly ten pages. William Seeley Gossett guessed the distribution by an inspired piece of mathematical detective work (for some of the relevant history, see Hald 1998, §27.5). The first rigorous proof was given in 1912 by a bright Cambridge undergraduate named R. A. Fisher. Gossett began his 1908 paper by noting that earlier statisticians had simply assumed "a normal distribution about the mean of the sample with standard deviation equal to  $s/\sqrt{n}$ " but that for smaller and smaller samples "the value of the s.d. found from the sample . . . becomes itself subject to an increasing error, until judgments reached in this way may become altogether misleading" (Hald 1998, p. 665). Fisher never tired of extolling "Student" (Gossett's pen name) for his great discovery, as well he might, for it is safe to say that without it, the (F) approach to statistics would never have gotten off the ground. For (F) would not then have been able to address the inferential problems associated with sampling a normal population for the vital case of small samples of unknown precision.

In essence, the pre-Gossett practice of replacing  $\sigma$  in  $n^{1/2}(\bar{x} - \mu)/\sigma$  by its ML estimate,  $s_n$ , would be about the only option open to (F) or (L) if this nuisance parameter could not be eliminated. However, that is to treat the unknown parameter as if it were known to be equal to its estimated value—precisely what Gossett's predecessors had done. Complete ignorance of  $\sigma$  should result in a fuzzier belief state than when it is known (compare Roy-

all 1997, p. 158). The only remedy (L) offers (p. 158) when nuisance parameters really are a nuisance (and cannot be eliminated) is to use the maximum of the likelihood function taken over all possible values of the relevant nuisance parameter(s). However, this is to equate a model with its best-fitting special case, which is to favor the more complicated of two models being compared. Moreover, in the real world outside of textbooks, normal samples do not come earmarked “variance known” or “variance unknown.”

To borrow “Example 1” from Jaynes (1983, p. 157), the mean life of nine units supplied by manufacturer A is 42 hours with s.d. 7.48, while that of four units supplied by B is 50 hours with s.d. 6.48. (F) proceeds in such cases to test the null hypothesis that the two s.d.’s are equal using the F-test originated by Fisher (de Groot 1986, §8.8). When the null hypothesis is accepted, (F) then treats the two s.d.’s as equal and proceeds to a two sample t-test of the equality of the means (de Groot 1986, §8.9), which is predicated on the equality of the two (unknown) variances. In the present example, the hypothesis of equal s.d.’s is accepted at the 5 percent significance level, but then the two-sample t-test (unaccountably) accepts the hypothesis that the two means are equal at a 10 percent level. Jaynes calculates odds of 11.5 to 1 that B’s components have a greater mean life, and without assuming equality of the variances. Then he asks, “Which statistician would you hire?”

The (F) solution extends to the case where independent samples are drawn from two normal populations of unknown variance, provided the variances are known to be equal or to stand in a given ratio. However, when the variances are known (or assumed) to be unequal, (F) fragments into a number of competing solutions with no general agreement as to which is best (Lindley 1965, pp. 94–95; Kendall and Stuart 1967, pp. 139ff). W.-U. Behrens proposed a solution in 1929 that Fisher rederived a few years later using his highly controversial fiducial argument (see the entry on R. A. Fisher). As Harold Jeffreys points out (1939, p. 115), the Behrens solution follows in a few lines from (2) using the Jeffreys prior for the unknown parameters (also see Lindley 1965, §6.3).

However, what of the intermediate cases where the variances are not known to be equal (the two-sample problem) and not known to be unequal (the Behrens-Fisher problem). In his definitive treatment, G. Larry Bretthorst (1993) takes up three problems: (1) determine if the two samples are from the same normal population, (2) if not, find how they differ, and (3) estimate the mag-

nitude of the difference. Thus, if they differ, is it the mean or the variance (or both)?

Consider, once more, Jaynes’s example. Bretthorst finds a probability of 0.58 that the s.d.’s,  $\sigma_1$  and  $\sigma_2$ , are the same, given the sample s.d.’s of 7.48 and 6.48, the inconclusive verdict intuition expects. (F) is limited to an unnuanced approach where one or the other of these alternatives must be assumed. The posterior distribution Bretthorst computes is a weighted average of those premised on equal and unequal population variances and thus lies between them (Bretthorst 1993, p. 190, and figure 1). By marginalization, it yields a 72 percent probability that the parent means are different. The analysis is based on independent uniform and log-uniform priors for the means and variances truncated, respectively, at  $34 = 46 - 12$  and  $58 = 46 + 12$ , and at  $\sigma_L = 3$  and  $\sigma_H = 10$ . This is not just for the sake of greater realism but to ensure that the posterior density is normalizable (p. 191). Doubling the range of the means lowers the probability that the parent populations differ from 0.83 to 0.765, a change of roughly eight percent, while doubling the range of the s.d.’s makes about a 2 percent difference. Hence, the inference appears to be reasonably robust. Finally, the Bayesian solution smoothly extends the partial solutions (F) offers when the variances are unknown; the (F) solutions appear as the limiting cases of the (B) solution when the probability that the variances are equal is either zero or one. This makes it hard for an (F) theorist to reject the Bayesian solution.

The (F) solutions also correspond to (B) solutions based on an uninformative prior. This Bayes equivalence of (F) interval estimates or tests is more widespread than one might suppose (Jaynes 1983, pp. 168–171, 175), but is by no means universal. Generalizing from the case of known variances, it would seem to hold when sufficient estimators of the parameter(s) of interest exist, no nuisance parameters are present, and prior knowledge is vague or insubstantial.

Confidence intervals for a binomial success rate,  $\theta$ , are harder to construct than the CI’s for a normal mean because here the population variance,  $n\theta(1 - \theta)$ , depends on the parameter being estimated. The solution is to find for each value of  $\theta$ , values  $p_L(\theta)$  and  $p_H(\theta)$ , such that

$$P(p \geq p_L | \theta) = \frac{1}{2}(1 - \alpha)$$

and

$$P(p \leq p_H | \theta) = \frac{1}{2}(1 - \alpha)$$

as nearly as possible, where  $p$  is the proportion of successes in  $n$  trials. In other words, one finds a direct > 100(1

–  $\alpha$ )% confidence interval for  $p$  for each value of the unknown success rate  $\theta$ . Then the corresponding CI for  $\theta$  comprises all those values whose direct CI contains the observed proportion  $p$ . For an example ( $n = 20$ ) and a chart, see Kendall and Stuart (1967, pp. 103–105), whose obscure exposition makes this rather convoluted method seem even more mysterious. Plainly, finding such CI’s is an undertaking, involving round off errors and approximations. By contrast, the Bayesian posterior density, given in the original memoir of Bayes, based on the uniform prior of  $\theta$ , for  $r$  successes in  $n$  trials is

$$p(\theta | n, r) = \frac{(n+1)!}{r!(n-r)!} \theta^r (1-\theta)^{n-r}$$

with mean  $(r+1)/(n+2)$  and variance,  $f(1-f)/(n+3)$ , where  $f = r/n$ . Hence, the Bayesian credence intervals assume the simple form,

$$f \pm k \sqrt{\frac{f(1-f)}{n+3}}$$

where  $k$  is 1.645, 1.96, and 2.57 for the 90, 95, and 99 percent intervals (using the normal approximation to the beta distribution). Jaynes finds (1983, p. 171) these Bayesian intervals are numerically indistinguishable from the CI’s of the same confidence coefficient, leading him to wryly observe that the Bayesian solution Fisher denigrated as “founded on an error” delivers exactly the same interval estimates as the (F) solution at a fraction of the computational and mathematical effort. The reason for the equivalence is that, despite its great difference in motivation and interpretation, the (F) method of confidence intervals is based in this case on a sufficient statistic, the observed relative frequency  $f$  of success.

As Jaynes notes, the official doctrine of (F) is that CI’s need not be based on sufficient statistics (Kendall and Stuart 1967, p. 153), and, indeed, the advertised confidence coefficient is valid regardless. Bayesian credence intervals, being based on the likelihood function, automatically take into account all the relevant information contained in the data, whether or not sufficient statistics exist. Thus, (F) methods not based on a sufficient statistic must perforce be wasting information, and the result one expects, given the optimality theorem, is a degradation of performance. The point is that the data may contain additional information that leads one to recognize that the advertised confidence coefficient is invalid (Loredo 1990, p. 117). The next several examples illustrate this and related points in rather striking fashion.

For a simple example (de Groot 1986, p. 400), let independent observations  $X_1$  and  $X_2$  be taken from a uniform distribution on the interval,  $(\theta - \frac{1}{2}, \theta + \frac{1}{2})$ , with  $\theta$  unknown. Then if  $Y_1 = \min(X_1, X_2)$  and  $Y_2 = \max(X_1, X_2)$ , we have:

$$P(Y_1 \leq \theta \leq Y_2) = P(X_1 \leq \theta)P(X_2 \geq \theta) + P(X_2 \leq \theta)P(X_1 \geq \theta) \\ = \frac{1}{2} \cdot \frac{1}{2} + \frac{1}{2} \cdot \frac{1}{2} = \frac{1}{2}$$

Thus, if  $Y_1 = y_1$  and  $Y_2 = y_2$  is observed,  $(y_1, y_2)$  is a 50 percent CI for  $\theta$ . However, what if  $y_2 - y_1 \approx 1$ ? Then  $(y_1, y_2)$  is virtually certain to contain  $\theta$ ; indeed, one easily checks that it is certain to contain  $\theta$  when  $y_2 - y_1 \geq 1/2$ . Thus, one has a recognizable subset of the outcome space on which the 50 percent confidence coefficient is misleadingly conservative.

For an example of the opposite kind, where confidence is misplaced, one can turn to “Example 5” of Jaynes (1983, p. 172f). A chemical inhibitor that protects against failures wears off after an unknown time  $\theta$  and decay is exponential (with mean one) beyond that point, so that a failure occurs at a time  $x$  with probability

$$f(x|\theta) = \exp(\theta - x)h(x, \theta)$$

where  $h(x, \theta) = 1$  if  $\theta < x$  and is otherwise zero. Since this data distribution for  $n$  failure times factors as

$$f_n(x_1, \dots, x_n|\theta) = \exp[-\sum x_i][e^{n\theta}h(y_1, \theta)]$$

the factorization criterion (de Groot 1986, p. 358) shows that  $Y_1 = \min(X_1, \dots, X_n)$  is a sufficient statistic. (Intuitively, the least time to a failure contains all the information in the  $n$  recorded failure times relevant to the grace period of  $\theta$ .) With a uniform distribution of  $\theta$  (which enters here as a positive location parameter), the posterior density of  $\theta$  is proportional to  $\exp[n(\theta - y_1)]$  and yields for three observations,  $(X_1, X_2, X_3) = (12, 14, 16)$ , a 90 percent credence interval of  $11.23 > \theta > 12.0$ , in good accord with qualitative intuition. However, (F) doctrine directs one to an unbiased estimator, and the point of the example is to show what can happen when a CI is not based on a sufficient statistic. Since

$$E(X) = \int_{\theta}^{\infty} x e^{\theta-x} dx = \theta + 1$$

an unbiased estimator of  $\theta$  is given by  $\theta^* = n^{-1} \sum_{i=1}^n (X_i - 1)$ . Notice, however, that this can be negative for permitted (positive) failure times, even though  $\theta$  is necessarily nonnegative. The shortest 90 percent CI based on this statistic’s sampling distribution

(found by computer, using an approximation) is  $\theta^* - 0.8529 < \theta < \theta^* + 0.8264$ , or, since  $\theta^* = 13$  for the three observations,

$$12.1471 < \theta < 13.8264$$

This consists entirely of values deductively excluded by the data! By contrast, the CI based on the sufficient statistic, the least of the failure times, is indistinguishable from its (B) counterpart.

Thus, Fisher was right to insist that his fiducial intervals be based on sufficient statistics. But, unfortunately, sufficient statistics do not always exist. A famous example is provided by the Cauchy distribution (the special case,  $\nu = 1$ , of Gossett's t-distribution), with density:

$$f(x|\theta) = \frac{1}{\pi} \frac{1}{1+(x-\theta)^2}$$

with  $\theta$  a location parameter to be estimated. The Cauchy distribution has the peculiarity that the mean of any finite number of observations has the same (Cauchy) distribution as a single observation. Given, say, two observations,  $X_1$  and  $X_2$ , the sampling distributions of either one or their mean,  $\theta^* = \frac{1}{2}(X_1 + X_2)$ , are all the same, and so, if one's choice of estimator is to be guided solely by the sampling distributions of the candidates, as (F) doctrine dictates, then any of these statistics is as good as another for the purpose of estimating  $\theta$ . However, would anyone be willing to use just the first observation and throw away the second? Or doubt that their mean is a better estimator of  $\theta$  than either observation taken alone? In fact, the mean is the optimal Bayes estimator for any loss function that is a monotonically increasing function of the absolute error,  $|\hat{\theta} - \theta|$ , in the sense that it minimizes one's expected loss after sampling. (Lacking a prior for  $\theta$ , (F) lacks any such clear-cut criterion of optimality.) Now, besides their mean, the two observations provide further information in the form of their range or half-range,  $Y = \frac{1}{2}(X_1 - X_2)$ . Jaynes then calculates the conditional distribution of  $\theta^*$  given  $Y$ , from which he calculates the probability that the 90 percent CI contains The true value of  $\theta$  given the value of the half-range  $Y$  (1983, p. 279). The calculations show that for samples of small range, the .90 confidence coefficient is conservative: The CI for  $y \leq 4$  will cover the true  $\theta$  more than 95 percent of the time. However, for samples of wide range,  $y \geq 10$ , which comprise about 6.5 percent of the total, the CI covers  $\theta$  less than 12 percent of the time.

By abandoning the principle of being guided only by the sampling distribution, (F) can also avail itself of the

conditional distribution and base different estimates of  $\theta$  on different values of  $Y$ , choosing for each observed  $y$  the shortest CI that, within that  $y$ -subclass, covers the true  $\theta$  90 percent of the time. For samples of narrow range, this delivers much shorter intervals than the standard 90 percent CI, while for samples of wide range, it covers the true  $\theta$  more often with a join of two separate intervals. The resulting rule is uniformly reliable in never under or overstating its probability of covering the true  $\theta$ , but by now one will have guessed that the uniformly reliable rule is the Bayesian rule!

A recurring theme of Jaynes's writings is that the (F) devotees of error probabilities and performance characteristics have never bothered to investigate the performance of the Bayesian solutions they denigrate as "founded on an error" or to compare their performance with their own preferred solutions. (B) methods based on uninformed priors capture Fisher's desideratum of "allowing the data to speak for themselves" as evidenced by their agreement with (F) methods based on sufficient statistics. It is then rather an onerous thesis to maintain that they fail to do this in cases where (F) lacks a solution or where, as it has just been seen, the (F) solution not so based leads to palpably absurd results or misleading statements of confidence. One can also sometimes criticize a frequentist solution as equivalent to a Bayesian solution based on an absurdly opinionated prior (see Jaynes 1983, p. 103).

Jaynes explains why (F) methods inevitably waste information as follows, "Orthodoxy requires us to choose a single estimator,  $b(D) \equiv b(X_1, \dots, X_n)$ , before we have seen the data, and then use only  $b(D)$  for the estimation" (2003, p. 510). The observed value of this statistic then places one on a manifold (or subspace) of  $n$ -dimensional space of dimension  $n - 1$ . If position on this manifold is irrelevant for  $\theta$ , then  $b(D)$  is a sufficient statistic, but if not, then  $D$  contains additional information relevant to  $\theta$  that is not conveyed by specifying  $b(D)$ . (B) is then able to choose the optimal estimator for the present data set. The sampling distribution of  $b(D)$  is simply not relevant, since one is free to choose different estimators or different CI's for different data sets.

## INFORMED PRIORS AND ENTROPY

Of the many approaches to constructing uninformed priors, group invariance has been stressed because of its intimate ties to consistency. The same rationale underwrites a powerful extension of (2) to a more general rule of minimal belief change that goes by minimizing the cross-entropy deviation from an initial (pre) distribution among all those satisfying empirically given distribu-

tional constraints (see the entry on information theory). Recall, the cross entropy or discrimination information of a distribution  $P = (p_1, \dots, p_n)$  with respect to  $Q = (q_1, \dots, q_n)$  is defined by

$$H(P, Q) = \sum_{i=1}^n p_i \ln \left( \frac{p_i}{q_i} \right)$$

And when  $Q = (n^{-1}, \dots, n^{-1})$  is a uniform distribution, the rule (*MINXENT*) of minimizing cross entropy specializes to the rule (*MAXENT*) of maximizing the (Shannon) entropy,

$$H(P) = - \sum_{i=1}^n p_i \ln p_i$$

which is a measure of the uncertainty embodied in  $P$ . Entropy figures centrally in Claude Shannon’s mathematical theory of communication (information theory), and looks to be a fundamental concept of probability theory as well. Thus, sufficient statistics, informally defined as “preserving all the information in the data relevant to inferences about  $\theta$ ,” do actually preserve information in the sense of entropy (Jaynes 2003, §14.2). Also see Jaynes (§17.4) for further links between sufficiency, entropy, Fisher information, and the Cramer-Rao inequality.

When the psi-test discussed earlier leads one to expect a significant improvement in support by moving to an alternative (and possibly more complicated) model, *MINXENT* can lead one to it, as in the example of a biased die discussed in information theory entry. Thus, *MINXENT* literally enables one to carve a model out of empirically given measurements or mean values. Jaynes’s original (1957) application to equilibrium thermodynamics (Jaynes 1983, chapters 1–6) with later extensions to nonequilibrium thermodynamics (chapter 10, §D) remains the exemplar, but a veritable floodtide of additional applications to all areas of scientific research have since followed, as recorded in the proceedings of workshops on Bayesian and maximum entropy methods held annually since 1981. The inferential problems this opens to attack lie even further beyond the range of (F) or (L).

Moreover, many classical models like the exponential or Gaussian arise most naturally as maxent distributions. Thus, the exponential, with density,  $f(x|\theta) = \theta \exp(-\theta x)$ , is the maxent distribution of a positive continuous  $X$  of known mean; the normal (or Gaussian) that of a distribution whose first two moments are known. Jaynes (2003, p. 208) makes a serious case that this best accounts for the ubiquity of the Gaussian as a distribution of errors or noise, so that it is neither “an experimental fact” nor a

“mathematical theorem,” but simply the most honest representation of what is typically known about one’s errors, namely, their “scale” and that positive and negative ones tend to cancel each other.

*MAXENT* functions primarily, though, as a means of arriving at informed priors. The superiority of a Bayes solution will be more manifest, in general, when substantial prior knowledge is formally incorporated in the analysis. Research might disclose, for example, that horse 1 finished ahead of horse 2 in two-thirds of the races both entered. If that is all that is known, then one’s prior for tonight’s race must satisfy  $p_1 = 2p_2$ . (How should this information affect the odds on the other horses?) In the inventory example of Jaynes (2003, §14.7), successive pieces of information, bearing on the decision which of three available colors to paint the day’s run of 200 widgets so as to ensure twenty-four-hour delivery, are assimilated, starting with the current stocks of each color, the average number of each color sold per day, the average size of an individual order for each color, and so on. This is not just an amusing and instructive example of entropy maximization, but, evidently, one with serious practical applications.

At the other extreme of uninformative, the Bayesian econometrician Arnold Zellner has used entropy to define a maximal data informative prior (MDIP) as one that maximizes

$$\int I(\theta) p(\theta) d\theta - \int p(\theta) \ln p(\theta) d\theta$$

the difference between the average information in the data density and the (variable) prior density, where

$$I(\theta) = \int f(x|\theta) \ln f(x|\theta) d\theta$$

measures the information conveyed by the data density,  $f(x|\theta)$ . Such a prior also maximizes the expected log-ratio of the likelihood function to the prior density (for a number of examples and yet another derivation of the Jeffreys log-uniform prior, see Zellner and Min 1993).

To Lindley’s oft-repeated question, “Why should one’s knowledge or ignorance of a quantity depend on the experiment being used to determine it?” Jaynes answers that the prior should be based on all the available prior information and “the role a parameter plays in a sampling distribution is always a part of that information” (1983, p. 352). However, it should not depend on the size of the sample contemplated (pp. 379–382).

Apart from the satisfaction of seeing that variously motivated lines of attack all lead to the same priors in the best understood cases, like location or scale parameters or regression coefficients (for which see Jaynes 1983, pp. 195–196), different methods can be expected to generalize in different ways when harder problems are addressed. Obviously, there is room for much creative thought here in what might be described as the new epistemology, the endeavor to accurately represent whatever is known in probabilistic terms—what Jaynes calls “that great neglected half of probability theory.” Such research can be expected to further the development of artificial intelligence and the formation of consensus priors in decision theoretic or policymaking contexts.

#### SUMMARY: A BAYESIAN REVOLUTION?

Is the much heralded Bayesian revolution a *fait accompli*? In his account of scientific revolutions, Thomas Kuhn may have erred in some of the details but certainly convinced his readers that there is a pattern here, something to construct a theory of. That applies, in particular, to revolutionary theory change, the overthrow of an old paradigm in favor of the new. Brush (1994, p. 137) touches on several of the reasons that usually enter in speaking of the acceptance of wave mechanics. Based on what has been surveyed in this entry, Bayesians would lodge the following parallel claims:

- (B) offers simpler solutions to the salient problems of the old (F) paradigm
- (B) offers a unified approach to all inferential problems—indeed, to all three problems of evidence, belief, and decision mentioned at the outset
- (B) is able to pose and solve problems of obvious importance that lie beyond the range of (F) or (L), among them problems involving nuisance parameters and those amenable to MINXENT.

(B) also lays claim to greater resolving power in the detection of periodicities in time series or in separating periodicities from trends (Jaynes 2003, p. 125 and chapter 17).

(B) views (2) as embodying the entire logic of science. It has demonstrated that (2), as well as its extension to MINXENT, is anchored in the bedrock of consistency and that the price of inconsistency is inefficiency, the waste of information present in the data. Finally, (B) claims to be able to ascertain the limits of validity of the methods of (F) by viewing them as approximations to Bayesian methods. That, too, is highly characteristic of the claims a new paradigm lodges against the old. In any

case, many time-honored procedures of (F), like significance tests or chi-square tests, retain an honorable place in the Bayesian corpus as approximate Bayes procedures, and where the elements needed for a Bayesian solution are lacking, one may use Bayesian logic to find a useful surrogate.

Critics will allege that Bayesians have not solved the “problem of the hypothesis space,” namely, to which hypotheses should one assign probabilities? Jaynesians admit they have not solved this problem, but neither has anyone else. Jaynes’s point, rather, is that the only way to discover that we have not gone to a deep enough hypothesis space is to draw inferences from the one we have. We learn most when our predictions fail, but to be certain that failed predictions reflect inadequacies of our hypothesis space rather than poor reasoning, “those inferences [must be] our *best* inferences, which make full use of all the information we have” (Jaynes 2003, p. 326).

## STEBBING, LIZZIE SUSAN (1885–1943)

Lizzie Susan Stebbing, the English logician and philosopher, was born in London. A very delicate child, she received a discontinuous education until she went to Girton College, Cambridge, in 1906. While at Cambridge she happened to read F. H. Bradley's *Appearance and Reality*, which led to her interest in philosophy. She became a pupil of the logician W. E. Johnson. From 1913 to 1915 she lectured in philosophy at King's College, London; and she became a lecturer at Bedford College, London, in 1915 and a professor in 1933.

In London Stebbing's philosophical development was stimulated by the meetings of the Aristotelian Society, which were often attended by Bertrand Russell, A. N. Whitehead, and G. E. Moore; and she always acknowledged the philosophical influence of Moore as particularly strong. In 1931 she published *A Modern Introduction to Logic* and in 1937 *Philosophy and the Physicists*, which were by a considerable degree the most substantial of her books. She wrote numerous papers, the best of which are to be found in *Mind* and the *Proceedings of the Aristotelian Society*.

In philosophy Stebbing's main interests lay in the metaphysical questions posed by logic and in the foundations of science. Much of her work in these topics is contained in *A Modern Introduction to Logic*. The book's merit does not lie in any originality in formal logic, or even in its method of presenting formal structures, but rather in its clear exposition of the logical theories of the early twentieth century, together with a stimulating, lucid, perceptive account of the metaphysical problems

the new logical techniques either dispersed or clarified, and of the metaphysics that lay behind these logical theories. It was the first book on modern logic that introduced together and comprehensively both the formalism and its related philosophical problems. It is probably still the best introduction for a reader prepared to give serious thought to such problems.

In the professional journals Stebbing published papers on a range of topics closely related to those of *A Modern Introduction to Logic*, but her interests were not confined to such purely academic, though deeply absorbing, matters. She wrote several books on what one might call logic in practice. (Her book *Thinking to Some Purpose* is a good example both in its title and in its content.) She was strongly convinced of the importance of rationality and clarity in the conduct of human affairs and of the immense importance of knowledge. She attempted, therefore to expose the artifices by which hard facts are obscured in soft language, either so that the unscrupulous may deceive us or so that we may hide from ourselves what we do not wish to see. Her books in this field are especially valuable for their actual examples of irrationality and emotional persuasion in high places and on vital matters.

This commitment to rational clarity was combined with her more purely professional interests and skills in *Philosophy and the Physicists*. In the course of writing books with the ostensible aim of popularizing contemporary science, Sir James Jeans and Sir Arthur Eddington had argued that modern physics shows the world to be quite other than the sort of place it seems to be, not merely physically but also metaphysically. Both argued for idealist views of physics and, consequently, for a comfortable if imperfectly clear form of theism. In much of her book Stebbing exposed the fallacies, needless obscurities and mystifications with which the pages of Jeans and Eddington abound. *Philosophy and the Physicists* is an excellent piece of rational cool criticism, but a significant characteristic of the book is its implicit faith that we need not seek protection behind intellectual smoke screens and, indeed, that this sort of evasion prevents any really dignified adjustment to the human situation based on knowledge and reason. Stebbing deeply believed that such an adjustment is possible.

### **Bibliography**

Books by Susan Stebbing are *A Modern Introduction to Logic* (London: Methuen, 1931; 2nd ed., revised, London, 1933); *Philosophy and the Physicists* (London: Methuen, 1937); *Thinking to Some Purpose* (Harmondsworth, U.K.: Penguin, 1939); and *Ideals and Illusions* (London: Watts, 1941). The Aristotelian Society collected the material for *Philosophical Studies: Essays in Memory of L. Susan Stebbing* (London: Allen and Unwin, 1948), a volume of essays that contains an appreciation by John Wisdom and a full bibliography of Stebbing's writings.

## STEFANINI, LUIGI

(1891–1956)

Luigi Stefanini, the Italian personalist philosopher, taught at Messina and Padua. He was a founder of the Gallarate movement and the founder and first editor of the *Rivista di estetica*. Much of Stefanini's own philosophy is to be found in his work on the history of philosophy. He tried to demonstrate by careful historical analysis that authentic religious and metaphysical needs are adequately met by certain historical positions, especially those of St. Augustine and St. Bonaventure. His guiding principle, "paradigmatism," is of Platonic and Neoplatonic origin and may be stated thus: that which is created in the image of another (as is man) has as its constitutive imperative, or life vocation, the expression in itself of its transcendental model.

Stefanini professed in turn Christian idealism, spiritualism, and personalism. His Christian idealism was based on a critique of Giovanni Gentile's claim that the self generates the self and the world and hence is the paradigm of the world. Stefanini held that the self apprehends itself not as self-generating but as created and therefore has its paradigm in an other. Art is an immediate expression of that other and provides an approach to the Christian experience, in which the image of God in the human subject is remodeled on the higher paradigm of Christ.

Stefanini's spiritualism began in a critique of historicism, phenomenology, and existentialism. All of these, he claimed, divide the transcendental from the existential. He sought to heal this split by the analysis of the self. The self is not existence as given (*Dasein*) but existence that utters itself. The self is spirit, or word, and this word does not utter, but alludes to, the Absolute; in this way it reveals its dependence. The purest form of this allusion to the Absolute is the Word of God, Christ. The vocation of the Christian is to utter that Word in himself.

Stefanini called his most mature thought “personalism.” The self is central to every form of participation and is the only ultimate point of reference. But the self cannot sustain itself; it rests upon the other, and the transcendent is therefore the principle of the self’s being. The self realizes itself as a person by its relation to the transcendent. It seeks to realize the transcendent in itself according to the limits and form of its own being.

## STEFFENS, HENRICH

(1773–1845)

Henrich Steffens, the philosopher, scientist, and novelist and short-story writer was of Danish and German descent. He was born in Stavanger, Norway, the son of a physician in the service of the Dano-Norwegian monarchy. From 1790 to 1794 Steffens studied natural science, especially mineralogy and geology, in Copenhagen. He next studied natural history in Kiel, where he became interested in philosophy. In 1798 he moved to Jena, drawn not least by the natural philosophy of Friedrich von Schelling, whose *Erster Entwurf eines Systems der Naturphilosophie* had appeared in 1797. In Jena, Steffens met Schelling, Johann Wolfgang von Goethe, and August Schlegel; and in Berlin in 1799 he met Friedrich von Schlegel and Friedrich Schleiermacher.

In 1802 Steffens returned to Copenhagen to lecture on natural philosophy. Through his large audience he influenced the development of the romantic movement in Denmark, but he failed to obtain the university position he had hoped for, and in 1804 he accepted a chair in natural philosophy and mineralogy at the University of Halle. In 1811 he was appointed professor of physics in Breslau, where he remained, except for a brief period of service as a volunteer in the war against Napoleon Bonaparte in 1813–1814, until 1832. In that year Steffens became professor at Berlin, where he lectured on natural philosophy, anthropology, and geology until his death.

Steffens’s philosophy was markedly influenced by Benedict de Spinoza and by Spinozistic pantheism, as well as by Schelling. Schelling’s *Von der Weltseele, eine Hypothese der höheren Physik zur Erklärung des allgemeinen Organismus* (On the world-soul, a hypothesis of higher physics in explanation of the general organism) appeared in 1798, and in Steffens’s *Beiträge zur innern Naturgeschichte der Erde* (Contributions to the inner natural history of the earth; 1801) the influence of Schelling is readily discernible. The title of Schelling’s work gives an indication of the substance and trend of Steffens’s philosophical thinking; it is a blend of natural science and speculative philosophy imbued with the general spirit of the romantic movement, somewhat less speculative than that of Schelling.

Steffens viewed the history of nature as a development or evolution from inorganic stages to organic and animate forms, governed by a divine purpose. His pantheism found characteristic expression in the view that nature itself is creative, the acme of the natural creative process being the free individual human personality, or spirit. According to Steffens’s *Anthropologie* (1822) man is a living unity of spirit and nature—a microcosm, in the sense that the history of humankind mirrors the development of nature itself. He found in myths and mythological traditions a true, though symbolically expressed, understanding and knowledge of nature; however, he believed that a proper scientific study of nature was a necessary prerequisite for a correct interpretation of the meaning of myths.

## STEIN, EDITH

(1891–1942)

Edith Stein was born into a German Jewish family on October 12, 1891, on Yom Kippur, in the Silesian capital Breslau, Germany (after 1945, Wrocław, Poland). She was the youngest of eleven children, four of whom died in early childhood. Her father, Siegfried Stein (1844–1893), had a small trade with coals and wood and died too early for his youngest child to have any memory of him. Her mother, Auguste Stein, née Courant (1849–1936), was a matriarchal, warm-hearted woman who tried to educate her children in the traditional Jewish faith and in the celebration of the rituals. Nonetheless, the industrious and highly intelligent girl became an agnostic from her puberty onward and already in school became a champion of women's liberation.

After a brilliant performance on school examinations, she studied psychology with William Stern, philosophy with Richard Höningwald, along with German literature and history, at the Universität Breslau from 1911 to 1913. One can obtain a good sense of her feelings from that period, up to her doctorate in 1916 from the Albert-Ludwigs-Universität Freiburg, from her fragmentary autobiography *Life in a Jewish Family*, written in 1933 but first published in 1965. In 1913 Stein went to Göttingen to study under the famous founder of phenomenology, Edmund Husserl (1859–1938), and with his assistant Adolf Reinach (1883–1917), whose death in World War I affected her very deeply. In 1915 she worked as a Red-Cross nurse in an international soldiers' recovery hospital in Weißkirchen, Mähren (now located in the Czech Republic). After completing her state examinations, she followed Husserl to Universität Freiburg in 1916, where she completed her dissertation *On the Prob-*

*lem of Empathy* summa cum laude. From 1917 to 1918 she served as Husserl's private assistant, transcribing, ordering, and completing his manuscripts, preparing for publication his *Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy*, books 2 and 3, along with his *On the Phenomenology of the Consciousness of Internal Time*, later published in 1927 by Martin Heidegger.

Between 1918 and 1932 Stein attempted four times to qualify for a habilitation (the highest qualification in the German university), at the universities in Göttingen, Freiburg, Breslau, and Kiel, but she failed partly because she was female and partly because she was a Jew. During a deepening personal as well as academic crisis as her relationships with the phenomenologists Roman Ingarden and Hans Lipps weakened, she started studying classical Christian literature, especially St. Teresa of Ávila, as well as Martin Luther, Søren Kierkegaard, and St. Augustine. Her Catholic baptism on January 1, 1922, separated her in a painful way from her family, especially from her mother, who received a second, almost unsustainable blow in October 1933, when Stein entered the Carmelite order in Cologne. From 1923 until 1931, she worked as a teacher of German and history at a girls' college, Mädchen-Lyzeum, in Speyer on the Rhine, and from 1932 until March 1933 she taught as a docent at the Deutsches Institut für wissenschaftliche Pädagogik (German Institute for Scientific Pedagogy) in Münster. From 1928 through 1933, her spiritual mentor was Raphael Walzer OSB, arch abbot of the Benedictine monastery at Beuron. During the same period she became well known in Catholic circles in Germany, Austria (Salzburg, Vienna), and Switzerland (Zurich) through her lectures on Christian anthropology and Christian feminism.

After the removal of non-Aryans from official positions in the spring of 1933, Stein left the institute to fulfill her wish for a Carmelite existence. In April 1933 she wrote a famous letter to Pope Pius XI asking him to protest against the humiliation of Jews and predicting a coming prosecution of the Catholic Church too. From 1933 through 1938 she stayed in the Carmelite cloisters in Cologne, using the name Sister Teresia Benedicta a cruce of the Cross OCD. In 1939 she moved to the Carmelite cloisters at Echt, Netherlands. After the protest of Dutch Catholic bishops against prosecution of Jews, she and her sister Rosa were arrested by the Gestapo on August 2, 1942, brought first to the Dutch camps of Amersfort and Westerbork, and taken from there by train to Auschwitz. The day of her arrival on August 9, 1942, is most probably the day she was killed. In 1987 she was beatified, in

1998 sanctified, and in 1999 named copatroness of Europe by Pope John Paul II.

### PHILOSOPHICAL WORKS

In the first, strictly phenomenological period of her writing while she was one of Husserl's leading students (1916–1922), Stein employed Husserl's phenomenological method in fundamental analyses in anthropology, focusing on psychology, psychophysical interactions, intersubjectivity, and personhood. Her dissertation investigated empathy (a field neglected by Husserl) as the basis for intersubjectivity and the experience of the other's and one's own body, referring to the tradition of Theodor Lipps, Max Scheler, and Alexander Pfänder, and then developing independent conclusions. In 1919, in *Einführung in die Philosophie*, Stein critiqued Husserl's idealistic position on the ego, contrasting his view of the monadic ego with arguments for a real external world. Her habilitation *Philosophy of Psychology and the Humanities* (1922/2000) differentiated the psyche and the soul with reference to causality and motivation. Causality determines the bound psyche with the help of conditions and psychic laws, while motivation inspires the free, creative will of the personal soul. Respectively they constitute the sensual, receptive subject and the rational, active subject. She takes an analogous approach in her treatment of the community and its transindividual reality in *Individuum und Gemeinschaft* (Individuality and community; 1922). The essential difference between psychic bindings and rationally deciding leads to the difference between psychology and the humanities (*Geisteswissenschaften*). The voluminous study *Eine Untersuchung über den Staat* (A study of the state; 1925) illuminates the ontological basis of sociology by differentiating between community and society and showing the roots of society in community and the roots of community in the individual.

In her second period after her baptism (1922–1937), Stein, in analyzing important parts of the Christian tradition but still doing so in a phenomenological way, was drawn to classical ontology and metaphysics. Inspired by the Jesuit Erich Przywara, in the 1920s Stein translated John Henry Newman's *Letters from the Anglican Period* and *Idea of a University*, and Thomas Aquinas's *Quaestiones disputatae de veritate* (Disputations on truth; 1931–1934) and *De ente et essentia* (On being and essence; unpublished yet). Her studies in Christian feminism and female education, including essays on Elisabeth of Thüringen and Teresa of Avila, revealed a remarkable phenomenology of womanhood, especially in reference

to the interrelation of body, soul, self-concept, and being divinely gifted. While teaching in Münster from 1932 to 1933, she wrote a philosophical anthropology and a fragmentary theological anthropology in *Der Aufbau der menschlichen Person* (The structure of human person) and *Was ist der Mensch?* (What is a human being?). The difference, but also the possible connection, between phenomenological method and scholastic ontology is shown in *Was ist Philosophie? Ein Gespräch zwischen Edmund Husserl und Thomas von Aquino* (1929) a Platonic dialogue between Husserl and Aquinas, with Aquinas as the leading speaker. In *Potenz und Akt* (Potentiality and act; 1931) and *Endliches und ewiges Sein* (Finite and eternal being; 1936/37), Stein tried to reconcile phenomenology and scholastic philosophy in a contemporary fashion. Referring to Aristotle, Aquinas, Augustine, pseudo-Dionysius, Heidegger, Jean Hering, and Hedwig Conrad-Martius (her godmother, famous for a philosophy of nature and of space and time), Stein tried to analyze different conceptions of being and to reconcile phenomenology and classical and medieval ontology into a philosophy for all time. Though she started with Aquinas, who maintained an Aristotelian ontology, she ultimately ended up closer to Augustine's personalism and his trinitarian view of creation. The aim of her philosophy was a theory of the person, not of ontological being.

In her third period (1940–1942), Stein composed two important studies on Christian spirituality and mystics. To prepare for a modern analysis of the great Spanish Carmelite reformer John of the Cross (1542–1591), she translated the complete works of pseudo-Dionysius (the Areopagite), the father of occidental mysticism, and dedicated to him the essay "Wege der Gotteserkenntnis" (Ways to recognize God; 1940/41). She reconstructed and commented on the three classical Areopagitic ways of pursuing theology: the positive, the negative, and the mystical. As an immediate fruit of rethinking the basics of mysticism, Stein provided an immanent interpretation of the theory and poetry of mystical ascent by John of the Cross, in her last, almost completed work *The Science of the Cross* (1950/2002). In his three-dark-nights theory of spiritual development, one must pass through the night of sentiment, the night of mind, and the night of faith before ascending to God. She also held that one must annihilate the self before reaching the glory of God—a theory that sheds light on Stein's own inner spiritual development. Her reflections retain language and methods close to phenomenological research.

## LEGACY

Until 1930 the writings and translations of Stein were published for the most part during her lifetime. All of her other works, letters, and uncompleted projects began to be published from 1950 to 1998 in *Edith Steins Werke* in 18 volumes by Herder in Freiburg. A new critical edition of all her writings, based on the complete material in the Carmelite Archive in Cologne and including translations and scattered pieces, is being projected from 2000 to 2010 as *Edith Stein Gesamtausgabe* (Complete works of Edith Stein) in 25 volumes, also by Herder. The interest in her life initially led to many hagiographic studies. Meanwhile, since the 1990s her philosophical work on Husserl and Heidegger has met with strong interest and received an increasingly positive appraisal. Stein's importance and influence in the history of phenomenology has yet to be fully explored.

## STEINER, RUDOLF

(1861–1925)

Rudolf Steiner, the German philosopher and occultist, was born in Kraljevic, Hungary, of Catholic parents. His early education was obtained at technical secondary schools and the Polytechnic Institute of Vienna. Steiner's anthroposophical teaching, presented as "spiritual science," is an extraordinary synthesis of "organic" ideas in nineteenth-century German thought with theosophical material and fresh occult intuitions. In 1902 Steiner became a lecturer and general secretary of the Theosophical Society's German branch, but his earlier thought had been basically formed between 1890 and 1897, years devoted to the study and editing of Johann Wolfgang von Goethe's scientific writings at the Goethe-Archiv in Weimar. In this time, and during a period (1897–1900) as editor of the *Magazin: Monatschrift für Litteratur*, he developed his own views of evolution, natural organization, and science through confrontation with the ideas of Charles Darwin, Ernst Heinrich Haeckel, Friedrich Nietzsche, and contemporary German philosophies.

Steiner presented his synthesis as a modern scientific and monistic world conception, despite the range of esoteric content it eventually included. His early work, *Philosophie der Freiheit* (1896), contained no occult material, but it left room for inclusion of such material by the theories of knowledge and of spiritual freedom which it expounded: Mechanistic science gives only abstract knowledge of some uniform relations in nature. The model for fuller knowledge of individual beings is the organic idea of a self-evolving and self-directing organ-

ism, which Goethe saw in the “primal plant.” The method for generalizing such knowledge is one of intuitive thinking. Steiner espoused a “monism of thought”: A valid world image is ever building as individual spirits live in (*miterleben*) the organic world process.

Heralding Nietzsche’s independence of thought, Steiner followed him in rejecting both natural teleology and objective moral laws. Yet he maintained that Nietzsche was always protestingly and tragically dashing his free spirit against an alien culture and a limited science of nature. Nietzsche’s doctrine of “eternal recurrence,” however, was a factor that led Steiner to give sympathetic attention to Indian thought. Nature is, after all, but one manifestation of spiritual reality, which reveals itself more directly in thought and in art. Among Indian ideas which Steiner adopted while a theosophist is the fourfold construction of man on Earth as having the physical, the ether, the astral bodies, and the “I,” with their respective powers of development and transformation.

After 1907 conflict with Annie Besant’s pro-Hindu policies led Steiner to withdraw from the Theosophical Society, but he continued on an independent line of esoteric thinking, to which in 1913 he gave the name “anthroposophy.” Natural evolution, he then taught, has thus far been a progression of bodily organizations into which “pure spirit” descends through successive reincarnations with the aim of producing individual self-consciousness. Reaching its apogee in the Renaissance, this development showed its dangerous limitations in nineteenth-century individualism. The societal remedy, Steiner declared in 1919, was not the collectivism of a totalitarian state but a “three-fold social organism,” in which the juridical, spiritual, and economic spheres of life are independently organized as three autonomous interacting systems. Equality is a concept applying particularly to the juridical sphere of rights (which includes just compensation for work), liberty to the spiritual domain, and fraternity or voluntary cooperation to the economic organization of production.

Steiner’s own interest lay primarily in the liberty of the spiritual sphere, which included great reaches of “cosmic memory.” In future stages of evolution, spirit, without loss of self-consciousness, must ascend again through knowledge of its cosmic relations to its universality and transcendence over matter. Special organs (“the lotuses”) must be cultivated to apprehend the higher worlds of spirit and the traces left by their events in the cosmic ether. These include the anti-Lucifer impulsions given by Buddha, Zarathustra, Plato, and Christ and the regenera-

tive solar influence of the blood shed in the mystery of Golgotha.

After World War I Steiner was able to establish a cultural center, the Goetheanum, in Switzerland at Dornach, near Basel. His movement spread from Germany to England, the United States, and other countries. Anthroposophy was practiced at various levels of initiation; those not ready for the higher insights could participate in the preliminary disciplines. These included eurythmic dance, mystery plays, organic agriculture and therapy, and distinctive educational measures in a number of notable elementary schools, beginning with the Waldorf School in Stuttgart. While the higher aim of Steiner’s pedagogy was to develop special powers of spiritual insight, the cultivation of moral balance, a harmony of virtuous dispositions intermediate between excesses and defects, was considered a prerequisite.

### **Bibliography**

- The writings of Rudolf Steiner are extensive. His autobiography, *Mein Lebensgang* (Dornach: Philosophisch-Anthroposophischer, 1925), was translated by Olin D. Wannamaker as *The Course of My Life* (New York, 1928).
- Of basic interest to students of general philosophy are *Philosophie der Freiheit* (Berlin, 1896), translated as *Philosophy of Spiritual Activity* (2nd ed., rev. and enl., London, 1916); *Goethes Weltanschauung* (Stuttgart, 1897); and *Friedrich Nietzsche: Ein Kämpfer gegen seine Zeit* (1895; expanded 2nd ed., Dornach: Philosophisch-Anthroposophischer, 1926).
- For further developments of his thought in various directions, see *Knowledge of the Higher Worlds and Its Attainment* (London and New York: Putnam, 1932); *The New Art of Education* (London: Anthroposophical, 1928); *The Problems of Our Time* (London and New York, 1919); and *The Writings and Lectures of Rudolf Steiner*, compiled by P. M. Allen (New York: Whittier, 1956).
- A collected edition of Steiner’s major writings was begun in observation of the centennial of his birth. Vol. I in English has appeared as *Cosmic Memory: Prehistory of Earth and Man*, (West Nyack, NY: Rudolf Steiner Publications, 1961); it is a translation by Karl E. Zimmer of *Aus der Akasha-Chronik*. Four additional volumes have been published. For additional information, the reader may consult the *Bibliographie der Werke Rudolf Steiners*, prepared by Guenther Wachsmuth (Dornach, 1942).
- A secondary work of interest is J. W. Hauer, *Werden und Wesen der Anthroposophie* (Stuttgart, 1922).

## STEPHEN, LESLIE

(1832–1904)

Leslie Stephen, an English man of letters, was the son of James and Jane Venn Stephen, both of whom came from families in the innermost group of the reforming Evangelicals who formed the so-called Clapham Sect. He attended Eton, briefly and unhappily, and then went to Trinity Hall, Cambridge, where he was made a fellow in 1854. Fellows had then to be ordained in the Church of England, and Stephen took holy orders and eventually became a priest, although he was not deeply religious. At the same time, religious doubt and disaffection began to trouble him. In 1862, as a result of these doubts, he resigned his fellowship, and in 1864 he left Cambridge for good. By 1865 he had completely lost all religious belief. He settled in London and began writing for various journals. Thereafter he wrote continually, copiously, and on a very wide range of topics.

In 1867 he married William Makepeace Thackeray's daughter Harriet Marian. She died in 1875, leaving him with one child. Three years later he married Julia Jackson Duckworth, a widow. They had four children, one of whom became the writer Virginia Woolf. Julia Stephen died in 1895.

Stephen was for many years editor of the *Cornhill Magazine*. In 1882 he accepted an invitation to edit the newly projected *Dictionary of National Biography*. The success of the project was largely due to his lengthy period of arduous service in this position (he wrote 387 of the biographies himself). Stephen was knighted in 1901.

Stephen was not a considerable innovator, in philosophy, in historical method, or in literary criticism. He had, however, very great gifts of rapid narration and clear and lively exposition. His work on the history of thought is based on massive reading and wide acquaintance with the social, political, and religious aspects of the periods of which he wrote. If it is neither original in its criticism nor profound in its understanding of positions, it is still useful and has not been entirely superseded because of its grasp of the broader contexts of thought and the skill with which it brings out the continuities from one period to another and from earlier formulations of problems to later ones.

It was Stephen who made Thomas Huxley's coinage *agnostic* an English word, and the problems and beliefs springing from his agnosticism underlay both his major historical works and his philosophical writings. He rejected theism of the sort he had originally been taught

because he rejected the doctrine of original sin and because the problem of evil seemed to him insoluble. To evade this problem by confessing the transcendence and incomprehensibility of God was, he thought, to change from a believer into a skeptic, and in that case the part of honesty was simply to avow oneself an agnostic. But true Victorian that he was, he felt that morality, by this view, becomes gravely problematical. If there is no deity to sanction moral principles, why will—why should—men obey them?

To answer these questions was part of Stephen's aim in his investigations of eighteenth-century thought. He dealt more systematically with them, and with others, in his least successful and most tedious book, *The Science of Ethics*. The agnostic, he held, must place morality on a scientific basis, and this means that there must be nothing in his ethics that is outside the competence of scientific inquiry. Brought up on John Stuart Mill and profoundly influenced by Charles Darwin, Stephen attempted to cut through what he impatiently dismissed as academic debates about morality by showing that moral beliefs were the result neither of excessively rational utilitarian calculation nor of mysterious intuition but of the demands of the social organism in its struggle for survival. Since the healthy survival of the social organism must increasingly coincide with conditions that bring the greatest happiness to the greatest number of those individuals who are the "cells" in the "social tissue," utilitarianism is not entirely false. But its atomistic analysis of society is erroneous, and its criterion of rightness is neither adequate nor entirely accurate. The healthy survival of society, and of oneself as part of it, can alone serve as sanction for morality, and the rules for that health, which are mirrored in our instincts and our deepest habits and appear in consciousness as intuitively known moral rules, can be put on a scientific basis only when we come to possess, as we do not yet, a scientific sociology.

### Bibliography

#### WORKS BY STEPHEN

Stephen's works are far too numerous to be listed completely here. *Essays on Freethinking and Plainspeaking* (London: Longmans, Green, 1873) and *An Agnostic's Apology and Other Essays* (London: Smith, Elder, 1893) contain most of his better-known popular essays. *The Science of Ethics* (London: Smith, Elder, 1882) is his only purely philosophical work. His important historical studies are *History of English Thought in the Eighteenth Century* (2 vols., New York: Putnam, 1876; 3rd ed., 1902); *The English Utilitarians* (3 vols., London: Duckworth, 1900); and *Hobbes* (London: Macmillan, 1904). To these the lectures in *English*

*Thought and Society in the Eighteenth Century* (London, 1904) provide a valuable supplement.

#### WORKS ON STEPHEN

The standard biography is F. W. Maitland's charming *Life and Letters of Leslie Stephen* (London: Duckworth, 1906), which contains an adequate bibliography of Stephen's work. Noel Annan, in *Leslie Stephen* (London: MacGibbon and Kee, 1951), studies Stephen as a representative Victorian thinker and as a link between the Clapham Sect and the Bloomsbury Group.

J. B. Schneewind (1967)

## STERN, LOUIS WILLIAM

(1871–1938)

Louis William Stern, the German philosopher and psychologist, was born in Berlin and received his PhD under Hermann Ebbinghaus in Berlin in 1892. From 1897 to 1915 he taught philosophy and psychology at the University of Breslau, and in 1915 he moved to Hamburg, where, in 1919, he helped to found the University of Hamburg. He was forced into exile in 1933 by the Nazi government and became professor of psychology and philosophy at Duke University. He died in Durham, North Carolina.

As a psychologist Stern revolted against the elementarism (the belief in the adequacy of analysis of consciousness into its elementary parts) current in Germany before the general acceptance of Gestalt psychology. In his early studies of the perception of change and motion, he employed phenomenological methods and anticipated some later developments in Gestalt psychology. He soon gave up psychophysical experimentation, however, and pioneered in various fields of applied psychology, such as psychology of childhood, forensic psychology, intelligence testing (he introduced the concept of the intelligence quotient), and vocational psychology. Stern's work in psychology was always timely and often ahead of his times; he therefore earned a reputation as a psychologist that he never enjoyed as a philosopher, for most of his philosophizing was either opposed to, or out of touch with, contemporary movements. Some resemblance to *Lebens-philosophie* can be discerned, but he had little contact with Wilhelm Dilthey and his circle. Stern's philosophy must be understood in conjunction with his own psychological work, as providing the presuppositions for his lifelong scientific focus on the individual person—not on elements in his behavior and not on abstract universal laws relating them, but on the unique man. Even against Gestalt psychology, which likewise rejected elementarism,

Stern's motto was: "No *Gestalt* without a *Gestalter*." The *Gestalter* was the person.

Stern called his philosophy critical personalism to distinguish it from other personalistic theories, such as animism, vitalism, and Cartesianism, which were based upon the familiar dualism of mind and body. For him the person was an integral totality (*unitas multiplex*) whose defining property was purposive activity. What is not a person is a thing. A thing is not a whole but merely an aggregate; not autonomous but determined from without; not concretely individual but fragmentary or abstract. The person-thing distinction does not correspond to the mind-body distinction; rather, Stern held, the person is "psychophysically neutral," and both mind and body are thinglike abstractions from the original concreteness of a person sufficiently complex to be called an organism. Only some persons are conscious; indeed, only some of them are living. The person-thing distinction is repeated hierarchically, and the world is a system of persons included in and inclusive of others. A thing is a person seen from the standpoint of the supervenient person; that is, a person which includes other persons as parts.

With this conception, which suggests Aristotle, Gottfried Wilhelm Leibniz, and Gustav Fechner, Stern formulated his theory of teleomechanics as a way of avoiding an ontological dichotomy between teleology and mechanism. Mechanical uniformities, patterns of thing-behaviors, are derivative from teleological activities of supervenient personal beings in which the things are components. By this theory Stern attempted to derive the formal concepts and principles of the thing-world as we know it, such as magnitude, uniformity, class, causality, space, and time. By making these concepts and principles derivative, not fundamental, Stern's theory gave metaphysical priority to teleological and irreducibly individualistic notions.

Since the concrete substances of the world are teleological both as goal-setting and as goal-realizing, Stern identified the concept of intrinsic value with that of genuine, or personal, being. There are values corresponding to every level of person, indeed to every individual in the hierarchy of persons. But whereas in the theory of teleomechanism persons become things in the context of supervenient persons and thereby have at most extrinsic value, Stern later explored interpersonal relations in which the autonomy of each person is preserved and heightened through those relations which constitute a higher person. To the teleomechanical (cosmological) relation between persons Stern now added the introcep-

tive (axiological) relation, by which ends and intrinsic values of other persons as such are used by each person as factors in his own selfhood and autonomous self-determination and growth. In the formation of more inclusive and autonomous persons, the value of the whole suffuses the included persons with a radiative value (*Strahlwert*) instead of depersonalizing them as merely instrumentally valuable.

Stern's studies of love, religion, art, history, and ethics are deep and perceptive applications of his account of introception and radiative values. The theory of radiative value is especially fruitful in his accounts of symbolism and expression in many fields, and in his theory of introception he attempted to rationalize the value-oriented assessment of total personality characteristic of his psychology of individual differences.

Stern's personalism differs from that of personal idealism in that it is neither theistic nor idealistic, nor so radically pluralistic. It has closer resemblances to Jan Christiaan Smuts's holism and to some phases of Max Scheler's theory of value.

### Bibliography

Works by Stern are *Person und Sache*, 3 vols. (Leipzig: Barth, 1906–1924); *Personalistik als Wissenschaft* (Leipzig: Barth, 1932); and *Allgemeine Psychologie auf personalistischer Grundlage* (The Hague: Nijhoff, 1936), translated by H. D. Spoerl as *General Psychology from the Personalistic Standpoint* (New York: Macmillan, 1938). An autobiographical essay may be found in Carl Murchison, *History of Psychology in Autobiography* (Worcester, MA, 1930), Vol. I, pp. 335–388.

*Lewis White Beck (1967)*

## STEVENSON, CHARLES L.

(1908–1979)

Charles L. Stevenson authored the first thorough emotivist, or noncognitivist, account of ethical language. Traditionally the study of ethics had involved a quest for the truth about what is good and right, but Stevenson abandoned that search and set out to investigate the practical use of ethical language to shape attitudes. In a series of articles, and in his 1944 book *Ethics and Language*, he proposed answers to classical philosophical questions about meaning and justification that set the agenda for the next several generations of moral philosophers.

Stevenson earned degrees at Yale and Cambridge before receiving his doctorate from Harvard in 1935. He

then taught at Harvard and Yale, where his original and challenging ideas about ethics were not popular. In 1946 he joined the philosophy department at the University of Michigan, where he remained till his retirement.

By the time *Ethics and Language* appeared, a form of emotivism had been sketched by A. J. Ayer, who claimed that ethical utterances are disguised commands and exclamations. Other students of ethics and language had introduced behavioral accounts of meaning, drawing attention to the actual use of moral language and questioning the place of reason in ethics. Stevenson's contribution was to integrate these ideas into a coherent theory and to emphasize the complexity and importance of the expressive function and the dynamic power of ethical language.

Disagreements in ethics, according to Stevenson, involve “an opposition of purposes, aspirations, wants, preferences, desires, and so on” (Stevenson 1944, p. 3). He called such disagreements “disagreements in attitude” and contrasted them with “disagreements in belief.” Ethical disagreements can be resolved by rational argument when they can be traced to disagreements in belief, but when disagreements in attitude remain after agreement about the facts has been reached, rational means will be of no use. When rational means fail, Stevenson noted, and even when they do not, we resort to a variety of non-rational methods. Non-rational persuasion exploits language that carries what Stevenson called “emotive meaning.” Emotive meaning “is the power that a word acquires, on account of its history in emotional situations, to evoke or directly express attitudes, as distinct from describing or designating them” (Stevenson, 1944, p. 33). Stevenson explored the many ways in which words with positive or negative emotive meaning can be used by speakers aiming to persuade others (or themselves) to alter (or preserve) some attitude.

Turning to the question of meaning, Stevenson argued that we can explain the meaning of an utterance such as *X is good* if we can find a relevant, similar expression that is free from ambiguity and confusion, and that allows us to do and say everything we can do and say with the original expression. By leaving out any mention of emotive meaning, a “subjectivist” definition such as *X is good = I approve of X* fails because it distorts the nature of ethical disagreement, which is fundamentally a clash of attitudes. Stevenson's suggestion, which he characterized as his “first pattern of analysis,” was that any adequate analysis of *X is good* will satisfy the following pattern:

*X is good = I approve of X, do so as well.*

The first element (*I approve of X*) gives a subjectivist descriptive meaning and is but one example from a long list of candidates. The second (*Do so as well*) represents the emotive meaning and indicates that exposure to utterances like *X is good* tends to bring about approval for *X*.

According to a first-pattern analysis, one persuades by making a straightforward ethical judgment, counting on the emotive meaning of the key terms to influence the attitudes of the audience. A second method of persuasion is illustrated by a “second pattern of analysis.” Many words carry strong emotive meaning, and just as we can influence attitudes by an explicit ethical judgment, so we can operate more subtly by exploiting what Stevenson called a “persuasive definition.” When we give or use a persuasive definition, we attach a new descriptive meaning to a term like *courage* or *justice* while keeping the emotive meaning unchanged. The point of doing this is to change the direction of peoples’ interests. As Stevenson says, “Words are prizes which each man seeks to bestow on the qualities of his own choice” (Stevenson 1944, p. 213) If we can redefine *courage* to cover our strategic retreat, then we too can be called courageous. “True courage,” we might say, “is knowing when to run.”

Stevenson observed that when our persuasion fits the first pattern, “attitudes are altered by ethical judgments,” and when it fits the second pattern, attitudes “are altered not only by judgments but by definitions” (Stevenson 1944, p. 210). The two patterns turn out to be equivalent in the sense that “for every second pattern *definition* there is a first pattern *judgment*, the latter being the persuasive counterpart of the former” (Stevenson 1944, p. 229).

Stevenson’s analysis of meaning had consequences for his view of another metaethical issue, the question of justification. When disagreement in attitude is not rooted in disagreement in belief, then the notion of a “reason” expands to include “any statement about any matter of fact which any speaker considers likely to alter attitudes” (Stevenson 1944, p. 114). This claim led some critics to accuse Stevenson of wanting to replace ethical reasoning with propaganda, but actually he claimed only that rational methods have limits and that persuasion is in play even when rational methods are used and even when we are trying to change or preserve our own attitudes. The choice of methods, he pointed out, is always a normative one, but he consistently identified his own study as a descriptive analytical one and refused to moralize about the ways of moralists.

In addition to his landmark works on metaethics, Stevenson wrote on aesthetics, music, and verse. He was a

serious amateur musician, frequently performing chamber music with his friends and family.

## STEWART, DUGALD

(1753–1828)

Dugald Stewart was an Edinburgh professor of moral philosophy who expounded the common sense theory of Thomas Reid and the libertarian political economy of Adam Smith. He taught from 1785 until illness forced his retirement in 1809. An eloquent spokesman for Reid and Smith rather than an original thinker, he left no legacy of his own but conveyed theirs. He provided his classes with a feast of psychology, ethics, and intellectual history and was the first professor in Britain to offer a course in political economy, which he began in 1800. A defender of academic freedom (see Brown [2004, 657] and Veitch [1858, lxxv–lxxix on the Leslie affair]), he both consoled and disturbed his audience by sustaining its metaphysical prejudices against Humean skepticism while revising its economic and political ones. He was no utilitarian yet advocated private liberty and the open market as the route to general happiness. His renown as a teacher was sustained by his books, which were translated into German, French, and Italian. He was honored by learned societies in Russia, Italy, and America, as well as by the Royal Societies of Edinburgh and London. Poet Robert Burns summed Stewart up as four parts Socrates, four parts Nathaniel, and two parts Brutus. He meant that

Stewart combined philosophical wisdom, a prophetic sense of morality, and a republican inclination.

Stewart's birth in Edinburgh on November 22, 1753 was in every sense an academic one. Not only was his father, Matthew, a college professor, but he was actually born in the college itself since their house was one of the college buildings. His father's family came from the southwest of Scotland where his grandfather was a minister. His mother was the daughter of an Edinburgh lawyer from whom she inherited the small Ayrshire estate of Catrine where the family spent the summer and where he befriended Burns whose home was at nearby Mossgiel.

Stewart attended the High School of Edinburgh where he learned Latin and Greek and the literature of both civilizations. He formed a lifelong attachment to the classics, a taste he shared with his revered friend Smith. In old age both philosophers turned to the early authors for pleasure and consolation, Smith to Sophocles and Euripides, Stewart to the Latin poets. He would later find this school education helpful in following the lectures of Adam Ferguson, whose class in moral philosophy he attended at the College in Edinburgh, which later became Edinburgh University. Ferguson was steeped in Roman history and literature, which formed the background to his lectures on moral and political philosophy and on civil society and its progress.

At the college, Stewart was introduced by John Stevenson, professor of logic and metaphysics, to the philosophy of John Locke, which was dominant at the time but which Stewart was to reject largely under the influence of Reid but also under that of Ferguson, who inspired his love of moral philosophy and whose chair he was to occupy. Before replacing Ferguson and after completing his college studies, Stewart had unexpectedly to take his father's place as professor of mathematics because illness forced his premature retirement. His father had achieved a minor international reputation as a Euclidean geometer although he was a reactionary who disdained algebraic geometry. He probably schooled his son informally in his own subject. Although Stewart was a good mathematician, he preferred philosophy, in which subject Ferguson discovered his talent.

Ferguson's philosophy was eclectic but principally Stoic. The classical moralists on whom he modeled himself advanced their own individual conceptions of virtue, of which they were taken to be exemplars. Assuming that moral philosophy is a kind of practical wisdom, their aim was to advise their students morally and lead them towards virtue. Stewart followed Ferguson's lead in adopting this ideal and in regarding right and wrong as

like *primary* qualities, such as hardness, and not like the *secondary* qualities of colour and taste. With Ferguson and Reid, he criticized the school of moral sense led by the Lockean Francis Hutcheson, professor of moral philosophy in Glasgow and Smith's teacher. Hutcheson, followed by David Hume, said that virtue and vice are perceived through moral sensations of pleasure and pain or displeasure. Reason, they thought, is indifferent to virtue, which is only discovered by the responsive heart. Their critics—Ferguson, Reid, and Stewart—proposed, on the contrary, that humans use rational intuition to see which actions are morally right or wrong. These qualities exist independently of feeling and sensation. If the two sides did not agree about how virtue is perceived and why it is pursued, they did agree that the fundamental virtues are those of benevolence and justice.

Though no populist, Stewart managed to be more supportive of the idea of liberal reform than Ferguson. He agreed with Ferguson on the need for political leadership by wise philosophers, though he was quite clear about the citizen's right to political representation and clear that personal liberty is sacred. If the citizen is to be led, then it is to be out of servitude toward liberty. He was therefore deeply interested in the French liberal movement, which was headed intellectually by Anne-Robert-Jacques Turgot, François Quesnay, and Marie-Jean-Antoine-Nicolas Caritat, Marquis de Condorcet. They saw the nation's economy as the means of raising the standard of living of all its citizens. The movement was taken over by extremist deputies in the Assembly and culminated in violence against the throne. This was not the intention of the economists, who were not arguing for populist control but for rule by platonic philosophers guiding the monarch.

Stewart visited Paris in 1788 and 1789 and met some of the reformist thinkers, who encouraged his belief in the peaceful benefits of economic reform under wise government. He subsequently explained his innocuous views on political reform in *Elements of the Philosophy of the Human Mind* (1792; 1818, Vol. 1, 234–276). But this had an un-looked-for consequence because it led Scotland's judiciary to suppose that he actually supported violent revolution. Included among those were two judges known personally to Stewart who wished him to tone down his political writings. He declined to alter the second edition (1802) of the offending text, explaining his reason in a footnote. Although he sympathized with French liberalism and, unusually for someone of his position, with the American assertion of political and eco-

conomic independence, he rejected violence as an instrument of change.

Stewart went to Glasgow to hear Reid lecture in 1772 just before he took over as deputy for his father. As professor of moral philosophy, Reid was famous for his theory of common sense and his criticism of Hume's skepticism and the theory that ideas are copies of sensations. It was Reid's theory of belief, or laws of belief, as Stewart preferred to phrase it, that specially appealed, and he dedicated his first book, *Elements*, to Reid in 1792. Stewart felt that describing Reid's work as an inquiry into the principles of common sense suggested quite wrongly that it was not a philosophical theory about a philosophical matter: There is no room for theory if it is only common sense. According to Stewart—though Reid did much in showing that sensation cannot explain central beliefs in personal identity, the external world, the past and the future—Reid made no progress on René Descartes's position on proof of the existence of the external world: In other words, we can only trust to our beliefs, not prove them. To advance further, Stewart revives a suggestion he attributes to Father Ruggero Giusseppe Boscovich the eighteenth-century Jesuit natural philosopher, that belief in external objects comes from the experience of their resistance. Stewart enlarges the suggestion with an idea from Turgot that, if experience suggests its cause, it is repetition of the experience that suggests the continuity of that cause (*Philosophical Essays*, chs. 1 and 2, 115–148). This account does not, he admits, completely prove that there are external objects but, rather, explains the belief as an expectation that what resists being touched or pushed will do so again because it continues to exist when it is not being felt.

As did the despised Lockians, Stewart believed that the philosophy of mind is a science in which data are our sensations, our thoughts, and our volitions. It tries to analyze states of consciousness without either aspiring to understand the ultimate nature of mind or trying to explain all belief by sensation and feeling. We are not directly conscious of mind, nor are we of matter. Although we do not know what matter is, nor what mind is, we do know that there are two fundamentally different kinds of experience. One suggests matter, the other mind. To materialists who said that if we do not know what matter or mind are, they might be the same thing, he replied in a footnote in the first part of the introduction to *Elements*: if they were the same, "it would no more be proper to say of mind, that it is material, than to say of body, that it is spiritual" (p. 5). It did not occur to Stewart that, since it is improper to say of what is spiritual that

it is material, if mind is matter, it would be improper to say that it is spiritual but not improper to say that it is material. It was inconceivable to him, though not to others such as David Hartley and Joseph Priestley, that mind might be located in the nervous system and the brain.

## STILLINGFLEET, EDWARD (1635–1699)

Edward Stillingfleet, an English Protestant theologian, was born in Cranborne, Dorset. He entered St. John's College, Cambridge, in 1649. On graduating in 1653 he was elected a college fellow, but after a year went into private employment. He was appointed rector of Sutton, Bedfordshire, in 1657. The Church of England was then under Presbyterian administration, but Stillingfleet received episcopal ordination in a clandestine ceremony and readily conformed after the restoration of the monarchy in 1660. A popular preacher in London legal circles, he became rector of St. Andrew's, Holborn, London, in 1665, and in 1678 rose to be dean of St. Paul's. On the accession of William III (1650–1702) in 1689 Stillingfleet was created bishop of Worcester. He was active in the politico-theological controversies of the time, most of which had a philosophical dimension. None of his writings was narrowly or exclusively philosophical.

His first work was *Irenicum* (1659). Though ostensibly an attempt to restore Protestant unity after several decades of sectarian divisions, it had a disguised episcopalian agenda. Stillingfleet resumed the debate with less disguise in the 1680s amid growing fears of a Catholic revival, publishing *The Mischief of Separation* (1680), *The Unreasonableness of Separation* (1681), and *Origines Britannicae* (1685). In *Irenicum* he allowed that episcopacy, presbytery, and independency could all point to precedents from the apostolic period; thus, all three could coexist compatibly. By 1685, however, he was arguing that the original English church had been an episcopal foundation, independent of Rome.

Stillingfleet's most consistent claim was that the primitive churches constituted a single society within each political state. Citing the authority of both natural and scriptural law, he portrayed the church of his own day as a subsociety operating within and compatibly with the laws of civil society, under which its members receive or lose privileges in proportion to their conformity. This was "latitudinarianism," a scheme that, by distinguishing essential from inessential matters, aimed to comprehend all believers in a national church and opposed the legal toleration of dissenting denominations. On matters not dictated by natural or revealed law—including the balance between episcopal and other forms—the overriding issue was one of civil peace, for which the civil administration was legislator. But many dissenters believed that there were theological issues here on which the civil power was incompetent to arbitrate. By the time of Stillingfleet's later writings against separation, there was a growing lobby in favor of the tolerationist alternative. John Locke prepared a critique of Stillingfleet in 1681 that survives in manuscript.

A second important early work, *Origines Sacrae* (1662), attempted to demonstrate the rational foundations of Judeo-Christian monotheism. Stillingfleet presented a detailed philosophy of history, exploring the nature of historical evidence and the grounds of assent to testimony. He claimed to establish the general superiority of written records over tradition and of the biblical record over ancient pagan history. On these principles he defended the authenticity of the biblical miracles, but not others, as confirming the authority of a revelation. Central to his argument was the concept of moral certainty. This was a genuine certainty attainable in matters beyond reasonable doubt by persons in possession of normal reason and of the evidence, where part of the function of reason is to judge the type of evidence appropriate to the context. By this means one can attain certainty in doctrinal

matters that are above reason but not contrary to it. One's confidence is underwritten by the certainty one has of the existence of God.

This was a different kind of certainty based on clear and distinct ideas, yet compatible with the recognition that the object of certainty is largely incomprehensible. Part of the inspiration here was Cartesian, but Stillingfleet's enthusiasm for Cartesianism moderated in his last years after he absorbed Henry More's criticisms of René Descartes's cosmology and saw the direction taken by some post-Cartesian thinkers such as Benedict (Baruch) de Spinoza. In 1697 he was at work on a new *Origines Sacrae*, but only a fragment survives.

The epistemology developed in *Origines Sacrae* provided the basis for a relentless polemic against Catholic views of the rule of faith, from *A Rational Account of the Grounds of Protestant Religion* (1664) to *The Doctrine of the Trinity and Transubstantiation Compared* (1687), with many intervening titles. Stillingfleet appealed to weakly formulated principles of reason and common sense to reiterate his conviction that the doctrine of the trinity, being derived from a historically sound scripture, albeit above reason, was an assured certainty of faith; whereas that of transubstantiation, being contrary to reason and sense, was not. The Catholics argued for an exact parallelism and believed that the Protestants had no reliable arbiter in their disagreements about biblical interpretation.

By 1687 Stillingfleet had opened up the debate over the identification of substance and the distinction of persons. This was an opportunity for a growing Unitarian movement on the edge of Anglicanism to weigh in, seeking to demonstrate on clear and distinct principles that both the trinity and transubstantiation were equally indefensible and to promote a revisionist account of the atonement. Simultaneously with this, a rising tide of deism—religious belief based on natural reason alone without revelation—was beginning to pose awkward questions about the credibility of revelation.

Stillingfleet had already attacked Socinianism, a continental form of Unitarianism, in 1669 and deism in 1677, without obvious effect. Beset with opposition on so many fronts, he published *A Discourse in Vindication of the Doctrine of the Trinity* (1696). He incorporated an attack on John Toland's deistic *Christianity Not Mysteriorous* (1696), implicating Locke as the supposed inspiration for Toland's rejection of truths above reason. As a result, his final years were taken up with a highly public dispute with Locke, each side contributing three pieces. The dispute was over whether Locke's philosophy was capable of

supporting what Stillingfleet considered the basic propositions of the creed. Confused by Locke's Cartesian language about clear and distinct ideas, he challenged Locke to show how such ideas could come by sensation or reflection. Locke, he complained, had a "new way" of ideas, one that left him apparently ambivalent over mind-body dualism, agnostic about substance and essence, and unable to demonstrate immortality or to explicate the distinction of persons on his philosophy: in short, unable to bring any certainty to matters of faith. Locke gave no quarter to Stillingfleet in his replies, insisting on the coherence of his philosophy and its compatibility with biblical doctrine but refusing to be drawn into theological debate. Where, however, Stillingfleet had identified ill-chosen uses of the phrase "clear and distinct ideas" in Locke's *Essay concerning Human Understanding*, Locke silently amended them in the fourth edition (1700).

## STIRNER, MAX

(1806–1856)

Max Stirner was the nom de plume of the German individualist philosopher Johann Kaspar Schmidt. Born in Bayreuth, Bavaria, Schmidt had a poor childhood. His academic career was long and fragmented. From 1826 to 1828 he studied philosophy at the University of Berlin, where he fell under the influence of G. W. F. Hegel. After brief periods at the universities of Erlangen and Königsberg, he returned to Berlin in 1832 and with some difficulty gained a certificate to teach in Prussian Gymnasiums. Several years of poverty and unemployment followed, until Schmidt found a position as teacher in a Berlin academy for young ladies run by a Madame Gropius. After this he lived something of a double life: The respectable teacher of young ladies had for another self the aspiring philosophical writer who assumed the name of Stirner.

The immediate stimulus that provoked Stirner to write his one important book, *Der Einzige und sein Eigentum* (Leipzig, 1845; translated by Steven T. Byington as *The Ego and His Own*, New York, 1907), was his association with the group of young Hegelians known as Die Freien (the "free ones"), who met under the leadership of the brothers Bruno and Edgar Bauer. In this company Stirner met Karl Marx, Friedrich Engels, Arnold Ruge, Georg Herwegh, and many other revolutionary intellectuals. In the same circle he also met Marie Dahnhardt, whom he married in 1843 and who left him in 1847. Before the publication of his book Stirner produced only a few brief periodical pieces, including an essay on educational methods printed by Marx in *Rheinische Zeitung*.

### THOUGHT

*Der Einzige und sein Eigentum*, a treatise in defense of philosophic egoism, carried to its extreme the young Hegelian reaction against Hegel's teachings. In part it was a bitter attack on contemporary philosophers, particularly those with social inclinations. Stirner's associates among Die Freien were rejected as strongly as Hegel and Ludwig Feuerbach.

Stirner's approach was characterized by a passionate anti-intellectualism that led him to stress the will and the

instincts as opposed to the reason. He attacked systematic philosophies of every kind, denied all absolutes, and rejected abstract and generalized concepts of every kind. At the center of his vision he placed the human individual, of whom alone we can have certain knowledge; each individual, he contended, is unique, and this uniqueness is the very quality he must cultivate to give meaning to his life. Hence, he reached the conclusion that the ego is a law unto itself and that the individual owes no obligations outside himself. All creeds and philosophies based on the concept of a common humanity are, in Stirner's view, false and irrational; rights and duties do not exist; only the might of the ego justifies its actions.

There is much in common between Stirner's embattled ego and Friedrich Nietzsche's superman; indeed, Stirner was seen as a forerunner of Nietzsche during the 1890s.

Stirner has often been included with the anarchist philosophers, and he has much in common with them. However, he differs from writers like William Godwin, Pierre-Joseph Proudhon, and Pëtr Alekseevich Kropotkin in that the idea of a system of natural law, or immanent justice, which human law negates, is essential to their points of view. Stirner, however, rejected the idea of any such law, and in this respect he stands nearer to certain existentialists and the nihilists. Furthermore, while the anarchist seeks freedom as his ultimate goal, Stirner regarded such an aim as always being limited by external necessities; in its place he sought uniqueness or "ownness." "Every moment," he said, "the fetters of reality cut the sharpest welts in my flesh. But *my own* I remain."

Stirner agreed with the anarchists, however, in regarding the state as the great enemy of the individual who seeks to fulfill his "own will." The state and the self-conscious and willful ego cannot exist together; therefore the egoist must seek to destroy the state, but by rebellion rather than by revolution. This distinction is essential to Stirner's doctrine. Revolution, in overthrowing an established order, seeks to create another order; it implies a faith in institutions. Rebellion is the action of individuals seeking to rise above the condition they reject; it "demands that one rise, or exalt oneself." Revolution is a social or political act; rebellion is an individual act, and therefore appropriate to the egoist. If rebellion prospers, the state will collapse.

In rebellion the use of force is inevitable, and Stirner envisaged "the war of each against all," in which the egoist fights with all the means at his command. This viewpoint led Stirner to justify and even to exalt crime. Crime is the assertion of the ego, the rejection of the sacred. The

aim of egoist rebellion is the free wielding of power by each individual.

In Stirner's view the end of this process is not conflict but a kind of dynamic balance of power between men aware of their own might, for the true egoist realizes that excessive possessions and power are merely limitations on his own uniqueness. His assertion is based on the absence of submissiveness in others; the withdrawal of each man into his uniqueness lessens rather than increases the chance of conflict, for "as unique you have nothing in common with the other any longer, and therefore nothing divisive or hostile either." Stirner argued that far from producing disunity among individuals, egoism allows the freest and most genuine of unions, the coming together without any set organization of the "Union of Egoists," which will replace not only the state with its political repression but also society with its less obvious claims.

#### LATER YEARS

*Der Einzige und sein Eigentum* is not just a most extreme expression of individualism, it is also the single manifestation of Stirner's own revolt against a frustrating life that finally submerged him. In his totally undistinguished later years he embarked on a series of unsuccessful commercial ventures and translated English and French economists. His remaining book, *Die Geschichte der Reaktion* (Berlin, 1852), lacked the fire of discontent that made his earlier work so provocative. Stirner's last years were shadowed by declining powers and haunted by creditors; he died poor and forgotten in 1856.

#### STÖHR, ADOLF (1855–1921)

Adolf Stöhr, the Austrian philosopher, psychologist, and linguist, was born at St. Pölten and studied law and philology, then botany, and finally philosophy, at the University of Vienna. In 1885 he was appointed *Privatdozent* in theoretical philosophy at the same university, rising to associate professor in 1901 and to full professor of the philosophy of the inductive sciences in 1911. He pub-

lished some thirty works in logic, natural philosophy, psychology, and philosophy.

### LANGUAGE AND THOUGHT

Stöhr developed his system of logic in the closest connection with the psychology of thought processes and linguistics. His work deals in great detail with the dependence of thought upon language (what he calls the glossomorphy of thought), and he warned against the dangerous consequences that flow from confusing forms of speech with forms of thought. Not only do we make use of language to fix our thoughts and to communicate our knowledge; we also think in our language, so that the structure of our thought reflects the logical forms of our language. When the course of thought becomes automatic, the result may be that self-critical thought is replaced by an “idle flow of speech” (“glossurgy”), which is frequently even self-contradictory.

Through such reflections Stöhr began the “critique of language” pursued later with such success by other important thinkers. With the aid of this critique, he sought above all to oppose the misuse of language in philosophy and to unmask the muddled philosophical thinking that gives rise to the reification of concepts, metaphors, and allegories. Because “our language compels us to designate consciousness as if it were constructed of a subject, of mental acts and of physical objects” (as in the sentence “I see an object”), the illusion arises that “thoughts have the form (*morphe*) of the language (*glossa*).” The final outcome is that fictions are taken for facts; metaphors, for that which is actually meant. Thus the fact of the psychological “I” is confused with the fiction of the mental “subject,” and the fact of phenomenal matter as a complex of visual and tactile sensations is confused with the materialistic fiction of a metaphysical matter (*Wege des Glaubens*, pp. 20ff.).

### METAPHYSICS

Stöhr distinguished three roots of metaphysical thinking: wonder at the facts (the “theorogonous” metaphysics of the “constructing imagination”); pain (the “pathogonous” metaphysics of the “suffering heart”); and glossomorphic confusion (the “glossogonous” metaphysics of the “rolling word”). Metaphysics can supply no universally valid knowledge because the transcendental is in principle unknowable; one can only “have faith” in the existence of something beyond experience. This metaphysical faith is the expression of a subjective reaction of the heart and is “lived.” Knowledge cannot engender faith, and faith cannot substitute for knowledge; for the

two are of an entirely different nature” (“Ist Metaphysik möglich?,” p. 30). “Everyone proceeds along that path of faith which his whole constitution obliges him to take. There is neither an inductive nor a deductive proof for or against a faith” (*Wege des Glaubens*, p. 36).

Stöhr rejected both “pathogonous” and “glossogonous” metaphysics, and thus the whole of metaphysics in the traditional sense, with its claim to knowledge of the transcendental. Anyone who pretends to provide such knowledge is philosophizing both “pathogonously” and “glossogonously.” Anyone who is unable to find the meaning of life in life itself, in the work and tasks of life, and therefore suffers in being alive, seeks that meaning beyond the world and life. Since he would like to convince others of the truth of his outlook on life and the world, which is directed to the beyond, he intentionally or unintentionally misuses language in order to offer rhetorical pseudo solutions to metaphysical pseudo problems as if they were genuine solutions to real problems.

Stöhr himself professed “theorogonous” metaphysics. He defined it as “the satisfaction of an artistic propensity by means of the elegant construction of a world view”—which, of course, must not contradict the facts. “Thus metaphysics, in contrast to the empirical sciences, does not grow through apposition, but continuous building, rebuilding and building anew” (*Lehrbuch der Logik*, p. 304). Stöhr constructed his own view of nature in this manner, not dogmatically but as an exercise, assigning more importance to the creation than to the validity of a system. (He often said in discussion: “I am only playing with these ideas. I do not say that this is the way things are. I do not say even that this is the way they probably are. All that I say is that this is the way they may be.”)

### NATURAL PHILOSOPHY

Stöhr attempted to explain the structure of matter and the peculiarities of organic happenings in conformity with his undogmatic approach. Since for him mechanism was the sole intelligible conception of nature, he sought to understand both the organic world and the inorganic world with the help of mechanistic conceptual models. Stöhr proved to be as original a thinker in the philosophy of nature as in logic and psychology. That many of his ingenious solutions to problems have become outmoded by the progress of the sciences does not alter the epistemological excellence of his clear and exact style of thought.

## Bibliography

Stöhr's major works include *Umriss einer Theorie der Namen* (Leipzig and Vienna: Deuticke, 1889); *Alegbra der Grammatik* (Leipzig: Deuticke, 1898); *Philosophie der unbelebten Materie* (Leipzig, 1907); *Der Begriff des Lebens* (Heidelberg: Winter, 1909); *Lehrbuch der Logik* (Leipzig: Deuticke, 1910); "Ist Metaphysik möglich?" in *Jahrbuch der philosophischen Gesellschaft an der Universität zu Wien 1914 und 1915* (Leipzig, 1916), pp. 25–36; *Psychologie. Tatsachen, Probleme und Hypothesen* (Vienna and Leipzig, 1917; 2nd ed., Vienna and Leipzig: W. Braumüller, 1922); and *Wege des Glaubens* (Vienna and Leipzig, 1921).

Works on Stöhr include Franz Ferdinand Worlitzky, *Über die Philosophie Adolf Stöhrs*, a dissertation (Vienna, 1925), and Franz Austeda, "Der Oesterreicher Adolf Stöhr—einer der bedeutendsten Denker unseres Jahrhunderts," in *Neue Wege* (Vienna) (104) (1955): 3–5.

## STOICISM

Stoicism was a philosophical movement founded in Athens in the late fourth century BCE by Zeno of Citium. Although Stoicism was shaped by many philosophical influences (including the thought of Heraclitus), it was throughout its history an essential part of the mainstream Socratic tradition of ancient philosophy. Inspired as well by the Cynics (Zeno was taught by Crates, a student of Diogenes of Sinope), Stoicism developed alongside and in competition with Platonism and Aristotelianism over the next 500 years. For centuries it was the main rival to Epicurean thought as well. Virtually no works survive from the early period of the school's history. Yet its doctrines have been reconstructed with a fair level of reliability on the basis of later accounts, critical discussions by non-Stoics, and the surviving works of later Stoic writers.

## HISTORY

When Zeno arrived in Athens, attracted from his home on Cyprus by Socratic philosophy, Plato's Academy was led by Polemo and was soon to make its historic shift away from what we now recognize as Platonism toward a form of skepticism under the leadership of Arcesilaus. Aristotle's legacy was still in the hands of Theophrastus, head of the Lyceum, though in the third century BCE the school would decline in philosophical power as it concentrated on more narrowly scientific problems. Nevertheless, the Aristotelian drive for broad-based philosophical synthesis had an impact on the shape of Stoicism. A significant group of philosophers, forming no particular school but many coming from nearby Megara,

concentrated on dialectic as their principal activity. These included Stilpo, also interested in ethics and metaphysics, and Diodorus Cronus, whose sharply formulated arguments provided powerful challenges in physics and metaphysics and challenged the Stoics to develop dialectic as a central part of their system. The Cynics in turn championed nature (as opposed to narrow polis-based social norms) as the foundation of ethics. All of this contributed to Zeno's formation of a powerful philosophical system whose internal articulation into three parts (logic, physics, ethics) was inspired by the Academic Xenocrates.

Stoicism was named for Zeno's favorite meeting place, the Painted Stoa in the Athenian marketplace. The movement was concentrated in a formal philosophical school in Athens for more than 200 years until political changes resulting from Rome's rise to power led prominent philosophers to spread out around the Mediterranean world, especially to Rhodes, Alexandria, and Rome itself. The climax of this process came when the Roman general Sulla sacked Athens in 86 BCE during the Mithridatic Wars. By the end of the first century BCE, Stoic activity was widely dispersed and had become a central part of intellectual culture in the Greco-Roman world. In the early second century CE, the emperor Hadrian founded a chair of Stoic philosophy in Rome (as well as chairs for the other major schools). With the rise of Neoplatonism, Stoicism gradually faded in prominence, though its influence persisted until the end of antiquity. Its impact on medieval philosophy was sporadic, but in the Renaissance it became an important part of the philosophical legacy of the ancient world to modern philosophy.

## PRINCIPAL STOICS AND THEIR WORKS

The founder of the school, Zeno, was a prolific author whose best-known work was his utopian *Republic*, influenced by his Cynic teachers and by Plato's *Republic*. He wrote extensively on ethics and politics (e.g., *On the Life according to Nature*; *On Law*; *On Human Nature*; *On Passions*; *On Greek Education*), on cosmology (*On the Universe*), on poetry (*Homeric Problems*; *On Listening to Poetry*), and on dialectic (*On Signs*; *Refutations*; *Solutions*). Of his many students, some (Persaeus and Sphaerus) also involved themselves in politics. Cleanthes was a highly prolific writer in the areas of cosmology, physics, ethics, and dialectic. He was also known for his poetry, especially the *Hymn to Zeus* (which has survived entire) and for his interest in Heraclitus. Cleanthes' contemporary Aristo of Chios favored the Cynic side of the

school's heritage and rejected physics and dialectic in favor of a teaching based solely on ethics. Though eclipsed by Cleanthes (who succeeded Zeno as head of the school) and Chrysippus (the third head of the school), Aristo's influence continued to be felt at least until the first century CE.

Chrysippus, the great systematizer of the Stoic tradition, put the school's doctrines on a solid footing after a long period of debate and criticism, especially by the Academic Arcesilaus. Respected as a second founder of the school, he and his students dominated its leadership for many decades. He argued that Zeno's philosophy (as he interpreted it) was essentially correct and thereby stabilized the essential doctrines of the school, which nevertheless continued to be open to internal debate. A highly prolific author (more than 700 books are attributed to him and a partial catalog survives in book 7 of Diogenes' *Lives*), Chrysippus revised and rounded out the areas of physics and ethics and put dialectic, especially the study of formal inference and the theory of language, on a new foundation. He wrote a work in defense of Zeno's *Republic*, evidently declining to abandon the school's Cynic roots, a large number of works on logic and dialectic (including *Logical Investigations*, of which a few fragments have survived among the Herculaneum papyri), and a nearly equal number on logic and physics. The best attested work is certainly his *On Passions*, from which Galen quotes many passages in the course of his criticism of Stoic views on psychology and ethics.

The next phase in the school's history came in the late second and early first centuries BCE, when Panaetius of Rhodes and subsequently Posidonius of Apamea adopted a more open stance toward Platonic and Aristotelian approaches than seems to have been characteristic of Chrysippus. There was, however, no dramatic departure from the earlier school. Prominent among later Stoics is Seneca the Younger, a Roman politician of the first century CE. Many of his works, including the *Moral Epistles to Lucilius*, were highly influential in the early modern period. Other works of Seneca's include *On Benefits* (which offers important arguments in ethics) and *Natural Questions* (on physics and meteorology). His works form the earliest corpus of Stoic writing that has survived to the modern era. Another Stoic was Epictetus, a prolific writer and teacher, mostly of ethics, in the late first century CE. He owed a great deal to Musonius Rufus, a Roman citizen from Etruria who wrote in Greek in the early first century CE. Epictetus's lectures were very influential in later antiquity and the early modern period; this is especially true of his *Handbook*, a compendium drawn

from the *Discourses*, which in turn was compiled by his student Arrian from his lectures. The emperor Marcus Aurelius left a set of personal philosophical reflections, *To Himself*, more commonly titled *Meditations*. In no sense a professional philosopher, Marcus combines a profoundly Stoic point of view, deeply influenced by Epictetus, with a more generalized "philosophical" stance reflecting influences from many traditions.

## CENTRAL IDEAS

The concept of nature played a central role in Stoicism. The key to human fulfillment or happiness (*eudaimonia*) is living according to nature, and Stoic philosophy was based on this conception of the goal of life. The study of the natural world, physics, was a major occupation of virtually all Stoics (Aristo of Chios being a notable early exception). Human nature for the Stoics is characterized by a rationality that, when fully developed, is divine in its perfection. A deep expression of our nature and of that of the cosmos is our capacity for logic. Nature was formally defined as "a craftsmanlike fire, proceeding methodically to creation (*genesis*)" (Diogenes 7.156). God, a fully rational and providential force causally responsible for the world and its orderliness, was equated with nature. Whereas the divine craftsman of Plato's *Timaeus* stood outside the physical cosmos, the rational creator god of Stoicism is completely immanent in the material world.

The Stoics, more than any other ancient school, emphasized the interdependence among the parts of philosophy. They used various similes to illustrate the point. Philosophy is like an animal—logic is the bones and sinews; ethics the flesh; physics the soul. Or it is like an egg—logic is the shell; ethics the white; physics the yolk. Or like agricultural land—logic is the wall around the field; ethics the fruit; physics the land or trees that bear the fruit. Ideas varied about the ordering and relative importance of the three parts and their subdivisions, but all agreed that philosophy, when properly taught, demanded an intimate blend of all three disciplines, regardless of the pedagogical order chosen (Diogenes 7.39–41).

The Stoics based all areas of their thought on a rigorous metaphysical principle that sharply distinguished the corporeal and the incorporeal. The key to this distinction is the argument that only bodies can interact causally, an argument that seems to have emerged from a critique of Plato's metaphysics. Hence god, the soul, nature, and the principles that organize raw matter into intelligible natural kinds are all forms of matter for the Stoics. Even cognitive states such as knowledge are treated

as corporeal dispositions of the material mind, since they have causal impact; so too for virtue and other dispositions. Their theory of perception similarly posits corporeal entities, lending weight to their essentially empiricist epistemology. The Stoics recognized only four incorporeal entities: void, space, time, and “sayables” (*lekta*, roughly, the meanings of thought and speech). Each of these incorporeal entities is parasitic on bodies, a necessary feature of the world but in itself causally inefficacious.

In ethics the central concept was virtue, understood in a distinctively Stoic manner. Human life has a single goal (*telos*): to live according to nature. Following Aristotle, the Stoics called achieving this goal “happiness” (*eudaimonia*). Perfection of our intrinsically rational nature is the only way to do this. This perfection, which they called “virtue” (*aretē*), is the necessary and sufficient condition for achieving our goal. This robust conception of virtue is at the center of Stoic thought and became the defining feature of the school.

## LOGIC

Stoic logic has two parts: dialectic and rhetoric. Dialectic is broader in scope than logic in the modern sense. Yet the Stoics made crucial advances even in logic understood in the narrower modern sense.

Traditionally, rhetoric had been the art of persuasion through speech. As such it was either condemned, as by Plato, or reformed, as by Aristotle. The Stoics restricted rhetoric by insisting that it, like other crafts, must be conducted under norms of truth and virtue. Hence rhetoric became the art of persuading an audience of the truth through orderly discourse and argument, differing from dialectic only in form; rhetoric is merely a more expansive way of achieving such conviction. As Zeno said, rhetoric is an open hand, while dialectic is a closed fist (Sextus 1935, 2.7 [= *Adv. Mathematicos* 2.7]). Stoic ideas about rhetoric understandably had limited influence.

In contrast, their dialectic had considerable influence, since it aimed to be a comprehensive study of human discourse and its relation to truth about the world. It covered the content of discourse as well as the utterances that express that content, both what is signified and what does the signifying. The relationship between linguistic signifiers and their meaning lies at the heart of Stoic dialectic. Accordingly, dialectic covered much of what we classify as epistemology and philosophy of language (including semantics), as well as the study of propositions and their relations. But since what is signified by speech are incorporeal sayables, dialectic also

included aspects of metaphysics and philosophy of mind. The broad Stoic conception of dialectic also covered what we would consider linguistics and grammar, the parts of speech and various forms of speech acts; their theories had great influence on the development of grammar as a discipline.

In perception, on the Stoic theory, we receive through the senses representations of objects and events. A rational animal becomes aware of this representational content by way of a sayable (usually a proposition [*axiōma*], defined as what admits of being true or false), which is dependent on the physical change in the mind. We either assent to this proposition, reject it as being unrepresentative of its alleged correlate in the world, or suspend judgment about its truth. This is the heart of Stoic epistemology. Academic critics of the Stoic theory argued that no sensory representation could be satisfactorily reliable. In defending their theory (in part by positing self-verifying cataleptic representations) and in elaborating how perceptual experience formed the basis for concepts, memories, and the like, the Stoics expanded on the foundations for empirical epistemology that Aristotle had laid.

The most important aspect of Stoic logic is its study of the forms of argument, inference, and validity. Stoics undertook this to defend the truth of their substantive doctrines and to demonstrate the pervasiveness of rational structures in the world. Chrysippus went beyond that goal and plunged into had been the starting point, and the subject had been advanced by the development of challenging paradoxes and puzzles by Megarian and other dialecticians. Chrysippus made the logic of propositions and arguments into a discipline.

Stoic logic takes the proposition (*axiōma*, often symbolized by an ordinal number) as its basic unit of analysis and works with a small set of operators used to connect them: “if,” “and,” “not,” and exclusive “or.” Five basic inference forms were recognized; all valid arguments were supposed to be derivable from these indemonstrable arguments by purely logical means. Stoics attempted to prove this completeness claim with the aid of higher-order logical principles. The five indemonstrables are the following:

- If the first, the second.
- But the first.
- Therefore, the second.
- If the first, the second.
- But not the second.
- Therefore, not the first.

Not both the first and the second.

But the first.

Therefore, not the second.

Either the first or the second.

But the first.

Therefore, not the second.

Either the first or the second.

But not the second.

Therefore, the first.

## PHYSICS

Stoic physics was, in its day, the most up-to-date and influential version of the nonatomistic physics pioneered by Empedocles and developed by Aristotle. Stoics posited a geocentric cosmos made up of earth, air, fire, and water arranged in four roughly concentric spheres. Although the cosmos has no void within it, it is surrounded by an indefinitely large void, which provides room for expansion when the cosmos reaches the end of its finite life span. The Stoics held that the cosmos was generated by the creative intelligence of Zeus and eventually ends by returning to the fire from which it was born. This process repeats itself forever—a doctrine that responds in part to Aristotle's arguments for the eternity of the cosmos. Since things expand when heated, the conflagration that occurs at the end of each cycle requires that there be empty space outside the physical world.

Zeus is a craftsman-god modeled on the creator god of Plato's *Timaeus* and initially identified with a kind of fire. Cosmogony begins when this fire transforms itself in a quasi-biological process that generates the four elements that are the stuff of the world. Fire has a dual role, both as the original divine source and as one of the four elements. Each element is analyzable into two principles, the active and the passive, but these principles are themselves corporeal. The active principle (like Aristotelian form) is immanent everywhere and is responsible for the structure and comprehensibility of things; hence it is often identified as god and reason, a creative form of fire that embodies a divine plan for every aspect of the physical world. This emphasis on unified and immanent divine power made the Stoics pioneers for later forms of pantheism.

Later Stoics (including Chrysippus) revised the role of fire and claimed that the immanent shaping power was better understood as *pneuma*, a unique blend of fire and air with an optimal combination of fluidity and tensile strength. *Pneuma* gives order and shape to things in varying degrees. In lifeless things like rocks it is a disposition

(*hexis*), giving them coherence and shape. In plants it is their "nature" (*phusis*) and accounts for their ability to grow and change. In animals it accounts for the full range of dynamic attributes, including perception and desire; hence it is there called "soul" (*psuchē*). In humans and gods this divine shaping power is labeled "reason" (*logos*). These various forms of a single power unite all entities into a single order, the cosmos. Since both the active shaping power and the passive component of a thing are corporeal, the Stoics had to give an account of how two such bodies could be fused into a perfect mixture. Their sophisticated theory of "total blending" was frequently criticized, but the concept of *pneuma* itself had considerable influence in later centuries.

The Stoics analyzed each individual entity by means of a complex theory that today would fall under the heading of metaphysics. They posit four "genera" or kinds (less helpfully, "categories"), all of which apply to every object. First, each object can be treated as a "substrate"; this merely asserts that it is a material object, a being, without specifying its attributes. Second, each object is "qualified," endowed (by the active principle or by *pneuma*) with structure sufficient to make it a definite thing. Qualities are either common (making the object a kind of thing, such as a human) or peculiar (making it a unique individual, such as Socrates). The third genus specifies dispositions or conditions of an entity (Socrates may be courageous or have frost-bitten feet), while the fourth is termed "relative disposition" and picks out relations such as being the father of someone or being on the right of someone. Though we cannot be certain of all its details, this theory clearly provided the analytical framework for Stoic corporealist physics.

Since the cosmos is a whole united by reason (i.e., the *pneuma* that pervades it), it can be regarded as a single living entity. In this perspective, everything else is a part of the whole, even humans, whose reason is the same in nature as that of Zeus. Hence humans are uniquely situated in the world, subordinate to it as parts but able to understand in principle the unified plan determining all that happens.

From a theological perspective, this plan appears as a providential divine arrangement, but in Stoic physics, it is actually a mere consequence of Stoic causal determinism. There are no uncaused events, so all that happens is determined by antecedent events and states of affairs in the world. The world, then, is a network of causal relationships capable in principle of being explained. If this were not the case, there would be uncaused events, which Stoics thought unacceptable; even the principle of biva-

lence (the claim that every proposition is either true or false) would be threatened, and Chrysippus (contrary to Aristotle and Epicurus) held that this logical principle obtains even for future-tense propositions.

Human thoughts, actions, and decisions are a part of this causally deterministic system, but moral responsibility is not threatened (according to the Stoics), since the decisive causal factor is the character and disposition of the agent as he or she reacts to the world. Critics in the ancient world argued that causal determinism jeopardized moral accountability, but Chrysippus stoutly maintained a distinction between being caused (as human actions are) and being necessitated by factors wholly external to the agent. Stoic compatibilism still seems reasonable to many philosophers, but it remained contentious in the ancient world.

## ETHICS

It is tempting to suppose that for the Stoics ethics is the most important branch of philosophy, subserved by logic and physics. But of all the similes used to describe the relationship among the parts of philosophy, only two support this claim: Posidonius's assertion that ethics is like the soul of an animal (Sextus 1935, 1.19 [= *Adv. Mathematicos* 7.19]) and the claim that ethics is like fruit on the trees (Diogenes 7.39–41). Other Stoics make physics the culmination of philosophical activity. Three factors incline us to regard ethics as the core of Stoic thought: the pattern of ancient philosophical controversy, the accidental bias of the surviving sources, and the fact that Stoic physics is today more obviously obsolete than Stoic ethics. To yield to this tendency is to take sides in a debate within the ancient school, to support the Socratic mission of Aristo of Chios against, for example, Chrysippus, who regarded theology (part of physics) as the culmination of philosophy (Plutarch 1035a).

Philosophy is a craft for living (*technē tou biou*). As a craft, it is based on a body of knowledge, consists in a stable disposition of a rational agent, and has a determinate function (*ergon*) and goal (*telos*). Stoicism is firmly embedded in the eudaimonistic tradition of ancient ethics, where the goal is *eudaimonia*, conventionally translated as “happiness.” For Stoics, the goal is to live in accordance with nature, and their claim is that this consists in living in accordance with virtue, since human virtue is the excellence of our nature. But our nature is fundamentally rational. Hence perfection of human reason is another summary expression of the goal. This remains a merely formal account until substantive Stoic views about human nature are considered. In contrast to

Plato and Aristotle, Stoics denied that the mature human soul contains essentially irrational components. In Stoic thought, there is no lower part of the soul to be tamed and managed by reason; rather, our rational faculties have an affective component, and so emotion and desire are features of some of our cognitive processes. Further, the Stoics held that our rational nature is qualitatively the same as the divine reason embedded in nature, so that our goal requires living in accordance with both human nature and cosmic nature (Diogenes 7.88).

Like all living things, humans are shaped by a fundamental drive to preserve and enhance their nature, a drive visible even in infants but taking on its characteristic form when they mature. This basic drive involves a commitment to pursue the good, understood as what is truly beneficial. Stoics accept the Socratic argument that only virtue is consistently and genuinely beneficial, since an excellence cannot be misused. Other advantageous things (health, pleasure, social standing, etc.) admit of misuse, so their value is merely provisional. They are preferred but not good. There is a similar account of vice (the only truly bad thing) and disadvantageous things like disease and poverty, which are dispreferred but not genuinely bad. This basic duality in Stoic value theory is a central feature of Stoic ethics. Though it is rational to avoid dispreferred things and embrace preferred things in the course of a well-planned human life, only genuine goods demand unconditional commitment.

This is the basis for the notorious Stoic rejection of passions, which are understood as unreasonable and excessive reactions to preferred and dispreferred things. If sickness and poverty are not bad but merely dispreferred, we should not grieve over them (but, of course, we should do our best to avoid them). If wealth is not a strict good, we should not be elated at achieving it (though there is nothing wrong with enjoying it). If a favorable reputation in our community is not an unconditional good, then we need not fear losing it. If romantic attachments are worth having but are not the *sine qua non* of human flourishing, then we should pursue potential partners without obsession. And so forth. Life according to our purely rational nature will be free of passions, but not devoid of affect. For in a life of virtuous choices and actions, there will be many things to want, to shun, and to rejoice over. Such positive affective states were called *eupatheiai*.

Most Stoics accepted the doctrine of the unity of virtues, though there was serious debate about the nature of that unity. But all Stoics held that virtuous action was limited to the sage—a normative ideal of perfected virtue used as a benchmark for good action. The Stoics distin-

guished between appropriate actions (*kathēkonta*), which can be determined by the proper application of moral guidelines and maxims, and genuinely good actions (*katorthōmata*), which are appropriate actions performed from the perfected disposition of a sage. Nonsages may have little real chance to attain wisdom, but their constant striving to determine the appropriate thing and to do is guided by the ideal of the sage. Stoic recommendations for appropriate actions (such as participation in civic life, unless it is hopelessly corrupt) are routinely presented as descriptions of what the sage will do, yet Stoicism does not categorically prescribe any particular actions. Only the commands to follow (or accommodate oneself to) nature and to act virtuously are unconditional.

Stoic ethics is often portrayed as mired in paradox, but we can make better sense of the persistent philosophical appeal of Stoicism if we focus instead on Stoics' stringent and carefully formulated theories in all branches of philosophy and their insistence that these parts should fit together into a coordinated whole, that they should combine the best understanding of the natural world available in their day with a deep commitment to the exercise of human reason as the key to human fulfillment.

## STOUT, GEORGE FREDERICK

(1860–1944)

George Frederick Stout was an English philosopher and psychologist. Records of Stout's early life are scant. He was born in South Shields, Durham. A clever boy at school, he went in 1879 to St. John's College, Cambridge, where he obtained first-class honors in the classical tripos with distinction in ancient philosophy and followed this with first-class honors in the moral sciences tripos with distinction in metaphysics. In 1884 he was elected a fellow of his college, and in 1891 he succeeded George Croom Robertson as editor of *Mind*. He was appointed Anderson lecturer in comparative psychology at Aberdeen in 1896; Wilde reader in mental philosophy at Oxford in 1899; and professor of logic and metaphysics at the University of St. Andrews in 1903. He remained at St. Andrews,

where he was instrumental in establishing a laboratory of experimental psychology, until his retirement in 1936. In 1939 he went to Sydney, Australia, to live with his son Alan, who had been appointed to the chair of moral and political philosophy at the University of Sydney. He spent the remaining years of his life joining vigorously in the discussions of a lively circle of younger philosophers at that university.

Stout's position in the history of philosophy and psychology is at the end of the long line of philosophers who, by reflective analysis, introspection, and observation, established the conceptual framework of what became in his time the science of psychology. He was a pupil of James Ward but not a mere disciple. He assimilated the essentials of Ward's system into his own philosophy of mind, but in the assimilation he transformed and extended them so that he created an entirely original and distinctive philosophy. Although he was formidable in polemical discussion, his bent was to constructive thinking. He assimilated many systems, boasting in later years, "I have got them all in my system" (idealism, realism, rationalism, and empiricism). He acknowledged indebtedness to philosophers as diverse as Benedict de Spinoza and Thomas Hobbes and to the last was preoccupied with the ideas of his contemporaries Bertrand Russell, G. E. Moore, and Ludwig Wittgenstein, and he was far from being unsympathetic to the increasingly influential schools of psychology: behaviorism and the hormic and gestalt psychologies.

In Stout's work there is a progressive development of three main theses: the doctrine concerning thought and sentience; the concept of the embodied self; and a doctrine concerning "conative activity." These central theses entail in their elaboration the reinterpretation of many of the concepts important, historically and analytically, in the philosophy of mind. It is difficult to distinguish clearly, although the attempt is rewarding, between changes (or developments) in Stout's views and changes merely in his terminology. In his earlier writings, for example, he was content to describe the ultimate data of our knowledge of the external world as "sensations." Later he followed Ward in using the term *presentations*, and finally he accepted *sense data* and *sensa* to facilitate discussion with the exponents of the prevailing phenomenalism of the day. The readiness to change his terminology was most striking in his many attempts to convey his distinctive doctrine of thought reference.

## THOUGHT AND SENTIENCE

Since the time of George Berkeley there has been a widely accepted doctrine that cognition begins with simple sensations which are mental states and "in the mind"; that these sensations and their corresponding images are associated in order to form complex ideas; that some of these sensations and images are projected so as to appear as phenomena of the external world; and that these sensations are the ultimate basis of our beliefs about and our knowledge of the external world. Against this Stout set up the proposition that sense experience involves "thought reference" to real objects. As René Descartes had held that "thought" (as he used the term) implies a thinker, so Stout held that "thought" (in the same sense) implies something real and objective which is thought about.

This thesis, prominent in his *Analytic Psychology*, was expressed in terms of the concept of "noetic synthesis." In his characteristic conciliatory way he conceded the abstract possibility of "anoetic sentience" (sense experience without thought reference), but in subsequent writings he was inclined to deny both the occurrence of anoetic sentience and (to coin a phrase for him) "non-sentient noesis" (imageless thought or any form of thought reference independent of sense experience). In the elaboration of this thesis he offered a paradoxical theory of error—one difficult to refute or prove—to the effect that there can be no complete error, no sheer illusion, no pure hallucination. All errors are misinterpretations of fact. This thesis was later expressed in terms of "original meaning," in saying that every sense experience is apprehended as "conditioned by something other than itself," or as an "inseparable phase of something other than itself." It was developed with subtlety and in detail in the genetic psychology of the *Manual of Psychology*.

Following Ward, Stout attempted to give a natural history of the development of human awareness of the world which also offered grounds for our knowledge of what the world is really like. The central thesis here is that we must accept as primary not only the particular sense data of experience but also the categories or ultimate principles of unity: space, time, thinghood, and causality. These are not so much a priori cognitions as dispositions to organize experience in certain ways. We do not, for instance, have a priori knowledge that every event has a cause, but we have a disposition to look for causes. So, *mutatis mutandis*, with the other categories.

## THE EMBODIED SELF

Stout, like Ward, accepted a two-dimensional, tripartite division of mental functions into cognition, feeling, and

conation; and he distinguished self, attitude, and object in each function. However, in the analysis of every concept in this scheme Stout modified every idea he took from Ward. He was more thoroughgoing in his adoption of Franz Brentano's principle that the essential component that distinguishes a mental function from a nonmental one is the attitude or way in which the subject is concerned with its objects. His most fundamental divergence from Ward was in his account of the knowing, feeling, and willing subject (self or ego). His differences from Ward are set out in detail in his important article "Ward as a Psychologist" (*Monist*, January 1926). Here he opposed to Ward's account of the pure ego his own view that the self as first known in sensible experience is that thing whose boundary from other things is the skin.

The *Manual of Psychology* contains a puzzling and confusing chapter, "Body and Mind," that combines a critique of the classical theories of interactionism, epiphenomenalism, and parallelism, all of which presupposed Cartesian dualism, with a defense of a version of parallelism that did not. This chapter puzzled students until, many years later, Stout was able to set out more clearly (especially in the Gifford Lectures) his basic philosophical thesis. This was a rejection of a dualistic ontology (that there are two sorts of substance, material things and minds) and a defense of a dualism of attributes—physical and mental—combined in a single entity, the embodied mind, which has both physical and mental attributes united somewhat as the primary and secondary characteristics are united in a material object as it is apprehended in naive perceptual situations. This view of the self entailed a corresponding reanalysis of the mental attitudes of cognition, feeling, and conation.

Stout discarded the dualism of substances but retained the dualism of qualities in his account of mental dispositions. These came to be described as "psychophysical dispositions" in accounts of the instincts, sentiments, attitudes, and other proposed ultimate sources of behavior. In this he anticipated and inspired the hormic psychology of William McDougall and, less directly, the theory of personality elaborated by Gordon Allport. McDougall was to describe the ultimate springs of human conduct in terms of certain innate primary psychophysical dispositions to perceive and attend to certain objects, to feel emotional excitement in the presence of such objects, and to experience an impulse to act in certain ways in regard to those objects. Allport later defined these sources of behavior as mental and neural "states of readiness" for such experiences and activities. In Stout

these concepts are embodied in a more radical account of conative activity and conative dispositions.

## CONATION

Although he accepted the classical tripartite division of mental functions, Stout accorded a certain priority to conation, so much so that he encouraged what has been described as the "conative theory of cognition," such as that developed by his contemporary Samuel Alexander. (The last paper published by Stout was "A Criticism of Alexander's Theory of Mind and Knowledge," *Australian Journal of Psychology and Philosophy*, September 1944.) The term *conative activity* covers all psychophysical processes which are directed to a goal (whether anticipated or not). It includes such cognitive processes as observation, recollection, and imagination, which are directed to the attainment of clearer and fuller perception of things present, the reconstruction of the past, and the comprehension of future possibilities. Conation is divided into practical and theoretical conation. Practical conative activity is directed to producing actual changes in the objects and situations with which the subject has to deal in the real world. Theoretical conation is directed to the fuller and clearer apprehension of such objects and situations. Stout's account of theoretical conation was in effect his account of attention. Attention is theoretical conation, although it incorporates practical conation through determining sensory-motor adjustments and the manipulation of instruments that facilitate clarity of perception.

Traditional accounts of association and reproductive and productive thinking were similarly revised and restated in conative terms. The law of association by contiguity was reformulated as the law of association by continuity of interest. One basic idea in all later theories of productive or creative thinking derives from Stout's account of "relative suggestion," an expression introduced by Thomas Brown that led to confusion between Stout's usage and Brown's.

In his treatment of all these concepts, Stout advanced beyond Ward and contributed significantly to the transition of psychology from a branch of philosophy to a science of human experience and behavior. These contributions were largely ignored, however, because of the powerful movements in psychology that were adverse to what had come to be described as "armchair psychology," that is, the purely formal analysis of psychological concepts. Stout's influence on philosophical thought outside his own circle of associates was also limited because of the reaction against "speculative" philosophy and the

increasing restriction of philosophical discussion to analysis, more especially to the analysis of linguistic usage.

Stout's philosophy was, mistakenly, treated as being in the tradition of metaphysical speculation and the creation of systems in the grand manner. His final position is most fully set out in the two volumes of Gifford Lectures. These embody many clarifications of concepts in the philosophy of mind and some acute criticism of earlier expositions of materialism and of contemporary phenomenalism. They contain the only records of Stout's views on aesthetics and ethics and his more tentative speculations concerning God, teleology, and the nature of material things. There is probably no philosopher who in his own thinking so smoothly made the transition from the prevailing idealism of the late nineteenth century to the prevailing critical, nonspeculative philosophy of the mid-twentieth century. Something of the idealist tradition is preserved in his sophisticated defense of philosophical animism, but more important are his detailed contributions to the transition from the philosophy of mind of the nineteenth century to that of the twentieth.

## STRATO AND STRATONISM

Little is known for sure about the life and work of Strato of Lampsacus, third head of Aristotle's school. He lived in Alexandria as tutor to the young Ptolemy Philadelphus for some time before he took over the leadership of the Peripatos; during this time he likely came into contact with the doctors and scientists patronized by the Ptolemaic court. He was head of Aristotle's school in Athens from Theophrastus's death in 286 BCE until his death in 268 or 269 BCE. The school seems to have dwindled into obscurity after Strato's time: Explanations offered for this include a suspect story that the school lost its library after Theophrastus's death.

Strato was known in antiquity as "the natural philosopher," possibly because of his insistence on separating the study of the natural world from any dependence on the divine. He reportedly ascribed all natural events to forces of weight and motion. He rejected Aristotle's doctrine of the fifth element, and also the idea that air and fire have an independent tendency to move upward, claiming instead that they are squeezed out by the fall of heavy bodies. His physics seems to have been basically Aristotelian, because he stressed the role of hot and cold in effecting change; yet he seems to have made changes in the doctrine of the void, because he held that it is at least possible within the cosmos. One report claims that he held that matter has passageways to allow the passage of light and heat. Controversy surrounds the relationship between Strato's view of the void and that of later Hellenistic theories of pneumatic effects. His best-known contributions to natural philosophy include attempts to prove the downward acceleration of falling bodies.

Besides work on logic, metaphysics, and ethics, Strato wrote a number of works on medical topics. Perhaps following Hellenistic medical research, he seems to have offered a naturalistic account of the soul, ascribing its functions to a substance, *pneuma*, carried in passageways throughout the body. He located the center of the soul's activity between the eyebrows, rejecting Aristotle's view that the heart is the center. He regarded reasoning as a causal movement in the soul, and offered lists of objections to Plato's arguments for the immortality of the soul.

Strato may have had some impact amongst the scientific figures in Alexandria, but his greatest notoreity was acquired some two millenium later. Ralph Cudworth characterized Strato's approach—which he called "hylozoism," the idea that matter is inherently alive—as a par-

ticularly pernicious brand of atheism. Although there is little evidence that this is Strato's view, his name became identified in the Enlightenment with a kind of naturalistic atheism.

## STRAUSS, DAVID FRIEDRICH

(1808–1874)

David Friedrich Strauss, the German theologian, historian of religion, and moralist, was born at Ludwigsburg in Württemberg. He studied from 1821 to 1825 at Blaubeuren, where he fell under the influence of the Hegelian theologian F. C. Baur, and at the Tübingen Stift from 1825 to 1831. He next attended the University of Berlin, where he heard lectures by G. W. F. Hegel and Friedrich Schleiermacher. In 1832 he went to the University of Tübingen as lecturer, remaining there until 1835, the year of the publication of the first volume of his most important work, *Das Leben Jesu kritisch bearbeitet* (2 vols., Tübingen, 1835–1836; translated from the 4th German edition by George Eliot as *The Life of Jesus Critically Examined*, London, 1848). The universal storm of public indignation that this book occasioned resulted in his dismissal from the university and his permanent retirement from academic life. Master of a clear and forthright prose style, Strauss had no difficulty supporting himself as a journalist and popular exponent of the view that religion—Christianity in particular—is an expression of the human mind's capacity to generate myths and treat them as truths revealed by God to man.

When he began his study of the Gospels, Strauss was neither a liberal nor a materialist. His original interests had been those of a Hegelian idealist; he had meant to

study the available records of Jesus' life in order to distinguish their historically valid content from the theological accretions that had become associated with them during the first two centuries of the Christian era. His investigations convinced him, however, that the principal importance of the Gospels was aesthetic and philosophical, not historical. On the one hand, the Gospels provided insight into the Messianic expectation of the Jewish people in the late Hellenistic period; on the other hand, they reflected a memory of the exceptional personality of a great man, Jesus. Thus envisaged, the Gospels were a synthesis of notions peculiar to the Jews regarding the nature of world history and of certain moral teachings associated with the name of a purely human, yet historically vague, personality, presented in an aesthetically pleasing form for members of a new religious community that was both Jewish and Greek in its composition. For Strauss, the Gospels were, in short, interesting primarily as evidence of the workings of consciousness in the sphere of religious experience: they showed how the mind could fabricate miracles and affirm them as true, contrary to the Hegelian dictum, then regarded as an established truth, that the real was rational and the rational was real.

Had Strauss halted at this point, his work might have been ignored as merely another vestige of the free thought of the Enlightenment. Instead, he went on to argue that even if the historicity of the account of Jesus's life in the Gospels were denied, it need not follow that the Gospels were a product of conscious invention or fraud. He held, rather, that they could be said to belong to a third order of mental activity, called by Hegel unconscious invention or myth and defined by him as an attempt to envision the Absolute in terms of images derived from sensible experiences. As unconscious invention, the Gospels were to be viewed as poetic renderings of man's desire to transcend the finitude of the historical moment, as evidence of the purely human desire to realize the immanent goal of Spirit in its journey toward the Hegelian Being-in-and-for-itself. Thus, although Strauss had denied that the Gospels were evidence of the direct intrusion of the divine into history or even of the true nature of Jesus' life, he had, in his own view, at least salvaged them as documents in the history of human expression. In doing so, of course, he had reduced them to the same status as the pagan myths, legends, and epics.

In a second work, *Die christliche Glaubenslehre* (2 vols., 1840–1841), Strauss tried to clarify the theoretical basis of his original historical inquiry. He argued that Christianity was a stage in the evolution of a true pantheism that had reached its culmination in Hegelian philos-

ophy. What the poet and mystic took for God was nothing but the world—specifically, man in the world—conceived in aesthetic terms. Science studied the same phenomena that are governed by physical laws, and philosophy was, as Hegel had taught, mind reflecting on these prior activities of thought and imagination.

*Das Leben Jesu* became a cause célèbre in a Germany growing increasingly reactionary both politically and intellectually. The attack launched against Strauss from all quarters soon made him a symbol to German liberals; he was regarded as a martyr of science and freedom of thought. Accordingly, Strauss was drawn into political as well as theological polemics. In 1848 he published at Halle a defense of bourgeois liberalism, *Der politische und der theologische Liberalismus*. He later turned to the study of philosophical materialism (that of Friedrich Albert Lange and of Charles Darwin) and to the production of a series of historical works on leading advocates of freedom of thought in European history (for example, a long biography of Ulrich von Hutten, 1858, and a study of Voltaire, 1870). As he progressed, he repudiated the Hegelianism of his first book. In a preface to a later edition of *Das Leben Jesu*, he stated that he had undertaken it to show “to those to whom the conceptions ... as to the supernatural character ... of the life of Jesus had become intolerable ... [that] the best means of effectual release will be found in historical inquiry.” Abandoning the last residues of his earlier idealism, he argued that “everything that happens, or ever happened, happened naturally.” He still recognized the aesthetic value of the Gospel account, but he now saw it as providing the image of the good life that had finally become possible on this earth because of the triumphs of science and industrial technology and the advance of political liberalism. It was this position that won for him the enmity of both Karl Marx and Friedrich Nietzsche. To Marx, he was the bourgeois *idéologue* par excellence, who tried to combine Christian sentimental ethics and the practices of capitalism in a single package. For Nietzsche, Strauss represented the German *Bildungsphilister* who made a show of intellectual radicalism but always left the conventional morality intact.

Strauss remained to the end of his life the spokesman of popular religious criticism, materialistic in his intention but Hegelian in method, a combination which allowed him to accommodate almost any position that appealed to him. After 1850 his political and social criticism became increasingly conservative—aristocratic, monarchical, and nationalistic. In part this transformation was due to the suspicion that popular democracy would be in general as unable to recognize genius as it

had been unable to recognize, in particular, the value of Strauss’s own works; but this transformation was also a result of his attempt to move from Hegelianism to positivism. In the second half of the eighteenth century, positivist social thought had become—as, for example, in Hippolyte Taine—a kind of crude determinism, hostile to any revolutionary impulse.

To the young Hegelians, who were already becoming aware of the methodological limitations of Hegel’s late thought, *Das Leben Jesu* provided an impulse to the critical, empirical study of the historical milieu within which *Geist* supposedly manifested itself, and it thus prepared them to accept Leopold von Ranke’s historicism. To German liberals, Strauss remained a symbol of the risks that had to be run by any German who presumed to espouse radical causes. The later Marxists regarded Strauss as merely a confused bourgeois who had blundered onto forbidden ground. For them, the way to a true revision of Hegelianism was provided by Ludwig Feuerbach. Feuerbach saw that the true importance of Strauss’s *Das Leben Jesu* lay in a problem that remained implicit in the work and was hardly touched upon by Strauss himself: the psychological problem about the nature of the mythmaking mechanism that distinguishes man from the rest of nature. It was Feuerbach, then, rather than Strauss, who posed the question with which German philosophy had to come to terms in the 1840s—the question of the relation between human consciousness and its material matrix.

## STRAWSON, PETER FREDERICK

(1919–)

Peter Frederick Strawson, the British philosopher, was educated at Christ's College, Finchley, and St. John's College, Oxford. He holds the BA and MA degrees and is a fellow of University College, Oxford.

### LANGUAGE AND LOGIC

Strawson is a leading member of the circle of philosophers whose work is sometimes described as “ordinary language philosophy” or as “Oxford philosophy.” Of his early work, the most influential and most controversial is the famous article “On Referring” (*Mind*, 1950), a criticism of the philosophical aspects of Bertrand Russell's theory of definite descriptions. According to Russell's theory any sentence of the form “The *f* is *g*”—for example, “The king of France is bald”—is properly analyzed as follows (in terms of our example): “There is a king of France. There is not more than one king of France. There is nothing which is king of France and which is not bald.”

Strawson argues that this analysis confuses referring to an entity with asserting the existence of that entity. In referring to an entity, a speaker presupposes that the entity exists, but he does not assert that it exists, nor does what he asserts entail that it exists. Presupposition is to be distinguished from entailment. In asserting something of the form “The *f* is *g*,” a speaker refers or purports to refer to an entity with the subject noun phrase, and to do so involves presupposing that there is such an entity, but this is quite different from asserting that there is such an entity.

According to Strawson this confusion between referring and asserting is based on an antecedent confusion between a sentence and the statement made in a particular use of that sentence. Russell erroneously supposes that every sentence must be either true, false, or meaningless. But, Strawson argues, sentences can be meaningful or meaningless and yet cannot strictly be characterized as true or false. Statements, which are made using sentences, but which are distinct from sentences, are, or can be, either true or false. The sentence “The king of France is bald” is indeed meaningful, but a statement made at the present time using that sentence does not succeed in being either true or false because, as there is presently no king of France, the purported reference to a king of France fails. According to Russell the sentence is meaningful and false. According to Strawson the sentence is meaningful, but the corresponding statement is neither true nor false because one of its presuppositions—namely, that there is a king of France—is false.

In another well-known article of this early period, “Truth” (*Analysis*, 1949), Strawson criticizes the semantic theory of truth and proposes an alternative analysis to the effect that “true” does not describe any semantic properties or, indeed, any other properties at all, because its use is not to describe; rather, we use the word *true* to express agreement, to endorse, concede, grant, or otherwise accede to what has been or might be said. Strawson explicitly draws an analogy between the use of the word *true* and J. L. Austin's notion of performatives. Like performatives, *true* does not describe anything; rather, if we examine its use in ordinary language, we see that it is used to perform altogether different sorts of acts.

This article gave rise to a controversy with Austin, a defender of the correspondence theory. The gist of Strawson's argument against the correspondence theory is that the attempt to explicate truth in terms of correspondence between statements on the one hand and facts, states of affairs, and situations on the other must necessarily fail because such notions as “fact” already have the “word–world relationship” built into them. Facts are not something which statements name or refer to; rather, “facts are what statements (when true) state.”

In his first book, *Introduction to Logical Theory* (New York and London, 1952), Strawson continued his investigation of the logical features of ordinary language by studying the relations between ordinary language and formal logic. The book, he says, has two complementary aims: first, to compare and contrast the behavior of ordinary words with the behavior of logical symbols, and, second, to make clear the nature of formal logic itself. It is in

the first of these two enterprises that he has shown the more originality and aroused the more controversy. The theme of this part of the book is that such logical systems as the propositional and predicate calculi do not completely represent the complex logical features of ordinary language and indeed represent them less accurately than has generally been supposed. He argues that the logical connectives, especially “ $\vee$ ,” “ $\supset$ ,” and “ $\equiv$ ,” are much less like “or,” “if,” and “if and only if” than is often claimed. In his discussion of predicate logic (Chs. 5 and 6), he continues the themes of “On Referring,” arguing that certain orthodox criticisms which are made of traditional Aristotelian syllogistic fail because of a failure to appreciate the fact that statements made in the use of a sentence of the form “All  $f$ s are  $g$ ” presuppose the existence of members of the subject class.

Thus, for example, the question whether it is true that all John’s children are asleep does not even arise if John has no children. Once it is seen that statements of the form “All  $f$ s are  $g$ ” have existential presuppositions, it is possible to give a consistent interpretation of the traditional Aristotelian system. The failure to understand this and the misconception regarding the relation of the predicate calculus to ordinary language are in large part due to the same mistakes that underlie the theory of descriptions: the failure to see the distinction between sentence and statement; the “bogus trichotomy” of true, false, or meaningless; and the failure to see the distinction between presupposition and entailment.

The final chapter of the book contains a discussion of probability and induction in which Strawson argues that attempts to justify induction are necessarily misconceived, since there are no higher standards to which one can appeal in assessing inductive standards. The question whether inductive standards are justified is as senseless as the question whether a legal system is legal. Just as a legal system provides the standards of legality, so do inductive criteria provide standards of justification. Underlying this point is the fact that inductive standards form part of our concept of rationality. It is, he says, a necessary truth that the only ways of forming rational opinions concerning what happened or will happen in given circumstances are inductive.

## METAPHYSICS

In the middle 1950s Strawson’s concerns shifted from investigations of ordinary language to an enterprise he named descriptive metaphysics. This enterprise differs from “revisionary metaphysics” in that it is content to describe the actual structure of our thought about the

world rather than attempting to produce a better structure, and it differs from ordinary conceptual analysis in its much greater scope and generality, since it attempts to “lay bare the most general features of our conceptual structure.”

These investigations resulted in the publication of a second book, *Individuals* (London, 1959). The book is divided into two parts. Part One, titled “Particulars,” deals with the nature of and preconditions for the identification of particular objects in speech; Part Two, “Logical Subjects,” concentrates on the relations between particulars and universals and on the corresponding and related distinctions between reference and predication and subjects and predicates. The first important thesis of the book is that from the point of view of particular identification, material objects are the basic particulars. What this means is that the general conditions of particular identification require a unified system of publicly observable and enduring spatiotemporal entities. The material universe forms such a system. Material objects can therefore be identified independently of the identification of particulars in other categories, but particulars in other categories cannot be identified without reference to material objects. This provides us, then, with a sense in which material objects are the basic particulars as far as particular identification is concerned.

A second thesis, one of the most provocative of the book, concerns the traditional mind/body problem. In Chapter 3, titled “Persons,” Strawson attacks both the Cartesian notion that states of consciousness are ascribed to mental substances, which are quite distinct from but nonetheless intimately connected to bodies, and the modern “no-ownership” theory, according to which states of consciousness are not, strictly speaking, ascribed to anything at all. Both views, he argues, are ultimately incoherent. The solution to the dilemma posed by these views is that the concept of a person is a primitive concept. It is a concept such that both states of consciousness and physical properties are ascribable to one and the same thing—namely, a person. The concept of a mind is derivative from the primitive concept of a person, and the concept of a person is not to be construed as a composite concept made up of the concept of a mind and the concept of a body. The recognition of the primitiveness of the concept of a person enables us to see both why states of consciousness are ascribed to anything at all and why they are ascribed to the very same thing to which certain physical states are ascribed.

Most of Part Two of *Individuals* is devoted to an investigation of the problems of the relations of subjects

and predicates. Strawson considers two traditional ways of making the distinction between subject and predicate: a grammatical criterion in terms of the different kinds of symbolism for subject and predicate expressions and a category criterion in terms of the distinction between particulars and universals. He investigates the “tensions and affinities” between these two criteria, and he concludes that the crucial distinction between the way a subject expression introduces a particular into a proposition and the way a predicate expression introduces a universal into a proposition is that the identification of a particular involves the presentation of some empirical fact which is sufficient to identify the particular (this harks back to the doctrine of what is presupposed by identifying references in “On Referring” and *Introduction to Logical Theory*), but the introduction of the universal term by the predicate term does not in general involve any empirical fact. The meaning of the predicate term suffices to identify the universal that the predicate introduces into the proposition. One might say that identifying reference to particulars involves the presentation of empirical facts; the predication of universals involves only the presentation of meanings. This enables us to give a deeper sense to Gottlob Frege’s notion that objects are complete—in contrast to concepts, which are incomplete—and it enables us to account for the Aristotelian doctrine that only universals and not particulars are predicable.

In tone, method, and overall objectives, *Individuals* stands in sharp contrast to Strawson’s earlier work. Piecemeal investigation of ordinary language occurs here only as an aid and adjunct to attacking large traditional metaphysical problems. One might say that *Individuals* employs essentially Kantian methods to arrive at Aristotelian conclusions. Yet much of the book is at least foreshadowed by Strawson’s earlier work, particularly “On Referring” and certain portions of his first book. The notion of descriptive metaphysics itself has been as influential as the actual theses advanced in *Individuals*. More than any other single recent work, this book has resurrected metaphysics (albeit descriptive metaphysics) as a respectable philosophical enterprise.

## STRING THEORY

Physicists believe there to be four fundamental forces. Three of these—the electromagnetic, the strong force, and the weak force—are amalgamated in the standard model of elementary particle physics, a family of quantum field theories that has enjoyed stupendous empirical success. Gravity, the fourth and feeblest fundamental force, is the subject of a stupendously successful *non-quantum* field theory, Einstein’s general theory of relativity (GTR). Desiring to fit all of fundamental theoretical physics into a quantum mechanical framework, and suspecting that GTR would break down at tiny (“Planck scale,” i.e.,  $10^{-33}$  cm) distances where quantum effects become significant, physicists have been searching for a quantum theory of gravity since the 1930s. In the last quarter of the twentieth century, string theory became the predominant approach to quantizing gravity, as well as to forging a unified picture of the four fundamental forces. A minority approach to quantizing gravity is the program of loop quantum gravity, which promises no grand unification. Both attempts to quantize gravity portend a science of nature radically different from the Newtonian one that frames much of classical philosophical discourse. They also present gratifying instances of working physicists actively concerned with recognizably philosophical questions about space, time, and theoretical virtue.

## THE STANDARD MODEL

String theory would quantize gravity by treating the gravitational force as other forces are treated. In the standard model, pointlike elementary particles, quarks, and leptons constitute matter. Each particle is characterized by invariants, such as mass, spin, charge, and the like. The matter-constituting particles have half-integer multiples of spin, which makes them fermions. Beside fermions, the standard model posits gauge bosons, “messenger parti-

cles” or carriers of the interaction, for each force in its ambit. Bosons are distinguished from fermions by having whole-integer multiples of spin. As early as 1934, preliminary work on the sort of coupling with matter required by a quantum theory suggested that, if the gravitational force had a gauge boson, it must be a mass 0 spin 2 particle, dubbed the *graviton*. No such particle is predicted by the standard model.

According to string theory, the elementary particles of the standard model are not the ultimate constituents of nature. Filamentary objects—strings—are. Different vibrational modes of these strings correspond to the different masses (charges, spins) of elementary particles. The standard model is recovered, and fundamental physics unified, in a string theory incorporating vibrational modes corresponding to every species of particle in the standard particle zoo (and so incorporating the strong, weak, and electromagnetic forces), as well as to the graviton (and so incorporating gravity).

#### THE EARLY YEARS OF STRING THEORY

String theory evolved from attempts, undertaken within the standard model in the 1970s, to model the strong nuclear force in terms of a band between particles. As a theory of the strong nuclear force, these attempts suffered in comparison to quantum chromodynamics. They also predicted the existence of a particle that had never been detected: a mass 0 spin 2 particle. In 1974, John Schwartz and Joël Scherk proposed to promote this empirical embarrassment to a theoretical resource: The undetected particle, they suggested, was in fact the graviton! (Further evidence that string theory encompasses gravity comes in the form of a consistency constraint on the background spacetime in which string theoretic calculations are carried out, which consistency constraint resembles the equations of GTR.)

String theory evolved piecemeal in the 1970s and 1980s, roughly by adapting perturbative approximation techniques developed for the standard model’s point particles to stringy entities. One benefit of the adaptation was the suppression of infinities that arise in perturbative calculations for point particles. In the standard model, these infinities call for the expedient of renormalization, the barely principled subtraction of other infinities to yield finite outcomes. Perturbative string theories require no such expedient. Worries that they harbored inconsistencies all their own, called *anomalies*, were allayed by Schwartz’s and Michael Green’s 1984 argument that string theories were anomaly-free—a result that galvanized research in the field.

By the early 1990s there were five different consistent realizations of perturbative string theory. These realizations shared some noteworthy features. First, their equations were consistent only in ten space-time dimensions. To accord with the appearance that space is three-dimensional, the extra six dimensions are supposed to be Planck-scale and compactified (“rolled up”). (The usual analogy invokes the surface of a cylinder, which is a two-dimensional object: one dimension runs along the length of the cylinder; the other is “rolled up” around its circumference. Supposing the rolled-up dimension to be small enough, a cylinder looks like a one-dimensional object, a line.) Details of the geometries of these extra dimensions influence the physics string theory predicts. These details are adjustable; only with certain choices of the geometries can string theory mimic the standard model.

The initial string theories dealt only with bosons. So that they might incorporate fermions as well, *supersymmetry* was imposed. That is, the equations of string theory were required to be invariant under half-integer changes in spin. Thus the theory predicts for every particle in the standard zoo that it has a supersymmetric partner. For the (spin 1/2) electron, a spin 0 “selectron;” for the (spin-1) photon, a spin 1/2 “photino,” and so on. Of these supersymmetric partners, none are observable using present technologies. But there is hope of detecting the lightest, the neutralino, with the Large Hadron Collider, slated to come on-line at CERN in 2007.

Parameters describing, for example, coupling strengths or the volume of the compactified extra dimensions appear in string theories. This means that each string theory can be thought of as a member of a family of related string theories, obtained from the first by varying the values of these parameters. A *duality* is said to obtain between theories so related. In the mid-1990s, Ed Witten and others uncovered evidence of dualities connecting pairs in the set of five consistent perturbative string theories. This emboldened Witten to propose that the existing, approximate, string theories were all approximations to a single underlying exact theory he dubbed “M-theory.” Although the equations of M-theory are unknown, it is believed that they hold in an eleven-dimensional spacetime, and have eleven-dimensional supergravity (ironically enough, a leading contender for the title “theory of everything” which string theory dislodged in the early 1980s) as their low-energy limit. In addition to strings, M-theory boasts higher-dimensional supersymmetric objects—membranes—some theorists have put to cosmological use, for example, by maintain-

ing that the three spatial dimensions of this world are a three-brane moving through an eleven-dimensional universe harboring other worlds such as this one.

Most predictions of fledgling programs in quantum gravity are experimentally inaccessible, and liable to stay that way. But a nonempirical circumstance is widely believed to confirm string theory. In black hole thermodynamics (developed by Stephen Hawking, Jacob Bekenstein, and others), black holes are attributed properties, such as temperature and entropy, that obey thermodynamic laws. (For instance, entropy, identified as the surface area of a black hole's future event horizon, never decreases.) For certain black holes known as extremal black holes, string theoretic calculations exactly reproduce the Bekenstein entropy formula. Although there has never been an observation confirming (or disconfirming) black hole thermodynamics, the recovery of the black hole entropy formula is widely held to be evidence that string theory is on the right track.

More empirical tests have been proposed, none strong. For example, if the extra dimensions posited by string theory are large enough, new mechanisms for the production of microscopic black holes could be unleashed at energies attainable in the Large Hadron Collider. But string theory is not required to posit large extra-dimensions. So the failure of microscopic black holes to appear would not force the abandonment of string theory.

Despite its successes, there are causes for complaint about string theory. It is not an exact theory yet. Its predictions might seem unduly sensitive to the discretionary matter of the geometry of the extra dimensions. In addition to predicting the existence of the standard particles and the graviton, it predicts the existence of infinitely many particles, including supersymmetric particles, humans have not seen (yet). It requires seven extra spatial dimensions humans have not seen (yet). And as formulated *at present*, it takes place in a fixed space-time background.

## STRING THEORY AND LOOP QUANTUM GRAVITY

The game of background-independent M-theory is afoot; some (e.g., Smolin 2001) hope that its pursuit will reveal connections between string theory and its main rival, loop quantum gravity. Background-independence is the rallying cry of the (much less populated) loop quantum gravity camp. Largely trained as general relativists, adherents of this approach take the fundamental moral of GTR to be that space-time is not a setting in which physics

happens but is itself a dynamical object, malleable in response to the matter and energy filling it. Whereas string theory seeks a quantum theory of gravity on the model of early twenty-first century quantum theory of other forces—a model that adds a graviton to a particle zoo revealed by approximations carried out in a fixed spacetime background—loop quantum gravity seeks a quantum theory of gravity by quantizing gravity: that is, by casting GTR as a classical theory in Hamiltonian form, and following a canonical procedure for quantizing such theories. Insofar as GTR's variables determine the geometry of space-time, should the quantization procedure succeed, space-time itself would be the commodity quantized.

The quantization procedure is complicated by the fact that GTR is a constrained Hamiltonian system: its canonical momenta are not independent. Instead, they satisfy constraint equations that must be reflected in the final quantum theory. The origin of these constraint equations is the diffeomorphism invariance of GTR, that is, if one starts with a solution to the equations of GTR and smoothly reassigns the dynamical fields comprising that solution to the manifold on which they are defined, one winds up with a solution to the equations of GTR. Adherents of loop quantum gravity take diffeomorphism invariance to express the background independence of GTR.

Loop quantum gravity exploits a Hamiltonian formulation of GTR due to Abhay Ashtekar, a physicist at Syracuse University. Its quantization is set in a Hilbert space spanned by spin-network states: graphs whose edges are labeled by integer multiples of  $1/2$ . Not set in some background space, these spin-network states are supposed to be the constituents from which space is built. Defined on their Hilbert space are area and volume (but not length) operators that have discrete spectra. A free parameter in the theory can be adjusted so that this quantization occurs at the Planck scale. On these grounds, its adherents claim loop quantum gravity to be a background-independent exact theory that quantizes space. Like string theory, loop quantum gravity finds quasi-confirmation in its accord with black hole thermodynamics: for all black holes, loop quantum gravity reproduces the Bekenstein entropy within a factor of 4.

Despite its successes, there are causes for complaint about loop quantum gravity. It does not incorporate the predictions of the standard model. So whereas it may be a quantum theory of gravity, it is not a theory of everything. More telling, loop quantum gravity as yet fails to

reflect the full diffeomorphism invariance of GTR in a way that is both consistent and has GTR as its classical limit. The sticking point is the classical Hamiltonian constraint, related to diffeomorphisms that can be interpreted as time translations. Until this constraint is wrangled, loop quantum gravity lacks a dynamics: it consists of a space of possible instantaneous spacetime geometries, without an account of their time development. Given loop quantum gravity's ideology of background-independence, this is disappointing.

There is no established philosophy of quantum gravity. But there is much to provoke the philosopher. What, according to string theory or loop quantum gravity, is the nature of space(-time)? How many dimensions has it? (These questions are complicated by dualities between string theories revealed by varying the volumes of their compactified geometries, as well as by the holographic hypothesis, according to which physics in the interior of a region—an  $n$ -dimensional space—is dual to physics on that region's boundary—an  $(n-1)$ -dimensional space.) The search for quantum gravity was set off by no glaring empirical shortcoming in existing theories, and has reached theories for which no empirical evidence is readily forthcoming. In the absence of empirical adequacy, other theoretical virtues occupy center stage: the ideal of unification, the capacity to reproduce the results, or preserve the insights, of other theories (even unconfirmed ones); the susceptibility of puzzles posed in one theoretical framework to solution techniques available in another. The nature of these virtues, and how best to pursue them, are often live questions for quantum gravity researchers. Their work holds interest for the methodologist and the metaphysician alike.

## STRUCTURALISM, MATHEMATICAL

Structuralism is a view about the subject matter of mathematics according to which what matters are structural relationships in abstraction from the intrinsic nature of the related objects. Mathematics is seen as the free exploration of structural possibilities, primarily through creative concept formation, postulation, and deduction. The items making up any particular system exemplifying the structure in question are of no importance; all that matters is that they satisfy certain general conditions—typically spelled out in axioms defining the structure or structures of interest—characteristic of the branch of mathematics in question. Thus, in the basic case of arithmetic, the famous "axioms" of Richard Dedekind (taken over by Giuseppe Peano, as he acknowledged) were conditions in a definition of a "simply infinite system," with an initial item, each item having a unique next one, no two with the same next one, and all items finitely many steps from the initial one. (The latter condition is guaranteed by the axiom of *mathematical induction*.) All such systems are structurally identical, and, in a sense to be made more precise, *the shared structure* is what mathematics investigates. (In other cases, multiple structures are allowed, as in abstract algebra with its many groups, rings, fields, and so forth.) This structuralist view of arithmetic thus contrasts with the absolutist view, associated with Gottlob Frege and Bertrand Russell, that natural numbers must in fact be certain definite objects, namely classes of equinumerous concepts or classes.

Historically, structuralism can be traced to nineteenth-century developments, including the rise of the axiomatic method and of non-Euclidean geometries leading to the recognition of multiple abstract spaces independent of *physical* space and of spatial intuition. David Hilbert, whose work in the foundations of geometry (1959 [1899]) was especially influential in this regard,

remarked that “points, lines, and planes” could be read as “tables, chairs, and beer mugs” (suitably interrelated; Shapiro, p. 157). In instructive correspondence with Frege, Hilbert championed the structuralist view of axioms in pure mathematics as defining structures of interest rather than as assertions whose terms must already be understood. In the twentieth century, the development of modern algebra and set theory informed the influential views of the Bourbaki, who explicitly espoused a set-theoretic version of structuralism. Virtually any mathematical structure (or “space,” e.g. metric, topological, and so forth) can be conceived or modeled as a set of objects with certain distinguished relations and/or operations on the set, and set theory has the resources for describing a wealth of interrelationships among structures, vital to advanced mathematics. The branch of logic known as *model theory* develops these ideas systematically.

Despite the success of set-theoretic structuralism in providing a unified framework for all major branches of mathematics, as an articulation of structuralism, it confronts certain problems. Notable among these is that it makes a major exception in its own case: despite the multiplicity of set theories (differing over axioms such as well-foundedness, choice, large cardinals, constructibility, and others), the axioms are standardly read as assertions of truths about “the real world of sets” rather than receiving a structuralist treatment. Questions then arise about this “fixed universe as background”: How does one know about this real-world structure, how rich it is at its various levels, and how far its levels extend? The (putative) set-theoretic universe cannot be a set; yet as a totality of a different order, is it not indefinitely extendable, contrary to its purported universality? These and related questions have led some philosophers, logicians, and mathematicians to develop alternative ways of articulating structuralism.

### ALTERNATIVE ARTICULATIONS TO STRUCTURALISM

The main alternatives to set-theoretic structuralism to be described here are, first, the view of structures as *patterns* or *sui generis universals*, developed by Michael Resnik and Stewart Shapiro, respectively; second, an eliminative, nominalistic *modal structuralism*, traceable in part to Russell and Hilary Putnam and developed by Geoffrey Hellman; and, finally, a version based on *category theory*, as a universal framework for mathematics independent of set theory, suggested by Saunders Mac Lane and others.

THE VIEW OF STRUCTURES AS PATTERNS OR UNIVERSALS. On the view of structures as patterns or universals, apparent reference to special objects in mathematics is taken at face value. Moreover, the reason that such objects are typically identified only by reference to operations and relations within a structure is that in fact they are *inherently incomplete*. They are to be thought of as *positions* or *places* in a pattern, on analogy with, say, the vertices of a triangle. For Resnik, identity and difference among positions make sense only in the context of a structure given by a theory. The number 2, say, is identified as the successor of 1, the predecessor of 3, and so on, but not intrinsically. Indeed, whether the natural number  $2 =$  the real number 2 is indeterminate, except relative to a subsuming structure specified by a broader theory; and then it would still be indeterminate whether the numbers of the new theory were the same as or different from the respective old ones. This theory-relativity of reference and identity—besides leading to complications in the account of the common mathematical practice of embedding structures of a prior theory in those of a later one, as well as in the account of applications of mathematics—reflects Resnik’s reluctance to think of patterns as an ontological foundation for mathematics. Talk of patterns may be only analogical, helping free one from the grip of traditional Platonism. Thus, a mathematical theory of structures is not given, in part because *its* objects could not then be identified with those of existing mathematical theories, defeating its purpose.

In contrast, Shapiro takes ontology seriously and develops an axiom system governing the existence of *antem* structures, abstract archetypes with places as objects, answering to that which particular realizations have in common. The background logic is second-order and the axioms resemble those of Zermelo-Fraenkel set theory but with an added *Coherence Postulate* guaranteeing an existing structure modeling any *coherent* second-order axiom system, where this new primitive is understood as analogous to the logical notion of *satisfiability*. Knowledge of key instances of this postulate arises naturally, it is argued, from their learning how to use mathematical language together with certain axioms characterizing the structure of interest (e.g. the principle of continuity of the real number system).

Although this view circumvents some of the objections raised against the set-theoretic version, it confronts a number of objections of its own. One (due to Jukka Keränen and John Burgess) points out that, whereas objects in a structure should be distinguishable entirely in terms of internal structural relationships, this is possible

only in cases admitting no nontrivial automorphisms (1-1 structure preserving maps from the class of places to itself other than the identity map). The natural numbers and the reals are “rigid” in this sense, but many nonrigid structures arise in mathematics (e.g. the complex numbers, permuting  $i$  and  $-i$ , or homogeneous Euclidean spaces under isometries, and so forth). A further objection finds a circularity in the account of abstraction offered; the relevant structural relations can only be distinguished from others generated, say, from permutations of objects if those objects (the places) can be picked out independently, contrary to the idea of “structural objects.” (This revives a well-known argument of Paul Benacerraf against numbers as objects generally.) Finally, although not committed to any maximal universe of sets, *ante rem* structuralism seems committed to a universe of all places in structures, contrary to the view that any such totality should be extendable.

**MODAL-STRUCTURALISM.** Turning to modal-structuralism, this view dispenses with special structural objects and indeed even with structures as objects, recognizing instead the possibility that enough objects—of whatever sort one likes—could be interrelated in the right ways as demanded by axioms or conditions appropriate to the mathematical investigation at hand. As suggested by Russell, the irrelevance of any intrinsic features of “mathematical objects” arises through *generalization*: statements “about numbers,” for instance, are not about special objects but about whatever objects there might be, collectively standing in the right sort of ordering. By speaking of wholes and parts and utilizing a logic of plurals—reasoning about many things at once without having to talk of sets or classes of them—such generalizations, even over functions and relations, can be framed in nominalistic terms. The effect is to generalize over “structures there might be” without actually introducing structures as entities. Extendability is respected, as it makes no sense to collect “all structures, or items thereof, that there might be.” Assuming the logical possibility of countably infinitely many objects, one can recover full classical analysis and, with coding devices, modern functional analysis and more. The main price paid for all of this is the adoption of a primitive notion of *possibility*, something set theory *explains* in terms of the existence of models. The gain is a circumvention of problems of reference to *abstracta* and a natural way of respecting indefinite extendability of mathematical domains.

**CATEGORY-THEORETIC STRUCTURALISM.** The final approach considered here is based on category theory. Having arisen in mathematics proper to help solve problems in algebraic topology and geometry, it can also serve as a general framework for mathematics. Its basic concepts are *mappings* (*morphisms* or *arrows*) between *objects*, and their *compositions*. The objects are typically what the other approaches call structures, described in relation to other such objects via morphisms (“arrows only”), not internally via set membership. Morphisms typically preserve relevant structure (algebraic, topological, differentiable, and so forth). *Toposes* are families of objects and morphisms with richness comparable to models of Zermelo set theory; they can serve as universes of discourse for mathematics. Generalizations of set-theoretic ideas are provided (such as Cartesian product, function classes, and logical operations, which generally obey intuitionistic laws, i.e. excluding the “law of excluded middle,”  $p$  or not  $p$ , for arbitrary  $p$ ). In contrast to set theory with its fixed universe, topos theory promotes a pluralistic conception of “many worlds,” functionally interrelated (cf. Bell).

It is clear that there are some interesting similarities between category-theoretic structuralism and modal-structuralism, and indeed the latter can be adapted to accommodate the former. Whether category-theoretic structuralism can stand on its own, however, is an open question that turns on such issues as whether its basic concepts are really intelligible without set theory, just what its background logic presupposes, and whether a theory of category of categories can serve as an autonomous framework.

In sum, structuralism has become a major arena for exploring central questions of ontology and epistemology of mathematics.

## STRUCTURALISM AND POSTSTRUCTURALISM

Structuralism emerged as a dominant intellectual paradigm in France in the late 1950s in part in response to the existentialist emphasis on subjectivity and individual autonomy—personified in the work and person of Jean-Paul Sartre—and in part as a reflection of the rising influence of research in the human sciences. In fact, structuralism has its origins in the work of the Swiss linguist Ferdinand de Saussure (1857–1913), whose 1906–1911 lectures at the University of Geneva, published on the basis of student notes in 1916 as the *Cours de linguistique générale*, provide structuralism's basic methodological insights and terminology. While Saussure's *Cours* makes frequent reference to a science that will study language as a system, it was the Russian-born linguist Roman Jakobson (1896–1982) who first used the

term *structuralism* in 1929, and it was Jakobson who introduced the basic principles of Saussurean linguistics to both the anthropologist Claude Lévi-Strauss (1908–) and the psychoanalyst Jacques Lacan. Lévi-Strauss and Lacan, along with the philosopher Louis Althusser (1918–1990) and the literary theorist Roland Barthes, together are viewed as the dominant figures in French structuralism whose work in the 1950s and 1960s revolutionized how one thought about the human sciences, psychoanalysis, literature, and Marxism.

What unites these structuralist theorists is less a shared set of philosophical theses than a shared set of methodological assumptions and a willingness to work with the concepts of Saussurean linguistics. Drawing on the four binary oppositions central to Saussurean linguistics—signifier (*signifiant*) and signified (*signifié*), langue and parole, synchronic and diachronic, and infrastructure and superstructure—and privileging in their analyses the former term in each binary pair, the structuralists were able to develop theories that diminished the role of the individual subject or agent while highlighting the underlying relations that govern social and psychic practices.

Saussure defined the linguistic sign as the unity of a sound-image (signifier) and a concept (signified). The signifier is that aspect of a sign that can become perceptible, the psychological imprint of the word-sound or the impression it makes on one's senses, while the signified is a set of psychological associations, the mental picture or description associated with a signifier. In general, then, the signifier is the material (auditory or visual) component of a sign, while the signified is the mental concept associated with that sign. By langue, Saussure meant the set of interpersonal rules and norms that speakers of a language must obey if they are to communicate; langue is the theoretical system or structure of a language like English, French, or Italian. By contrast, parole is the actual manifestation of the system in speech and writing, the speech act, language as used. The distinction between langue and parole is the distinction between structure and event, between a collective product passively assimilated by the individual and the individual act.

By synchronic Saussure named the structural properties of a system at a particular historical moment, while the diachronic referred to the historical dimension of a language, the historical evolution of its elements through various stages. Finally, infrastructure refers to the set of underlying relations that explain the superstructure or surface structure that is open to observation and description. For Saussure, langue functions as the infrastructure

to parole as superstructure, while, oversimplifying greatly, on Althusser's reading of Marx, the relations of means and modes of material production are the infrastructure, while ideology (family, religion, law, social organizations, etc.) is the resultant superstructure, or on Lacan's reconstruction of Sigmund Freud, the dynamic relations among the id, ego, and superego play themselves out at the infrastructural level, while the observable superstructural effects are displayed through behavior.

Their social scientific emphasis on structures also led the structuralists to downplay the role of consciousness, which figured so prominently in existentialism and phenomenology. This deflation of the importance of consciousness and subjectivity—the so-called “death of the subject”—can be seen in all the structuralists' work. Lévi-Strauss's structural analysis of myths, for example, suggests we interpret myths as parole or speech acts that are not the articulations of any particular conscious subject but are instead expressions and variations of a few basic structural relations that form a culture's langue, the set of interpersonal rules and norms that operate unconsciously and that actors in a culture must obey if they are to function. So, in *The Raw and the Cooked* (*Le cru et le cuit*) (1964), Lévi-Strauss analyzes 187 separate myths, showing them all to be variations, transformations, reversals, inversions, and so on of a deep structural opposition between the raw and the cooked, which is itself at the superstructural level of myth the expression of the underlying infrastructural opposition of nature and culture.

This methodological privileging of structure—the underlying rules or general laws—over event—the act of articulating the myth—leads structuralism to place emphasis on synchronic relations rather than on diachronic developments. The structuralists are thus concerned with studying particular systems or structures under somewhat artificial and ahistorical conditions in the hope of explaining their present functioning, as we see in Althusser's concentration on the various ideological state apparatuses at work at a given time in a society rather than the historical evolution of these various cultural formations, or in Barthes's emphasis on writing (*écriture*) as a function that exceeds the author's desire to express or communicate (which Barthes associates with style).

Poststructuralism is the name bestowed in the English-speaking philosophical and literary communities on the ideas of several French philosophers whose work arose as a distinctly philosophical response to the privileging of the human sciences that characterized structuralism. Under the name *poststructuralism* are brought

together a number of theorists and theoretical positions that, in France, are often positioned far apart. The name is, however, preferable to either *deconstructionism* or *postmodernism*, which are frequently taken to be synonymous with *poststructuralism* as a rubric under which are grouped together the work of Jacques Derrida, Michel Foucault, Gilles Deleuze, and Jean-François Lyotard, as well as Luce Irigaray, Julia Kristeva, and Hélène Cixous. By contrast, in France only Derrida would be associated with deconstruction, and only Lyotard with postmodernism and, contrary to their English-speaking reception, each of these philosophers is considered to have a distinct project that results only rarely in any two of them being treated together by interpreters sympathetic to their work.

One can locate the emergence of poststructuralism in Paris in the late 1960s: Foucault published *Les mots et les choses: Une archéologie des sciences humaines* in 1966; Derrida published *De la grammatologie, L'écriture et la différence* and *La voix et le phénomène* in 1967; and Deleuze published *Différence et répétition* in 1968 and *Logique du sens* in 1969.

While not wanting to overlook the important differences between these thinkers, there are nevertheless certain themes and trends that do emerge in various ways in the work of many of the French philosophers and theorists who follow structuralism. In some cases these should be seen as correctives to the excesses of structuralism, in other cases as various ways in which thinkers coming into prominence in the late 1960s and early 1970s were to give expression to the Nietzschean-Freudian-Marxian spirit of the times, and in still other cases as a way of retrieving themes from some of the French traditions that had fallen out of favor during the scientific orientation of the 1950s and early 1960s—the return of certain ethical, spiritual, and religious themes, along with some positions associated with phenomenology and existentialism. What cannot be denied, and should not be underestimated, is that the hegemony of structuralist social scientific thinking in the late 1950s and early 1960s was followed by the reemergence of the value of specifically philosophical thinking.

One way to understand their specifically philosophical orientation is to note that while the poststructuralists, like their structuralist predecessors, drew heavily on the ideas of Marx and Freud, unlike the structuralists, they drew at least as much from the third so-called master of suspicion—Friedrich Nietzsche. Nietzsche's critique of truth, his emphasis on interpretation and differential relations of power, and his attention to questions of style

in philosophical discourse became central motifs within the work of the poststructuralists as they turned their attention away from the human sciences and toward a philosophical-critical analysis of writing and textuality (Derrida); relations of power, discourse, and the construction of the subject (Foucault); desire and language (Deleuze); questions of aesthetic and political judgment (Lyotard); and questions of sexual difference and gender construction (Irigaray, Kristeva, and Cixous).

And so, while the structuralist theorists had turned away from philosophy, theorists following structuralism readily identify themselves as philosophers. This is not surprising when one remembers that most of the poststructuralist philosophers “came of age” in an intellectual environment dominated by Sartre’s existentialism and they all studied and were profoundly influenced by Maurice Merleau-Ponty’s thinking on language and corporeality as well as Martin Heidegger’s critique of the history of metaphysics. But unlike most philosophical thinkers in France who preceded the rise of structuralism, French philosophers after structuralism engage in philosophical reflection and analysis while taking account of the institutional and structural forces that inform philosophical thinking itself.

Although it is impossible to locate any set of themes that unite all the poststructuralist philosophers, it would not be inaccurate to note certain motifs that appear frequently in their works: an attention to questions of language, power, and desire that emphasizes the context in which meaning is produced and makes problematic all universal truth and meaning claims; a suspicion toward binary, oppositional thinking, often opting to affirm that which occupies a position of subordination within a differential network; a suspicion toward the figure of the humanistic human subject, challenging the assumptions of autonomy and transparent self-consciousness while situating the subject as a complex intersection of discursive, libidinal, and social forces and practices; and a resistance to claims of universality and unity, preferring instead to acknowledge difference and fragmentation. Situating these philosophical thinkers after structuralism, then, three themes in particular can be highlighted: the return to thinking historically, the return of thinking about the subject, and the emphasis on difference.

### THE RETURN TO THINKING HISTORICALLY

There are many ways in which philosophical thinking in France after structuralism can be viewed as a corrective to the overemphasis on synchrony that one finds in struc-

turalist writing. There is no single reason behind this, nor a single form in which French philosophy after structuralism seeks to think time, temporality, or history. But where the structuralists sought to understand the extratemporal functioning of systems (whether social, psychic, economic, or literary), thinkers like Foucault, Derrida, Deleuze, or Lyotard attend to the historical unfolding of the phenomena they choose to examine. In part, the attention to time, temporality, and history can be viewed as a consequence of the intellectual resources to which these thinkers appeal, resources that were not necessarily central to the work of their structuralist predecessors. Foucault, for example, draws on the study of the history of science and scientific change in the work of Georges Canguilhem (1904–1995) and Gaston Bachelard, while Deleuze returns to Henri Bergson’s theories of time and *durée* (duration) as well as Nietzsche’s eternal return. For Derrida, it is primarily Heidegger’s focus on Being and the history of philosophy as a history of the forgetting of the ontological difference (the difference between Being and beings) that leads him to think in terms of the history of metaphysics as a history of logocentrism and ontotheology.

### THE RETURN OF THINKING ABOUT THE SUBJECT

Where the rhetoric of the “death of the subject” was characteristic of the structuralists, this was never really the case with most of the philosophers labeled *poststructuralist*. To be sure, thinkers like Derrida, Foucault, or Deleuze were never comfortable with the subject-centered thinking of the existentialists or phenomenologists. But they were equally uncomfortable with the straightforwardly antihumanist rhetoric of structuralist thinkers like Althusser or Lévi-Strauss. Thus, Derrida could reply to a question concerning the “death of the subject” that the subject is “absolutely indispensable” and that he does not destroy the subject but situates it in terms of “where it comes from and how it functions.”

Even Foucault, who can arguably be associated with the rhetoric of the “death of the subject” in his works of the early 1960s, can at the same time be shown to have been thinking about the question of the construction of the modern subject throughout his oeuvre. That is to say, a distinction can and should be drawn between the “end of man” and the “death of the subject.” It may be the case that Foucault’s early work engages in thinking the end of man, as we can see, for example, in the closing pages of *The Order of Things* (*Les mots et les choses*). But it would be a mistake to equate the referent of “man” in these early

contexts with what Foucault means by “subject.” There is no question that the subject named “man” in philosophical discourse, from René Descartes’s *cogito* to Immanuel Kant’s autonomous rational moral agent, is a concept toward which Foucault has little sympathy. But even in a supposedly antihumanist work like the essay “What Is an Author?” (1969) Foucault’s desire to deflate the subject as epistemically and discursively privileged is not conjoined with an attempt to eliminate the subject entirely. Instead, Foucault seeks to analyze the subject as a variable and complex function of discourse and power, which, he writes, means to ask not “How can a free subject penetrate the substance of things and give it meaning?” but “How, under what conditions and in what forms, can something like a subject appear in the order of discourse? What place can it occupy in each type of discourse, what functions can it assume, and by obeying what rules?”

What this means, and what has been largely misunderstood by many of Foucault’s critics, is that his so-called antihumanism was not a rejection of the human *per se*; it was instead an assault on the philosophically modern idea that sought to remove man from the natural world and place him in a position of epistemic, metaphysical, and moral privilege that earlier thought had set aside for God. Foucault’s work is less an antihumanism than an attempt to think humanism and the subject after the end of (modern) man. Far from being a thinker of the “death of the subject,” Foucault simply refuses to accept the subject as given, as the foundation for ethical or rational thinking. The subject is, instead, something that has been historically created and Foucault’s work, in its entirety, is engaged in analyzing the various ways that human beings are transformed into subjects, whether subjects of knowledge, of power, of sexuality, or of ethics.

For feminist thinkers writing after structuralism, the question of the subject was also central to their work as they sought to challenge both philosophical and psychoanalytic assumptions concerning the subject as sexed or gendered male or masculine. The feminists don’t object to the subject simply being sexed or gendered; it is the subject’s being sexed/gendered male that is the object of their criticisms. Although there are important differences between the theoretical positions of Cixous, Irigaray, or Kristeva, insofar as these “difference feminists” argue for sexual difference and the significant and important differences between male and female desire, they had to argue that there were important differences between male and female subjects. And to make this argument required that they refuse to follow the structuralist project of entirely eliminating the subject.

So, for example, while Irigaray acknowledges that insofar as the logic of subjectivity has relegated women to the position of object, one should not give up the possibility of occupying the position of the subject insofar as this is a position that women have heretofore never been able to occupy. In fact, she suggests that insofar as the circulation of women as objects of social-sexual exchange has been foundational to the Western patriarchal social order, one should not underestimate the possibilities for radical social transformation if women were to finally emerge as “speaking subjects.”

The “speaking subject” is also a central focus of Kristeva’s work, as she defines her project of analytical semiology or semanalysis, in part, as one of reinserting subjectivity into matters of language and meaning. Such a subject would not, of course, be a Cartesian or Husserlian subject, who could function as a pure source of meaning. Rather, following the discoveries of Freud, Lacan, and structural linguistics (Saussure and Émile Benveniste [1902–1976]), the “speaking subject” will always be a “split subject,” split between conscious motivations and the unconscious, between structure and event, and between the subject of the utterance (*sujet d’énonciation*) and the subject of the statement (*sujet d’énoncé*). Elsewhere, in *Revolution and Poetic Language* (*La révolution du langage poétique: L’avant-garde à la fin du XIXe siècle, Lautréamont et Mallarmé*) (1974), this subject is developed as a subject-in-process/on-trial (*sujet-en-procès*), a dynamic subject at the intersection of the semiotic and the symbolic, making itself and being made, but a subject nonetheless.

## THE EMPHASIS ON DIFFERENCE

One of the essential themes of Saussure’s linguistics was that “in language there are only differences *without positive terms*” (Saussure 1959). By this, he meant that language functions as a system of interdependent units in which the value of each constituent unit results solely from the simultaneous presence of other units and the ways each unit differs from the others. This attention to difference led the structuralists to emphasize in their analyses relations rather than things and to focus on the differential relations between the objects they studied rather than the objects themselves. While the structuralists all took note of this theme, the emphasis on difference did not become truly dominant until after the hegemony of the structuralist paradigm began to wane. It has already been noted that sexual difference is a theme that almost all the feminist thinkers after structuralism have addressed. Indeed, Irigaray goes so far as to suggest that,

if Heidegger is right in thinking that each epoch has but a single issue to think through, then “sexual difference is ... the issue of our age” (Irigary 1993, p. 5). Similarly, Cixous sees the rigid conceptualization of sexual difference as what supports the identification of the male/masculine with the Same, while the female/feminine is rendered Other. For Cixous, the way out of this patriarchal system is not through the elimination of difference but through escaping the dominant logic of difference as hierarchal opposition to a new logic of difference in which “difference would be a bunch of new differences” (Cixous and Clément 1986).

Sexual difference is only one form in which the post-structuralist attention to difference has appeared. Insofar as Derrida’s philosophical project began as an attempt to deconstruct the logocentric history of metaphysics as a metaphysics of presence that invariably privileges the temporal present, his coining of the neologism *différance* sought to situate at the foundation of deconstructive analysis an attention to difference by highlighting both meanings of the French verb *différer*: to defer in terms of delay over time and to differ in terms of spatial nonidentity. Insofar as *différance* names the movement of both temporal deferring and spatial differing, it stands as the transcendental condition for the possibility of differentiation, that is, *différance* is what makes differences possible.

This attention to difference—rather than a focus on identity or the Same—is particularly central to the projects of Lyotard and Deleuze. For Deleuze, whose work often takes a form of presentation much more in the mold of traditional philosophical analysis than the other philosophers writing after structuralism, difference has been a central and constant focus of his thinking. His *Nietzsche et la philosophie* (1962), which was the first of the major French interpretations of Nietzsche to appear, appeals to the concept of difference to show how Nietzsche departs from the Hegelian tradition (where Hegel’s dialectic supersedes difference, Nietzsche’s philosophy affirms it), to explicate Nietzsche’s will to power (as the differential element between active and reactive forces), and to interpret Nietzsche’s thought of the eternal recurrence (not as the eternal return of the same but as the repetition of difference). Deleuze develops these themes much further in *Différence et répétition* as he attempts to think the concept of difference in itself while challenging the metaphysical tradition for associating difference with opposition and the negative and privileging identity and the Same as primary.

For Lyotard, whose work is more closely tied to post-modernism than the other French philosophers, what characterizes the postmodern, as he puts it in the introduction to *The Postmodern Condition (La condition post-moderne: Rapport sur le savoir)* (1979), is an “incredulity toward metanarratives.” Rather than naming a specific epoch, the postmodern names, instead, an antifoundationalist attitude that exceeds the legitimating orthodoxy of the moment. Postmodernity, then, does not follow modernity but resides constantly at the heart of the modern, challenging those totalizing and comprehensive master narratives (like the Enlightenment narrative of the emancipation of the rational subject or the Marxist narrative of the emancipation of the working class) that serve to legitimate its practices. In place of these grand meta- and master narratives, Lyotard suggests one looks instead to less ambitious “little narratives” that refrain from totalizing claims in favor of recognizing the specificity and singularity of events. To refuse to sanction the move to a metanarrative in the ethical, political, aesthetic, and metaphysical domains commits one to a philosophy of difference in that it accepts that oppositions will not be resolved in some higher unity and concludes that multiple and discordant voices are not only inevitable but desirable.

Beyond his postmodernist polemic, reflecting on difference operates at the core of what Lyotard considered his most important work, *Le Différend* (1983), in which he attempts to account for radical and incommensurable differences in the discourses of ethics and politics, that is, those incommensurable differences that will not admit any shared standard to which one could appeal in making judgments concerning what is different. The *différend* is thus defined as “a case of conflict, between (at least) two parties, that cannot be equitably resolved for lack of a rule of judgment applicable to both arguments” (Lyotard 1988). For Lyotard, once one has given up on master narratives, one must also give up on a master narrative of justice or the good to which all parties will agree. While such a master narrative is presupposed for a democratic politics based on consensus and agreement, the political question for Lyotard is ultimately the question of how to make decisions in the case of a *différend* in which, by definition, no consensus is possible. The choice, it would seem, is either violence or a new kind of political thinking that can accommodate *différends* in a shared social space where norms work to minimize evil rather than maximize good and where evil is itself defined in terms of the continued interdiction of different possibilities.

## INFLUENCE

The impact of poststructuralism on philosophy, aesthetics, literary studies, and social theory has been extensive. While Continental philosophy was, during the 1970s, dominated by issues related to phenomenology, existentialism, and the works of Edmund Husserl, Heidegger, and Sartre, in the early 2000s the scope of Continental philosophy is increasingly focused on issues that originate in the works of post-1960 French thinkers. Derrida, and deconstruction, has been a major force in literary theory and criticism since the early 1970s. Since the early 1980s, Derrida has become a major influence in philosophical studies and he and Foucault have had the widest influence on English-language writers. Since 1980 other poststructuralist texts have appeared in translation and, as a consequence, we now see the impact on philosophers of Deleuze's important and innovative readings of major philosophical figures (David Hume, Benedict [Baruch] de Spinoza, Gottfried Wilhelm Leibniz, Kant, Nietzsche, and Bergson) as well as his analyses, alone and in collaboration with Félix Guattari, of psychoanalysis, cinema, art, literature, and contemporary culture; Lyotard's essays on politics, aesthetics, and art history, plus his important reflections on Kant's *Critique of Judgment* and questions of modernity and postmodernity; Irigaray's critical rereadings of Freud, the philosophical canon (Plato, Descartes, Heidegger, Nietzsche, Merleau-Ponty, and Emmanuel Levinas), and her reflections on language and sexual difference; Cixous's engendering writing and reflecting on its relations to the body, particularly the feminine body; and Kristeva's thinking on semiotics, abjection, and desire in language.

## PRIMARY WORKS

- Althusser, Louis. *Pour Marx*. Paris: F. Maspero, 1965. English-language translation: *For Marx*. Translated by Ben Brewster. London: Verso, 1990.
- Cixous, Hélène, and Catherine Clément. *La jeune née*. Paris: Union générale d'Éditions, 1975. English-language translation: *The Newly Born Woman*. Translated by Betsy Wing. Minneapolis: University of Minnesota Press, 1986.
- Deleuze, Gilles. *Différence et répétition*. Paris: Presses universitaires de France, 1968. English-language translation: *Difference and Repetition*. Translated by Paul Patton. New York: Columbia University Press, 1994.
- Deleuze, Gilles. *Logique du sens*. Paris: Éditions de Minuit, 1969. English-language translation: *The Logic of Sense*, edited by Constantin V. Boundas. Translated by Mark Lester with Charles Stivale. New York: Columbia University Press, 1990.
- Deleuze, Gilles. *Nietzsche et la philosophie*. Paris: Presses universitaires de France, 1962. English-language translation: *Nietzsche and Philosophy*. Translated by Hugh Tomlinson. New York: Columbia University Press, 1983.
- Deleuze, Gilles, and Félix Guattari. *Capitalisme et schizophrénie. 1. L'anti-Oedipe*. Paris: Éditions de Minuit, 1972. English-language translation: *Anti-Oedipus*. Translated by Robert Hurley, Mark Seem, and Helen R. Lane. New York: Viking Press, 1977.
- Deleuze, Gilles, and Félix Guattari. *Capitalisme et schizophrénie. 2. Mille plateaux*. Paris: Éditions de Minuit, 1980. English-language translation: *A Thousand Plateaus: Capitalism and Schizophrenia*. Translated Brian Massumi. Minneapolis: University of Minnesota Press, 1987.
- Deleuze, Gilles, and Félix Guattari. *Qu'est-ce que la philosophie?* Paris: Éditions de Minuit, 1991. English-language translation: *What Is Philosophy?* Translated by Hugh Tomlinson and Graham Burchell. New York: Columbia University Press, 1994.
- Derrida, Jacques. *De la grammatologie*. Paris: Éditions de Minuit, 1967. English-language translation: *Of Grammatology*. Translated by Gayatri Chakravorty Spivak. Baltimore, MD: Johns Hopkins University Press, 1976.
- Derrida, Jacques. *L'écriture et la différence*. Paris: Éditions du Seuil, 1967. English-language translation: *Writing and Difference*. Translated by Alan Bass. Chicago: University of Chicago Press, 1978.
- Derrida, Jacques. *Marges de la philosophie*. Paris: Éditions de Minuit, 1972. English-language translation: *Margins of Philosophy*. Translated by Alan Bass. Chicago: University of Chicago Press, 1982.
- Foucault, Michel. *The Essential Works of Michel Foucault, 1954–1988*. 3 vols., edited by Paul Rabinow. Vol. 1: *Ethics: Subjectivity and Truth*, edited by Paul Rabinow; translated by Robert Hurley (New York: New Press, 1997). Vol. 2: *Aesthetics, Method, and Epistemology*, edited by James D. Faubion; translated by Robert Hurley (New York: New Press, 1998). Vol. 3: *Power*, edited by James D. Faubion; translated by Robert Hurley (New York: New Press, 2000).
- Foucault, Michel. *Histoire de la sexualité. 1. La volonté de savoir*. Paris: Éditions Gallimard, 1976. English-language translation: *The History of Sexuality. Vol. One: An Introduction*. Translated by Robert Hurley. New York: Vintage Books, 1980.
- Foucault, Michel. *Les mots et les choses: Une archéologie des sciences humaines*. Paris: Éditions Gallimard, 1966. English-language translation: *The Order of Things: An Archeology of the Human Sciences*. New York: Vintage Books, 1970.
- Foucault, Michel. *Surveiller et punir: Naissance de la prison*. Paris: Éditions Gallimard, 1975. English-language translation: *Discipline and Punish: The Birth of the Prison*. Translated by Alan Sheridan. New York: Vintage Books, 1977.
- Irigaray, Luce. *Ce sexe qui n'en est pas un*. Paris: Éditions de Minuit, 1977. English-language translation: *This Sex Which Is Not One*. Translated by Catherine Porter with Carolyn Burke. Ithaca: Cornell University Press, 1985.

- Irigaray, Luce. *An Ethic of Sexual Difference*. Translated by Carolyn Burke and Gillian C. Gill. Ithaca, NY: Cornell University Press, 1993.
- Irigaray, Luce. *Speculum de l'autre femme*. Paris: Éditions de Minuit, 1974. English-language translation: *Speculum of the Other Woman*. Translated by Gillian C. Gill. Ithaca: Cornell University Press, 1985.
- Kristeva, Julia. *Desire in Language: A Semiotic Approach to Literature and Art*, edited by Leon S. Roudiez. Translated by Thomas Gora, Alice Jardine, and Leon S. Roudiez. New York: Columbia University Press, 1980.
- Kristeva, Julia. *Pouvoirs de l'horreur: Essai sur l'abjection*. Paris: Éditions du Seuil, 1980. English-language translation: *Powers of Horror: An Essay on Abjection*. Translated by Leon S. Roudiez. New York: Columbia University Press, 1982.
- Kristeva, Julia. *La révolution du langage poétique: L'avant-garde à la fin du XIXe siècle, Lautréamont et Mallarmé*. Paris: Éditions du Seuil, 1974. English-language translation: *Revolution in Poetic Language*. Translated by Margaret Waller. New York: Columbia University Press, 1984.
- Lacan, Jacques. *Écrits*. Paris: Éditions du Seuil, 1966. English-language translation: *Écrits: A Selection*. Translated by Alan Sheridan. New York: W. W. Norton, 1977.
- Lévi-Strauss, Claude. *Anthropologie structurale*. Paris: Plon, 1958. English-language translation: *Structural Anthropology*. Translated by Claire Jacobson and Brooke Grundfest Schoepf. New York: Basic Books, 1963.
- Lévi-Strauss, Claude. *Mythologiques. 1. Le Cru et le cuit*. Paris: Plon, 1964. English-language translation: *The Raw and the Cooked*. Translated by John and Doreen Weightman. New York: Harper and Row, 1969.
- Lévi-Strauss, Claude. *Les structures élémentaires de la parenté*. Paris: Presses universitaires de France, 1949. English-language translation: *The Elementary Structures of Kinship*. Edited by Rodney Needham. Translated by James Harle Bell and John Richard von Sturmer. Boston: Beacon Press, 1969.

## STUMPF, KARL

(1848–1936)

Karl Stumpf, the German psychologist and philosopher, was born in Wiesentheid, Bavaria. He studied law at Würzburg, but under the influence of Franz Brentano his interests turned to philosophy and psychology. In 1868 he took a degree at Göttingen, under Rudolf Hermann Lotze, with a dissertation on the relation between Plato's God and the Idea of the Good. In 1869 he entered the Catholic seminary in Würzburg, where he studied St. Thomas Aquinas and the Scholastics. A year later, having lost his faith in orthodox Christianity and having abandoned the idea of becoming a priest, he left the seminary and became docent at Göttingen, where he taught for three years. His acquaintances included the philosopher and psychologist Gustav Fechner, who used Stumpf as a subject for his experiments in aesthetics.

Stumpf's passionate fondness for music motivated his pioneering research in the psychology of sound perception. In 1873 he became professor of philosophy at Würzburg and in 1879, at Prague. His associates included Ernst Mach and Anton Marty. In 1884 he moved to Halle, where Edmund Husserl (who later dedicated his *Logische Untersuchungen* to Stumpf) became his student. Stumpf moved to Munich in 1889, but his heretical religious views made him uncongenial to some of his orthodox colleagues and to the authorities. He therefore accepted a professorship in Berlin in 1894. There he founded the Phonogram Archive, devoted to collecting recordings of primitive music, and the Psychological Institute, and for a time he directed research in Immanuel Kant and Gottfried Wilhelm Leibniz at the Academy of Sciences. Besides Husserl, his most famous student was Wolfgang Köhler, the Gestalt psychologist. William James, who praised Stumpf's *Tonpsychologie* very highly, was a friend and correspondent.

Stumpf contributed greatly to the development of psychology from a branch of philosophy into an empirical science. His own experimental work was largely concerned with acoustical phenomena, but he also wrote on other topics in psychology, such as the theory of emotions. As a philosopher, Stumpf was an empiricist who preferred John Locke and George Berkeley to the tradition of German idealism. He praised Kant for emphasizing the concepts of necessity and duty but rejected the view that the categories are a priori (by which Stumpf meant innate) and not derived from perceptions. The category of substance, or "thing," he maintained, is a concept that can be traced back to such actual experiences as that

of perceiving the close interpenetration of the parts of a whole. The constituent characteristics of a sensory feeling, such as quality and intensity, form a whole rather than a mere aggregate. Experience includes the perceiving of relations; it does not consist merely of individual sensations that need to be related by the understanding.

In the realm of mental functions, all simultaneous states of consciousness and intellectual and emotional activities are perceived as a unity. The concept of a substance, whether of a physical or a psychological substance, is not that of a bundle of qualities, as with David Hume, but is a unity of qualities and relations. As for the concept of cause, Stumpf believed that both Kant and Hume were wrong; we can sometimes actually perceive a causal nexus as opposed to a mere sequence, and this experience is the origin of the category of cause. For example, when our thought processes are governed by some interest or mood, we do not first experience the interest and only subsequently its effects; rather, we are aware of the interest and its effects all at once. Thus we directly experience causality in our own internal activity. Without this we would not be conscious of reality. We transfer this awareness of causality to natural phenomena, although this projection is superfluous for scientific purposes where only lawlike sequences of events are needed.

Stumpf accepted a dualism of mind and nature but regarded the task of philosophy as the investigation of what mind and nature have in common. Philosophy is the science that studies the most general laws of the psychological and of the real. To be real means to have effects. The reality of our own mental states is the first datum. We recognize the reality of external objects as they affect us, having first acquired the idea of causality internally.

From Brentano, Stumpf took the fundamental notion of self-evidence. We experience the self-evidence of such judgments as  $2 \times 2 = 4$ , and this self-evidence cannot be further reduced. It is the subjective aspect of truth. Truth itself is that property of contents of consciousness whereby they compel assent. Truth is a function of that which is thought, not a function of the thinker. Stumpf explicitly rejected the positivist and pragmatist theories of truth.

Knowledge is of two sorts, a priori and a posteriori. A priori knowledge consists of deductions from self-evident propositions and from bare concepts. It ought to be expressed in hypothetical propositions, since no determination of fact is here made. Mathematical knowledge is of this type. If there are more geometries than one, all are a priori; only their applicability to objective space is an empirical question. A priori knowledge may be secured

from any concept. The mere concept of three tones implies a definite order according to which a tone of one pitch must be located between the other two. The concept of a tone series contains the possibility of its continuation ad infinitum. These are propositions that we know but that neither have nor require proof. They are analytic, not only known by means of our concepts but known because they are about our concepts. A posteriori knowledge, on the other hand, is of facts and laws. Both sensory contents and mental activities or functions are experienced directly. Stumpf introduced the term *Sachverhalte* (state of affairs) into philosophy, although he claimed only to have replaced Brentano's notion of "content of judgment" with the term.

Stumpf rejected the idea of vitalism or of any sort of life force, although he did not oppose empirical psychovitalism, the view that feelings, thoughts, and volitions can be stimuli for physical nerve processes. He argued that evolution did not dispose of the problem of teleology, since life itself, whose origin from nonliving atoms is so mathematically improbable, requires an explanatory hypothesis.

## STURZO, LUIGI

(1871–1959)

Luigi Sturzo, the Italian political figure and philosopher who elaborated a systematic historical anthropology, was born in Caltagirone, Sicily. He was ordained a priest in 1894 and received a doctorate in philosophy from the Gregorian University in Rome in 1898. He taught philosophy at the seminary in Caltagirone from 1898 to 1903. Sturzo served as mayor of Caltagirone from 1905 to 1920. He founded the Italian Popular Party in 1919 and served as its political secretary from 1919 to 1923. As early as 1926, in *Italy and Fascism*, Sturzo exposed the total economic concentration of power in the ruling radical right and the method of violence by which the power elite governed. His major works were written in exile in the period from 1924 to 1946 in Paris, London, and New York and were first published in translations. In recognition of his historic role in the birth of the Italian Republic, Sturzo was named a senator for life in 1952.

In philosophy Sturzo elaborated a "dialectic of the concrete" based primarily on the thought of St. Augustine, Gottfried Wilhelm Leibniz, Giambattista Vico, and Maurice Blondel. He opposed this dialectic to both absolute idealism, which he regarded as a necessitarian monism, and scholastic realism, which he considered a spectatorlike abstractionism. At the basis of his thought is historical man projected into "the fourth dimension, that of time." Man is at one and the same time individual and social, free and conditioned, structural and in process; he is a singular history in process rather than a nature fixed in essence. Man is never pure becoming, however, but a radical tendency toward reason in action.

Organically, man is constitutionally relational in his total organic connections. Socially, he is a manifold and simultaneous projection of collective purposes that are made concrete in social structures that embody his many needs in a dynamic interplay of primary and subsidiary associations.

When collective purposes become institutionalized and each social form presses for exclusive domination,

conflicts are engendered. If one form gains such domination, forces of renewal and reform are unwittingly released. Thus, driven by precarious and incomplete achievements, man advances by conquering new dimensions of experience, both personal and collective.

The most radical novelty and the most powerful solvent of conflicting interests is the concrete ingression of the divine into the total human process. This “historicization of the divine” in its empirical reality is both singular and collective and constitutes the driving force of human progress.

Although he recognized the recurrence of regression, Sturzo professed an enlightened optimism, similar to that of Pierre Teilhard de Chardin, born out of his vision of one humankind moving toward ever greater socialization through the growth of international consciousness as revealed in the rationalization of force and the repudiation of war.

## SUÁREZ, FRANCISCO

(1548–1617)

Francisco Suárez, the Spanish scholastic philosopher and theologian, “Doctor Eximius,” was born at Granada. His father was a wealthy lawyer and Francisco was the second of eight sons, six of whom entered the religious life. In 1564 he applied for admission to the Jesuit order. Perhaps because of ill health he showed little promise at first, and he failed to pass the examinations. Suárez appealed the verdict of his examiners, but his second examinations were not much better than the first. The provincial agreed, however, to admit Suárez at a lower rank. Shortly after his admission to the order, he began his study of philosophy. He showed little promise in the next few months and considered abandoning his studies for a lesser occupation in the order. However, he was persuaded by his superior to continue his studies, and within the next few years he became an outstanding student. Completing his course in philosophy with distinction, he transferred to the theology curriculum at the University of Salamanca and soon became an outstanding theologian.

In 1571 he was appointed professor of philosophy at the Jesuit college in Segovia and shortly thereafter was ordained to the priesthood. From 1576 to 1580 he served at the University of Valladolid and was then honored with an appointment to the chair of theology at the Jesuit college in Rome. Five years later he was transferred to a similar chair at the University of Alcalá. He had now achieved considerable reputation as a theologian and in 1593 was singled out by Philip II of Spain for appointment to the chair of theology at the University of Évora in Portugal. The years at Évora saw the publication of such major works as the *Disputationes Metaphysicae* (1597); the *De Legibus ac Deo Legislatore* (1612); the *Defensor Fidei* (1613), a refutation of the *Apologia* of King James I of England; and the *Varia Opuscula Theologica* (1599), which embodied Suárez’s contributions to the congruist movement. In 1616 Suárez retired from active teaching; he died the following year.

At the time of his death, Suárez’s reputation as a philosopher and theologian was extraordinary, and his metaphysics dominated thought at Catholic and many Protestant universities for the next two centuries. René Descartes is said to have carried a copy of the *Disputationes* with him during his travels. The *Ontologia* of Christian Wolff owed much to Suárez, and Gottfried Wilhelm Leibniz read him avidly. Arthur Schopenhauer declared that the *Disputationes* was an “authentic com-

pendium of the whole scholastic wisdom.” After Thomas Aquinas, to whom he owed much, Suárez is generally recognized as the greatest of the Scholastics. His philosophy will be considered under two headings, the metaphysics (including epistemology) and the philosophy of law.

## METAPHYSICS

The metaphysics of Suárez is basically Aristotelian and Thomistic yet also highly original. It reveals remarkable erudition and a profound knowledge of his medieval predecessors. Some of the outstanding features of Suárez’s metaphysics may be shown in a brief exposition of his views on the nature of metaphysics, the theory of distinctions, the principle of individuation, the problem of universals, the knowledge of singulars, the doctrine of analogy, the existence of God, and the problem of freedom.

**NATURE OF METAPHYSICS.** Suárez defined metaphysics as the science of being qua being. Taken as a noun, being signifies a real essence; taken as a participle, being refers to the act of existing. A real essence is non-contradictory, and by real Suárez means that which can or actually does exist in reality. Being may also be distinguished as real being and conceptual being. Real being may be immaterial, material, substantial, or accidental. The concept of being is analogical, derived from knowledge of the various kinds of real being; it is not univocal. The metaphysician is concerned primarily with immaterial being, and metaphysics is necessary for an understanding of sacred theology.

**THEORY OF DISTINCTIONS.** Like his predecessors Suárez held that in God essence and existence are one. Aquinas held that in finite beings essence and existence are really distinct. Suárez, however, maintained that the distinction is solely one of reason, a mental or logical distinction, for to assert a real distinction presupposes a knowledge of existence, and this would entail an essence of existence. To the Thomist objection that the denial of real existence destroys the contingency of created beings, Suárez replied that it is unnecessary to add a real distinction to establish the contingency, for it is in the nature of created being to be contingent. The emphasis upon essence in contrast to existence led Étienne Gilson to refer to Suárez’s metaphysics as “essentialistic” in contrast to the “existentialistic” metaphysics of Aquinas.

**PRINCIPLE OF INDIVIDUATION.** The principle of individuation is neither the *materia signata* of Aquinas nor the *haecceitas* of John Duns Scotus, although Suárez

agreed with Scotus that “individuality adds to the common nature [essence] something which is mentally distinct from that nature ... and which together with the nature constitutes the individual metaphysically.” In composite substances both form and matter individuate, for the essence of the individual is made up of both matter and form, with form the principal determinant. Individuals may be distinguished on the basis of their matter—for example, quantity—but their individuation is determined by form and matter, not by our mode of cognition.

**PROBLEM OF UNIVERSALS.** Universals have no existence either in reality or in individuals. There are only individuals; universals do have a foundation in reality, however, for the mind abstracts them from the likenesses of individuals. Suárez criticizes the Ockhamists for insisting that universals are only words or mental constructs, but it is difficult to dissociate his position from theirs, for he strongly insists that there are as many essences as individuals and that each individual being is an individual essence.

**KNOWLEDGE OF SINGULARS.** With Scotus, Suárez maintained that the intellect has a direct knowledge of singulars. “Our intellect knows the individual material object by a proper species of it ... our intellects know individual material objects without reflection.” Suárez maintained that the active intellect can have this kind of knowledge, for there is nothing contradictory about such knowledge and it is in conformity with experience. Furthermore, it is the function of the active intellect to make the passive intellect as similar as possible to the representation of the phantasms. Unlike Aquinas, Suárez maintained that the passive intellect can abstract the universal and that the active intellect can know the individual material object.

**DOCTRINE OF ANALOGY.** Suárez rejected the Scotist doctrine of the univocity of being. Like Aquinas he accepts the analogicity of being, but he insists that there is only an analogy of attribution—not of proportionality—which possesses an element of metaphor. “Every creature is being in virtue of a relation to God, inasmuch as it participates in or in some way imitates the being of God.”

**EXISTENCE OF GOD.** A metaphysical rather than a physical proof is needed to establish the existence of God. The major defect in the Aristotelian argument from motion is the principle that “everything which is moved

is moved by another.” For this principle Suárez substituted the metaphysical principle that “everything which is produced is produced by another.” From this principle he argued that there must be an unproduced or uncreated being, for an infinite regress either of a series or a circle of finite beings cannot be accounted for. And even if an infinite series were accepted, such a series would depend on a cause external to it. From the conclusion that there exists an uncreated being, Suárez proceeded to demonstrate that there is only one such being. Regarding the nature of such a being, its perfection, wisdom, infinitude, and so on, he followed Aquinas.

**PROBLEM OF FREEDOM.** Like Luis de Molina, Suárez was convinced that the Thomist doctrine that God physically predetermines the free act of the individual nullified man’s freedom. Suárez maintained that through the *scientia media* God knows from all eternity what an individual will do if his grace is extended to him, and he consequently gives sufficient grace to effect the congruent action of the individual’s will with his grace.

#### PHILOSOPHY OF LAW

Although Aquinas’s influence on Suárez is apparent, Suárez was a highly original and influential thinker in the philosophy of law. He effected the transition from the medieval to the modern conception of natural law, and his influence is particularly noticeable in the work of Hugo Grotius.

**NATURE OF LAW.** Suárez maintained that Aquinas’s definition of law as “an ordinance of reason directed to the common good” placed an inordinate emphasis on reason or intellect. Suárez did not deny that reason has a part in the law, but he did hold that obligation is the essence of law and that obligation is essentially an act of will. He defined law as “an act of a just and right will by which a superior wills to oblige his inferior to do this or that.”

**ETERNAL LAW.** Like Aquinas, Suárez distinguished between eternal, divine, natural, and human law. However, the treatment of each is based on Suárez’s contention that law is fundamentally an act of will. Eternal law is the divine providence that extends to all creatures and from which the other laws are derived. Defined as “a free decree of the will of God, who lays down the order to be observed,” it is immutable and has always existed with God. It differs from the other laws, whose origins depend upon their promulgation; the eternal law receives its promulgation only through the other laws. Man’s knowledge of such a law is limited and is reflected in his accept-

ance of the divine law, the discovery of the natural law, and his promulgation of the human law.

**DIVINE LAW.** Divine law is the direct revelation of God—the Mosaic law. The power and the will of God are the source of man’s obligation to obey the divine law. In contrast, the power and the obligation of the human law are directly the will of the legislator, although indirectly the will of God.

**NATURAL LAW.** Natural law receives considerable attention from Suárez. This law is the participation of the moral nature of man in the eternal law. The natural law is based on the light of reason, but it is the work of the divine will and not the human will; its ultimate source is God, the supreme legislator. The natural law is not identified with man’s nature; it transcends his will. The precepts of the natural law are the general and primary principles—to do good and avoid evil; the more definite and specific principles—that God must be worshiped; and certain moral precepts that may be deduced from the primary principles—that usury is unjust, adultery wrong, and so on. There is no dispensation from the natural law; its precepts are immutable. Thus, the introduction of private property did not reflect a change in the natural law, for although the natural law conferred all things upon men in common, it did not positively enjoin that only this form of ownership should endure.

**HUMAN LAW.** Human law must be based on either the divine law or the natural law and is best exemplified in political philosophy. Following Aristotle, Suárez held that man is a social animal. He rejected the view that political society is artificial, the result of a social contract or an enlightened egoism. The state is natural, and the legislative power is derived from the community and exists for the good of the community. The ultimate source of such power is God, who bestows it as a natural property upon the community. Such power is actualized only upon the formation of a political society. The form of government is essentially a matter of choice by the people. The modernity of Suárez is revealed in his rejection of the medieval ideal of the imperial power. He accepted the sovereignty of individual rulers and was skeptical of the feasibility of a world state. In discussing the rule of tyrants, he distinguished between a legitimate ruler who behaves tyrannically and a usurping tyrant. Revolt against the latter is self-defense; it is even legitimate to resort to tyrannicide provided that the injustice is extreme and the appeal to authority impossible. In the case of the legitimate ruler, the people have a right to rebel, for they bestowed the

power upon the ruler. Tyrannicide is rejected here, and the rules of a just war must be followed. Suárez maintained that war is not intrinsically evil; just and defensive wars are permissible, and considerable attention is given to the conditions for waging a just war. Suárez also rejected the extremist views of papal power over temporal rulers, but he argued for the spiritual supremacy and jurisdiction of the papacy. This implied that the papacy has an indirect power to direct secular rulers for spiritual ends.

See *Unconscious*

## SUBJECT AND PREDICATE

The contrast between "subject and predicate" is a significant one in at least four different realms of discourse: grammar, epistemology, logic, and metaphysics. A large number of philosophical problems have to do with how the distinction on one level is related to that on some other level; whether there really are four such distinct realms and, if so, how they bear on one another are matters of controversy.

### GRAMMAR

In the realm of grammar, subject and predicate are sentence parts; they are, therefore, words or groups of words, and their definition and identification is a matter of syntax. In the simplest case, where the sentence consists of just two words, such as

- (1) Bats fly,
- (2) Fraser swims,

the subject is the noun and the predicate is the verb. Very few sentences are so simple, but an indicative sentence with just one noun and one verb remains a good paradigm for the grammatical categories of subject and predicate because we can see in it the form of the sentence stripped down to its essentials: If either of the two words were omitted, we would no longer have an indicative sentence. Furthermore, very many sentences of English, as

well as of other familiar European languages, break neatly and obviously into two parts corresponding to the noun and the verb in the paradigm, and modern linguistic analysis of sentence syntax generally begins by viewing a sentence as a noun phrase plus a verb phrase:

$$S \rightarrow NP + VP$$

Although subject-predicate sentences are very common in English and in other languages, this form of sentence is not the only one, other forms being exemplified in English by normal idiomatic expressions for commands, requests, salutations, and so on. These other forms of sentence, however, have traditionally been assimilated to the subject-predicate form through the assumption of an “unexpressed subject” or some other missing element. It once seemed reasonable to try to save appearances in this way because subject and predicate seemed to be universal grammatical categories, found not only in the European languages but also, for example, in Sanskrit. Recent familiarity with a wider variety of languages has shown that these categories are by no means universal, and it is doubtful whether any grammatical categories or linguistic forms are universal. Some linguists have proposed that topic and comment are found universally, although subject and predicate are not. These categories, however, do not have to do just with the arrangement of words in sentences but rather with knowing what is being discussed and understanding what is said about it; hence topic and comment are not purely grammatical categories. The present situation in linguistics may therefore be summed up by saying that subject and predicate are useful grammatical concepts but do not represent universal grammatical categories.

In philosophy the grammatical distinction between subject and predicate has been prominent at least since Plato, who, in the *Sophist*, distinguished nouns and verbs as two classes of names. It is fair to say, however, that in that discussion, as well as in subsequent ones, philosophers have been interested in this grammatical distinction primarily because of the use they might make of it in treating problems of epistemology, logic, and metaphysics.

## EPISTEMOLOGY

In epistemology the contrast between subject and predicate is a contrast between that part of a sentence which serves to identify or designate what is being discussed and that part which serves to describe or characterize the thing so identified. The categories of subject and predi-

cate have more claim to universality at the level of epistemology (semantics) than at the level of grammar (syntax). It is here that the hypothesis about topic and comment, mentioned earlier, has its significance, for the fact that every language has some grammatical device or other for identifying a subject, or topic, and predicating something of it, or commenting on it, largely accounts for our remarkable ability to translate the content of any message from one language into another.

The epistemological sense of subject and predicate has much in common with the grammatical sense: Sentences (1) and (2) can be taken as paradigms for both senses, and the grammatical subject very frequently identifies the subject of discourse. Nevertheless, the two senses are not identical. They diverge, for example, in sentences with a dummy subject. In “It is raining” the expletive “it” is the grammatical subject of the sentence, but since it does not designate anything at all, it does not designate or identify what the sentence is about. Other instances are more relevant to philosophical issues and may be controversial. Consider

- (3) What is not pink is not a flamingo.
- (4) What is not just is not to be done.

There is no difficulty with (4), for it says something about unjust acts, and hence its grammatical and epistemological subjects coincide. But (3) seems to be about flamingos rather than about nonpink things, even though it has the same grammatical form as (4). Perhaps this is because we directly recognize and classify things as flamingos and as unjust acts, and even as pink, whereas in order to call something “not pink” one would normally first recognize it as gray or blue or some other color. If this is correct, the epistemological subject of (3) is mentioned in the grammatical predicate rather than in the grammatical subject.

Another instance of the divergence of the epistemological and grammatical senses is in relational sentences, such as

- (5) Andrew was hit by Bernard.
- (6) The cat is between the bird and the snake.

Sentences (5) and (6) may be taken to be about the two persons and the three animals, respectively, and what is said about their epistemological subjects is that a certain relation is true of them. Treating (5) and (6) as having multiple subjects in this manner is much more congenial than is a grammatical analysis to what Bertrand Russell, among others, said about the importance of relations.

It should be noted that what counts as the epistemological subject of a statement may be determined in part by the context in which it is made: If Bernard is the “topic” of conversation, (5) would naturally be construed as a “comment” about him, but other conversations in which (5) occurs will be focused differently. The importance of context in determining what counts as a subject differentiates the epistemological conception of subject from all the others.

Predicates as well as subjects have required special treatment in epistemology. Immanuel Kant distinguished real predicates from grammatical or logical predicates, a real predicate being one that says something about the subject—that is, one which attributes some property to the subject. Kant’s contention that “exists” is not a real predicate but only a grammatical or logical one provides the basis for his refutation of the Ontological Argument. Statements of identity have also been held by Gottlob Frege, Russell, Ludwig Wittgenstein, and others not to be genuine predications—or at least not to be straightforward ones. Hence, in

(7) Tully is Cicero

the words “is Cicero” would not express an epistemological predicate, although they assuredly constitute the grammatical predicate. These are matters that are still not so clear as they might be.

Some very important topics in semantics and the philosophy of language are connected with the epistemological contrast between subject and predicate. In order to know what a person is talking about, I must know to what (or to whom) certain words in his utterances refer; the problem of how words can have such reference is an important one. In order to understand what is said about the subject under consideration, I must further know what is signified or entailed or meant by certain other words the person uses, whence arises another important problem, how words come to have sense or connotation. The distinction between two such modes of meaning, characteristic respectively of subjects and of predicates, has a long history and is still a live issue. Plato, in the *Theaetetus* and the *Sophist*, distinguished the mode of meaning of nouns from that of verbs. More recently J. S. Mill’s distinction between connotation and denotation and Frege’s distinction between sense and reference have taken up the same theme and made it central to the philosophy of language.

## LOGIC

In formal logic there has been a distinction between subject and predicate ever since Aristotle’s pioneering work in the field, but a dispute about the nature and scope of the distinction separates traditional from modern logicians. Aristotle would regard sentences (1) and (2) as both having subject-predicate form, but only (1) could serve as a paradigm for his formal logic. In traditional formal logic what is important about the subject term in the paradigm is, roughly, that it comes at the beginning of the sentence and indicates what (or who) is being discussed and that its quantity can be expressed by “some” or “all” preceding the noun. The pattern involved is

$$S \text{ is } P,$$

and since every proposition must have a topic about which something is asserted, this pattern is held to be manifested universally in categorical propositions. In modern logic, on the other hand, what is important about the subject term is that it is a proper name and stands for an individual, and so only sentence (2) can serve as a paradigm of the subject-predicate form. The pattern involved is

$$Fa$$

(where “*F*” stands for some attribute and “*a*” is a proper name); this pattern never applies to general propositions, since fully general propositions contain quantifiers, variables, and predicate terms but no proper names. According to this view general propositions pertain just to predicates and are not subject-predicate propositions at all. Russell’s famous attack on “subject-predicate logic” was an attack on the view that every proposition must have a logical subject.

From a formal point of view the issue can be seen as a dispute about whether the principle of transposition (or contraposition) applies to subject-predicate propositions. In traditional logic it does, for the complement of a predicate can serve as a subject. This is not the case in modern logic, however, where only singular terms count as subjects and where transposition applies only to complex propositions compounded with the “if-then” sentence connective. There is a related divergence in the treatment of existence. Kant, a typical traditional logician in this respect, called existence a “logical” predicate, although not a “real” one; in effect, the grammatical analysis of assertions of existence into subject and predicate is carried over into logic. In modern logic, on the other hand, existence is generally represented through quantification, rather than through a predicate.

Epistemological and metaphysical considerations are involved in this dispute about how to represent subjects and predicates in formal logic. Roughly speaking, traditional logic seems to favor some sort of realistic view of universals, since terms representing universals can serve as both logical subjects and logical predicates. In the notation of modern logic, on the other hand, only singular expressions can serve as logical subjects, and this rule seems to give prominence to individuals rather than to universals. But a variety of epistemological and metaphysical views can consistently be advanced by both traditional and modern logicians, and the ascendancy of modern logic can be attributed to its greater flexibility, adaptability, and power as a calculus, rather than to epistemological and metaphysical views associated with it. It seems prudent, therefore, to keep matters of perspicuous symbolism and logical transformation separate from other considerations.

To illustrate the problems about the relation of logical structure to epistemological structure, one might consider

(8) All ravens are black.

The epistemological subject of (8) is ravens, and hence one would go about confirming the proposition by examining ravens and finding them black. If, using the rule of transposition, we derive from (8) the logically equivalent form

(9) All nonblack things are nonravens,

one is tempted to assume that the epistemological subject and predicate of (8) have been similarly transposed, so that nonblack things is the epistemological subject of (9). This assumption gives rise to the so-called paradox of confirmation, for it then appears as though we might confirm (8) and (9) by examining nonblack things and finding them not to be ravens, contrary to our normal procedure for confirming such simple generalizations. One solution is to hold that transposition does not apply to the epistemological structure of a proposition, that the epistemological structure of a proposition is therefore not always parallel to its logical structure, and that the epistemological subject of (9) is the same as that of (8)—that is, ravens. But the desire to have epistemological structure unambiguously represented in logical notation is a powerful consideration for some philosophers, and hence the matter is still controversial.

## METAPHYSICS

The distinctions between subject and predicate in grammar, epistemology, and logic have given rise to a variety of metaphysical doctrines. These doctrines deserve separate consideration because although they are closely related to the distinctions already sketched and are suggested by them, none follows from them.

Plato noted that applying different predicates to a subject often entails a change in the subject, whereas applying a predicate to different subjects does not entail a change in the predicate. He took this changelessness to be a mark of reality (as well as epistemological priority), and hence his theory of Forms gives great ontological prominence to predicates (concepts, universals—i.e., that which a grammatical predicate stands for). This bold thesis opened a long and continuing dispute about the nature of universals, the problem being to determine what ontological commitments, if any, are entailed by our use of predicative expressions (in the epistemological sense).

Aristotle, in contrast to Plato, gave ontological standing to subjects as well as to predicates. Discussing substance in his *Categories*, he defined “first substances” as things satisfying two conditions: (a) being subjects but never predicates and (b) not being in or of something else (as a color or surface must be the color or surface of some other thing). He then defined “second substances” as things satisfying the second condition but not the first. First substances are individuals. Second substances are species or universals and hence incorporate an element of Plato’s metaphysics (although not all universals are substances). An attractive feature of Aristotle’s metaphysical treatment of subjects is that it fits his conception of subjects in epistemology and logic: What we talk about and investigate (especially in biology, Aristotle’s scientific forte) are individuals and species, and his logic allows both individual names and universal terms, including species names, to occur as logical subjects. But, in spite of its merits, Aristotle’s metaphysical conception of subjects is often regarded as unsatisfactory, largely because of qualms about putting individuals and species in one basket, about distinguishing predicates that stand for substances from those that do not, and about the usefulness of traditional logic.

Gottfried Wilhelm Leibniz’s doctrine of monads builds on Aristotle’s conception of individual substance. But Leibniz considered Aristotle’s definition inadequate, and he defined a monad or individual substance as a subject that contains all its predicates—that is, as an individual from whose “notion” it is possible to deduce all that may ever be truly predicated of it. Few philosophers have

thought there were any such substances. One difficulty may be that Leibniz attributed to his monads, which are epistemological subjects, the sort of identity that characteristically belongs to a predicate—namely, a definite set of entailments that define it.

Whereas Leibniz had only one kind of substance, G. W. F. Hegel allowed only one individual substance, the Absolute. The Absolute is the ultimate subject of every statement and resembles Leibniz's monads in that it contains all its predicates in the same sense as the monads are supposed to. Other philosophers have not been convinced of the existence of such a universal subject; Russell, who acknowledges Hegelian idealism to be a plausible account of the metaphysical implications of traditional logic, regards the doctrine as a *reductio ad absurdum* argument against a logic that analyzes every proposition as having a subject and a predicate.

Another interesting element of idealism is the concept of the concrete universal. Like the idea of a monad, this concept is an attempt to overcome the subject-predicate dualism by amalgamating features of both subjects and predicates in a single sort of entity. Whereas a monad is a subject with characteristics of a predicate (in that its identity is determined by what is logically contained in it, or entailed by it), a concrete universal is a predicate treated as a concrete individual thing.

One philosopher who accepted the subject-predicate dualism as a basis for his metaphysics was Frege. There are, he maintained, two radically different sorts of things, objects and concepts. Objects are complete, or "saturated," and stand on their own, so to speak; we have names for them and talk about them, but the name of an object can never be a grammatical or logical predicate. Concepts, or, more generally, what Frege called "functions," are incomplete, or "unsaturated"; they require an object to complete them and hence cannot stand alone, and a concept term is always a predicate, never a subject. Frege's dualistic view has been very influential with other philosophical logicians, including Russell, Wittgenstein, Rudolf Carnap, and P. T. Geach, but difficulties in Frege's formulation of it have impeded its general acceptance.

One difficulty is that even Frege wished to talk about concepts, and hence he had to suppose that each concept has a special object associated with it that serves only as an object to talk about when we mean to discuss the concept. A more serious difficulty is that the object-concept dualism does not fit with Frege's semantic distinction between sense and reference, which also arises from a consideration of subjects and predicates. One might expect that reference would be the mode of meaning

characteristic of names of objects, and sense the mode of meaning characteristic of concept terms; however, both names and concept terms have both sense and reference. Frege had powerful reasons for what he said, but the final impression is that his two distinctions are distressingly unrelated; hence, the philosophers most influenced by him have differed from him. Russell, for example, vigorously rejected Frege's distinction between sense and reference (in his essay "On Denoting"), and Wittgenstein in his *Tractatus Logico-Philosophicus*, although indebted to Frege when he characterized his metaphysical objects, left no room for any other entities corresponding to Fregean functions.

Many analytic philosophers (which included Carnap, Ernest Nagel, and Max Black) hold that neither grammatical nor logical categories have metaphysical implications. P. F. Strawson, however, revived the issue among them by considering the implications and presuppositions of grammatical, logical, and epistemological subjects in his metaphysical essay *Individuals*. On balance, metaphysical skepticism must probably be considered as controversial as any of the metaphysical doctrines proposed.

## SUBJECTIVISM IN ETHICS

See *Ethical Subjectivism*

## SUBJECTIVIST EPISTEMOLOGY

A "subjectivist epistemology" is one that implies the standards of rational belief are those of the individual believer or those of the believer's community. Thus, subjectivism can come in either an individualistic form or a social form. A key negative test of subjectivism is whether an account implies that by being rational one is assured of having beliefs that are more reliable than they would be otherwise—that is, more reliable than they would be if one were not rational. Thus, reliabilist accounts of rational beliefs are paradigmatically objective. So are traditional foundationalist accounts. By contrast, if an account implies that the standards one must meet if one's beliefs are to be rational are those that one would regard as intellectually defensible were one to be ideally reflective (Foley 1987, 1993), then the account is subjective. Similarly, an account is subjective if it implies that one's beliefs are rational if they meet the standards of one's community (Rorty 1979) or the standards of the recognized experts in one's community (Stich 1985). Likewise, an account is subjective if it implies that one's beliefs are rational if they meet the standards of the human community at large, provided nothing else in the account implies that adhering to such standards will reliably produce true beliefs.

One of the considerations favoring a subjectivist epistemology is that it provides an attractive way of describing what is going on in skeptical scenarios—for example, one in which everything appears normal from

my subjective point of view even though my brain has been removed from my body and placed in a vat, where it is being fed sensory experiences by a deceiving scientist. In such a scenario, almost everything I believe about my immediate surroundings would be false. Hence, I would have little knowledge about these surroundings, but what I believe about them might nonetheless be rational. Indeed, my beliefs would be as rational as my current beliefs about my surroundings. The most plausible explanation as to why this is so is that there is at least one important sense of rational belief according to which having rational beliefs is essentially a matter of meeting subjectively generated standards. Thus, by being envatted I may be deprived of the opportunity of having knowledge about my surroundings, but I am not necessarily also deprived of an opportunity of having rational beliefs.

## SUBJECTIVITY

Subjectivity is, primarily, an aspect of consciousness. In a sense, conscious experience may be described as the way the world appears from a particular mental subject's point of view. The idea that there is a distinction between appearance and reality seems to presuppose the distinction between subjective and objective points of view.

### THE TWO CONTROVERSIES

There are two principal controversies surrounding subjectivity: first, whether subjectivity, as it is manifested in consciousness, is an essential component of mentality; and second, whether subjectivity presents an obstacle to naturalistic theories of the mind.

**THE FIRST CONTROVERSY.** Most philosophers agree that intentionality—the ability to represent—is characteristic of mentality. However, there is strong disagree-

ment over whether subjectivity is also necessary. Those philosophers who think it is (e.g., Searle 1992) argue that true—or what they call “original”—intentionality can only be attributed to a conscious subject. In this view, representational properties can only be ascribed to unconscious states and to unconscious machines—such as computers and robots—in a derivative sense. With respect to computers, the claim is that their internal states only have meaning to the extent that people (conscious subjects) interpret them to mean something. On their own, these states are merely meaningless formal symbols. When it comes to unconscious states—such as the unconscious beliefs and desires hypothesized in Freudian psychology—the claim is that only by virtue of their effects on one’s conscious beliefs and intentions do they have content. The source of all genuine meaning resides in conscious, subjective mental activity.

The basic argument for this position is that for something to count as a representation—as meaning something—there must be a subject for whom its meaning is significant; a subject who is aware of and appreciates what it means. Otherwise, the argument goes, without a subject who understands, interprets, and makes use of the meaning, there is no basis for saying it means anything at all. In particular, given that most conditions stateable in objective terms for what a brain state or a computer state represents leave room for alternative interpretations, it is only by reference to the awareness of a conscious subject that a representation acquires determinate content.

Other philosophers reject this assimilation of intentionality and subjectivity, arguing that a theory of intentionality—one that applies equally to conscious and unconscious states—can be developed independently of a theory of subjectivity (e.g., Dretske 1981 and Fodor 1987). Some theorists see no need at all to appeal to the interpretive activity of a conscious subject to fix the content of a representational state. In this view, meaning ultimately comes down to information, a notion that may be treated in objective terms.

Others agree that some appeal to the purposes of the agent is necessary in order to ground an assignment of meaning to brain states. However, they claim that it is not necessary to invoke the subjective character of a subject’s conscious states for this purpose. Rather, it suffices to show that by assigning the relevant interpretation to the subject’s internal states one may provide appropriate psychological explanations of the subject’s behavior and explain that subject’s success in his or her interactions with the environment. What a subject’s beliefs and desires

are about is determined, in this view, by the nature of the subject’s interactions with the environment and the role these states play in her or his internal psychological economy. These are facts clearly stateable from an objective point of view; no special appeal to the subjective experience of the agent is required.

Just how serious the first controversy is depends considerably on one’s stand with respect to the second one. Suppose that one adopts the position that only creatures possessing subjective, conscious states are capable of any mentality at all. Still, if one also thinks that possession of subjective consciousness is a perfectly natural phenomenon—itsself explicable in physical, or objective terms—the sting is largely removed from this position. There is now no reason to think properly programmed computers or robots couldn’t possess the full range of mental states, so long as they satisfied the naturalistic conditions for conscious subjectivity.

**THE SECOND CONTROVERSY.** With respect to this second question—whether or not subjectivity presents a problem for a naturalistic framework—one may reason as follows. A complete inventory of the world should, if it is truly complete, capture everything there is and everything going on. It seems natural to suppose that such a complete description is in principle possible, and is in fact the ideal aim of natural science. But some argue that facts that are essentially accessible only from a particular subject’s point of view cannot be included in this allegedly complete objective description (Nagel 1974, 1986). If they cannot, this would seem to undermine the idea that the natural world constitutes a coherent, lawful, and objective whole.

For example, take the fact of one’s own existence. You could read through this hypothetical exhaustive description of the world, and it would include a description of a body at a particular spatio-temporal location, with particular physiological (or even nonphysical) processes going on inside it. However, what would be missing is that this is your body—this is you. No collection of facts stateable in objective terms seem to add up to this body being yours.

Or take the problem of personal identity. From a point of view outside the subject, what it is that makes one the same person across time—whether it be a matter of bodily or psychological continuity—seems to admit of borderline cases or matters of degree, or other sorts of indeterminacy. Thought experiments involving split brains, machines that take “memories” from one brain and implant them in another, and the like, reveal just how

difficult it is to pin down personal identity as a determinate matter of objective fact. Yet, from the point of view of the subject, what it is to be oneself seems to be a clear-cut, all-or-nothing matter. Either one continues to exist or one doesn't. It is hard to reconcile the objective and subjective perspectives on this question.

One particularly difficult manifestation of the problem of subjectivity is how to account for the fact that there is "something it is like" to be certain objects (say a human being), or occupy certain states (say, visual experiences), but not others (say, a rock, and its states). This is also known as the problem of "qualia." From an objective point of view, there would seem to be nothing special about the neurological activity responsible for conscious experience that would explain what it's like for the subject. Two influential thought experiments starkly illustrate the problem.

Nagel (1974) presents the problem this way. Bats navigate in the dark by emitting high-pitched sounds and detecting their echos—a sensory system known as "echolocation." From an objective, third-person point of view, there is nothing especially difficult about understanding how this system works. While there are of course difficult technical questions, the idea that the bat extracts information concerning the location and movement of its target from the returning sound waves bouncing off of it is fairly clear. The problem emerges when one considers what echolocation is like for the bat, from its point of view. People know that there is something particular it is like to see a sunset, smell a rose, or feel a pain. There is every reason to believe that there is also something particular it is like to sense by echolocation. Yet, when the question is posed this way, it doesn't seem as if any of the details learned about the information-processing capabilities of the bat are helpful in answering this simple question: What is it like for the bat? It seems as if only by adopting the bat's point of view, by humans' experiencing echolocation, could one obtain a clue concerning what it is like.

Jackson (1982) asks people to consider the following situation. Imagine Mary, a neuroscientist who learns everything there is to know about the physiology and information processing involved in color vision. However, she learns this while restricted to a completely black and white environment, so that she herself never experiences color sensations. In a sense, she would be in the same position vis-à-vis everyone else that everyone else is vis-à-vis bats. At some point Mary is released from her purely black and white environment and allowed to see color. Suppose she now sees a red rose for the first time.

It seems undeniable that her reaction would be one of wonder and novelty. "So that's what red looks like!" she might say. But now, if the subjective experience were adequately captured by the objective, third-person descriptions presented in her science texts, why should she experience novelty and wonder? That she would have this experience seems to demonstrate that what is apprehended from the first-person, subjective point of view is distinct from what is describable in objective, third-person terms.

Many philosophers argue that subjectivity does not present a special puzzle. For some (e.g., Searle 1992), it is just a fact that the world contains both objective facts and irreducibly subjective facts; their relation requires no explanation and produces no mystery. For most, though, the demystification of the subjective is accomplished by some sort of reductionist strategy (e.g., Lycan 1987 and 1990, and Rosenthal 1986), one that shows how to incorporate so-called subjective facts into an all-embracing, naturalistic and objective scientific framework. One influential model of subjectivity is the internal monitoring, or higher-order thought model. In this view, which fits well with a functionalist approach to the mind-body problem in general, subjectivity is principally a matter of some mental states representing other mental states. That is, to be aware of, or to apprehend from the first-person point of view, that one is having a certain experience, is merely to occupy a mental state that represents one as having that experience. If this is what subjectivity amounts to, then any model of the mind that builds in the requisite architectural features will explain subjectivity. A model of this sort of internal scanning already exists with computers.

Advocates for the view that subjectivity presents no special mystery sometimes point to the perspectival character of indexical expressions such as "I" and "here" for support. The idea is that it is generally acknowledged that the meaning of such expressions cannot be captured in nonindexical terms (Perry 1979), yet this doesn't give rise to any special philosophical problem or mystery. Because one cannot derive a statement containing an indexical expression from statements free of indexicals, one need not conclude that there are any special indexical facts that are indescribable in indexical-free terms. There are theories that take into account the special behavior of such terms consistent with a general theory that applies to nonindexical terms as well.

In the same way, goes the argument, subjective mental phenomena can be incorporated into a more general theory of the world that applies to nonsubjective phe-

nomena as well. For instance, whereas it may be true that Mary, in the Jackson example described above, could not predict what it would be like to see red from her knowledge of the neurophysiology of color vision, this need not be taken to show that there are irreducibly subjective facts. It could be that human beings possess a distinct representational system that is employed only when information comes directly from the sensory systems (Rey 1993). It is no surprise that the same fact can be represented in distinct ways, and that being represented in distinct ways may obscure its identity from the subject.

### ELIMINATING SUBJECTIVITY

Yet another approach to the problem of subjectivity is eliminativism (e.g., Churchland 1985, Dennett 1991). Proponents of this view will grant that none of the models proposed to account for subjectivity really explains it; but, they argue, that is due to the human intuitive conception of subjectivity—indeed of consciousness in general—being too confused, or incoherent, to be susceptible to scientific explanation. Subjectivity just isn't a real phenomenon, so there's nothing in the end to explain.

### SUBLIME, THE

This title already raises the conundrum that "the sublime" has regularly, although in different ways, posed. The substantivized form of the adjective suggests something one could point to where sublimity resides. The sublime might even be misconstrued (as it was by Edmund Burke) as a property of certain objects. But the sublime refers to no thing; it is instead an effect produced by the limits of our capacities for perception and representation. As such the sublime has played a vital role in the history of aesthetic theory as well as in postmodernist debates about representation and the limits of knowledge.

The sublime was first theorized by the pseudonymous Longinus in *On the Sublime*, written in the first century CE. Longinus conceives sublimity as a quality of elevated prose of great rhetorical power. Not until the seventeenth century does the sublime become associated with natural phenomena, and then with the incomprehensible excesses of natural force. In *A Philosophical Enquiry into the Origin of Our Ideas of the Sublime and the Beautiful* (1757), Burke provided an empiricist account of kinds of objects and situations that induce sublime perceptual experiences. Where beauty is found for Burke in things, the perception of which seems to harmonize with human sensory capacities, the sublime object of perception challenges our senses or exceeds our perceptual grasp. Burke equivocated on the implications of his empiricism, however, by conceiving sublimity as a property of these perceptually challenging objects or scenes, rather than understanding sublimity as a kind of secondary quality to be located in the relationship between perceiver and perceived.

Immanuel Kant provided in his *Critique of Judgment* (1790) the essential formulation of the sublime that has organized most subsequent discussion. Beauty, sublimity, and aesthetic qualities generally are for Kant no proper-

ties of objects; they are the felt effects of judgments that reflective perceivers make on the form and content of their experience. A judging subject finds something beautiful when its appearance or design, without or before applying conceptual rules to it, invigorates her cognitive capacities generally, and inspires an imaginative appreciation of the object. Judgments of beauty, then, reflect a harmony between feeling and cognition that is absent in the judgment of the sublime. People feel sublimity, to the contrary, in cases where their efforts to comprehend something are stymied by vastness, complexity, or by the natural might of that which threatens to overwhelm them.

These varieties of sublimity reflect Kant's germinal distinction between the mathematical and the dynamical sublime. The subject encounters mathematical sublimity when attempting to comprehend perceptually an object too vast (the starry heavens) or too grand (the great pyramids, from the correct distance) to take in all at once. The mathematical sublime exceeds one's conceptual grasp by inducing in the subject perceptual riches too extensive to subsume satisfactorily under available categories. It points up the limits of human capacity to perceive comprehensively and to represent to humans conceptually what is perceived. The frustration of this nevertheless gives rise to aesthetic pleasure for Kant, because the humbling of certain human cognitive capacities reminds people of the superiority of reason's capacity to think the infinite. For this reason, the sublime has regularly invited a theological interpretation throughout the European tradition.

The judging subject feels dynamical sublimity when threatened by the extraordinary forces of violent nature. This strain of Kant's theory of sublimity inspired the subsequent generation of Romantic poets, not to mention the later Nietzschean appreciation of Dionysian artistic impulses. Throughout the nineteenth century, the sublime is associated with excesses of natural force, tormented outpourings of emotion, and the transgression of norms of representation. Hence in the twentieth century the effects of sublime experiences were embraced by the sequence of artistic avant-garde movements that sought to induce ecstatic or liminal aesthetic responses designed to challenge conventional artistic or cultural norms. What a culture already possesses the conceptual apparatus to represent adequately cannot be sublime; the goal of the avant-garde was to allude to something that defies available means of representation.

Not surprisingly, then, the sublime was of great interest to postmodern theorists of the late twentieth cen-

ture. Developments in multiple fields (the crisis of representation in anthropology, attacks on the representational theory of the mind in philosophy) encouraged postmodernists to embrace sublimity as the irrational and humiliating counterpoint to modernist categorizing zeal and its bureaucratic rationality. To embrace sublimity and to induce its manifestation in judging subjects is, as Jean-François Lyotard put it in *The Postmodern Condition* (1984), "To present the fact that the unrepresentable exists" (p. 78). Rather than regard that humbled subject as the last word on the sublime, however, future theorists of this perennial notion may see the sublime, that which challenges human perceptual and conceptual reach, as a regular inducement to strive to extend that reach, rather than a reason to cease the attempt.

## SUBSTANCE AND ATTRIBUTE

The concepts of "substance and attribute" are the focus of a group of philosophical problems that have their origins in Greek philosophy and in particular the philosophy of Aristotle. The concepts are, of course, familiar to prephilosophical common sense. Yet although we are acquainted with the distinction between things and their properties and are able to identify the same things among the changing appearances they manifest in time, these commonsense notions give rise to a group of philosophical problems when we come to scrutinize them. Thus we may wonder what it is that remains the same when, for example, we say that the car has new tires and lights and does not run as smoothly as it used to, but is still the same car; or when we say that although we could hardly recog-

nize him, this man is the same one we went to school with thirty years ago.

It is interesting to note that the principal term for substance in the writings of Aristotle is *ousia*, a word that in earlier Greek writers means “property” in the legal sense of the word, that which is owned. (This sense is familiar in English in the old-fashioned expression “a man of substance.”) The word *ousia* also occurs in philosophical writings before Aristotle as a synonym for the Greek word *physis*, a term that can mean either the origin of a thing, its natural constitution or structure, the stuff of which things are made, or a natural kind or species. The Latin word *substantia*, from which the English term is derived, is a literal translation of the Greek word *hypostasis* (“standing under”). This term acquired its philosophical connotations in later Greek and occurs principally in controversies among early Christian theologians about the real nature of Christ. A third philosophical term, *hypokeimenon* (“that which underlies something”), is used by both Plato and Aristotle to refer to that which presupposes something else.

There is, however, little of philosophical importance to be learned from the etymology of the terms in which problems are formulated and discussed. We shall first consider the questions to which the concepts of substance and attribute give rise in some of the philosophers for whom they have been important. We may then ask which of these questions remain as live philosophical issues at the present time and what answers can be given to these surviving questions.

## ARISTOTLE

Aristotle’s account of substance has been the most influential in the history of philosophy. His account is, however, obscure and probably inconsistent. The difficulties of elucidating and reconciling the various parts of his doctrine have been part of the cause of its influence—it has offered a continuing challenge to commentators and critics from Aristotle’s time to the present. “Substance in the truest and primary and most definite sense of the word is that which is neither predicable of a subject nor present in a subject; for instance, the individual man or horse” (*Categories* 2A11). The explanation is obscure, but the examples cited leave no doubt of what Aristotle means here: Substance in the most basic sense of the word is the concrete individual thing. However, he goes on at once to mention a second sense of the word: “Those things are called substances within which, as species, the primary substances are included; also those which, as genera, include the species. For instance the individual

man is included in the species ‘man’ and the genus to which the species belongs is ‘animal’; these, therefore,—the species ‘man’ and the genus ‘animal’—are termed secondary substances.” These secondary substances are predicable of a subject. “For instance, ‘man’ is predicated of the individual man” (*Categories* 2A21–22), as when we say “Socrates is a man.” Aristotle seems to have the idea here that essences or natures are substances, and the more qualities they comprise, the more substantial they really are; he explains, “Of secondary substances, the species is more truly substance than the genus, being more nearly related to primary substance” (*Categories* 2B7). For example, the species *Canis domesticus* shares more qualities in common with the individual dog Tray than does the genus *Canis*.

This notion of essences as substances is treated at length by Aristotle in the *Metaphysics* and seems to be his preferred sense of the term. The intimation that the more qualities something has, the more substantial it is, has the advantage of suggesting that being a substance is a matter of degree and not an all-or-nothing matter. This hint, which Aristotle does not develop, contains an important idea, as will be seen later. But the doctrine of secondary substances has little else to recommend it and involves a serious logical confusion between the relations of class membership and class inclusion, as well as the notorious difficulties of the doctrine of essences.

Aristotle’s main purpose in the *Categories* is to contrast the independent way of existing proper to substances with the parasitic mode of being of qualities and relations. Substances can exist on their own; qualities and relations, only as the qualities of or relations between substances. The key to this distinction is given by the phrase “present in a subject.” (The Greek word for “subject” here is *hypokeimenon*, literally “underlay.”) Substances are never “present in a subject.” This does not mean, as Aristotle explains, that a substance is never “present in” something else as a part of a whole. On the contrary, he cites heads and hands (*Categories* 8B15) as substances although they are parts of bodies. Rather, *x* is present in *y* when it is “incapable of existence apart from” *y*. This notion introduces a third sense of substance as that which is capable of independent existence. This sense is of considerable importance in later philosophy, but Aristotle does not develop it. He uses it chiefly to emphasize the distinction between substances on the one hand and their qualities and relations on the other. A quality—“red,” “sweet,” or “virtuous”—cannot exist apart from an *x* that has the quality. Relations such as “larger than” or

“to the left of” cannot occur in the absence of the *x* and *y* that they relate.

It is true, of course, as Aristotle’s critics have pointed out, that it is no more possible for a substance to exist without qualities than for qualities to exist without a substance. However, it is possible to point to *prima facie* examples of qualities existing without substances—the blue of the sky, for instance, or a red afterimage floating in my visual field. Surely the sky is not a substance, nor is my visual field. However, one cannot point to any instances of substances existing without qualities. Even if it makes sense to suppose that such a thing could occur, it is clearly incapable of being identified. Aristotle does not consider these problems. What he seems to have meant, although he does not express himself clearly, is that what is capable of independent existence is the concrete individual thing, a substance with its qualities and in its network of relations to other substances. But even here there is an obvious difficulty. Once we introduce the notion of relations involving other substances, we put a restriction on independent existence.

A fourth criterion of substance is that “while remaining numerically one and the same, it is capable of admitting contrary qualities” (*Categories* 4A10). This Aristotle calls “the most distinctive mark of substance.” This notion is developed, more by later philosophers than by Aristotle himself, into the conception of a center of change and so of a substratum that underlies and supports its qualities. Finally, Aristotle emphasizes the notion of substance as a logical subject, “that which is not asserted of a subject, but of which everything else is asserted” (*Metaphysics* 1029A8), and he links this sense of the term with the concept of substratum. This logical criterion has been criticized as making the notion of substance dependent on the structure of Greek (and some other Indo-European languages), in which subject-predicate sentences are a standard mode of expression, and upon a restricted and now outmoded view of logic in which all statements canonically expressed are in a form in which a predicate is affirmed of a subject. It is not the case that sentences in all languages fall into a subject-predicate form or that this form of expression is adequate for a developed logic.

## OTHER PHILOSOPHERS

The various notions of substance as (1) the concrete individual, (2) a core of essential properties, (3) what is capable of independent existence, (4) a center of change, (5) a substratum, and (6) a logical subject are never thoroughly worked out and reconciled in Aristotle. He appears to

emphasize now one and now another mark of substance as of paramount importance. The quotations cited above have been chiefly from the *Categories*; the topic is taken up and discussed at length in the *Metaphysics*. The discussion is tentative and not finally conclusive, but Aristotle seems to favor alternative (2), substance as essence, as his preferred sense. But the whole treatment is important not for the answers that he gives but for the questions that he raises. Discussions of substance in later philosophers have tended, with few exceptions, to take over one or more of the six senses proposed by Aristotle as the clue to the problem.

**ATOMISTS AND MEDIEVALS.** Of the philosophical theories of antiquity, one other is of some consequence. Ancient atomism, founded by Leucippus and Democritus, developed by Epicurus, and expressed in its most attractive form in the *De Rerum Natura* of the Roman poet Lucretius, suggests that the truly real and substantial elements of nature are the atoms out of which everything is composed. It is these that are fundamental, unchangeable, and, in the last resort, capable of independent existence. The problem of substance and attribute was not much discussed by the ancient atomists, but their theories provide material for an answer to the question raised by Aristotle.

During the Middle Ages, discussion of this problem was very naturally centered upon the theological repercussions of rival theories. In particular, the doctrines of the Incarnation of Christ and of transubstantiation depended for their rational justification upon a plausible theory of substance. But these theological outworks produced no new basic insights that can be regarded as an improvement on the work of Aristotle. Indeed, they are just variations upon Aristotelian themes.

**DESCARTES.** The revival of philosophy in the seventeenth century in a form that was relatively independent of the religious framework of medieval philosophy produced several systems for which the notion of substance is fundamental. In the work of René Descartes the concepts of substance and attribute become associated naturally with those of the conscious self and its states, and the problem of substance becomes associated with the problem of personal identity. Descartes had been thoroughly trained in the form of Aristotelian scholasticism current in his day, and his notions of substance are in part derived from this and in part inconsistent with it. He gives a formal definition of substance as follows: “Everything in which there resides immediately, as in a subject, or by means of which there exists anything that we per-

ceive, i.e. any property, quality, or attribute of which we have a real idea is called a *Substance*; neither do we have any other idea of substance itself, precisely taken, than that it is a thing in which this something that we perceive or which is present objectively in some of our ideas, exists formally or eminently. For by means of our natural light we know that a real attribute cannot be an attribute of nothing” (*Philosophical Works*, translated by Haldane and Ross, 2nd ed., Cambridge, U.K., 1931, Vol. II, p. 53). In other words, what we are directly aware of are attributes of things and not the things themselves. But it is a logically self-evident principle (known by “the natural light” of reason) that an attribute must be an attribute of something, and the something is a substance—known by this inference and not directly. So far Descartes does not depart from scholastic doctrine, but he goes on to affirm that substances have essential attributes. For example, thought is the essential attribute of mind, and extension is the essential attribute of matter. But he does not explain what a substance is apart from its essential property. What is the mind apart from thinking or matter apart from extension? Unless this question is answered, how can Descartes answer the later empiricist criticism that the concept of substance is meaningless because empty of content?

In another context (*ibid.*, p. 101) he gives an alternative definition of substance. “Really the notion of *substance* is just this—that which can exist by itself, without the aid of any other substance.” This second definition is a bad one, being circular in expression; but clearly Descartes has in mind both here and in the quotation above simply the Aristotelian criteria (3) and (5). On the basis of these definitions, Descartes postulates three types of substance: material bodies, minds, and God. But the first two, being in a certain sense dependent on God for their existence, clearly have a lower grade of substantiality. Descartes’s conception of substance and attribute is made impossible to understand by the vagueness of the notion “attribute” by which he seeks to clarify the idea of substance. If “attribute” means “property or relation,” it simply is not true that all attributes are attributes of substances. For example, a color may have properties that are not properties of the colored thing. It is true of the color *red* that it is produced by light of wavelength about 7000 angstrom units, but this is not true of red objects. In any case, it seems that Descartes has simply defined *substance* and *attribute* relative to each other so that his explanation is circular and thus uninformative: Attributes are what qualify substances and substances are what have attributes.

SPINOZA. Descartes’s second account of substance as that which is capable of independent existence was taken up and developed by Benedict de Spinoza in his *Ethics*. Spinoza was a student of Descartes and may be regarded as one who developed some of Descartes’s ideas to consistent but surprising conclusions. Reflecting on Descartes’s second account of substance, Spinoza showed that if by *substance* we mean, according to his definition, “that which is in itself and is conceived through itself,” it is easy to show that there can be only one such being, the whole universe. Thus Spinoza equated substance with God and nature, the three terms being synonymous for him. This “hideous hypothesis,” in David Hume’s ironical phrase, has won for Spinoza the inconsistent titles of atheist and pantheist. What he did, in fact, was to demonstrate the alarming consequences for religious orthodoxy of Descartes’s second definition and to indicate obliquely that substantiality in this sense is a matter of degree. Nothing in the universe is completely independent of its environment, although some things are more independent than others. A human being has a certain degree of independence of his environment but can exist only within a certain range of temperature, pressure, and humidity, and with access to air, food, and water. Other things may be more or less independent of their surroundings, and the extent of their freedom in each case is an empirical question. Spinoza did not draw this conclusion, but it is implicit in his development of Descartes.

LEIBNIZ. Another rationalist philosopher, Gottfried Wilhelm Leibniz, makes the concept of substance fundamental to his philosophical system. He uses two of the Aristotelian criteria of substance, substance as a center of change and substance as a logical subject, but adds the concept of simplicity. The basic elements of Leibniz’s metaphysical system were what he called monads. In his *Monadology* he defines *monad* as “nothing but a simple substance.... By ‘simple’ is meant ‘without parts.’” That there are such simple substances follows, for Leibniz, from the admitted fact that there are compound things, which can be nothing but collections of simple things. Leibniz seems here to have been influenced by the arguments of the ancient materialists for the existence of atoms. His monads, however, were supposed to be immaterial substances, centers of change and thus subjects of predicates. Unfortunately, by describing his substances in this way, he deprives the term of meaning just as Descartes had done. He does indeed affirm that his monads are centers of activity, but this activity is manifested only in their tendency to move from one state to another. But if the essence of something is to be the *x* that under-

goes changes and of which predicates can be affirmed, it can have no positive character of its own. In Bertrand Russell's words, "substance remains, apart from its predicates, wholly destitute of meaning" (*The Philosophy of Leibniz*, p. 50).

LOCKE, BERKELEY, HUME. Leibniz had criticized the British empiricist philosopher John Locke for professing to find substance an empty concept. The weakness of Locke's criticisms of the concept was that he concentrated his attack on the notion of a substratum of qualities. This is not the most important of the Aristotelian senses of the term. But if "substratum" can be shown to be an empty notion, it is easy to raise skeptical doubts about some of the associated senses, particularly those of substance as a center of change, as the concrete individual, and as a logical subject. Locke points out that we find in experience groups of qualities that occur together in time and place. We therefore presume these qualities to belong to one thing and come to use one word, "gold," "apple," or "water" (whatever it may be) to refer to the collection of properties "which indeed is a complication of many ideas together." Further, "not imagining how these simple ideas can subsist by themselves, we accustom ourselves to suppose some *substratum* wherein they do subsist, and from which they do result, which we therefore call *substance*" (*Essay concerning Human Understanding*, Book II, Ch. 23).

Substance, then, is not a positive concept but merely an "obscure and relative" notion of "the supposed but unknown support of those qualities we find existing, which we imagine cannot exist *sine re substante* without something to support them." Since Locke has already tried to show that all our meaningful concepts originate in experience, substance is an awkward counterexample to his theory of knowledge. Indeed, he would probably have rejected it altogether but for certain associated moral and theological doctrines that his cautious and conformist temperament made him forbear to reject outright. Moreover, he seems to have been unable to reject Descartes's principle that attributes must inhere in a substance, although he does not submit this supposed logical truth to any rigorous examination.

However, Locke's empiricist successors, George Berkeley and Hume, were fully aware of the importance of Locke's criticism and his reduction of the notion to "an uncertain supposition of we know not what." Berkeley's attack on the concept of material substance owes much to Locke, and Hume was content to write off the whole idea as an "unintelligible chimaera." Moreover, Hume

extended the skepticism of Locke and Berkeley in respect of material substance to question, on analogous grounds, the existence of spiritual substances or selves. It is clear that a mind whose function is merely to be the bearer of states of consciousness is as vacuous a notion as Locke's material "we know not what."

KANT. Immanuel Kant's *Critique of Pure Reason* (1781) transformed the notion of substance, as it did so many other philosophical concepts. In Kant's view, "substance" does not refer to a feature of the objective world independent of human thinking. On the contrary, the unity and permanence of substances are features contributed by the human understanding to the world of phenomena. This represents a very radical revision of the concept of substance. Substance shrinks from being a fundamental feature of the objective world to an aspect under which men cannot help classifying their experience—and they cannot help themselves not because of the nature of external reality but because of the structure of their own cognitive apparatus.

#### MODERN CRITICISM

Since Kant's day the permanent and valuable features of philosophy have been those that have grown out of the immense development of the formal and natural sciences from the end of the eighteenth century to the present, a development that has shown the falsity of the scientific assumptions on which the Kantian revolution was built. For example, Kant believed that Newtonian physics, Euclidean geometry, and Aristotelian logic were finally and beyond all question true of the world, and some features of his system depend on these assumptions. This development has presented the problem of substance as a problem soluble, if at all, in the light of empirical evidence drawn from the relevant sciences. It has, moreover, made clear that there is no one problem of substance but a number of subproblems that can be treated independently.

These problems can still be stated in something like their original Aristotelian form, but we may find ourselves looking in different areas of knowledge for their answers. There is no one unitary science, such as metaphysics or ontology, that can be looked to for a solution. For example, the notion of substance as a logical subject of predicates (as when we say of a piece of gold, "*It is heavy*," "*It is yellow*," "*It is malleable*," "*It melts at 1063° C*," and so on) is now seen to be a problem of interest to formal logic and to linguistics. It is a technical question of logic whether all sentences about individual things can be

(or must be) expressed in subject-predicate form. And it is a technical question of linguistics whether all languages use such a form to express these notions, or indeed have a subject-predicate syntax at all. (The answer in both cases seems to be “No.”)

**INDEPENDENT EXISTENTS.** The question “What, if anything, is capable of independent existence?” can be seen, insofar as it relates to material things, to be a question to which physics, chemistry, and biology give us the answers. (If the question is asked about the existence of nonmaterial things such as numbers or propositions, we have first to make clear what is meant by “existence” in such contexts.) We see that *independent* is not a term with a clear meaning but, rather, is an elliptical expression. “*X* is capable of independent existence” means “*X* is capable of existing without regard to features  $y_1, y_2, \dots, y_n$  of its environment.” Since these conditions are so numerous, it is easier to express the concept negatively: “*X* is not independent” means “*X* is incapable of existing apart from conditions  $z_1, z_2, \dots, z_n$ ” or “ $z_1, \dots, z_n$  are necessary conditions for the existence of *X*.” On this interpretation, a substance in the sense of something that is capable of completely independent existence is something for whose existence there are no necessary conditions. The specific values of the variable *z* will vary with the value of *X*. For example, if *X* is a piece of ice or a lump of metal, one of the *z*’s will be temperature; if *X* is a green plant, the *z*’s will include light and oxygen; and so on. It may well be that nothing in the universe is independent of all conditions, but whether this is so is an empirical question.

**ESSENCES.** Aristotle’s favorite, but least satisfactory, account of substance was that of substance as essence, an essence being a set of qualities that conjointly embody the nature of the thing they qualify, are grasped by intellectual intuition, and are expressed in the definition of the thing. But developments in the sciences (especially in biology) and in the philosophy of science over the past century have shown that this notion is illusory. Definitions, in the contemporary view, are either descriptions of current linguistic usage or recommendations for linguistic conventions. They cannot seek to explicate the essential nature of the definiendum because naturally occurring objects have no such invariable natures. Definitions in formal sciences like mathematics and logic do delineate the invariant properties of the definienda precisely because they are proposals for conventions.

**SUBSTRATUM.** There remains for consideration substance in the senses of (a) a center of change, (b) a sub-

stratum of qualities, and (c) the concrete individual thing. Senses (a) and (b) are closely akin and are both vulnerable to the empiricist line of criticism made famous by Locke. We may regard a particular thing as qualified by different properties at different times (for example, when an insect changes from egg to caterpillar to pupa to moth), or as qualified by a group of qualities at the same time (for example, when we say that a lump of sugar is white and sweet and soluble). Both of these ways of looking at substance lead to the unanswerable question “What is it that is the bearer of the qualities in each case?” But the answer to this cannot even be as satisfactory as Locke’s “something we know not what,” for by thus separating the subject (or hypothetical bearer of the qualities) from its predicates, we effectively prevent ourselves from saying anything about it. For to say anything about it is merely to assign to it one more predicate. This way of explaining substance makes it an empty concept.

Yet the obvious alternative to this blind alley seems no more promising. Suppose that when we say “Some apples are red” we do not mean what contemporary logic teaches us to mean: There is an *x* that has both the property of being an apple and the property of being red. Suppose that instead we mean: That set of particular properties which we call “apple” includes the further property of being red. Then the relation “being predicated of” turns out to be nothing more than the familiar relation of being a member of a group. This conclusion looks innocuous until we realize that this interpretation would make all subject-predicate affirmations either necessarily true or logically false. For the proposition “The set of properties  $Q_1, Q_2, \dots, Q_n$  contains the property  $Q_n$ ” is a logically true statement. And if we amend it to make it informative thus: “The set of properties  $Q_1, \dots, Q_n$  contains the property  $Q_{n+1}$ ” we do not have an informative proposition but, rather, a logically false one.

The way out of this dilemma is not to ask such misleadingly general questions as “What is the locus of change?” or “What is the bearer of properties?” We can ask for the detailed history of a particular thing, an insect, a plant, a man or what not, and the answer will be given to us by the relevant sciences—embryology, anatomy, physiology. We can ask for the detailed structure of a particular thing, a piece of gold, a moth, a man, or what not; again the relevant science—physics, chemistry, anatomy—will give us the answer if the answer is known. But we cannot ask for the history or structure of things in general, for there is no science of things in general.

**CONCRETE INDIVIDUALS.** A similar criticism awaits the last of the Aristotelian answers to the question about substance: A substance is a concrete individual thing. We cannot sensibly ask what makes things-in-general concrete individuals. The notion of a concrete individual thing is clear in its standard cases, like men, tables, mice, or stones. But it is unclear in its nonstandard applications. Is a cloud a concrete individual or is it just the particles that make it up that can be so called? Is a rainbow? Or a dream table? Can electrons be called individual things when it is impossible in principle to identify them and trace their continuous histories? Examples such as these show the futility of trying to find a general formula that will clarify the notion of a concrete individual thing. We can, of course, ask the psychologists what perceptual characteristics of things lead us to class them as individuals. That a set of jointly occurring properties stands out in our perceptual field, that it moves as one, that it persists through time—all these and other characteristics will lead us to regard a thing as a thing. But there is no decisive test which will enable us to decide, if we are doubtful, whether a certain *x* is really a concrete individual or not. In borderline cases this must be a matter for decision, not diagnosis.

## SUFISM

The origins of Sufism (*taṣawwuf* in Arabic), or Islamic mysticism, appear clearly in the spiritual practise of the Prophet Muhammad in seventh-century Arabia (Massignon 1954, Lings 1993). Sufism's key contemplative discipline, remembrance of God (*dhikr*), was practiced continually by the Prophet and is alluded to in fifteen verses of the Qur'ān. From this practise the Sufis developed an entire science of invocations and supplications (*adhkār*) designed to cultivate the heart, refine the soul, and elevate ordinary human consciousness into awareness of the ever-immanent divinity (Chittick 1987). There are nonetheless a number of formative influences on early Sufism that are extraneous to early Qur'ānic spirituality. Michael Sells (1996) has demonstrated that the heritage of pre-Islamic poetry provided numerous subthemes (for example, drunkenness, love-madness, perpetual wandering, the secret shared between lover and beloved) for later Sufi literature and poetry. Scholars such as D. Miguel Asin Palacios, Tor Andrae, Duncan Macdonald, Louis Massignon, Henry Corbin and Luce López-Baralt have revealed how some of the ascetic and mystical tendencies in early Sufism bear close resemblances to

Christian mysticism, a thesis adumbrated by Tor Andrea's *In the Garden of Myrtles: Studies in Early Islamic Mysticism* (1987).

### QUR'ĀNIC ORIGINS AND FORMATIVE INFLUENCES FROM THE SEVENTH TO TENTH CENTURY

The word *Ṣūfi* as a technical term does not itself come into use before the end of the eighth century CE. The last of the following four possible etymologies of the word (there is no consensus) reflects the relation of the movement with Greek philosophy: from *Ahl-i Ṣuffa*, “the People of the Veranda,” the Prophet's most intimate companions in seventh-century Medina; from *ṣafā*, meaning purity; from *ṣūf*, meaning wool; and from the Greek *sofos*, that is, *sagesse*, a cognate of *sophia* (“wisdom”). In the context of the last-cited etymology, Sufism appears to be related to Islamic “philosophy” or *falsafa* in Arabic, *faylasūf* (philosopher) being the Arabic transcription of the Greek *philosophos*. Although the terms *Sufi* and *Sufism* are historically applicable only to the type of mystic and mysticism developed within Islam, based upon pursuit of the Prophet's exemplary practice (*sunna*), it is undeniable that many of the theosophical elements in Sufism, especially as the mystical tradition changed and developed over the course of later centuries, are largely derived from Greek thought.

Mystical teachings are usually ascribed to a number of the Companions (*al-aṣḥāb*) of the Prophet and their “followers” (*al-tabā'iyun*) (Ernst 1999), the first and foremost being the fourth Sunni Caliph 'Alī ibn Abī Ṭālib (d. 661) whose sermons, letters, poems, and maxims were compiled by Sharif al-Raḍī (d. 1015) in the *Nahj al-balāghah*. 'Alī features as the starting-point of all the esoteric initiatic chains of Sufism, whether Sunni or Shī'ite, and is recognized as the founder of two fundamental Sufi doctrines: renunciation of the world (*zuhd*) and spiritual poverty (*faqr*). His possession of gnostic insight and esoteric knowledge (*'ilm-i ladunī*) is acknowledged by all Muslim theologians, Sufi mystics, and philosophers.

Ḥasan al-Baṣrī (d. 728), the principal founder of the early ascetic movement of Islam that later became known as Sufism, is listed as Imam 'Alī's succeeding link in most Sufi initiatic chains among the “followers” of the Prophet's “Companions.”

The next most significant figure in Sufi thought is the sixth Shī'ite Imam Abū Ja'far al-Ṣādiq (d. 765), the author of the earliest mystical Qur'ān commentary, described as “the soundest of all the Shaykhs, upon whom

all of them rely. . . . He is the path-master of the people of love (*pīshvā-yi ahl-i 'ishq*) (‘Attār 1993, p. 12). In fact, the love mysticism of Sufism may be traced back to both al-Ṣādiq and to his contemporary, Rābi'a al-Adawiyya (d. 788–792), the most famous female Sufi in all history, of whom Ibn 'Arabī commented, “She is the one who analyzes and classes the categories of love to the point of being the most famous interpreter of love.”

It was in the ninth century, when Greek philosophy was being introduced into Islam and when all the technical vocabulary of philosophy and theology in the Arabic language was being fashioned, that most of the basic technical terms, concepts, and categories of Sufism were also elaborated. It was probably in response to the Neoplatonic philosophers of the “School of Baghdad” (revolving around Caliph al-Ma'mūn, who supported the translation of Greek works into Arabic and Syriac) that the Sufis of the ninth century first began to use the term *mystical knowledge* (or *ma'rifat*) instead of *rational knowledge* (or *'ilm*) to refer to the type of experiential, gnostic knowledge they possessed, in order to distinguish it from the mental, purely theoretical knowledge of their contemporaries, the Neoplatonists. (Danner 1987, p. 254).

It is not mere historical coincidence that both of these celebrated Schools of Baghdad—that of the philosophers and that of the Sufis—evolved at exactly the same time and place. From the early ninth century, Muslim Peripatetic philosophy and Sufi mysticism shared a common psychological vocabulary simultaneously fed by the two streams of Qur'ānic spirituality and Greek philosophical writings, which had been translated into Arabic. Although the intellectual contexts and applications of this vocabulary differed greatly, the lexicon of both was often identical; a huge stream of common terms flowed through both systems from the two sources. For instance, in psychology, both Sufi mystics and Peripatetic philosophers shared a common terminology: for soul, *nafs*; for spirit, *rūh*; for heart, *qalb*, for phantasy, *wahm*; for imagination, *khiyāl*; for reason, *'aql*. While all these terms also figure prominently in the Qur'ān, they were corralled and culled as suitable translations (as Harry Wolfson [1935] established in a seminal article) by Muslim thinkers such as al-Farabi, Avicenna, and Ghazālī.

In the ninth century three mystics were of primary importance for the development of Sufi esoteric and mystical terminology. The first two are vaunted for their role in the development of psychospiritual terminology of Sufism, whereas the third is famous for his unusual but highly influential mystical theology. All three affected the

formulation of Sufi philosophy, if *philosophia* is understood in its literal sense as love of divine wisdom.

The first figure was al-Ḥarīth al-Muḥāsibī (d. 857), who lived and taught in Baghdad. From the standpoint of formulation of mystical doctrine, psychological examination of the spiritual life, and authorship of definitive textbooks on both subjects, he was indubitably the most illustrious Sufi of the ninth century. As “the real master of primitive Islamic mysticism,” as Margaret Smith put it, most later elaboration and exposition of Sufi technical terminology—such as self-examination (*muḥāsaba*), contemplation (*muraqaba*), fear (*khawf*), hope (*rajaʿ*), patience (*ṣabr*), contentment (*riḍāʿ*)—can be traced back to terminology that first appeared in his works.

The second figure, Dhūʿl-Nūn al-Miṣrī (d. 861), “the founder of theosophical Sūfiism,” as Nicholson (1906) rightly calls him, played a formative role in the evolution of Sufi doctrine. He had been the first to provide a systematic teaching about the mystical states and spiritual stations (*aḥwāl u maqāmāt*) of Sufism and was also the first to discourse on mystical knowledge, or *maʿrifat*, and to distinguish it from academic knowledge, or *ʿilm*. He was also founder of the practice and theory of the “art of audition to music” and the first to describe in poetic detail the types of “ecstatic rapture” (*samāʿ* and *wajd*), which ensued from this aesthetic tool of contemplative vision. He was also the first mystic to use the imagery of the wine of love and cup of mystical of gnosis poured out for the lover (Smith 1991).

However, it was the third figure, Abū Yazīd (or Bāyazīd) Bisṭāmī (d. 848 or 875), who personified the Muslim mystic par excellence and who served as the real cornerstone of the free-spirited classical Sufism of later generations. He is the most frequently cited mystic in Sufi poetry. Bāyazīdian Sufism still represents the zenith of anticlerical thinking in Islam. His paradoxical utterances (he wrote nothing down), transmitted by word of mouth by disciples, soon became the subject of intricately argued prose commentaries and complicated Sufi metaphysical compositions in prose and verse. A century after his death, a separate Bāyazīdian school came into being; some two centuries later this school’s contours became intellectually formalized in ʿAlī Hujwīrī’s (d. 1071) *Kashf al-mahjūb*, a Persian manual of Sufi teachings and doctrine, in which Bāyazīd’s followers are classified as comprising a separate school of thought known as the Ṭayfūriyya and described as advocates of rapture (*ghalabat*) and intoxication (*sukr*) as opposed to Junayd’s School of Sobriety (*saḥw*). Of particular importance in Sufi philosophy is Bāyazīd’s doctrine of *fanāʿ*, or annihilation,

of the selfhood or individual ego identity in God’s Self-identity, enabling the mystic to contemplate God directly through God’s own eye (Rūzbihān 1966, p. 115).

Aside from these three key Sufis, there were a number of other significant mystics in the history of ninth-century Sufism, most notably Ḥakīm al-Tirmidhī (d. 908), from the Transoxanian town of Tirmirdh, one of the most interesting and prolific authors to write on themes such as sanctity and prophethood. His works became the subject of commentaries by later Sufis such as Ibn ʿArabī.

The main center for the development of Sufi doctrine in the ninth and tenth centuries was Khurāsān, in northern Iran, and the city of Nishāpūr, which, following the fall of Baghdad to the Buwayhids in 945, became the center of Sunni Islam for the next two centuries. Nishāpūr was the center of the antiascetic Sufi school of the *Malāmātiyya* (lovers of blame), whose masters enjoined their students to practice psychological introspection into the blemishes of the “lower soul” (*nafs*), or ego, and to expose their personal faults in public. Its central teacher, Abū Ḥafṣ Ḥaddād (d. 874–879), advocated opening oneself to public blame, concealing all one’s own praiseworthy virtues from public scrutiny while accusing oneself of spiritual shortcomings. Its two other main representatives in Nishāpūr, Hamdūn al-Qaṣṣār (d. 884) and Abū ʿUthmān al-Ḥīrī (d. 910), were famous for nonconformist mysticism: Qaṣṣār criticized as egotistical those who overtly perform *dhikr*, and al-Ḥīrī reproached as hypocritically impious those who engaged in acts of devotion with any degree of awareness of self.

Three important developments in Sufism—institutional, aesthetic and pedagogical—took place in Nishāpūr at the end of the ninth century. Regarding the institutional developments, Margaret Malamud (1977) and Jacqueline Chabbi (1994) have shown that, in the early ninth century, some of the earliest Sufi *khānaqāhs* (meeting houses) were established in Nishāpūr. Abū Saʿīd Abīʿl-Khayr (967–1049) was the first person to formalize a program for institutional and communal living of disciples, codifying rules for novices in his Sufi *khānaqāh*. In mystical aesthetics, Abū Saʿīd is significant for having definitively integrated the practice of “audition to poetry with music” (*al-samāʿ*) into the Sufi devotional life. He pioneered the expression of mystical ideas in Persian verse, using the quatrain form (*rubāʿī*), in which he was the chief forerunner of Sanāʿī, ʿAṭṭār, and Rūmī (Graham 1999).

Fritz Meier (1999) has shown how a radical transformation in Sufism took place in Nishāpūr regarding the

theory of pedagogy and practice of the master-disciple relationship from end of the late ninth century onwards. The spiritual master, who had formerly figured merely as an academic instructor of a group of students, now became the main fulcrum of the *via mystica*. He was transformed into a spiritual trainer of adepts, a saint in whom the student—now disciple—is obliged to confide with childlike trust his inmost thoughts and grant unquestioning obedience, considering him as the absolute authority and ultimate judge in all matters. By the eleventh century, this aristocratic Nishāpūrian model of the spirituality came to prevail throughout the Sufi tradition worldwide.

The leader and founder of the other important mystical school of Sufism, which was centred in Baghdad, was Abū'l-Qāsim Junayd (d. 910), who perfected Muḥāsibī's orthodox teachings and utilized his terminology. Junayd's translation of Bāyazīd's sayings from Persian into Arabic and commentary on them were preserved in Abū Naṣr Sarrāj al-Ṭūsī's (d. 378/988) *Illumination of Sufism* (*Kitāb al-luma' fī'l-taṣawwuf*), "the oldest surviving general account of Sufism" (Arberry 1950). Junayd elaborated Bāyazīd's doctrine of *fanā'* in depth and detail, careful to guard against the negative consequences of the doctrine, which, superficially considered, might be interpreted by Sufism's enemies as either a kind of an ontological nihilism or else a subjective interiorised pantheism; he thus rejected both the doctrine of *ḥulūl* ("incarnationism," whereby God infuses himself in man as one substance into another) and *iṭṭihād* ("unitive absorption" of the individual's finite selfhood in God). Junayd's sober integration of the theosophical teachings of Sufism with Islamic legalism constitutes the basis for the orthodox understanding of Sufism down to the present day.

Because of the century and city (Baghdad) in which he flourished, Junayd was highly influenced by the school of Islamic Neoplatonism that had been established there. The theory of Al-Fārābī (d. 950), known as the "second teacher" (*al-mu'allim al-thānī*) after Aristotle, was that religions constitute elaborate symbol systems to be interpreted by an elite group of sages. This rationalist esotericism found a fit gnostic reprise in Junayd's use of mystical terminology that employed Sufi symbolic sayings couched in an enigmatic and hermetic writing style (*ishārāt*). A comparison of Junayd's basic concepts (as Ali Hassan Abdel-Kader [1976] has shown) with those of Plotinus—the stages of the mystical path, the doctrine of the preexistence and postexistence of the soul, the theory of contemplation (*mushāhada*), and the idea that mundane beauty stimulates the longing of the soul for its

home Yonder—reveals Junayd's intellectual fraternity with the great pagan philosopher of late antiquity.

Junayd's school of sobriety stands in contrast to the boldly unconventional mystical theology of his most celebrated contemporary, the great martyr of Sufism Maṣū'ir al-Ḥallāj (d. 922), to whose life and thought Louis Massignou consecrated a huge four-volume monograph, *La Passion de Husayn Ibn Maṣū'ir Ḥallāj: martyr mystique de l'Islam* (1982). As Massignou (1986) pointed out, Ḥallāj figures as a precursor of Ghazālī in his endeavor to bring dogma into harmony with Greek philosophy on the basis of mystic experience. Ḥallāj was a disciple of Sahl ibn 'Abd Allāh Tustarī (d. 896), famed for his esoteric Qur'ānic exegesis. Tustarī identified "the search for knowledge" (*ṭalab al-'ilm*) as incumbent upon all Muslims with mystical feeling and spiritual consciousness (*'ilm al-ḥāl*). He defined this consciousness as the deep-felt realization that God is the witness (*shāhid*) of the devotee's thoughts, words, and deeds, which, with practice, can be transmuted into realized sapience or existential verification of knowledge (*taḥqīq al-'ilm*).

At least two key philosophical doctrines in Sufism are traceable to Ḥallāj: first, the idea of Love (*'ishq*) as "essential desire" (that is, human erotic aspiration as identical with the divine Essence), which Ḥallāj's follower Abū al-Ḥasan al-Daylamī (tenth century), was first to attribute to him in the *Kitāb 'atf al-alif al-ma'lūf 'alā'l-lām al-ma'ṭūf* (The book of the inclination of the familiar alif toward the inclined lam), the first book on mystical love in Islam which drew on Sufism, philosophy, and Arabic court culture (*adab*). Ḥallāj's controversial usage of the Arabic *'ishq* (passionate love) for the human-divine relationship has startling similarities to the objections raised by Christian theologians against the use of the Platonic *eros* and the Latin *amor* as equivalents to the Pauline *agape*. Ibn Sīnā's (Avicenna, d. 1037) philosophical conception of love (*'ishq*) as the universal principle of being, animate and inanimate; his view of God as the First Beloved (*Ma'shūq-i awwal*) who is simultaneously loved, lover, and love, is connected with Ḥallāj's theory (Anwar 2003, Ernst 1994). Second, Ḥallāj's conception of divine union as embodying realization of the essential oneness or unification of the human spirit with God (*'ayn al-jam'*) was expressed notably in his shocking theopathic locution *Anā al-Ḥaqq* ("I am God"), for utterance of which he was martyred.

During the tenth century Persian mystics continued to compose manuals and systematic treatises on Sufism in Arabic: Abū Bakr Muḥammad al-Kalābādhī (1989) (d. 990, a native of Bukhara) wrote his pioneering *Introduc-*

tion to the Creed of the Sufis (*Kitāb al-ta'arruf li-madhhab ahl al-taṣawwuf*), an important introduction to—and integration of Islamic exotericism with—Sufism. In this work he prudently avoided any mention of Ḥallāj, still considered a heretic by the jurists. Another Sufi scholar, Abū Naṣr Sarrāj (d. 988) from Khurasan, wrote “the oldest surviving general account of Sufism” (Arberry 1950, p. 67). *Illumination of Sufism* (*Kitāb al-luma' fi'l-taṣawwuf*). One of Ḥallāj's masters, Abū Ṭālib al-Makkī (d. 996), composed the most celebrated Sufi textbook of the Baghdad School entitled *The Food of Hearts* (*Qūt al-qulūb*), which anticipated the reconciliation of mystical and legalistic Islam that would later appear in Ghazālī's works.

### ABŪ ḤĀMID AL-GHAZĀLĪ'S ATTACK ON PHILOSOPHY AND THE RENAISSANCE OF SUFISM IN THE TWELFTH CENTURY

The birth of Islam's greatest mystical theologian, Abū Ḥāmid al-Ghazālī (in Ṭūs in Khurasan in 1058) occurred at the peak of the arch of the development of Islamic mystical tradition in eleventh-century Khurasan, at the precise cusp when one half of the tangent of the Persian-Arabic mystical tradition, buttressed by the rise of Arabic mystical literature (mostly composed by Persian Sufis), faced the other half of the arch's tangent, the first beginnings of Sufi literature in Persian. The two pillars of this arch were, respectively, the *malāmātī* Sufism of Abū Sa'īd Abī'l-Khayr and the Hellenistic philosophy of Abū 'Alī Sīnā (Avicenna)—who, being affected and profoundly influenced the Sufism of his day, wrote a number of visionary works in Arabic (and the earliest philosophical work in Persian) that provided the speculative premises for the development of the love mysticism espoused by the later Persian Sufi poets.

So it is on the foundation of the Persian Sufi tradition that Ghazālī's theological achievement rests. Nearly all the major founders of Khurasani Sufism flourished during Ghazālī's era, having been born either in decades immediately before or after his birth. These included the likes of Abū 'Abd al-Raḥmān al-Sulamī (d. 1021), one of the main chroniclers of early Sufism, best known for his Arabic tract *The Generations of Sufis* (*Ṭabaqāt as-ṣūfiyya*), a compendium of the biographies of Sufis of five earlier generations that is a fundamental source for early Sufi history. 'Abd Allāh Anṣārī (d. 1089) of Heart, the leading stylist of Persian rhyming prose, translated and adapted Sulamī's tract into a Khurasanian dialect of New Persian. Almost as important as Sulamī's *Ṭabaqāt* is the best compendium of early Sufi doctrine, namely the *Treatise*

(*Risāla*) on Sufism in Arabic by Abū'l-Qāsim al-Qushayrī (d. 1072) of Nishāpūr. All of these sources Ghazālī read and knew and often reproduced them verbatim in his works.

In his autobiography, *Al-Munqidh min al-ḍalāl*, Ghazālī records how he investigated the truth claims and methods advanced by four different schools of thought: scholastic theology (*Kalām*), Isma'īli pedagogy (*ta'lim*), philosophy (*falsafa*), and Sufism (*taṣawwuf*); he concluded that the Sufi way is the highest and most perfect of them. The distinguishing dimension of Sufi teaching, he asserted, was that “it was not apprehended by study, but only by immediate experience (*dhawq*, literally “tasting”), by ecstasy, and by a moral change. (*Mā lā yumkin al-wuṣūl ilayih bā'l-ta'allum bul bā'l-dhawq wa'l-hāl wa tabaddal al-ṣafāt.*) I apprehended that the Sufis were men who had real experiences, not men of words (*arbāb al-aḥwāl, lā aṣḥāb al-aqwāl*).” The unstated implication of the Sufi experience was that it allowed the adept, without recourse to either theology or philosophy, to personally verify and partially access the experience of prophecy (Hodgson 1977). Ghazālī's approach to prophecy accorded with Avicenna's view of the faculty of intuition and imagination possessed by certain adept Sufis that enabled them to have access to illumination of the active intelligence (Griffel 2002). He believed that only the science of disclosure (*'ilm al-mukāshafa*) allowed one to “gain knowledge of the meaning of prophecy and the prophet, and of the meaning of revelation” (*al-waḥy*) (Heer 1999, p. 247 and Ghazālī 1962, p. 47), which led to the privileging of esoteric visionary thinking in later Islamic epistemology.

Ghazālī consecrated two works to the Neo-Platonic philosophers, al-Fārābī and Avicenna in particular. The first of these works was his *Objectives of the Philosophers* (*Maqāṣid al-falāsifa*); written in Arabic, it closely followed Avicenna's Persian work *Dānish-nāma 'Alālī*, providing an overall account of the history of Muslim philosophy and a lucid exposition of the philosophical doctrines that he later means to criticize. The second work, *The Incoherence of the Philosophers* (*Tahāfut al-falāsifa*), was a decisive attack on the emanative metaphysics, causal theory, and the psychology of the philosophers (especially Avicenna); in this work he sets out to prove that the philosophers are unable to prove religious truths from a theoretical point of view.

Modern scholars disagree about Ghazālī's contribution to the development of later Islamic philosophy. Lenn Goodman (1992), Ahmed El-Ehwany (1995), and Fazlur Rahman (2000) view his emphasis on Sufism as fettering

philosophic method and stifling the development of science in Islam, whereas M. Hodgson (1977), S. H. Nasr, and Henry Corbin (1996) perceive his contribution as having provided an excellent philosophical basis for the rise of later Islamic intellectual mysticism (*ḥikmat* and *ʿirfān*). Although it is true that Ghazālī's *Tahāfut* put later Islamic philosophy on the defensive, his reinterpretation of *falsafa* made philosophical ideas more accessible in the Islamic intellectual milieu than they had previously been and provided a necessary niche for philosophy to flourish in orthodox Islamic theological thought. Because Sufi theories of knowledge took center stage in his epistemological thinking, from the post-Ghazālī period in Islam down to early modern times, esoteric modes of expression invariably came to enjoy great popularity. Ghazālī believed the sapience of the heart (*dhawq*) to be superior to rational knowledge (*ʿilm*) and thought that gnosis (*maʿrifat*) could be obtained by means of the Sufi practices of remembrance of God and contemplation (*al-dhikr waʿl-fikr*), visionary unveiling (*kashf*) and abstaining from all but God Almighty. In this respect, his views are identical to those of Ibn ʿArabī a century later, whose writings on these subjects closely resemble Ghazālī's.

His most important composition was a monumental opus divided into forty books entitled *Ihyāʾ ʿulūm al-dīn* (*The Revivification of the Sciences of Religion*), which, in its day, was unique in its cosmopolitan scope and integration of technical terminology, ideas, and writings derived from diverse sources. The *Ihyāʾ*, a highly successful attempt to revive Islamic faith and piety on the basis of Sufism, had a profound impact on the later Islamic theological tradition. It began, in fact, what has been described as “the thirteenth-century revival of Sufism” (Danner 1988) and “the reorientation of the piety of Islam on the basis of Sufism.” Because of men such as Ghazālī, Sufism became “acceptable to the *ʿulamaʾ* themselves,” so that “gradually Sufism, from being one form of piety among others, and by no means the most accepted one either officially or popularly, came to dominate religious life not only within the Jamaʿi-Sunni fold, but to a lesser extent even among Shiʿis” (Hodgson 1977, 2:203).

Mention here must be made of an equally important figure in the history of Sufism, namely Ghazālī's brother Aḥmad Ghazālī (d. 1126), who was the foremost metaphysician of love in the Sufi tradition (Lombard 2003). His impact on the later Persian Sufi tradition was even more profound than that of his brother the theologian. Aḥmad was the teacher of two important figures in particular: Abū'l-Najīb al-Suhrawardī (d. 1168) (Pourjavady 2001), who was in turn the master of his nephew Shihāb

al-Dīn Abū Ḥafṣ ʿUmar Suhrawardī (d. 1234), the founder of the Suhrawardī order (famed as the “Mother of Sufi Orders”), who also authored the *ʿAwārif al-maʿārif*, a manual of Sufism so fundamental and all-encompassing that it was translated and adapted into Persian several times and taught throughout madrasas and *khānaqāhs* in the Indian subcontinent for centuries afterward. Aḥmad Ghazālī was also the master of the enigmatic mystical theologian and founder of Sufi speculative metaphysics: ʿAyn al-Quḍāt al-Hamadhānī (executed in 1132 by fanatical Muslim clerics for his uncompromising Sufi beliefs).

### ILLUMINATIONISM AND THE RISE OF THE SUFI ORDERS

In terms of Islamic *philosophia*, the most important figure following Ghazālī was Shihāb al-Dīn Yaḥyā Suhrawardī (born in Suhraward, in northwest Persia, in 1154 and died in Aleppo in 1191), renowned as *Shaykh al-Ishrāq*, the “master of illuminationist theosophy” or the “sage of the theosophy of oriental lights.” He was the most significant Platonic philosopher in the Eastern lands of medieval Islam. Described by Henry Corbin (1971, p. 340) as “an irregular Sufi of no formal affiliation,” Suhrawardī traced his thought back to various sources: Islamicized Peripatetic philosophers (he followed Avicenna's metaphysics in many respects), the Hermetic tradition of Egypt (Hermes, Asclepius), the pre-Islamic Persians of Mazdean Iran (Kayomarth, Kaykhusraw and Zoroaster), and Greek thought (Socrates, Plato, Aristotle). His theosophy anticipated in Islam the universalistic philosophy of fifteenth-century Renaissance Platonists such as Gemistos Pletho and Marsilio Ficino. In the world of Islam, his writings were highly influential on the intellectual development of the Neoplatonist thinkers of seventeenth-century the School of Isfahan. Despite his Peripatetic roots, Suhrawardī featured Sufis in his works, considering them to be the true philosophers of Islam. In this context, he related a dream he had had of Aristotle in which the latter identified Bāyazīd Bisṭāmī, Sahl Tustarī, and Ḥallāj as the highest Muslim thinkers (Walbridge 2000).

Suhrawardī's epistemology was based on Sufi visionary experience, and in his major work, the *Philosophy of Oriental Illumination* (*Ḥikmat al-ishrāq*), he goes to considerable lengths of philosophical argument to prove the verity of mystical intuition (*kashf*). He calls this intuition “knowledge by presence” (*ʿilm-i ḥuḍūrī*), according to which the self can know things directly by virtue of the very presence of itself (Yazdi 1992). The doctrine of

knowledge by presence is one of Suhrawardī's distinctive contributions to philosophy, and his *ishrāqī* theosophy generated a philosophical school that still dominates traditional schools of Iranian thought today. His influence "was greater than that of Averroes, for while the latter was largely forgotten in the Islamic world, Suhrawardī has continually attracted Islamic readers, followers, and opponents up to our own day" (Walbridge 2000, p. 5).

The twelfth century was also graced by the presence of the founders of two of the most influential Sufi orders in later medieval Islam: Abū Ya'qūb al-Hamadhānī (d. 1140), founder of the Naqshbandī order, and 'Abd al-Qādir al-Jīlānī (d. 1166), founder of the Qādirī order. Two of the greatest poets of Persian literary history flourished in the same century. Ḥakīm ("the Sage") Sanā'ī of Ghazna (d. between 1131 and 1150) was a pioneer in the development of the gnostic ghazal and the first Persian Sufi poet to blend poetic imagery of the sacred and the profane into a refined philosophical lyricism. Sanā'ī's follower, Nizāmī (d. 1202), wrote a series of unrivaled romantic epics and much mystical poetry. Another important figure is Rūzbihān Baqlī (d. 1210), whose writings constitute "a vast synthesis and rethinking of early Islamic religious thought from the perspective of pre-Mongol Sufism" (Ernst 1996, p. x), furnishing us with "a vital resource for understanding the experiential basis, not simply of Persian Sufi literature, but of Sufism and indeed mysticism in general" (Ernst 1996, p. 11). His monumental *Commentary on the Paradoxes of the Sufis (Sharḥ-i shaḥīyyāt)* is an indispensable source for the interpretation of the higher reaches of Sufi apophatic theology.

The most important Persian Sufi poet of the twelfth century was Farīd al-Dīn 'Aṭṭār (d. 1221), the prolific author of numerous epic Persian poetic works. His seminal masterpiece, *The Conference of the Birds (Manṭiq al-tayr)*, has been translated into most European languages. 'Aṭṭār's major prose work was the monumental compendium, in Persian, of biographies of the famous Sufis, *Tadhkirat al-awliyā' (Memoirs of the Saints)*.

'Aṭṭār's contemporary was Najm al-Dīn Kubrā (d. 1221), another important figure in medieval Sufism. The founder of the Kubrawiyya, also known as the Central Asian school of Sufism, Kubrā was known for his theory of light apparitions that are beheld by the spiritual imagination in the imaginal realm (*'ālam al-mithāl*). These theories were elaborated by later Sufis of this order, who included some of the most important names of the twelfth and thirteenth centuries. Their interpretation of these phenomena, especially when combined with their adherence to the theomist doctrine and technical ter-

minology of Ibn 'Arabī, constitute one of the most important chapters in the history of Islamic mysticism.

Perhaps the most famous Kubrawī mystic was Najm al-Dīn Rāzī (d. 1256), author of the *Devotees' Highroad (Mīrṣād al-'ibād)*, an important manual of Sufi methodology in which he elaborated the peculiarly Kubrawī notion of a series of subtle centers of perception (*laṭā'if*) (Rāzī 1986, p. 299ff.). He also explained the varieties of visionary contemplation (*mushāhadāt-i anwār*) (Rāzī 1986) and continued an esoteric commentary on the Qur'ān that had been begun by Najm al-Dīn Kubrā and completed by another Kubrawī master, 'Alā' al-Dawla Simnānī (d. 1326), who elaborated his own theory of the scripture's seven esoteric levels of meaning, each of which, he said, corresponded to a subtle center of light (*laṭīfa*) (Waley 1991, Elias 1995) and expressed the inner reality (*ḥaqīqa*) of one of the prophets.

The Kubrawī school also featured a number of other notable Sufis who flourished in Iran and Central Asia: Sa'd al-Dīn Ḥammūya (d. 1253), author of the *Al-Miṣbāḥ fī'l-taṣawwuf*; Sayf al-Dīn Bākharzī (d. 1260), author of the *Waqā' i' al-khalwa*; Abū'l-Mafākhīr Yaḥyā Bakhrāzī (d. 1335–1336), the author of an important Sufi manual, *Fuṣūṣ al-ādāb*; and 'Azīz-i Nasafī (d. between 1282 and 1300), a Sufi philosopher from Uzbekistan who wrote a number of profoundly original works in Persian that still remain popular. In India, the Kubrawiyya played an important role down to fourteenth century. A disciple of Simnānī named Sayyid 'Alī Hamadānī (d. 1385) was the last great thinker of the order in Central Asia; he founded the Hamadānī line, and, according to legend, was responsible for the Islamization of Kashmir.

This order was also influential in China, where Sufism first established a foothold in the early fifteenth century. The writings of two Kubrawī masters, Rāzī and Nasafī, were among the first Islamic works that were translated into Chinese in the seventeenth century, thus forming the intellectual bedrock of the Chinese Islamic tradition. The development of Islam in China is inextricably connected with the translation of Sufi texts into Chinese. Prior to the twentieth century, only four Islamic books had been translated into Chinese, all of them Persian Sufi classics belonging to the Kubrawī and Ibn 'Arabī schools (Murata 1999). Sufism in China today remains dominated by the Naqshbandī and Qādirī orders (Gladney 1999).

## RŪMĪ AND IBN 'ARABĪ

The thirteenth century was the golden age of Sufism, when the most celebrated Persian poet in Islamic history,

Jalāl al-Dīn Rūmī (d. 1273), appeared. He was the author of the most extensive collection of mystical poetry, with the widest pattern of meters yet seen in Persian poetry. His collection of mystical-erotic lyrics, the *Dīvān-i Shams-i Tabrīz* (compiled under the name of Shams-i Tabrīz because the signature verse of nearly each poem bore the name “Shams,” symbolic of the poet’s absorption in his spiritual teacher of this name) totals some 35,000 verses. Each of these *ghazals* (Arabic for “love-lyric”) is between five and sixty lines long and expresses the mystery of their relationship, as well as the paradoxes and subtleties of the mystical theology of Sufism. Each poem was the product of an ecstatic experience realized by the poet under the influence of the Sufi music-and-dance (*samā’*) ceremony, which came to be the hallmark of his order, called the Mevlevi in Turkey and later known in the West as the Whirling Dervishes. In the eighteenth and nineteenth centuries, the Mevlevi Order’s (from Rūmī’s sobriquet *Mawlānā*, “our teacher”) exotic flowing skirts and hypnotic revolving dance became the most popular European tourist attraction east of Athens, prompting Alexander Pope in his *Essay on Man* to observe that “Eastern priests in giddy circles run, / And turn their heads to imitate the Sun.”

During the last decade and a half of his life, Rūmī began to compose the *Mathnawī-yi ma’ nawī* (Rhyming spiritual couplets), dictated to his disciples under the sway of rapture. Eventually comprising more than 26,000 couplets of didactic poetry, this mystical epic became Rūmī’s chief literary monument. “Judged by modern standards,” wrote R. A. Nicholson in 1925 in his introduction to his critical edition and translation of the poem, “the *Mathnawī* is a very long poem: it contains almost as many verses as the *Iliad* and *Odyssey* together and about twice as many as the *Divina Commedia*.”

Islam’s greatest mystical thinker, known as the *Magister Magnus* or Shaykh al-Akbar, Muḥyī al-Dīn Ibn ‘Arabī of Spain (d. 1240), generated a new era of writing in the field of Islamic gnosis with a string of Sufi commentators on his works and a whole school of theosophy still vital in Iran, India, Turkey, North Africa, Malaysia, and neighboring areas. Ibn ‘Arabī was a very prolific author and, with the possible exception of Ghazālī, has been the most extensively studied thinker in the Islamic world (Morris 1986–1987). He composed some 850 works; 700 of these are extant, and at least 450 of them are genuine. His writings were responsible for formalizing and crystallizing the largely orally transmitted doctrines of the founders of the various Sufi Orders and thus fostered a common heritage for Sufism, which was then in

the process of “creating new structures and attracting a wider flock of followers.” (Chodkiewicz 1991, p. 51).

His major work, *The Meccan Revelations* (*al-Futūḥāt al-makkiyya*), covers 2,580 pages of small Arabic script (in its new critical edition the work is projected to cover thirty-seven volumes of about 500 pages each). His most famous work, however, is a short work entitled *Fuṣūṣ al-ḥikam*, made up of twenty-seven chapters, each of which is devoted to the divine wisdom revealed in a particular prophet and specific divine word. Each of these prophets represents a different mode of knowing. The title may be translated as “Bezels of Wisdom,” implying that each prophet in his human setting is a kind of gemstone in which “each kind of wisdom is set, thus making of each prophet the signet or sign, by selection, of a particular aspect of God’s wisdom” (Austin 1980, p. 16). The first chapter of the book concerns Adam and the last concerns Muḥammad, although the prophets discussed in between are not dealt with in chronological order. For nearly five hundred years it was the most frequently commented upon work in Sufi and theological circles in the Middle East, Central Asia, and India. In fact, the *Fuṣūṣ* was the chief intellectual preoccupation of the Sufis in India, where commentaries were written on the book by Sayyid ‘Alī Hamadānī in Kashmir, Shaykh ‘Alī Mahaymī in Gujerat, and Muhammad Gisūdarāz in the Deccan (Ahmad 1963).

Ibn ‘Arabī’s name is inextricably associated with the doctrine of the “Unity of Being,” “Oneness of Existence,” or “theomonism” (*waḥdat al-wujūd*), which should not be confused with pantheism. In this view, God is identical to created beings in His manifestation but completely separate and distinguished from them in their essences, so there is no substantial continuity between God and creation. All living beings participate with God through the theophany of His divine Names (the Living, the Speaking, the Hearing, the Omniscient, and so on), for we are all manifestations of one Light—the orifices of being through which His illumination is shone. Existence thus manifests itself by means of epiphany or theophany (*tajallī*), of which there are two types: intellectual theophany (*tajallī ‘ilmī*), which is a manifestation of Being that is termed the “Most Holy Emanation” (*fayḍ al-aqdās*), and existential theophany (*tajallī wujūdī*), which is termed the “Sacred Emanation” (*fayḍ al-muqaddas*). The first type of theophany belongs to the Divine Essence, appertaining to the World of Unity (*‘ālam al-aḥadiyya*); the second type hails from the World of Unicity (*‘ālam al-waḥda*). Unlike the Peripatetic philosophers and most Sunni theologians, Ibn ‘Arabī believed nothing

to be external to the divinity or outside the Absolute. Existential multiplicity is not a kind of divine action outside of Being in its Essence and Attributes. He considered “Being as an unconditional absolute (*mawjūd-la-bi-shart*) beyond all duality or multiplicity. According to him, the multiplicity which we observe at the sensible or spiritual levels does not affect the Unity of Being in its creative act. It simply represents its various degrees and many states. The existential theophanies, therefore, only constitute a facet of the Absolute-God who is One in His existence and many in His manifestations” (Yahia 1991, p. 36).

Knowledge of both existence and God can only be grasped imaginatively, that is, by intuitive disclosure (*kashf*) and contemplative insight (*shuhūd*), not through reason (*‘aql*), because a likeness of God can be gained only by recourse to imagination, not reason. Ibn ‘Arabī’s doctrine of the metaphysical, transpersonal imagination (*khiyāl munfaṣil*), which possesses its own distinct independent ontological level (comparable to Jung’s collective unconscious) lead him to espouse an epistemology that harmonizes reason and mystical insight (Chittick 1996, p. 666). God’s self-manifestation (*zuhūr*) can thus be intuited through the theophany of His divine names, which are manifest to the visionary imagination of the mystic, who can thereby experience a supersensory reality (Izutsu 1994).

Ibn ‘Arabī’s writings, employing “all the tools of the theologians, philosophers, grammarians, and other specialists” (Chittick 1989, p. 289), generated “by far the most elaborate Islamic ‘philosophy of religion’ and religious life, a comprehensive metaphysics which offered an all-encompassing justification and explanation for the observed diversity of religions, philosophic, and spiritual ‘paths’ to God—whether within the multiple sects and schools of later Islamic culture, or in the wider, even multi-confessional context of the Ottoman, Safavid and Mogul empires.” (Morris 1998, p. 23) As. T. Izutsu (1995, p. 552) has pointed out, “Even today the metaphysics of Ibn ‘Arabī together with—or mingled with—that of Suhrawardī, the Master of Illumination (*Shaykh al-Ishrāq*), form the basis of the philosophical-gnostic world-view of Iranian Muslim intellectuals. In fact, one of his surnames, *Muhyī al-Dīn*, meaning literally ‘revivifier of religion,’ manifests its living force when it is seen in terms of the role his thought has played in the historical formation of Iranian Islam.”

Many of the greatest names in the annals of Persian Islam have counted themselves as disciples or at least interpreters of his doctrines. These include the likes of Awḥād al-Dīn Kirmānī (d. 1238), Ṣadr al-Dīn Qūnawī (d. 1274),

Fakhr al-Dīn ‘Irāqī (d. 1289), Sa‘īd al-Dīn al-Farghānī (d. 1299), ‘Azīz al-Dīn Nasafī (d. circa 1300), Mu‘ayyid al-Dīn Jandī (d. 1301), ‘Abd al-Razzāq al-Kashānī (d. 1339), ‘Alā al-Dawla Simnānī, Dāwūd Qaysārī (d. 1350), Rukn al-Dīn (Bābā Ruknā) Mas‘ūd Shirāzī (d. 1367), Maḥmūd Shabistarī (d. after 1339), Muḥammad Shirin Maghribī (d. 1408), Khwāja Muḥammad Parsā (d. 1419), Ṣā‘īn al-Dīn Turkah Iṣfahānī (d. 1427), Shāh Nimatu’llāh Walī (d. 1431), and Shāh Dā‘ī Shirāzī (d. 1464).

## SUFISM IN THE SCHOOL OF ISFAHAN

Prior to the advent of the modern age, the most significant development in Islamic thought occurred in the philosophical collegium of Isfahan in Safavid Iran (1501–1722), a unique amalgam of Sufism, Shī‘ism, Platonist Ishrāqī theosophy, and Islamic rationalism that was heavily grounded in the theosophical theories of classical Sufism. Although all its members exhibited a profound respect for the ethical, intellectual, and spiritual ideals of classical Persian Sufism, few of them seem to have openly accepted the requirement of following the *ṭarīqa* discipline involving obedience to a living master (*pīr*, *murshid*). The writings of its members are permeated with Shī‘ite piety, imamology, and theology, and were intellectually inspired by the Illuminationist (*Ishrāqī*) theosophy of Shaykh Yaḥyā Suhrawardī, which mixed Peripatetic rationalism with Islamic Platonism. Its main thinker, Mullā Ṣadrā (d. 1650), drew heavily on other renowned Sufi authors such as Abū Naṣr Sarrāj, ‘Ayn al-Quḍāt Hamadhānī, Abū Ḥāmid al-Ghazālī, and Ibn ‘Arabī (Pourjavady 1999). In fact, as S. H. Nasr has noted, if viewed correctly in historical context, the entire later school of Ṣadrā’s Transcendental Theosophy, both in Iran and India, might be better classified as a sort of “speculative Sufism” (*taṣawwuf-i nazārī*) (Nasr 1993, p. 124) rather than as simply a species of philosophical mysticism (*ḥikmat*).

Hodgson (1977, 3:52) has noted how the Platonists of Isfahan may be compared at points with their contemporaries, the Cambridge Platonists of England in their ecumenical interests. Mīr Findiriskī (d. 1640–1641) was one of the major philosophers of the School of Isfahan and was committed to the transmission and translation of the Hindu holy books and scriptures into Persian; he composed a commentary on the *Yoga-Vāshishtha* of Vālmiki. The Muslimization of Hindu mystical thought that resulted from the efforts of such philosophers and translators both in Iran and India can be compared to Marsilio Ficino’s Christianization of the Greek Neoplatonic classics in his translations of Plato and Plotinus into Latin.

SUFISM IN EASTERN EUROPE, THE  
MIDDLE EAST, IRAN, AND INDIA  
FROM THE SEVENTEENTH CENTURY  
TO THE PRESENT

Since the late eighteenth century Muslim Sufi orders throughout the world have been in the throes of crisis and transformation because of the combined influences of modernism, Islamist reformism, nationalism, and European colonialism. A key to these upheavals has been the continuing impact of fundamentalist Islamism on Sufism throughout the Islamic world, a trend that began in the early twentieth century.

Throughout the Sunni world, *Salafis* (puritans claiming to be followers of the “pious forbears” of the Prophet)—particularly in Egypt—have attacked Sufism as “inauthentic,” a “Trojan horse for unwarranted innovations that owe their origins to non-Muslim civilizations such as Greece, Persia, and India” (Cornell 2004, p. 59). The same attacks have occurred in other Sunni-dominated countries of the Middle East. In Algeria and Syria, Sufis are beleaguered on the one hand by the all-encroaching influence of Western secularism, which endorses the Western modernist view of mysticism as an anachronistic superstition, and Wahhābī scriptural literalists on the other.

In Eastern Europe, Sufism has been a significant force since the early fifteenth century, especially in Bosnia, where a number of leading intellectuals, thinkers, and poets, mostly followers of the Mevlevīya and Naqshbandī Orders, penned influential mystical treatises and books and wrote glosses on classical tracts. After the collapse of the Ottoman Empire, Albania became an important center of Sufism, with the majority of its inhabitants belonging to one or another Sufi order (Clayer 2001).

Since the early sixteenth century Sufism has been firmly established in Turkey “as a fundamental element of Ottoman Islamic society, where in the urban context, the Mevlevīya played an important role in the education of Ottoman elites and in the cultivation of Sufi and Persian literatures” (Lapidus 1992, p. 29). In Ottoman society, Rūmī’s Mevlevī order, to which most of the country’s intellectual and artistic elite belonged, became the greatest preserver of musical creativity in a religious context. The Mevlevīya produced some of Turkey’s finest musicians and calligraphers and the most sophisticated religious poet of early modern times, Ghālib Dede (1799), whose poem *Beauty and Love* is a supreme work of world literature (Holbrooke 1994, Winter 1994). Although, by the end of the nineteenth century, almost every city in the

Ottoman Empire possessed its own Mevlevī center (Zarcone 2000), by the early twentieth century, because of the Kemalist laws against the Orders, many of the Sufi centers were closed down or destroyed (Raudvere 2002). The law of September 1925, which stated that “from this day forth, there are not *tarikats*, or *dervishes*, and *murids* belonging to them, within the boundaries of the Turkish Republic” (Algar 1994, p. 55) explicitly banned all dervish gatherings, practices, and teachings. The Naqshbandī Order was subject to particular governmental persecution and harassment. Since the 1950s there has been a relaxation of some of these restrictions because of the Turkish government’s attempt to harness Sufism’s spiritual potential to further its own secularist sociopolitical agenda. Because the agenda of the Kemalist secular state is to counter Islamist fundamentalism with Sufism’s mystical and moral universalism (ignoring its institutional, contemplative, and practical aspects), there has been a consequent revival of Sufi activities such as Mevlevī dervish dancing, and renewed interest in the cultural heritage of Sufi architecture, poetry, literature and music.

In Egypt, hardline Islamist ideologues such as Muḥammad Rashīd Riḍā (d. 1935) and Ḥasan al-Banna (d. 1949), founder of the Muslim brotherhood, condemned Sufism wholesale as a repository of corrupting opinions and ideas in Islam. Another Egyptian fundamentalist thinker, Sayyid Quṭb (d. 1966), argued that Sufism represented a debilitating, antirational, antiprogressive force in the Islamic tradition (Abu-Rabi 1988). For more than a century, Sufism in Egypt has been controlled by an elaborate state apparatus. Since 1903 the leaders of the Orders have been governed and often appointed by a Supreme Council of the Sufi Orders. In the interests of religious and state conformism, most of the transcendentalist, illuminationist, ecstatic, and unitive aspects of the Sufi tradition are publicly denigrated and suppressed in favor of a sober, reformist mysticism focused on communal moral virtues and study of *ḥadīth* and the Qur’ān. The doctrines of rapture and intoxication maintained by the great founders of Sufi theosophy such as Ḥallāj and Bāyazīd are frowned upon by the Sufi Council (Hoffman 1995).

In Saudi Arabia, Sufism is banned today by the *ḥadīth*-driven scripturalism of the Wahhābī literalist theologians. The entire corpus of Sufi writings, philosophy, poetry, theosophy, and literature—whether these be the more orthodox works of Ghazālī or the visionary meditations of Ibn ‘Arabī, which were once accepted as a mainstay of traditional Islamic theology by a broad spectrum of believers—have been anathematized by the Wahhābī

hierarchy that controls the mosques, schools, and universities (Cornell 2004). Even the writings of great Sufi masters such as Aḥmad Ibn Idrīs (d. 1837) (the renowned Sufi saint of Moroccan origin who lived in Arabia and defended Ibn ‘Arabī’s Sufi doctrines in face of Wahhābī persecution) remain anathema to the Saudi fundamentalist state (Radtke 2000).

In Algeria during the nineteenth century, the Sufi orders played a leading role, among other Muslim groups, in fighting French imperialism, and stood in the vanguard of opposition to France’s cultural and political colonialism (Benaissa 1997). During the twentieth century all the Sufi orders suffered persecution by the *Salafi* reformists, who accused them of backwardness and deviance from orthodoxy (Andezian 1994). In recent decades terrorist organizations, inspired by these same Algerian *Salafis*, have continued their attack on Sufism, whereas the modernist secularist elements equate Sufism with decadence and backwardness, so that today “for many if not most educated Algerians, Sufism is virtually synonymous with ‘maraboutism’—saint-worshipping idolatry, superstitious donning of amulets, snake-charming, etc.” (Shah-Kazemi 1994, p. 171)

In Iran, most of the main nineteenth-century political reformers, such as Akhundzāda (d. 1878), Mīrzā Malkum Khān (d. 1908), and Mīrzā Āqā Khān Kirmāni (d. 1896) attacked Sufism, castigating its alleged passivity and religious conformism (Lewisohn 1998–1999). Radical Iranian secular intellectuals of the early twentieth century, such as Aḥmad Kasravī (d. 1946) widened this critique to sweepingly condemned Sufism as “one of the deep-rooted and greatly misguided beliefs to have appeared in Islam” (Kasravī 1990, p. 79). In the Islamic Republic in the early twenty-first century, mystical philosophy (*ḥikmat*) is encouraged, and there has been a renaissance in the publication of works on classical *taṣawwuf*, with Sufis abounding in all major urban centers, but their activities and gatherings are often closely monitored by the fundamentalist state. Since 1978 the theocratic regime has tried to write Sufism out of the textbooks of Iranian history and to destroy the mausoleums of the masters and living institutions of the Orders which dot the country; nevertheless, both above and below ground the Sufi orders have managed to survive.

In Pakistan, there has been a renaissance in the publication of Sufi literature, much of it patronized by the state and nationalist interests, which underwrite editions and Urdu translations of prominent Sufi poets who composed verse in regional vernaculars. Works by the famous masters of the Chishtī, Suhrawardī, and Naqshbandī

Orders from the thirteenth to the nineteenth centuries “are widely available for popular use through modern Urdu translations in India and Pakistan, and occasionally in other languages as well (Ernst 2000, p. 335). Pakistani modernists such as Muhammad Iqbal (d. 1938) have made use of classical figures such as Rūmī, Ḥallāj, and Junayd in their own writings to further their own personal philosophical agenda but have denounced khānaqāh-based Sufism and the master-disciple relationship; some have attacked as decadent the Sufi love mysticism of Persian poets such as Ḥāfīz. Recently, Sufism has sometimes been press-ganged to support nationalism—as in Z. A. Bhutto’s claim that Sufi saints were forerunners of the modern Islamic state of Pakistan (Ernst 1997, pp. 79, 209).

From the tenth century onward, the Islamization of India “was achieved largely by the preaching of the dervishes, not by the word” (Schimmel 1975, p. 346). The two main Indian orders that dominated the cultural and religious life of the land were the Chishtiyya and Suhrawardiyya, which had been introduced into India with the foundation of the Sultanate of Delhi; within a short time thousands of their khānaqāhs and zāwiyahs had woven themselves into the complex religious culture of India, smoothing and softening relations between opposing religious identities. The rise of the Indian Bhakti movements in the fourteenth and fifteenth centuries took place in the background and under the direct influence of *khānaqāh*-based Sufism of the Suhrawardī and Chishtī Orders (Nizami 1957).

The school of Ibn ‘Arabī in India was sustained by Sufis of all the major Orders. The renewer of the Chishtī Order in northern India, ‘Abd al-Quddūs Gangūhī (d. 1437), who had mastered the famous Hatha Yoga treatise Amrit Kund and who wrote Hindi poetry influenced by Nathpanthi Yogic and Bhakti traditions, strongly defended the philosophy of the ‘Unity of Being’ in his treatises and correspondence (Farooqī 2004, pp. 4–6). Some of the great Chishtī Sufis were ardent supporters of Ibn ‘Arabī’s theomorphism. Shaykh Muḥibb-Allāh Ilāhābādī (d. 1648), a vicar of the grandson of ‘Abd al-Quddūs Gangūhī, was known as the “Supreme Master” (Shaykh-i Kabīr) for works that defended and commented on Ibn ‘Arabī’s *Fuṣūṣ al-ḥikam*. (Farooqī 2004).

The rulers of the Mughal Empire, from Akbar the Great (d. 1604) down to Shāh Jahān (d. 1658), patronized Sufis of the Chishtī, Qādarī, and Naqshbandī Orders, and utilized Sufi ecumenical “unity of religions” theory to unite their Hindu and Muslim subjects. Many Sufis in India tried to bridge the differences between Hindu and

Muslim mysticism; hence one important service that the Sufi Orders and Sufis in South Asia performed was the promotion of sectarian harmony and interfaith tolerance (Islam 2002, p. 447). Mystics such as Niẓām al-Dīn Awliyāʾ and Dārā Shikūh were known for their tolerance of religious diversity and their appreciation of Hindu spirituality. Dārā Shikūh (d. 1659), the eldest son of the Mughal Emperor Shāh Jahān, wrote a comparative study of Sufi and Vedantic technical terms (*Conjunction of the two Oceans* [*Majmaʾ al-baḥrayn*]) and a Persian translation of fifty-two Upanishads (*The Supreme Arcanum* [*Sirr-i akbar*]). This work was later translated into Latin by Anquetil-Duperron, inspiring Schopenhauer and a whole string of European and American philosophers after him throughout the nineteenth century. Sufis of the Chishtī and Qādirī Orders rendered the Bhagavadgītā into Persian three times during the Mughal period in the seventeenth century, with Ibn ʿArabīʾs theory of an underlying mystical unity of religions used by its translators to interpret Hinduism in the context of Islamic theomonism (Vassie 1999).

#### SUFISM IN THE CONTEMPORARY WEST

Up until the late eighteenth century, the cultural and intellectual influence of the Sufi tradition upon Western Europe had been marginal (Chodkiewicz 1994), although certain Sufi thinkers such as Ghazālī did have a formative influence upon certain Christian philosophers such as Raymond Lull (Urvoy 2004). In the nineteenth century, Persian Sufi theosophy and poetry entered the course of Western European thought through key representatives of the German Idealist and American Transcendentalist movements, particularly in the figures of Goethe in Germany and Emerson in North America, both of whom were profoundly influenced by translations of Persian Sufi mystical literature (Jahanpour 1999). During the twentieth century, the traditionalist school founded by the French metaphysician René Guénon (d. 1951)—who converted to Islam and spent the last twenty years of his life in Cairo as a Sufi shaykh of the North African Shadhili Order—have constituted the avant-garde of Sufi teaching in the West. Sufi Muslims among Guénon’s followers included Frithjof Schuon, Titus Burckhardt, Martin Lings, and S. H. Nasr, whose writings endeavor to revive Muslim orthodox traditional Sufi teachings in the light of the *Sophia perennis*, aiming to address both Islamic orthodoxy and the ecumenical concerns of comparative religion. Other advocates of the *Sophia perennis* and followers of the traditionalist school who were deeply

influenced by Sufism are Ananda Coomaraswamy and Aldous Huxley.

The renowned Greek-Armenian spiritual teacher G. I. Gurdjieff (d. 1949), who was steeped in Sufi theosophy, spread his teachings during the 1930s and 1940s throughout Europe and the United States through a wide circle of followers, such as P. D. Ouspensky (d. 1947), P. L. Travers, René Daumal, and Maurice Nicoll. Many of Gurdjieff’s followers articulated his esoteric teachings as being a kind of Sufism divorced from traditional Islam. During the same period, the so-called “Sufi Order of the West,” founded by Ināyat Khān (d. 1927), an Indian musician of the Chishtī Order, preached Sufism in Europe and North America as a sort of woolly universal mysticism that could be detached from its Islamic roots. Idries Shah (d. 1996), a prolific author of more than twenty-five books on Sufism, did much to introduce Sufism to the educated middle classes in the West, particularly artists and intellectuals, teaching that Sufism lies at the heart of all religion, although his interpretation of Sufism was primarily a *malāmatī* rather than an orthodox Muslim one.

Over the past few decades, under the leadership of Dr. Javad Nurbakhsh, the Iranian Niʿmatu’llāhī order has become a major publisher of Sufi works in English, French, German, Russian, Spanish, and Italian. This order lays little emphasis on the Islamic dimension of Sufism, stressing its universalism and ethnic Persian origins. Since the 1980s, there has also been a renaissance of scholarship on classical Sufi texts in French, English, and German, and the publication of critical studies and editions of the works of the great Sufi saints in all the major European languages has blossomed. Rūmī has become the best-selling poet in the history of American poetry publishing.

There are today at least fifty different Sufi movements in North America, the literary output of which, as Marcia Hermansen (2000, p. 158) observes, “is by now so vast that it would require a volume rather than an essay to adequately discuss the history and doctrines of each of the groups in detail.” Sufism and its Orders are today found throughout all the major countries of Europe; in Britain alone, there are at least twenty-five active orders whose followers’ ethnic origins can be traced back to Pakistan, India, the Middle East, Iran, and West Africa (Geaves 2000).

## SUHRAWARDĪ, SHIHĀB AL-DĪN YAḤYĀ

(c. 549 AH/1155 CE–587 AH/1191 CE)

Shihāb al-Dīn Yaḥyā Suhrawardī was born in Suhraward, ancient Media, in northwestern Iran. He died in Aleppo, in the full bloom of youth, a victim of the vindictiveness of the doctors of the Law and of the fanaticism of Ṣalāḥ al-Dīn (the "Saladin" of the Crusaders). It is important that this philosopher not be confused with two other Sufis with similar names (Shihāb al-Dīn 'Omar and Abu'l-Najīb Suhrawardī).

A guiding thought dominates Suhrawardī's work: to restore the philosophy and theosophy of the sages of ancient Persia. Three centuries before it was effected in the works of the great Byzantine philosopher Georgius Gemistus Pletho, the conjunction of the names of Plato

and Zoroaster was realized in the works of this thinker of Islamic Persia. Broadly outlined, this work (where the influence of Hermeticism and late Neoplatonism was also joined) brought forth an interpretation of the theory of Platonic Ideas in terms of Zoroastrian angelology. If his design reconciled itself with difficulty to the spirit of legalistic Islam, of religion and the Law, it was not, on the other hand, contrary to a spiritual Islam, bringing into play all its resources and profoundly influencing it. This employment in effect imposed on philosophy an exigency that assured it thenceforth of a completely characteristic place in Islam. Suhrawardī did not separate philosophy and spirituality; a philosophy that does not terminate in or at least tend toward a mystical and spiritual experience is a vain undertaking. Seeking out a mystical and spiritual experience without a preliminary philosophical position puts one in great danger of losing one's way. The influence of this doctrine has been considerable, especially in Iran, and endures even to the present.

The key word in Suhrawardī's entire work is (in Arabic) *Ishrāq*. Literally, it means the illumination of the sun when it arises (*Aurora consurgens*). Transposed to the spiritual plane, it means a type of knowledge which is the very *Orient* of knowledge. Suhrawardī's principal work is titled *Ḥikmat al-Ishrāq*, "Oriental" philosophy or theosophy (the term *ḥikmat ilāhīya* being the exact equivalent of the Greek *theosophia*). It deals with a philosophy that is Oriental because it is illuminative and illuminative because it is Oriental. Between these two terms there is reciprocity rather than opposition (as C. Nallino believed). The disciples and perpetuators of Suhrawardī are known as the *Ishrāqīyūn* or *Mashriqīyūn*, the "Orientals." Suhrawardī himself is designated as preeminently the *shaikh al-Ishrāq*. Prior to Islam, these "Orientals" are to him essentially the sages of ancient Persia. Their "philosophy of enlightenment" originated with the concept of *Xwarnah* (Light-of-Glory in the Avesta and Mazdaistic cosmology; *Khorreh* in Persian). In its turn, this concept dominates the entire work of the *shaikh al-Ishrāq*. "Oriental" knowledge, which is its subject matter, is essentially a discovered "presential" knowledge (*'ilm hoḍūri*), and intuitive perception, such as knowledge of oneself, in opposition to a type of representative knowledge (*'ilm ṣūri*), through the intermediary of a Form or a *species*.

This is why an entire section of our shaikh's work (among approximately fifty titles, a trilogy, each of whose constituent elements is composed of a logic, a physics, and a metaphysics) is dedicated to freeing philosophy from all accumulated obstacles attributable to the abstractions of the Peripatetics and the scholastic scholars

of Islam (the *Mutukallimūn*). This preliminary study was crowned with the work cited above, where, from the analysis of the concept of being as Light, the theory of the procession of beings of Light is disengaged (complex angelic hierarchies, deduced somehow from the esoteric interpretation of the laws of optics). To the structure of these hierarchies correspond those of the plans of the universe, which are “symbolic of each other.” Suhrawardī, more particularly, seemed to have been the first to found, systematically, an ontology of the *mundus imaginalis* (*‘ālam al-mithāl*), a world of the Image and a world of the Souls (the *malakūt*), acting as an intermediary between the world of pure Intelligences (the *jabarūt*) and the sensible world. This is a world without which the visionary experiences of the prophets and mystics, as well as the suprasensible events that the philosophy of the Resurrection treats, would remain unexplained. From this another complete section of Suhrawardī’s works, deliberately written in Persian, was introduced, especially to this world, as the first phase of spiritual initiation. It forms a cycle of symbolic tales in which Suhrawardī consciously followed Avicenna (Ibn Sīnā). He knew very well what he owed to Avicenna and why he was able to go further than he: Avicenna also had formulated the project of an “Oriental” philosophy, but he could not realize it, not having known its true source.

Thus did the work of the *shaikh al-Ishrāq* give rise in Islam to a current of philosophy and spirituality distinct from the three currents that are usually considered, that of *Kalām* (the rational scholastic scholars), that of the *falāsifa* (philosophers known as the Hellenists), and Sufism. It is currently said that the *Ishrāq* is to the philosophy of the *falāsifa* what Sufism is to the theology of the *kalam*. By doing this, Suhrawardī defended the cause of philosophy against the pious agnosticism of the literalist theologians, as well as against that of certain Sufi pietists. It was only because his work was ignored for so long a time in the West (where one was accustomed to assessing Islamic philosophy from the viewpoint of what was known of it by Latin Scholastics) that an exaggerated importance was attached to Averroes, whose work was considered as having attained the self-proclaimed pinnacle and terminal point of philosophy in Islam. Neither the Peripateticism of Averroes (with which the ontology of *Malakūt* was lost) nor the critique of the philosophy of Muḥammad al-Ghāzalī has had any influence on Oriental Islam, notably on Iranian philosophy. Even there, what develops is a “Suhrawardian Avicennism” to which is joined the influence of Ibn al-‘Arabī (of Andalusia, died 1240 CE, one of the greatest mystical theosophists of all time), which spread forth into the “prophetic philoso-

phy” of Shī‘ism. The influence of Suhrawardī’s doctrines was later dominant in the School of Ispahan, in the sixteenth and seventeenth centuries, in the Iran of the Safavids (with the great names of Mīr Dāmād, Mullā Ṣadrā Shīrāzī, Moḥsen Fayz, Qāzī Sa‘id Qommī, and so forth), as it was also later preponderant in India in those circles influenced by the generous religious reform of Shāh Akbar. It still makes itself felt in Iran at the present time.

### **Bibliography**

For an edition of the works of Suhrawardī, see *Opera Metaphysica et Mystica*, Vol. I, edited by Henry Corbin (Istanbul: Maarif Matbaası, 1945), and *Oeuvres philosophiques et mystiques* (which is *Opera Metaphysica et Mystica*, Vol. II), edited by Henry Corbin (Teheran: Institut franco-iranien, 1952). The two volumes contain a long introduction in French.

*Henry Corbin (1967)*

## SUHRAWARDĪ, SHIHĀB AL-DĪN YAḤYĀ [ADDENDUM] (1155 or 1156–1191)

Shihāb al-Dīn Suhrawardī is one of the most well known, innovative, yet controversial Persian philosophers of the history of philosophy in Iran. He was executed in 1191 at the age of thirty-six by the express command of King Saladin, most probably for his illuminationist political doctrine. This doctrine is Platonist in principle, and is based on Fārābī’s structure of the ideal republic, commonly known as the “Virtuous City,” in which justice is achieved based on the enlightened rule of the inspired philosopher-sage. Later Shī‘a scholastic political thought draws heavily on Suhrawardī’s illuminationist political doctrine.

Suhrawardī authored nearly fifty works, many of them devoted to the systematic refinement and reconstruction of philosophical arguments of the prevailing Avicennan peripatetic system of his time. Suhrawardī’s stipulated aim was to refine the Greek-inspired Avicennan texts, and as such he is one of the first philosophers to challenge the unquestioned superiority of Aristotle.

Suhrawardī's philosophical aim was not to refute rational philosophy, nor to reduce it to ill-defined mysticism; rather, his creative thinking represented a positive philosophical approach aimed primarily at constructing a consistent system to prove the rational validity of revealed knowledge, as well as the intuitive and the inspired, non-predicative cognitive modes.

Medieval historians and scholastic commentators recognize Suhrawardī's innovative thinking and named him the founder of a new system, the "philosophy of Illumination." Recent analytical studies of Suhrawardī's Arabic and Persian works that together define the new system have led to the revision of earlier Orientalist misrepresentations of Suhrawardī as a mystic or a theosopher. Suhrawardī was above all a rationalist thinker whose ambition in philosophy was to construct a consistent holistic system to remove presumed logical gaps in the Aristotelian scientific system known to him in Avicenna's peripatetic philosophical corpus. The aim of Suhrawardī's reconstructed system was to define a new scientific method named the "Science of Lights" (*al-ilm al-anwār*) that then is employed in the construction of a unified epistemological theory, named Knowledge by Presence (*al-ilm a-ḥuḍūrī*), capable of scientifically explaining an inclusive range of phenomena that cover the domains of sensation, intellection, intuition, inspiration, and revelation.

The Knowledge by Presence theory has been widely acclaimed in all major philosophical works in Arabic and Persian—from Suhrawardī's own time to the present—as the crowning achievement of the philosophy of illumination, and was later employed by the major Persian thinkers in their probing of theories of knowledge. For example, the much acclaimed seventeenth-century Persian scholastic philosopher, Mullā Ṣadrā, uses the illuminationist theory of Knowledge by Presence to, among other things, explain God's knowledge of things as well as man's knowledge of God. This knowledge by presence is of essence, and its construction exemplifies Suhrawardī's aim to refine and reconstruct peripatetic arguments, not to refute them. Suhrawardī attempted to prove that the Avicennan Essentialist Definition (*al-ḥadd al-tāmm*, similar to Aristotle's *horos* and *horismos*) does not provide knowledge of essence of primary principles; and that Aristotelian theory of intellectual knowledge—which in its Avicennan peripatetic formulation is seen as conjunction with the Active Intellect (acting as *dator formarum*), does not bestow principles of science to the knower.

In his analysis Suhrawardī first examined the logical law of identity and criticized knowledge by predication;

he then took up the notion of union and conjunction in physics, finally constructing a unified theory as metaphysical law. The unified theory of Knowledge by Presence, then, is stated as an identity-preserving relation (literally an "illuminationist relation," *al-idāfa al-ishrāqiyya*) between the domains "knower" and "known," or the intellect and the intellected—or simply knowing and being. This type of knowledge is the technical refinement of Plato's "intellectual vision" plus Aristotle's logical notion of "quick wit" (*agkhinoia*); it posits priority to the self-conscious subject's immediate grasp of the real, manifest essence of objects. Suhrawardī's epistemological theory may be compared with Kant's notion of "immediate relation to objects," but is not to be reduced to Bertrand Russel's "knowledge by acquaintance," and in general anticipates Descartes's views on knowledge.

Suhrawardī's legacy defines the height of Arabic and Persian philosophy's twelfth-century rational response to the Ash'arite and other Ghazzālī-inspired theological antirational dogma. This philosophical legacy continues to this day, where the philosophy of illumination is an accepted school of Islamic philosophy and is taught in Shi'ite scholastic circles in Iran. While the most major innovation of Suhrawardī's technical philosophical work may be seen in his unified epistemological theory, and while it is his illuminationist political doctrine that has had the widest impact on Persian intellectual and religious traditions, still illuminationist philosophy includes many technical innovations. To name a few: the definition of an independent modal operator in the construction of a superiterated modal proposition as the single form to which all types of propositions are reduced; the proof of the impossibility of the necessary and always true validity of the universal, affirmative proposition; reduction of the Figures of Syllogism, as well as other technical innovations.

Some of his ideas in ontology and cosmology should also be mentioned: In his system, God and the intellects are types of lights; creation is the propagation of abstract, countless, continuous lights as self-conscious entities, extended in durationless time from the source, becoming less intense with distance, and the source, the Light of Lights, is the most essentially luminous, thus the most visible and self-cognizant of all. The process of becoming indicates continuum being, and is defined by rapidly increasing sequences of light-essences within a time-space continuum, where measured time and Euclidean space apply to the corporeal realm, and time without measure and non-Euclidean space define a separate realm Suhrawardī names "Mundus Imaginalis," which is an

“amazing” boundary “wonderland” realm joining the domain “intellect” with the domain “soul.” This realm of being is named in many later works as the locus of experiential knowledge, and the idea also impacted textual traditions beyond the purely philosophical, notably wide-ranging Persian mystical poetry.

**See also** Illuminism.

### **Bibliography**

Two of Suhrawardī’s philosophical texts are now available in bilingual editions. These texts are the best source for the study of his thinking:

*The Book of Radiance: A Parallel English-Persian Text*, edited and translated, with introduction, by Hossein Ziai. Costa Mesa, CA: Mazda Publishers, 1998.

*The Philosophy of Illumination: A New Critical Edition of the Text of Hikmat al-ishrāq with English Translation, Notes, Commentary, and Introduction by John Walbridge & Hossein Ziai*. Provo, UT: BYU Press, 1999.

A number of studies have been published, and the reader may consult them as further reading on Suhrawardī and his philosophy of illumination:

## SUICIDE

What role may a person play in the end of his or her own life? Is suicide wrong, always wrong, profoundly morally wrong? Or is it almost always wrong, but excusable in a few cases? Or is it sometimes morally permissible? Is it not intrinsically wrong at all though perhaps often imprudent? Is it sick? Is it a matter of mental illness? Is it

a private or a social act? Is it something the family, community, or society could ever expect of a person? Or is it solely a personal matter, perhaps a matter of right, based in individual liberties, or even a fundamental human right?

What role a person may play in the end of his or her own life is the central ethical issue in suicide around which a set of related issues also form: What should the role of other persons be towards those intending suicide? What should the role of medical and psychiatric clinicians be toward a patient who intends suicide since it is they who are said to be charged with protecting human life? What intervention may the state make to interfere with a person’s intention to end his or her own life? What responsibility do others—both immediate others such as family and friends or more distant or generalized others such as employers or institutions or society as a whole—bear when a person commits suicide?

This spectrum of views about the *ethics* of suicide—from the view that suicide is profoundly morally wrong to the view that it is a matter of basic human right, and from the view that it is primarily a private matter to the view that it is largely a social one—lies at the root of contemporary practical controversies over suicide. These practical controversies include at least three specific matters of high contemporary saliency:

- *Physician-assisted suicide in terminal illness*, the focus of intense debate in parts of the world with people who have long life expectancies and with high-tech medical systems, particularly the Netherlands, the United States, the United Kingdom, Canada, Switzerland, Belgium, Germany, and Australia;
- *Hunger strikes and suicides of social protest*, as in Turkey, Northern Ireland, and wartime Vietnam;
- *Suicide bombings* and related forms of self-destruction employed as military, guerilla, or terrorist tactics in ongoing political friction, including kamikaze attacks by wartime Japan; suicide missions by groups from Tamil separatists to al-Qaeda, and suicide bombings in the conflicts in Israel, Palestine, Iraq, and elsewhere.

Ethical issues have occupied the center of attention in the philosophical discussion of suicide, but conceptual and epistemological ones also play a role, as do a broad range of further issues raised within world historical, religious, and cultural traditions.

## CONCEPTUAL AND LINGUISTIC ISSUES

The term *suicide* carries extremely negative connotations. However, there is little agreement on a formal definition. Some authors count all cases of voluntary, intentional self-killing as suicide; others include only cases in which the individual's primary intention is to end his or her life. Still others recognize that much of what is usually termed suicide neither is wholly voluntary nor involves a genuine intention to die, such as suicides associated with depression or other mental illness. Many writers exclude cases of self-inflicted death that, while voluntary and intentional, appear aimed to benefit others or to serve some purpose or principle—for instance, Socrates drinking the hemlock, Captain Lawrence Oates's (1890–1912) walking out into the Antarctic blizzard to allow his fellow explorers to continue without him, or the self-immolation of war protesters. These cases are usually not called suicide but *self-sacrifice* or *martyrdom*, terms with strongly positive connotations.

Attempts to differentiate these positive cases from negative ones often seem to reflect moral judgments, not genuine conceptual differences, and the linguistic framing of a practice plays a substantial role in social policies about suicide. For example, supporters of physician-assisted suicide often use the term *aid-in-dying* as well as earlier euphemisms such as *self-deliverance* to avoid the negative connotations of *suicide* while opponents insist on the more negative term *suicide*. Islamic militants attacking civilians are called *martyrs* by their supporters and those who recruit them but *suicide bombers* by their targets and by the Western press.

Differences among languages also play a role in the conceptualization of suicide. While for example English, French, Spanish, and many other languages have just a single, primary word for suicide, German has four: *Selbstmord* (self-murder), *Selbsttötung* (self-killing), *Suizid* (the Latinate term), and *Freitod* (free death). This latter German term has comparatively positive, even somewhat heroic, connotations, making it possible for German-speakers to think about the deliberate termination of their lives in a linguistic way not easily available to speakers of English or other languages that rely on a single, principal term with strongly negative connotations.

Linguistic issues also arise in attempts to refer to the performance of the act of suicide. The expression to “commit” suicide has been common, echoing the phrase to commit a crime; contemporary suicidologists typically use a variety of less-stigmatizing alternatives, including *suicided*, *completed suicide*, and *died by suicide*.

Some authors claim that it is not possible to reach a rigorous formal definition of suicide and prefer a *critical* or operational approach to characterizing the term, noting its varied, shifting, and often inconsistent range of uses. Translation from one language to another may also prove difficult since there is sometimes little way to preserve comparatively positive connotations of some terms. Cases of death from self-caused accident, self-neglect, chronic self-destructive behavior, victim-precipitated homicide, high-risk adventure, refusal of life-saving medical treatment, and self-administered euthanasia—all of which share many features with suicide but are not usually termed such—cause still further conceptual difficulty.

Nevertheless, conceptual and linguistic issues concerning suicide are of considerable practical importance in policy formation, affecting, for instance, coroners' practices in identifying causes of death, insurance disclaimers, psychiatric protocols, religious prohibitions, codes of medical ethics, laws prohibiting or permitting assistance in suicide, social stigma and respect, and public response to international and political issues such as suicide bombing and protest suicide.

## EPISTEMOLOGICAL ISSUES

Closely tied to conceptual issues, the central epistemological issues raised by suicide involve the kinds of knowledge available to those who contemplate killing themselves. The issue of what, if anything, can be known to occur after death has generally been regarded as a religious issue answerable only as a matter of faith; few philosophical writers have discussed it directly, despite its clear relation to theory of mind. Some writers have argued that since we cannot have antecedent knowledge of what death involves, we cannot knowingly and voluntarily choose our own deaths; suicide is therefore always irrational. Others, rejecting this argument, instead attempt to establish conditions for the rationality of suicide. Others consider whether death is always an evil for the person involved and whether death is appropriately conceptualized as the cessation of life. Still other writers examine psychological and situational constraints on decision making concerning suicide. For instance, the depressed, suicidal individual is described as seeing only a narrowed range of possible future outcomes in the current dilemma, the victim of a kind of *tunnel vision* constricted by depression. The possibility of preemptive suicide in the face of deteriorative mental conditions such as Alzheimer disease is characterized as a problem of having to use that very mind which may already be deterio-

rating to decide whether to bear deterioration or die to avoid it. Still others suggest that suicide would be the most straightforward expression of normative skepticism, expressing the view that life has no meaning and nothing is of value.

## SUICIDE IN WORLD HISTORICAL TRADITIONS: THE WEST

Much of the extremely diverse discussion of suicide in the history of Western thought has been directed to ethical issues. Plato acknowledges Athenian burial restrictions—the suicide was to be buried apart from other citizens with the hand severed and buried separately—and in the *Phaedo*, he also reports the Pythagorean view that suicide is categorically wrong. But Plato also accepts suicide under various conditions, including shame, extreme distress, poverty, unavoidable misfortune, and *external compulsions* of the sort imposed on Socrates by the Athenian court: Socrates was condemned to drink the hemlock. In the *Republic* and the *Laws*, respectively, Plato obliquely insists that the person suffering from chronic, incapacitating illness or uncontrollable criminal impulses ought to allow his life to end or cause it to do so. Aristotle held more generally that suicide is wrong, claiming in the *Nicomachean Ethics* that it is *cowardly* and *treats the state unjustly*. The Greek and Roman Stoics, in contrast, recommended suicide as the responsible, appropriate act of the wise man, not to be undertaken in emotional distress but as an expression of principle, duty, or responsible control of the end of one's own life, as exemplified by Marcus Porcius Cato Uticensis (Cato the Younger) (95 BCE–46 BCE), Lucretia (sixth century BCE), and Lucius Annaeus Seneca.

Although Old Testament texts describe individual cases of suicide (Abimilech, Samson, Saul and his armor-bearer, Ahithophel, and Zimri), nowhere do they express general disapproval of suicide. However, the Greek-influenced Jewish soldier and historian Flavius Josephus (37 CE–100 CE) rejects it as an option for his defeated army, and clear prohibitions of suicide appear in Judaism by the time of the Talmud during the first several centuries CE, often appealing to the Biblical text Genesis 9:5: “For your lifeblood I will demand satisfaction.” New Testament does not specifically condemn suicide, and mentions only one case: the self-hanging of Judas Iscariot after the betrayal of Jesus. There is evident disagreement among the early Church Fathers about the permissibility of suicide, especially in one specific circumstance: among others, Eusebius Pamphilus (c. 264–340), Ambrose (c.

340–397), and Jerome (c. 342–420) all considered whether a virgin may kill herself in order to avoid violation.

While Christian values clearly include patience, endurance, hope, and submission to the sovereignty of God, values that militate against suicide, they also stress willingness to sacrifice one's life, especially in martyrdom, and absence of the fear of death. Some early Christians (e.g., the Circumcellions, a subset of the rigorist Donatists) apparently practiced suicide as an act of religious zeal. Suicide committed immediately after confession and absolution, they believed, permitted earlier entrance to heaven. Rejecting such reasoning, St. Augustine asserted that suicide violates the commandment *Thou shalt not kill* and is a greater sin than any that could be avoided by suicide. Whether he was simply clarifying earlier elements of Christian faith or articulating a new position remains a matter of contemporary dispute. In any case, it is clear that with this assertion, the Christian opposition to suicide became unanimous and absolute.

This view of suicide as morally and religiously wrong intensified during the Christian Middle Ages. St. Thomas Aquinas argued that suicide is contrary to the natural law of self-preservation, injures the community, and usurps God's judgment “over the passage from this life to a more blessed one” (*Summa theologiae* 2a 2ae q64 a5). By the High Middle Ages the suicide of Judas, often viewed earlier as appropriate atonement for the betrayal of Jesus, was seen as a sin worse than the betrayal itself. Enlightenment writers began to question these views. Thomas More incorporated euthanatic suicide in his *Utopia*. In *Biathanatos*, John Donne (c. 1572–1631) treated suicide as morally praiseworthy when done for the glory of God—as, he claimed, was the case for Christ; David Hume mocked the medieval arguments, justifying suicide on autonomist, consequentialist, and beneficent grounds.

Later thinkers such as Mme. de Staël (Anne Louise Germaine, née Necker, the baroness Staël-Holstein)—although she subsequently reversed her position—and Arthur Schopenhauer construed suicide as a matter of human right. Throughout this period, other thinkers insisted that suicide was morally, legally, and religiously wrong: among them, John Wesley (1703–1791) said that suicide attempters should be hanged, and Sir William Blackstone (1723–1780) described suicide as an offense against both God and the king. Immanuel Kant used the wrongness of suicide as a specimen of the moral conclusions the categorical imperative could demonstrate. In contrast, the Romantics tended to glorify suicide, and

Friedrich Nietzsche insisted that “suicide is man’s right and privilege.”

Although religious moralists have continued to assert that divine commandment categorically prohibits suicide, that suicide repudiates God’s gift of life, that suicide ruptures covenantal relationships with other persons, and that suicide defeats the believer’s obligation to endure suffering in the image of Christ, the volatile discussion of the moral issues in suicide among more secular thinkers ended fairly abruptly at the close of the nineteenth century. This was due in part to Émile Durkheim’s insistence that suicide is a function of social organization, and also to the views of psychological and psychiatric theorists, developing from Jean Esquirol (1772–1840) to Sigmund Freud, that suicide is a product of mental illness. These new *scientific* views reinterpreted suicide as the product of involuntary conditions for which the individual could not be held morally responsible. The ethical issues, which presuppose choice, reemerged only in the later part of the twentieth century, stimulated primarily by discussions in bioethics of terminal illness and other dilemmas at the end of life.

#### SUICIDE AND MARTYRDOM IN MONOTHEIST RELIGIOUS TRADITIONS

The major monotheisms, Judaism, Christianity, and Islam, all repudiate suicide though in each, martyrdom is recognized and venerated. Judaism rejects suicide but venerates the suicides at Masada and accepts *Kiddush Hashem*, self-destruction to avoid spiritual defilement. At least since the time of Augustine, Christianity has clearly rejected suicide but accepts and venerates martyrdom to avoid apostasy and to testify to one’s faith. Islam also categorically prohibits suicide but at the same time defends and expects martyrdom to defend the faith. Yet whether the distinction between suicide and martyrdom falls in the same place for Judaism, Christianity, and Islam is not clear. Judaism appears to accept self-killing to avoid defilement or apostasy; Christianity teaches submission to death where the faith is threatened but also celebrates the voluntary embrace of death in such circumstances; some Islamic fundamentalists support the political use of suicide bombing, viewing it as consistent with Islam and its teachings of *jihad*, or holy war to defend the faith, though others view this as a corruption of Islamic doctrine.

Thus, while all three traditions revere those who die for the faith as martyrs and all three traditions formally repudiate suicide, at least by that name, the practices they

accept may be quite different: Christians would not accept the mass suicide at Masada; Jews do not use the suicide-bombing techniques of their Islamic neighbors in Palestine; and Muslims do not extol the passive submission to death of the Christian martyrs, appealing on Quranic grounds to a more active self-sacrificial defense of the faith.

#### OTHER RELIGIOUS AND CULTURAL VIEWS OF SUICIDE

Many other world religions hold the view that suicide is *prima facie* wrong but that there are certain exceptions. Still others encourage or require suicide in specific circumstances. Known as *institutionalized suicide*, such practices in the past have included the *sati* of a Hindu widow who was expected to immolate herself on her husband’s funeral pyre; the *seppuku* or *hara-kiri* of traditional Japanese nobility out of loyalty to a leader or because of infractions of honor; and, in traditional cultures from South America to Africa to China, the apparently voluntary submission to sacrifice by a king’s retainers at the time of his funeral in order to accompany him into the next world. Inuit, Native American, and some traditional Japanese cultures have practiced voluntary abandonment of the elderly, a practice closely related to suicide, in which the elderly are left to die, with their consent, on ice floes, on mountaintops, or beside trails.

In addition, some religious cultures have held comparatively positive views of suicide, at least in certain circumstances. The Vikings recognized violent death, including suicide, as guaranteeing entrance to Valhalla. Some Pacific Island cultures regarded suicide as favorably as death in battle and preferable to death by other means. The Jains, and perhaps other groups within traditional Hinduism, honored deliberate self-starvation as the ultimate asceticism and also recognized religiously motivated suicide by throwing oneself off a cliff. On Mangareva, members of a traditional Pacific Islands culture also practiced suicide by throwing themselves from a cliff, but in this culture not only was the practice largely restricted to women, but a special location on the cliff was reserved for noble women and a different location assigned to commoners. The Maya held that a special place in heaven was reserved for those who killed themselves by hanging (though other methods of suicide were considered disgraceful), and, though the claim is disputed, may have recognized a goddess of suicide, Ixtab. Many other pre-Columbian peoples in the Western hemisphere engaged in apparently voluntary or semi-voluntary ritual self-sacrifice, notably the Aztec practice of heart sacrifice, which

was generally characterized at least at some historical periods by enhanced status and social approval. The view that suicide is intrinsically and without exception wrong is associated most strongly with post-Augustinian Christianity of the medieval period, surviving into the present; this absolutist view is not by and large characteristic of other cultures.

### ETHICAL ISSUES IN CONTEMPORARY APPLICATION: PHYSICIAN-ASSISTED SUICIDE

The *right to die* movement emerging in the 1970s, 1980s, and 1990s, counting among its achievements the passage of *natural death*, *living will*, and *durable power of attorney* statutes that gave patients greater control in decision making about their end-of-life medical care, also raised the question of what role the dying person might play in shaping his or her own death and what role the physician might play in directly assisting the patient's dying. These notions have often appealed to the concept of *death with dignity*, though the coherence of that notion is sometimes challenged. Public rhetoric quickly labeled the practice at issue *physician-assisted suicide* although less negatively freighted labels such as *physician-aid-in-dying* or *physician-negotiated death* have also been advanced as more appropriate.

Proponents of legalizing the practice have argued in its favor on two principal grounds: (1) autonomy, the right of a dying person to make his or her own choices about matters of deepest personal importance, including how to face dying, and (2) the right of a person to avoid pain and suffering that cannot be adequately controlled. Opponents offer two principal competing claims: (1) that fundamental moral principle prohibits killing, including self-killing, and (2) that allowing even sympathetic cases of physician assistance in suicide would lead down the *slippery slope*, as overworked doctors, burdened or resentful family members, and callous institutions eager to save money would manipulate or force vulnerable patients into choices of suicide that were not really their own. Pressures would be particularly severe for patients with disabilities, even those who were not terminally ill, and the result would be widespread abuse.

Compromise efforts, launched by bioethicists, physicians, legal theorists, and others on both sides, have focused primarily on the mercy argument from avoiding pain: It is claimed that improving pain control in terminal illness, including accelerated research, broader education of physicians, rejection of outdated concerns about addiction associated with opioid drugs, and recourse to

terminal sedation or induced permanent unconsciousness if all else fails will serve to decrease requests for physician assistance in suicide. These compromise views also hold that assistance in suicide should remain, if available at all, a last resort in only the most recalcitrant cases.

However, although proponents of physician-assisted suicide welcome advances in pain control, many reject this sort of compromise arguing that it restricts the freedom of a person who is dying to face death in the way he or she wants. They point out that other apparent compromises, such as the use of terminal sedation, are both repugnant and can be abused, since full, informed consent may not actually be sought. Proponents also object on grounds of equity: It is deeply unfair, they insist, that patients dependent on life-support technology such as dialysis or a respirator can achieve a comparatively easy death at a time of their own choosing by having these supports discontinued—an action fully legal—but patients not dependent on life supports cannot die as they wish but must wait until the inevitable end when the disease finally kills them.

Many opponents of physician-assisted suicide reject attempts at compromise as well, sometimes arguing on religious grounds that suffering is an aspect of dying that ought to be accepted, sometimes holding that patients' wishes for self-determination ought not override the scruples of the medical profession, and sometimes objecting to any resort at all to assisted dying, even in very rare, difficult cases. And some who accept the claim that death is sometimes a benefit to which a person can be morally entitled still object that placing this choice in the hands of patient would make him or her worse off by obliging him or her to choose at all, even if the choice is against. There is little resolution, however, of the competing claims of autonomist and mercy claims on the one hand and wrongness-of-killing and social-consequences views on the other. Like the social arguments over abortion, disagreement continues both at the level of public ferment and at the deeper level of philosophical principle although the raising of the issue itself has meant far greater attention to issues about death and dying.

### ETHICAL ISSUES IN CONTEMPORARY APPLICATION: SUICIDE IN OLD AGE

While comparatively rarely discussed in contemporary moral theory, the more difficult applied question concerns suicide in old age for reasons of old age alone though this is said to be an issue that will increasingly confront an aging society. In both historical argumentation and the very small amount of contemporary theoriz-

ing, the fundamental issues of suicide in old age concern two distinct sets of reasons for suicide, in practice often intertwined: (1) *Reasons of self-interest*: suicide in order to avoid the sufferings, physical limitations, loss of social roles, and stigma of old age; (2) *Other-regarding reasons*: suicide in order to avoid becoming a burden to others, including family members, caretakers, immediate social networks, or society as a whole.

Contemporary reflection, at least explicitly, countenances neither of these as adequate reasons for suicide in old age. With regard to self-interested reasons, modern gerontology maintains a resolutely upbeat and optimistic view of old age, insisting that it is possible to ameliorate many of the traditional burdens of old age—chronic illness, isolation, poverty, depression, and chronic pain—by providing better medical care, better family and caregiver education, and more comprehensive social programs. With respect to other-regarding reasons, including altruistic reasons, contemporary views consider it unconscionable—especially in the wealthy societies of the developed world—to regard elderly persons as burdens to families or to social units or to the society; nor is it thought ethically permissible to allow or encourage elderly persons to see themselves this way. While the notion that the elderly are to be venerated is associated primarily with the traditional cultures of the Asia, especially China, Western societies also insist, though sometimes ineffectually in a youth-oriented culture, on respect for the aged and on enhancing long lives. Simply put, the prevalent assumption in the Western cultures in the twenty-first century is that there can be no good *reasons* for suicide in old age even though suicide is frequent, especially in men in old age. Daniel Callahan (1930–), although opposing suicide in old age, points to contemporary medicine’s relentless drive for indefinite extension of life, arguing that the elderly should forgo heroic life-prolonging care and refocus their attention instead on turning matters over to the next generation. Carlos Prado (1937–), exploring issues of declining competence, raises the issue of *preemptive* suicide in advanced age. Colorado Governor Richard Lamm’s widely (mis)quoted remark that the elderly have a “duty to die,” unleashed a small storm of academic and public discussion concerning suicide in terminal illness and in old age (Hardwig 1997).

Hints of real social friction can be seen over both self-interested and other-regarding and altruistic reasons for suicide in old age. Having fully legalized physician-assisted suicide and voluntary active euthanasia, the Netherlands is now considering whether to honor advance directives such as living wills in which a now-

competent person requests physician-aided death after the onset of Alzheimer disease, a condition particularly frequent among the elderly. Double-exit suicides, often of married partners in advanced age even though only one is ill, startle public awareness. Disputes over generational equity in the face of rising health care costs question whether life prolongation means merely the extension of morbidity and whether health care ought to be preferentially allocated to the young rather than the old. The issue of whether a person may ethically and reasonably refuse medical treatment in order to spare health care costs to preserve an inheritance for his or her family is already beginning to be discussed; the same issue also raises the question of suicide. And issues about suicide in old age are posed by far-reaching changes in population structure, the *graying* of societies in Europe and the developed world: As birthrates fall and the proportion of retirees threatens to overwhelm the number of still-working younger people, could there be any obligation, as Euripides (c. 480–406 BCE) put it in *The Suppliants* nearly 2,500 years ago, go “hence, and die, and make way for the young”?

No party now encourages suicide for the elderly, and, indeed, no party even raises the issue; but the issue of suicide as a response to self-interested avoidance of the conditions of old age and to other-interested questions about social burdens of old age cannot be very far away. Drawing as they might on both Stoic and Christian roots in the West and on non-Western practices now coming to light, the ethical disputes over suicide in old age, independent of illness, are likely to intensify the currently vigorous debate over suicide in terminal illness: Can suicide in old age represent, as one author puts it, the last rational act of autonomous elders, or does it represent the final defeated event in a series of little tragedies of all kinds?

## SULZER, JOHANN GEORG (1720–1779)

Johann Georg Sulzer, the Swiss aesthetician, was born in Winterthur. After studying in Zürich under J. J. Bodmer, he became a tutor in a private home in Magdeburg in 1743. He then went to Berlin, where he became acquainted with Pierre-Louis Moreau de Maupertuis and Leonhard Euler. In 1747 he was appointed professor of mathematics at the Joachimsthaler Gymnasium and in 1763 he moved to the new Ritterakademie. Illness forced him to resign in 1773, but in 1775 he was appointed director of the philosophical section of the Berlin Academy, to which he had been elected in 1750.

Sulzer's *Allgemeine Theorie der Schönen Künste* (General theory of the fine arts) was originally planned as a revision of Jacques Lacombe's *Dictionnaire portatif des*

*beaux-arts* (1752), but it developed into an original encyclopedia covering both general aesthetics and the theory and history of each of the arts and of literature. The edition of 1796–1798, completed with biographical supplements by Christian Friedrich von Blankenburg, is still the best *summa* of German Enlightenment aesthetics and theory of art, as well as being an original contribution to aesthetics.

Sulzer's style, his psychological interests, and his unsystematic method were typical of the "popular philosophers." Because of his lack of system, and because his ideas are spread through the various articles of his encyclopedia, it is difficult to reduce his views to an organic and systematic whole.

Sulzer's aesthetics was inspired by Gottfried Wilhelm Leibniz, A. G. Baumgarten, G. F. Meier, Moses Mendelssohn, Joseph Addison, Edwards Young, and others. But the psychological character of Sulzer's work is even stronger than that of Baumgarten, Meier, or Mendelssohn. He was the first to find the source of beauty in the perceiving subject only, abandoning every residue of French classicism still present in his German predecessors.

Following Leibniz, Sulzer held that the essence and perfection of the soul consists in its activity of representation. The soul is representing sensibly when it is representing a multiplicity of partial representations taken as a whole. If it is representing every part of a representation as a distinct unit, it is thinking. Sensible representation is more effective than thought, and leads more readily to action. Thus the "lower faculty" of representation of traditional German psychology became more important relative to intellect in Sulzer than in Baumgarten or Meier.

Aesthetics, for Sulzer as for Baumgarten and Meier, was the theory of sensible representation. It explained how to arouse the soul to greater activity. This activity would make sensible representations more lively, and because the activity of representation was intimately connected with the feeling of pleasure, more pleasurable and beautiful.

By studying the psychological constitution of the soul it would be possible to deduce the general rules of the different arts—the more special rules can neither be deduced nor taught. The most important rule concerns the harmony of unity and multiplicity in the beautiful object as it arises out of the representative action of the soul. The object must conform to a spontaneous (*ungezwungen*) order and it must be coherent (*zusammenhängend*).

Sulzer held that beauty is judged by a special feeling—taste—that he sometimes seems to have held to be a function of a faculty different from intellect and the faculty of moral feeling but closely connected with both, particularly with the latter through the moral value of beauty. Taste itself is a transition between thinking and feeling.

Beauty, according to Sulzer, is a product of genius which is the highest stage of the spontaneous representative state of the soul. Genius is a natural force within the soul, and it acts unconsciously in a rational way. It does not, contrary to Baumgarten and Meier, create a new world. Art is an imitation of nature not because it copies nature, but because the artist of genius imitates nature's creative process. He creates nothing outside of nature, but something new within the natural world. In general, art is the expression of a psychological state of man; it imitates human nature in that it expresses nature through the representation of an object.

Sulzer, influenced by Johann Joachim Winckelmann, held that some works of art represent an ideal—that is, they express sensibly a general concept not mixed with anything particular.

In the theory of the individual arts Sulzer's most important contributions were in the aesthetics of music. Music, according to Sulzer, was the expression of passion. Opera, which is a union of all the arts, is the highest form of drama. Besides influencing musical theoreticians, Sulzer's aesthetics influenced Immanuel Kant and Friedrich Schiller; and although Sulzer was attacked by Johann Wolfgang von Goethe in 1772, his work was the foundation of the aesthetics of the *Sturm und Drang*.

## SUMNER, WILLIAM GRAHAM (1840–1910)

The American social philosopher, economist, and cultural anthropologist William Graham Sumner was graduated from Yale in 1863 and continued his studies at Geneva, Göttingen, and Oxford, with the aim of entering the Episcopal ministry. He did so in 1867, having returned to America the preceding year. Increasingly, however, this calling conflicted with his wider interests, and when in 1872 he was offered the chair of political and social science at Yale University, he gladly accepted it. He soon gained a considerable reputation as a teacher, publicist, and local politician, but his chief claim to renown derived from his studies in social development, culminating in his masterpiece, *Folkways* (1907).

Two conflicting impulses—polemical and scientific—dominated Sumner’s approach to the study of society. It was undoubtedly the polemical impulse that fed the scientific. Dissatisfaction with the reformist dogmatism of his age prompted his search for a scientific basis for his own no less dogmatic advocacy of *laissez-faire*. In place of “political engineering” based on a facile and sentimental philosophy, Sumner advocated “social evolutionism” free from moralizing preconceptions.

Sumner identified the basic social forces with certain group habits, or “folkways,” which, he held, operate on a subconscious level and reflect the spontaneous and the primary needs and interests of a given society, such as hunger, sex, vanity, and fear. These needs and interests, rather than conceptually formed purposes, determine the course of social development. Once the folkways attain persistence and stability, they become reinforced by more conscious processes, such as religious sanctions. Through repeated transmission they assume the status of sociomoral traditions, or “mores.” The mores, supported by group authority, then function as the chief agencies of “legitimation”; they determine what shall be deemed right or wrong, or socially acceptable or unacceptable. The mores form the matrix into which an individual is born, and they pervade and control his ways of thinking

in all the exigencies of life. The individual becomes critically conscious of his mores only when he comes into contact with another society with different mores or, if he lives in a society at a higher level of civilization, through literature.

Attempts to change a particular set of mores meet with considerable resistance, for they present themselves “as final and unchangeable, because they present answers which are offered as ‘the truth’” (*Folkways*, Ch. 2, Sec. 83). Hence, Sumner argued, it was not likely that they could be substantively affected by revolutions or other pre-determined acts or changed “by any artifice or device, to a great extent, or suddenly, or in any essential element” (*ibid.*, Sec. 91). Legislation by itself can do little to bring about a transformation of social and moral values. To be truly effective, legislation must grow out of a people’s mores; only then is it in keeping with their basic “interests.” Nonetheless, Sumner did not deny the significance of legislation, as some commentators have suggested. Indeed, he believed it had a highly educative role, even when it was ineffective in achieving its intended ends. For “it is only in so far as things have been transferred from the mores into laws and positive institutions that there is discussion about them or rationalizing upon them” (*ibid.*, Sec. 80). These unintended consequences, far from being a threat to the established system of mores, constitute a vital component of that system, since it is through such a “rationalizing” process that the mores develop “their own philosophical and ethical generalizations, which are elevated into ‘principles’ of truth and right” (*ibid.*, Sec. 83).

Although Sumner had little faith in the efficacy of social and economic change produced by state intervention, he was by no means a fatalist or a blind defender of the status quo. A relativist in the tradition of Baron de Montesquieu and Johann Gottfried Herder, a conservative in the tradition of Edmund Burke and Alexander Hamilton, an individualist in the tradition of Thomas Jefferson and Wilhelm von Humboldt, a historicist in the tradition of Friedrich Karl von Savigny and the romantics, a Spencerian and Darwinist by confession, Sumner believed that man could mold his social life only by paying heed to the “organic” nature of social growth, that he could modify its operative values only “by slow and long continued effort” (*ibid.*, Sec. 91).

Starting from premises not unlike those of Karl Marx, Sumner was, in a sense, a social determinist. However, he recognized the dynamic role of beliefs and the operative value of ideas and, like Marx, he denied their independence from or superiority to material interests.

Material interests constituted both the primary source and the ultimate sanction of social action. Although they drew opposite inferences from their shared premises, and although they were both mistaken in their several dogmatisms and prophecies, Sumner and Marx nevertheless laid bare in an equally fearless manner many features of social development that their generation ignored.

## SUPERVENIENCE

There is supervenience when and only when there cannot be a difference of some sort A (for example, mental) without a difference of some sort B (for example, physical). When there cannot be an A-difference without a B-difference, then but only then A-respects supervene on B-respects. Supervenience claims are thus modal claims. They are claims to the effect that *necessarily*, there is exact similarity in A-respects whenever there is exact similarity in B-respects. So if, for example, mental properties supervene on physical properties, then, necessarily, individuals that are physically indiscernible (exactly alike with respect to every physical property) are mentally indiscernible (exactly alike with respect to every mental property). Thus, A-properties supervene on B-properties just in case how something is with respect to A-properties is a function of how it is with respect to B-properties.

Supervenience has been invoked in nearly every area of analytical philosophy. In addition to its having been claimed that mental properties supervene on physical properties, it has also been claimed that normative properties—moral, aesthetic, epistemic, and so on—supervene on natural properties, that general truths supervene on particular truths, and that modal truths supervene on nonmodal truths. Supervenience, moreover, has been used to distinguish various kinds of internalism and externalism: epistemic, semantic, and mental. And it has been invoked to test claims of reducibility and claims of conceptual analysis, both of which entail supervenience claims. Much of the philosophical work on supervenience itself, as opposed to its philosophical applications, has focused on distinguishing various varieties of supervenience, and examining their pairwise logical relations. But, before turning to the main varieties of supervenience, we can make some central points working just with the idea that there cannot be an A-difference without a B-difference.

### 1. MODEL FORCE

The term *cannot* in a supervenience claim can express logical impossibility, nomological impossibility (impossibility by virtue of laws of nature), or some other kind of impossibility. If it is logically impossible for there to be an A-difference without a B-difference, then A-properties logically supervene on B-properties; if that is only nomologically impossible, then there is merely nomological supervenience. The property *being a bachelor* logically supervenes on the set of properties {*being unmarried, being a man*} because it is logically impossible for indi-

viduals to differ with respect to *being a bachelor* without differing with respect to some property in that set. According to the Wiedemann-Franz law, the electrical conductivity of metals covaries with their thermal conductivity; thus, in metals, electrical-conductivity properties nomologically supervene on thermal conductivity properties (and vice versa).

## 2. THE RELATA OF THE SUPERVENIENCE RELATION

A difference can be a difference in any respect in which there can be a difference: a difference with respect to what properties something has, in what truths hold, in what conditions obtain, in what events occur, in what laws of nature there are, and so on. The *relata* of the supervenience relation thus seem many and varied. Indeed in “There cannot be an A-difference without a B-difference,” A and B may range over nearly all manner of entities. It is often claimed, however, that nonempty sets of properties are the *primary relata* of the supervenience relation: either A-respects and B-respects will be properties in some nonempty sets of properties A and B, or else A-respects will supervene on B-respects in virtue of A-properties supervening on B-properties (Kim 1984). This view requires an “abundant” (as opposed to a “sparse”) conception of properties, according to which properties “may be as extrinsic, as gruesomely gerrymandered, as miscellaneous disjunctive, as you please. ... [They] far outrun the predicates of any language we could possibly possess. ... In fact, the properties are as abundant as the sets themselves, because for any set whatever, there is the property of belong to that set” (Lewis 1986, 59–60).

Indeed, on this conception, there are even necessarily uninstantiated properties such as *being an electron and not being an electron*, and so properties are not always ways things might be. In the literature on supervenience, an abundance of properties is often assumed, and such will be assumed in this essay. But whether there is supervenience does not turn on whether there are abundant properties, or, if nominalists are right, even on whether there are properties at all. A nominalist could maintain that what A-predicates are true of something supervenes on what B-predicates are true of it. Nor does it turn on whether there is some uniform category of being the members of which are the *primary relata* of the supervenience relation. It does not even turn on whether there is a relation of supervenience in anything other than a merely pleonastic sense: talk of A bearing the supervenience relation to B might be taken to be just a way of saying that there cannot be an A-difference without a

B-difference. What matters is that there be true statements of the form, “There cannot be an A-difference without a B-difference.” And such there are in abundance, including many of philosophical interest.

## 3. LOGICAL PROPERTIES OF THE SUPERVENIENCE RELATION

Supervenience is reflexive, transitive, and nonsymmetric. Trivially, it holds when  $A = B$  and so is reflexive. It is also transitive, because if there cannot be an A-difference without a B-difference, and cannot be a B-difference without a C-difference, then there cannot be an A-difference without a C-difference. However, it is neither symmetric nor asymmetric, and so is nonsymmetric. Every reflexive case of supervenience is trivially symmetric. But, for instance, *being a bachelor* asymmetrically supervenes on *{being unmarried, being a man}*. James is a man and Vanessa is not, and so they differ with respect to B-properties. But since James is married, they are exactly alike with respect to *being a bachelor*: neither of them has that property.

## 4. SUPERVENIENCE AND ENTAILMENT

A notion of property entailment can be defined as follows: property P entails property Q if and only if it is logically necessary that whatever has P has Q. Supervenience shares with entailment the properties of being reflexive, transitive, and nonsymmetric. Property supervenience, however, is neither necessary nor sufficient for property entailment. The property *being a brother* entails the property *being a sibling*. But *being a sibling* does not supervene on *being a brother*. Thus, suppose that Sarah has a sister and that Jack is an only child. Then Sarah is a sibling and Jack is not, though neither is a brother. Property entailment thus does not suffice for supervenience.

It is often claimed in the literature that *logical supervenience suffices for entailment* (see, for example, Chalmers 1996). But that is not in general true. If  $A = \{P \& Q\}$  and  $B = \{P, Q\}$ , then the A-property logically supervenes on B-properties, but no B-property entails the A-property. Indeed, every property F will supervene with logical necessity on its complement, not-F: Two things cannot differ with respect to F without differing with respect to not-F (and vice versa). But of course *being F* does not entail *being not-F* (McLaughlin 1995).

There seem, moreover, to be philosophically interesting cases of logical supervenience without entailment. Particular truths do not entail general truths. But general truths (arguably) supervene on particular truths (Skyrms 1981, Lewis 1986a). Bertrand Russell correctly noted:

“you cannot ever arrive at a general fact by [deductive] inference from particular facts, however, numerous” (1918/1992, p. 235, quoted in Bricker 2005). He concluded from this that “you must admit general facts as distinct from and over and above particular facts” (1981/1992, p. 236). If, however, general facts logically supervene on particular facts, then there is a sense in which that is not so, for once all the particular facts of a world are fixed, the general facts are fixed as well. A compelling case has been made that general facts logically supervene on particular facts, despite not being entailed by them (Bricker 2005).

## 5. SUPERVENIENCE AND ONTOLOGICAL PRIORITY

Many of the most interesting cases of supervenience are ones in which the subvenient factors are *ontologically prior* to the supervenient factors. Supervenience itself, however, is not an ontological priority relation. Ontological priority is irreflexive and asymmetric: Nothing can be ontologically prior to itself or be ontologically prior to something that is ontologically prior to it. But supervenience is reflexive and not asymmetric. Supervenience claims do not, in general, entail “in virtue of” claims. Every property supervenes on its complement, but of course nothing has a property F in virtue of having its complement not-F because nothing has both F and not-F (at least at the same time). Further, properties that everything necessarily has, and ones that nothing could possibly have, supervene on any property whatsoever. The necessary property *being an electron or not an electron* trivially supervenes on the property *being an antique*; and the necessarily uninstantiated property *being an electron and not being an electron* does well. The reason is that no two things can differ with respect to either such noncontingent property; and so, trivially, for any property, no two things can differ with respect to them without differing with respect to it. But there is no ontological priority in such cases. (McLaughlin 1995)

## 6. SUPERDUPER VENIENCE

Supervenience is just the relation of functional dependence: A-properties supervene on B-properties just in case how something is with respect to A-properties is a function of how it is with respect to B-properties. Given that, when A-properties supervene on B-properties, we expect there to be some explanation of why that is so. In the case of logical supervenience, the explanation might be that A-properties are necessary properties or that they are properties nothing could have. Or the explanation might be

that A-properties are identical with B properties. Or the explanation might be that A-properties are determinables of B-properties and B-properties are all the determinates of A-properties, as *being colored* is a determinable of all the shades of color (*being red*, and so on), and they are determinates of *being colored*. And in the case of merely nomological supervenience, the explanation will appeal to a law of nature. (This list of possible explanations is not intended to be exhaustive.) When a supervenience relation is explainable, there is “superdupervenience” (Horgan 1993). Appeals to in principle unexplainable supervenience—supervenience without the possibility of superdupervenience—would arguably be mystery-mongering.

## 7. SUPERVENIENCE, CONCEPTUAL ANALYSIS, AND REDUCTION

Although logical supervenience does not suffice for conceptual analysis, the latter requires the former: if A-factors can be conceptually analyzed in terms of B-factors, then A-factors logically supervene on B-factors. Supervenience is thus useful in testing claims that a certain kind of conceptual analysis is possible. According to a simple causal theory of perceptual knowledge, a subject’s perceptual knowledge that P can be analyzed as P’s bearing an appropriate causal connection to the subject’s perceptual belief that P. To test the claim, one need not await a specific proposal as to what kind of causal connection is appropriate. For such a conceptual analysis is possible only if two believers that P cannot differ with respect to perceptually knowing that P without differing with respect to how the fact that P is causally connected to their belief that P. This supervenience thesis is open to refutation by a single counterexample. The well-known “fake barn country” case (Goldman 1976) yields a putative counterexample to this thesis. Thus, the claim that a certain kind of conceptual analysis is possible can be refuted by appeal to a false implied supervenience thesis (or, FIST). Claims that certain kinds of reductions are possible can be similarly tested by their implied supervenience theses. (McLaughlin 1995)

## 8. INDIVIDUAL/GLOBAL SUPERVENIENCE

There is a distinction between *individual* supervenience and *global* supervenience. The former concerns differences in individuals; the latter concern differences in possible worlds. The claim that individuals cannot differ with respect to their moral properties without differing with respect to their natural properties (Hare 1952) is an indi-

vidual supervenience thesis. The claim that possible worlds cannot differ with respect to what general truths hold in them without differing with respect to what particular truths hold in them is a global supervenience thesis.

## 9. STRONG/WEAK INDIVIDUAL SUPERVENIENCE

Two nonequivalent kinds of individual supervenience have been formulated as follows (see Kim 1987):

**POSSIBLE-WORLDS WEAK INDIVIDUAL SUPERVENIENCE.** A-properties weakly supervene on B-properties if and only if in any possible world  $w$ , B-indiscernible individuals in  $w$  are A-indiscernible in  $w$ .

**POSSIBLE-WORLD STRONG INDIVIDUAL SUPERVENIENCE.** A-properties strongly supervene on B-properties if and only if for any possible worlds  $w$  and  $w^*$ , and any individuals  $x$  and  $y$ , if  $x$  in  $w$  is B-indiscernible from  $y$  in  $w^*$ , then  $x$  in  $w$  is A-indiscernible from  $y$  in  $w^*$ .

The possible worlds quantified over might be all logically possible worlds or only all nomologically possible worlds (and so on); thus, weak and strong supervenience relations can have different modal strengths. As the names suggest, strong supervenience is stronger than weak supervenience (*modulo* sameness of modality). When the range of worlds is the same, strong supervenience of A-properties on B-properties entails weak supervenience of A-properties on B-properties, but the latter does not in general entail the former. Notions of weak and strong individual supervenience have also been formulated as follows, using the modal operator *necessarily* rather than quantification over possible worlds (Kim 1984).

**OPERATOR-WEAK INDIVIDUAL SUPERVENIENCE.** A-properties weakly supervene on B-properties if and only if necessarily, for any A-property  $F$ , if something has  $F$ , then there is a B-property  $G$  such that it has  $G$ , and whatever has  $G$  has  $F$ .

**OPERATOR-STRONG INDIVIDUAL SUPERVENIENCE.** A-properties strongly supervene on B-properties if and only if necessarily, for any A-property  $F$ , if something has  $F$ , then there is a B-property  $G$  such that it has  $G$ , and necessarily whatever has  $G$  has  $F$ .

The strong version is formulated exactly like the weak version except that it contains one more necessity operator. The two modal operators in the strong case can

be the same or different. When all of the modal operators are the same, strong supervenience entails weak supervenience, but the latter does not in general entail the former.

If necessity is understood as universal quantification over possible worlds, then operator-weak supervenience entails world-weak supervenience, and operator-strong supervenience entails world-strong supervenience. However, the converse entailments do not hold in general. The operator definitions go beyond the idea that B-indiscernible individuals must be A-indiscernible. Operator-strong supervenience with logical necessity guarantees that every A-property is entailed by a B-property. And both operator-weak supervenience and operator-strong supervenience entail that if something has an A-property, then it has some B-property. Neither world-weak supervenience nor world-strong supervenience has that entailment, and so world-strong supervenience fails even to entail operator-weak supervenience (McLaughlin 1995). The property *being a bachelor* fails to even operator-weakly supervene on  $\{\textit{being unmarried}, \textit{being a man}\}$ , even though the former world-strongly supervenes on the latter. The weak and strong operator definitions are, however, equivalent to the corresponding world-definitions in the special case of nonempty sets of properties closed under the Boolean operations of complementation and conjunction and/or disjunction, and ones involving quantification (Kim 1987). (The qualifiers *world* and *operator* will now be dropped.)

## 10. SUPERVENIENCE AND INTERNALISM/EXTERNALISM DISTINCTIONS

Individual supervenience has proved useful for formulating various kinds of internalism/externalism distinctions. For example, according to internalists about mental content, what content a mental state has will strongly supervene on intrinsic properties of the subject of the mental state. Content externalists deny such supervenience, and indeed typically deny there is even weak supervenience: they typically hold that two subjects within a possible world can be intrinsic duplicates while being in mental states with different contents. (Twin-Earth cases [Putnam 1975] are invoked in would-be arguments by appeal to FISTs against internalist theories of content.) Similarly, an internalist about epistemic justification asserts that whether a belief is justified strongly supervenes on what mental states the subject is in. Epistemic externalists deny that, and indeed deny that whether a belief is epistemically justified even weakly supervenes on what mental

states the subject is in. Moreover, supervenience has been employed to capture the traditional distinction between internal and external relations (Lewis 1986a): internal relations (such as *being taller than*) strongly supervene on the intrinsic natures of its *relata*, whereas external relations (such as *being three kilometers from*) fail to even weakly supervene on the intrinsic natures of its *relata*.

### 11. WEAK SUPERVENIENCE WITHOUT STRONG SUPERVENIENCE

There can be weak supervenience without strong supervenience. But when this is the case, we expect an explanation of why weak supervenience holds that does not entail that strong supervenience holds as well. In any possible world, if two individuals assert exactly the same propositions, then they are exactly alike in having asserted a true proposition: The one will have asserted a true proposition if and only if the other did. The explanation is that any proposition will have a unique truth value relative to a world. But since contingent propositions are true in some worlds but not in others, strong supervenience fails in the case in question. It has been claimed that, although moral properties weakly supervene on natural properties, they do not strongly supervene on them (Hare 1952). And it has been claimed that, although mental properties weakly supervene on physical properties, they do not strong supervene on them (Davidson 1985). Defense of these claims requires an explanation of why weak supervenience holds despite the failure of strong supervenience. Although attempts have been made to provide such an explanation in the moral case (Blackburn 1993), there has been no attempt in the mental case. Many philosophers doubt such an explanation is possible in the mental case.

### 12. GLOBAL SUPERVENIENCE

Global supervenience has been invoked in the formulation of various philosophical doctrines (see, for example, Horgan 1982, 1984; Haugeland 1982; Post 1987). David Lewis's (1986a, x) doctrine of Humean Supervenience, according to which everything supervenes on the pattern of perfectly natural qualitative properties across space-times points, is a global supervenience thesis. Although Donald Davidson (1970) proposed a weak individual supervenience thesis to characterize the dependency of mental properties on physical properties, several attempts have been made to characterize physicalism as a global supervenience thesis (Lewis 1983, Chalmers 1996, Jackson 1996).

For example, Frank Jackson has proposed the following formulation: Any possible world that is a minimal

physical duplicate of our world is a duplicate *simpliciter* of it (1998, p. 12). A physical duplicate of our world is any world exactly like it in every physical respect—with respect to its worldwide pattern of distribution of physical properties and relations, its physical laws, and so on. A minimal physical duplicate is any physical duplicate that contains nothing other than what is metaphysically necessary to be a physical duplicate. It is controversial whether this thesis suffices for physicalism; unlike physicalism, it seems compatible with the existence of a necessarily existing God. But even if it does not suffice, if physicalism requires it, then it earns its keep. A substantive condition of adequacy on physicalism would be that it explain why the supervenience thesis is true. And physicalism itself would be rendered testable, even in the absence of a fully adequate formulation. Given that we are phenomenally conscious, if, as some philosophers (Chalmers 1996) maintain, a “zombie world” is possible—a world that is a minimal physical duplicate of our world but entirely devoid of phenomenal consciousness—then physicalism is false. Of course, the success of this would-be refutation by appeal to a FIST turns on the controversial issue of whether a zombie world is indeed possible.

Global property supervenience has often been formulated as follows:

**GLOBAL SUPERVENIENCE.** A globally supervenes on B if and only if, for any possible worlds  $w_1$  and  $w_2$ , if  $w_1$  and  $w_2$  have exactly the same worldwide pattern of distribution of B-properties, then  $w_1$  and  $w_2$  have exactly the same worldwide pattern of distribution of A-properties.

It is now usually acknowledged that the notion of a worldwide pattern of distribution of properties should be understood in terms of a kind of property-preserving isomorphism between worlds as follows (McLaughlin 1996, 1997; Stalnaker 1996):

An isomorphism  $I$  between the inhabitants of any worlds  $w_1$  and  $w_2$  preserves F-properties if and only if, for any  $x$  in  $w_1$ ,  $x$  has an F-property in  $w_1$  just in case the image of  $x$  under  $I$  (the individual to which  $I$  maps  $x$ ) has  $P$  in  $w_2$ .

### 13. WEAK, INTERMEDIATE, AND STRONG GLOBAL SUPERVENIENCE

A variety of different kinds of global supervenience has been formulated:

A-properties weakly globally supervene on B-properties if and only if, for any worlds  $w_1$  and  $w_2$ , if there is a B-preserving isomorphism between  $w_1$  and  $w_2$ , then there

is an A-preserving isomorphism between them (McLaughlin 1996, 1997; Stalnaker 1996; Sider 1999).

A-properties intermediately globally supervene on B-properties if and only if, for any worlds  $w_1$  and  $w_2$ , if there is a B-preserving isomorphism between  $w_1$  and  $w_2$ , then there is at least one isomorphism between them that is both A-and-B-preserving (Shagrir 2002, Bennett 2004).

A-properties strongly globally supervene on B-properties if and only if, for any worlds  $w_1$  and  $w_2$ , every B-preserving isomorphism between  $w_1$  and  $w_2$  is an A-preserving isomorphism between them. (McLaughlin 1996, 1997; Stalnaker 1996; Sider 1999). Strong global supervenience entails intermediate global supervenience, which entails weak global supervenience. But the converse entailments all fail to hold in general.

There seem to be no cases of philosophical interest in which weak global supervenience holds, but both strong and intermediate global supervenience fail to hold. In some cases of interest, however, intermediate global supervenience holds, even though strong global supervenience may fail to hold. Many philosophers maintain that two numerically distinct objects can have the same spatiotemporal location and so be spatiotemporally coincident. A frequently cited would-be example is a clay statue and the lump of clay that makes it up. Even if they are spatiotemporally coincident throughout their existence—created at the same time and destroyed at the same time—they nevertheless have different modal properties: for example, the lump could survive being squashed, while the statue could not. But they have exactly the same categorical properties (mass, size, shape, and so on). If the statue is indeed not the lump, then the statue's modal properties will neither individually strongly nor individually weakly supervene on its categorical properties. (Multiple-domain individual supervenience will hold, however [see Kim 1988 and Zimmerman 1995].) And modal properties will fail to strongly globally supervene on categorical properties. But weak global supervenience (Sider 1999) and intermediate global supervenience (Bennett 2004) will both hold. An appeal to intermediate global supervenience would not by itself, however, solve “the grounding problem,” the problem of how individuals with exactly the same categorical properties can differ in their modal properties (Bennett 2004). A solution to the grounding problem would have to explain why intermediate global supervenience holds and do so in a way that does not entail that coincident objects are identical.

#### 14. SOME EQUIVALANCIES

The plethora of technical definitions of kinds of supervenience gives the appearance of more variety than there is. Strong individual supervenience entails strong global supervenience (Kim 1984), but strong global supervenience does not in general entail strong individual supervenience (Paull and Sider 1992). Nevertheless, strong individual supervenience and strong global supervenience are equivalent in cases in which the base set of properties B is closed under Boolean operations and ones involving quantification and identity (Stalnaker 1996). Strong individual supervenience is also equivalent to strong global supervenience in cases in which A and B are sets of intrinsic properties (Shagrir 2002, Bennett 2004). It has, moreover, been compellingly argued that in cases in which A and B are sets of intrinsic properties, weak and strong individual supervenience are equivalent as well. Weak individual supervenience, strong individual supervenience, and strong global supervenience are equivalent for sets of intrinsic properties.

## SUPPES, PATRICK

(1922–)

Patrick Suppes is an American philosopher and scientist. Born in Tulsa, Oklahoma, Suppes was educated at Tulsa Central High School and pursued undergraduate studies at the University of Oklahoma, the University of Tulsa, and the University of Chicago, with particular emphasis on physics and meteorology. He graduated from Chicago in 1943, then spent 1944 to 1946 in the United States Army Air Force. During graduate studies in philosophy at Columbia University in the years 1947 through 1950 Suppes studied with Ernest Nagel, combining courses in philosophy with further work in physics and mathematics. Somewhat surprisingly in the light of his later research in psychology, he did not study that subject at either the undergraduate or the graduate level.

Suppes received his Ph.D. in philosophy from Columbia University in 1950. His entire academic career has been spent at Stanford University, where he began as an assistant professor of philosophy in 1950. He subsequently held concurrent positions in the departments of psychology, statistics, and education, and from 1959 until his retirement directed the Institute for Mathematical Studies in the Social Sciences at Stanford, a research center he co-founded with the economist Kenneth Arrow. He has been a pioneer in computer-assisted education and in 1967, with the psychologist Richard Atkinson, founded a successful company, Computer Curriculum Corporation. He has received numerous honors during his career, culminating with the award of the National Medal of Science in 1990. Suppes retired from Stanford in 1992, but he has continued an active research program, including work on robotics and experimental work on the neural bases of language processing.

### WORK

Suppes's work is unusual in its combination of significant scientific research with rigorous philosophical analysis, in its scope, and in its constructive orientation. It spans philosophy, psychology, probability and statistics, education, and computer science. The focus here is on his contributions to the philosophy of science, although his positions in that area are always deeply rooted in his scientific work. Throughout his career, Suppes has emphasized the

pluralistic and complex nature of actual, rather than idealized, scientific methods. For example, as early as 1962 he argued that there was a hierarchy of models between data and theory, anticipating in certain ways the later philosophical literature emphasizing the importance of scientific models. Many of Suppes's principal philosophical contributions have been in the area of formal methods, both as a way of injecting precision into philosophical questions and as an effective set of tools for producing answers to those questions.

At the heart of his philosophical work lies the semantic account of theories, of which Suppes—building on joint work with J. C. C. McKinsey and employing Alfred Tarski's work on formal models—was the primary developer. The semantic account, which is the chief rival to the syntactic account of theories, also served as the foundation for the later structuralist approach to theories. In Suppes's version of the semantic account, a theory is identified with a class of set-theoretical structures—models in the sense of mathematical logic. Thus, rather than a theory being a set of sentences or propositions represented in first order logic—the identification made by the logical empiricists and their successors, particularly Quine—a theory in Suppes's sense abstracts from a particular linguistic representation and focuses instead on what makes that theory true, using the full apparatus of set theory. Thus, Newton's, Hamilton's, and Lagrange's versions of classical mechanics are simply different linguistic representations of the same underlying semantic theory. This powerful foundational apparatus allows for an easy representation of the kind of mathematics needed for scientific theories—in contrast to first order logic, which is an apparatus that is too weak to capture large parts of standard mathematics. The apparatus employed in the semantic approach is especially useful in such areas as measurement theory, a subject to which Suppes has made contributions of permanent value. The semantic approach also leads naturally to a focus on axiomatized theories because this allows the content of the theories to be fully captured in an explicit, and often recursive, set of constraints. This emphasis on formal methods follows naturally from Suppes's view that there are only practical, rather than theoretical, differences between representations of mathematical theories and representations of scientific theories.

A key concept in Suppes's work is that of a representation theorem. A representation theorem for a set of models  $M$  asserts that there exists a subset  $R$  of  $M$  such that for any model  $m$  in  $M$  there is a model  $r$  in  $R$  that is isomorphic to  $m$ . Such representation theorems play a

central role in measurement theory when  $R$  is a class of numerical measurement structures and  $M$  is the class of empirical models upon which measurement procedures are to be placed. Philosophically, the emphasis on identity up to isomorphism (or, more generally, homomorphism) entails that the abstract structure of systems is captured, rather than any intrinsic features that are unique to the system.

Suppes's other important contributions include his monograph on probabilistic causality that, together with Reichenbach's earlier treatment, began this distinctive and widely discussed approach to causation; his pioneering work on the identification of aural and visual language recognition using electroencephalographic brain data; his work exploring variant probability spaces in quantum theory; an exploration of Bayesian inference; and the role of invariances in classical and relativistic physics. As the culmination of developing a number of stochastic models of learning, Suppes proved in 1969 that any finite automaton could be represented by a stimulus-response learning model, a result of importance to controversies about the nature of language learning. Together with the work on theory structure and measurement theory, these form an impressive and permanent set of contributions to the philosophy of science.

Suppes's publications are demanding but always lucid; they invariably repay careful study. Inevitably, they only partially convey his considerable influence as a teacher and professional colleague, an influence grounded in equal parts of rigor, style, humor, and clarity. A comprehensive and detailed presentation of his mature views is given in *Representation and Invariance of Scientific Structures* (2002).

## SUSO, HEINRICH

(1295/1300–1366)

Heinrich Suso, the Rhineland mystic, was born at Constance and early entered the Dominican order. A mystical experience at the age of eighteen set him on the path of asceticism, but a later one, between 1335 and 1340, led him to abandon self-mortification and to embark on an active career as preacher and spiritual adviser. As a result of attacks on some of his teachings and on his personal character, he was transferred to Ulm in 1348.

During his period of studies in Cologne, Suso had come into contact with Johannes Tauler and also came under the influence of Meister Eckhart. Indeed, in *Das Büchlein der Wahrheit* (*The Little Book of Truth*, c. 1327) he was bold enough to defend Eckhart against the doctrinal charges leveled against him, setting Eckhart's disputed doctrines alongside other quite orthodox statements made by him and providing interpretations that did not entail pantheistic conclusions.

Although Suso made use of the Eckhartian-sounding distinction between the undifferentiated Godhead and God as manifested in the persons of the Trinity, he did not hold that there was an ontological distinction within the divine Being. Rather, he held that the distinction was an intellectual one, made from the human point of view and dependent on our mode of trying to understand God's nature. Although Suso also used extreme Neoplatonic language in speaking of God as Nothing, he made it clear that this was simply to say that, because of God's complete simplicity, we cannot ascribe predicates to him in the sense in which they are applied to creatures. Suso went on to try to explain the contrasting and paradoxical multiplicity of God's nature, as exhibited in the Trinity, by the usual concept of eternal procession. Like his doctrine

that the distinction between the Godhead and God as the Trinity is not an ontological one, the notion of procession should be taken in a way that does not imply the priority of God considered as a simple Nothing over God considered as the Father, Son, and Holy Spirit. Thus, Suso drew a strong distinction between the procession occurring within the divine Being and the creation of the world. The latter is a free act of God, and creatures owe their being to him; thus God is ontologically prior to the world. On the other hand, the internal dynamics of the Trinity are a perfect and eternal feature of God's life.

The idea of God as Nothing reflected, as did similar doctrines held by other medieval mystics, not only a view about predication in theology but also about the mystical experience itself. Thus, Suso characteristically spoke of that state in which the contemplative is taken out of himself and is made calm in the ground of the eternal Nothing. The fact that the contemplative experience is free from images and discursive thought is a sufficient explanation of the negative language used. Suso generally avoided the suggestion that the soul is merged with the Godhead and described the union as one of wills in which, however, the soul retains its identity. Nevertheless, there were times when he, orthodox as he generally was and wished to be, spoke of a substantial identification with the Godhead. Some explanation of this apparent inconsistency is found in his assertion that in the mystical state the individual is no longer aware of his own identity. It is afterward, and through going beyond a merely phenomenological description of the experience, that the mystic is able to give what he considers to be the correct theological account of it.

Suso's chief works were the autobiographical *Das Buch von dem Diener* (*The Life of the Servant*); the *Horologium Sapientiae*, which also occurs in a somewhat different German version as *Das Büchlein der ewigen Weisheit* (*The Little Book of the Eternal Wisdom*); and *Das Büchlein der Wahrheit* (*The Little Book of Truth*). The second of these, which is a dialogue about and meditation on the sufferings of Christ, attained a wide circulation, almost rivaling that of Thomas à Kempis's *The Imitation of Christ*. Because of the degree of openness in the description of his inner life, Suso's writings constitute a valuable source for the study of Christian mysticism.

### **Bibliography**

The German writings can be found in Karl Bihlmayer, *Heinrich Suso: deutsche Schriften* (Stuttgart, 1907). The *Horologium Sapientiae* was edited by J. Strange (Cologne, 1861). Useful translations are J. M. Clark, *Little Book of Eternal Wisdom and Little Book of Truth* (London: Faber and

Faber, 1953) and *The Life of the Servant* (London, 1952). For a general introduction, see J. M. Clark, *The Great German Mystics* (Oxford: Blackwell, 1949), Ch. 4.

## SWEDENBORG, EMANUEL

(1688–1772)

Emanuel Swedenborg, the scientist, biblical scholar, and mystic, was a member of a famous Swedish family of clergymen and scholars; his father was a prominent bishop and a prolific writer. Swedenborg studied the classics and Cartesian philosophy at Uppsala and became interested in mathematics and natural science. In 1710 he went abroad, spending most of the next five years in England, where he learned the Newtonian theories and developed a modern scientific outlook. After his return to Sweden in 1715, Swedenborg was appointed an assessor in the College of Mines by Charles XII. He held this office until 1747, when he resigned in order to devote his time to the interpretation of the Scriptures.

### PHILOSOPHY OF NATURE

Swedenborg's many writings are characterized by great scholarship and by a fervent search for a synthesis of ancient wisdom and modern experience, empirical science, rationalistic philosophy, and Christian revelation. After some minor treatises on geological and cosmological problems, he published his first important work in 1734, *Opera Philosophica et Mineralia* (3 vols., Dresden and Leipzig); the first part of this work, *Principia Rerum Naturalium*, contains his philosophy of nature. Here Swedenborg used the concept of the mathematical point, which he described as coming into existence by motion from the Infinite. This point forms a nexus, or connection, between the Infinite and the finite world, and by its motion it creates aggregates of elements that build up the Cartesian vortexes, which are interpreted as the fundamentals of nature. The original motion in the Infinite, however, is not a mechanical motion but a kind of Leibnizian conatus, a motive force in nature that corresponds to will in human minds. In the first point there is a corresponding tendency, which transmits itself to the subsequent aggregates in this great chain of being.

The outlines of Swedenborg's natural philosophy are derived from René Descartes, Gottfried Wilhelm Leibniz, and other rationalists, but in the *Principia* Swedenborg was also inspired by empirical philosophy, especially that of John Locke. A similar English influence can be

observed in Swedenborg's cosmology, which is set forth in the *Principia* and in a short hexaameron titled *De Cultu et Amore Dei* (London, 1745). In these works Swedenborg presents a nebular hypothesis according to which the planets are formed of solar matter. It has been maintained that the planet theory of Immanuel Kant and Pierre Simon de Laplace might have been derived from Swedenborg via the comte de Buffon, but most probably the similarities between Swedenborg and Buffon depend on their common source of inspiration, Thomas Burnet's *Telluris Theoria Sacra* (The sacred theory of the earth; 1681). This treatise was widely known (even Samuel Taylor Coleridge admired it), and there is no doubt that it guided Swedenborg in his cosmology. Swedenborg's cosmology was essentially mechanistic, but like the great speculative philosophers of the seventeenth century, he attempted very early to find a theory that could combine these scientific hypotheses with Christianity.

Together with this mechanistic outlook there are several elements in Swedenborg's philosophy of nature that anticipate the organic theories set forth in his anatomic and psychological works. These works include *Oeconomia Regni Animalis* (2 vols., London and Amsterdam, 1740–1741), *Regnum Animale* (3 vols., The Hague and London, 1744–1745), and many other posthumously published treatises on the animal kingdom. The main problem concerning Swedenborg here is the relationship between soul and body. Since he was not satisfied by any of the current philosophical hypotheses, he turned to the study of contemporary microanatomy and physiology. His own theory, which is sometimes called the *harmonia constabillita* (coestablished harmony), is similar to Leibniz's theory of preestablished harmony. The two models are not identical, however, since there is a component of successive growing in Swedenborg's notion that is missing in the preestablished harmony.

In his physiological research Swedenborg starts with the study of the blood, which in its relation to the organization of the human body corresponds in some important ways to the role of the mathematical point as a nexus between the spiritual and the physical worlds. Swedenborg distinguishes several degrees of purity in the blood, with the highest degree corresponding to the Cartesian spiritous fluid. This fluid functions both as a concrete communication line between soul and body and as an abstract principle, a formative force of the body (*vis formatrix*). Swedenborg combined this concept of life force with Aristotle's concept of form and developed a teleological system very much like Leibniz's monadology.

**DOCTRINE OF SERIES AND DEGREES.** Swedenborg's system may be called the doctrine of series and degrees. The degrees are distinct links in the universal chain and form connected series of several kinds. Three of these series—the mineral kingdom, the plant kingdom, and the animal kingdom—belong to the earth. In these great series there are also subordinate series, down to the lowest elements. Each series has its first substance, which is dependent on the first series of nature. The first series of nature is an organic development of the concept of the mathematical point. Here, Swedenborg comes very close to the Neoplatonic conception of a world soul, a creative intellect from which the material world is called forth by the process of emanation. It seems probable that Aristotle's notion of the hierarchy of organisms was a decisive influence in the structuring of this gigantic system, in which Swedenborg has tried to arrange all series and degrees in a fixed order that determines all their interrelations. Swedenborg refused to follow Leibniz and Christian Wolff in calling his first substances monads because he did not look upon them as absolutely simple. For him they are created not directly from the Infinite but via the first substance of nature, in the same way that, according to the *Principia*, all natural elements are produced indirectly via the mathematical point.

The first substance of the series, its *vis formatrix*, determines the development of the whole series. There exists nothing in nature that does not belong to such a series. In the *Oeconomia* the human series consists of four degrees, the soul (*anima*), the reason (*mens rationalis*), the vegetative soul (*animus*), and the corresponding sense organs of the body, but in the theosophic writings after 1745 the series is reduced to three degrees with the *animus* subordinated to the *mens rationalis*. Nor is there any first substance of nature in these later works. The chain of the series extends up to God, who himself becomes the highest series.

## PSYCHOLOGY

The philosophy of the theosophic period thus presents a kind of Neoplatonic emanation system, although in his earlier works Swedenborg was more influenced by contemporary philosophy. In his psychology he also turned to Locke, and his epistemology coincides with Locke's tabula rasa theory. According to Swedenborg, there are no innate ideas in the *mens rationalis*. He also thought, however, that all a priori knowledge is in the *anima* but that after the Fall of humanity the soul (*anima*) was separated from the body; this synthetic source of knowledge—in some ways corresponding to Locke's notion of intuitive

knowledge—was thereby closed for ordinary people. If we could return to Adam's integrity before the Fall, it would be opened up anew. This dream of regaining paradise haunted Swedenborg in the decade before 1745, and he attempted to devise several methods for discovering this lost knowledge.

## DOCTRINE OF CORRESPONDENCE

One of the best-known elements in Swedenborg's philosophy is his doctrine of correspondence. This doctrine parallels the speculations about *harmonia constabillita*, but it also has other connections with contemporary thought. The meaning of the term *correspondence* is stated in a short manuscript written in 1741 and titled *Clavis Hieroglyphica* (A Hieroglyphic Key; London, 1784). This work is an attempt to illustrate how linguistic terms may be used with three different meanings—the natural, the spiritual, and the divine. Later, this doctrine becomes the fundamental exegetic principle of the theosophic works. Swedenborg's doctrine of correspondence is an attempt to describe and explain the relations between the spiritual world and our material universe by means of linguistic analogies, the construction of which may be illustrated by the following example from *Clavis Hieroglyphica*.

(1) There is no motion without *conatus*, but there is *conatus* without motion. For if all *conatus* were to break out into open motion the world would perish, since there would be no equilibrium. (2) There is no action without will, but there is will without action. If all will were to break out into open action man would perish, since there would be no rational balance or moderating reason. (3) There is no divine operation without providence, but there is indeed a providence not operative or effective. If all providence were operative and effective, human society would not be able to subsist such as it now is, since there would be no true exercise of human liberty. (*Psychological Transactions by Emanuel Swedenborg*, pp. 162–163)

The notions *conatus*, will, and providence correspond; so do world, humankind, and human society. By such means, the principles of the philosophy of nature are given a wider field of application, so that they reveal heavenly and divine secrets. Fundamentally, this doctrine may be interpreted as a variation of the Platonic theory of the relations between the world of ideas and the world of senses, but it is important to stress that Swedenborg

looked upon his system primarily as a synthesis of ancient wisdom and contemporary thought.

The *Clavis Hieroglyphica* is related to the interpretations of hieroglyphics that were made during the Renaissance. This is apparent in Swedenborg's use of excerpts from Wolff's *Psychologia Empirica* (1732) where the famous German rationalist discusses the Egyptian hieroglyphs and their mystic signification and gives examples from John Amos Comenius and others. More important, Wolff inspired speculation about the universal philosophical language, *mathesis universalium* (Swedenborg) or *characteristica universalis* (Leibniz). In a posthumously published manuscript (Stockholm, 1869), Swedenborg tried to formulate his psychophysical conclusions in algebraic formulas of sorts, and he declared his conviction that such an attempt might eventually succeed. But in the meantime he introduced in the *Clavis Hieroglyphica* what he called a key to natural and spiritual arcana by way of correspondences and representations. Thus, there is no doubt that the doctrine of correspondence must be regarded as Swedenborg's contribution to the solution of the problem of the philosophical language. It should be noted, however, that he seems to have been influenced by Nicolas Malebranche in respect to the correspondent relations between the mind and the cerebral base. Swedenborg also follows another fundamental thought of Malebranche, according to which the omnipotence of God functions in conformity with an eternal order (*l'ordre immuable*); this idea becomes prominent in Swedenborg's theosophic writings.

## THEOSOPHIC WORKS

Swedenborg's scientific and theosophic works are closely related. The decisive difference is that Swedenborg after a profound spiritual experience in 1745 directed his reasoning exclusively toward the interpretation of Scripture according to the doctrine of correspondence. His first exegetic work is *Arcana Coelestia quae in Genesi et Exodo Sunt Detecta* (8 vols., London, 1749–1756), and it was followed by many others. In all his exegetic treatises Swedenborg also gives vivid descriptions of his experiences in the spiritual world. Apart from these descriptions we meet with the same main theories, although they have been developed into an emanationist theology. Like most of his contemporaries, Swedenborg had always been certain of the existence of spirits and angels, and in the exegetic works he went so far as to describe a comprehensive spiritual system. The spirits live in cities where they have an active social life with social functions (even marriage) corresponding to earthly conditions. The rele-

gation of spirits to heaven or hell from the intervening spiritual world depends on the spirits themselves, since their utmost desire (*amor regnans*) leads them into suitable company.

Christ and the doctrine of atonement play a very insignificant role in Swedenborg's theology, and he dismissed the Trinity dogma. Christ is the *Divinum Humanum*, a manifestation in time of God himself. Swedenborg's theology is extremely intellectual and totally dependent on the interpretation of the divine word as the mediating link between the Creator and humankind. In the course of time decadent churches have destroyed the original meaning of this word, and Swedenborg saw his mission as the restoration of its primary sense. He identified his own exegetic activity with the return of Messiah and the foundation of the New Jerusalem. However, Swedenborg did not aspire to effect conversions but confined himself to explaining the spiritual meaning of the Scriptures. He felt he had been commanded to do this in his decisive vision of 1745.

## CONCLUSION

This is not the place to discuss the difficult problem of Swedenborg's mental status. For many modern observers it is only too easy to look upon his theosophy as the result of a pathological development of a pronouncedly schizoid personality whose intense desire for synthesis could not be satisfied within the boundaries of science and normal experience. But this must remain speculation. What is certain is that hundreds of thousands of followers have seen in him a prophet and visionary explorer of divine secrets. He has had a wide influence in several fields of thought and art, especially in romantic and symbolist literature; for poets like Charles-Pierre Baudelaire and August Strindberg he was a teacher and predecessor. Swedenborg is, of course, not a philosopher in the modern meaning of the word, but he is an interesting representative of the mystical trend in eighteenth-century thought.

## Bibliography

Swedenborg's manuscripts are deposited in the library of the Royal Academy of Science in Stockholm. The greater part of

them have been published (as photolithographs of the original or in edited translations or both) by the New Church societies, especially the Swedenborg Scientific Association in the United States, which is a great aid to scholars. Swedenborg wrote in Latin, but almost all of his works are available in English translations; a detailed but unfortunately obsolete bibliography is J. Hyde, *A Bibliography of the Works of Emanuel Swedenborg Original and Translated* (London: Swedenborg Society, 1906).

The following English translations of his many philosophical and scientific works can be recommended: *The Principia; or, The First Principles of Natural Things, Being New Attempts Toward a Philosophical Explanation of the Elementary World*, translated by A. Clissold, 2 vols. (London, 1846); *The Infinite and the Final Cause of Creation, Also the Intercourse between the Soul and the Body*, translated by J. J. G. Wilkinson (London, 1908); *Psychologica, Being Notes and Observations on Christian Wolff's "Psychologia Empirica" by Emanuel Swedenborg*, translated and edited by A. Acton (Philadelphia, 1923); *The Economy of the Animal Kingdom, Considered Anatomically, Physically, and Philosophically by Emanuel Swedenborg*, translated by A. Clissold, 2 vols. (London, 1845–1846); *The Fibre*, Vol. III of *The Economy of the Animal Kingdom, Considered Anatomically, Physically, and Philosophically by Emanuel Swedenborg*, translated and edited by A. Acton (Philadelphia, 1918); *A Philosopher's Note Book. Excerpts from Philosophical Writers and from the Sacred Scriptures on a Variety of Philosophical Subjects; Together with Some Reflections, and Sundry Notes and Memoranda by Emanuel Swedenborg*, translated and edited by A. Acton (Philadelphia, 1931); *The Brain Considered Anatomically, Physiologically, and Philosophically by Emanuel Swedenborg*, translated and edited by R. L. Tafel, 2 vols. (London, 1882–1887); *Three Transactions on the Cerebrum. A Posthumous Work by Emanuel Swedenborg*, translated and edited by A. Acton, 2 vols. (Philadelphia, 1937–1940); *Psychological Transactions by Emanuel Swedenborg*, translated and edited by A. Acton, 2nd ed. (Philadelphia, 1955); *Rational Psychology. A Posthumous Work by Emanuel Swedenborg*, translated and edited by N. H. Rogers and A. Acton (Philadelphia, 1950); *The Animal Kingdom Considered Anatomically, Physically, and Philosophically by Emanuel Swedenborg*, translated by J. J. G. Wilkinson, 2 vols. (Boston, 1858); *The Animal Kingdom*, Parts 4 and 5, translated and edited by A. Acton (Bryn Athyn, PA, 1928); *The Five Senses*, translated and edited by E. S. Price (Philadelphia, 1914); and *The Worship and Love of God*, translated by F. Sewall and A. H. Stroh (Boston, 1925).

The vast literature about Swedenborg is of unequal quality. An excellent survey is given in M. Lamm, *Swedenborg* (Stockholm, 1915); it has been translated by Ilse Meyer-Lüne as *Swedenborg: Eine Studie über seine Entwicklung zum Mystiker und Geisterseher* (Leipzig, 1922), and into French by E. Söderlindh as *Swedenborg* (Paris, 1936). This is still the best work available. In Ernst Benz, *Emanuel Swedenborg: Naturforscher und Seher* (Munich, 1948), there is more stress on theology and church history, but in general the author follows Lamm. A popular biography is S. Toksvig, *Emanuel Swedenborg, Scientist and Mystic* (New Haven, CT: Yale University Press, 1948). A modern solid monograph, although inspired by New Church teachings, is C. O. Sigstedt, *The Swedenborg Epic* (New York: Bookman

Associates, 1952). An analysis of *De Cultu et Amore Dei*, which also deals with many of the philosophical and scientific problems in the rest of Swedenborg's production up to 1745, is I. Jonsson, *Swedenborgs Skapelsedrama "De Cultu et Amore Dei"* (Stockholm, 1961), written in Swedish with a summary in English.

Swedenborg's correspondence has been published in translations and with very informative commentaries in A. Acton, *The Letters and Memorials of Emanuel Swedenborg* (Bryn Athyn, PA: Swedenborg Scientific Association, 1948).

The biographical sources are collected in R. L. Tafel, *Documents concerning the Life and Character of Emanuel Swedenborg*, 3 vols. (London, 1875–1890).

Among the many useful studies by A. H. Stroh may be mentioned "The Sources of Swedenborg's Early Philosophy of Nature," Vol. III of *Emanuel Swedenborg: Opera Quaedam aut Inedita aut Obsoleta de Rebus Naturalibus*, published by the Royal Swedish Academy of Science (Stockholm, 1911), and "Swedenborg's Contributions to Psychology," in *Transactions of the International Swedenborg Congress* (London, 1911).

See also Clarke Garrett, "Swedenborg and the Mystical Enlightenment in Eighteenth-Century England," *Journal of the History of Ideas* (45 [1984]: 67–82).

## SWIFT, JONATHAN (1667–1745)

Jonathan Swift, the British clergyman, moralist, satirist, poet, and political journalist, was born in Dublin, a few months after his father's death. He was educated at Kilkenny Grammar School and received his MA *speciali gratiâ* from Trinity College, Dublin, in 1686 and MA from Hart Hall, Oxford, in 1692. Periodically, from 1689 to 1699, he acted as secretary to Sir William Temple at Moore Park, Surrey. Ordained deacon and priest in the established church of Ireland, he was left by Temple's death in 1699 to make a career for himself. As domestic chaplain to the earl of Berkeley, lord justice of Ireland, he returned to Dublin and was granted the DD degree in 1701 by Trinity College.

In 1704 there appeared anonymously (his customary mode of publishing) *A Tale of a Tub* and *The Battle of the Books*, brilliant satires upholding the ancients against the moderns; assaulting both Catholic and Puritan theologies while upholding the *via media* of the Anglican Church; and castigating the shallowness of contemporary scholarship and literature. Thereafter Swift associated with the Whiggish wits in the circle of Joseph Addison and Richard Steele, contributing to the *Tatler* and laughing the astrologer John Partridge out of business in the hilar-

ious *Bickerstaff Papers* (1708–1709). Gradually, however, when the Whig ministry displayed no interest either in the welfare of the Irish church or in Swift's own ecclesiastical preferment, he veered toward the Tories. His literary friends now included Alexander Pope, John Gay, William Congreve, Matthew Prior, and John Arbuthnot, many of whom later joined with him in the famous Scriblerus Club dedicated to eternal warfare against the dunces.

In 1710 Swift assumed the editorship of the *Examiner*, thus becoming party spokesman for the new Tory ministry of Robert Harley and Lord Bolingbroke. He shortly resigned this post to work on *The Conduct of the Allies* (1711), a pamphlet designed so to sway public opinion as to bring about the end of the "Whiggish" War of the Spanish Succession, an event that occurred in 1713 with the Treaty of Utrecht. Swift was unable, however, to reconcile the ever increasing animosities between Harley (now Lord Oxford) and Bolingbroke, each of whom was surreptitiously treating with both Jacobite and Hanoverian claimants to the British crown. The death of Queen Anne in 1714 and the accession of George I (of Hanover) led to the downfall and disgrace of the Tory Party. Swift, having been installed the previous year as dean of St. Patrick's Cathedral in Dublin, retired to Ireland, a country whose people he despised. A fascinating record of events and personalities of the turbulent years of ecclesiastical and political intrigues, 1710–1713, is preserved in his letters to Esther Johnson, known as the *Journal to Stella*.

During the long years of "exile," Swift, paradoxically, became the national hero of Ireland, rising to her defense against the ruthless exploitation by the English. Two works are especially notable in this campaign. First, there was *The Drapier's Letters to the People of Ireland* (1724), which caused the king of England, the prime minister, and the Parliament to back down from the insult to the people of Ireland in the proposed coining of William Wood's copper halfpence. And second, there was *A Modest Proposal For preventing the Children Of Poor People From Being a Burthen to Their Parents or Country, And For making them Beneficial to the Publick* (1729), which employed shock technique to apprise the Irish people of the fact that slaughtering and dressing infants for the dinner tables of English absentee landlords was really little different from prevailing conditions, which allowed them to die of starvation. In the *Proposal* and other politico-economic publications Swift advocated what was later to be called the boycott. In 1726 the immortal social and political satire *Gulliver's Travels* was published in London. Minor works—economic, political, and satirical—con-

tinued to appear until about 1739. In 1742 Swift's health had deteriorated to the extent that, for his own protection, he was declared of unsound mind and memory and incapable of caring for himself or his estate. Today it is recognized that Swift was suffering from labyrinthine vertigo (Ménière's disease), a purely physical disease, and that in modern terminology he was not insane. He lingered on until 1745, when he died in his seventy-eighth year and was buried in St. Patrick's Cathedral, ironically leaving most of his estate for the founding of a hospital for the insane. His last words were "I am a fool." He had prepared for himself an epitaph in Latin that is translated "When savage indignation can no longer torture the heart, proceed, traveller, and, if you can, imitate the strenuous avenger of noble liberty." "Savage indignation" and the fight for "noble liberty" are truly the prime characteristics of Jonathan Swift.

#### RELIGION AND MORALITY

Never professing to be a philosopher, Swift was nevertheless a serious thinker on the problems of religion and morality; however, because of his pervasive use of irony, his writings in this area have not infrequently been misunderstood and maligned. Swift always maintained, and quite properly, that he was not attacking religion but the corruptions and excesses of religion and the abuses of reason. As dean, he performed all the functions of that office and was in every respect a sincere Christian. In his surviving sermons, only eleven of which are unquestionably authentic, he takes a commonsense (derived from the funded experience of humankind) approach to theology. The lingering Trinitarian controversy, which caused such bitterness and name-calling among the "orthodox" that Parliament prohibited further publication on the subject, Swift found thoroughly repugnant. In *A Letter to a Young Gentleman, lately enter'd into Holy Orders* (1720), Swift advised that the Christian mysteries should not be explicated by divines but should remain incomprehensible, for otherwise they would not be "mysteries." Though God-given, human reason is not infallible, because of the interests, passions, and vices of the individual. Although there is clearly a skeptical bent in Swift, he is not to be regarded as a skeptic. Mysteries (for instance, the Trinity) are to be accepted on faith (which is above reason) and asserted on the authority of the Scriptures. As Swift stated in a private letter, "The grand points of Christianity ought to be taken as infallible revelations." It was this orthodox insistence on revelation that made Swift the intractable enemy of the English deists, who maintained that knowledge is prior to assent or faith.

Swift's religious antirationalism, anti-intellectualism, and fideism are well illustrated in his writings against the deists: John Toland, Matthew Tindal, and Anthony Collins were his chief butts. Collins who, in his *Discourse of Free thinking* (1713), had twice taunted Swift by name, is subjected to Swiftian irony in *Mr. C——n's Discourse of Freethinking; put into plain English by way of Abstract, for the Use of the Poor* (1713). Grossly unjust to Collins though it is deliberately intended to be, Swift's work is a witty exploitation of antirationalistic and anti-intellectualistic arguments. The optimistic apriorism inherent in deism was repugnant to Swift, who as an essentially Christian pessimist was always less concerned with philosophical and theological niceties than with the practical problems of morality.

Swift's vital interest in morality is observable in *An Argument against Abolishing Christianity* (1711). This masterpiece of irony attacks the rationalistic deistical concept of a self-sufficient religion of nature that needs no special revelation by assuming the position that "real" Christianity is no longer capable of justification to a sophisticated age. However, "nominal" Christianity is justifiable on grounds of expediency: It may help to preserve pride, wealth, and power and, possibly, to prevent a drop in the stock market of as much as 1 percent. *A Project for the Advancement of Religion and the Reformation of Manners* (1709) urges Queen Anne to lead a moral crusade against existing vices in the nation. That Swift was not ironic but completely earnest in this project is certain because of the abhorrence of human vices and the necessity for reformation he expressed in many other writings.

Believing that man is not *animal rationale* but merely *rationalis capax*, Swift discerns a negative philosophy of history in the human tendency to degenerate after a certain degree of order and virtue has been achieved. In this restrictive sense only is he to be called a Christian misanthrope or simply a misanthrope. Swift devoted his life to exposing cruelty, inhumanity, inordinate love of power, pride, corrupt politics, and political oppression and to inculcating integrity and virtue in its major aspects of magnanimity and heroism—yet with no illusion that human nature is capable of reaching virtue in an eminent degree. This satiric-moralistic aim, enhanced by Swift's comic vision, finds its most brilliant literary achievement in *Gulliver's Travels*, a work that always has, and always will, vex, shock, divert, and entertain the world.

## SWINESHEAD, RICHARD

*(mid-1300s)*

Richard Swineshead (Swyneshed; on the Continent, more commonly Suiseth) is the name now commonly ascribed to the author of the *Book of Calculations* (*Liber Calculationum*) although in various manuscripts and printed editions he is also given the first names John, Raymund, Roger, and William, among others. Based on the work of James A. Weisheipl, a different person with the name Roger Swyneshed, who was a Benedictine monk at Glastonbury, is now credited with writing a work that is in some ways similar, titled *Descriptions of Motions* or *On Natural Motions* (*Descriptiones motuum* or *De motibus naturalibus*) dated to the mid-1330s and found in Erfurt manuscript Amplonian F 135, ff. 25va–47rb. This same Roger Swyneshed is credited with logical works *On Insolubles* and *On Obligations* (*De insolubilibus* and *De obligationibus*) connected to standard academic exercises within medieval universities. If the same person wrote all of these works, then his views must have matured and changed considerably between the writing of the various works. The following entry will be limited to a discussion of the author of the *Book of Calculations*. Those interested in the history of logic should turn first to the articles, listed below, by Paul Spade on Roger Swyneshed's works.

Documentary evidence indicates that Swineshead was a fellow of Merton College, Oxford, probably in 1340—certainly in 1344—and again in 1355. Manuscript copies of the *Book of Calculations* are often incomplete and arranged differently from the printed editions. The work shows clear influence of Thomas Bradwardine's *On the Proportions of Velocities in Motions* (1961 [1328]) and of William Heytesbury's *Rules for Solving Sophisms* (1494 [1335]). Influence of the *Book of Calculations* begins to show up in Paris before 1350. Through the early sixteenth century, the work was widely studied on the Continent, in Italy and Spain as well as France, leading to various propeudetic works explaining its methods to potential readers. G. W. Leibniz several times recommended that the book be reprinted, both as a gem of the early history of printing and because the author was among the first to introduce mathematics into natural philosophy or metaphysics. To that end Leibniz went so far as hire someone to copy the Venice, 1520, printed edition by hand in preparation for the reprinting. Although Leibniz's project never came to fruition, the hand copy still exists in the Niedersächsische Landesbibliothek in Hannover, Germany.

In the printed versions of the *Book of Calculations* there are sixteen treatises, which cover:

- I. Intension and remission of forms.
- II. (Measures of) difform qualities.
- III. Intensity of elemental bodies having two unequally intense qualities.
- IV. Intensity of mixed bodies.
- V. Rarity and density.
- VI. Augmentation.
- VII. Reaction.
- VIII. Powers of things.
- IX. Difficulty of action.
- X. Maxima and minima.
- XI. Place of an element.
- XII. Light sources.
- XIII. Action of light sources.
- XIV. Local motion.
- XV. Motion in nonresisting media (in media with varying resistances).
- XVI. Induction of the maximum degree.

What these treatises have in common is an effort to attach quantitative measures to physical entities. Swineshead first tries to establish scales of measure for static magnitudes, such as intensities of heat and cold. He then attempts to measure speeds of change in the three categories in which medieval Aristotelians believed motion to occur, namely place, quality, and quantity. Treatise XIV, on dynamics, assumes the truth of Bradwardine's rule stating that the velocities in motions depend on the ratios of forces to resistances, using a special sense of the variation of ratios connected with the notion of *compounding* ratios used in Euclid's *Elements* (Book VI, proposition 23). The *Book of Calculations* represents a stage in medieval intellectual development in which logic (including the theory of supposition) together with mathematics begin to move physics from the matrix of natural philosophy to the status of an exact science.

Most of the treatises of the *Book of Calculations* follow the standard scholastic format in which arguments are given for and against competing opinions before Swineshead settles on and argues for the theory he believes to be more correct. Like Heytesbury's *Rules for Solving Sophisms*, the *Book of Calculations* seems to have

been composed to provide university undergraduates with the analytical tools they needed to participate in disputations. As such, it is a good text to use for learning about the concepts and tools of fourteenth-century natural philosophy, including mathematics. Although the book does not expound its natural philosophical, let alone its metaphysical, foundations in detail, Swineshead appears to have agreed with the other Oxford Calculators, who (with the exception of Walter Burley) adopted the Scotistic addition theory of qualitative change and favored the ontological parsimony usually associated with William of Ockham. For more detail on the logical tools assumed by Swineshead, one should look to the work of Heytesbury, and for the natural philosophical background, to John Dumbleton's *Summa logicae et philosophiae naturalis*, as described in the work of Edith Sylla (1991b). A final fourteenth-century Oxford scholar whose work is related to that of Swineshead is Richard Kilvington, on whom there is significant recent scholarly work.

## SYLLOGISM

See *Logic, Traditional; Logical Terms, Glossary of*

## SYLVESTER OF FERRARA, FRANCIS

(c. 1474–1528)

Francis Sylvester of Ferrara, a leading Thomistic commentator, sometimes listed under Francis, sometimes under his family name Silvestri, and cited in the Latin literature as Ferrariensis, was born in Ferrara, Italy. He entered the Dominican order in 1488, and took his magistrature in theology at Bologna in 1507. He later taught philosophy and theology at Bologna and other cities in northern Italy. Sylvester's "Commentary on *Summa Contra Gentiles*" has been printed with the definitive edition

of that work of St. Thomas Aquinas in the Leonine edition of *Opera Omnia S. Thomae* (Vols. XIII–XV, Rome, 1918–1926). Among his other philosophical writings are two commentaries on Aristotle: *Annotationes in Libros Posteriorum* (Venice, 1535), and *Quaestionum Libri de Anima* (Venice, 1535).

A critic of Scotist and Ockhamist thought, Sylvester of Ferrara held some highly personal views, modifying Thomism in directions different from those of his contemporary Cajetan. In psychology and epistemology, Sylvester taught a theory of intellectual abstraction by compresence in which the actual object of understanding is quite different from the intelligible determinant that is impressed on the possible intellect (*species impressa* is not the *intelligibile*). The agent intellect performs two distinct actions, one on the phantasm and the other on the possible intellect. He modified Thomas's view that the proper object of the understanding is the universalized nature of sensible things, by teaching that the possible intellect forms a proper concept of the singular. In metaphysics, he also modified Thomism, saying that pure essences—for example, the natures of angels—may be multiplied numerically in existence, although how this is done is unknown. Concerning the individuation of bodies, Sylvester held that this is accomplished by matter as marked by definite dimensions (*materia signata quantitate determinata*).

Perhaps Sylvester is best known for his explanation of metaphysical analogy as that general characteristic of beings whereby they all somewhat resemble each other and yet are different. Contrary to the theory of Cajetan that all analogy reduces to that of proportionality, Sylvester argued that in every instance of analogy there is a first analogate which determines the meaning of the other analogates (*analogia unius ad alterum*). In endeavoring to harmonize various texts of Thomas, Sylvester may have minimized the essential character of analogy, moving in the direction of attribution and metaphor.

Among twentieth-century followers of Sylvester's theory of analogy are such important Thomists as F. A. Blanche, J. M. Ramirez, and N. Balthasar.

## SYMBOLIC LOGIC

See *Logic, History of: Modern Logic*

## SYMPATHY AND EMPATHY

The notions of empathy and sympathy have a muddled history, and they are often used interchangeably. Recently, efforts at clarifying the difference have focused on empathy first and proceeded to characterize sympathy by contrast. The contemporary philosophical conception of empathy has three aspects. If Sam empathizes with Maria's anger, then: 1) Sam has a representation of Maria as angry; 2) Sam comes to have his empathic experience because of his representation of Maria as angry; 3) Sam's experience involves experiencing a state that is similar to anger.

On most accounts, sympathy differs from empathy by being triggered solely by emotions that are linked with pain and involves—either as consequence or through sharing the other person's pain—feeling sorry for the other person or wanting to alleviate the other person's suffering. The phrases *feeling with* and *feeling for*, respectively, are often used to capture the difference between the two notions.

Concerning number one above, the main point of contention is whether it is a requirement that the representation of Maria as angry be true, or whether Sam can empathize with Maria even if Maria is not angry now. Concerning number two, the main issue is how to describe the process of coming to feel empathic because of someone else's emotion. Does it require imagining the other person's emotion/situation or is it the case that a purely causal story not involving imagination sufficient for empathy? Concerning number three, the question is how to characterize the kind of affective experience empathy is. Is it an emotion of the same type as that of the person empathized with? Or are there rather natural empathic counterpart emotions corresponding to the emotions of the person empathized with? Or does empathic experience involve having some nonemotional feelings associated with the emotion empathized?

Although all these questions are still debated, there are two points of agreement: Empathy is not an emotion,

but a phenomenon concerning the way one comes to be in touch with other people's emotions; in contrast, sympathy is, on one common conception, an emotional experience and amounts to something close to compassion. This contemporary understanding of empathy and sympathy has had many historical precursors under various confusing names. Most of these have focused on number two (i.e. the special way in which empathic experience is caused). Benedict de Spinoza's theory of affect imitation and David Hume's principle of sympathy, both central to these authors' conceptions of moral agency, exemplify the view that a fundamental trait of humanity resides in its capacity to experience other people's affects simply through the process of imagining these people experiencing these affects. The Scottish philosopher and economist, Adam Smith, held a similar view although his focus was on imagining other people's situations rather than affects.

The concept of empathy became prominent at the turn of the nineteenth century in German psychology and philosophy. It played an important role in elucidating human creatures' emotional engagement with the arts and how they come to interpret and understand each other as psychological beings. It was in this context that the term *empathy* itself was coined to translate the German word *Einfühlung* (i.e., "to feel one's way into"). Edmund Husserl, his student Edith Stein, and later Max Scheler are three philosophers whose contributions have shaped our present understanding of empathy. In particular, they each offered a particular elucidation of number three, insisting, each in their own way, that empathic experience cannot be of the same sort as the feeling that is the object of the empathic experience. Empathizing with someone who is angry would thus not involve oneself being angry, although it might involve the feelings associated with anger.

Interest in empathy and sympathy—and the broader interest in psychological simulation—has recently been driven by the thought that these phenomena are keys to the understanding of the development of moral agents. The idea—associated with a Humean take on morality—is that empathy is the most important source of one's understanding of others as beings with joys and sufferings directly dependent on the way one treats them. Hence the thought that moral sentiments and moral agency stem from a capacity to empathize with others. Contemporary empirical research on empathy has reinforced this idea. So has the existence of people (psychopaths) lacking both empathy and moral concern. However, the existence of people suffering from the same deprivation (some high-functioning autistic people) but

manifesting a clear concern with morality suggests that empathy might only be a significant aid to moral growth, but not a necessary component of it.

## SYNONYMITY

"Synonymity" has been a major topic in philosophy since the publication of Rudolf Carnap's *Meaning and Necessity* in 1947, though it was discussed earlier in the writings of W. V. Quine and C. I. Lewis. After Quine and Morton White launched their attacks on the tenability of the analytic-synthetic distinction, around 1950, the two topics became closely linked.

### SYNONYMITY AND THE ANALYTIC-SYNTHETIC DISTINCTION

Analytic statements, in Quine's account, fall into two classes. Those of the first class, exemplified by (1), are logically true.

- (1) No unmarried man is married.

Quine has no objection to the notion of analytic truth as used here, for he has what he regards as an acceptable account of the notion of logical truth in terms of which the notion of analytic truth is partially explicated. "The relevant feature of this example is that it not merely is

true as it stands, but remains true under any and all reinterpretations of ‘man’ and ‘married.’ If we suppose a prior inventory of *logical* particles, comprising ‘no,’ ‘un-,’ ‘not,’ ‘if,’ ‘then,’ ‘and,’ etc. then in general a logical truth is a statement which is true and remains true under all reinterpretations of its components other than the logical particles” (all quotations from Quine are from “Two Dogmas of Empiricism”).

All logical truths are analytic. The problems that beset analyticity, however, concern those purported analytic truths which are not logical truths. These are typified by

(2) No bachelor is married.

This is not a logical truth, for it does not remain true under every reinterpretation of its nonlogical components, “bachelor” and “married.” If (2) is nevertheless to be considered analytic, it is because we can turn it into the logical truth (1) by replacing synonyms with synonyms. Thus, since “bachelor” and “unmarried man” are synonyms, we may replace the former with the latter in (2) in order to arrive at (1), a truth of logic.

It might appear that a generalization of the above considerations would yield a satisfactory account of the notion of an analytic statement. The generalization would go as follows: a statement is analytic if and only if it either (1) is a logical truth or (2) is transformable into a logical truth by the substitution of synonyms for synonyms. This account is rejected by Quine and White on the ground that synonymy (or synonymy, as Quine prefers) is no clearer a notion than analyticity. In Quine’s words, “We still lack a proper characterization of this second class of analytic statements, and therewith of analyticity generally, inasmuch as we have had in the above description to lean on a notion of ‘synonymy’ which is no less in need of clarification than analyticity itself.”

### INTERCHANGEABILITY CRITERION OF SYNONYMITY

A natural response to Quine is that we can give an acceptable account of synonymy in terms of interchangeability. The suggestion is that the synonymy of two linguistic forms consists simply in their interchangeability in all contexts without change of truth-value—interchangeability, in Gottfried Wilhelm Leibniz’s phrase, *salva veritate*. Benson Mates has offered an argument to show that if two expressions are synonymous they are interchangeable everywhere *salva veritate*. Following Gottlob Frege, Mates assumes that the meaning of a declarative sentence is a function of the meanings of the words

which compose the sentence. Furthermore, two declarative sentences having the same meaning will necessarily have the same truth-value. It follows from these two assumptions that the replacement of a word in a sentence by another word synonymous with it cannot change the meaning of that sentence and hence cannot change its truth-value. Thus, if two words are synonymous they are interchangeable everywhere *salva veritate*.

In spite of the reasonableness of the above argument, the proposed interchangeability criterion soon runs into difficulty. Consider the synonymous pair “bachelor” and “unmarried man.” The following statement is true:

(3) “Bachelor” has fewer than ten letters.

But the result of replacing the word *bachelor* by its synonym *unmarried man* is the false statement

(4) “Unmarried man” has fewer than ten letters.

This case can presumably be set aside on the ground that quoted expressions should themselves be understood as words functioning as names for their quoted contents. The interchangeability test is then interpreted as not applying to words such as *bachelor* when they appear as fragments of other words, such as “*bachelor*.” This makes the account of synonymy rest on the notion of wordhood, but Quine does not object on this account.

Perhaps Quine does not take seriously enough the difficulties involved here. Consider the synonymous pair “brothers” and “male siblings.” Replacement of the former by the latter in

(5) *The Brothers Karamazov* is Dostoevsky’s greatest novel

turns a true statement into one which is not true,

(6) *The Male Siblings Karamazov* is Dostoevsky’s greatest novel.

Quine cannot object to this replacement for the same reason he objects to substitution of synonyms for synonyms within the context of quotation marks, for he cannot reasonably claim that titles are all single words.

The most serious problem connected with the interchangeability criterion is that the requirement is, apparently, too strong. Problems about wordhood aside, it is doubtful that paradigmatic synonym pairs like “bachelor” and “unmarried man” can pass the test. Consider the statement

(7) Jones wants to know whether a bachelor is an unmarried man.

Suppose it true, as it may well be, of some man named "Jones." Replacement of synonym for synonym here yields a statement that is no doubt false,

- (8) Jones wants to know whether a bachelor is a bachelor.

### CARNAP'S "INTENSIONAL ISOMORPHISM"

Carnap intended the concepts of intensional isomorphism and intensional structure to be explications of the ordinary notion of synonymy. Intensional isomorphism is explained in terms of logical equivalence (L-equivalence) when the usual application of the latter notion is extended beyond full sentences to cover various sentence parts. For example, two names "*a*" and "*b*" are L-equivalent if and only if "*a* = *b*" is logically true (L-true). Two (one-place) predicate expressions "*P*" and "*Q*" are L-equivalent if and only if " $(x)(Px \equiv Qx)$ " is L-true. (This means that it is L-true that whatever has the property *P* also has the property *Q*, and conversely.) An analogous definition extends the notion of L-equivalence to many-place predicates (expressions for relations). Expressions for which the relation of L-equivalence has been defined in this manner are called "designators." If two designators are L-equivalent they are said to have the same intension.

Intensional structure is explained thus: "If two sentences are built in the same way out of corresponding designators with the same intensions, then we shall say that they have the same intensional structure" (all quotations from Carnap are from *Meaning and Necessity*). For example, consider the expressions " $2 + 5$ " and "II sum V." These occur in a language *S* in which "2," "5," "II," and "V" are designations for numbers and "+" and "sum" signs for arithmetical operations. We suppose that according to the semantical rules of *S*, "2" is L-equivalent to "II" (and thus the two have the same intension), "5" is L-equivalent to "V," and "+" is L-equivalent to "sum." With regard to this example Carnap says, "...we shall say that the two expressions are *intensionally isomorphic* or that they have the *same intensional structure*, because they are not only L-equivalent as a whole, both being L-equivalent to '7,' but consist of three parts in such a way that corresponding parts are L-equivalent to one another and hence have the same intension." In our example corresponding parts correspond spatially, but this is not a necessary condition. Thus, Carnap regards " $5 > 3$ " as intensionally isomorphic to "Gr(V,III)" because the (two-place) predicates ">" and "Gr" are L-equivalent and so are "5" and "V" and "3" and "III." The (two-place) predicates "correspond," regardless of their positions in the sentences. The sentence " $(2 + 5)$

> 3" is intensionally isomorphic to "Gr(Sum(II,V),III)" because " $2 + 5$ " is intensionally isomorphic to "Sum(II,V)" and the predicate expressions are L-equivalent, as are "3" and "III." On the other hand " $7 > 3$ " is not intensionally isomorphic to "Gr(Sum(II,V),III)" even though "Gr" is L-equivalent to ">," "3" to "III," and "Sum(II,V)" to "7." They are not intensionally isomorphic because "Sum(II,V)" is not intensionally isomorphic to "7," although these expressions have the same intension (are L-equivalent). Intensional isomorphism of two expressions requires the intensional isomorphism of all corresponding subdesignators.

**OBJECTIONS.** Consider Carnap's extension of the use of " $\equiv$ " so as to hold between predicators. According to this extension, if  $A_i$  and  $A_j$  are two predicators of degree 1, the following abbreviation is allowable:

$$A_i \equiv A_j \quad \text{for } (X)(A_i X \equiv A_j X).$$

Now let us assume as L-true a sentence of the following form:

$$(1) \quad A_i \equiv A_j.$$

This sentence will be intensionally isomorphic to

$$(2) \quad A_i \equiv A_i.$$

But (1) is not intensionally isomorphic to

$$(3) \quad (X)(A_i X \equiv A_i X),$$

which is the definitional expansion of (2). Sentence (1) will not be intensionally isomorphic to (3), because (3) contains a designator, "(X)," which cannot be matched to a designator in (1). The point of this criticism is that an expression can be intensionally isomorphic to another expression without being isomorphic to a third expression which has the same meaning as the second according to a definition. For this reason intensional isomorphism seems not to be an adequate explication of synonymy.

In "A Reply to Leonard Linsky," Carnap says that the ordinary notion of synonymy is imprecise. He concludes that more than one explicans must be considered. He proposes a series of seven possible explicata, at least some of which would not be affected by the above criticism.

The most serious argument against Carnap's program is that of Benson Mates: Let "*D*" and "*D*" be abbreviations for two intensionally isomorphic sentences. Then the following are also intensionally isomorphic:

- (1) Whoever believes that *D* believes that *D*.

(2) Whoever believes that *D* believes that *D'*.

Now the following sentence is true:

(3) Nobody doubts that whoever believes that *D* believes that *D*.

But (4), which is intensionally isomorphic to (3), is very likely false:

(4) Nobody doubts that whoever believes that *D* believes that *D'*.

If anybody even doubts that whoever believes that *D* believes that *D'*, then (4) is false, and the consequence is that two intensionally isomorphic sentences will differ in truth-value. But since two synonymous sentences cannot differ in truth-value, it follows that intensional isomorphism is not adequate as an explication for synonymy.

According to Hilary Putnam, Carnap believes that his theory in its present form cannot refute Mates's criticism. However, other philosophers (notably Alonzo Church) disagree with Putnam and (apparently) Carnap over the soundness of Mates's argument.

## GOODMAN'S THEORY

One of the most widely discussed contributions to the topic of synonymy is Nelson Goodman's "On Likeness of Meaning." His view is particularly attractive to nominalistic philosophers who would avoid "abstract" entities, such as thoughts, senses, and meanings, in their semantic theories. Goodman proposes to explicate the notion of synonymy solely in terms of words and their "extensions"—the objects to which they apply. His account is confined to predicate expressions.

Suppose we say that two predicate expressions have the same meaning if and only if they have the same extensions—are true of the same things. A fatal objection to this view is that there are clear cases where two words have the same extension but do not have the same meaning. *Centaur* and *unicorn*, for example, have the same (null) extension, yet they differ in meaning.

We thus see that any simple identification of sameness of meaning of two expressions with sameness of extension must fail. But Goodman argues that we can still give an extensional account of sameness of meaning; although two words may have the same extension, certain predicates composed by making identical additions to these two words may have different extensions. *Centaur* and *unicorn* have the same (null) extension, but there are centaur pictures that are not unicorn pictures. Thus, "centaur picture" and "unicorn picture" have different

extensions. Goodman concludes that "difference of meaning among extensionally identical predicates can be explained as difference in the extensions of certain other predicates. Or, if we call the extension of a predicate by itself its *primary* extension, and the extension of any of its compounds a *secondary* extension, the thesis is formulated as follows: two terms have the same meaning if and only if they have the same primary and secondary extensions." Suppose that in accordance with our nominalistic inclinations we exclude thoughts, concepts, attributes, meanings from the extensions under consideration. This means that when considering the identity of meaning of, for example, *centaur* and *unicorn* we will ignore such secondary extensions as those of "thought of a unicorn" and "thought of a centaur" or "concept of a unicorn" and "concept of a centaur." "If the thesis is tenable, we have answered our question by stating, without reference to anything other than terms and the things to which they apply, the circumstances under which two terms have the same meaning" (all quotations from Goodman are from "On Likeness of Meaning").

Let us see how Goodman's solution works. The predicates "(is the) morning star" and "(is the) evening star" have the same (primary) extension but differ in meaning. This difference is explained by Goodman as being due to a difference in the secondary extensions of these predicates. There are morning-star pictures that are not evening-star pictures and vice versa.

Now consider any predicates "*P*" and "*Q*." Consider the actual ink marks which constitute any inscription of the phrase "a *P* that is not a *Q*." Such an inscription will itself be part of the (secondary) extension of the predicate "*P*," for it will be part of the extension of the expression "*P*-description." But no inscription of the phrase "a *P* that is not a *Q*" will be part of the extension of the expression "*Q*-description." It follows from this that "*P*" and "*Q*" have different (secondary) extensions and hence that they are not synonymous. Since "*P*" and "*Q*" are any predicate expressions, no two predicates are synonymous. For example, any inscription of the phrase "a centaur that is not a unicorn" will be part of the extension of the expression "centaur description," but it will not be part of the extension of the expression "unicorn description." Hence, "centaur" and "unicorn" have different secondary extensions (though they have the same primary extension), so they differ in meaning.

## ORDINARY-LANGUAGE VIEW

The discussions of the interchangeability criterion of synonymy and of Goodman's extensional criterion lead to

the same radical conclusion. No two expressions are synonymous. Many philosophers regard this result as a *reductio ad absurdum* of the proposed criteria. Goodman seems to regard the result as a *reductio ad absurdum* of what is “commonly supposed” about synonymy. It is not clear whether he thinks that these views are commonly supposed only by the philosophers who discuss such questions or that they are held by those who in ordinary language sometimes declare two words to be synonymous. What is “commonly supposed,” according to Goodman, is that (1) some predicates are synonymous with others and (2) synonymous expressions can replace each other “in all nonextensional contexts without change of truth-value.”

Goodman holds that the two requirements are incompatible, and we can see why. “A *P* that is not a *Q*” is a *P*-description, not a *Q*-description; “a *Q* that is not a *P*” is a *Q*-description, not a *P*-description. On the supposition that “*P*” and “*Q*” are synonymous the following two statements have the same truth-value, if the interchangeability criterion is correct.

(1) “A *P* that is not a *Q*” is a *P*-description.

(2) “A *P* that is not a *Q*” is a *Q*-description.

However, the first statement is true and the second false. Thus, the predicates “*P*” and “*Q*” are not interchangeable everywhere, even in extensional contexts. But since “*P*” and “*Q*” are any predicates, no predicates are interchangeable everywhere. It follows from this that either no predicates are synonymous or synonymous predicates are not interchangeable everywhere.

In the face of this dilemma Goodman takes the alternative of declaring that “the relation of exact synonymy between diverse predicates is null.” This is to say that no two predicates (or expressions of any kind, presumably) are “exactly synonymous.” To many it has seemed more reasonable to abandon the interchangeability criterion. If no two expressions are synonymous or mean exactly the same thing, it is hard to see how the expressions “synonymous expressions” and “mean exactly the same thing” could have any currency in our language. Is it really credible that whenever we say two expressions are synonymous we are wrong? Is it not much more likely that the philosophers who discuss these issues have supposed that our concepts are governed by criteria which in fact do not apply? Consider a dictionary of synonyms. Is it credible that it is wrong in every entry because no two terms are synonymous? Surely not.

The above, or something like it, represents the response of the ordinary-language philosophers to the

radical conclusions discussed in the earlier parts of this article. Such philosophers observe that a pair of terms may be regarded as synonymous “for certain purposes.” This requires that they be interchangeable not everywhere but only in contexts relevant to the given discussion. It is wrong, these philosophers argue, to treat language as though it were a calculus governed by exact rules. But it is one thing to complain that the philosophers have distorted our actual use of the concept of synonymy and quite another to supply a careful and complete account of what that use is. Such an account remains to be given.

## SYNONYMY [ADDENDUM]

Intuitively, two expressions are synonymous if and only if (iff) they have the same meaning. Despite the apparently straightforward nature of this definition, the notion of synonymy has been hard pressed in contemporary philosophy of language. Difficulties arise from two directions: general skepticism about intensional semantics and specific concerns involving substitution into intensional contexts.

### QUINE AGAINST INTENSIONAL SEMANTICS

In "Two Dogmas of Empiricism" (1951), W. V. O. Quine leveled an influential attack on intensional semantic concepts, concepts that express meaning relations (e.g., "analytic," "synonymous," and "antonymous"). While Quine acknowledged that such concepts are as a group interdefinable, he argued that no members of the class can be made philosophically respectable on empiricist principles.

His argument can be stated as follows. To be acceptable, semantic concepts must be definable in terms that are either formal (i.e., purely logical or linguistic) or observational. Quine first argued that there is no noncircular, nonarbitrary formal definition of the relevant semantic concepts. Thus, any definition will have to be stated in observational terms. But the semantic concepts under consideration presuppose that sentences have meanings individually. Yet, except at the theoretical periphery, where one finds observation sentences, observation does not bear on sentences one by one (holism).

Consequently, there is no way to assign observational meanings to sentences individually. It follows that no acceptable definition of intensional concepts is possible.

### MATES'S PUZZLE

In "Two Dogmas," Quine noted the possibility of defining an analytic statement as one that may be turned into a logical truth by replacing synonyms with synonyms. Quine then considered the possibility of defining synonymy in terms of substituting *salve veritate* (i.e., substituting without changing the truth value) in all nonquotational contexts. The suggestion is a natural one, since substitution of synonymous expressions ought to preserve compositional meaning, which in turn ought to preserve truth. Moreover, Quine's reasons for rejecting this proposal were not particularly forceful.

Benson Mates (1952) soon formulated a powerful and independently puzzling argument against substitution *salve veritate* as an adequate basis on which to define synonymy. Take any two purportedly synonymous expressions, say "chew" and "masticate." Now consider the following truism:

- (1) Nobody doubts that whoever believes that *x* chews, believes that *x* chews.

According to the proposed definition of synonyms, (1) implies (2):

- (2) Nobody doubts that whoever believes that *x* chews, believes that *x* masticates.

But clearly (2) may be false even though (1) is true, as when someone is unsure whether or not "chew" and "masticate" are synonymous. Consequently, "chews" and "masticates" are not synonymous. Moreover, this same argument will work for *any* pair of purportedly synonymous expressions.

Mates's puzzle is philosophically interesting apart from the question of whether or not substitution *salve veritate* underwrites an adequate definition of synonymy. For, in a compositional semantics for a language, substitution *salve veritate* appears to be at least a necessary condition for any pair of words to be synonymous.

### RESPONSES

Attempts to revive a definition of synonymy have relied on hidden quotation, have sought to define synonymy in terms of responses to stimuli, and have involved rejecting the requirement of a reductive definition.

**METALINGUISTIC RESPONSES.** A natural first response to Mates's puzzle is to treat sentences like (1) and (2) as in some way covertly involving direct quotation. Wilfrid Sellars (1955), for instance, thought that sentences (1) and (2) should be reinterpreted as (1\*) and (2\*):

(1\*) Nobody doubts that whoever believes "x chews," believes "x chews."

(2\*) Nobody doubts that whoever believes "x chews," believes "x masticates."

Church (1954) offers a slightly more complex variant of this approach.

Despite their initial appeal, such metalinguistic responses do not appear to do justice the issue. For instance, while (1\*) and (2\*) explicitly involve English expressions, the original sentences do not; there is not even the presumption that people who are counterexamples to (2) must speak English. On this point, Tyler Burge (1978) seems quite right to note that while linguistic considerations may well be involved in such claims as (1) and (2), this does not show that these considerations enter into the content of the attitude report.

**NEO-QUINEANISM.** A second approach to synonymy derives from the work of Quine himself. Despite his attack on intensional semantics, Quine (1960) was able to preserve a vestigial concept of synonymy. He called two sentences *stimulus synonymous* for a speaker at a particular time iff the speaker would accept or reject them both under the same range of observational conditions. (A similar but more tenuous definition can be given for words.) Yet for many sentences, our assent or dissent does not depend on observation. Quine's concept of stimulus synonymy is far less widely applicable than the intuitive notion.

Peter Pagin (2001) attempted to extend this general sort of definitional strategy. According to Quine's holism, sentences may be partially ordered by how closely tied they are to observation. Observation sentences are either accepted or rejected on the basis of current observation. Most of the remaining sentences of the language, however, are assigned truth values more or less likely to be revised in light of further observation. On this basis, Pagin defined two statements  $A$  and  $B$  to be equally revisable ( $=_r$ ), for a speaker at a particular time, as follows:  $A =_r B$  iff for any statement  $C$ ,  $A <_r C$  iff  $B <_r C$ . Equivalently,  $A =_r B$  iff for any statement  $C$ ,  $C <_r A$  iff  $C <_r B$ . Here  $<_r$  is the relation of being less revisable than (for a speaker at a time). Pagin then offers the following definition (in

which  $A(\alpha/\beta)$  is any statement that results from substituting  $\alpha$  for  $\beta$  in  $A$ , not necessarily uniformly):

Expressions  $\alpha$  and  $\beta$  are synonymous iff for any statement  $A$ ,  $A =_r A(\alpha/\beta)$ .

Pagin's definition runs into problems at the level of statement synonymy. Let  $A$  and  $B$  be two distinct sentences that happen to be equally prone to revision. Then, setting  $\alpha = B$  and  $\beta = A$ , we have it that any two statements that are equirevisable are synonymous. But surely it is possible to have two nonsynonymous statements that are equally prone to revision in light of recalcitrant data. In addition, Pagin's definition appears to flounder on a variant of Mates's argument. For let  $\alpha =$  "masticates" and  $\beta =$  "chews" and let  $A =$  sentence (1) above. Then (2) will arise by substitution of  $\alpha$  for  $\beta$  in  $A$ . But (1) and (2) are plainly not equally revisable, and so fail to qualify as synonyms on the proposed definition. And this result will clearly generalize to any pair of distinct expressions. This result is not surprising, for if substitution of synonyms cannot preserve truth, it can hardly be expected to preserve revisability.

**NEOINTENSIONALISM.** A final approach to restoring a definition of synonyms involves rejecting Quine's demand for a reductive definition altogether. Over the years, Jerrold Katz has developed a distinctive non-Fregean version of this approach. Katz's neointensionalism (2004) consists of two major theses: (i) Expressions of the language have a sense structure specified in terms of their parts. (ii) The sense structure of an expression is specified independently of its referential properties. Thus, senses are not modes of presentation. Rather, they constitute an *autonomous* semantic level posited (on the basis of the judgments of competent speakers of the language) to account for the sense properties of expressions (e.g., being meaningful, being synonymous). On such a view, it is straightforward to define synonymy in terms of having the same meaning (sense), since there is no further requirement to analyze meanings in terms of nonintensional concepts.

But clearly it will not do to allow the two semantic levels (sense and reference) to come apart completely. We cannot have an expression that, for instance, is synonymous with the definite description "the first celestial body visible in the evening" but that refers to, say, Margaret Thatcher. Consequently, Katz proposed that while sense does not *determine* reference, it does *mediate* it; that is, having a sense is necessary (though maybe not sufficient) for reference. The picture that Katz paints is one where we develop an autonomous theory of sense on the evidence

of competent speakers' use of the language and then use that theory to constrain our theory of reference.

Katz's semantic theory does not appear, however, to avoid many of the objections that led to the downfall of its Fregean predecessors. Consider, for example, the fact that ordinary competent speakers of a language are occasionally radically mistaken about the nature of the entities about which they are speaking. Jonathan Cohen (2000), for instance, notes that in the past the best evidence from competent native speakers of English would have supported the hypothesis that the kind term "whale" included as a component of its sense the semantic marker FISH. Intuitively, however, those speakers were still referring to the same natural kind (the whale) as we do. But this judgment is inconsistent with Katz's proposal.

## SYNTACTICAL AND SEMANTICAL CATEGORIES

The basis for any theory of syntactical categories is the linguistic fact that in all natural languages there are strings of (one or more) words which are mutually interchangeable in all well-formed contexts *salva beneformatione*—that is, with well-formedness (grammaticality, syntactical correctness) being preserved in the inter-

change—and that there are innumerable other strings which do not stand in this relation. Any theory of semantical categories rests on a similar fact, with *well-formed* replaced by *meaningful* or *semantically correct*, and *beneformatione* by *significatione*.

The relation between *well formed* and *meaningful* is, in general, complex, and neither term is simply reducible to the other. The English expression "Colorful green ideas sleep furiously" (to use an example given by Noam Chomsky) is, at least *prima facie*, syntactically well formed. Yet it is semantically meaningless, even though certain meanings can be assigned to it by special conventions or in special contexts. In contrast, many everyday utterances are syntactically ill formed (because of false starts, repetitions, and the like) but semantically perfectly meaningful, again at least *prima facie*.

Chomsky and his followers have recently stressed that for natural languages well-formedness and meaningfulness are mutually irreducible, but this view has not gone unchallenged. For constructed language systems, particularly those meant to serve as languages of science, it has generally been assumed that the notions of well-formedness and meaningfulness coincide.

Since the time of Aristotle it has been customary among philosophers to explain the linguistic facts about interchangeability by resort to ontological assumptions. Certain strings of words, it is said, are not well formed (or meaningful) because the entities denoted by the substrings (the meanings, denotata, etc., of these substrings) do not fit together. Edmund Husserl, one of the authors who dealt most explicitly with interchangeability, coined the term *meaning categories* (*Bedeutungskategorien*). He maintained that we determine whether or not two expressions belong to the same meaning category, or whether or not two meanings fit together, by "apodictic evidence." But his examples and terminology—for instance, the use of the expression "adjectival matter" (*adjektivische Materie*)—indicate that his apodictic evidence was nothing more than a sort of unsophisticated grammatical intuition, which he hypostatized as insights into the realm of meanings.

Husserl certainly deserves great credit for distinguishing between nonsense (*Unsinn*) and "countersense" (*Widersinn*), or, in modern terms, between strings that violate rules of formation and strings that are refutable by the rules of deduction. But he is also responsible for the initiation of a fateful tradition in the treatment of semantical (and syntactical) categories. This tradition assumes—sometimes without even noticing the problematic status of the assumption, more often with only

the flimsiest justification—that if two strings are interchangeable in some one context *salva beneformatione*, they must be so in all contexts.

This entry will discuss the chief modern contributions to the theory of syntactical and semantical categories. It will first outline the achievements of the Polish logician Stanisław Leśniewski and his pupil Kazimierz Ajdukiewicz. It will then evaluate the contributions by Rudolf Carnap and, in particular, stress the added flexibility gained by his decision not to adhere to Leśniewski's "main principle." Finally, the synthesis by Yehoshua Bar-Hillel of the insights of Ajdukiewicz and Carnap into a theory of syntactical categories and the demonstration by Chomsky of the essential inadequacy of categorial grammars for a description of the syntactical structure of natural languages will be mentioned.

## LEŚNIEWSKI

In 1921, Leśniewski made an attempt to simplify Bertrand Russell's ramified theory of types but was not satisfied with the outcome. A type theory, however simplified and otherwise improved, remained for him an "inadequate palliative." He therefore began, the following year, to develop a theory of semantical categories that had greater appeal to his intuitive insights into the syntactical and semantical structure of "proper" language. For this purpose he turned from Russell to Husserl, of whose teachings he had learned from his teacher and Husserl's pupil, Kazimierz Twardowski, and, in particular, to Husserl's conception of meaning categories. As a prototype of a proper language, to which his theory of semantical categories was to be applied, Leśniewski constructed the canonical language *L*. Husserl's tacit assumption that if two strings are interchangeable in some one context *salva beneformatione*, they must be so in all contexts was elevated to the rank of the "main principle of semantical categories." Today Leśniewski's term *semantical categories* must be regarded as a misnomer, since the categorization was based on purely syntactical considerations. At the time, however, Leśniewski, like many other authors, believed that well-formedness and meaningfulness are completely coextensive for any proper language.

According to Leśniewski, each string, whether a single word or a whole phrase, of a proper language, and hence of his canonical language *L*, belongs to at most one category out of an infinitely extensible complex hierarchy. Strings are understood as tokens rather than as types. Moreover, two equiform tokens may well belong to different categories. This homonymy, however, never leads

to ambiguity, since in any well-formed formula the context always uniquely determines the category of the particular token. In fact, Leśniewski exploited this homonymy for systematic analogy, with an effect similar to that obtained by Russell's exploitation of the typical ambiguity of strings (*qua* types).

Leśniewski excluded from the hierarchy only strings outside a sentential context, terms inside quantifiers binding variables, and parentheses and other punctuation signs. Defined constants were automatically assigned to categories by means of "introductory theses," as Leśniewski called those object-language sentences which, in his view, served to introduce new terms into an existing language. He gave rigid directives for the formation of introductory theses, assignment to a category being valid only after these theses were specified. The constructive relativity thus introduced was intended to take the place of the order restrictions by which Russell had sought to avoid the semantical antinomies.

In his canonical language Leśniewski worked with two basic categories, "sentences" and "nominals," and a potential infinity of functor categories. He admitted only indicative sentences; interrogatives, imperatives, hortatives, and the like were excluded. He explicitly rejected any categorial distinction between proper names and common nouns or between empty, uniquely denoting, and multiply denoting nominal phrases, although he later drew these distinctions on another basis. In the notation subsequently devised by Ajdukiewicz the category, say, of the sentential negation sign (that is, of a functor which, from a sentence as argument, forms a complex expression itself belonging to the category of sentences) is denoted by its "index" "*s/s*." The denominator of this "fraction" indicates the category of the argument and the numerator that of the resulting string. The index of such binary connectives as the conjunction sign is "*s/ss*." With "*n*" as the category index of nominals, "*n/n*" is assigned to "attributive adjectives" (but also to "nominal negators" such as "non-\_\_\_\_"), "*s/n*" to "predicative intransitive verbs," "*s/nm*" to "predicative transitive verbs," "*s/n//s/n*" to certain kinds of "verbal adverbs," etc.

## AJDUKIEWICZ

With the help of this notation Ajdukiewicz was able to formulate, in 1935, an algorithm for the determination of the syntactical structure of any given string in certain languages and, in particular, of its "syntactical connexity"—that is, its well-formedness. These languages had to embody, among other conditions, the Polish notation, in which functors always precede their arguments (thereby

freeing parentheses from their customary duty as scope signals and making them available for other duties) and had to be “monotectonic,” in H. B. Curry’s later terminology—that is, to allow just one structure for each well-formed formula. These conditions of course excluded the natural languages from coming under Ajdukiewicz’s algorithm.

To illustrate: Let

*Afagbc*

be a string in a given language fulfilling the above conditions. Let “*n*” be the index of “*a*,” “*b*,” and “*c*,” let “*s/n*” be the index of “*f*,” let “*s/nn*” be the index of “*g*,” and let “*s/ss*” be the index of “*A*.” The index string corresponding to the given string is, then,

<i>A</i>	<i>f</i>	<i>a</i>	<i>g</i>	<i>b</i>	<i>c</i>
<i>s/ss</i>	<i>s/n</i>	<i>n</i>	<i>s/nn</i>	<i>n</i>	<i>n</i>

Let the only rule of operation be the following: replace  $\alpha/\beta\beta$  (where  $\alpha$  and  $\beta$  are any index or string of indexes) by  $\alpha$  (always applying the rule as far “left” as possible). One then arrives in two steps at the “exponent” “*s*,” thus verifying that the given string is a sentence with the “parsing” (*A(fa)(gbc)*). The whole derivation can be pictured as follows:

In 1951, Bar-Hillel adapted Ajdukiewicz’s notation to natural languages by taking into account the facts that in such languages arguments can stand on both sides of the functor, that each element, whether word, morpheme, or other appropriate atom in some linguistic scheme, can be assigned to more than one category, and that many well-formed expressions will turn out to be syntactically ambiguous or to have more than one structural description. These changes greatly increased the linguistic importance of the theory of syntactical categories and initiated the study of a new type of grammars, the so-called categorial grammars.

Ajdukiewicz never questioned the validity of Leśniewski’s main principle. Neither did Alfred Tarski at first. It was taken for granted in the main body of Tarski’s famous 1935 paper, “Der Wahrheitsbegriff in den formalisierten Sprachen.” (The concept of truth in formalized

languages; whose Polish original dates from 1931.) The appendix to this paper voiced some doubts as to its intuitive appeal, but these doubts probably derived more from a growing preference for set-theoretical logics over type-theoretical ones than from straight linguistic considerations.

### CARNAP

Rudolf Carnap, in *Der logische Aufbau der Welt* (1928), had few misgivings about applying the simple theory of types to natural languages. Like Russell, he made a half-hearted attempt to provide a quasilinguistic justification for the type hierarchy, and his notion of “spheres” (*Sphären*) occupies a position approximately midway between Russell’s types and Leśniewski’s semantical categories. Carnap’s explanation of certain philosophical pseudo problems as based on a “confusion of spheres” (*Sphärenvermengung*) antedates Gilbert Ryle’s discussion of “category mistakes” in his *Concept of Mind* (London, 1949) by more than twenty years. Both explanations rest on an uncritical implicit adherence to the “main principle,” even though Leśniewski’s formulation was not known to Carnap at the time he wrote his book, probably because Leśniewski’s publications prior to 1929 were all in Russian or Polish. At the same time, neither Leśniewski, Ajdukiewicz, nor Tarski quotes Carnap’s book in their pertinent articles. Ryle, in his book, does not mention any of these publications.

Carnap was apparently the first logician to use the term *syntactical categories*, in 1932. At that time he believed that all logical problems could be treated adequately as syntactical problems, in the broad sense he gave the term.

He was also the first to free himself from the main principle. It eventually occurred to him that this principle embodied an arbitrary restriction on freedom of expression. Any attempt to impose this restriction on natural languages resulted in an intolerable and self-defeating proliferation of homonymies, similar to the outcome of the attempt by Russell and some of his followers to impose type-theoretical restrictions on natural languages, other than the tolerable “typical” ambiguities. In some cases it sounded rather natural to invoke equivocation (which is, of course, a “nontypical” ambiguity)—in the tradition of Aristotle, who used this notion to explain the deviancy of “The musical note and the knife are sharp.” But in innumerable other cases there were no independent reasons for such invocation, and the induced artificialities exploded the whole structure. For instance, very strong reasons seem to be required if one

were to assign the string “I am thinking of” to a different type or syntactical category each time the string following it belonged to a different type or category. For one may have after “I am thinking of” such varied strings as “you,” “freedom,” “the theory of syntactical categories,” and “the world going to pieces.”

In 1934, in *Logische Syntax der Sprache*, Carnap took implicit account of the possibility that two strings might be interchangeable in some contexts but not in all. He coined the term *related* for this relation and used *isogenous* for the relation of total interchangeability. Languages in which all strings are either pairwise isogenous or unrelated have, in this respect, a particularly simple structure. But there is no reason to assume that natural languages will exhibit this particularly simple structure. In fact, observing the main principle becomes a nuisance even for rich constructed language systems; as Carnap showed, the principle is not observed in some of the better-known calculi (perhaps contrary to the intention of their creators) with no real harm done.

#### BAR-HILLEL AND CHOMSKY

The relation “related” is clearly reflexive and symmetrical; hence, it is a similarity relation. The relation “isogenous” is, in addition, transitive; hence, it is an equivalence relation. Starting from these two relations, Bar-Hillel, in 1947, developed a theory of syntactical categories, illustrated by a series of model languages, all of which were, in a certain natural sense, sublanguages of English. In 1954, Chomsky developed a more powerful theory by taking into account, in addition, relations between the linguistic environments of the strings compared.

Recently, primarily owing to the insights of Chomsky and coming as a surprise to most workers in the field, it has become clear that interchangeability in context cannot by itself serve as the basic relation of an adequate grammar for natural languages. It may play this role for a number of constructed languages, and it certainly does so, for example, in the case of the standard propositional calculi. More exactly, it provides a satisfactory basis for what have become known as “phrase-structure languages,” or what Curry calls “concatenative systems.”

A phrase-structure language is a language (a set of sentences) determined by a phrase-structure grammar, the grammar being regarded as a device for generating or recursively enumerating a subset of the set of all strings over a given vocabulary. A phrase-structure grammar, rigorously defined, is an ordered quadruple  $\langle V, T, P, S \rangle$ , where  $V$  is a finite vocabulary,  $T$  (the terminal vocabu-

lary) is a subset of  $V$ ,  $P$  is a finite set of productions of the form  $X \rightarrow x$  (where  $X$  is a string over  $V-T$ , the auxiliary vocabulary, and  $x$  is a string over  $V$  consisting of at least one word), and  $S$  (the initial string) is a distinguished element of  $V-T$ . Any terminal string (string over  $T$ ) that can be obtained from  $S$  by a finite number of applications of the productions is a sentence. When the  $X$ 's in all the productions consist of only one word the grammar is called a context-free, or simple, phrase-structure grammar.

Interchangeability in context seems also to be adequate for describing the surface structure of all English sentences but not for describing their “deep structure.” It is powerful enough to enable us to analyze correctly the sentence “John loves Mary” ( $S$ ) as a concatenate of a noun phrase ( $NP$ ), consisting in this particularly simple illustration of a single noun ( $N$ ), and a verb phrase ( $VP$ ), consisting of a transitive verb ( $Vt$ ) and another noun phrase itself consisting of a noun. Two customary representations of this analysis are the “labeled bracketing,”

$$(s_{(NP(N)John)(VP(Vt)loves)(NP(N)Mary)})),$$

and the “inverted tree,”

(both representations are simplified for present purposes). Interchangeability in context is likewise powerful enough to provide “Mary is loved by John” with the correct structure,

$$(s_{(NP(N)Mary)(VP(PassVt)is(Vt)love)-ed\ by)(NP(N)John)})).$$

However, these analyses will not exhibit the syntactically (and semantically) decisive fact that “Mary is loved by John” stands in a very specific syntactical relation to “John loves Mary,” namely that the former is the passive of the latter. No grammar can be regarded as adequate that does not, in one way or another, account for this fact. Transformational grammars, originated by Zellig Harris and considerably refined by Chomsky and his associates, appear to be in a better position to describe the deep structures of these sentences and of innumerable others.

Such grammars adequately account for the relation between the active and passive sentences and explain the fact that one intuitively feels “John” to be in some sense the subject of “Mary is loved by John,” a feeling often expressed by saying that “John,” though not the “grammatical” subject, is still the “logical” subject of the sentence. Transformational analysis shows that “John,” though indeed not the subject in the surface structure of the given sentence, is the subject of another, underlying sentence of which the given sentence is a transform.

It has recently been proved that categorial grammars and context-free phrase-structure grammars are equivalent, at least in the weak sense of generating the same languages qua sets of sentences over a given vocabulary, though perhaps not always assigning the same structure(s) to each sentence. These sets can also be generated (or accepted) by certain kinds of automata, the so-called push-down store transducers. The connection that this and other results establish between algebraic linguistics and automata theory should be of considerable importance for any future philosophy of language.

#### DEVELOPMENTS IN THE 1960S

The early 1960s witnessed a revival of interest in the semantical categorization of expressions in natural languages, mostly under the impact of the fresh ideas of Chomsky and his associates. The whole field of theoretical semantics of natural languages is still very much in the dark, with innumerable methodological and substantive problems unsolved and sometimes hardly well enough formulated to allow for serious attempts at their solution. However, there is now a tendency to include indexes of semantical categories in the lexicon part of a complete description of such languages. These indexes, after application of appropriate rules, determine whether a given string is meaningful and, if it is, what its meaning is in some paraphrase of standardized form or, if it is not, how it deviates from perfect meaningfulness. In addition to semantical category indexes there are morphological, inflectional, and syntactical category indexes that determine whether the given string is morphologically and syntactically completely well formed, that present its syntactical structure in some standardized form, or that indicate the ways in which it deviates from full well-formedness.

Whether at least some semantical categories can, or perhaps must, be considered in some sense universal (language-independent) is a question that, like its syntactical counterpart, is now growing out of the speculative stage, with the first testable contributions beginning to

appear. Investigations by Uriel Weinreich (1966) have cast serious doubts on the possibility of making a clear distinction between syntactical and semantical categories. Should these doubts be confirmed, the whole problem of the relation between these two types of categories will have to be reexamined.

*Yehoshua Bar-Hillel (1967)*

## SYNTACTICAL AND SEMANTICAL CATEGORIES [ADDENDUM]

Categorial distinctions in syntax and semantics are drawn on the basis of the distribution of linguistic expressions. According to the classical definitions, two expressions belong to the same syntactic category just in case they can be interchanged in every well-formed context *salva beneformatione* (without loss of well-formedness) and they belong to the same semantic category just

in case they can be interchanged in every meaningful context *salva significatione* (without loss of meaningfulness) (Bar-Hillel 1953). The question is what counts as interchange in a context. Interpreting this phrase naïvely will result in inadequate definitions: Intuitively, one cannot conclude that “You are bald” and “I am bald” belong to different syntactic categories because “Most people who like you are bald” is well-formed, whereas “Most people who like I am bald” is not. Likewise, it cannot be concluded that *cat* and *dog* belong to different semantic categories from the fact that *location* is meaningful, whereas *lodogion* is not. Interchange of non-constituents is irrelevant for syntactic or semantic categorization.

One might try to modify the classical definition minimally, by saying that two expressions belong to the same syntactic category just in case they occupy the same range of syntactic positions within well-formed complex expressions, and they belong to the same semantic category just in case they occupy the same range of syntactic positions within meaningful complex expressions. But this still leads to excessively fine-grained categories. If one insists that *book* and *books* must belong to different syntactic categories because the first but not the second can occur with the indefinite article, or that *year* and *century* belong to distinct semantic categories because the morpheme *-ly* can attach meaningfully to the first but (arguably) not the second, they will miss a number of crucial generalizations.

The most useful categories will group together linguistic expressions that share much, but perhaps not all their distribution. Consider, for example, the syntactic category of prepositions. A distributional pattern used in identifying these is that prepositions can be intensified by *right* or *straight*, whereas other kinds of words cannot. “He went straight down the ladder” and “He lives right in the center of town,” for instance, are well-formed, whereas “He went straight crazy” and “He is right the center of attention” are ungrammatical. This is an important test even though it yields both false negatives and false positives. “He went straight home” and “He came right with a friend.” The exceptions can be neglected because *home* is idiosyncratic (for some reason “He went to home” is ungrammatical, but “He went to his home” is fine), and the facts about *with* allow for a different explanation (*with* cannot be intensified with *straight* or *right* because, given its meaning, it cannot be intensified at all).

One common way to achieve flexibility in talking about the distribution of linguistic expressions is to introduce *features*. Features are properties of words and morphemes that are marked in the lexicon (according to

a common conception of lexical items, they are nothing more than structured bundles of features). Complex expressions inherit some of the features of their constituents. Some features are both semantically and syntactically significant (e.g. [PAST] which is a property of ‘loved Hugo’ but not ‘loves Hugo’), some are syntactically but not semantically significant (e.g. [ACCUSATIVE] which is a property of the first person pronoun in ‘They want me to come’ but not in ‘They want that I come’), and some are semantically but not syntactically significant (e.g. [ADULT], which is a property of ‘horse’ but not of ‘foal’).

Classical definitions can be modified by saying that two expressions belong to the same syntactic (semantic) category whenever they share a syntactically (semantically) significant set of features. This allows someone to say, for example, that nouns form a single syntactic category exhibiting important subcategorial distinctions (e.g., between proper nouns and common nouns, or between count nouns and mass nouns) and also cross-categorial similarities (e.g., prepositions and nouns do not allow the prefix “un-”).

## CATEGORIAL GRAMMARS

Even if certain differences of distribution are allowed within categories, about a dozen of them are still needed, and if significant subcategories are taken into account, the tally will go well above 100. To systematize these, one needs to involve them in describing the syntax and the semantics of the language (or languages) to which they belong. One of the simplest conceivable ways this could be done is through a *categorial grammar* (Ajdukiewicz 1967, Bar-Hillel 1953, Lambek 1958)

Categorial Grammars make the following four fundamental assumptions. First, words and morphemes are assigned, *pace ambiguity*, a single syntactic category in the lexicon. Second, there are a few basic syntactic categories, and the rest are derived through a few schemata. Categorial grammars vary widely in what they allow as basic categories, but for the sake of illustration, let us take the base consisting of the categories *S*, *N*, and *NP*—the category of sentences, nouns, and noun phrases. All categorial grammars include derived types that can be generated by the schema: If *A* and *B* are categories, so is *A/B*. Third, there are a few syntactic operations, including the one for right-concatenation: If *e* is of syntactic category *A/B* and *e'* is of syntactic category *B*, then there is an expression *ee'* of syntactic category *A*. Fourth, every expression within a given syntactic category has the same type of semantic value, and its semantic category is determined by its type.

Again, categorial grammars differ in the system of semantic types they assume, but a fairly typical idea is to assign the type  $t$  to  $S$ , the type  $\langle e, t \rangle$  to  $N$ , the type  $\langle \langle e, t \rangle, t \rangle$  to  $NP$ , and to lay down the schema that if the type of  $A$  is  $\alpha$  and the type of  $B$  is  $\beta$  then the type of  $A/B$  is  $(\beta, \alpha)$ . If the semantics is extensional, semantic values of type  $e$  are entities, semantic values of type  $t$  are truth values, and semantic values of type  $(\beta, \alpha)$  are functions from semantic values of type  $\beta$  to semantic values of type  $\alpha$  (note that although the syntactic categories  $N$  and  $NP$  are basic, their semantic types are not). This divergence could be avoided if we had a basic syntactic category  $P$  of proper names with the associated semantic type  $e \rightarrow N$  and  $NP$  could then perhaps be identified with the derived syntactic categories  $S/P$  and  $S/(S/P)$ , respectively (Ajdukiewicz 1967). Assigning the semantic type  $e$  to proper names would seem to be desirable anyway—it seems plausible that if semantics is extensional, the semantic value of *John* should be John himself, not the (characteristic function of the) set of (characteristic functions of) sets containing John. But if proper names and noun phrases are allowed to belong to different syntactic categories, it must be explained why their distribution is so very similar, which is why Montague (1973) decided against this option. One could get around this difficulty by introducing type-lifting rules (Hendriks 1987, Partee 1987).

In a minimal categorial grammar, the only syntactic rule is right-concatenation (interpreted as functional application). This is clearly inadequate because it cannot capture syntactic generalizations about word order. A natural idea to rectify this shortcoming is to introduce the schemata that if  $A$  and  $B$  are categories, then so is  $A \setminus B$ , and that if  $e$  is of syntactic category  $A \setminus B$  and  $e'$  is of syntactic category  $A$  then there is an expression  $e'e$  of syntactic category  $B$  (left-concatenation is also interpreted as functional application). But the resulting framework is still much too restrictive.

Until the very end of the 1960s it was widely assumed that categorial grammars are inadequate as syntactic theories of natural languages. There have been three basic strategies to challenge this attitude. The first is to add a transformational component to categorial grammars, whereas the second involves adding free permutations and propose syntactic filters to eliminate the ungrammatical (but interpretable) expressions. (For the former strategy see Lewis [1970]; for the latter see Cresswell [1973]). Both of these lines concede that categorial grammar is incomplete and perhaps nonexplanatory as a syntactic theory, but they argue that it still is the best structure to base compositional semantics on. The third

strategy is more ambitious: It extends the set of permissible syntactic operations beyond concatenation and thereby seeks to achieve descriptive adequacy and explanatory power. This is the avenue most categorial grammarians have followed since the early 1970s.

The most important extension of permissible syntactic operations is the introduction of a different sort of concatenation—one that is not interpreted as functional application, but as functional composition. The simplest one of these is: If  $e$  is of syntactic category  $A/B$  and  $e'$  is of syntactic category  $B/C$ , then  $ee'$  is of syntactic category  $A/C$ ; if the semantic value of  $e$  is the function  $f$  and the semantic type of  $e'$  is the function  $g$ , then the semantic value of  $ee'$  is a function  $h$  such that for every  $x$ :  $h(x) = f(g(x))$ .

A categorial grammar can have mixed composition rules as well, allowing the composition of a left-slash category with a right-slash category. These rules allow for the construction of sentences containing more than one quantifier to have different derivational histories, which in turn can account for scope ambiguities. They also open up the possibility to construct and interpret non-constituents (such as “Ron loves” in “Ron loves spinach”), which in turn allows categorial grammar to deal with difficult coordination phenomena, such as “Ron loves and Mia hates spinach” (Dowty 1987). All this is done without the introduction of a separate level of logical form with phonologically empty elements. Obviously, to prevent overgeneration, the application of composition rules must be tightly constrained (Steedman 1987).

Although very much a minority view among syntacticians, categorial grammar can explain a good deal about the structure of natural languages; for a survey, see Jacobson (1996). The attempt to do away with any structure other than what is visible on the surface is philosophically intriguing, especially considering that it is often supposed to lead to the complete elimination of variables (Szabolcsi 1989, Jacobson 1999). That the elimination of variables from certain logical languages was possible without limiting their expressive power is well-known from Quine (1966), but the claim that all sentences lack these devices may have much more significant consequences for philosophy. For one thing, those who believe in being ontologically committed to the values of the variables that are quantified over must find where these variables are. Quine’s answer was that they are within the formulae of a formal first-order language that are associated with sentences through regimentation—a process where the outcome depends on one’s particular interests. The result was the doctrine of ontological relativity (Quine 1969).

## STRUCTURAL VALIDITY

Suppose categorial grammarians are empirically adequate and there is no need for a separate level of logical form to account for syntactic generalizations. There still might be the need for logical forms to distinguish between lexical and structural entailments. Consider, for example, the contrast between “Lou is a bachelor; therefore Lou is unmarried” and “Martin walked quickly; therefore Martin walked.” Intuitively, the first is valid in part because of what *bachelor* means, whereas the validity of the second is independent of the lexicon. The established account of structural validity rests on logical form: An entailment is structurally valid if, and only if, it is valid in virtue of logical form (i.e., if, and only if, the logical forms of the premise(s) logically entail(s) the logical form of the conclusion). For example, if the (simplified) logical forms within the second entailment are:

$$\begin{aligned} & \exists e (\text{walk}(\text{Martin}, e) \wedge \text{quick}(e)) \\ & \exists e \text{ walk}(\text{Martin}, e), \end{aligned}$$

As Davidson (1967) has argued, the entailment is indeed structurally valid on the established account. However, if there is no separate logical form, structural validity must be understood in a different manner.

The obvious thing to say is that semantic categories can provide a definition of structural validity without taking a detour through logical forms. One can say that an entailment is structurally valid just in case any uniform substitution of expressions of the same semantic category within it results in a valid entailment (Evans 1976). If, as categorial grammar assumes, syntactic categories are associated with a unique semantic type, which in turn determines semantic category, one may replace *semantic* with *syntactic* in the above definition. An interesting consequence of this definition is that logical consequence expressed in natural language (setting aside cases like “Hugo walks; therefore Hugo walks”) will not be structural. But this is arguably as it should be: the inference “Hugo walks and talks; therefore Hugo walks” is valid in part because of what *and* means—replace it with *or* and the resulting entailment is no longer valid. Although logical entailments are said to be valid in virtue of their form, except for the special case of concluding something from itself, their validity also rests upon the lexical meaning of logical constants.

## SYNTAX

“Syntax” is the theory of the construction of sentences out of words. In linguistics, syntax is distinguished from morphology, or the theory of the construction of words out of minimal units of significance, only some of which are words. According to this division, it is a matter of morphology that the word *solubility* decomposes into

“dissolve” + “able” + “ity”; but it is a matter of syntax to analyze the construction of the sentence, “That substance is able to dissolve.”

Although syntax is a traditional grammatical topic, it was only with the rise of formal methods growing out of the study of mathematical logic that the subject attained sufficient explicitness to be studied in depth, in works by Zelig Harris (1957) and Noam Chomsky (1957). Since then a flourishing field has been created; for it was rapidly discovered that the syntax of human languages was far more complex than at first appeared. In this respect, the development of syntax is comparable to other fields of cognitive science such as human vision, problem-solving capacities, and the organization of commonsense knowledge, all of which gave rise to difficult problems once the goal of fully explicit representation was put in place.

The dawn of syntax is marked by the realization that the structure of sentences is hierarchical; that is, that behind the linear order of words and morphemes that is visible in natural languages there is another organization in terms of larger or smaller constituents nested one within another. Description of sentences at this level is said to give their phrase structure. Moreover, phrases of a given kind can occur within others of the same kind: It is this recursive feature of language that enables sentences of arbitrary complexity to be constructed. The realization that phrase structure is recursive is very old. Assuming the categories of a complete noun phrase (NP) and sentence (S), Antoine Arnauld (1662) gives the examples (rendered here in English):

- (1) (<sub>S</sub>The divine law commands that [<sub>S</sub>kings are to be honored])
- (2) (<sub>S</sub>[<sub>NP</sub>Men [<sub>S</sub>who are pious]] are charitable)

remarking that in (1) the embedded element “kings are to be honored” is a sentence occurring within a sentence, and that in (2) the relative clause has all the structure of a sentence, except that the relative pronoun “who” has replaced the subject.

In linguistic theory the recursive structure of syntax is expressed by principles of combination modeled after the clauses of an inductive definition. However, far more complex devices seem to be required for a compact description that helps to reveal the basis of the native speaker’s ability. Chomsky’s introduction of grammatical transformations opened the way to a variety of formalisms and developments (see Atkinson, Kilby, and Roca 1988 for a useful overview). Chomsky also initiated the conception of linguistic theory as a study of the acquisition of a system of linguistic knowledge, or com-

petence. Any human language is acquirable under ordinary experiential conditions by any normal child. The space between empirical evidence and the resulting linguistic competence is sufficiently great that a kind of readiness for language, universal grammar in Chomsky’s terminology, is presupposed. Contemporary theory seeks to probe the basis for this readiness in terms of innate rules and principles of grammar. For a more recent statement, see Chomsky and H. Lasnik (in Jacobs et al. 1993).

Within philosophy too the theory of syntax came to play an important role in the systematization of mathematics, and assumed central importance in Rudolf Carnap (1934). Carnap distinguished between grammatical syntax, of the sort that a linguist might give in a description of a language, and logical syntax, whose aim was not only to specify the class of sentences (or well-formed formulas of a calculus) but also to use formal methods in constructing a theory of logical consequence and logical truth. Carnap employed the distinction between grammatical form and logical form, which plays a crucial part in Ludwig Wittgenstein’s views both in the *Tractatus* and in the *Philosophical Investigations*, and has become part of the lore of analytic philosophy. The scope of logical syntax in Carnap’s terms took on much of the role of semantics in later philosophical discussion. Even with the later distinction between syntax and model-theoretic semantics, syntactic properties of formalized languages are still crucial for properties of systems of logic (soundness and completeness), and proof theory is established as a part of the syntax of mathematics.

In linguistic theory syntax and semantics have become increasingly intertwined disciplines, as it was realized that there are explanatory issues in relating linguistic forms to the specific meanings, or range of meanings, associated with them. S. Lappin (1995) contains a number of useful expositions on this theme; see also R. Larson and G. Segal (1995). The current research climate is in practice very different from conceptions associated with “ordinary language” philosophy: The contemporary view is not that ordinary speech lacks an exact logic, but rather that a diligent, collaborative effort is required to find out what the logic is. The concentration on logic implies that syntactic investigations have a metaphysical dimension. The patterns of inference of ordinary language call for formalization as part of a general account of the structure of individual human languages, or human language in general, and this formalization may in turn lead to proposals for reification, as in Donald Davidson’s (1967) hypothesis that references to events are pervasive in ordinary action sentences.

On the side of linguistics proper, the problems of morphology have been treated in a progressively more syntactic manner as, for instance, our example *solubility* can be seen as built up by rules of a sort familiar from syntax. The result is the area now called morphosyntax, where the question whether morphology is a distinct level of linguistic organization is under active debate; see R. Hendrick (1995) for more recent discussion.

## TAGORE, RABINDRANATH (1861–1941)

Rabindranath Tagore was an Indian writer and philosopher. Romain Rolland, referring to the Orient and the Occident, said that Tagore contributed more than anyone else toward “the union of these two hemispheres of spirit.” Sarvepalli Radhakrishnan called Tagore “the greatest figure of the Indian renaissance.”

Tagore was born in Calcutta, studied in London, returned to India, and was married in 1883. He founded Visvabharati, a university at Santiniketan (near Bolpur), became India’s most popular poet, won the Nobel Prize for literature in 1913, and was knighted in 1915. He visited and lectured in Canada, the United States, South America, England and several countries of Europe, the Soviet Union, Turkey, Iran, Ceylon, China, and Japan. He was in personal contact with Henri Bergson, Benedetto Croce, Albert Einstein, Bertrand Russell, and other leading intellectual figures of his period.

Tagore wrote about fifteen books of philosophical lectures and essays, about one hundred books of verse (mostly in Bengali, and partly translated by himself from his own Bengali version into English), about fifty plays

(in some of which he acted the main role), and about forty works of fiction. His main writings of philosophical interest are *Sadhana: The Realisation of Life* (1913), *Personality* (1917), *Creative Unity* (1922), *The Religion of Man* (1931), all published in London and New York, and *Man* (1937), published in Madras. His best-known poems appear in *Gitanjali* (Song offerings), translated by the author from the original Bengali, with an introduction by W. B. Yeats (1913); *The Crescent Moon*, likewise translated by the author from the original Bengali (1913); and *Fruit-Gathering* (1916), all published in London and New York. He produced some drawings and paintings, beginning about his seventieth year, and planned and produced ballets.

Tagore’s basic philosophical position is one that recognizes the useful insights of the main opposing views on a given question. For example, concerning the transcendence or immanence of God, Tagore accepted, on the one hand, the value of the doctrine of Brahman as “the absolute Truth, the impersonal It, in which there can be no distinction of this and that, the good and the evil, the beautiful and its opposite, having no other quality except its ineffable blissfulness in the eternal solitude of its consciousness”; but he also felt, on the other hand, that “whatever name may have been given to the divine Real-

ity it has found its highest place in the history of our religion owing to its human character, giving meaning to the idea of sin and sanctity, and offering an eternal background to all the ideals of perfection which have their harmony with man's own nature" (*The Religion of Man*).

Similarly, he combined the best insights of humanists, who exalt man, and of otherworldly seekers of the World Force, who belittle man; of naturalists, who deny spirit, and of extreme partisans of spirit, who cut man off from nature; of individualists and universalists; of determinists and defenders of free will; of hedonists and ascetics; and of romanticists and realists.

In his social philosophy, as well as in his metaphysics, Tagore attempted to synthesize polar opposites. Neither wholly conservative nor wholly liberal, he favored gradual reform. This evolutionary note is reflected in his views on the economic order, public health, education, the social structure, national politics, and international affairs.

Tagore's emphasis on the mediating unity that embraces variety appears, for example, in *Sadhana*, where he wrote: "Facts are many, but the truth is one.... Man must clearly realise some central truth which will give him an outlook over the widest possible field. And that is the object which the Upanishad has in view when it says, Know thine own Soul. Or, in other words, realise the one great principle of unity that there is in every man."

In May 1930 Tagore delivered the Hibbert Lectures at Oxford. In the following year, the lectures were published in expanded form as a book, *The Religion of Man*. Tagore's mediationism appears in the book in such passages as the following: "The final freedom which India aspires after ... is beyond all limits of personality, divested of all moral or aesthetic distinctions; it is the pure consciousness of Being, the ultimate reality." The yogi has claimed that through intensive concentration and quietude we do reach "that infinity where knowledge ceases to be knowledge, subject and object become one—a state of existence that cannot be defined.... India attunes man to the grand harmony of the universal, leaving no room for untrained desires of a rampant individualism to pursue their destructive career unchecked, but leading them on to their ultimate modulation in the Supreme."

### **Bibliography**

The philosophical works by Tagore that are mentioned above, as well as others, have been published in various editions, in English and in translation into European languages.

Works on Tagore's philosophy include the following (arranged in chronological order): Sarvepalli Radhakrishnan, *The Philosophy of Rabindranath Tagore* (London: Macmillan, 1918; reissued Baroda: Good Companions, 1961); Sachin Sen, *The Political Thought of Tagore* (Calcutta: General Printers and Publishers, 1947); B. G. Ray, *The Philosophy of Rabindranath Tagore* (Bombay: Hind Kitabs, 1949); V. S. Naravane, *Rabindranath Tagore, A Philosophical Study* (Allahabad: Central Book Depot, n.d.); and Sasadhar Sinha, *Social Thinking of Rabindranath Tagore* (New York: Asia Publishing House, 1962).

Of the many biographies of Tagore, mention may be made of Krishna Kripalani, *Rabindranath Tagore: A Biography* (New York: Oxford University Press, 1962).

*William Gerber (1967)*

## TAINÉ, HIPPOLYTE-ADOLPHE (1828–1893)

Hippolyte-Adolphe Taine was a philosopher, psychologist, historian, and critic. Taine and Ernest Renan were the leading French positivistic thinkers of the second half of the nineteenth century. As a result of Taine's great independence of mind, his life was not always comfortable. Discriminatory treatment from the authorities of the Second Empire led to his withdrawal from teaching from 1852 to 1863, when he was appointed an examiner at Saint-Cyr. The next year he became a lecturer at the École des Beaux Arts; from his lectures there came his famous *Philosophie de l'art*. At the intervention of the Catholic clergy, a French Academy award for his *Histoire de la littérature anglaise* was denied him, and he was elected to the academy only in 1878, after the fall of the Second Empire. By that time he had antagonized both liberals and Bonapartists by his ruthless destruction of the revolutionary and Napoleonic legends. Nevertheless, his influence was great and diversified. His positivistic and physiological approach to psychology was adopted by Théodule Ribot, Pierre Janet, and others, and his opposition to centralization and to revolutionary experiments attracted Catholic traditionalists such as Paul Bourget and Maurice Barrès, who, however, ignored his severe condemnation of the old regime and his outspoken sympathies for Protestant and parliamentary England.

Although Taine's philosophical views were formed early in life under the joint influence of Benedict de Spin-

oza, G. W. F. Hegel, and classical science, they were first systematically expounded in his *De l'intelligence*. The theory of mind presented in this book is based on Taine's general monism and determinism. Thus in the preface to the fourth edition (Paris, 1883), he stated his opposition to faculty psychology on the grounds that words such as *capacity*, *self*, *reason*, and *memory* suggest by their simplicity the existence of indivisible mental entities and thus prevent us from grasping the enormous complexities of the underlying psychological mechanisms. The self is nothing but a series of mental events. In his attack on the substantialization of the self and the reification of abstractions, Taine drew on psychopathology and neural physiology. Psychopathology shows how mental disease can dissociate the components of a complex phenomenon that appears subjectively as simple; neural physiology reveals the enormous complexity of the neural mechanism that underlies mental phenomena. Taine held a double-aspect theory of the relation between introspective data and public physical events; the mental and the physical are two sides of the same process, "two translations of the same text" (*De l'intelligence*, Book 4, Ch. 2). Taine's use of physiological analysis, his strictures on introspection, and his mechanistic determinism place him among the naturalists.

Like most of his contemporaries, Taine regarded classical science as complete, and its picture of nature as definitive. Like Herbert Spencer, Wilhelm Ostwald, and others, he regarded the law of conservation of energy as ultimate, as "the immutable ground of being," and the equivalence of cause and effect as a consequence of this law.

Taine applied his rigorous determinism to all phenomena—physical, mental, and social. There is little in his writings dealing directly with physical phenomena, but there is no question that the determinism of classical physics was for him an ideal model to which other sciences should conform. Thus in the introduction to his *Histoire de la littérature anglaise*, he proposed that every social phenomenon should be explained as the result of race, environment, and time—that is, of the particular psychosocial state of a society. Taine had already applied this method in previous essays, and he applied it in his *Philosophie de l'art* and later in his major historical work, *Les origines de la France contemporaine*, inspired by his reflections on the French defeat in 1870. The thesis of this monumental and controversial work is that there was one persistent theme—excessive centralization—underlying all the violent upheavals of modern France. Introduced by the Bourbons, it was strengthened by the French Rev-

olution, which destroyed the natural provinces and replaced them by departments which were mere administrative appendices of the central government; in the hands of Napoleon Bonaparte the centralized administrative structure was an efficient tool of internal control and external conquest, but it became an unwieldy bureaucratic machine as soon as it was deprived of Napoleon's ruthless energy.

Taine's detailed study of social conditions under the old regime, of revolutionary excesses, and of mob psychology after 1789 strengthened the inclination to pessimism present in his previous writings. This inclination found its most eloquent expression in the following passage: "Man is a nervous machine, governed by a mood, disposed to hallucinations, transported by unbridled passions, essentially unreasonable" (*History of English Literature*, Vol. II, p. 173). In *De l'intelligence* Taine had said that every image tends to acquire a hallucinatory intensity unless checked by the inhibiting influence of other images. Thus mental equilibrium and social stability are mere "happy accidents." Civilization is a mere surface beneath which lurk irrational drives always ready to break through.

## TARSKI, ALFRED

(1902–1983)

Alfred Tarski, the Polish-American mathematician and logician, was born in Warsaw, received his doctorate in mathematics from the University of Warsaw in 1924, and two years later was named docent. In 1939 he emigrated to the United States. Appointed lecturer in mathematics at the University of California (Berkeley) in 1942, he remained at that institution for the rest of his life, serving as professor of mathematics from 1946 and becoming professor emeritus in 1968.

### MATHEMATICS

Tarski worked in both pure mathematics, especially set theory and algebra, and mathematical logic, especially metamathematics. This entry will not discuss his mathematical contributions, although some of them (in particular his famous theorem, established jointly with Stefan Banach, on the decomposition of the sphere, as well as his theory of inaccessible cardinals) have a definite bearing on the epistemology of mathematics. (See S. Banach and A. Tarski, "Sur la décomposition des ensembles des points en parties respectivement congruentes," *Fundamenta Mathematicae* 6 [1924]: 244–277.)

It should be noted that in these papers Tarski has not criticized the assumptions of set theory. Like most mathematicians he has simply accepted them as true. This attitude and a systematic use of set-theoretic concepts have profoundly influenced his work in logic and metamathematics. Unlike the followers of David Hilbert and of L. E. J. Brouwer, Tarski has not refrained from the use of infinitistic set-theoretical concepts. He finds a definition or a

theorem to be acceptable if it is expressed or proved on the basis of set theory. This attitude, of course, is completely different from that of Hilbert's formalism or Brouwer's intuitionism.

As a consequence of this methodological attitude, Tarski has gained much freedom in introducing new notions and thus has put himself in a much more advantageous position than the adherents of Hilbert or Brouwer. Consider the following very simple but typical example. In *Logic, Semantics, Metamathematics* (p. 38) Tarski defines the set of consequences of a given set of axioms as the smallest set containing the axioms and closed with respect to the rules of proof, and on this definition he bases the whole theory of the consequence relation in the propositional calculus. A follower of Hilbert or Brouwer would never accept such a definition because he would regard the clarification of the notion of set (involved in this definition) as the ultimate aim of his activity.

The free use of set theory has enabled Tarski to extend the field of application of metamathematics (see, for instance, his investigations of "infinitary languages," discussed below) and has formed a natural basis for the development of his semantic method. This method can indeed be formulated only in a language that has considerable deductive strength and is provided with means to express definitions of a very complicated structure. The general theory of sets satisfies both these requirements.

Obviously Tarski's methodological attitude is rejected by the adherents of finitism and by all logicians who seek in metamathematics a justification or explanation of set theory.

### METAMATHEMATICS

Metamathematics is a branch of mathematical logic that studies formal theories and solves problems pertaining to such theories. Tarski contributed so much to this field that he deserves to be regarded, with Hilbert, as its cofounder.

**AXIOMATIC THEORY OF FORMAL SYSTEMS.** In his early papers Tarski presented an axiomatic theory of arbitrary formal systems. A "theory" for him is a set (whose elements are called formulas) and a function (called the consequence function) that correlates a set of formulas with each such set; this new set is called the set of consequences of the first set. The consequence function is not wholly arbitrary; it must satisfy certain axioms that will not be reproduced here. Several metamathematical notions, such as consistency, completeness, and inde-

pendence, can be defined for theories in this abstract sense. All formal theories that were known in 1930 can be subsumed under this scheme. While this is no longer true today (see below), a relatively small rectification of Tarski's axioms would suffice to restore the universality of his scheme.

**SYSTEMS BASED ON PROPOSITIONAL LOGIC.** Besides discussing the most general scheme of formal theories, Tarski axiomatically described theories based on the classical propositional logic. Here the assumptions must, of course, be specialized. It is assumed, for example, that certain operations are defined on the set of formulas (the joining of two formulas by means of a connective). An example of an important property of consequence that Tarski took as an axiom is the deduction theorem. Its importance is that it provides the possibility of defining the consequence function in terms of one fixed set  $S_0$  of sentences, specifically the set of consequences of the empty set. In concrete cases,  $S_0$  consists of logical tautologies expressible in the given theory. In what follows, we shall speak of theories as being based on a logic  $L$  if  $S_0$  is the set of tautologies of the logic  $L$ .

**DESCRIPTION OF SYSTEMS.** Tarski calls a set  $X$  of formulas a system if it is deductively closed, that is, if it is equal to its set of consequences. In "Grundzüge des Systemkalküls" he formulated a general program aimed at describing all systems of a given theory. Tarski showed in this paper that in order to achieve this aim it is sufficient to describe all complete systems, and he illustrated his program in several simple but interesting cases of decidable theories. Many ideas developed in this paper were later incorporated by Tarski in the general theory of models.

## SEMANTICS

In the early 1930s Tarski formulated the semantic method, which is his most important achievement in logic. The essence of the method consists in discussion of the relations between expressions and the objects they denote.

Tarski himself said that his semantics was a modest discipline. Yet the philosophical claims of semantics were ambitious from the start. Tarski's aim was "to construct—with reference to a given language—a *materially adequate and formally correct definition of the term 'true sentence,'*" a problem "which belongs to the classical questions of philosophy."

Almost from the beginning the methods of semantics exerted a profound influence on philosophers engaged in the construction and study of exact scientific languages. Semantics opened new possibilities in these studies, which formerly were limited to purely syntactic problems and thus were unable to express relations between languages and extralinguistic objects. Semantics offered a natural tool for the discussion of such relations. The price one had to pay was the use of a much stronger metalanguage than the one sufficient for syntax. At any rate, semantic methods became an accepted tool in the study of scientific languages: "Contemporary studies in the methodology of science are primarily concerned with the syntax and semantics of the language of science" (R. M. Martin, *Truth and Denotation*, Chicago, 1958, p. 16).

Tarski published little concerning the applicability of semantics to the study of empirical languages (see, however, his remarks in "The Semantic Conception of Truth and the Foundations of Semantics"). Rather, he limited himself to applications of his method to logic and mathematics. His most outstanding contributions in these areas will be described briefly.

## INTERPRETATIONS OF PROPOSITIONAL CALCULI.

The propositional calculus provides us with simple examples of semantic notions. Thus, the two-element Boolean algebra is an interpretation of the calculus; the propositional connectives are interpreted as functions whose arguments and values range over the algebra. We may accordingly conceive of the propositional calculus as a language that describes the two-element algebra. Instead of the two-element algebra we may take any other matrix for the propositional calculus. Thus, a formal calculus may have (and in general does have) many interpretations. Tarski early became acquainted with these notions through his collaboration with Jan Łukasiewicz, who in the 1920s initiated the metatheoretical investigation of propositional calculi. In a joint publication Tarski and Łukasiewicz gave a general set-theoretical definition of a matrix and showed its usefulness in various special problems.

**MODELS.** Models play the same role for theories based on (extensions of) the first-order functional calculus as that played by matrices for propositional calculi. If a theory  $T$  has as its primitive constants  $k$  predicates with  $r_1, \dots, r_k$  arguments, then a model for  $T$  is defined as an ordered  $k + 1$ -tuple  $\langle A, R_1, \dots, R_k \rangle$ , where  $R_i$  is a relation with  $r_i$  arguments ranging over  $A$  ( $i = 1, \dots, k$ ). A model determines a partition of sentences into two sets, one consisting of sentences that are true in the model and the

other of sentences that are false in the model. A formula that contains free variables is by itself neither true nor false in the model, but if arbitrary elements of  $A$  are correlated with the free variables of the formula, it becomes either true or false. In the first case we say that the elements of  $A$  correlated with the free variables satisfy the formula in the model. We have here an analogy with the situation in the propositional calculus: if a matrix is given and if its elements are correlated in an arbitrary way with the free variables of a formula, then the formula has a value that is an element of the matrix. This analogy between models and matrices was stressed in “The Concept of Truth in Formalized Languages,” in *Logic, Semantics, Metamathematics*, pp. 152–278. (This is an English translation of an earlier paper.)

The notion of a model and some related semantic notions were known to mathematicians and logicians long before the work of Tarski. No one, however, was concerned to strive for such a degree of precision as Tarski maintained. The fruits of Tarski’s approach are first, a precise set-theoretical description of the semantic notions, together with a meticulous discussion of the language in which these definitions are expressible; second, the discovery of general properties of these notions which sometimes are very startling; and third, the discovery of a broad field of applications.

The semantic notions, which before Tarski were used in solving relatively special problems concerning consistency and independence, now turned out to be powerful tools in dealing with many metamathematical investigations. For a philosopher the most important application of the semantic method is Tarski’s theory of truth.

**LOGICAL CONSEQUENCE.** Logical consequence is defined as follows: a sentence  $F$  is a logical consequence of a set  $X$  of sentences if  $F$  is true in every model in which all sentences of  $X$  are true. For theories based on first-order logic this notion is coextensive with the syntactic notion of derivability (Gödel’s completeness theorem). For theories based on the higher-order logics or on the various extensions of first-order logic, these notions are essentially different. Analyzing the intuitions underlying the notion of consequence, one arrives with Tarski at the conclusion that it is the semantic and not the syntactic notion that adequately describes the notion that is intuitively given. At the same time, many logics in which the consequence functions are defined semantically turn out to be free from defects resulting from the incompleteness phenomenon discovered by Kurt Gödel. This shows the essential gains brought by the acceptance of the semanti-

cally defined notion of logical consequence. What is lost is the finitary (“combinatorial”) description of the consequence function.

**DEFINABILITY.** Like the notion of consequence, definability can be treated syntactically and semantically. Although investigations in both these directions were pursued in special cases before Tarski, it is only following Tarski’s work that we can speak of a systematic theory of definability.

*Syntactic theory of definability.* Let  $T$  be a formal theory among whose constants there is a one-place predicate  $C$ . We say that  $C$  depends on other constants of  $T$  if there is a formula  $F$  free of  $C$  with exactly one free variable  $x$  such that the equivalence  $C(x) \equiv F$  is provable in  $T$ . In special cases this notion was used long before Tarski; but Tarski was the first to formulate this notion precisely and in the general case, to discuss its properties, and to discover a far-reaching parallelism between the notions of consequence and definability. One of the most interesting results of his theory is a general formulation of a method (due in principle to A. Padoa) allowing one to establish the independence of a constant. Tarski also showed the universality of this method in cases in which the theory under consideration is based on second-order logic or its extensions; the case of theories based on first-order logic was decided much later by E. W. Beth.

*Semantic notion of definability.* Let  $M$  be a model as defined above. A subset  $S$  of  $A$  is called definable in  $M$  if there is a formula  $F$  with exactly one free variable such that an element  $a$  of  $A$  satisfies  $F$  in  $M$  if and only if  $a$  is an element of  $S$ . The formula  $F$  is called a definition of  $S$  in  $M$ .

The determination of the class of definable sets is an interesting problem that occupies a central place in investigations concerning the so-called hierarchies of sets. Without going into details, the aim of these investigations is to discuss sets obtainable from simple sets (which constitute the lowest level of the hierarchy) by means of fixed operations that lead to higher and higher levels. Hierarchies of this kind are discussed in mathematics (the Borel and the projective hierarchies) and in metamathematics (the arithmetical, the hyperarithmetical, and the analytic hierarchies). Tarski and Kazimierz Kuratowski in a joint paper described a method that in many cases allows one to infer directly, from the form of definition of a set, to which level of a given hierarchy this set belongs. Their method introduced essential simplifications into the theory of hierarchies.

The importance of these investigations for metamathematics will be clear if we reflect that, for example, Gödel's incompleteness theorem is an obvious corollary of the fact that the set of (numbers of) sentences derivable from the axioms of arithmetic does not belong to the lowest level of the arithmetical hierarchy. Tarski's work on definability is thus closely connected with problems of incompleteness. The most important result in this field is his theorem on truth, which says that under very general assumptions the set of (numbers of) sentences that are true in a model  $M$  is not definable in  $M$ . Gödel's incompleteness theorem for arithmetic and many related results are immediate corollaries of this theorem ("On Undecidable Statements in Enlarged Systems of Logic and the Concept of Truth," 1.939). Tarski's semantic theorem, however, requires for its formulation as well as for its proof a much stronger logical basis than the syntactic theorem of Gödel.

**GENERAL THEORY OF MODELS.** Notions closely related to models (as defined above) appeared in abstract mathematics independently of the logical investigations. Mathematicians were led to notions of this degree of generality by the development of abstract algebra. Tarski developed these algebraic investigations and tied them to metamathematics.

It is easy to explain the close connections between the general theory of models and the theory of systems. If we consider a theory whose consequence function is defined semantically, then every system is determined by the class of those models in which all sentences of the system are true. Conversely, every model determines a (complete) system consisting of sentences that are true in the model. However, different models may yield one and the same system.

Tarski and his students exploited these relationships especially for the case in which the theory under consideration is based on first-order logic. In this case it is irrelevant whether we accept the semantic or the syntactic notion of consequence, and we thus have the advantage of being able to use on the one hand the connection between systems and models and on the other the various properties of the consequence function that result from its syntactic definition. One of these properties is the so-called compactness of the consequence function, which states that if a set  $X$  of sentences is contradictory, then the same is true of a finite subset of  $X$ .

In his publications on the theory of models, which date as far back as 1949, Tarski sought to develop the theory in purely mathematical terms and avoided notions

current in logic but less so in mathematics. Consequently his papers on the theory of models are more accessible to mathematicians than to logicians. The details of his highly technical works on the theory of models cannot be related here, and we must content ourselves with the brief indications given above.

**GENERALIZATIONS OF FIRST-ORDER LOGIC.** As was stated earlier, the general setting of model theory is meaningful for theories that are not necessarily based on first-order logic. Tarski suggested two important generalizations of first-order logic and showed that the model-theoretic approach to these logics leads to important discoveries.

The first of these logics is one with infinitely long formulas ("A Sentential Calculus with Infinitely Long Expressions"). Such formulas are, of course, abstract entities definable only in strong systems of set theory; nevertheless, Tarski showed that most of the questions formerly raised exclusively for theories based on ordinary logic are also meaningful for this abstractly described logic. The mathematically important work "Some Problems and Results Relating to the Foundations of Set Theory" resulted from a negative solution of the analogue of the compactness problem ("Some Model-Theoretical Results concerning Weak Second Order Logic," *Notices of the American Mathematical Society* 5, Abstract 550–6) for logics with infinitely long formulas.

Another important logic introduced by Tarski is weak second-order logic, that is, second-order logic in which the set variables are restricted to finite sets. For this logic as well, the semantic notion of consequence is definable only in a fairly strong system of set theory. Thus weak second-order logic, like the preceding one, is only an abstract construction. Tarski established various metamathematical properties of this logic (for instance, the analogue of the Skolem-Löwenheim theorem) and showed that they imply important mathematical consequences in algebra.

## FURTHER CONTRIBUTIONS

**DECISION PROBLEM AND UNDECIDABLE THEORIES.** The decision problem for a theory  $T$  is the question whether there exists an algorithm allowing one to decide whether a sentence of  $T$  is or is not provable in  $T$ . Tarski discussed this problem for a large number of theories using the so-called method of the elimination of quantifiers, which originated with Thoralf Skolem ("The Concept of Truth in Formalized Languages," in *Logic, Language, Metamathematics*, p. 204). The most important

result in this direction was a positive solution of the problem in the case in which  $T$  is the first-order theory of the field of real numbers (*A Decision Method for Elementary Algebra and Geometry*). This result found numerous applications in algebra and geometry.

A theory for which the decision problem does not admit a positive solution is called undecidable. It was related above how Tarski deduced the incompleteness (and hence the undecidability) of arithmetic from his general theorem. His further efforts were directed toward establishing the undecidability of various very weak but mathematically interesting theories. To this end he introduced the important notion of essential undecidability. A theory is said to be essentially undecidable if all consistent extensions of it are undecidable. Tarski showed in *Undecidable Theories* (1953) that a theory that has a joint consistent extension with an essentially undecidable theory based on a finite number of axioms is itself undecidable, although in general not essentially undecidable. This theorem provided a basis for numerous undecidability results obtained partly by Tarski and partly by his collaborators.

**INTUITIONIST AND MODAL LOGICS.** Of the numerous papers that Tarski devoted to the propositional calculus, only those on the intuitionistic and modal propositional calculi can be mentioned here. In "Sentential Calculus and Topology" (*Logic, Semantics, Metamathematics*, pp. 421–454) he established a startling connection between intuitionistic logic and topology: he constructed matrices for the intuitionistic propositional calculus, using as elements closed subsets of a topological space. In his further work on this calculus, done jointly with J. C. C. McKinsey, he no longer used topological notions but worked instead with certain algebraic structures. The class of all subsets of a topological space and the class of all closed subsets of such a space are examples of such structures, which Tarski and McKinsey called closure algebras and Brouwerian algebras, respectively. Using them, they established several properties of the intuitionistic and modal propositional logics.

**CYLINDRIC ALGEBRAS.** The above papers give a good illustration of Tarski's growing tendency to deal with metamathematical problems by means of algebraic tools. Another example is his work on cylindric algebras. These algebraic structures are related to the predicate calculus with identity in the way Boolean algebras are related to the usual propositional calculus. Logics with infinitely

long expressions can also be investigated by means of suitable cylindric algebras.

**CALCULUS OF BINARY RELATIONS.** The calculus of binary relations was created by Ernst Schröder but soon fell into oblivion. Tarski gave axioms for this calculus, investigated its relations to the predicate calculus, and initiated extensive work on the models of his axioms. Of the several applications of the calculus found by Tarski, the axiomatization of set theory without variables, the existence of undecidable subsystems of the two-valued propositional calculus, and a general method of reduction of the number of primitive terms of a theory should be mentioned.

## PHILOSOPHY

In the rich bibliography of Tarski's publications there are almost no philosophical papers. The exceptions are "The Establishment of Scientific Semantics" and "The Semantic Conception of Truth and the Foundations of Semantics," which deal with the philosophical significance of semantics. A partial exception is Tarski's paper on the notion of truth (in *Logic, Semantics, Metamathematics*, pp. 153–278), although the bulk of it is devoted to a systematic exposition of semantics.

Tarski, in oral discussions, often indicated his sympathies with nominalism. While he never accepted the "reism" of Tadeusz Kotarbiński, he was certainly attracted to it in the early phase of his work. However, the set-theoretical methods that form the basis of his logical and mathematical studies compelled him constantly to use the abstract and general notions that a nominalist seeks to avoid. In the absence of more extensive publications by Tarski on philosophical subjects, this conflict appears to have remained unresolved.

## TARSKI, ALFRED [ADDENDUM]

Alfred Tarski was born in 1901 (not 1902, as stated in the original entry). The name on his birth certificate was Alfred Teitelbaum (variant: Tajtelbaum); he changed it to Alfred Tarski in 1924. That same year his dissertation, written under the direction of Stanisław Lesniewski, was

published in two parts, the first under his birth name and the second under Alfred Tajtelbaum-Tarski; thereafter, all his articles and books were published under the name Alfred Tarski.

Tarski’s immigration to the United States was somewhat accidental: He was attending a meeting of the Unity of Science at Harvard University in September 1939 when the Nazis invaded Poland and World War II began. Tarski was stranded and separated from his wife and two children, who were left behind in Warsaw (they were reunited after the war, but most of his family perished in the Holocaust). In 1942, after three years of casting about for a position, he received a one-year appointment as a lecturer at the University of California, Berkeley (UCB), from which he quickly rose to professor of mathematics in 1946. Working intensively with increasing success, he built a substantial graduate program in logic and, within a decade, Berkeley became a mecca for logicians worldwide. In 1957 Tarski was instrumental in creating the interdepartmental Program in Logic and Methodology of Science at UCB that mainly bridged the departments of mathematics and philosophy.

Tarski retired in 1968 but was recalled to teach for the next five years. He continued to do research and advise students until a year before his death in 1983. In the last decade of his life he received a number of honors, including honorary doctorates from the Universidad Católica de Chile, the Université d’Aix-Marseille II, and the University of Calgary; in addition, in 1981 he was awarded the Berkeley Citation, the highest honor that UCB can bestow. For a full biography see Anita Burdman Feferman and Solomon Feferman (2004).

From the 1960s to the end of his life, with the collaboration of colleagues and students, Tarski concentrated on the topics of axiomatic geometry and algebraic logic, while continuing to contribute to the areas of model theory, set theory, and universal algebra. His work on first-order systems of Euclidean geometry and the work that it led to in non-Euclidean geometry is described in a joint article with Steven R. Givant, “Tarski’s System of Geometry” (1999). The research on relation algebra was capped by the joint monograph with Givant, *A Formalization of Set Theory without Variables* in 1987. In that it is shown how a wide variety of formal theories in the first-order predicate calculus, including set theory, can be axiomatized equivalently in purely quantifier-free relation-algebraic terms, even though those do not suffice in general to axiomatize first-order logic. The work on the algebraization of the full first-order logic with equality is explicated in the two substantial volumes of *Cylindric*

*Algebras* (1971–1985), written in collaboration with Leon Henkin and Donald Monk.

## TAULER, JOHANNES

(c. 1300–1361)

The German mystic Johannes Tauler entered the Dominican order at Strasbourg about the age of fifteen and probably studied in the Dominican *studium generale* at Cologne, where he may have been taught by Meister Eckhart. He was certainly influenced by the latter and by the contemplative movement known as the *Gottesfreunde* (Friends of God). He was in Strasbourg at the time of Pope Innocent XXII’s interdict on the city for taking the wrong side in the war between different sections of the Holy Roman Empire, but there is no good evidence for the story that during the Black Death he defied the interdict by administering sacraments to the dying. He remained a loyal and orthodox member of the church. Much legendary material surrounds his life, and various

spurious works are attributed to him. It was on the basis of these sources that some earlier scholars mistakenly thought of Tauler as a precursor of the Reformation.

In his sermons, Tauler geared mystical teachings, which made use of Eckhartian and Neoplatonic concepts, to practical purposes. He was deeply committed to the view that mystical experiences are a nourishment to the soul in supporting the individual in a life of active love and that there are behavioral criteria for estimating their worth. He believed that in this active life we may possess God through a fusion of the divine and human wills. However, far from reducing contemplative religion to the exercise of good works, Tauler believed that the love of God and the love of men go together and that the former finds its consummation in the inner union of the soul with the Creator.

In principle, all men should be capable of this return of the soul to its Source (the notion of return was typical of the Neoplatonic tradition with which Tauler was acquainted). Two qualifications, however, must be made. First, the way of return, according to Tauler’s account, involves great heroism and suffering. The creaturely side of man must be crucified. Self-mortification is a sign of burning love of God, and eventually the friend of God may acquire a real desire for, rather than an aversion to, suffering. In this emphasis on suffering, Tauler was strongly Christocentric in his preaching. But second, the fall of man has so tainted the human being that the divine light, which illuminates the contemplative and brings about the return to God, is something that man cannot achieve on his own. It is the gift of divine grace. Thus, the culmination of the mystic’s quest is not a personal achievement of the mystic, but an enjoyment granted from beyond.

The importance of the need for grace gave Tauler’s mysticism a firmly orthodox character. Nevertheless, he maintained that the operation of divine grace requires a right attitude on the part of men. Tauler speaks of God as a fisherman who lets down a baited hook into the ocean. Those fish who are not disposed toward the bait will not be hooked. This simile had its basis in Tauler’s account of human psychology.

According to his psychology, three aspects of the soul can be distinguished. At the deepest level is the Ground of the soul—otherwise referred to as the Spark, the Apex (*Punkt*), and God in the soul—a concept deriving from Eckhart’s teaching. However, Tauler is eager to assert that the Ground is God-given and is not an intrinsic, natural property of the individual. At another level, the soul possesses intellect, sense faculties, and will. Third, there is

what Tauler refers to as the heart (*das Gemüt*). The attitude of the individual toward the divine Being is determined by whether his heart is turned toward the Ground or away from it. If the former, God will descend, draw the spirit up to himself, and unite it with him. Man's choice is therefore essentially a choice of disposition. Once this choice has been made, God through his grace will conform the human will to his own. Thus, the end of the contemplative life is a state in which the mystic is, so to speak, "taken over" by God, so that all his actions express God's purposes rather than his own.

## TAYLOR, ALFRED EDWARD (1869–1945)

Alfred Edward Taylor, the British philosopher, was born at Oundle, Northamptonshire, and educated at New College, Oxford. His teaching experience was unusually varied: He was a fellow of Merton College, Oxford, 1891–1898; lecturer at Owens College, Manchester, 1898–1903; professor of logic and metaphysics at McGill University, Montreal, 1903–1908; professor of moral philosophy at St. Andrews University, 1908–1924; and professor of moral philosophy at Edinburgh, 1924–1941. His interests were also varied; not only was he an authority on Greek philosophy but he also made extensive contributions to current thinking on ethics, metaphysics, and the philosophy of religion. Taylor's thought was within the tradition of British neo-Hegelianism, but as his philosophy developed, other influences came in also, though he

remained firmly attached to a theistic and spiritualist interpretation of reality.

In the field of Greek philosophy, Taylor is noted chiefly for his work on Plato. He gives a full-scale exposition of Plato's thought in *Plato: The Man and His Work* (London, 1926) and a detailed study of Plato's cosmology in *A Commentary on Plato's Timaeus* (Oxford, 1928). Even in these works Taylor's own philosophical interests assert themselves, notably in his attempt to minimize alleged differences between the Platonic and biblical ways of understanding creation and in his contention that the Demiurge of Plato is a creator in the full sense of the word.

Taylor's philosophy found early expression in *The Problem of Conduct* (London, 1901) and in *Elements of Metaphysics* (London, 1903). At this stage he was influenced primarily by F. H. Bradley and English idealism. Later, Platonism, Thomism, and even Bergsonism became important additional influences on his mature thought as expressed in *The Faith of a Moralists* (London, 1930), a work based on his Gifford Lectures of 1926–1928.

Here Taylor claims that if we take moral experience seriously, we must recognize that it points beyond itself to, and is completed in, religion and that we are thus led to theism. Moral experience does deserve to be taken seriously, for facts and values are given together and never occur in separation in our concrete experience of the world. A naturalistic philosophy that allows reality to fact but denies it to value is guilty of a false abstraction. This argument about the concreteness of experience is a necessary prolegomenon to Taylor's position as a whole, for if the values of the moral life were divorced from the facts of the world, then no argument from moral experience to the nature of reality could succeed.

Taylor's attempt to move from the facts of moral experience to a religious metaphysics turns on two main considerations. The first concerns the nature of the good at which the moral life aims. Is it a temporal good or is it an eternal good? Taylor contends that even to be able to ask this question and to be aware of the temporal dimension of our existence is to have begun to transcend the form of temporality. Further reflection shows that no merely temporal goods can satisfy the demands of man's nature. Such goods are defective in various ways; for instance, they can be attained only successively and cannot be enjoyed simultaneously. One might answer, of course, that this merely shows that human aspirations are doomed to frustration, but Taylor rejects this and claims that the facts of moral striving point to an eternal good.

The second consideration concerns the question of how such an eternal good is to be attained. Can man of himself attain to an eternal good? Taylor answers in the negative, for he sees sin and guilt as inhibiting the moral life and preventing man from reaching his goal. But again he does not accept this frustration as final. Man's unavailing endeavors to reach toward the eternal good are met by what Taylor calls the initiative of the eternal. This is the divine grace that reaches down to man and enables his moral fulfillment. Thus, the moral life finds its completion in religion; if we deny this, we are bound to say that the moral life is self-stultifying. To take its demands seriously is to believe that it makes sense, and according to Taylor, it makes sense only in the light of a theistic worldview.

The individual destined for an eternal good and enabled by divine grace to move toward that good is also assured of immortality. Hence, from consideration of the implications of the moral life alone we arrive at a kind of minimal theology, so to speak, of God, grace, and immortality. But Taylor, who was himself a devout churchman of the Anglican communion, asks whether this minimal theology does not, like morality, point beyond itself for completion. The concreteness that characterizes Taylor's starting point is apparent again in his conclusions, as he argues that a bare philosophical theism needs to be embodied in an actual historical religion. Although the philosopher does not appeal to revelation, his analysis can, Taylor believed, bring us to the point at which we see the need for a concrete revelation to complete the bare schema of philosophical theology. Philosophy makes it reasonable to expect that there would be such a revelation, and Taylor thinks that Christian revelation especially fulfills this expectation. He continued to wrestle with the problems of religion, which provide the themes for two of his last books, *The Christian Hope of Immortality* (London, 1938) and *Does God Exist?* (London, 1943).

## TEILHARD DE CHARDIN, PIERRE

(1881–1955)

Pierre Teilhard de Chardin, the paleoanthropologist and Roman Catholic priest who advocated a doctrine of cosmic evolution, was born in Sarcenat, France. At the age of eighteen he entered the Jesuit order, and he remained a faithful member of it for the rest of his life. By the time he was ordained, his interest in science and the reading of Henri Bergson resulted in his becoming a fervent evolutionist. Association with the Bergsonian scholar Édouard Le Roy also deeply influenced his thought. It became one of Teilhard's aims to show that evolutionism does not entail a rejection of Christianity. He likewise sought to convince the church that it can and should accept the implications of the revolution begun by Charles Darwin, but he met with uniform opposition from ecclesiastical superiors.

In 1926 he was expelled from the Catholic Institute in Paris, at which he had taught after returning from service in World War I. Until 1946 he was "exiled" in China, where he participated in paleontological researches that led to the discovery of Beijing man. He also completed the manuscript of his major work, *Le phénomène humain* (*The Phenomenon of Man*); but despite repeated applications to Rome he was refused permission to publish it. After his death the appearance of the work, along with his other essays, gave rise to controversies both inside and outside the church.

The evolutionism that Teilhard advocated is all-embracing and characterizes much more than living things. Teilhard contended that long before living things appeared on Earth, the basic stuff of the cosmos was undergoing irreversible changes in the direction of greater complexity of organization. Hence, nonliving nature is profoundly historical. It is not a system of stable elements in a closed equilibrium. On the contrary, it conforms at all stages to a "law of complexification," comparable in importance to the law of gravity and illustrated by the vast array of organic forms that have appeared in evolutionary history. The most recent of these forms is man.

When viewed "from without" by the physical sciences, man is a material system in the midst of other material systems. But each individual man experiences himself "from within" as a conscious being. Consciousness is thus directly identifiable as "spiritual energy." Teilhard maintained that *all* constituents of the cosmos, from elementary particles to human beings, have "a conscious

inner face that everywhere duplicates the material external face." Since this is so, the physical evolution of the cosmic stuff will at the same time be an evolution of consciousness. The more highly integrated a material system, the more developed its psychical interior will be. Thus, in the human brain an intense concentration, or "involution," of cells has led to the emergence of self-conscious thought, the most advanced stage reached by evolution thus far.

But greater developments are in store from the evolutionary convergence of disparate cultures and forms of consciousness. Man is now a single, interbreeding species expanding on the finite, spherical surface of the planet and still showing signs of biological immaturity. Furthermore, his capacity for self-conscious thought and the production of cultures has added a new "layer" to Earth's surface, which Teilhard calls the "noosphere," distinct from, yet superimposed on, the biosphere. The noosphere, or "thinking layer," forms the unique environment of man, marking him off from all other animals. The evolutionary convergence that it makes possible will be manifested externally in the unification of all human cultures into a single world culture. Paralleling this, a movement toward psychical concentration will occur, so that the noosphere will become involuted in a Hyperpersonal Consciousness "at a point which we might call *Omega*." Here evolution will reach the terminal phase of convergent integration.

Teilhard's concept of Point Omega is obscure, like other aspects of his evolutionism, because it is essentially the expression of a mystical vision. Omega is not identical with God but, rather, is God insofar as he determines the direction and goal of cosmic history. Hence, the evolutionary process is orthogenetic, although neither vitalistic nor wholly devoid of chance events. The integration of all personal consciousnesses at Omega will be achieved, Teilhard urged, through love, which forms *le milieu divin*, the spirit of Christ at work in nature.

Teilhard's doctrine tends to become pantheistic in certain of its formulations. On the whole, it is difficult to reconcile Teilhard's views either with orthodox Christian teaching or with a scientific theory of evolution. Yet the prose poetry of *The Phenomenon of Man* has stirred the imagination of theologians, philosophers, and scientists, even when it has not won their assent.

## TELEOLOGICAL ARGUMENT FOR THE EXISTENCE OF GOD

The “Teleological Argument for the existence of God” is a member of the classic triad of arguments, which is completed by the Ontological Argument and the Cosmological Argument. Stated most succinctly, it runs:

The world exhibits teleological order (design, adaptation).

Therefore, it was produced by an intelligent designer.

To understand this argument, we must first understand what teleological order is.

### TELEOLOGICAL ORDER

Generally speaking, to say that a group of elements is ordered in a certain way is to say that they are interrelated so as to form a definite pattern, but the notion of a definite pattern is vague. Any set of elements is interrelated in one way rather than another, and any complex of interrelations might be construed by someone as a definite pattern. Certain patterns are of special interest for one reason or another, and when one of these is exhibited, the complex would ordinarily be said to be ordered. Thus, when the elements form a pattern in whose perception we take intrinsic delight, we can speak of aesthetic order. When there are discernible regularities in the way, certain elements occur in spatiotemporal proximity, we can speak of causal order. The distinctive thing about teleological (Greek, *telos*, “end” or “goal”) order is that it introduces the notion of processes and structures being fitted to bring about a certain result.

The usual illustrations of teleological order are from living organisms. It is a common observation that the anatomical structures and instinctive activities of animals are often nicely suited to the fulfillment of their needs. For example, the ears of pursuing, carnivorous animals, like the dog and the wolf, face forward so as to focus sounds from their quarry, while the ears of pursued, herbivorous animals, like the rabbit and the deer, face backward so as to focus sounds from their pursuers.

Examples of instinctive behavior are even more striking. The burying beetle deposits its eggs on the carcass of a small animal and then covers the whole “melange” with dirt to protect it until the young hatch out and find an ample supply of (hardly fresh) meat at hand.

If we are going to distinguish teleological order from causal order, we shall have to make explicit the tacit assumption that the result the structure or process in question is fitted to bring about is of value. Otherwise, *any* cause-effect relationship would be a case of teleological order. It is just as true to say that wind is fitted to produce the result of moving loose dirt into the air as it is to say that the mechanism of the eye is fitted to produce sight. The latter would be counted as an example of “design,” whereas the former would not, because we regard sight as something worth having, whereas the movement of dirt through the air is not generally of any value. This has the important implication that insofar as it is impossible to give an objective criterion of value, it will not be an objective matter of fact that teleological order is or is not exhibited in a given state of affairs.

It is important to note that the term *design*, as used in this argument, does not by definition imply a designer. If it did, there could be no argument from design to the existence of God; we would have to know that the phenomena in question were the work of a designer before we could call them cases of design. We must define *design* in such a way as to leave open the question of its source. We have design in the required sense when things are so ordered that they tend to perform a valuable function. We might put this by saying that things are ordered as they would be if some conscious being had designed them, but in saying this we are not committing ourselves to the proposition that a mind has designed them. The equivalent terms *adaptation* and *teleological order* are not so liable to mislead in this way.

Arguments for the existence of God have been based on kinds of order other than the teleological. Exhortations to move from a consideration of the starry heavens to belief in God constitute an appeal to aesthetic order. It is sometimes claimed that we must postulate an intelligent creator to explain the regularity with which the solar system operates. Here it is causal order that is involved. Arguments like these are often not clearly distinguished from those based on teleological order, to which we shall confine our attention.

## ARGUMENTS FROM PARTICULAR CASES OF DESIGN

The simplest form of the argument is that in which we begin with particular cases of design and argue that they can be adequately explained only by supposing that they were produced by an intelligent being. Thus William Paley, an eighteenth-century philosopher, in a classic formulation of the argument concentrated on the human eye as a case of design, stressing the ways in which various parts of the eye cooperate in a complex way to produce sight. He argued that we can explain this adaptation of means to end only if we postulate a supernatural designer. This is the heart of the teleological argument—the claim that adaptation can be explained only in terms of a designer. It always rests, more or less explicitly, on an analogy with human artifacts. Thus, Paley compared the eye to a watch and argued as follows: If one were to find a watch on a desert island, one would be justified in supposing that it was produced by an intelligent being. By the same token (the adjustment of means to ends) one is entitled, upon examination of the human eye, to conclude that it was produced by an intelligent being.

If it is asked why we should take artifacts as our model, the answer would seem to be this. Artifacts are certainly cases of design. In a watch, for example, the structure is well suited to the performance of a valuable function: showing the time. With artifacts, unlike natural examples of design, we have some insight into what is responsible for the adjustment of means to end. We can understand it because we can see how this adjustment springs from the creative activity of the maker, guided by his deliberate intention to make the object capable of performing this function. Hence, in natural cases of adaptation where the source of the adaptiveness is not obvious, we have no recourse but to employ the only way we know of rendering such phenomena intelligible—supposing them to stem from conscious planning. Since we do not observe any planner at work, we must postulate an invisible planner behind the scenes.

**CRITICISMS.** The comparison to artifacts was attacked by David Hume in his *Dialogues concerning Natural Religion*, in which he suggested that the production of artifacts by human planning is no more inherently intelligible than the production of organisms by biological generation. Why, asked Hume, should we take the former rather than the latter as the model for the creation of the world? Even if we admit that the world exhibits design, why are we not as justified in supposing that the world was generated from the sexual union of two parent

worlds as in supposing that it was created by a mind in accordance with a plan? In answer to Hume it might be argued that creation gives a more satisfactory and a more complete explanation than generation because the generation consists of a reproduction of the same kind of thing and hence introduces another entity that raises exactly the same kind of question. If we are initially puzzled as to why a rabbit has organs that are so well adapted to the satisfaction of its needs, it does not help to be told that it is because the rabbit sprang from other rabbits with just the same adaptive features. If, on the other hand, we could see that the rabbit had been deliberately constructed in this way so that its needs would be satisfied, we would be making progress. To this Hume would reply that the mind of the designer also requires explanation. Why should the designer have a mind that is so well fitted for designing? Thus, this explanation also leaves problems dangling, but at least it is not just the same problem. If we were to reject every explanation that raised fresh problems, we would have to reject all of science.

**DARWINIAN THEORY OF EVOLUTION.** The development of the Darwinian theory of evolution opened up the possibility of a more serious alternative to the theistic explanation. According to this theory, the organic structures of today developed from much simpler organisms by purely natural processes. In this theory (as developed since Charles Darwin) two factors are considered to play the major role: mutations and overpopulation. (A mutation occurs when an offspring differs from its parents in such a way that it will pass this difference along to its offspring, and they will pass it along, and so on. It is a relatively permanent genetic change.)

The way these factors are thought to work can be illustrated by taking one of the cases of adaptation cited above. If we go back far enough in the ancestry of the dog, we will discover ancestors that did not have ears facing forward. Now let us suppose that a mutation occurred that consisted of an ear turned somewhat more forward than had been normal. Granting that organisms tend to reproduce in greater numbers than the environment can support, and hence that there is considerable competition for the available food supply, it follows that any feature of a given organism that gives it any advantage over its fellows in getting food or in avoiding becoming prey will make it more likely to survive and pass along its peculiarity to its offspring. Thus, within a number of generations we can expect the front-turned-ear proto-dogs to replace the others and be left in sole possession of the field. Since mutations do occur from time to time, and since some of them are favorable, we have a set of purely natural factors

by whose operation the organic world can be continuously transformed in the direction of greater and greater adaptation.

The Darwinian theory aspires to do no more than explain how more complex organisms develop from less complex organisms. It has nothing to say about the origins of the simplest organisms. However, no matter how simple the organism, its structure must be fitted to the satisfaction of its needs, or it will not survive. Therefore, Darwinian theory is not a complete explanation of the existence of teleological order in the world; it merely tells us how some cases develop from other cases. Hence, it alone is not an alternative to the theistic explanation, but in principle there is no reason why it should not be supplemented by a biochemical theory of the origin of life from lifeless matter. No such theory has yet been completely established, but progress is being made. When and if this is done, there will be an explanation of design in living organisms for which there is empirical support, and it can no longer be claimed that theism represents the only real explanation of such facts.

**WHAT FOLLOWS FROM THE ARGUMENT.** The other major deficiency in Paley's form of the argument is that, even if valid, it does not go very far toward proving the existence of a theistic God. The most we are warranted in concluding is that each case of design in the natural world is due to the activity of an intelligent designer. Nothing is done to show that all cases of design are due to one and the same designer; the argument is quite compatible with polytheism or polydaemonism, in which we would have one supernatural designer for flies, another for fish, and so on. Even if there is one, and only one, designer, nothing is done to show that this being is predominantly good rather than evil; neither is anything done to show that he is infinitely powerful or wise, rather than limited in these qualities. Of course the theist might seek to supplement this argument by others, but by itself it will not bear the weight.

#### ARGUMENT FROM THE UNIVERSE AS A WHOLE

No argument that, like the Teleological Argument, is designed to show that facts in nature require a certain explanation, can establish the existence of a deity absolutely unlimited in power, knowledge, or any other respect. By such reasoning we can infer no more in the cause than is required to produce the effect. This deficiency is irremediable. However, there is a simple way of eliminating competing scientific claims—by starting

from the universe as a whole rather than from individual instances of design within the universe. There are different ways of doing this. We might think of the whole universe as instrumental to some supreme goal, or we might think of the universe as a unified system of mutually adjusted and mutually supporting adaptive structures.

Taking the whole universe as instrumental to some supreme goal would give us the strongest argument, for here the analogy with consciously designed artifacts is strongest. An artifact like a house, ship, or watch is designed for the realization of goals outside its internal functioning; it is intended to be used for something. Therefore, if the analogy with artifacts is the main support for the notion that the universe was the result of conscious planning, that support would be firmest if grounds were presented for thinking that the universe as a whole was well fitted to be used for something. And if this something were of maximum value, we would then have a basis for attributing supreme goodness to the designer.

However, this alternative is rarely taken, largely because it is difficult to decide on a suitable candidate for, in Alfred, Lord Tennyson's words, the "far-off divine event, toward which the whole creation moves." The most common suggestions are the greater glory of God and the development of moral personality. But in regard to the first, no one can really understand just what it would mean for a God who is eternally perfect to receive greater glory, and in regard to the second, even if we can overcome doubts that moral development is worth the entire cosmic process, it would seem impossible ever to get adequate grounds for the proposition that everything that takes place throughout all space and time contributes to this development.

The second interpretation, that the universe is a unified system of mutually adjusted and mutually supporting adaptive structures—has been tried more often. So conceived, the argument will run as follows.

- (1) The world is a unified system of adaptations.
- (2) We can give an intelligible explanation of this fact only by supposing that the world was created by an intelligent being according to some plan.
- (3) Therefore, it is reasonable to suppose that the world was created by an intelligent being.

The famous formulation of the argument in Hume's *Dialogues* makes explicit the analogy on which, as we have seen, step two depends. Hume's formulation, which is substantially equivalent to the above, runs as follows.

- (1) The world is like a machine.

- (2) Machines are made by human beings, in accordance with plans.
- (3) Like effects have like causes.
- (4) Therefore, the world probably owes its existence to something like a human being, who operates in accordance with a plan.

TYPES OF ADAPTATION. If one is to think of the whole universe as a system of connected adaptations, he will consider kinds of adaptation other than that exemplified by the fitness of organisms to the conditions of life; this kind alone will not bear the whole weight. F. R. Tennant, who has developed the weightiest recent presentation of the teleological argument in his *Philosophical Theology*, discusses six kinds of adaptation:

- (1) The intelligibility of the world. The world and the human mind are so related that we can learn more and more without limit.
- (2) The adaptation of living organisms to their environments. This is the kind on which we have been concentrating.
- (3) The ways in which the inorganic world is conducive to the emergence and maintenance of life. Life is possible only because temperatures do not exceed certain limits, certain kinds of chemical processes go on, and so on.
- (4) The aesthetic value of nature. Nature is not only suited to penetration by the intellect; it is also constituted so as to awaken valuable aesthetic responses in man.
- (5) The ways in which the world ministers to the moral life of men. For example, through being forced to learn something about the uniformities in natural operations, men are forced to develop their intelligence, a prerequisite to moral development. And moral virtues are acquired in the course of having to cope with the hardships of one's natural environment.
- (6) The overall progressiveness of the evolutionary process.

Tennant admits that no one of these forms of adaptiveness is a sufficient ground for the theistic hypothesis, but he maintains that when we consider the ways in which they dovetail, we will see theism to be the most reasonable interpretation. Thus, the adjustment of lower organisms to the environment takes on added significance when it is seen as a stage in an evolutionary process culminating in man, which in turn is seen to be more

striking when we realize the ways in which nature makes possible the further development of the moral, intellectual, and aesthetic life of man.

When the argument takes this form, it is no longer subject to competition from scientific explanations of the same facts. If our basic datum is a certain configuration of the universe as a whole, science can, by the nature of the case, offer no explanation. Science tries to find regularities in the association of different parts, stages, or aspects within the physical universe. On questions as to why the universe as a whole exists, or exists in one form rather than another, it is silent. Ultimately this is because science is committed to the consideration of questions that can be investigated empirically. One can use observation to determine whether two conditions within the universe are regularly associated (increase of temperature and boiling), but there is no way to observe connections between the physical universe as a whole and something outside it. Therefore, there is no scientific alternative to the theistic answer to the question "Why is the universe a unified system of adaptations?"

ALTERNATIVE EXPLANATIONS OF ADAPTATION. What alternatives to the theistic explanation of adaptation are there? In the literature on the subject one often encounters the suggestion that we have this kind of universe by chance. If we dismiss the animistic notion of chance as a mysterious agent, the suggestion that we have this kind of universe by chance boils down to a refusal to take the question seriously. It may be said that the fact that the universe as a whole exhibits teleological order is not the sort of thing that requires explanation. It is difficult to see what justification could be given for this statement other than an appeal to the principle that sense observation is the only source of knowledge and/or meaning.

One cannot perceive by the senses any relation between the physical universe as a whole, or any feature thereof, and something outside it on which it depends. Hence, an extreme form of empiricism would brand the question posed by the Teleological Argument as fruitless or even meaningless. If, on the other hand, the question is taken seriously, any answer will be as metaphysical as the theistic answer, for it is really a question as to what characteristics are to be attributed to the cause (or causes) of the universe. Do the relevant facts about the world most strongly support the theistic position that the cause is a perfectly good personal being who created the universe in the carrying out of a good purpose? Or is there some other view that is equally, or more strongly, supported by

the evidence? The Manichaeans held that the physical universe was the work of a malevolent deity and that man must separate himself from the body in order to escape this diabolical power and come into contact with the purely spiritual benevolent deity. It has also been held in many religions that the universe is the joint product of two or more deities who differ markedly in their characteristics. In Zoroastrianism it is held that the world is the battleground of a good deity and an evil deity, the actual state of affairs bearing traces of both. Indian religious philosophy typically regards the universe as resulting from a nonpurposive manifestation of, or emanation from, an absolute unity that is not personal in any strict sense.

**EXTENT OF ADAPTIVENESS IN THE UNIVERSE.** To evaluate the Teleological Argument in the light of competing explanations, we must ask whether the extent of adaptiveness in the universe is sufficient to warrant the theistic conclusion. As the problem is formulated in Hume's *Dialogues*, is there a close enough analogy between the universe and a machine? This requires judging the relative proportion of adaptive features to non-adaptive or maladaptive features. In addition to taking account of Tennant's enumeration of the ways in which the shape of things is instrumental to the realization of valuable ends, we must look at the other side of the picture and try to form an adequate impression of (1) the ways in which the shape of things is neutral, providing neither for good nor for evil, and (2) the ways in which the shape of things frustrates the search for value.

As for (1), as far as we can see, the distribution of matter and the variety of chemical elements in the world, to take two examples at random, could have been very different from what they are without reducing the chances of sentient beings leading satisfying lives.

As for (2), we begin to trespass onto the problem of evil, except that here we are interested in suffering and frustration not as possible disproofs of theism but as affecting the cogency of the Teleological Argument for the existence of God. There are many ways in which the organization of the world makes for disvalue rather than value in the lives of men and other sentient creatures. One need only mention the numerous sources of disease, the incidence of malformed offspring, the difficulty of attaining optimum conditions for the development of healthy personalities, and the importance of antisocial tendencies in human nature. It is quite possible, of course, that all the things that seem to be unfortunate features of the world as it exists are necessary elements in the

best of all possible worlds. If we already believe that the world is the creation of a perfect deity, that carries with it the belief that these apparent evils are necessary even though we cannot see how they are. However, if we are trying to establish the existence of a perfect deity, we have to proceed on the basis of what we can see. And since, so far as we can see, the world would be better if the features listed above were altered, we cannot argue that the state of adaptiveness in the world requires explanation in terms of a perfectly good, omnipotent deity. But we have already seen, on other grounds, that the Teleological Argument cannot be used to establish the existence of a being unlimited in any respect.

The serious problem that remains is whether the total picture of adaptation and maladaptation, so far as we have it, gives sufficient support to the hypothesis that the world represents the at least partial implementation of a plan that is at least predominantly good. To resolve this problem we must weigh opposite factors and arrive at a final judgment of their relative importance. Unfortunately there are no real guidelines for this task. No one knows how much adaptation, relative to maladaptation, would warrant such a conclusion; and even if he did, he would not know what units to employ to perform the measurement. What is to count as one unit of adaptation? Do we count each individual separately, or is each species one unit? How can we compare the value of human knowledge with the disvalue of disease? It would seem that on this issue different positions will continue to be taken on the basis of factors outside the evidence itself.

In the Middle Ages there was general acceptance of an Aristotelian physics, according to which even purely physical processes were explained in terms of the natural tendency of a body toward an end. (Fire naturally tends to come to rest at the periphery of the universe.) Given this background, it was argued that the consideration of any natural processes led to the postulation of a designer. The argument in this form is found in Thomas Aquinas, *Summa Theologiae*, Part I, Question 2, Article 3. Contemporary Thomistic statements try to adjust this line of thought to modern physics. See G. H. Joyce, *The Principles of Natural Theology*

(New York: AMS Press, 1972); Réginald Garrigou-Lagrange, *God, His Existence and His Nature*, 2 vols. (St. Louis: Herder, 1934–1936); and D. J. B. Hawkins, *The Essentials of Theism* (New York: Sheed and Ward, 1949).

The influential presentation by the eighteenth-century thinker William Paley is to be found in his *Natural Theology: Or, Evidences of the Existence and Attributes of the Deity, Collected from the Appearances of Nature* (Indianapolis: Bobbs-Merrill, 1963). Important more recent formulations include F. R. Tennant, *Philosophical Theology*, 2 vols. (New York, 1928–1930), Vol. II, Ch. 4, and A. E. Taylor, *Does God Exist?* (New York: Macmillan, 1947).

Acute criticisms of the argument are to be found in David Hume, *Dialogues concerning Natural Religion*; Immanuel Kant, *Critique of Pure Reason*, Book II. Ch. 3; C. D. Broad, *Religion, Philosophy, and Psychical Research* (New York: Harcourt Brace, 1953); John Laird, *Theism and Cosmology* (New York, 1942); and J. J. C. Smart, “The Existence of God,” in *New Essays in Philosophical Theology*, edited by Antony Flew and Alasdair MacIntyre (London: SCM Press, 1955).

## TELEOLOGICAL ARGUMENT FOR THE EXISTENCE OF GOD [ADDENDUM]

The argument from the causal order of the universe to the existence of an intelligent designer has experienced a revival in the work of Richard Swinburne and others (see also Collins 2002). Swinburne’s cumulative case for God’s existence is an argument to the best explanation, citing various pieces of data or evidence that are (a) relatively improbable on an assumption of naturalism but (b) relatively probable if theism is true (Swinburne 1979). One such datum is that the universe conforms to simple, mathematically formulable scientific laws—that is it exhibits *causal order*. (This differs from *spatial order*, an arrangement of parts that serves the purpose of a greater whole, as in an organism’s suitability for its environment.) While theories of evolution partially undermine the argument from spatial order, they leave the following argument from causal order untouched:

(1) The universe conforms to formulas. (“The orderliness of nature is a matter of the vast uniformity in powers and liabilities of bodies throughout endless time and space, and also in the paucity of kinds of components of bodies” [Swinburne 1979, p. 140].)

(2) There are only two kinds of explanation for phenomena: scientific explanation and personal explanation (Swinburne 1979, pp. 140–141).

(3) No scientific explanation of (1) is possible. (The data in (1) concern the most basic or ultimate constituents of material bodies and the most fundamental physical laws; scientific explanation reaches no further.)

(4) Thus, either there is a personal explanation for (1) or it has no explanation (i.e., it occurs by chance).

(5) That there is a personal explanation for (1) is more probable than that it has no explanation.

(6) Hence, (1) confirms the hypothesis of a personal cause of the universe.

Naturalism offers no explanation for the causal order and fundamental intelligibility of the universe. Indeed, this type of order is surprising if the universe did not result from purpose or design. On the other hand, a personal being has reasons to produce causal order in the universe, due to aesthetic considerations—for example, order is more beautiful than chaos—and other value considerations (a universe with intelligent beings who can understand their world is preferable to a universe with no intelligent beings or with rational creatures whose attempts to “read the book of Nature” cannot succeed). Causal order combines with additional data that exhibit properties (a) and (b) above to support the further conclusion that *theism is more probable than naturalism*, even if the probability of theism is not greater than 0.5 or fifty percent.

Critics point to the difficulty of assigning a priori objective probabilities to large-scale metaphysical theories. Perhaps this can be blunted by appealing to epistemic probability—given what is known minus the assumption of intelligent design, it does not seem likely that the universe would exhibit such precise and ubiquitous causal order. Further scrutiny falls on the argument’s conclusion, which posits only a personal cause, not a being with every perfection. Swinburne claims that considerations of simplicity lead to a positing of only one person—a person who has infinite knowledge and power, because any finite amount would require further explanation as to why the person has exactly this degree of knowledge or power.

Finally, the cumulative case argument draws upon further features of the universe that similarly confirm theism and disconfirm naturalism. Such features include the existence of a material universe, consciousness and

moral awareness, and evidence of providence, miracles, and religious experiences. (Note that in chapters ten and eleven, Swinburne argues that evil and suffering do not disconfirm theism. The claim that they do, he writes, “stems from a failure to appreciate the deepest needs of men ... and the strength of the logical constraints on the kinds of world which God can make” (1979, p. 224).

## TELEOLOGICAL ETHICS

Theories about what is right and wrong are standardly divided into two kinds: those that are teleological and those that are not. Teleological theories are ones that first identify what is good in states of affairs and then characterize right acts entirely in terms of that good. The paradigm case of a teleological theory is therefore an impartial consequentialist theory, such as hedonistic utilitarianism; defended by John Stuart Mill (1969) and Henry Sidgwick (1907), it says the right act is always the one whose consequences contain the greatest total pleasure possible. But the category of teleological ethics is normally thought to be broader than that of consequentialism, so there can be teleological theories that are not consequentialist. This can be so, however, in several different ways.

Hedonistic utilitarianism has three principal features: First, it identifies good states of affairs independently of claims about the right, so even pleasure in a wrong act, such as a sadist’s pleasure in torturing, is intrinsically good; and these goods are always consequences in the ordinary sense of acts that produce them, that is, separate states that follow after the acts. Second, in

evaluating consequences, utilitarianism weighs all people’s pleasures impartially, so for any person, a stranger’s pleasure counts just as much as his child’s or even his own. Finally, utilitarianism characterizes right acts in terms only of promoting the good and, more specifically, of maximizing it, so the right act is always the one that produces the most good possible.

Although teleological theories must identify the good independently of the right, they can recognize many goods other than pleasure. Some possible goods, such as knowledge and artistic creativity, are, like pleasure, states of individual persons. Others involve patterns of distribution across persons, such as that they enjoy equal pleasures or, on a different view, pleasures proportioned to their merit. Yet others, such as the existence of beauty or of complex ecosystems, are independent of persons. (Goods of all three types are affirmed in the *ideal consequentialisms* of G. E. Moore (1903) and Hastings Rashdall (1907). These initial goods are all, like pleasure, consequences in the ordinary sense of acts that produce them, but other possible goods are not. Imagine that a theory values difficult activities because they are difficult. Then engaging in a difficult activity, such as playing chess, will promote value not just by producing it as an external consequence but also by instantiating it, or by having difficulty as an intrinsic feature. The same holds if a theory values action from a virtuous motive, such as a benevolent desire for another’s pleasure. Then a benevolent act will contribute to value in part through an intrinsic feature—its being benevolent. This is a first way in which a theory can be teleological but not consequentialist: If consequentialism can value only the external consequences of acts, as some definitions assume, then a theory fits the broader but not the narrower concept if it values some intrinsic properties of acts. It can still evaluate acts by the total state of the world that will obtain if they are performed, but some relevant features of that state are now internal to them.

A teleological theory can also abandon the second feature of utilitarianism—its impartiality about the good. Thus, a teleological theory can be egoistic, telling individual agents to promote only their own pleasure, knowledge, or other goods, or, conversely, can say that they should promote only others’ good and not their own. It can also embrace what C. D. Broad (1971) called “self-referential altruism,” which says that while people should give some weight to everyone’s good, they should care more about that of those who are close to them, such as their family and friends. These theories can still identify the good independently of the right and say right acts

maximize the good, but if it is essential to consequentialism to be impartial, as again some assume, they are teleological but not consequentialist.

These first two possibilities come together in a group of theories often categorized as teleological but not consequentialist—the eudaimonist theories of Aristotle and other ancient philosophers. They derive all moral requirements from a final end or good they call a person's *eudaimonia*, translated either as happiness or as flourishing. They are therefore formally egoistic since each person's final end is just that person's own eudaimonia. But they hold that a principal component of eudaimonia is moral virtue, which will express itself in virtuous acts such as helping others from benevolent motives. Eudaimonist theories can in principle yield the same substantive duties as utilitarianism, telling each person to maximize pleasure impartially. But their explanatory claims do not use the causal relation central to utilitarianism, saying, instead, that acts of helping others are required because they can instantiate moral virtue, which in turn instantiates part of eudaimonia.

Finally, a theory can abandon the third, maximizing feature of utilitarianism. This feature is extremely demanding since it implies that any time we do not do everything we can to benefit other people, which includes any time we relax or amuse ourselves, we act wrongly. One possibility, proposed by Michael Slote (1985), is to replace the maximizing principle with a *satisficing* one that says an act is right so long as its consequences are good enough, either in absolute terms or because they make some reasonable proportion of the greatest improvement the agent can make in the circumstances. Many writers see satisficing as consistent with consequentialism, but if it is essential to the latter to be maximizing, as some definitions imply, a satisficing principle again generates a nonconsequentialist teleology. A related possibility, proposed by Samuel Scheffler (1982), is to retain a maximizing principle but simultaneously grant agents an option to give somewhat more weight to their own good. Then, if they prefer a smaller benefit for themselves to a somewhat greater one for other people, they do not act wrongly, though if they preferred the greater good, they also would not act wrongly. The resulting view is probably not consequentialist since it does not contain only principles about promoting the good; but it arguably is teleological since its principles all do concern the good in some way.

More radical departures from maximizing may be possible. Teleological theories are commonly contrasted with deontological ones, which say an act can be wrong

even if it has the best consequences. Thus, a deontological theory can say it is wrong to kill an innocent person even if that will prevent five other innocent people from being killed because doing so violates a moral constraint against killing; it can likewise contain constraints against lying, promise-breaking, and so on. A deontological theory is clearly nonconsequentialist, and it is also nonteleological if its constraints are independent of the good, say, if it contains independent, underived prohibitions of killing and lying. But some deontologists, who call their view Thomist, do connect constraints to the good. They start by identifying certain states of affairs as intrinsically good, say, pleasure, knowledge, and freedom. But they then claim that alongside a duty to promote these goods is a separate and stronger duty to respect them, which means not choosing against or intentionally destroying them. This second duty grounds constraints against killing, which destroys good human life; lying, which aims at the opposite of knowledge; and more.

But Thomists such as John Finnis (1980) call their view teleological since it is centered on goods that can and should be promoted. The same could not be said of Kantian deontologies, which ground constraints in respect for a value that is located in persons rather than in states of affairs and is not to be promoted since there is no duty to increase the number of valuable persons. But Thomist deontology shares enough assumptions with paradigmatically teleological theories that it arguably, if not uncontroversially, belongs in the category. (If so, deontological ethics contrasts with consequentialism but not necessarily with teleology.)

Teleological moral theories relate all moral duties to the goodness of states of affairs. They will therefore be rejected by those who think claims about intrinsic goodness are unintelligible or who hold, with Kant (1998), that the fundamental value is that of persons. These are minority views, however. Most philosophers accept as underived such claims as that pain is evil and knowledge good, so there is at least some moral duty to prevent the one and promote the other. The key issue about teleological ethics, then, is whether *all* duties can be related to the good. In addressing this issue, the many forms teleological ethics can take should be remembered. It can value not just pleasure but also, say, equal distribution and virtuous action; it can allow or even require agents to give more weight to some people's good; and it need not demand maximization of the good. But the question remains whether teleological ethics can recognize moral constraints, which can make it wrong to do what has the best effects. Strict consequentialists reject such con-

straints or claim that belief in them is justified only insofar as it has good consequences. But those who find constraints independently compelling will ask whether teleological ethics can accommodate constraints, as Thomist theories try to do, and, if so, whether it gives them the best explanation. If the answer to both questions is yes, then the teleological approach to ethics can capture a wide range of moral phenomena. If not, it will be unacceptable to those who think it sometimes wrong to do what will promote the most good.

## TELEOLOGY

The term *teleology* locates a series of connected philosophical questions. If we grant that there is such a thing as purposive or goal-directed activity (as we must, since, for example, a political campaign aimed at victory represents a clear, uncontroversial case), we may ask the fol-

lowing questions: (1) By what criteria do we identify purposive activity? (2) What is the nature of the systems that exhibit purposive activity? (3) Does the nature of purposive activity require us to employ special concepts or special patterns of description and explanation that are not needed in an account of nonpurposive activity? And if we grant that there are objects and processes which perform functions (again, as we must, since no one would deny, for instance, that the human kidney performs the function of excretion), we may ask: (4) By what criteria do we identify functions? (5) What is the nature of the systems that exhibit functional activity? (6) Does the description of functions require special concepts or special patterns of analysis?

These six questions have been formulated with the help of a distinction between purposive and functional activity. Although the distinction is not always drawn in discussions of teleology, it is desirable for a number of reasons. It seems, at least *prima facie*, that the criteria of functional activity are quite distinct from the criteria of purposive activity: urine excretion, for example, seems to be a function by virtue of its role in the economy of a living organism, whereas activity seems to be purposive in virtue of the manner in which it is controlled. Thus, it seems at least logically possible that a purposive activity could perform no function, and that a function could be performed without purposive activity. Moreover, in view of this fundamental conceptual difference between purpose and function, we should expect the analysis of purposive and functional activity to show differences in logical pattern. On the other hand, it also seems clear that there are close connections between function and purpose; thus the final question: (7) What is the relation between ascriptions of function and ascriptions of purpose?

### PURPOSE ACTIVITY

**CRITERIA.** A number of writers have proposed definitions of "goal-directed" or "purposive" action that leave open the question whether the action is intentional or in any way involves consciousness. R. B. Braithwaite suggests, as a behavioral criterion of goal-directed activity that either may or may not be goal-intended, "persistence toward the goal under varying conditions." This is a condensed version of very similar criteria offered by R. B. Perry, E. S. Russell, and A. Hofstadter. All presuppose that a goal may be identified and that both persistence and sensitivity to varying conditions may be located by reference to the goal. E. C. Tolman adds the requirement that purposive activity show "docility," that is, some improve-

ment in reaching the goal in the course of successive trials. But docility, however important it may be in the total picture of biological purposiveness, is surely not part of the criterion of purposiveness. Any abilities that are in fact learned could, in logical principle, be innate.

This criterion, in Braithwaite's form, is of course susceptible of considerable refinement; Braithwaite himself (in *Scientific Explanation*), for example, proposes a way of identifying variations in conditions as relevant variations for applying the criterion. Further possible refinements will be discussed in the next section.

The apparent circularity in the criterion—defining “goal-directed” in terms of a “goal”—is not serious. The location of persistence, sensitivity, and a goal may proceed together by a method of successive approximations. For example, a pattern of animal behavior may appear persistent and lead to a tentative identification of a goal, and the identification may be checked by looking for sensitivity to conditions or further evidence of persistence. A hypothesis about any one of the three—goal, persistence, sensitivity—can be confirmed by investigating either of the other two.

It seems clear that there are behavioral criteria for identifying purposive action, not only of human beings but also of other animals and of artifacts such as self-guided missiles. A pilot who watches a rocket approach in spite of his evasive maneuvers would rightly have no doubts about either the goal-directedness of the rocket's movements or the identity of its goal. No doubt the actual criteria of purposiveness that have been proposed suffer various shortcomings. In particular, they seem to lay down a necessary but not a sufficient condition. However, most philosophers would regard the program of seeking behavioral criteria as sound.

**NATURE OF SYSTEMS SHOWING PURPOSIVE ACTIVITY.** Is it possible for the philosopher, as distinct from the biologist, psychologist, or communications engineer, to say anything illuminating about the nature of the systems—men, mice, and missiles—that engage in purposive activity? He can at least examine more closely the behavioral criteria of purposiveness, in order to see whether there might be covert reference to the nature of the system in the criterias' actual application. A critic of the behavioral criteria might remark that a river is persistent in reaching the sea and is sensitive to the conditions necessary for reaching the sea—it detours all obstacles—but we would not call the flowing of a river purposive, nor would we call the sea or reaching the sea

its goal. In short, the critic might say, a river is not the sort of thing to which we ever ascribe purposiveness.

**Directive correlation.** A number of philosophers, including Braithwaite, Ernest Nagel, George Sommerhoff, and Morton Beckner, have proposed ways of avoiding the difficulty about rivers and the like. Although there are differences in their accounts, they all adopt the strategy of regarding an activity as purposive only when its goal-seeking character is the outcome of relatively independent but dovetailing processes. Sommerhoff, for example, defines “purposive behavior” with the help of a concept he terms “directive correlation.” Two variables, such as the position of a moving target and the direction in which an automatic target-tracking mechanism points, are said to be directionally correlated with respect to a goal state (in this case, the state in which the mechanism points at the target) whenever: (1) The two variables are independent in the sense that any value of one is compatible with any value of the other; (2) The actual value of both, at a given time, is at least in part causally determined by the prior value of a “coenetic” (steering) variable (in the example, the coenetic variable is the same as one of the directionally correlated variables, namely, the position of the moving target); and (3) the causal determination is such that the actual values of the directionally correlated variables are sufficient for the realization of the goal state. Sommerhoff then defines “purposive behavior” as directionally correlated behavior in which the coenetic variable is identical with one of the directionally correlated variables.

Stipulations (2) and (3) make the notion of two processes dovetailing so as to achieve a goal as precise as the notion of causal determination; and stipulation (1) specifies that the processes must be independent. The requirement of independence rules out such cases as the river, for the direction in which a river flows is not independent of the lay of the land.

Sommerhoff's analysis is not without difficulties (see Nagel and Beckner), but it is undoubtedly correct in general approach. A system *S* that could exhibit directive correlation would satisfy a number of prior conceptions about purposive behavior; for instance, that *S* would employ information about its environment, particularly about an aspect of the environment associated with the goal, and that the behavior of *S* would be dependent upon a specialized physical hookup, such as some sort of circuitry.

It is now possible to suggest a schema for constructing a criterion of purposive activity that includes both a necessary and a sufficient condition and that incorporates some reference both to the empirical character of

the activity and to the nature of the system that engages in it. Activity is purposive if and only if it exhibits sensitivity and persistence toward a goal as a result of directive correlation.

**NEED FOR SPECIAL CONCEPTS OR PATTERNS OF DESCRIPTION AND EXPLANATION.** Purposive activity, in the analyses of Braithwaite and Sommerhoff described above, does not involve a special kind of causality but only a special organization of ordinary causal processes. If these analyses are correct, both living organisms and artificial machines are capable of purposive activity. If, therefore, special concepts or patterns of description and explanation are not needed in the case of purposive machines, it would appear that they are equally unnecessary in the case of organisms. Many philosophers have drawn this conclusion, and it must be admitted that accounts like Braithwaite's and Sommerhoff's constitute powerful arguments in its support.

There is room for some doubt, however. Even if we grant that purposive activity can be defined in terms that are equally applicable to organic and inorganic systems, it does not follow that all purposive activity can be explained on the model of inanimate activity. The most serious doubt concerns those purposive activities that may be described as the acts of agents, such as acts deliberately undertaken for the sake of a consciously envisaged end. Suppose, for example, that some or all of these acts of agents are in principle unpredictable—a view accepted by some philosophers. Then, if they can be explained at all, their explanation is essentially post hoc. The pattern of such explanation is not yet properly understood; nevertheless, there is at least some doubt that it can dispense with the conception of following a rule. But these considerations raise questions that cannot be pursued here.

## FUNCTIONS

**CRITERIA.** When we assert truly—for example, that a function of the kidney is the excretion of urine—precisely what relations must hold between the kidney and excretion? It has been proposed, for example by Nagel, that such teleological terms as *purpose* and *function* can be eliminated in the following way: An expression such as “A function of the kidney is the excretion of urine” is translated into the nonteleological expression “The kidney is a necessary (or necessary and sufficient) condition of urine excretion.” In general we may interpret Nagel as proposing a translation schema—For “*F* is the function of *A*,” write “*A* is a necessary (or necessary and sufficient) condition of *F*”—that dispenses with teleological lan-

guage and that also provides part of a criterion (a necessary condition) for identifying functions.

At best, however, Nagel's schema must be modified, for the possession of kidneys is neither a necessary nor a sufficient condition of urine excretion. It is obviously not sufficient; but it is also not necessary, since urine can also be excreted by various artificial devices. (If it is objected that these devices are themselves a sort of kidney, then the statement that a kidney is necessary for excretion reduces to a tautology.) Moreover, the translation schema is much less plausible when applied to organic functions that are ordinarily accomplished in distinct ways. Temperature regulation, for example, is a function of man's body hair; but hair is not necessary for heat regulation, since the function may be performed by other physical and physiological mechanisms. When we ascribe a function to the kidney or to body hair, we seem to be saying no more than that these structures contribute to certain processes; we leave open the question whether they are necessary or sufficient for the processes. The relation “contributing to” may be defined without employing teleological language. Let *F* be a process, some or all of which takes place in system *S*; and let *A* be a part of, or a process in, *S*. Finally, let the terms “*S*-like,” “*F*-like,” and “*A*-like” refer, respectively, to all those entities that answer to the definition of the terms employed in specifying *S*, *F*, and *A*. (In the example “A function of the kidney in vertebrates is the excretion of urine,” all vertebrates are *S*-like, all cases of urine excretion are *F*-like, and all kidneys are *A*-like.) Then “*A* of *S* contributes to *F*” if and only if there exist *S*-like systems and states or environments of these *S*-like systems in which *F*-like processes occur and the possession of *A*-like parts or processes is necessary for the occurrence of *F*-like processes.

On this definition, we may say that in general a man's kidney contributes to the excretion of urine and that body hair contributes to heat regulation. And if we adopt the translation schema “For ‘*F* is the function of *A* in *S*,’ write ‘*A* contributes to *F* in *S*,’” we may say, even in the case of a man whose bad kidneys have been bypassed to an artificial kidney, that the function of his flesh-and-blood kidneys is still the excretion of urine; they merely fail to perform it.

**NATURE OF SYSTEMS SHOWING FUNCTIONAL ACTIVITY.** Nagel's translation schema and the above modification of it provide a way of translating a teleological statement  $T_1$  into a statement  $T_2$  that does not employ explicitly teleological terms. Therefore, the satisfaction of  $T_2$  by a given *A*, *F*, and *S* is a necessary condition of  $T_1$ 's

being a function of  $A$ . It is, however, not a sufficient condition; we may not in general translate  $T_2$  into  $T_1$ . We would not say, for example, that the function of the ground is to hold up the rocks even though, in our technical sense, the ground contributes to the holding up of rocks. It would seem that out of the whole set of “contributing” cases, only a very restricted subset could be regarded as functions.

How may this subset be specified? We ordinarily attribute functions to two sorts of systems, artifacts and living things. We may consider first a simple artifact such as a cooking pan. We ascribe a function to the whole pan: cooking. Moreover, we also ascribe functions to parts and properties of the pan insofar as they contribute to its usefulness in cooking. For example, it is natural to think of the handle as providing a grip, of the rivets as fastening on the handle, and so on. In short, whenever we are prepared to acknowledge a single function  $F$ , we are also prepared to acknowledge a hierarchy of functions, with  $F$  at the top and the functions at each lower level contributing to all those above them.

The assignment of functions to living organisms proceeds on the same principle. There are two organic processes that are regarded as fundamental, the maintenance of life and reproduction. Alternatively, these two processes may be thought of as contributing to a single process, the maintenance of a species, which stands at the top of all functional hierarchies. The fundamental processes thus play a defining role in the identification of functions. The following schema lays down a necessary and sufficient condition of functional activity:  $F_1$  is a function of  $A$  in  $S$  if and only if  $A$  contributes to  $F_1$  in  $S$ ; and  $F_1$  is identical with or contributes to  $F_2$  in  $S$ , where  $F_2$  is either a purpose for which the artifact  $S$  is designed or the process of maintenance of the species of which  $S$  is a member.
