I have enumerated the most important features characterizing the mental condition of the degenerate. The reader can now judge for himself whether or not the diagnosis 'degeneration' is applicable to the originators of the new aesthetic tendencies. It must not for that matter be supposed that degeneration is synonymous with absence of talent. Nearly all the inquirers who have had degenerates under their observation expressly establish the contrary. A badly balanced mind is susceptible of the highest conceptions, while, on the other hand, one meets in the same mind with traits of meanness and pettiness all the more striking from the fact that they co-exist with the most brilliant qualities.' We shall find this reservation in all authors who have contributed to the natural history of the degenerate. 'As regards their intellect, they can,' says Roubinovitch, 'attain to a high degree of development, but from a moral point of view their existence is completely deranged. . . . A degenerate will employ his brilliant faculties as well in the service of some grand object as in the satisfaction of the basest propensities.' Lombroso has cited a large number of undoubted geniuses who were equally undoubted mattoids, graphomaniacs, or pronounced lunatics; and the utterance of a French savant, Guerinsen, 'Genius is a disease of the nerves,' has become a 'winged word.' This expression was imprudent, for it gave ignorant babblers a pretext, and apparently a right, to talk of exaggeration, and to contemn experts in nervous and mental diseases, because they professedly saw a lunatic in everyone who ventured to be something more than the most characterless, average being. Science does not assert that every genius is a lunatic; there are some geniuses of superabundant power whose high privilege consists in the possession of one or other extraordinarily developed faculty, without the rest of their faculties falling short of the average standard. Just as little, naturally, is every lunatic a genius; most of them, even if we disregard idiots of different degrees, are much rather pitiably stupid and incapable; but in many, nay, in abundant cases, the 'higher degenerate' of Magnan, just as he occasionally exhibits gigantic bodily stature or the disproportionate growth of particular parts, has some mental gift exceptionally developed at the cost, it is true, of the remaining faculties, which are wholly or partially atrophied. It is this which enables the well-informed to distinguish at the first glance between the sane genius, and the highly, or even the most highly, gifted degenerate. Take from the former the special capacity through which he becomes a genius, and there still remains a capable, often conspicuously intelligent, clever, moral, and judicious man, who will hold his ground with propriety in our social mechanism. Let the same be tried with the case of a degenerate, and there remains only a criminal or madman, for whom healthy humanity can find no use. If Goethe had never written a line of verse, he would, all the same, have still remained a man of the world, of good principles, a fine art connoisseur, a judicious collector, a keen observer of nature. Let us on the contrary, imagine a Schopenhauer who had written no [astounding] books, and we should have before us only a repulsive *lusus naturae,* whose morals would necessarily exclude him from all respectable society, and whose fixed idea that he was a victim of persecution would point him out as a subject for a madhouse. The lack of harmony, the absence of balance, the singular incapacity of useful applying, or deriving satisfaction from, their own special faculty among highly gifted degenerates, strikes every healthy censor who does not allow himself to be prejudiced by the noisy admiration of critics, themselves degenerates: and will always prevent his mistaking the mattoid for the same exceptional man who opens out new paths for humanity and leads it to higher developments. I do not share Lombroso's opinion that highly-gifted degenerates are an active force in the progress of mankind. They corrupt and delude; they do, alas! frequently exercise deep influence, but this is always a baneful one. It may not be at once remarked, but it will reveal itself subsequently. If contemporaries do not recognise it, the historian of morals will point it out *a posteriori.* They, likewise, are leading men along the paths they themselves have found to new goals; but these goals are abysses or waste places. They are guides to swamps like will-o'-the-wisps, or to ruin like the ratcatcher of Hammelin. Observers lay stress on their unnatural sterility. 'They are,' says Tarabund, 'cranks; wrongheaded, unbalanced, incapable creatures; they belong to the class of whom it may not be said that they have no mind, but whose mind produces nothing.' 'A common type' writes Legrain, 'unites them:—weakness of judgment and unequal development of mental powers. . . . Their conceptions are never of a high order. They are incapable of great thoughts and prolific ideas. This fact forms a peculiar contrast to the frequently excessive development of their powers of imagination.' 'If they are painters,' we read in Lombroso, 'then their predominant attribute will be their colour-sense; they will be decorative. If they are poets, they will be rich in rhyme, brilliant in style, but barren of thought; sometimes they will be "decadents."

Such are the qualities of the most gifted of those who are discovering new paths, and are proclaimed by enthusiastic followers as the guides to the promised land of the future. Among them degenerates and mattoids predominate. The second of the above-mentioned diagnoses, on the contrary, applies for the most part to the multitude who admire these individuals and swear by them, who imitate the fashions they design, and take delight in the extravagances described in the previous chapter. In their case we have to deal chiefly with hysteria, or neurasthenia.

For reasons which will be elucidated in the next chapter, hysteria has hitherto been less studied in Germany than in France, where, more than elsewhere, it has formed a subject of earnest inquiry. We owe what we know of it almost exclusively to French investigators. The copious treatises of Axenfield, Richer, and in particular Gilles de la Tourette, adequately comprise our present knowledge of this malady; and I shall refer to these works when I enumerate the symptoms chiefly indicative of hysteria.

Among the hysterical—and it must not be thought that these are met with exclusively, or even preponderantly, among females, for they are quite as often, perhaps oftener, found among males—among the hysterical, as among the degenerate, the first thing which strikes us is an extraordinary emotionalism. 'The leading characteristic of the hysterical,' says Colin, 'is the disproportionate impressionability of their psychic centres. . . . They are, above all things, impressionable.' From this primary peculiarity proceeds a second quite as remarkable and important—the exceeding ease with which they can be made to yield to suggestion. The earlier observers always mentioned the boundless mendacity of the hysterical; growing, indeed, quite indignant at it, and making it the most prominent mark of the mental condition of such patients. They were mistaken. The hysterical subject does not consciously lie. He believes in the truth of his craziest inventions. The morbid mobility of his mind, the excessive excitability of his imagination, conveys to his consciousness all sorts of queer and senseless ideas. He suggests to himself that these ideas are founded on true perceptions, and believes in the truth of his foolish inventions until a new suggestion—perhaps his own, perhaps that of another person—has ejected the earlier one. A result of the susceptibility of the hysterical subject to suggestion is his irresistible passion for imitation, and the eagerness with which he yields to all the suggestions of writers and artists. When he sees a picture, he wants to become like it in attitude and dress; when he reads a book, he adopts its views blindly. He takes as a pattern the heroes of the novels which he has in his hand at the moment, and infuses himself into the characters moving before him on stage.

Added to this emotionalism and susceptibility to suggestion is a love of self never met in a sane person in anything like the same degree. The hysterical person's own 'I' towers up before his inner vision, and so completely fills his mental horizon that it conceals the whole of the remaining universe. He cannot endure that others should ignore him. He desires to be as important to his fellow-men as he is to himself. 'An incessant need pursues and governs the hysterical—to busy those about them with themselves. A means of satisfying this need is the fabrication of stories by which they become interesting. Hence come the adventurous occurrences which often enough occupy the police and the reports of the daily press. In the busiest thoroughfare the hysterical person is set upon, robbed, maltreated and wounded, dragged to a distant place, and left to die. He picks himself up painfully, and informs the police. He can show the wounds on his body. He gives all the details. And there is not a single word of truth in the whole story; it is all dreamt and imagined. He has himself inflicted his wounds in order for a short time to become the centre of public attention. In the lower stages of hysteria this need of making a sensation sometimes assumes more harmless forms. It displays itself in eccentricities of dress and behaviour. 'Other hysterical subjects are passionately fond of glaring colours and extravagant forms; they wish to attract attention and make themselves talked about.'

▣ Charlotte Perkins Gilman, from *Women and Economics* (1898)

Charlotte Perkins Gilman was an accomplished writer and a feminist theorist. Although she was not widely recognized in her day as a sociologist, she also contributed to the field of sociology through her analysis of gender inequality. The intersection of eugenic thought and Progressive Era feminism is seen here in an excerpt from Gilman's best-known work of nonfiction. According to Gilman, Western women as a group are disabled by the culture, which overemphasizes their sexual appeal and maternal functions, to the detriment of their strength, coordination, and intelligence. This culturally produced weakness is in turn transmitted to their children, according to Gilman, and thus a feminism that restores and celebrates women's "natural" physical and mental gifts is also in the best interests of the race.

In this, in a certain over-coarseness and hardness, a too great belligerence and pride, a too great subservience to the power of sex-attraction, we find the main marks of excessive sex-distinction in men. It has been always checked and offset in them by the healthful activities of racial life. Their energies have been called out and their faculties developed along the lines of human progress. In the growth of industry, commerce, science, manufacture, government, art, religion, the male of our species has become human, far more than male. Strong as this passion is in him, inordinate as is his indulgence, he is a far more normal animal than the female of his species,—far less over-sexed. To him this field of special activity is but part of life,—an incident. The whole world remains besides. To her it is the world.

To make clear by an instance the difference between normal and abnormal sex-distinction, look at the relative condition of a wild cow and a "milch cow" such as we have made. The wild cow is a female. She has healthy calves, and milk enough for them; and that is all the femininity she needs. Otherwise than that she is bovine rather than feminine. She is a light, strong, swift, sinewy creature, able to run, jump and fight if necessary. We, for economic uses, have artificially developed the cow's capacity for producing milk. She has become a walking milk machine, bred and tended to that express end, her value measured in quarts. The secretion of milk is a maternal function—a sex function. The cow is oversexed. Turn her loose in natural conditions and, if she survives the change, she would revert in a very few generations to the plain cow, with her energies used in the general activities of her race, and not all running to milk.

Physically, woman belongs to a tall, vigorous, beautiful animal species, capable of great and varied exertion. In every race and time when she has opportunity for racial activity, she develops accordingly and is no less a woman for being a healthy human creature. In every race and time when she is denied this opportunity,—and few indeed, have been her years of freedom,—she has developed in the lines of action to which she was confined; and those were always the lines of sex-activity. In consequence the body of woman, speaking in the largest generalization, manifests sex-distinction predominantly.

Woman's femininity—and the "eternal feminine" means simply the eternal sexual—is more apparent in proportion to her humanity than the femininity of other animals in proportion to their caninity or felinity or equinity. "A feminine hand" or "a feminine foot" is distinguishable anywhere. We do not hear of " a feminine paw" or a "feminine hoof." A hand is an organ of prehension, a foot an organ of locomotion: they are not secondary sexual characteristics. The comparative smallness and feebleness of woman is a sex distinction. We have carried it to such an excess that women are commonly known as "the weaker sex." There is no such glaring difference between male and female in other advanced species. In the long migration of birds, in the careless motion of the grazing herds that used to swing up and down over the continent each year, in the wild steep journeys of the breeding salmon, nothing is heard of the weaker sex. And among the higher carnivore, where longer maintenance of the younger brings their condition nearer ours, the hunter dreads the attack of the female more than that of the male. The disproportionate weakness is an excessive sex-distinction. Its injurious effect may be broadly shown in Oriental nations, where the female in curtained harems is confined most exclusively to sex-functions and denied most fully the exercise of race-functions. In such peoples the weakness, the tendency to small bones and adipose tissue of the over-sexed female, is transmitted to the male with a retarding effect on the development of the race. Conversely in early Germanic tribes, the comparatively free and humanly developed women—tall, strong and brave—transmitted to their sons a greater proportion of human power and much less of morbid sex-tendency.

The degree of feebleness and clumsiness common to women, the comparative inability to stand, walk, run, jump, climb and perform other race-functions common to both sexes, is an excessive sex distinction; and the ensuing transmission of this relative feebleness to their children, boys and girls alike, retards human development. Strong, free, active women, the sturdy, field-working peasant, the burden-bearing savage, are no less good mothers for their human strength. But our civilized "feminine delicacy," which appears somewhat less delicate when recognized as an expression of sexuality in excess,—makes us no better mothers, but worse. The relative weakness of women is a sex-distinction. It is apparent in her to a degree that injures motherhood, that injures wifehood, that injures the individual. The sex-usefulness and the human usefulness of women, their general duty to their kind, are greatly injured by this degree of distinction. In every way the over-sexed condition of the human female reacts unfavorably upon herself, her husband, her children, and the race.

Charlotte Perkins Gilman, from "The Yellow Wallpaper" (1899)

Charlotte Perkins Gilman was herself prescribed the "rest cure" by its greatest proponent, Dr. Samuel Weir Mitchell. The oppressive gender assumptions implicit in the treatment of "invalid women"—with near-complete confinement to the home and bed, alone, without reading or other activity—were not lost on Gilman. "The Yellow Wallpaper," widely read as a feminist classic, is a semiautobiographical account of a woman's descent into madness.

John laughs at me, of course, but one expects that in marriage.

John is practical in the extreme. He has no patience with faith, an intense horror of superstition, and he scoffs openly at any talk of things not to be felt and seen and put down in figures.

John is a physician, and *perhaps*—(I would not say it to a living soul, of course, but this is dead paper and a great relief to my mind)—*perhaps* that is one reason I do not get well faster.

You see he does not believe I am sick!

And what can one do?

If a physician of high standing, and one's own husband, assures friends and relatives that there is really nothing the matter with one but temporary nervous depression—a slight hysterical tendency—what is one to do?

My brother is also a physician, and also of high standing, and he says the same thing.

So I take phosphates or phosphites—whichever it is, and tonics, and journeys, and air, and exercise, and am absolutely forbidden to "work" until I am well again. . . .

So I walk a little in the garden or down that lovely lane, sit on the porch under the roses, and lie down up here a good deal.

I'm getting really fond of the room in spite of the wall-paper. Perhaps *because* of the wall-paper.

It dwells in my mind so!

I lie here on this great immovable bed—it is nailed down, I believe—and follow that pattern about by the hour. It is as good as gymnastics, I assure you. I start, we'll say, at the bottom, down in the corner over there where it has not been touched, and I determine for the thousandth time that I *will* follow that pointless pattern to some sort of a conclusion. . . .

There is one end of the room where it is almost intact, and there, when the crosslights fade and the low sun shines directly upon it, I can almost fancy radiation after all,—the interminable grotesques seem to form around a common centre and rush off in headlong plunges of equal distraction.

It makes me tired to follow it. I will take a nap I guess.

I don't know why I should write this.

I don't want to.

I don't feel able. And I know John would think it absurd. But I must say what I feel and think in some way—it is such a relief!

But the effort is getting to be greater than the relief.

Half the time now I am awfully lazy, and lie down ever so much.

John says I mustn't lose my strength, and has me take cod liver oil and lots of tonics and things, to say nothing of ale and wine and rare meat.

Dear John! He loves me very dearly, and hates to have me sick. I tried to have a real earnest reasonable talk with him the other day, and tell him how I wish he would let me go and make a visit to Cousin Henry and Julia.

But he said I wasn't able to go, nor able to stand it after I got there; and I did not make out a very good case for myself, for I was crying before I had finished.

It is getting to be a great effort for me to think straight. Just this nervous weakness I suppose.

And dear John gathered me up in his arms, and just carried me upstairs and laid me on the bed, and sat by me and read to me till it tired my head.

He said I was his darling and his comfort and all he had, and that I must take care of myself for his sake, and keep well.

He says no one but myself can help me out of it, that I must use my will and self-control and not let any silly fancies run away with me.

There's one comfort, the baby is well and happy, and does not have to occupy this nursery with the horrid wall-paper.

If we had not used it, that blessed child would have! What a fortunate escape! Why, I wouldn't have a child of mine, an impressionable little thing, live in such a room for worlds.

I never thought of it before, but it is lucky that John kept me here after all, I can stand it so much easier than a baby, you see.

Of course I never mention it to them any more—I am too wise,—but I keep watch of it all the same.

There are things in that paper that nobody knows but me, or ever will.

Behind that outside pattern the dim shapes get clearer every day.

It is always the same shape, only very numerous.

And it is like a woman stooping down and creeping about behind that pattern. I don't like it a bit. I wonder—I begin to think—I wish John would take me away from here!

Stephen Crane, from *The Monster* (1899)

Levi Hume, a resident of Port Jervis, New York, became the model for Henry Johnson, the main character in Crane's novel The Monster*, about a black man who must face the ridicule of the townspeople. In real life, Hume was a physically disabled man who was employed as an ash man. Hume's physical imperfections, coupled with the layers of black soot he wore as a result of his labors, caused the townspeople to be less than kind. Furthermore, The Monster is said to have parallels to one of the town's most shameful historic events, the only public lynching in New York State. Interestingly enough, the lynching is said to have occurred in Orange Square—the very same square in which Crane used to sit with the orange blossoms. In the novel, a small-town doctor's son is saved from a burning house by Henry Johnson, a black man. In gratitude, the doctor takes it upon himself to salvage the life of the badly burned and disfigured hero. Others warn him that he is doing no service to the patient, but the physician cannot let go of one to whom he owes such a profound debt. The town begins to fear the newly created "monster." The burned man's life becomes a nightmare of rejection; the physician and his family are progressively rejected by the community.*

V.

Jake Rogers was the first man to reach the home of Tuscarora Hose Company Number Six. He had wrenched his key from his pocket as he tore down the street, and he jumped at the spring-lock like a demon. As the doors flew back before his hands he leaped and kicked the wedges from a pair of wheels, loosened a tongue from its clasp, and in the glare of the electric light which the town placed before each of his hose-houses the next comers beheld the spectacle of Jake Rogers bent like hickory in the manfulness of his pulling, and the heavy cart was moving slowly towards the doors. Four men joined him at the time, and as they swung with the cart out into the street, dark figures sped towards them from the ponderous shadows back of the electric lamps. Some set up the inevitable question, "What district?"

"Second," was replied to them in a compact howl. Tuscarora Hose Company Number Six swept on a perilous wheel into Niagara Avenue, and as the men, attached to the cart by the rope which had been paid out from the windlass under the tongue, pulled madly in their fervor and abandon, the gong under the axle clanged incitingly. And sometimes the same cry was heard, "What district?"

"Second."

On a grade Johnnie Thorpe fell, and exercising a singular muscular ability, rolled out in time from the track of the on-coming wheel, and arose, dishevelled and aggrieved, casting a look of mournful disenchantment upon the black crowd that poured after the machine. The cart seemed to be the apex of a dark wave that was whirling as if it had been a broken dam. Back of the lad were stretches of lawn, and in that direction front doors were banged by men who hoarsely shouted out into the clamorous avenue, "What district?"

At one of these houses a woman came to the door bearing a lamp, shielding her face from its rays with her hands. Across the cropped grass the avenue represented to her a kind of black torrent, upon which, nevertheless, fled numerous miraculous figures upon bicycles. She did not know that the towering light at the corner was continuing its nightly whine.

Suddenly a little boy somersaulted around the corner of the house as if he had been projected down a flight of stairs by a catapultian boot. He halted himself in front of the house by dint of a rather extraordinary evolution with his legs. "Oh, ma," he gasped, "can I go? Can I, ma?"

She straightened with the coldness of the exterior mother-judgment, although the hand that held the lamp trembled slightly. "No, Willie; you had better come to bed."

Instantly he began to buck and fume like a mustang. "Oh, ma," he cried, contorting himself—"oh, ma, can't I go? Please, ma, can't I go? Can't I go, ma?"

"It's half past nine now, Willie."

He ended by wailing out a compromise: "Well, just down to the corner, ma? Just down to the corner?"

From the avenue came the sound of rushing men who wildly shouted. Somebody had grappled the bell-rope in the Methodist church, and now over the town rang this solemn and terrible voice, speaking from the clouds. Moved from its peaceful business, this bell gained a new spirit in the portentous night, and it swung the heart to and fro, up and down, with each peal of it.

"Just down to the corner, ma?"

"Willie, it's half past nine now."

VI.

The outlines of the house of Dr. Trescott had faded quietly into the evening, hiding a shape such as we call Queen Anne against the pall of the blackened sky. The neighborhood was at this time so quiet, and seemed so devoid of obstructions, that Hannigan's dog thought it a good opportunity to prowl in forbidden precincts, and so came and pawed Trescott's lawn, growling, and considering himself a formidable beast. Later, Peter Washington strolled past the house and whistled, but there was no dim light shining from Henry's loft, and presently Peter went his way. The rays from the street, creeping in silvery waves over the grass, caused the row of shrubs along the drive to throw a clear, bold shade.

A wisp of smoke came from one of the windows at the end of the house and drifted quietly into the branches of a cherry-tree. Its companions followed it in slowly increasing numbers, and finally there was a current controlled by invisible banks which poured into the fruit-laden boughs of the cherry-tree. It was no more to be noted than if a troop of dim and silent gray monkeys had been climbing a grape-vine into the clouds.

After a moment the window brightened as if the four panes of it had been stained with blood, and a quick ear might have been led to imagine the fire-imps calling and calling, clan joining clan, gathering to the colors. From the street, however, the house maintained its dark quiet, insisting to a passer-by that it was the safe dwelling of people who chose to retire early to tranquil dreams. No one could have heard this low droning of the gathering clans.

Suddenly the panes of the red window tinkled and crashed to the ground, and at other windows there suddenly reared other flames, like bloody spectres at the apertures of a haunted house. This outbreak had been well planned, as if by professional revolutionists.

A man's voice suddenly shouted: "Fire! Fire! Fire!" Hannigan had flung his pipe frenziedly from him because his lungs demanded room. He tumbled down from his perch, swung over the fence, and ran shouting towards the front door of the Trescotts.' Then he hammered on the door, using his fists as if they were mallets. Mrs. Trescott instantly came to one of the windows on the second floor. Afterwards she knew she had been about to say, "The doctor is not at home, but if you will leave your name, I will let him know as soon as he comes."

Hannigan's bawling was for a minute incoherent, but she understood that it was not about croup.

"What?" she said, raising the window swiftly.

"Your house is on fire! You're all ablaze! Move quick if—" His cries were resounding in the street as if it were a cave of echoes. Many feet pattered swiftly on the stones. There was one man who ran with an almost fabulous speed. He wore lavender trousers. A straw hat with a bright silk band was held half crumpled in his hand.

As Henry reached the front door, Hannigan had just broken the lock with a kick. A thick cloud of smoke poured over them, and Henry, ducking his head, rushed into it. From Hannigan's clamor he knew only one thing, but it turned him blue with horror. In the hall a lick of flame had found the cord that supported "Signing the Declaration." The engraving slumped suddenly down at one end, and then dropped to the floor, where it burst with the sound of a bomb. The fire was already roaring like a winter wind among the pines.

At the head of the stairs Mrs. Trescott was waving her arms as if they were two reeds. "Jimmie! Save Jimmie!" she screamed in Henry's face. He plunged past her and disappeared, taking the long-familiar routes among these upper chambers, where he had once held office as a sort of second assistant house-maid.

Hannigan had followed him up the stairs, and grappled the arm of the maniacal woman there. His face was black with rage. "You must come down," he bellowed.

She would only scream at him in reply: "Jimmie! Jimmie! Save Jimmie!" But he dragged her forth while she babbled at him.

As they swung out into the open air a man ran across the lawn, and seizing a shutter, pulled it from its hinges and flung it far out upon the grass. Then he frantically attacked the other shutters one by one. It was a kind of temporary insanity.

"Here, you," howled Hannigan, "hold Mrs. Trescott—And stop—"

The news had been telegraphed by a twist of the wrist of a neighbor who had gone to the fire-box at the corner, and the time when Hannigan and his charge struggled out of the house was the time when the whistle roared its hoarse night call, smiting the crowd in the park, causing the leader of the band, who was about to order the first triumphal clang of a military march, to let his hand drop slowly to his knees.

VII.

Henry pawed awkwardly through the smoke in the upper halls. He had attempted to guide himself by the walls, but they were too hot. The paper was crimpling, and he expected at any moment to have a flame burst from under his hands.

"Jimmie!"

He did not call very loud, as if in fear that the humming flames below would overhear him.

"Jimmie! Oh, Jimmie!"

Stumbling and panting, he speedily reached the entrance to Jimmie's room and flung open the door. The little chamber had no smoke in it at all. It was faintly illumined by a beautiful rosy light reflected circuitously from the flames that were consuming the house. The boy had apparently just been aroused by the noise. He sat in his bed, his lips apart, his eyes wide, while upon his little white-robed figure played caressingly the light from the fire. As the door flew open he had before him this apparition of his pal, a terror-stricken negro, all tousled and with wool scorching, who leaped upon him and bore him up in a blanket as if the whole affair were a case of kidnapping by a dreadful robber chief. Without waiting to go through the usual short but complete process of wrinkling up his face, Jimmie let out a gorgeous bawl, which resembled the expression of a calf's deepest terror. As Johnson, bearing him, reeled into the smoke of the hall, he flung his arms about his neck and buried his face in the blanket. He called twice in muffled tones: "Mam-ma! Mam-ma!"

When Johnson came to the top of the stairs with his burden, he took a quick step backwards. Through the smoke that rolled to him he could see that the lower hall was all ablaze. He cried out then in a howl that resembled Jimmie's former achievement. His legs gained a frightful faculty of bending sideways. Swinging about precariously on these reedy legs, he made his way back slowly, back along the upper hall. From the way of him then, he had given up almost all idea of escaping from the burning house, and with it the desire. He was submitting, submitting because of his fathers, bending his mind in a most perfect slavery to this conflagration.

He now clutched Jimmie as unconsciously as when, running toward the house, he had clutched the hat with the bright silk band.

Suddenly he remembered a little private staircase which led from a bedroom to an apartment which the doctor had fitted up as a laboratory and work-house, where he used some of his leisure, and also hours when he might have been sleeping, in devoting himself to experiments which came in the way of his study and interest.

When Johnson recalled this stairway the submission to the blaze departed instantly. He had been perfectly familiar with it, but his confusion had destroyed the memory of it.

In his sudden momentary apathy there had been little that resembled fear, but now, as a way of safety came to him, the old frantic terror caught him. He was no longer creature to the flames, and he was afraid of the battle with them. It was a singular and swift set of alternations in which he feared twice without submission, and submitted once without fear.

"Jimmie!" he wailed, as he staggered on his way. He wished this little inanimate body at his breast to participate in his tremblings. But the child had lain limp and still during these headlong charges and countercharges, and no sign came from him.

Johnson passed through two rooms and came to the head of the stairs. As he opened the door great billows of smoke poured out, but gripping Jimmie closer, he plunged down through them. All manner of odors assailed him during this flight. They seemed to be alive with envy, hatred, and malice. At the entrance to the laboratory he confronted a strange spectacle. The room was like a garden in the region where might be burning flowers. Flames of violet, crimson, green, blue, orange, and purple were blooming everywhere. There was one blaze that was precisely the hue of a delicate coral. In another place was a mass that lay merely in phosphorescent inaction like a pile of emeralds. But all these marvels were to be seen dimly through clouds of heaving, turning, deadly smoke.

Johnson halted for a moment on the threshold. He cried out again in the negro wail that had in it the sadness of the swamps. Then he rushed across the room. An orange-colored flame leaped like a panther at the lavender trousers. This animal bit deeply into Johnson. There was an explosion at one side, and suddenly before him there reared a delicate, trembling sapphire shape like a fairy lady. With a quiet smile she blocked his path and doomed him and Jimmie. Johnson shrieked, and then ducked in the manner of his race in fights. He aimed to pass under the left guard of the sapphire lady. But she was swifter than eagles, and her talons caught in him as he plunged past her. Bowing his head as if his neck had been struck, Johnson lurched forward, twisting this way and that way. He fell on his back. The still form in the blanket flung from his arms, rolled to the edge of the floor and beneath the window.

Johnson had fallen with his head at the base of an old-fashioned desk. There was a row of jars upon the top of this desk. For the most part, they were silent amid this rioting, but there was one which seemed to hold a scintillant and writhing serpent.

Suddenly the glass splintered, and a ruby-red snakelike thing poured its thick length out upon the top of the old desk. It coiled and hesitated, and then began to swim a languorous way down the mahogany slant. At the angle it waved its sizzling molten head to and fro over the closed eyes of the man beneath it. Then, in a moment, with mystic impulse, it moved again, and the red snake flowed directly down into Johnson's upturned face.

Afterwards the trail of this creature seemed to reek, and amid flames and low explosions drops like red-hot jewels pattered softly down it at leisurely intervals.

VIII.

Suddenly all roads led to Dr. Trescott's. The whole town flowed toward one point. Chippeway Hose Company Number One toiled desperately up Bridge Street Hill even as the Tuscaroras came in an impetuous sweep down Niagara Avenue. Meanwhile the machine of the hook-and-ladder experts from across the creek was spinning on its way. The chief of the fire department had been playing poker in the rear room of Whiteley's cigar-store, but at the first breath of the alarm he sprang through the door like a man escaping with the kitty.

In Whilomville, on these occasions, there was always a number of people who instantly turned their attention to the bells in the churches and schoolhouses. The bells not only emphasized the alarm, but it was the habit to send these sounds rolling across the sky in a stirring brazen uproar until the flames were practically vanquished. There was also a kind of rivalry as to which bell should be made to produce the greatest din. Even the Valley Church, four miles away among the farms, had heard the voices of its brethren, and immediately added a quaint little yelp.

Doctor Trescott had been driving homeward, slowly smoking a cigar, and feeling glad that this last case was now in complete obedience to him, like a wild animal that he had subdued, when he heard the long whistle, and chirped to his horse under the unlicensed but perfectly distinct impression that a fire had broken out in Oakhurst, a new and rather high-flying suburb of the town which was at least two miles from his own home. But in the second blast and in the ensuing silence he read the designation of his own district. He was then only a few blocks from his house. He took out the whip and laid it lightly on the mare. Surprised and frightened at this extraordinary action, she leaped forward, and as the reins straightened like steel bands, the doctor leaned backward a trifle. When the mare whirled him up to the closed gate he was wondering whose house could be afire. The man who had rung the signal-box yelled something at him, but he already knew. He left the mare to her will.

In front of his door was a maniacal woman in a wrapper. "Ned!" she screamed at sight of him. "Jimmie! Save Jimmie!"

Trescott had grown hard and chill.

"Where?" he said. "Where?"

Mrs. Trescott's voice began to bubble. "Up—up—up—" She pointed at the second-story windows.

Hannigan was already shouting: "Don't go in that way! You can't go in that way!"

Trescott ran around the corner of the house and disappeared from them. He knew from the view he had taken of the main hall that it would be impossible to ascend from there. His hopes were fastened now to the stairway which led from the laboratory. The door which opened from this room out upon the lawn was fastened with a bolt and lock, but he kicked close to the lock and then close to the bolt. The door with a loud crash flew back. The doctor recoiled from the roll of smoke, and then bending low, he stepped into the garden of burning flowers. On the floor his stinging eyes could make out a form in a smouldering blanket near the window. Then, as he carried his son toward the door, he saw that the whole lawn seemed now alive with men and boys, the leaders in the great charge that the whole town was making. They seized him and his burden, and overpowered him in wet blankets and water.

But Hannigan was howling: "Johnson is in there yet! Henry Johnson is in there yet! He went in after the kid! Johnson is in there yet!"

These cries penetrated to the sleepy senses of Trescott, and he struggled with his captors, swearing unknown to him and to them, all the deep blasphemies of his medical-student days. He arose to his feet and went again toward the door of the laboratory. They endeavored to restrain him, although they were much affrighted at him.

But a young man who was a brakeman on the railway, and lived in one of the rear streets near the Trescotts, had gone into the laboratory and brought forth a thing which he laid on the grass.

IX.

There were hoarse commands from in front of the house. "Turn on your water, Five!" "Let 'er go, One!" The gathering crowd swayed this way and that way. The flames, towering high, cast a wild red light on their faces. There came the clangor of a gong from along some adjacent street. The crowd exclaimed at it. "Here comes Number Three!" "That's Three a-comin'!" A panting and irregular mob dashed into view, dragging a hose-cart. A cry of exultation arose from the little boys. "Here's Three!" The lads welcomed Never-Die Hose Company Number Three as if it was composed of a chariot dragged by a band of gods. The perspiring citizens flung themselves into the fray. The boys danced in impish joy at the displays of prowess. They acclaimed the approach of Number Two. They welcomed Number Four with cheers. They were so deeply moved by this whole affair that they bitterly guyed the late appearance of the hook and ladder company, whose heavy apparatus had almost stalled them on the Bridge Street hill. The lads hated and feared a fire, of course. They did not particularly want to have anybody's house burn, but still it was fine to see the gathering of the companies, and amid a great noise to watch their heroes perform all manner of prodigies.

They were divided into parties over the worth of different companies, and supported their creeds with no small violence. For instance, in that part of the little city where Number Four had its home it would be most daring for a boy to contend the superiority of any other company. Likewise, in another quarter, when a strange boy was asked which fire company was the best in Whilomville, he was expected to answer "Number One." Feuds, which the boys forgot and remembered according to chance or the importance of some recent event, existed all through the town.

They did not care much for John Shipley, the chief of the department. It was true that he went to a fire with the speed of a falling angel, but when there he invariably lapsed into a certain still mood, which was almost a preoccupation, moving leisurely around the burning structure and surveying it, puffing meanwhile at a cigar. This quiet man, who even when life was in danger seldom raised his voice, was not much to their fancy. Now old Sykes Huntington, when he was chief, used to bellow continually like a bull and gesticulate in a sort of delirium. He was much finer as a spectacle than this Shipley, who viewed a fire with the same steadiness that he viewed a raise in a large jackpot. The greater number of the boys could never understand why the members of these companies persisted in re-electing Shipley, although they often pretended to understand it, because "My father says" was a very formidable phrase in argument, and the fathers seemed almost unanimous in advocating Shipley.

At this time there was considerable discussion as to which company had gotten the first stream of water on the fire. Most of the boys claimed that Number Five owned that distinction, but there was a determined minority who contended for Number One. Boys who were the blood adherents of other companies were obliged to choose between the two on this occasion, and the talk waxed warm.

But a great rumor went among the crowds. It was told with hushed voices. Afterward a reverent silence fell even upon the boys. Jimmie Trescott and Henry Johnson had been burned to death, and Dr. Trescott himself had been most savagely hurt. The crowd did not even feel the police pushing at them. They raised their eyes, shining now with awe, toward the high flames.

The man who had information was at his best. In low tones he described the whole affair. "That was the kid's room—in the corner there. He had measles or somethin,' and this coon—Johnson—was a-settin' up with 'im, and Johnson got sleepy or somethin' and upset the lamp, and the doctor he was down in his office, and he came running up, and they all got burned together till they dragged ‘em out.”

Another man, always preserved for the deliverance of the final judgment, was saying: “Oh, they’ll die sure. Burned to flinders. No chance. Hull lot of ‘em. Anybody can see.” The crowd concentrated its gaze still more closely upon these flags of fire which waved joyfully against the black sky. The bells of the town were clashing unceasingly.

A little procession moved across the lawn and toward the street. There were three cots, borne by twelve of the firemen. The police moved sternly, but it needed no effort of theirs to open a lane for this slow cortege. The men who bore the cots were well known to the crowd, but in this solemn parade during the ringing of the bells and the shouting, and with the red glare upon the sky, they seemed utterly foreign, and Whilomville paid them a deep respect. Each man in this stretcher party had gained a reflected majesty. They were footmen to death, and the crowd made subtle obeisance to this august dignity derived from three prospective graves. One woman turned away with a shriek at sight of the covered body on the first stretcher, and people faced her suddenly in silent and mournful indignation. Otherwise there was barely a sound as these twelve important men with measured tread carried their burdens through the throng.

The little boys no longer discussed the merits of the different fire companies. For the greater part they had been routed. Only the more courageous viewed closely the three figures veiled in yellow blankets.

X.

Old Judge Denning Hagenthorpe, who lived nearly opposite the Trescotts, had thrown his door wide open to receive the afflicted family. When it was publicly learned that the doctor and his son and the negro were still alive, it required a specially detailed policeman to prevent people from scaling the front porch and interviewing these sorely wounded. One old lady appeared with a miraculous poultice, and she quoted most damning scripture to the officer when he said that she could not pass him. Throughout the night some lads old enough to be given privileges or to compel them from their mothers remained vigilantly upon the kerb in anticipation of a death or some such event. The reporter of the *Morning Tribune* rode thither on his bicycle every hour until three o’clock.

Six of the ten doctors in Whilomville attended at Judge Hagenthorpe’s house.

Almost at once they were able to know that Trescott’s burns were not vitally important. The child would possibly be scarred badly, but his life was undoubtedly safe. As for the negro Henry Johnson, he could not live. His body was frightfully seared, but more than that, he now had no face. His face had simply been burned away.

Trescott was always asking news of the two other patients. In the morning he seemed fresh and strong, so they told him that Johnson was doomed. They then saw him stir on the bed, and sprang quickly to see if the bandages needed readjusting. In the sudden glance he threw from one to another he impressed them as being both leonine and impracticable.

The morning paper announced the death of Henry Johnson. It contained a long interview with Edward J. Hannigan, in which the latter described in full the performance of Johnson at the fire. There was also an editorial built from all the best words in the vocabulary of the staff. The town halted in its accustomed road of thought, and turned a reverent attention to the memory of this hostler. In the breasts of many people was the regret that they had not known enough to give him a hand and a lift when he was alive, and they judged themselves stupid and ungenerous for this failure.

The name of Henry Johnson became suddenly the title of a saint to the little boys. The one who thought of it first could, by quoting it in an argument, at once overthrow his antagonist, whether it applied to the subject or whether it did not.

Nigger, nigger, never die,
Black face and shiny eye.

Boys who had called this odious couplet in the rear of Johnson’s march buried the fact at the bottom of their hearts.

Later in the day Miss Bella Farragut, of No. 7 Watermelon Alley, announced that she had been engaged to marry Mr. Henry Johnson.

XIV.

Reifsnyder’s assistant had gone to his supper, and the owner of the shop was trying to placate four men who wished to be shaved at once. Reifsnyder was very garrulous—a fact which made him rather remarkable among barbers, who, as a class, are austerely speechless, having been taught silence by the hammering reiteration of a tradition. It is the customers who talk in the ordinary event.

As Reifsnyder waved his razor down the cheek of a man in the chair, he turned often to cool the impatience of the others with pleasant talk, which they did not particularly heed.

"Oh, he should have let him die," said Bainbridge, a railway engineer, finally replying to one of the barber's orations. "Shut up, Reif, and go on with your business!"

Instead, Reifsnyder paused shaving entirely, and turned to front the speaker. "Let him die?" he demanded. "How vas that? How can you let a man die?"

"By letting him die, you chump," said the engineer. The others laughed a little, and Reifsnyder turned at once to his work, sullenly, as a man overwhelmed by the derision of numbers.

"How vas that?" he grumbled later. "How can you let a man die when he vas done so much for you?"

"'When he vas done so much for you?'" repeated Bainbridge. "You better shave some people. How vas that? Maybe this ain't a barber shop?"

A man hitherto silent now said, "If I had been the doctor, I would have done the same thing."

"Of course," said Reifsnyder. "Any man vould do it. Any man that vas not like you, you—old—flint-hearted—fish." He had sought the final words with painful care, and he delivered the collection triumphantly at Bainbridge. The engineer laughed.

The man in the chair now lifted himself higher, while Reifsnyder began an elaborate ceremony of anointing and combing his hair. Now free to join comfortably in the talk, the man said: "They say he is the most terrible thing in the world. Young Johnnie Bernard— that drives the grocery wagon—saw him up at Alek Williams's shanty, and he says he couldn't eat anything for two days."

"Chee!" said Reifsnyder.

"Well, what makes him so terrible?" asked another.

"Because he hasn't got any face," replied the barber and the engineer in duet.

"Hasn't got any face?" repeated the man. "How can he do without any face!" "He has no face in the front of his head, in the place where his face ought to grow."

Bainbridge sang these lines pathetically as he arose and hung his hat on a hook. The man in the chair was about to abdicate in his favor. "Get a gait on you now," he said to Reifsnyder. "I go out at 7.31."

As the barber foamed the lather on the cheeks of the engineer he seemed to be thinking heavily. Then suddenly he burst out. "How would you like to be with no face?" he cried to the assemblage.

"Oh, if I had to have a face like yours—" answered one customer.

Bainbridge's voice came from a sea of lather. "You're kicking because if losing faces becomes popular, you'd have to go out of business."

"I don't think it will become so much popular," said Reifsnyder.

"Not if it's got to be taken off in the way his was taken off," said another man. "I'd rather keep mine, if you don't mind."

"I guess so!" cried the barber. "Just think!"

The shaving of Bainbridge had arrived at a time of comparative liberty for him. "I wonder what the doctor says to himself?" he observed. "He may be sorry he made him live."

"It was the only thing he could do," replied a man. The others seemed to agree with him.

"Supposing you were in his place," said one, "and Johnson had saved your kid. What would you do?"

"Certainly!"

"Of course! You would do anything on earth for him. You'd take all the trouble in the world for him. And spend your last dollar on him. Well, then?"

"I wonder how it feels to be without any face?" said Reifsnyder, musingly.

The man who had previously spoken, feeling that he had expressed himself well, repeated the whole thing. "You would do anything on earth for him. You'd take all the trouble in the world for him. And spend your last dollar on him. Well, then?"

"No, but look," said Reifsnyder; "supposing you don't got a face!"

XV.

As soon as Williams was hidden from the view of the old judge he began to gesture and talk to himself. An elation had evidently penetrated to his vitals, and caused him to dilate as if he had been filled with gas. He snapped his fingers in the air, and whistled fragments of triumphal music. At times, in his progress toward his shanty, he indulged in a shuffling movement that was really a dance. It was to be learned from the intermediate monologue that he had emerged from his trials laurelled and proud. He was the unconquerable Alexander Williams. Nothing could exceed the bold self-reliance of his manner. His kingly stride, his heroic song, the derisive flourish of his hands—all betokened a man who had successfully defied the world.

On his way he saw Zeke Paterson coming to town. They hailed each other at a distance of fifty yards.

"How do, Broth' Paterson?"

"How do, Broth' Williams?"

They were both deacons.

"Is you' folks well, Broth' Paterson?"

"Middlin,' middlin.' How's you' folks, Broth' Williams?"

Neither of them had slowed his pace in the smallest degree. They had simply begun this talk when a considerable space separated them, continued it as they passed, and added polite questions as they drifted steadily apart. Williams's mind seemed to be a balloon. He had been so inflated that he had not noticed that Paterson had definitely shied into the dry ditch as they came to the point of ordinary contact.

Afterward, as he went a lonely way, he burst out again in song and pantomimic celebration of his estate. His feet moved in prancing steps.

When he came in sight of his cabin, the fields were bathed in a blue dusk, and the light in the window was pale. Cavorting and gesticulating, he gazed joyfully for some moments upon this light. Then suddenly another idea seemed to attack his mind, and he stopped, with an air of being suddenly dampened. In the end he approached his home as if it were the fortress of an enemy.

Some dogs disputed his advance for a loud moment, and then discovering their lord, slunk away embarrassed. His reproaches were addressed to them in muffled tones.

Arriving at the door, he pushed it open with the timidity of a new thief. He thrust his head cautiously sideways, and his eyes met the eyes of his wife, who sat by the table, the lamp-light defining a half of her face. "Sh!" he said, uselessly. His glance travelled swiftly to the inner door which shielded the one bedchamber. The pickaninnies, strewn upon the floor of the living-room, were softly snoring. After a hearty meal they had promptly dispersed themselves about the place and gone to sleep. "Sh!" said Williams again to his motionless and silent wife. He had allowed only his head to appear. His wife, with one hand upon the edge of the table and the other at her knee, was regarding him with wide eyes and parted lips as if he were a spectre. She looked to be one who was living in terror, and even the familiar face at the door had thrilled her because it had come suddenly.

Williams broke the tense silence. "Is he all right?" he whispered, waving his eyes toward the inner door. Following his glance timorously, his wife nodded, and in a low tone answered,

"I raikon he's done gone t'sleep."

Williams then slunk noiselessly across his threshold.

He lifted a chair, and with infinite care placed it so that it faced the dreaded inner door. His wife moved slightly, so as to also squarely face it. A silence came upon them in which they seemed to be waiting for a calamity, pealing and deadly.

Williams finally coughed behind his hand. His wife started, and looked upon him in alarm. "'Pears like he done gwine keep quiet ter-night," he breathed. They continually pointed their speech and their looks at the inner door, paying it the homage due to a corpse or a phantom. Another long stillness followed this sentence. Their eyes shone white and wide. A wagon rattled down the distant road. From their chairs they looked at the window, and the effect of the light in the cabin was a presentation of an intensely black and solemn night. The old woman adopted the attitude used always in church at funerals. At times she seemed to be upon the point of breaking out in prayer.

"He mighty quiet ter-night," whispered Williams. "Was he good ter-day?" For answer his wife raised her eyes to the ceiling in the supplication of Job. Williams moved restlessly. Finally he tip-toed to the door. He knelt slowly and without a sound, and placed his ear near the key-hole. Hearing a noise behind him, he turned quickly. His wife was staring at him aghast. She stood in front of the stove, and her arms were spread out in the natural movement to protect all her sleeping ducklings.

But Williams arose without having touched the door. "I raikon he er-sleep," he said, fingering his wool. He debated with himself for some time. During this interval his wife remained, a great fat statue of a mother shielding her children.

It was plain that his mind was swept suddenly by a wave of temerity. With a sounding step he moved toward the door. His fingers were almost upon the knob when he swiftly ducked and dodged away, clapping his hands to the back of his head. It was as if the portal had threatened him. There was a little tumult near the stove, where Mrs. Williams's desperate retreat had involved her feet with the prostrate children.

After the panic Williams bore traces of a feeling of shame. He returned to the charge. He firmly grasped the knob with his left hand, and with his other hand turned the key in the lock. He pushed the door, and as it swung portentously open he sprang nimbly to one side like the fearful slave liberating the lion. Near the stove a group had formed, the terror-stricken mother with her arms stretched, and the aroused children clinging frenziedly to her skirts.

The light streamed after the swinging door, and disclosed a room six feet one way and six feet the other way. It was small enough to enable the radiance to lay it plain. Williams peered warily around the corner made by the door-post.

Suddenly he advanced, retired, and advanced again with a howl. His palsied family had expected him to spring backward, and at his howl they heaped themselves wondrously. But Williams simply stood in the little room emitting his howls before an open window. “He’s gone! He’s gone! He’s gone!” His eye and his hand had speedily proved the fact. He had even thrown open a little cupboard.

Presently he came flying out. He grabbed his hat, and hurled the outer door back upon its hinges. Then he tumbled headlong into the night. He was yelling: “Docteh Trescott! Docteh Trescott!” He ran wildly through the fields, and galloped in the direction of town. He continued to call to Trescott as if the latter was within easy hearing. It was as if Trescott was poised in the contemplative sky over the running negro, and could heed this reaching voice—”Docteh Trescott!”

In the cabin, Mrs. Williams, supported by relays from the battalion of children, stood quaking watch until the truth of daylight came as a re-enforcement and made them arrogant, strutting, swashbuckler children, and a mother who proclaimed her illimitable courage.

XVI.

Theresa Page was giving a party. It was the outcome of a long series of arguments addressed to her mother, which had been overheard in part by her father. He had at last said five words, “Oh, let her have it.” The mother had then gladly capitulated.

Theresa had written nineteen invitations, and distributed them at recess to her schoolmates. Later her mother had composed five large cakes, and still later a vast amount of lemonade.

So the nine little girls and the ten little boys sat quite primly in the dining-room, while Theresa and her mother plied them with cake and lemonade, and also with ice-cream. This primness sat now quite strangely upon them. It was owing to the presence of Mrs. Page. Previously in the parlor alone with their games they had overturned a chair; the boys had let more or less of their hoodlum spirit shine forth. But when circumstances could be possibly magnified to warrant it, the girls made the boys victims of an insufferable pride, snubbing them mercilessly. So in the dining-room they resembled a class at Sunday-school, if it were not for the subterranean smiles, gestures, rebuffs, and poutings which stamped the affair as a children’s party.

Two little girls of this subdued gathering were planted in a settle with their backs to the broad window. They were beaming lovingly upon each other with an effect of scorning the boys.

Hearing a noise behind her at the window, one little girl turned to face it. Instantly she screamed and sprang away, covering her face with her hands. “What was it? What was it?” cried every one in a roar. Some slight movement of the eyes of the weeping and shuddering child informed the company that she had been frightened by an appearance at the window. At once they all faced the imperturbable window, and for a moment there was a silence. An astute lad made an immediate census of the other lads. The prank of slipping out and looming spectrally at a window was too venerable. But the little boys were all present and astonished.

As they recovered their minds they uttered warlike cries, and through a side-door sallied rapidly out against the terror. They vied with each other in daring.

None wished particularly to encounter a dragon in the darkness of the garden, but there could be no faltering when the fair ones in the dining-room were present. Calling to each other in stern voices, they went dragooning over the lawn, attacking the shadows with ferocity, but still with the caution of reasonable beings. They found, however, nothing new to the peace of the night. Of course there was a lad who told a great lie. He described a grim figure, bending low and slinking off along the fence. He gave a number of details, rendering his lie more splendid by a repetition of certain forms which he recalled from romances. For instance, he insisted that he had heard the creature emit a hollow laugh.

Inside the house the little girl who had raised the alarm was still shuddering and weeping. With the utmost difficulty was she brought to a state approximating calmness by Mrs. Page. Then she wanted to go home at once.

Page entered the house at this time. He had exiled himself until he concluded that this children's party was finished and gone. He was obliged to escort the little girl home because she screamed again when they opened the door and she saw the night.

She was not coherent even to her mother. Was it a man? She didn't know. It was simply a thing, a dreadful thing.

XVII.

In Watermelon Alley the Farraguts were spending their evening as usual on the little rickety porch. Sometimes they howled gossip to other people on other rickety porches. The thin wail of a baby arose from a near house. A man had a terrific altercation with his wife, to which the alley paid no attention at all.

There appeared suddenly before the Farraguts a monster making a low and sweeping bow. There was an instant's pause, and then occurred something that resembled the effect of an upheaval of the earth's surface. The old woman hurled herself backward with a dreadful cry. Young Sim had been perched gracefully on a railing. At sight of the monster he simply fell over it to the ground. He made no sound, his eyes stuck out, his nerveless hands tried to grapple the rail to prevent a tumble, and then he vanished. Bella, blubbering, and with her hair suddenly and mysteriously dishevelled, was crawling on her hands and knees fearsomely up the steps.

Standing before this wreck of a family gathering, the monster continued to bow. It even raised a deprecatory claw. "Don' make no botheration 'bout me, Miss Fa'gut," it said, politely. "No, 'deed. I jes drap in ter ax if yer well this evenin,' Miss Fa'gut. Don' make no botheration. No, 'deed. I gwine ax you to go to er daince with me, Miss Fa'gut. I ax you if I can have the magnifercent gratitude of you' company on that 'casion, Miss Fa'gut."

The girl cast a miserable glance behind her. She was still crawling away. On the ground beside the porch young Sim raised a strange bleat, which expressed both his fright and his lack of wind. Presently the monster, with a fashionable amble, ascended the steps after the girl.

She grovelled in a corner of the room as the creature took a chair. It seated itself very elegantly on the edge. It held an old cap in both hands. "Don' make no botheration, Miss Fa'gut. Don' make no botherations. No, 'deed. I jes drap in ter ax you if you won' do me the proud of acceptin' ma humble invitation to er daince, Miss Fa'gut."

She shielded her eyes with her arms and tried to crawl past it, but the genial monster blocked the way. "I jes drap in ter ax you 'bout er daince, Miss Fa'gut. I ax you if I kin have the magnifercent gratitude of you' company on that 'casion, Miss Fa'gut."

In a last outbreak of despair, the girl, shuddering and wailing, threw herself face downward on the floor, while the monster sat on the edge of the chair gabbling courteous invitations, and holding the old hat daintily to its stomach.

At the back of the house, Mrs. Farragut, who was of enormous weight, and who for eight years had done little more than sit in an arm-chair and describe her various ailments, had with speed and agility scaled a high board fence.

XVIII.

The black mass in the middle of Trescott's property was hardly allowed to cool before the builders were at work on another house. It had sprung upward at a fabulous rate. It was like a magical composition born of the ashes. The doctor's office was the first part to be completed, and he had already moved in his new books and instruments and medicines.

Trescott sat before his desk when the chief of police arrived. "Well, we found him," said the latter.

"Did you?" cried the doctor. "Where?"

"Shambling around the streets at daylight this morning. I'll be blamed if I can figure on where he passed the night."

"Where is he now?"

"Oh, we jugged him. I didn't know what else to do with him. That's what I want you to tell me. Of course we can't keep him. No charge could be made, you know."

"I'll come down and get him."

The official grinned retrospectively. "Must say he had a fine career while he was out. First thing he did was to break up a children's party at Page's. Then he went to Watermelon Alley. Whoo! He stampeded the whole outfit. Men, women, and children running pell-mell, and yelling. They say one old woman broke her leg, or something, shinning over a fence. Then he went right out on the main street, and an Irish girl threw a fit, and there was a sort of riot. He began to run, and a big crowd chased him, firing rocks. But he gave them the slip somehow down there by the foundry and in the railroad yard. We looked for him all night, but couldn't find him."

"Was he hurt any? Did anybody hit him with a stone?"

"Guess there isn't much of him to hurt any more, is there? Guess he's been hurt up to the limit. No. They never touched him. Of course nobody really wanted to hit him, but you know how a crowd gets. It's like—it's like—"

"Yes, I know."

For a moment the chief of the police looked reflectively at the floor. Then he spoke hesitatingly. "You know Jake Winter's little girl was the one that he scared at the party. She is pretty sick, they say."

"Is she? Why, they didn't call me. I always attend the Winter family."

"No? Didn't they?" asked the chief, slowly. "Well—you know—Winter is—well, Winter has gone clean crazy over this business. He wanted—he wanted to have you arrested."

"Have me arrested? The idiot! What in the name of wonder could he have me arrested for?"

"Of course. He is a fool. I told him to keep his trap shut. But then you know how he'll go all over town yapping about the thing. I thought I'd better tip you."

"Oh, he is of no consequence; but then, of course, I'm obliged to you, Sam."

"That's all right. Well, you'll be down to-night and take him out, eh? You'll get a good welcome from the jailer. He don't like his job for a cent. He says you can have your man whenever you want him. He's got no use for him."

"But what is this business of Winter's about having me arrested?"

"Oh, it's a lot of chin about your having no right to allow this—this—this man to be at large. But I told him to tend to his own business. Only I thought I'd better let you know. And I might as well say right now, doctor, that there is a good deal of talk about this thing. If I were you, I'd come to the jail pretty late at night, because there is likely to be a crowd around the door, and I'd bring a—er—mask, or some kind of a veil, anyhow."

XIX.

Martha Goodwin was single, and well along into the thin years. She lived with her married sister in Whilomville. She performed nearly all the house-work in exchange for the privilege of existence. Every one tacitly recognized her labor as a form of penance for the early end of her betrothed, who had died of small-pox, which he had not caught from her.

But despite the strenuous and unceasing workaday of her life, she was a woman of great mind. She had adamantine opinions upon the situation in Armenia, the condition of women in China, the flirtation between Mrs. Minster of Niagara Avenue and young Griscom, the conflict in the Bible class of the Baptist Sunday-school, the duty of the United States toward the Cuban insurgents, and many other colossal matters. Her fullest experience of violence was gained on an occasion when she had seen a hound clubbed, but in the plan which she had made for the reform of the world she advocated drastic measures. For instance, she contended that all the Turks should be pushed into the sea and drowned, and that Mrs. Minster and young Griscom should be hanged side by side on twin gallows. In fact, this woman of peace, who had seen only peace, argued constantly for a creed of illimitable ferocity. She was invulnerable on these questions, because eventually she overrode all opponents with a sniff. This sniff was an active force. It was to her antagonists like a bang over the head, and none was known to recover from this expression of exalted contempt. It left them windless and conquered. They never again came forward as candidates for suppression. And Martha walked her kitchen with a stern brow, an invincible being like Napoleon.

Nevertheless her acquaintances, from the pain of their defeats, had been long in secret revolt. It was in no wise a conspiracy, because they did not care to state their open rebellion, but nevertheless it was understood that any woman who could not coincide with one of Martha's contentions was entitled to the support of others in the small circle. It amounted to an arrangement by which all were required to disbelieve any theory for which Martha fought. This, however, did not prevent them from speaking of her mind with profound respect.

Two people bore the brunt of her ability. Her sister Kate was visibly afraid of her, while Carrie Dungen sailed across from her kitchen to sit respectfully at Martha's feet and learn the business of the world. To be sure, afterwards, under another sun, she always laughed at Martha and pretended to deride her ideas, but in the presence of the sovereign she always remained silent or admiring. Kate, the sister, was of no consequence at all. Her principal delusion was that she did all the work in the upstairs rooms of the house, while Martha did it downstairs. The truth was seen only by the husband, who treated Martha with a kindness that was half banter, half deference. Martha herself had no suspicion that she was the only pillar of the domestic edifice. The situation was without definitions. Martha made definitions, but she devoted them entirely to the Armenians and Griscom and the Chinese and other subjects. Her dreams, which in early days had been of love of meadows and the shade of trees, of the face of a man, were now involved otherwise, and they were companioned in the kitchen curiously, Cuba, the hot-water kettle, Armenia, the washing of the dishes, and the whole thing being jumbled. In regard to social misdemeanors, she who was simply the mausoleum of a dead passion was probably the most savage critic in town. This unknown woman, hidden in a kitchen as in a well, was sure to have a considerable effect of the one kind or the other in the life of the town. Every time it moved a yard, she had personally contributed an inch. She could hammer so stoutly upon the door of a proposition that it would break from its hinges and fall upon her, but at any rate it moved. She was an engine, and the fact that she did not know that she was an engine contributed largely to the effect. One reason that she was formidable was that she did not even imagine that she was formidable. She remained a weak, innocent, and pig-headed creature, who alone would defy the universe if she thought the universe merited this proceeding.

One day Carrie Dungen came across from her kitchen with speed. She had a great deal of grist. "Oh," she cried, "Henry Johnson got away from where they was keeping him, and came to town last night, and scared everybody almost to death."

Martha was shining a dish-pan, polishing madly. No reasonable person could see cause for this operation, because the pan already glistened like silver. "Well!" she ejaculated. She imparted to the word a deep meaning. "This, my prophecy, has come to pass." It was a habit.

The overplus of information was choking Carrie. Before she could go on she was obliged to struggle for a moment. "And, oh, little Sadie Winter is awful sick, and they say Jake Winter was around this morning trying to get Doctor Trescott arrested. And poor old Mrs. Farragut sprained her ankle in trying to climb a fence. And there's a crowd around the jail all the time. They put Henry in jail because they didn't know what else to do with him, I guess. They say he is perfectly terrible."

Martha finally released the dish-pan and confronted the headlong speaker. "Well!" she said again, poising a great brown rag. Kate had heard the excited new-comer, and drifted down from the novel in her room. She was a shivery little woman. Her shoulder-blades seemed to be two panes of ice, for she was constantly shrugging and shrugging. "Serves him right if he was to lose all his patients," she said suddenly, in bloodthirsty tones. She snipped her words out as if her lips were scissors.

"Well, he's likely to," shouted Carrie Dungen. "Don't a lot of people say that they won't have him any more? If you're sick and nervous, Doctor Trescott would scare the life out of you, wouldn't he? He would me. I'd keep thinking."

Martha, stalking to and fro, sometimes surveyed the two other women with a contemplative frown.

XX.

After the return from Connecticut, little Jimmie was at first much afraid of the monster who lived in the room over the carriage-house. He could not identify it in any way. Gradually, however, his fear dwindled under the influence of a weird fascination. He sidled into closer and closer relations with it.

One time the monster was seated on a box behind the stable basking in the rays of the afternoon sun. A heavy crêpe veil was swathed about its head.

Little Jimmie and many companions came around the corner of the stable. They were all in what was popularly known as the baby class, and consequently escaped from school a half-hour before the other children. They halted abruptly at sight of the figure on the box. Jimmie waved his hand with the air of a proprietor.

"There he is," he said.

"O-o-o!" murmured all the little boys—"o-o-o!" They shrank back, and grouped according to courage or experience, as at the sound the monster slowly turned its head. Jimmie had remained in the van alone. "Don't be afraid! I won't let him hurt you," he said, delighted.

"Huh!" they replied, contemptuously. "We ain't afraid."

Jimmie seemed to reap all the joys of the owner and exhibitor of one of the world's marvels, while his audience remained at a distance—awed and entranced, fearful and envious.

One of them addressed Jimmie gloomily. "Bet you dassent walk right up to him." He was an older boy than Jimmie, and habitually oppressed him to a small degree. This new social elevation of the smaller lad probably seemed revolutionary to him.

"Huh!" said Jimmie, with deep scorn. "Dassent I? Dassent I, hey? Dassent I?"

The group was immensely excited. It turned its eyes upon the boy that Jimmie addressed. "No, you dassent," he said, stolidly, facing a moral defeat. He could see that Jimmie was resolved. "No, you dassent," he repeated, doggedly.

"Ho!" cried Jimmie. "You just watch!—you just watch!"

Amid a silence he turned and marched toward the monster. But possibly the palpable wariness of his companions had an effect upon him that weighed more than his previous experience, for suddenly, when near to the monster, he halted dubiously. But his playmates immediately uttered a derisive shout, and it seemed to force him forward. He went to the monster and laid his hand delicately on its shoulder. "Hello, Henry," he said, in a voice that trembled a trifle. The monster was crooning a weird line of negro melody that was scarcely more than a thread of sound, and it paid no heed to the boy.

Jimmie strutted back to his companions. They acclaimed him and hooted his opponent. Amidst this clamor the larger boy with difficulty preserved a dignified attitude.

"I dassent, dassent I?" said Jimmie to him. "Now, you're so smart, let's see you do it!"

This challenge brought forth renewed taunts from the others. The larger boy puffed out his cheeks. "Well, I ain't afraid," he explained, sullenly. He had made a mistake in diplomacy, and now his small enemies were tumbling his prestige all about his ears. They crowed like roosters and bleated like lambs, and made many other noises which were supposed to bury him in ridicule and dishonor. "Well, I ain't afraid," he continued to explain through the din.

Jimmie, the hero of the mob, was pitiless. "You ain't afraid, hey?" he sneered. "If you ain't afraid, go do it, then."

"Well, I would if I wanted to," the other retorted. His eyes wore an expression of profound misery, but he preserved steadily other portions of a pot-valiant air. He suddenly faced one of his persecutors. "If you're so smart, why don't you go do it?" This persecutor sank promptly through the group to the rear. The incident gave the badgered one a breathing-spell, and for a moment even turned the derision in another direction. He took advantage of his interval. "I'll do it if anybody else will," he announced, swaggering to and fro.

Candidates for the adventure did not come forward. To defend themselves from this counter-charge, the other boys again set up their crowing and bleating. For a while they would hear nothing from him. Each time he opened his lips their chorus of noises made oratory impossible. But at last he was able to repeat that he would volunteer to dare as much in the affair as any other boy.

"Well, you go first," they shouted.

But Jimmie intervened to once more lead the populace against the large boy. "You're mighty brave, ain't you?" he said to him. "You dared me to do it, and I did—didn't I? Now who's afraid?" The others cheered this view loudly, and they instantly resumed the baiting of the large boy.

He shamefacedly scratched his left shin with his right foot. "Well, I ain't afraid." He cast an eye at the monster. "Well, I ain't afraid." With a glare of hatred at his squalling tormentors, he finally announced a grim intention. "Well, I'll do it, then, since you're so fresh. Now!"

The mob subsided as with a formidable countenance he turned toward the impassive figure on the box. The advance was also a regular progression from high daring to craven hesitation. At last, when some yards from the monster, the lad came to a full halt, as if he had encountered a stone wall. The observant little boys in the distance promptly hooted. Stung again by these cries, the lad sneaked two yards forward. He was crouched like a young cat ready for a backward spring. The crowd at the rear, beginning to respect this display, uttered some encouraging cries. Suddenly the lad gathered himself together, made a white and desperate rush forward, touched the monster's shoulder with a far-outstretched finger, and sped away, while his laughter rang out wild, shrill, and exultant.

The crowd of boys reverenced him at once, and began to throng into his camp, and look at him, and be his admirers. Jimmie was discomfited for a moment, but he and the larger boy, without agreement or word of any kind, seemed to recognize a truce, and they swiftly combined and began to parade before the others.

"Why, it's just as easy as nothing," puffed the larger boy. "Ain't it, Jim?"

"Course," blew Jimmie. "Why, it's as e-e-easy."

They were people of another class. If they had been decorated for courage on twelve battle-fields, they could not have made the other boys more ashamed of the situation.

Meanwhile they condescended to explain the emotions of the excursion, expressing unqualified contempt for any one who could hang back. “Why, it ain’t nothin.’ He won’t do nothin’ to you,” they told the others, in tones of exasperation.

One of the very smallest boys in the party showed signs of a wistful desire to distinguish himself, and they turned their attention to him, pushing at his shoulders while he swung away from them, and hesitated dreamily. He was eventually induced to make furtive expedition, but it was only for a few yards. Then he paused, motionless, gazing with open mouth. The vociferous entreaties of Jimmie and the large boy had no power over him.

Mrs. Hannigan had come out on her back porch with a pail of water. From this coign she had a view of the secluded portion of the Trescott grounds that was behind the stable. She perceived the group of boys, and the monster on the box. She shaded her eyes with her hand to benefit her vision. She screeched then as if she was being murdered. “Eddie! Eddie! You come home this minute!”

Her son querulously demanded, “Aw, what for?”

“You come home this minute. Do you hear?”

The other boys seemed to think this visitation upon one of their number required them to preserve for a time the hang-dog air of a collection of culprits, and they remained in guilty silence until the little Hannigan, wrathfully protesting, was pushed through the door of his home. Mrs. Hannigan cast a piercing glance over the group, stared with a bitter face at the Trescott house, as if this new and handsome edifice was insulting her, and then followed her son.

There was wavering in the party. An inroad by one mother always caused them to carefully sweep the horizon to see if there were more coming. “This is my yard,” said Jimmie, proudly. “We don’t have to go home.”

The monster on the box had turned his black crêpe countenance toward the sky, and was waving its arms in time to a religious chant. “Look at him now,” cried a little boy. They turned, and were transfixed by the solemnity and mystery of the indefinable gestures. The wail of the melody was mournful and slow. They drew back. It seemed to spellbind them with the power of a funeral. They were so absorbed that they did not hear the doctor’s buggy drive up to the stable. Trescott got out, tied his horse, and approached the group. Jimmie saw him first, and at his look of dismay the others wheeled.

“What’s all this, Jimmie?” asked Trescott, in surprise.

The lad advanced to the front of his companions, halted, and said nothing. Trescott’s face gloomed slightly as he scanned the scene.

“What were you doing, Jimmie?”

“We was playin,’” answered Jimmie, huskily.

“Playing at what?”

“Just playin.’”

Trescott looked gravely at the other boys, and asked them to please go home. They proceeded to the street much in the manner of frustrated and revealed assassins. The crime of trespass on another boy’s place was still a crime when they had only accepted the other boy’s cordial invitation, and they were used to being sent out of all manner of gardens upon the sudden appearance of a father or a mother. Jimmie had wretchedly watched the departure of his companions. It involved the loss of his position as a lad who controlled the privileges of his father’s grounds, but then he knew that in the beginning he had no right to ask so many boys to be his guests.

Once on the sidewalk, however, they speedily forgot their shame as trespassers, and the large boy launched forth in a description of his success in the late trial of courage. As they went rapidly up the street, the little boy, who had made the furtive expedition cried out confidently from the rear, “Yes, and I went almost up to him, didn’t I, Willie?”

The large boy crushed him in a few words. “Huh!” he scoffed. “You only went a little way. I went clear up to him.”

The pace of the other boys was so manly that the tiny thing had to trot, and he remained at the rear, getting entangled in their legs in his attempts to reach the front rank and become of some importance, dodging this way and that way, and always piping out his little claim to glory.

XXI.

“By-the-way, Grace,” said Trescott, looking into the dining-room from his office door, “I wish you would send Jimmie to me before school-time.”

When Jimmie came, he advanced so quietly that Trescott did not at first note him. “Oh,” he said, wheeling from a cabinet, “here you are, young man.”

“Yes, sir.”

Trescott dropped into his chair and tapped the desk with a thoughtful finger. “Jimmie, what were you doing in the back garden yesterday—you and the other boys—to Henry?”

“We weren’t doing anything, pa.”

Trescott looked sternly into the raised eyes of his son. “Are you sure you were not annoying him in any way? Now what were you doing, exactly?”

“Why, we—why, we—now—Willie Dalzel said I dassent go right up to him, and I did; and then he did; and then—the other boys were ‘fraid; and then—you comed.”

Trescott groaned deeply. His countenance was so clouded in sorrow that the lad, bewildered by the mystery of it, burst suddenly forth in dismal lamentations. “There, there. Don’t cry, Jim,” said Trescott, going round the desk. “Only—” He sat in a great leather reading-chair, and took the boy on his knee. “Only I want to explain to you—”

After Jimmie had gone to school, and as Trescott was about to start on his round of morning calls, a message arrived from Doctor Moser. It set forth that the latter’s sister was dying in the old homestead, twenty miles away up the valley, and asked Trescott to care for his patients for the day at least. There was also in the envelope a little history of each case and of what had already been done. Trescott replied to the messenger that he would gladly assent to the arrangement.

He noted that the first name on Moser’s list was Winter, but this did not seem to strike him as an important fact. When its turn came, he rang the Winter bell. “Good-morning, Mrs. Winter,” he said, cheerfully, as the door was opened. “Doctor Moser has been obliged to leave town to-day, and he has asked me to come in his stead. How is the little girl this morning?”

Mrs. Winter had regarded him in stony surprise. At last she said: “Come in! I’ll see my husband.” She bolted into the house. Trescott entered the hall, and turned to the left into the sitting-room.

Presently Winter shuffled through the door. His eyes flashed toward Trescott. He did not betray any desire to advance far into the room. “What do you want?” he said.

“What do I want? What do I want?” repeated Trescott, lifting his head suddenly. He had heard an utterly new challenge in the night of the jungle.

“Yes, that’s what I want to know,” snapped Winter. “What do you want?”

Trescott was silent for a moment. He consulted Moser’s memoranda. “I see that your little girl’s case is a trifle serious,” he remarked. “I would advise you to call a physician soon. I will leave you a copy of Doctor Moser’s record to give to any one you may call.” He paused to transcribe the record on a page of his note-book. Tearing out the leaf, he extended it to Winter as he moved toward the door. The latter shrunk against the wall. His head was hanging as he reached for the paper. This caused him to grasp air, and so Trescott simply let the paper flutter to the feet of the other man.

“Good-morning,” said Trescott from the hall. This placid retreat seemed to suddenly arouse Winter to ferocity. It was as if he had then recalled all the truths, which he had formulated to hurl at Trescott. So he followed him into the hall, and down the hall to the door, and through the door to the porch, barking in fiery rage from a respectful distance. As Trescott imperturbably turned the mare’s head down the road, Winter stood on the porch, still yelping. He was like a little dog.

XXII.

“Have you heard the news?” cried Carrie Dungen, as she sped toward Martha’s kitchen. “Have you heard the news?” Her eyes were shining with delight.

“No,” answered Martha’s sister Kate, bending forward eagerly. “What was it? What was it?”

Carrie appeared triumphantly in the open door. “Oh, there’s been an awful scene between Doctor Trescott and Jake Winter. I never thought that Jake Winter had any pluck at all, but this morning he told the doctor just what he thought of him.”

“Well, what did he think of him?” asked Martha.

“Oh, he called him everything. Mrs. Howarth heard it through her front blinds. It was terrible, she says. It’s all over town now. Everybody knows it.”

“Didn’t the doctor answer back?”

“No! Mrs. Howarth—she says he never said a word. He just walked down to his buggy and got in, and drove off as co-o-o-l. But Jake gave him jinks, by all accounts.”

“But what did he say?” cried Kate, shrill and excited. She was evidently at some kind of a feast.

“Oh, he told him that Sadie had never been well since that night Henry Johnson frightened her at Theresa Page’s party, and he held him responsible, and how dared he cross his threshold—and—and—and—”

“And what?” said Martha.

“Did he swear at him?” said Kate, in fearsome glee.

"No—not much. He did swear at him a little, but not more than a man does anyhow when he is real mad, Mrs. Howarth says."

"O-oh!" breathed Kate. "And did he call him any names?"

Martha, at her work, had been for a time in deep thought. She now interrupted the others. "It don't seem as if Sadie Winter had been sick since that time Henry Johnson got loose. She's been to school almost the whole time since then, hasn't she?"

They combined upon her in immediate indignation. "School? School? I should say not. Don't think for a moment. School!"

Martha wheeled from the sink. She held an iron spoon, and it seemed as if she was going to attack them. "Sadie Winter has passed here many a morning since then carrying her school-bag. Where was she going? To a wedding?"

The others, long accustomed to a mental tyranny, speedily surrendered.

"Did she?" stammered Kate. "I never saw her."

Carrie Dungen made a weak gesture.

"If I had been Doctor Trescott," exclaimed Martha, loudly, "I'd have knocked that miserable Jake Winter's head off."

Kate and Carrie, exchanging glances, made an alliance in the air. "I don't see why you say that, Martha," replied Carrie, with considerable boldness, gaining support and sympathy from Kate's smile. "I don't see how anybody can be blamed for getting angry when their little girl gets almost scared to death and gets sick from it, and all that. Besides, everybody says—"

"Oh, I don't care what everybody says," said Martha.

"Well, you can't go against the whole town," answered Carrie, in sudden sharp defiance.

"No, Martha, you can't go against the whole town," piped Kate, following her leader rapidly.

"'The whole town,'" cried Martha. "I'd like to know what you call 'the whole town.' Do you call these silly people who are scared of Henry Johnson 'the whole town'?"

"Why, Martha," said Carrie, in a reasoning tone, "you talk as if you wouldn't be scared of him!"

"No more would I," retorted Martha.

"O-oh, Martha, how you talk!" said Kate. "Why, the idea! Everybody's afraid of him."

Carrie was grinning. "You've never seen him, have you?" she asked, seductively.

"No," admitted Martha.

"Well, then, how do you know that you wouldn't be scared?"

Martha confronted her. "Have you ever seen him? No? Well, then, how do you know you *would* be scared?"

The allied forces broke out in chorus: "But, Martha, everybody says so. Everybody says so."

"Everybody says what?"

"Everybody that's seen him say they were frightened almost to death. 'Tisn't only women, but it's men too. It's awful."

Martha wagged her head solemnly. "I'd try not to be afraid of him."

"But supposing you could not help it?" said Kate.

"Yes, and look here," cried Carrie. "I'll tell you another thing. The Hannigans are going to move out of the house next door."

"On account of him?" demanded Martha.

Carrie nodded. "Mrs. Hannigan says so herself."

"Well, of all things!" ejaculated Martha. "Going to move, eh? You don't say so! Where they going to move to?"

"Down on Orchard Avenue."

"Well, of all things! Nice house?"

"I don't know about that. I haven't heard. But there's lots of nice houses on Orchard."

"Yes, but they're all taken," said Kate. "There isn't a vacant house on Orchard Avenue."

"Oh yes, there is," said Martha. "The old Hampstead house is vacant."

"Oh, of course," said Kate. "But then I don't believe Mrs. Hannigan would like it there. I wonder where they can be going to move to?"

"I'm sure I don't know," sighed Martha. "It must be to some place we don't know about."

"Well," said Carrie Dungen, after a general reflective silence, "it's easy enough to find out, anyhow."

"Who knows—around here?" asked Kate.

"Why, Mrs. Smith, and there she is in her garden," said Carrie, jumping to her feet. As she dashed out of the door, Kate and Martha crowded at the window. Carrie's voice rang out from near the steps. "Mrs. Smith! Mrs. Smith! Do you know where the Hannigans are going to move to?"

XXIII.

The autumn smote the leaves, and the trees of Whilomville were panoplied in crimson and yellow.

The winds grew stronger, and in the melancholy purple of the nights the home shine of a window became a finer thing. The little boys, watching the sear and sorrowful leaves drifting down from the maples, dreamed of the near time when they could heap bushels in the streets and burn them during the abrupt evenings.

Three men walked down the Niagara Avenue. As they approached Judge Hagenthorpe's house he came down his walk to meet them in the manner of one who has been waiting.

"Are you ready, judge?" one said.

"All ready," he answered.

The four then walked to Trescott's house. He received them in his office, where he had been reading. He seemed surprised at this visit of four very active and influential citizens, but he had nothing to say of it.

After they were all seated, Trescott looked expectantly from one face to another. There was a little silence. It was broken by John Twelve, the wholesale grocer, who was worth $400,000, and reported to be worth over a million.

"Well, doctor," he said, with a short laugh, "I suppose we might as well admit at once that we've come to interfere in something which is none of our business."

"Why, what is it?" asked Trescott, again looking from one face to another. He seemed to appeal particularly to Judge Hagenthorpe, but the old man had his chin lowered musingly to his cane, and would not look at him.

"It's about what nobody talks of—much," said Twelve. "It's about Henry Johnson."

Trescott squared himself in his chair. "Yes?" he said.

Having delivered himself of the title, Twelve seemed to become more easy. "Yes," he answered, blandly, "we wanted to talk to you about it."

"Yes?" said Trescott.

Twelve abruptly advanced on the main attack. "Now see here, Trescott, we like you, and we have come to talk right out about this business. It may be none of our affairs and all that, and as for me, I don't mind if you tell me so; but I am not going to keep quiet and see you ruin yourself. And that's how we all feel."

"I am not ruining myself," answered Trescott.

"No, maybe you are not exactly ruining yourself," said Twelve, slowly, "but you are doing yourself a great deal of harm. You have changed from being the leading doctor in town to about the last one. It is mainly because there are always a large number of people who are very thoughtless fools, of course, but then that doesn't change the condition."

A man who had not heretofore spoken said, solemnly, "It's the women."

"Well, what I want to say is this," resumed Twelve: "Even if there are a lot of fools in the world, we can't see any reason why you should ruin yourself by opposing them. You can't teach them anything, you know."

"I am not trying to teach them anything." Trescott smiled wearily. "I—It is a matter of—well—"

"And there are a good many of us that admire you for it immensely," interrupted Twelve; "but that isn't going to change the minds of all those ninnies."

"It's the women," stated the advocate of this view again.

"Well, what I want to say is this," said Twelve. "We want you to get out of this trouble and strike your old gait again. You are simply killing your practice through your infernal pig-headedness. Now this thing is out of the ordinary, but there must be ways to—to beat the game somehow, you see. So we've talked it over—about a dozen of us—and, as I say, if you want to tell us to mind our own business, why, go ahead; but we've talked it over, and we've come to the conclusion that the only way to do is to get Johnson a place somewhere off up the valley, and—"

Trescott wearily gestured. "You don't know, my friend. Everybody is so afraid of him, they can't even give him good care. Nobody can attend to him as I do myself."

"But I have a little no-good farm up beyond Clarence Mountain that I was going to give to Henry," cried Twelve, aggrieved. "And if you—and if you—if you—through your house burning down, or anything—why, all the boys were prepared to take him right off your hands, and—and—"

Trescott arose and went to the window. He turned his back upon them. They sat waiting in silence. When he returned he kept his face in the shadow. "No, John Twelve," he said, "it can't be done."

There was another stillness. Suddenly a man stirred on his chair.

"Well, then, a public institution—" he began.

"No," said Trescott; "public institutions are all very good, but he is not going to one."

In the background of the group old Judge Hagenthorpe was thoughtfully smoothing the polished ivory head of his cane.

XXIV.

Trescott loudly stamped the snow from his feet and shook the flakes from his shoulders. When he entered the house he went at once to the dining-room, and then to the sitting-room. Jimmie was there, reading painfully in a large book concerning giraffes and tigers and crocodiles.

"Where is your mother, Jimmie?" asked Trescott.

"I don't know, pa," answered the boy. "I think she is upstairs."

Trescott went to the foot of the stairs and called, but there came no answer. Seeing that the door of the little drawing-room was open, he entered. The room was bathed in the half-light that came from the four dull panes of mica in the front of the great stove. As his eyes grew used to the shadows he saw his wife curled in an arm-chair. He went to her. "Why, Grace," he said, "didn't you hear me calling you?"

She made no answer, and as he bent over the chair he heard her trying to smother a sob in the cushion.

"Grace!" he cried. "You're crying!"

She raised her face. "I've got a headache, a dreadful headache, Ned."

"A headache?" he repeated, in surprise and incredulity.

He pulled a chair close to hers. Later, as he cast his eye over the zone of light shed by the dull red panes, he saw that a low table had been drawn close to the stove, and that it was burdened with many small cups and plates of uncut tea-cake. He remembered that the day was Wednesday, and that his wife received on Wednesdays.

"Who was here to-day, Gracie?" he asked.

From his shoulder there came a mumble, "Mrs. Twelve."

"Was she—um," he said. "Why—didn't Anna Hagenthorpe come over?"

The mumble from his shoulder continued, "She wasn't well enough."

Glancing down at the cups, Trescott mechanically counted them. There were fifteen of them. "There, there," he said. "Don't cry, Grace. Don't cry."

The wind was whining round the house, and the snow beat aslant upon the windows. Sometimes the coal in the stove settled with a crumbling sound, and the four panes of mica flashed a sudden new crimson. As he sat holding her head on his shoulder, Trescott found himself occasionally trying to count the cups. There were fifteen of them.

Walt Whitman, from "The Wound-Dresser" (1900)

The American poet Walt Whitman found himself working in hospitals as a nurse during the Civil War, when his brother George appeared on a listing of the wounded at the Battle of Fredericksburg. Whitman's description of one new amputee records his nursing duties as well as his sensitivity to the physical details of human pain.

From the stump of the arm, the amputated hand,
I undo the clotted lint, remove the slough, wash off the matter and blood,
Back on his pillow the soldier bends with curv'd neck and side-falling head,
His eyes are closed, his face is pale, he dares not look on the bloody stump,
And has not yet looked on it.

Helen Keller, from *The Story of My Life* (1902)

Helen Keller's education moves increasingly from learning based on sensation to knowledge of abstraction as her acquisition of language grows. Here Keller explains how she acquires the building blocks for an understanding of such abstract ideas as love on the basis of her experience of the natural world.

Chapter V

I recall many incidents of the summer of 1887 that followed my soul's sudden awakening. I did nothing but explore with my hands and learn the name of every object that I touched; and the more I handled things and learned their names and uses, the more joyous and confident grew my sense of kinship with the rest of the world.

When the time of daisies and buttercups came Miss Sullivan took me by the hand across the fields, where men were preparing the earth for the seed, to the banks of the Tennessee River, and there, sitting on the warm grass, I had my first lessons in the beneficence of nature. I learned how the sun and the rain make to grow out of the ground every tree that is pleasant to the sight and good for food, how birds build

Mark Twain and Helen Keller *(ca. 1908), by Isabelle B. Lyon (1868–1958). The U.S. humorist Mark Twain is photographed here with Helen Keller. Keller was photographed with many other celebrity figures, and here she is positioned in a characteristic pose that emphasizes her deaf-blindness for viewers.*

their nests and live and thrive from land to land, how the squirrel, the deer, the lion and every other creature finds food and shelter. As my knowledge of things grew I felt more and more the delight of the world I was in. Long before I learned to do a sum in arithmetic or describe the shape of the earth, Miss Sullivan had taught me to find beauty in the fragrant woods, in every blade of grass, and in the curves and dimples of my baby sister's hand. She linked my earliest thoughts with nature, and made me feel that "birds and flowers and I were happy peers."

But about this time I had an experience which taught me that nature is not always kind. One day my teacher and I were returning from a long ramble. The morning had been fine, but it was growing warm and sultry when at last we turned our faces homeward. Two or three times we stopped to rest under a tree by the wayside. Our last halt was under a wild cherry tree a short distance from the house. The shade was grateful, and the tree was so easy to climb that with my teacher's assistance I was able to scramble to a seat in the branches. It was so cool up in the tree that Miss Sullivan proposed that we have our luncheon there. I promised to keep still while she went to the house to fetch it.

Suddenly a change passed over the tree. All the sun's warmth left the air. I knew the sky was black, because all the heat, which meant light to me, had died out of the atmosphere. A strange odour came up from the earth. I knew it, it was the odour that always precedes a thunderstorm, and a nameless fear clutched at my heart. I felt absolutely alone, cut off from my friends and the firm earth. The immense, the unknown, enfolded me. I remained still and expectant; a chilling terror crept over me. I longed for my teacher's return; but above all things I wanted to get down from that tree.

There was a moment of sinister silence, then a multitudinous stirring of the leaves. A shiver ran through the tree, and the wind sent forth a blast that would have knocked me off had I not clung to the branch with might and main. The tree swayed and strained. The small twigs snapped and fell about me in showers. A wild impulse to jump seized me, but terror held me fast. I crouched down in the fork of the tree. The branches lashed about me. I felt the intermittent jarring that came now and then, as if something heavy had fallen and the shock had traveled up till it reached the limb I sat on. It worked my suspense up to the highest point, and just as I was thinking the tree and I should fall together, my teacher seized my hand and helped me down. I clung to her, trembling with joy to feel the earth under my feet once more. I had learned a new lesson—that nature "wages open war against her children, and under softest touch hides treacherous claws."

After this experience it was a long time before I climbed another tree. The mere thought filled me with terror. It was the sweet allurement of the mimosa tree in full bloom that finally overcame my fears. One beautiful spring morning when I was alone in the summer-house, reading, I became aware of a wonderful subtle fragrance in the air. I started up and instinctively stretched out my hands. It seemed as if the spirit of spring had passed through the summer-house. "What is it?" I asked, and the next minute I recognized the odour of the mimosa blossoms. I felt my way to the end of the garden, knowing that the mimosa tree was near the fence, at the turn of the path. Yes, there it was, all quivering in the warm sunshine, its blossom-laden branches almost touching the long grass. Was there ever anything so exquisitely beautiful in the world before! Its delicate blossoms shrank from the slightest earthly touch; it seemed as if a tree of paradise had been transplanted to earth. I made my way through a shower of petals to the great trunk and for one minute stood irresolute; then, putting my foot in the broad space between the forked branches, I pulled myself up into the tree. I had some difficulty in holding on, for the branches were very large and the bark hurt my hands. But I had a delicious sense that I was doing something unusual and wonderful so I kept on climbing higher and higher, until I reached a little seat which somebody had built there so long ago that it had grown part of the tree itself. I sat there for a long, long time, feeling like a fairy on a rosy cloud. After that I spent many happy hours in my tree of paradise, thinking fair thoughts and dreaming bright dreams.

Chapter VI

I had now the key to all language, and I was eager to learn to use it. Children who hear acquire language without any particular effort; the words that fall from others' lips they catch on the wing, as it were, delightedly, while the little deaf child must trap them by a slow and often painful process. But whatever the process, the result is wonderful. Gradually from naming an object we advance step by step until we have traversed the vast distance between our first stammered syllable and the sweep of thought in a line of Shakespeare.

At first, when my teacher told me about a new thing I asked very few questions. My ideas were vague, and my vocabulary was inadequate; but as my knowledge of things grew, and I learned more and more words, my field of inquiry broadened, and I would return again and again to the same subject, eager for further information. Sometimes a new word revived an image that some earlier experience had engraved on my brain.

I remember the morning that I first asked the meaning of the word, "love." This was before I knew many words. I had found a few early violets in the garden and brought them to my teacher. She tried to kiss me: but at that time I did not like to have any one kiss me except my mother. Miss Sullivan put her arm gently round me and spelled into my hand, "I love Helen."

"What is love?" I asked.

She drew me closer to her and said, "It is here," pointing to my heart, whose beats I was conscious of for the first time. Her words puzzled me very much because I did not then understand anything unless I touched it.

I smelt the violets in her hand and asked, half in words, half in signs, a question which meant, "Is love the sweetness of flowers?"

"No," said my teacher.

Again I thought. The warm sun was shining on us.

"Is this not love?" I asked, pointing in the direction from which the heat came. "Is this not love?"

It seemed to me that there could be nothing more beautiful than the sun, whose warmth makes all things grow. But Miss Sullivan shook her head, and I was greatly puzzled and disappointed. I thought it strange that my teacher could not show me love.

A day or two afterward I was stringing beads of different sizes in symmetrical groups—two large beads, three small ones, and so on. I had made many mistakes, and Miss Sullivan had pointed them out again and again with gentle patience. Finally I noticed a very obvious error in the sequence and for an instant I concentrated my attention on the lesson and tried to think how I should have arranged the beads. Miss Sullivan touched my forehead and spelled with decided emphasis, "Think."

In a flash I knew that the word was the name of the process that was going on in my head. This was my first conscious perception of an abstract idea.

For a long time I was still—I was not thinking of the beads in my lap, but trying to find a meaning for "love" in the light of this new idea. The sun had been under a cloud all day, and there had been brief showers; but suddenly the sun broke forth in all its southern splendour.

Again I asked my teacher, "Is this not love?"

"Love is something like the clouds that were in the sky before the sun came out," she replied. Then in simpler words than these, which at that time I could not have understood, she explained: "You cannot touch the clouds, you know; but you feel the rain and know how glad the flowers and the thirsty earth are to have it after a hot day. You cannot touch love either;

but you feel the sweetness that it pours into everything. Without love you would not be happy or want to play."

The beautiful truth burst upon my mind—I felt that there were invisible lines stretched between my spirit and the spirits of others.

From the beginning of my education Miss Sullivan made it a practice to speak to me as she would speak to any hearing child; the only difference was that she spelled the sentences into my hand instead of speaking them. If I did not know the words and idioms necessary to express my thoughts she supplied them, even suggesting conversation when I was unable to keep up my end of the dialogue.

This process was continued for several years; for the deaf child does not learn in a month, or even in two or three years, the numberless idioms and expressions used in the simplest daily intercourse. The little hearing child learns these from constant repetition and imitation. The conversation he hears in his home stimulates his mind and suggests topics and calls forth the spontaneous expression of his own thoughts. This natural exchange of ideas is denied to the deaf child. My teacher, realizing this, determined to supply the kinds of stimulus I lacked. This she did by repeating to me as far as possible, verbatim, what she heard, and by showing me how I could take part in the conversation. But it was a long time before I ventured to take the initiative, and still longer before I could find something appropriate to say at the right time.

The deaf and the blind find it very difficult to acquire the amenities of conversation. How much more this difficulty must be augmented in the case of those who are both deaf and blind! They cannot distinguish the tone of the voice or, without assistance, go up and down the gamut of tones that give significance to words; nor can they watch the expression of the speaker's face, and a look is often the very soul of what one says.

▣ W. E. B. Du Bois, from "The Talented Tenth" (1903)

In one of the most famous essays in African American literature, Du Bois champions his vision of an exceptional group of individuals who might set the tone and educate the great majority of African American citizens. The "talented tenth" would represent a notion of intellectual superiority parallel to that espoused by Galton in Hereditary Genius.

The Negro race, like all races, is going to be saved by its exceptional men. The problem of education, then, among Negroes must first of all deal with the Talented Tenth; it is the problem of developing the Best of this race that they may guide the Mass away from the contamination and death of the Worst, in their own and other races. Now the training of men is a difficult and intricate task. Its technique is a matter for educational experts, but its object is for the vision of seers. If we make money the object of man-training, we shall develop money-makers but not necessarily men; if we make technical skill the object of education, we may possess artisans but not, in nature, men. Men we shall have only as we make manhood the object of the work of the schools—intelligence, broad sympathy, knowledge of the world that was and is, and of the relation of men to it—this is the curriculum of that Higher Education which must underlie true life. On this foundation we may build bread winning, skill of hand and quickness of brain, with never a fear lest the child and man mistake the means of living for the object of life.

If this be true—and who can deny it—three tasks lay before me; first to show from the past that the Talented Tenth as they have risen among American Negroes have been worthy of leadership; secondly to show how these men may be educated and developed; and thirdly to show their relation to the Negro problem.

You misjudge us because you do not know us. From the very first it has been the educated and intelligent of the Negro people that have led and elevated the mass, and the sole obstacles that nullified and retarded their efforts were slavery and race prejudice; for what is slavery but the legalized survival of the unfit and the nullification of the work of natural internal leadership? Negro leadership therefore sought from the first to rid the race of this awful incubus that it might make way for natural selection and the survival of the fittest. In colonial days came Phillis Wheatley and Paul Cuffe striving against the bars of prejudice; and Benjamin Banneker, the almanac maker, voiced their longings when he said to Thomas Jefferson, "I freely and cheerfully acknowledge that I am of the African race and in colour which is natural to them, of the deepest dye; and it is under a sense of the most profound gratitude to the Supreme Ruler of the Universe, that I now confess to you that I am not under that state of tyrannical thraldom and inhuman captivity to which too many of my brethren are doomed, but that I have abundantly tasted of the fruition of those blessings which proceed from that free and unequalled liberty with which you are favored, and which I hope you will willingly allow, you have mercifully received from the immediate hand of that Being from whom proceedeth every good and perfect gift.

"Suffer me to recall to your mind that time, in which the arms of the British crown were exerted with every powerful effort, in order to reduce you to a state of servitude; look back, I entreat you, on the variety of dangers to which you were exposed; reflect on that period in which every human aid appeared unavailable, and in which even hope and fortitude wore the aspect of inability to the conflict, and you cannot but be led to a serious and grateful sense of your miraculous and providential preservation, you cannot but acknowledge, that the present freedom and tranquility which you enjoy, you have mercifully received, and that a peculiar blessing of heaven.

"This, sir, was a time when you clearly saw into the injustice of a state of Slavery, and in which you had just apprehensions of the horrors of its condition. It was then that your abhorrence thereof was so excited, that you publicly held forth this true and invaluable doctrine, which is worthy to be recorded and remembered in all succeeding ages: 'We hold these truths to be self evident, that all men are created equal; that they are endowed with certain inalienable rights, and that among these are life, liberty and the pursuit of happiness.'"

Then came Dr. James Derham, who could tell even the learned Dr. Rush something of medicine, and Lemuel Haynes, to whom Middlebury College gave an honorary A. M. in 1804. These and others we may call the Revolutionary group of distinguished Negroes—they were persons of marked ability, leaders of a Talented Tenth, standing conspicuously among the best of their time. They strove by word and deed to save the color line from becoming the line between the bond and free, but all they could do was nullified by Eli Whitney and the Curse of Gold. So they passed into forgetfulness.

But their spirit did not wholly die; here and there in the early part of the century came other exceptional men. Some were natural sons of unnatural fathers and were given often a liberal training and thus a race of educated mulattoes sprang up to plead for black men's rights. There was Ira Aldridge, whom all Europe loved to honor; there was that Voice crying in the Wilderness, David Walker, and saying:

"I declare it does appear to me as though some nations think God is asleep, or that he made the Africans for nothing else but to dig their mines and work their farms, or they cannot believe history sacred or profane. I ask every man who has a heart, and is blessed with the privilege of believing—Is not God a God of justice to all his creatures? Do you say he is? Then if he gives peace and tranquility to tyrants and permits them to keep our fathers, our mothers, ourselves and our children in eternal ignorance and wretchedness to support them and their families, would he be to us a God of Justice? I ask, O, ye Christians, who hold us and our children in the most abject ignorance and degradation that ever a people were afflicted with since the world began—I say if God gives you peace and tranquility, and suffers you thus to go on afflicting us, and our children, who have never given you the least provocation—would He be to us a God of Justice? If you will allow that we are men, who feel for each other, does not the blood of our fathers and of us, their children, cry aloud to the Lord of Sabaoth against you for the cruelties and murders with which you have and do continue to afflict us?"

This was the wild voice that first aroused Southern legislators in 1829 to the terrors of abolitionism.

In 1831 there met that first Negro convention in Philadelphia, at which the world gaped curiously but which bravely attacked the problems of race and slavery, crying out against persecution and declaring that "Laws as cruel in themselves as they were unconstitutional and unjust, have in many places been enacted against our poor, unfriended and unoffending brethren (without a shadow of provocation on our part), at whose bare recital the very savage draws himself up for fear of contagion—looks noble and prides himself because he bears not the name of Christian." Side by side this free Negro movement, and the movement for abolition, strove until they merged in to one strong stream. Too little notice has been taken of the work which the Talented Tenth among Negroes took in the great abolition crusade. From the very day that a Philadelphia colored man became the first subscriber to Garrison's "Liberator," to the day when Negro soldiers made the Emancipation Proclamation possible, black leaders worked shoulder to shoulder with white men in a movement, the success of which would have been impossible without them. There was Purvis and Remond, Pennington and Highland Garnett, Sojourner Truth and Alexander Crummel, and above, Frederick Douglass—what would the abolition movement have been without them? They stood as living examples of the possibilities of the Negro race, their own hard experiences and well wrought culture said silently more than all the drawn periods of orators—they were the men who made American slavery impossible. As Maria Weston Chapman said, from the school of anti-slavery agitation, "a throng of authors, editors, lawyers, orators and accomplished gentlemen of color have taken their degree! It has equally implanted hopes and aspirations, noble thoughts, and sublime purposes, in the hearts of both races. It has prepared the white man for the freedom of the black man, and it has made the black man scorn the thought of enslavement, as does a white man, as far as its influence has extended. Strengthen that noble influence! Before its organization, the country only saw here and there in slavery some faithful Cudjoe or Dinah, whose strong natures blossomed even in bondage, like a fine plant beneath a heavy stone. Now, under the elevating and cherishing influence of the American Anti-slavery Society, the colored race, like the white, furnishes Corinthian capitals for the noblest temples."

Where were these black abolitionists trained? Some, like Frederick Douglass, were self-trained, but yet trained liberally; others, like Alexander Crummell and McCune Smith, graduated from famous foreign universities. Most of them rose up through the colored schools of New York and Philadelphia and Boston, taught by college-bred men like Russworm, of Dartmouth, and college-bred white men like Neau and Benezet.

After emancipation came a new group of educated and gifted leaders: Langston, Bruce and Elliot, Greener, Williams and Payne. Through political organization, historical and polemic writing and moral regeneration, these men strove to uplift their people. It is the fashion of to-day to sneer at them and to say that with freedom Negro leadership should have begun at the plow and not in the Senate—a foolish and mischievous lie; two hundred and fifty years that black serf toiled at the plow and yet that toiling was in vain till the Senate passed the war amendments; and two hundred and fifty years more the half-free serf of to-day may toil at his plow, but unless he have political rights and righteously guarded civic status, he will still remain the poverty-stricken and ignorant plaything of rascals, that he now is. This all sane men know even if they dare not say it.

And so we come to the present—a day of cowardice and vacillation, of strident wide-voiced wrong and faint hearted compromise; of double-faced dallying with Truth and Right. Who are to-day guiding the work of the Negro people? The "exceptions" of course. And yet so sure as this Talented Tenth is pointed out, the blind worshippers of the Average cry out in alarm: "These are exceptions, look here at death, disease and crime—these are the happy rule." Of course they are the rule, because a silly nation made them the rule: Because for three long centuries this people lynched Negroes who dared to be brave, raped black women who dared to be virtuous, crushed dark-hued youth who dared to be ambitious, and encouraged and made to flourish servility and lewdness and apathy. But not even this was able to crush all manhood and chastity and aspiration from black folk. A saving remnant continually survives and persists, continually aspires, continually shows itself in thrift and ability and character. Exceptional it is to be sure, but this is its chiefest promise; it shows the capability of Negro blood, the promise of black men. Do Americans ever stop to reflect that there are in this land a million men of Negro blood, well-educated, owners of homes, against the honor of whose womanhood no breath was ever raised, whose men occupy positions of trust and usefulness, and who, judged by any standard, have reached the full measure of the best type of modern European culture? Is it fair, is it decent, is it Christian to ignore these facts of the Negro problem, to belittle such aspiration, to nullify such leadership and seek to crush these people back into the mass out of which by toil and travail, they and their fathers have raised themselves?

Can the masses of the Negro people be in any possible way more quickly raised than by the effort and example of this aristocracy of talent and character? Was there ever a nation on God's fair earth civilized from the bottom upward? Never; it is, ever was and ever will be from the top downward that culture filters. The Talented Tenth rises and pulls all that are worth the saving up to their vantage ground. This is the history of human progress; and the two historic mistakes which have hindered that progress were the thinking first that no more could ever rise save the few already risen; or second, that it would better the unrisen to pull the risen down. . . .

The problem of training the Negro is to-day immensely complicated by the fact that the whole question of the efficiency and appropriateness of our present systems of education, for any kind of child, is a matter of active debate, in which final settlement seems still afar off. Consequently it often happens that persons arguing for or against certain systems of education for Negroes, have these controversies in mind and miss the real question at issue. The main question, so far as the Southern Negro is concerned, is: What under the present circumstance, must a system of education do in order to raise the Negro as quickly as possible in the scale of civilization? The answer to this question seems to me clear: It must strengthen the Negro's character, increase his knowledge and teach him to earn a living. Now it goes without saying that it is hard to do all these things simultaneously or suddenly and that at the same time it will not do to give all the attention to one and neglect the others; we could give black boys trades, but that alone will not civilize a race of ex-slaves; we might simply increase their knowledge of the world, but this would not necessarily make them wish to use this knowledge honestly; we might seek to strengthen character and purpose, but to what end if this people have nothing to eat or to wear? A system of education is not one thing, nor does it have a single definite object, nor is it a mere matter of schools. Education is that whole system of human training within and without the school house walls, which molds and develops men. If then we start out to train an ignorant and unskilled people with a heritage of bad habits, our system of training must set before itself two great aims—the one dealing with knowledge and character, the other part seeking to give the child the technical knowledge necessary for him to earn a living under the present circumstances. These objects are accomplished in part by the opening of the common schools on the one, and of the industrial schools on the other. But only in part, for there must also be trained those who are to teach these schools—men and women of knowledge and culture and technical skill who understand modern civilization, and have the training and aptitude to impart it to the children under them.

Carry A. Nation, from *The Use and Need of the Life of Carry A. Nation* (1905)

Carry Nation, who is best known for her radical advocacy of temperance, included in her autobiography a discussion of her child's chronic health issues (and her interpretation of them as "the result of a drunken father and a distracted mother"). The Campbellite religious dimension of this excerpt is particularly strong, and probably strange to many, but it is quite in line with the temperance rhetoric of the time.

About this time my little Charlien, who had been such a help to me, began to go into a decline, until she was taken down with typhoid fever. Her case was violent and she was delirious from the first. This my only child was peculiar. She was the result of a drunken father and a distracted mother. The curse of heredity is one of the most heart-breaking results of the saloon. Poor little children are brought into the world, cursed by disposition and disease, entailed on them. How can mothers be true to their offspring with a constant dread of the nameless horrors wives are exposed to by being drunkards' wives. Men will not raise domestic animals under conditions where the mothers may bring forth weak or deformed offspring. My precious child seemed to have taken a perfect dislike to Christianity. This was a great grief to me, and I used to pray to God to save her soul at any cost; I often prayed for bodily affliction on her, if that was what would make her love and serve God. Anything for her eternal salvation.

Her right cheek was very much swollen, and on examination we found there was an eating sore inside her cheek. This kept up in spite of all remedies, and at last the whole of her right cheek fell out, leaving the teeth bare. My friends and boarders were very angry at the physician, saying she was salivated. From the first something told me this is an answer to your prayer. At this time, when her life was despaired of, I had an intense longing to save my child, who was so dear to me. I said: "Oh, God, let me keep a piece of my child." A minister said: "Don't pray for the life of your child; she will be so deformed it were better she were dead." I could not feel this way. After being at death's door for nine days, she began to recover. The wound in her face healed up to a hole about the size of a twenty-five cent piece. Her jaws closed and remained so for eight years. The sickness of my daughter and the keeping up of the hotel was such a tax on my mind, that for six months all transactions would recede from my memory. For instance, if anyone told me something, in an hour afterwards, I could not tell whether it had been hours, days or months since it was told me. I never entirely recovered from this, still being forgetful of names, dates and circumstances, unless they are particularly impressed upon my mind. When I could afford it, I took my child, then twelve years old, down to Galveston, put her under the care of Dr. Dowell for the purpose of closing the hole in her cheek. I had to leave the little one down there among strangers, for I could not afford to stay with her. A mother only will know what this means. After four operations the place was closed up in her cheek, still her mouth was closed, her teeth close together. I suffered torture all these years for fear she might strangle to death. I took her to San Antonio, Texas, to Dr. Herff, and he and his two sons removed a section of the jawbone, expecting to make an artificial joint, enabling her to use the other side of her jaw. After all this, the operation was a failure, and her jaws closed up again.

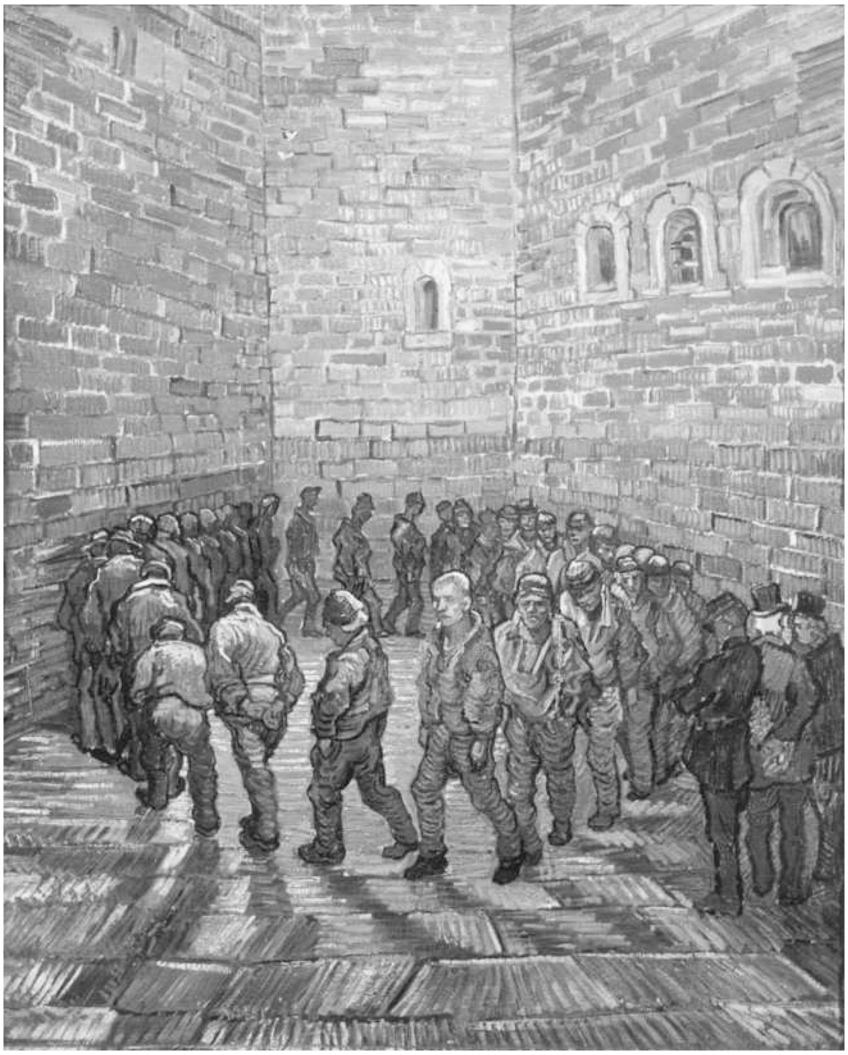
Upton Sinclair, from *The Jungle* (1906)

Sinclair's novel about the ravages of the meatpacking industry in Chicago on the lives of nonunionized labor was instrumental in leading to reforms. The first excerpt below discusses the ubiquitous prevalence of disability among children of the working classes. The second excerpt discusses the descent of the out-of-work protagonist, Jurgis, into abject poverty and a life of begging for work that he can no longer perform physically.

From Chapter 13

During this time that Jurgis was looking for work occurred the death of little Kristoforas, one of the children of Teta Elzbieta. Both Kristoforas and his brother, Juozapas, were cripples, the latter having lost one leg by having it run over, and Kristoforas having congenital dislocation of the hip, which made it impossible for him ever to walk. He was the last of Teta Elzbieta's children, and perhaps he had been intended by nature to let her know that she had had enough. At any rate he was wretchedly sick and undersized; he had the rickets, and though he was over three years old, he was no bigger than an ordinary child of one. All day long he would crawl around the floor in a filthy little dress, whining and fretting; because the floor was full of drafts he was always catching cold, and snuffling because his nose ran. This made him a nuisance, and a source of endless trouble in the family. For his mother, with unnatural perversity, loved him best of all her children, and made a perpetual fuss over him—would let him do anything undisturbed, and would burst into tears when his fretting drove Jurgis wild.

And now he died. Perhaps it was the smoked sausage he had eaten that morning—which may have been made out of some of the tubercular pork that was condemned as unfit for export. At any rate, an hour after eating it, the child had begun to cry with pain, and in another hour he was rolling about on the floor in convulsions. Little Kotrina, who was all alone with him, ran out screaming for help, and after a while a doctor came, but not until Kristoforas had howled his last howl. No one was really sorry about this except poor Elzbieta, who was inconsolable. Jurgis announced that so far as he was concerned the child would have to be buried by the city, since they had no money for a funeral; and at this the poor woman almost went out of her senses, wringing her hands and screaming with grief and despair. Her child to be buried in a pauper's grave! And her stepdaughter to stand by and hear it said without protesting! It was enough to make Ona's father rise up out of his grave to rebuke her! If it had come to this, they might as well give up at once, and be buried all of them together! . . . In the end Marija said that she would help with ten dollars; and Jurgis being still obdurate, Elzbieta went in tears and begged the money from the neighbors, and so little Kristoforas had a mass and a hearse with white plumes on it, and a tiny plot in a graveyard with a wooden cross to mark the place. The poor mother was not the same for months after that; the mere sight of the floor where little Kristoforas had crawled about would make her weep. He had never had a fair chance, poor little fellow, she would say. He had been handicapped from his birth. If only she had heard about it in time, so that she might have had that great doctor to cure him of his lameness! . . . Some time ago, Elzbieta was told, a Chicago billionaire had paid a fortune to bring a great European surgeon over to cure his little daughter of the same disease from which Kristoforas had suffered. And because this surgeon had to have bodies to demonstrate upon, he announced that he would treat the children of the poor, a piece of magnanimity over which the papers became quite eloquent. Elzbieta, alas, did not read the papers, and no one had told her; but perhaps it was as well, for just then they would not have had the carfare to spare to go every day to wait upon the surgeon, nor for that matter anybody with the time to take the child. . . .



Prisoner's Walk *(1890), by Vincent Van Gogh (1853–1890). Painted while Van Gogh was an inmate at the asylum in San Remy, the painting captures the claustrophobia and despair that accompany individual loss of liberty at the hands of institutions.*

From Chapter 27

Poor Jurgis was now an outcast and a tramp once more. He was crippled—he was as literally crippled as any wild animal which has lost its claws, or been torn out of its shell. He had been shorn, at one cut, of all those mysterious weapons whereby he had been able to make a living easily and to escape the consequences of his actions. He could no longer command a job when he wanted it; he could no longer steal with impunity—he must take his chances with the common herd. Nay worse, he dared not mingle with the herd—he must hide himself, for he was one marked out for destruction. His old companions would betray him, for the sake of the influence they would gain thereby; and he would be made to suffer, not merely for the offense he had committed, but for others which would be laid at his door, just as had been done for some poor devil on the occasion of that assault upon the "country customer" by him and Duane.

And also he labored under another handicap now. He had acquired new standards of living, which were not easily to be altered. When he had been out of work before, he had been content if he could sleep in a doorway or under a truck out of the rain, and if he could get fifteen cents a day for saloon lunches. But now he desired all sorts of other things, and suffered because he had to do without them. He must have a drink now and then, a drink for its own sake, and apart from the food that came with it. The craving for it was strong enough to master every other consideration—he would have it, though it were his last nickel and he had to starve the balance of the day in consequence.

Jurgis became once more a besieger of factory gates. But never since he had been in Chicago had he stood less chance of getting a job than just then. For one thing, there was the economic crisis, the million or two of men who had been out of work in the spring and summer, and were not yet all back, by any means. And then there was the strike, with seventy thousand men and women all over the country idle for a couple of months—twenty thousand in Chicago, and many of them now seeking work throughout the city. It did not remedy matters that a few days later the strike was given up and about half the strikers went back to work; for every one taken on, there was a "scab" who gave up and fled. The ten or fifteen thousand "green" Negroes, foreigners, and criminals were now being turned loose to shift for themselves. Everywhere Jurgis went he kept meeting them, and he was in an agony of fear lest some one of them should know that he was "wanted." He would have left Chicago, only by the time he had realized his danger he was almost penniless; and it would be better to go to jail than to be caught out in the country in the winter time.

At the end of about ten days Jurgis had only a few pennies left; and he had not yet found a job—not even a day's work at anything, not a chance to carry a satchel. Once again, as when he had come out of the hospital, he was bound hand and foot, and facing the grisly phantom of starvation. Raw, naked terror possessed him, a maddening passion that would never leave him, and that wore him down more quickly than the actual want of food. He was going to die of hunger! The fiend reached out its scaly arms for him—it touched him, its breath came into his face; and he would cry out for the awfulness of it, he would wake up in the night, shuddering, and bathed in perspiration, and start up and flee. He would walk, begging for work, until he was exhausted; he could not remain still—he would wander on, gaunt and haggard, gazing about him with restless eyes. Everywhere he went, from one end of the vast city to the other, there were hundreds of others like him; everywhere was the sight of plenty and the merciless hand of authority waving them away. There is one kind of prison where the man is behind bars, and everything that he desires is outside; and there is another kind where the things are behind the bars, and the man is outside. . . .

Joseph Conrad, from *The Secret Agent* (1907)

The mind is hierarchically superior to the body in the Western tradition; it follows from this that human beings whose minds are weak are not wise enough to restrain their bodily passions. Here Conrad displays Stevie's inability to control himself, but he also illustrates the split between mind and body in the characters of Mrs. Verloc and Stevie. The question is, how long will Mrs. Verloc be able to exercise mental control over Stevie's powerful physical inclinations?

Stevie, left alone beside the private lamp-post of the Charity, his hands thrust deep into his pockets, glared with vacant sulkiness. At the bottom of his pockets his incapable, weak hands were clenched hard into a pair of angry fists. In the face of anything which affected directly or indirectly his morbid dread of pain, Stevie ended by turning vicious. A magnanimous indignation swelled his frail chest to bursting, and caused his candid eyes to squint. Supremely wise in knowing his own powerlessness, Stevie was not wise enough to restrain his passions. The tenderness of his universal charity had two phases as indissolubly joined and connected as the reverse and obverse sides of a medal. The anguish of immoderate compassion was succeeded by the pain of an innocent but pitiless rage. Those two states expressing themselves outwardly by the same signs of futile bodily agitation, his sister Winnie soothed his excitement without ever fathoming its twofold character. Mrs Verloc wasted no portion of this transient life in seeking for fundamental information. This is a sort of economy having all the appearances and some of the advantages of prudence. Obviously it may be good for one not to know too much. And such a view accords very well with constitutional indolence.

On that evening on which it may be said that Mrs Verloc's mother having parted for good from her children had also departed this life, Winnie Verloc did not investigate her brother's psychology. The poor boy was excited, of course. After once more assuring the old woman on the threshold that she would know how to guard against the risk of Stevie losing himself for very long on his pilgrimages of filial piety, she took her brother's arm to walk away. Stevie did not even mutter to himself, but with the special sense of sisterly devotion developed in her earliest infancy, she felt that the boy was very much excited indeed. Holding tight to his arm, under the appearance of leaning on it, she thought of some words suitable to the occasion.

"Now, Stevie, you must look well after me at the crossings, and get first into the bus, like a good brother."

This appeal to manly protection was received by Stevie with his usual docility. It flattered him. He raised his head and threw out his chest.

"Don't be nervous, Winnie. Mustn't be nervous! Bus all right," he answered in a brusque, slurring stammer partaking of the timorousness of a child and the resolution of a man. He advanced fearlessly with the woman on his arm, but his lower lip drooped. Nevertheless, on the pavement of the squalid and wide thoroughfare, whose poverty in all the amenities of life stood foolishly exposed by a mad profusion of gas-lights, their resemblance to each other was so pronounced as to strike the casual passers-by.

Before the doors of the public-house at the corner, where the profusion of gas-light reached the height of positive wickedness, a four-wheeled cab standing by the kerbstone, with no one on the box, seemed cast out into the gutter on account of irremediable decay. Mrs Verloc recognized the conveyance. Its aspect was so profoundly lamentable, with such a perfection of grotesque misery and weirdness of macabre detail, as if it were the Cab of Death itself that Mrs Verloc, with that ready compassion of a woman for a horse (when she is not sitting behind him), exclaimed vaguely!

"Poor brute."

Hanging back suddenly, Stevie inflicted an arresting jerk upon his sister.

"Poor! Poor!" he ejaculated appreciatively. "Cabman poor, too. He told me himself."

The contemplation of the infirm and lonely steed overcame him. Jostled, but obstinate, he would remain there, trying to express the view newly opened to his sympathies of the human and equine misery in close association. But it was very difficult. "Poor brute, poor people!" was all he could repeat. It did not seem forcible enough, and he came to a stop with an angry splutter. "Shame!" Stevie was no master of phrases, and perhaps for that very reason his thoughts lacked clearness and precision. But he felt with great completeness and some profundity. That little word contained all his sense of indignation and horror at one sort of wretchedness having to feed upon the anguish of the other—as the poor cabman beating the poor horse in the name, as it were, of his poor kids at home. And Stevie knew what it was to be beaten. He knew it from experience. It was a bad world. Bad! Bad!

Mrs Verloc, his only sister, guardian, and protector, could not pretend to such depths of insight. Moreover, she had not experienced the magic of the cabman's eloquence. She was in the dark as to the inwardness of the word "Shame." And she said placidly:

"Come along, Stevie. You can't help that."

The docile Stevie went along; but now he went along without pride, shamblingly, and muttering half words, and even words that would have been whole if they had not been made up of halves that did not belong to each other. It was as though he had been trying to fit all the words he could remember to his sentiments in order to get some sort of corresponding idea. And, as a matter of fact, he got it at last. He hung back to utter it at once.

"Bad world for poor people."

Directly he had expressed that thought he became aware that it was familiar to him already in all its consequences. This circumstance strengthened his conviction immensely, but also augmented his indignation. Somebody, he felt, ought to be punished for it—punished with great severity. Being no sceptic, but a moral creature, he was in a manner at the mercy of his righteous passions.

"Beastly!" he added, concisely.

It was clear to Mrs Verloc that he was greatly excited.

"Nobody can help that," she said. "Do come along. Is that the way you're taking care of me?"

Stevie mended his pace obediently. He prided himself on being a good brother. His morality, which was very complete, demanded that from him. Yet he was pained at the information imparted by his sister Winnie—who was good. Nobody could help that! He came along gloomily, but presently he brightened up. Like the rest of mankind, perplexed by the mystery of the universe, he had his moments of consoling trust in the organized powers of the earth.

"Police," he suggested, confidently.

"The police aren't for that," observed Mrs Verloc, cursorily, hurrying on her way.

Stevie's face lengthened considerably. He was thinking. The more intense his thinking, the slacker was the droop of his lower jaw. And it was with an aspect of hopeless vacancy that he gave up his intellectual enterprise.

"Not for that?" he mumbled, resigned but surprised. "Not for that?" He had formed for himself an ideal conception for the metropolitan police as a sort of benevolent institution for the suppression of evil. The notion of benevolence especially was very closely associated with his sense of the power of the men in blue. He had liked all police constables tenderly, with a guileless trustfulness. And he was pained. He was irritated, too, by a suspicion of duplicity in the members of the force. For Stevie was frank and as open as the day himself. What did they mean by pretending then? Unlike his sister, who put her trust in face values, he wished to go to the bottom of the matter. He carried on his inquiry by means of an angry challenge.

"What are they for then, Winn? What are they for? Tell me."

Winnie disliked controversy. But fearing most a fit of black depression consequent on Stevie missing his mother very much at first, she did not altogether decline the discussion. Guiltless of all irony, she answered yet in a form which was not perhaps unnatural in the wife of Mr Verloc, Delegate of the Central Red Committee, personal friend of certain anarchists, and a votary of social revolution.

"Don't you know what the police are for, Stevie? They are there so that them as have nothing shouldn't take anything away from them who have."

She avoided using the verb "to steal," because it always made her brother uncomfortable. For Stevie was delicately honest. Certain simple principles had been instilled into him so anxiously (on account of his "queerness") that the mere names of certain transgressions filled him with horror. He had been always easily impressed by speeches. He was impressed and startled now, and his intelligence was very alert.

"What?" he asked at once, anxiously. "Not even if they were hungry? Mustn't they?"

The two had paused in their walk.

"Not if they were ever so," said Mrs Verloc, with the equanimity of a person untroubled by the problem of the distribution of wealth and exploring the perspective of the roadway for an omnibus of the right colour. "Certainly not. But what's the use of talking about all that? You aren't ever hungry."

She cast a swift glance at the boy, like a young man, by her side. She saw him amiable, attractive, affectionate and only a little, a very little peculiar. And she could not see him otherwise, for he was connected with what there was of the salt of passion in her tasteless life—the passion of indignation, of courage, of pity, and even of self-sacrifice. She did not add: "And you aren't likely ever to be as long as I live." But she might very well have done so, since she had taken effectual steps to that end. Mr Verloc was a very good husband. It was her honest impression that nobody could help liking the boy. She cried out suddenly:

"Quick, Stevie. Stop that green bus."

And Stevie, tremulous and important with his sister Winnie on his arm, flung up the other high above his head at the approaching bus, with complete success.

Clifford Beers, from *A Mind That Found Itself* (1910)

The story of Clifford Beers's hallucinations and suicide attempts, which led to his being committed to an asylum, provides the author with an opportunity to reflect upon care methods in U.S. asylums. In this excerpt, he examines the abuse applied to patients by their personal attendants and the way in which such abuse can be fostered by the institutions in which the attendants work.

XXIX

The central problem in the care of the insane is the elimination of actual physical abuse. What I have narrated from my own experience and from the experiences of others makes clear enough the nature of the average attendant. Under a bad regime their baser natures gradually gain the mastery. Surprising as it may seem, many an assault is due in the last analysis to a wanton desire to satisfy what amounts to a craving for human blood. This fact is well illustrated in the remark of an attendant, in the Kentucky institution already referred to, who said, "When I came here if any one had told me that I would be guilty of striking a patient I would have called him crazy himself, but now I take delight in punching hell out of them."

What is responsible for the development of the brutal attendant and his continued existence?

In the first place, not only do locks and bars *protect* men mean enough to abuse the helpless, the sense of security itself really *inspires* them to wicked deeds. And this feeling of security is strengthened by the knowledge that chance witnesses can but rarely testify convincingly in a court of law. Being removed from the restraining influence of sane eyes, the attendant does not fear to abuse, or (the vicious type) even sometimes to kill a patient. At the worst he sees no greater penalty in store for him than the loss of his position. The chance of arrest and trial is so remote as to escape consideration; and a trial has few terrors for such attendants as are arrested, for acquittal is almost certain. Indeed, on those rare occasions when attendants happen to be indicted for murder or manslaughter, the public generally gives them the benefit of the doubt, assuming that their work is highly dangerous, and arguing that the occasional sacrifice of the life of an insane patient is unavoidable, therefore justifiable. In this the public is in error, for, though the work in question may be, and at times *is,* harassing, it is, by no means, peculiarly hazardous. The number of unprovoked attacks made upon attendants by insane patients is, in fact, small, and would become almost negligible were all patients treated kindly from the moment of commitment.

But can we put all the blame on attendants for assaulting patients when the management shows no aggressive disposition to protect the latter? Such indifference is far more reprehensible than the cowardly conduct of ill-paid men, the majority of whom have had few advantages of education. The professional thug-attendant who, when a fellow-attendant is assaulting a patient, deliberately turns his back so that he may say, if ever questioned, that he saw no assault, is, in my opinion, less deserving of censure than those doctors who, knowing that brutality is common in their institution, weakly resign themselves to what they call "conditions."

Much of the suffering among the insane to-day is, in my opinion, due to the giving of too much authority to assistant physicians. Many of them, especially the young and inexperienced, are not to be trusted implicitly. Or, if they are to be given almost absolute authority over the patients in wards assigned to their care, let the superintendent exercise his authority to set aside any order which he may deem inexpedient or unjust. All superintendents have such authority. What I wish to emphasize is that they too often fail to exercise it. As a result of their laxness, or timidity—a timidity perhaps inspired by a misconception of the ethics of their profession—the helpless patient is permitted unnecessarily to suffer; and, I regret to record, frequently is this suffering of the patient due to what seems a selfish desire of the superintendent to preserve peace in his official family—the medical staff. Official peace at such a price amounts to crime.

But quite as culpable as lax discipline is the selfish desire on the part of doctors in authority to escape annoying investigations. When it does happen that they cannot avoid reporting felonious assaults or suspected murders to the proper authorities, their action, I regret to say, is too often in mere self-defense, and not from a righteous desire to protect their patients. Knowing that the battered and mutilated condition of the corpse, or a living victim of abuse, for that matter, will arouse suspicion on the part of the relatives of the victim, those in authority sometimes take the initiative in order to "save their face." In making this assertion I am well within the bounds of charity and truth, and the conduct of this type of doctor at the subsequent trial invariably is such as to support my contention. This behavior is quite human; for, let it be borne in mind that almost every honest investigation into these suspicious deaths reveals a greater or less degree—sometimes a criminal degree—of neglect on the part of the doctors themselves. If cornered at last by an aroused public opinion they are too ready to shift the responsibility upon the ignorant and untrained attendants whose brutality is but the reflex of the doctors' indifference, neglect, or cowardice. But this is the last resort. Usually they will first equivocate to the verge of deliberate falsehood. They will outrun the public by giving the benefit of all doubts to the attendants. Not to do so would in many cases cause the accused to turn on them and reveal conditions they would prefer to hide. Human nature, like Nature herself, is influenced by immutable laws. Self-interest is apt to kill one's higher feelings. To fight the fight of the oppressed, the outraged, the dead, too frequently forces one to abandon a chosen career. Therefore, the still voice of a timid conscience whispers (in a perverted sense): "Let the dead bury their dead."

I cannot lay too much stress on this absolute fact: that hospital managements deliberately, wilfully, and selfishly suppress evidence which, if presented to the proper authorities, would lead to the conviction of guilty attendants, and eventually to their almost complete elimination from asylums. Several instances of such suppression have come to my attention since my discharge, two of which I shall now cite. During the summer of 1907, a Committee of Investigation appointed by the Legislature of the State of New Jersey, uncovered, several months after the commission of the crime, the suppressed evidence of the murder of a patient by attendants at the Trenton State Hospital. On the witness-stand the hospital official in authority admitted that the attendants had killed the patient and that their only punishment had been their prompt discharge as employees. He further admitted that the "scandal" had been deliberately suppressed, and that no evidence or report of the crime had been submitted to the proper authorities as is, of course, required by law. So skilfully was this crime concealed that even the wife of the victim was unable to learn the cause of her husband's death until the investigators laid bare the facts. And this same Committee of Investigation uncovered another alleged and, to my mind, proved murder in another State Hospital for the Insane—at Morris Plains, New Jersey. Here, again, the "scandal" (a hospital euphemism for "murder" and lesser crimes) was "hushed-up" or "whitewashed." When it was finally dragged into the light of day, what happened? Those in authority, making characteristic use of the ignorance of the public regarding such matters, brazenly, I think, denied in sweeping terms, and under oath, the incriminating evidence of supposedly credible witnesses. If an investigation in New Jersey can reveal two unreported murders that occurred within a year in two State Hospitals, how many such crimes would be unearthed should the two hundred and twenty-six public and one hundred and two private hospitals for the insane in this country be *honestly* investigated? The probable figure is too appalling to print. . . .

We must admit that the problem of securing efficiency among attendants is not an easy one. To make it easier several improvements must be made in the lot of the attendants themselves. For one thing, the niggardly salaries now offered make it extremely difficult for a management to secure or keep the right type. Competent men and women can earn two or three times as much in other and more congenial lines of endeavor. The average scale of wages for attendants in hospitals for the insane ranges from sixteen to twenty-four dollars a month, with room and board. Women usually receive sixteen or eighteen dollars at the beginning; men from eighteen to twenty, though the rates vary throughout the country. There is a slight margin, too, for an increase in salary, but even the exceptionally able attendants seldom receive more than thirty dollars a month. This bespeaks a false, a vicious economy. Not that the average attendant deserves a cent more than he receives; but would it not be wiser, more humane, and, in the end, cheaper, to offer inducements calculated to attract to this neglected field of service a higher type of character?—nay, and keep him there, for nothing is more demoralizing than the constant changing that goes on in the ranks of the present attendants. To offer a wage of, say, forty, with a maximum of fifty dollars a month, including board and room, would, no doubt, be a move in the right direction.

However, such a merely pecuniary inducement would not, of itself, accomplish the purpose. Indeed, alone, it might defeat the purpose. For, after discussing this problem with doctors who have employed attendants, I am brought to the conclusion that increased wages, unaccompanied by increased and deserved privileges, and more wholesome and refined surroundings, would probably appeal only to burly workers in rougher fields. Wages high enough to attract a more refined type are, at the present stage of hospital development, out of the question; whereas privileges and refining influences might even now be brought to bear with excellent effect. Model dormitories, and separate cottages for married employees, instead of mere sleeping places, shorter and less exhausting hours, and proper places in which the extra leisure could be enjoyed—a library, billiard room, etc.,—these would go farther than money toward the great task of refinement. It is unfair to keep an attendant on duty twelve or fifteen hours a day (these are now the common working hours) and for the balance of his time confine him to his ward under restrictions nearly as irksome as those to which the patients themselves must perforce submit. A few States, notably New York and Massachusetts, have granted appropriations for the creation of such conditions as I am describing. If these appropriations were enlarged, and if other States followed the same policy, it is safe to predict that thousands of refined men and women would enter this field who are now debarred. And once in the work they should be offered the same chances for advancement as are offered to employees in any well conducted commercial establishment. Such a policy, carried to its logical conclusion, would include also a system of pensions for those attendants who should devote the better part of their lives to this noble service.

Still another effective means of eliminating brutality by the introduction of refining influences would consist in the wider employment of women nurses in men's wards. To the uninitiated this suggestion will no doubt seem ill-advised; yet, at this moment, there are in this country—and abroad, as well,—some hospitals for the insane where women nurses, assisted, of course, by orderlies, as are nurses in general hospitals, are managing men's wards with gratifying success. What is needed is a general adoption of this humane practice. Not all classes of male patients can safely or advantageously be placed in charge of women nurses; but other classes—the more intelligent and less disturbed—comprising thousands, can, if anything, be managed better by women of capacity than by men of any sort. The superior tact and quicker sympathy of women—God-given qualities—work wonders among insane men quite as readily as in the sane world. It cannot be denied that under the present regime women nurses in charge of troublesome women patients have not been entirely free from charges of cruelty; indeed, the contrary has been proved, as the results of investigations show—but they are far less subject to this charge than men attendants. According to those superintendents who have successfully placed women nurses in charge of men's wards, thousands of male patients who now suffer at the hands of unfeeling and incompetent male attendants could be brought under remedial and uplifting influences simply by having women placed over them in positions of authority. And the salutary influence of women in wards where they are available would have a tendency, as experience has demonstrated, to spread throughout all other wards where their immediate presence is impracticable or unsafe. It would therefore seem desirable to substitute female for male nurses wherever possible.

Such a course, too, would further simplify the problem of securing an adequate number of attendants. The services of women are easier to secure, and women readily take up nursing as a profession—as a life-work; whereas men naturally look upon such work simply as a means of providing a livelihood until they can secure work more to their liking.

There are in this country about twenty thousand men and women working as attendants in our asylums and hospitals for the insane. Of this number several thousand are, without doubt, individuals of refinement. Now, if a few thousand persons of refinement can work under such conditions as obtain so generally to-day in our hospitals and asylums, is it not reasonable to suppose that improved conditions would eventually attract a full complement of workers of the same type? Strange as it may seem, many attendants now so employed, enjoy their work and would not of their own choice relinquish it. And I make bold to appeal to those grinding thousands now eking out a livelihood in work apparently more attractive, but, in truth, less endurable, to seek improved conditions and increased usefulness in those hospitals where the application of the Golden Rule to insanity is now possible. In such places a feeling of security and interest soon overcomes the instinctive timidity or repugnance felt by many when, in the capacity of attendants, they first come in contact with the insane. Such contact, barring exceptional cases influenced by a too impressionable temperament on the part of the nurse, renders one, as it were, immune. It would surprise (perhaps annoy) many sane persons, were they to realize how slightly many of the inmates of asylums differ from their more fortunate brothers at large. Yet among those who have been brought into close contact with the insane this is a trite observation; and it is the key to the problem which causes so many to wonder how and why it is that men and women, at liberty to choose their vocations, deliberately cast their lot with that portion of humanity which the average person seems so willing to shun.

Konrad Biesalski, from *Manual for the Care of Cripples* (1911)

The pediatrician, surgeon, and orthopedic specialist Konrad Biesalski (1868–1930) can be regarded as a founder of German rehabilitation and disability policy. Above all, he looked after the care of physically disabled people, who at the beginning of the twentieth century were still called "cripples." In 1906, he initiated the first registry and census of physically disabled children and youth in the German empire; the census produced the proof that disability constituted a major problem with respect to the poor population. In addition, Biesalski defined physical disability as an illness in the medical-orthopedic sense, after which he was able to establish treatment and social policies for physically disabled people.

I. What Is a Cripple?

This question has been answered variously depending on the specific profession or position of the person answering with respect to the cripple's care. In 1906 all crippled youth were officially counted in Germany. As a result of this census, a definition has been established. . . .

It states: 'A cripple in need of institutional care is (as a result of a congenital or acquired nerve or bone and joint condition) a sick person, who is disabled in the use of his trunk or limbs. The interaction between the degree of his ailment (including other illnesses and defects) and the cost of living in his surroundings is so unfavorable that his remaining mental and physical strength can only be developed to the highest possible economic independence in an institution that can offer a variety of medical and pedagogic measures that are necessary for this aim.'

The entire public system of cripples' care [*Krüppelfürsorge*] in Germany deals only with the cripples amongst the poor population. Cripples of affluent parents are not counted in these official statistics.

The above definition emphasizes that the cripple is an ill person, for whose care the doctor is ultimately responsible. The definition goes on to divide the cripple's care into two large groups: the first, in which the level of care requires placement in a special institution—a so-called cripple home—the elaboration of which is included in the above definition, and the second, in which the cripples can also become 'de-crippled' [*entkrüppelt*] without home care. Therefore, the main division is between the 'Institutional' [*Heimbedürftige*] and the 'Non-Institutional' [*Nichtheimbedürftige*].

If a child with a congenitally defective arm is born the son of an affluent father, this child is not subject to the public system of cripples' care, because the father will raise the boy to reach his highest potential work capacity through the father's own fortunes. If a child suffers from a moderate ailment, e.g. from a middle-degree curvature of the spine, however, and is at the same time an orphan or illegitimate child, and feeble-minded, deaf-mute, or blind and poor, this child needs our help. Without it, the child would be neglected physically, morally, and economically.

The uppermost *purpose of all well-ordered cripples' care,* is to make the cripple fit for work, or in short, as expressed in a catchphrase, to change him from an alms recipient into a taxpayer. To achieve this purpose, three separate groups of professionals are active in the cripples' care. The *doctor* cures the cripple's ailment or at least improves it as much as possible. The *teacher* provides the cripple with the necessary school education, the *master craftsman* teaches him a trade. Although these three fields are independent of one another, they do not stand next to each other as strangers, but instead work at the same time with and in one another, so that out of these three occupations a completely new field emerges, namely, that of cripples' care. . . .

Randolph Bourne, "The Handicapped" (1911)

In John Dos Passos's sprawling epic U.S.A., *social critic and writer Randolph Bourne (1886–1918) is described as "a tiny twisted unscared ghost in a black cloak hopping along the grimy old brick and brownstone streets still left in New York, crying out in a shrill soundless giggle: War is the health of the state." Bourne's opposition to World War I, his understanding of the changes it would bring, and his appreciation of the role of youth in social movements are usually seen as his primary intellectual contributions. However, he has recently been receiving more attention for his writing about disability. His essay "The Handicapped" originally appeared in the* Atlantic Monthly *in 1911. Bourne died in 1918 in the influenza epidemic that followed in the wake of World War I.*

It would not perhaps be thought, ordinarily, that the man whom physical disabilities have made so helpless that he is unable to move around among his fellows, can bear his lot more happily, even though he suffer pain, and face life with a more cheerful and contented spirit, than can the man whose handicaps are merely enough to mark him out from the rest of his fellows without preventing him from entering with them into most of their common affairs and experiences. But the fact is that the former's very helplessness makes him content to rest and not to strive. I know a young man so helplessly disabled that he has to be carried about, who is happy in reading a little, playing chess, taking a course or two in college, and all with the sunniest good-will in the world, and a happiness that seems strange and unaccountable to my restlessness. He does not cry for the moon.

When the handicapped youth, however, is in full possession of his faculties, and can move about freely, he is perforce drawn into all the currents of life. Particularly if he has his own way in the world to make, his road is apt to be hard and rugged, and he will penetrate to an unusual depth in his interpretation both of the world's attitude toward such misfortunes, and of the attitude toward the world which such misfortunes tend to cultivate in men like him. For he has all the battles of a stronger man to fight, and he is at a double disadvantage in fighting them. He has constantly with him the sense of being obliged to make extra efforts to overcome the bad impression of his physical defects, and he is haunted with a constant feeling of weakness and low vitality which makes effort more difficult and renders him easily fainthearted and discouraged by failure. He is never confident of himself, because he has grown up in an atmosphere where nobody has been very confident of him; and yet his environment and circumstances call out all sorts of ambitions and energies in him which, from the nature of his case, are bound to be immediately thwarted. This attitude is likely to keep him at a generally low level of accomplishment unless he have an unusually strong will, and a strong will is perhaps the last thing to develop under such circumstances.

The handicapped man is always conscious that the world does not expect very much from him. And it takes him a long time to see in this a challenge instead of a firm pressing down to a low level of accomplishment. As a result, he does not expect very much of himself; he is timid in approaching people, and distrustful of his ability to persuade and convince. He becomes extraordinarily sensitive to other people's first impressions of him. Those who are to be his friends he knows instantly, and further acquaintance adds little to the intimacy and warm friendship that he at once feels for them. On the other hand, those who do not respond to him immediately cannot by any effort either on his part or theirs overcome that first alienation.

This sensitiveness has both its good and its bad sides. It makes friendship the most precious thing in the world to him, and he finds that he arrives at a much richer and wider intimacy with his friends than do ordinary men with their light, surface friendships, based on good fellowship or the convenience of the moment. But on the other hand this sensitiveness absolutely unfits him for business and the practice of a profession, where one must be "all things to all men," and the professional manner is indispensable to success. For here, where he has to meet a constant stream of men of all sorts and conditions, his sensitiveness to these first impressions will make his case hopeless. Except with those few who by some secret sympathy will seem to respond, his physical deficiencies will stand like a huge barrier between his personality and other men's. The magical good fortune of attractive personal appearance makes its way almost without effort in the world, breaking down all sorts of walls of disapproval and lack of interest. Even the homely person can attract by personal charm.

The doors of the handicapped man are always locked, and the key is on the outside. He may have treasures of charm inside, but they will never be revealed unless the person outside cooperates with him in unlocking the door. A friend becomes, to a much greater degree than with the ordinary man, the indispensable means of discovering one's own personality. One only exists, so to speak, with friends. It is easy to see how hopelessly such a sensitiveness incapacitates a man for business, professional or social life, where the hasty and superficial impression is everything, and disaster is the fate of the man who has not all the treasures of his personality in the front window, where they can be readily inspected and appraised.

It thus takes the handicapped man a long time to get adjusted to his world. Childhood is perhaps the hardest time of all. As a child he is a strange creature in a strange land. It was my own fate to be just strong enough to play about with the other boys, and attempt all their games and "stunts," without being strong enough actually to succeed in any of them. It never used to occur to me that my failures and lack of skill were due to circumstances beyond my control, but I would always impute them, in consequence of my rigid Calvinistic bringing-up, I suppose, to some moral weakness of my own. I suffered tortures in trying to learn to skate, to climb trees, to play ball, to conform in general to the ways of the world. I never resigned myself to the inevitable, but overexerted myself constantly in a grim determination to succeed. I was good at my lessons, and through timidity rather than priggishness, I hope, a very well-behaved boy at school; I was devoted, too, to music, and learned to play the piano pretty well. But I despised my reputation for excellence in these things, and instead of adapting myself philosophically to the situation, I strove and have been striving ever since to do the things I could not.

As I look back now it seems perfectly natural that I should have followed the standards of the crowd, and loathed my high marks in lessons and deportment, and the concerts to which I was sent by my aunt, and the exhibitions of my musical skill that I had to give before admiring ladies. Whether or not such an experience is typical of handicapped children, there is tragedy there for those situated as I was. For had I been a little weaker physically, I should have been thrown back on reading omnivorously and cultivating my music, with some possible results; while if I had been a little stronger, I could have participated in the play on an equal footing with the rest. As it was, I simply tantalized myself, and grew up with a deepening sense of failure, and a lack of pride in that at which I really excelled.

When the world became one of dances and parties and social evenings and boy-and-girl attachments,—the world of youth,—I was to find myself still less adapted to it. And this was the harder to bear because I was naturally sociable, and all these things appealed tremendously to me. This world of admiration and gayety and smiles and favors and quick interest and companionship, however, is only for the well-begotten and the debonair. It was not through any cruelty or dislike, I think, that I was refused admittance; indeed they were always very kind about inviting me. But it was more as if a ragged urchin had been asked to come and look through the window at the light and warmth of a glittering party; I was truly in the world, but not of the world. Indeed there were times when one would almost prefer conscious cruelty to this silent, unconscious, gentle oblivion. And this is the tragedy, I suppose, of all the ill-favored and unattractive to a greater or less degree; the world of youth is a world of so many conventions, and the abnormal in any direction is so glaringly and hideously abnormal.

Although it took me a long time to understand this, and I continued to attribute my failure mostly to my own character, trying hard to compensate for my physical deficiencies by skill and cleverness, I suffered comparatively few pangs, and got much better adjusted to this world than to the other. For I was older, and I had acquired a lively interest in all the social politics; I would get so interested in watching how people behaved, and in sizing them up, that only at rare intervals would I remember that I was really having no hand in the game. This interest just in the ways people are human, has become more and more a positive advantage in my life, and has kept sweet many a situation that might easily have cost me a pang. Not that a person with disabilities should be a sort of detective, evil-mindedly using his social opportunities for spying out and analyzing his friends' foibles, but that, if he does acquire an interest in people quite apart from their relation to him, he may go into society with an easy conscience and a certainty that he will be entertained and possibly entertaining, even though he cuts a poor enough social figure. He must simply not expect too much.

Perhaps the bitterest struggles of the handicapped man come when he tackles the business world. If he has to go out for himself to look for work, without fortune, training, or influence, as I personally did, his way will indeed be rugged. His disability will work against him for any position where he must be much in the eyes of men, and his general insignificance has a subtle influence in convincing those to whom he applies that he is unfitted for any kind of work. As I have suggested, his keen sensitiveness to other people's impressions of him makes him more than usually timid and unable to counteract that fatal first impression by any display of personal force and will. He cannot get his personality over across that barrier. The cards seem stacked against him from the start. With training and influence something might be done, but alone and unaided his case is almost hopeless. The attitude toward him ranges from, "You can't expect us to create a place for you," to, "How could it enter your head that we should find any use for you?" He is discounted at the start: it is not business to make allowances for anybody; and while people are not cruel or unkind, it is the hopeless finality of the thing that fills one's heart with despair.

The environment of a big city is perhaps the worst possible that a man in such a situation could have. For the thousands of seeming opportunities lead one restlessly on and on, and keep one's mind perpetually unsettled and depressed. There is a poignant mental torture that comes with such an experience,—the urgent need, the repeated failure, or rather the repeated failure even to obtain a chance to fail, the realization that those at home can ill afford to have you idle, the growing dread of encountering people,—all this is something that those who have never been through it can never realize. Personally I know of no particular way of escape. One can expect to do little by one's own unaided efforts. I solved my difficulties only by evading them, by throwing overboard some of my responsibility, and taking the desperate step of entering college on a scholarship. Desultory work is not nearly so humiliating when one is using one's time to some advantage, and college furnishes an ideal environment where the things at which a man handicapped like myself can succeed really count. One's self-respect can begin to grow like a weed.

For at the bottom of all the difficulties of a man like me is really the fact that his self-respect is so slow in growing up. Accustomed from childhood to being discounted, his self-respect is not naturally very strong, and it would require pretty constant success in a congenial line of work really to confirm it. If he could only more easily separate the factors that are due to his physical disability from those that are due to his weak will and character, he might more quickly attain self-respect, for he would realize what he is responsible for, and what he is not. But at the beginning he rarely makes allowances for himself; he is his own severest judge. He longs for a "strong will," and yet the experience of having his efforts promptly nipped off at the beginning is the last thing on earth to produce that will.

If the handicapped youth is brought into harsh and direct touch with the real world, life proves a much more complex thing to him than to the ordinary man. Many of his inherited platitudes vanish at the first touch. Life appears to him as a grim struggle, where ability does not necessarily mean opportunity and success, nor piety sympathy, and where helplessness cannot count on assistance and kindly interest. Human affairs seem to be running on a wholly irrational plan, and success to be founded on chance as much as on anything. But if he can stand the first shock of disillusionment, he may find himself enormously interested in discovering how they actually do run, and he will want to burrow into the motives of men, and find the reasons for the crass inequalities and injustices of the world he sees around him. He has practically to construct anew a world of his own, and explain a great many things to himself that the ordinary person never dreams of finding unintelligible at all. He will be filled with a profound sympathy for all who are despised and ignored in the world. When he has been through the neglect and struggles of a handicapped and ill-favored man himself, he will begin to understand the feelings of all the horde of the unpresentable and the unemployable, the incompetent and the ugly, the queer and crotchety people who make up so large a proportion of human folk.

We are perhaps too prone to get our ideas and standards of worth from the successful, without reflecting that the interpretations of life which patriotic legend, copy-book philosophy, and the sayings of the wealthy give us, are pitifully inadequate for those who fall behind in the race. Surely there are enough people to whom the task of making a decent living and maintaining themselves and their families in their social class, or of winning and keeping the respect of their fellows, is a hard and bitter task, to make a philosophy gained through personal disability and failure as just and true a method of appraising the life around us as the cheap optimism of the ordinary professional man. And certainly a kindlier, for it has no shade of contempt or disparagement about it.

It irritates me as if I had been spoken of contemptuously myself, to hear people called "common" or "ordinary," or to see that deadly and delicate feeling for social gradations crop out, which so many of our upper middle-class women seem to have. It makes me wince to hear a man spoken of as a failure, or to have it said of one that he "doesn't amount to much." Instantly I want to know why he has not succeeded, and what have been the forces that have been working against him. He is the truly interesting person, and yet how little our eager-pressing, on-rushing world cares about such aspects of life, and how hideously though unconsciously cruel and heartless it usually is!

Often I had tried in argument to show my friends how much of circumstance and chance go to the making of success; and when I reached the age of sober reading, a long series of the works of radical social philosophers, beginning with Henry George, provided me with the materials for a philosophy which explained why men were miserable and overworked, and why there was on the whole so little joy and gladness among us, and which fixed the blame. Here was suggested a goal, and a definite glorious future, toward which all good men might work. My own working hours became filled with visions of how men could be brought to see all that this meant, and how I in particular might work some great and wonderful thing for human betterment. In more recent years, the study of history and social psychology and ethics has made those crude outlines sounder and more normal, and brought them into a saner relation to other aspects of life and thought, but I have not lost the first glow of enthusiasm, nor my belief in social progress as the first right and permanent interest for every thinking and true-hearted man or woman.

I am ashamed that my experience has given me so little chance to count in any way either toward the spreading of such a philosophy or toward direct influence and action. Nor do I yet see clearly how I shall be able to count effectually toward this ideal. Of one thing I am sure, however: that life will have little meaning for me except as I am able to contribute toward some such ideal of social betterment, if not in deed, then in word. For this is the faith that I believe we need to-day, all of us,—a truly religious belief in human progress, a thorough social consciousness, an eager delight in every sign and promise of social improvement, and best of all, a new spirit of courage that will dare. I want to give to the young men whom I see,—who, with fine intellect and high principles, lack just that light of the future on their faces that would give them a purpose and meaning in life,—to them I want to give some touch of this philosophy, that will energize their lives, and save them from the disheartening effects of that poisonous counsel of timidity and distrust of human ideals which pours out in steady stream from reactionary press and pulpit.

It is hard to tell just how much of this philosophy has been due to handicap. If it is solely to that that I owe its existence, the price has not been a heavy one to pay. For it has given me something that I should not know how to be without. For, however gained, this radical philosophy has not only made the world intelligible and dynamic to me, but has furnished me with the strongest spiritual support. I know that many people, handicapped by physical weakness and failure, find consolation and satisfaction in a very different sort of faith,—in an evangelical religion, and a feeling of close dependence on God and close communion with him. But my experience has made my ideal of character militant rather than long-suffering.

▣ W. Y. Evans Wentz on Changelings and Fairy Faith (1911)

The Fairy-Faith in Celtic Countries was the first book by W. Y. Evans Wentz, who later went on to translate the essential texts of Tibetan Buddhism, such as The Book of the Dead. *In this work, science meets superstition: Evans Wentz interprets fairy tales in order to explain the treatment of disabled children and beliefs about them. The work grows out of Modernist Primitivism, which emphasized the need to take seriously what earlier generations had dismissed as "primitive." Evans Wentz does this by showing how apparently "superstitious" healing practices actually were real "medicine" in former cultural beliefs and by discussing Celtic stories about changelings.*

Our examination of living children said to have been changed by fairies shows . . . (a) that many changelings are so called merely because of some bodily deformity or because of some abnormal mental or pathological characteristics capable of an ordinary rational explanation, (b) but that other changelings who exhibit a change of personality, such as is recognized by psychologists, are in many cases best explained on the Demon-Possession Theory, which is a well-established scientific hypothesis.

Therefore, since the residuum or x-quantity of the Fairy-Faith, the folk-religion of the Celtic peoples, cannot be explained away by any known scientific laws, it must for the present stand, and the Psychological Theory of the Nature and Origin of the Belief in Fairies in Celtic Countries is to be considered as hypothetically established in the eyes of Science. Hence we must cease to look upon the term *fairy* as being always a synonym for something fanciful, non-real, absurd. We must also cease to think of the Fairy-Faith as being no more than a fabric of groundless beliefs. In short, the ordinary non-Celtic mind must readjust itself to a new set of phenomena that through ignorance on its part it has been content to disregard, and to treat with ridicule and contempt as so much outworn 'superstition.'

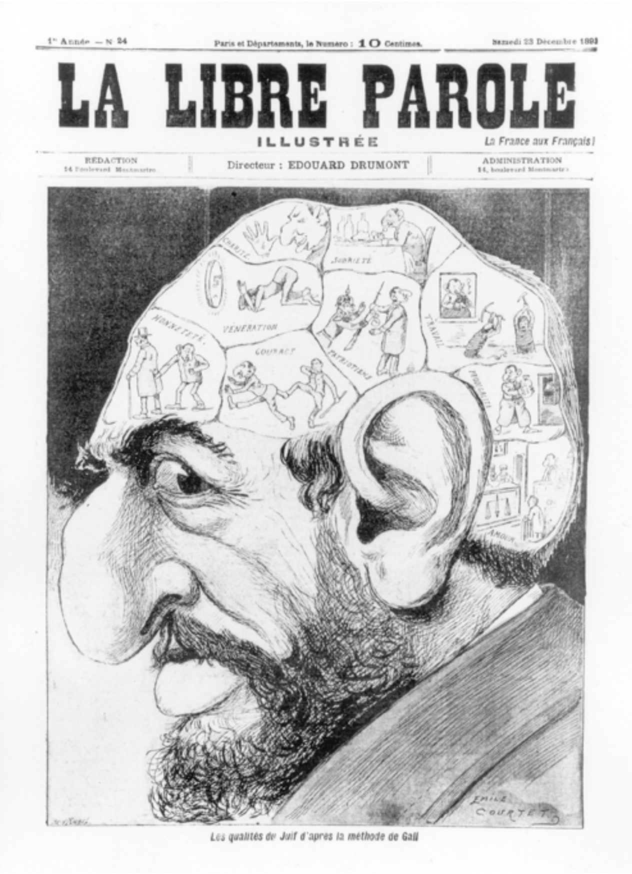
▣ Charles B. Davenport, "Marriage Laws and Customs" (1912)

Charles Benedict Davenport (1866–1944) was born in Stamford, Connecticut, and received a PhD in biology from Harvard in 1892. He became director of Cold Springs Harbor Laboratory, where he founded the U.S. Eugenics Record office. In his 1912 essay, "Marriage Laws and Customs," Davenport warns that escalating numbers of immigrants will result in a rampant increase in feebleminded, insane, sexually deviant, and impoverished people.

The subject matter of eugenics is offspring and offspring imply parents. For legal and other reasons society regards a knowledge of parentage as very important. Marriage is society's method of securing that knowledge. Incidentally the arrangement of marriage is of



The Qualities of the Jew After Gall's Method *(1893), by Emile Courtet (1857–1938). The "inferiority" of Jewish people and other minorities were often emphasized in caricatures that exaggerated physical features presumed to deviate from those of the dominant culture.*

Source: Art Resource, New York.

value for eugenical studies, in fact the principles of eugenics could hardly be established in its absence.

But society asks not only for a registry of matings but seeks to control, in some degree, the nature of the matings. On the one hand it seeks to protect monogamy and the young from the legal consequences of marriage. On the other hand, the nature of control measures, roughly, the result of society's experience that certain matings result in undesirable offspring. Let us, accordingly, examine some of these laws.

The most widespread marriage regulation of biological import in modern civilized states is that which limits the relationship of those whose mating may receive a legal sanction. In practically all of the States of the Union marriage of brother and sister, of parent and child, even of grandparent and grandchild is forbidden, and it is sometimes expressly stated that such marriages have no legal standing. In most States the marriage of uncle and niece, or of aunt and nephew, are forbidden. When it comes to the mating of cousins, legislators have been in much greater doubt. About a third of the States forbid such marriages, and these are chiefly in the western, or more recently settled, territory. In most European States, I am informed, no legal limitation to the marriage of cousins exists.

Let us now consider in how far there is a biological justification for these laws. I know that there are those who hold that the mating even of brother and sister for generations may result in offspring without blemish. We are referred to the Incas of Peru, about whom we know little in detail, and to the Ptolomies, of whom we know a little more, but not as much as a well-trained field worker of the Eugenics Record Office would discover in two or three days. The last Cleopatra, the daughter of a brother and sister, is pointed out to us as the great argument against the evil effects of incestuous marriages. That she was the crowning flower of a beautiful race may be admitted, but is there any doubt that, were she living to-day, she would be placed in the manic-depressive ward of a hospital for the insane, with further history of paranoia and erotomania? But we, too, have histories of incest, brought in by our field workers, histories of families brought up, not in palaces, but in hovels in the woods. For example, a criminalistic man had, by an unknown woman, a number of boys and girls. One of the boys, who was a drunken, feeble-minded fellow with criminalistic tendencies, has had by his own sister a daughter who is a drunken epileptic. This daughter by her own father has had four children of whom one is epileptic, two are imbecile, and the fourth was an encephalic monster who died at birth. I would undertake to produce two cases of this general sort for each case that may be offered of the "romantic," "vivacious" product of a brother and sister mating. And can we doubt that a sober minded people have been impressed by such cases as I have cited, have stored them up in their memory as part of experience, and have crystallized that experience in laws against incest?

And how about the marriage of first cousins? Are the laws that forbid such marriages justifiable? Our modern knowledge of heredity leads to the conclusion that cousin marriages (like the marriage of sibs, possibly) [are] not injurious per se, but because such marriages enhance the probability that the same defect shall inhere in each of the two germ-cells that unite to start the development of the child. While the prohibition of cousin marriages is doubtless a rough eugenic measure, it were better if the prohibition were qualified somewhat as follows: “The marriage of cousins is forbidden when in the parental fraternity that is common to both, there is a case of inability to learn at school, of dementia precox or manic depressive insanity in any of their forms, of epilepsy, of congenital deafness, of albinism, or of cleft palate.” Such a restriction in the application of the law might well increase the difficulty of administering it, but the law would be rendered more significant and less unjust. . . .

If [laws forbidding cousin marriages under certain conditions] could not be enforced, of what use would they be? Their value would be primarily educational, and this value would be enhanced by a penalty for every enfringement of the law, such as more or less prolonged deprivation of some of the rights of citizenship. In time the reasonableness of the legislation would make a strong appeal.

The second legal limitation of a biological sort is that concerning the physical (including the mental) condition of those who contemplate marriage. Many States provide that if either party is an idiot or insane, the marriage is void, on the legal ground that such persons are incapable of making a valid contract. In not a few States paupers are permitted to marry only under restrictions, the limitation having an economic basis, namely that a male pauper cannot support a wife. In few, if any, of the States of the Union have the legislators or the people grasped the idea of restricting the marriage of the mentally or physically defective in order to diminish the procreation of more defectives. Laws against the marriage of the feebleminded are futile in any case. For so long as a feeble-minded person is at large he will find another feeble-minded person who will live with him and have children by him. It would be as sensible to hope to control by legislation the mating of rabbits. The only way to prevent the reproduction of the feeble-minded is to sterilize or segregate them. As to the marriage of the insane, it seems doubtful if it is wise to refuse this without qualification. Two mentally normal persons who have each an insane parent are more apt to have insane offspring than an insane person who marries one in whom there is no taint of insanity. I think it might be unwise to deny to every person who has shown a tendency to manic depressive insanity in its lighter forms marriage into mentally sound stock. Further study of this matter is needed. The requirement of a physician’s certificate as to bodily soundness, which some clergymen are requiring in the States, is primarily directed toward venereal disease and certainly has eugenical bearings. When a requirement is made of a certificate that both parties come of mentally and physically satisfactory stock, a still more important step in eugenics will have been taken.

Finally, the third legal limitation of a biological sort is that concerning the mixture of races. Most of the States of the Union have laws declaring marriages void when contracted between a white person and a negro or the descendants of a negro for a certain number of generations, usually three; i.e., “having one-eighth of negro blood.” But the law of the State of Georgia prohibits for ever and declares null and void any marriage between a white person and one of “African descent.” The Oregon law renders void any marriage of a white person with a person having one-fourth or more of negro, Chinese or Kanaka blood, or any person having more than one-half Indian blood.

The biological basis for such laws is doubtless an appreciation of the fact that negroes and the other races carry traits that do not go well with our social organization. For the Ethiopian has not undergone that selection that in Europe weeded out the traits that failed to recognize property rights, or that failed to give industry, ambition and sex control. The Southerner looks aghast at the possibility that these traits shall become disseminated throughout his social organization and become part and parcel of the make up of his descendants. So with the cruelty of the Indian. These fears are justified, but the cure is inadequate. Already the south is full of persons of one-eighth negro blood, whose (illegitimate) children may legally marry with whites. The Georgia law which denies marriage of white persons to descendants of blacks, however remote, is equally futile. Many a child arises in the third or later generations that by no test shows evidence of “African descent.” How unjust the Missouri law that provides that the proportion of negro blood is to be determined by the jury from the appearance of the person! The south, indeed, has a problem in its huge “feeble-minded” coloured population; but the problem is of the same order as that in the north and in England, and the solution is this: Forget unessentials, like skin colour, and focus attention on socially important defects. Then, by sterilization or segregation, prevent the reproduction of the socially inadequate. Thus will the mentally incompetent strains be eliminated and the good physical traits of some of the black races be added, as a valued heritage to enhance the physical manhood of the south.

I feel sure that if law will take lessons from biology many of the disasters that have been feared may be averted.

Maria Montessori on the Orthophrenic School (1912)

In 1896, Maria Montessori (1870–1952) became one of the first female physicians in Italy. During her tenure at the psychiatric clinic of the University of Rome, Montessori developed an interest in disabled children. In 1899, she and Giuseppe Montesano founded the Scuola Magistrale Ortofrenica, which was both an educational institute for disabled children and a training institute for instructors. Montessori was a lecturer of disability pedagogy from 1900 to 1918 at the Regio Instituto Superiore Femminile di Magistero in Rome. Montessori traveled extensively and presented her work in order to disseminate her ideas. Maria Montessori was nominated three times for the Nobel Peace Prize. The excerpt below from her book, The Montessori Method *(1912), provides an overview of the methods she developed for educating disabled children*

From Chapter 2. "History of Methods"

About fifteen years ago, being assistant doctor at the Psychiatric Clinic of the University of Rome, I had occasion to frequent the insane asylums to study the sick and to select subjects for the clinics. In this way I became interested in the idiot children who were at that time housed in the general insane asylums. In those days thyroid organotherapy was in full development, and this drew the attention of physicians to deficient children. I myself, having completed my regular hospital services, had already turned my attention to the study of children's diseases.

It was thus that, being interested in the idiot children, I became conversant with the special method of education devised for these unhappy little ones by Edward Seguin, and was led to study thoroughly the idea, then beginning to be prevalent among the physicians, of the efficacy of 'pedagogical treatment' for various morbid forms of disease such as deafness, paralysis, idiocy, rickets, etc. The fact that pedagogy must join with medicine in the treatment of disease was the practical outcome of the thought of the time. And because of this tendency the method of treating disease by gymnastics became widely popular. I, however, differed from my colleagues in that I felt that mental deficiency presented chiefly a pedagogical, rather than mainly a medical, problem. Much was said in the medical congresses of the medico-pedagogic method for the treatment and education of the feebleminded, and I expressed my differing opinion in an address on *Moral Education* at the Pedagogical Congress of Turin in 1898. I believe that I touched a chord already vibrant, because the idea, making its way among the physicians and elementary teachers, spread in a flash as presenting a question of lively interest to the school.

In fact, I was called upon by my master, Guido Baccelli, the great Minister of Education, to deliver to the teachers of Rome a course of lectures on the education of feeble-minded children. This course soon developed into the State Orthophrenic School, which I directed for more than two years.

In this school we had an all-day class of children composed of those who in the elementary schools were considered hopelessly deficient. Later on, through the help of a philanthropic organisation, there was founded a Medical Pedagogic Institute where, besides the children from the public schools, we brought together all of the idiot children from the insane asylums in Rome.

I spent these two years with the help of my colleagues in preparing the teachers of Rome for a special method of observation and education of feeble-minded children. Not only did I train teachers, but what was much more important, after I had been to London and Paris for the purpose of studying in a practical way the education of deficients, I gave myself over to the actual teaching of the children, directing at the same time the work of the other teachers in our institute.

I was more than an elementary teacher, for I was present, or directly taught the children, from eight in the morning to seven in the evening without interruption. These two years of practice are my first and indeed my true degree in pedagogy. From the very beginning of my work with deficient children (1898 to 1900) I felt that the methods which I used had in them nothing peculiarly limited to the instruction of idiots. I believed that they contained educational principles *more rational* than those in use, so much more so, indeed, that through their means an inferior mentality would be able to grow and develop. This feeling, so deep as to be in the nature of an intuition, became my controlling idea after I had left the school for deficients, and, little by little, I became convinced that similar methods applied to normal children would develop or set free their personality in a marvellous and surprising way.

Isabelle Thompson Smart, from *Studies in the Relation of Physical Inability and Mental Deficiency to the Body Social* (1912)

Isabelle Thompson Smart, MD, was the Medical Examiner of Mentally Defective Children to the Department of Education in New York City. Smart wrote numerous eugenics tracts seeking to enlist pediatricians in the task of identifying and reporting potentially "defective" children to social work agencies. Her work demonstrates the prominent role of female professionals in the eugenics intelligentsia. The excerpt below demonstrates efforts in the medical arena by women to apply a more empirical and hard-hitting diagnostic gaze; this involvement by women differs radically from that of the more maternal social workers whom H. H. Goddard believed to be the most effective for assessments and information-gathering tasks.

Emerson once said that "Nothing great was ever achieved without enthusiasm" and perhaps we have here the crux of our problem for the care and training of the mental defective. Certainly, up to within a very short time ago there was no very definite or marked enthusiasm over either the physical or mental qualifications of the ament. The less said about this class of society the better pleased people seemed to be, and, as for our lawmakers and those whose duty it was to make adequate provision for these unfortunates and protect them by the much vaunted "strong arm of the law," they have time and again turned a deaf ear to any plea which was made in their behalf, and we are now reaping in a large harvest of shame and crime as a just reward for the general ignorance and neglect of them.

I have chosen, somewhat at random, a group of 10,000 cases which have been presented to me for medical examination, to determine their physical and mental fitness for the work required of them in the school grades. In every instance the child had fallen behind others of his or her age and grade and had continued to retrogress for some terms. In every instance I found positive physical defects, and, with many, combination of physical unfitness with a serious mental defect, which demanded a proper segregation of the case in question. Oft times the improvable cases had become discouraged because of the ever constant inability to cope with the tasks set by the curriculum, discouragement when the little brother or sister, perhaps years younger than our weakling, was able to reach the same grade with our defective and in a term pass ahead to a higher grade, receiving the praise of parents and teachers, while our unfortunate received the on demand berating which he should never have been called upon to bear. Today the outlook for such a child is a little more favorable, for the sleepiest teachers now have had borne in upon them the fact that there are children who are wholly incapable of doing grade work, and that very many are unable to do even the manual work.

Ten thousand cases! Ten thousand little human beings so seriously handicapped that they will never be able to enter fully into competition in order to earn a livelihood—so seriously handicapped that the major number should be segregated, and marriage and procreation be absolutely denied them.

The greater number of the physical defects could be very much bettered—many of them cured—but the mental unfitness is irreparable. Up to a certain point, all of these cases could be trained to become useful units in a colony life, suited to their individual needs and under proper supervision; but if left to drift, after their brief term of school life ends, will in large measure become derelicts, and will, in time, fill our penal institutions and our homes for fallen women or worse, live at large and procreate their kind in large numbers.

Not a single low-grade case of imbecility or idiocy has been included in the number of cases presented; all would fall within the limits of middle grade and morons.

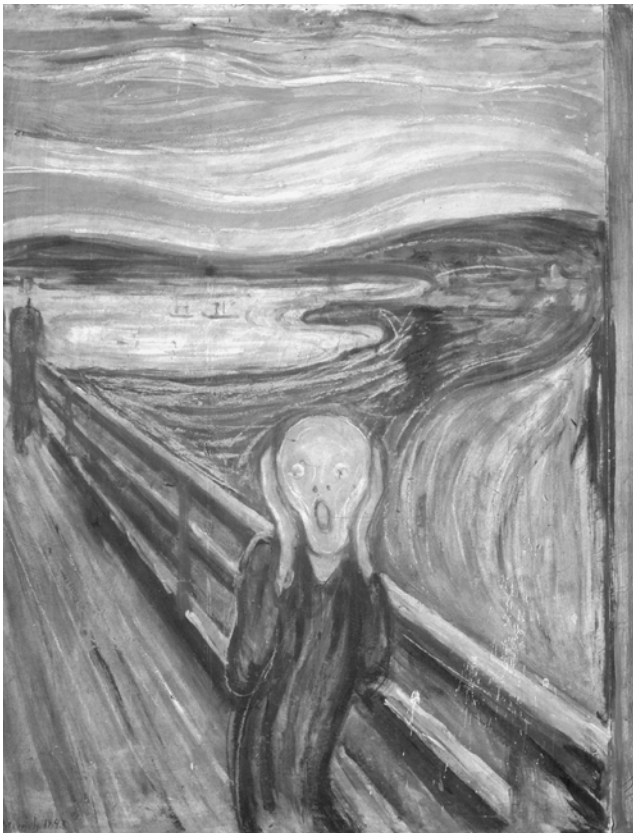
All of the low-grade cases of idiocy, imbecility, and Mongolianism should, without any question, be placed where they may be protected from society and from themselves; but the number is so great in the city and State of New York that adequate provision is, at present, and for some years to come entirely out of the question. . . .

Perhaps one of the most interesting phases of my work has been the attempt to tabulate the nations represented by the children sent up to me for these special examinations. It is only in the natural sequence of the manner of growth of our population that a very large percentage of the cases of mental defect should be found among our alien population, for in such a cosmopolitan city as New York nearly all nations send representatives—one might say misrepresentatives, for, surely, no mental derelict can truly be said to represent his or her native land. Up to the present and, at this time, one cannot tell what changes may occur—the two nations which may be said to lead all others are Russia and Italy. For a long time Russia was first on the list, but now Italy has come up to her and has even surpassed her by a fraction of 1 percent. The German Empire and Austria have contributed no small number, while Britain sends her quota, Ireland leading, followed by England and Scotland; Wales has not contributed any subject for my study. The other countries contributing their quota have been Poland, Scandinavia, France, Bohemia, Romania, Spain, Turkey, Switzerland, Syria, Greece, Arabia, Canada, West Indies, and, of the South American countries, Brazil.

These studies of our urban population are in no way complete, nor can they become so for a very long time, because of the inadequacy of the number employed in making these investigations. The need for more physicians who are specializing in this particular field of research is great, and their work should be augmented by that of an earnest, intelligent corps of social workers, whose time would be entirely devoted to the ferreting out of the kind of statistics which will prove of paramount value.

The hygienic relation of persons of such lowered physical and mental stamina to the body social, it seems to me, is so apparent as to make a summing up practically unnecessary. Surely no one in this audience needs to be prodded to do his duty in seeking the proper housing, proper segregation, and right and just laws for the unfortunate class of individuals we have had under consideration.

What we need in the United States of America is a realizing sense by our thinking people of the enormity of the problem which confronts us. Our immigration problem is tremendous. Gladly do we welcome the poor amid the downtrodden of other nations, but we must be firm in our exclusion of the mentally unfit. Our work there must go on not only at our ports of entry, but at the points of embarking, and the steamship companies must be held responsible for their unprincipled part in the bringing over, under much hardship, of so many cases of mental and physical unfitness.



The Scream *(1893), by Edvard Munch (1863–1944). Munch's painting* The Scream *portrays a figure that is often taken as a quintessential expression of modernity. Munch himself writes that he experienced intense fear during a moment of isolation while on an evening walk: "My friends walked on—I stood there, trembling with fear. And I sensed a great, infinite scream pass through nature." Wavy lines and a red sky capture the sensation of terror he describes, and Munch's effort to capture his own feelings of besiegement by emotions struck a cord of sentiment for many at the time.*

Without a doubt we will always have the "ament" and the physical defective with us, for so long as we disobey the laws of hygiene and of health we must expect at least a part of the punishment meted out on the innocent offspring. It is largely dependent on those of us who are alive to the immenseness of the problem and who are in vital touch with it to make our voices heard whenever and wherever we find opportunity to do so. We must even make these opportunities, and we must have our law makers become familiar with the class of cases herein described.

They must be made cognizant of the conditions producing such defectives, and then made intelligent as to the direful consequences of legalizing the propagation of the unfit.

The task is stupendous, but if all interested will loyally pull together for the common good of humanity I am hopeful that we may accomplish much. "Nothing great was ever achieved without enthusiasm."

Percental chart of 10,000 cases showing relative physical defects.

Chorea	4.0
Epilepsy	5.1
Heart	29.9
Nose	34.9
Throat	42.6
Neurotic	37.0
Sex	41.5
Speech	42.0
Ears	48.3
Dental	71.4
Indicating general medical care	74.3
Eyes	95.3
Needing residential hospital care	6.9
Needing special open-air school	3.5

Percental chart of 10,000 cases children born in foreign countries.

Italy	15.3
Russia	15.1
Germany	7.7
Austria	3.5
Ireland	3.3
England	.9
Roumania	.8
Scandinavia	.7
Polish Jews	.5

Henry H. Goddard, "The Improvability of Feeble-Minded Children" (1913)

Henry H. Goddard (1866–1957) served as director of the Vineland Training Center for Feebleminded Boys and Girls in New Jersey between 1906 and 1918. An ardent eugenicist who believed that "feeblemindedness" was hereditary, Goddard believed that intelligence could be scientifically measured, because mental capacity was fixed and finite. To measure intelligence, he translated and adapted Binet's Intelligence Test in order to diagnose adolescent residents under his charge at Vineland. However, in order to show the test's wider validity, he also applied it to immigrants at Ellis Island and to U.S. army recruits. He was hired as *a consultant by the New York Public Schools regarding the placement of students into special learning tracks. Ultimately, Goddard renounced many of the positions he had touted for decades in various eugenics contexts.*

How improvable is a feeble-minded child? This question is so fundamental, and so much depends upon the answer to it, that it is no wonder it has been the burning question since the care of the feeble-minded became common. Historically it has played no small part in the progress of the institutional care of these defectives. For years and years it was believed that nothing could be done for them and consequently nothing was done. Then, under the inspiration of the immortal Séguin it was discovered much could be done, and it is no wonder that in the enthusiasm of that discovery many went to the opposite extreme and believed that they could even be cured.

It is somewhat unfortunate that today there are certain belated travelers along the road who will talk of curing feeble-mindedness, while the impossibility of the cure of this condition has long been demonstrated. The question of improvability has had its ups and downs from the time of Séguin until the present. Today we might be said to be in the blackness of confusion. We think feeble-mindedness is improvable, from one standpoint; considering it in another way, we conclude it is not.

We know that there is a time when the feeble-minded have reached their limit, and our institutions are largely filled with individuals who are known to have long since passed their limit of improvement. In the case of younger children we still talk about improvable and unimprovable cases. In the case of any particular individual there is or has been in the past, very little dispute among those who know the case. More recently we have been led to question this, and we at Vineland, have had some dispute as to whether a group of children was improving or not improving.

Viewed from the standpoint of our usual definition of arrested development, the question is: are these persons already arrested in their development, or are they only in the process of arrest? And if the latter, how long does this process continue, and what is its method? Does a child develop at a normal rate up to a certain point and then suddenly stop, or does he develop slowly from birth up to a certain age, and then stop? Or again, does he develop at a normal rate for a few years, and then take a few years in which he keeps getting more and more backward, continually slowing down and finally stopping?

Whatever theories there may have been in answer to these questions, there have never been so far as the writer knows, many facts to substantiate the position until the present time. The reason for this lack of data is, that we never had any adequate means of measuring the mental development of a child at any one time. That difficulty has now been remedied through the Binet-Simon Measuring Scale of Intelligence, and on the basis of this we are now able to present data which seem to go a long way toward answering the question. This scale of intelligence has been in use at Vineland for two years, thereby giving us three annual testings. Upon a study of these results we ought to be able to answer the question, “How many children are improving and how many are standing still?” We had hoped to be able to do this after one year, but we found that there was considerable variability, which experience taught us was entirely normal with feeble-minded children, they doing one day what they cannot do the next, or vice versa; so that we are compelled to wait for the end of the second year giving us the third testing before we could draw any definite conclusion. The facts here presented are based upon the examination of three hundred forty-six children of both sexes, of mental ages from one to twelve, and physical ages from five to forty, with a few beyond this upper limit.

We have had three annual testings by the Binet scale, the result is that from the first to the last testing, two years apart, one hundred and nine persons have made no variation whatever not even a point. This is thirty-two per cent. If we add to this those who have gained or lost one or two points, we have two hundred thirty-two individuals, or about sixty-seven percent whose variation is so slight that it must be considered accidental. The remaining 33 percent have gained or lost three points or more. If we subtract those who have lost, we have left ninety-six persons or twenty-eight percent who at first sight seem to have made some definite progress. Closer examination, however convinces us that some part of this is due to what we have sometimes called the normal variation of the abnormal mind; in other words, that it is somewhat an accident, perhaps of attention, as to whether a child answers one question more or one question less than he did on a former occasion.

A fact which makes us believe that much of this is due to accidental variation, is that these changes occur quite as often in the older persons, who, no one of experience, believes is actually increasing in mentality, as they do among those of the younger years where we might more naturally expect it. These data wait further analysis and study, and the application of further studies, but it seems to be pretty clearly indicated that the vast majority of feeble-minded children are not changing and are not improving in their intellectual level; if there is an improvement it seems to be during the mental ages of three to nine inclusive. Among the idiots, for example, it is very low indeed; here are the figures for the idiots, that is, those having a mentality of one or two.

1. Of twenty-one idiots testing one year mentally, only one is able to do any of the Binet. He (a boy of fifteen) has from the first testing, known his eyes and mouth but has made no improvement. All have stood still. That is, twenty-one idiots, mentality one, age eight to thirty-eight, have made no progress.

2. Of thirty idiots testing two years mentally, twenty-seven, ages ten to thirty six, have not changed; three, aged respectively eleven, twelve and seventeen have learned one point in the Binet.

Of twenty-five idiots testing 2 1–5 to 2 4–5, fifteen have not varied except when the test was given by inexperienced persons and a retesting brought back the former grading. These fifteen range in age from seventeen to thirty six. One, aged thirty, has lost one point, 2 2–5 to 2 1–5, and five aged fourteen to twenty-one, have gained one to three points, none reaching higher than 2 4–5 by this gain. [Goddard's application of IQ scoring was intended to assess the mental age of the person examined, as distinct from chronological age. According to his theory, the mental capacities of "subnormals" became prematurely arrested and no amount of training/education could improve them.]

The remaining four started two years ago with a "potentiality" for three years mentality and have advanced as follows:

F. 14—2 2–5 to 3 2–5.
F. 15—2 3–5 to 3.
F. 16—2 3–5 to 3.
M. 12—2 4–5 to 3 1–5.

The conclusion that we are thus forced to accept, namely, that a very small percentage of feeble-minded children is making any mental improvement, is both surprising and somewhat discouraging, and will even be rejected by some as certainly fallacious; for do we not know that they are improving? Do we not see them improving every day? Are they not learning to do things?

The great group of the so called improvable children are doing things to-day that they could not have done a year ago. This is most certainly true, and in this fact lies our excuse for our institutions with their training departments. Nevertheless it is not difficult to show that this is not incompatible with the conclusion drawn from our data. To make this clear it is only necessary to call attention to the difference between what we may call trainability and raising the intellectual level.

A normal boy of eight, for example, has what we may call for convenience, eight-year-old intelligence; his intelligence is not yet as high as that of a normal boy of nine, still less of ten, but he can do certain things, namely those things which involve nothing more than eight-year-old intelligence. He cannot do anything that involves nine-year-old intelligence or anything higher. Now the normal boy is of eight-year intelligence only one year, and then he becomes nine years old and does the things that involve nine-year intelligence. Then he becomes ten years, and so on, until he reaches his complete development. But the feeble-minded boy who is arrested in his development at the age of eight remains with a mentality of eight year after year. As the years go by he can never learn to do things that require nine or ten-year-old intelligence because he never has that much intelligence, but there is no limit to the number of eight-year-old things that he can learn to do. It is this trainability to do anything and everything that involves only eight-year-old intelligence that is generally mistaken for increase in intelligence itself; and this is the explanation of the misunderstanding when the psychologist says the child has not improved and the teacher says he has; the former means that he has not increased his mental level, the latter means that he has learned to do a number of things that he could not do a year ago. Both are correct. He has learned to do these things and he will continue to learn to do new things for a good many years, but he can never learn to do anything that requires a higher intelligence than that at which he was arrested in his development.

So far we have not answered the question, "How does the child reach his point of arrested development?" Is it by a gradual slowing down or by a sudden stop? Nor can we answer this question surely, as yet. Perhaps it is a matter of the individual. Some develop one way and some another. The full answer to this part of the question must wait further study.

There are some indications, however, that some children arc pretty nearly normal until about eight or nine or ten years of age, and then they stop rather suddenly. For example, children test normal at six, and defective at ten never having developed beyond seven. Or defective at twelve, not having developed beyond nine. Others seem to have always been a little backward, but kept getting more and more backward until the age perhaps of nine or ten, when they seem to have entirely stopped. It must be possible to measure the rate of progress sometime when our psychological methods become more complete. . . .

The capacity for learning at the different ages during the evolutionary period might be likened to tin cups of uniform diameter but varying in height. The short cup can not be made to hold more than its capacity, so no amount of training will enable the child of a low mental age—the short cup—to perform the things which only a person of higher mental age—the long cup—can learn. On the other hand there are things that a child of any given mental age can learn to do,—the number increasing with the advance of mental age to the end of the period of mental evolution.

Sigmund Freud, from "On Narcissism: An Introduction" (1914)

Freud develops his concept of narcissism, the pathological focus on one's own person to the exclusion of others, through the example of pain. Pain and suffering supposedly steal a person's interest in other people, thereby approximating the pathological selfishness called narcissism.

It is universally known, and we take it as a matter of course, that a person who is tormented by organic pain and discomfort gives up his interest in the things of the external world, in so far as they do not concern his suffering. Closer observation teaches us that he also withdraws *libidinal* interest from his love-objects: so long as he suffers, he ceases to love. The commonplace nature of this fact is no reason why we should be deterred from translating it into terms of the libido theory. We should then say: the sick man withdraws his libidinal cathexes back upon his own ego, and sends them out again when he recovers. 'Concentrated is his soul,' says Wilhelm Busch of the poet suffering from toothache, 'in his molar's narrow hole.' Here libido and ego-interest share the same fate and are once more indistinguishable from each other. The familiar egoism of the sick person covers both. We find it so natural because we are certain that in the same situation we should behave in just the same way. The way in which a lover's feelings, however strong, are banished by bodily ailments, and suddenly replaced by complete indifference, is a theme which has been exploited by comic writers to an appropriate extent.

Sigmund Freud, from *Some Character-Types Met with in Psycho-Analytic Work* (1916)

Freud explains that pain and physical deformity produce a feeling of extraordinariness in people with disabilities to the point where they may believe that moral laws obeyed by other people do not apply to them. Freud offers the example of Richard III as a disabled person who believes that life's rules do not govern his behavior because he deserves compensation for his suffering. Feelings of being disadvantaged, Freud argues, lead to pathological egotism.

Psycho-analytic work is continually confronted with the task of inducing the patient to renounce an immediate and directly attainable yield of pleasure. He is not asked to renounce all pleasure; that could not, perhaps, be expected of any human being. . . . No, the patient is only asked to renounce such satisfactions as will inevitably have detrimental consequences. His privation is only to be temporary; he has only to learn to exchange an immediate yield of pleasure for a better assured, even though a postponed one. Or, in other words, under the doctor's guidance he is asked to make the advance from the pleasure principle to the reality principle by which the mature human being is distinguished from the child. . . .

When in this way one asks the patient to make a provisional renunciation of some pleasurable satisfaction, to make a sacrifice, to show his readiness to accept some temporary suffering for the sake of a better end, or even merely to make up his mind to submit to a necessity which applies to everyone, one comes upon individuals who resist such an appeal on a special ground. They say they have renounced enough and suffered enough, and have a claim to be spared any further demands; they will submit no longer to any disagreeable necessity, for they are exceptions and, more over, intend to remain so. . . .

Now it is no doubt true that everyone would like to consider himself an ‘exception’ and claim privileges over others. But precisely because of this there must be a particular reason, and one not universally present, if someone actually proclaims himself an exception and behaves as such. This reason may be of more than one kind; in the cases I investigated I succeeded in discovering a common peculiarity in the earlier experiences of these patients’ lives. Their neuroses were connected with some experience or suffering to which they had been subjected in their earliest childhood, one in respect of which they knew themselves to be guiltless, and which they could look upon as an unjust disadvantage imposed upon them. . . . In one of these patients, a woman, the attitude towards life which I am discussing came to a head when she learnt that a painful organic trouble, which had hindered her from attaining her aims in life, was of congenital origin. So long as she looked upon this trouble as an accidental and late acquisition, she bore it patiently; as soon as she found that it was part of an innate inheritance, she became rebellious. The young man who believed that he was watched over by a special providence had in his infancy been the victim of an accidental infection from his wet-nurse, and had spent his whole later life making claims for compensation, an accident pension, as it were, without having any idea on what he based those claims. In this case the analysis, which constructed this event out of obscure mnemic residues and interpretations of the symptoms, was confirmed objectively by information from his family.

For reasons which will be easily understood I cannot communicate very much about these or other case histories. Nor do I propose to go into the obvious analogy between deformities of character resulting from protracted sickliness in childhood and the behaviour of whole nations whose past history has been full of suffering. Instead, however, I will take the opportunity of pointing to a figure created by the greatest of poets—a figure in whose character the claim to be an exception is closely bound up with and is motivated by the circumstance of congenital disadvantage.

In the opening soliloquy to Shakespeare’s *Richard III,* Gloucester, who subsequently becomes King, says:

> But I, that am not shaped for sportive tricks,
> Nor made to court an amorous looking-glass;
> I that am rudely stamp’d, and want love’s majesty
> To strut before a wanton ambling nymph;
> I, that am curtail’d of this fair proportion,
> Cheated of feature by dissembling Nature,
> Deform’d, unfinish’d, sent before my time
> Into this breathing world, scarce half made up,
> And that so lamely and unfashionable,
> That dogs bark at me as I halt by them;
> . . . .
> And therefore, since I cannot prove a lover,
> To entertain these fair well-spoken days,
> I am determined to prove a villain,
> And hate the idle pleasures of those days.

At a first glance this tirade may perhaps seem unrelated to our present theme. Richard seems to say nothing more than: ‘I find these idle times tedious, and I want to enjoy myself. As I cannot play the lover on account of my deformity, I will play the villain; I will intrigue, murder and do anything else I please.’ Such a frivolous motivation could not but stifle any stirring of sympathy in the audience, if it were not a screen for something much more serious. Otherwise the play would be psychologically impossible, for the writer must know how to furnish us with a secret background of sympathy for his hero, if we are to admire his boldness and adroitness without inward protest; and such sympathy can only be based on understanding or on a sense of a possible inner fellow-feeling for him.

I think, therefore, that Richard’s soliloquy does not say everything; it merely gives a hint, and leaves us to fill in what it hints at. When we do so, however, the appearance of frivolity vanishes, the bitterness and minuteness with which Richard has depicted his deformity make their full effect, and we clearly perceive the fellow-feeling which compels our sympathy even with a villain like him. What the soliloquy thus means is: ‘Nature has done me a grievous wrong in denying me the beauty of form which wins human love. Life owes me reparation for this, and I will see that I get it. I have a right to be an exception, to disregard the scruples by which others let themselves be held back. I may do wrong myself, since wrong has been done to me.' And now we feel that we ourselves might become like Richard, that on a small scale, indeed, we are already like him. Richard is an enormous magnification of something we find in ourselves as well. We all think we have reason to reproach Nature and our destiny for congenital and infantile disadvantages; we all demand reparation for early wounds to our narcissism, our self-love. Why did not Nature give us the golden curls of Balder or the strength of Siegfried or the lofty brow of genius or the noble profile of aristocracy? Why were we born in a middle-class home instead of a royal palace? We could carry off beauty and distinction quite as well as any of those whom we are now obliged to envy for these qualities.

▣ D. Amaury Talbot, from *Woman's Mysteries of a Primitive People: The Ibibios of Southern Nigeria* (1915)

This is an ethnography of the Ibibio, a Nigerian tribe. Written by a pioneering Englishwoman in the early twentieth century, this book focuses on the ritual life of women. Despite the naive colonialist attitude, it presents a female perspective that was seldom seen in the ethnographic literature of the period.

From Chapter III. "Birth Customs"

In that part of the district which lies round Awa a reason is given for the killing of twins which is quite unconnected with any idea as to demoniacal origin. The following is the local account of the cause of the custom:

> The first pair of twins sent to Earth, so our mothers tell, unfortunately came to the dwelling of a family poor and of little account. When news of their arrival reached the neighbouring chiefs and members of great houses, these gathered together in much anxiety at such an unprecedented occurrence, and consulted as to what should be done. "Behold," said they, "this woman first bore one child. Now she has given birth to two together; should she continue to go on in the way in which she has begun, next time she may bear four, and after that six or even eight, and so on until her family surpasses any of ours. If poor people are allowed to grow 'strong' at such a rate, what will become of us? We shall have no chance to seize their property on the death of the head of their house, nor to force them to serve us as before when their family was small and of little account and there was none to take their part."

That, so our grandmothers tell, is the reason why the murder of twins was started in the Awa country. Had the first twins come to a rich or powerful family there would have been no killing.

> Not long afterwards the king's head wife also gave birth to a boy and a girl, and a meeting of the townsfolk was called to discuss the matter. The king and his relatives tried their utmost to save the lives of the babes, but the poor folk combined and said, "They shall be killed, as were those of our women." The more the rich strove to save the chief's twin children, the more did the poor insist upon their death, crying, "As you did to us and our babes, so will we do also unto you and yours." That is the reason why twin children were killed even unto our own day. In the country round Awa, however, no "twin mother" is ever put to death, only driven forth from her town.

With this fear before their eyes, it is natural that women about to become mothers should consult a native doctor some time before the expected birth of their babes in order to learn from him if there is any probability of the arrival of twins. Should he answer in the affirmative, medicine is given by which the danger may be averted.

Next to the dread of becoming a mother of twins looms that of bearing a child into whose body some evil spirit has entered. This may be that of ancestor or kinsman undesirable on account of bodily or mental deformity, or because they come from a family tainted with "witchcraft."

So-called "birth-marks" seem to be quite common among this people, although such are here attributed to causes different from those assigned them in northern climes. An Ibibio baby is eagerly scanned for any sign that may reveal the identity of the indwelling Ego. Parents often notice some likeness to a dead friend, or trick of speech or movement in a child that to their minds shows that it is an old spirit reborn in some new body. A striking example of the way in which such deductions are made happened at Ndiya about ten years ago, and was told as follows:

"Patients' Examination" during a mission studying sleeping sickness in French Congo (1907). Colonial infiltration by European powers around the globe was often accompanied by medical studies of native populations. Of particular interest were indigenous diseases that also affected European immigrants residing in these locations. Here, resident people are examined by medical authorities to better understand the nature of sleeping sickness among residents of the Congo.

Source: Art Resource, New York.

> A man named Osim Essiet married a wife, and a little while before the birth of their first child he was attacked by an enemy and left lying in the bush with his head severed from his body. When he did not return, friends set out to look for him. After some time they found the corpse, bore it home and laid it upon a native bed. When the young wife saw this horrible sight, she cried out and flung herself down by the side of the body, calling upon the name of her husband and entreating him not to leave her.
>
> Some weeks afterwards the child was born. Round his neck was the mark as of a line at the place where his father's head had been severed, and, indeed, his neck is still shorter than that of most people. The townsfolk noticed this peculiarity, and felt sure, because of it, that the boy was really Osim Essiet himself come back to life again because he loved his wife very dearly and in answer to her entreaties that she might not be left alone. They therefore gave him, in his new incarnation, the same name as he had borne before.

A somewhat similar case happened at Ikott Atako, near Eket, and is thus related:

> There was once a woman of this town, Etuk Nkokk by name, who, not long after she had left the Fatting-house, bore a boy. At first the babe was like other children save that he was very weak, but as the years went on he hardly seemed to grow at all, and by the age of twenty was not quite four feet high. One day his mother went out and noticed the fine strong children born to her neighbors. When she came home, she looked gloweringly at her sickly son and said, "No other woman has a child like you! I wish you might die that I may be no more shamed by the sight of you!" Not long afterwards the boy sickened and died, and before they brought the coffin in which to lay him for burial the mother said to herself: "This piccan gave me too much trouble! I wish to find some way of punishing him and preventing him from returning to life." So she took thought, and at length cut off his right hand, saying to herself, "Now he will surely be ashamed, and not come back into my family any more."
>
> A few months later another child was born, but lo! it was the same boy come back again, as was plain to be seen because he had only one hand. When the people went to see the mother and the new-born babe, they recognized him at once for the one who had died, and, seeing the handless wrist, asked "How could you do such a cruel thing to your firstborn?" She answered, "It was because I did not want him to come back again, and thought he would be ashamed to show himself among us thus maimed." The people said, "It is a misfortune, but it cannot be helped! This is your punish-

> ment, and you must just do your best for him." So the woman took their advice and did everything possible for the child, in consequence of which he grew up and is still alive, a little taller than during his first earth-life, but smaller than other men.

The mother of Chief Henshaw of Oron regards him as an example of reincarnation. The name Nyung, by which he is everywhere known among black people, means "thrice born"—an appellation which she gave him because her two first babes had died, and she believed that at his birth the same spirit came back once more; this time, not in vain.

The dread of the return of "wandering souls," who reincarnate only to bring trouble upon the family into which they have chosen to come, is common over the greater part of West Africa. Mary Kingsley thus describes the way in which parents seek to protect themselves against the infliction of these annoying spirits:

> When two babes in a family have previously died in suspicious circumstances the father takes the body of the third baby which has also died in the same way and smashes one of its leg bones before it is thrown away into the bush; for he knows he has got a wanderer soul—namely a *sisa*. . . . He just breaks the leg so as to warn the soul he is not a man to be trifled with, and will not have his family kept in a state of perpetual uproar and expense. It sometimes happens, however, in spite of this that when his fourth baby arrives that too goes off in convulsions. Thoroughly roused now, paterfamilias sternly takes a chopper, and chops that infant's remains extremely small, and it is scattered broadcast. Then he holds he has eliminated that sisa from his family.

I am informed, however, that the fourth baby to arrive in a family afflicted by a *sisa* does not usually go off in convulsions, but that fairly frequently it is born lame, which shows that it is that wanderer soul back with its damaged leg.

▣ Frank B. Linderman, from *Indian Why Stories* (1915)

Indian "Why Stories" were collected, translated, and written down by European missionaries and early ethnographers. They presumably helped to capture what was often pejoratively thought of as aboriginal folklore by Native American tribes in North America. The stories attempt to explain physical or cognitive differences that exist among people and other species.

How The Ducks Got Their Fine Feathers

Another night had come, and I made my way toward War Eagle's lodge. In the bright moonlight the dead leaves of the quaking-aspen fluttered down whenever the wind shook the trees; and over the village great flocks of ducks and geese and swan passed in a never-ending procession, calling to each other in strange tones as they sped away toward the waters that never freeze.

In the lodge War Eagle waited for his grandchildren, and when they had entered, happily, he laid aside his pipe and said:

"The Duck-people are travelling to-night just as they have done since the world was young. They are going away from winter because they cannot make a living when ice covers the rivers.

"You have seen the Duck-people often. You have noticed that they wear fine clothes but you do not know how they got them; so I will tell you to-night.

"It was in the fall when leaves are yellow that it happened, and long, long ago. The Duck-people had gathered to go away, just as they are doing now. The buck-deer was coming down from the high ridges to visit friends in the lowlands along the streams as they have always done. On a lake Old-man saw the Duck-people getting ready to go away, and at that time they all looked alike; that is, they all wore the same colored clothes. The loons and the geese and the ducks were there and playing in the sunlight. The loons were laughing loudly and the diving was fast and merry to see. On the hill where Old-man stood there was a great deal of moss, and he began to tear it from the ground and roll it into a great ball. When he had gathered all he needed he shouldered the load and started for the shore of the lake, staggering under the weight of the great burden. Finally the Duck-people saw him coming with his load of moss and began to swim away from the shore.

"'Wait, my brothers!' he called, 'I have a big load here, and I am going to give you people a dance. Come and help me get things ready.'

"'Don't you do it,' said the gray goose to the others; 'that's Old-man and he is up to something bad, I am sure.'

"So the loon called to Old-man and said they wouldn't help him at all.

"Right near the water Old-man dropped his ball of moss and then cut twenty long poles. With the poles he built a lodge which he covered with the moss, leaving a doorway facing the lake. Inside the lodge he built a fire and when it grew bright he cried:

"'Say, brothers, why should you treat me this way when I am here to give you a big dance? Come into the lodge,' but they wouldn't do that. Finally Old-man began to sing a song in the duck-talk, and keep time with his drum. The Duck-people liked the music, and swam a little nearer to the shore, watching for trouble all the time, but Old-man sang so sweetly that pretty soon they waddled up to the lodge and went inside. The loon stopped near the door, for he believed that what the gray goose had said was true, and that Old-man was up to some mischief. The gray goose, too, was careful to stay close to the door but the ducks reached all about the fire. Politely, Old-man passed the pipe, and they all smoked with him because it is wrong not to smoke in a person's lodge if the pipe is offered, and the Duck-people knew that.

"'Well,' said Old-man, 'this is going to be the Blind-dance, but you will have to be painted first.

"'Brother Mallard, name the colors—tell how you want me to paint you.'

"'Well,' replied the mallard drake, 'paint my head green, and put a white circle around my throat, like a necklace. Besides that, I want a brown breast and yellow legs: but I don't want my wife painted that way.'

"Old-man painted him just as he asked, and his wife, too. Then the teal and the wood-duck (it took a long time to paint the wood-duck) and the spoonbill and the blue-bill and the canvasback and the goose and the brant and the loon—all chose their paint. Old-man painted them all just as they wanted him to, and kept singing all the time. They looked very pretty in the firelight, for it was night before the painting was done.

"'Now,' said Old-man, 'as this is the Blind-dance, when I beat upon my drum you must all shut your eyes tight and circle around the fire as I sing. Every one that peeks will have sore eyes forever.'

"Then the Duck-people shut their eyes and Old-man began to sing: 'Now you come, ducks, now you come—tum-tum, tum; tum-tum, tum.'

"Around the fire they came with their eyes still shut, and as fast as they reached Old-man, the rascal would seize them, and wring their necks. Ho! things were going fine for Old-man, but the loon peeked a little, and saw what was going on; several others heard the fluttering and opened their eyes, too. The loon cried out, 'He's killing us—let us fly,' and they did that. There was a great squawking and quacking and fluttering as the Duck-people escaped from the lodge. Ho! but Old-man was angry, and he kicked the back of the loon-duck, and that is why his feet turn from his body when he walks or tries to stand. Yes, that is why he is a cripple to-day.

"And all of the Duck-people that peeked that night at the dance still have sore eyes—just as Old-man told them they would have. Of course they hurt and smart no more but they stay red to pay for peeking, and always will. You have seen the mallard and the rest of the Duck-people. You can see that the colors Old-man painted so long ago are still bright and handsome, and they will stay that way forever and forever. Ho!"

▣ Franz Kafka, from *The Metamorphosis* (1915)

Franz Kafka (1883–1924) was born in Prague, Czechoslovakia, to a middle-class Jewish family. His works are often characterized as expressing the essential alienation of the human condition at the beginning of the twentieth century. His experience of tuberculosis played a key role in the cultivation of his distinctive absurdist fictional style, in which characters suffer profoundly from social neglect. The excerpt here from one of his most celebrated stories, The Metamorphosis, *demonstrates his profound identification with individuals whose divergent bodies and minds result in their isolation from the rest of society. Kafka spent his final years moving in and out of sanatoriums that were often indicative of the impersonal bureaucracies of modern life that he critiqued.*

As Gregor Samsa awoke one morning from uneasy dreams he found himself transformed in his bed into a gigantic insect. He was lying on his hard, as it were armor-plated, back and when he lifted his head a little he could see his domelike brown belly divided into stiff arched segments on top of which the bed quilt could hardly stay in place and was about to slide off completely. His numerous legs, which were pitifully thin compared to the rest of his bulk, waved helplessly before his eyes. . . .

First of all he wanted to get up quietly, without any excitement; get dressed; and, the main thing, have breakfast, and only then think about what to do next, for he saw clearly that in bed he would never think things through to a rational conclusion. He remembered how even in the past he had often felt some kind of slight pain, possibly caused by lying in an uncomfortable position, which, when he got up, turned out to be purely imaginary, and he was eager to see how today's fantasy would gradually fade away. That the change in his voice was nothing more than the first sign of a bad cold, an occupational ailment of the traveling salesman, he had no doubt in the least.

It was very easy to throw off the cover; all he had to do was puff himself up a little, and it fell off by itself. But after this, things got difficult, especially since he was so unusually broad. He would have needed hands and arms to lift himself up, but instead of that he had only his numerous little legs, which were in every different kind of perpetual motion and which, besides, he could not control. If he wanted to bend one, the first thing that happened was that it stretched itself out; and if he finally succeeded in getting this leg to do what he wanted, all the others in the meantime, as if set free, began to work in the most intensely painful agitation. "Just don't stay in bed being useless," Gregor said to himself.

First he tried to get out of bed with the lower part of his body, but this lower part—which by the way he had not seen yet and which he could not form a clear picture of—proved too difficult to budge; it was taking so long; and when finally, almost out of his mind, he lunged forward with all his force, without caring, he had picked the wrong direction and slammed himself violently against the lower bedpost, and the searing pain he felt taught him exactly the lower part of his body was, for the moment anyway, the most sensitive.

He therefore tried to get the upper part of his body out of bed first and warily turned his head toward the edge of the bed. This worked easily, and in spite of its width and weight, the mass of his body finally followed, slowly, the movement of his head. But when at last he stuck his head over the edge of the bed into the air, he got too scared to continue any further, since if he finally let himself fall in this position, it would be a miracle if he didn't injure his head. And just now he had better not for the life of him lose consciousness; he would rather stay in bed.

But when, once again, after the same exertion, he lay in his original position, sighing, and again watched his little legs struggling, if possible more fiercely, with each other and saw no way of bring peace and order into this mindless motion, he again told himself that it was impossible for him to stay in bed and that the most rational thing was to make any sacrifice for even the smallest hope of freeing himself from bed. But at the same time he did not forget to remind himself occasionally that thinking things over calmly—indeed, as calmly as possible—was much better than jumping to desperate decisions. At such moments he fixed his eyes as sharply as possible on the window, but unfortunately there was little confidence and cheer to be gotten from the view of the morning fog, which shrouded even the other side of the narrow street. "Seven o'clock already" he said to himself as the alarm clock struck again, "seven o'clock already and still such a fog."

▣ Ada M. Fitts, "Classes and Institutions" (1916)

This excerpt comes from a paper read at the National Conference of Charities and Correction, Indianapolis, Indiana, May 1916, and at the National Educational Association, New York City, July 1916. Ada M. Fitts was the Supervisor of Special Classes for Boston, Massachusetts. The essay identifies various scenarios for educating children diagnosed as feebleminded.

The problem of feeble-mindedness is very much before the public, and everywhere in this country, community surveys, the use of mental tests and studies of family histories are furnishing evidence that the feeble-minded are an increasingly important factor in all forms of social and educational work.

Along with the other agencies that are interested in finding a solution to this far reaching problem, the public school authorities have become aroused and are providing classes which it is hoped will furnish training for pupils who are not able to make good in the regular grades. Before discussing my subject: "How to Fill the Gap Between the Special Classes and Institutions," I wish to review what the public schools have attempted to do in preparation for this time of leaving school. It is generally believed that the special

Photograph of Auguste Renoir at his easel (1914). From 1898 onward, Renoir (1841–1919) experienced bouts of rheumatoid arthritis, which ultimately worked its way to his legs and hands. He continued to paint, often in his studio from his bed, while wedging his brushes between his fingers or binding them with tape. As his paralysis increased, he turned from painting to sculpture, where he would employ an assistant to form the clay to his specifications.

Source: Art Resource, New York.

class is the first step in the attempt to solve the problem. Its function is first: to educate the community and the teachers of normal children to realize the situation; second: to seek out the feeble-minded children and help them, and by so doing, help the normal children who have been retarded; third: to relieve the teacher who gives perhaps thirty percent, of her energy to the few feeble-minded pupils she may have. This energy is taken from her normal pupils and does not materially benefit the feeble-minded, as only in the special class can we do our best for these children; fifth, to secure justice to society, for it is a matter of social justice that the feeble-minded be recognized and trained as far as it is possible to do so.

The pupils should be selected by a trained expert who uses a combination of tests and who will win the confidence of parents as well as give a diagnosis of the child's mental and physical condition. In many places the high grade improvable feeble-minded children have been selected by such experts and then placed in classes under the direction of trained teachers. The number of pupils in a class is wisely limited to fifteen to a teacher, and through individual work she tries to fit her pupils for adult life. Special classes take feeble-minded children as early as possible—say—from seven to eight years of age. Some eventually return to grade and are able to complete a part of the fourth grade work; a few more are transferred directly to the institution; but the majority should remain in special classes till they reach the school age limit.

Three methods have been adopted: first, to have the special class occupy a room in an elementary school building and care for the mentally defective children of that immediate district; second, to group these pupils in a central school; and third, a combination of both individual classes and centers. In Massachusetts until recently, children were allowed to leave school at fourteen, but with the raising of the compulsory school age limit to sixteen, we found ourselves (two years ago) face to face with the problem of what to do with the special class children who must remain in school until they are sixteen years of age. In Boston in order to provide the next necessary step beyond the individual class, the regular grade pupils occupying two six-room buildings, were accommodated elsewhere and these buildings were used as centers: one for special class girls and another for special class boys. Pupils for these centers were selected from individual classes all over the city (one or two from each) as their fitness to profit by this special advantage was recognized. The separation of the sexes has proved to be of distinct advantage both to pupils and teachers, thus adding to the efficiency of the work. Little difficulty has been experienced thus far in transportation over long distances, the city paying the car fares.

At the centers advanced manual work is begun and grading and classification are possible. The program is so arranged that each child has one and one-half hours physical, one and one-half hours academic, and two hours manual work each day. The girls are given a trained teacher to instruct them in domestic science, millinery, sewing, embroidery, crocheting, knitting, mending and preserving. The boys are taught brush making, boot blacking, woodworking, serving of lunches, dish washing, simple tailoring, gardening, assistant janitor work, and other forms of comparatively unskilled labor. In this way we attempt to carry on the training of special class children from seven to sixteen years of age.

The special class, in my opinion, should be still further supplemented by workrooms where, under favorable conditions, pupils over sixteen may be provided with work for which they would be paid. Cobbling, chair caning, tool sharpening, brush and mat making, are industries which might be carried on profitably. They could thus be guarded and controlled in part without being taken from their homes. This brings up the question of how long the public schools should assume the responsibility of these children beyond the school age limit. It seems to me that it should do so for another year or two at least, unless there is some other agency ready to do the work. The school funds are used for work with adults in continuation and evening schools and centers—why not for the much needed work with the feeble-minded?

The most important factor is the teacher who presides over the special class. She must be one who is quick to perceive, able to adapt, whose sympathies are keen and whose outlook is broad, but who combines with these gifts, steadiness of purpose and the power to raise and hold her pupil to his best. A sense of humor will help out in many a situation. In Boston the teachers are given time in which to visit the children's homes, learn the conditions and confer with the parents. The teacher knows how much freedom can safely be given the child; she knows his limitations and when work is undertaken for which he is not adapted, she is able to suggest other lines. She could keep in touch with him and advise him as need arose, if she had the time; but the demands of her classroom are all that should be asked of her strength. In some cities, visiting teachers whose function is that of social workers have done this work most acceptably.

Most will agree that the ideal condition would be for many of the mentally defective to go from the school directly to the institution, and thus safeguard the public from inefficiency, unemployment, pauperism, vagrancy, degeneracy, and all the other social consequences of feeblemindedness. Since this is impossible, we must attempt to fill the gap between the special class and the institution by providing a system of after-care for the feeble-minded who are forced to compete with the normal in the working world. As has been said "It is not sufficient for society that the subnormal should be properly trained in school; it is the business of someone to see that they meet the difficulties of the earn-a-living world. It is of small use to train laboriously in school for shop or farm and then see the graduate enter messenger service or other unskilled and spasmodic labor. Pioneers are needed to make this new adjustment, to study the situation, plan for it, and to enter into it. It is time for them to think together, plan together, and for others to help put the results of the deliberation into operation."

The child may have been prepared for appropriate employment, but he cannot be given the necessary power of self-direction. The subnormal person (young or old) does not have that guiding power within; he must have outside control that should never be relaxed. The need is for a person or persons who will provide this oversight and follow the career of each individual, continuing the guidance begun by the teacher. He should be closely connected with the representatives of various educational, religious, philanthropic, civic and medical organizations. This person should be strong, tactful, persistent one who has been a teacher of mentally defective children and also, if possible, with training as a social worker. The after-care work would naturally divide into two parts: first, the obtaining of information about pupils; second, oversight of pupils at work and knowledge of where suitable positions can be secured. In order to do this it would be necessary to canvass the employers of comparatively unskilled labor to arrange to have notifications sent the officer when there are vacancies to be filled. . . .

At the Massachusetts School for the Feeble-Minded at Waverley, Dr. Fernald is making a careful after-care study of all the patients who have been discharged from the school for the past twenty-five years. He says: "Wherever it is possible our field-workers have visited these patients and the fullest inquiry has been made as to the kind of life they have lived since leaving the institution. The inquiry was planned primarily to furnish a basis of evolution as to the practical results given at the school. The inquiry also sought information as to the social, economic and moral life of the feeble-minded individual in the community."

Carl Sandburg, "Cripple" (1916)

Carl Sandburg (1878–1967) was a Chicago-based poet well known for his depictions of midwestern life. In poems such as "Cripple," he metaphorized disability as a sign of the ravages of industrialization on the body. Additionally, Sandburg used images of Nature as a sign of robust health compared to the decrepitude of the life of an individual with disability.

Once when I saw a cripple
Gasping slowly his last days with the white plague,
Looking from hollow eyes, calling for air,
Desperately gesturing with wasted hands
In the dark and dust of a house down in a slum,
I said to myself
I would rather have been a tall sunflower
Living in a country garden
Lifting a golden-brown face to the summer,
Rain-washed and dew-misted,
Mixed with the poppies and ranking hollyhocks,
And wonderingly watching night after night
The clear silent processionals of stars.

Captain Arthur H. Samuels on Disabled Veterans (1918)

The author of this piece argues that what the general public, and particularly businessmen and employers, owe disabled veterans is not charity, but a job, and a continuing commitment in the postwar period to see to it that the private sector does its part to reintegrate these men, after government programs have rehabilitated and retrained them.

"After the war, if a cripple stops me on the street and asks for help," said a philanthropic business man in New York recently, "how can I tell whether he is a real veteran or just an impostor? Of course, I always want to give something to the boys who went over the top. Will they wear a button to show that they've been soldiers?"

And the answer was this: "Any man who stops you and asks for alms is a beggar whether he was in the war or not. No buttons or insignia will be necessary."

This New Yorker had naïvely got at the very roots of reconstruction. Thousands of men and women everywhere are puzzled over the same thing, for the public does not yet understand the distinction between the cripple who can make good if he wants to, and the beggar who *could* make good but *doesn't* want to.

The gap is wide; and one of the most difficult and vital tasks confronting the Government and the other forces involved in the problem is to reconstruct the public attitude: to destroy utterly the worn-out notion about the cripple and to teach the new.

Picture a soldier who has lost both legs walking—he *will* walk—into the president's office of an industrial plant, where he is received cordially and with honor.

"It happened in the Toul sector," he says "about a year and a half ago and it was nine months before I was discharged from the hospital with these artificial legs. But early in the game I made up my mind to make good. I couldn't go back to railroading—I used to be a conductor—so I decided to take up stenography and typewriting. The Government gave me a fine course, everything I needed. I am qualified to hold down a secretarial job and I need one right now. I can't afford to be idle."

The president who really admired his caller, listened politely. He liked the man's personality. He reached for his check book.

"We are proud of men like you," he said as he wrote, "and you deserve to succeed. Here's fifty dollars. I'm sorry I haven't a position open. Good luck to you. You deserve success."

Now the ex-soldier was human and he accepted the money. He shouldn't have done so. But he is not the one to be blamed. The president, unwittingly, did a vicious thing by offering it to him and every man or woman who gives alms but not opportunity to the disabled man—soldier, sailor, or civilian—is an enemy of reconstruction. One gift of money that is not actually earned may utterly stifle the ambition of the handicapped man.

Business men must be told this again and again. The American public must know that their Government has provided a fair compensation and insurance for the wounded, which, with vocational training, provide our returned soldiers and sailors with adequate means to re-enter civil life. There is a general appreciation of the fact that our men will not be turned loose and allowed to drift as after former wars, but it is natural that a subject so new and complicated has got to be explained, iterated, and reiterated.

This is being done today in an infinite number of ways. The various forces that create and guide public opinion in America are at work enthusiastically and wholeheartedly, offering every possible means of cooperation. For after all, reconstruction is not a matter of propaganda to be jammed through: it is news—one of the biggest pieces of news that has yet found its way into the channels of national publicity.

Newspapers, magazines, motion pictures, pamphlets, speeches—these and other mediums are bringing reconstruction and its significance into the American home and American industry. The Office of the Surgeon General, the American Red Cross, and the Federal Board for Vocational Education are small portion of the factors making it known.

The success of this great plan will depend on the attitude of the public. Public opinion is a pretty loose term as it is generally applied. In this instance, however, it is pat, because it represents several very definite and concrete elements—the man himself, his family, his friends, and his employers. Sympathy and encouragement are plentiful these days while we are in the throes of the conflict, but they will be difficult to maintain when the thrill of battle has passed and the nation has settled down to its normal activities. And after the war—long after—they will be needed most.

Men and women of America by word-of-mouth, house-to-house publicity based on what they read and hear are rapidly developing a new psychology toward the handicapped. Gradually they are reconstructing themselves. And the more thoughtful are beginning to comprehend that physical reconstruction and vocational training will not stop with the coming of peace, but will become powerful and permanent factors in American society and industry.

▣ Violet Jacob, "Kirsty's Opeenion" (1918)

In this Scots dialect poem, Violet Jacob (1863–1946) portrays the changed domestic arrangements of the disabled World War I veteran after his return home. In the last lines, the reader is assured that the wife has not become less quarrelsome in consideration of her husband's lost limb; instead, the poet declares that his military experience itself has simply made him less susceptible to nagging.

Fine div I ken what ails yon puddock, Janet,
That aince wad hae her neb set up sae hie;
There's them that disna seem to understaun it,
I'se warrant ye it's plain eneuch to me!

Mibbie ye'll mind her man-a fine wee cratur,
Ower blate to speak (puir thing, he didna daur);
What garred him fecht was jist his douce-like natur;
Gairmans is bad, but Janet's tongue was waur.

But noo he's hame again, ye wadna ken her,
He isna feared to contradick her flet;
He smokes a' day, comes late to get his denner,
(I mind the time she'd sort him weel for that!)

What's garred her turn an tak a road divairgint?
Ye think she's wae because he wants a limb?
Ach! haud yer tongue, ye fuil—the man's a sair-gint,
An there's nae argy-bargyin wi him!

▣ Office of the Surgeon General, "War Cripple Axioms and Fundamentals" (1918)

This document summarizes the influential views of Douglas C. McMurtrie, the director of the Red Cross Institute for Crippled and Disabled Men and editor of the American Journal of Care for Cripples, on the proper assumptions to adopt in order to direct the work of rehabilitation and reintegration of disabled World War I veterans. McMurtrie, along with rehabilitation professionals in every major nation at war at the time, believed that aggressive normalization through systematic vocational retraining must be the basis of any program for rehabilitation of men injured or made chronically ill in consequence of service during the war.

Part 1. Public Policy: The Modern Program of Assistance and Benefit Disabled Veterans in the Twentieth Century

21. To complete physical rehabilitation in amputation cases, artificial limbs must be supplied. That a stump shrinks for some time after amputation introduces one

element of difficulty, in that a limb that fits six months after amputation may come far from doing so after twelve months. For this reason it may be wise to provide the soldier at first with a simple temporary limb, and later with a more elaborate and permanent one. He must be quite explicitly assured of this plan, however, as he will otherwise become suspicious of being put off with an inferior article.

22. Employment of the graduates must be closely integrated with [that] secured for the re-educated soldier, but he must be placed as intelligently as possible. To the man the work must be satisfactory and the environment agreeable; to the employer the personality of the soldier must be acceptable and his product sufficient to the requirements. Of course, this ideal can only be approximated, but a trained and capable employment officer can do much in this direction. Only by skilled and thorough work can permanent results be obtained—and nothing is more costly to all parties concerned than short-time employment and frequent change of job.

23. The first job for the man returned from the front is easy to secure—so easy that we should not be misled by the superficial indications. The employer is patriotic and anxious to help the crippled soldiers. But when the war shall have been over a few years, these motives will be no longer effective. The man taken on in a time of national stress will be just one of the employees, and his retention in service will depend upon performance alone. If the original placement was intelligent the man will have made progress, gained confidence and experience and made his position sure. If, on the other hand, he was ill-fitted for the job, he will have grown progressively less efficient and in consequent discouraged, and his status will be precarious indeed. A permanent injury might thus result from an employment bungle in the first instance. All this simply means that effective placement is not an amateur job.

24. The support and direction of after-care for the war cripple is most emphatically a national one. This can be demonstrated not only as a matter of principle but also by actual experiential results.

From the viewpoint of principle, it may be concluded that the returned soldier should not be dependent for one of his most vital necessities on the dole of private charity, for which is expected a grateful appreciation.

25. The training schools should be under public control and have the advantage of central direction by expert and capable executives. There is also no riper field for the expression of mawkish sentimentality than in caring for the crippled or blind, and the injured soldier must be protected from becoming its victim. With schools operated under local auspices there would be a few good ones, and many of the indifferent variety. And there is no problem more delicate than that of coping with ill-directed and silly charitable enterprises.

26. The chief advantage accruing from centralized public control is the character the work then assumes in its relation to the individual war cripples. It is regarded much as is the public school system; the solder is thus entitled to training by virtue of his rights as a citizen and an honorable public servant. There is of charity no taint whatever.

With an acknowledged national responsibility, the facilities provided can keep pace with—or, indeed, ahead of—the requirements. The work can be carried out on a plan fixed in advance, and its standards be consistent country-wide.

27. Another advantage of federal control lies in the simplicity of integration between the medical and educational interests. The former is under military and, therefore, national authority, and simplification of procedure cannot but result from having the latter of less scope. The training classes must in many instances be carried on in medical institutions, as there is a considerable period of convalescence in which the men should be under re-education.

28. One of the principal methods of restoring disabled soldiers to health is the prescription of specified exercise, and it has been found that this is best gained in workshops rather than with mechanotherapeutic apparatus. Finding that they can do some practical thing, however simple, is immensely encouraging to men who may have lost hope of future usefulness. Occupational therapy plays now one of the leading roles in the convalescent treatment of the wounded, and this makes all the more desirable a close relation between the two branches of the work.

29. A central and national direction of the work for war cripples does not in the least prelude the utilization of volunteer effort and facilities. In fact, voluntary contribution of time and money is highly desirable, particularly in committing more people to a first-hand interest in the enterprise, and in giving the schools root in their local communities. Buildings can be loaned, trade school classrooms and equipment made available, machinery and apparatus for instruction

donated, funds contributed, and personal service volunteered. Existing organizations can offer to provide the necessary social service work in the homes of the men; local employment agencies can be of help by acting [as] links in the national chain.

30. Such private assistance will be more than desirable; it will be essential. Because provision for war cripples is a temporary problem and it would not be wise to erect new buildings, equip expensive machine shops, and build up a complete and self-sufficient organization for a few years' work. For trade classes it will be better to obtain the use for part time of shops in existing schools—institutions which will be in position to afford such facilities on account of the number of their regular students who will have been called to arms. In England, the technical institutes are being wisely used; in France, many war cripples are being instructed in the regular schools of agriculture.

▣ Alice Duer Miller, "How Can a Woman Best Help?" (1918)

Rehabilitation professionals were keenly aware that a particularly important private agent in the reintegration of the disabled veteran was his mother, wife, or girlfriend. By pampering him, a woman could sap his will to become self-supporting and encourage him to feel it was his right to be taken care of for the rest of his life. On the other hand, by accepting partnership with the government in encouraging him to help himself, a woman was an especially significant influence on the normalization of his postdisability life.

Practical experience of the war shows that the degree to which a soldier can recover is in a large measure a question of his state of mind; and his state of mind is usually a reflection of the state of mind of his wife or his mother. Women have always known in a general way that mental attitude has much to do with a patient's recovery in ordinary illness. Now we see that the same thing is true of the man who has contracted tuberculosis, has been blinded, has lost an arm or a leg, or is suffering from any of the physical or mental diseases that war leaves in its wake. The hope of his future lies in making him believe he has a future. His return to useful activity depends on his own conviction that he can be useful. The instant he is content to be an invalid he will become and remain an invalid.

To prevent his losing hope, to keep up his sense of responsibility is in the power of his womankind. That is why it is necessary that every woman who has a man on the other side should understand what the government is trying to do for him, why it is doing it, and how she can help.

First of all she ought to know that each man's pension will be continued however little or much he progresses on the road to health and self-support. The government does this not only from a sense of justice, but because, knowing that recovery is largely a mental state, it realizes that it would be setting up an obstacle, if it should penalize a man for recovering by taking away or even decreasing his pension.

Then, women should see that the government is doing this for the sake of the wounded men themselves. Protection of the health of soldiers while they are part of the fighting force, is for the sake of the army. But this re-education of wounded men for civil life is done in the interest of the individual. In past times, governments have found it cheaper to entomb such men in institutions for incurables and in soldiers' homes—to pay them their pensions and forget about them. The present idea is that the country owes them more than their pensions; it owes them the fullest possible return to a normal life.

But in order to return them to normal life it will be necessary to retain control of them beyond the military hospital. There must first come bedside treatment, of course—the direct medical or surgical treatment for the disease or wound; then the special treatment necessary to fit him for his selected occupation; then, outside the hospital, his training in a vocational school; and then at last his entrance upon his industrial job.

In every step the help of women is essential; not only in cheering him during the first stages, but in encouraging him to follow patiently and exactly the detail of his training—a routine more wearisome to many natures than fighting.

Our government asks that we use our love to strengthen the will of our wounded—not to weaken it. This may sound like a harsh thing to say to a woman who has sent out a strong healthy man and receives him back blinded or crippled, until we remember that the object of it is to save the soldier and to keep alive in him the courage that was by no means all expended at the front.

The shock to the man who wakes up after the operation to find that he has lost an arm or a leg is not only the shock of his own handicap, but the horror of being a dependent—something useless and abnormal. Too much sympathy of the wrong kind intensifies this feeling, instead of decreasing it. And as a matter of fact, it isn't true; with the help of modern science, the handicapped man can still attain a high degree of usefulness and activity.

The recovery of our disabled soldiers—their return to a useful life—is in the control of the women of this country. No war work that has ever been offered to us is as important—or perhaps as difficult.

But it can be done only with the help of women—only if wives and mothers and sisters will give as much pride and self-sacrifice to the return of their men to civil life as they gave to sending them away to the colors.

▣ Two Cripples, "The Sluggard and the Ant" (1918)

Those advancing the new program of aggressive normalization knew that without the cooperation of the public and the disabled veterans themselves, they would not get very far in reintegrating men as self-supporting citizens in the economy and in society. In this selection, we see the effort to shift the terms of the discourse about the character of the ideal disabled veteran ("the ant") away from the tradition that conceived him as a warrior and hero and toward a vision of the veteran as uncomplaining, hardworking, resilient, and—perhaps above all else—industrious. By contrast, "the sluggard" wants to be taken care of by a government pension and to have his children work for him.

The Sluggard

One of my arms below the elbow was shot off in an accident. The other arm was shot off nearer the hand. I cannot and I have not been able to do any work myself. Fortunately for me, I was and am able to control my children who did my work as I directed them. Otherwise I should have been an object of charity. That is how I made my success at farming.

Injured soldiers should live on a pension. Other people should follow gainful occupations.

The Ant

I have both arms off, my right arm is taken off at the shoulder joint and of the left arm I have a three-inch stump, and you have no idea how much this stump helps out. I am farming 180 acres; I have 80 in corn and 80 in oats every year. I have a married man working for me. I always pay my hired help well and keep them satisfied and interested in my work. I plow corn with a riding cultivator, haul corn, or anything, drive the binder when cutting oats, the mower when cutting hay; in fact, everything my hired man does but hitching and harnessing the horses, milking the cows, and a few odd jobs; but while he is doing the rest of the work I am feeding the hogs, horses, and cows and tending to business affairs. I do the feeding by taking a scoop shovel on my shoulder and holding it with my hand and chin and it does not hurt or bother me in the least.

I do my own planting of corn and sowing of oats. Of course, I have things fixed and made handy for me. All the doors and gates are made so I can open them.

I do all my driving with the lines over my shoulder. I drive four and five horses abreast by hitching them so I can drive them all with just two lines. I learn how to do new things every day. I can drive a Ford car as good as any one, cranking it with my feet. Since my accident I have bought 120 acres of land, have not quite paid for it yet, but expect to in three years.

I also have gotten married and, of course, a man in my condition needs a wife. We have a little boy four and a half years old who is also a great comfort to me. I never allow myself to get the blues or discouraged. I try to always look on the bright side of things. I find it helps me. I pay my bills and keep my credit good, and whenever I need money I can get it, and that is what it takes to make the farm go. I do all my own correspondence and write my checks with the pencil between my teeth. I think I have given you a-plenty but there are many things that I can do that I have not written, and if I can help you any in the future will be glad to do so.

Douglas C. McMurtrie, from *The Disabled Soldier* (1919)

During and the immediately after World War I, Douglas McMurtrie surveyed the emergence of programs of vocational rehabilitation in all of the major nations at war, including the enemy belligerents, Germany and its allies, whose efforts he admired greatly for their professionalism and dedication, even as he acknowledged the official state of animosity. In these three selections, McMurtrie traces the inception and development during the war of the idea that aggressive normalization is the best method of rehabilitation. He acknowledges the different mix of national and local factors in each example, accounting, to varying degrees in each case, for the relevance of prior programs of assistance to disabled soldiers, wartime contingencies such as labor shortages and fiscal difficulties, the nature of the industrial infrastructure, and the state of public opinion regarding both disability and veterans.

Chapter XIV

Kingdom and Dominion

When England sent her first "contemptible little army" to the continent in defense of the violated rights of Belgium, it was followed not alone by more British but by troops from every corner of the globe. In every dominion of the empire troops were enlisted to "fight for the right" as the home country had seen it, and were dispatched to the front as fast as circumstances allowed.

Great Britain and every one of her dominions, in consequence of their heroic stand for the benefit of civilization, have had to face the problem of the returning disabled soldier. In the solutions attained by these commonwealths, dealing as they have with Anglo-Saxons, men of similar traditions, habits, and impulses as ourselves, the United States must find peculiar interest and derive unusual profit from the showing of their experience.

When the first British disabled began to return to the streets of London, there was scant provision for their care.

Now to every British soldier who lies in the hospital ward three possibilities are open—a visit from the dark-winged Messenger, a period of convalescence and the buckling on again of the sword for another thrust at the Hun, or "Blighty," the old familiar haunts, an economic crutch in the shape of a pension, and a job suited to his physical limitations. As surely as the stricken deer seeks the familiar glades so does the discharged warrior turn his halting steps to the sheep downs of the south or the smoky towns of Lancashire, the heather hills of Scotland, the mines of Cardiff, or the long, long way to *Tipperary.*

If we could visualize the procession of maimed and disabled men in mufti as it leaves the discharge depot we would see it melt away into the economic horizon of every portion of the United Kingdom, to carry to each county, borough, and town the problem of the care of the disabled man as a legacy of the Great War for the stability of those free institutions the Anglo-Saxon prizes above life or sound limbs. And in each and every district he will find that provision has been made to continue his medical treatment, choose for him an occupation suited to the abridgement of his powers, and induct him into it after proper training. Should he be in doubt as to his rights under the new and unusual laws of the realm, the Local Pensions Committee stands ready to secure his rights, succor his family, and educate him to surmount the handicap the enemies of civilization have laid upon him. And this, not because England thought this out as the best way to care for her disabled heroes, but because it chimed in with her way of doing things in the past. Local government has always been a cherished prerogative of the English commonwealth since the days of the petty kingdoms. A representative government may sketch its plans in the large, but the English community must be given a free hand in filling in the local training of disabled soldiers.

So when the Disabled Sailors' and Soldiers' Committee reported to Parliament in 1915 that "the care of the sailors and soldiers, who have been disabled in the war, is an obligation which should fall primarily upon the state" and that body passed the Naval and Military War Pensions Act in 1915 to provide for "the care of officers and men disabled in consequence of the present war," the plan proposed to commit the disabled man to the care of a local committee of his own townsmen. To be sure, later developments of the plan necessitated modifications of this scheme in the interests of coordinated measures for the economic welfare of the realm, but this is essentially the genius of the English plan—local responsibility for bringing the opportunities afforded by the government to the door of each disabled man.

Specific instances of like care [are] not wanting. The Incorporated Soldiers' and Sailors' Help Society, which was established under royal patronage at the close of the South African War, had sought to aid the ex-service man in finding employment by furnishing him with the name of a "friend" in each parish or ward throughout the empire. The Old Age Pensions scheme of the state was administered by local committees in every borough and urban district having a population of 20,000 or over. The necessities of the families of the enlisted men had long been looked after by the Soldiers' and Sailors' Families Association by a ramification of local committees composed largely of clergymen and ladies of leisure in all parts of the country.

It was quite natural, therefore, that Parliament should look to a local committee to take the hand of the disabled man and lead him all the way back to a life of productive and contented activity. It was thought that the necessities of each man could best be assessed and provided for by a committee of his townsmen familiar with the conditions that environed him and his family. The soundness of this principle cannot be questioned, and while it may not make for uniformity it at least has the advantage of intimacy. It is the recognition of a principle, expressed many times in Parliamentary debate and charity organization, that in dealing with individuals in widely differing stations in life and with peculiar necessities, a human element must somehow be provided which the uniformity of governmental regulations does not permit. The human element—a quick sympathy, an intimate knowledge of a disabled man's circumstances, a way to help [those] unfamiliar to rules of a bureau—this can be supplied best by the local committees.

And so England followed the blazed trail of private philanthropic organizations and established Local Pensions Committees in every county, county borough, and urban district having a population of not less than 50,000. The committees are responsible to the Ministry of Pensions, which establishes rules and regulations to secure uniformity in the provisions they make for the men committed to their care. The appointment of these committees is largely left to the local authorities, but in general they must include some women, some representatives of labor, and members of the Soldiers' and Sailors' Families Association, and of the Soldiers' and Sailors' Help Society. A salaried secretary appointed by the Ministry of Pensions is a kind of liaison officer between the local body and the central office.

The duties of the Local Pensions Committee are broadly sketched in the instructions of the Ministry of Pensions: "The local committee should regard themselves as responsible for all discharged men of this class (i.e., disabled) living in their area. They should make it their business to get in touch with every such man, whether or not he has obtained employment or occupation since his discharge, and see that the treatment or training which his condition needs is secured for him when he needs it. . . . It is vitally important both in the man's interest and in that of the Nation that any case which needs either treatment or training should be taken in hand at once. Local committees must not be content with dealing only with the men who happen to present themselves to them for assistance; they must see that they have information as to the condition of all discharged pensioners in their areas, and make it a point of getting in touch with them directly they are discharged."

The committee is to be guided in its decisions in regard to suitable training for a man by several considerations. His previous occupation must have weight. The proposed occupation must be suitable to his age, disablement, and physical condition. If any recommendation as to his training has been indicated on his notification of award for pension or by a hospital visitor, this must be considered. Not least of the factors entering into a solution of the problem before the committee must be the opportunities for a living wage in the occupation chosen for him.

It must be quite clear that if the local committee were left to its own devices wholly in choosing an occupation for the man the result in the field of industry might be disastrous. The influx of a large number of disabled men into a particular occupation without some standard of training might arouse antagonisms that would be unfortunate. This necessitated some rulings by the central office in the interests of coordinated effort. Both the employers of labor and the work people must have some voice in the matter, especially in a country whose labor organization has made such strides. The necessary machinery was provided by the Ministry of Pensions cooperating with the ministry of Labor. Trade Advisory Committees have been appointed *for most of the principal trades.* Each committee is composed of an equal number of employers and work people. It is the duty of each committee to advise the Ministry of Pensions as to conditions under which the training of men in that trade can best be given, the best methods of training, the suitable centers for it, and in general to secure uniformity in the training. The numerous reports already issued contain a valuable fund of information regarding the trade from the viewpoint of the man who is physically handicapped. The analysis of an industry with the man with abridged powers in view is a phase of industrial efficiency that the war has developed. Never again can the old laissez faire policy of allowing the handicapped man to stumble along the industrial road undirected and unassisted prevail. Society cannot again close its eyes to this waste of human efficiency and the heartbreak of the man whose work powers are unappreciated because of some physical abridgement he has suffered.

The question of wages to be paid to a disabled man will always be a vexing problem. Where a disabled man can do his full stint of the work and compete with his normal fellows, he should plainly receive the equal wages whether he is receiving a pension or not. But there are grounds for debate when the man is physically unable to perform a full task either in hours or output. The inevitable tendency will be for the employer to depreciate the man's ability. The exploitation of the disabled man, especially when he is receiving a pension, is feared by organized labor, jealous of its wage standards. An effort has been made to provide machinery for obviating his difficulty. The Ministry of Labor has set up in the principal industrial centers advisory wages boards composed of representatives of employers and work people and three members of the Local Pensions Committee. This committee is to advise the local committee, or an employer desirous of employing a handicapped man, what would be an equitable wage in his particular case, taking into consideration the man's physical capacity and the current rate of wages for the industry in that locality. The question of a man's pension is not to be taken into account. The committee acts purely in an advisory capacity, but it is hoped by these means to provide against the exploitation of cripples or the lowering of trade standards.

It is the duty of the Local Pensions Committee to provide facilities for the training of its disabled ex-service men. It was soon seen that the training facilities of a larger area than that within the jurisdiction of most local committees must be made available if the variety of occupations demanded were to be provided. So Joint Advisory Committees, composed of the representatives of local committees, were formed in 1916 to arrange comprehensive schemes for utilizing the facilities for technical education within whole counties or groups of counties. Twenty-two of these joint committees were formed in the United Kingdom. They surveyed the technical facilities in their respective districts and syndicated them in the interests of all.

For many years the British government has had local technical schools, and the result has been a surprisingly large number of institutions where one or more trades are taught. These trades cover the principal industries of the country. The number of technical schools in the industrial counties of Lancashire and Yorkshire is particularly noticeable. Both of these counties formulated ambitious schemes for the training of disabled men in every variety of industry pertaining to the soil, the mine, the factory, and the sea. The cooperation of all the principal technical schools in the training of disabled men was secured. The offer of facilities seems to have greatly exceeded the demand.

Not only have the technical schools been utilized for re-education but many men have been trained directly in workshops and factories. The plan advocated by several of the trades advisory committees provides that a man shall spend part of his time at a school and part of his time in actual work in a factory or workshop; by this means a balance is maintained between the theoretical and the practical.

It must not be supposed that every man returns to his home district absolutely unprepared for an altered industrial career. Many of the men avail themselves of the opportunities afforded by the workshops connected with the hospitals in which they have spent their period of convalescence. Early in the history of the war lucrative workshops were established in the hospitals of Roehampton and Brighton, whither men who have suffered some amputation are sent. Major Mitchell, the director of one of the leading technical institutes, was chosen to direct the courses. The therapeutic value of manual work has been fully recognized, and many a man, invited to busy himself in a workshop with the tools of a man's job ready to his hands, has not only found a stimulus to the functional activity of injured members but has actually learned a trade while waiting for nature to heal his wounds and the government to furnish him with an artificial limb. Not every man avails himself of the opportunities offered him in the hospital and must look to his local committee to furnish the opportunities for training he slighted or to supplement his training by continuations courses.

Upon his discharge from military service the disabled man is granted a pension based upon the degree of physical disability he has suffered and is free to return to his home locality. His future lies within the advisory jurisdiction of his Local Pensions Committee acting for the ministry of Pensions. He may choose to live a life of inactivity depending for a scanty subsistence upon the slender stipend granted him by the Ministry of Pensions. He may accept a job ready to his hand, because of acute industrial conditions caused by the war, from which he is likely to be ousted by the return of able-bodied men upon the demobilization of the army. Or, he may accept training at the expense of the state and become a skilled worker with better prospects of continued employment when normal times return. The good sense of the man and the persuasiveness of the local committee will largely determine what course he is to pursue.

If he elects to take training he will receive, during the time required for his re-education up to six months, his total disability pension together with a family allowance, all necessary fees will be paid for him and at the end of his course he will receive a bonus for each week of training. The state cares for both himself and his family during his period of re-education. At the end of his course he will be fortified against the exigencies of the future by the wages he can earn at a skilled trade and the regular pension to which his injuries entitle him. It is expressly stipulated that his pension shall never suffer diminution because of his increased earning capacity. Many disabled men are now receiving from this dual source larger incomes than they enjoyed before they entered the service of their country.

The demand for disabled men who have received training has been so great that no difficulty has been found in finding employment for them. The admirable system of state labor exchanges provides the facilities for placing disabled men in industry and their services will be in still greater demand when peace returns and conditions of employment are greatly altered by the return of men from the front.

While the preparation of disabled men to enter into competition with their normal fellows seems to promise the best results on the whole, still it must be recognized that many men with severe physical limitations must be provided for in special institutions under favorable work conditions. Specialized machinery and carefully planned team work can make productive units of badly handicapped men with whom the average employer is not willing to bother. Large provision for this class of men has been made by the Lord Roberts' Workshops, which are being multiplied in different parts of the country. Some ten years before the war the Soldiers' and Sailors' Help Society opened workshops in London to provide employment for disabled ex-service men for whom it was extremely difficult to find work. The work has been greatly expanded since the war, and the enterprise has taken the name of the nation's military idol, who was greatly interested in the project. Toy-making, with the many processes involved, has been found a suitable industry for many types of disability, and the enterprise has been successfully conducted on a sound commercial basis. The plans of the society contemplate facilities in the eleven workshops in different parts of the country for the accommodation of between four and five thousand men.

Across the Firing Line

Prepared as she was for war, so also was Germany prepared for the consequences of war. At the outbreak of the war, she had of all other countries laid the most solid foundation for the care of the crippled soldier. The German National Federation for the Care of Cripples is an organization of long standing. There had been developed, during half a century's experience, fifty-eight cripple homes, under private auspices, ranging in size from six to three hundred beds. Some of them were already taking adults as well as children, and they had among them 221 workshops, teaching 51 trades. In addition, there were sanatoria and re-educational workshops for industrial cripples under the employers' accident insurance companies; there were orthopedic hospitals operated by municipalities, and there were trade schools and employment bureaus under various government auspices.

All these resources accumulated in peacetime for the rehabilitation of cripples were mobilized immediately after the outbreak of the war—almost simultaneously with the military mobilization. Eight days after the outbreak of hostilities, the Empress, at the instance of Dr. Biesalski, Germany's leading orthopedist and secretary of the National Federation for the Care of Cripples, address[ed] to existing institutions for the crippled a letter pointing out the necessities ahead and urging them to open their doors and provide facilities for the treatment and training of disabled soldiers. To this all the homes immediately consented. Dr. Biesalski undertook a tour of Germany and visited the principal cities urging the formation of voluntary committees for the care of war cripples. The immediate result was the formation of volunteer committees in many cities and of larger ones in some states and provinces. At the present time, Germany is thoroughly covered by a network of such organizations. A local committee usually comprises representatives of the municipality, of the military district command, the accident insurance associations, the Red Cross, the women's leagues, the employers, the chamber of commerce, the chamber of handwork, and the labor unions. In the fall of 1915, a national committee was formed with the object of coordinating the work and making investigations and plans for the future.

There are four stages in the treatment of the disabled soldier: (1) medical treatment; (2) provision of artificial limbs and functional re-education; (3) vocational advice and vocational re-education; and (4) placement. Of these activities, the first two are controlled by the imperial military authorities and are conducted on uniform lines. With regard to vocational and economic rehabilitation, on the contrary, there is no general direction given by any central authority; the re-education schools are of varying types and most unevenly distributed; the work is in the hands of local and private or semi-private agencies; it is done mostly by volunteers and is not even supervised by the imperial government.

However, in spite of the absence of any general system of organization, there is a complete unity of purpose and the work is everywhere carried on in accordance with certain universally accepted and officially sanctioned principles. These were formulated by Dr. Biesalski in this way:

1. No charity, but work for the war disabled.
2. Disabled soldiers must be returned to their homes and to their old conditions; as far as possible, to their old work.
3. The disabled soldier must be distributed among the mass of the people as though nothing had happened.
4. There is no such thing as being crippled, while there exists the iron will to overcome the handicap.
5. There must be the fullest publicity on this subject, first of all among the disabled men themselves.

The possibility of rehabilitation is accepted as a creed by all the institutions working to this end, it is put in practice, and the statement is that in ninety percent of the cases the desired results are attained.

There is a fairly complete network of orthopedic homes distributed all over the empire. Their number has been put at about two hundred. They are all under military discipline. The time for treatment for a man in the orthopedic hospital is from two to six months. Men are kept here until they are ready to go back to the army or are pronounced definitely unfit for service. Even if they are so unfit, the war department does not discharge them until they are pronounced by the physician physically fit to go back to civil life.

The best hospitals are excellently equipped. Complaints have been made, however, that the remote hospitals have very incomplete arrangements and that the great demand for orthopedists leaves some places unsupplied.

More and more emphasis is being placed on physical exercise as a means of bringing disabled men back to the standard. The plan is that a man shall begin very simple but systematic physical exercises even before he is out of bed. These are gradually increased until finally he has two or three hours a day under a regular gymnasium instructor. Games and outdoor sports are found to have an immense therapeutic value, both psychological and physiological, as compared with medico-mechanical treatment. Thus we find, at the different hospitals, as part of the regular regime, ball playing, spear throwing, bowling, shooting, quoits, handball, jumping, club swinging, and swimming. Finally, though the hospitals do not attempt to train a man to a trade, many of them have attached workshops for purposes of functional re-education. There is great emphasis placed on the fact that even this occupational therapy should be really useful and should lead the patient direct[ly] to some practical occupation.

All artificial limbs are furnished and kept in repair by the government. The government has prescribed maximum prices for prostheses of different types. Otherwise there is no official supervision. No standard pattern is prescribed, and the matter is left to the doctors and engineers of the country. The result is an immense stimulation of activity. The magazines are full of descriptions of new prostheses recommended by doctors and manual training teachers from all parts of the country. At an exhibition of artificial limbs, held at Charlottenburg, they were shown thirty kinds of artificial arms and fifty types of artificial legs in actual use.

The principle now thoroughly accepted is that the prosthesis should reproduce not the lost limb but the lost function. It should not be an imitation arm or leg, but a tool. The standard of merit is the number of activities it makes possible.

Re-education in Germany goes on at the same time as the medical treatment. This has two causes. First, there is the strong conviction among all cripple welfare workers that results can be obtained only by getting hold of a patient at the earliest possible moment of convalescence, and second, the fact that, since the government does not pay anything towards re-education, it is more economical for the care committees to attend to it while the men are in the hospitals and thus save themselves the expense of maintenance.

The local care committee usually appoints vocational advisers whose appointments have to be sanctioned by the local military authorities, who control the visits to the men in the hospitals. As soon as a soldier is well enough to be visited, the committee sends representative to get full data on his experience and his physical condition, and then advise him as to re-education or immediate return to work. The principle is fast held to that man must, if humanly possible, go back to his old trade, or, failing that, to an allied one.

The trade training is given while the men are still in the military hospital, beginning, in fact, as soon as they are able to be out of bed. The workshops are maintained by the local care committees; they can be located either in the hospital, or at an outside point to which the men go every day. The first plan is followed by but a few of the larger institutions; in most instances there are no workshops maintained at the hospitals. The local care committee may utilize the local trade schools. There are excellent facilities for this, since every town has at least one trade school. Some representative of the educational authorities generally serves on the local care committee and the schools are eager, in any case, to offer free instruction. German magazines are full of advertisements of free courses for war cripples, offered by schools of the most varying kind, public and private, from agricultural and commercial schools to professional schools and universities. On the other hand, in a large town, with a number of hospitals, the committee may create a school of its own. Thus, in Dusseldorf, for instance, where there are fifty hospitals, the committee has taken possession of a school building equipped with shops and tools and given twenty courses open to men from all the hospitals.

It is planned that none of the courses shall take more than six months, the maximum time for hospital care. These short courses are intended for men of experience who need further practice in their old trade or in an allied one. If a man needs further training after this short course, he becomes the charge of the local care committee, which supports him while he attends a technical school or pays the premium for apprenticing him to a master workman.

A special effort is being made to return to the land all who have any connection with it, such as farmers, farm laborers, and even hand-workers of country birth. All the hospitals that have any land give courses in farming and gardening for their patients. It is estimated that there are several hundred such hospital farms, small or large, operated by the wounded. In addition to this, there are definite summer farm courses at agricultural schools and universities, which are free to cripples. There are in the empire ten regular agricultural schools for war cripples.

Since the one-armed man has one of the gravest handicaps, special arrangements have been made in several places for his training. The purpose of these courses for the one-armed is to accustom the soldier to exercise the stump and the remaining member performing the daily duties such as eating, washing, dressing, tying knots, using simple tools, and the like. This is a preliminary to specialized trade training, and the process is said usually to require about six weeks.

An essential feature of the course is left-handed writing for those who have lost the right arm, not only for men in preparation for clerical work but for others as well. This training banishes to a marked degree the feeling of helplessness and likewise gives the hand greater flexibility and skill. German teachers have made a scientific study of this question and state that left-handed writing can be made as legible and characteristic as right-handed. Samples of left-handed writing from Nurnberg show excellent script after from twelve to twenty lessons.

Left-handed drawing, designing, and modeling are often added subjects of instruction. Men with clerical experience are taught to use the typewriter, sometimes using the stump, sometimes a special prosthesis, and sometimes with a shift key worked with the knee.

All the schools for one-armed put great emphasis on physical training. In the school at Heidelberg, under a regular gymnasium instructor, the men do almost all the athletic feats possible to two-armed men.

There is no uniform machinery for the placement of war cripples. The care committees, while interviewing the man in the hospital, also get in touch with his former employer. Sometimes a position is thus secured even before the man has started his training, and the latter is then adapted to the requirements of that particular position. But it is not always possible to place a man with his old employer. Some of the larger care committees run employment bureaus of their own. Others turn over to some other agency the man who cannot be taken back to his old position—usually to the regular employment bureaus. Germany has a system of public employment bureaus supported by the municipalities. The bureaus in each state or province are united under a state or provincial directorate, and the directorates in an imperial federation. Some of these had before the war, special divisions for the handicapped, and others have established them since the outbreak of hostilities. Employers' and workmen's associations are of considerable assistance in the placement of war cripples, especially the Federation of German Employers' Associations, which has been recently formed for this particular purpose, and the many master guilds of handworkers. There are also a number of agencies due to charitable or private initiative.

Finally, there are open to war cripples a very large number of positions in government service. The imperial government has promised that all former employees of the railways, post office, and civil service will be re-employed, if not in their old capacity, in a kindred position. These men are to be paid without consideration of their pensions. The post office department has decided to give all future agencies and sub-agencies in the rural districts to war cripples, provided they are fit for the positions and want to settle on the land. Many city governments make efforts to take in cripples. There are reserved for cripples a number of employments under the war department, which through its recently created welfare department attempts also to develop placement activity wherever there is no very active local care committee, publishing twice a week a journal which lists positions open for war cripples.

Chapter XVI: For the U.S. Forces

The situation of the United States with regard to making provision for the disabled soldier is perhaps slightly different from that of the other belligerents. One of the principal causes of difference is the selective influence on the personnel of the military forces of the conscription law.

This legislation has specifically exempted, temporarily at any rate, agricultural workers, highly skilled mechanics, and those who, because of their special qualifications, are necessary to the maintenance of the national interest at home. In Italy and France the situation with regard to the make-up of the army is vastly different. There we find almost all the able-bodied agricultural workers in the service, and battalions of highly skilled mechanics and experienced workmen in uniform.

The problem of refitting for industry the disabled soldiers of the European forces is therefore very unlike that of the United States. Up to the present time the force sent to the front consists practically of men between the ages of twenty-one and thirty-one. This means that the majority of men disabled will not be highly skilled or long experienced in any occupation and thus will be more plastic from the vocational point of view. Past experience has in European practice been the main determinant of training for the future. It may be expected that in many of the American cases this will afford no definite criterion. Either the soldier may have entered the service direct from school or college or if he has been at work for some time, it is likely to have been in a dozen different jobs of varying character. Many of the men, therefore, can answer definitely to no "former occupation." As has been found in Canadian experience, the soldier when asked his trade will report that for three months prior to the war he worked on a railroad. "Then you are a railroad man?" is the question. "No," is the answer, "for the two months before that I was in a cotton mill, and still earlier drove a delivery wagon for a local firm." In such a case past experience is almost a negligible factor, and the man may properly be restudied vocationally in order that he may be trained in the skilled trade most suited to his qualifications and talents.

An interesting experiment in vocational analysis and allocation has been carried out by the military authorities in classifying drafted men for special lines of army service. The new recruits have been given simple psychological tests prior to their assignment to work as radio operators, oxy-acetylene welders, linemen in the signal corps, drivers or mechanicians in the motor transport service, and so forth. The results have been encouraging and the experience gained will undoubtedly be helpful in further vocational guidance of the men returning for discharge.

In the general process, it is likely that many men who were previously undifferentiated as to occupation, who possibly looked forward to careers as clerks or general utility men, may be directed into skilled trades which will afford to them a much greater financial opportunity, and will contribute more largely to the national stability and efficiency.

The recent wave of interest in the United States in vocational education has put the country in better shape to deal with the instructional requirements of the disabled soldier than would have been the case ten years ago. Although not claiming facilities to compare with those afforded by the fine system of technical institutes in Great Britain, there are in practically every important urban community of America, one or more vocational schools. Industrial education is well provided for by schools, the first of which were founded by private initiative but operated on a noncommercial basis. The later institutions have been established by local educational authorities as part of the public school systems.

Commercial education, to a noteworthy extent, is still in the hands of business colleges that are run as profit-making enterprises. But the work of many of them is efficient to a creditable degree.

Agricultural education has been splendidly provided for by the agricultural colleges and experiment stations maintained by the several states, with assistance, in some instances, from the national government. These institutions have the most modern equipment, expert teaching staffs, and the finest facilities for imparting a practical knowledge of agriculture.

And finally, it must be recalled that practically every American university has industrial departments with shop equipment, which afford to students not only the theoretical, but also the practical, type of instruction. As the war goes on the universities will be drained of students, while the vocational schools whose regular pupils are of younger age, will tend to continue full. In Canada the university plants have been put to good use in the training of disabled soldiers. Even more extensive facilities of this character are available in the United States.

Prior to the entry of America into the war there had been almost no provision for rehabilitation of the disabled adult. There had been several employment bureaus for cripples, in New York, Boston, Cincinnati, and Philadelphia. These agencies had been struggling bravely, without recourse to training facilities, and with scant public support, to solve the economic problems of the disabled, and were attaining an encouraging degree of success. About five years previous there had been started, but later discontinued, a training school for crippled men.

So in spite of the excellent foundation of general vocational education the United States, at her entrance into hostilities, stood practically without special facilities for the re-education of the disabled. The need of such special provision had been long recognized by workers with the handicapped and was repeatedly discussed in a special journal on cripples that was their organ.

The first move to meet this need was taken the second month after America's declaration of war, when a public-spirited citizen offered to the American Red Cross funds sufficient to establish and maintain in New York City a training school for crippled men. While an original motive of the fight was a desire to make provision that might be helpful to the disabled American soldier, the school was started for crippled men in general, without distinction as to their civilian or military affiliation. Thus came into being the Red Cross Institute for Crippled and Disabled Men.

It became soon evident that this organization had logical responsibilities much wider in scope than the conduct of a local school of re-education. Legislation making government provision for the training of disabled soldiers did not appear on the statute books until fourteen months after the inception of hostilities, so for a considerable period there was no official agency to which to turn for information and advice. Yet there was wide interest in provision for the disabled soldier. To meet demands from the public for data on the organization, methods, and principles of re-education, as derived from experience abroad, and to provide a scientific foundation for the development of its own activities, the Institute initiated in July 1917, a department of research. There was early issued a bibliography of the subject, followed by reports on activity in different countries, monographs, and translations, which have been freely distributed for the information of all interested in the subject.

This Institute, which undertook at once the training of crippled industrial workers, has established courses in the manufacture of artificial limbs, oxy-acetylene welding, printing, motion picture operating, jewelry-making, and mechanical drafting. There are also departments of employment, industrial surveys, and public education.

During the incubation of the national program the Red Cross Institute for Crippled and Disabled Men thus served as an experiment station and proving ground, and unofficially met demands upon it to the best of its ability.

In the formulation of the government plans there was considerable difference of opinion as to what authority or authorities should be charged with the responsibility of re-educating the disabled soldier. It was urged on the one hand that the entire task of rehabilitation in all its aspects should be entrusted to the Surgeon General of the Army; on the other hand that it might be handled by the Bureau of War Risk Insurance—a government department administering family allotments and allowances and the new life and disability insurance, privilege of which was offered to men entering upon military service. A later suggestion advanced by the Council of National Defense was that re-education be entrusted to a commission under the War Department, made up of representatives of all the official and non-official interests concerned. Another proposal which was approved by a conference called by the Surgeon General of the army at the instance of the Secretary of War, and which was embodied in the draft of a legislative proposal, called for an independent commission of five, composed of representatives of the Surgeon General of the Army, the Surgeon General of the Navy, the Treasury Department, the Department of Labor, and the Federal Board for Vocational Education.

The Administration felt, however, the unwisdom of erecting more independent boards or commissions unrelated to the regular executive mechanism. For this reason it was decided to fix the task on some already existing government department. The one designated in legislation introduced with executive approval, and later enacted, assigned the responsibility of providing for the rehabilitation of the disabled soldier and sailor to the Federal Board for Vocational Education, a body which had been created a year earlier to administer federal aid to vocational education by the states. The bill committing this new function to the Board became law on June 27, 1918.

Meantime, the Surgeon General of the Army had been establishing reconstruction hospitals for the intensive treatment of physical disablement. In connection with each of these medical centers educational work had been undertaken—with three ends in view. The first was to provide to convalescent patients occupation for therapeutic purposes; the second to provide educational opportunities during the period of invalidism to men who would be returned to the front or discharged without permanent disability; the third to train disabled men whom it was desired to retain in the military organization for special or limited service. In carrying out the two latter aims, the educational departments of the hospitals have entered well within the vocational field.

Important links in the military hospital chain are the reception hospitals at Fox Hills, Staten Island, N.Y.; at Ellis Island, in New York harbor and at Newport News, VA. At these institutions there are first received from hospital ships or transports all soldiers invalided home from overseas. The men are classified as to treatment need and district of residence, and promptly “cleared” to the appropriate institution.

During the period of hospital or convalescent care the soldier has advantage of physical and occupational therapy administered by a corps of trained workers known as “reconstruction aides” but more familiarly named “blue gowns” on account of their uniform.

Classes in the various military hospitals have already been established. The subjects taught at General Hospital No. 6, for McPherson, Atlanta, Ga., for example are motor mechanics, telegraphy, wireless telegraphy, typewriting, mechanical drafting, cabinet-making, carpentry, harness repairing, poultry raising, reading and writing English, penmanship and bookkeeping, and printing.

When a candidate for discharge from the military forces is so disabled as to entitle him to compensation for disability, his case is discussed with him, while he is still in the hospital, by a vocational adviser of the Federal Board for Vocational Education. He is told that the United States Government will train him free of charge for a new trade. It is entirely optional with the man whether he take advantage of this opportunity for training or not, but every influence is brought to bear to make his decision affirmative.

After the disabled man is discharged from the hospital, he becomes a civilian and his dealings are with the Federal Board and the Bureau of War Risk Insurance.

If the man decides to take a course of training, he is supported during the period of re-education through payment by the Bureau of War Risk Insurance of his compensation for disability or his former military pay, whichever is the greater. During this period the compulsory allotments and allowances to his dependents are continued just as if he were still in military service. He is given instruction that is paid for and supervised by the Federal Board for Vocational Education in one of the schools approved by that body.

The Federal Board for Vocational Education has announced that its provision of re-education will be made, so far as possible, through the use of existing schools, or by placement for training, under a modified system of apprenticeship, with manufacturing or commercial establishments. Special institutions will be founded only where absolutely necessary.

The Board is establishing district offices to decentralize the work, is making training arrangements for current cases, and is following up to their homes men who were discharged from the army prior to the inception of re-educational activity, and who stand in possible need of training. Local offices are already in operation in New York, Boston, Philadelphia, Cincinnati, Atlanta, Washington, D.C., New Orleans, Minneapolis, Chicago, St. Louis, Dallas, Denver, San Francisco, and Seattle.

After training is complete, the re-educated soldier will be placed in a job by the Federal Board, acting, as provided by the law, in cooperation with the United States Employment Service of the Department of Labor. The Board also includes in its placement function any man physically rehabilitated in an army or navy hospital, whether he be a candidate for retraining or not.

The American Red Cross has offered to the government authorities the facilities of its extensive home service organization throughout the country. This service, directed by the Department of Civilian Relief, can help to align the family as an encouraging force behind the re-education program, can keep the family wheels moving smoothly during the period of training, can provide to the vocational officers much useful information on the home conditions and community record of any individual soldiers, can follow up the case after return to employment, and help in many ways to make the re-education permanently effective.

The actual work of putting the disabled American soldier back on his feet is still in its infancy, and many details still remain to be worked out in experience. But in principle, the United States has followed the best example of her Allies—in accepting provision for the disabled soldiers as a national responsibility to be met at public expense. It is clear that no American soldier need be dependent upon the alms of charity for his rehabilitation.

But the complete success of the work rests with the people of the United States—upon whether we sympathetically grasp and effectively express in our relations with the graduates of re-education the new spirit of dealing with the disabled—upon whether we sense the glory of restoring the ex-soldier's ability to earn his own living, or whether we continue the old temporary hero worship and permanent pauperization. The self-respect of self-support or the ignominy of dependence—which shall the future hold for our disabled soldiers? The credit or the blame for the decision will largely rest with the American public.

The open road is before us.

Sherwood Anderson, from *Winesburg, Ohio* (1919)

In the preface to his story of oppressive midwestern small-town life, Sherwood Anderson discusses his narrator's obsession with disabled characters, or, as he calls them, "grotesques." The act of characterization requires a "deforming" precept in that characters are brought to life through their defining idiosyncrasies. In this excerpt, the narrator imagines a procession of such characters with their "misshapen bodies" parading before him in dreams.

The writer, an old man with a white mustache, had some difficulty in getting into bed. The windows of the house in which he lived were high and he wanted to look at the trees when he awoke in the morning. A carpenter came to fix the bed so that it would be on a level with the window.

Quite a fuss was made about the matter. The carpenter, who had been a soldier in the Civil War, came into the writer's room and sat down to talk of building a platform for the purpose of raising the bed. The writer had cigars lying about and the Carpenter smoked.

For a time the two men talked of the raising of the bed and then they talked of other things. The soldier got on the subject of the war. The writer, in fact, led him to that subject. The carpenter had once been a prisoner in Andersonville Prison and had lost a brother. The brother had died of starvation, and whenever the carpenter got upon that subject, he cried. He, like the old writer, had a white mustache, and when he cried he puckered up his lips and the mustache bobbed up and down. The weeping old man with the cigar in his mouth was ludicrous. The plan the writer had for the raising of his bed was forgotten and later the carpenter did it in his own way and the writer, who was past sixty, had to help himself with a chair when he went to bed at night.

In his bed, the writer rolled over on his side and lay quite still. For years he had been beset with notions concerning his heart. He was a hard smoker and his heart fluttered. The idea had got into his mind that he would come to die unexpectedly and always when he got into bed he thought of that. It did not alarm him. The effect in fact was quite a special thing and not easily explained. It made him more alive, there in bed, than any other time. Perfectly still, he lay and his body was old and not much use any more, but something inside him was altogether young. He was like a pregnant woman, only that thing inside him was not a baby but a youth. No it wasn't a youth, it was a woman, young, and wearing a coat of mail like a knight. It is absurd, you see, to try to tell what was inside the old writer as he lay on his high bed and listened to the fluttering of his heart. The thing to get at is what the writer, or the young thing within the writer, was thinking about.

The old writer, like all of the people in the world, had got, during his long life, a great many notions in his head. He had once been quite handsome and a number of women had been in love with him. And then, of course, he had known people, many people, known them in a peculiarly intimate way that was different from the way in which you and I know people. At least that is what the writer thought and the thought pleased him. Why quarrel with an old man concerning his thoughts?

In bed, the writer had a dream that was not a dream. As he grew somewhat sleepy but was still conscious, figures began to appear before his eyes. He imagined the young indescribable thing within himself was driving a long procession of figures before his eyes.

You see interest in all this lies in the figures that went before the eyes of the writer. They were all grotesques. All of the men and women the writer had ever known had become grotesques.

The grotesques were not all horrible. Some were amusing, some almost beautiful, and one, a woman all drawn out of shape, hurt the old man by her grotesqueness. When she passed he made a noise like a small dog whimpering. Had you come into the room you might have supposed the old man had unpleasant dreams or perhaps indigestion.

For an hour the procession of the grotesques passed before the eyes of the old man, and then, although it was a painful thing to do, he crept out of bed and began to write. Some one of the grotesques had made a deep impression on his mind and he wanted to describe it.

At his desk the writer worked for an hour. In the end he wrote a book which he called "The Book of the Grotesque." It was never published, but I saw it once and it made an indelible impression on my mind. The book had one central thought that is very strange and has always remained with me. By remembering it I have been able to understand many people and things that I was never able to understand before. The thought was involved but a simple statement of it would be something like this:

That in the beginning when the world was young there were a great many thoughts but no such thing as a truth. Man made the truths himself and each truth was a composite of a great many vague thoughts. All about in the world were the truths and they were all beautiful.

The old man had listed hundreds of the truths in his book. I will not try to tell you all of them. There was the truth of virginity and the truth of passion, the truth of wealth and of poverty, of thrift and of profligacy, of carelessness and of abandon. Hundreds and hundreds were the truths and they were all beautiful.

And then people came along. Each as he appeared snatched up one of the truths and some who were quite strong snatched up a dozen of them.

It was the truths that made the people grotesques. The old man had quite an elaborate theory concerning the matter. It was his notion that the moment one of the people took one of the truths to himself, called it his truth, and tried to live his life by it, he became a grotesque and the truth he embraced became a falsehood.

You can see for yourself how the old man, who had spent all his life writing and was filled with words, would writes hundreds of pages concerning this matter. The subject would become so big in his mind that he himself would be in danger of becoming a grotesque. He didn't, I suppose, for the same reason that he never published the book. It was the young thing inside him that saved the old man.

Concerning the old carpenter who fixed the bed for the writer, I only mentioned him because he, like many of what are called very common people, became the nearest thing to what is understandable and lovable of all the grotesques in the writer's book.

John Dos Passos on Randolph Bourne (1919)

In this obituary for Randolph Bourne, John Dos Passos identifies the profound lack of choices afforded to those with body differences, while also noting that choice persists as the American value par excellence. As a person with a disability, one's freedom to choose is already curtailed at birth, and one's body becomes a constant reminder of this foreclosure on bodily liberties. In addition, Dos Passos uses the occasion to comment upon the radical insights into war and the wages of social disenfranchisement possessed by disabled thinkers and writers.

Randolph Bourne

Randolph Bourne came as an inhabitant of this earth without the pleasure of choosing his dwelling or his career. He was a hunchback, grandson of a congregational minister, born in 1886 in Bloomfield, New Jersey; there he attended grammar school and high school. At the age of seventeen he went to work as a secretary to a Morristown businessman. He worked his way through Columbia working in a pianola record factory in Newark, working as proofreader, piano tuner, accompanist in a vocal studio in Carnegie Hall.

At Columbia he studied with John Dewey, got a traveling fellowship that took him to England Paris Rome Berlin Copenhagen, wrote a book on the Gary schools. In Europe he heard music, a great deal of Wagner and Scriabine and bought himself a black cape.

This little sparrowlike man
tiny twisted bit of flesh in a black cape,
always in pain and ailing,
put a pebble in his sling
and hit Goliath square in the forehead with it.
War, he wrote, is the health of the state.

Half musician, half educational theorist (weak health and being poor and twisted in body and on bad terms with his people hadn't spoiled the world for Randolph Bourne; he was a happy man, loved die Meistersinger and playing Bach with his long hands that stretched so easily over the keys and pretty girls and good food and evenings of talk. When he was dying of pneumonia a friend brought him an eggnog; Look at the yellow, its beautiful, he kept saying as his life ebbed into delirium and fever. He was a happy man.) Bourne seized with feverish intensity on the ideas then going around at Columbia he picked rosy glasses out of the turgid jumble of John Dewey's teaching through which he saw clear and sharp.

the shining capitol of reformed democracy,
Wilson's New Freedom;
but he was too good a mathematician;
he had to work the equations out;
with the result that in the crazy spring of 1917
he began to get unpopular where his bread was buttered at the New Republic;
for New Freedom read Conscription, for Democracy,
Win the War, for Reform, Safeguard the Morgan
Loans for Progress Civilization Education Service,
Buy a Liberty Bond, Strafe the Hun, Jail the Objectors.

He resigned from the New Republic; only The Seven Arts had the nerve to publish his articles against the war. The backers of the Seven Arts took their money elsewhere; friends didn't like to be seen with Bourne, his father wrote him begging him not to disgrace the family name. The rainbowtinted future of reformed democracy went pop like a pricked soapbubble.

The liberals scurried to Washington; some of his friends pled with him to climb up on Schoolmaster Wilson's sharabang; the war was great fought from the swivel chairs of Mr. Creel's bureau in Washington.

He was cartooned, shadowed by the espionage service and the counter-espionage service; taking a walk with two girl friends at Wood's Hole he was arrested, a trunk full of manuscript and letters stolen from him in Connecticut. (Force to the utmost, thundered Schoolmaster Wilson).

He didn't live to see the big circus of the Peace of Versailles or the purplish normalcy of the Ohio Gang. Six weeks after the armistice he died planning an essay on the foundations of future radicalism in America.

If any man has a ghost
Bourne has a ghost,
a tiny twisted unscared ghost in a black cloak
hopping along the grimy old brick and brownstone
streets still left in downtown New York,
crying out in a shrill soundless giggle;
War is the health of the state.

Karl Binding and Alfred Hoche, from *Permission for the Destruction of Worthless Life, Its Extent and Form* (1920)

Binding and Hoche's influential work argued that the German state was failing under the burden of caring for disabled people who were using up a disproportionate amount of resources. They referred to such individuals as "lives unworthy of life" and divided potential candidates for state-sponsored "euthanasia" into three groups: war wounded, patients in permanent comas, and "idiots" housed in psychiatric hospitals. The work proved critical in fashioning a medical industry that would recognize killing as a viable application of medical technology.

Are there humans who have lost their human characteristics to such an extent that their continued existence has lost all value for themselves and for society? One only needs to pose the question and a feeling of anxiety stirs in anyone who is used to assessing the value of individual lives both to the people themselves and to the community. He is painfully aware of how wasteful we are with the most valuable and self-sufficient lives which are full of energy and vigour and what labor, patience, and resources are squandered simply in order to try and sustain worthless lives until nature—often cruelly tardy—removes the last possibility of their continuation. If, at the same time, one thinks of a battlefield covered with thousands of young corpses, or of a mine in which hundreds of hard-working miners have been buried, and if one compares them to our institutions for idiots, with the care which is devoted to their inmates—one is deeply shocked by the sharp discrepancy between, on the one hand, the sacrifice of man's most precious resource and, on the other, the tremendous care devoted to creatures which are not only completely worthless but are of negative value.

It cannot be doubted that there are people for whom death would come as a release and, at the same time, for society and the state in particular, would represent liberation from a burden which, apart from being an example of a great self sacrifice, is not of the slightest use. . . .

However, I am firmly of the opinion that rational calculation should not be the sole basis on which to answer this question; the reply must win approval through a deep sense of correctness. Every killing which is permitted must be felt, at least by the person concerned, as a release; otherwise, such permission must be ruled out.

It follows from this, however, that it is absolutely vital to respect completely everybody's will to live, even that of the most sick, tortured, or useless people.

The legal order can never be allowed to operate as a murderer and a killer forcibly breaking the will to live of its victims. Naturally, there can be no question of permitting the killing of the feeble-minded person who feels happy with his life.

W. E. B. Du Bois, "Race Intelligence" (1920)

In this comment, Du Bois attacks the legacy of scientific racism in efforts to find a physical source for proving African American inferiority.

For a century or more it has been the dream of those who do not believe Negroes are human that their wish should find some scientific basis. For years they depended on the weight of the human brain, trusting that the alleged underweight of less than a thousand Negro brains, measured without reference to age, stature, nutrition or cause of death, would convince the world that black men simply could not be educated. Today scientists acknowledge that there is no warrant for such a conclusion and that in any case absolute weight of the brain is no criterion for racial ability. Measurements of the bony skeleton followed and great hopes of the scientific demonstration of race inferiority were held for a while. But they had to be surrendered when Zulus and Englishmen were found in the same dolichocephalic class. Then came psychology: The children of the public schools were studied and it was discovered that some colored children ranked lower than white children. This gave wide satisfaction even though it pointed out that the average included most of both races and that considering the educational opportunities and social environment of the races the differences were measurements simply of the ignorance and poverty of the black child's surroundings.

O Hwa-Su, "The Bride Who Would Not Speak" (1920)

This tale was told by O Hwa-Su and collected by Zong In-Sob in Korea in 1920. The tale includes a common Korean saying given to a woman getting married: she should be "mute for three years, deaf for three years and blind for three years." This indicates women's difficult position in their parents-in-law's family and patriarchal culture. They were admonished to perform a disabled person, but they could never be actually disabled to remain in marriage.

Once upon a time a man said to his daughter when she was setting out to go for her wedding, 'A daughter-in-law's life is very hard. She must pretend that she does not see the things that are to be seen, that she does not hear the words spoken around her, and she must speak as little as possible.'

So for three years after her marriage the girl spoke never a word. Her husband's family thought she was deaf and dumb, and so they decided to send her back to her father's house.

As she went back riding in a palanquin she chanced to hear a mountain pheasant call, and she said, 'Dear pheasant! I have missed your voice these long years.' Her father-in-law, who was walking beside the palanquin, was overjoyed to hear her speak and took her back to her husband at once. Then he sent his servants to catch the pheasant.

As she cooked the pheasant the daughter-in-law sang, 'The wings that protected me I will serve to my father-in-law. And the rolling nagging beak I will serve to my mother-in-law. And the rolling eyes will do for my husband's sister.'

Ewald Meltzer, Survey Sent to German Parents of 162 Disabled Children (1920)

In 1920, Ewald Meltzer sent around the following survey to the parents of 162 disabled children in order to assess attitudes toward euthanasia. Nazi advocates of medical murder later referenced the poll as evidence that parents would not protest the death of their institutionalized disabled children. In fact, the architects of the children's "euthanasia" program employed parental comments about how such killings might be carried out with their consent.

Meltzer Questionnaire

Given in 1920 to male parents or guardians of two hundred children living at the Katharinehof State Home for Non-Educable, Feeble-Minded Children in Grosshennersdorf, Germany.

> Would you give your consent in every circumstance to a painless shortening of your child's life, after an expert had determined him incurably imbecilic?
>
> Would you give your consent only if you could no longer care for your child, for example if you were about to pass away?

Would you give your consent if your child were suffering serious physical and mental anguish?

What is your wife's opinion of questions 1–3?

Martin Barr, "Some Notes on Asexualization" (1920)

Martin Barr, MD, served as chief physician of the Pennsylvania Training School for Feeble-minded Children in Elwyn, Pennsylvania. He was one of the fiercest advocates of coerced sterilization of individuals diagnosed as feebleminded in the United States.

Asexualization is not a new subject. Indeed as practiced in many lands, in many forms, for thousands of years, it is almost as old as the world itself. In the Scriptures we find mention of it, notably in the Book of Job, and in some parts of the New Testament; and it is often referred to in other ancient writings: the Histories of Assyria, China, Egypt, India, Persia, Rome and Greece speak of it again and again. It was practiced before the reign of Semiramis; and Andramgtis, King of Lydia, sanctioned sterilization in both sexes. . . .

Goethe said: "Fools and sensible people are alike harmless. It is only the half-foolish and half-wise who are most dangerous." Surely this is a truth verified by the fact that the feeble-minded have so multiplied and increased as to become a distinct race, now beginning to be recognized as such; needing protection for themselves and the world from them. But what is not *fully* *recognized,* as yet, is the fact that mental defectives suffer not only from exaggerated sexual impulses; but from mental and moral debility, causing always a minimum of judgment and of will-power, leaving them greater slaves to the impulse of the moment, than are many normal children.

There is consequently little, if any, balance between the intellectual and moral faculties, and but a rudimentary idea of relative values, constituting inability to recognize or to resist coming in; rendering them therefore mere creatures of the moment and slaves of temptation. Indeed they are so crooked that they are parallel to nothing, and one can hardly fathom how protean are the vagaries of mental defect.

That the quieting of nervous and exaggerated emotional excitation is a primary and necessary factor in developing and training mental defectives, experience has proven; it further points to asexualization as a powerful agent; a measure therefore contributing to the protection and advancement of the individual, either within or without institution walls.

Moreover this quieting of, or power of holding in abeyance, the sexual impulses, is the surest weapon for combating prostitution, providing thus a protection to society as well as to the irresponsible who, recognized or unrecognized, proves either seducer or victim.

"Race betterment," thus once secured, insures not only diminution of the defective, but also of the criminal ranks, now continually recruited from that class.

This movie still is from The Hunchback of Notre Dame, *Lon Chaney's first big-budget film and the one that made him a star of the cinema screen. Chaney delivers a remarkable performance as Quasimodo, using heavy weights to simulate a "crippled" gait but still managing to retain the expressive power of his body.*

Source: *The Hunchback of Notre Dame* (1923), directed by Wallace Worsley. B&W, 69 minutes. Reprinted by permission of Paul Darke.

The jails, penitentiaries, almshouses and reformatories are filled with defectives, many of whom are allowed to return unprotected to life outside, where—as before stated, with the sexual impulses ever exaggerated—they reproduce their kind from 2 to 6 times more rapidly than do normal people.

Heredity being the primary factor in production, the natural means of arrest is the removal of sexual desire in the unfit, and destruction of power to procreate.

A very conservative estimate places the number of mental defectives in the United States at between 300,000 and 400,000, while it is fairly computed that of these only 39,000 are cared for in institutions.

There are 51,000 avowed cases of feeble-minded in the state of New York, over 14,000 in Massachusetts, and in Pennsylvania the number has been estimated at 20,000.

It has been conjectured that over 50 percent of the prostitutes in the United States are feeble-minded.

We quarantine influenza, leprosy and venereal diseases and have laws governing the use of alcohol and of narcotics; and, while we have some laws for the *protection* of the feeble-minded, we have accomplished but little to stem the tide of degeneracy, and pollution of our normal population.

In 1892 the Training School at Elwyn demonstrated the benefit of asexualization by the sterilization of two patients. When in 1894 Dr. P. Hoyt Pilcher, of Winfield, Kansas, reported that he had operated upon a number [of] boys (38 cases) with gratifying results, a howl went up throughout the length and breadth of our land, the like of which was never heard before or since. The political papers censured him, and the medical journals, in the main praised and upheld him.

Later, Dr. Everett Flood, in Massachusetts, operated upon 26 cases, with the result that sexual appetite disappeared absolutely in all but two, and in these was markedly reduced.

Necessity for the adoption of heroic measures has been found, in the experience of a large proportion of institutions, asylums and prisons, and is now being persistently urged by leaders in the work.

That mere sentimental prejudice is gradually succumbing to the promulgation of this prevention of "True Race Suicide" is shown in the action of the legislatures of some thirteen states legalizing the asexualization of imbeciles, criminals and rapists.

Pennsylvania, the first to demonstrate by operation the beneficial results attained by asexualization, was also the first to demand legislative authority in broadening the work. In this thrice have her efforts been defeated—each time suppressed by a single voice—the veto of two governors (1905–1909) and the influence of one legislator (1911).

In 1907 Indiana passed the first bill authorizing operations upon confirmed criminals, idiots, imbeciles and rapists in state institutions.

Some 800 were vasectomied; and of these 200 were operated upon at their own request.

California followed with a law to permit the asexualization of inmates of state hospitals for feebleminded, and convicts in state institutions.

In 1909 Connecticut enacted a similar law, followed by New Jersey, Wisconsin and New Hampshire; the operations to be oophorectomy in the females and castration, or vasectomy, in the males.

We must face the fact that the very life-blood of the nation is being poisoned by the rapid production of mental and moral defectives, and the only thing that will dam the flood of degeneracy and insure the survival of the fittest, is abrogation of all power to procreate.

The shibboleth of the day is "lock up all degenerates once so proven." And this we do. But sooner or later the brighter ones, whose defects for a time are masked by the benefits received from training, are removed from the protection of sequestration, either by parents or guardians convinced of "cure" so-called; or again by the misdirected philanthropy of idle women; or some charitable societies, eager to set them at liberty "that they may have their chance." They have all right—and pressing forward they go out to meet the "Years to Come" and tramp through the black morasses of sexual filth until precipitated into the whirlpool of the stormy "Sea of Life" from which few, if any, ever return: and double prisoners and captives of the victims and their own passions, they sink lower and lower, consorting with the muck and filth, the scum and dregs of mankind. Then these hereditary irresponsibles—degenerates, imbeciles, defective delinquents and epileptics—the very nightmare of the human race, ever with sexual impulses exaggerated, find their "chance" in reproduction. Unconsciously innocent poisoners of a normal race, they are nevertheless its worst enemy.

In regard to the character of operations: Personally I prefer castration for the male, and oophorectomy for the female, as insuring security beyond adventure; and when performed on the young, desire almost entirely ceases, or is at least held in reasonable abeyance.

If for sentimental reasons the removal of the organs are objected to, vasectomy or fellectomy may be substituted.

Helen MacMurchy, from *The Almosts: A Study of the Feebleminded* (1920)

This excerpt provides an early example of literary analysis that considers artistic attention to disabled characters. While the author gives credit for this representational "kindness," she also affirms a eugenics divide between "normal" and "abnormal" citizens.

Chapter V. The Case for the Feeble-minded

Great writers have recognized the feeble-minded. They know that there are such people. When they painted the great world there was a place found on the canvas for the feeble-minded. Great writers discovered long before the modern "uplifter" was born that we must reckon with the mental defective as one of those many things in heaven and earth that are not dealt with by some philosophers, and yet that makes a great difference to the community and to social progress.

Kindness is the key that unlocks the problem of the feeble-minded—kindness and wisdom. The feeble-minded must have a permanent guide, philosopher and friend, so Wamba has Cedric and Gurth, Maggy has Little Dorrit, Billy has Dr. Amboyne, and Henry Little, and Barnaby Rudge has his mother. Mental defectives cannot manage by themselves, though we have tried to pretend to the contrary.

As to our attitude towards them: Nicholas Nickleby "treated Smike like a human creature." So he was. So was the Fool in "Lear." So with the rest. They are human creatures—human beings, and differ among themselves in reactions, in character, in endowment, in emotion, almost as much as the rest of us. Yet while this is true, there remains a world of difference even in fiction between the normal and the mentally defective. Little Dorrit and Maggy, Gurth and Wamba, Gabriel Varden and Barnaby Rudge—the verdict is never in doubt for a moment. The one makes upon the reader the definite impression of a normal person, but the other is "not all there."

T. S. Eliot, from *The Waste Land* (1922)

Eliot builds on the classical tradition that links disability to superhuman gifts through the figure of Tiresias, the blind seer. However, what the blind prophet foretells in The Waste Land is the banality and insignificance of modern existence.

From "The Fire Sermon"

At the violet hour, when the eyes and back
Turn upward from the desk, when the human engine waits
Like a taxi throbbing waiting,
I Tiresias, though blind, throbbing between two lives,
Old man with wrinkled female breasts, can see
At the violet hour, the evening hour that strives
Homeward, and brings the sailor home from sea,
The typist home at teatime, clears her breakfast, lights
Her stove, and lays out food in tins.
Out of the window perilously spread
Her drying combinations touched by the sun's last rays,
On the divan are piled (at night her bed)
Stockings, slippers, camisoles, and stays.
I Tiresias, old man with wrinkled dugs
Perceived the scene, and foretold the rest—
I too awaited the expected guest.
He, the young man carbuncular, arrives,
A small house agent's clerk, with one bold stare,
One of the low on whom assurance sits
As a silk hat on a Bradford millionaire.
The time is now propitious, as he guesses,
The meal is ended, she is bored and tired,
Endeavours to engage her in caresses
Which still are unreproved, if undesired.
Flushed and decided, he assaults at once;
Exploring hands encounter no defence;
His vanity requires no response,
And makes a welcome of indifference.
(And I Tiresias have foresuffered all
Enacted on this same divan or bed;
I who have sat by Thebes below the wall
And walked among the lowest of the dead.)
Bestows one final patronizing kiss,
And gropes his way, finding the stairs unlit . . .

William Carlos Williams, "To Elsie" (1923)

Perhaps the premier imagist poet in the United States, William Carlos Williams also served as a physician in New Jersey. His poem "To Elsie" metaphorizes modernist concerns with collapsing social institutions in the figure of Elsie, the "broken-brained" maid who took care of his house. Enshrining a common eugenics theme of hereditary degeneration, Elsie represents both an infantilized disabled woman and a symbol of capitalism's unbridled pursuit of consumerist lifestyles.

The pure products of America
go crazy—
mountain folk from Kentucky

or the ribbed north end of
Jersey
with its isolate lakes and

valleys, its deaf-mutes, thieves
old names
and promiscuity between

devil-may-care men who have taken
to railroading
out of sheer lust of adventure—

and young slatterns, bathed
in filth
from Monday to Saturday

to be tricked out that night
with gauds
from imaginations which have no

peasant traditions to give them
character
but flutter and flaunt

sheer rags—succumbing without
emotion
save numbed terror

under some hedge of choke-cherry
or viburnum—
which they cannot express—

Unless it be that marriage
perhaps
with a dash of Indian blood

will throw up a girl so desolate
so hemmed round
with disease or murder

that she'll be rescued by an
agent—
reared by the state and

sent out at fifteen to work in
some hard-pressed
house in the suburbs—

some doctor's family, some Elsie—
voluptuous water
expressing with broken

brain the truth about us—
her great
ungainly hips and flopping breasts

addressed to cheap
jewelry
and rich young men with fine eyes

as if the earth under our feet
were
an excrement of some sky

and we degraded prisoners
destined
to hunger until we eat filth

while the imagination strains
after deer
going by in fields of goldenrod in

the stifling heat of September
Somehow
it seems to destroy us

It is only in isolate flecks that
something
is given off

No one
to witness
and adjust, no one to drive the car

Henry Edward Abt, from *The Care, Cure, and Education of the Crippled Child* (1924)

Henry Edward Abt was a progressive social reformer during the early twentieth century in the United States. This excerpt provides a good example of the ways in which Abt sought to champion the treatment and education of disabled children as a primary sign of modern U.S. enlightenment.

In the course of this book we shall first step back and examine those darker ages when physical imperfection was a horrible stigma. We shall examine in a cursory manner those physical conditions which cause children to be handicapped. We shall then follow the little cripple as he is carried to the modem clinic, subjected to modern miracles of surgery, brought to the cheerful convalescent home, where he perhaps stands erect for the first time in his life, and where he is brought from the darkness of ignorance and introduced to the delights of education; and we shall finally gaze upon him and his fellows as they step forth into life and find themselves fully able to cope with their problems as if they had never been prostrate. . . .

Chapter I: Introduction

On a hot summer afternoon in 1863, a foreign representative to the United States, several members of the Cabinet, and the President of the United States are said to have been traversing one of the broad avenues of Washington. They were discussing matters of international importance. It was, therefore, somewhat surprising to the others when Abraham Lincoln abruptly interrupted the conversation and left the group. Stooping at a nearby tree, the emancipator lifted a fallen baby bird to its nest. Returning to his associates, Lincoln remarked, “And now, gentlemen, continue.”[1]

Although one of the greatest leaders the world has ever known found time to give his attention to an unfortunate little bird, until the past century all humanity has carelessly and consistently neglected its own unfortunate crippled children. For centuries of the Christian Era men have declared, like Mr. Scrooge in Charles Dickens’ immortal *Christmas Carol,* “What then, if he be like to die, he had better do it, and decrease the surplus population.” Hundreds of millions of those declaring themselves followers of the Master who said, “Suffer little children to come unto me, for such is the kingdom of God,”[2] and again, to the hunchback woman, “Woman, thou art loosed from thine infirmity,”[3] have made crippled children public jests, exiles from society.

The movement to care for and educate children, maimed or deformed by disease or accident, may be considered to have two aspects, the humanitarian and the sociological. This classification is recorded not because any such distinct cleavage exists, but to satisfy those who insist upon a mechanistic interpretation of life. Unless the “science” of sociology succeeds in making life more beautiful for its students, for the immediate spiritual happiness of the largest proportion of human beings, or for generations to come, it is an inexcusable waste of time. Were life really the dismal mechanical existence that some of our sociological scholars are pleased to interpret, it would seem that this information had best be transmitted to as few humans as possible. If life, properly understood, were truly nothing but a birth-to-death struggle, devoid of joy or pleasure, it would seem that the “laissez-faire” policy of those who interpret it in this manner had best be extended to education and study of the sort they pursue. The popular proverb, “ignorance is bliss” is easily extended to this sort of knowledge, for the ignorant might then grasp their few momentary transports of ecstasy without realizing their error.

As a matter of fact, no such situation exists. The study of crippled children brings to the right-minded man an appreciation of his own happy, healthy existence, a deeper understanding of the suffering and distress of his neighbors, leading to a deeper and finer emotional experience, as well as the knowledge of how to reduce and alleviate this suffering.

---

[1] The author has searched unsuccessfully for the source of this anecdote. It is a story he heard as a young child, and is one which he has never forgotten. It is very appropriately illustrative of the spirit of the movement to aid crippled children.

Thomas Mann, from *The Magic Mountain* (1924)

Mann, for whom the modern world resembles a hospital, examines life at the microscopic level where matter experiences a ceaseless cycle of renewal and decay. Human life is the awakened consciousness of this relation between living and dying.

What then was life? It was warmth, the warmth generated by a form-preserving instability, a fever of matter, which accompanied the process of ceaseless decay and repair of albumen molecules that were too impossibly complicated, too impossibly ingenious in structure. It was the existence of the actually impossible-to-exist, of a half-sweet, half-painful balancing, or scarcely balancing, in this restricted and feverish process of decay, and renewal, upon the point of existence. It was not matter and it was not spirit, but something between the two, a phenomenon conveyed by matter, like the rainbow on the waterfall, and like the flame. Yet why not material—it was sentient to the point of desire and disgust, the shamelessness of matter become sensible of itself, the incontinent form of being. It was a secret and ardent stirring in the frozen chastity of the universal; it was a stolen and voluptuous impurity of sucking and secreting; an exhalation of carbonic acid gas and material impurities of mysterious origin and composition. It was a pullulation, an unfolding, a form-building (made possible by the over-balancing of its instability, yet controlled by the laws of growth inherent within it), of something brewed out of water, albumen, salt and fats, which was called flesh, and which became form, beauty, a lofty image, and yet all the time the essence of sensuality and desire. For this form and beauty were not spirit-borne; nor, like the form and beauty of sculpture, conveyed by a neutral and spirit-consumed substance, which could in all purity make beauty perceptible to the senses. Rather was it conveyed and shaped by the somehow awakened voluptuousness of matter, of the organic, dying-living substance itself, the reeking flesh.

▣ Oliver Wendell Holmes, *Buck v. Bell*, 274 U.S. 200 (1927)

In one of the most notorious eugenics-based legal cases, U.S. Supreme Court Justice Oliver Wendell Holmes based his decision in support of sterilization on the longstanding prejudice that cognitively disabled women were more promiscuous than non-disabled women. Eugenics historians have since established that Carrie Buck—the woman targeted in the case because of a diagnosis of "feeblemindedness"—had been raped by a relative of her foster parents. Further study of the case has revealed that her lawyer in the case acted in collusion with the lawyer for the Virginia Colony to ensure that the sterilization law was upheld.

Mr. Justice Holmes delivered the opinion of the Court.

This is a writ of error to review a judgment of the Supreme Court of Appeals of the State of Virginia, affirming a judgment of the Circuit Court of Amherst County, by which the defendant in error, the superintendent of the State Colony for Epileptics and Feeble Minded, was ordered to perform the operation of salpingectomy upon Carrie Buck, the plaintiff in error, for the purpose of making her sterile. 143 Va. 310. The case comes here upon the contention that the statute authorizing the judgment is void under the Fourteenth Amendment as denying to the plaintiff in error due process of law and the equal protection of the laws.

Carrie Buck is a feeble minded white woman who was committed to the State Colony above mentioned in due form. She is the daughter of a feeble minded mother in the same institution, and the mother of an illegitimate feeble minded child. She was eighteen years old at the time of the trial of her case in the Circuit Court, in the latter part of 1924. An Act of Virginia, approved March 20, 1924 recites that the health of the patient and the welfare of society may be promoted in certain cases by the sterilization of mental defectives, under careful safeguard, &c.; that the sterilization may be effected in males by vasectomy and in females by salpingectomy, without serious pain or substantial danger to life; that the Commonwealth is supporting in various institutions many defective persons who if now discharged would become a menace but if incapable of procreating might be discharged with safety and become self-supporting with benefit to themselves and to society; and that experience has shown that heredity plays an important part in the transmission of insanity, imbecility, &c. The statute then enacts that whenever the superintendent of certain institutions including the above named State Colony shall be of opinion that it is for the best interests of the patients and of society than an inmate under his care should be sexually sterilized, he may have the operation performed upon any patient afflicted with hereditary forms of insanity, imbecility, &c., on complying with the very careful provisions by which the act protects the patients from possible abuse.

The superintendent first presents a petition to the special board of directors of his hospital or colony, stating the facts and the grounds for his opinion, verified by affidavit. Notice of the petition and of the time and place of the hearing in the institution is to be served upon the inmate, and also upon his guardian, and if there is no guardian the superintendent is to apply to the Circuit Court of the County to appoint one. If the inmate is a minor notice also is to be given to his parents if any with a copy of the petition. The board is to see to it that the inmate may attend the hearings if desired by him or his guardian. The evidence is all to be reduced to writing, after the board has made its order for or against the operation, the superintendent, or the inmate, or his guardian, may appeal to the Circuit Court of the County. The Circuit Court may consider the record of the board and the evidence before it and such other admissible evidence as may be offered, and may affirm, revise, or reverse the order of the board and enter such order as it deems just. Finally any party may apply to the Supreme Court of Appeals, which, if it grants the appeal, is to hear the case upon the record of the trial in the Circuit Court and may enter such order as it thinks the Circuit Court should have entered. There can be no doubt that so far as procedure is concerned the rights of the patient are most carefully considered, and as every step in this case was taken in scrupulous compliance with the statute and after months of observation, there is no doubt that in that respect the plaintiff in error has had due process of law.

The attack is not upon the procedure but upon the substantive law. It seems to be contended that in no circumstances could such an order be justified. It certainly is contended that the order cannot be justified upon the existing grounds. The judgment finds the facts that have been recited and that Carrie Buck "is the probable potential parent of socially inadequate offspring, likewise afflicted, that she may be sexually sterilized without detriment to her general health and that her welfare and that of society will be promoted by her sterilization," and thereupon makes the order. In view of the general declarations of the legislature and the specific findings of the Court, obviously we cannot say as matter of law that the grounds do not exist, and if they exist they justify the result. We have seen more than once that the public welfare may call upon the best citizens for their lives. It would be strange if it could not call upon those who already sap the strength of the State for these lesser sacrifices, often not felt to be such by those concerned, in order to prevent our being swamped with incompetence. It is better for all the world, if instead of waiting to execute degenerate offspring for crime, or to let them starve for their imbecility, society can prevent those who are manifestly unfit from continuing their kind. The principle that sustains compulsory vaccination is broad enough to cover cutting the Fallopian tubes. *Jacobson* v. *Massachusetts,* 197 U.S. 11. Three generations of imbeciles are enough.

But, it is said, however it might be if this reasoning were applied generally, it fails when it is confined to the small number who are in the institutions named and is not applied to the multitudes outside. It is the usual last resort of constitutional arguments to point out shortcomings of this sort. But the answer is that the law does all that is needed when it does all that it can, indicates a policy, applies it to all within the lines, and seeks to bring within the lines all similarly situated so far and so fast as its means allow. Of course so far as the operations enable those who otherwise must be kept confined to be returned to the world, and thus open the asylum to others, the equality aimed at will be more nearly reached.

Judgment affirmed.

Mr. Justice Butler dissents.

D. H. Lawrence, from *Lady Chatterley's Lover* (1928)

Lawrence uses Clifford, the cripple in the motor-chair, to criticize modernity's embrace of technology to the exclusion of love and the natural world. On the one hand, Clifford wants Connie to bear a son for him and to preserve the natural world from destruction. On the other hand, he wants a son only to carry forward his name, and he represents the forces of technology that attack nature. How easy would it be for Lawrence to embody these contradictory positions had Clifford not been disabled?

On a frosty morning with a little February sun, Clifford and Connie went for a walk across the park to the wood. That is, Clifford chuffed in his motor-chair, and Connie walked beside him.

The hard air was still sulphurous, but they were both used to it. Round the near horizon went the haze, opalescent with frost and smoke, and on the top lay the small blue sky; so that it was like being inside an enclosure, always inside. Life always a dream or a frenzy, inside an enclosure.

The sheep coughed in the rough, sere grass of the park, where frost lay bluish in the sockets of the tufts. Across the park ran a path to the wood-gate, a fine ribbon of pink. Clifford had had it newly gravelled with sifted gravel from the pit-bank. When the rock and refuse of the underworld had burned and given off its sulphur, it turned bright pink, shrimp-coloured on dry days, darker, crab-coloured on wet. Now it was pale shrimp-colour, with a bluish-white hoar of frost. It always pleased Connie, this underfoot of sifted, bright pink. It's an ill wind that brings nobody good.

Clifford steered cautiously down the slope of the knoll from the hall, and Connie kept her hand on the chair. In front lay the wood, the hazel thicket nearest, the purplish density of oaks beyond. From the wood's edge rabbits bobbed and nibbled. Rooks suddenly rose in a black train, and went trailing off over the little sky.

Connie opened the wood-gate, and Clifford puffed slowly through into the broad riding that ran up an incline between the clean-whipped thickets of the hazel. The wood was a remnant of the great forest where Robin Hood hunted, and this riding was an old, old thoroughfare coming across country. But now, of course, it was only a riding through the private wood. The road from Mansfield swerved round to the north.

In the wood everything was motionless, the old leaves on the ground keeping the frost on their underside. A jay called harshly, many little birds fluttered. But there was no game; no pheasants. They had been killed off during the war, and the wood had been left unprotected, till now Clifford had got his game-keeper again.

Clifford loved the wood; he loved the old oak-trees. He felt they were his own through generations. He wanted to protect them. He wanted this place inviolate, shut off from the world.

The chair chuffed slowly up the incline, rocking and jolting on the frozen clods. And suddenly, on the left, came a clearing where there was nothing but a ravel of dead bracken, a thin and spindly sapling leaning here and there, big sawn stumps, showing their tops and their grasping roots, lifeless. And patches of blackness where the woodmen had burned the brushwood and rubbish.

This was one of the places that Sir Geoffrey had cut during the war for trench timber. The whole knoll, which rose softly on the right of the riding, was denuded and strangely forlorn. On the crown of the knoll where the oaks had stood, now was bareness; and from there you could look out over the trees to the colliery railway, and the new works at Stacks Gate. Connie had stood and looked, it was a breach in the pure seclusion of the wood. It let in the world. But she didn't tell Clifford.

This denuded place always made Clifford curiously angry. He had been through the war, had seen what it meant. But he didn't get really angry till he saw this bare hill. He was having it replanted. But it made him hate Sir Geoffrey.

Clifford sat with a fixed face as the chair slowly mounted. When they came to the top of the rise he stopped; he would not risk the long and very jolty down-slope. He sat looking at the greenish sweep of the riding downwards, a clear way through the bracken and oaks. It swerved at the bottom of the hill and disappeared; but it had such a lovely easy curve, of knights riding and ladies on palfreys.

'I consider this is really the heart of England,' said Clifford to Connie, as he sat there in the dim February sunshine.

'Do you?' she said, seating herself in her blue knitted dress, on a stump by the path.

'I do! this is the old England, the heart of it; and I intend to keep it intact.'

'Oh yes!' said Connie. But, as she said it she heard the eleven-o'clock hooters at Stacks Gate colliery. Clifford was too used to the sound to notice.

'I want this wood perfect . . . untouched. I want nobody to trespass in it,' said Clifford.

There was a certain pathos. The wood still had some of the mystery of wild, old England; but Sir Geoffrey's cuttings during the war had given it a blow. How still the trees were, with their crinkly, innumerable twigs against the sky, and their grey, obstinate trunks rising from the brown bracken! How safely the birds flitted among them! And once there had been deer, and archers, and monks padding along on asses. The place remembered, still remembered.

Clifford sat in the pale sun, with the light on his smooth, rather blond hair, his reddish full face inscrutable.

'I mind more, not having a son, when I come here, than any other time,' he said.

'But the wood is older than your family,' said Connie gently.

'Quite!' said Clifford. 'But we've preserved it. Except for us it would go . . . it would be gone already, like the rest of the forest. One must preserve some of the old England!'

‘Must one?’ said Connie. ‘If it has to be preserved, and preserved against the new England? It’s sad, I know.’

‘If some of the old England isn’t preserved, there’ll be no England at all,’ said Clifford. ‘And we who have this kind of property, and the feeling for it, must preserve it.’

There was a sad pause. ‘Yes, for a little while,’ said Connie.

‘For a little while! It’s all we can do. We can only do our bit. I feel every man of my family has done his bit here, since we’ve had the place. One may go against convention, but one must keep up tradition.’ Again there was a pause.

‘What tradition?’ asked Connie.

‘The tradition of England! of this!’

‘Yes,’ she said slowly.

‘That’s why having a son helps; one is only a link in a chain,’ he said.

Connie was not keen on chains, but she said nothing. She was thinking of the curious impersonality of his desire for a son.

‘I’m sorry we can’t have a son,’ she said.

He looked at her steadily, with his full, pale-blue eyes.

‘It would almost be a good thing if you had a child by another man,’ he said. ‘If we brought it up at Wragby, it would belong to us and to the place. I don’t believe very intensely in fatherhood. If we had the child to rear, it would be our own, and it would carry on. Don’t you think it’s worth considering?’

Connie looked up at him at last. The child, her child, was just an ‘it’ to him. It . . . it . . . it!

‘But what about the other man?’ she asked.

‘Does it matter very much? Do these things really affect us very deeply? . . . You had that lover in Germany . . . what is it now? Nothing almost. It seems to me that it isn’t these little acts and little connexions we make in our lives that matter so very much. They pass away, and where are they? Where . . . Where are the snows of yesteryear? . . . It’s what endures through one’s life that matters; my own life matters to me, in its long continuance and development. But what do the occasional connexions matter? And the occasional sexual connexions especially! If people don’t exaggerate them ridiculously, they pass like the mating of birds. And so they should. What does it matter? It’s the life-long companionship that matters. It’s the living together from day to day, not the sleeping together once or twice. You and I are married, no matter what happens to us. We have the habit of each other. And habit, to my thinking, is more vital than any occasional excitement. The long, slow, enduring thing . . . that’s what we live by . . . not the occasional spasm of any sort. Little by little, living together, two people fall into a sort of unison, they vibrate so intricately to one another. That’s the real secret of marriage, not sex; at least not the simple function of sex. You and I are interwoven in a marriage. If we stick to that we ought to be able to arrange this sex thing, as we arrange going to the dentist; since fate has given us a checkmate physically there.’

Connie sat and listened in a sort of wonder, and a sort of fear. She did not know if he was right or not. There was Michaelis, whom she loved; so she said to herself. But her love was somehow only an excursion from her marriage with Clifford; the long, slow habit of intimacy, formed through years of suffering and patience. Perhaps the human soul needs excursions, and must not be denied them. But the point of an excursion is that you come home again.

‘And wouldn’t you mind *what* man’s child I had?’ she asked.

‘Why, Connie, I should trust your natural instinct of decency and selection. You just wouldn’t let the wrong sort of fellow touch you.’

She thought of Michaelis! He was absolutely Clifford’s idea of the wrong sort of fellow.

‘But men and women may have different feelings about the wrong sort of fellow,’ she said.

‘No,’ he replied. ‘You care for me. I don’t believe you would ever care for a man who was purely antipathetic to me. Your rhythm wouldn’t let you.’

She was silent. Logic might be unanswerable because it was so absolutely wrong.

‘And should you expect me to tell you?’ she asked, glancing up at him almost furtively.

‘Not at all, I’d better not know. . . . But you do agree with me, don’t you, that the casual sex thing is nothing, compared to the long life lived together? Don’t you think one can just subordinate the sex thing to the necessities of a long life? Just use it, since that’s what we’re driven to? After all, do these temporary excitements matter? Isn’t the whole problem of life the slow building up of an integral personality, through the years? living an integrated life? There’s no point in a disintegrated life. If lack of sex is going to disintegrate you, then go out and have a love-affair. If lack of a child is going to disintegrate you, then have a child if you possibly can. But only do these things so that you have an integrated life, that makes a long harmonious thing. And you and I can do that together . . . don't you think? . . . if we adapt ourselves to the necessities, and at the same time weave the adaptation together into a piece with our steadily-lived life. Don't you agree?'

Connie was a little overwhelmed by his words. She knew he was right theoretically. But when she actually touched her steadily-lived life with him she . . . hesitated. Was it actually her destiny to go on weaving herself into his life all the rest of her life? Nothing else?

Was it just that? She was to be content to weave a steady life with him, all one fabric, but perhaps brocaded with the occasional flower of an adventure. But how could she know what she would feel next year? How could one ever know? How could one say Yes? for years and years? The little yes, gone on a breath! Why should one be pinned down by that butterfly word? Of course it had to flutter away and be gone, to be followed by other yes's and no's! Like the straying of butterflies.

'I think you're right, Clifford. And as far as I can see I agree with you. Only life may turn quite a new face on it all.'

'But until life turns a new face on it all, you do agree?'

'Oh yes! I think I do, really.'

She was watching a brown spaniel that had run out of a side-path, and was looking towards them with lifted nose, making a soft, fluffy bark. A man with a gun strode swiftly, softly out after the dog, facing their way as if about to attack them; then stopped instead, saluted, and was turning downhill. It was only the new game-keeper, but he had frightened Connie, he seemed to emerge with such a swift menace. That was how she had seen him, like the sudden rush of a threat out of nowhere.

He was a man in dark green velveteens and gaiters . . . the old style, with a red face and red moustache and distant eyes. He was going quickly downhill.

'Mellors!' called Clifford.

The man faced lightly round, and saluted with a quick little gesture, a soldier!

'Will you turn the chair round and get it started? That makes it easier,' said Clifford.

The man at once slung his gun over his shoulder, and came forward with the same curious swift, yet soft movements, as if keeping invisible. He was moderately tall and lean, and was silent. He did not look at Connie at all, only at the chair.

'Connie, this is the new game-keeper, Mellors. You haven't spoken to her ladyship yet, Mellors?'

'No, Sir!' came the ready, neutral words.

The man lifted his hat as he stood, showing his thick, almost fair hair. He stared straight into Connie's eyes, with a perfect, fearless, impersonal look, as if he wanted to see what she was like. He made her feel shy. She bent her head to him shyly, and he changed his hat to his left hand and made her a slight bow, like a gentleman; but he said nothing at all. He remained for a moment still, with his hat in his hand.

'But you've been here some time, haven't you?' Connie said to him.

'Eight months, Madam . . . your Ladyship!' he corrected himself calmly.

'And do you like it?'

She looked him in the eyes. His eyes narrowed a little, with irony, perhaps with impudence.

'Why, yes, thank you, your Ladyship! I was reared here . . . '

He gave another slight bow, turned, put his hat on, and strode to take hold of the chair. His voice on the last words had fallen into the heavy broad drag of the dialect . . . perhaps also in mockery, because there had been no trace of dialect before. He might almost be a gentleman. Anyhow, he was a curious, quick, separate fellow, alone, but sure of himself.

Clifford started the little engine, the man carefully turned the chair, and set it nose-forwards to the incline that curved gently to the dark hazel thicket.

'Is that all then, Sir Clifford?' asked the man.

'No, you'd better come along in case she sticks. The engine isn't really strong enough for the uphill work.' The man glanced round for his dog . . . a thoughtful glance. The spaniel looked at him and faintly moved its tail. A little smile, mocking or teasing her, yet gentle, came into his eyes for a moment, then faded away, and his face was expressionless. They went fairly quickly down the slope, the man with his hand on the rail of the chair, steadying it. He looked like a free soldier rather than a servant. And something about him reminded Connie of Tommy Dukes.

When they came to the hazel grove, Connie suddenly ran forward, and opened the gate into the park. As she stood holding it, the two men looked at her in passing, Clifford critically, the other man with a curious, cool wonder; impersonally wanting to see what she looked like. And she saw in his blue, impersonal eyes a look of suffering and detachment, yet a certain warmth. But why was he so aloof, apart?

Clifford stopped the chair, once through the gate, and the man came quickly, courteously, to close it.

'Why did you run to open?' asked Clifford in his quiet, calm voice, that showed he was displeased. 'Mellors would have done it.'

'I thought you would go straight ahead,' said Connie.

'And leave you to run after us?' said Clifford.

'Oh, well, I like to run sometimes!'

Mellors took the chair again, looking perfectly unheeding, yet Connie felt he noted everything. As he pushed the chair up the steepish rise of the knoll in the park, he breathed rather quickly, through parted lips. He was rather frail really. Curiously full of vitality, but a little frail and quenched. Her woman's instinct sensed it.

Connie fell back, let the chair go on. The day had greyed over; the small blue sky that had poised low on its circular rims of haze was closed in again, the lid was down, there was a raw coldness. It was going to snow. All grey, all grey! the world looked worn out.

The chair waited at the top of the pink path. Clifford looked round for Connie.

'Not tired, are you?' he said.

'Oh, no!' she said.

But she was. A strange, weary yearning, a dissatisfaction had started in her. Clifford did not notice: those were not things he was aware of. But the stranger knew. To Connie, everything in her world and life seemed worn out, and her dissatisfaction was older than the hills.

They came to the house, and around to the back, where there were no steps. Clifford managed to swing himself over on to the low, wheeled house-chair; he was very strong and agile with his arms. Then Connie lifted the burden of his dead legs after him.

The keeper, waiting at attention to be dismissed, watched everything narrowly, missing nothing. He went pale, with a sort of fear, when he saw Connie lifting the inert legs of the man in her arms, into the other chair, Clifford pivoting round as she did so. He was frightened.

'Thanks, then, for the help, Mellors,' said Clifford casually, as he began to wheel down the passage to the servants' quarters.

'Nothing else, Sir?' came the neutral voice, like one in a dream.

'Nothing, good morning!'

'Good morning, Sir.'

'Good morning! it was kind of you to push the chair up that hill . . . I hope it wasn't heavy for you,' said Connie, looking back at the keeper outside the door.

His eyes came to hers in an instant, as if wakened up. He was aware of her.

'Oh no, not heavy!' he said quickly. Then his voice dropped again into the broad sound of the vernacular: 'Good mornin' to your Ladyship!'

'Who is your game-keeper?' Connie asked at lunch.

'Mellors! You saw him,' said Clifford.

'Yes, but where did he come from?'

'Nowhere! He was a Tevershall boy . . . son of a collier, I believe.'

'And was he a collier himself?'

'Blacksmith on the pit-bank, I believe: overhead smith. But he was keeper here for two years before the war . . . before he joined up. My father always had a good opinion of him, so when he came back, and went to the pit for a blacksmith's job, I just took him back here as keeper. I was really very glad to get him . . . its almost impossible to find a good man round here for a gamekeeper . . . and it needs a man who knows the people.'

'And isn't he married?'

'He was. But his wife went off with . . . with various men . . . but finally with a collier at Stacks Gate, and I believe she's living there still.'

'So this man is alone?'

'More or less! He has a mother in the village . . . and a child, I believe.'

Clifford looked at Connie, with his pale, slightly prominent blue eyes, in which a certain vagueness was coming. He seemed alert in the foreground, but the background was like the Midlands atmosphere, haze, smoky mist. And the haze seemed to be creeping forward. So when he stared at Connie in his peculiar way, giving her his peculiar, precise information, she felt all the background of his mind filling up with mist, with nothingness. And it frightened her. It made him seem impersonal, almost to idiocy.

And dimly she realized one of the great laws of the human soul: that when the emotional soul receives a wounding shock, which does not kill the body, the soul seems to recover as the body recovers. But this is only appearance. It is really only the mechanism of the re-assumed habit. Slowly, slowly the wound to the soul begins to make itself felt, like a bruise, which only slowly deepens its terrible ache, till it fills all the psyche. And when we think we have recovered and forgotten, it is then that the terrible after-effects have to be encountered at their worst.

So it was with Clifford. Once he was 'well,' once he was back at Wragby, and writing his stories, and feeling sure of life, in spite of all, he seemed to forget, and to have recovered all his equanimity. But now, as the years went by, slowly, slowly, Connie felt the bruise of fear and horror coming up, and spreading in him. For a time it had been so deep as to be numb, as it were non-existent. Now slowly it began to assert itself in a spread of fear, almost paralysis. Mentally he still was alert. But the paralysis, the bruise of the too-great shock, was gradually spreading in his affective self.

And as it spread in him, Connie felt it spread in her. An inward dread, an emptiness, an indifference to everything gradually spread in her soul. When Clifford was roused, he could still talk brilliantly and, as it were, command the future: as when, in the wood, he talked about her having a child, and giving an heir to Wragby. But the day after, all the brilliant words seemed like dead leaves, crumpling up and turning to powder, meaning really nothing, blown away on any gust of wind. They were not the leafy words of an effective life, young with energy and belonging to the tree. They were the hosts of fallen leaves of a life that is ineffectual. . . .

Nicholas O. Isaacson, "The Tie That Binds" (1928)

Disabled veterans are frequently seen exclusively as clients of the welfare state, whose identities and organizations are a product exclusively of their effort to exact benefits and assistance from governments. While this perspective does speak to an aspect of the experience of disabled veterans in the modern era, it fails to understand the larger sources of the disabled veterans' solidarity in such common experiences as war, incurring a disability, and rehabilitation. It also fails to account for idealism born of these common experiences and informing their solidarity. Founded in the wake of World War I, the Disabled American Veterans of the World War included men with the complete spectrum of service-related impairments and chronic illnesses; the organization had a membership of approximately 25,000 men in the interwar period.

Born in the tumult of bloody battle—brotherhood is a bond that has endured, and will endure on down from ages past to aeons yet to come—the tie of comradeship.

Men who have bared their breasts to the barbs of a common foe, who have taken in their bodies the lethal gas, the rending shot and the macerating shell of a national enemy are joined together in a union eternal.

Soldier organizations have that bond in common.

But only in the Disabled American Veterans of the World War is that bond sanctified by the blood sacrifice, welded by the heat of passion that rises as comrade sees the soul of comrade torn from body and sent to the haven of the souls of those gone West.

We stand, all for one, one for all.

We are the DAV.

For those who made the supreme sacrifice we have reverence and cherished memories.

For those who bled, but did not die, who won back some measure of their splendid young manhood offered so freely that the nation might not be crushed beneath the heel of foreign oppression, we hold comradeship, and the hand of congratulation.

For those who still fight on, weary, tired, but dauntless, who spend their days gazing at wall and ceiling in the hospitals, we have sympathy and extend the hand and pledge of eternal loyalty.

Some of us have fared well, in those days since the dawn of Armistice broke over a world soon to be at peace, a world in which no screaming shells flew through the air, seeking lodgement in the flesh of men. Some of us have fought a bitter fight, seeking to retrace that pathway to success. Some of us are still at the lower levels of that upward path.

But whatever our condition, whatever our present status, we are Comrades. We are, as ever and for always, one for all and all for one.

Much has been done, in the years that have passed, to better conditions. Far more is yet to be encompassed.

Together, in unison, constantly striving to attain our objectives, we can wear away the opposition that stands between us and our hopes. As a great, unified power we can go forward to that state where no veteran may suffer further as a result of sacrifices for his country.

Bring in the comrade who is not a member, that we may grow in power. Bring in the comrade who may need our combined power of organization to win that which may be his just due, but of which he has been deprived.

Live, think, talk the bond that binds us.

With that thought in mind, of loyalty, faith, and love for one another, as your commander for the glorious organization year that closes with this convention, I greet you.

NICHOLAS O. ISAACSON,
State Commander.

William Faulkner, from *The Sound and the Fury* (1929)

William Faulkner (1897–1962), one of the most celebrated writers of the American modernist period, created lasting stories about the experiences of people with disabilities in the early twentieth century. Sometimes these were deployed as metaphors of social decay, but Faulkner also wrote memorable portraits by imagining disabled people’s subjective perspective of the world. This excerpt from The Sound and the Fury*, a novel narrated by multiple characters, opens with a first-person narrative of Benjamin Compson (“Benjy”), a 33-year-old man diagnosed with “idiocy” who was based on a neighbor of Faulkner’s with Down syndrome. The second excerpt is narrated by Benjy’s brother, Jason Compson, a violent eugenicist who would like to have his sibling institutionalized so he would no longer “disgrace” his fallen aristocratic Southern family. The dialectic between the two demonstrates the violence directed at cognitively disabled people during the eugenics period.*

Benjy Compson narrating the event leading up to his castration:

They came on. I opened the Gate and they stopped, turning. I was trying to say, and I caught her, trying to say, and she screamed and I was trying to say and trying and the bright shapes began to stop and the bright shapes began to stop and I tried to get out. I tried to get it off my face, but the bright shapes were going again. They were going up the hill to where it fell away and I tried to cry. But when I breathed in, I couldn’t breathe out again to cry, and I tried to keep from falling off the hill and I fell off the hill into the bright, whirling shapes.

Jason Compson’s internal narrative about his brother Benjamin:

How to stop my clock with a nose spray and then you can send Ben to the Navy I says or to the Calvary anyway, they use geldings in the Calvary. Then when she sent Quentin home for me to feed too I says I guess that’s right too, instead of me having to go way up north for a job they sent the job down here to me and then Mother begun to cry and I says it’s not that I have any objection to having it here; if it’s any satisfaction to you I’ll quit work and nurse it myself and let you and Dilsey keep the flour barrel full, or Ben, rent him out to a sideshow; there must be folks somewhere that would pay a dime to see him, then she cried more and kept saying my poor afflicted baby and I says yes he’ll be quite a help to you when he gets his growth not being more than one and a half times high as me now and she says she’d be dead soon and then we’d all be better off and so I says all right, all right, have it your way.

The Beginning of Korean Special Education (1929)

George Paik explains the origin of education for disabled children as American missionary Dr. Rosetta Hall’s effort. In his description, blind people’s traditional occupation is introduced. The Braille applied by Hall was later replaced with Pak Du Seong’s Hunmaengjeongeum, the Korean alphabet.

All persons suffering from deformities claim our sympathy, but the blind in Korea deserve a double share, not only for their physical misfortune, but also because they are often forced to become sorcerers and exorcists. In order to make “the blind girls of Korea happy, useful members of the Christian home circle,” Mrs. Rosetta S. Hall, M.D., initiated education for them. When Mrs. Hall was a girl she had learned, as an amusement, the use of the “New York point” system of raised letters. When she came to Korea as a missionary, she found that her casually acquired knowledge was most useful.

As early as the spring of 1894 she began to give instruction to the blind daughter of a Christian. When her husband died, in 1894, she returned to America. During her stay in the United States, she visited the

The Wizard of Oz *is the classic fantasy of the girl Dorothy, from middle America (Kansas), who finds herself in a surreal world populated by Munchkins and anthropomorphized animals and inanimate figures.*

Institution for the Blind in New York and relearned the "Point" system. Upon her return to Korea in 1897, she adapted this to the Korean alphabet and syllabary, preparing part of a primer and the Ten Commandments, and taught the girl whom she had begun to instruct in 1894. The work thus commenced so attracted the attention of the people that by 1906 there were seven students. With money given her by friends in America, Mrs. Hall maintained a class-room in connection with her dispensary, where these girls were taught. They were not only given regular day school education, but also lessons in the practical arts.

Thomas "Fats" Waller, Harry Brooks, and Andy Razaf, "What Did I Do To Be So Black and Blue" (1929)

The blues classic, recorded by Louis Armstrong, plays with the metaphor of bruising—black and blue marks—to explore racism in the United States.

Cold empty bed . . . springs hurt my head
Feels like ole Ned . . . wished I was dead
What did I do . . . to be so black and blue
Even the mouse . . . ran from my house
They laugh at you . . . and all that you do
What did I do . . . to be so black and blue

I'm white . . . inside . . . but, that don't help my case
That's life . . . can't hide . . . what is in my face
How would it end . . . ain't got a friend
My only sin . . . is in my skin
What did I do . . . to be so black and blue
How would it end . . . I ain't got a friend
My only sin . . . is in my skin
What did I do . . . to be so black and blue

"Where Work of Salvaging Human Beings Goes Forward" (1930)

The following article details the philosophy of 1930s-era segregated schooling for physically disabled children in the United States by describing the School for Crippled Children (later named Condon School) in Cincinnati, Ohio. These institutions were established as an alternative to hospital schools, but they were largely nonintegrated, both racially and in terms of developmental disability, until the 1960s. This particular school included a full therapeutic regimen—physical, occupational, speech, medical, and dental—that functioned parallel to academic and technical training.

Cincinnati is the scene of one of the greatest human experiments going on in the present-day world—the reconstruction of human salvage. While the best that Cincinnati affords [in] medical and surgical skill is concentrated in trying to make normal as possible, misshapen bodies and twisted limbs, the best educational thought of the city is directed to preparing them to cope with the problems of life in competition with the normal persons of the community.

The experiment is being conducted and conducted happily—in the School for Crippled Children, operated by the Board of Education on Rockdale avenue, near Burnet, Avondale. The school has just about everything needed to sustain life and keep residents happy. It's a self-contained structure, and inside its walls one might eat, sleep, work, play, see the doctor, read and learn without ever finding it necessary to leave.

Cincinnati treats its unfortunate children well here. They're taught to make the most of themselves. They're taught to forget that they're handicapped. They're taught to lead normal lives. They're taught to earn a living among normal persons.

It is this psychological background, this self-confidence, that is the school's primary objective, Mrs. Mary T. Betts, principal, explains. And, proudly she conducts visitors through the structure.

She shows them the modern pediatric orthopedic, cardiac and dental offices, each fitted with the latest and most perfect of instruments and other equipment, but it is with more pride that she shows the class rooms, where the students are given a cultural background, and the handicraft rooms, where they are given a vocational background.

Handicraft Rooms

There are two principal handicraft rooms and a number of smaller ones. The one for boys is fitted out exactly like those in schools for normal children. There are work benches, equipped with vises, and there are wood-working tools of every sort. Off on the side is a smaller room, where the finished products are painted.

The work of the students shows quite the professional touch. They produce everything from small bookends on up, and each piece is carefully tooled and decorated.

On the girls' side is a large sewing room and a large kitchen. The students here learn everything from lowering hems to delicate embroidery, and from frying eggs to preparing exotic salads.

"We attempt to teach them to do the unusual sort of work," Mrs. Bett explains, "The unusual provides them a better market and a better chance to make a living."

Even while they're in school the students may make part of their expenses, for much of the work they produce finds a ready market, not only in Cincinnati, but throughout the country.

For Regular Study

The classrooms for regular study, too, are like ordinary classrooms, except that the desks and chairs may be fitted with special apparatus to make the child more comfortable.

But in spite of all such things as these, most of the pupils must be treated for their afflictions, and the school provides for them thoroughly.

In one respect it differs from other such institutions. Most of them are either only one story high, or have ramps, instead of stairways, to link the several floors. The Cincinnati school has stairways.

"After all," Mrs. Betts says, "in ordinary conditions [the] children must climb stairs. Here we can teach them to do it, increase their confidence in their ability to do it."

The stairways are provided with banisters of several heights, to aid the children, and their instructors, of course help them further. And there are elevators for wheel-chair patients.

The various clinics are each considered complete. There [are] complete orthopedic and pediatric suites, where each case receives special attention and corrective treatment. Outstanding specialists contribute their services.

There is a large restroom, open in warm weather and gassed in in cold weather, where, on cloudy days the children lie on cots in a circle under a gargantuan ray machine which substitutes for the sun.

Virginia Woolf, from *On Being Ill* (1930)

In this excerpt from an essay that was published as a slim book in 1930, Woolf proclaims the universal, the inescapable, the invisible, and the overwhelming nature of the embodied experience. Everyone has a body that endures illness and pain, and no one can be in the world separate from the body. However, the literary reflection of these truths is minimal (to Woolf's eye), because the whole idea of "this monster, the body, this miracle, its pain" is so fearsome to contemplate.

Considering how common illness is, how tremendous the spiritual change that it brings, how astonishing, when the lights of health go down, the undiscovered countries that are then disclosed, what wastes and deserts of the soul a light attack of influenza brings to view, what precipices and lawns sprinkled with bright flowers a little rise of temperature reveals, what ancient and obdurate oaks are uprooted in us by the act of sickness, how we go down into the pit of death and feel the waters of annihilation close above our heads and wake thinking to find ourselves in the presence of the angels and the harpers when we have a tooth out and come to the surface in the dentist's armchair and confuse his "Rinse the mouth—rinse the mouth" with the greetings of the Deity stooping from the floor of Heaven to welcome us—when we think of this, as we are so frequently forced to think of it, it becomes strange indeed that illness has not taken its place with love and battle and jealousy among the prime themes of literature. Novels, one would have thought, would have been devoted to influenza; epic poems to typhoid; odes to pneumonia; lyrics to toothache. But no; with a few exceptions—De Quincey attempted something of the sort in *The Opium Eater;* there must be a volume or two about disease scattered through the pages of Proust—literature does its best to maintain that its concern is with the mind; that the body is a sheet of plain glass through which the soul looks straight and clear, and, save for one or two passions such as desire and greed, is null, and negligible and non-existent. On the contrary, the very opposite is true. All day, all night the body intervenes; blunts or sharpens, colours or discolours, turns to wax in the warmth of June, hardens to tallow in the murk of February. The creature within can only gaze through the pane—smudged or rosy; it cannot separate off from the body like the sheath of a knife or the pod of a pea for a single instant; it must go through the whole unending procession of changes, heat and cold, comfort and discomfort, hunger and satisfaction, health and illness, until there comes the inevitable catastrophe; the body smashes itself to smithereens, and the soul (it is said) escapes. But of all this daily drama of the body there is no record. People write always of the doings of the mind; the thoughts that come to it; its noble plans; how the mind has civilised the universe. They show it ignoring the body in the philosopher's turret; or kicking the body, like an old leather football, across leagues of snow and desert in the pursuit of conquest or discovery. Those great wars which the body wages with the mind a slave to it, in the solitude of the bedroom against the assault of fever or the oncome of melancholia, are neglected. Nor is the reason far to seek. To look these things squarely in the face would need the courage of a lion tamer; a robust philosophy; a reason rooted in the bowels of the earth. Short of these, this monster, the body, this miracle, its pain, will soon make us taper into mysticism, or rise, with rapid beats of the wings, into the raptures of transcendentalism.

Erich Maria Remarque, from *The Road Back* (1931)

Another source of the solidarity of disabled veterans has been their persistent difficulties in dealing with the state in its capacity as a provider of assistance and benefits. Impersonal and insensitive administration of programs, declining commitment to fund programs during periods of fiscal stringency, and ignorance of specific disabling conditions have consistently plagued relations between disabled veterans and government. These difficulties are exacerbated under circumstances of defeat, in which governments have to contend with demoralization as well as economic collapse. In this selection, from a novel written by the most significant German interpreter of the World War I experience, the desperate situation of German disabled veterans after World War I is captured, as is the terrible toll of war upon the bodies of the veterans involved in the ghostly protest demonstration that Remarque describes.

In Freaks, *a community of circus "freaks" takes revenge on a female trapeze artist and her strong-man lover after she has married Hans, a short-statured performer, for his fortune. The director, Tod Browning, cast in key parts disabled actors, including Harry Earles, Daisy Earles, Daisy and Violet Hilton, Johnny Eck, Randion, and others. The film became deeply controversial in its day, largely because of the fact that living disabled people were employed in key roles. In the 1960s, the film experienced a revival as a cult classic as an insightful social allegory about intolerance.*

Source: *Freaks* (1932), directed by Tod Browning. B&W, 60 minutes.

Demonstrations in the streets have been called for this afternoon. Prices have been soaring everywhere for months past, and the poverty is greater even than it was during the war. Wages are insufficient to buy the bare necessities of life, and even though one may have the money it is often impossible to buy anything with it. But ever more and more gin palaces and dance halls go up, and ever more and more blatant is the profiteering and swindling.

Scattered groups of workers on strike march through the streets. Now and again there is a disturbance. A rumor is going about that troops have been concentrated at the barracks. But there is no sign of it as yet.

Here and there one hears cries and counter-cries. Somebody is haranguing at a street corner. Then suddenly everywhere is silence.

A procession of men in the faded uniforms of the frontline trenches is moving slowly toward us. It is formed up by sections, marching in fours. But white placards are carried before: *Where is the Fatherland's gratitude?—The War Cripples are starving.*

The men with one arm are carrying the placards, and they look around continually to see if the procession is still coming along properly behind them, for they are the fastest.

These are followed by men with sheep dogs on short, leather leads. The animals have the red cross of the blind at their collars. Watchfully they walk along beside their masters. If the procession halts they sit down, and then the blind men stop. Sometimes dogs off the street will rush in among the column, barking and wagging their tails, wanting to romp and play with them. But these merely turn their heads and take no notice of all the sniffing and yapping. Yet their ears are erect, pricked and alert, and their eyes are alive; but they walk as if they no longer wished to run and to jump, as if they understood for what they are there. They have separated themselves from their fellows, as Sisters of Mercy separate themselves from jolly shop girls. Nor do the other dogs persist long; after a few minutes they give up and make off in such haste that it looks almost as if they were flying from something. Only a powerful mastiff stands still, and with front legs widely straddling, barks slowly, deep and hollow, till the procession is past.

It is strange how a face without eyes alters—how in the upper half it becomes extinct, smooth and dead; and how odd the mouth is in comparison, when it speaks! Only the lower half of the face lives. All these have been shot blind; and so they behave differently from men born blind. They are more violent, and at the same time more cautious, in their gestures that have not yet gained the sureness of many years of darkness. The memory of colors, of sky, earth and twilight still lives with them. They move still as if they had eyes; involuntarily they lift and turn their heads to see who it is that speaks to them. Some have black patches or bandages over their eyes, but most go without them, as if by that means they would stand nearer to colors and the light. Their eyelids are withered and closed: only the narrow strip of the lower lid still protrudes a little, blotched, wet and red like a dim, cheerless dawn. Many of them are healthy, powerful fellows with strong limbs that would like well to move freely and have play. The pale sunset of the March sky gleams behind their bowed heads. In shop windows the first lamps are being lighted. But they hardly feel the mild, sweet air of evening on their brow. In their heavy boots they move slowly through the everlasting darkness that stretches about them like a cloud; and troubled and persistent, their thoughts clamber up and down the meager scale of figures that would mean bread and comfort and life to them, and yet cannot be. Hunger and penury stir idly in the darkened rooms of their mind. Helpless and full of dull fear, they sense their nearness; yet they cannot see them nor do aught against them but to walk slowly in their numbers through the streets, lifting up their dead faces from the darkness toward the light, in dumb appeal to others, who can still see.

Behind the blind come the men with one eye, the tattered faces of men with head wounds: wry, bulbous mouths, faces without noses and without lower jaws, entire faces one great red scar with a couple of holes where formerly were a mouth and a nose. But above this desolation, quiet, questioning, sad human eyes.

On these follow the long lines of men with legs amputated. Some already have artificial limbs that spring forward obliquely as they walk and strike clanking on the pavement, as if the whole man were artificial, made up of iron and hinges. Others have their trouser legs looped up and made fast with safety pins. These go on crutches or sticks with black rubber pads.

Then come the shakers, the shell-shocked. Their hands, their heads, their clothes, their bodies quake as though they still shuddered with horror. They no longer have control of themselves; the will has been extinguished, the muscles and nerves have revolted against the brain, the eyes become void and impotent.

One-eyed and one-armed men are pushing along wicker carriages with oilcloth covers, wherein are other men so badly wounded that they can now only live in wheeled chairs. Among them a few men come trailing a flat handcart, such as carpenters use to transport bedsteads or coffins. On it there sits a torso. The legs are gone from the hips. It is the upper half of a powerful man, nothing more. He has broad, stalwart shoulders and a big, brave face with a heavy moustache. On his head he wears a peaked cap. It may be that he was formerly a furniture mover. Beside him is a placard with wobbly lettering that he has, no doubt, painted himself—I should like to walk too, mate. With solemn face he sits there; now and then, supporting himself on his arms, he will swing a little farther up the wagon so as to change his seat.

A young, pale fellow without arms, and legs amputated at the knees, follows after him. The knees stand in thick, leather wrappings like great hooves. It appears so odd that one involuntarily looks under the wagon, as if the legs must surely carry on there beneath it. In his arm stumps he carries a placard: Many thousands of us are still lying in the hospitals.

The procession drags slowly along the streets. Wherever it passes, all is still. Once, at the corner of Hook Street, it has to wait a long time. A new dance palace is being erected there, and the street is blocked with heaps of sand, cement mixers and girders. Between the struts over the entrance is the name in illuminated letters: "Astoria Dance-Palace and Wine Saloon." The trolley with the torso stands directly beneath it, waiting until some iron girders have been shifted. The dull glow of the lighted sign floods over him, coloring the silent face to an awful red, as if it were swelling with some terrible fury and must suddenly burst into a hideous cry.

But then the column moves on, and again it is just the face of the furniture mover, pallid from the hospital in pale evening, and smiling gratefully as a comrade puts a cigarette between his lips.

Quietly the groups pass on through the streets, without cries, without indignation, resigned—a complaint, not an accusation. They know that those who can shoot no more need not expect over-much help. They will go on to the Town Hall and stand there a while; some secretary or other will say something to them, then they will break up and return singly to their rooms, their narrow dwellings, their pale children and their awful misery, without much hope, prisoners of the destiny that others made for them.

Ernest Hemingway, from "A Way You'll Never Be" (1933)

Here Hemingway plays with the stream-of-consciousness technique used by modernist writers, the style of writing by association, to represent Nick Adams's shell-shocked state of mind. This story is one of Hemingway's most successful experiments with how to picture the cognitive breakdown of a protagonist.

"I am a veteran of the Eritrea campaign," said the adjutant stiffly. "I fought in Tripoli."

"It's quite something to have met you," Nick put out his hand. "Those must have been trying days. I noticed the ribbons. Were you, by any chance, on the Carso?"

"I have just been called up for this war. My class was too old."

"At one time I was under the age limit," Nick said. "But now I am reformed out of the war."

"But why are you here now?"

"I am demonstrating the American uniform," Nick said. "Don't you think it is very significant? It is a little tight in the collar but soon you will see untold millions wearing this uniform swarming like locusts. The grasshopper, you know, what we call the grasshopper in America, is really a locust. The true grasshopper is small and green and comparatively feeble. You must not, however, make a confusion with the seven-year locust or cicada which emits a peculiar sustained sound which at the moment I cannot recall. I try to recall it but I cannot. I can almost hear it and then it is quite gone. You will pardon me if I break off our conversation?"

"See if you can find the major," the adjutant said to one of the two runners. "I can see you have been wounded," he said to Nick.

"In various places," Nick said. "If you are interested in scars I can show you some very interesting ones but I would rather talk about grasshoppers. What we call grasshoppers, that is, and what are, really, locusts. These insects at one time played a very important part in my life. It might interest you and you can look at the uniform while I am talking."

Nathanael West, *Miss Lonelyhearts* (1933)

The medium of film creates and reinforces a series of socially horrific predicaments that are seen as simply generated by an obscene body. These are largely located around disfigurement and around those bodies that have been deemed to be repulsive in a field of vision. Many novelists of the twentieth century, including Elizabeth Bowen in Death of the Heart, *Harper Lee in* To Kill a Mockingbird, *and Manuel Puig in* The Kiss of the Spider Woman, *wrestled with the implications of film as a burgeoning and influential mode of storytelling. Because film operates as a more visual narrative medium than printed text, film stories have tended to emphasize physical appearance as a social value. Similarly, film mobilizes audiences around the suspense and shock value that can be precipitated in a simple narrative premise: the placing of visually different bodies on exhibition.*

Hence, the crafting of narratives around repulsive bodies and the development of film as a craft have occurred hand in hand. In the history of film production, one finds an entire genre of horror films developing within the visually sophisticated era of silent cinema and remaining heavily influential into the 1930s. For example, during the eugenics era in Germany, influential films developed at Babelsburg studios made the new "horror" genre a principal part of their repertoire. In the United States, subsequent to a break with Edison's efforts to control production, an alliance among Hollywood studios became the central source of filmed story products. The excerpt below is from Nathanael West's Miss Lonelyhearts. *West was among the authors who wrote about the culture and effects of classic or "golden"-era Hollywood.*

In his novels, West, like the cinema of which he writes, explored the implications of a predominantly visual medium upon those it casts as visually repulsive. This excerpt is also significant because it appears as a preface to Erving Goffman's influential, and contemporaneous, study entitled Stigma: Notes on the Management of Spoiled Identity. *Most important, primary sources on film narrative and disability are significant because a central strand of disability studies involves a critique of the misrepresentations of cinema in its presentation of disability as a horror and a personal tragedy.*

Dear Miss Lonelyhearts—

I am sixteen years old now and I don't know what to do and would appreciate it if you could tell me what to do. When I was a little girl it was not so bad because I got used to the kids on the block makeing fun of me, but now I would like to have boy friends like the other girls and go out on Saturday nites, but no boy will take me because I was born without a nose—although I am a good dancer and have a nice shape and my father buys me pretty clothes.

I sit and look at myself all day and cry. I have a big hole in the middle of my face that scares people even myself so I cant blame the boys for not wanting to take me out. My mother loves me, but she crys terrible when she looks at me.

What did I do to deserve such a terrible bad fate? Even if I did do some bad things I didn't do any before I was a year old and I was born this way. I asked Pape and he says he doesnt know, but that maybe I did something in the other world before I was born or that maybe I was being punished for his sins. I dont believe that because he is a very nice man. Ought I commit suicide?

Sincerely yours,
Desperate

Kye Yong Muk, from "Adada the Idiot" [*Paegch'i Adada*] (1935)

"Adada the Idiot" depicts Adada, a disabled woman with speech and cognitive impairment. This short story has been interpreted as offering a critique of the increasing materialism of Korean society by depicting that society as morally disabled. The story was made into films in 1956 and 1987.

Adada was a mute. When she tried to talk the only sounds she could make were a stuttering "a-da-da" over and over. Sometimes however, when she really tried, the words would come out one at a time fairly well, but this was so only with simple words.

So people ridiculed her and even though her real name was Hwak-sil, everyone called her "Adada." Naturally the name stuck, with even her father and mother coming to call her that. And for her part, whenever anyone called "Adada" she responded as though it were her real name.

"I'm getting gray hair because of you, bitch," her mother spat. "Either go on back to your husband or get the hell out of here and go somewhere and die. Bitch! Bitch! Bitch!" . . .

As if to say, "I'll do as you wish," Adada shook her head sadly and filled with fright, uncertain as to what she should do, dragged herself outside the gate.

Once outside, she still had no idea where she could go. . . .

The realization that she had no place to go made her feel a deep longing for her husband's home of five years ago, which was now useless except for the solace of tears. In those days her mother- and father-in-law had treated her well. They were concerned lest she be cold or warm, whether the work was too hard for her or whether she was tired. How eagerly they had humored her. And at night her husband had held her close to his bosom, melting her weariness. Ah, how well her husband and his parents had treated her!

And it was true. For the first five years of her marriage she had been loved by the whole family. Not that the idea of marrying a mute had been particularly appealing, but otherwise he never could have married without actually buying a wife. At 28 and still single he was finding it difficult enough to fill his own gullet. . . .

On top of that, Adada was a good worker. She docilely did whatever she was told and had never complained in the least. So it was that this family whose poverty had kept them at each other's throats with sullen looks and unpleasant words suddenly became wreathed in smiles of harmony, like a garden blessed with spring showers.

Of course, Adada was not normal and she did make mistakes, but [the] in-laws, who were being supported by her, did not look upon her with disgust, but rather made every effort to console her and to cover up her faults.

It was there that Adada felt human happiness for the first time in her life. She felt bitter whenever she thought of how her own parents had not even considered her as a human being because she was a "worthless child," or more to the point that she was a "wicked child" who was disgracing the family's good name. . . .

The years have passed and the one somjigi of paddy field which had been the foundation of their existence gradually brought them to a comfortable life. And with several hundred yen in savings, this man who was her husband began to hate his mute wife for no reason. . . .

"Bitch," he would say, "I'm sick of looking at you. Go back to your parents." And that would be followed by a beating. Still, Adada suffered patiently and did her duty as a wife and as a daughter-in-law. All of this endeared Adada even more to her in-laws. Finally the son, sensing that the daughter-in-law could not be pried away from the father and feeling domestic frustration, sold off the entire year's harvest and left home. In his quest for emotional solace he squandered all his money on sex and drink, lived a worthless life and then, joining up with some friends, crossed over the river into Antung in Manchuria.

Immersing himself in the life of this speculative city he managed, by dint of physical labor, to get together some capital, and with a few good speculative investments his dream of wealth began miraculously to come true, and almost inadvertently he managed to accumulate close to 20,000 yen. With this small fortune he picked, from the vast number of women who had been following his money, a true love for this perfect wife and took her home with him.

Then dreaming of a completely new way of life, he built another house, and his cruelty toward Adada became even worse than before. [On] top of this, his father was much taken with the intelligent, gracious new daughter-in-law whom they had no reason to be ashamed of.

No longer in favor with her in-laws, with no one to take her side, and unable to bear the beatings of her insensitive husband, she was finally driven out. . . .

But where to go? As she turned the problem over in her mind she came to the conclusion that the only one in this world she could turn to was Surong.

A bachelor, now over thirty, Surong had no parents, no brothers or sisters, no cousins. . . .

Surong had been playing up to Adada for the past year. Even though she was a mute and had been driven from her husband's home, she was nevertheless Kim Ch'o-si's daughter, so he was self-effacing, and taking care not to act too boldly, he trained his sights on her and watched carefully to determine her feelings toward him. . . .

[The] two of them exchanged wedding vows without a formal ceremony and at daybreak left the village and slipped away to an island called Simmi-do to settle down to a peaceful life. . . .

"Look," he said. "It doesn't look like a lot but there's 1,500 ryang here—that's 150 in yen. At today's prices we can easily buy 2,000 p'yŏng of land." Adada did not answer. A definite tinge of sadness flashed across her face. . . . Adada simply shook her head without speaking. . . . As a matter of fact, even when he said he had money, Adada never imagined it was so much, and when she heard Surong say he was going to buy land with all that money she could feel all the happiness she had dreamed of slipping away from her. . . .

Adada put down the basket on the sand and removed the roll of money from the waist of her trousers. With a twirl she loosened the piece of rag which had been wrapped around the money in who knows how many layers. Adada stood there staring vacantly, waiting, wishing that they would quickly either sink beneath the water of float out to sea. . . .

Adada felt exhilarated beyond description. When she thought how those countless pieces of money which were being pulled down into the water were taking all of her own misfortunes with them into the great boundless sea from which there would be no return, Adada was so happy she could have danced. . . .

"Ya, ya. Adada! The money! Did you take the money? The money, the money . . . !" he shouted. His voice a shattering bolt from the blue. . . .

Little by little the sweep and flow of the waves quickened their pace. The bills flowed to and fro, playing a game of hide and seek with him, as if trying to lure him into the deep waters. . . .

Surong realized that the money was gone now, but he could not lift his eyes from the water and stood there like a man bereft of his senses staring dumbfoundedly. Then like a shot, he became running to the small hill by the water's edge where Adada stood trembling and, without saying a word, kicked her viciously in the midsection. The sound of a grunt pierced the air at almost the same time the muck splattered in all directions as Adada slid down head first into the slime of the edge of the sea. And then a scream. . . .

Surong, his fist still clenched, stands there like a statue peering into the heaving waves. . . .

Above, flocks of seagulls wheel about and glide in circles looking for their mates, oblivious to the grim human tragedy which has taken place. They screech noisily and with the sound of their wings beating in great flaps they grace the seaside panorama with a joyful dance.

The League of the Physically Handicapped (1935)

In 1935, at the height of the Great Depression, a group of disabled people joined together as the League of the Physically Handicapped to protest job discrimination. Bureaucratic rules and individual prejudices kept many disabled people from benefiting from the government employment supports provided by President Roosevelt's New Deal programs. This excerpt includes the League's assessment of the problem and their demands for change.

The fliers handed out by members of the League of the Physically Handicapped, explained that people with handicaps "cannot get regular jobs as teachers or librarians in New York State. . . . Even a typist must pass a physical examination. . . . In private business the Physically Handicapped invariably are discriminated against. They work harder for less wages. [Given this disability-based employment bias,] our League demands that handicapped people receive a just share of the millions of jobs being given out by the government. . . . The Handicapped still are discriminated against by Private Industry. It is because of this discrimination that we demand the government recognize its obligation to make adequate provisions for handicapped people in the Works Relief Program."

Kang Kyong-Ae, from *The Underground Village [Jihachon]* (1936)

Kang Kyong-Ae, a feminist novelist, focused on depicting people in the lower classes and women's lives in colonial Korea in a form of critical realism. The Underground Village is a novella portraying the impoverished countryside life of a man with partially paralyzed limbs, Ch'il-sŏng; his love interest, the blind woman K'ŭnnyon; and his mother and siblings. The excerpts include Ch'il-sŏng's encounters with another man with a physical disability from a work injury as well as the end of the story.

The sun was burning upon the western hill. Ch'il-sŏng, as usual, staggered past this village with his beggar's sack slung over his shoulder. He kept pulling down his crownless straw hat, but the sun continued broiling his forehead, and drops of sweat rolled down. Dust rose up from the parched road like smoke and made it difficult for him to breathe.

"There he comes again!"

"Come on!"

The little urchins at play by the roadside shouted and ran toward him. Ch'il-sŏng swore to himself and hurried his steps, but the children soon overtook him and pulled at his clothes.

"Cry, lad! Cry!" One of the urchins blocked Ch'il-sŏng's way and laughed. The children surrounded him in a circle.

"Hey, kid, how old are you?"

"Show us what you earned today."

One of the urchins snatched at the beggar's sack, and all the others clapped their hands. Ch'il-sŏng stood immobile and glared at the biggest of the group. He knew that if he tried to advance or swore at them they would pester him still more vigorously.

"Oh, he looks like a gentleman today."

One bristly-haired urchin brandished a stick before him with a bit of cowdung at the tip. The children all giggled and made as if to smear cowdung on Ch'il-sŏng with their sticks. Ch'il-sŏng could not stand it, so he ran as fast as he could. . . .

It was not the first time that he had been chased away by a dog; and countless times he had been abused and persecuted by men, too.

But somehow he felt an uncontainable fury today.

"Why are you standing there like that?"

He looked back in surprise to find that he was standing before a small building which was a water-mill. The man who was looking at him with outstretched neck seemed between forty and fifty, and Ch'il-sŏng could instantly tell that he was a cripple and a beggar like himself. The man grinned. He did not feel like going in, but entered after some hesitation. With a strong smell of rice husks came also the stink of horse droppings.

"Come to this side . . . Oh, your clothes are all wet."

The man stood on his crutches, spread the straw mat he had been sitting on, and sat down on one corner of it. Ch'il-sŏng quickly noted the man's gray hair and beard. He feared that the man might try to take away his earnings.

"You must be cold because of those wet clothes. You put on my old clothes and take them off and dry them." The man searched his bundle and said, "Here it is. Come here."

Ch'il-sŏng looked back. It was a dark western jacket patched in several places. He envied him such a good garment and looked directly in his smiling eyes. He did not look like a man who would try to snatch away other beggars earnings. Ch'il-sŏng dropped his glance and looked at the water dripping from his sleeves. The man walked toward him, leaning on his crutch.

"Why are you standing there like that? Put this on."

"Oh, no." Ch'il-sŏng stepped back one step and looked at the western jacket. His heart throbbed before a garment the like of which he had never worn in his life.

"Oh, aren't you a stubborn fellow! Then come here and sit on this mat." The man led him by the hand and made him sit on the straw mat. The man pretended not to notice Ch'il-sŏng's twisted legs. . . .

"Are you a born cripple?" the man suddenly asked. Ch'il-sŏng bowed his head and, after much hesitation, answered, "No."

"Then it was because of an illness. Did you get any treatment?"

Ch'il-sŏng looked long at his legs again, hesitating. At last he muttered: "No. None at all."

"Ugh, in this world sound legs get broken. It's no surprise not to get treatment for sicknesses."

The man laughed into void. The laughter made Ch'il-sŏng shudder. He glanced at the man. As he looked out at the road with fiercely dilated eyes, blue veins stood out on the man's forehead and his lips were tightly shut.

"Oh, I curse myself to think how stupid I was! I should have fought till death! What a damned stupid fool I was." . . .

"Listen fellow. I was head of a family once. I was a model worker in a factory, too. A first-rate engineer . . . After my leg was broken I was fired from the factory, and my woman ran away and the kids cried from hunger. . . . My parents died of sorrow. Oh, there's no use telling it."

The man stared at Ch'il-sŏng. Ch'il-sŏng's heart throbbed for some reason and he could not face the man's glance, so he looked at his broken leg, and at the mute bovine earth beneath that leg. . . .

"Oh, ours will all be swept away now! Our field can't escape being flooded when K'ŏnnyon's field got swept away. . . . Oh, K'ŏnnyon's lucky she doesn't have to live through this. She got married yesterday."

"What?" Ch'il-sŏng screamed. The precious material stored in his bosom struck his skin like a rock. His mother, startled, looked at her son.

"Mom, look at that!" Ch'il-un jumped up and groaned. They all looked. The cloth wrapped round the baby's head was about half torn off and maggots big as rice grains were crawling out of it.

"Oh, God! What has happened? What has happened!" His mother went over to the baby and snatched away the cloth. The rat skin came away at that, and from it dropped hordes of maggots bathed in blood.

"Baby! My baby! Wake up! Oh, wake up!" Hearing his mother's scream, Ch'il-sŏng ran outside frantically. The rain poured down fiercely and the gale blew like mad, and the sky, torn mercilessly by the lightning, wailed with thunder. Ch'il-sŏng glared at the sky.

National Socialist Propaganda, *Volk und Rasse* (1936)

The National Socialist propaganda machine got up to speed in the 1930s as the German population was infiltrated with eugenic ideology. The German people were supposed to consider their family planning and reproduction as entirely in the service of creating a healthy, national body. The following is an example from the monthly newsletter, Volk und Rasse ["Nation and Race"].

"Healthy marriage is a national duty."

"The nation has the duty to return consecration to the institution of marriage, which is appointed the task of conceiving images of God and not freaks between man and ape."

Japanese Schools for the Physically and Mentally Handicapped (1937)

The following excerpt about the history of schools for students with physical and sensory disabilities is taken from a book written in 1937 about the educational history of Japan. The discussion demonstrates the country's commitment to schooling disabled children but also the common practice of educating them in separate facilities. The discussion ends with a critique of nonsystematic education for students with cognitive disabilities.

The Imperial Ordinance relating to schools for the blind, deaf and dumb makes it compulsory for each prefecture and the Hokkaido to establish at least one school of each class of the afflicted. Further, permission is given to cities, towns and villages, or to private persons, to found schools for the blind, deaf and dumb. At the present time in Japan there are two government institutions of this type, one the Tokyo School for the Blind and the other the Tokyo School for the Deaf and Dumb. Both are under the immediate control of the Department of Education. In addition, there are twenty-nine public schools for such afflicted persons, and forty-two private schools. The discrepancy between the number of public schools is explained by the fact that the government rules permit prefectures to adopt schools established by private individuals or by cities or towns as prefectural schools, and advantage has been taken of this regulation by a number of prefectures.

Schools of this type generally consist of two departments, the elementary and the middle grade, although in some schools permission is granted to dispense with either department. To be admitted to the elementary department of any school for the blind, or the deaf and dumb, candidates must be over six years of age. For admission to the middle grade department they must have completed the elementary training or give proof of an equivalent standard.

In the schools for the blind the curriculum in general emphasizes such subjects as music, acupuncture and massage. Teaching by the Braille method is not so advanced as in the West. But there is a system adapted by a Japanese teacher, and based on the Braille, by which the blind are taught to read. For the most part, however, blind Japanese students are taught by ear and memory-training. Throughout the whole period of Japanese history, massage, which plays so large a part in the therapeutics of the country, has been looked upon as an art particularly suited to the blind. This traditional attitude is still maintained, so that the schools for the blind offer a first-class training in massage.

The annual number of applicants for admission to the Tokyo School for the Blind is about 125, of whom approximately 60 are admitted. The subsequent careers of the graduates from this school, to take a typical year, are as follows:

Teachers	14
Engaged in acupuncture and massage	6
Hospital workers	2
Further study	10
Others	2

The schools for the deaf and dumb are similarly divided into two departments, providing an elementary and a middle course. The ordinary curriculum is confined very largely to drawing, sewing and the industrial arts. Some success has been achieved in teaching articulation and lip-reading, for which purpose the most modern Western methods have been introduced into a few schools, which have thereby trained instructors for other schools.

The Tokyo School for Deaf-mutes has in the neighbourhood of 130 applicants each year, but of these only about 90 are admitted.

Unfortunately, there is as yet in Japan no well-arranged system of training mentally defectives. Their education in separate classes is carried on experimentally in a few schools, thanks to the initiative of the local authorities. There is, however, no properly organized public system designed to provide the care and training that could so well be utilized by this unfortunate type, which for the most part are left to the care, or otherwise, of their families.

In The Story of Alexander Graham Bell, *the inventor of the telephone, whose mother is deaf, marries a woman who is deaf as well. The film depicts Bell as heroic in his efforts to assist individuals with hearing and speech impairments to communicate.*

John Steinbeck, from *Of Mice and Men* (1937)

Steinbeck plays with the stereotype of the well-meaning but dangerous idiot. Lennie is attracted to beautiful things but destroys them, turning the world against him and his brother, George. George is his brother's keeper, but the job seems too hard to bear when that brother is mentally disabled.

Lennie went behind the tree and brought out a litter of dried leaves and twigs. He threw them in a heap on the old ash pile and went back for more and more. It was almost night now. A dove's wings whistled over the water. George walked to the fire pile and lighted the dry leaves. The flame cracked up among the twigs and fell to work. George undid his bindle and brought out three cans of beans. He stood them about the fire, close in against the blaze, but not quite touching the flame.

"There's enough beans for four men," George said.

Lennie watched him from over the fire. He said patiently, "I like ‘em with ketchup."

"Well, we ain't got any," George exploded. "Whatever we aint' got, that's what you want. God a'mighty, if I was alone I could live so easy. I could go get a job an' work, an' no trouble. No mess at all, and when the end of the month come I could take my fifty bucks and go into town and get whatever I want. Why, I could stay in a cat house all night. I could eat any place I want, hotel or any place, and order any damn thing I could think of. An' I could do all that every damn month. Get a gallon of whisky, or set in a pool room and play cards or shoot pool." Lennie knelt and looked over the fire at the angry George. And Lennie's face was drawn with terror. "An' whatta I got," George went on furiously. "I got you! You can't keep a job and you lose me ever' job I get. Jus' keep me shovin' all over the country all the time. An' that ain't the worst. You get in trouble. You do bad things and I got to get you out." His voice rose nearly to a shout. "You crazy son-of-a-bitch. You keep me in hot water all the time." He took on the elaborate manner of little girls when they are mimicking one another. "Jus' wanted to feel that girl's dress—jus' wanted to pet it like it was a mouse—Well, how the hell did she know you jus' wanted to feel her dress? She jerks back and you hold on like it was a mouse. She yells and we got to hide in a irrigation ditch all day with guys lookin' for us, and we got to sneak out in the dark and get outta the country. All the time somethin' like that—all the time. I wisht I could put you in a cage with about a million mice an' let you have fun." His anger left him suddenly. He looked across the fire at Lennie's anguished face, and then he looked ashamedly at the flames.

It was quite dark now, but the fire lighted the trunks of the trees and the curving branches overhead. Lennie crawled slowly and cautiously around the fire until he was close to George. He sat back on his heels. George turned the bean cans so that another side faced the fire. He pretended to be unaware of Lennie so close beside him.

"George," very softly. No answer. "George!"

"Whatta you want?"

"I was only foolin,' George. I don't want no ketchup. I wouldn't eat no ketchup if it was right here beside me."

"If it was here, you could have some."

"But I wouldn't eat none. George. I'd leave it all for you. You could cover the beans with it and I wouldn't touch none of it."

George still stared morosely at the fire. "When I think of the swell time I could have without you, I go nuts. I never get no peace."

Lennie still knelt. He looked off into the darkness across the river. "George, you want I should go away and leave you alone?"

"Where the hell could you go?"

"Well, I could. I could go off in the hills there. Some place I'd find a cave."

Social Security Report on Disability Insurance (1938)

The report demonstrates the degree of U.S. government resistance to efforts to adjust the Social Security Act in order to include permanent disability within its provisions.

The Board recognizes that the administrative problems involved are difficult, although it does not believe them insuperable. It also recognizes that provision for permanent total disability would increase the cost of the system both now and in the future. For these reasons it is not making any positive recommendations on this matter at this time.

Public Speech by the Bishop of Munster (1941)

This sermon, delivered August 3, 1941, by Cardinal August Count von Galen, Bishop of Munster, came as a bombshell. Thousands of copies were printed and circulated. Nazi leaders were furious but helpless to prohibit the critique without fueling public opposition.

Fellow Christians! In the pastoral letter of the German Bishops of 26 June 1941, which was read out in all the Catholic churches in Germany on 6 July, 1941, it states among other things: It is true that there are definite commandments in Catholic moral doctrine which are no longer applicable if their fulfillment involves too many difficulties. However, there are sacred obligations of conscience from which no one has the power to release us and which we must fulfill even if it costs us our lives. Never under any circumstances may a human being kill an innocent person apart from war and legitimate self-defence. On 6 July, I already had cause to add to the pastoral letter the following explanation: for some months we have been hearing reports that, on the orders of Berlin, patients from mental asylums who have been ill for a long time and may appear incurable, are being compulsorily removed. Then, after a short time, the relatives are regularly informed that the corpse has been burnt and the ashes can be delivered. There is a general suspicion verging on certainty, that these numerous unexpected deaths of mentally ill people do not occur of themselves but are deliberately brought about, that the doctrine is being followed, according to which one may destroy so-called 'worthless life' that is kill innocent people if one considers that their lives are of no further value to the nation and the state.

I am reliably informed that lists are also being drawn up in the asylums of the province of Westphalia as well of those patients who are to be taken away as so called 'unproductive national comrades' and shortly to be killed. The first transport left the Marienthal institution near Munster during this past week.

German men and women §211 of the Reich Penal Code is still valid. It states: 'he who deliberately kills another person will be punished by death for murder if the killing is premeditated.'

Those patients who are destined to be killed are transported away from home to a distant asylum presumably in order to protect those who deliberately kill those poor people, members of our families, from this legal punishment. Some illnesses are then given the cause of death. Since the corpse has been burnt straight away the relatives and also the criminal police are unable to establish whether the illness really occurred and what the cause of death was. However, I have been assured that the Reich Interior Ministry and the office of the Reich Doctor's Leader, Dr. Conti, make no bones about the fact that in reality a large number of mentally ill people in Germany have been deliberately killed and more will be killed in the future.

Autopsy area where murdered disabled inmates with gold teeth or "unusual" anatomies were studied after the gassing. The autopsy table itself continued to be used into the 1970s by occupational and physical therapists for stretching exercises into the 1970s. Today the site exists as memorial to the victims of National Socialist medical violence during World War II.

Source: Photo by Sharon Snyder.

The Penal Code lays down in §139: 'he who receives credible information concerning the intention to commit a crime against life and neglects to alert authorities or the person who is threatened in time will be punished.' When I learnt of the intention to transport patients from Marienthal in order to kill them, I brought a formal charge at the State Court in Munster and with the Police President in Munster by means of a registered letter which reads as follows: 'According to information which I have received, in the course of this week a large number of patients from the Marienthal Provincial Asylum near Munster are to be transported to the Eighberg asylum so-called "unproductive national comrades" and will then be soon deliberately killed, as is generally believed has occurred with such transports from other asylums. Since such an action is not only contrary to the moral laws of God and Nature but is also punishable by death as murder under §211 of the Penal Code, I hereby bring a charge in accordance with my duty under §139 of the Penal Code, and request you to provide immediate protection for national comrades threatened in this way by taking action against those agencies who are intending the removal and murder, and that you inform me of the steps that have been taken.' I have received no news concerning intervention by the Prosecutor's Office or by the police. . . .

Thus we must assume that the poor helpless patients will soon be killed. For what reason? Not because they have committed a crime worthy of death. Not because they attacked their nurses or orderlies so that the latter had no other choice but to use legitimate force to defend their lives against their attackers. Those are cases where, in addition to the killing of an armed enemy in a just war, the use of force to the point of killing is allowed and is often required. No, it is not for such reasons that these unfortunate patients must die but rather because, in the opinion of some department, or the testimony of some commission, they have become 'worthless life' because according to this testimony they are 'unproductive national comrades.' The argument goes: they can no longer produce commodities, they are like an old machine which no longer works, they are like an old horse which has become incurably lame, they are like a cow which no longer gives milk. What does one do with such an old machine? It is thrown on the scrap heap. What does one do with a lame horse, with such an unproductive cow? No, I do not want to continue the comparison until the end—however fearful the justification for it and the symbolic force of it are. We are not dealing with machines, horses and cows whose only function is to serve mankind, to produce goods for man. One may smash them, one may slaughter them as soon as they no longer fulfill this function. No, we are dealing with human beings, our fellow human beings, our brothers and sisters. With poor people, sick people, if you like unproductive people. But have they for that reason forfeited the right to life? Have you, have I the right to live only so long as we are productive, so long as we are recognised by others as productive? If you establish and apply the principle that you can kill 'unproductive' fellow human beings then woe betide us all when we become old and frail! If one is allowed to kill the 'unproductive' people then woe betide the invalids who have used up, sacrificed and lost their health and strength in the productive process. If one is allowed forcibly to remove one's unproductive fellow human beings then woe betide loyal soldiers who return to the homeland seriously disabled, as cripples, as invalids. If it is once accepted that people have the right to kill 'unproductive' fellow humans—and even initially if it only affects the poor defenceless mentally ill—then as a *matter of principle* murder is permitted for all unproductive people, in other words for the incurably sick, the people who have become invalids through labor and war, for us all when we become old, frail, and therefore unproductive.

Then, it is only necessary for some secret edict in order that the method developed for the mentally ill should be extended to other 'unproductive' people, that it should be applied to those suffering from incurable lung disease, to the elderly who are frail or invalids, to the severely disabled soldiers. Then none of our lives will be safe any more. Some commission can put us on the list of the 'unproductive,' who in their opinion have become worthless life. And no police force will protect us and no court will investigate our murder and give the murderer the punishment he deserves. Who will be able to trust his doctor any more? He may report the patient as 'unproductive' and receive instructions to kill him. It is impossible to imagine the degree of moral depravity, of general mistrust that would then spread even through families if this dreadful doctrine is tolerated, accepted, and followed. Woe to mankind, woe to our German nation if God's holy commandment 'Thou shalt not kill,' which God proclaimed on Mount Sinai amidst thunder and lightning, which God our Creator inscribed in the conscience of mankind from the very beginning, is not only broken, but if this transgression is actually tolerated and permitted to go unpunished.

I'll give you an example of what is going on. In Marienthal there was a man of about 55, a peasant from a rural parish in the Munster area—I could give you his name—who for some years had been suffering from mental disturbance and who had therefore been put in the care of the Marienthal asylum. He was not really mentally ill, he could receive visitors and was very pleased whenever his relatives came to see him. Only a fortnight ago, he received a visit from his wife and from one of his sons who is a soldier at the front and had home leave. So the farewell was a sad one: who knows if the soldier will return, will see his father again, for after all he may die in the struggle on behalf of his national comrades. The son, the soldier, will almost certainly never see his father again here on earth because since then he has been put on the list of the 'unproductive.' A relative who wanted to visit the father in Marienthal last week was turned away with the news that the patient has been transported away from here on the orders of the Ministerial Council for the Defence of the Reich. Nobody could say where to: the relatives would be informed in a few days time. What will the news be? Will it be the same as in other cases? That the person had died, that the corpse had been burnt, that the ashes can be delivered after payment of a fee? In that case, the soldier who is at the front risking his life for his German national comrades, will not see his father again here on earth because German national comrades at home have killed him . . .

Katharine Butler Hathaway, from *The Little Locksmith* (1943)

The Little Locksmith is an extraordinary autobiography written by a woman who spent 10 years of her life strapped to a board in an unsuccessful attempt to prevent curvature of the back from a spinal tumor. The first excerpt included here discusses her transition from a carefree childhood to a "bedridden" and contemplative existence. During the course of the story, she changes from a child repulsed by the hunchbacked figure of a local locksmith to one who longs to find a house best fitted to her life as a disabled woman.

This is the story of such transformations, both large and small, and now in the beginning I will tell the nature of the predicament which first made this kind of magic dear to me—the predicament and the magic together which made necessary and possible at last my visit to the almond-shaped island which lay in the palm of my right hand. For of course, without a predicament, there is no need of magic.

When I was five years old I was changed from a rushing, laughing child into a bedridden, meditative one. As the years passed, my mother explained to me just what had happened, and why I had to be so still. She told me how lucky I was that my parents were able to have me taken care of by a famous doctor. Because, without the treatment I was having, I would have had to grow up into a—well, I would have had to be, when I grew up, like the little locksmith who used to come to our house once in a while to fix locks. I knew the little locksmith, and after this, when he came, I stared at him with a very strange intimate feeling. He never looked back at me. His eyes were always down at what he was doing, and he apparently did not want to talk with or look at anybody. He was very fascinating indeed. He was not big enough to be considered a man, yet he was not a child. In the back his coat hung down from an enormous sort of peak, where the cloth was worn and shiny, between his shoulders, and he walked with a sort of bobbing motion. In front his chin was almost down on his chest, his hands were long, narrow, and delicate, and his fingers were much cleverer than most people's fingers. There was something about him, something that was indescribably alluring to a child. Because he was more like a gnome than a human being he naturally seemed to belong to our world more than to the grown-up world. Yet he seemed to refuse to belong to our world or anybody else's. He acted as if he lived all alone in a very private world of his own.

Somehow I knew that there was a special word that the grownups called a person shaped like the little locksmith, and I knew that to ordinary healthy grownups it was a terrible word. And the strange thing was that I, Katharine, the Butlers' darling little girl, had barely escaped that uncanny shape and that terrible word. Because I was being taken care of by a famous doctor nobody would ever guess, when I grew up, that I might have been just like the little locksmith.

Staring wonderingly at him, I knew it. I knew that compared with him I was wonderfully lucky and safe. Yet deep within me I had a feeling that underneath my luck and safeness the real truth was that I really belonged with him, even if it was never going to show. I was secretly linked with him, and I felt a strong, childish, amorous pity and desire toward him, so that there was even a queer erotic charm for me about his gray shabby clothes, the strange awful peak in his back, and his cross, unapproachable sadness which made him not look at other people, not even at me lying on my bed and staring sideways at him. (Pp. 14–15)

A house such as I was dreaming of would be only another example, I thought, of the easy magic of transformation by which one thing becomes its opposite. All that was needed, I thought, was a person bold and independent enough to undertake it. That person would need to be very bold indeed, because the process of transformation was so entirely a matter of faith and magic and simplicity that nobody would believe that it could be done until after it had been done. I thought for several reasons that I might be the bold person.

Sometimes a worm will sew a stitch in a young leaf, and even though the leaf may partly unfold, and partly grow and live, it will always be a crumpled and imperfect leaf. My body, like the leaf, represented that mysterious element of imperfection in Nature, which allows the worm to maim the leaf; I represented the flaw which exists side by side with a design which appears to be flawless. Because the worm had sewed a stitch in me and made me forever crumpled, I belonged to the fantastic company of the queer, the maimed, the unfit. It was understood that I could not play a part in the ordained dance of love, in obedience to the design. I was obliged, therefore, in a certain sense, to skip in my own life all the years and all the force and strength which other women gave to love and to the bearing of children. I was obliged to skip the years of sexual activity and become, while I was still young and joyous, the equivalent of an old woman, a detached, sexless, meditative observer. But I was too sympathetic and ardent to be a passive observer. I had to act in some way. I had to participate, myself, in the ritual of love and experience. With my belief in the magic of transformation and my belief in my own power to exert it, I suddenly knew that I was the suitable bold person, the little, old, young crumpled person who could accomplish, if anyone could, this amazing project. I saw myself as the potent little figure, not old and not young, conspicuously lacking in size and in beauty, who appears and reappears in all folk tales as the good godmother, the talismangiver, the magic-bringer, who inevitably comes to the rescue of young people who are much bigger and more beautiful than she is, yet who get themselves entangled in their life-size and more than life-size human troubles and are weak and helpless until that familiar little nonhuman figure arrives on the scene. I knew that my destiny would reach its mark if I could work this unheard-of transformation and make my house the place of refuge and solace I had been dreaming of. I sat on my doorstep in Castine in the still autumn sunlight, and I began to be quite astonished and a little appalled by the things that I found myself thinking. But I did not let that scare me. For my third wish I wrote in my imagination across the panel under the mantelpiece in the square room behind me the last two lines of Shelley's Epipsychidion. "Come, leave the crowd which errs and which reproves, And come and be my guest, for I am Love's."

I wrote them only in my imagination, but in my imagination they were always there, as long as the house belonged to me—the invitation which I wanted to give to all the people in the world who needed it. I might have written beside it, "Unto the pure all things are pure; but unto them that are defiled and unbelieving is nothing pure"; but it seemed to me it came to the same thing.

I wanted my house, then, to be a safe refuge for three kinds of people, who are all alike in being at a particular disadvantage in the outside world because they all possess and are guided by the mystic's innocence toward life, the fearless innocence which is not afraid of facing everything, and, facing everything, dares to believe, as Blake says, that all that is, is holy. My feeling of affinity toward that fundamental kind of innocence was the basis of each of my three wishes concerning the future of the house. It was the essential attitude which I wanted my house to prove possible and to defend. (Pp. 199–201)

▣ "N-P": The Case of Neuropsychiatric Disability (1944)

The program of aggressive normalization remained in force throughout the twentieth century and was improved and expanded on in numerous ways, especially as new understandings of disability and new conditions of war demanded. One particularly significant area of transformation was in the provision of psychological services, especially to those sustaining neuropsychiatric disabilities, which were as old as warfare itself, but largely misunderstood until the twentieth century as evidence of cowardice and malingering. Through preinduction testing, some armed forces tried to weed out men unlikely to have the emotional stability to serve under wartime conditions, but the greater the manpower needs, the more such standards were relaxed, and the more the armed services needed to be able to provide psychological treatment.

Every month thousands of men return home from preinduction examinations or from the U.S. Army with N-P stamped on their medical records. N-P (neuropsychiatric) sometimes means insane but usually means psychoneurotic. What psychoneurotic means, few laymen know. Most psychoneurotics do not know either. Many of them think they are insane or soon will be. So do family and neighbors who look askance, and employers who sometimes refuse jobs. (Last week the Army changed its N-P stamp to read "Unsuited for military service.") Because few N-Ps discuss their plight, few people realize how many there are.

But last week 2,000 psychiatrists at the 100th meeting of the American Psychiatric Association heard some startling figures from the Army's Colonel William Clare Menninger (brother of famed Psychiatrist Karl Menninger). Since Pearl Harbor the Army has turned down 1,340,000 men for neuropsychiatric causes, has discharged 216,000. These figures would be even higher if the men in Army neuropsychiatric wards were included.

Most practical report on the N-P problem was made to the meeting by New York Hospital's white-haired, 40-year-old Dr. Thomas Alexander Cumming Rennie. Dr. Rennie realized that discharged and deflected N-Ps need psychiatric care, without it might develop real mental illness. He also realized that there was no place where they could get such help. So last August he started a psychiatric clinic at the hospital, manned one night a week by twelve psychiatrists, a psychologist, seven social workers. The clinic gives psychiatric interviews, group treatment, occupational therapy, arranges social gatherings, dates, helps men get jobs.

Dr. Rennie told last week's meeting that the clinic has definitely proved its value to N-Ps. Of its 200 patients (about one-third from the Army, only 14 actual combat veterans) 104 are improved (some became perfectly well after only one one-hour psychiatric interview), many are still under treatment: a very few had to be sent to mental hospitals. (Some of these have since been discharged, now hold jobs.)

New York City already has six such psychiatric clinics; Boston has four, and there are a few others. But Dr. Rennie will not be satisfied until all available psychiatrists are helping in such clinics. Even so most of the cases would go untended—the U.S. has only about 3,000 psychiatrists altogether, of whom 800 are at war.

Gwendolyn Brooks, from *A Street in Bronzeville* (1945)

This poem provides reflections on heaven from the perspective of a physically disabled African American girl. The poem focuses on locating a "straight" environment that will better accommodate and accept the speaker's differences.

hunchback girl: she thinks of heaven

My Father, it is surely a blue place
And straight. Right. Regular. Where I shall find
No need for scholarly nonchalance or looks
A little to the left or guards upon the
Heart to halt love that runs without crookedness
Along its crooked corridors. My Father,
It is a planned place surely. Out of coils,
Unscrewed, released, no more to be marvelous,
I shall walk straightly through most proper halls
Proper myself, princess of properness.

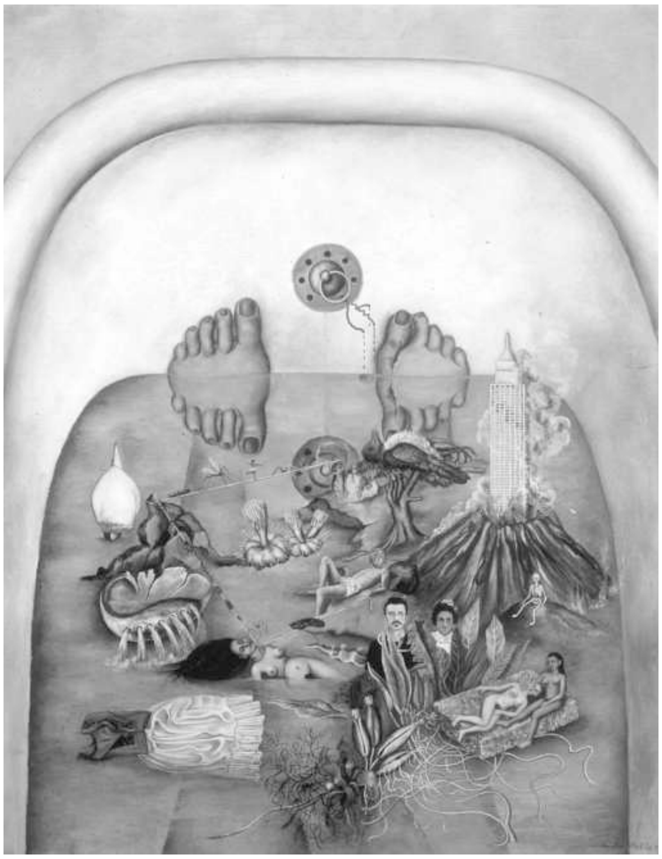
Frida Kahlo (1907–1954)

Frida Kahlo constructed images of a disabled female body out of seemingly disparate pieces. Her work interweaves traditional Mexican votive painting, technical images of the body that emerged from modern medical science (x-rays, surgical implements, hospital experience), and Christian iconography of redemption through physical suffering. In this way, she rendered an entirely new view of personal experience. Kahlo is among the first, and perhaps the most daring, to render a portrait of transparent, explicit, literalized bodily trauma. Prior to her work, pain was shown through the gestures of agony (e.g., scenes of crucifixion or martyrdom, as in the work of Käthe Kollwitz or Picasso's *Guernica*) or explicit gore (e.g., battle scenes, beheadings by Salome or Judith, any number of mythological illustrations).

Kahlo's work is particularly of interest to disability studies not only for the autobiographical renditions of her injuries, illnesses, and surgeries, but also because of the nature of the body she invents. Often the interior of the body is visible and continuous with the exterior in a kind of psychic Möbius strip. In works such as *The Broken Column, The Two Fridas, Roots, The Tree of Hope,* and *Without Hopes,* there is no clear division between inner reality and outer appearance, and thus the unsharable nature of individual pain becomes explicit. By the 1930s, x-ray technology had been in public use for some time, ending the concept of the opaque body, and public hospitals had also been established as places of collective community experience. Kahlo demolishes the idea of the body in pain as a shameful or hidden object. Her body is offered up in many contexts, but her pain imagery is never separate from her life at large, and her pain is never represented as a different sphere of experience



What the Water Gave Me *(1938), by Frida Kahlo (1907–1954). Frida's body is both intimately present and hidden, while the water of her private bathtub transforms into the river of life. She contemplates the flow of her history as images of her family, her European and Mexican heritage, and intense love relationships emerge from the reflecting pool of the self.*

Source: Art Resource, New York.

Without Hopes *(1945), by Frida Kahlo (1907–1954). The painting depicts a postsurgery Frida vomiting her insides into a harsh, Aztec landscape. Fears of internal decay, the seeds of death, and the rotten remains of still-life objects erupt and seem to be a truer representation of her body than the hidden form under the infected blanket.*

Source: Art Resource, New York.

in kind or degree. Her illnesses are fully in context of the rest of her life. The examinations of marriage, sexuality, cultural patrimony, and family are in the same visual iconographies as those of disability.

Her paintings must also be seen in the context of the traditional image of the female body as a mysterious, irrational, and secretive vessel. The baring of her body inside and out is more transgressive than a simple nude self-portrait. Her body is small and doll-like. It appears as a toy in the thrall of immense forces, not as a mythic goddess-like being. In embedding the matter-of-fact details of her medical experiences within a highly emotional language, she both demystifies disability and presents it outside of the context of the casebook (again, she may be the first to do this). To open oneself to a Kahlo painting is to feel the vulnerability of one's own body and to immediately experience its transcendence through art.

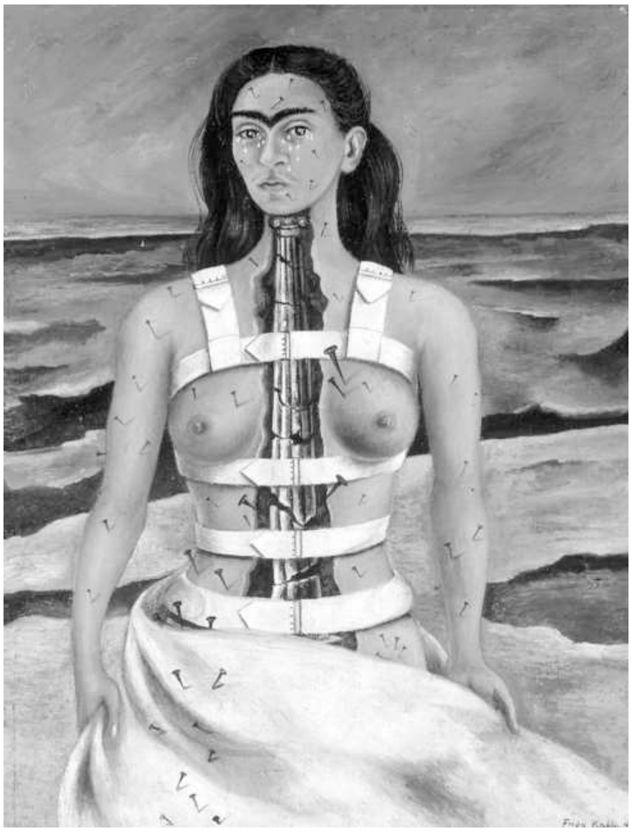
Another aspect of disability is the mutability of her body (a factor of chronic but unpredictable illness), symbolized in her portrayals of her body in partial transmutation with animals, partners, or the natural world in general. One could view her deep pairing with monkeys, with Diego, with the Little Deer, and with her doubled self as a reflection of the way that disabled people must often render all control or custody over their bodies. A kind of permeability arises, a thinning of boundaries that enables her to see herself as an amalgam of parts. History, love, and culture build her self-portraits. She depicts herself or others in isolation only when in a state of deep emotional pain and despair (*Self-Portrait with Cropped Hair, Suicide of Dorothy Hale*).

Disability is often imagined as a state of weakness and withdrawal. Frida Kahlo gives us a world in which pain becomes a fire in the machine, a state of wild ferocity, a disrobing to reveal a body in full communion.

—Riva Lehrer

The Two Fridas *(1939), by Frida Kahlo (1907–1954). Kahlo painted this immediately after her divorce from Diego Rivera. Reminiscent of a wedding portrait, one Frida (in traditional Mexican Tehuna dress) comforts an injured and bleeding Frida (in Victorian gown). In nurturing her discarded self, she also seems to marry her disabled self, equating the states of emotional and physical pain.*

Source: Art Resource, New York.



The Broken Column *(1944), by Frida Kahlo (1907–1954). The most explicit image in her canon of work, this painting fully exposes the nature of Kahlo's injury and gives no hint of the possibility of relief inside or outside her body. It is a brilliant rendering of the way in which illness can cause the entire world to seem bleak and hostile to the body in pain.*

Culture and Resistance
1946–Present

▣ William Carlos Williams, from *Paterson* (1946)

The American imagist poet-physician William Carlos Williams quotes from a lengthy newspaper account of a visit to "a natural curiosity" as a metaphor for humanity as a monstrous exhibit.

A gentleman of the Revolutionary Army, after describing the Falls, thus describes another natural curiosity then existing in the community: "In the afternoon we were invited to visit another curiosity then existing in the neighborhood. This is a monster in human form, he is twenty-seven years old, his face from the upper part of his forehead to the end of his chin, measures *twenty-seven inches,* and around the upper part of his head is twenty-one inches: his eyes and nose are remarkably large and prominent, chin long and pointed. His features are coarse, irregular and disgusting, his voice rough and sonorous. His body is twenty-seven inches in length, his limbs are small and much deformed, and he has the use of one hand only. He has never been able to sit up, as he cannot support the enormous weight of his head; but he is constantly in a large cradle, with his head supported in pillows. He is visited by great numbers of people, and is peculiarly fond of the company of clergymen, always inquiring for them among his visitors, and taking great pleasure in receiving religious instruction. General Washington made him a visit, and asked 'whether he was a Whig or a Tory.' He replied that he had never taken an *active* part on either side."

▣ Ann Petry, from *The Street* (1946)

One of the great works of African American literature, Ann Petry's The Street *documents the corrupt systems of economic inequity and food distribution that undermine the community's health and well-being. In the second excerpt, the story describes the physically massive and largely immobile body of Mrs. Hedges, who functions in the novel as a moral center.*

She thought about the stores again. All of them—the butcher shops, the notion stores, the vegetable stands—all of them sold leavings, the sweepings, the impossible unsalable merchandise, the dregs and dross that were reserved especially for Harlem.

Yet the people went on living and reproducing in spite of the bad food. Most of the children had straight bones, strong white teeth. But it couldn't go on like that. Even the strongest heritage would one day run out. Bub was healthy, sturdy, strong, but he couldn't remain that way living here. (P. 153)

In the middle of the block there was a sudden thrust of raw, brilliant light where the unshaded bulbs in the big poolroom reached out and pushed back the darkness. A group of men stood outside its windows watching the games going on inside. Their heads were silhouetted against the light.

Lutie, walking quickly through the block, glanced at them and then at the women coming toward her from Eighth Avenue. The women moved slowly. Their shoulders sagged from the weight of the heavy shopping bags they carried. And she thought, That's what's wrong. We don't have time enough or money enough to live like other people because the women have to work until they become drudges and the men stand by idle.

She made an impatient movement of her shoulders. She had no way of knowing that at fifty she wouldn't be misshapen, walking on the sides of her shoes because her feet hurt so badly; getting dressed up for church on Sunday and spending the rest of the week slaving in somebody's kitchen.

It could happen. Only she was going to stake out a piece of life for herself. She had come this far poor and black and shut out as though a door had been slammed in her face. Well, she would shove it open; she would beat and bang on it and push against it and use a chisel in order to get it open. (Pp. 185–186)

Lutie's mouth closed. She had never seen Mrs. Hedges outside of her apartment and looked at closely she was awe-inspiring. She was almost as tall as the Super, but where he was thin, gaunt, she was all hard, firm flesh—a mountain of a woman.

She was wearing a long-sleeved, high-necked flannelette nightgown. It was so snowy white that her skin showed up intensely black by contrast. She was barefooted. Her hands, her feet, and what could be seen of her legs were a mass of scars—terrible scars. The flesh was drawn and shiny where it had apparently tightened in the process of healing.

The big white nightgown was so amply cut that, despite the bulk of her body, it had a balloon-like quality, for it billowed about her as she stood panting slightly from her exertion, her hands on her hips, her hard, baleful eyes fixed on the Super. The gaudy bandanna was even now tied around her head in firm, tight knots so that no vestige of hair showed. And watching the wide, full nightgown as it moved gently from the draft in the hall, Lutie thought Mrs. Hedges had the appearance of a creature that had strayed from some other planet.

Her rich, pleasant voice filled the hallway, and at the sound of it the dog slunk away, his tail between his legs. 'You done lived in basements so long you ain't human no more. You got mould growin' on you,' she said to Jones.

Lutie walked away from them, intent on getting up the stairs as quickly as possible. Her legs refused to carry her and she sat down suddenly on the bottom step. The long taffeta skirt dragged on the tiled floor. Bits of tobacco, the fine grit from the street, puffed out from under it. She made no effort to pick it up. She put her head on her knees, wondering how she was going to get the strength to climb the stairs.

'Ever you even look at that girl again, I'll have you locked up. You oughtta be locked up, anyway,' Mrs. Hedges said.

She scowled at him ferociously and turned away to touch Lutie on the shoulder and help her to her feet. 'You come sit in my apartment for a while till you get yourself back together again, dearie.'

She thrust the door of her apartment open with a powerful hand, put Lutie in a chair in the kitchen. 'I'll be right back. You just set here and I'll make you a cup of tea. You'll feel better.'

The Super was about to go into his apartment when Mrs. Hedges returned to the hall. 'I just wanted to tell you for your own good, dearie, that it's Mr. Junto who's interested in Mis' Johnson. And I ain't goin' to tell you again to keep your hands off,' she said.

'Ah, shit!' he said vehemently.

Her eyes narrowed. 'You'd look awful nice cut down to a shorter size, dearie. And there's folks that's willin' to take on the job when anybody crosses up they plans.'

She stalked away from him and went into her own apartment, where she closed the door firmly behind her. In the kitchen she put a copper teakettle on the stove, placed cups and saucers on the table, and then carefully measured tea into a large brown teapot. Lutie, watching her as she walked barefooted across the bright-colored linoleum, thought that instead of tea she should have been concocting some witch's brew.

The tea was scalding hot and fragrant. As Lutie sipped it, she could feel some of the shuddering fear go out of her.

'You want another cup, dearie?'

'Yes, thank you.'

Lutie was well on the way to finishing the second cup before she became aware of how intently Mrs. Hedges was studying her, staring at the long evening skirt, the short coat. Again and again Mrs. Hedges' eyes would stray to the curls on top of Lutie's head. She should feel grateful to Mrs. Hedges. And she did. But her eyes were like stones that had been polished. There was no emotion, no feeling in them, nothing visible but shiny, smooth surface. It would never be possible to develop any real liking for her.

'You been to a dance, dearie?'

'Yes. At the Casino.'

Mrs. Hedges put her teacup down gently. 'Young folks has to dance,' she said. 'Listen, dearie,' she went on. 'About tonight'—she indicated the hall outside with a backward motion of her head. 'You don't have to worry none about the Super bothering you no more. He ain't even going to look at you again.'

'How do you know?'

'Because I scared him so he's going to jump from his own shadow from now on.' Her voice had a purring quality.

Lutie thought, You're right, he won't bother me any more. Because tomorrow night she was going to find out from Boots what her salary would be and then she would move out of this house.

'He ain't really responsible,' Mrs. Hedges continued. 'He's lived in cellars so long he's kind of cellar crazy.'

'Other people have lived in cellars and it didn't set them crazy.'

'Folks differs, dearie. They differs a lot. Some can stand things that others can't. There's never no way of knowin' how much they can stand.'

Lutie put the teacup down on the table. Her legs felt stronger and she stood up. She could get up the stairs all right now. She put her hand on Mrs. Hedges' shoulder. The flesh under the flannel of the gown was hard. The muscles bulged. And she took her hand away, repelled by the contact.

'Thanks for the tea,' she said. 'And I don't know what I would have done if you hadn't come out in the hall—' Her voice faltered at the thought of being pulled down the cellar stairs, down to the furnace room—

'It's all right, dearie.' Mrs. Hedges stared at her, her eyes unwinking. 'Don't forget what I told you about the white gentleman. Any time you want to earn a little extra money.'

Lutie turned away. 'Good night,' she said. She climbed the stairs slowly, holding on to the railing. Once she stopped and leaned against the wall, filled with a sick loathing of herself, wondering if there was something about her that subtly suggested to the Super that she would welcome his love-making, wondering if the same thing had led Mrs. Hedges to believe that she would leap at the opportunity to make money sleeping with white men, remembering the women at the Chandlers' who had looked at her and assumed she wanted their husbands. It took her a long time to reach the top floor.

Mrs. Hedges remained seated at her kitchen table, staring at the scars on her hands and thinking about Lutie Johnson. It had been a long time since she thought about the fire. But tonight, being so close to that girl for so long, studying her as she drank the hot tea and seeing the way her hair went softly up from her forehead, looking at her smooth, unscarred skin, and then watching her walk out through the door with the long skirt gently flowing in back of her, had made her think about it again—the smoke, the flame, the heat. (Pp. 237–241)

Murrogh De Burgh Nesbitt, from *The Road to Avalon* (1949)

In 1944, after 40 years of energetic life with physical disability, and having experience of counseling many South Africans with serious impairments, Murrogh Nesbitt sketched his dream of a rehabilitation center run by disabled people in a mountain setting that would enhance the self-healing process. Focusing initially on servicemen disabled in World War II, Nesbitt believed they needed more than surgical and medical interventions, more than aids and gadgets. They needed a time and context in which their spirits could heal. They needed the comradeship of active disabled people to prepare for the challenges ahead.

Disabled men do not want to be coddled. They must never be allowed to think that they have lost any of their potential manhood because of their disabilities.

I know that the real battle for the disabled men will begin when they face the world and have to earn their own living. The medical men and the surgeon have their place in the scheme when these men have to be treated for their wounds. The psychiatrist and psychologist have their places, but surely there is also room in rehabilitation schemes for the services of disabled men who have conquered all difficulties and have lived normal lives.

Disabled men have told me that I have changed their mental outlook. They have told me that when they have seen what I can do the urge comes to them to do likewise. They know that I have trekked out of the valley of shadows, that I have climbed mountains. I am not saying these things in a spirit of egoism. These are facts, and facts are worth all your tons of theory.

Source: Nesbitt, Murrogh De Burgh. 1949. P. 218 in *The Road to Avalon.* London: Hodder & Stoughton.

In the 1946 film The Best Years of Our Lives, *three men return from World War II to a small town in middle America and have varying degrees of success adjusting to postwar civilian life. The part of Homer Parrish, a Navy veteran who has lost both his hands, is played by nonprofessional actor Harold Russell. While serving as a demolitions instructor at a military base in North Carolina in 1944, Russell's hands were blown off in an accident involving a defective fuse. Ten days after his accident, he was transferred from the base hospital to the amputees' ward at Walter Reed General Hospital for advanced medical care. There, he was fitted for prosthetic replacements for his hands and given instruction in how to use them. His proficiency in their use was profiled in an army documentary, Diary of a Sergeant. For his role as Homer Parish, Russell received two Oscars: one for Best Supporting Actor and one for "bringing aid and comfort to disabled veterans." The film also received the Academy Award for Best Picture.*

Russell became an advocate for veterans and people with disabilities. He helped organize the World Veterans Federation and served as vice president of its World Veterans Fund, served three terms as the National Commander of the AMVETS, and was appointed chair of the President's Committee on Hiring the Handicapped by President Lyndon Johnson. He wrote two autobiographies, Victory in My Hands *(1949, with Victor Rosen) and* The Best Years of My Life *(1981, with Dan Ferullo). Russell died in 2002 at the age of 88.*

Anzia Yezierska, from Red *Ribbon on a White Horse* (1950)

One of 10 children who immigrated at age 15 from Russian Poland to New York City's Lower East Side, Yezierska's writing spoke eloquently to the plight of Yiddish immigrants, the poor, and aged. Yezierska had a significant visual impairment, and her daughter hired transcribers to allow her to continue writing after she became blind. This excerpt from her fictionalized autobiography details her childhood friendship with a disabled man.

Always whenever I saw Zalmon Shlomoh I would feel that I too was a cripple. It leaped out of my eyes like the guilt of secret sin, that devouring hunger in me. People ran away from it as from a deformity. Only Zalmon Shlomoh, the hunchback, could feel and see the wild wolves of that hunger and not be frightened away.

I wondered, as I recalled the days when Zalmon was my only friend, whether he was still alive. If I could reach him, would he be glad to see me? Dared I look him up, to find out? But I knew he could never forgive my becoming one of the bloody rich. I never would look him up.

I thought of the time Zalmon had come to see me with a newspaper package under his arm. In the secondhand shop he had picked up, for a dime, an old record of Beethoven's "Moonlight Sonata." Instead of talking, he turned on the record again and again, filling the small room with the melancholy tenderness of all the unspoken love in the world.

One night he had taken me to hear Caruso in Pagliacci. The grief of the clown reached up to us in the gallery. That glorious voice cried out the ache of our own unlived lives.

Even while we sat together, cousins in sorrow, I was affronted by Zalmon's fish smells. In his new suit he looked as incongruous as a dog in a praying shawl. His charm was great enough to make me forget the dwarfed deformity of his body, but his fish smells drove me away. I could smell them even now.

Josephine Miles, Poems (20th c.)

Josephine Miles (1911–1985), an award-winning poet who taught at the University of California at Berkeley during the mid-twentieth century, was the first woman ever to be tenured in the English Department there. Miles lived with severe rheumatoid arthritis and, in the absence of elevators and wheelchair-accessible entrances, had to be carried across campus and up stairs by male assistants.

Reason (1955)

Said, Pull her up a bit will you, Mac, I want to unload there.
Said, Pull her up my rear end, first come first serve.
Said, Give her the gun, But, he needs a taste of his own bumper.
Then the usher came out and got into the act.
Said, Pull her up, pull her up a bit, we need this space, sir.
Said, For God's sake, is this still a free country or what?
You go back and take care of Gary Cooper's horse
And leave me handle my own car.
Saw them unloading the lame old lady,
Ducked out under the wheel and gave her an elbow,
Said, all you needed to do was just explain;
Reason, Reason is my middle name.

Doll (1979)

Through the willows bent down to shelter us where we played
House in the sandy acres, though our dolls,
Especially Lillian, weathered all the action,
I kept getting so much earlier home to rest
That medical consultation led to cast
From head to toe. It was a surprise for my parents
And so for me also, and I railed
Flat out in the back seat on the long trip home
In which three tires blew on our trusty Mitchell.
Home, in a slight roughhouse of my brothers,
It turned out Lillian had been knocked to the floor and broken
Across the face. Good, said my mother
In her John Deweyan constructive way,
Now you and Lillian can be mended together.
We made a special trip to the doll hospital
To pick her up. But, They can't fix her after all, my father said,
You'll just have to tend her with her broken cheek.
I was very willing. We opened the box, and she lay
In shards mixed among tissue paper. Only her eyes
Set loose on a metal stick so they would open
And close, opened and closed, and I grew seasick.
A friend of the family sent me a kewpie doll.
Later Miss Babcox the sitter,
After many repetitious card games,
Said, We must talk about bad things.
Let me tell you
Some of the bad things I have known in my life.
She did not ask me mine, I could not have told her.
Among the bad things in my life, she said.
Have been many good people, good but without troubles;
Her various stories tended
To end with transmigrations of one sort or another,
Dishonest riches to honest poverty; kings and queens
To Indians over an adequate space and time.

In The Secret Garden, *an adaptation of Frances Hodgson Burnett's classic story, Margaret O'Brien stars as the orphan who transforms the lives of her embittered uncle and his bedridden son when she starts tending a garden on the grounds of their country mansion. The sobriety of black and white gives way to a blast of Technicolor.*

Source: *The Secret Garden* (1949), directed by Fred M. Wilcox. United Kingdom. B&W/color, 92 minutes. Reprinted by permission of Paul Darke.

Take this cat coming along here, she said,
A glossy black cat whom she fed her wages in salmon,
He is a wise one, about to become a person.
Come to think of it, possibly Lillian
Is about to become a cat.
She will have different eyes then, I said.
Obviously. Slanted, and what is more
Able to see in the dark.

Hah Keun-Chan, from "Ill-fated Father and Son" [*Sunan I'dae*] (1957)

The title "Ill-fated Father and Son" can also be translated as "The Sufferings of Two Generations." In the story, the father, Man-do, who lost his arm in World War II during his conscripted labor in the South Pacific, greets his son, Chin-su, who is returning from the Korean War with one leg. Hah Keun-Chan's works mostly deal with national tragedy such as war experience and the lives of the lower class.

Chin-su comes back alive; there is the lingering sad news that some have died in the war and some haven't heard whether or not their sons were killed! Oh my son Chin-su is still alive, he's coming back.

Thinking of it has made Mr. Pak Man-do climb to the top of Yongmaru hill in one breath; usually he would sit and rest once or twice in order to climb the hill. . . .

It was not hard to climb down the hill. As Man-do's only arm, his right, swung back and forth, his pace naturally began to quicken. The sleeve of his left arm was carelessly stuck in the pocket of his vest. My only son to be shot dead in the war was unimaginable! Of course he had to come back alive! But since he's coming back from a hospital, he must have been wounded slightly. But surely not like I was.

Man-do looked down at the sleeve stuck in the pocket of his vest. Nothing in it. It was merely a cloth cylinder without any left arm. The sleeve was always stuck in the pocket of his vest; it hung and swung from the left shoulder. Perhaps a bullet only slightly grazed Chin-su's calf or buttocks. If he was wounded so badly as to lose an arm like me, that cry baby surely couldn't put up with the pain. Inwardly worried about his son, Man-do muttered to himself. . . .

Squatting down at the edge of the brook, Man-do untied his belt, passed water, and felt better. Bubbles formed due to the urine on the mirror surface of the water, and a school of fishes swam up. There were some fish as big as your thumb.

I sure wish I could have a drink and some of those raw fish dipped in red pepper sauce. His mouth watered at the sight of the fish as he thought about a drink. But he blew his nose noisily and began to cross the log bridge carefully. . . .

He lit a cigarette. He never sat on a bench in the waiting room of the station without recalling a memory which always struck terror into his heart. His lost arm with fingers turned black and blue like a moss-clad log, seemed to lie heavily on his mind.

At that time there had been a crowd of over a hundred people in this station. Among them had been Man-do. Waiting for a train to carry them away, none of them had known their destination. They had been draftees pressed into service by the Japanese government-general; none of them had any choice but to get on the train; all of them like puppets had been manipulated by order of the Japanese.

Some of them had been told they would be sent to the coal-mines in Hokkaido and others had asserted that the islands of Southeast Asia would be their destination. There had been some people who said even Manchuria would be alright for them. Man-do, thinking that any place would be alright for him, [had] puffed out his cigarette smoke through the nostrils of his turned-up nose. . . .

When he had heard the train enter the vicinity, its sad warning whistle merged into his deep vast grief, . . . Man-do felt his eyes misty with tears. But as the train pulled away from the station, his sad feeling began to fade from his mind. Man-do, then, found himself somewhat inwardly pleased. . . .

On the day of the accident they were, as usual, preparing a hole in which to set dynamite in the crack of a rock. When everything was ready all but one would get out of the tunnel. . . . Man-do was almost out of the entrance when he heard a bombshell blast with a gust of wind. He nearly went crazy. It was bombs from a plane flying directly over the entrance. Backing and falling, he saw another plane swooping down from the mountain ridge, and dashed back. As soon as he plunged inside, the tremendous explosion of the dynamite swept the inside of the tunnel. Man-do felt his consciousness dimmed in a flash. . . .

He found himself on a soft mattress of a hospital, after regaining consciousness. He felt the terrible pain making a sudden attack on his ill-fated shoulder. They had already operated on his disfigured shoulder.

The sudden whistle of a train from the bend of the mountain awoke him, drenched in the mournful memory. Jumping up from the bench, he gripped the bunch of mackerel beside him. His heart throbbed more quickly as the whistle became closer and louder. . . .

In the wave of people moving toward the exit, he saw a wounded soldier limping on crutches; he did not pay any attention. It seemed there were no more people getting off at this stop. A few people who had not yet gotten aboard were only walking up and down along the platform to get on the train.

I think he wouldn't lie about this coming in his letter to me. . . . Feeling his heart somewhat troubled, Man-do muttered to himself.

"Father!"

A voice from behind him came to him. He started and turned his head in a great hurry. At the moment he looked back, he became pop-eyed and opened his mouth wide. The man standing on his crutches was surely his son, but utterly unlike before. A trouser leg of his pants was flapping in the wind!

Astounded by Chin-su's disfigurement, Man-do found himself falling into despair. At last, his eyes began to water with tears.

"Oh, my goodness!"

They were the first words that came from Man-do, in a tone trembling with excitement. He doubled up his fist firmly, holding the bunch of mackerel.

"God, what on earth is the matter with you?"

"Father!"

"Oh, you poor boy!"

Man-do's [turned]-up nose was running snivel. Tears were flowing down Chin-su's cheeks. "Come on, let's go!" said Man-do bluntly as he began to walk briskly ahead of Chin-su with the grim look that the unexpected misfortune was entirely due to Chin-su himself. Chin-su, licking the salty tears that ran down over his upper lip, limped after his father.

Man-do, never turning his head toward his son, went on walking, averting his eyes. Looking down at the ground like a man with a heavy load on his back, Man-do went on walking without a pause. Chin-su, supported by crutches, couldn't by any means keep up with the pace of a healthy man, and to make him more miserable, Man-do was quickening his steps. At last the distance between the two became so great that the low voice hardly reached Man-do. . . .

Then both father and son came out of the wine house and walked along a footpath between the rice-fields.

This time, unlike before, Chin-su walked ahead of his father. From behind, looking at his son who was limping on his crutches, Man-do followed him at a snail's pace, dangling the mackerel from his one arm. Man-do felt uneasy in his stomach, and staggered. He drank too much, he thought. He began to lose his senses. But it didn't matter, he felt.

"Hey, Chin-su!"

"Yes."

"What happened to your leg?"

"I was hit by a grenade fragment."

"By a grenade fragment?"

"Yes."

"Um . . ."

"The whole leg turned bad so they had to cut it off at the hospital."

There was a brief silence.

"Father."

"What?"

"I'm afraid I can't live like this!"

"What do you mean? Until they die, everyone struggles to live. Don't be so stupid!"

Again the silence.

"Look, son! I live well enough with only one arm, don't I? Of course, it doesn't look too good, but that doesn't have anything to do with living."

"I wish I were you. Walking on this one leg is killing me."

"Oh, boy, you're wrong. What's the use of walking? You can do any work you want with two good hands."

"Really?"

"Sure. In fact, we can share the work between us; you can do the indoor housework sitting down, while I take care of the heavy work outside. We'll have no problems at all."

"I guess not."

Chin-su, sighing slightly, looked back at his father. Man-do smiled gently, turning his face toward him. The alcohol had passed through his system quickly and Man-do's bladder was bursting.

Man-do squatted by the roadside and tried to grasp the string binding the mackerel with his teeth. Seeing this, Chin-su said, "Let me hold the fish, father."

Until his father finished urinating, Chin-su with his crutches in one hand and the fish in the other waited in the road. After finishing, Man-do promptly took the bunch of fish from his son.

At last, they arrived at the brook with the narrow log bridge across it. Chin-su saw that he was going to have a problem getting across. The sandy stream-bed didn't seem firm enough to support him on his crutches, though the water was shallow enough. What's more, it was absolutely impossible for him to cross the narrow log bridge. The only thing, he believed, left to him was to roll up his trousers after all, and so flopping on the bank, he began to do so.

"That's alright, just ride on my back, son."

Man-do looked down at Chin-su a little vacantly.

"All you have to do is climb on my back and we can both get across. Come on. Take the fish."

He thrust out the bunch of mackerel toward Chin-su.

With a look of embarrassment, Chin-su hesitatingly took it. With his back to his son, Man-do stretched out his only arm and said,

"Climb on, son."

Chin-su rode gently on the back of his father, holding his crutches in one hand and the mackerel in the other. With his single arm stretched behind, Man-do clutched Chin-su's leg firmly, and told him, "You'd better hold on to my neck tightly."

Clutching the fish and crutches as he hugged his father with both arms, Chin-su's eyes began to fill and his face tightened with emotion. Man-do, straining his stomach muscles, stood up slowly. His knees were shaking slightly under the weight, but he thought he could make it.

Stepping out on the narrow log bridge, Man-do began muttering to himself: How pitiful for this strong young body to be disfigured! Chin-su, you have met a sad lot in this misguided world. Damn it! Your whole future is hopelessly doomed. Hopeless!

While these thoughts were running through Man-do's mind, Chin-su, clinging to his father's back with his face shrouded in despair, groaned inwardly: Now I have been cursed too. My father has no luck at all. It'd have been better if I'd . . . died. . . .

Still swayed by the wine and weighted down by his son, Man-do stepped carefully on the bridge.

The Yongmaru hill standing tall before them looked down silently on this ill-fated father and son.

German Movement of Mentally Disabled People (1958)

The Bundesvereinigung Lebenshilfe für Menschen mit geistiger Behinderung (Federal Association of Assisted Living for People with Cognitive Disabilities) is one of the most successful and largest disability self-help organizations in Germany. It was founded in 1958 as Lebenshilfe für das geistige behinderte Kind

(Assisted Living for the Mentally Handicapped Child) by a small group of experts and parents of cognitively disabled children. Its foundation was a reaction to the crimes perpetrated against disabled people during the National Socialist era. Thanks to the Bundesvereinigung, the Federal Republic of Germany was able to connect with the standard of education for cognitively disabled children and youth in other Western countries and in Northern European countries.

Letter of Invitation to the First Meeting, being held in Marburg/Lahn, November 13, 1958

Re: Preliminary discussion towards the foundation of a German organization of parents and friends of the mentally handicapped.

On the 23rd of November at 1:30 p.m., a meeting will take place in the educational counseling center in Marburg/Lahn regarding the possibility of founding a German national organization of parents and friends of the mentally handicapped as well as the goals and purposes of such an organization.

You are cordially invited to this meeting.

Organizations of this type already exist in many countries. The largest and so far most successful of such is the "National Association for Retarded Children" in the United States. . . .

The fact that the general public in Germany has to date done so relatively little for the general welfare of the mentally handicapped, has for many affected families needlessly increased the difficulties with their problem children in such a way that not seldom they become hardly bearable burdens.

As we know from the U.S., England, Holland, and a few other countries, institutions such as remedial kindergartens, schools for children that are only on the motor level trainable (imbeciles), schools for mongoloid children, training schools [*Anlernwerkstätten*], sheltered workshops, short-stay homes, summer camps, night schools, and evening clubs for the mentally handicapped, can highly contribute to limiting this problem to its narrowest borders.

The suggestion to call into being such institutions in this country as well will have to come from an influential parent organization, which will not grow weary in fighting again and again, wherever necessary for the welfare and happiness of its charges. With the help of the collective experiences from parent organizations in other countries, it should be possible in the foreseeable future to achieve a fundamental expansion of facilities for the mentally handicapped here as well. Also, the present period of economic prosperity should undoubtedly favor the success of such efforts. . . .

1958—Protocol of the Inaugural Meeting from November 23, 1958, Marburg

. . . After greeting those individuals present, the Summoner of the meeting, Mr. Tom Mutters, gave an overview of parental organizations for mentally handicapped children in other countries and underlined . . . the goals and purposes of a similar organization in Germany. . . . There was agreement, above all, on the following individual items:

- Contact should be made with all neighboring institutions that have similar objectives.
- The new organization should fight for, above all, a reform of home care; in particular, it should aim at supporting the institutions to stay in contact with the families.
- For the time being, the reform movement will emphasize the promotion of 'sheltered workshops and remedial kindergartens.' . . .

There was also a warning given to the new organization of following too strongly the course of already existing umbrella organizations of a denominational or solicitous sort, and it was unanimously pleaded for the creation of an independent organization that is fundamentally led by parents of disabled children.

The main task of the association was defined as fostering exemplary helping institutions, not however, to establish or maintain such institutions itself. The planned assistance should benefit all mentally handicapped (not only mongoloids and not only children). However, out of psychological grounds it seems opportune to anchor the expression, "Help for Children" in the association's description.

After a thorough discussion of the various possibilities, the group reached an agreement on the following description: "Lebenshilfe für das geistig behinderte Kind e.V." [Assisted Living for the Mentally Handicapped Child, a Registered Organization].

Harper Lee, from To *Kill a Mockingbird* (1960)

Harper Lee's classic novel about growing up in the racially segregated U.S. South hinges on a variety of disability-based revelations. The falsely accused African American character, Tom Robinson, is proven innocent by Atticus Finch on the basis of an impairment he received when his arm was caught in a cotton gin. Nevertheless, the all-white jury finds him guilty of the crime of raping a lower-class white woman, Mayella Ewell. Additionally, a cognitively disabled character, Boo Radley, ultimately saves the children from a violent attack by Mayella's father, who is enraged by their father's willingness to defend a black man. In this excerpt, the children (Jem, Scout, and Dill) create horror stories about Boo's disability and incarceration within his family home.

Jem gulped down his second glassful and slapped his chest. "I know what we are going to play," he announced. "Something new, something different."

"What?" asked Dill.

"Boo Radley."

Jem's head at times was transparent: he had thought that up to make me understand he wasn't afraid of Radleys in any shape or form, to contrast his own fearless heroism with my cowardice.

"Boo Radley? How?" asked Dill.

Jem said, "Scout, you can be Mrs. Radley—"

"I declare if I will. I don't think—"

"Smatter?" said Dill. "Still scared?"

"He can get out at night when we're all asleep . . ." I said.

Jem hissed. "Scout, how's he gonna know what we're doin'? Besides, I don't think he's still there. He died years ago and they stuffed him up the chimney."

Dill said "Jem, you and me can play and Scout can watch if she's scared."

I was fairly sure Boo Radley was inside that house, but I couldn't prove it, and felt it best to keep my mouth shut or I would be accused of believing in Hot Steams, phenomena I was immune to in the daytime.

Jem parceled out our roles: I was Mrs. Radley, and all I had to do was come out and sweep the porch. Dill was old Mr. Radley: he walked up and down the sidewalk and coughed when Jem spoke to him. Jem, naturally, was Boo: he went under the front steps and shrieked and howled from time to time.

The Men *focuses on a ward full of paraplegic war veterans, including Marlon Brando as a wheelchair user, who struggle to come to terms with their altered bodies and a hostile social world beyond the rehabilitation unit.*

Source: *The Men* (1950), directed by Fred Zinnemann. United States. B&W, 85 minutes. Reprinted by permission of Paul Darke.

As the summer progressed, so did our game. We polished and perfected it, added dialogue and plot until we had manufactured a small play upon which we ran changes every day.

Dill was a villain's villain: he could get into any character part assigned him, and appear tall if height was part of the devilry required. He was as good as his worst performance; his worst performance was Gothic. I reluctantly played assorted ladies who entered the script. I never thought it was as much fun as Tarzan, and I played that summer with more than vague anxiety despite Jem's assurances that Boo

Radley was dead and nothing would get me, with him and Calpurnia there in the daytime and Atticus home at night.

Jem was a born hero.

It was a melancholy little drama, woven from bits and scraps of gossip and neighborhood legend: Mrs. Radley had been beautiful until she married Mr. Radley and lost all her money. She lost most of her teeth, her hair, and her right forefinger (Dill's contribution. Boo bit it off one night when he couldn't find any cats or squirrels to eat.); she sat in the living room and cried most of the time, while Boo slowly whittled away at all the furniture in the house. The three of us were the boys who got into trouble; I was the probate judge, for a change; Dill led Jem away and crammed [him] beneath the steps, poking him with the brush broom. Jem would reappear as needed in the shapes of the sheriff, assorted townsfolk, and Miss Stephanie Crawford, who had more to say about the Radleys than anybody in Maycomb.

When it was time to play Boo's big scene, Jem would sneak into the house, steal the scissors from the sewing machine drawer when Calpurnia's back was turned, then sit in the swing and cut up newspapers. Dill would walk by, cough at Jem, and Jem would fake a plunge into Dill's thigh. From where I stood it looked real.

When Mr. Nathan Radley passed on his daily trip to town, we would stand still and silent until he was out of sight, then wonder what he would do to us if he suspected. Our activities halted when any of the neighbors appeared, and once I saw Miss Maudie Atkinson staring across the street at us, her hedge clippers in mid-air.

One day we were busily playing Chapter XXV, Book II of One Man's Family, we did not see Atticus standing on the sidewalk looking at us, slapping a rolled magazine against his knee. The sun said twelve noon.

"What are you all playing?" he asked.

"Nothing," said Jim.

Jem's evasion told me our game was a secret, so I kept quiet.

"What are you doing with the scissors, then? Why are you tearing up that newspaper? If its today's I'll tan you."

"Nothing."

"Nothing what?" said Atticus.

"Nothing sir."

"Give me those scissors," Atticus said. "They're nothing to play with. Does this, by any chance have anything to do with the Radleys?"

"No sir," said Jem, reddening.

"I hope it doesn't," he said shortly, and went inside the house.

"Jem-m . . .."

"Shut up! He's gone into the living room, he can hear us in there."

Safely in the yard, Dill asked Jem if we could play anymore.

"I don't know. Atticus didn't say we couldn't—"

"Jem," I said, "I think Atticus knows it anyway."

I was not so sure, but Jem told me I was being a girl, that girls always imagine things, that's why other people hated them so, and if I started behaving like one I could just go off and find some to play with.

"All right, you just keep it up then," I said. "You'll find out."

Atticus's arrival was the second reason I wanted to quit the game. The first reason happened the day I rolled into the Radley front yard. Through all the head-shaking, quelling of nausea and Jem-yelling, I heard another sound, so low I could not have heard it from the sidewalk. Someone inside the house was laughing.

Erving Goffman, from *Asylums: Essays on the Social Situation of Mental Patients and Other Inmates* (1961)

Many psychiatric survivors credit Erving Goffman's work as significant in revealing how a dependency on long-term institutionalization creates an inherently disempowering system of psychiatric care.

Like the neophytes in many of these total institutions, the new inpatient finds himself cleanly stripped of many of his accustomed affirmations, satisfactions, and defenses, and is subjected to a rather full set of mortifying experiences: restriction of free movement, communal living, diffuse authority of a whole echelon of people, and so on. Here one begins to learn about the limited extent to which a conception of oneself can be sustained when the usual setting of supports for it are suddenly removed. . . . While undergoing these humbling moral experiences, the inpatient learns to orient himself in terms of the "ward system." (P. 148)

. . . Once lodged on a given ward, the patient is firmly instructed that the restrictions and deprivations he encounters are not due to such blind forces as tradition or economy—and hence dissociable from self—but are intentional parts of his treatment, part of his need at the time, and therefore an expression of the state that his self has fallen to. Having every reason to initiate requests for better conditions, he is told that when the staff feel he is "able to manage" or will be "comfortable with" a higher ward level, then appropriate action will be taken. In short, assignment to a given ward is presented not as a reward or punishment, but as an expression of his general level of social functioning, his status as a person. (P. 149)

The Korean Child Welfare Committee, from *Handicapped Children's Survey Report* (1961)

These excerpts are from the first nationwide disability census in Korea, which has unique categories of disability different from later statistics. For example, children of mixed races were classified as socially handicapped, but this classification disappears from the disability category in later statistics. The survey was funded by various international social welfare foundations, the U.S. Army, and Korean governmental and church-related organizations. The report was published in Korean and English. The report includes the history of welfare services for handicapped children, case studies, essays by professionals on social issues and concerns of each category, and statistical descriptions of the results.

Foreword

Soon Yung Kwon

The Korea Child Welfare Committee has contributed to the promotion of child welfare in Korea in many ways for the past ten years, and this survey of children with physical, mental or social handicaps was one of its largest undertakings to date.

The Children's Survey Sub-committee, organized in September 1960 prepared for the nation-wide survey that was effectively carried out as of 10 April 1961. The Committee received financial assistance from both Korean and international voluntary agencies and individuals, administrative and technical participation of the Ministry of Health and Social Affairs, and those of provincial and local government.

Based on the decision of the Committee to use as interviewers, the Tong or Dong chiefs of villages who have little knowledge in handicaps of people, the survey had to be limited to such severe handicaps as a layman could plainly identify. Therefore, the children with slight handicaps and the children who are suffering from sicknesses or diseases that might cause handicaps in the future were not included in the Survey.

Some socially handicapped children such as juvenile delinquents; orphans; children born outside marriage, children of leper parents, and children of widows were not included in this survey. . . .

Healthy children of leper parents find themselves rejected by and ostracized from society. However, the survey did not include the group because of technical difficulties in the method of survey that was employed. An article on the subject was included in this report. Loss of husbands and fathers during the Korean War produced many widows and orphans. Widows living with their dependent children often find it difficult to get married again in this society and feel that they are a complicated social problem.

As the result of this survey many facts have been discovered. Handicapped boys are 27.2% more in number than the girls, as the total 77,903 handicapped children include 49,560 boys and 28,343 girls. The largest in number of handicaps is "paralytic or palsied" with 31,475 children with paralytic handicaps (38.7% is the total). The four Provinces that have the largest number of handicapped children are in order of Cheju-do, Cholla Namdo, Kyongsang Namdo and Cholla Pukdo. Seoul City has the smallest. 46,563 handicapped children or 82.6% are the children of low income families whose tax assessment is under category number 5. 58,947 handicapped children or 65.9% of the total indicated their desire for medical care.

Introduction

In Korea, many national crises and rapid social changes during the past twenty years have spawned serious problems contributing to human suffering in all walks of life. A large number of these problems are related directly to the welfare of children, such as care of orphans, prevention of and guidance for steadily increasing juvenile delinquents, rehabilitation of children with physical or mental handicaps, as well as protection of children placed under social discrimination. There is a growing awareness of the need for better provision of educational opportunities for the less fortunate, attention for child health, cultivation of recreational activities and other programs and services promoting general welfare of children.

Faced with the tremendous task of meeting so many needs on every side with little experience and resources, both government and voluntary agencies have been placed under pressure to develop adequate welfare services based on systemic assessment of needs and resources through a social survey. The need to fill this gap in the development of social welfare services was well demonstrated by the fact that there was extremely meager statistical information available on the nation's children when this committee began the collection of preliminary statistics.

This survey on handicapped children was the first such experiment on a nation-wide scale in the social welfare field, undertaken with scientific approach in an effort to introduce facts which we hope will be used for planning and implementation of needed services. It has been duly recognized by the committee that the problems of handicapped children are only a small portion of those related to the total family and child welfare needs in Korea. (P. 14)

The Mixed Racial Child, by Anne M. Davison

Most of the mixed racial children in Korea are illegitimate because mothers are casual or regular prostitutes of foreign servicemen. Of course the girl does not want to remain in that category, and she hopes constantly that he will marry her and take her away. If he is a white serviceman, he is the most [desirable]. If she lives with him and has his child, the baby may be used as a lever to try to press him into marriage. In the marriage of an oriental and an occidental, the marriage custom of one or the other or both may be followed. If a western marriage is registered, the Korean community accepts it, but if the eastern custom is followed in a mixed marriage, the western country may not recognise it legally. When there is a marriage by Korean custom, as long as her "husband" remains in Korea, she is a respectable member of society, but when her "husband" leaves and returns to his own country, leaving her behind, everyone feels that he is a deserter. She is then thrust back into the community as an outcast and joins the group of cast-off wives, and other rejected people. Her chances of rehabilitation become very small.

There are girls as well as men who use the present social situation for their own ends. Sometimes the girl leads the man on, with no intention of leaving her way of life. She promises to marry and emigrate. Their marriage is made a legal one. If he must leave early, then she may refuse to follow him. She blames legal offices, friends and welfare worker, as excuses for her own indecision. The husband on the other side of the world feels that her delays in joining him are caused by outside attitudes of prejudice against his oriental wife because he does not really understand her basic problem.

What happens to the children in all these situations? They follow along and share the insecurity that their parents have made for them. They share the hope of the mother, that the father will return and marry her and take them all away, or marry the mother for debts, living expenses, and school fees. Such hopes keep the child's life uncertain and constantly insecure. Sometime the father says, "Send my son, even if my wife won't come." Very often another foreign man will feel that this girl has been badly treated, and pity may drive him to marry her and adopt her illegitimate children as well.

The decision to release a child for foreign adoption abroad is reached in various ways.

1. It may be complete economic inability to support that is the deciding factor. Having a child is costly, and the mother has probably become deeply indebted to the brothel keeper. Legally she cannot be made to meet debts of this nature, but she knows that she has a social obligation, that will weigh heavily on her until it is met.
2. A release for adoption may be given by a girl who has reached the end of her hope that the father will return as he promised he would do. By this time the child may be ten years old.
3. She may release her baby because he hampers her movement, is costly, and may remind her of a man who is no longer around. An oriental girl finds it hard to accept the fact that a foreign man is not interested in what happens to his child, especially if the child is a boy, and she constantly wants to have the father consulted about plans for their child. This may delay an adoption for years.
4. Some girls realise that foreign adoption in the long view will give more opportunity to the child, than anything they can give, and unselfishly they face the separation and make plans together with the adoption agency for his emigration.

Girls who make a success of prostitution financially are in a position where they can hire an older woman or a friend to care for the child. The mother can then write directly to the father, ask for support, or better still, from her point of view, beg him to divorce his wife and come back and marry her. The children are being held for blackmail purposes, and not loved by the mother or given the security of a home environment. These are the children that suffer the most and the longest. They are usually living in the middle of a prostitute community, and they must face each day the fact that they are consequences that have made no one happy, and often no one wants. Girls who move to some sections of an urban community, and who thus lose their identity somewhat, may find themselves and their children accepted more readily in the new community. This is so especially if the school teacher's attitude is one of acceptance and understanding. Of course children tease each other unmercifully, but if the teacher and the mother understand, and are a strength to a child, an adjustment may by made. However, when that point is reached, often the child may be behind in his school grade. It may mean that if the mother has no money for school fees, the child may have to leave school altogether, even though he is getting along well. As most of the prostitutes have very little education themselves, few of them having completed primary school, and have lost their self for an education for their children as other parents in the community.

The social and psychological handicaps of these children may be complicated by the addition of the physical or mental ones as well, such as polio, tuberculosis, feeble-mindedness etc.

Until the channel is opened to change a child's surname legally, there is not likely to be extensive adoption of mixed racial children in Korea. There needs to be a great deal more publicity and supervised assistance before families will be able to accept the challenge and do anything as radical as this. However, the government has taken the stand that a child should not be penalised for any misbehaviour of the parents. They have made . . . provisions for legal birth registrations for *all* [children]. As mixed racial marriage are increasing, there are growing numbers of mixed racial legitimate children in the community.

Foreign adoption is only a partial solution for the problems of mixed racial children's problems. There has not been enough time yet to evaluate the results of placing oriental children in western homes. For the present, plans should be made for the best possible solution to each situation may be found, either here in Korea or aboard. (Pp. 71–74)

▣ Thomas S. Szasz, from *The Myth of Mental Illness* (1961)

Thomas S. Szasz's popular work remains controversial. Recommended by psychiatric survivor/user advocates who are also affiliated with the antipsychiatry movement, many credit Szasz's ideas as providing instrumental theoretical support during the movement's early years.

It is customary to define psychiatry as a medical specialty concerned with the study, diagnosis, and treatment of mental illnesses. This is a worthless and misleading definition. Mental illness is a myth. Psychiatrists are not concerned with mental illnesses and their treatments. In actual practice they deal with personal, social, and ethical problems in living.

▣ Michel Foucault, from *The Birth of the Clinic* (1963)

In The Birth of the Clinic, *Foucault analyzes the objectifying rhetoric of diagnosis applied by clinical medicine to its human objects. The work, along with his* Madness and Civilization, *furthers his anatomy of institutions as disciplinary spaces. Collectively, the two works demonstrate Foucault's lifelong critique of pathology as a distancing formula of empiricism that empties subjects of their humanity.*

From the Preface

Commentary questions discourse as to what it says and intended to say; it tries to uncover that deeper meaning of speech that enables it to achieve an identity with itself, supposedly nearer to its essential truth; in other words, in stating what has been said, one has to re-state what has never been said. In this activity known as commentary which tries to transmit an old, unyielding discourse seemingly silent to itself, into another, more prolix discourse that is both more archaic and more contemporary—is concealed a strange attitude toward language: to comment is to admit by definition an excess of the signified over the signifier; a necessary, unformulated remainder of thought that language has left in the shade—a remainder that is the very essence of thought, driven outside its secret—but to comment also presupposes that this unspoken element slumbers within speech (*parole*), and that, by a superabundance proper to the signifier, one may, in questioning it, give voice to a content that was not explicitly signified. . . . Is it not possible to make a structural analysis of discourses that would evade the fate of commentary by supposing no remainder, nothing in excess of what has been said, but only the facts of its historical appearance?

From Chapter One: Spaces and Classes

In order to know the truth of the pathological fact the doctor must abstract the patient . . . paradoxically, in relation to that which he is suffering from, the patient is only an external fact; the medical reading must take him into account only to place him in parentheses. . . .

Medical perception must be directed neither to series nor to groups; it must be structured as a look through a magnifying glass, which, when applied to different parts of an object, makes one notice other parts that one would not otherwise perceive, thus initiating the endless task of understanding the individual. . . .

In fact, no hostile disease is a pure disease. . . .

From Chapter Two: A Political Consciousness

Being a collective phenomenon, it [an epidemic] requires a multiple gaze; a unique process, it must be described in terms of its special, accidental, unexpected qualities. The event must be described in detail but it must also be described in accordance with the coherence implied by multi-perception: being an imprecise form of knowledge, insecurely based while ever partial, incapable of acceding of itself to the essential or fundamental, it finds its own range only in the cross-checking of viewpoints, in repeated, corrected information, which finally circumscribes,

In Rear Window, *a news photographer, confined to his room by a broken leg, believes that he has seen a murder committed in an apartment on the other side of the courtyard. The film employs physical mobility as a metaphor for masculine oedipal conflicts with women.*

Source: *Rear Window* (1954), directed by Alfred Hitchcock. United States. Color, 110 minutes. Reprinted by permission of Paul Darke.

where gazes meet, the individual, unique nucleus of these collective phenomena. At the end of the eighteenth century this form of experience was being institutionalized. . . .

A medicine of epidemics could exist only if supplemented by a police. . . .

The myth of a nationalized medical profession, organized like the clergy, and invested, at the level of man's bodily health, with power similar to those exercised by the clergy over men's souls; in the myth of a total disappearance of disease in an untroubled, dispassionate society restored to its original state of health. . . .

Medicine will also embrace a knowledge of *healthy man* that is a study of *nonsick-man* and a definition of the model man. . . .

From Chapter Three: The Free Field

For these, "communal houses for the sick" must be set up that would function as family substitutes and spread, in the form of reciprocity, the gaze of compassion; in this way, the poor would find "in companions of their own kind naturally sympathetic creatures who are not necessarily strangers to them." Thus disease would everywhere find its natural, or almost natural, locale, where it would be free to follow its own course and to abolish itself in its truth. . . .

The hospital is an anachronistic solution that does not respond to the real needs of the poor and that stigmatizes the sick in a state of penury. . . .

From Chapter Four: The Old Age of the Clinic

The clinic, on the other hand, was thought to be the element of its positive accumulation: it was this constant gaze upon the patient, this age-old, yet ever renewed attention that enabled medicine not to disappear entirely with each new speculation, but to preserve itself, to assume little by little the figure of the truth that is definitive, if not completed, in short, to develop, below the level of the noisy episodes of its history, in a continuous historicity. In the non-variable of the clinic, medicine, it was thought, had bound truth and time together. . . .

From Chapter Five: The Lesson of the Hospitals

What allows man to resume contact with childhood and to rediscover the permanent birth of truth is this bright, distant, open naivety of the gaze. . . .

Once the criteria of competence had been laid down, a selection could be made of those to whom the lives of citizens might be safely entrusted; medicine would then become a closed profession. . . .

A structure had to be found for the preservation of both the hospitals and the privileges of medicine, that was compatible with the principles of liberalism and the need for social protection—the latter understood somewhat ambiguously as the protection of the poor by the rich and the protection of the rich against the poor. . . .

But to look in order to know, to show in order to teach, is not this a tacit form of violence, all the more abusive for its silence, upon a sick body that demands to be comforted, not displayed? . . .

And in accordance with a structure of reciprocity, there emerges for the rich man the utility of offering help to the hospitalized poor: by paying for them to be treated, he is, by the same token, making possible a greater knowledge of the illnesses with which he himself may be affected; what is benevolence towards the poor is transformed into knowledge that is applicable to the rich. . . .

From Chapter Six: Signs and Cases

The symptom—hence its uniquely privileged position—is the form in which the disease is presented: of all that is visible, it is closest to the essential; it is the first transcription of the inaccessible nature of the disease. . . .

The sign announces: the prognostic sign, what will happen; the anamnestic sign, what has happened; the diagnostic sign, what is now taking place. . . . Through the invisible, the sign indicates that which is further away, below, later. It concerns the outcome, life and death, time, not that immobile truth, that given, hidden truth that the symptoms restore to their transparency as phenomena. . . .

Individual variations are spontaneously effaced by integration. In the medicine of species, this effacement of particular modifications was assured only by a positive operation: in order to accede to the purity of essence, it was first necessary to possess it, and then to use it to obliterate the excessively rich content of experience; it was necessary, by a prior choice, "to distinguish what is constant from what is variable in it, the essential from the purely accidental." . . .

From Chapter Seven: Seeing and Knowing

The glance, on the other hand, does not scan a field: it strikes at one point, which is central or decisive; the gaze is endlessly modulated, the glance goes straight to its object. . . .

From Chapter Eight: Open up a Few Corpses

A fine transmutation of the corpse had taken place: gloomy respect had condemned it to putrefaction, to the dark work of destruction; in the boldness of the gesture that violated only to reveal, to bring to the light of day, the corpse became the brightest moment in the figures of truth. . . .

Anatomy could become pathological only insofar as the pathological spontaneously anatomizes. Disease is an autopsy in the darkness of the body, dissection alive. . . .

From Chapter Nine: The Visible Invisible

Life, with its finite, defined margins of variation, was to play the same role in pathological anatomy as the broad notion of nature played in nosology: it was the inexhaustible, but closed basis in which disease finds the ordered resources of its disorders. . . .

Death is disease made possible in life . . . deviation in life is of the order of life but of a life that moves towards death. . . .

Thomas Pynchon, from *The Crying of Lot 49* (1966)

This excerpt from the American postmodern writer's first novel provides an important example of disability as a marker of social ostracism. However, rather than foregrounding physical difference as undesirable, the passages employ disability as that which identifies the existence of alternative political communities outside of a stultifying mainstream.

Out at the airport Oedipa, feeling invisible, eavesdropped on a poker game whose steady loser entered each loss neat and conscientious in a little balance-book decorated inside with scrawled post horns. "I'm averaging a 99.37 percent return, fellas," she heard him say. The others, strangers, looked at him, some blank, some annoyed. "That's averaging it out, over 23 years," he went on, trying a smile. "Always just that little percent on the wrong side of breaking even. Twenty-three years. I'll never get ahead of it. Why don't I quit?" Nobody answering.

In one of the latrines was an advertisement by ACDC, standing for Alameda County Death Cult, along with a box number and post horn. Once a month they were to choose some victim from among the innocent, the virtuous, the socially integrated and well-adjusted, using him sexually, then sacrificing him. Oedipa did not copy the number.

Catching a TWA flight to Miami was an uncoordinated boy who planned to slip at night into aquariums and open negotiations with the dolphins, who would succeed man. He was kissing his mother passionately goodbye, using his tongue. "I'll write, ma," he kept saying. "Write by WASTE," she said, "remember. The government will open it if you use the other. The dolphins will be mad." "I love you, ma," he said. "Love the dolphins," she advised him. "Write by WASTE."

So it went. Oedipa played the voyeur and listener. Among her other encounters were a racially-deformed welder, who cherished his ugliness, a child roaming the night who missed the death before birth as certain outcasts do the dear lulling blankness of the community; a Negro woman with an intricately-marbled scar along the baby-fat of one cheek who kept going through rituals of miscarriage each for a different reason, deliberately as others might the ritual of birth, dedicated not to continuity but to some kind of interregnum; an aging night-watchman, nibbling at a bar of Ivory Soap, who had trained his virtuoso stomach to accept also lotions, air-fresheners, fabrics, tobaccoes and waxes in a hopeless attempt to assimilate it all, all the promise, productivity, betrayal, ulcers, before it was too late; and even another voyeur, who hung outside one of the city's still-lighted windows, searching for who knew what specific image. Decorating each alienation, each species of withdrawal, as cufflink, decal, aimless doodling, there was somehow always the post horn. She grew so to expect it that perhaps she did not see it quite as often as she later was to remember seeing it. A couple-three times would really have been enough. Or too much.

She busrode and walked on into the lightening morning, giving herself up to a fatalism rare for her. Where was the Oedipa who'd driven so bravely up here from San Narciso? That optimistic baby had come on so like the private eye in any long-ago radio drama, believing all you needed was grit, resourcefulness, exemption from hidebound cops' rules, to solve any great mystery.

But the private eye sooner or later has to get beat up on. This night's profusion of post horns, this malignant, deliberate replication, was their way of beating up. They knew her pressure points, and the ganglia of her optimism, and one by one, pinch by precision pinch, they were immobilizing her.

▣ From the Social Security Act of 1967, Section 223 (d)(3) (United States)

The U.S. Social Security Act presented a variety of iterations of the definition of disability over the course of its development and implementation. In the 1967 version, disability was narrowed to a category of incapacity to work.

An individual . . . shall be determined to be under a disability only if his physical or mental impairment or impairments are of such severity that he is not only unable to do his previous work but cannot, considering his age, education, and work experience, engage in any kind of substantial gainful work which exists in the national economy, regardless of whether such work exists in the immediate area in which he lives, or whether a specific job vacancy exists for him, or whether he would be hired if he applied for work.

▣ R. D. Laing, from *The Politics of Experience* (1968)

R. D. Laing, a psychiatrist who came to be known as the father of the antipsychiatry movement, stressed that our modern sense of "normality" creates and then camouflages deep intrinsic loss. The antipsychiatry movement is often associated with the psychiatric survivor/user movement.

What we call "normal" is a product of repression, denial, splitting, projection, introjection and other forms of destructive action on experience. . . . It is radically estranged from the structure of being.

The more one sees this, the more senseless it is to continue with generalized descriptions of supposedly specifically schizoid, schizophrenic, hysterical "mechanisms."

There are forms of alienation that are relatively strange to statistically "normal" forms of alienation. The "normally" alienated person, by reason of the fact that he acts more or less like everyone else, is taken to be sane. Other forms of alienation that are out of step with the prevailing state of alienation are those that are labeled by the "normal" majority as bad or mad.

The condition of alienation, of being asleep, of being unconscious, of being out of one's mind, is the condition of normal man.

▣ From the Rehabilitation Act of 1973 (United States)

The Rehabilitation Act of 1973 was one of the earliest efforts to formalize legislation in the United States that guaranteed disabled people protection from discrimination under the law. The Vocational Rehabilitation Act of 1920 had marked the first major legislation establishing public rehabilitation programs for persons with disabilities in the United States. Funds were provided for vocational guidance, training, occupational adjustment, prosthetics, and placement services. Amendments during subsequent decades expanded the scope of federal programs. The Rehabilitation Act of 1973, which changed the name of the legislation from the Vocational Rehabilitation Act to the Rehabilitation Act, man dated a priority to serve persons with severe disabilities and affirmative action programs were established in Title V, Sections 501, 502, 503, and 504.

The Rehabilitation Act of 1973 was the predecessor of the 1990 Americans with Disabilities Act and promoted equal access throughout all segments of society. This excerpt is from the act as it was amended in 1998 by the Workforce Investment Act.

Section 2 (a): Findings

Congress finds that—

(1) millions of Americans have one or more physical or mental disabilities and the number of Americans with such disabilities is increasing;

(2) individuals with disabilities constitute one of the most disadvantaged groups in society;

(3) disability is a natural part of the human experience and in no way diminishes the right of individuals to—

- (A) live independently;
- (B) enjoy self-determination;
- (C) make choices;
- (D) contribute to society;
- (E) pursue meaningful careers; and
- (F) enjoy full inclusion and integration in the economic, political, social, cultural, and educational mainstream of American society;

(4) increased employment of individuals with disabilities can be achieved through implementation of statewide workforce investment systems under title I of the Workforce Investment Act of 1998 that provide meaningful and effective participation for individuals with disabilities in workforce investment activities and activities carried out under the vocational rehabilitation program established under title I, and through the provision of independent living services, support services, and meaningful opportunities for employment in integrated work settings through the provision of reasonable accommodations;

(5) individuals with disabilities continually encounter various forms of discrimination in such critical areas as employment, housing, public accommodations, education, transportation, communication, recreation, institutionalization, health services, voting, and public services; and

(6) the goals of the Nation properly include the goal of providing individuals with disabilities with the tools necessary to—

(A) make informed choices and decisions; and

(B) achieve equality of opportunity, full inclusion and integration in society, employment, independent living, and economic and social self-sufficiency, for such individuals.

(b) Purpose

The purposes of this Act are—

(1) to empower individuals with disabilities to maximize employment, economic self-sufficiency, independence, and inclusion and integration into society, through—

(A) statewide workforce investment systems implemented in accordance with title I of the Workforce Investment Act of 1998 that include, as integral components, comprehensive and coordinated state-of-the-art programs of vocational rehabilitation;

(B) independent living centers and services;

(C) research;

(D) training;

(E) demonstration projects; and

(F) the guarantee of equal opportunity; and

(2) to ensure that the Federal Government plays a leadership role in promoting the employment of individuals with disabilities, especially individuals with significant disabilities, and in assisting States and providers of services in fulfilling the aspirations of such individuals with disabilities for meaningful and gainful employment and independent living.

Laurence Olivier directs and stars in Richard III*, a triple Bafta-winning adaptation of Shakespeare's "hump-backed" king turned power-mongering usurper of the British throne.*

Source: *Richard III* (1955), directed by Laurence Olivier. United Kingdom. Color, 158 minutes. Reprinted by permission of Paul Darke.

(c) Policy

It is the policy of the United States that all programs, projects, and activities receiving assistance under this Act shall be carried out in a manner consistent with the principles of—

(1) respect for individual dignity, personal responsibility, self-determination, and pursuit of meaningful careers, based on informed choice, of individuals with disabilities;

(2) respect for the privacy, rights, and equal access (including the use of accessible formats), of the individuals;

(3) inclusion, integration, and full participation of the individuals;

(4) support for the involvement of an individual's representative if an individual with a disability requests, desires, or needs such support; and

(5) support for individual and systemic advocacy and community involvement.

Section 7: Definitions

(20) Individual with a disability

(A) In general

Except as otherwise provided in subparagraph (B), the term "individual with a disability" means any individual who—

(i) has a physical or mental impairment which for such individual constitutes or results in a substantial impediment to employment; and

(ii) can benefit in terms of an employment outcome from vocational rehabilitation services provided pursuant to title I, III, or VI.

(21) Individuals with a significant disability

(A) In general

Except as otherwise provided in subparagraph (B), the term "individual with a significant disability" means an individual with a disability—

(i) who has a severe physical or mental impairment which seriously limits one or more functional capacities (such as mobility, communication, self-care, self-direction, interpersonal skills, work tolerance, or work skills) in terms of an employment outcome;

(ii) whose vocational rehabilitation can be expected to require multiple vocational rehabilitation services over an extended period of time; and

(iii) who has one or more physical or mental disabilities resulting from amputation, arthritis, autism, blindness, burn injury, cancer, cerebral palsy, cystic fibrosis, deafness, head injury, heart disease, hemiplegia, hemophilia, respiratory or pulmonary dysfunction, mental retardation, mental illness, multiple sclerosis, muscular dystrophy, musculo-skeletal disorders, neurological disorders (including stroke and epilepsy), paraplegia, quadriplegia, and other spinal cord conditions, sickle cell anemia, specific learning disability, end-stage renal disease, or another disability or combination of disabilities determined on the basis of an assessment for determining eligibility and vocational rehabilitation needs described in subparagraphs (A) and (B) of paragraph (2) to cause comparable substantial functional limitation.

(B) Independent living services and centers for independent living

For purposes of title VII, the term "individual with a significant disability" means an individual with a severe physical or mental impairment whose ability to function independently in the family or community or whose ability to obtain, maintain, or advance in employment is substantially limited and for whom the delivery of independent living services will improve the ability to function, continue functioning, or move towards functioning independently in the family or community or to continue in employment, respectively.

(C) Research and training

For purposes of title II, the term "individual with a significant disability" includes an individual described in subparagraph (A) or (B).

(D) Individuals with significant disabilities

The term "individuals with significant disabilities" means more than one individual with a significant disability.

(E) Individual with a most significant disability

(i) In general

The term "individual with a most significant disability," used with respect to an individual in a State, means an individual with a significant disability who meets criteria established by the State under section 101(a)(5)(C).

(ii) Individuals with the most significant disabilities

The term "individuals with the most significant disabilities" means more than one individual with a most significant disability.

(22) Individual's representative; applicant's representative

The terms "individual's representative" and "applicant's representative" mean a parent, a family member, a guardian, an advocate, or an authorized representative of an individual or applicant, respectively.

(23) Institution of higher education

The term "institution of higher education" has the meaning given the term in section 1201(a) of the Higher Education Act of 1965 (20 U.S.C. 1141(a)).

(24) Local agency

The term "local agency" means an agency of a unit of general local government or of an Indian tribe (or combination of such units or tribes) which has an agreement with the designated State agency to conduct a vocational rehabilitation program under the supervision of such State agency in accordance with the State plan approved under section 101. Nothing in the preceding sentence of this paragraph or in section 101 shall be construed to prevent the local agency from arranging to utilize another local public or nonprofit agency to provide vocational rehabilitation services if such an arrangement is made part of the agreement specified in this paragraph.

(25) Local workforce investment board

The term "local workforce investment board" means a local workforce investment board established under section 117 of the Workforce Investment Act of 1998.

(26) Nonprofit

The term "nonprofit," when used with respect to a community rehabilitation program, means a community rehabilitation program carried out by a corporation or association, no part of the net earnings of which inures, or may lawfully inure, to the benefit of any private shareholder or individual and the income of which is exempt from taxation under section 501(c)(3) of the Internal Revenue Code of 1986.

(27) Ongoing support services

The term "ongoing support services" means services—

(A) provided to individuals with the most significant disabilities;

(B) provided, at a minimum, twice monthly—

(i) to make an assessment, regarding the employment situation, at the worksite of each such individual in supported employment, or, under special circumstances, especially at the request of the client, off site; and

(ii) based on the assessment, to provide for the coordination or provision of specific intensive services, at or away from the worksite, that are needed to maintain employment stability; and

(C) consisting of—

(i) a particularized assessment supplementary to the comprehensive assessment described in paragraph (2)(B);

(ii) the provision of skilled job trainers who accompany the individual for intensive job skill training at the worksite;

(iii) job development, job retention, and placement services;

(iv) social skills training;

(v) regular observation or supervision of the individual;

(vi) followup services such as regular contact with the employers, the individuals, the individuals' representatives, and other appropriate individuals, in order to reinforce and stabilize the job placement;

(vii) facilitation of natural supports at the worksite;

(viii) any other service identified in section 103; or

(ix) a service similar to another service described in this subparagraph.

(28) Personal assistance services

The term "personal assistance services" means a range of services, provided by one or more persons, designed to assist an individual with a disability to perform daily living activities on or off the job that the individual would typically perform if the individual did not have a disability. Such services shall be designed to increase the individual's control in life and ability to perform everyday activities on or off the job.

(29) Public or nonprofit

The term "public or nonprofit," used with respect to an agency or organization, includes an Indian tribe.

(30) Rehabilitation technology

The term "rehabilitation technology" means the systematic application of technologies, engineering methodologies, or scientific principles to meet the needs of and address the barriers confronted by individuals with disabilities in areas which include education, rehabilitation, employment, transportation, independent living, and recreation. The term includes rehabilitation engineering, assistive technology devices, and assistive technology services.

Toni Morrison, from *The Bluest Eye* (1970)

In this novel, Morrison employs disability as a constitutive feature of several of her most memorable characters. In the excerpt here, Polly's identity forms around a limp that she develops after stepping on a rusty nail in childhood. The work's key argument explores concepts of racial beauty as "the most destructive idea in western culture."

Polly

The easiest thing to do would be to build a case out of her foot. That is what she herself did. But to find out the truth about how dreams die, one should never take the word of a dreamer. The end of her lovely beginning was probably the cavity in one of her front teeth. She preferred, however, to think always of her foot. Although she was the ninth of eleven children and lived on a ridge of red Alabama clay seven miles from the nearest road, the complete indifference with which a rusty nail was met when it punched clear through her foot during her second year of life saved Pauline Williams from total anonymity. The wound left her with a crooked archless foot that flopped when she walked—not a limp that would have eventually twisted her spine, but a way of lifting the bad foot as though she were extracting it from little whirlpools that threatened to pull it under. Slight as it was, this deformity explained for her many things that would have been otherwise incomprehensible: why she alone of all the children had no nickname; why there were no funny jokes and anecdotes about funny things she had done; why no one ever remarked on her food preferences—no saving of the wing or neck for her—no cooking of the peas in a separate pot without rice because did not like rice; why nobody teased her; why she never felt at home anywhere, or that she belonged anyplace. Her general feeling of separateness and unworthiness she blamed on her foot. Restricted as a child, to this cocoon of her family's spinning, she cultivated quiet and private pleasures. She liked, most of all, to arrange things. To line things up in rows—jars on shelves at canning, peach pits on the step, sticks, stones, leaves—and the members of her family let these arrangements be. When by some accident somebody scattered her rows, they always stopped to retrieve them for her, and she was never angry, for it gave her a chance to rearrange them again. Whatever portable plurality she found, she organized into neat lines, according to their size, shape or gradations of color. Just as she would never align a pine needle with the leaf of a cottonwood tree, she would never put the jars of tomatoes next to the green beans. During all of her four years of going to school, she was enchanted by numbers and depressed by words. She missed—without knowing she missed—paints and crayons. . . . When the war ended and the twins were ten years old, they too left school to work. Pauline was fifteen, still keeping house, but with less enthusiasm. Fantasies about men and love and touching were drawing her mind and hands away from her work. Changes in weather began to affect her, as did certain sights and sounds. These feelings translated themselves into extreme melancholy. She thought of the death of newborn things, lonely roads, and strangers who appear out of nowhere simply to hold one's hand, woods in which the sun was always setting. In church especially did these dreams grow. The songs caressed her, and while she tried to hold her mind on the wages of sin, her body trembled for redemption, salvation, a mysterious rebirth that would simply happen, with no effort on her part. In none of her fantasies was she ever aggressive; she was usually idling by the river bank, or gathering berries in a field when a someone appeared, with gentle and penetrating eyes, who—with no exchange of words—understood; and before whose glance her foot straightened and her eyes dropped. The someone had no face, no form, no voice, no odor. He was a simple Presence, an all-embracing tenderness with strength and a promise of rest. It did not matter that she had no idea of what to do or say to the Presence—after the wordless knowing and the soundless touching, her dreams disintegrated. But the Presence would know what to do. She had only to lay her head on his chest and he would lead her away to the sea, to the city, to the woods . . . forever. . . . Thus it was that when the Stranger, the someone, did appear out of nowhere, Pauline was grateful but not surprised. He came, strutting right out of a Kentucky sun on the hottest day of the year. He came big, he came strong, he came with yellow eyes, flaring nostrils, and he came with his own music.

Pauline was leaning idly on the fence, her arms resting on the crossrail between the pickets. She had just put down some biscuit dough and was cleaning the flour from under her nails. Behind her at some distance she heard whistling. One of these rapid, high-note riffs that black boys make up while sweeping, shoveling. Or just walking along. A kind of city-street music where laughter belies anxiety, and joy is as short and straight as the blade of a pocketknife. She listened carefully to the music and let it pull her lips into a smile. The whistling got louder, and still she did not turn around, for she wanted it to last. While smiling to herself and holding fast to the break in somber thoughts, she felt something tickling her foot. She laughed aloud and turned to see. The whistler was bending down tickling her broken foot and kissing her leg. She could not stop her laughter—not until he looked up at her and she saw the Kentucky sun drenching the yellow, heavy-lidded eyes of Cholly Breedlove.

▣ Toni Morrison, from *Sula* (1973)

In this novel, African American novelist Toni Morrison explores disability as a source of individual authority rather than a disqualification. In this scene, her protagonist, Eva Peace, presides over her neighborhood while communal memory grows dim about her previous life as a nondisabled woman. For Morrison, Eva's power becomes increasingly the subject of her mythical qualities as a communal storyteller.

1921

The creator and sovereign of this enormous house with the four sickle-pear trees in the front yard and the single Elm in the back yard was Eva Peace, who sat in a wagon on the third floor directing the lives of her children, friends, strays, and a constant stream of boarders. Fewer than nine people in the town remembered when Eva had two legs, and her oldest child, Hannah was not one of them. Unless Eva introduced the subject, no one ever spoke of her disability; they pretended to ignore it, unless, in some mood of fancy, she began some fearful story about it—generally to entertain children. How the leg got up by itself one day and walked on off. How she hobbled after it but it ran too fast. Or how she had a corn on her toe and it just grew and grew and grew until her whole foot was a corn and then it traveled on up her leg and wouldn't stop growing until she put a red rag at the top but by that time it was already at her knee.

Somebody said Eva stuck it under a train and made them pay off. Another said she sold it to a hospital for

$10,000—at which Mr. Reed opened his eyes and asked, "Nigger gal legs goin' for $10,000 *a piece?*" as though he could understand $10,000 *a pair*—but for *one?*

Whatever the fate of her lost leg, the remaining one was magnificent. It was stockinged and shod at all times and in all weather. Once in a while she got a felt slipper for Christmas or her birthday, but they soon disappeared, for Eva always wore a black laced-up shoe that came well above her ankle. Nor did she wear overlong dresses to disguise the empty place on her left side. Her dresses were mid-calf so that her one glamorous leg was always in view as well as the long fall of space below her left thigh. One of her men friends had fashioned a kind of wheelchair for her: a rocking-chair top fitted to a large child's wagon. In this contraption she wheeled around the room, from bedside to dresser to the balcony that opened out the north side of her room or to the window that looked out on the back yard. The wagon was so low that children who spoke to her standing up were eye-level with her, and adults, standing or sitting, had to look down at her. But they didn't know it. They all had the impression that they were looking up at her, up into the open distances of her eyes, up into the soft black of her nostrils and up at the crest of her chin.

Union of the Physically Impaired Against Segregation, from *Aims* (1974)

This reading is excerpted from a policy statement created by British disability protestors as a critique against social obstacles to their full equality. The group was started by disabled activist Paul Hunt when he wrote an open letter to a local newspaper, The Guardian, *and invited other disabled people to join him in his protest. Hunt spent a number of years as a resident of an institution and actively sought to expose the lack of control allowed to disabled people. The Union of the Physically Impaired Against Segregation also engaged in key struggles for the rights to integrated education, accessible housing, as well as meaningful employment. The organization disbanded in 1990 but still serves as one of the earliest examples of organizing against socially created obstacles to disabled peoples' integration.*

The Union aims to have all segregated facilities for physically impaired people replaced by arrangements for us to participate fully in society. These arrangements must include the necessary financial, medical, technical, educational and other help required from the State to enable us to gain the maximum possible independence in daily living activities, to achieve mobility, to undertake productive work, and to live where and how we choose with full control over our lives.

Policy Statement

1. *Disability and Segregation.* Britain today has the necessary knowledge and the advanced technology to bring physically impaired people into the mainstream of life and enable us to contribute fully to society. But instead of the Country's resources being concentrated on basic human problems like ours, they are frequently misspent, for example, on making sophisticated weapons of destruction, and on projects like Concorde and Centre Point. So despite the creation today of such an enormous capacity, which could help overcome disability, the way this capacity is misdirected means that many physically impaired people are still unnecessarily barred from full participation in society. We find ourselves isolated and excluded by such things as flights of steps, inadequate public and personal transport, unsuitable housing, rigid work routines in factories and offices, and a lack of up-to-date aids and equipment.

2. There are a few individual examples of severely impaired people being able to overcome many of these barriers by the use of sufficient resources in the right way. They prove that integration is possible. But as a group we are still often forced to put up with segregated and inferior facilities. We get sent to special schools, colleges or training centres. We are systematically channelled into segregated factories, centres, Homes, hostels and clubs. If we do manage to become mobile, it is often in antiquated tricycles or specially labelled transport. All these segregated forms of help represented progress in years past. But since the means for integration now undoubtedly exists, our confinement to segregated facilities is increasingly oppressive and dehumanising. . . .

5. *Low Bargaining-Power.* When we do succeed in getting employment, our comparatively low productivity means that we have low bargaining-power when it comes to negotiating decent treatment and facilities. Our position is similar to that of many people who are middle-aged or elderly, who have had break-downs,

or are mentally handicapped, black, ex-prisoners, unskilled workers, etc. We are usually among the first to lose our jobs and be cast on the scrap-heap when it suits the needs of the economy. If we are lucky we may be drawn in again, to do the worst paid work, when business starts to boom once more. If we are unlucky, then we could face a lifetime on the degrading, means-tested poverty line. If we are very unlucky we may be consigned to a soul-destroying institution.

6. *Institutions—The Ultimate Human Scrap-Heaps.* The union of the Physically Impaired believes that the reality of our position as an oppressed group can be seen most clearly in segregated residential institutions, the ultimate human scrap-heaps of this society. Thousands of people, whose only crime is being physically impaired, are sentenced to these prisons for life—which may these days be a long one. For the vast majority there is still no alternative, no appeal, no remission of sentence for good behaviour, no escape except the escape from life itself.

The Seventh Seal *is a doom-laden allegory set in medieval times when plague is raging through the land. A knight is challenged to a game of chess by Death, and the knight attempts to reveal the goodness of humankind in order to stave off his own encroaching mortality.*

Source: *The Seventh Seal* (1957), directed by Ingmar Bergman. Sweden. B&W, 100 minutes. Reprinted by permission of Paul Darke.

7. The cruelty, petty humiliation, and physical and mental deprivation suffered in residential institutions, where isolation and segregation have been carried to extremes, lays bare the essentially oppressive relations of this society with its physically impaired members. As in most similar places, such as special schools, there are some staff and volunteers doing their best to help the residents. But their efforts are systematically overwhelmed by the basic function of segregated institutions, which is to look after batches of disabled people— and in the process convince them that they cannot realistically expect to participate fully in society and earn a good living. This function was generally appropriate when special residential institutions first came into being, since in the competitive conditions of the time many physically impaired people could not even survive without their help. But now it has become increasingly possible for severely impaired people not just to survive, but also to work and become fully integrated, the need for segregated institutions no longer exists in the way it did. They have become seriously out of step with the changed social and technological conditions of Britain today. . . .

12. *Disablement Outside Institutions.* Our Union maintains that the present existence of segregated institutions and facilities is of direct relevance even for less severely impaired people who may expect to avoid having to use them. Those of us who live outside institutions can fully understand the meaning of disability in this society only when we take account of what happens to the people who come at the bottom of our particular group. Their existence and their struggles are an essential part of the reality of disability and to ignore them is like assessing the condition of elderly people in this society without considering the existence of geriatric wards.

13. It is also true that the kind of prejudiced attitudes we all experience (other people being asked if we take sugar in our tea is the usual example) are related to the continued unnecessary existence of sheltered institutions. Those who [do this] are indicating that they think we are not capable of participating fully and making our own decisions. They are harking back to the time when disabled people had to be sheltered much more, and they imply that really we ought to be back in our rightful place—that is, a special school, club, hospital unit, Home or workshop. Physically impaired people will never be fully accepted in ordinary

society while segregated institutions continue to exist, if only because their unnecessary survival today reinforces out of date attitudes and prejudices.

14. *Medical Tradition.* Both inside and outside institutions, the traditional way of dealing with disabled people has been for doctors and other professionals to decide what is best for us. It is of course a fact that we sometimes require skilled medical help to treat our physical impairments—operations, drugs and nursing care. We may also need therapists to help restore or maintain physical function, and to advise us on aids to independence and mobility. But the imposition of medical authority, and of a medical definition of our problems of living in society, have to be resisted strongly. First and foremost we are people, not "patients," "cases," "spastics," the "deaf," "the blind," "wheelchairs," or "the sick." Our Union rejects entirely any idea of medical or other experts having the right to tell us how we should live, or withholding information from us, or [making] decisions behind our backs.

15. We reject also the whole idea of "experts" and professionals holding forth on how we should accept our disabilities, or giving learned lectures about the "psychology" of disablement. We already know what it feels like to be poor, isolated, segregated, done good to, stared at, and talked down to—far better than any able-bodied expert. We as a Union are not interested in descriptions of how awful it is to be disabled. What we are interested in, are ways of changing our conditions of life, and thus overcoming the disabilities which are imposed on top our physical impairments by the way this society is organised to exclude us. In our view, it is only the actual impairment which we must accept; the additional and totally unnecessary problems caused by the way we are treated are essentially to be overcome and not accepted. We look forward to the day when the army of "experts" on our social and psychological problems can find more productive work.

Alice Walker, from *Meridian* (1976)

Following in a long tradition of stories about children raised without parents in nature (such as Itard's writings on Victor of Aveyron, for instance, described in Fernald's excerpt in Part Two), Walker's chapter extends the analogy to dehumanizing beliefs about African Americans during the civil rights era. In order to "tame" the wild child's renegade nature, she is captured by administrators at an all-black university for women. However, the do-gooders tragically decide that she is incapable of living alongside other educated individuals and attempt to find a school for "special children" in which to house her.

The Wild Child

The Wild Child was a young girl who had managed to live without parents, relatives or friends for all of her 13 years. It was assumed she was thirteen, though no one knew for sure. She did not know herself, and even if she had known, she was not capable of telling. Wile Chile, as the people in the neighborhood called her (saying it slowly, musically, so that it became a kind of lewd, suggestive song), had appeared one day in the slum that surrounded Saxon College when she was already five or six years old. At that time there were two of them, Wile Chile and a smaller boy. The boy soon disappeared. It was rumored that he was stolen by the local hospital for use in experiments, but this was never looked into. In any case, Wile Chile was seen going through garbage cans and dragging off pieces of discarded furniture, her ashy black arms straining at the task. When a neighbor came out of her house to speak to her, Wile Chile bolted, not to be seen again for several weeks. This was the pattern she followed for years. She would be seen scavenging for food in the garbage cans, and when called to, she would run.

In the summer she wore whatever was available in castoff shorts and cotton tops. Or she would wear a pair of large rayon panties, pulled up under her arms, and nothing else. In winter she put together a collection of wearable junk and topped it with a mangy fur jacket that came nearly to the ground. By the age of eight (by the neighbors' reckoning) she had began to smoke, and, as she dug about in the debris, kicking objects this way and that (cursing, the only language she knew), she puffed on cigarette butts with a mature and practiced hand.

It was four or five winters after they first spotted her that the neighbors noticed Wile Chile was pregnant. They were critical of the "low-down dirty dog" who had done the impregnating, but could not imagine what to do. Wile Chile rummaged about as before, eating rancid food, dressing herself in castoffs, cursing and bolting, and smoking her brown cigarettes.

It was while she was canvassing voters in the neighborhood that Meridian first heard of the Wild Child. The neighbors had by then tried to capture her: A home for her lying-in had been offered. They failed to catch her, however. As one neighbor explained it, Wile Chile was slippier than a greased pig, and unfortunately the comparison did not end there. Her odor was said to be formidable. The day Meridian saw the Wild Child she withdrew to her room in the honors house for a long time. When the other students looked into her room they were surprised to see her lying like a corpse on the floor beside her bed, eyes closed and hands limp at her sides. While lying there she did not respond to anything; not the call to lunch, not the phone, nothing. On the second morning the other students were anxious, but on that morning she was up.

With bits of cake and colored beads and unblemished cigarettes she tempted Wile Chile and finally captured her. She brought her onto the campus with a catgut string around her arm; when Wile Chile tried to run Meridian pulled her back. Into a tub went Wile Chile, whose body was caked with mud and rust, whose hair was matted with dust, and whose loud obscenities mocked Meridian's soothing voice. Wile Chile shouted words that were never uttered in the honors house. Meridian, splattered with soap and mud, broke down and laughed.

At dinner Wile Chile upset her tablemates with the uncouthness of her manners. Ignoring their horrified stares she drank from the tea pitcher and put cigarette ashes in her cup. She farted, as if to music, raising a thigh.

The housemother, called upon in desperation by the other honor students, attempted to persuade Meridian that the Wild Child was not her responsibility.

"She must not stay here," she said gravely. "Think of the influence. This is a school for young ladies." The housemother's marcel waves shone like real sea waves, and her light-brown skin was pearly under a mask of powder. Wile Chile trembled to see her and stood cowering in a corner.

The next morning, while Meridian phoned schools for special children and then homes for unwed mothers—only to find there were none that would accept Wile Chile—The Wild Child escaped. Running heavily across a street, her stomach the largest part of her, she was hit by a speeder and killed.

John Gliedman and William Roth, from "The Grand Illusion" (1976)

In the fall of 1976, the organizers of the 1977 White House Conference on Handicapped Individuals invited John Gliedman and William Roth to submit an "Awareness Paper" on the communications disabilities. Deciding to run with the topic, they responded with "The Grand Illusion," a 37-page Goliath of an essay, typeset on an IBM Selectric Composer to conserve space, that contained large chunks of the 1976 working draft of their book The Unexpected Minority *(1980). Although "The Grand Illusion" was not the first work to highlight the analogies between the disabled and other stigmatized minorities, the essay's relentless emphasis on the degree to which disability is a social construction was unusual for the times. The authors developed their analysis further in* The Unexpected Minority, *where they presented the first comprehensive critique of traditional lay and expert views of disability and embedded the need for legal and political action within a perspective that integrated the minority group model with what today is variously called the postmodern or "disability as human variation" model. Perhaps because of its laser-like focus on developing the minority group model of disability, "The Grand Illusion" had its intended effect of shaking people up. "The Grand Illusion" was distributed to all who attended the White House conference, but it was not included in the volume of Awareness Papers that the organizers subsequently published, an omission that the authors have always considered a signal bureaucratic honor.*

The individual's communication options are generated by the nature of the setting. Is the individual among friends? Is he among strangers who respect him for what he is rather than see him as a handicap? And to an equally remarkable extent, the social possibilities of any normal setting are in turn partly determined by an individual's earlier social experience. Has he had a good education? Has he had sexual experience? Has he been able to travel? What was (or is) the individual's childhood like? The answers to these questions are as decisive as the answers to the medical questions. Indeed, in a certain sense, they are far more decisive because they determine the ultimate significance of the medical answers in the individual's life.

One of the most recognized disability films in the history of cinema, The Miracle Worker *tells the story of Annie Sullivan's struggles to teach the deaf and blind Helen Keller how to communicate in sign language.*

Source: *The Miracle Worker* (1962), directed by Arthur Penn. United States. B&W, 106 minutes. Reprinted by permission of Paul Darke.

In recent years there has been much talk about the emphasis upon meaningless academic credentials in American life. [In] a cruel and largely unperceived way, the able-bodied world practices a parallel kind of credentialing on the disabled. All too often the child or the newly disabled adult learns that the prerequisite for being in social settings where a simple cry by a person with CP, a touch by a blind person, or a nod or grimace of joy is exactly right—and communicates far more than mere words—is a normal body. As much as anything our emphasis on the most mechanical aspects of communication reflects (or at least is congruent with) an important fact about cultural attitudes toward disability. To focus so exclusively on the sensory and motor obstacles to the message—and to overlook the sociological medium upon which all communication depends—is, in effect, to ratify the systematic exclusion of large numbers of disabled individuals from situations of genuine intimacy. It is to ratify their exile to the impoverished setting of the classroom, the doctor's office, the hospital ward, and the family bedroom which visitors are not shown. All too often we wind up helping the severely communication-disabled communicate as *patients* not as self-sufficient adults.

In sum, even if we restrict ourselves to the considerations of the classically defined communications disabilities, much of what the individual experiences as the most limiting and destructive aspect of his communications disability is the result of an ultimately social and ultimately arbitrary set of decisions, not an inevitable consequence of his biological deficit. Society not biology decrees that individuals crippled by severe CP are denied access to the mainstream of life. Society not biology decrees that the deaf must use cumbersome visual devices or speech instead of sign language to communicate with the hearing.

If most communications disabilities contain a sociological component of no mean importance, what of other kinds of handicaps? Might their not inconsiderable

But to even mention in passing the importance of a rich and varied life experience to successful communication—however communication be defined—is to touch upon one of the great tragedies of handicap. Characteristically we make every effort to help the disabled individual compensate for his reduced ability to transmit or receive messages by teaching him how to be more explicit. In the process what is often forgotten—especially in the education of the handicapped child—is the positive functions of ellipsis for the able-bodied. Nowhere is this clearer than in the most meaningful and intimate situations of life—the touch of two lovers, the telegraphic speech of two old friends on the same wavelength, the poetry of silence. Here again the severely communication disabled individual often possesses more than enough biological capacity for effective communication. What is often lacking is not the biological potential but the social potential—i.e., a life in which intimacy is possible with anyone.

sociological component also produce significant obstacles to communication—obstacles whose ultimate origins are to be found not in the bodies of the disabled but in the minds of the able-bodied?

To broach these questions requires a significant expansion of the definition of communication common in the specialized literature which treats [of] communication disorders. It requires that we explore all kinds of communication, verbal and nonverbal. It requires that we recognize that each of us speaks many "languages" besides English—languages which communicate our self image to the other, our state of mind, our character, our social status, and our feelings about the other; language which communicates to the other whether we think he has a future and whether we have a future, in our private life and in professional life; language which passes judgment on the quality of the interaction between self and other, whether we might be compatible acquaintances, business associates, friends or lovers. And it is to recognize that each of us broadcasts this information on many "wavelengths" simultaneously, only one of these wavelengths being captured by a summary of what was actually said. We broadcast by means of our oral speech style, our grammar, our choice of words, our wit, and our accent. We broadcast by means of our tone of voice, our intonation, our clarity of articulation; by the way we pause between phrases and words: by our pitch, and our timber. We broadcast by means of the gestures we consciously or unconsciously make with our arms and legs, and if our arms and legs are paralyzed that very fact broadcasts a message. We broadcast by means of our facial expressions. We do so even if we are blind and do not control what the other reads into our face. We broadcast by our posture, our motor control, and by the overall way we look; an atrophied limb broadcasts a message; so does a wheel chair or an iron lung. We broadcast information by means of each of these channels, and what is communicated on one channel affects what is communicated on the other channels. Indeed, even our interpretation of the literal meaning of spoken speech is far more dependent upon what is broadcast on other "wavelengths." As anyone who has puzzled his way through transcripts of taped conversations knows, much that is self-evident face-to-face becomes unclear and ambiguous when we do not know what gestures, and tones of voice were used—or, even, upon occasions, the physical context in which the words were uttered, or the speaker's job, status, or sex.

But to adopt a definition of communication which is more in consonance with current linguistic, anthropological, and sociological practice, is to see that the communication problems of the disabled represent one side of what is perhaps the root problem of handicap in America—a problem which might aptly be called "The Other American Dilemma." The problem of handicap is multitudinous in its complexity. It involves medicine, rehabilitation, education, psychiatry. But first and foremost it is a problem of the able-bodied. By accident or by design, the world which the able-bodied have built interposes all manner of physical and social obstacles to the achievement of an adult identity for the disabled. For the individual with a relatively minor disability, these obstacles exert at the very least a severe psychic toll in unnecessarily low self-esteem, anxiety, demoralization, and diminished communication possibilities and abilities. For the more severely handicapped, biologically imposed limitations loom larger, but the really insuperable obstacles remain those imposed upon the individual by an able-bodied world which all too often returns his efforts for self-realization and communication with stigma, indifference, ignorance, and even, upon occasion, systematic efforts to persuade him to adjust to a life of needless dependency.

In the pages which follow we shall pursue a path which arches back and forth between these two faces of "The Other American Dilemma." In sections II and III, by means of analysis and copious example we explore some of the more important sociological obstacles experienced by most handicapped individuals. First appearing in the very act by which an able-bodied person sees a handicapped person, they are rooted in deep-seated cultural definitions of the meaning of disability. These definitions impede communication on many levels. After exploring some of these levels, we briefly examine some of the strategies the handicapped adopt to overcome these sociological obstacles—strategies which also often exact a terrible human cost. In sections IV and V we turn to a consideration of possible ways of improving the sociological situation of handicap. As we will see, one of the best ways may lie through the handicapped, as a social group, seeking to emulate the strategy which has proven so successful for the members of other stigmatized minority groups in the last generation. An important precondition for pursuing this course is the elimination of the many environmental barriers to the mobility of disabled individuals—e.g., buildings without ramps or adequate rest rooms, public telephones, and elevators not coded in Braille, and automobiles and public transportation systems which often are virtually unusable. Besides sharply curtailing the exercise of fundamental civil liberties, these physical barriers also represent a major obstacle to interpersonal communication on their own account. Next we briefly examine some of the other obstacles to communication, self-realization, and the achievement of an adult identity that that society puts in the way of the handicapped child and adult. These obstacles range from the way in which our helping services treat an individuals handicap and not the needs of the whole person, to the way society structurally discriminates against the handicapped as independent producers and consumers. We shall see that the effects of these institutional obstacles parallel the effects of environmental barriers to mobility: both represent concrete social precipitates of our underlying cultural definition of handicap. Finally, in the Appendix, we attempt systematically to catalogue some of the main ways in which break downs in communication between able-bodied and handicapped individuals can occur.

* * *

Before we can perceive a biological difference as a handicap, we must know—or have reason to believe—that it is chronic. Because this knowledge is not unambiguously transmitted by the rays of light which are focused into an image on the retina, the fact that we seem to instantaneously see that the man is handicapped reflects an interpretation of what our retina receives. To be sure, knowledge that a biological deficit is chronic is, in the everyday sense of the word, a reasonably objective matter. One consults a doctor, a textbook, or one's own experience. There is nothing subjective about knowing that a man with a spinal cord injury will not be able to use his legs again unless there is a breakthrough in treating his kind of spinal block. But suppose that in addition to such facts, other, less impeccable and less objective pieces of knowledge intervene between the image of the handicapped man on our retina and our seeing him, suppose that beliefs with little or no basis in reality intervene and govern what we see?

In her biography of Moshe Dayan, the general's daughter writes that after he lost his right eye in battle, her father was mystified by the fascination which his injury seemed to hold for many women. Dayan's disability is one of the few which change dramatically in character as one moves from childhood to adulthood. The nature of this change tells us something important about what we have to assume before we perceive something as a handicap.

A thought experiment. Conjure up in your mind a military man with an eye-patch. Now examine your feelings. Is there not something romantic and heroic about the injury? Doesn't it suggest a dark and complex past, a will of uncommon strength, perhaps a capability for just enough brutality to add an agreeable trace of sinister and virile unpredictability to the man? Depending on one's politics, it can suggest a resourceful ally or a dangerous enemy. Mustn't one be very tough and very competent indeed, to escape so lightly from a brush with death? No doubt these reactions explain why the only time Madison Avenue used a disability to enhance the glamour (and salability) of a commodity was in the Hathaway shirt ads of the 1960's.

Now replace the image of the Hathaway man with an eye-patch with the image of a young child with an eye-patch. For most people, something strange happens. The romance and mystery of the disability disappear. What we see is a handicapped child. There is something sad and even pitiful about him. Looking at his face we fear for his future and worry about his present. We think: this poor kid is going to have a hard time growing up and making it in this world. Where the presence of an eye-patch made the Israeli leader seem even more of a general (an adult role), the presence of an eye-patch on a child is a sign of damage, a cause for pity, an indication that this is a child whose ability to fit into some adult role in the future is in serious jeopardy.

Similar shifts in valence as a function of age or sex occur with a host of minor disfigurements or cosmetic blemishes—with scars and with certain kinds of ugliness which seem quite terrible in a child or a woman and seem sexy or virile in an adult male. Such shifts also appear to occur with certain kinds of limps requiring the use of a cane, as an acquaintance of ours learned to his astonishment when, after a hiking accident which left him hobbling about for several weeks, he was told by a number of friends that he looked very distinguished using a cane and should consider always using one. Needless to say, this is not something which anyone ever says to a young child who is forced to use a cane.

But General Dayan's eye-patch also points to something else. It points to a class of fairly serious physical disabilities which shuttle back and forth between being perceived as handicaps, or as enhancers, the direction of the shuttle being a function of one's adult role. (All of them, let us add at once, are perceived as handicaps when they appear in women and children.) In Jean Renoir's "La Grand Illusion," Erich von Stroheim plays the part of a man with a brace under his chin, a lame leg, a body scarred by burns, and a back injury which requires that he wear a steel corset. While the enumeration of these disabilities suggests a rather severely disabled man, we do not perceived the commandant as handicapped when we watch the film.

There are at least three possible explanations for this, and each suggests a cluster of special adult roles which are able to assimilate certain kinds of major handicaps more readily than most adult roles.

First, the movie is set during wartime. During war, our tacit definitions of handicap are relaxed. We adopt—if that be the word—a more sane approach, what counts is not so much how a man looks (within limits) but whether he can still function. And while von Stroheim is no longer fit for combat duty, he is perfectly capable of running a prisoner of war camp, and controlling the lives of hundreds of able-bodied people.

The second explanation involves the kind of character von Stroheim plays. An old Prussian aristocrat with a Spartan sense of morality and honor which elicits respect, he quite literally refuses to cease being an adult. And because society gives him the means—a war, a position of responsibility behind the lines and an aristocratic identity—he carries it off.

The final explanation is, we believe, generic. It is easier to integrate (and therefore to defuse) a disability into one's adult identity if one is cast as a villain. Villains are supposed to be scary. They are also supposed to be cunning, resourceful, and capable of outwitting death. A disability or two serves to indicate these characteristics—hence the false arm of Dr. No in the James Bond thriller, *The Island of Dr. No,* or in Bond's *From Russia With Love,* the thug with the hook on his arm which can cut through metal and glass. Hence the cluster of disabilities which afflict Dr. Strangelove, in Stanley Kubrick's "Dr. Strangelove," but which do not always succeed in causing us to view him as handicapped—the arm which is not fully under his control, the partial paralysis which results in his being pushed about in a wheelchair and wearing braces on his legs.

Closely related to these implicit rules about when a physical imperfection is perceived as a disability or a handicap, is the phenomenon of anthropomorphicization.

All of us remember childhood stories about four-footed creatures of the plains and forests—horses running wild and free, lion cubs overcoming the dangers of the veldt and becoming hunters, deer and bear living out their lives in the green solitude of the forest. When we heard these stories as children—and when we retell them to our own children—there seems nothing strange or unnatural to ascribing a full range of (juvenile and adult) human characteristics to creatures who hunt with their claws or live by grazing on grass and shrubbery. One thinks of *Winnie-The-Pooh,* of *Bambi,* of *Lassie,* or Jack London's *The Call of the Wild,* of *Black Beauty,* of *Born Free,* of a multitude of other stories about animals in which a perfect equation is made between human child and animal child, human adult and animal adult.

But now perform the following thought experiment. Replace the animal figures in one of these stories with human beings who possess exactly the same range of functional capacities as the animals in question. For a deer who can run swiftly but can only manipulate objects with his mouth and tongue, substitute the image of a man paralyzed from the neck down who is as mobile as a deer in his electric wheelchair, and who can also manipulate objects with his mouth and tongue. Or instead of a family of lions, imagine a family of severely retarded individuals with intact bodies. Here, too, there is a perceptual "snap." Our willingness to expand the category of human to include juvenile and adult forms other than our own dissolves when we try to make it embrace severely handicapped people as well. Indeed, the very idea seems a contradiction in terms, an exercise in sick humor, and certainly something that we are not about to expose our children to.

Yet reflect a moment. Why is it a contradiction in terms to ascribe human characteristics to a man in an electric wheelchair or to a profoundly retarded person? Is it not because, bound up in our perception of animals, is the belief that on their own terms, they are complete, whole, and either adult or in the process of growing up to become adult, whereas it is precisely this quality of adultness (future or present) which is absent in our perception of these people we perceive as handicapped?

▣ Judi Chamberlin, from *On Our Own: Patient-Controlled Alternatives to the Mental Health System* (1978)

Described by many in the antipsychiatric movement as a landmark work, On Our Own *represents one of the earliest writings by a self-proclaimed psychiatric survivor.*

In Whatever Happened to Baby Jane? *two former movie stars live in their gloomy Hollywood mansion; one is in a wheelchair, and the other is mentally ill. The plot revolves around the responsibility for the accident that confined the matinee star to a wheelchair.*

Source: *Whatever Happened to Baby Jane?* (1962), directed by Robert Aldrich. United States. B&W, 130 minutes. Reprinted by permission of Paul Darke.

This excerpt, from the chapter entitled "Consciousness Raising," discusses the importance of raising the consciousness of both mental patients and others.

Consciousness raising is an ongoing process. Negative stereotypes of the "mentally ill" are everywhere and are difficult not to internalize, no matter how sensitive one becomes. This stereotyping has been termed "sane chauvinism" or "mentalism" by mental patients' liberation groups. Like sexism, mentalism is built into the language—*sick* and *crazy* are widely used to refer to behavior of which the speaker disapproves. The struggle against mentalism is one of the long-range activities of mental patients' liberation. . . . My feelings began to change when I discovered the existence of the Mental Patients' Liberation Project in New York, one of the earliest mental patients' liberation groups. We talked about our experiences and discovered how similar they were. Whether we had been in grim state hospitals or expensive private ones, whether we were there voluntarily or involuntarily, whether we had been called schizophrenic, manic-depressive, or whatever, our histories had been extraordinarily similar. We had experienced depersonalization, the stupefying effects of drugs, the contempt of those who supposedly "cared" for us. Out of this growing awareness came a deeper understanding of the true purpose of the mental health system. It is primarily social control.

Sherwood Hall, from *With Stethoscope in Asia: Korea* (1978)

Sherwood Hall was the son of Dr. Rosetta S. Hall and Dr. William Hall, American missionaries and physicians in Korea. Dr. Rosetta Hall established modern special education in Korea in 1894. Sherwood Hall wrote a book based on his mother's diary. This excerpt shows the Western Christian perspective on disabled people in traditional Korea and the missionaries' roles.

Dr. [William?] Hall's first Christian convert in Pyong Yang was Mr. O Syok Hyong (who was among those cast into prison and later released during the recent persecutions). Mr. O had a little daughter who was blind. Mrs. Hall had encountered blind and deaf-mute patients in her medical work and longed to be able to do something to help them. However, the condition of both the blind and deaf-mutes in Korea at that time, Mrs. Hall discovered, was indeed pitiable. The deaf-mutes were considered imbeciles who survived by their animal instincts and the blind became fortune tellers or sorcerers (*mudongs*) if their parents were rich enough to have them thus trained. Otherwise, they were neglected and ignored, often poorly fed and clothed and allowed to sit in a corner until eventually they lost even the ability to walk.

Although Mrs. Hall had wanted to do something to help blind children, she had been cautioned that the Koreans might not understand her purpose. In time of any disturbances, they might point to the blind students as proof of the false tale that circulated during the Baby Riots of 1888 that doctors were taking out the children's eyes to make medicine.

When Mrs. Hall observed that Mr. O's eldest daughter was blind, she thought, "Here's my chance to begin. Her father is a Christian, and will not misinterpret my motive." . . .

Pongnai responded so eagerly and with such intelligence, that Mrs. Hall felt that she could be helped to learn to read if only Mrs. Hall had knowledge of the proper technique for teaching the blind. She resolved to learn more about it, for it could be a means of combating the superstition which prevented the blind from enjoying a life of usefulness. . . .

After moving to Pyong Yang, my mother had started working again with Mr. O's blind daughter, Pongnai. Teaching Pongnai with these new resources was at first slow and tedious work, but once she had mastered the alphabet and the syllabary, it was plain sailing. In a year, Pongnai could read all that my mother had been able to prepare and she learned to write in point and to make her own lessons from dictation. My mother also taught her to knit.

Patients, seeing Pongnai so happy and industrious, would ask my mother if other blind girls they knew might join her. Thus began the first school for the blind in Korea, and after the Pyong Yang Girls' School was built, a classroom for blind girls was added. My mother's belief was that the blind girls should be taught together with the seeing girls and should participate in their games. All that was necessary was to add a special teacher to the school staff for the beginners. Pongnai eventually became such a teacher as the work for the blind and deaf expanded.

▣ Leslie Fiedler, from *Freaks, Myths and Images of the Secret Self* (1978)

In one of the earliest analyses of freak shows as a social forum for producing difference, Fiedler adopts his characteristic psychoanalytic framework from which to read freak relations in the sideshow context. For Fiedler, the freak show provided audiences with opportunities to more directly encounter the Other of embodiment. One gazed at freaks while experiencing an internal catharsis that ultimately confirmed one's own membership in the ranks of the normal.

Even the ritualized murder of Freaks, however, seemed in ancient times to verge on sacrilege, and its incidence, therefore, was much lower than we might suppose. Sometimes, indeed, they were preserved and worshipped, as was clearly the case of a hideously distorted shamanka (female medicine woman) found in an underground cave in Czechoslovakia in the midst of ritual splendor 25,000 years after her interment. And even the Emperor Augustus, convinced that all freaks, especially Midgets, possessed the Evil Eye, nonetheless had created for his court a gold statue with diamond eyes representing his pet Dwarf, Lucius.

So there never was in earlier times any total genocidal onslaught against Freaks like that launched by Hitler against Dwarfs in the name of modern "eugenics." And it is even likely that fewer monsters were denied a chance to live in "priest-ridden" societies than in an AMA-controlled age like our own, in which "therapeutic abortions" are available to mothers expecting monstrous births, and infanticide is practiced under the name of "removal of life-supports from non-viable major terata."

At any rate, the word "monster" retains much of the awe once felt in the presence of newborn malformations, and the word, therefore, along with its variant form, "monstrosity," has never disappeared from the working vocabulary of carnivals and side shows. Indeed, I can still play in my head a spiel of a "freak show talker," familiar to me since childhood. Jo-Jo, the dog-faced boy, that ghost of a voice keeps saying, the greatest an-thro-po-log-i-cal-mon-ster-os-i-ty in captivity Brought back at great expense from the jungles of Bary-zil. Walks like a boy. Barks like a dog. Crawls on his belly like a snake. And at the drawled five syllables of mon-ster-os-i-ty, I feel my spine tingle and my heart leap as I relive the wonder of seeing for the first time my own most private nightmares on public display out there.

Why have I not used the word "monster," then, to describe those "unnatural creatures" whose natural history I am trying to write? In 1930, C. J. S. Thompson called a similar study, *The Mystery and Lore of Monsters.* But over the more than four decades since its appearance, the term "monster," has been preempted to describe creations of artistic fantasy like *Dracula, Mr. Hyde,* the *Wolf Man, King Kong,* and the nameless metahuman of Mary Shelley's *Frankenstein. . . .*

To be sure, monsters have a mythological dimension like Freaks, and in this respect they are unlike the category of unfortunates whom early French teratologists called mutiles: the blind, deaf, dumb, crippled, perhaps even hunchbacks and harelips, though these are marginal; along with amputees, paraplegics, and other victims of natural or man-made disaster. Children who are born legless or armless, their limbs amputated by a tangled umbilical cord, are sometimes hard to tell from true phocomelics, or seal children, with vestigial hands and feet attached directly to the torso. But once identified, they are primarily felt as objects not of awe but of pity.

Self-Advocacy in Australia (1981)

The Code of Rights of REINFORCE, the Victorian Association for Intellectually Disadvantaged Citizens, was drawn up in August 1981 at the Fifth Strand, an international conference of people labeled as mentally retarded. The Fifth Strand was an alternative conference that ran parallel with a "professional" conference on mental retardation.

Code of Rights

We want more training for jobs outside.

We want to see more people out of institutions.

We want better transport and lower fares and better services.

We are humans first and disadvantaged second.

All theatres to have concessions for each session.

We need more access to community facilities.

Everybody living in institutions has the right to community living, to be trained for jobs and to education.

We want more group homes to be built and more half-way houses.

Each pension should be above the poverty line and increase quarterly.

We want the right to have our own choice of medical insurance and our own doctor.

We have the right to have our rights protected, to be protected from violence and crime.

We have the right to information about marriage and relationships.

We have the right to live in our own home.

We have the right to spend our own money.

Kubrick's cool cynicism and screenwriter Terry Southern's caustic humor are perfectly wedded in Dr. Strangelove, *a vision of nuclear apocalypse brought about by a mad U.S. general's paranoia about women and Commies. Peter Sellers excels as a black-gloved, wheelchair-using, Kissinger-esque president.*

Source: *Dr. Strangelove* (1964), directed by Stanley Kubrick. United Kingdom. B&W, 93 minutes. Reprinted by permission of Paul Darke.

We demand all discrimination to cease.

We have the right to live with whom we want.

We have the right to know where our money is going.

Intellectually disadvantaged citizens should have access to low-rent flats and houses in the community.

We demand the closing of institutions for intellectually disadvantaged people.

We have the right to education.

We have the right to privacy.

We have the right to private ownership.

We have the right to equal day's pay for a fair day's work.

We have the right to worker's compensation.

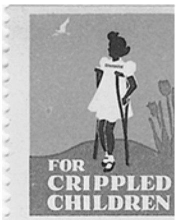
Images of Disability on Stamps

Stamps reveal a lot about a country—both how it sees itself and how it wants others to see it. As such, disability is almost always seen in terms of impairment and little else on stamps across the world. Africa is the continent that has most "exploited" impairment on stamps and can often be interpreted as a country fulfilling First World expectations in an attempt to demonstrate its own sense of impairment of wealth, health, and education. But, to be fair, the First World (Western and wealthy countries) has almost unanimously exploited impairment, not only by making it the definition of disablement but also by creating an intrinsic cultural link between impairment and charity.

Charity and education about the prevention of impairment are givens and are seen as a wholly "good" thing. Thus, some images of impairment on stamps are so gloriously non-PC that they seem almost a joy in their celebration of otherness. Though a massive explosion of postal images of disability and impairment took place after the United Nations' 1981 International Year of the Disabled, prior to that, postal images of disability had appeared consistently in relation to wars (veterans), charity, immunization programs (polio in particular), and health education programs.

As with any stamp-collecting theme, there are always many more examples of the theme than one would ever hope for, be it images of disabled people; of particular impairments; or of wheelchairs, crutches, hearing aids, and the like. Stamps have been—and still are—advertisements for a (usually dubious) collective ideology of disablement; thus, we see the current increase in representations of disability on stamps linked to current issues such as stem cell research or HIV issues. But, like disability itself, disability and impairment are now and will continue to be on stamps in virtually every country in the world. (See www.outside-centre.com for listing and images.)

Paul Darke



▣ Tetsuko Kuroyanagi, from *Totto-chan: The Little Girl at the Window* (1981)

This excerpt is from Totto-chan: The Little Girl at the Window, *a best-selling memoir by Japanese television talk show host and author Tetsuko Kuroyanagi. The book recalls her year as a first grader at Tomoe Academy, a progressive school created and run by Sosaku Kobayashi. (The school was destroyed in 1945 when the United States bombed Tokyo.) Kuroyanagi appreciated Headmaster Kobayashi's philosophy of "leveling the playing field" for all children, a very unusual approach to education in Japan before the surrender and occupation. The title of the book draws on a Japanese expression: people who were "over by the window" were marginalized, not part of the larger group (a similar Western expression would be to say that someone at work was "moved to a corner office" and thus taken out of the mainstream—though of course this expression conveys a positive separation). There isn't much mention of physical disability in this context in the book, but the epilogue refers to one particular classmate of the author's, Akira Takahashi. The reference to Sports Day is to a day when everyone in a school (and sometimes the parents as well) takes part in a festival of track and field events. Normally, a person of short stature would stand little chance at such events; however, the Headmaster had arranged for first-grade events that would actually be simpler for a person of short stature than for a child of average height. "Lunchtime speeches" at Tomoe referred to the Headmaster having children get up during lunch and make short speeches about almost anything, in order to help them develop self-confidence. At least in the first grade at Tomoe, swimming was "clothing optional"; the Headmaster thought that the children would get over any "morbid curiosity" about their bodies, especially with someone like Akira Takahashi in the class.*

The Swimming Pool

That was a red-letter day for Totto-chan. It was the first time she had ever swum in a pool. And without a stitch on!

It happened in the morning. The headmaster said to them all, "It's become quite hot all of a sudden, so I think I'll fill the pool."

"Wow!" everybody cried, jumping up and down. Totto-chan and the first grade children cried "Wow" too, and jumped up and down with even greater excitement than the older students. The pool at Tomoe was not rectangular like most pools, as one end was narrower than the other. It was shaped pretty much like a boat. The lay of the land probably had something to do with it. But nonetheless, the pool was a large and splendid one. It was situated between the classrooms and the Assembly Hall.

All during their lessons, Totto-chan and the others kept stealing glances out of the window at the pool. When empty it had been littered with fallen leaves just like the playground. But now that it was clean and beginning to fill up, it started to look like a real swimming pool.

Lunchtime finally arrived, and when the children were all gathered around the pool, the headmaster said, "We'll do some exercises and then have a swim."

"Don't I need a swimsuit to go swimming?" thought Totto-chan. When she went to Kamakura with Mother and Daddy, she took a swimsuit, a rubber ring, and all sorts of things. She tried to remember if the teacher had asked them to bring swimsuits.

Then, just as if he had read her thoughts, the headmaster said, "Don't worry about swimsuits. Go and look in the Assembly Hall."

When Totto-chan and the other first graders got to the Assembly Hall the bigger children were taking off their clothes with shrieks of delight as if they were going to have a bath. They ran out, one after the other, stark naked, onto the school grounds. Totto-chan and her friends hurriedly followed them. In the warm breeze it felt wonderful not to have any clothes on. When they got to the top of the steps outside the Assembly Hall they found the others already doing warm-up exercises. Totto-chan and her classmates ran down the steps in their bare feet.

The swimming instructor was Miyo-chan's elder brother—the headmaster's son and an expert in gymnastics. He wasn't a teacher at Tomoe but he was on the swimming team of a university. His name was the same as the school's—Tomoe. Tomoe-san wore swimming trunks.

After their exercises, the children let out screams as cold water was poured over them, and then they jumped into the pool. Totto-chan didn't go in until she had watched some of the others and satisfied herself they could stand. It wasn't hot, like a bath, but it was lovely and big, and as far as you could stretch your arms there was nothing but water.

Thin children, plump children, boys, girls—they were all laughing and shouting and splashing in their birthday suits.

What fun, thought Totto-chan, and what a lovely feeling! She was only sorry [her dog] Rocky couldn't come to school. She was sure that if he knew he could go in without a swimsuit he'd be in the pool, too.

You might wonder why the headmaster allowed the children to swim naked. There were no rules about it. If you brought your suit and wanted to wear it, that was perfectly all right. On the other hand, like today, when you suddenly decided to go in and hadn't a suit, that was perfectly all right, too. And why did he let them swim in the nude? Because he thought it wasn't right for boys and girls to be morbidly curious about the differences in their bodies, and he thought it was unnatural for people to take such pains to hide their bodies from each other.

He wanted to teach the children that all bodies are beautiful. Among the pupils at Tomoe were some who had had polio, like Yasuaki-chan, or were very small, or otherwise handicapped, and he felt if they bared their bodies and played together it would rid them of feelings of shame and help to prevent them developing an inferiority complex. As it turned out, while the handicapped children were shy at first, they soon began to enjoy themselves, and finally they got over their shyness completely.

Some parents were worried about the idea and provided their offspring with swimsuits which they insisted should always be worn. Little did they know how seldom the suits were used. Observing children like Totto-chan—who right from the start decided swimming naked was best—and those who said they had forgotten to bring their suits and went in anyway, most of them became convinced it was much more fun swimming naked like the others, so all they did was make sure they took wet swimsuits home! Consequently, almost all the children at Tomoe became as brown as berries all over, and there were hardly any with white swimsuit marks. (Pp. 66–69)

Takahashi

One morning, when they were all running about the school grounds, the headmaster said, "Here's a new friend for you. His last name is Takahashi. He'll be joining the first grade train."

The children, including Totto-chan, looked at Takahashi. He took off his hat and bowed, and said shyly, "How do you do?"

Totto-chan and her classmates were still quite small, being only in the first grade, but Takahashi, although he was a boy, was much smaller still, with short arms and legs. His hands, in which he held his hat, were small, too. But he had broad shoulders. He stood there looking forlorn.

"Let's talk to him," said Totto-chan to Miyo-chan and Sakko-chan. They went over to Takahashi. As they approached him he smiled affably, and they smiled back. He had big round eyes and looked as if he wanted to say something.

"Would you like to see the classroom in the train?" Totto-chan offered.

"Mm!" replied Takahashi, putting his hat back on his head.

Totto-chan was in a great hurry to show him the classroom and bounded over to the train, calling to him from the door, "Hurry up."

Takahashi seemed to be walking fast but was still a long way off.

"I'm coming," he said as he toddled along trying to run.

Totto-chan realized that while Takahashi didn't drag his leg like Yasuaki-chan, who had had polio, he was taking the same amount of time to get to the train. She quietly waited for him. Takahashi was running as fast as he could and there was no need to say, "Hurry," for he *was* hurrying. His legs were very short and he was bow-legged. The teachers and grown-ups knew that he had stopped growing. When he saw that Totto-chan was watching him, he tried to hurry faster, swinging his arms, and when he got to the door, he said, "You do run fast." Then he said, "I'm from Osaka."

"Osaka?" cried Totto-chan excitedly. Osaka was a dream city she had never seen. Mother's younger brother—her uncle—was a university student, and whenever he came to the house he used to take her head in both his hands and lift her up as high as he could, saying, "I'll show you Osaka. Can you see Osaka?"

It was just a game grown-ups used to play with children, but Totto-chan believed him. It stretched the skin of her face horribly and pulled her eyes out of shape and hurt her ears, but she would frantically look into the distance to try and see Osaka. But she never could. She always believed, however, that one day she would be able to see it, so whenever her uncle came, she would ask, "Show me Osaka." So Osaka had become the city of her dreams. And Takahashi came from there!

"Tell me about Osaka," she said to Takahashi.

"About Osaka?" he asked, smiling happily. His voice was clear and mature. Just then the bell rang for the first class.

"What a pity," said Totto-chan. Takahashi went in gaily, swinging the little body that was almost hidden by his bag, and sat down in the front row. Totto-chan hurriedly sat down next to him. She was glad you could sit anywhere you liked. She didn't want to leave him. Thus, Takahashi became one of her friends, too. (Pp. 90–100)

Sports Day

Tomoe's Sports Day was held every year on the third of November. The headmaster had decided on that day after a lot of research, in which he found out that the third of November was the autumn day on which it had rained the fewest times. Perhaps it was due to his skill in collecting weather data, or perhaps it was just that the sun and clouds heeded his desire—that no rain should mar the Sports Day so anticipated by the children, who had decorated the school grounds the day before and made all sorts of preparations. Whatever it was, it was almost uncanny the way it never rained on that day.

As all kinds of things were done differently at Tomoe, its Sports Day, too, was unique. The only sports events that were the same as at other elementary schools were the Tug of War and the Three-Legged Race. All the rest had been invented by the headmaster. Requiring no special or elaborate equipment, they made use of familiar everyday school things.

For instance, there was the Carp Race. Large tubular cloth streamers, shaped and painted like carp—the kind that are flown from poles in May for the Boys' Day Festival—were laid in the middle of the school grounds. At the signal, the children had to start running toward the carp streamers and crawl through them from the mouth end to the tail end and then run back to the starting point. There were only three carp—one red and two blue—so three children raced at a time. The race looked easy but was quite difficult. It was dark inside, and the carp were long, so you could easily lose your sense of direction. Some children, including Totto-chan, kept coming out of the mouth, only to realize their mistake and hurriedly burrow inside again. It was terribly funny to watch because the children crawling backward and forward inside made the carp wriggle as if they were alive.

There was another event called Find-A-Mother Race. At the signal the children had to run toward a wooden ladder propped up on its side, crawl through it between the rungs, take an envelope from a basket, open it, and if the paper inside said, for instance, "Sakko-chan's mother," they would have to find her in the crowd of spectators, take her hand, and return together to the finishing line. One had to ease oneself through the ladder with catlike grace or one's bottom could get stuck. Besides that, a child might know well enough who Sakko-chan's mother was, but if the paper read "Miss Oku's sister," or "Mr. Tsue's mother," or "Mrs. Kuninori's son," whom one had never met, one had to go to the spectators' section and call in a loud voice, "Miss Oku's sister!" It took courage. Children who were lucky and picked their own mothers would jump and down shouting, "Mother! Mother! Hurry!" The spectators, too, had to be alert for this event. There was no telling when their names might be called, and they would have to be ready to get up from the bench or from the mat where they were sitting, excuse themselves, and wend their way out as fast as they could to where someone's child was waiting, take his or her hand, and go running off. So when a child arrived and stopped in front of the grown-ups, even the fathers held their breath, wondering who was going to be called. There was little time for idle chit-chat or nibbling food. The grown-ups had to take part in events almost as much as the children.

The headmaster and other teachers joined the children in the two teams for the Tug of War, pulling and shouting, "Heave-ho, heave-ho!" while handicapped children, like Yasuaki-chan, who couldn't pull, had the task of keeping their eyes on the handkerchief tied to the center of the rope to see who was winning.

The final Relay Race involving the whole school was also different at Tomoe. No one had to run very far. All one had to do was run up and down the semicircular flight of concrete steps leading to the Assembly Hall. At first glance it looked absurdly easy, but the steps were unusually shallow and close together, and as no one was allowed to take more than one step at a time, it was quite difficult if you were tall or had large feet. The familiar steps, bounded up each day at lunchtime, took on a fresh, fun aspect on Sports Day, and the children hurried up and down them shrieking gaily. To anyone watching from afar, the scene would have looked like a beautiful kaleidoscope. Counting the top one there were eight steps in all.

The first Sports Day for Totto-chan and her classmates was a fine day just as the headmaster had hoped. The decorations of paper chains and gold stars made by the children the day before and the phonograph records of rousing marches made it seem like a festival.

Totto-chan wore navy blue shorts and a white blouse, although she would have preferred to wear athletic bloomers. She longed to wear them. One day after school the headmaster had been giving a class in eurythmics to some kindergarten teachers, and Totto-chan was very taken with the bloomers some of the women were wearing. What she liked about them was that when the women stamped their feet on the ground, their lower thighs showing beneath the bloomers rippled in such a lovely grown-up way. She ran home and got out her shorts and put them on and stamped on the floor. But her thin, childish thighs didn't ripple at all. After trying several times, she came to the conclusion it was because of what those ladies had been wearing. She asked what they were and Mother explained they were athletic bloomers. She told Mother she definitely wanted to wear bloomers on Sports Day, but they couldn't find any in a small size. That was why Totto-chan had to make do with shorts, which didn't produce any ripples, alas.

Something amazing happened on Sports Day. Takahashi, who had the shortest arms and legs and was the smallest in the school, came first in everything. It was unbelievable. While the others were still creeping around inside the carp, Takahashi was through it in a flash, and while the others only had their heads through the ladder, he was already out of it and running several yards ahead. As for the Relay Race up the Assembly Hall steps, while the others were clumsily negotiating them a step at a time, Takahashi—his short legs moving like pistons—was up them in one spurt and down again like a speeded-up movie.

"We've got to try and beat Takahashi," they all said.

Determined to beat him, the children did their utmost, but try as they might, Takahashi won every time. Totto-chan tried hard, too, but she never managed to beat Takahashi. They could outrun him on the straight stretches, but lost to him over the difficult bits.

Takahashi went up to collect his prizes, looking happy and as proud as Punch. He was first in everything so he collected prize after prize. Everyone watched enviously.

"I'll beat Takahashi next year!" said each child to himself. But every year it was Takahashi who turned out to be the star athlete.

Now the prizes, too, were typical of the headmaster. First Prize might be a giant radish; Second Prize, two burdock roots; Third Prize, a bundle of spinach. Things like that. Until she was much older Totto-chan thought all schools gave vegetables for Sports Day prizes.

In those days, most schools gave notebooks, pencils, and erasers for prizes. The Tomoe children didn't know that, but they weren't happy about the vegetables. Totto-chan, for instance, who got some burdock roots and some onions, was embarrassed about having to carry them on the train. Additional prizes were given for various things, so at the end of Sports Day all the children at Tomoe had some sort of vegetable. Now, why should children be embarrassed about going home from school with vegetables? No one minded being sent to buy vegetables by his mother, but they apparently felt it would look odd carrying vegetables home from school.

A fat boy who won a cabbage didn't know what to do with it.

"I don't want to be seen carrying this," he said. "I think I'll throw it away."

The headmaster must have heard about their complaints for he went over to the children with their carrots and radishes and things.

"What's the matter? Don't you want them?" he asked. Then he went on, "Get your mothers to cook them for dinner tonight. They're vegetables you earned yourselves. You have provided food for your families by your own efforts. How's that? I'll bet it tastes good!"

Of course, he was right. It was the first time in her life, for instance, that Totto-chan had ever provided anything for dinner.

"I'll get Mother to make spicy burdock!" she told the headmistress. "I haven't decided yet what to ask her to make with the onions."

Whereupon the others all began thinking up menus, too, describing them to the headmaster.

"Good! So now you've got the idea," he said, smiling so happily his cheeks became quite flushed. He was probably thinking how nice it would be if the children and their families ate the vegetables while talking over the Sports Day events.

No doubt he was thinking especially of Takahashi—whose dinner table would be overflowing with First Prizes—and hoping the boy would remember his pride and happiness at winning those First Prizes before developing an inferiority complex about his size and the fact he would never grow. And maybe, who knows, the headmaster had thought up those singularly Tomoe-type events just so Takahashi would come first in them. (Pp. 109–114)

From the Epilogue

What are they doing now, those friends of mine who "traveled" together with me on the same classroom "train?"

Akira Takahashi

Takahashi, who won all the prizes on Sports Day, never grew any taller, but entered, with flying colors, a high school famous in Japan for its rugby team. He went on to Meiji University and a degree in electronic engineering.

He is now personnel manager of a large electronics company near Lake Hamana in central Japan. He is responsible for harmony in the work force and he listens to complaints and troubles and settles disputes. Having suffered much himself, he can readily understand other people's problems, and his sunny disposition and attractive personality must be a great help, too. As a technical specialist, he also trains the younger men in the use of the large machines with integrated circuitry.

I went to Hamamatsu to see Takahashi and his wife—a kindly woman who understands him perfectly and has heard so much about Tomoe she says it is almost as if she had gone there herself. She assured me Takahashi has no complexes whatever about his dwarfism. I am quite sure she is right. Complexes would have made life very difficult for him at the prestigious high school and university he attended, and would hardly enable him to work as he does in a personnel department.

Describing his first day at Tomoe, Takahashi said he immediately felt at ease when he saw there were others with physical handicaps. From that moment he suffered no qualms and enjoyed each day so much he never even once wanted to stay home. He told me he was embarrassed at first about swimming naked in the pool, but as he took off his clothes one by one, so he shed his shyness and sense of shame bit by bit. He even got so he did not mind standing up in front of the others to make his lunchtime speeches.

He told me how Mr. Kobayashi had encouraged him to jump over vaulting-horses higher than he was, always assuring him he could do it, although he suspects now that Mr. Kobayashi probably helped him over them—but not until the very last moment, letting him think he had done it all by himself. Mr. Kobayashi gave him confidence and enabled him to know the indescribable joy of successful achievement. Whenever he tried to hide in the background, the headmaster invariably brought him forward so he had to develop a positive attitude to life willy-nilly. He still remembers the elation he felt at winning all those prizes. Bright-eyed and sensible as ever, he reminisced happily about Tomoe.

A good home environment must have contributed, too, to Takahashi's developing into such a fine person. Nevertheless, there is no doubt about the fact that Mr. Kobayashi dealt with us all in a very far-sighted way. Like his constantly saying to me, "You're really a good girl, you know," the encouraging way he kept saying to Takahashi, "You can do it!" was a decisive factor in shaping his life.

As I was leaving Hamamatsu, Takahashi told me something I had completely forgotten. He said he was often teased and bullied by children from other schools on his way to Tomoe and would arrive there crestfallen, whereupon I would quickly ask him what children had done it and was out of the gate in a flash. After a while I would come running back and assure him it was all right now and wouldn't happen again.

"You made me so happy then," he said when we parted. I had forgotten. Thank you, Takahashi, for remembering. (Pp. 193–195)

Stanley Elkin, from *The Magic Kingdom* (1985)

Elkin's novel exposes the absurdities lurking beneath charity efforts to treat terminally ill children to fantasy vacations in order to lessen their "suffering." Instead, the trip descends into sentimental nightmare that benefits no one other than the resort owners. In this excerpt, the group's aptly named personal assistant, Colin Bible, uses the Disneyland parade as an opportunity for a lesson about human variation across body types.

"Come, children," Colin said.

"We already seen that parade," said Benny Maxine.

"I want you to see it again."

In Coming Home, *Jane Fonda portrays a woman who is married to a man fighting in Vietnam. After volunteering to work at a local veteran's hospital, she falls in love with a paralyzed veteran who becomes an active antiwar protester.*

Source: *Coming Home* (1978), directed by Hal Ashby. United States. Color, 126 minutes. Reprinted by permission of Paul Darke.

"Where are you taking them?" Nedra Carp asked.

"You needn't come, Miss Carp, if you don't wish to."

"Oh, I couldn't let you go by yourself. Who'd push the girl's wheelchair?"

"I'll push it. Benny can handle Mudd-Gaddis's."

Maxine looked at the nurse.

"Anyway, I don't see what the rush is. The parade don't start for nearly an hour yet."

There were frequent parades in the Magic Kingdom. Mr. Moorhead had given them permission to stay up one night to watch the Main Street Electrical Parade, a procession of floats outlined in lights like the lights strung across the cables, piers, spans, and towers of suspension bridges. There were daily "character" parades in which the heroes and heroines of various Disney films posed on floats, Alice perched on her mushroom like the stem on fruit; Pinocchio in his avatar as a boy, his strings fallen away, absent as shed cocoon; Snow White flanked by her dwarfs; Donald Duck, his sailor-suited, nautical nephews. They'd seen this one, too. There'd been high school marching bands, drum majors, majorettes, pom-pom girls, drill teams like a Swiss Guard. Tall, rube-looking bears worked the crowd like advance men, parade marshals. Some carried balloons in the form of Mickey Mouse's trefoil-shaped head, vaguely like the club on a playing card. (Pluto marched by, a Mickey Mouse pennant over his right shoulder like a rifle. "Dog soldier!" Benny Maxine had shouted through his cupped hands. The mutt turned its head and, in spite of its look of pleased, wide-eyed, and fixed astonishment, had seemed to glare at him.) Everywhere there were Mickey Mouse banners, guerdons, pennants, flags, color pikes, devices, and standards, the flash heraldics of all blazoned envoy livery. Music blared from the floats, from the high-stepping tootlers: Disney's greatest hits, bouncy and martial as anthems. It could almost have been a triumph, the bears, ducks, dogs, and dwarfs like slaves, like already convert captives from exotic far-flung lands and battlefields. The Mouse stood like a Caesar in raised and isolate imperiality on a bandbox like a decorated cake. He was got up like a bandmaster in his bright red jacket with its thick gold braid, his white, red-striped trousers. His white gloves were held stiff and high as a downbeat against his tall, white-and-red shako. His subjects cheered as he passed. (You wouldn't have guessed that Minnie was his concubine. In her polka dot dress that looked almost like homespun, and riding along on a lower level of a lesser float, she could have been another pom-pom girl.)

It was toward this parade they thought they were headed.

But Main Street was practically deserted.

"What was the rush?" Nedra Carp asked.

"Yeah, where's the fire?" said Benny Maxine.

"Hang on," Colin Bible told them. "You'll see."

"It's another half hour yet," Lydia Conscience said.

"Are we just going to stand around?" Janet Order asked from her wheelchair.

"We could be back in our rooms resting," Rena Morgan said.

"We can sit over there," Colin said. He pointed across Main Street to the tiny commons.

Old-fashioned wood benches were placed outside a low iron railing that ran about a fenced green.

"We sit here we won't see a thing once it starts," Noah Cloth said.

"He's right," Tony Word said. "People will line up along the curb and block out just everything."

"Hang on," Colin Bible said. "You'll see."

About twenty minutes before the parade was scheduled to start, a few people began to take up positions along the parade route.

"Look there," Colin said.

"Where, Colin?" Janet said.

"There," he said, "the young berk crossing the street, coming toward us." He was pointing to an odd-looking man with a wide thin mustache, macho and curved along his lip like a ring around a bathtub. His dark thick sideburns came down to a level just below his mouth. "They're dyed, you know," Colin whispered. "They're polished with bootblack."

"How would you know that, Colin?" Noah asked.

"Well, not to blind you with science, I'm a nurse, aren't I? And 'haven't a nurse eyes, 'haven't a nurse 'air? When you see stuff so inky? There ain't such darkness collected together in all the dark holes."

"All the dark holes," Benny Maxine repeated, pretending to swoon.

"Look alive, mate," Colin scolded, "we're on a field trip, a scientifical investigation."

"We're only waiting for the parade to begin," Lydia said.

"A parade we already seen."

"Two times."

"By day and by night."

"M-I-C-K-E-Y M-O-U-S-E."

"Can't we give the parade a pass?"

"*This,*" Colin hissed, "*This* is the parade! This is the parade and you've *never* seen it! All you seen is the cuddlies, all you seen is the front runner, excellent dolls, happy as Larry and streets ahead of life."

"Really, Mister Bible," Nedra Carp said, "such slangy language!"

"Lie doggo, dearie, please. Keep your breath to cool your porridge, Miss Carp."

"I don't think this is distinguished, Mister Bible," Miss Carp said.

"Jack it in," he told her sharply. "Distinguished? *Distinguished?* I'm showing them the popsies; I'm showing them the puppets. I'm displaying the nits and flourishing the nut cases. The bleeders and bloods, the yobbos and stooges. I'm furnishing them mokes and bringing them muggings. All the mutton dressed as lamb. No one has yet, God knows, so old Joe Soap will must."

"Why?"

"Ask me another," he said.

"Why?"

"They've got to find out how many beans make five, don't they? It's only your ordinary level pegging, merely keeping abreast. There's a ton of niff in this world, you know. There's just lashings and lashings of death. Hark!" He broke off. "*Watch what you think you're going to miss.* Hush! Squint!" The man in the mustache and sideburns was passing in front of them.

And now you couldn't have dragged them away. You couldn't have rolled Janet Order's or Mudd-Gaddis's wheelchair downhill.

"Uh-oh," Colin Bible said, "we've been sold a pup."

"Snookered!" said one of the children.

"Skinned!" said another.

"Socked!"

"Some mothers have 'em," Benny Maxine said.

Because they saw that Colin had been wrong.

The man was not young, after all. He could have been in his fifties. He wore cowboy boots, the cheap imitation leather not so much worn as peeling, chipped as paint and mealy and rotten as spoiled fruit. His high raised heels were of a cloudy translucent plastic. Flecks of gold-colored foil were embedded in them like sparks painted on a loud tie. Up close he had the queer, pale, lone, and fragile look of men who cut themselves shaving. Of short-order cooks, of men wakened in drunk tanks or beaten in fights. A bolo tie, like undone laces, hung about a bright pink rayon shirt that fit over a discrete paunch tight and heavy as muscle. A chain that ran through a wallet in the back pocket of his pants was attached to his belt.

Nor were his broad sideburns dyed. They were tattooed along his ears and down his cheeks. His mustache was tattooed. The actual gloss and sheen tattooed too—like highlights in a landscape. Everything only indelible, deep driven inks among the raised scars of his illustrious whiskers.

They were gathering, coming together quickly now, lining up along the curbs, building a crowd, rapidly taking up the best vantage points like people filling a theater. "See 'em? They look like fans at the all-in wrestling," Colin said wickedly. And they did. Something not so much supportive as impatient and partisan about them. Apple Annies of style, Typhoid Marys of spirit, the men as well as the women, they could have been carriers, not of disease but of vague, pandemic strains on the psyche, on tastes not depleted but somehow made to accommodate to the surrender terms of their lives and conditions. As though they'd survived their dreams, even their lives, only to find a need to be at a parade of cartoon characters at Disney World.

It was different with the children, their parents. Oddly in the minority, Colin barely made mention of them, as though most lives came with a grace period, thirty or thirty-five years, say, some fifty-thousand-mile guarantee of the agreeable and routine. It was the widows traveling together he pointed out, the senior citizens up from Miami or down from such places as Detroit or Cleveland on package tours. It was the retirees, the couples unescorted by kids. They were casually dressed, the women in pants suits or sometimes in shorts—it was a mild fall day—the men in Bermudas, in slacks the color of artificial fruit flavors, in white shoes, in billed caps with fishermen's patches. (Cinderella Castle, towering above them in the background, made them seem even more like subjects than ever, reasonably content, well off, even, but with a whiff of the indentured about them, of an obligated loyalty.)

"Look there!" Colin Bible said. "And *there.* Look at those over there!"

There was a couple with the lined, bloated, and satisfied heads of midgets. Wens were sprinkled across their faces like a kind of loose change of flesh.

There was a potbellied, slack-breasted man, his wife with bad skin, wrinkled, scarred, pitted as scrotum. They had smooth, fat fingers, and their hands were balled into the ineffectual, hairless fists of babies.

"Look, look there, how ugly!" Colin said.

An angry woman with long dark hair, her back to the street, stood near the couple with the wens. Her hair, tied beneath her chin, looked like a babushka. She stared back at Colin and the children, her black, thick eyebrows exactly the color and shape of leeches above eyes set so deep in her skull they seemed separated from her face, hidden as eyes behind a mask or holes cut from portraits in horror films. A set of tiny lips, Kewpie-doll, bow-shaped, red and glossy as wet paint, and superimposed, grafted onto her real lips like a botched bookkeeping or clumsy work in a child's coloring book, tinted an additional ferocity into her scrutiny.

"It breaks your heart," Colin said. "Imperfection everywhere, everywhere. Not like in nature. What, you think stars show their age? Oceans, the sky? No fear! Only in man, only in woman. Trees never look a day older. The mountains are better off for each million years. Everywhere, everywhere. Bodies mismanaged, malfeasance, gone off. Like styles, like fashions gone off. It's this piecemeal surrender to time, kids. You can't hold on to your baby teeth. Scissors cut paper, paper covers rock, rock smashes scissors. A bite of candy causes tooth decay, and jaw lines that were once firm slip off like shoreline lost to the sea. Noses balloon, amok as a cancer. Bellies swell up and muscles go down. Hips and thighs widen like jodhpurs. My God, children, we look like we're dressed for the horseback! (And everywhere, everywhere, there's this clumsy imbalance. You see these old, sluggish bodies on thin-looking legs, like folks carrying packages piled too high. Or like birds puffed out, skewed, out of sorts with their foundations.) And hair. Hair thins, recedes, is gone. Bodies fall away from true. I don't know. It's as if we've been nickel-and-dimed by the elements: by erosion, by wind and water, by the pull of gravity and the oxidation of the very air. Look! Look there!"

A middle-aged woman in a print dress waited in house slippers for the parade to begin. She was crying. Tears pushed over the ledges of her eyes. A clear mucus filled a corner of one nostril.

A dowager's hump draped a pretty young woman's shoulders and back like a shawl.

They saw the details of a man's face, the stubble, lines, cleft, dimples, and pores, sharp and clarified as close-ups in black-and-white photographs.

Sunglasses in the form of swans, masks, butterflies, or random as the form of costume jewelry. Odd-shaped wigs and hairdos sat on people's heads like a queer gardening, a strange botany. And, everywhere, penciled eyebrows, painted lips, like so many prostheses of the cosmetic.

It had begun now, the parade. A well-dressed man in a business suit stood at attention as the floats passed by. He held his hat over his heart. (And sanity, sanity too, marred, scuffed as a shoe, wrinkled as laundry.) It had begun now, but the children weren't watching. They couldn't take their eyes off the crowd. ("*This, this* is the parade!") They stared at the special area the park had provided for guests in wheelchairs, at the old men and women who sat in them, bundled against some internal chill on even this warm day, wrapped in blankets that tucked over their feet, in sweaters, in scarves, in wool gloves and mittens, covered by hats, by caps, Mickey Mouse's eared beanies, dark as *yarmulkes,* on top of their other headgear; at, among them, an ancient woman in a rubber Frankenstein mask for warmth; at her nurse, feeding her cigarettes, venting her smoke through a gap in the monster's wired jaws. At other women, depleted, tired, who sat on benches, their dresses hiked well above their knees, their legs (in heavy stockings the color of miscegenetic, coffee-creamed flesh) not so much spread as forgotten, separated, guided by the collapsing, melted lines of their thighs. At their husbands (or maybe just the men they lived with, for convenience, for company, for making the welfare checks go farther), their hands in their laps, incurious as people who have just folded in poker. (And *everywhere* those dark glasses. "It ain't for the glare," Colin told them, "it's for the warmth!") At grown men and women wearing the souvenirs of the Magic Kingdom: sweat shirts, T-shirts, with Eeyore, with Mickey Mouse, with Jiminy Cricket, Alice-in-Wonderland pinafores, Minnie Mouse dresses, carryalls with Dumbo and Tigger and Tramp. At a woman in her sixties, inexplicably wearing a boa, a turban, a veil of wide, loose black mesh; at hands and arms and shoulders blotched by liver spots; at a man in baggy pants suspiciously, unscrupulously bulging. At a man in shorts, the enlarged veins on his legs like wax dripping down Chianti bottles in Italian restaurants.

At a woman with oily skin and pores like a sort of goose-flesh, visible as the apertures of chickens where their pinfeathers had been plucked. At a still handsome woman with bare, shapely, but hairy legs (hair even on the tops of her feet), carefully trimmed as sideburns or rolled as stockings two inches below her knee; at a powerfully built man in his sixties whose chest hair, visible through his sheer tank top, had been as lovingly, patiently groomed as a high school boy's. (Everywhere, everywhere hair—the strange feeling they had that they were among birds, the wigs, the boa, the babushka of hair beneath the woman's chin, the piled hairdos, the thinning hair, the penciled eyebrows, the tattooed mustache and sideburns of the strange Westerner. Mudd-Gaddis's own baldness and the chemotherapeutic fuzz of several of the children. Because everything has a reasonable explanation, and almost all had heard that hair didn't stop growing after you died. Because everything has a reasonable explanation and hair was the gnawed, tenuous rope by which they hung on to immortality.)

Everywhere there were peculiar couples. A boy and a girl who couldn't have been more than twelve but looked in their runt intimacy as if they could have been married. The boy held his arm protectively about the girl's shoulder, his free hand in the pocket of his three-quarter-length trench coat as though he fondled a gun. He wore a jacket, a shirt, and a tie. His floods, honed as a knife along their permanent crease, rose above sharp, snazzy shoes. The girl, shorter than her small boyfriend, in a decent wool coat that looked as if it had been bought at a back-to-school sale, smiled wanly. Her black full hair showed signs of gray and she seemed a little nervous, wary, even long-suffering, beneath the arm of her protector, as if she knew his faults, perhaps, his diseases—which weren't diseases in her book—his excessive drinking, his compulsive gambling, his quick fists and rude abuse.

And stared openly at the mismatched couples: at the big, powerful girls next to undersized men and the men large as football players beside bloodless, scrawny women, at the couples widely discrepant in age in open attitudes of love and regard, handholding or clutching butts, the men's fingers casually resting along breasts as if they lolled in water. Or their arms thrown abruptly across each other's shoulders. Sending the smug signals of secret satisfactions, like the wealthy, perhaps, like people in drag.

And at a closely supervised group of the retarded, oddly ageless, the males in overalls, the females in loose, shapeless dresses and rolled stockings, clutching one another with their short fat fingers, their strange, pleased eyes fixed in their happy Smile Faces like raisins in cakes, beaming above their neglected teeth, beaming, beaming beneath their close-cropped hair on their broad, short skulls.

(Yet most were not defective, merely aging or old, or anyway beyond that thirty- or thirty-five-year grace period that seemed to come with most lives.)

Not even needing Colin now to direct their attention, to point things out. In it themselves now, raising their voices, like people outbidding each other in some hot contest, not even listening; or, if listening, then listening for the break in the other's discourse, for that opportune moment when they could have their say, get in their licks; or, if listening, then listening not just for the other to finish but for some generalized cue, some more or less specific tag on which they could build, add, like players of dominoes, say, or card games that followed strict suit. But generally too excited even for that. Only half listening, really, less, fractionally, marginally, seeing how it was with them and concentrating only on the essence, pith, and gist of what they would say, thinking in a sort of deliberate and polite headlines but settling finally into a kind of conversation and still using the language of that other kingdom, the one they'd come from to get to this one.

"Lord love a duck!" said Janet Order. "Just clap eyes on these gaffers."

"My word, Janet! They're for it, I'd say so," Rena Morgan agreed.

"Lamb turning to mutton." Janet sighed.

"Fright fish."

"Blood puddles."

"Lawks!" said Benny Maxine. "Look at the bint with the healthy arse. I'm gone dead nuts on that fanny."

"Ooh, it's walloping big, ain't it?" Tony Word said.

"If it ever let off it wouldn't 'alf make a pongy pooh," Benny asserted.

"Like Billy-O!" Tony said.

"Good gracious me!" said Lydia Conscience. "Say what you will, my heart goes out to the old biddy what looks like someone put her in the pudding club."

"Yar, ain't she dishy? There's one in every village."

Tony Ward considered. "No," he said. "She's just put on the nose bag. It's simply a case of your lumping, right grotty greedguts."

"Only loads of grub then, you think?" Lydia asked.

"Oh, yes," said Tony. "Oodles of inner man. Tub and tuck."

"Jesus weeps!" said illiterate Noah Cloth, looking about, his gaze settling on the little group of the retarded. "He weeps for all the potty, pig-ignorant prats off their chumps, for all the slow-coach clots and dead-from-the-neck-up dimbos, and wonky, puddle coots and gits, goofs and goons, for all his chuckle-headed, loopy muggings and passengers past praying for."

"Put a sock in it, old man," Benny Maxine said softly.

"For all the nanas," Noah said, crying now. "For all the bright specimens."

"Many's the nosh-up gone down that cake hole," Tony Ward said, his eyes fixed on the fat woman Lydia Conscience had thought pregnant. "Many's the porky pots of tram-stopper scoff and thundering stodge through that podge's gob," he said without appetite.

"She's chesty," Rena Morgan said, weeping, of a woman who coughed. "She should put by the gaspers."

"She's had her day," said Janet Order.

"Coo! Who ain't?" Rena, sobbing, wanted to know. "Which of us, hey? Which of them?"

"Are they all on the dream holiday then?" Charles Mudd-Gaddis asked.

"All, old son, and no mistake," Lydia Conscience said wearily.

"A shame," he said. "Letting themselves go like that. And them with their whole lives in front of them."

And, at last, just rudely pointing. (They could have been mutes waving at entrées, aiming at desserts in a cafeteria line.) Whirling, indiscriminate, flailing about in some random *"J'accuse"* of the spontaneous. Whining, wailing, whimpering, weeping.

Because everything has a reasonable explanation. They lived in England's cold climate. They came from a place where clothes made their men and their women. They were unaccustomed to sportswear, to shorts and the casual lightweights and washables of the near tropics. They were unaccustomed, that is, to the actual shapes of people and simply did not know that what they saw was just the ordinary let-hung-out wear and tear of years, of meals, of good times and comforts and all the body's thoughtless kindnesses to itself. So that when Colin said what he said they believed him.

"I tell you," he told them, "that's you in a few years, never mind those three-score-and-ten you thought was your birthright. All that soured flesh, all those bitched and bollixed bodies. You see? You see what you thought you were missing?"

"Bodies," Nedra Carp said. "Don't tell me about bodies. I *know* about bodies."

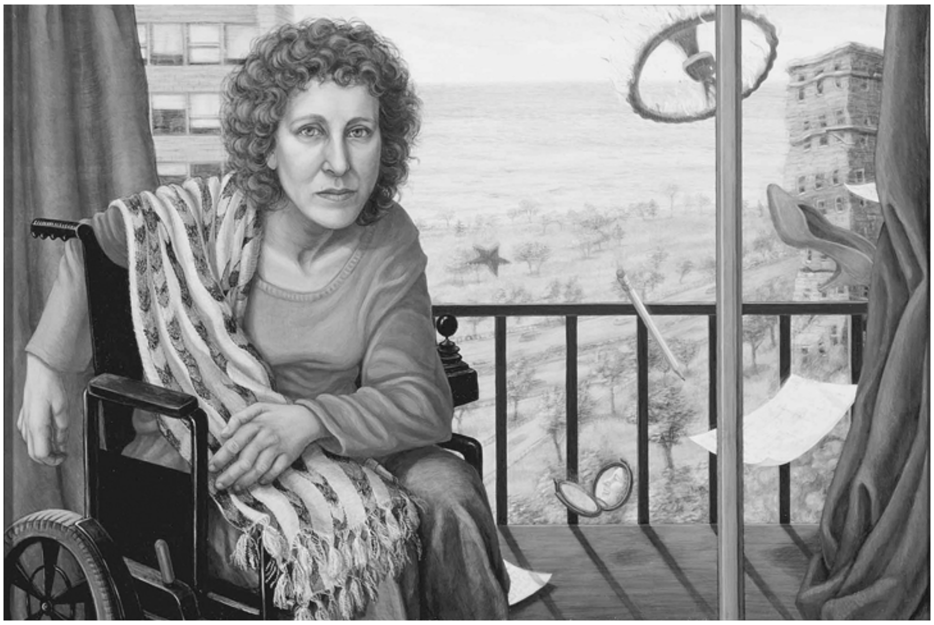
Australian Disability Advocacy (1980s)

The Disability Services Act of 1986 shapes funding for disability services in Australia. It marks a shift away from charitable, segregated services and toward community-based services aimed at community integration and participation, increased workforce participation, independence, and promoting positive images of persons with disabilities. The entry of "advocacy services" into the program represented a significant triumph for activist groups in the Australian disability scene, which had increased voice after the International Year for Disabled Persons in 1981.

From Disability Services Act of 1986 Part II, Divisions 1 and 7

Advocacy services means:

(a) self advocacy services, namely, services to assist persons with disabilities to develop or maintain



"Circle Story #3: Susan Nussbaum," *by Riva Lehrer. 1998. Acrylic on panel. 16" by 26." Susan Nussbaum is a playwright, actress, director, and disability rights activist. She has starred in, written and/or directed productions at the Goodman, Victory Gardens, and Blue Rider theaters, and other major venues. Her play Mishuganismo is included in Staring Back, and her latest play, No One As Nasty, opened at Chicago's Victory Gardens Theater in 2000. She also teaches pla writing at the Mark Taper Forum in Los Angeles. Nussbaum was injured in a car accident twenty years ago, and she has examined the disability experience with an unsparing, critical wit.*

the personal skills and self confidence necessary to enable them to represent their own interests in the community;

(b) citizen-advocacy services, namely, services to facilitate persons in the community to assist:

(i) persons with disabilities; or

(ii) the families of, and other persons who provide care or assistance, to persons with disabilities; to represent their interests in the community; or group-advocacy services, namely, services to facilitate community organisations to represent the interests of groups of persons with disabilities.

Commentary

Australian disability activist groups were influenced by two main streams of analysis. Physical disability activists, shaped by the disability rights movement emerging from the United Kingdom and the United States, adopted a "social model" of disability. This analysis was taken up by some individuals with intellectual impairment, arguing that with skills and training individuals previously judged incompetent could speak up for themselves. This stream is characterized as the empowerment model of advocacy.

The other stream emerged from the Syracuse University Training Institute for Human Service Planning, Leadership and Change Agentry. The theory of social devaluation was taken into the model for citizen advocacy. It also influenced many parents, especially those with family members with intellectual or multiple impairments. This stream can be characterized as the social role valorization model. It was this stream that gave the advocacy services section of the Disability Services Act of 1986 its name and configuration—thereby providing great opportunities as well as opening up continuing debates.

The two streams have many points of confluence, especially the centrality of the demand for community life and the dissolution of institutional and congregate services and for the defense of certain rights. However, many contested issues continue to reflect their divergence: the clash between a collectivist rights movement and the incipient individualism of social valorization.

But this can never be the full story. Such a division is too crude. Disability advocacy in Australia has taken on a new spirit of cooperation, building on contributions from community development, enriched by understandings of new social movements. Activists and scholars are expanding the social model of disability with wisdom about relationality, the learnings of seeking normalization, and the critical insights of postmodern thought.

The quest remains—to hold faith with the streams of this history while developing creative theory and practice that can deal with the challenges still faced by many people with impairments.

Cheryl Marie Wade, "I Am Not One of The" (1987)

In this work, disabled U.S. poet and performance artist Cheryl Marie Wade celebrates the differences across disabilities that normative culture rejects. In doing so, the poem creates an alternative value system that turns socially imposed "deviance" into a revelation about the persistence of human variation.

I am not one of the physically challenged
I'm a sock in the eye with gnarled fist
I'm a French kiss with cleft tongue
I'm orthopedic shoes sewn on a last of your fears
I am not one of the differently abled
I'm an epitaph for a million imperfect babies left untreated
I'm an ikon carved from bones in a mass grave at Tiergarten, Germany
I'm withered legs hidden with a blanket
I am not one of the able disabled
I'm a black panther with green eyes and scars like a picket fence
I'm pink lace panties teasing a stub of milk white thigh
I'm the Evil Eye
I'm the first cell divided
I'm mud that talks
I'm Eve I'm Kali
I'm The Mountain That Never Moves
I've been forever I'll be here forever
I'm the Gimp
I'm the Cripple
I'm the Crazy Lady
I'm The Woman With Juice

Sally Zinman, Howie T. Harp, and Su Budd, from *Reaching Across: Mental Health Clients Helping Each Other* (1987)

In this excerpt from this groundbreaking self-help manual for psychiatric survivors, Su Budd explains why client-centered, peer-driven support is a keystone of the psychiatric survivor/user movement.

In a mutual support group, we can develop our own power base. As we reach out horizontally to each other, recipients become providers and vice versa. We can feel a certain independence or distance from the mental health system that empowers us to discern the differences between available services more clearly, and to choose only those services provided by that system, which we find to be beneficial to us. This makes the mental health system more accountable to us and holds it responsible to answer our needs as we define them. Since we are not part of the mental health system, we do not keep medically oriented records, which dehumanize people. We do not need records to provide each other with good support. We do not have to wonder what is being written into our "charts" by others, and we do not have to deal with the feelings that come up with being diagnosed.

"Position of the Students, Faculty and Staff of Gallaudet University" (1988)

In March 1988, students at Gallaudet University protested the selection of a hearing president out of three candidates—the other two were deaf. The excerpt below lays out the demands of the protestors, which successfully resulted in the hiring of the deaf university's first deaf president.

The appointment of the new president of Gallaudet University has resulted in an OVERWHELMING vote of NO CONFIDENCE in the Board of Trustees!

DEMANDS

1) We demand that the Board of Trustees appoint one of the two deaf finalists as President, Gallaudet University . . . NOW!

2) We demand that Jane Basset Spilman resign from the Board immediately and that a deaf Board Member be elected as chairperson.

3) We demand that the Board [initiate] the process of changing its By-Laws to conform with the C.O.E.D.'s [recommendations] to Congress of a 51% deaf member representation on the Board of Trustees.

4) We demand that no student, staff or faculty member of Gallaudet University be subject to any reprisals as a result of their standing on this matter.

11:30 am, March 7, 1988

Audre Lorde, "A Burst of Light: Living with Cancer" (1988)

Born in New York in 1934 to West Indian parents, Audre Lorde went on to be a teacher and international lecturer. Her book The Cancer Journals *details her efforts to survive breast cancer while also combating the sexism, racism, and able-ism of the medical industry. She refused to separate the struggle for dignity in the wake of her diagnosis from other civil rights agendas, and her writing insightfully dovetails with these political concerns to form a new alignment for collective action.*

If I am to put this all down in a way that is useful, I should start with the beginning of the story.

Sizable tumor in the right lobe of the liver, that's what the doctors said. Lots of blood vessels in it means it's most likely malignant. Let's cut you open right now and see what we can do about it. Wait a minute, I said. I need to feel this thing and see what's going on inside myself first, I said, needing some time to absorb the shock, time to assay the situation and not act out of panic. Not one of them said, I can respect that, but don't take too long about it.

Instead, that simple claim to my body's own process elicited such an attack from a reputable Specialist in Liver Tumors that my deepest—if not necessarily most useful—suspicions were totally aroused.

What a doctor could have said to me that I would have heard was, 'You have a serious condition going on in your body and whatever you do about it you must not ignore it or delay deciding how you are going to deal with it because it will not go away no matter what you think it is.' Acknowledging my own responsibility for my own body. Instead, what he said to me was, 'if you do not do exactly what I tell you to do right now without questions you are going to die a horrible death.' In exactly those words.

I felt the battle lines Danny being drawn up within my own body.

I saw this specialist in liver tumors at a leading cancer hospital in New York City, where I had been referred to as an outpatient by my own doctor.

The first people who interviewed me in white coats from behind a computer were only interested in my health care benefits and proposed method of payment. Those crucial facts determined what kind of plastic ID card I would be given, and without a plastic ID card, no one at all was allowed upstairs to see any doctor, as I was told by the uniformed, pistoled guards at all the stairwells.

From the moment I was ushered into the doctor's office and he saw my x-rays, he proceeded to infantilize me with an obviously well practiced technique. When I told him I was having second thoughts about a liver biopsy, he glanced at my chart. Racism and Sexism joined hands across the table as he saw I taught at a university. 'Well, you look like an *intelligent* girl,' he said, staring at my one breast all the time he was speaking. 'Not to have this biopsy immediately is like sticking your head in the sand.' Then he went on to say that he would not be responsible when I wound up screaming in agony one day in the corner of his office!

I asked this specialist in liver tumors about the dangers of a liver biopsy spreading an existing malignancy, or even encouraging it in a borderline tumor. He dismissed my concerns with a wave of his hand, saying, instead of answering, that I really did not have any other sensible choice.

I would like to think that this doctor was sincerely motivated by a desire to me to seek what he truly believed to be the only remedy for my sickening body, but my faith in that scenario is considerably diminished by his $250 consultation fee and his subsequent report to my own doctor containing numerous supposedly clinical observations of remaining pendulous breast.

In any event, I can thank him for the fierce shard lancing through my terror that shrieked there must be some other way, this doesn't feel right to me. If this is cancer and they cut me open to find out, what is stopping that intrusive action from spreading the cancer, or turning a questionable mass into an active malignancy? All I was asking for was the reassurance of a realistic [answer] to my real questions, and that was not forthcoming. I made up my mind that if I was going to die in agony on someone's office floor, it certainly wasn't going to be his! I needed information, and pored over books on the liver in Barnes & Noble Medical Textbook Section on Fifth Avenue for hours. I learned, among other things, that the liver is the largest, most complex, and most generous organ in the human body. But that did not help me very much.

In this period of physical weakness and psychic turmoil, I found myself going through an intricate inventory of rage. First of all at my breast surgeon—had he perhaps done something wrong? How could such a small breast tumor have metastasized? Hadn't he assured me he'd gotten it all, and what was this now anyway about micro-metastases? Could this tumor in my liver have been seeded at the same time as my breast cancer? There were so many unanswered questions, and too much that I just did not understand.

But my worst rage was the rage at myself. For a brief time I felt like a total failure. What had I been busting my ass doing these past six years if it wasn't living and loving and working to my utmost potential? And wasn't that all a guarantee supposed to keep exactly this kind of thing from ever happening again. So what had I done wrong and what was I going to have pay for it? Why Me?

Elephant Man *tells the extraordinarily moving tale of the unfortunate Joseph Merrick, born with a rare disease, who was taken from the world of the freak show to the pinnacle of Victorian society.*

Source: *Elephant Man* (1980), directed by David Lynch. United Kingdom. B&W, 124 minutes. Reprinted by permission of Paul Darke.

But finally a little voice inside me said sharply 'Now really, is there any other way you would have preferred living the past six years that would have been any more satisfying? And be that as it may, *should* or *shouldn't* isn't even the question. How do you want to live the rest of your life from now on and what are you going to do about it?' Time's awasting!

Gradually, in those hours in the stacks of Barnes & Noble, I felt myself shifting into another gear. My resolve strengthened as my panic lessened. Deep breathing regularly. I'm not going to let them cut into body again until I'm convinced that there's no other alternative. And this time, the burden of proof rests with the doctors because their record of success with liver cancer is not so good that it would make me jump at a surgical solution. And scare tactics are not going to work. I have been scared for six years and that hasn't stopped me. I've given myself plenty of practice in doing whatever I need to do, scared or not, so scare tactics are just not going to work. Or I hoped they were not going to work. At any rate, thank the goodness, they were not working yet. One step at a time.

But some of my nightmares were pure hell, and I started having trouble sleeping.

In writing this I have discovered how important some things are that I thought were unimportant. I discovered this by the high price they exact for scrutiny. At first I did not want to look again at how slowly I came to terms with my own mortality on a deeper level than before. Medical textbooks on the liver were fine, but there were appointments to be kept, and bills to pay, and decisions about the upcoming trip to Europe to be made. And what do I say to my children. Honesty has always been the bottom line between us, but did I really need them going through this with me during their final, difficult years at college? On the other hand, how could I shut them out of the most important decision of my life?

I made a visit to my breast surgeon, a doctor with whom I have always been able to talk frankly, and it was

In Whose Life Is It Anyway?, *a wisecracking sculptor, paralyzed from the neck down after a car crash, struggles for his right to die.*

Source: *Whose Life Is It Anyway?* (1981), directed by John Badham. United States. Color, 118 minutes. Reprinted by permission of Paul Darke.

from him that I got my first trustworthy and objective sense of timing. It was from him that I learned that the conventional forms of treatment for liver metastases made little more than one year's difference in the survival rate. I heard my old friend Clem's voice coming back to me through the dimness of thirty years: 'I see you coming here trying to make sense where there is no sense. Just try living in it. Respond, alter, see what happens.' I thought of the African way of perceiving life, as experience to be lived rather than as problem to be solved.

Homeopathic medicine calls cancer the cold disease. I understand that down to my bones that quake sometimes in their need for heat, for the sun, even for just a hot bath. Part of the way in which I am saving my own life is to refuse to submit my body to cold whenever possible.

In general, I fight hard to keep my treatment scene together in some coherent and serviceable way, integrated into my daily living and absolute. Forgetting is no excuse. It's as simple as one missed shot could make the difference between a quiescent malignancy and one that is growing again. This not only keeps me in an intimate, positive relationship to my own health, but it also underlies the responsibility for attending to my own health. I cannot simply hand over that responsibility to anyone else.

Which does not mean I give into the belief, arrogant or naïve, that I know everything I need to know in order to make informed decisions about my body. But attending to my own health, gaining enough information to help me understand and participate in the decisions made about my body by people who know more medicine than do I, are all crucial strategies in my battle for living. They also provide me with important prototypes for doing battle in all other areas of my life.

Battling racism and battling sexism and battling apartheid share the same urgency inside me as battling cancer. None of these struggles are ever easy, and even the smallest victory is never to be taken for granted. Each victory must be applauded, because it is so easy not to battle at all, to just accept and call that acceptance inevitable.

And all power is relative. Recognizing the existence as well as the limitations of my own power, and accepting the responsibility for using it in my own behalf, involve me in direct and daily actions that preclude denial as a possible refuge. Simone de Beauvoir's words echo in my head: 'It is in the recognition of the genuine conditions of our lives that we gain the strength to act and our motivation for change.'

▣ Michelle Cliff, "If I Could Write This in Fire, I Would Write This in Fire" (1988)

In this passage, the Jamaican American writer Michelle Cliff describes how race and disability conjoin in the minds of English and American missionaries during a girl's experience of a grand mal seizure.

Some of the girls were out-and-out-white (English and American), the rest us were colored—only a few were dark. Our uniforms were blood-red Gabardine, heavy and hot in buildings meant to re-create England; damp with stone floors, facing onto a cloister, or quad as they called it. We began each day with the headmistress leading us in English hymns. The entire school stood for an hour in the zinc-roofed Gymnasium.

Occasionally a girl fainted, or threw up. Once, a girl had a grand mal seizure. To any such disturbance the response was always "keep singing." While she flailed on the stone floor, I wondered what the mistress would do. We sang "Faith of our Fathers," and watched our classmate as her eyes rolled back in her head. I thought of people swallowing their tongues. This student was dark—here on a scholarship—and the only woman who came forward to help her was the gamesmistress, the only dark teacher. She kneeled beside the girl and slid the white webbed belt from her tennis shorts, clamping it between the girl's teeth. When the seizure was over, she carried the girl to a tumbling mat in a corner of the gym and covered her so she wouldn't get chilled.

Were the other women unable to touch the girl because of her darkness? I think that now. Her darkness and her scholarship. She lived on Windward Road with her grandmother; her mother was a maid. But darkness is usually enough for women like those to hold back. Then, we usually excused that kind of behavior by saying they were "ladies" (we were constantly being told that we should be ladies also. One teacher went so far as to tell us many people thought Jamaicans lived in trees and we had to show these people they were mistaken). In short, we felt insufficient to judge the behavior of these women. The English ones (who had the corner on power in the school) had come all this way to teach us. Shouldn't we treat them as missionaries they were certain they were?

The Creole Jamaicans had a different role; they were passing on those of us who were light-skinned the Creole heritage of collaboration, assimilation, loyalty to our betters. We were expected to be willing subjects in this outpost of civilization.

The girl left school that day and never returned.

▣ Katherine Dunn, from *Geek Love* (1989)

In these excerpts from Dunn's fantasy novel, the bald, albino, hunchbacked, female narrator, Olympia, describes her status in a disabled family that purposefully breeds "human oddities" for their freak show exhibition. The second passage details the loss of anonymity often experienced by disabled people in public settings.

I was born three years after my sisters. My father spared no expense in these experiments. My mother had been liberally dosed with cocaine, amphetamines, and arsenic during her ovulation and throughout her pregnancy with me. It was a disappointment when I emerged with such commonplace deformities. My albinism is the regular pink-eyed variety and my hump, though pronounced, is not remarkable in size or shape as humps go. My situation was far too humdrum to be marketable on the same scale as my brother's and sisters.' Still, my parents noted that I had a strong voice and decided I might be an appropriate shill and talker for the business. A bald albino hunchback seemed the right enticement toward the esoteric talents of the rest of the family. The dwarfism, which was very apparent by my third birthday, came as a pleasant surprise to the patient pair and increased my value. From the beginning I slept in the built-in cupboard beneath the sink in the family living van, and had a collection of exotic sunglasses to shield my sensitive eyes. (P. 8)

She talks. People talk easily to me. They think a bald albino hunchback dwarf can't hide anything. My worst is all out in the open. It makes it necessary for people to tell you about themselves. They begin out of simple courtesy. Just being visible is my biggest confession, so they try to set me at ease by revealing our equality, by dragging out their own less-apparent deformities. That's how it starts. But I am like a stranger on the bus and they get hooked on having a listener. They go too far because I am one listener who is in no position to judge or find fault. They stretch out their dampest secrets because a creature like me has no virtues or morals. If I am “good” (and they assume that I am), it’s obviously for lack of opportunity to be otherwise. And I listen. I listen eagerly, warmly, because I care. They tell me everything eventually. (P. 156)

My tall stool was cutting off blood to my legs and I squirmed and craned my neck. Arty was turned away from me, watching McGurk, who slumped down and sat on the bed. “I’ll show you the lubrication and drainage system, but . . .” He hiked at his trousers until both knees were bare, white and hairless. The shoes came up his shins and turned into grey socks. “But I guess you want my credentials,” McGurk said. He reached up his right pant leg. There was a snap and the shoe toppled over with the plastic shin and knee sticking out of it. A dim gleam came from the dark fold of the empty trouser leg. He slid his hand up the other trouser leg and both legs lay on the floor with steel shining out of the hollow tops of the knees. He pulled his pant legs up his thighs and showed the steel caps on the stumps. There were a groove, a few grip protrusions, and a number of electrical contact points protruding from each unit. He looked up, calmly waiting. (P. 169)

From the Americans with Disabilities Act of 1990 (United States)

Building on the landmark protections established in Section 504 of the Rehabilitation Act (see entry above), the Americans with Disabilities Act codified the definition of disability beneath three sweeping categories: (a) incapacity in at least one major life function, (b) an established history of such an impairment, or (c) a belief that one has such an impairment. While the first two designations continued a long tradition of medical pathology as a key qualifying category, the third definition established the social basis of disability. The Act further established disability as involving a class of individuals protected under the law against discrimination in employment, education, public access, and so forth. Most legal analysts are in agreement that, since its passage, its protections have been significantly eroded by conservative U.S. judiciary forces that have ruled in favor of businesses and other public institutions seeking to protect their monetary interests.

Sec. 2. Findings and Purposes

(a) Findings.—The Congress finds that—

(1) some 43,000,000 Americans have one or more physical or mental disabilities, and this number is increasing as the population as a whole is growing older;

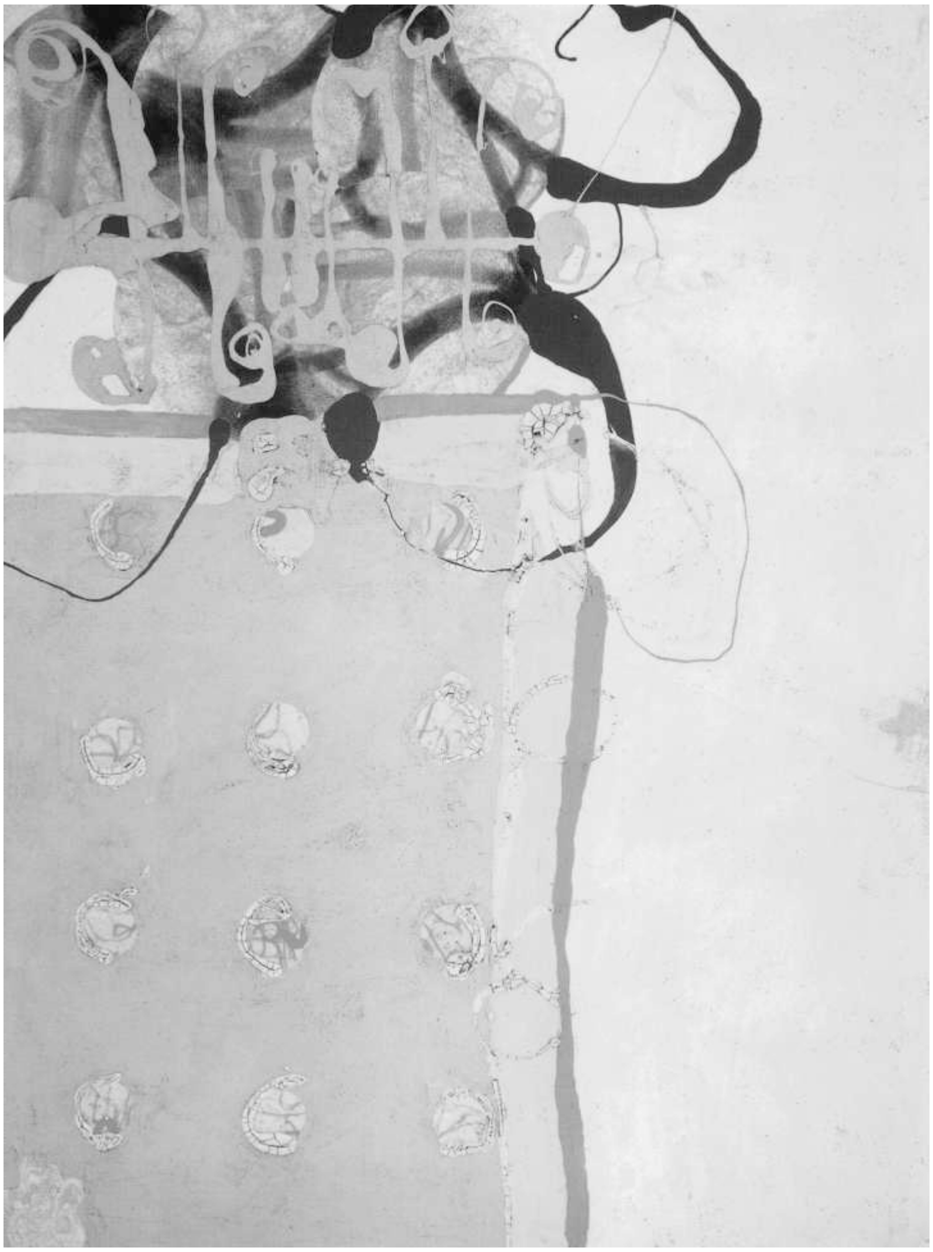
(2) historically, society has tended to isolate and segregate individuals with disabilities, and, despite some improvements, such forms of discrimination against

individuals with disabilities continue to be a serious and pervasive social problem;

(3) discrimination against individuals with disabilities persists in such critical areas as employment, housing, public accommodations, education, transportation, communication, recreation, institutionalization, health services, voting, and access to public services;

(4) unlike individuals who have experienced discrimination on the basis of race, color, sex, national origin, religion, or age, individuals who have experienced discrimination on the basis of disability have often had no legal recourse to redress such discrimination;

(5) individuals with disabilities continually encounter various forms of discrimination, including outright intentional exclusion, the discriminatory effects of architectural, transportation, and communication barriers, overprotective rules and policies, failure to make modifications to existing facilities and practices, exclusionary qualification standards and criteria, segregation, and relegation to lesser services, programs, activities, benefits, jobs, or other opportunities;



"Fidelity," by Katherine Sherwood. 2000. Mixed media on paper. An artist with a visual impairment, Sherwood works with abstract imagery that comments on ways of seeing and perceiving the world.

(6) census data, national polls, and other studies have documented that people with disabilities, as a group, occupy an inferior status in our society, and are severely disadvantaged socially, vocationally, economically, and educationally;

(7) individuals with disabilities are a discrete and insular minority who have been faced with restrictions and limitations, subjected to a history of purposeful unequal treatment, and relegated to a position of political powerlessness in our society, based on characteristics that are beyond the control of such individuals and resulting from stereotypic assumptions not truly indicative of the individual ability of such individuals to participate in, and contribute to, society;

(8) the Nation's proper goals regarding individuals with disabilities are to assure equality of opportunity, full participation, independent living, and economic self-sufficiency for such individuals; and

(9) the continuing existence of unfair and unnecessary discrimination and prejudice denies people with disabilities the opportunity to compete on an equal basis and to pursue those opportunities for which our free society is justifiably famous, and costs the United States billions of dollars in unnecessary expenses resulting from dependency and nonproductivity.

(b) Purpose.—It is the purpose of this Act—

(1) to provide a clear and comprehensive national mandate for the elimination of discrimination against individuals with disabilities;

(2) to provide clear, strong, consistent, enforceable standards addressing discrimination against individuals with disabilities;

(3) to ensure that the Federal Government plays a central role in enforcing the standards established in this Act on behalf of individuals with disabilities; and

(4) to invoke the sweep of congressional authority, including the power to enforce the fourteenth amendment and to regulate commerce, in order to address the major areas of discrimination faced day-to-day by people with disabilities.

Sec. 3. Definitions

As used in this Act:

(1) Auxiliary aids and services.—The term “auxiliary aids and services” includes—

(A) qualified interpreters or other effective methods of making aurally delivered materials available to individuals with hearing impairments;

(B) qualified readers, taped texts, or other effective methods of making visually delivered materials available to individuals with visual impairments;

(C) acquisition or modification of equipment or devices; and

(D) other similar services and actions.

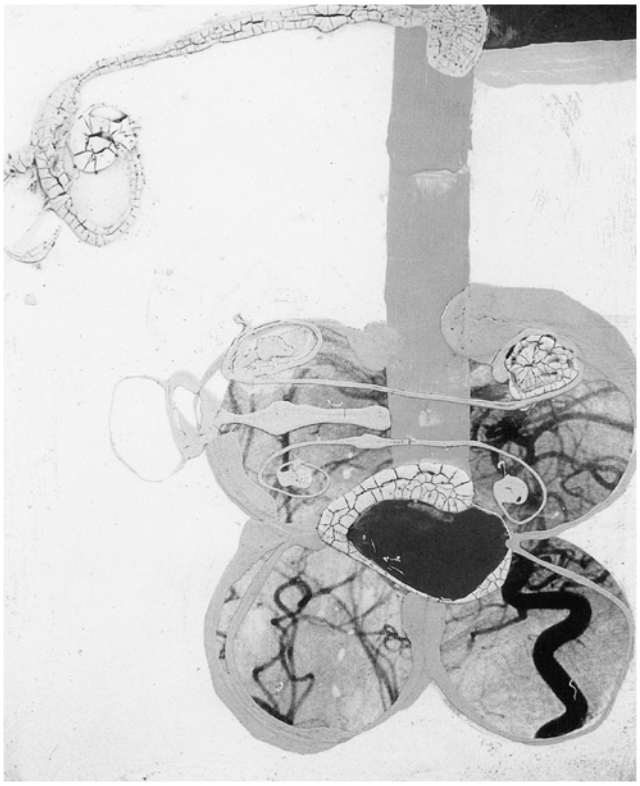
(2) Disability.—The term “disability” means, with respect to an individual—

(A) a physical or mental impairment that substantially limits one or more of the major life activities of such individual;

(B) a record of such an impairment; or

(C) being regarded as having such an impairment.

(3) State.—The term “State” means each of the several States, the District of Columbia, the Commonwealth of Puerto Rico, Guam, American Samoa, the Virgin Islands, the Trust Territory of the Pacific Islands, and the Commonwealth of the Northern Mariana Islands.



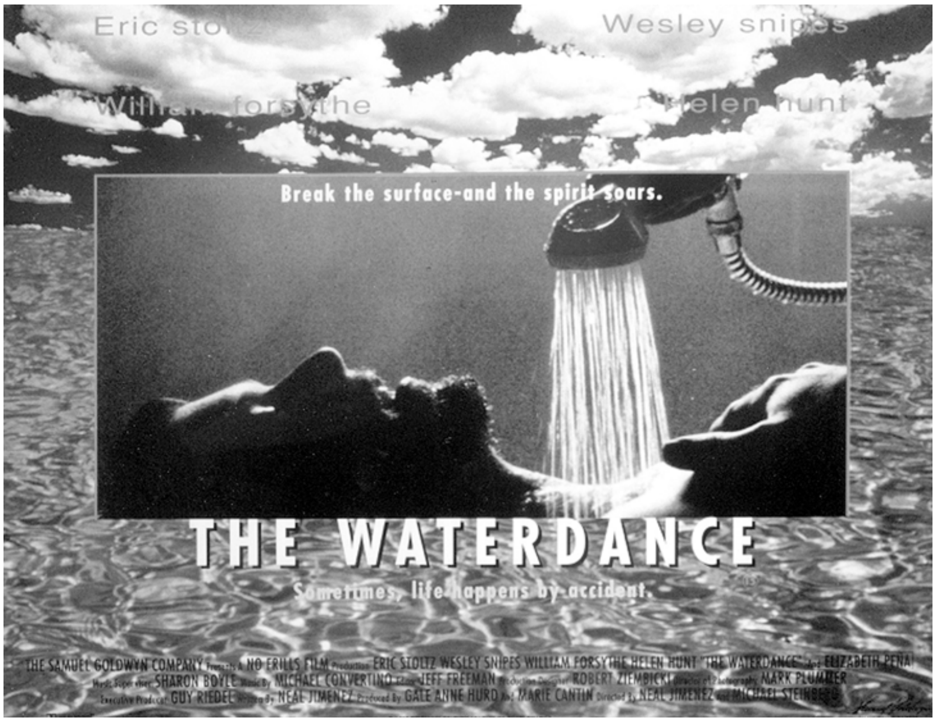
“Fidelity II,” by Katherine Sherwood. 2000. Mixed media on canvas. An artist with a visual impairment, Sherwood works with abstract imagery that comments on ways of seeing and perceiving the world.

▣ Law on the Protection of Disabled Persons of 1990 (China)

The Law of the People’s Republic of China on the Protection of Disabled Persons was passed at the 17th Meeting of the Standing Committee of the Seventh National People’s Congress on December 28, 1990, and was implemented on May 15, 1991. This is a significant and landmark legal document, because it is the first disability law to safeguard the legal rights and interests of disabled people since the founding of the People’s Republic of China. Although many terms in the law are too general to implement in practice, it does mark the beginning of a recognition of basic human rights of this much-neglected group of people in China.

Article 1 [Purpose and Basis]

This Law is formulated in accordance with the Constitution for the purpose of protecting the lawful rights and interests of, and developing undertakings for disabled persons, and ensuring their equal and full



The Waterdance *is an important film about author Joel Garcia's efforts to adjust to his paralysis after a hiking accident. The story delves into the hassles and humiliations of life in a rehabilitation center, including the tensions that erupt between disabled residents.*

Source: *The Waterdance* (1992), directed by Neil Jimenez and Michael Steinberg. United States. Color, 106 minutes. Reprinted by permission of Paul Darke.

participation in social life and their share of the material and cultural wealth of society.

Article 2 [Definition,Categories and Criteria]

A disabled person refers to one who suffers from abnormalities or loss of a certain organ or function, psychologically or physiologically, or in anatomical structure and has lost wholly or in part the ability to perform an activity in the way considered normal.

The term "disabled persons" refers to those with visual, hearing, speech or physical disabilities, mental retardation, mental disorder, multiple disabilities and/or other disabilities.

The criteria for classification of disabilities shall be established by the State Council.

Article 3 [Protection of Rights]

Disabled persons shall enjoy equal rights with other citizens in political, economic, cultural and social fields, in family life and other aspects. The citizen's rights and personal dignity of disabled persons shall be protected by law.

Discrimination against, insult of and infringement upon disabled persons shall be prohibited.

Article 4 [Special Assistance]

The state shall provide disabled persons with special assistance by adopting supplementary methods and supportive measures with a view to alleviating or eliminating the effects of their disabilities and external barriers and ensuring the realization of their rights.

Article 5 [Special Assurance]

The state and society shall provide special assurance, preferential treatment and pension for wounded or disabled servicemen and persons disabled while on duty or for protecting the interests of the state and people.

Article 6 [Responsibilities of Government]

The people's governments at all levels shall incorporate undertakings for disabled persons into plans for economic and social development through budget arrangement, overall planning and coordination and other measures under strengthened leadership with a view to ensuring that undertakings for disabled persons develop in coordination with economic and social progress.

The State Council and the people's governments of provinces, autonomous regions and municipalities directly under the Central Government shall adopt organizational measures to coordinate departments concerned in the work for people with disabilities. The establishment of specific institutions shall be decided upon by the State Council and/or the people's governments of provinces, autonomous regions and municipalities directly under the Central Government.

Departments concerned under the people's governments at various levels shall keep in close contact with disabled persons, solicit their opinions and fulfill respectively their own duties in the work for disabled persons.

Article 7 [Responsibilities of the Society]

The whole society should display socialist humanitarianism, understand, respect, care for and assist people with disabilities and support the work for disabled persons.

State organs, non-governmental organizations, enterprises, institutions and urban and rural organizations at grassroots level should do their work for disabled persons well, as is within their responsibility.

State functionaries and other personnel engaged in the work for disabled persons should work hard to fulfill their lofty duties in serving disabled people.

In Afraid of the Dark, *an 11-year-old boy with a blind mother worries about the identity of the psychopath who is attacking blind women and begins to suspect those around him.*

Source: *Afraid of the Dark* (1992), directed by Mark Peploe. United Kingdom/France. Color, 91 minutes. Reprinted by permission of Paul Darke.

Article 8 [Responsibilities of Disabled Persons' Federation]

China Disabled Persons' Federation (CDPF) and its local branches shall represent the common interests of disabled persons, protect their lawful rights and interests, unite, educate disabled persons, and provide service for disabled persons.

CDPF shall undertake tasks entrusted by the government, conduct work for disabled persons and mobilize social forces in developing undertakings for disabled persons.

Article 9 [Responsibilities of Fosterer, Guardian and Family Member]

Legal fosterers of disabled persons must fulfill their duties towards their charges.

Guardians of disabled persons must fulfill their duties of guardianship and protect the lawful rights and interests of their charges.

Family members and guardians of disabled persons should encourage and assist disabled persons to enhance their capability of self-reliance.

Maltreatment and abandoning of disabled persons shall be prohibited.

Article 10 [Obligations of Disabled Persons]

Disabled persons must abide by laws, carry out their due obligations, observe public order and respect social morality.

Disabled persons should display an optimistic, and enterprising spirit, have a sense of self-respect, self-confidence, self-strength and self-reliance, and make contributions to the socialist construction.

Article 11 [Prevention of Disabilities]

The state shall undertake, in a planned way, the work of disability prevention, strengthen leadership in this regard, publicize and popularize knowledge of good pre-natal and post-natal care as well as disability prevention, formulate laws and regulations dealing with disability causing factors such heredity, diseases, medical poisoning, accidents, calamity and environmental pollution and adopt measures to prevent the occurrence and aggravation of disabilities by organizing and mobilizing social forces.

Article 12 [Award]

Governments and departments concerned shall award those disabled persons who have made notable achievements in socialist construction and those units or individuals who have made remarkable contributions to safeguarding the lawful rights and interests of disabled people, promoting undertakings and providing service for disabled persons.

Walt Stromer on the Functional Brutality of Military Medicine (1990)

Dealing with large numbers of often desperately injured or chronically ill men and believing in the program of aggressive normalization, military doctors were known to spare few feelings in informing men that their disabilities were permanent and that they needed to begin to adjust to them immediately, without self-pity or self-deception. While this often caused great resentment, it also served for many as a stimulus to make the necessary adjustments to new circumstances. Walt Stromer, long a member of the Blinded Veterans Association, went on to become a Professor of Speech at Cornell College in Iowa, where he was on the faculty for 32 years before retiring.

The View From Here

Editor's Note: Walt Stromer, guest columnist for this issue, lives in Mt. Vernon, Iowa. He is retired from Cornell College, where he taught speech for 32 years. Now he reaches adult education classes in other subjects he likes, and goes to the library a lot.

A Letter Too Late

By Walt Stromer

It was March 1945, and we were headed home on the Queen Mary. We sailed at 23 knots, zigzagging for fear of torpedoes. There were more than three thousand survivors aboard, wounded and disabled of the great crusade. Going home to cold drinks, hot dogs and assorted miracles.

A month later at Dibble General Hospital in California, no one had talked to me about miracles, so I made an appointment to see Lt. Fritchie, the ward officer. At ten the next morning, I knocked on his door. He opened it saying, "There's a chair straight ahead of you—sit down." He rustled through papers for a few seconds. Then he said, "I've looked through your files. I guess you know your case is hopeless. You'll never see again. Any questions?" After a few seconds, I said, "No." He said, "All right," and opened the door.

I walked out and closed the door. I didn't slam it. Lying back in my bunk, I don't remember all the thoughts, but suicide did come to mind. In about fifteen minutes, someone yelled, "Chow," which changed my thinking for the moment.

Before that morning I had just disliked Lt. Fritchie. After that I hated him. But a strange thing happened. I began to think about it from his position. He had to give that same terrible news to several hundred young men . . . news that could tear a man apart. Also some of us needed to be told to stop wishing and dreaming and to get on with living and the business of rehabilitation.

Five years later, I wrote to the Lieutenant to tell him I understood why he had been so brusque. His wife wrote back to say he had died two years earlier of cancer.

Sorry, sir.

World Federation of Psychiatric Users, Minutes of the First Committee Meeting (1991)

The first organizational committee meeting for the World Federation of Psychiatric Users was held in Mexico City on August 23, 1991. Representatives included those from the United States, Mexico, Japan, Netherlands, and New Zealand.

Mexico City, 23 August 1991

Present: Jan Dirk van Abshoven (Netherlands), Paolo del Vecchio (USA), Bob Long (USA)—replacing Esperanza Isaac, Mary O'Hagan (New Zealand), Pauline Hinds (New Zealand), Natosughi (Japan), Masaji Koganezawa (Japan) Adriana Lopez (Mexico)

Agenda

1. Meeting rules
2. Name for organisation
3. Priority tasks
4. Who will do what and when

1. Meeting Style and Voting Rules

Mary began by stating the need for cooperation. She said the meeting would run by consensus but there will be a vote for some agenda items. There will be no formal 'rules of order.' Each country represented will have one vote.

2. Name

There was some discussion about what term to call ourselves by. Survivor, client, inmate, psychiatrically labelled, purchaser and ex-patient were rejected. Opinion was divided between "user" and "consumer." The USA favoured "consumer." Mexico, New Zealand, Japan and the Netherlands favoured "user."

The following suggestions for the name of the organisation were put to the vote.

World Federation of Mental Health Users	Holland
World Federation of Psychiatric Users	Mexico, NZ
International Federation of Psychiatric Survivors	
Worldwide Congress of MH Consumers	
Worldwide Network of Psych Users	Japan
World Union of Mental Health Consumers	USA

The name of the organisation is:
World Federation of Psychiatric Users

3. Prioritising Tasks for the Next Two Years

The following tasks were developed before the meeting. Each country voted on what they thought should be the top three priorities for the next two years.

1. Network and inform users and user groups of the WFPU and increase membership. Produce and distribute a newsletter.

2. Hold international teleconferences

3. Produce and distribute discussion papers to users, professionals etc on the following issues:

- ECT
- Neuroleptics
- third world issues
- self-help / self-advocacy
- psychiatric labelling
- international bill of rights

4. Unified and coordinated response to any major rights violations that occur

5. Administrative tasks:

- fundraising
- yearly lists and censuses
- information storage
- coordination of tasks
- development of rules
- correspondence
- logo / letterhead
- committee meetings
- pamphlets

6. Continue user contact with WFMH and encourage users to go to Tokyo and to organise a user only conference before or after the World Congress for Mental Health, in Tokyo in 1993.

All countries voted for 1, 5 and 6 as priorities for the next two years.

- Newsletter / Networking / Membership
- Administrative tasks
- Contact with WFMH / Users to Tokyo

The non-priority tasks could still be done if there was time and energy for it.

4. Details on Priority Tasks

Many of the details decided on about the priority tasks are in the WFPU Plan (enclosed) which allocates who will do what and by when. Discussion not included in the Plan follows.

Newsletter

The newsletter will be free. It will be published every 6 months.

Membership

Membership shall be US $5.00 but users will have the option of paying no fee if they cannot afford it.

Administration

New Zealand will provide the office and administrative tasks for WFPU for the next two years.

Funding

There was a wide ranging discussion on ways to get funding. People felt it would be unethical to get sponsorship from drug companies. Funding will be needed for a pamphlet on WFPU. The Japanese could be approached for funding for user travel/conference to Tokyo. Fifty percent of funding should go to groups in originating country once WFPU is well-established.
MEETING ENDS

▣ Robert Brown and Hope Schutte, from *Our Fight: A Battle against Darkness* (1991)

A wealthy nation, fortunate to have never suffered the humiliation of total defeat, surrender, and occupation, the United States nonetheless has seen many of the same general problems in administering benefits and programs of assistance for disabled veterans that we see in defeated nations, such as Germany after the world wars. The history of American disabled veterans' organizations, especially at the level of the national office, has often been a struggle against bureaucratic lethargy, incompetence, and insensitivity. As this selection makes clear, the Blinded Veterans Association, which was founded by 100 blinded veterans of World War II then undertaking mobility and orientation training at an Army facility in Connecticut, has a long history of representing a wide variety of visually impaired veterans in their struggles with the bureaucracies in charge of overseeing programs relevant to its members' interests.

There is a special room on the first floor of the Blinded Veterans Association national headquarters building in Washington, D.C. It's where we keep our files, the records of all the men and women who, over nearly the past 46 years, have come to us for help.

Well, it isn't really a room—just an area walled off by an arrangement of room dividers, room dividers obscured by long rows of gray, brown, and green filing cabinets. Many of the cabinets are quite old and beat up. Yet they contain the names and experiences of men and women, thousands of blinded veterans who have been a part of BVA.

They tell stories, true stories, of the individual struggles of veterans blinded in combat, or though accident or disease, to regain their dignity and independence—stories of sacrifice and courage, of suffering and damaged lives and disappointment. Theirs is an accounting, a history of the desperation, and the hopes and dreams of thousands of American veterans who lost their sight.

And the file cabinets contain the story of the early days of the Blinded Veterans Association, the joyous successes and disappointing failures, the work accomplished and the work left undone by our early founders—a group of dedicated, determined young blinded veterans pulling together to do all they could to help their comrades so that they, too, might reclaim the basic rights of any human—dignity and independence.

One evening after all the other office staff had left for home, and feeling somewhat tired after a day of "working the phones," I stopped by the file room. I had some time to spend until I could get a ride home so I started opening some of the older cabinets and thumbing through the files I found there.

The file folders themselves are all different sizes and colors. Some, dating back to BVA's beginnings in the mid-1940s, are yellowed with age and have that dusty, old paper odor. Yet whether from World War II or the present time, each folder contains the personal history of a blinded veteran who has asked BVA for help.

Most of them contain letters, frequently laboriously hand written by the blinded servicemen themselves. These are quite difficult to read. Others are typewritten and frequently full of typing errors made by veterans struggling to communicate the best they could.

Usually, there are also military service records, medical records, and letters from doctors chronicling what had happened to the veteran, i.e., explaining the source of his blindness and other injuries, if he has them. There are copies of applications to the Veterans Administration for whatever benefits were needed and available copies of completed forms for compensation of injuries, educational and vocational training programs, and prosthetic equipment; and copies of job applications and resumes. The records of the men and women in the files come from every branch of service. Folder after folder, the lives of the blinded veterans who have come to BVA for help.

I continued pulling files and reviewing the old records, although with some hesitation, with a feeling that I was unearthing old troubles and sufferings long laid to rest and, probably, best left as they were. With a sense that there might be more in the old folders than I wanted to know about right then, because I had worked on veterans cases all that day and some of the blinded veterans who come to BVA asking for help have problems so daunting, so intractable that each and every one of us here has questioned our own ability and competence. We frequently wonder and worry: Did we do enough? Could we have done more? Perhaps done a better job? Did we try hard enough?

But my curiosity overcame my hesitation and I continued looking back in the early days, in 1946 and 1947, just after World War II had ended and just after BVA was organized, our headquarters office was located in New York City. We didn't have much to offer then—no Field Service Program, no Service Officers, no board of Veterans Appeals Claims Representative. Not much but togetherness.

Still, it was obvious that the early BVA staff did an excellent job. And the value of blinded veterans helping other blinded veterans was also apparent because our early workers took a realistic, down-to-earth approach, accepting the fact of their blindness and building upon what was left. They were good advice to their fellow blinded veterans; and they were tough, pushing and prodding much needed changes through the frequently unyielding Veterans Administration bureaucracy.

In many ways, these files are almost a chronology of America's wars in the Twentieth Century: World War II; Korea; Vietnam; and even the "cold war" in Europe, the Mid-East and the Pacific. There are even folders on blinded veterans from World War I, the folders of blinded servicemen who came to BVA for help after we were formed.

The files showed me that the injuries of the men blinded in Korea were much the same as those of the men blinded in World War II: bullet wounds to the head, grenade fragments in the eyes, artillery bursts, land mines, burns, airplane crashes. All the horrible aspects of war.

A large number of files show an initial date of contact with the BVA as the late 1960s and early 1970s. The awful consequences of the Vietnam War: men and women, most in their forties now, many of whom are still struggling to build a life for themselves. Soldiers, marines and airmen whose eyes were blasted or burned away by rocket propelled grenades, or "RPGs" as the men called them; or by AK-47s; or in the fires of downed airplanes or helicopters. And land mines, land mines, land mines—dirt and stones and metal fragments blasted into faces and eyes. Records on men and women blinded in exploding ammunition dumps; blinded in vehicle crashes; blinded by artillery malfunctions. And although we haven't reached as many of these veterans as we'd like to, or been able to do all that we know needs doing, we at BVA are still trying to help them as much as we possibly can.

Then, there are folders with more recent dates, too, because each year a substantial number of servicemen go blind whether or not there is a war in progress: servicemen who are blinded in accidents or by disease while on active duty; those who go blind after leaving service; or servicemen manifesting age-related diseases which cause blindness. In fact, many of the files dated 1980 and up belong to veterans of World War II, Korea, and the long years of the cold war and show a real change in the origins of blindness—Diabetes, Glaucoma, Macular Degeneration, Retinitis Pigmentosa, Multiple Sclerosis, Optic Atrophy—diseases with strange names that usually do not strike until later in life, yet with devastating impact. They all destroy precious sight.

To me, on that late night, I realized that the files at BVA speak not only of war, of suffering, but of bravery and courage and sacrifice, of the meaning of service and the price of freedom. And I believe they also speak of fellowship. Because we at BVA are all blinded veterans—whether we served during war or peacetime; were blinded in combat or in an accident; lost our sight to disease while in service or many years later. And we are all bound together by our love of country and our desire for a peaceful world. We do our best to serve and help one another without regard to race, creed, sex, religion or political affiliation.

To receive our assistance, you need only be a veteran and be "legally blind." Currently, the standard definition of legal blindness is: "best corrected vision in the better eye of no more than 20/200 or a visual field of no more than 20 percent in the better eye."

Since World War II, America's blinded veterans have encountered many frustrations in their dealings with the Veterans Administration. Continual turnover in Veterans Administration Regional Office . . . staff; lack of training about the special needs of blinded veterans; indifference caused by heavy workloads; difficulties with communicating and implementing updated benefit rulings; and a pervasive ignorance about the causes of blindness and its actual—as opposed to imagined—limitations have all resulted in inequities in the VA's treatment of blinded soldiers. Unfortunately, many of these inequities are still prevalent today. For example, up until 1972 blinded veterans who had suffered anatomical loss of both eyes usually received much larger VA disability compensation awards than those veterans who were equally sightless but whose eyes had not been enucleated.

And because one of the most serious problems facing nearly all blinded veterans is not having enough money to meet even the most basic of their living expenses, the matter of compensation or pensions has become an overriding issue.

It is, in fact, along with our personal advocacy of blind rehabilitation for nearly all blinded veterans, the most prevalent issue involved with the blinded veterans we try to help and, therefore, occupies a great deal of our time.

The issue is a complex one. Originally disability compensation was awarded for injuries sustained during battle. It was conceived as unrelated to economic need: the Military Service or the Veterans Administration was simply "compensating" the veteran for his blindness or other injuries incurred in combat as a means for insuring that his future standard of living would not be affected by his diminished earning capacity. The amount, or rate, of service-connected compensation was to be proportionately related to the severity of his disability or loss. Basically, this is the system still in effect today.

Therefore, in most cases, veterans blinded while on active duty through either disease or injury, and through no fault of their own, are subsequently compensated for their loss. Additionally, veterans whose "aggravation" of blindness can be proven—that is, if a veteran has a certain disease affecting vision, for example Multiple Sclerosis, which manifests itself following active duty and, if the disease follows an abnormally rapid progression which can be presumed to be a consequence of the stresses of military service—may also be certified as service connected, and thus become eligible to receive all corresponding service-connected compensation. Today, these benefits now also include medical care, educational and vocational training benefits, housing grants, automobile grants and dependent benefits.

Pension, on the other hand, was established as recompense or recognition for services rendered to the nation. It was a means of assisting veterans in living out their days with the dignity that comes from having one's basic needs met and was, therefore, intended for any veteran in temporary or permanent need of financial assistance due to non-service-connected illness or disability, or old age. Current criteria for being awarded a VA pension generally include: total disability; service during a wartime period; and low-income status. Today's VA pensions also entitle the veteran to medical care and several other benefits as well.

Determining amounts for either compensation or pension awards is a complex process based upon an elaborate and highly detailed rating system. Compensation and pension amounts are also frequently revised upward to reflect increases in cost of living.

When a veteran contacts BVA, we immediately try to determine whether or not the veteran may be eligible for either service-connected or non-service-connected benefits. If so, we assist him or her in preparing claims applications and monitor the application as it works its way through the VA process, solving whatever problems arise and helping track down whatever additional information is needed to insure that the compensation or pension award received is an equitable one.

Our experiences over the years have taught us the sad truth that fairness and equity on the part of the VA, as well as other service agencies, simply cannot be assumed. For some reason, VA rating officials sometimes seem to take an almost whimsical approach to blinded veterans, denying their legitimate compensation claims and insisting on injury ratings far below those allowed by regulation. Part of the problem seems to lie in the misreading of medical evaluations; and part of it from medical evaluations that were performed poorly to begin with, resulting in inadequate measures and descriptions of the nature and extent of veterans' blindness. Strange as it may sound, despite the high level of technology that exists in medical science today, many doctors remain incredulously ignorant of blindness—of its sources and of its attendant problems.

Consequently, much of our work on behalf of blinded veterans becomes very technical. In response, we have established, and maintain, a high level of technical expertise that enables us to challenge the bureaucracy when such mistakes are made.

Naturally, wherever and whenever possible we try to get the blinded veteran "service connected." As need dictates, we search for old records and documents from military service years that may show a service-related cause for the blindness. We review old claims and claim denials to see if errors have been made. And when we feel that a veteran's claim has been unfairly turned down at the VA Regional Office level, we represent the veteran's case at the next level of appeal, the Board of Veterans Appeals.

Indeed, many, if not most, of the benefits blinded veterans receive today stem from BVA's efforts over the years, and the work continues. Through often bitter experience we have learned that the VA, like many other federal agencies, simply cannot be trusted to look after us. The present system of blind rehabilitation centers and clinics and of Visual Impairment Service Teams . . . and many other services now available to all veterans will persist only as long as BVA and its sister veterans organizations remain vigilant.

We at BVA are here to help all blinded veterans, both individually and collectively. We, sometimes alone, sometimes in conjunction with our sister veterans service organizations, present legislative initiatives and frequently attend hearings on veteran's legislation. Our officers, directors, national office and field staff all represent blinded veterans before departments and agencies at the state, regional, and national levels, including the U.S. Congress, the Department of Veterans Affairs, the President's Committee on Employment of People with Disabilities, the Small Business Administration, the U.S. Office of Personnel Management, the U.S. Department of Labor, the Department of Health and Human Services and the Department of Education—as we have since our formation in 1945.

We also testify on behalf of blinded veterans at hearings of the House and Senate Committees on Veterans Affairs, on problems related to blind rehabilitation, veterans' access to health care, improved prosthetic services, and on the budget for the Department of Veterans Affairs.

Over the years BVA has taken on a lot. But we know that many pressing needs of blinded veterans remain unmet. And it is our sincere hope that one day, funds and continuing strong leadership providing, we will be given the opportunity to grapple with these issues, too, in order to more completely fulfill our mission to provide mutual support and assistance to all blinded veterans.

▣ From *Dendron News* (1992)

This excerpt, which appeared on the back page of Dendron News, *provides a brief explanation of the name chosen for one of the first "Psychiatric Survivors & Allies Independent Media."*

What is "Dendron" anyway?

Your brain has billions of cells called *neurons.* Information flows between neurons through the branches of DENDRITES, which comes from the Greek word for *tree,* DENDRON. This paper is printed on recycled paper from dendrons (post-consumer). Brains look like ancient, wild forests. Psychiatry is like modern forestry—clearcutting brains to prop up the current failing, dominating system. So connect your liberating thoughts with others globally through DENDRON.

▣ Disability Discrimination Act of 1992 (Australia)

The Australian Disability Discrimination Act (DDA) 1992 was enacted at a time in Australia's history when there was a concerted effort to address the social exclusion of disability people. The Australian Disability Discrimination Act 1992 reflected many of the principles enshrined in the Americans with Disabilities Act 1990 and included coverage for work, education, accommodation, sport and recreation.

While the initial proposal for the enactment of the legislation appeared as an unprecedented move by government to redress discrimination on the grounds of disability, increasingly, the limitations of the DDA are being revealed. The national legislative framework pursued a policy of restrained social recognition of equality before the law. Reforming social institutions for the collective good of disabled people has been constrained by the legislation's "complaints framework," as the onus of reporting experiences of discrimination is placed on disabled individuals. Further, organizations and social institutions can be absolved of legal accountability and *compliance with the DDA if they can prove "unjustifiable hardship" on economic grounds. Other constraining factors consist of the Australian Government's National Competition Policy. In Australia, national legislation is reviewed to ensure that it does not impede the competitive capacity of the economy, in line with competitive market ideology. During 2003 and 2004, the DDA underwent extensive review with national public consultations. There was overwhelming public support to strengthen the DDA, particularly in the area of employment. However, many of the recommendations and the current government's commitment to National Competition Policy do not appear to redress discrimination on the grounds of disability.*

Section I—This Act may be cited as the Disability Discrimination Act 1992

Objects

The objects of this Act are:

(a) to eliminate, as far as possible, discrimination against persons on the ground of disability in the areas of

- (i) work, accommodation, education, access to premises, clubs and sport; and
- (ii) the provision of goods, facilities, services and land; and
- (iii) existing laws; and
- (iv) the administration of Commonwealth laws and programs; and

(b) to ensure, as far as practicable, that persons with disabilities have the same rights to equality before the law as the rest of the community; and

(c) to promote recognition and acceptance within the community of the principle that persons with disabilities have the same fundamental rights as the rest of the community.

Disability discrimination

(1) For the purposes of this Act, a person (*discriminator*) discriminates against another person (*aggrieved person*) on the ground of a disability of the aggrieved person if, because of the aggrieved person's disability, the discriminator treats or proposes to treat the aggrieved person less favourably than, in circumstances that are the same or are not materially different, the discriminator treats or would treat a person without the disability.

(2) For the purposes of subsection (1), circumstances in which a person treats or would treat another person with a disability are not materially different because of the fact that different accommodation or services may be required by the person with a disability.

Indirect disability discrimination

For the purposes of this Act, a person (*discriminator*) discriminates against another person (*aggrieved person*) on the ground of a disability of the aggrieved person if the discriminator requires the aggrieved person to comply with a requirement or condition:

(a) with which a substantially higher proportion of persons without the disability comply or are able to comply; and (b) which is not reasonable having regard to the circumstances of the case; and (c) with which the aggrieved person does not or is not able to comply.

Disability discrimination–interpreters, readers and assistants

For the purposes of this Act, a person (*discriminator*) discriminates against another person with a disability (*aggrieved person*) if the discriminator treats the aggrieved person less favourably because of the fact that the aggrieved person is accompanied by:

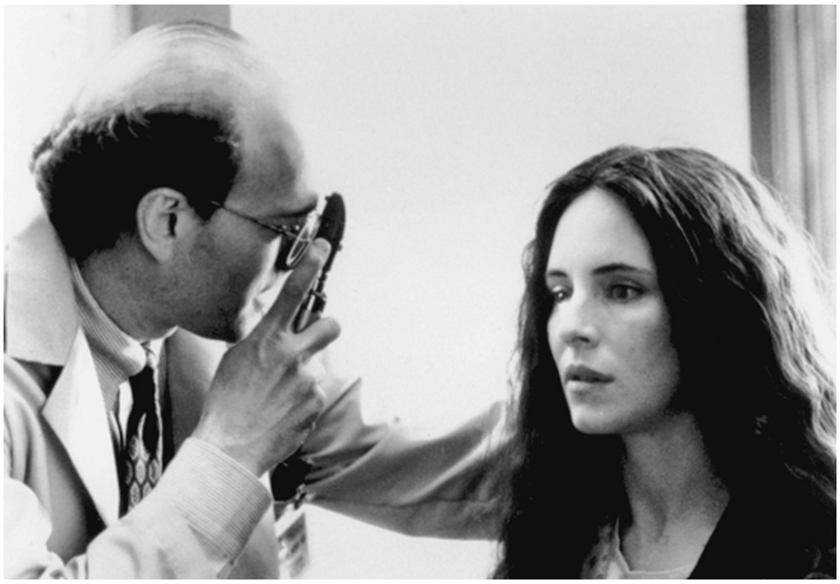
(a) an interpreter; or (b) a reader; or (c) an assistant; or (d) a carer; who provides interpretive, reading or other services to the aggrieved person because of the disability, or because of any matter related to that fact, whether or not it is the discriminator's practice to treat less favourably any person who is accompanied by: (e) an interpreter; or (f) a reader; or (g) an assistant; or (h) a carer.

Disability discrimination–guide dogs, hearing assistance dogs and trained animals

(1) For the purposes of this Act, a person (*discriminator*) discriminates against a person with: (a) a visual disability; or (b) a hearing disability; or (c) any other disability; (*aggrieved person*) if the discriminator treats the aggrieved person less favourably because of the fact that the aggrieved person possesses, or is accompanied by: (d) a guide dog; or (e) a dog trained to ssist the aggrieved person in activities where hearing is required, or because of any matter related to hat fact; or (f) any other animal

trained to assist the aggrieved person to alleviate the effect of the disability, or because of any matter related to that fact; whether or not it is the discriminator's practice to treat less favourably any person who possesses, or is accompanied by, a dog or any other animal.

(2) Subsection (1) does not affect the liability of a person with a disability for damage to property caused by a dog or other animal trained to assist the person to alleviate the effect of the disability or because of any matter related to that fact.



In Blink, *a musician recovers her sight after 20 years and believes that she has witnessed a murder. A detective decides to trust her account and protects her from danger.*

Act done because of disability and for other reason

If: (a) an act is done for 2 or more reasons; and (b) one of the reasons is the disability of a person (whether or not it is the dominant or a substantial reason for doing the act); then, for the purposes of this Act, the act is taken to be done for that reason.

Unjustifiable hardship

For the purposes of this Act, in determining what constitutes unjustifiable hardship, all relevant circumstances of the particular case are to be taken into account including: (a) the nature of the benefit or detriment likely to accrue or be suffered by any persons concerned; and (b) the effect of the disability of a person concerned; and (c) the financial circumstances and the estimated amount of expenditure required to be made by the person claiming unjustifiable hardship; and (d) in the case of the provision of services, or the making available of facilities—an action plan given to the Commission under section 64.

Discrimination in employment

(1) It is unlawful for an employer or a person acting or purporting to act on behalf of an employer to discriminate against a person on the ground of the other person's disability or a disability of any of that other person's associates: (a) in the arrangements made for the purpose of determining who should be offered employment; or (b) in determining who should be offered employment; or (c) in the terms or conditions on which employment is offered.

(2) It is unlawful for an employer or a person acting or purporting to act on behalf of an employer to discriminate against an employee on the ground of the employee's disability or a disability of any of that employee's associates: (a) in the terms or conditions of employment that the employer affords the employee; or (b) by denying the employee access, or limiting the employee's access, to opportunities for promotion, transfer or training, or to any other benefits associated with employment; or (c) by dismissing the employee; or (d) by subjecting the employee to any other detriment.

(3) Neither paragraph (1)(a) nor (b) renders it unlawful for a person to discriminate against another person, on the ground of the other person's disability, in connection with employment to perform domestic duties on the premises on which the first-mentioned person resides.

(4) Neither paragraph (1)(b) nor (2)(c) renders unlawful discrimination by an employer against a person on the ground of the person's disability, if taking into account the person's past training, qualifications and experience relevant to the particular employment

and, if the person is already employed by the employer, the person's performance as an employee, and all other relevant factors that it is reasonable to take into account, the person because of his or her disability: (a) would be unable to carry out the inherent requirements of the particular employment; or (b) would, in order to carry out those requirements, require services or facilities that are not required by persons without the disability and the provision of which would impose an unjustifiable hardship on the employer.

Accommodation

(1) It is unlawful for a person, whether as principal or agent, to discriminate against another person on the ground of the other person's disability or a disability of any of that other person's associates: (a) by refusing the other person's application for accommodation; or (b) in the terms or conditions on which the accommodation is offered to the other person; or (c) by deferring the other person's application for accommodation or according to the other person a lower order of precedence in any list of applicants for that accommodation.

(2) It is unlawful for a person, whether as principal or agent, to discriminate against another person on the ground of the other person's disability or a disability of any of the other person's associates: (a) by denying the other person access, or limiting the other person's access, to any benefit associated with accommodation occupied by the other person; or (b) by evicting the other person from accommodation occupied by the other person; or (c) by subjecting the other person to any other detriment in relation to accommodation occupied by the other person; or (d) by refusing to permit the other person to make reasonable alterations to accommodation occupied by that person if:

(i) that person has undertaken to restore the accommodation to its condition before alteration on leaving the accommodation; and

(ii) in all the circumstances it is likely that the person will perform the undertaking; and

(iii) in all the circumstances, the action required to restore the accommodation to its condition before alteration is reasonably practicable; and

(iv) the alteration does not involve alteration of the premises of any other occupier; and

(v) the alteration is at that other person's own expense.

(3) This section does not apply to or in respect of:
(a) the provision of accommodation in premises if:

(i) the person who provides or proposes to provide the accommodation or a near relative of that person resides, and intends to continue to reside on those premises; and

(ii) the accommodation provided in those premises is for no more than 3 persons other than a person referred to in subparagraph (a)(i) or near relatives of such a person; or

(b) the accommodation is provided by a charitable or other voluntary body solely for persons who have a particular disability and the person discriminated against does not have that particular disability; or

(c) the provision of accommodation in premises where special services or facilities would be required by the person with a disability and the provision of such special services or facilities would impose unjustifiable hardship on the person providing or proposing to provide the accommodation whether as principal or agent.

National Empowerment Center's Mission Statement (1992)

The National Empowerment Center was founded in 1992 through a grant from the Center for Mental Health Services, Substance Abuse and Mental Health Services Administration, U.S. Department of Health and Human Services, to act as a consumer-run National Technical Assistance Center. Located in Lawrence, Massachusetts, it remains a significant component of the psychiatric survivor/user movement. The group's website is at http://www.power2u.org.

Our Mission

The mission of the National Empowerment Center Inc. is to carry a message of recovery, empowerment, hope and healing to people who have been diagnosed with mental illness. We carry that message with authority because we are a consumer/survivor/expatient-run organization and each of us is living a personal journey of recovery and empowerment. We are convinced that recovery and empowerment are not the privilege of a few exceptional leaders, but rather are possible for each person who has been diagnosed with mental illness. Whether on the back ward of a state mental institution or working as an executive in a corporation, we want people who are mental health consumers/survivors/ex-patients to know there is a place to turn to in order to receive the information they might need in order to regain control over their lives and the resources that affect their lives. That place is the National Empowerment Center.

▣ Richard Powers, from *Operation Wandering Soul* (1993)

Powers's dystopic novel takes place on a pediatric ward for disabled children in Los Angeles. Rather than passively submitting to their destiny as wards of the state, medical guinea pigs, or sentimentalized charity objects, the children begin to do research in order to re-create a more meaningful history of disability and adult neglect for themselves. Specifically, they spend each evening having their nurse, Linda, read tales about other disabled children from around the world from whom they might better learn to navigate their own stigmatized lives. In this excerpt, they listen to a version of the ancient Japanese myth of Hiruko, the Leech Child, who is abandoned by his parents to die because of his disabilities but ends up sailing around the world in search of comradeship (see an excerpt from the original version of this story in Part One).

(Night 57, Japan)

This is how the world begins. At first, the All was no more than a blurry egg, full of seeds and shaken together. After a time beyond telling, the heavier parts began to sink down and the lighter floated upon them, forming the plain of high heaven. On this plain, three gods were born of no one, lived out an eternity, and then vanished back into nothing.

How you gonna be born of no one? Everybody got . . .

Shh. Come on. It's a makeup; that's how it opens. Next there came about, on their own, a few pairs of gods who lived in the drifting middle of nowhere. The youngest couple among them were called Izanami and Izanagi, or She-the-Inviter and He-the-Inviter. She and He were ordered by their elders to collect a solid world from out of the shapeless, muddy waters that flowed beneath the high plain of heaven. They stood on the bridge of the sky and dipped a jeweled spear into the sandy broth below them, stirring it slowly. They pulled their spear out of the waters. A drop of brine sticking to the shaft fell off to form Onogoro, the first island.

She-the-Inviter and He-the-Inviter climbed down onto the island and began exploring it. They circled slowly around one another at the pillar at the center of the solid world. Slowly, they discovered each other, and learned that they wanted one another.

Uh-oh. They in trouble now. When my daddy found my big brother and me . . .

No, sweetheart; it wasn't like that. Remember, these two gods had no parents. Slowly, by experiment and chance, She-the-Inviter and He-the-Inviter learned how to make a baby. But their first child was born with something wrong with it. Because She did not yet know the rules of courtship she accidentally broke them. So the first infant who laid eyes on the world was born deformed.

Heh. Like me, you mean?

Yes, Chuck, my man. A little like you. She and He named their boy Hiruko, the Leech Child. They didn't know what they were supposed to do with him, so they built him a boat of reeds and set the boy adrift on the open sea. So you see, the very first child *ever* was abandoned. As soon as the Leech Child drifted out of sight, his parents began making other babies, more deities to cover every walk of creation.

Among their new children were the eight main islands of the world. She-the-Inviter was burned to death while giving birth to her last child, Fire. Gods spilled out of her dying body. Other gods arose from the tears of her husband's eyes. In a rage, He-the-Inviter swung his great blade and cut off the head of Fire, his son. From out of the bleeding neck of Fire there sprang Thunder, with several more gods.

The soul of She-the-Inviter went down into Yomi, the land of darkness, where He-the-Inviter madly followed. He wanted to find her and bring her back to life. But his wife had already eaten food cooked in the land of darkness, so she could not come back. The dead She warned her husband not to look upon her. But he disobeyed her command. He looked at her face, and saw something horrible. His wife was rotting. Maggots covered her. Shh! Yes, like the ones in old garbage. He-the-Inviter ran back up into the world in terror. She was hurt and angry, and She sent a pack of Furies to chase after her husband.

When He reached the surface once again, He sealed up the entrance to the land of darkness with an enormous rock. His wife became furious. She threatened to kill a thousand of their children every day that He kept her trapped. But He just sneered at her. He said that he would father fifteen hundred new children for every thousand that She killed. She and He knew they had come to an end.

To purify himself, He bathed in the waters. As He washed, more gods sprang from him. From the water sprinkling from his left eye was born the Sun, and from his right the Moon. Out of his nose there came Susanoo, the God of the Wind and Storm.

Korean Protest of Socially Marginalized Peoples: Intersexed. Lesbian, Disabled, Prostitutes, Seoul, Korea, 2003.

His nose? Gross. But what about the boy in the boat? The Leech?

It doesn't say. He must have floated for a long, long time. Reeds can be very watertight in these stories. But the ocean can be pretty big too. The Leech Child probably drifted in the current for years, farther and farther away, into places where land was completely unheard of.

Maybe the boat was held together by little metal clasps. That's it; I once read something like this. He pulled one of these metal strands loose and fashioned a bit of tinsel from it, which he dangled in the water just to amuse himself, because it looked pretty. And that's how, by accident, he learned that fish will bite at a hook. And he figured out that by eating fish, he could live pretty much as long as he needed.

Yeah? Well, all right. It's possible. Read us another one.

(Night 139, central Italy. Twin infant sons of a vestal virgin and the God of War are sentenced by the king to be drowned in the Tiber. Miraculously, the cask they are put in floats. They are found and suckled by a wolf more loving than human parents. The foundlings grow up to invent the West.)

Go on. We want more.

(Night 21, the Near East. Another terrified tyrant orders all the male offspring of a certain tribe to be drowned to death. The mother makes a little reed ark for the boy, and lays him in the rushes on the riverbank. The tyrant's daughter finds the infant, and hires the boy's own mother to nurse him. The boy grows up to bring God's law to . . .)

Why drowning? Why water all the time? Why little boats?

Yes, that's odd, isn't it? Happens all over the place. Look at this: Night 308, the Mississippi. Night 145, Norway. Night 98, Kashmir. Night 114, Zimbabwe.

(Across the planet, attempted drownings, tiny bound bodies thrown deliberately back into the sea. All through the time line, vanishing into the current, carried along by the undertow. Every other story in any anthology—children sealed up, locked in casks, keelhauled, strapped on rafts, sucked down by the departing tide. A few miraculously saved, for future purposes.)

And some mom and dad always want to kill them.

Yes, true! Notice how the stories always blame some evil step-something, or foster fathers, or kings? Guilty conscience, I'll bet you anything. These cats have something to hide, I'm here to tell you. If they're not putting the kids out to drown in chests, then they're

Enchanted Cottage *is a queasily sentimental tale in which a blind pianist persuades a disfigured war veteran and a homely woman that they are, in fact, beautiful.*

The Hunter College Disability Studies Project, "Definition of Disability Studies" (1990s)

One effort at the university level to gain recognition of disability as a multicultural experience was undertaken in the 1990s by disability studies faculty at Hunter College in New York City. The following is an excerpt from the rationale offered to allow disability to serve as fulfillment of the multicultural studies requirement. Although the proposal ultimately failed, the effort sparked other efforts to adopt similar requirements at U.S. universities and colleges across the country.

Disability Studies

Disability Studies reframes the topic of disability by focusing on disability as a social phenomenon, as a social construct, as a metaphor and in fact as a culture. It does this by examining myths and ideas related to disability in all forms of cultural representations and throughout history. This focus shifts the emphasis away from examining the characteristics of impairments and their prevention, treatment and remediation to the study of disability as a social/cultural/political phenomenon. This shift does not indicate a denial of the presence of impairments and physical limitations, nor a rejection of the utility of intervention and treatment. Rather, the examination of disability as a socially constructed category is conducted in order to disentangle those impairments and limitations from the myth, ideology and stigma that influence social interaction and social policy. This analysis challenges the idea that the economic and social status and the assigned roles of people with disabilities are an inevitable outcome of their impairments, an idea similar to the argument that women's roles and status are biologically determined.

It is useful to disentangle the social construction from the physical realities of disability. One can begin to understand the breadth and depth of discrimination, marginalization, alienation and oppression of people with disabilities. In addition, Disability Studies is a prism through which we can gain a broader understanding of society and human experience, and the significance of human variation. Just as looking at American Studies from an African-American perspective provides a more comprehensive view of America's history, Disability Studies provides a more complex view [of] many critical social issues: competence, wholeness, independence/dependence, autonomy, health, physical appearance, aesthetics, and community, which pervade every aspect of the civic and pedagogical culture. Scholarship in this field addresses such fundamental ideas as who is considered a burden and who is a resource, who is expendable and who is esteemed, who should engage in the activities that might lead to reproduction and who should not, and if reproduction is not the aim, who can engage in erotic pleasures and who should not. Disability Studies examines the eugenics ideology that informs the discourse on abortion, pre-natal screening, birth control, euthanasia and medical ethics. And as Longmore (1992) points out, it also deepens the "historical comprehension of a broad range of subjects, for instance the history of values and beliefs regarding human nature, gender and sexuality; American notions of individualism and equality, and the social and legal definitions of what constitutes a minority group."

Circle Story #5: Mike Ervin and Anna Stonem, *by Riva Lehrer. 1998. Mixed media on paper, 22" by 21." Mike Ervin, journalist, writer and playwright, and Anna Stonum, poet, and visual artist, are shown in a double portrait. Ervin and Stonum were both dedicated disability rights activists and traveled the country to participate in political actions. They had been married for a decade before Anna Stonum's sudden death of heart failure in February 1999. Ervin's disability is Duchenne's muscular dystrophy, and Stonum's was Friedreich's ataxia.*

The field of Disability Studies is multidisciplinary, includes both theory and research and has relevance to both liberal arts and applied fields. It draws on paradigms and constructs from anthropology, literature, sociology, history, political science, education and others. Incorporated into the liberal arts curriculum, it has the potential to organize and critique the existing representations of disability and ability in the culture. This process can expose ways that disability has been socially constructed and reveal the consequences of that construction for the pedagogic and civic cultures.

The myths and ideologies about disability entrenched in the curriculum parallel those that wield influence in the civic culture. The present curriculum supports the social organization and practices within the civic culture whose institutions often maintain an inequitable distribution of power and opportunity based on perceptions of competence and value. Therefore, a goal of Scholars in Disability Studies is to expose, deconstruct, and analyze fallacies and inconsistencies and examine their implications for social interaction. When incorporated into the curriculum, Disability Studies has the potential to redress the inadequacies in the structure and content of the curriculum by approaching disability as a phenomenon that organizes social, political and intellectual experience.

▣ Mike Ervin, *The History of Bowling* (1999)

The History of Bowling *is the story of Chuck, a 32-year-old quadriplegic college freshman who, after 15 years of watching TV in his mother's attic, has gathered the courage to return to college. As he begins to relish coming out of the disability closet, he finds love in, of all places, PE class. His paramour, Lou, is a senior with an invisible disability (epilepsy) who has spent her life trying to hide her condition. When an insensitive coach forces the two to collaborate on a project, love blossoms and lovers' quarrels ensue, comically spurred on by Chuck's seductive roommate, Cornelius, who is deaf and blind, as well as a cad and a con. The playwright, Mike Ervin, is a well-known Chicago writer and disability rights activist. He coordinates the Victory Gardens Access Project, a program that uses technology to make live theater accessible for persons with disabilities.*

Act I : Scene I: Lou and Chuck
are in opposite corners of the stage.

LOU (to audience): I finally broke down and got a doctor's note. I hated to do it but I had to. It was the only way I could get out of that stupid mandatory PE credit. I had the doctor at the student infirmary write me a note saying it was unsafe for me to take PE because it could set off a seizure if I got hit in the head with a ball. Of course it was bull shit. But the doctors at the student infirmary are like retired podiatrists. They don't know any better. I felt cheap and sleazy after I did it. Not because it was a lie, but because I played the cripple game. I only played the cripple game once before in my whole life. I could have played it a thousand times. But the only time I ever did, I stood up and said, "Well, your honor, sir, it's just that I have epilepsy. And if I were to have a seizure in the jury box . . ."

CHUCK (to audience): I, on the other hand, am the king of the doctor's notes. I could fill [the] gymnasium with all the doctor's notes I've had to get. When I got the license plates with the little wheelchair hieroglyphic, I had to get a doctor's note. When I got this wheelchair, doctor's note. When I applied to this university, doctor's note again. One time I was in a shoe store and the manager rushed up and he said that before he would let any of his sales people touch my feet, I would have to bring a doctor's note.

LOU (to audience): I know, I know, I should have stood up and said, "I have epilepsy, your honor, but it will in no way interfere with my ability to do the job!" But I didn't have time for jury duty.

CHUCK (to audience): The shoe store manager was so uptight. He said, "I'm sorry sir, but I don't

In The Piano, *a mute Scottish woman travels with her young daughter for an arranged marriage to a landowner in New Zealand. She is forced to leave her most treasured possession, her piano, on the beach, but she enters into a bizarrely erotic relationship with the half-Maori who purchases it.*

Source: *The Piano* (1994), directed by Jane Campion. Australia. Color, 120 minutes. Reprinted by permission of Paul Darke.

want them to be responsible if something should happen." I said, "What, you had a cripple come in here once and his feet exploded?" And he said, "It's not that I don't have empathy for your situation." That really made me laugh. I said, "How can YOU feel sorry for ME? You manage a shoe store!"

LOU (to audience): My mother would hate it if she knew I got a doctor's note. The one thing she has no patience for is "those people who use their handicap as a weapon."

CHUCK (to audience): Beggars on the street are like that too. They try to hit up everyone who comes by, but never me. It's an insult. They're wearing shoes they found in the dumpster, but they think they're better off than me. I wish I could afford to flash 500 bucks at one of them! I'd show them boy!

LOU (to audience): I should have known it wouldn't be that easy. I delivered my doctor's note to Mr. Barnes, the PE teacher. I tried to act like I was really broken up about not being able to take PE.

(Enter BARNES, perusing a note. He's the devil wearing gym teacher's clothes with a whistle around his neck.)

BARNES: Oh dear. Epilepsy, huh?

LOU: Yes. And I really can't [take] the risk.

BARNES: Oh, mercy no. Most certainly not.

LOU: I'm really sorry. I'll have to get an exemption, I guess.

BARNES: We'll have to put you in the special section.

LOU: What!

BARNES: Oh yes. The special section. For the people with handicaps. Maybe you can't literally participate in athletic activities, but you surely can write term papers about them. You and your partner.

LOU: Partner?

BARNES: But of course. Another handicapped person.

LOU: You mean, someone who's blind, or in a wheelchair?

BARNES: Could be a hemophiliac. (Laughs a diabolical laugh.)

(Barnes exits.)

CHUCK *(to audience):* The street preachers are the worst. I try my best to ignore them, until they start with that, "Pray to Jesus and he'll make you walk!" One day I passed that one who's always in front of the drug store with the bullhorn shouting, "Jesus! Jesus! Jesus!" And he says to me, "You better get right with Jesus, or he ain't never gonna make you walk!"

LOU (*to audience*): Oh God! A partner! My mother would say, "Serves you right! You can either use your handicap to make excuses or you can stand on your own two feet!"

CHUCK (*to audience*): "You better get right with Jesus or he ain't never gonna make you walk!" Who the hell does he think he is? So I turned to him and I said, "You better get right with Jesus, or he ain't never gonna make you white!"

LOU (*to audience*): I had to meet my partner at the cafeteria. Two o'clock Tuesday. All I knew was his name was Chuck. That's all I knew. Oh God! I don't belong here!

CHUCK (*to audience*): He told me don't think my wheelchair will keep me from going to hell! I said I hope not. One time I made airplane reservations and they told me before I could board I'd have to have a doctor's note. I just bet you if I did go to hell, Satan would hit me up for a doctor's note.

LOU (*to audience*): There was this black boy named Terry. His face was hideously burned. It was like his face was made of wax and big wax tears dripped down and solidified. His face was smeared, like someone tried to put it back in place with a putty knife.

(Lou walks toward Chuck and sees him sitting at a cafeteria table.)

LOU: Chuck?

CHUCK: Yeah.

LOU: I'm Lou.

CHUCK: My partner?

LOU: Yes.

CHUCK: What are you? Hemophiliac?

LOU: Epilepsy.

CHUCK: Epilepsy people can't take PE?

LOU: There's been a mistake. I was supposed to get an exemption.

CHUCK (*Laughing*): An exemption from Barnes? That sadistic bastard? They say he wouldn't let his dead grandma off the hook for P.E. We're lucky he's not making us run laps.

LOU: I wish he was.

CHUCK: Thanks.

LOU: I didn't mean it like that.

CHUCK: Right.

LOU: I didn't.

(Pause.)

CHUCK: You a freshman?

LOU: No. A senior. It's my last semester.

CHUCK: A senior? And just taking PE now?

LOU: I put it off until the last minute. And now I can't avoid it anymore. What are you?

CHUCK: A freshman.

LOU: How old are you?

CHUCK: Thirty two.

LOU: And you're a freshman?

CHUCK: It's a long story.

(Pause.)

LOU: I didn't mean anything by what I said. It's just that I hate writing term papers. And especially about sports. I don't know anything about sports. I hate sports. I have no idea what to write about.

CHUCK: Yeah well that's OK. I know a lot about sports. That's all I did for the last fucking 15 years. Watch sports on cable. Stock car racing, water polo, the world table tennis championships. But I was about to tell Barnes he could shove his busy work. Then I got to thinking about it and pretty soon I got real excited. So don't worry. I know exactly what we're gonna write about!

LOU: Oh good. What?

CHUCK (*bitterly*): Bowling!

LOU: Bowling?

CHUCK: Bowling.

LOU: I hate bowling.

CHUCK: So do I.

LOU: I don't know anything about bowling. I've never set foot in a bowling alley.

CHUCK: That's all right. I know all about bowling. I did it enough times.

LOU: You? Bowling?

CHUCK: Yep. Bowling Buddies. Crippled kids bowling club. Every third Saturday. The bastards! I think they were Christian kids. Real clean rah-rah types. I think maybe we were extra credit. They'd close down Rainbow Lanes for the afternoon and bring the cripples in. Sons of bitches!

LOU: My God.

CHUCK: I know. And bowling buddies motto was "anybody can bowl a strike." They had this ramp. It looked like a miniature playground slide. They'd put the ball on top and you'd push it and would roll down the ramp and head down the lane. Anybody could do it. There was this kid with no arms. He pushed the ball with his head.

LOU: Please. I don't want to hear anymore

CHUCK: He was a maniac. He'd get a running start and butt heads with the bowling ball. They made him wear a leather helmet. We called him kamikaze. And in bowling buddies, no one ever threw a gutter ball. You know why?

LOU: Don't tell me.

CHUCK: Because the Christians ran along side the lane and if the ball headed for the gutter, they'd kick it back on course.

LOU: All right! All right! We'll do bowling!

CHUCK: It's all true. Every word.

LOU (*to audience*): He made me feel how I felt when my friend Amy told me about the bastard she was married to who beat her up for years. The Amy I knew was the head of an agency, served on several boards. She was an activist. If any man tried that with the Amy I knew, she'd break his neck. Same way with Chuck. I couldn't believe he let them do that to him. Somewhere along the line, he'd completely transformed.

(Lou approaches Chuck.)

CHUCK: Still exists, bowling buddies. Chapters all over the country.

(Lou crawls up onto his lap and kisses him long and hard. Barnes runs out frantically blowing his whistle and he throws a penalty flag.)

Scene II: The cafeteria. Lou and Chuck sit at a table with food trays on it. Lou has a pen and writing pad.

CHUCK: OK. Read that back.

LOU: Again?

CHUCK: Yes. Again. Got to get it right. You know what a fucker Barnes is.

LOU: All right, all right! (*reading*). The history of bowling.

CHUCK: Not from the top. Start from the part about Old Lady McDonald.

LOU (Reading): Bowling buddies was founded in 1962 by Mrs. Roger McDonald as a monument to her late husband. She wanted to combine his two great passions in life: service to the less fortunate and bowling.

CHUCK: Ok. Great. Now skip down to the part about the blind kids.

LOU: This is depressing.

CHUCK: I know. Keep reading.

LOU: Blind kids . . . blind kids. . . . Ok: (*Reading*) The blind kids were the worst bowlers in the world. Everybody ran for cover. But even the blind kids never threw a gutter ball. No one ever threw a gutter ball in bowling buddies. That was another one of our proud mottoes. But why not? What's wrong with throwing a gutter ball? What were they afraid of? And we all accepted it. No one questioned it. Not one of us ever demanded our inalienable right to throw a gutter ball!

CHUCK: OK. Good. Now add, "In life, there's gutter balls. It's a fact. Better learn how to deal with it."

Big Picture, *by Tim Lowly. 1997. Tempera on panel. 120" by 120," In this work, Lowly captures the students and teachers interacting in a special education class in Seoul, Korea.*

LOU: That's sick!

CHUCK: I know. I told you he's a sadist. That's how he gets his jollies. Him and the jocks. But we're gonna get the last laugh.

LOU: Oh God! Why did I try to get an exemption!

CHUCK: Oral presentation's a tough job. Takes a tough woman. So see. I have respect for you.

LOU: No way! Why don't you do it?

CHUCK: Oh don't worry. I'll be there. I just haven't figured out in what capacity.

LOU: No way am I doing any oral presentations!

CHUCK: We need to finish this.

LOU: I'm serious.

CHUCK: We'll discuss it later. Now what did I say before? Life is full of gutter balls.

(Lou reluctantly picks up the pad.)

LOU: Oh screw it. I don't care. Write about whatever you want. I just want to get this over with so I can graduate.

CHUCK: Good. Ok so write that down about gutter balls.

LOU: The minute I get out of here, I've already decided what I'm gonna do. You know what I'm gonna do?

CHUCK: I'd love to hear every detail. Really I would. But let's do the gutter balls first.

LOU: I'm gonna hop a boxcar. I don't care which one. Just pick one and go. I did it once before. All by myself. Rode all the way across Indiana. Changed my life. I know it's hard to believe riding across Indiana could change your life. But it's the boxcar. It's magic. The moonlight.

CHUCK: Even Indiana.

LOU: Yes! Even Indiana! Exactly. That's the beauty of it. I'm glad I wasn't in West Virginia or some place that really is beautiful or I wouldn't have got the full impact. It was the only time I rode. It scares me when I think back. Not because I was alone.

LOU: This is bull shit. You don't have any respect for me. We're supposed to be partners! I'm just a fucking secretary!

CHUCK: No. I just think better out loud.

LOU: And this whole paper is all about you.

CHUCK: No way. It's more about you than me. It's your worst nightmare.

LOU: What the hell is that supposed to mean?

CHUCK: They're gonna kidnap you and make you a bowling buddy!

LOU: Write your own fucking paper!

CHUCK (*mocking Lou*): Help! Help! Zombies! Hey, you think I don't have respect for you? You get the toughest job of all. You get to do the oral presentation.

LOU: Presentation? To whom?

CHUCK: To Barnes. He didn't tell you that part?

LOU: No!

CHUCK: Oh yeah. Oral presentation. To the whole gym class. It's our final. At the end of the semester he parades all the cripples into the gym and they present their papers to all the jocks.

I'm glad I was alone. I wouldn't have got the full impact if I wasn't alone. But when I think back, I'm lucky I didn't kill myself when I jumped off. I could've broken both legs. Then what? In the middle of a prairie. I could've died out there. I could've been eaten by wolves. People hop moving boxcars and they get sucked under the train and killed. That's the thing. I was so depressed and I did it all with such a sudden rush of abandon—almost suicidal. Not completely suicidal. It wasn't guaranteed death like jumping off a cliff. There was just a chance. But I didn't care. But I trust my motivations now. They're positive. I'm doing it to reward myself. And I'll wait until the train is stopped from now on before I hop on and off. But God, it's so amazing out in a box car. I was howling at the moon like a coyote.

CHUCK: Yeah well I wouldn't know. I don't do boxcars.

LOU: Oh. Sorry. Where were we?

CHUCK: Gutter balls. Ever since the dawn of time there have been gutter balls.

LOU: I want to tell you something.

CHUCK (*irritated*): Can we write that down first?

LOU: I want to tell you now before we go any further.

CHUCK: OK! What!

LOU: Because it may make a difference.

CHUCK: In what?

LOU: In general.

CHUCK: It won't. What?

LOU: This is my third college.

CHUCK: Uh huh?

LOU: And I'm only 22.

CHUCK: OK?

LOU: I started college when I just turned 17. I was double promoted twice. I was honor society.

CHUCK: Congratulations.

LOU: So I dropped out of two colleges in two years. I was running from lovers.

CHUCK: So?

LOU: So the second one was a woman.

CHUCK: Was it fun?

LOU: Fun? I don't know. I guess. Mostly. Until the end.

CHUCK: Well good. Can we finish with the gutter balls?

LOU: Will you pose for me?

CHUCK: What?

LOU: I'm a photographer too. I want you pose for me. Please?

CHUCK: OK sure. Now please—

LOU: Nude.

(Pause.)

CHUCK: You're kidding, right?

LOU: No. It's an on-going series I'm doing. People I know. I don't ask everybody I know to pose. Very few, actually. They have to have a certain charisma. Not really charisma. More like audacity. Audacity and a certain playfulness. The audacity to be playful. But I guess that's charisma. I've only asked four or five of my friends. And my aunt.

CHUCK: You took naked pictures of your aunt?

LOU: She's not like most aunts. She's real cool. What I do is I take their picture in their natural habitat—doing something they do every day, except nude. And they do it like they don't even realize they're nude. Just go about their business. Except nude. Like the one I took of my aunt, she was vacuuming. And my friend Gordon, the thing he does every day is wait for the stupid subway. So we went down to the subway late at night when no one was around. And he stood there naked waiting for the train. So with you, I'd probably do it in your dorm room working on your bowling paper. Except nude. It's the juxtaposition of the mundane and the extraordinary. A statement about freedom. So will you do it?

CHUCK: I don't know.

LOU: Why not? Can't you handle it?

CHUCK: I can handle it!

LOU: Then you'll do it?

CHUCK: Maybe.

Steven Brown, *Institute on Disability Culture Manifesto* (1999)

This manifesto documents the long list of disability activist complaints against media spectacles such as Jerry Lewis's Labor Day Telethon for Muscular Dystrophy. In his cyber newsletter, author Steven Brown galvanizes public opposition to the telethon by explaining why charity activities do more harm than good for disabled populations. In this excerpt, he *brings together some of his previous publications in his cyber newsletter.*

August 1999, Number Six

IT'S TELETHON TIME–AGAIN

Labor Day will be here before we know it—and once again Jerry Lewis and hopefully Jerry's Orphans, the protest group developed to oppose the MDA telethon, will be in the spotlight. Telethons have the ability to bring about some of the most vituperative arguments about disability issues. Here's what I've written about telethons in the past:

THE TRUTH ABOUT TELETHONS

"Recently, I chanced upon an article in DISABLED USA describing the efforts of a person with Multiple Sclerosis first to retain her well-paying job, then to find a new one that matched her abilities and expectations. She failed. Or, more properly, her society failed her. She unnerved prospective employers who were afraid her dreaded disease would frighten both co-workers and the public, not to mention render her unfit to be a productive, and compatible, employee. After several years of searching for appropriate employment she has determined that her best route to continued success and continued productivity is through free-lance photography and other artistic endeavors. Her disability did not force her out of the employment mainstream. Society's handicapping barriers did.

For several years now, I've been receiving the GAUCHER'S DISEASE REGISTRY NEWSLETTER. I've even published articles in it addressing the importance of the disability movement. I was pleased to note that the Newsletter's editor was starting to refer to "people with disabilities" and to include articles about disability rights and advocacy. But two issues ago, I was horrified to read two articles concerning a young Englishwoman with Gaucher's Disease. She was constantly being described, and describing herself, as being victimized by this disease. Now I'm not going to maintain that Gaucher's Disease is a welcome guest that should be greeted with a fervor of hospitality. I'm much too familiar with its broken bones, heartaches, and physical pain. But I'm also unwilling to be labeled a victim who has survived its ravages. You see, "victim" has an ugly connotation that offends—no, enrages—me. Being told, or believing, I'm a victim places all the responsibility for the results of the disease in the disease itself. Now I ask you, does a disease feel; is it cognizant, does it manipulate? As far as I know, disease does none of these things, but people do. I resent being called a victim because that implies that I have no control over the way I react to my disease, to my disability. But the fact is, I do have control. I can decide whether to succumb to my pain or to adapt myself to it. I can decide whether I want to grind my bones into pieces or to use a wheelchair for mobility. I can decide whether to risk passing this inherited disease onto my own natural children or to remain childless. I can decide. I am a victim only when I let my disease rule me. I am a person with a disability when I choose how to react to the characteristics of my disease. Anyone can choose to be a victim of anything. And anyone can choose not to be.

You're probably wondering, if you've been tenacious enough to read this far, what these thoughts have to do with telethons. Two things. First, I chose that title to grab your attention, just like telethons are supposed to do. Second, it has occurred to me that the way the majority of us think and feel about disability has been shaped by telethons, by what we might call "the telethon mentality." When I think about Multiple Sclerosis, the first phrase that comes to me is "killer of young adults." When I think about Muscular Dystrophy, it is "Jerry's Kids." Telethons may do some good. They may expose some people to disability. They may raise money for research and charity. They may give attention to people who need it. But they also isolate people with disabilities as victims, as subjects of charity, as a "thing" to be considered annually when their group's time comes to appear on TV. While disability advocates continue to insist that we want to be integrated into a society organized to allow us access to all its avenues, telethons continue to segregate us as a population to be pitied, to be identified as distinct, and to be helped. The truth about telethons is that they are mechanisms of segregation. The truth about accessibility is that it is a mechanism of integration.

The long-winded point of this essay is that it is time for us to stop being victims. It is time for us to stop being ruled by our diseases, our impairments, our limitations. It is time for us to stop being ruled by our disabilities. It is time for us to control our lives, our environments, ourselves. It is time for us to control our disabilities. It is time for us to make telethons and "the telethon mentality" a thing of the past. It is time."

(From Volume VII, Summer/Fall 1985 OKLAHOMA COALITION OF CITIZENS WITH DISABILITIES NEWSLETTER, 4–5)

"Telethons have generated great controversy for the past decade or so. Entertainer Jerry Lewis has become the focal point of this conflict. Best known for his comedy routines and slapstick movie roles, Lewis has been identified with the Muscular Dystrophy Association (MDA) for many years. The MDA has sponsored an annual telethon during the Labor Day weekend since 1981. Each year Lewis takes the opportunity to write an article about MDA in PARADE magazine which is distributed with many Sunday papers. Lewis' articles have tended to bemoan the plight of children who have Muscular Dystrophy and to include pleas to support "his children," some of whom are almost as old as he is.

Several years ago Lewis spent some time in a wheelchair to see what it was like. He wrote about his experiences in PARADE. His comments were so disparaging that two advocates with Muscular Dystrophy formed a group called, "Jerry's Orphans," to sponsor annual Labor Day weekend demonstrations to protest Lewis' demeaning approach to disability.

The two combatants have waged a public battle, which led to a 1993 article in VANITY FAIR magazine characterizing Lewis' personality and the substance of the issues involved. In the article, Paul Longmore, a historian with a disability known for his studies of the media and telethons, described the impact of telethons on the American public.

> Four major telethons—Easter Seals, the Arthritis Foundation, United Cerebral Palsy, and the M.D.A.— are the single most powerful cultural mechanism defining the public identities of people with disabilities in our society today, mainly because they reach so many people. . . . The telethon sponsors claim that, collectively, they have a combined audience of 250 million people.
>
> That's the equivalent of the population of this country. The message of telethons is that whatever condition people with disabilities have, that condition has essentially spoiled their lives, and the only way to correct that is to cure them. The message of the disability-rights movement is that it's possible to be a whole person with a disability.

The final two sentences of Longmore's analysis form a precise description of the models of charity and celebration of disability that have emerged in the late twentieth century. The most comprehensive assessment of the charity mentality comes from an English photographer with a disability, David Hevey. In his 1992 book, THE CREATURES TIME FORGOT, Hevey exposes charities as the most visible appendage of what he calls the "disability industry." Hevey contends that charities have created a hegemony, an almost complete dominance, of what the public perceives as the one voice of people with disabilities. But in reality, disabled people wait at the end of the line of the disability industry's priorities.

Foremost among any charity's goals are survival and ensuring that those individuals who contribute to the agency's success feel good about themselves. This can be accomplished by attaining the dual objectives of raising money for the organization and determining how to distribute it to the organization's needy clientele.

One result of this model [is] that the needs of the charity, or disability industry, must come before all other concerns. A more invidious consequence is that the only way charities and their ilk can continue to exist and to feel good about their selfless contributions to those less fortunate than themselves is to have a perpetual supply of victims of disability's tragic ravages." . . .

In 1999, the biggest problem I have with telethons of any kind continues to be that they promote segregation, not integration. It is long beyond time to be rid of telethons. Since they are not going away, I can only suggest the next best thing: do whatever you can to oppose them, including not sending money to any of them! If you want to make a charitable donation, find another way to do it. Let's give telethons a simple message: GO AWAY.

Emma Morgan, "Attention Deficit Disorder" (1996)

In this ironically entitled poem, the disabled poet Emma Morgan demonstrates how attention deficit disorder (ADD) proves a reasonable response to the chaotic backdrop of world events in the mid-1990s. Rather than portraying her own mental state and tendency to shift from activity to activity as a liability, the poem helps readers recognize ADD as a viable mode of attention that allows the narrator to sift through seemingly insignificant details in order to highlight their overlooked importance.

In my world of mental anarchy
The task "to clean the house"
Breaks into ten
And ten again
Like a seven breaking into two and five
One and six then three and four
Each another sum of parts
So that I might wash a dish
Dust three shelves
Read one page
And return a phone call
Before I finally settle
Into sweeping half the stairs
Or scouring one sink
With a ferocity of purpose.

When you speak to me
of Russian borders rearranging—
your hair-do
the glimmer of your nail polish
the dream I had last night
and one pattern on the wallpaper

at your back
vie for my attention
like a class of eager children
sliding off their seats
with the sheer potency of right answers
Your world of global puzzles
Loses me in a grand collage of universes
Each the size of the pen cap
Held between your teeth
But give me just your shoe
Or one braided lace
To you a detail—
To me a world of six strands
Each a set of threads
The tension of the weave precise
And I can see what isn't visible to you

You couldn't stand to pay attention
In that small world
Snaking through the eyelets of your shoe

I dismiss the boundaries

Of minute, hour, day
Until there's only task—
Task so focused it becomes world
My mind a sheet of paper
Folded in on itself
And again
Until it becomes a crane
A Moor on horseback
Or a hummingbird
Poised on the lip of a blossom
Balanced on a stillness
Built of motion

Michael Bérubé, from *Life as We Know It: A Father, a Family, and an Exceptional Child* (1996)

This essay on the birth of the author's son, Jamie, with Down syndrome reinterprets the meaning of a pathologized genetic condition as valued difference. Employing arguments from evolutionary biology, civil rights politics, and science fiction film, Bérubé rejects a pitying or patronizing attitude in order to reclaim the social context for almost a half million people in the United States.

There has never been a better time to be born with Down syndrome—and that's really saying something, since Down syndrome appears to have been with us for ten million years or more. How do we know? Because in the 1970s, Down syndrome was reported in gorillas and chimpanzees. Since there's no chance that we humans "gave" Down syndrome to other primate species, it would seem that trisomy 21 has been an integral part of being "human" ever since our evolutionary tree split off from that of apes. Cro-Magnons and Neanderthals had babies with Down syndrome; even those ape-men and ape-women in the opening scene of Stanley Kubrick's *2001: A Space Odyssey*—they had kids with Down syndrome, too. For whatever reason, we've produced offspring with Down syndrome with remarkable regularity at every point in our history as hominids—even though it's a genetic anomaly that's not transmitted hereditarily (except in extremely rare instances) and has no obvious survival value. The statistical incidence of Down's in the current human population is no less staggering; there

Japanese protesters with wheelchair barricade, 2004.

may be almost half a million people with Down's in the United States alone, or just about one on every other street corner.

But although *Homo sapiens* and all our hominid forebears have always experienced some difficulty dividing our chromosomes properly, Down syndrome was not identified and named until 1866, when British physician J. Langdon Down diagnosed it as "mongolism" (because it produced children with almond- shaped eyes reminiscent, to at least one nineteenth- century British mind, of Central Asian faces). At the time, the average life expectancy of children with Down's was under ten. And for a hundred years thereafter—during which the discovery of antibiotics lengthened the lifespan of Down's kids to around twenty—Down syndrome was known as "mongoloid idiocy."

The 1980 edition of my college genetics textbook, *The Science of Genetics: An Introduction to Heredity,* opens its segment on Down's with the words, "An important and tragic instance of trisomy in humans involves Down's Syndrome, or mongoloid idiocy." It includes a picture of a toddler-age mongoloid idiot along with a cellular photograph of his chromosomes (called a "karyotype") and the completely erroneous information that most people with Down's have IQs in the low 40s. The presentation is objective, dispassionate, and strictly "factual," as it should be in a college textbook. But reading it again in 1991, I began to wonder: is there a connection between the official textual representation of Down syndrome in medical discourses (including college textbooks) and the social policies by which people with Down syndrome are understood and misunderstood?

You bet your life there is. Now, anyone who's paid attention to the "political correctness" wars on American campuses knows how stupid the academic left can be. We're always talking about language instead of reality, whining about "lookism" and "differently abled persons" instead of changing the world the way the real he-man left used to do. But you know, there really is a difference between calling someone a "mongoloid idiot" and calling him or her "a person with Down syndrome." There's even a difference between calling people "retarded" and calling them "delayed." These words may appear to mean the same damn thing when you look them up in Webster's, but I remember full well from my days as an American male adolescent that I never taunted my peers by calling them "delayed." Even for those of us who were shocked at the frequency with which "homo" and "nigger" were thrown around in our fancy Catholic high school, "retard" aroused no comment, no protest. In other words, a retarded person is just a retard. But *delayed* persons will get where they're going eventually, if you'll only have some patience with them. (Pp. 25–26)

In retrospect, it's beginning to look as if many of the developmental deficits attributed to Down syndrome could instead be attributed to institutionalization. Of course, the phrase "mongoloid idiocy," and its attendant policies, did not cause Down syndrome. But words and phrases are the devices by which we beings signify what homosexuality, or Down syndrome, or anything else, will mean. There surely were, and are, the most intimate possible relations between the language in which we spoke of Down's and the social practices by which we understood it—and refused to understand it. You don't have to be a poststructuralist or a postmodernist or a post-*anything* to get this; all you have to do is meet a parent of a child with Down syndrome. Not long ago, we lived next door to people whose youngest child had Down's. After James was born, they told us of going to the library to find out more about their baby's prospects and wading through page after page of outdated information, ignorant generalizations, and pictures of people with Down's in mental institutions, face down in their feeding trays. These parents demanded the library get some better material on Down syndrome and throw out the garbage. [This garbage] has had its effects *for generations.* It may look to you like it's only words, but perhaps the fragile neonates whose lives were impeded by the policies—and conditions—of institutionalization can testify in some celestial court to the power of mere language, to the intimate links between words and social policies.

Some of my friends tell me this sounds too much like "strict social constructionism"—that is, too much like the proposition that culture is everything and biology is only what we decide to make (of) it. But although James is pretty solid proof that human biology exists independent of our understanding of it, every morning when he gets up, smiling and babbling to his family, I can see for myself how much of his life depends on our social practices. On one of those mornings I turned to my mother-in-law and said, "He's always so full of mischief, he's always so glad to see us—the only thought I can't face is the idea of this little guy waking up each day in a state mental hospital." To which my mother-in-law replied, "Well, Michael, if he were waking up every day in a state mental hospital, he wouldn't *be* this little guy."

As it happens, my mother-in-law doesn't subscribe to any strict social constructionist newsletters; she was just passing along what she took to be good common sense. But every so often I wonder how common that sense really is. Every ten minutes we hear that the genetic basis of something has been "discovered," and we rush madly to the newsweeklies: disease is genetic! Homosexuality is genetic! Infidelity, addiction, adventurousness, obsession with mystery novels—all genetic! The discourses of genetics and inheritance, it would seem, bring out the hidden determinist in more of us than will admit it. Sure, there's a baseline sense in which our genes "determine" who we are. We can't play the tune unless the score is written down somewhere in the genome. But one does not need or require a biochemical explanation for literary taste, or voguing, or faithless lovers. In these as in all things human, including Down's, the genome is but a template for a vaster and more significant range of social and historical variation. That's true even from human attributes that are clearly more "biological" than voguing and reading. Figuring out even the most rudimentary of relations between the genome and the immune system (something of great relevance to us wheezing asthmatics) involves so many trillions of variables that a decent answer will win you an all-expense-paid trip to Stockholm. Nor can you predict allergic reactions from the genes alone: because the body's immune system takes a few years to go on-line, your environmental variables (from dioxin to cat dander) are very likely going to be more important to you than most hereditary "constants" you care to name.

Yet even if you don't think that biology is destiny, and even if you don't believe evolution follows any plan, there's still something very seductive about the thought that Down syndrome wouldn't have been so prevalent in humans for so long without good reason. Indeed, there are days when, despite everything I know and profess, I catch myself believing that people with Down syndrome are here for a specific purpose—perhaps to teach us patience, or humility, or compassion, or mere joy. A great deal can go wrong with us *in utero,* but under the heading of what goes wrong, Down syndrome is among the most basic, the most fundamental, the most common, *and* the most innocuous, leavening the species with children who are somewhat slower, and usually somewhat gentler, than the rest of the human brood. It speaks to us strongly of design—if design govern in a thing so small. (Pp. 32–35)

European Union Disability Policy (1997)

The European Union's disability policy has gradually shifted from one that emphasizes disability as an *individual trauma of adjustment to that of socially created barriers that inhibit disabled people's participation in society. In particular, the barriers identified here are identified as economic and attitudinal in nature. These obstacles affect the quality of life experienced by disabled people in their daily lives.*

THE COUNCIL OF THE EUROPEAN UNION AND THE REPRESENTATIVES OF THE GOVERNMENTS OF THE MEMBER STATES MEETING WITHIN THE COUNCIL,

Whereas the Commission has issued a communication entitled 'Equality of opportunity for people with disabilities—A new European Community disability strategy';

Whereas people with disabilities constitute a significant proportion of the population of the Community and, as a group, they face a wide range of obstacles which prevent them from achieving equal opportunities, independence and full economic and social integration;

Whereas respect for human rights is a fundamental value of the Member States which is underlined in Article F.2 of the Treaty on European Union;

Whereas the principle of equality of opportunity for all, including people with disabilities, represents a core value shared by all Member States; whereas this implies the elimination of negative discrimination against people with disabilities and improving their quality of life; and whereas access to mainstream education and training, where appropriate, can play an important role in successful integration in economic and social life;

Whereas the Community charter on the fundamental social rights of workers, adopted at the European Council in Strasbourg on 9 December 1989 by the Heads of State or Government of 11 Member States, proclaims inter alia, in point 26:

'26. All disabled persons, whatever the origin and nature of their disability, must be entitled to additional concrete measures aimed at improving their social and professional integration.

These measures must concern, in particular, according to the capacities of the beneficiaries, vocational training, ergonomics, accessibility, mobility, means of transport and housing';

Whereas in its recommendation of 24 July 1986 on the employment of disabled people in the Community (1) the Council recommended Member States to take all appropriate measures to promote fair opportunities for disabled people in the field of employment and vocational training including initial training and employment as well as rehabilitation and resettlement;

Whereas the free movement of persons must be ensured in accordance with the existing Community legislation for the benefit of all the citizens of the European Union, including those with disabilities and those who are responsible for people with disabilities;

Whereas the overall purpose of the United Nations Standard Rules on the Equalization of Opportunities for Persons with Disabilities, adopted by the General Assembly on 20 December 1993 (2) is to ensure that all people with disabilities may exercise the same rights and obligations as others;

Whereas these Rules call for action at all levels both within States as well as through international cooperation to promote the principle of equality of opportunity for people with disabilities;

Whereas in its White Paper 'European social policy—a way forward for the Union,' adopted on 27 July 1994, the Commission indicated that it intended to prepare an appropriate instrument endorsing the principles of the United Nations Standard Rules on the Equalization of Opportunities for Persons with Disabilities;

Whereas, while responsibility in this field lies with the Member States, the European Community can make a contribution in fostering cooperation between Member States and in encouraging the exchange and development of best practice in the Community and within the policies and activities of the Community institutions and organs themselves;

Whereas the aims set out in this resolution on the equalization of opportunities for people with disabilities and the ending of negative discrimination are without prejudice to the right of each Member State to lay down its own rules and provisions for achieving the said aims, in accordance with the principle of subsidiarity and to the full extent that the resources of society permit:

I. REAFFIRM THEIR COMMITMENT TO:

1. the principles and values that underline the United Nations Standard Rules on the Equalization of Opportunities for Persons with Disabilities;

2. the ideas underlying the Council of Europe's resolution of 9 April 1992 on a coherent policy for the rehabilitation of people with disabilities;

3. the principle of equality of opportunity in the development of comprehensive policies in the field of disability, and

4. the principle of avoiding or eliminating any form of negative discrimination on the sole grounds of disability.

Japanese protest organizers preparing for press conference, 2004.

Source: Photo by Nagase Osamu.

II. CALL ON MEMBER STATES:

1. to consider if relevant national policies take into account, in particular, the following orientations:

- empowering people with disabilities for participation in society, including the severely disabled, while paying due attention to the needs and interests of their families and carers,
- mainstreaming the disability perspective into all relevant sectors of policy formulation,
- enabling people with disabilities to participate fully in society by removing barriers,
- nurturing public opinion to be receptive to the abilities of people with disabilities and toward strategies based on equal opportunities;

2. to promote the involvement of representatives of people with disabilities in the implementation and follow-up of relevant policies and actions in their favour.

III. INVITE THE COMMISSION:

1. to take account, where appropriate, and within the provisions of the Treaty, of the principles set out in this resolution in any relevant proposal it submits on Community legislation, programmes or initiatives;

2. to promote—in collaboration with the Member States and with non-governmental organizations of and for people with disabilities—the exchange of useful information and experience especially concerning innovative policies and good practice;

3. to submit periodic reports to the European Parliament, the Council, the Economic and Social Committee and the Committee of the Regions on the basis of information supplied by the Member States, describing the progress made and the obstacles encountered in implementing this resolution;

4. to take account of the results of the evaluation of the Helios II programme when considering whether it would be appropriate to bring forward proposals for follow up.

IV. INVITE OTHER COMMUNITY INSTITUTIONS AND ORGANS:

to contribute to the realization of the aforementioned principles in the framework of their own policies and activities.

Not Dead Yet

Organized in 1996 to oppose a lethal resurgence of physician-assisted suicide campaigns, Not Dead Yet began to publicly protest efforts by various factions to legalize the right to die. These efforts particularly came in the wake of some people's unwillingness to prosecute Jack Kevorkian, who devised a "suicide machine" used to end the life of those with "terminal illness." However, the group's research successfully demonstrated that such a justification both was false—Kevorkian assisted in the suicides of many individuals with nonterminal illnesses—and cultivated

Japanese protest banner, 2004.

a lethal atmosphere for all disabled people in the country. In recent years, the movement has also made public protests against other "pro-death" perspectives, such as Clint Eastwood's film Million Dollar Baby, *and during the court-ordered death of Terry Schiavo. For more information, contact: Not Dead Yet, 7521 Madison Street, Forest Park, IL; phone (708) 209–1500; fax: (708) 209–1735; website: www.notdeadyet.org.*

Not Dead Yet is a national grassroots organization of people with disabilities formed in response to the increasing threat of legalized physician assisted suicide and euthanasia in the United States and around the world. Not Dead Yet's mission is to advocate against legalization of physician assisted suicide, active euthanasia, and non-voluntary withholding of life-sustaining medical treatment. Not Dead Yet works to bring a disability-rights perspective to the public policy debate, and an awareness of the effects of disability discrimination in the health care system and society overall.

Formed in 1996, Not Dead Yet has worked to educate, support, coordinate and lead the disability community's effort to stop the so-called "right to die" from becoming a duty to die or a right to kill. To date, eleven other national disability groups have adopted formal positions against assisted suicide. Twenty-six national disability organizations supported Not Dead Yet's opposition to the starvation and dehydration of Terri Schiavo based on the lack of clear and convincing evidence of her wishes.

Not Dead Yet grassroots members have undertaken specific activities in the name of the organization and in support of its mission in at least 30 states, and conducted national actions targeting Jack Kevorkian, Princeton Professor Peter Singer, the Hemlock Society, and the World Federation of Right To Die Societies. Over 500 Not Dead Yet members rallied at the U.S. Supreme Court in 1997 to oppose a constitutional right to assisted suicide. Not Dead Yet's amicus brief filed in the U.S. Supreme Court in the case of *Vacco v. Quill* was among a handful, out of over 60 such briefs, cited by the High Court in its final opinion. Not Dead Yet has also led in the filing of disability rights briefs in several other cases, including but not limited to the Conservatorship of the Person of Robert Wendland in the California Supreme Court (2000), three briefs in the Guardianship of Theresa Marie Schiavo (Florida and federal courts, 2002–2003), and *Oregon v. Ashcroft* (Ninth Cir. 2002). Not Dead Yet has also given invited testimony three times before the U.S. Congress, and its leaders have appeared on over twenty national television news and talk show broadcasts.

▣ Stephen Kuusisto, from "Harvest" (1997)

In "Harvest," visually impaired poet Stephen Kuusisto captures his own way of seeing as part of the pleasure of living in a visual world that is not distorted by his vision but enhanced.

My temporal task is to hear music,
drink a cup of chrysanthemum tea,
admire the white moon of the morning,
even if my eyes tell me there are two moons.

Judi Chamberlin, from "Confessions of a Noncompliant Patient" (1998)

Nearly 30 years after the release of her landmark work On Our Own, *Judi Chamberlin continues to write about psychiatric survivorship and resistance to the psychiatric system. This is the closing paragraph of her 1998 article "Confessions of a Noncompliant Patient."*

Let us celebrate the spirit of noncompliance that is the self struggling to survive. Let us celebrate the unbowed head, the heart that still dreams, the voice that refuses to be silent. I wish I could show you the picture that hangs on my office wall that inspires me every day, a drawing by Tanya Temkin, a wonderful artist and psychiatric survivor activist. In a gloomy and barred room, a group of women sit slumped in defeat, dressed in rags, while on the opposite wall their shadows, upright, with raised arms and wild hair and clenched fists, dance the triumphant dance of the spirit that will not die.

Sally Clay, "People Who" (1998)

This poem was read during the Million Mad March on May 2, 1998. Held in Washington, D.C., the march coincided with an International Day of Madness, creating an opportunity for psychiatric consumers/survivors to raise their voices and increase their visibility.

Those people lock the door before us
And stay on the other side.
They inject us with poison
And electrocute our soul.
They are those who hold the keys
And pull all the strings.

Those people take our money
And use it to build prisons.
They go home at night to suburban houses
Where we are not allowed to live.

We the people are People Who
Are cherished by none
Except our own.

Our feet move to the beat of free verse,
And our souls sing in silent places.
Warm blood flows through invisible hearts
That can't be treated.

We are not puppets, there are no strings attached.
We cut the cord and walk through open doors.

We are People Who
Leap and dare to imagine.
We spend our talent
Furnishing the place of hope.
We are people who will treat those others
By acting out, and dreaming.

Those people are People Who
Are our own.
We are people who
Also care for them.

The Developmental Disabilities Assistance and Bill of Rights Act of 2000 (United States)

This act, P.L. 106–402, is the 2000 reauthorization of the original act (P.L. 95–602); it is significant in being the first introduction (in statutory terms) of the term developmental disabilities (DD). The general intent was (and largely remains) to fill in the gap on services, policy, and planning for DD populations. The national network of state DD Councils, Protection and Advocacy agencies, and University Centers for Excellence are funded under DD Act authorization.

Developmental Disability

(A) In General

The term “developmental disability” means a severe, chronic disability of an individual that—

(i) is attributable to a mental or physical impairment or combination of mental and physical impairments;

(ii) is manifested before the individual attains age 22;

(iii) is likely to continue indefinitely;

(iv) results in substantial functional limitations in 3 or more of the following areas of major life activity:

- (I) Self-care.
- (II) Receptive and expressive language.
- (III) Learning.
- (IV) Mobility.
- (V) Self-direction.
- (VI) Capacity for independent living.
- (VII) Economic self-sufficiency; and

(v) reflects the individual’s need for a combination and sequence of special, interdisciplinary, or generic services, individualized supports, or other forms of assistance that are of lifelong or extended duration and are individually planned and coordinated.

114 Stat. 1684 P.L. 106–402 (2000).

Jim Ferris, “Poems with Disabilities” (2000)

The Americans with Disabilities Act signaled a change in awareness of people with disabilities in the United States. Wheelchair-accessible parking spaces and bathroom stalls became more common, and resentment toward disabled people often was expressed in absurd jokes about extreme accommodations. This poem spoofs those jokes and the attitudes that spawn them while suggesting that disabled people are deserving of prominent places in the American scene.

I’m sorry—this space is reserved
For poems with disabilities. I know
It’s one of the best spaces in the book,
But the Poems with Disabilities Act
Requires us to make reasonable
Accommodations for poems that aren’t
Normal. There is a nice space just
A few pages over—in fact (don’t
Tell anyone) I think it’s better
Than this one. I myself prefer it.
Actually I don’t see any of those
Poems right now myself, but you never know
When one might show up, so we have to keep
This space open. You can’t always tell
Just from looking at them, either. Sometimes
They’ll look just like a regular poem
When they roll in—you’re reading along
And suddenly everything
Changes, the world tilts
A little, angle of vision
Jumps, focus
Shifts. You remember
Your aunt died of cancer at just your age
And maybe yesterday’s twinge means
Something after all. Your sloppy,
Fragile heart beats
A little faster
And then you know.
You just know.
And the poem is right
Where it
belongs.

Parade by Susan Nussbaum (2000)

In this dramatic satire, Susan Nussbaum takes on critical disability issues such as physician-assisted suicide and medical health care rationing. The work establishes the imperative of normative “good” health as an oppressive expectation for disabled people in late twentieth-century United States.

Two disabled women enter.

One Glad we got here early.

Two Mmm. Wanna get good spots.

One Because why go to the trouble if you can’t see everything.

Two No, I agree. This is—you know, we’ll be able to see the whole—

One We won’t miss a thing.

Pause while they look through their binoculars.

Two So it’s just us?

One What? No, Jeanette couldn’t come.

Two She just couldn’t make it, huh?

One No, she wasn’t—

Two Feeling well?

One She wasn't feeling—she's fine but she wasn't feeling—

Two Up to it?

One Right. I don't know. Well, she's caught in that cycle of—

Two Yeah.

One Oh, well.

Two It happens.

One Anyway, I'm glad we're here.

Two Yeah. Can I say something?

One What?

Two I don't want to sound—jumping the gun—but—and I don't want to—she has an aura of—I just don't like being with her. I like her, don't—I'm not saying I don't respect her.

Disability protester at the 2004 World Social Forum in Mumbai, India, holding sign stating that the venue was not accessible to disabled participants.

Source: Photo by Meenu Bhambhani.

One Well, there's a difference between liking and spending time with. I like her, too, but she doesn't—I don't know . . .

Two Take care of herself.

One She doesn't take care of herself.

Two And, you know, what does that say about her? Between the two of us. It reflects back.

One I'm glad you said it, and not me. Really, thank you.

Two It can have the effect of making *us* look—like we're . . .

One No, I know. Is it wrong to be aware of the effect of how it looks to be with people who, for whatever reason, don't have a *consciousness* about what's— about priorities—the things *we* feel are important? I don't think so.

Two I'm sick of feeling guilty about it.

One Me, too! Exactly!

Beat.

Two But you look well.

One Thank you. Thanks. I am well. I feel good. What about you? How's your quality of life?

Two Very high, thanks. I've been moving up in the point range.

One Good for you. Where—do you mind if I ask—where on the scale?

Two I was a four, now I'm a five.

One You're kidding. What did you do? I mean, what'd you—?

Two I've been contributing a lot lately. Which makes me feel great and which you have to feel great in order to do! A vicious cycle. But not *vicious,* just cyclical.

One A whole point just for contributing. No, but that's great. From four to five.

Two It's a good feeling.

One Mm hmm.

Two So. What're you these days?

One Me? I'm a seven.

Two Whoa. That's—I thought I was in good shape. You're a seven?

One Yup. You know, because I don't lose credit for burdening.

Two Individual or collective?

One Oh, I was an individual burden. What about you?

Two Oh, same old. I'm a burden to several individuals and society as a whole.

One Actually, I wasn't really a burden, but my mom needed the extra credit for caretaking, so she claimed me as a burden. So, technically—

Two Officially, you were a burden.

One Uh huh.

Two Is that legal? For your mom to—?

One What? Yeah. Well, pretty much. I mean . . .

Two So—your mom needed the extra points . . .

One Before she was kevorked, yeah.

Two Huh.

One What? It's not like we were making *money* off it. It's not like we're Point Scalpers, or anything.

Two No, I know. I mean, it's not like you were *selling* your mom the extra credit. Which, far be it from me—I'd do the same thing, except my mom was liberated in one of the early Ethical Life Rationings. So, you know . . .

One You must be proud.

Two Oh, yeah. She was a great example. She was very unselfish.

One How old was she?

Two Sixty.

One Well, that's the age.

Two Yeah.

One That's when my mom's quality of life scale started dropping. And after she broke her hip and became a burden to society herself, it just got to the point where her safeguards were really, you know, in the toilet, and finally she just said forget it and got liberated.

Two That's show biz.

Beat.

Well, at least you got that extra point back.

One Yeah, I'm happy about that. Let's face it, I needed the point. I'm still a collective burden.

Two Well, who isn't? The collective burden stuff is killing me. So to speak. Ha ha.

One I know. It's not so much the environmental category as the cosmetic. It's an automatic two points off the quality of life scale to be born this way.

Two Sure. Plus, the extra points off as you grow out of childhood. Losing the cuteness credits.

One Well, the kids are cuter.

Two Yeah, they get those little wheelchairs . . .

One Remember those telethons they used to have? With the kids?

Two Yeah, and people would actually give money, right? They would donate all this—

One Oh, yeah, they'd raise millions and millions of dollars and—

Two Hundreds of millions of—

One God, I wonder what ever happened to all that money.

Two No one knows.

Beat.

One And what happened to that guy? The—you know—the telethon guy?

Two Murdered.

One Oh, right, yeah. That real gruesome—

Two Yeah. Anyway, it's weird, because for me, I lose a point and a half for—you know, the sight of me makes people—feel agitated—

One So do I.

Two Wait. You lose points in addition to the—

One Right. Public Physical Appropriateness Ratio. Minus one point five.

Two I'm surprised we're the same.

One 1.5's pretty standard. I mean, we probably upset people about the same amount.

Two I guess. I get a .3 credit, though.

One How come?

Two For being a visual reminder to wear seatbelts. So . . .

One Wow, that's a—lucky girl. Hey, look, that guy must be in the parade.

Two Where? That guy?

One Yeah, in the Eskimo outfit.

Two Oh, right. The Eskimo float.

One Do they still do that?

Two What?

One Walk out into glaciers and stuff when they're too old to be useful?

Two I don't think there're very many of 'em left to do that. They die the regular way, I think. They just have an Eskimo thing in the parade as a, like a symbol . . .

One Like an example . . .

Two Yeah, like a nostalgia thing.

One Hey, heads up. There's a doctor.

Two Where?

One There! There! Jesus, he's walking right toward us!

Two Oh, shit! (*calls out*) Hello, Doctor! How's your quality of life today?

One Beautiful day for the parade, Doctor!

Two Fine, thank you! High quality today, Doctor! Feeling like a full ten today!

One I feel like a twelve, Doctor!

Two Who needs safeguards on a day like today!

One Enjoy the parade, Doctor!

Two Viva Voluntary Self-elimination!

They salute as Doctor passes.

One Doctors make me nervous.

Two Tell me about it.

One Yeah. Hey look, there's the Global Insurance Corporation float! What—can you see what the banner says?

They take out their binoculars.

Two "Better Dead Than Sick in Bed."

One Oh, uh huh. Boy, I guess it's really starting now.

Two Yeah, here goes. There's supposed to be some new stuff this year. New floats.

One Well, new legislation. So, naturally. I—you know, I do feel kind of bad Jeanette couldn't make it.

Two I know. Even though she drives me crazy, it's not like I don't kind of miss her.

One Not that I think she—I mean, she's *fine*—

Two Right. She's doing fine, she's—she's not feeling well for one *day,* it's not the end of—

One No, it's not.

Two Which is all it is. Right?

One I told her she had to take *care* of herself better. Get her points up.

Two Name of the game.

Beat.

They look through binoculars.

Two Look, the Doctor's float is passing. I like their new uniforms, don't you?

One Oh, absolutely, I love leather. I wonder if my doctor's up there.

Two Mine is. He's real patriotic.

One Didn't your doctor write that book? That real famous—what's it called?

Two "The Depression Myth: No Excuses."

One Right. He's really a hardliner, I guess.

Two Let's just say I better not get a bad case of the flu.

One Hey, remember that time we were—the three of us—you, me and Jeanette—and we were at that concert—and—god, remember that song?—about how ethical life rationing was this forced thing—

Two And the police came and stopped the concert and Jeanette wouldn't—

One Yeah, she refused to leave and she started shouting and stuff and—

Two She was chanting—wait, what was it—I don't know, something really—

One Right, right. The Supreme Court are Hit Men, that kind of—

Two She was always a radical.

One It's turns people off to say the Supreme Court are hit men. People don't wanna hear that.

Two I don't wanna hear it.

One Too extreme.

Two Way out there.

Beat.

They look through their binoculars.

One There's the Afterlife float. Wow. Pretty.

Two They must spend a lot of money on that one.

One Mmm. Well, they have it. Afterlife Industry is huge. Wow. The Afterlife must really be fantastic.

Two You can see why people look forward to it.

One You know, in ancient Egypt, the pharoahs would be buried with all their earthly posessions, like gold and stuff.

Two I know. It's amazing the stuff people believe in.

One Really.

They look through binocs.

Two Ooh, look at that float. That's beautiful. Someone must've spent ages blowing up all those latex exam gloves.

One Where? Oh, the Preventive Chronic Care Float. Yeah. That's new this year. I read all about it in the Liberation newsletter.

Two Look, it's so big they had to have two floats.

One Huh? Oh, no, the second float is for the surpluses.

Two What?

One You know, the surplus people.

Two Oh, yeah. That's a new thing this year. You know, some of those people don't even look sick.

One Oh, well, you don't have to be sick anymore. To be euthanized.

Two What? But—

One Well, that's the preventive part. Because they found out you can sort of predict who's gonna get sick, how much it'll cost, and you know, that kinda thing.

Two They can predict? Boy, it's amazing what they can—

One Uh huh. Like people from a lower income brackett, who don't have insurance—

Two They don't take very good care of themselves—

One Yeah, so they can predict that those people are gonna be like, Burden City.

Two Wow.

One And they put this float at the end of the parade, and after the parade, the deal is all the surplus people go off and get euthanized.

Two That's why it's at the end. Sort of a *piece de resistance* thing.

One I mean, there's all these incentives and stuff. Tax breaks for survivors. It's really a good deal for some people. Some of them, they don't have jobs, they don't have skills, so you know.

Two Their quality of life numbers must stink. I guess, you know, the thing is, if they want to live, they'll do something about their situation. Work on their numbers, try not to burden. Like we did.

They look thru binocs.

Two Hey, wait. Wait! Look! That's her!

One What? Who?

Two Jeanette! She's on that float!

One Oh my god! What's she—? She said she couldn't come. She said she wouldn't be here. There must be a mistake!

Two But that's her. Why would she volunteer to be liberated? She doesn't even believe in it.

One She didn't volunteer! They—Somebody made a mistake! (*calling out*) Hey! Hey! You've got the wrong person up there! Hey!

Two (under her breath)

Wait! Stop! Are you crazy? If she's up there it's because she's supposed to be up there. Don't make a big thing of it! You're just gonna get yourself—both of us—a lot of attention that we don't need. Just get a grip on yourself. Just calm down.

One But—

Two Just shut up!

They look through their binocs.

One Well, that's it. Parade's over.

Two Yeah.

One I'm sorry I—I'm sorry about that outburst.

Two Well. No harm done.

One No.

Two That's the main thing.

One Right. It came as a surprise. Seeing someone you know makes you think how—it makes you aware of your own—

Two Yeah, but we're in good shape. Our numbers are up and our safeguards are in place.

Just keep reminding yourself of that.

One She was always a radical.

Two That's right. I just didn't want anyone to think you and she were—Everyone is so paranoid these days.

One We're in good shape.

Two No, I know. We are.

One That's right.

Two So I guess I'll see you.

One Yeah. Well, this was fun.

Two It was. The floats were really—

One They were absolutely—

Two They were terrif.

One So, dinner next week, okay?

Two Sounds good.

One Okay. Keep your numbers up!

Two You, too.

One and Two Viva Voluntary Self-elimination!

Blackout.

From the Charter of Fundamental Rights of the European Union, (2000)

The Charter of Fundamental Rights of the European Union is the result of a unique procedure in the history of the European Union (EU). For the first time, the EU proclaimed the civil, political, economic, and social rights of European citizens and all persons living in the EU. On December 7, 2000, the presidents of the European Parliament, of the Council, and of the Commission signed and proclaimed the Charter on behalf of their institutions in Nice, France.

SOLEMN PROCLAMATION

The European Parliament, the Council and the Commission solemnly proclaim the text below as the Charter of Fundamental Rights of the European Union.

Done at Nice on the seventh day of December in the year two thousand.

PREAMBLE

The peoples of Europe, in creating an ever closer union among them, are resolved to share a peaceful future based on common values.

Conscious of its spiritual and moral heritage, the Union is founded on the indivisible, universal values of human dignity, freedom, equality and solidarity; it is based on the principles of democracy and the rule of law. It places the individual at the heart of its activities, by establishing the citizenship of the Union and by creating an area of freedom, security and justice.

The Union contributes to the preservation and to the development of these common values while respecting the diversity of the cultures and traditions of the peoples of Europe as well as the national identities of the Member States and the organisation of their public authorities at national, regional and local levels; it seeks to promote balanced and sustainable development and ensures free movement of persons, goods, services and capital, and the freedom of establishment.

To this end, it is necessary to strengthen the protection of fundamental rights in the light of changes in society, social progress and scientific and technological developments by making those rights more visible in a Charter.

This Charter reaffirms, with due regard for the powers and tasks of the Community and the Union and the principle of subsidiarity, the rights as they result, in particular, from the constitutional traditions and international obligations common to the Member States, the Treaty on European Union, the Community Treaties, the European Convention for the Protection of Human Rights and Fundamental Freedoms, the Social Charters adopted by the Community and by the Council of Europe and the case-law of the Court of Justice of the European Communities and of the European Court of Human Rights.

Enjoyment of these rights entails responsibilities and duties with regard to other persons, to the human community and to future generations.

The Union therefore recognises the rights, freedoms and principles set out hereafter.

CHAPTER III

EQUALITY

Article 20
Equality before the law

Everyone is equal before the law.

Article 21
Non-discrimination

1. Any discrimination based on any ground such as sex, race, colour, ethnic or social origin, genetic features, language, religion or belief, political or any other opinion, membership of a national minority, property, birth, disability, age or sexual orientation shall be prohibited. . . .

Article 26
Integration of persons with disabilities

The Union recognises and respects the right of persons with disabilities to benefit from measures designed to ensure their independence, social and occupational integration and participation in the life of the community.

Council Decision of 3 December 2001 on the European Year of People with Disabilities 2003 (2001)

The Council Decision is the document that establishes agreement among European countries to hold a year dedicated to the forwarding of the political agenda of disabled people. Full inclusion involves the development of a barrier-free Europe as an ideal of access for all individuals.

THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 13 thereof,

Having regard to the proposal from the Commission,

Having regard to the opinion of the European Parliament,

Having regard to the opinion of the Economic and Social Committee,

Having regard to the opinion of the Committee of the Regions,

Whereas:

(1) The promotion of a high level of employment and of social protection, and the raising of the standard of living and quality of life of the population of the Member States, are objectives of the European Community.

(2) The Community Charter of the Fundamental Social Rights of Workers recognises the need to take appropriate action for the social and economic integration of disabled people.

(3) The Resolution of the Council and the Ministers for Education, meeting within the Council, of 31 May 1990 concerning integration of children and young people with disabilities into ordinary systems of education stresses that "the Member States have agreed to intensify, where necessary, their efforts to integrate or encourage integration of pupils and students with disabilities, in all appropriate cases, into the ordinary education system."

(4) The Resolution of the Council and of the Representatives of the Governments of the Member States meeting within the Council of 20 December 1996 on equality of opportunity for people with disabilities, and the Council Resolution of 17 June 1999 on equal employment opportunities for people with disabilities, reaffirm the basic human rights of disabled people to equal access to social and economic opportunities.

Disability protest at the World Social Forum in Mumbai, India, 2004. Participants from across India shout slogans such as "WSF Shame! Shame!" and "WSF Inaccessible, Inaccessible!"

Source: National Centre for Promotion of Employment for Disabled People, New Delhi, India.

(5) The conclusions of the Lisbon European Council of 23 and 24 March 2000 call upon Member States to take greater account of social exclusion in their employment, education and training, health and housing policies and to define priority actions for specific target groups, such as people with disabilities.

(6) The European social agenda approved by the Nice European Council meeting on 7, 8 and 9 December 2000 states that the European Union will develop, in particular during the European Year of People with Disabilities (2003), "all action intended to bring about the fuller integration of disabled people in all areas of life."

(7) The year 2003 will mark the 10th anniversary of the adoption by the UN General Assembly of the Standard Rules on the Equalisation of Opportunities for Persons with Disabilities, which have enabled considerable progress to be made in an approach to disability in accordance with human rights principles.

(8) This Decision respects fundamental rights and observes the principles recognised in particular by the Charter of Fundamental Rights of the European Union. In particular, this Decision seeks to promote application of the principles of non-discrimination and integration of people with disabilities.

(9) The European Parliament, the Economic and Social Committee and the Committee of the Regions have all urged the Community to strengthen its contribution to efforts in Member States to promote equal opportunities for people with disabilities, with a view to their integration into society.

(10) On 10 May 2000 the Commission adopted a communication entitled "Towards a barrier-free Europe for people with disabilities," in which it commits itself to developing and supporting a comprehensive and integrated strategy to tackle social, architectural and design barriers that unnecessarily restrict access for people with disabilities to social and economic

opportunities. The Parliament has unanimously adopted a similar resolution.

(11) The general framework in favour of equal treatment in employment and occupation provided for by Directive 2000/78/EC and the Community action programme to combat discrimination in order to support and supplement legislative measures at Community and Member State level set up by Decision 2000/ 750/EC aim at changing practices and attitudes by mobilising the players involved and fostering the exchange of information and good practice.

(12) Since exclusion from the labour market of people with disabilities is inextricably linked to problems of attitude and a lack of information about disability, it is necessary to increase society's understanding of the rights, needs and potential of disabled persons, and a joint effort by all the "different partners is required to develop and promote a flow of information and an exchange of good practice.

(13) Raising awareness relies primarily on effective action at Member State level which should be supplemented by concerted efforts at Community level. The European Year could act as a catalyst in raising awareness and in building momentum.

(14) Consistency and complementarity with other Community action is needed, in particular with action to combat discrimination and social exclusion, and to promote human rights, education, training and gender equality.

(15) The joint statement of 20 July 2000 provides for the budget authority to deliver an opinion on whether the new proposals with budgetary implications are compatible with the financial framework, without any reduction in existing policies.

(16) The Agreement on the European Economic Area (EEA Agreement) provides for closer cooperation in the social field between the European Community and its Member States, on the one hand, and the countries of the European Free Trade Association participating in the European Economic Area (EFTA/EEA), on the other. Provision should be made for participation, on the one hand, by the candidate countries of central and eastern Europe, in accordance with the conditions established in the Europe Agreements, in their additional protocols and in the decisions of the respective Association Councils, on the other hand, by Cyprus, Malta and Turkey, funded by additional appropriations in accordance with the procedures to be agreed with those countries.

(17) A financial reference amount within the meaning of paragraph 34 of the Interinstitutional Agreement of 6 May 1999 between the European Parliament, the Council and the Commission on budgetary discipline and improvement of the budgetary procedure is included in this Decision without thereby affecting the powers of the budgetary authority as they are defined by the Treaty.

(18) Since the objectives of the proposed action aimed at generating at European level awareness of the rights of people with disabilities, cannot be adequately achieved by the Member States on account, inter alia, of the need for multilateral partnerships, the transnational exchange of information and the Community-wide dissemination of good practice, and can therefore be better achieved at Community level, the Community may adopt measures, in accordance with the principle of subsidiarity as set out in Article 5 of the Treaty. In accordance with the principle of proportionality, as set out in that Article, this Decision does not go beyond what is necessary to achieve those objectives.

(19) The measures necessary for the implementation of this Decision should be adopted in accordance with Council Decision 1999/468/EC of 28 June 1999 laying down the procedures for the exercise of implementing powers conferred on the Commission,

HAS DECIDED AS FOLLOWS:

Article 1
Establishment of the European Year of People with Disabilities

The year 2003 shall be designated as the "European Year of People with Disabilities."

Article 2
Objectives

The objectives of the European Year of People with Disabilities shall be:

(a) to raise awareness of the rights of people with disabilities to protection against discrimination and to full and equal enjoyment of their rights;

(b) to encourage reflection on and discussion of the measures needed to promote equal opportunities for people with disabilities in Europe;

(c) to promote the exchange of experience of good practice and effective strategies devised at local, national and European level;

(d) to reinforce the cooperation between all parties concerned, namely government, the social partners, NGOs [nongovernmental organizations], the social services, the private sector, communities, voluntary sector groups, people with disabilities and their families;

(e) to improve communication regarding disability and promote a positive image of people with disabilities;

(f) to raise awareness of the heterogeneity of people with disabilities and of the various kinds of disability;

(g) to raise awareness of the multiple discrimination facing people with disabilities;

(h) to pay special attention to awareness of the right of children and young people with disabilities to equality in education, so as to encourage and support their full integration in society and to promote the development of European cooperation between those professionally involved in the education of children and young people with disabilities, in order to improve the integration of pupils and students with special needs in ordinary or specialised establishments and in national and European exchange programmes.

Article 3
Content of measures

1. The measures designed to meet the objectives set out in Article 2 may entail the development or the provision of support to:

(a) meetings and events;

(b) information and promotional campaigns throughout the Member States;

(c) cooperation with broadcasting and media organisations;

(d) surveys and studies on a Community-wide scale;

2. Details of the measures referred to in paragraph 1 are set out in the Annex.

Article 4
Implementation at Community level

The Commission shall ensure the implementation of the Community actions covered by this Decision in conformity with the Annex.

It shall conduct a regular exchange of views with representatives of people with disabilities at Community level on the design, implementation and follow-up of the European Year of People with Disabilities. To that end, the Commission shall make the relevant information available to these representatives. The Commission shall inform the Committee established under Article 6(1) of their opinion.

Article 5
Cooperation and implementation at national level

1. Each Member State shall be responsible for the coordination and implementation at national level of the measures provided for in this Decision, including the selection of projects under Part B of the Annex.

To this end, each Member State shall establish or designate a national coordinating body or an equivalent body to organise the participation of the Member State in the European Year of People with Disabilities. This body shall ensure that it is representative of a range of organisations representing people with disabilities and other relevant stakeholders.

2. The measures required to determine global grants to be allocated to the Member States to support actions at national, regional and local level shall be adopted in accordance with the procedure referred to in Article 6(2). Global grants shall be awarded only to public-law bodies or bodies which have a public-service mission guaranteed by the Member States.

3. The procedure for the use of global grants shall be subject to an agreement between the Commission and the Member State concerned.

The procedure shall detail in particular, in compliance with the Financial Regulation of 21 December 1977 applicable to the general budget of the European Communities:

(a) the measures to be implemented;

(b) the criteria for choosing beneficiaries;

(c) the conditions and rates of assistance;

(d) the arrangements for monitoring, evaluating and ensuring the financial control of the global grant.

Article 6
Committee

1. The Commission shall be assisted by a Committee, (hereinafter referred to as “the Committee”).

2. Where reference is made to this paragraph, Articles 3 and 7 of Decision 1999/468/EC shall apply.

3. The Committee shall adopt its rules of procedure.

Article 7
Financial arrangements

1. Measures which are Community-wide in nature, as described in Part A of the Annex, may be subsidised up to 80 % or give rise to procurement contracts financed from the general budget of the European Communities.

2. Measures which are local, regional or national, possibly with a transnational dimension, as described in Part B of the Annex, may be co-financed from the general budget of the European Communities up to a maximum of 50 % of the total cost.

Article 8
Application and selection procedure

1. Decisions on the financing and co-financing of measures under Article 7(1) shall be adopted in accordance with the advisory procedure referred to in Article 6(2). The Commission shall ensure a balanced distribution among the different fields of activity involved.

2. Requests for financial assistance for measures under Article 7(2) shall be submitted to the Member States. On the basis of the opinion expressed by the national coordinating bodies, Member States shall select beneficiaries and allocate financial assistance to the applicants selected in accordance with Article 5(3).

Article 9
Consistency and complementarity

The Commission, in cooperation with the Member States, shall ensure consistency between the measures provided for in this Decision and other Community actions and initiatives.

The Commission shall also ensure that appropriate efforts are made to enable people with disabilities to participate equally in Community programmes and initiatives.

It shall also ensure optimal complementarity between the European Year of People with Disabilities and other existing Community, national and regional initiatives and resources, where these can contribute to fulfilling the objectives of the European Year of People with Disabilities.

Article 10

Participation by the EFTA/EEA countries, the associated countries of central and eastern Europe, Cyprus, Malta and Turkey

The European Year of People with Disabilities shall be open to participation by the following countries:

(a) EFTA/EEA countries in accordance with the conditions established in the EEA Agreement;

(b) the candidate countries of central and eastern Europe . . . in accordance with the conditions established in the Europe Agreements, in their additional protocols and in the decisions of the respective Association Councils;

(c) Cyprus, Malta and Turkey, their participation being funded by additional appropriations in accordance with procedures to be agreed with those countries.

Article 11
Budget

1. The financial reference amount for the implementation of this Decision is hereby set at EUR 12 million.

2. The annual appropriations shall be authorised by the budgetary authority within the limits of the financial perspective.

3. Actions aimed at preparing the launching of the European Year of People with Disabilities may be financed as from 1 January 2002.

Article 2
International cooperation

Within the framework of this Decision, the Commission may cooperate with relevant international organisations.

Article 13
Monitoring and evaluation

The Commission shall submit, by 31 December 2004 at the latest, a report to the European Parliament, the Council, the Economic and Social Committee and the Committee of the Regions on the implementation, results and overall assessment of the measures provided for in this Decision, including an assessment of the long-term effects of the measures. The Commission shall ensure that the report is drawn up in formats accessible to people with disabilities.

Article 14
Entry into force

This Decision shall be published in the Official Journal of the European Communities.

It shall take effect on the day of its publication.

Done at Brussels, 3 December 2001.
For the Council
The President
F. Vandenbroucke

Source: European Council. 2001. 2001/903/EC: Council Decision of 3 December 2001 on the European Year of People with Disabilities 2003. *Official Journal L 335* (December 19), pp. 0015–0020.

The Disability Media Action and Awareness Project, "'Do You Mean to Say What We Hear?' A Disability Language Reference"

(2000–2001)

From 2000 to 2001 a group of disabled activists, academics, artists, and community residents in Chicago compiled the following guidelines about appropriate language use in coverage of disability issues. The creation of such guidelines was intended to steer journalists toward less objectifying and demeaning portrayals of disabled people and to demonstrate the lack of objectivity in current rhetorical constructions of disability in mainstream U.S. journalism.

We include below some "street" perspectives on terms that continue to circulate around (and even impinge upon) people with disabilities. These terms have been selected as worthy of more thoughtfulness. They name affinities (and not) among a group of people with disabilities who have put some thought into the matter of representation; the mainstream media; diagnostic labels; and disability subcultures. The definitions reflect widely shared perspectives across Chicago disability groups.

Terms were compiled by the Disability Media Action and Awareness Project—a group that monitors coverage of disability communities and disability issues in the Chicago media. Our purpose? To serve as a link between Chicago media professionals and the authentic voices of disabled persons in Chicago.

Language is important because our language reflects our ideas about being human! The terms we use when referring to each other shape our values. We want to help media professionals reflect on terms that have traditionally dehumanized people with disabilities. This is not a comprehensive list and not everyone would agree. These are just the twists of language that most sock it to us in the gut—good and bad.

—The Disability Media Action and Awareness Project, University of Illinois at Chicago, Disability Studies a.k.a. Michael Ervin, Sharon Snyder, Gary Arnold, Larry Biondi, Kenneth Borst, Will Cowing, Stephen Drake, Herbert Hoffman, Ayo Maat, Gloria Nichols, Joan Porter, Harvey Rabin, and Monique Streff.

Blind People: Technically blind people recognize one another as those with 2200 or less sight with correction. Those with limited sight are usually referred to as people with low vision. But some people who are blind think this is a nit-picky distinction. They say you are either legally blind or not.

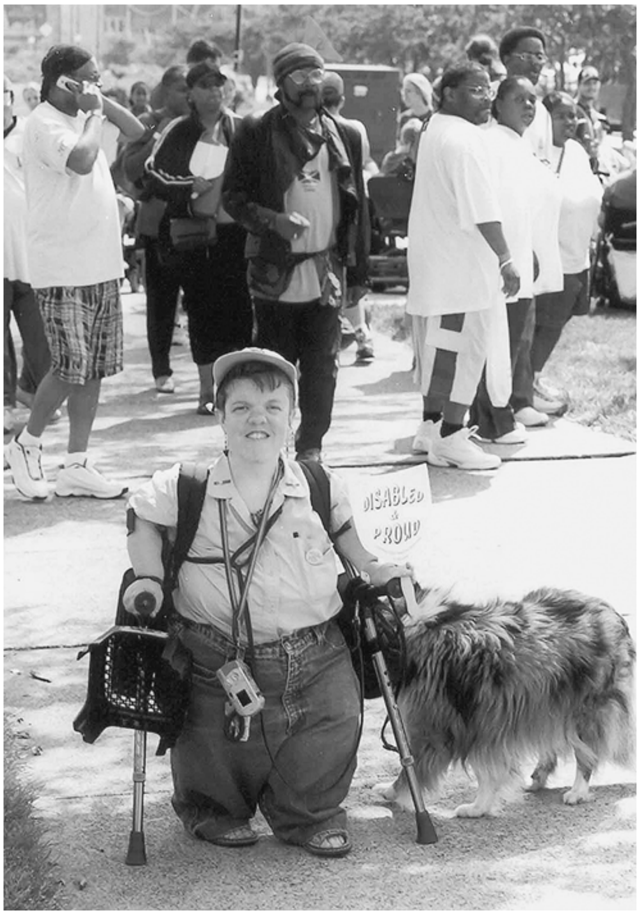
Cerebral Palsy: The most common misconception about people with cerebral palsy is that they have intellectual problems involving thinking and reasoning. Most people who bear the label C.P. have cognition that operates in similar ways to other general non disabled groups. Cerebral palsy is a misleading term when you think about it. Palsy is an archaic word meaning muscular inability to move part or all of the body. Put it all together and it implies a paralyzed brain. No one has come up with a better term so go ahead and use it. But understand its shortcomings when applied to real people.

Confined to a wheelchair: Confined means "limited, small, cramped or completely enclosed." A wheelchair is the opposite. It is liberating. Why not be accurate and say he/she is a wheelchair user or uses a wheelchair?

Courageous: Why are we insulted when someone says we are brave and courageous? Doesn't everyone want to be considered brave and courageous? Well, these words are often used to describe people with disabilities who are just living their lives. They are doing nothing spectacular, just activities everyone does. But if nothing is expected of us, when we are successful it may be viewed as extraordinary. To say we are brave and courageous just for living life implies that we would be justified in giving up and doing nothing.

Crippled: Before we get too far we should talk about out and out Hate Speech usage such as Cripple, Retard, Spastic, Freak. These are words that kept us fearful when we were growing up. Some still use crippled as "completely ruined or damaged." Of course, crippled is archaic, too, and still sounds like Victorian back bedrooms. Note: we sometimes call ourselves crippled to "be real" and nitty gritty among ourselves—or to off-set the hate tossed our way. That does not mean you should.

Deaf and dumb/mute: This was used a lot in an old Jane Wyman movie, which shows how out of date it is. Dumb implies stupid, and mute means unable to speak. Most deaf people can use their voices, though many choose not to. These terms should be consigned to the linguistic basement. Why not he/she does not speak with his/her voice?



Proud Short-Statured Woman and Dog at the Chicago Disability Pride Parade, 2004.

Defects: As in "only you can prevent birth defects." Propagandizes the idea that a disabled person should be prevented instead of accepted and included. Assumes everyone's body falls short of some ideal "whole." An inaccurate and frequently abusive idea.

Guide dog: The proper term for dogs assisting blind people. Seeing-eye dog is the name of one of the guide dog training schools. Dogs that assist sighted people with disabilities are called service dogs.

Invalid: Changing the accent doesn't change the meaning of the word. It wouldn't be any less offensive to call a woman a bim-BO. No matter how you slice it, it still means In-VA-lid.

Handicapped: We don't like this one for a lot of reasons. Mainly it places the emphasis on the wrong spot by saying the disability is what handicaps us. Sounds like one is the perpetual object of charity, emblem of a telethon, or in need of pity. Barriers are what handicap. Besides, "handicapped" sounds whiney, doesn't it?

Hard of hearing: This has emerged again as a term for those who have partial hearing. And no, people who have partial sight are not hard of sight.

Mental Retardation: This sounds like a permanent unalterable predicament—that one's life and brain [are] fixed and that one will be forever stunted. Developmental delay implies that people are always catching up rather than perceiving the world in cognitively varied ways. Please say people with cognitive or developmental disabilities.

Midget: Went out of fashion with court dwarves. Seems to assume that everyone of short stature is there to entertain. Assumes that the person's size accounts for their amicable or sometimes devilish personality. Please say person of short stature.

Non disabled: Whatever.

Normal: Who's to say what is normal? Let ye who is normal cast the first stone.

Overcome: This implies that [those who don't] overcome their disability . . . are the one[s] with the problem. They are either not trying hard enough or don't have the right attitude. It's not our disabilities we have to overcome. It's the barriers that disallow our participation.

Patient: This implies that we are always ill or in need of being fixed. People with disabilities are only patients in our relations with our doctors, just like the nondisabled.

People with disabilities: This has evolved as the proper term because it puts the person first. We know it can become literarily cumbersome when used repeatedly. "Disabled people" is fine and actually preferred in some countries as a claim of pride and solidarity. "The disabled," however, makes everyone sound like an item or immovable object.

Physically Challenged, Handicapable, Differently-abled: Ridiculous terms that are used by people who seem uncomfortable with disabled people or with their own disabilities. Why bend over backward not to say disabled as if it is a bad word?

Special: The word gives an inaccurate impression that people born with disabilities get special treatment throughout life. It even perpetuates the myth that children with disabilities are spoiled. Sugar coats an experience or makes it cute. Even sounds like luck is involved!

Suffering: Bears the automatic coding that a disabled life is miserable such as in "he suffers from brain damage." Instead of saying a person suffers from, is stricken by or afflicted with (etc!) a disability, [j]ust say he/she has a disability.

Vegetable: A favorite of legal defense teams and those of pro-euthanasia persuasions. Someone who is supposed to be a burden upon family, society and country. A waste of space. No longer animal, thus no longer human. What next, mineral?

Victim: Assumes that all people with disabilities are suffering from some great tragedy. When people with disabilities are victims, it's usually for reasons that have little to do with the bodily experiences from their disability. See also "burden."

Wheelchair bound: Makes it sound as if we are tied up, being held hostage. Some people with disabilities are into bondage, but not all. No one is bound to their wheelchair. Everyone gets out of it at least once a day.

A Special Bonus for Being a Good Sport and Sticking It Out!! SLANG!

Some throw these words around with abandon while others find some of them too dangerous in any context, no matter how self-deprecating or ironic. WARNING: DO NOT ATTEMPT TO USE WITHOUT PROPER CONTEXT:

Some examples:

Blind people: Blinks, bats.

People with physical disabilities: Gimps, crips.

Nondisabled people: Uprights, verticals, walkie-talkies, bipeds.

Super duper overcoming disabled people (i.e. jocks): Supercrips.

Super duper passive and subservient disabled people: Tiny Tims.

▣ Apology on the 75th Anniversary of the *Buck v. Bell* Decision (2002)

In the most notorious sterilization case, Buck v. Bell (1927; see excerpt from the decision on pp. 390–391, this volume), the argument supporting sterilization was based on the longstanding prejudice that cognitively disabled women were more promiscuous than nondisabled women. Eugenics historians have since established that Carrie Buck (the cognitively disabled woman targeted in the case) had been raped by a relative of her foster parents. The statement, by Virginia Governor Mark R. Warner, was read by Delegate Mitch Van Yahres at a ceremony on May 2, 2002, to dedicate a highway marker commemorating the Buck v. Bell decision. The highway marker's wording was authorized by the Virginia Board of Historic Resources.

I am sorry that I am unable to be with you on this important occasion.

In 1924, Virginia, like many states, passed a law permitting involuntary sterilization. In 1927, Carrie Buck was the first person sterilized by the Commonwealth pursuant to that law. Virginia's actions were upheld by the Supreme Court of the United States, and the government ultimately sterilized approximately 8,000 people.

Last year, the General Assembly passed a resolution expressing profound regret for the Commonwealth's role in the eugenics movement. Today, I offer the Commonwealth's sincere apology for Virginia's participation in eugenics. As I have previously noted, the eugenics movement was a shameful effort in which state government never should have been involved.

We must remember the Commonwealth's past mistakes in order to prevent them from recurring. This highway marker will serve as a constant reminder of how our government failed its citizens and how we must always strive to do better.

▣ International Commemoration Committee on Eugenic Mass Murder (2003)

On May 2, 2003, the following elegy was read in public ceremonies throughout Europe and the United States. These commemoration events sought to remind populations of the eugenics-based killings in National Socialist Germany that ultimately led to the Holocaust against Jews, Romany ("gypsy"), and gay people. The document details some of the processes and technology implemented against those with disabilities and psychiatric diagnoses in German psychiatric institutions. These practices were later exported to Nazi death camps during the implementation of the "final solution" involving mass extermination.

In Memoriam,

In 1939 at a psychiatric institution in Germany a group of patients were told to undress and take a shower. After the "shower" door was locked, one psychiatrist turned a valve, releasing poisonous gas through pipes into the "shower" room. Then the psychiatrists looked on through a glass aperture as the patients slowly asphyxiated to death in the fumes.

Disabled protesters at the 2004 World Social Forum in Mumbai, India, march toward the podium to press for their demands.

Source: National Centre for Promotion of Employment for Disabled People, New Delhi, India.

By 1941, before the mass murders in the concentration camps had begun, hundreds of thousands of defenseless people, men, women, children, the elderly, and infants, who had been defined by doctors as "life unworthy of living," had been gassed, drugged, shot, or deliberately starved to death. The murders continued even after 1945.

It is often incorrectly assumed that the murders were ordered by Hitler. In fact, doctors proceeded independent of government approval. In 1941 after Hitler ordered a stop to the murders, doctors committed what has since been dubbed "wild euthanasia."

These eugenic mass murders had been endorsed by the medical establishment decades before the [N]azis came to power. They were sanctioned by proponents of eugenics in other countries, including doctors in the United States and England.

History has failed to do justice to the hundreds of thousands of victims. Therefore, we, the International Commemoration Committee on Eugenic Mass Murder, set aside the date May 2 in memoriam, and demand that no person, with or without disability, ever fall victim to medical murder again.

Reprinted by permission.

Disabled Students Union Meeting (2003)

The formation of the Disabled Students Union (DSU) was one of the first successful organizing efforts around disability issues in colleges and universities in the United States. Below is an excerpt from the organization's call for members at the University of Illinois at Chicago (UIC). The group's founders also went on to successfully create a National Disabled Students Union that organized disabled students and their close advocates at the national level.

January 28, 2003 11:30 a.m.–1:00 p.m.
Room 448 IIDD

ACCESS IS A CIVIL RIGHT!
About the Disabled Students Union

The purpose of this cross-disability organization is to mobilize, organize, and represent students with disabilities at UIC in order to promote empowerment and community solidarity among people with disabilities on campus. Students with disabilities at UIC are one of the most underrepresented and marginalized minority groups on campus. DSU was created (Feb. 2000) with the express intent of strengthening the political voice and power of students with disabilities on campus. DSU is a socio-political advocacy organization that seeks to build disability community, culture, pride and power.

If you are a student with a disability and you are interested in participating in the DSU to promote disability access and disability pride, then we need your input and involvement!

▣ *Los Angeles Times* on Eugenics Apologies (2003)

At the outset of the twenty-first century, numerous states issued formal apologies to disabled people and their families who were negatively affected by sterilization practices. The following journalistic article discusses the larger issue of such apologies, and particularly California's longstanding lack of inquiry into the state's ambitious eugenics effort to sterilize more than 20,000 disabled people.

To make amends for a state program that sterilized 7,600 people against their will, North Carolina's governor created a panel last year to probe the history of the effort, interview survivors and consider reparations.

In Oregon, then-Gov. John Kitzhaber last year apologized in person to some of the 2,600 people sterilized there, and he created an annual Human Rights Day to commemorate the state's mistake. On the day Virginia Gov. Mark R. Warner apologized, Jesse Meadows and other victims unveiled a roadside marker.

"It felt pretty good to be there, even though it was so late," said Meadows, 80.

Some historians and advocates for the disabled had a mixed reaction to the apology issued Tuesday by Gov. Gray Davis for California's policy, the most aggressive in the nation, which sterilized an estimated 20,000 mentally disabled people and others from 1909 through the 1960s.

Davis offered his apology in a press release. No survivors or disability groups were on hand to accept it. There was no order to probe for more details of a history that, according to scholars, is still largely unexplored and not fully understood.

"It's like a preemptive apology. . . . We don't know yet who to apologize to," said Alexandra Stern, a University of Michigan historian who is writing a book about California's sterilization program.

"An apology with no attempt to find the people who deserve to receive it is meaningless," said Stephen Drake, research analyst with Not Dead Yet, a national disability rights group. "If the governor is serious about wanting to understand this shameful chapter of California history, then you need an effort to study the records of just how this was done."

"I think it's premature," said Paul Lombardo, a University of Virginia historian who revived interest in the state policy when he lectured Tuesday to a California Senate committee. The lecture, which some officials said was the first time they had heard of the sterilization policy, triggered a statement within hours from Davis and a separate apology from state Atty. Gen. Bill Lockyer.

Lombardo and Drake said the apologies were welcome as acknowledgments of past abuse. "But if they don't try to understand the history, then I don't know what it's worth," Lombardo added.

Historians have only recently begun to explore California's sterilization effort. Primarily at institutions for the mentally ill and the developmentally disabled, the state sterilized thousands of people under the premise that the "unfit" should be removed from the gene pool so their children would not burden society.

But some of the basic details still are missing. Among them: exactly how many people were sterilized.

The mentally ill and developmentally disabled were the initial focus of the policy, but some historians believe that it also targeted Mexican and Asian immigrants, criminals, juvenile delinquents and sexually active women.

Even the date that the practice ended is unclear, though it may have been as late as 1969.

"We checked that and we haven't been able to determine that," said Bertha Gorman, spokeswoman for the California Health and Human Services Agency. Because of patient confidentiality rules, historians have had little access to state records that might shed light on the state's sterilization history.

"Shouldn't we demand that the state fill in the history?" asked David Mitchell, who runs a disabilities studies program at the University of Illinois at Chicago. "That would be the foundation of a meaningful apology."

Russell Lopez, a spokesman for the governor, said he had called three state departments last week in an attempt to find survivors but was told no names could be released because of patient confidentiality rules.

"The governor just learned about this," Lopez said, "and he decided it was something he must do: apologize for what the Legislature did in the past."

In Virginia, North Carolina and Oregon, a combination of media interest and university research brought attention to past sterilization programs and led to the state apologies.

Although some details remain clouded, there is no doubt that California was once home to the largest sterilization program in the nation and to some of the most influential supporters of the practice, including the publisher of the *Los Angeles Times* in the 1930s.

At least 30 states passed laws in the first decades of the 1900s that aimed to shape society by denying the so-called unfit the ability to reproduce. Scientists already had shown how careful breeding could improve crops and livestock. Now, they were arguing that selective breeding could improve humanity and wipe out poverty, prostitution and mental illness, which were thought to have genetic roots.

The concept, known as eugenics, led to the sterilization of more than 63,000 people in the United States from about 1907 through the 1970s.

California accounted for one-third of all operations. Its sterilization law was the second in the nation, after Indiana's.

The state's enthusiasm for eugenics was so well known that it is mentioned in "The Great Gatsby." When Nazi Germany wrote its sterilization policy, it borrowed from California's law, historians say.

"Why California more than other states? That's a key question," Stern said. "I think it has to do with the need to civilize the frontier."

In better breeding practices, Californians saw a way to control the chaos of nature. And their use in human reproduction had the support of prominent citizens, including then-Stanford University President David Starr Jordan and Pasadena citrus magnate Ezra Gosney, who founded one of the most influential think tanks devoted to eugenics, the Human Betterment Foundation, in 1926.

Another cheerleader was *The Times,* whose publisher, Harry Chandler, was listed as a member of the Human Betterment Foundation in a 1938 pamphlet by the group.

"We have secured the ardent support of the *Los Angeles Times,*" Gosney wrote in a 1937 dispatch to the *Eugenical News,* a monthly periodical. "They are running an article each week in their Sunday magazine edition which, while not as good as the editor-owner of the paper would like, keeps the subject before the people and does much to encourage us in carrying on."

That Sunday column, called "Social Eugenics," ran from 1935 to 1941 and argued for strong sterilization laws, said Lombardo of the University of Virginia. The paper ran at least 120 of them, he added.

Through much of the 1930s, many sterilization advocates also cheered on the eugenics policies in Germany. "Why Hitler Says: 'Sterilize the Unfit!'" ran a headline in a 1935 issue of *The Times'* magazine. "Here, perhaps, is an aspect of the new Germany that America, with the rest of the world, can little afford to criticise."

Under California law, people with "mental disease" could be sterilized if doctors believed the condition could be passed to descendants. The superintendents of state institutions had broad authority to decide how often to use the procedure, Stern said.

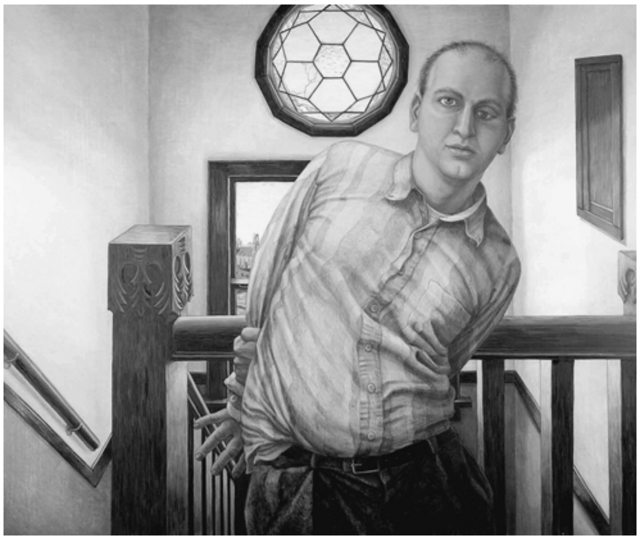
"The term 'mental disease' could be interpreted broadly," she said. "People who were epileptics were lumped in there, and people with 'perverse' sexual tendencies, so you had gay men."

Some who were sterilized had landed in state institutions on grounds of theft, forgery and truancy from school. In some places, women appear to have been sterilized merely for promiscuity.

"Something like 25% of the girls who have been sterilized were sent up here solely, or primarily, for that purpose," wrote Paul Popenoe, director of the Human Betterment Foundation, during a 1926 research trip to the Sonoma State Home for the Feeble-Minded. "They are kept only a few months—long enough to operate and instill a little discipline in them; and then returned home."

Stern and Lombardo believe that hundreds of prisoners, as well as many of the women and others at the Sonoma facility, are not included in the commonly cited figure of 20,000 sterilizations in California.

They also suspect that the state's strong anti-immigrant movement of the early 1900s targeted Mexicans and other nonwhite groups with sterilization, an attempt to dilute their presence in the population. But no broad survey of the racial and ethnic profile of sterilization patients has been done.



Circle Story #1: Jeff Carpenter, *by Riva Lehrer. 1997. Jeff Carpenter, a comedian, writer and teacher, works with an improvisational troupe and also performs solo work. Carpenter was injured in a random drive-by shooting several years ago, and he has written darkly sardonic pieces about its difficult aftermath.*

Joel Braslow, an associate professor of psychiatry at UCLA, says critiques of sterilization laws often misstate how the policy was practiced.

In state institutions, he says, doctors cared little about eugenics. Instead, they saw sterilization as a humane and beneficial treatment for patients, along with lobotomies and other now-discredited practices.

“In practice, we didn't sterilize the severely retarded,” said Dr. William Keating, a surgeon at Sonoma State Hospital throughout the 1950s. “They had very little opportunity for sex. The people we concentrated on were people who were moderately retarded, who had a chance of going out and getting pregnant.”

In an interview, Keating said he performed 500 to 600 tubal ligations and vasectomies at the institution. Individuals who could perform some sort of job outside the institution would be released, but not if they were at risk of getting pregnant or impregnating someone. In effect, sterilization was a ticket to a work furlough, or general release.

Keating recalled a young man who had an IQ he estimated to be 85. After his vasectomy, the man was released, only to return for a visit one day—in full Army uniform. He had become a first lieutenant during the Korean War.

Eugenic sterilizations tailed off through the 1950s and 1960s but remained legal until 1979. Today, state law allows sterilization for mentally incompetent people who cannot give informed consent. A court-appointed conservator must petition a judge for permission.

Victim Jesse Meadows said that Virginia, at least, “ought to pay people for what they did.” Meadows, of Lynchburg, was sent to the Virginia Colony for Epileptics and the Feebleminded in 1940, after his mother died and his father remarried. He was sterilized there, at age 17.

“They said it was to help my health . . . and so I wouldn't have no feeble-minded children,” Meadows said.

Virginia's apology and roadside marker “helped me some,” Meadows said. “But it's hard to forget that somebody ruined your life like that.”

Margaret Talbot, from “The Executioner's I.Q. Test” (2003)

One of the more contentious issues in the United States at the beginning of the twenty-first century is the issue of capital punishment for people with cognitive disabilities. Given the lengthy history of IQ testing and its controversial status as a valid scientific evaluation tool, the following excerpt from a journalistic article provides an important commentary on the continuing use of such testing to determine ultimate decisions about “ability to reason” as the basis for enactments of state-sponsored murder.

Most people will never take an I.Q. test, and if they do, it probably won't have a big impact on them. Generally speaking, I.Q. tests do not carry much weight anymore. Not with vague charges of cultural bias still clinging to them. Not at a time when multiple intelligences—that happy, inclusive vision in which nearly everybody is good at something—are on the ascendancy. If you do take a Stanford-Binet or a Wechsler, and you score in the average range, well, there you'll be, with hardly a reason to mention it. If you score high, the particular number won't matter much—unless you're the sort to join Mensa, and then it will matter only to your fellow Mensa members. But if you are in the bottom 3 percent of the population that scores 70 or lower, your actual I.Q. number will mean a great deal. Scores in that range will most likely lead to a diagnosis of mental retardation, and that diagnosis will entail many things, starting with mandated special education. Since last June, across the United States, it has also entailed exemption from capital punishment. And so, for someone who has committed a capital crime, an I.Q. score can mean the difference, quite literally, between life and death. It can mean, if we want to be blunt about it, that there is such a thing as being too dumb to die, at least at the hands of the state.

▣ Andrea Dworkin, "Through the Pain Barrier" (2005)

This is the last piece written by Andrea Dworkin, composed just a month before she died. Few knew that she had suffered from an agonizing bone disease for several years. She describes with grim humor her worst moments and why she felt she was starting to heal.

The doctor who knows me best says that osteoarthritis begins long before it cripples—in my case, possibly from homelessness, or sexual abuse, or beatings on my legs, or my weight.

John, my partner, blames *Scapegoat,* a study of Jewish identity and women's liberation that took me nine years to write; it is, he says, the book that stole my health. I blame the drug-rape that I experienced in 1999 in Paris. I returned from Paris and finished *Scapegoat* over a period of months while caring for my dying father. Shortly after he died I was in hospital, delirious from a high fever, with infection and blood clots in my legs. I was there for a month. John had been told that I was dying. I forgot that in hospitals when one is dying, nurses abrogate the rules. John was allowed in after visiting hours; nurses would pull the curtain around my bed and let him lie with me. This was my happiness. Doctors tell me that there is no medical truth to my notion that the rape caused this sickness or what happened after it. I believe I am right: it was the rape. They don't know because they have never looked.

A few months after I got out of the hospital, my knees began to change. They lost their flexibility. Slowly they stiffened. As they stiffened they became sore. They started to hurt terribly—as if injured but not visibly injured. I got a cellphone—this was before they were ubiquitous—so that if I couldn't walk any more I could call a car. I had given up on New York City subways: my knees could no longer bend enough to use them.

I went to an orthopaedic surgeon. I was diagnosed with osteoarthritis in my knees. I was treated with the anti-inflammatory Celebrex and, when that didn't work, its stronger cousin, Vioxx. Vioxx was recently taken off the market by its makers because of a risk of heart attacks or strokes; I was on it for three years. I had cortisone shots in my knees, followed by prednisone. The cortisone shots, which are painful, worked only once. Then I could walk without pain; in joy I sat on my front steps and talked with my neighbour—inconsequential chat. When I tried to stand up, my knees were rigid and excruciating. I managed to stand and swivel around; I took the remaining two steps up to my front door and used the door to drag me inside. I had had an hour-and-a-half of freedom.

My mobility lessened as the pain increased. Eventually I found myself housebound. I could walk only a few steps at a time, intimidated by the pain and the refusal of my knees to bend. John and I lived in a three-floor house. I could barely make my way up or down the steps. I'd crawl up the steps on hands and feet. I'd try to go down on my butt, step by step. The kitchen was on the first floor; the toilet on the second; my desk, books and shower on the third. My physical world became tiny and pain-racked. I stayed in my bed when I could. John brought me up food. I'd go out only to the doctors.

The orthopaedist started giving me narcotics, most of which contained acetaminophen, a common, nonprescription analgesic. My pharmacist persuaded the doctor that the liver damage caused by too much acetaminophen was more dangerous to me than stronger drugs. Through her advocacy I got a drug normally given only to cancer patients. It was a little yellow lollipop and when in pain one was supposed to lick. I licked a lot. I was told that I had to have my knees replaced. The prostheses are made out of titanium and plastic. I had both knees replaced at once, a normal practice now but unusual even a few years ago. My surgeon would later tell me that if I had had one done, I would never have returned for the second. He got that right.

I still don't know what he did to me but I came to the conclusion that the operation was barbaric, involving as it did the sawing out of the arthritis, which meant sawing through bones. It was like being kneecapped, twice, or having one's knees and bones hammered and broken into bits. After the operation I was in a nightmare of narcotics and untouchable pain. There were morphine shots. I asked for them and got them often. Even morphine shots in the upper arm hurt.

I had a hallucination but it is still real as rain to me. I was in Virginia Woolf's house and I was happy. But "they" wanted me to go down the stairs. I can't, I begged, I can't. My hospital bed was at the top of the stairs and I was afraid that they were going to push me down. I saw the steep decline of the steps. I couldn't get over my visceral fear of falling or being pushed or being turned over from the bed down the flight of steps. I kept experiencing my bed as being on the edge of a precipice.

One day, I remember, a nurses' aide braided my hair and I felt cooler, cleaner. I was on the bedpan, but raising myself up to use it—knees—was so fiercely painful that I would rather lie in my piss.

Then the day came when I had to walk. There was a vinyl chair next to my hospital bed. The physical therapist's name was Carl. He was like a tree trunk, big and solid. You can do it, he said. I'll help you; we'll just go over to the chair. It was impossible, outside the realm of the imaginable. Carl let me hold on to him in a desperate, tight embrace as he carried me over to the chair. My legs dangled, my knees twisted, I sweated, I screamed. See, you could do that, he said, without a shred of irony. I had to sit there for two hours, which meant knees bent but not weight-bearing. Nurses came by and gave verbal approval: good dog, good dog. Eventually Carl carried me back to bed.

Pain is a four-letter word. There is no way to recreate it through memory. It is not like the flashback arising from traumatic events such as rape or battery. The flashback is as if it is happening now, in the present, even if it is from decades ago. Pain can be recent yet inaccessible to immediate experience. Torturers know that people can't die from pain. The consequences of pain—for instance a heart attack—yes, but not from pain itself, however intense. The horror is that no one dies from pain. This means that suffering can be immeasurable, enduring, without respite. So it would be for me for the next two years.

I was taken to an institute for physical rehabilitation. A nurses' aide took me to shower in a wheelchair. I used a walker from the cot on which I slept to the wheelchair, maybe two miserable steps. I had two responsibilities—take my pain medications (Vicodin or Percocet) and show up at the right room at the right time for the scheduled rehabilitative class. I was not allowed to go to class if I did not take the painkillers. In fact, the pain was unrelenting. I lived for the next pill.

Physical therapy is based on tiny movements, increments of change that almost defy detection; it is built on the repetition of the minuscule. Yet to the hurt person these motions or movements or minute steps are hard. The first time is daunting and the 10th is like climbing Mount Everest. I sit in a big room, my wheelchair in a big circle of wheelchairs. Big is good because it means that my turn does not come often. I stand up by holding on to a walker and take a step. Then I step back and sit down. The cycle is hideous. The steps with the walker increase to two, then three. After several weeks I am assigned a means of locomotion: crutches.

Rehabilitation also includes so-called occupational therapy: throw a ball around in a circle; put round pegs in round holes; stand up, arms on a table, and read a page of a magazine; water a plant; play checkers or cards; and the pièce de résistance, cook and serve a simple meal. I am guided in the intricacies of shopping while crippled; I learn how to use a "grabber" to latch on to things I have dropped or cannot reach; I am taught again how to put on shoes and socks and tie shoelaces.

I also have to meet the institution's psychologist once. I keep getting called back.

When I ask why, I am told that I am "interesting." Well, yes, I think, I used to be. The narcotics help me deal with the psychologist but the physical pain simply marches on. It does not lessen or change or stop.

I learn three rules in my occupational therapy classes: never hold on to anything that moves; if it rains or snows, stay inside, even if that means cancelling doctors' appointments (to those medicalised this is nearly profane); and kick the cat—if a cat curls up in front of your feet, kick it away. I learned to use my crutch to kick the cat. I will go to hell for this.

On discharge, social services are provided. My male partner is not expected to be a care-giver. I am sent an itinerant nurse, a young, poorly paid and badly trained social aide to help me with baths and to do light housework, and a freelance physical therapist who will do the drill: stand up, take steps, bend your knees, and—the killer—stand on your toes.

And on discharge a wreck like me is sent to a "pain management centre." Despite my small successes at physical rehabilitation I am in agony. I spend almost all my time in bed, a bed of nails, all through the knees. The pain management centre is run by Curly, Larry and Moe. First there is a 10-page questionnaire. Rate from 1 to 10 your pain (I modestly assert an 8; my social conscience, atavistic as it is, tells me that there are others in more pain). Rate from 1 to 10: is your mother dead; how many people in your family have died of cancer; how is your sex life; how many times a week do you have sex?

They want me to undress so they can examine me. This is absurd. I refuse. There is a table they want me to lie on that they claim lessens pain. The bottom line is that New York State regulates narcotics to such an extent that regular doctors are reluctant to write prescriptions for painkillers; and so Curly, Larry and Moe at pain management put you through whatever rigmarole and then write prescriptions, none of which, according to state law, can be refilled. So one is in a cycle of coming back for new prescriptions and new indignities every 30 days.

Curly eventually puts me on Percocet, fentanyl patches and methadone. I am on these drugs for nearly two years. I become slightly indifferent to the awful pain. My speech slurs and my memory is impaired. It is during this time that I write my memoir Heartbreak. I want to remember some good things in my life. I work for one hour a day. The narcotics do not make me Coleridge; but I hold my own.

One day I wake up and the pain is gone from my right knee—as if God had intervened. The pain in the left one is the same. I begin to go outside on my crutches. I can walk half a block to my local Starbucks. One day I sit there, still on my meds, and I see the ballet going on outside. The sidewalk is heavy with pedestrian traffic. They are so unselfconscious, these normal walkers. They have different gaits; they move effortlessly; each dances without knowing it. I used to be one of them. I want to be again.

The anti-drama of small gesticulations continues, this time in physical therapy several blocks from where I live. My left knee is still rotten. After another year of physical therapy they give me a cane. I put away all the crutches and other signs of what I call "disability chic." I can sort of walk. The cane means victory. The pain in my left knee keeps me on my meds. Over the course of another year, that pain lessens. It's a whisper, a shadow—it goes. I give up the pills, though I go through a nasty withdrawal from methadone.

Alas, there is no happy ending. John and I move to Washington so that he can take a job as managing editor of a large-circulation magazine. We live in an apartment without steps. I am on the cane. I go into physical therapy because, unable to stand up straight, I hunch over the cane. A few days later I am at the kitchen table reading a magazine. I stand up to get something and my right knee cannot bear any weight, none. I can't use it because I can't step on it. I have no pain; I have had no warning. I get to my crutches, which are in a closet. I need both of them in order to move. My right knee remains useless. The physical therapist determines that the quadriceps above the knee has stopped working, because imperceptible pain occasions the quad muscle to give out. Then my knee buckles and I fall. It is dangerous to fall. I see the physical therapist twice a week.

The orthopaedic surgeon ("a genius with knees," says my internist) puts me in a restrictive brace that allows

"Disabled and Proud" wheelchair lovers hug each other during the Chicago Disability Pride Parade, 2004.

my knee to bend only so far. That way, if my knee fails, I am unlikely to fall. After nearly a year of physical therapy my quad muscle is not much stronger and my knee still buckles. The surgeon sends me to a rehabilitation hospital where they make me a new brace, specifically fitted to my leg. This brace works on the opposite principle to the first one: it immobilises the knee so that no buckling is possible, thus, no fall is possible.

It takes months for artisans to make the brace. It goes from beneath my calf to the top of my thigh. It is made of a black space-age material created to go to Mars or Saturn. Nothing makes it bend or stretch or break. It is completely unforgiving. I call it Darth Vader. It is the principle of evil incarnate. The straps that attach front to back are Velcro. I am supposed to lock it when I walk and unlock it when I want to sit. The brace is worn under my pants leg so no one can see it. Each manipulation is distinct: in public locking it makes me look as if I am masturbating, and unlocking it makes me look as if I am fondling my thigh. The brace must be very tight and positioned perfectly to work. It takes me nearly two months to learn how to put it on and use it. I lose my balance in efforts to lock it. Once I flip backward, magically landing on a chair.

Self-respect demands that I clean up the faecal mess that my cat has made. It is the immobilized knee that makes bending down to the floor fraught with peril. I start falling and know that I must not hit the floor. I fight against gravity, my fingernails clawing at the walls and my hand grasping for the door frame. I know that if I fall I probably will not be able to get up. Somehow I raise myself.

I was slow with the first brace. I had to remind myself to be patient. With Darth I make the turtle look like the hare. The landscape is one of hazard. Anything can reach up and bite me: a break in the sidewalk; leaves; sand; mud; a sudden slope up or down; a stone; some pebbles. Anything threatening balance is dangerous: first the brace itself; then wind, people running or bicycling or being too close or too many; a fast car; a step; a curb; a puddle; heavy doors; slick surfaces. Crowds are impossible and so are stairs.

I want to be able to carry a cup along with a plate to the kitchen sink in one trip. I don't want to have to make two trips. The cup slips and breaks. This happens several times. Is it a small thing? I can't bear it or accept it. I reject the extent of my disability. I find myself in a silent rage that stretches over weeks. I am utterly exhausted by my incapacity. I am worn out from walking. I am sick of physical therapy.

There are little humiliations. I keynote a conference on the Holocaust. The organiser picks me up. She is driving a truck. I try to climb up into it. She physically pushes me under my ass without permission, all the while talking to me in baby talk, put your tooshie there, keep your cute little fanny there. I turn to her and say, I am disabled, not stupid. A friend throws a party for me in Washington. I ask how many steps there are to the apartment. He doesn't know. I assume he will get back to me. John and I go to the party. There are three flights of steps. I can't get to the party being given for me. We could have given it in another venue, the friend says the next day. It cuts. I go to a bar and need to use the rest room. The men's is filthy, the bartender says; the women's is two flights up. I use the dirty one. I go to a new movie theatre that has elevators and disability bathrooms but the polished stone of the floor is so slick that my crutches cannot safely navigate it. I am walking with a friend who suddenly looks at my crutches and says, you don't want to be this way the rest of your life, do you? Her repulsion is barely masked. I feel unutterably alone.

Each disabled person has a story, often including pain, impairment, disorientation and loss of control. Each disabled person lives always on the threshold of separation, exile and involuntary otherness. Only a determined policy of public access can help to mitigate the loneliness. One needs to be able to enter buildings; have a cup of coffee; go to a restaurant, the theatre, cinema or a concert; attend school; go to lectures or readings; use public transport, bathrooms, hotel showers; go to museums and sporting events and political rallies. One needs equal opportunity in employment. One needs to be integrated into the world, not separated from it; yet one has special needs, ones that able-bodied people rarely consider. The low consciousness of the able-bodied increases alienation.

For mobility problems, one needs a new geography: kerb ramps; ramps in addition to steps; handrails; grab bars; high toilets; light doors; wheelchairs; room for wheelchairs in public bathrooms and hotel rooms; elevators; safety in floor surfaces including carpeting; entry and egress from public transport as well as acceptable seating; and a host of other considerations. Other disabilities require other remedies. In 1990 Congress passed the landmark Americans with Disabilities Act, which articulated in great detail the requirements for making the world available to disabled people. This is a civil rights law that recognises the exclusion of disabled people from the larger community as outright discrimination.

The law had its impact because disabled people found aggressive trial lawyers to sue commercial and private venues for noncompliance. The plaintiffs went after big-money damages for violating the civil rights mandated by the ADA. Eventually it became clear that compliance would be cheaper than continuing litigation. Losing money does put the fear of God into Americans.

I have to say that the ADA increases the quality of my life, Darth notwithstanding. I get through airports in a wheelchair provided by the airline; John takes me to the zoo a few blocks from where we live [and] the zoo provides a wheelchair; local coffee houses to which I gravitate have disability-standard bathrooms; there are special seats for me in cinemas and theatres and in rock venues; there are kerb ramps at pedestrian crossings and ramps or elevators in addition to steps and escalators in most public accommodations. In my neighbourhood I see many other disabled people outside all the time. We are not rare or invisible, because we are not hidden as if in shame.

And bless those nasty trial lawyers, whom George W Bush and the Republicans hate so much. Without them the ADA would be a useless pile of paper.

For myself—despite physical therapy, the breaking cups, and my immobilised knee—in the middle of the night, worn down, I listen to Yo-Yo Ma playing Bach or Loretta Lynn's Van Lear Rose; and I am, I think, healing. Surely music must be more powerful than bad luck.

Source: Dworkin, Andrea. 2005, April 23. "Through the Pain Barrier." *The Guardian.* Available at: http://books.guardian.co.uk/news/articles/0,6109,1468336,00.html. Reprinted by permission of the Guardian News Service.

CHRONOLOGY

1500 BCE Egypt: The Ebers Papyrus, a medical textbook, devotes an entire chapter to eye diseases. It also shows that deafness is well understood and that clinical knowledge has developed.

400 BCE Graeco-Anatolian Hippocratic writings coin the word e*pilepsy* for a convulsive condition they view as a disease rather than a possession or punishment. Today, it is estimated that more than 80 percent of the 40 million people who currently have epilepsy throughout the world have little access or no access to contemporary treatments.

300 BCE China: *The Yellow Emperor's Internal Classic* is the first text to outline acupuncture. Ordinances on emergency relief for the disabled date to the Han Dynasty, 206 BCE–AD 220. Fiscal and administrative disability classification date at least to the Tang Dynasty, 618–907.

1250–1350 High point of medieval medicalization during which theoretical explanations for conditions gain currency in Western Europe. Prior to this time, in the most general of terms, lay explanations held more sway, ranging from the superstitious to the spiritual to the vindictive. With the founding of the universities, medical theory, typified by the four humors, became more influential in governmental, legal, and elite social circles. Disabling conditions like epilepsy, strokes, and paralyses, as well as psychiatric conditions, increasingly fell under the social control of doctors.

1400 Turkey: Deaf people work in the Ottoman Court from the 15th to the 20th centuries. Sign language becomes a recognized means of communication among both hearing and deaf courtiers.

1593 England: The origins of disability as a social and political category emerge with the first state disability benefits being enacted by Parliament for those disabled in war.

1593 Europe and the United States: English Parliament initiates Europe's first national system of benefits for rank-and-file disabled veterans. The first veterans' homes—France's Hôtel des Invalides, Britain's Chelsea Hospital, and Frederick the Great's Invalidenhaus in Berlin—are established in 1633, 1685, and 1748, respectively. Following the American Civil War, the U.S. government responds with a system of homes, preferences in government hiring, land grants, free prosthetics, and pensions for disabled veterans (however, southern veterans were limited to usually scanty state pensions).

1601 England: The Poor Law is passed to provide family and community support for those unable to make a living for themselves.

1604 Laws on witchcraft in the colonies all evolve from a 1604 English Statute that makes "being a witch" punishable by death. During outbreaks of witch-hunting, the "different" body itself is targeted as a sign and symptom of one's confederation with demonic forces.

1697 England: The first English workhouse for people with mental and physical disabilities is established in Bristol in 1697.

1704 Bethlem Hospital in the United States has 130 residents housing the "furiously mad."

1714 Canada: The Bishop of Quebec opens the first building in Canada exclusively for the confinement of mentally disturbed individuals. It is adjacent to Quebec General Hospital.

1749 France and England: Denis Diderot pens one of the most influential treatises on the blind and education in his *Letter on the Blind* in which he argues that the blind can be educated. In 1784, Valentin Haüy opens the first school for the blind in Paris. He perfects a system of raised *letters* to enable the blind to read. In 1828, Louis Braille modifies a raised *dot* system invented by Charles Barbier, which is used today by blind persons to read and communicate. In 1847, William Moon, an Englishman, develops an embossed script based on Roman capitals that blind adults can learn to read in a few days. It is the first reading system for the blind to be widely adopted across the world, but because it is costly to print, the Braille system, which can be produced by blind individuals for themselves, overtakes Moon's system.

1755 France, the United States, and Germany: The Abbé Charles-Michel de l'Épée establishes the first state-supported school for the training of young deaf children, where he teaches sign language. The school serves as an inspiration for the establishment of other European schools and has a dramatic impact on social attitudes toward the deaf. In 1817, Thomas Gallaudet and Laurent Clerc establish the Asylum for the Deaf (now American School for the Deaf) in Hartford, Connecticut. Clerc imports the French sign system, which influences the makeup of contemporary American Sign Language (ASL). In 1778, Samuel Heinicke establishes a school in Leipzig, Germany, where the "oral method" is used.

1800 France: Victor of Aveyron, a "feral child" found in southern France, is brought to Paris. Jean Marc Gaspard Itard, a French physician, develops a systematic training program for the boy and works intensively with him for five years. Itard considered his attempt at educating Victor to be a failure because the boy did not learn to use a language. Nevertheless, Itard's disciples, including Edouard Séguin, Maria Montessori, and Alfred Binet, continue his work by establishing classes for children considered to be "mentally retarded."

1802 France: The world's first pediatric hospital, L'Hôpital des Enfants Malades, is founded.

1817 The American School for the Deaf is founded in Hartford, Connecticut. It is the first school for disabled children in the Western Hemisphere.

1817 James Parkinson, a London physician, describes what is to become known as Parkinson's disease.

1817 Thomas Gallaudet and Laurent Clerc open the American Asylum for the Education of the Deaf and Dumb in Hartford, Connecticut.

1828 Frenchman Louis Braille, blind from childhood, modifies a raised-dot system of code, one of the most important advances in blind education. It not only allows the blind to read at a much faster rate but also makes it possible for the blind to be teachers of the blind. UNESCO creates the World Braille Council in 1952.

1829 France: Louis Braille publishes an explanation of his embossed dot code.

1832 Samuel Gridley Howe is chosen to direct what is later to be called the Perkins School for the Blind in Boston. It becomes the model for schools around the nation. Laura Bridgman and Helen Keller attend Perkins. In 1837, Ohio establishes the first state-sponsored school for the blind.

1834 England: The English Poor Law Amendment stipulates five categories of those unable to work: children, the sick, the insane, defectives, and the aged and infirm. This sets the stage for the development of specialty institutions that isolate the disabled from the community.

1841 P. T. Barnum purchases Scudder's American Museum in New York City. This moment is considered to be the beginning of the "Golden Age" of freaks, which persists until the 1940s. The tension

between freaks and disability rights comes to a head in 1984, when disability rights activist Barbara Baskin successfully lobbies the New York State Fair to remove Sutton's Incredible Wonders of the World Sideshow, featuring a limbless man who performs as the "Frog Boy," from the midway.

1843 Due to the influence of Dorothea Dix, an American social reformer, the Massachusetts legislature allocates funds to greatly expand the State Mental Hospital at Worcester. Dix also plays an instrumental role in the creation of 32 mental hospitals and becomes nationally known for her reform efforts. By the late 1840s, Dix focuses on developing a national plan that addresses the treatment of people with mental illness.

1846 William Thomas Green Morton discovers anesthesia and in 1867 Joseph Lister provides a model for antisepsis. These new technologies play a central role in the future of aesthetic surgery as well as surgical intervention for every type of disability that calls for it. Penicillin is discovered in 1929, cutting mortality rates in hospitals dramatically.

1848 The North Carolina School for the Deaf begins the first publication for Deaf persons with its school newspaper, *The Deaf Mute.* First published in 1907, the *Matilda Ziegler Magazine for the Blind* is an ongoing Braille publication.

1848 Samuel Gridley Howe founds the first residential institution for people with mental retardation at the Perkins Institution in Boston.

1851 In the United States there are 77 residential institutions for children, 1,151 by 1910, and 1,613 by 1933. By the 1950s and 1960s, family members and politicians throughout Western Europe, Canada, and the United States push for the deinstitutionalization of people with disabilities.

1851 The first International Sanitary Conference is held in Paris, France, with 12 countries participating. It leads to the World Health Organization, the WHO, which formally comes into existence in 1948.

1857 Edward Miner Gallaudet, youngest son of Thomas Hopkins Gallaudet, establishes the Columbian Institution for the Instruction of the Deaf, Dumb, and Blind, located in Washington D.C. Its college division, eventually known as the National Deaf-Mute College, is the world's first institution of higher education for deaf people. Abraham Lincoln signs its charter on April 8, 1864; today it is known as Gallaudet University.

1857 English philosopher Herbert Spencer is first to use the expression "survival of the fittest." The application of his idea in combination with Charles Darwin's theories in his 1859 book, *The Origin of the Species,* is called Social Darwinism. It is widely accepted and promoted in Germany in the 1920s and leads Adolf Hitler to express prejudice against the weak, sick, and disabled.

1863 Louis Agassiz, a significant American naturalist, advocates the permanence of different races and worries about the "tenacious influences of physical disability" if races were mixed.

1864 Germany: Karl Ferdinand Klein, teacher for deaf-mutes, and Heinrich Ernst Stotzner are considered the founding fathers of the *training school,* which calls for schools to be created for less-capable children with the goal of improving their lot. Training schools remain in effect today, but critics maintain that there is an over-representation of socially and economically underprivileged students in this type of setting experiencing little academic success.

1868 Sweden: The Stockholm Deaf Club is the first recorded organization of people with disabilities.

1870 England and Wales: Education for children with disabilities begins when universal elementary education is first introduced around this time. From 1895 onward, schools for "defective" children spring up. In 1899, Alfred Eichholz, an inspector of special education, draws up key recommendations, which leave their mark on the historic 1994 Education Act legislation. In 1978, the Warnock report

introduces the term *special needs education,* which soon gains acceptance worldwide. With the 1994 UNESCO Salamanca Statement and Framework for Action on Special Needs Education, a major shift in organizing educational services for children with disabilities is confirmed internationally.

1876 Isaac Newton Kerlin, Edouard Séguin, and others establish the Association of Medical Officers of American Institutions for the Idiotic and Feeble-Minded Persons. Today, it is known as the American Association on Mental Retardation. Séguin, who staunchly believes in the educability of those with significant cognitive disabilities, is styled as "apostle to the idiots," by Pope Pius X, reflecting the attitude of the time.

1880 The United States National Association of the Deaf (NAD), the first organization of deaf or disabled people in the Western Hemisphere, is established. In 1964, the Registry of Interpreters for the Deaf (RID) is formed to establish a national body of professionals who are trained and certified to enable communication between deaf, signing persons and nondeaf, speaking persons.

1880 Helen Keller is born in Tuscumbia, Alabama. An illness at the age of 19 months leaves her totally deaf and blind. In 1887, Anne Sullivan, recently graduated from Perkins Institution for the Blind, joins the Keller household as Helen's teacher and remains Keller's companion for nearly 50 years. For many, Keller's story is the quintessential overcoming narrative.

1881 The Chicago City Council enacts the first American "ugly law" forbidding "any person, who is diseased, maimed, mutilated or deformed in any way, so as to be an unsightly or disgusting object, to expose himself to public view."

1882 The first major federal immigration law in the United States, the Immigration Act of 1882, prohibits entry to "lunatics," "idiots," and persons likely to become unable to take care of themselves. Most of the restrictions that apply specifically to disability are removed from U.S. law in 1990. Today, disabled immigrants are still denied an entry visa if they are deemed "likely to become a public charge."

1887 Walter Fernald serves as superintendent of the Massachusetts School for the Feeble-Minded (now known as the Fernald Center) from 1887 to 1924. Unlike most of his colleagues, Fernald moderates some of his earlier extreme views and eventually develops one of the country's largest "parole" systems for moving institutional residents back into smaller, community-based residences.

1887 The American Orthopaedic Association is founded. German and British counterparts are founded in 1901 and 1918, respectively.

1895 The chiropractic profession is founded. This type of care is used to relieve musculoskeletal pain, one of the most common causes of disability.

1899 Maria Montessori and a colleague open the Scuola Magistrale Ortofrenica in Rome, an educational institute for disabled children and a training institute for instructors. Her method relies on the concept of sensory-based instruction as a means for developing intellectual competence. Her methods allow the child the greatest possible independence in order to foster his or her own development (the child's own inner "building plan").

1904 Sir Francis Galton, half first cousin of Charles Darwin, defines the term e*ugenics* (which he coined in 1883) in a paper he presents to the Sociological Society on May 16. He argues for planned breeding among the "best stock" of the human population, along with various methods to discourage or prevent breeding among the "worst stock." Galton also develops the idea for intelligence tests. The term *feeblemindedness* is defined as broadly as possible and is widely used by eugenic social reformers to conflate myriad social problems. Further naming, classification, and labeling provides eugenicists with a troubling rationale for treating people with coercion, disrespect, and profound inhumanity. Persons within the various categories of sub-normality become particularly vulnerable

to state-sanctioned segregation, institutional confinement, and enforced sterilization. Eugenics is widely practiced in Europe, the United States, and Canada, culminating in the systemic murder of more than 260,000 disabled people by the Nazis between 1939 and 1945. Today, the so-called new eugenics, known as "human genetics," appeals to the needs of the individual. Critics (some of the first in Germany), however, criticize individualistic eugenic approaches and disclose the connections between human genetics, national socialist racial hygiene, and eugenics.

1905 Alfred Binet and Theodore Simon publish the first intelligence scale, known as the Binet-Simon Test.

1908 The publication of Clifford Beers's *A Mind That Found Itself* initiates the mental health hygiene movement in the United States. Speaking out against mistreatment and neglect within the system, Beers establishes the Connecticut Committee of Mental Hygiene, which expands in 1909, becoming the National Committee for Mental Hygiene and is now known as the National Mental Health Association. In 1940 there are 419,000 patients in 181 state hospitals. In 1943, the patient-doctor ratio is 277:1, and by the mid-1950s in New York state alone, there are 93,000 inpatients. The Bazelon Center for Mental Health Law, founded in 1972 by a group of committed lawyers and professionals in mental health and mental retardation, attempt to improve mental health service provision through individual and class action suits. In 1980, a group of these lawyers form the National Association of Rights Protection and Advocacy (NARPA). One-third of its board of directors must identify themselves as current or former recipients of mental health care. The association is committed to the abolishment of all forced treatment.

1908 Pastor Ernst Jakob Christoffel establishes a home in Turkey for blind and otherwise disabled and orphaned children. This grows into Christoffel-Blindenmission (CBM), an independent aid organization of Christians of various denominations united to help disabled people in third world countries. Today, it supports more than 1,000 development projects in 108 countries. In 1999, CBM, other agencies, and the World Health Organization initiate VISION 2020: The Right to Sight, a global initiative for the elimination of avoidable blindness by the year 2020.

1909 Germany: The German Organization for the Care of Cripples is created as an umbrella organization for the care of the physically disabled. The Prussian Cripples' Care Law of 1920 for the first time provides a right to medical care and scholarly and occupational education for this group.

1912 Henry H. Goddard publishes *The Kadikak Family,* supports the beliefs of the eugenics movements, and helps create a climate of hysteria in which human rights abuse of the disabled, including institutionalization and forced sterilization, increases. In 1927, the U.S. Supreme Court, in *Buck v. Bell,* rules in favor of forced sterilization of people with disabilities, further fueling eugenics movements—the number of sterilizations increases.

1914 By this date, Sigmund Freud develops his most enduring influence on the study of disability, namely, the theory of psychosomatic illness in which a psychopathological flaw is given corporeal form as a symptom, thereby establishing the notion that people succumb to disease or disability because they feel guilty about past or present repressed desires.

1918 The Smith-Sears Veterans Rehabilitation Act passes, authorizing VR services for World War I veterans. In 1916, the National Defense Act marks the beginning of the U.S. government's supportive attitude toward rehabilitation. In 1920, the Smith-Fess Act marks the beginnings of the civilian VR program. The Social Security Act of 1935 establishes state-federal VR as a permanent program that can be discontinued only by an act of Congress.

1919 Edgar "Daddy" Allen establishes what becomes known as the National Society for Crippled Children. In the spring of 1934, the organizational launches its first Easter "seals" money-making campaign. Donors place seals on envelopes containing their contributions. The seal is so well-known that it

becomes part of the organization's official name. Today, Easter Seals assists more than one million children and adults with disabilities and their families annually through a nationwide network of more than 500 service sites. During the 1920s, Franklin D. Roosevelt inspires the March of Dimes.

1920 At about this time, the Shriners open hospitals for the care of crippled children. President Herbert Hoover establishes a "Children's Charter" in 1928 highlighting the need to attend to the needs of crippled children.

1921 Franklin D. Roosevelt contracts poliomyelitis. Despite damage to his legs (which makes him a wheelchair user) and deep depression, through enormous rehabilitative effort, he eventually re-enters politics and becomes president of the United States. His triumph over personal disability becomes legendary. Critics, however, fault him for choosing to minimize his disability in what is called his "splendid deception." He establishes a center for the treatment of polio patients in Warm Springs, Georgia, called the Georgia Warm Springs Foundation (1927), which hires medical specialists from Atlanta to direct orthopedics. In 1937, President Roosevelt becomes the prime mover behind the National Foundation for Infantile Paralysis Research.

1921 Mary L. McMillan (Molly) establishes the American Women's Physical Therapeutic Association, which is known today as the American Physical Therapy Association (APTA).

1921 The American Foundation for the Blind is established.

1921 Canada: Researchers isolate the hormone insulin. In 1922, Frederick Banting, Charles Best, J. B. Collip, and J.R.R. Macleod produce and test the pancreatic extract on people with diabetes, for which they are awarded a Nobel Prize. Insulin becomes a wonderful treatment for diabetes, but not a cure.

1921 France: Three historical waves of advocacy movements can be identified beginning with the National Federation of Injured Workers (FNAT) in 1921 and other organizations that focus essentially on the protection of rights. Another factor that stimulates advocacy groups in the first wave is the wounded veterans of World Wars I and II. A second wave dates from the period after World War II. Many advocacy groups form between 1950 and 1970, such as the Union of Associations of Parents of Maladjusted Children (UNAPEI) in 1960. A third wave finds a gradual emergence of three types of associations: those that run specialized facilities (for example, Living Upright, which, in 1970, leads to the creation of the first group living facility); those interested in trade unions; and those represented by user-advocate associations. Financing comes in large part from public funds, thereby creating a government-association partnership.

1922 The founding of Rehabilitation International sets the stage for the establishment of other international organizations of and for people with disabilities that link together throughout the world. Later international organizations include, among numerous others, the World Federation of the Deaf (1951), Inclusion International (1962), the International Association for the Scientific Study of Intellectual Disability (1964), Disabled Peoples' International (1981), and the International Disability Alliance (1999).

1925 The American Speech-Language-Hearing Association, today the American Academy of Speech Correction, is established to provide high-quality services for professionals in speech-language pathology, audiology, and speech and hearing science, and to advocate for people with communication disabilities.

1928 Charles Nicolle is the first deaf person to be awarded a Nobel Prize.

1929 Seeing Eye establishes the first dog guide school in the United States.

1930 The Veterans Administration is created to administer benefits, promote vocational rehabilitation, and return disabled veterans to civil employment. There is a record of provision for disabled veterans in the United States since the Revolutionary War and the Civil War. After World War I, three agencies administer veteran's benefits.

1932 Herbert A. Everest, a mining engineer with a disability, and Harry C. Jennings collaborate to design and patent the cross-frame wheelchair, which becomes the standard for the wheelchair industry that exists today. Developed during World War I, the first powered wheelchair appears, but doesn't gain popularity for another 30 years.

1935 President Franklin D. Roosevelt signs the Social Security Act of 1935 on August 14. Beginning in 1956, SSA amendments provide disability benefits.

1935 By 1935, in the United States more than 30 states pass laws allowing for the compulsory sterilization of those deemed genetically unfit in state and federal institutions. By 1970, more than 60,000 people are sterilized under these laws.

1935 As a result of being denied participation in the Works Progress Administration (WPA), six young people with disabilities hold a sit-in at the offices of New York City's Emergency Relief Bureau, demanding jobs in non-segregated environments and explicitly rejecting charity. The League of the Physically Handicapped is born out of this activism and operates in New York from 1935 to 1938. The League identifies social problems that remain issues today.

1935 Peer support in the United States is traced to the establishment of Alcoholics Anonymous in this year. Interest in peer support increases in the 1960s and is adopted by the disabled community. Movements, such as the Center for Independent Living, and groups, such as the National Spinal Cord Injury Association, make peer support one of their major activities.

1936 The American Academy of Physical Medicine & Rehabilitation is founded, leading to the approval of the American Board of Physical Medicine & Rehabilitation by the American Medical Association in 1947.

1937 The Fair Housing Act of 1937 passes with a mandate to assist the poor, a group that includes people with disabilities, by creating public housing. However, it is not until the Rehabilitation Act of 1973 that housing law specifically deals with discrimination faced by individuals with disabilities in housing programs that receive federal funding. The 1988 amendment to the Fair Housing Act of 1968 extends protection for people with disabilities beyond those of Section 504 of the Rehabilitation Act to include private housing.

1939 The Nazi regime institutes the Aktion T4 program in Germany. Children and, later, adults with disabilities are selectively killed both in hospitals and in special centers. The program was officially terminated by Adolf Hitler in August 1941, but practitioners "informally" continued it through a phase historians have called "wild euthanasia."

1940 State activists for the blind, including Jacobus Broek, come together in Wilkes-Barre, Pennsylvania, to charter the National Federation of the Blind (NFB). In 1957, the NFB publishes the first edition of the *Braille Monitor,* which is still in print today. In 1960, dissatisfied NFB members form the American Council of the Blind (ACB).

1940 Paul Strachan establishes the American Federation of the Physically Handicapped, the nation's first cross-disability, national political organization.

1942 The American Psychiatric Association develops a position statement in favor of the euthanasia of children classified as *idiots* and *imbeciles.*

1943 The LaFollette-Barden Act, also known as the Vocational Rehabilitation Amendments, adds physical rehabilitation to federally funded vocational rehabilitation programs.

1943 The United Nations is established on October 24 by 51 countries. The global Programme on the Disability is the lead program concerning disability. Many other types of programs, activities, and instruments include the 1975 Declaration on the Rights of Disabled Persons, the 1981 International Year of

Disabled Persons, the 1982 World Programme of Action Concerning Disabled Persons, the 1983–1992 UN Decade of Disabled Persons, and the 1993 Standard Rules on the Equalization of Opportunities for Persons with Disabilities. In 1988, the first UN Disability Database (DISTAT) publishes statistics from 63 national studies covering 55 countries and the 2001 publication presents 111 national studies from 78 countries, indicating a growing interest worldwide for the collection of usable data. In 2005, a UN Ad Hoc Committee continues to consider a Convention on the Rights of Disabled Persons that is a legally binding human rights instrument. Today the UN membership totals 191 countries.

1943 ◆ Sweden: In possibly the first reference to the concept of normalization, the most significant driving force in the ongoing closure of state-run or state-funded institutions for people with a disability is made by the Committee for the Partially Able-Bodied, established by the Swedish Government. Through the advocacy of people such as Niels Erik Bank-Mikkelsen, normalization, with its profound positive effect on the lives of people who were once removed and segregated from society, remains relevant today.

1944 ◆ Richard Hoover invents long white canes known as Hoover canes that are used by many blind people.

1944 ◆ The word *genocide* first appears in a book by a Polish lawyer Raphael Lemkin titled *Axis Rule in Occupied Europe* in which he describes Nazi Germany's practices but also seeks the adoption of legal restrictions so that genocide will not occur. In 1948, the United Nations adopts a declaration and then a convention on genocide that describe both against whom genocide might be directed and acts constituting genocide. Article 6 of the Rome Statute of the International Criminal Court (ICC), established in 2002, uses language identical to that in the UN convention to define genocide. More than 90 countries are parties to the ICC, but not the United States.

1945 ◆ President Harry Truman signs into law an annual National Employ the Handicapped Week. In 1952, it becomes the Presidents' Committee on Employment of the Physically Handicapped, a permanent organization, which reports to the President and Congress.

1945 ◆ Canada: Lyndhurst Lodge, the first specialized rehabilitation center for spinal cord injury (SCI) in the world, and the Canadian Paraplegic Association, the first association in the world administered by individuals with SCI, are established.

1946 ◆ The first chapter of what will become the United Cerebral Palsy Association, Inc. is established in New York City. It is chartered in 1949, and along with the Association for Retarded Children, it becomes a major force in the parents' movement of the 1950s.

1946 ◆ The National Mental Health Foundation is founded by attendants at state mental institutions who aim to expose abusive conditions. Their work is an early step toward deinstitutionalization.

1946 ◆ The National Institutes of Mental Health (NIMH) are founded in the United States.

1946 ◆ Europe: The European Union is founded on September 17 in Paris. It consistently shows its commitment to eliminating discrimination on many fronts through joint declarations, resolutions, directives, and action programs. With regard to disability, the European Union supports actions in favor of people with disabilities, principally in the form of European Social Fund interventions. Action programs aim at facilitating the exchange of information between member states and nongovernmental organizations with a view to identifying good practices, integrating people with disabilities into society, and raising awareness of related issues. The EU Council of Ministers Recommendation on the Employment of Disabled People (1986) calls on member states to "eliminate negative discrimination by reviewing laws, regulations and administrative provisions to ensure that they are not contrary to the principle of fair opportunity for disabled people." Further

steps are taken in 1996 when a communication on equality of opportunities for disabled people sets out a new European disability strategy that promotes a rights-based approach, rather than a welfare-type approach. This is strengthened in 1997 when the heads of state act to strengthen Article 13 of the European Community Charter of Fundamental Social Rights of Workers (1989), giving the European Community specific powers to take action to combat a broad spectrum of discrimination that includes disability.

1948 ◆ The National Paraplegia Foundation is established as the civilian branch of the Paralyzed Veterans of America.

1948 ◆ The World Health Organization is established. The WHO actively promotes human rights and the principle of equity in health among all people of the world, including persons with disabilities. Today it consists of 191 member states, but strives for universal membership. In 1980, the WHO publishes the International Classification of Impairments, Disabilities, and Handicaps (ICIDH) and issues a revised version in 2001, the International Classification of Functioning, Disability, and Health (ICF).

1948 ◆ The United Nations General Assembly adopts the "Universal Declaration of Human Rights," which promotes and affirms the fundamental rights to life, liberty, and security; to medical care and social services; and to the benefit from scientific progress and its uses.

1948 ◆ Sir Ludwig Guttmann organizes the first Stoke Mandeville (England) Games for the Paralysed, thus launching the Paralympic movement. The Games become international in 1952. In 1960, the first Paralympic Summer games are held in Rome and the first Paralympic Winter Games follow in 1976. The Paralympic Games are multi-disability, multi-sport competitions and have become the second-largest sporting event in the world, only after the Olympic Games.

1948 ◆ World War II bomber pilot and war hero Leonard Cheshire establishes what is to become the largest charitable supplier of services for disabled people in the United Kingdom. In the 1960s, the resistance of disabled people who live in one Leonard Cheshire home, Le Court, plays a major role in establishing the British disabled people's movement. In the late 1990s, the Leonard Cheshire organization establishes the Disabled People's Forum, which is run by disabled people and supports disabled people's involvement and empowerment.

1949 ◆ Timothy Nugent founds the National Wheelchair Basketball Association, and the first Annual Wheelchair Basketball Tournament takes place.

1949 ◆ Europe: The Council of Europe, an intergovernmental organization, is founded. Its activities cover all major issues facing European society other than defense. Human dignity, equal opportunities, independent living, and active participation in the life of the community form the heart of the Council of Europe's activities in relation to people with disabilities. The European Social Charter of 1961 and its revision in 1996 include specific wording and expand the rights of individuals with disabilities.

1950 ◆ The Social Security Amendments of 1950 provide federal-state aid to the permanently and totally disabled (APTD), which serves as a limited prototype for future Social Security assistance programs for disabled people.

1950 ◆ The National Mental Health Association is formed with the mission to continue 1908-advocate Clifford W. Beers's goals of "spreading tolerance and awareness, improving mental health services, preventing mental illness, and promoting mental health."

1950 ◆ The National Association for Retarded Children (NARC) is established by families in Minneapolis. It is the first and most powerful parent-driven human-services lobby in the nation to emerge in the 1950s.

1950 Amniocentesis is developed by a Uruguayan obstetrician. Later, advanced prenatal testing provides a battery of powerful medical tools to predict risk of disability and provide information to parents about their pregnancies.

1951 With the founding of the World Federation of the Deaf, the deaf community becomes international.

1953 Francis Crick and James Watson propose a three-dimensional structure for the DNA molecule. The paper they publish also gives clues to genetic mechanisms. Today, more than 6,000 monogenic disorders have been identified, and these affect approximately 1 in 200 live births.

1955 The polio vaccine, developed by Dr. Jonas Salk, becomes available, thus ending polio epidemics in the Western world. A new oral vaccine, developed by Dr. Albert B. Sabin, is approved for use in 1961.

1956 Social Security Disability Insurance (SSDI) becomes available through amendments to the Social Security Act of 1935 (SSA) for those aged 50–64. Other important amendments to SSA include the following: 1958: provides for dependents of disabled workers; 1960: removes age limit; 1965: Medicare and Medicaid provide benefits within the framework of the SSA (until 1977); 1967: provides benefits to widows and widowers over the age of 50; 1972: Supplemental Security Income (SSI) establishes a needs-based program for the aged, blind, and disabled; 1984: the Social Security Disability Reform Act responds to the complaints of hundreds of thousands of people whose disability benefits have been terminated; 1996: President Clinton signs the Personal Responsibility and Work Opportunity Reconciliation Act, making it more difficult for children to qualify as disabled for SSI purposes.

1959 The UN Declaration of the Rights of the Child is adopted; the UN Convention on the Rights of the Child is adopted in 1989. A central principle of both documents is access to education for all children including those with disabilities. In 1993, a related UN document, the Standard Rules for the Equalization of Opportunity, extends this to preschool children, and in 1994, UNESCO's Salamanca Statement and Framework for Action specifies the provision of special education for children with disabilities or learning difficulties. These documents constitute a universal bill of rights that can serve as a framework in the development of national policies worldwide.

1961 The American Council of the Blind is established.

1961 Europe: The European Social Charter (ESC) protects "the right of physically and mentally disabled persons to vocational training, rehabilitation and social resettlement." In 1996, it is revised, updated, and expanded to take account of social changes.

1961 Michel Foucault's work *The History of Madness in the Classical Age* becomes obligatory reading for those concerned with the archaeology of madness and its treatments. It continues to be an academic *rite de passage.*

1962 Battered child syndrome is defined. Researchers estimate that the incidence of maltreatment of children with disabilities is between 1.7 and 3.4 times greater than of children without disabilities.

1962 Russia: The Moscow Theater of Mime and Gesture is the first professional deaf theater in the world. It has been in continuous operation for more than 40 years and has staged more than 100 classic and modern plays.

1963 Congress enacts new legislation to ensure funding for a comprehensive program of research on mental retardation through the National Institute on Child Health & Human Development. In 1965, the Office of Economic Opportunity launches the Elementary and Secondary Education Act (ESEA), commonly known as Project Head Start. The goal is to prevent developmental disability by providing increased opportunities for disadvantaged children in the preschool years.

1963 The Developmentally Disabled Assistance and Bill of Rights Act (DD ACT) is authorized, with its last reauthorization in 1996. It focuses on individuals with developmental disabilities such as intellectual disability, autism, cerebral palsy, epilepsy, and hearing and visual impairments, among others.

1964 The Civil Rights Act is passed. It becomes the model for future disability rights legislation.

1964 France: L'Arche is established. By the beginning of the twentieth-first century, it includes more than 113 communities in 30 countries. "The Ark" is a distinctive style of community living, based on "core members" and "assistants," who view their commitment as sharing life *with* people with disabilities, rather than as caregivers.

1965 Newly enacted Medicare and Medicaid provide national health insurance for both elderly (over 65) and disabled persons.

1965 The Vocational Rehabilitation Amendments of 1965 are passed. They provide federal funds for the construction of rehabilitation centers and create the National Commission on Architectural Barriers to Rehabilitation of the Handicapped.

1965 The Autism Society of America is founded.

1967 Deaf actors establish the National Theatre of the Deaf (NTD). It is the world's first professional deaf theater company and the oldest continually producing touring theater company in the United States. Today, after almost 40 years, the NTD chronicles over 6,000 performances. The National Theatre Workshop for the Handicapped begins in 1977 and the Other Voices Project in 1982. These groups are among the earliest groups formally to place the disability experience at the heart of their creative endeavors.

1967 Heart transplantation is introduced. This technology is preceded by open-heart surgery developed in the 1950s and coronary bypass and internal pacemakers in the1960s. The Framingham Heart Study begins in 1948. It collects data over the next decades that help identify major risk factors contributors to heart disease.

1967 Paul Lemoine in France in 1967 and Kenneth Jones and David Smith in the United States in 1973 independently describe the condition fetal alcohol syndrome (FAS), which comprises a recognizable pattern of birth defects attributable to the adverse effects of maternal alcohol abuse during pregnancy.

1967 England: St. Christopher's Hospice in South London opens. It is the first attempt to develop a modern approach to hospice and palliative care.

1968 Congress enacts the Architectural Barriers Act. The ABA requires access to facilities designed, built, altered, or leased with federal funds.

1968 The Fair Housing Amendments to the Civil Rights Act of 1968 guarantees civil rights of people with disabilities in the residential setting. The amendments extend coverage of the fair housing laws to people with disabilities and establish accessible design and construction standards for all new multifamily housing built for first occupancy on or after March 13, 1991.

1968 Sweden: The origins of People First® go back to a meeting of parents of children with intellectual disabilities whose motto is "we speak for them." However, the people with disabilities in attendance wish to speak for themselves and start their own self-advocacy group. Similar groups quickly spread to England and Canada. The name People First is chosen at a conference held in Salem, Oregon, in 1974. People First is an international self-advocacy organization run by and for people with intellectual disabilities to work on civil and human rights issues.

1970 Landmark legal cases such as *Diana v. State Board of Education* (1970; Latino students) and *Larry P. v. Riles* (1971–1979; minority students) challenge biases inherent in standardized testing procedures used to identify students as eligible for special education. Both cases call into question the widespread use of "scientifically" objective measures to gauge intellectual ability. Today, despite reforms, a disproportionate number of students from racial, ethnic, and linguistic minorities continue to be placed in special education classes.

1970 Japan: The Disabled Persons' Fundamental Law (DPFL) becomes one of the 27 fundamental laws that stipulate basic principles in each policy area. Major revision takes place in 1993 reflecting a progress of guiding principles in disability policy that are deeply influenced by international movements such as the International Year of Disabled Persons (1981) and the UN Decade of Disabled Persons (1983–1992). Disability Studies as well as modern disability movements are born this same year, when members of Aoi Shiba, a group of people with cerebral palsy, protest publicly for the first time against sympathetic views toward the killing of disabled children by their parents. Aoi Shiba and other disability movements join in the establishment of Disabled Peoples' International in 1981. In 1986, the Rehabilitation Engineering Society of Japan (RESJA) is established. In 1992, disability movements in Japan initiate the Asian and Pacific Decade of Disabled Persons 1993 to 2002. The Japan Society for Disability Studies is established in 2003 and a unified national organization, Japan Disability Forum (JDF), is established in 2004.

1970 United Kingdom: The Chronically Sick and Disabled Persons Act (CSDPA) strengthens the provisions in the 1948 National Assistance Act (NAA). Later, the Disability Discrimination Acts of 1995 and 2005, together with the Disability Rights Commission Act of 1999, constitute the primary source of antidiscrimination legislation for disabled people.

1971 A U.S. District Court decision in *Wyatt v. Stickney* is the first important victory in the fight for deinstitutionalization.

1971 WGBH Public Television establishes the Caption Center, which provides captioned programming for deaf viewers.

1971 Gerontologist M. Powell Lawton defines *functional assessment* as any systematic attempt to objectively measure the level at which a person is functioning in a variety of domains. Over 30 years later, functional assessment, in combination with *outcomes analysis,* is considered one of the "basic sciences" of rehabilitation. In 1980, the World Health Organization proposes a series of definitions, which have a profound impact on the assessment of functional status and outcomes in rehabilitation. It is modified and revised in 1993 and 2001.

1971 The Declaration on the Rights of Mentally Retarded Persons (UN 1971), the Declaration on the Rights of Disabled Persons (UN 1975), and the World Programme of Action Concerning Disabled Persons (UN 1982) indicate the emergence of a global discourse of rights for disability.

1972 A group of people with disabilities (including Ed Roberts, John Hessler, and Hale Zukas), known as the Rolling Quads, living together in Berkeley, California, formally incorporate as the Center for Independent Living (CIL). This first CIL in the country becomes the model for Title VII of the Rehabilitation Act of 1973. In the late 1980s and early 1990s the group's advocacy efforts help pass the Americans with Disabilities Act (ADA). CILs are always controlled by disabled people. Accepted by most people as the birth of the modern independent living movement, the Berkeley concept migrates to other countries. In 1999, a global summit on independent living is held in Washington D.C. The summit brings together more than 70 countries. The Washington Declaration that comes out of the conference establishes a set of basic principles. In 1996, the Ed Roberts Campus, an international center and a service facility, is created in Berkeley, California, in memory of Edward V. Roberts, founder of the independent living concept.

1972 ◆ A young television reporter for the ABC network, Geraldo Rivera, is given a key to one of the wards at Willowbrook State School on Staten Island, New York. Established in the late 1930s as a state-of-the-art facility for the "mentally deficient," by 1972, Willowbrook becomes a warehouse for the "socially undesirable" of New York City, with a substantial minority having no disability at all. The inhumane conditions deteriorate to the extent that a visitor remarks, "In Denmark we don't let our cattle live this way." Rivera's exposé leads to a lawsuit that results in the Willowbrook Consent Decree of 1975, which creates a detailed system of monitoring and oversight of all residents living there at that time, to be met until the last of the "class clients," as they are sometimes referred to, pass on. The property has since been sold to a college.

1972 ◆ Paul Hunt's call for a consumer group to promote the views of actual and potential residents of institutional homes for the disabled in the United Kingdom results in the establishment of the Union of the Physically Impaired against Segregation (UPIAS). The group's aim is to formulate and publicize plans for alternative forms of support in the community. Hunt is regarded by many disability activists as the founder of the modern disabled people's movement.

1972 ◆ New Zealand: Three key pieces of legislation pass have long-term effects on the disabled community: the 1972 no-fault Accident Compensation Act that provides monetary compensation to victims based on level of impairment suffered; the 1975 Disabled Persons Community Welfare Act, giving assistance to disabled people, parents, and guardians, as well as voluntary associations; and the Human Rights Act of 1977, which does not include disability as a recognized grounds for discrimination. Today, disabled populations in New Zealand continue to fight to establish an identity as disabled people rather than a group needing "welfare." One task is to promote legislation that includes disability as a group against whom discrimination is outlawed.

1973 ◆ The Rehabilitation Act of 1973 lays the foundation for the disability rights movement. Its Section 504 asserts that people with disabilities have equal rights that prevent discrimination based on their disability in programs or activities that receive federal funding. This is the first major nationwide antidiscriminatory legislation designed to protect disabled Americans. These rights are further protected with the landmark Americans with Disabilities Act (ADA) of 1990.

Section 501 of the Act requires affirmative action and nondiscrimination in employment by federal agencies of the executive branch. Section 502 creates the Access Board, which grows out of the 1965 National Commission on Architectural Barriers to Rehabilitation of the Handicapped. As a result of the commission's June 1968 report, Congress enacts the Architectural Barriers Act (ABA). Section 503 requires that to receive certain government contracts, entities must demonstrate that they are taking affirmative action to employ people with disabilities. The enduring hallmark of the act, Section 504, provides that no otherwise qualified individual with a disability shall, solely by reason of his or her disability, be excluded from the participation in, denied the benefits of, or subjected to discrimination under any program or activity receiving federal funds. However, it would take five years of lobbying and protesting before the American Coalition of Citizens with Disabilities (ACCD) wins the release of regulations that allow Section 504 to be implemented.

The Act is in many ways the direct predecessor to the ADA. However, the primary focus is vocational training and rehabilitation, and over the next half-century, disability law and advocacy move from the medical (medical issues) and vocational (often a justification for welfare and benefits) models to a civil rights model, which seeks to remove the barriers that impede the full integration of people with disabilities into society.

1973 ◆ The term *mainstreaming* emerges within the educational jargon associated with the Education for All Handicapped Children Act (EHA), the early U.S. legislation subsequently reauthorized as the Individuals with Disabilities Act (IDEA) in 1990.

1973 ◆ Ronald Mace is the driving force behind the creation of the first accessible state building code in the United States (North Carolina, 1974) and in the drafting of national accessibility codes and

standards. He coins the term *universal design* to capture and promote his expanded philosophy of "design for all ages and abilities"—curb cuts being his favorite example.

1973 ◆ Washington D.C. introduces the first handicap parking stickers. The Federal-Aid Highway Act funds curb cuts.

1974 ◆ First Lady Betty Ford and investigative reporter Rose Kushner are diagnosed with breast cancer. They help break the public silence on this topic. In 1954, Terese Lasser begins Reach to Recovery, a program of volunteers who have previously undergone radical mastectomies who provide emotional support to hospitalized women who have just had the operation. Today, one in eight women is diagnosed with breast cancer during her lifetime.

1975 ◆ The Education for All Handicapped Children Act, the first separate federal legislation authorizing special education for children and youth, passes, due, in part, to the advocacy efforts of a group of parents. In 1990, it becomes known as the Individuals with Disabilities Education Act, or IDEA.

1975 ◆ The Developmentally Disabled Assistance and Bill of Rights Act, providing federal funds for programs that provide services for people with developmental disabilities, passes.

1975 ◆ The Association of Persons with Severe Handicaps (TASH) is founded. It calls for the end of aversive behavior modification and deinstitutionalization of people with disabilities.

1975 ◆ The UN General Assembly adopts the Declaration on the Rights of Disabled Persons, which states that all persons with disabilities have the same rights as other people. This document is not legally binding and can be attributed in part to a UN Ad Hoc Committee set up in 2001 to consider a Convention on the Rights of Disabled Persons that is legally binding.

1975 ◆ United Kindom: The Union of the Physically Impaired against Segregation (UPIAS) publishes a paper that redefines the term *disability,* which becomes known as the social model of disability as it radically transforms the way disabled people see themselves and their place in society.

1976 ◆ The Higher Education Act of 1965, which establishes grants for student support services aimed at fostering an institutional climate supportive of low-income and first-generation college students, is amended to include individuals with disabilities. In March 1978, the Association on Handicapped Student Service Programs in Post-Secondary Education is founded. It later becomes the Association on Higher Education and Disability (AHEAD).

1976 ◆ Sponsored by Ralph Nader's Center for the Study of Responsive Law, the Disability Rights Center is founded in Washington D.C.

1977 ◆ Protesting the federal government's delayed enactment of the rules and regulations for the implementation of the Rehabilitation Act of 1973, disabled activists on April 1 organize protests at the federal offices of the Department of Health and Human Services in various cities across the United States. In San Francisco, protesters hold the regional offices hostage for 28 days, gaining national attention and resulting in an agreement with federal officials for the rapid establishment of the rules and regulations to implement Section 504 of the Act.

1977 ◆ Max Cleland is appointed to head the U.S. Veterans Administration. He is the first severely disabled person to hold this post.

1977 ◆ S. Z. Nagi defines *disability* as an individual's performance of tasks and activities related to achievement of social roles—a distinct concept, different from *impairment.* It is further formalized with the introduction of the World Health Organization's International Classification of Impairments, Disabilities, and Handicaps in 1980 and further refined in 2001 in its International

Classification of Functioning, Disability, and Health. Nagi's model is used as the basis for the Americans with Disabilities Act, for almost all disability social policy in the United States, and for statistics at the United Nations and in Europe.

1978 ◆ The Child Abuse Prevention and Treatment and Adoption Reform Act of 1978 and the Adoption Assistance and Child Welfare Act of 1980 promote the adoption of children with special needs, including disabilities.

1978 ◆ The Atlantis Community, the second independent living center in the country after Berkeley, is established in Denver, Colorado, in 1975. On July 5–6, 1978, twenty disabled activists from the Atlantis Community block buses with their wheelchairs and bodies and bring traffic to a standstill at a busy downtown intersection. This act of civil disobedience results in the American Disabled for Accessible Public Transit, the original name for the American Disabled for Attendant Programs Today, or ADAPT.

1978 ◆ Legislation creates the National Institute on Handicapped Research. In 1986, it is renamed the U.S. National Institute on Disability and Rehabilitation Research (NIDRR). Its mission is to contribute to the independence of persons of all ages who have disabilities. It is located in the Department of Education under the Office of Special Education and Rehabilitation Services.

1978 ◆ The World Health Organization starts to promote the concept of community-based rehabilitation (CBR) as a means of helping people with disabilities in the developing world. It emerges, in part, from the WHO primary health care campaign Health for All by the Year 2000. Around the same time, in Western countries, home-visiting programs in which a trained worker regularly visits the family to advise on ways of promoting child development become one of the success stories of modern disability services. Among the best-known programs are those based on a model originating in Portage, Wisconsin, and now used in many countries.

1978 ◆ England: The Warnock report introduces the term *special needs education.* It marks a major shift in organizing educational services for children with disabilities and results in the new conceptualization of special needs education. This change is confirmed internationally by the Salamanca Statement and Framework for Action on Special Needs Education at the UNESCO's Conference held in Salamanca in 1994. This theoretical shift is marked with the change of the term *integration* to *inclusion* or *inclusive education.*

1978 ◆ USSR: The Action Group to Defend the Rights of the Disabled is established to advocate for legal rights for Soviets with disabilities.

1979 ◆ The Disability Rights Education and Defense Fund (DREDF) establishes itself as a leading cross-disability civil rights law and policy center. It is founded by people with disabilities and parents of children with disabilities. Because its philosophy is closely aligned with other civil rights struggles, in 1981, DREDF is invited to join the executive committee of the national's largest coalition of civil rights groups, the Leadership Conference on Civil Rights. In 1987, DREDF establishes the Disability Rights Clinical Legal Education Program and begins teaching disability rights law at the University of California's Boalt Hall School of Law.

1979 ◆ The National Alliance for the Mentally Ill (NAMI) is founded. NAMI is an advocacy and education organization.

1979 ◆ Germany: The first Cripples' Group is founded as a cross-disability group with emancipatory aims. In an attempt to reinterpret disability in positive terms, the cofounders choose the term *Krüppel* over handicapped or disabled.

1979 ◆ Nicaragua: The Organization of the Revolutionary Disabled is set up in the wake of the Sandinista victory.

1980 ◆ The California Governor's Committee on Employment of People with Disabilities and entertainment and media industry professionals establish the Media Access Office (MAO).

1980 ◆ About the time Congress is considering passage of the ADA (1990), marketers begin to acknowledge the economic potential of the disabled community; consequently, the appearance of disabled characters in consumer goods advertising mushroom and ability-integrated advertising becomes much more commonplace. Organizations such as MAO and NOD (National Organization on Disability) provide advertising strategies and guidance.

1980 ◆ The Rehabilitation Engineering and Assistive Technology Society of North America (RESNA), an interdisciplinary association composed of individuals interested in technology and disability, is founded.

1980 ◆ The World Health Organization's International Classification of Impairments, Disabilities, and Handicaps (ICIDH), a groundbreaking, but controversial, classification system is tentatively released for trial purposes with the goal of uniform information collection worldwide. It has a negligible impact on disability statistics or data collection; however, researchers argue that it is a vast improvement over available tools. It is renamed and vastly revised in 2001.

1980 ◆ England: Graeae Theatre Group, composed of disabled actors, directors, and other theater professionals, is founded in London by Nabil Shaban and Richard Tomlinson. It takes its name from the the Graeae of Greek mythology, three gray-haired sisters who shared one eye and one tooth. Graeae's first production is *Sideshow*.

1980 ◆ Netherlands: The Liliane Foundation starts by assisting 14 children. In 2002, it helps 31,982 children spread over 80 countries. The Foundation's efforts are directed primarily toward children with disabilities living at home. Its aim is to have direct contact with the child within the home situation and to assist the personal growth and happiness of the child, thus providing "tailor-made" assistance.

1980 ◆ Taiwan: The Physically and Mentally Disabled Citizens Protection Law is promulgated. It guarantees legal rights for the disabled and creates a significant improvement in their welfare. Although most of the disabled people in Taiwan still struggle to earn their due respect, today, public awareness of this group is emerging gradually and significantly.

1980 ◆ United Kingdom and Europe: The Black Report (*Report of the Working Group on Inequalities in Health)* is published. Among other groups it targets disabled people for better conditions that lead to better health. The report does not find favor with the Conservative government, but begins to be implemented under the Labour government in 1997. With its central theme of equity, the report plays a central role in the shaping of the World Health Organization's Common Health Strategy of the European Region.

1981 ◆ The Reagan Administration begins to amend and revoke disability benefits, a policy that continues throughout his administration and leads several disabled people who are in despair over the loss of their benefits to commit suicide.

1981 ◆ Justin Dart, recognized as the founder of the Americans with Disabilities Act (ADA, 1990), is appointed to be vice-chair of the National Council on Disability. The council drafts a national policy on equal rights for disabled people; the document becomes the foundation of the ADA.

1981 The Committee on Personal Computers and the Handicapped is established in Illinois, an indicator of the disabled community's interest in information technology (IT) accessibility, but in order to stimulate the development of suitable products, activists lobby for legislative protections, which are included in the Americans with Disabilities Act of 1990. In 2000, a suit brought by the National Federation of the Blind against AOL is suspended when AOL agrees to make its software accessible by April 2001. The World Wide Web Accessibility Initiative (WAI) launches in 1997. It raises the level of awareness of disability accessibility issues within the Internet community, especially among those who design and implement web pages.

1981 The first reported cases of AIDS in the United States appear in June. Today, the World Health Organization estimates that worldwide, approximately 40 million people are living with HIV/AIDS; 22 million men, women, and children have died; and 14,000 new infections are contracted every day. Around the world, in the year 2003, the AIDS epidemic claims an estimated 3 million lives, and almost 5 million people acquire HIV, 700,000 of them children. Currently, 6 million people infected with HIV in the developing world are estimated to need access to antiretroviral therapy to survive, but only 400,000 have this access.

1981 Disabled Peoples' International (DPI) is officially founded at a meeting in Singapore. The establishment of such international organizations around this time represents the disability movement becoming a global social movement instead of a national one. DPI is directed by persons with disabilities working in human rights advocacy. It sponsors World Assemblies, which are held every four years to develop a multiyear action plan. The most recent one is held in 2002 in Sapporo, Japan, where delegates from more than 100 countries come together. A leading slogan for DPI and other disability groups, coined in the early 1990s, is "nothing about us without us."

1981 The International Year of Disabled Persons encourages governments to sponsor programs that assimilate people with disabilities into mainstream society. Despite the positive worldwide effects it has, the UN program also creates some angry activists with disabilities who protest against the charity approach officially adopted for the event. Consequently, the activists build their own infrastructure consisting of counseling and advocacy facilities as well as job creation programs.

1981 Australia: Australia's modern disability policy takes shape after the 1981 International Year of Disabled Persons. Examples: The 1980s see a shift away from institutional care; the Commonwealth Disability Service Act provides a framework for the provision of disability services; and in 1991, the federal Disability Reform Package maximizes the employment of disabled. In 1995, a legal decision represents a watershed in telecommunications policy for people with disabilities when a commission's inquiry finds the national carrier, Telstra, guilty of discrimination against people with severe hearing or speech impairments. The success of the action results in the Telecommunications Act of 1997, which includes new provisions for the deaf community.

1981 Mexico: The Program of Rehabilitation Organized by Disabled Youth of Western Mexico begins as a rural community-based rehabilitation program.

1981 Soweto: The Self Help Association of Paraplegics begins as an economic development project.

1981 United Kingdom: Disabled people set up the British Council of Disabled Persons (BCOPD), the United Kingdom's national organization of disabled people, to promote their full equality and participation in UK society.

1981 Zimbabwe: The National Council of Disabled Persons, initially registered as a welfare organization, becomes a national disability rights group.

1982 ◆ Disability Studies originates with the formation of the Society for the Study of Chronic Illness, Impairment, and Disability. In 1986, it officially changes its name to the Society for Disability Studies (SDS). Disability Studies is a critical field of study based in human and social science.

1982 ◆ *In re Infant Doe* (commonly known as the Baby Doe case) launches the debate as to whether parents or medical authorities should choose to let a disabled infant die rather than provide the necessary medical treatment and nourishment essential to sustain life. In response to this and other cases, the U.S. Department of Health and Human Services creates a rule maintaining it unlawful for any federally funded hospital to withhold medical treatment from disabled infants. In 1984, the U.S. Congress enacts the Child Abuse Amendments, which calls for the medical treatment of newborns with disabilities unless the child would die even with medical intervention. The issue makes it to the U.S. Supreme Court in 1986 with the *Bowen v. American Hospital Association* case. The Court holds that denying treatment to disabled infants does not constitute legally protected discrimination under Section 504 of the Rehabilitation Act and that hospitals and physicians are to implement the decision of the parents. The decision results in the passage of the Child Abuse Prevention and Treatment Act Amendments of 1984. In the year 2000, a scholar argues that the Amendments, presidential commission writings, and disability advocates "have all combined to ensure that most babies who can benefit from medical interventions do receive them."

1982 ◆ Disability Awareness in Action (DAA) and other groups such as the Disabled Peoples' International (DPI) and International Disability Alliance (IDA) are the driving force behind the globalization of disability issues through the World Program of Action (1982), the United Nations Standard Rules of Equalization of Opportunities for People with Disabilities (1993), the World Summit for Social Development (1995), and the Education for All Framework for Action (2000), as well as the current campaign to secure a UN convention on the rights of disabled people.

1982 ◆ The National Council on Independent Living (NCIL) is formed in the United States. It provides an excellent example of leadership for people with disabilities by people with disabilities.

1982 ◆ Canada: The Charter of Rights and Freedoms section of the Constitution provides protection to persons with disabilities.

1982 ◆ France: Handicap International is founded in Lyon. It is active in various areas associated with all the causes of handicaps, both traumatological (land mines, road accidents) and infectious (polio, leprosy). In the 1990s it begins working on mental disability issues as a result of experience with Romanian orphanages and the war in the Balkans. In 1992, Handicap International creates its first two mine clearance programs and in 1997 it is the joint winner of the Nobel Peace Prize for its leading role in the fight against landmines.

1983 ◆ Rights-based approaches to disability rapidly gain currency in many developing countries since the UN Decade of Disabled Persons, 1983–1992. UNESCAP's Biwako Millennium Framework for Action towards an Inclusive, Barrier-Free and Rights-Based Society for People with Disabilities in Asia and the Pacific sets the priorities for the extended Decade of Disabled Persons, 2003–2012.

1983 ◆ Access and accessibility are concepts discussed throughout the World Programme of Action Concerning Disabled Persons passed by the UN General Assembly. The General Assembly in 1993 passes the Standard Rules on the Equalization of Opportunities for Persons with Disabilities.

1983 ◆ England: The first Covent Garden Day of Disabled Artists is held in London.

1983 ◆ Thailand: DPI-Thailand is established.

1984 ◆ The Access Board issues the "Minimum Guidelines and Requirements for Accessible Design," which today serves as the basis for enforceable design standards. The 1990 Americans with

Disabilities Act (ADA) expands the board's mandate to include developing the accessibility guidelines for facilities and transit vehicles. The Rehabilitation Act Amendments of 1998 give the Access Board additional responsibility for developing accessibility standards for electronic and information technology. In 2001, Section 508 of federal law establishes design standards for federal websites, making them accessible to individuals with disabilities.

1985 The U.S. Department of Health and Human Services issues the first comprehensive national minority health study, which shows racial disparity in health and concludes that the difference in mortality is not acceptable. In 1998, studies indicate that racial disparity has not improved as much as hoped; consequently, President Bill Clinton launches an initiative that sets a national goal of eliminating disparities in six key areas by the year 2010. Some of these areas include diseases and conditions considered to be disabling as well as life threatening.

1986 The Air Carrier Access Act (ACAA) passes. It requires the U.S. Department of Transportation to develop new regulations that ensure that disabled people are treated without discrimination in a way consistent with the safe carriage of all passengers. The relevant regulations, Air Carrier Access rules, are published in March 1990.

1986 The National Council on the Handicapped publishes its report *Toward Independence.* It recommends that "Congress should enact a comprehensive law requiring equal opportunity for individuals with disabilities" and suggests that the law be called "the Americans with Disabilities Act." In its 1988 follow-up report, *On the Threshold of Independence,* the council takes the somewhat unusual step of publishing its own draft of the ADA bill.

1986 The Equal Opportunities for Disabled Americans Act allows recipients of federal disability benefits to retain them even after they obtain work, thus removing a disincentive that keeps disabled people unemployed.

1986 Australia: The Disability Services Act provides that a person with disability has the right to achieve his or her individual capacity for physical, social, emotional, and intellectual development. In 1992, the Disability Discrimination Act supports nondiscrimination in education and training. It also makes it unlawful to discriminate in relation to access to premises, including public transportation.

1986 Canada: The Employment Equity Act mandates the institution of positive policies and practices to ensure that persons in designated groups, including persons with disabilities, achieve at least proportionate employment opportunities.

1986 England: The first issue of the magazine *Disability Arts in London* (DAIL) is produced in London.

1986 Southern Africa: The Southern Africa Federation of the Disabled is formed as a federation of nongovernmental organizations of disabled persons.

1988 The Technology Act (Technology-Related Assistance for Individuals with Disabilities Act of 1988 and its 1994 amendments), and, in 1998, the Assistive Technology Act (AT) provide financial assistance to states to support programs of technology-related assistance for individuals with disabilities of all ages. The1988 act defines *assistive technology* (AT). The Americans with Disabilities Act of 1990 prohibits discrimination against people with disabilities in employment, public institutions, commercial facilities, transportation, and telecommunications, which includes accessibility to all entrances, bathrooms, program areas, and parking spaces as well as interpreters for the deaf and Braille and large-print materials for the blind. The Telecommunications Act of 1996 requires the telecommunication industry to make equipment that will support transmission of information in forms accessible to people with disabilities including broadband and television program captioning. By 2000, approximately 10 percent of the U.S. population uses AT devices and/or modifications to their home, work, or school that allow them to participate in major life activities.

1988 ◆ Congress introduces a series of amendments to the Civil Rights Act of 1968, including a prohibition of housing discrimination against people with disabilities. These amendments are known as the Fair Housing Act Amendments of 1988.

1988 ◆ China: Deng Pufang, a wheelchair user and son of the late Chinese leader Deng Xiaoping, is the driving force behind a series of laws and programs initiated to improve life for the disabled. In 1984, he sets up the China Welfare Fund for Disabled Persons and, in 1988, the China Disabled Persons' Federation, which endeavors to improve public images of disabled people. Today, there are 60 million disabled people in China.

1989 ◆ The European Network on Independent Living (ENIL) is set up. It focuses on personal assistance as a key component of independent living.

1990 ◆ ADAPT, the American Disabled for Attendant Programs Today, originally called the American Disabled for Accessible Public Transit, continues to gain public awareness through tactics of civil disobedience until regulations are finally issued with the passage of the Americans with Disabilities Act (ADA).

The ADA passes, after ADAPT uses tactics of civil disobedience, in the tradition of other civil rights movements, in one of the largest disability rights protests to date (600 demonstrators), the "Wheels of Justice March," during which dozens of protesters throw themselves out of their wheelchairs and begin crawling up the 83 marble steps to the Capitol to deliver a scroll of the Declaration of Independence. The following day 150 ADAPT protesters lock wheelchairs together in the Capitol rotunda and engage in a sit-in until police carry them away one by one.

George H.W. Bush signs the ADA on July 26. It provides employment protections for qualifying persons with disability. It is the most prominent and comprehensive law prohibiting discrimination on the basis of disability in the United States, expanding the mandate of Section 504 of the Rehabilitation Act of 1973 to eliminate discrimination by prohibiting discrimination in employment, housing, public accommodations, education, and public services.

In June 2000, the National Council on Disability issues a report, *Promises to Keep: A decade of Federal Enforcement of the Americans with Disabilities Act,* which includes 104 specific recommendations for improvements to the ADA enforcement effort. On December 1, 2004, the council issues a final summary report, *Righting the ADA,* in order to address "a series of negative court decisions [that] is returning [Americans with disabilities] to 'second-class citizen' status that the Americans with Disabilities Act was supposed to remedy forever."

1990 ◆ The ADA requires public entities and businesses to provide effective communication to individuals with disabilities. Title IV of the ADA mandates that nationwide telecommunication systems be accessible to persons with speech or hearing disabilities. The Federal Communications Commission (FCC) requires relay services to be in place by July 26, 1993. The Telecommunications Act of 1996 adds provisions to the Communications Act of 1934 that requires manufactures and providers of telecommunications equipment and services to ensure accessibility to persons with disabilities. In 2000, President Bill Clinton establishes regulations governing the accessibility to people with disabilities of the electronic and information technology used within the federal government.

1990 ◆ The Individuals with Disabilities Education Act (IDEA) is enacted. It guarantees the right to free and appropriate education for children and youth with disabilities and focuses on higher expectations, mainstreaming students where possible, and an increased federal rule in ensuring equal educational opportunity for all students. IDEA requires schools to provide a free and appropriate public education to eligible children with disabilities. It also requires schools to develop an individualized education plan (IEP) for each child and placement in the least restrictive environment (LRE) for their education. IDEA is amended in 1997 and reauthorized again in 2004 as the Individuals with Disabilities Education Improvement Act.

1990 ◆ Legislation establishes the National Center for Medical Rehabilitation Research (NCMRR), whose mission is to foster development of scientific knowledge needed to enhance the health, productivity, independence, and quality of life of persons with disabilities. It has primary responsibility for the U.S. Government's medical rehabilitation research that is supported by the National Institutes of Health (NIH).

1990 ◆ The World Declaration on Education for All (EFA) is adopted in Jomtien, Thailand, by more than 1,500 persons representing the international community. Article 23 of the UN Convention on the Rights of the Child states that disabled children have the right to a "full and decent life" and that member nations provide free education and training to disabled children whenever possible in order to provide the "fullest possible social integration and individual development." UNESCO is the lead UN organization for special needs education.

1990 ◆ Korea: The disability movement celebrates the passage of the Employment Promotion Act for People with Disabilities. The government imposes control over the disabled population in the 1960s and 1970s by forwarding institutionalization under the banner of "protection," promoting sterilization, and violating the rights of disabled people in general. The 1981 International Year of Disabled Persons influences the government, and new laws, such as the Welfare Law for Mentally and Physically Handicapped, are enacted, and the human rights of disabled people becomes the dominant rhetoric of the disability movement.

1990 ◆ United Kingdom: The National Disability Arts Forum is launched at the UK-OK Conference at Beaumont College in Lancashire, UK.

1991 ◆ The Resolution on Personal Assistance Services is passed at the International Personal Assistance Symposium. Personal assistance services are the most critical services for individuals. Critical aspects of these services are that they must be available up to 24 hours a day, 7 days a week, to people of all ages, and with access to governmental payments. In the United States alone, personal assistance services affect the lives of more than 9.6 million citizens with disabilities.

1991 ◆ Australia: The federal Disability Reform Package is introduced; the Disability Discrimination Act, which covers issues of discrimination in education, is enacted in 1992; and the Commonwealth Disability Strategy, designed to provide equal access to government services for people with disabilities, is first introduced in 1994 and then revised in 2000. During the 1990s similar discrimination legislation emerges in other countries, such as New Zealand's Human Rights Act, the U.K.'s Disability Discrimination Act, Israel's Disabled Persons Act, Canada's Human Rights Act, and India's Disabled Person's Act.

1991 ◆ China: The most important laws and initiatives reside in the 1991 Law on Protection of Disabled Persons and a series of National Work Programs for Disabled Persons (1988, 1991, 1996, 2001), which integrate disability into the government's Five-Year Plans. China participates heavily in the United Nations Decade of Disabled Persons, 1983–1992, and initiates the Asia Pacific Decade of the Disabled Persons, 1993–2002. China continues to collaborate with UN projects involving the disabled and will host the 2007 International Special Olympics in Shanghai.

1991 ◆ Serbia and Montenegro: From the 1960s to the 1980s, post–World War II Yugoslavia is lauded for being a socially advanced nonaligned nation, but the contemporary wars that decimate Yugoslavia begin in 1991, and today there are more than one million disabled citizens, refugees, and casualties due to the wars. Disabled people in Serbia and Montenegro (formally named the Federal Republic of Yugoslavia—FRY) are left with shattered pieces of the spent past with little hope for the near future. Although the FRY constitution prescribes special protection of disabled persons in accordance with legal provisions and Serbia is party to numerous UN documents and acts, a disabled expert in 2004 admits that discrimination against persons with disability in Serbia and Montenegro is a

long-term problem that people without disability tend to ignore. Two of the most effective advocacy groups making in-roads today are the Association of Students with Disabilities and the Center for Independent Living in Belgrade.

1992 ◆ The UN Economic and Social Commission of Asia and the Pacific (ESCAP) proclaims a 10-year program known as the Asian and Pacific Decade of Disabled Persons 1993–2002 with goals of full participation and equality for persons with disabilities.

1993 ◆ The United Nations publishes the Standard Rules on the Equalization of Opportunities for Persons with Disabilities, which becomes the international legal standards for disability programs, laws, and policies. Although not legally enforceable this instrument sets an inclusive and antidiscriminatory standard that is used when national policies are developed. It marks a clear shift from the rehabilitation and prevention paradigm to the human rights perspective on disability.

1993 ◆ Slovak Republic: The Czech and Slovak Republics separate into two independent countries. They both join the European Union in 2004. In Slovakia, a large number of highly innovative and resourceful grassroots nongovernmental organizations emerge to address the human rights, quality-of-life, and independent living priorities of citizens with disabilities. They pursue this mission, however, with extremely limited resources and with varying degrees of support from a multiparty parliament.

1993 ◆ Sweden: The Independent Living Institute (ILI) is founded.

1994 ◆ Two networks, one for elderly persons and the other for persons with disabilities, join together to form the U.S. National Coalition on Aging and Disability. In following years, policy makers and advocates begin to see the benefits of merging some services.

1994 ◆ Germany: The disability rights movement is successful in using for its own aims the reform of the German constitution, which is made necessary by the reunification process. An amendment to the constitution forbids discrimination on the grounds of disability. Other such laws as the Rehabilitation of Participation Law (2001) and the Federal Equal Rights Law (2002) are formulated with the active contribution of disability rights activists, and in 2003, the official German program of the European Year of People with Disabilities is organized by a prominent activist.

1994 ◆ Sweden: The Swedish Disability Act (LSS) comes into force. It expands the 1985 Special Services Act. The LSS is also more ambitious than its predecessor, calling for “good living conditions” rather than just an “acceptable standard of living.”

1995 ◆ The National Council on Disability, a federal agency, makes recommendations to the president and Congress on disability issues. Among other issues, it calls for the end to the use of aversives (techniques of behavior control such as restraints, isolation, and electric shocks) because they are abusive, dehumanizing, and psychologically and physically dangerous. Other organizations follow, such as the Autism National Committee in 1999, TASH in 2004, and the International Association for the Right to Effective Treatment in 2003.

1995 ◆ The Commission for Case Management Certification (CCMC) incorporates. Case management is a process of care planning and coordination of the services and resources used by people with disabilities and their families.

1995 ◆ Europe: The Association for the Advancement of Assistive Technology in Europe (AAATE) is founded as an interdisciplinary association devoted to increasing awareness, promoting research and development, and facilitating the exchange of information. AAATE is composed of more than 250 members from 19 countries. It interacts with sister organizations in North America, Japan, and Australia to advance assistive technology worldwide. The Tokushima Agreement, signed in 2000 by AAATE, the Rehabilitation Engineering and Assistive Technology Society of North America

(RESNA), the Rehabilitation Engineering Society of Japan (RESJA), and the Australian Rehabilitation and Assistive Technology Association (ARATA), promotes exchange of information and collaboration.

1995 United Kingdom: The campaign for antidiscrimination legislation begins in earnest with the emergence of the disability movement in the late 1970s. The Disability Discrimination Act of 1995 (DDA) together with the Disability Rights Commission Act of 1999 constitute the primary source of antidiscrimination legislation for disabled people in the United Kingdom. The Disability Discrimination Act 2005 extends the protection.

1996 There are 1.4 million fewer disabled older persons in the United States than would have been expected if the health status of older people had not improved since the early 1980s.

1996 Advocates for mental health parity such as the National Alliance for the Mentally Ill (NAMI; 1979) believe that mental illnesses are real illnesses and that health insurance and health plan coverage for treatment should be equal with coverage of treatment for all other illnesses. Due in part to advocacy, the Mental Health Parity Act becomes law in 1996. In 1999, mental illness ranks first in causing disabilities among many industrialized nations, including the United States, which experiences a loss of productivity in this year of $63 billion. In the United States, 5 to 7 percent of adults suffer from serious mental disorders and 5 to 9 percent of children suffer from serious emotional disturbances that severely disrupt their social, academic, and emotional functioning.

1996 Costa Rica: Approval of a law called Equal Opportunities for People with Disabilities is a turning point for the population with disabilities, which is among the most excluded sectors of society. The law is inspired in part by the United Nations Standard Rules on the Equalization of Opportunities for Disabled People (1993). Disability experience in Costa Rica is definitely transformed as a result of the mandates of this generic law, as people with disabilities and their families start to use this legal instrument as a strategy to empower themselves.

1996 Europe: Created in 1996, the European Disability Forum (EDF) is today the largest independent, trans-European organization that exists to represent disabled people in dialogue with the European Union (EU) and other European authorities. Its mission is to promote equal opportunities for disabled people and to ensure disabled citizens full access to fundamental and human rights through its active involvement in policy development and implementation in the EU. The EDF has national councils in 17 European countries and has 127 member organizations. The European Year of People with Disabilities 2003 is one of the EDF's most important campaigns.

1996 India: The Persons with Disabilities (Equal Opportunities, Protection of Rights and Full Participation) Act, 1995, becomes law. It is the first legislation for equal opportunities for disabled people. Prior to this, disabled persons receive services but not legal protection. Improvements in conditions begin in 1981 with the International Year of Disabled Persons. India is a signatory to the UN resolution of 1976 establishing it and is thereby committed to improving the lot of the disabled. The Lunacy Act of 1912 is repealed and the National Mental Health Act is passed in 1987. Nonetheless, with approximately 70 million disabled people residing in India (in a population of over a billion), the government does not include the domain of disability in the 2001 census, which reflects the attitudinal barriers in acknowledging the disabled identity.

1997 Government expenditures on behalf of persons with disabilities may total as much as $217.3 billion (taking into account the costs that would be expected among persons with disabilities in the absence of the disability), the equivalent of 2.6 percent of the gross domestic product in the United States for 1997.

1997 The landmark 1997 UNESCO Universal Declaration on the Human Genome and Human Rights frames the actual application of the new scientific developments raised by genetics. As a policy

statement, it provides the first signs that genetics will be applied in ways that maintain human rights. In 2003, the Council of Europe and the council's Steering Committee in Bioethics issue policy statements in a working document titled Application of Genetics for Health Purposes. In the case of gene therapy, in 1994, the Group of Advisors on the Ethical Implications of Biotechnology of the European Commission voices concern regarding equity, maintaining that all genetic services that are available for the entire population should be equally available for persons of disability. Today, UNESCO's Human Genome Organization's Ethics Committee, the World Health Organization, the Council of Europe, and consumer organizations such as Inclusion International, Rehabilitation International, and Disabled Peoples' International play major roles in translating genetic innovations into health service and public health fields, helping develop policies that focus on the general recognition, respect, and protection of the rights to which all people, whether disabled or nondisabled, are entitled. Concerns related to the possible undermining of human rights are expressed in 2003 when Disabled People's International demands a prohibition on compulsory genetic testing.

1997 Colombia: The General Act for People with Disabilities, also known as the Disability Act: Law for Opportunity, passes. The 2003–2006 National Plan of Attention to Persons with Disabilities estimates that 18 percent of the general population has some type of disability. Despite the existence of at least 37 disability-related legal policies (2001), the government provides limited spending on programs that protect the rights of people with disabilities, and the lack of enforcement of rights remains a major concern. Today's awareness efforts include marathons with the participation of the general population to raise money for educational programs for children with special needs, Special Olympics, new organizations such as the Colombian Association for the Development of People with Disabilities, and media awareness campaigns.

1998 President Bill Clinton issues an executive order ensuring that the federal government assumes the role of a model employer of adults with disabilities.

1998 President Clinton signs into law the Rehabilitation Act of 1973 Amendments. Section 508 requires that electronic and information technology (EIT), such as federal websites, telecommunications, software, and information kiosks, must be usable by persons with disabilities.

1998 Ireland: The Irish Employment Equality Act entitles all individuals, including disabled persons, equal treatment in training and employment opportunities. The Education Act of 1998 requires schools to provide education to students that is appropriate to their abilities and needs. The Education for Persons with Disabilities Bill passes in 2003. A Disability Bill published in 2001 fails to underpin a rights-based approach and is withdrawn amid a storm of protest in 2002; a redrafting of a new Disability Bill is suffering from continuing delays. Traditionally, Irish voluntary organizations play a reactionary role in the development of services for people with disabilities and a key role as pressure groups trying to keep disability issues on the political agenda.

1999 The National Center on Physical Activity and Disability (NCPAD) is established as an information and resource center that offers people with disabilities, caregivers, and professionals the latest information on fitness, recreation, and sports programs for people with disabilities.

1999 Established by a panel of experts brought together to evaluate the UN Standard Rules on the Equalization of Opportunities for Persons with Disability, the International Disability Alliance (IDA) encourages cross-disability collaboration and supports the participation of international disability organizations in the elaboration of a proposed UN convention on disability.

1999 England: The first disability film festival, Lifting the Lid, is held at the Lux Cinema in London.

2000 The National Telability Media Center collects documentation of 3,000+ newsletters, 200 magazines, 50 newspapers, 40 radio programs, and 40 television programs dedicated to disability in the United States alone. *The Ragged Edge, Mainstream* (Internet-based), and *Mouth* are examples of disability rights-focused publications.

2000 *Healthy People 2000,* the second edition of the Surgeon General's report on health promotion and disease prevention (the first edition published in 1979), includes some reference to the health and well-being of people with disabilities, but few data are available. In the mid-1990s, the U.S. Department of Health and Human Services begins a dialogue with the Centers for Disease Control and Prevention to include people with disabilities in the third edition, *Healthy People 2010.* The resulting report includes more than 100 objectives that include "people with disabilities" as a subpopulation for data gathering.

2000 The World Bank, increasingly concerned with how to include disabled persons in the economies and societies of developing nations, establishes an online clearinghouse to make documents concerning the disabled readily available to member nations and the general public and holds its first course on disability issues in 2004 in Guatemala.

2000 Africa: The African Decade of Persons with Disabilities, 2000–2009, is adopted by the Declaration of the Organization of African Unity. The African Network of Women with Disabilities (2001) and the community-based rehabilitation organization CBR Africa Network (CAN) are examples of the many activities that result from the African Decade.

2000 Brazil is one of the few countries to include an entire section on disability in its 2000 census. Results show that 14.5 percent of the population, roughly 24 million people, report having some form of disability, the poorest region, the northeast, reporting the highest percentage and the richest, in the south, the lowest. People with disabilities in the first half of the twentieth century have no voice or representation. In 1932, the first Pestalozzi Society, a community-based school for children with intellectual disabilities, is founded. By the end of the twentieth century, there are 146 Pestalozzi Societies and more than 1,700 chapters of the Association of Parents and Friends of the Exceptional. The first center for independent living is established in 1988 (CVI-RIO). In 1992 and 1995, CVI-RIO organizes two international conferences on disability issues called DefRio, out of which comes "Goals of the ILM," a document that delineates the basis for the independent living movement in Brazil; however, financial support is not provided by the government, creating a struggle for sustainability. Brazil has progressive policies toward disability. The constitution includes sections on the rights of people with disabilities, and laws have been passed with regard to accessibility, education, and employment.

2000 Europe: A European Community directive requires all member states to have introduced antidiscrimination laws in the fields of employment and training by the end of 2006. It seeks to establish a general framework for equal treatment in employment and occupation and to render unlawful discrimination based on, among other categories, disability. The European Union Charter of Fundamental Rights sets out in a single text, for the first time in the EU's history, the whole range of civil, political, economic, and social rights of European citizens. Disability is included in the general nondiscrimination clause (Article 21), but Article 26 specifically states that the Union recognizes and respects the rights of persons with disabilities to benefit from measures designed to ensure their independence, social and occupational integration, and participation in the life of the community.

2000 The Human Genome Project (HGP), an international effort to specify the 3 billion pairs of genes that make up the DNA sequence of the entire human genome, produces its first draft in June 2000. Formally begun in October 1990, it is completed in 2003.

2001 ◆ President Clinton declares in Executive Order No. 13217 the commitment of the United States to community-based alternatives for individuals with disabilities. This ensures that the *Olmstead v. L.C.* decision (1999), which mandates the right for persons with disability to live in the least-restrictive setting with reasonable accommodations, is implemented in a timely manner. The executive order directs federal agencies to work together to tear down the barriers to community living.

2001 ◆ In the United States, census data indicate that only 48 percent of citizens 25 to 64 years old with severe disabilities have health insurance compared with 80 percent of individuals with nonservere disabilities and 82 percent of nondisabled Americans. Women with disabilities in general are more likely to live in poverty than men. Minorities with disabilities are more likely to live in poverty than nonminorities with disabilities. In 2003, in the United States, about 28 percent of children with disabilities live in poor families compared with 16 percent of all children.

2001 ◆ A UN Ad Hoc Committee begins discussions for a legally binding convention under the draft title Comprehensive and Integral Convention on the Protection and Promotion of the Rights and Dignity of Persons with Disabilities. Its fifth session is held in early 2005.

2001 ◆ A new World Health Organization classification of people with disabilities, the International Classification of Functioning, Disability, and Health (ICF), replaces the old International Classification of Impairments, Disabilities, and Handicaps (ICIDH). The ICF definition shifts the focus from disability as an innate deficit ("medical model") to disability as constructed through the interaction between the individual and the environment ("social model"). This shift encourages a focus on the kinds and levels of interventions appropriate to the needs of individuals.

2001 ◆ UNESCO launches pilot education projects for disabled children in Cameroon, the Dominican Republic, Egypt, Ghana, India, Madagascar, Mauritius, Nicaragua, Paraguay, South Africa, Vietnam, and Yemen. The global initiative Education for All 2000 has as its primary millennium development goal universal education by the year 2015.

2002 ◆ The U.S. Supreme Court rules that executing persons with mental retardation is unconstitutional.

2002 ◆ Disabled Peoples' International's 2002 Sapporo Platform, developed by 3,000 delegates from more than 90 countries, urges members to take every opportunity to seek publicity and awareness in order to change negative images of disabled people.

2002 ◆ Canada: The Canadian International Development Bank announces the approval of the Canada-Russia Disability Program, a four-year $4 million project, focusing on education, disability studies, social work practice, social policy, and information dissemination.

2003 ◆ A national survey that updates the Disability Supplement to the 10-year-old National Health Interview Survey highlights barriers to care among the uninsured. The uninsured are four times as likely to postpone care and three times as likely to go without needed supplies.

2003 ◆ The National Association of Social Workers (NASW) issues a policy statement that discusses their core values with respect to working with people with disabilities, including self-determination, social justice, and dignity and worth of the person. The statement emphasizes that social workers are responsible to take action with people who have disabilities in advocating for their rights to fully participate in society.

2003 ◆ The Disability Awareness in Action (DAA) database contains a total of 1,910 reports of known abuse affecting nearly 2.5 million disabled people. In the area of education alone, it documents

118 cases affecting 768,205 people in 67 countries. Responding to this documentation and other reports, the United Nations Commission on Human Rights creates the Global Rights campaign to address human rights abuses. Disability rights organizations use this information to insist on a UN convention on the rights of disabled people that would be legally binding on nation-states.

2003 The International Association for the Study of Pain has more than 6,700 members, representing more than 100 countries and 60 disciplinary fields. Chronic pain is one of the leading causes of recurrent and permanent disability in the developed world today, yet less than 1 percent of the U.S. National Institutes of Health's budget supports research into mechanisms and management of pain. The U.S. Congress declares 2000–2010 the Decade of Pain Control and Research.

2004 The *Journal of Gene Medicine* (January) reports that 636 gene therapy clinical trials are completed or ongoing, involving 3,496 patients. The first gene therapy clinical trials begin in the early 1990s.

Today Seventy to eighty percent—approximately 400 million—of the world's disabled people (600 million, or 10 percent of the world's population) live in the developing world, and of the world's poorest of the poor, 20 to 25 percent are disabled. In most countries, 1 out of 10 persons has a disability. Many international efforts are under way to address poverty and disability, such as those of the Action on Disability Development and the Chronic Poverty Research Centre.

Today E-health is the use of emerging interactive telecommunications technologies such as the Internet, interactive TV, kiosks, personal digital assistants, CD-ROMs, and DVD-ROMs to facilitate health improvement and health care services, including those with disabilities. E-health relies on environments that use a variety of technologies that can compensate for the lack of sensory ability. Telerehabilitation is an example of services delivered information technology and telecommunication networks.

Today Celebrating difference is the mantra and visible manifestation of disability culture in all regions of the world.

SEARCHING FOR AND EVALUATING WEBSITES

Anne Armstrong

The Internet, or Web, provides a vast number of channels through which researchers can find information on virtually any subject. The expansiveness of the Web can be daunting to new researchers. On the other hand, researchers often assume that they have mastered the Web in its entirety when indeed they have merely scratched the surface in terms of the numbers of resources they have consulted and searches they have performed.

Because the field of disability studies is continually evolving and inherently multidisciplinary, Web searchers can draw on previously conducted research from disciplines within the humanities, social sciences, and health sciences. This guide aims to expose beginning researchers to a mixture of general and subject-specialized Web-based search tools, as well as strategies for performing sophisticated Web searches and criteria for evaluating websites. In addition to its broad subject coverage, the field of disability studies differs from most fields in that many researchers may themselves have disabilities affecting their ability to perform research on the Web. For this reason, this description concludes with an overview of accessibility issues on the Web and suggestions for further reading.

OVERVIEW OF WEB-BASED RESEARCH TOOLS

When approaching Web searching, researchers should be aware of the multitude of search tools available to them, in addition to the varying purposes of these tools. Many users approach Web searching with the assumption that "everything is in Google," but this is a limiting misconception. No single search engine contains everything on the Web. Furthermore, all search engines function differently and rank results differently. Therefore, sampling various search tools increases the comprehensiveness of results on any topic. This discussion outlines multiple types of search tools available on the Web and offers potential starting points for Internet research on issues related to disability studies, whether from a health sciences, social sciences, or humanities perspective.

The Web-based search tools outlined in this chapter include general search engines, subject-specialized search engines, directories, indexes, catalogs, and Listservs. It is important to note that different types of search tools cover different parts of the Web. The Web is composed of layers. The top layer is detectible by general search engines, while a deeper layer termed "the invisible Web" can be penetrated only by specialized search engines, indexes, and catalogs. Readers should be aware that because the Web is in a constant state of flux, currently available resources may become obsolete over time, and newer, more sophisticated search tools will undoubtedly evolve.

General Search Engines

Most people who have searched the Web are familiar with sites such as Google, HotBot, or Lycos, which allow them to enter a string of keywords into a search box to retrieve a list of relevant websites (see Table 1). These sites, referred to as search engines, search the Web by means of a program called a *spider* (also

Table 1 Selected General Search Engines

Name	URL
AltaVista	www.altavista.com
Excite	www.excite.com
GO	www.go.com
Google	www.google.com
HotBot	www.hotbot.com
Lycos	www.lycos.com
Yahoo!	www.yahoo.com

called a *robot* or *crawler*). Since search engines tend to index millions of websites, they are most useful for entering specific search terms rather than broad concepts such as disability studies.

While Web searchers tend to pick a favorite search engine and return to it repeatedly, it is important to note that different search engines produce varying results, and that a truly comprehensive Web searcher should compare the results of multiple search engines. The variation between search engines can be attributed to differences between the spiders fueling the search engines as well as differences in the level of indexing and the order in which results are ranked. While some search engines index the full text of documents, others may index only the first page, or merely the *meta-tags*, which are lines of code containing keywords. Web searchers should be aware that developers of websites may intentionally increase their usage of certain words or meta-tags to increase the prominence of their website among search results. This practice has been referred to as *spamdexing* and is most prevalent among the developers of commercial websites advertising products and services. Due to the constant fluctuation of the Web, no search engine is entirely up-to-date; results produced by identical searches can vary greatly from one day to the next, even when one is using the same search engine.

Subject-Specialized Search Engines

Subject-specialized search engines (also referred to as subject portals) developed by educational institutions, associations, government agencies, and corporate entities narrow the broad scope of the Web, providing a focused channel by which researchers can search for information when they have determined the discipline from which their topic stems. Examples of such search engines are listed in Table 2. While subject-specialized search engines index considerably fewer websites and documents than general search engines, the information contained within them has been preselected, ideally by experts within a given field. Many subject-specialized search engines expose searchers to parts of the "invisible Web" not indexed by general search engines. Subject-specialized search engines can ease the research process by whittling down the Web to a more manageable size. However, researchers who use them should take the time to view the criteria for selection of

Table 2 Examples of Subject-Specialized Search Engines

Directories

Directories are hierarchically arranged subject guides composed of websites chosen by or recommended to editors of the directory (Table 4). Usually, directories follow a template in which major subject categories such as health, sciences, social sciences, or humanities are posted on the top-level page. Each of these links leads to lists of narrower subcategories. The links on the second level lead to narrower subcategories, and so on. A sample hierarchy from the directory created by Google (available at http://directory.google.com) lists the following subject breakdown: Society → Disabled → Disability studies.

Directories provide Web searchers with the ability to browse recommended resources in various subject areas without having to enter specific search terms. Other useful attributes of directories are that they often contain summaries and evaluations of websites.

Article Indexes

Article indexes allow researchers to search by topic for published articles in magazines and scholarly journals. Researchers could certainly locate journal and magazine articles using a freely available search engine such as Google, but they would merely be skimming the surface of what has been published. While the Web provides access to *more* content, it does not provide comprehensive access to research published in journal articles. Article indexes are for the expressed purpose of finding journal articles. With a few exceptions (such as PubMed, an article index of health sciences journals developed and maintained by the National Library of Medicine), article indexes are not freely available on the Web. Libraries purchase subscriptions to multiple article indexes covering a wide spectrum of disciplines. The indexes available through a given library are often dictated by the curriculum of the college or university that the library serves. Thus, large research institutions offer a greater number of specialized article indexes than smaller institutions and public libraries. Due to licensing agreements between article index providers and libraries, off-site access to indexes is usually limited to faculty and students of a college or university. However, there are many libraries that allow members of the public to use their article indexes from within the library. A local public library would be a good starting place for those not connected with academic or commercial organizations.

Since article indexes are proprietary products developed by companies for sale to libraries, they tend to offer specialized search features that are not always available on freely available search engines. These features include subject headings, thesauri, abstracts (summaries of articles), and frequently the full text of articles. Researchers should familiarize themselves with online tutorials, "help" screens, and "about" pages to increase the effectiveness of their searching.

Freely available article indexes relevant to disability studies include the following:

- PubMed: A product of the National Library of Medicine, which includes more than 14 million citations for biomedical articles dating back to the 1950s. URL: http://www.ncbi.nlm.nih.gov/entrez

- CIRRIE: Center for International Rehabilitation Research Information and Exchange, a database containing more than 24,000 citations of international research published from 1990 to the present. URL: http://cirrie.buffalo.edu

Catalogs

While researchers can search indexes to find articles on specific topics, they can search online catalogs to find books. Some catalogs list the books available at individual libraries, while others contain the holdings of multiple libraries and institutions. The individual catalogs of public libraries and universities are usually freely available on the Web. The most comprehensive catalog is called WorldCat, developed by an organization called OCLC (Online Computer Library Center). WorldCat lists books available at public and academic libraries throughout the world. Like most article indexes, WorldCat is not freely available on the Web and must be accessed through a library.

Listservs

Listservs are mailing lists on the Internet that facilitate online discussions on various subjects. They allow researchers within a given field to communicate about scholarly issues via email. People customarily sign up for Listservs by sending an e-mail to the Listserv address stating that they wish to subscribe. Several Listservs related to disability studies are listed in Table 5. In addition, Web searchers can perform a search on a database called tile.net to search for Listservs by topic.

SEARCH STRATEGIES

Since search capabilities vary from site to site, Web searchers should use online "help" screens and tutorials to learn search tips and strategies for improving their search results. Some search techniques common to several Web-based search tools are summarized below.

Quotation Marks

When entering a search, users should enter phrases in quotation marks to stipulate that they would like the results to contain a specific word combination and order. For instance, multiword concepts such as "disability studies," "adaptive technology," and "section 508" should be entered within quotation marks. Proper names can also be entered within quotation marks.

Truncation

Truncation symbols allow Web searchers to simultaneously search for multiple endings of a given word. For instance, assuming that the asterisk is the designated truncation symbol in a search engine, entering the word "impair*" would produce results including all forms of the word after the root, including "impair," "impaired," "impairment" and "impairments." In addition to adding truncation symbols to the end of words, users may also insert internal truncation symbols if there are potential variations for the spelling of the middle of a word. For instance, entering the word "colo*r" would simultaneously search for the words "color" and "colour." "Help" screens or "search tips" usually list the designated truncation symbol for a given database.

Boolean Logic

Developed by the English mathematician George Boole, Boolean logic is a mathematical framework that Web searchers can apply to broaden or refine their searches. There are three words, or *operators*, that Web searchers can use to combine their keywords to perform more complex searches: AND, OR, and NOT. The three Boolean operators are summarized below, along with potential applications. It is important to read the online "help" section of a database before performing a Boolean search, as Boolean searching does not work in all databases.

Using the Boolean Operator "AND"

Combining words with "AND" narrows a search, as the database retrieves only items that contain *all* the words entered. The second search example below will produce fewer results than the first, since there are three keywords that must appear within the content of each result.

"disability studies" AND theory
"disability studies" AND theory AND history

Using the Boolean Operator "OR"

Entering the term "OR" between keywords stipulates that any, but not all, of the words entered must appear within the search results. Using "OR" is a way of searching for synonyms or related terms when there are multiple words for the same concept. The example below shows how you could broaden your search if you wanted to search for multiple adaptive technology applications in a search engine. The second search example will potentially produce more results than the first, since there is an additional keyword that the results could include.

JAWS OR "Ruby OpenBook"
JAWS OR "Ruby OpenBook" or "window eyes"

Using the Boolean Operator "NOT"

Entering the Boolean operator "NOT" after a word stipulates that the word should not appear within the results. Using "NOT" in a search can be particularly useful if a word is frequently used in multiple contexts and you wish to eliminate results dealing with a particular topic. In the example below, the second search will ideally eliminate items relating to the state of New Mexico, given that the researcher is looking for information on legislation related to disabilities in the country of Mexico. The use of NOT can be too limiting. The second search would eliminate results that discussed both Mexico and New Mexico.

Disabilities AND legislation AND Mexico
Disabilities AND legislation AND Mexico NOT "new mexico"

Nesting

Nesting allows Web searchers to simultaneously search for multiple search terms relating to the same topic. The grouping of synonymous terms within parenthesis is referred to as nesting, as multiple terms relating to the same idea are clustered together as a single concept. When using nesting, the words within the parenthesis are connected by the Boolean operator "OR."

To find information about software for people who are visually impaired, search results are increased by using nesting to group multiple words for each facet of the topic:

(software or "adaptive technology") AND ("visually impaired" or blind)

Plus and Minus Signs

Most general search engines allow users to enter plus or minus signs before a particular word. Entering a plus sign before a word (e.g., +ADA) stipulates that the word must appear within the search results. A minus sign before a word (e.g.,–mobility) stipulates that the word should not appear within the results. Since some search engines also use plus and minus signs as substitutes for Boolean operators, it is important to view online "help" or "search tips."

Search Limits

Most search engines allow users to limit their results by date, language, or document type. Limiting capabilities vary from site to site and are customarily outlined in online "help" screens. In general, article indexes have more sophisticated limiting capabilities than search engines that are freely available on the Web.

EVALUATING WEBSITES

A researcher weighing the quality of a journal article faces a lesser challenge than a researcher considering a website as a potential resource. The publishing industry applies labels to periodicals of varying type: Scholarly journals, popular magazines, trade publications, and newspapers comprise the major categories. Articles submitted to scholarly journals undergo a peer review process by experts in a given field. If in doubt as to the suitability of journal for scholarly purposes, a researcher can consult a directory of periodicals such as *Ulrich's Periodicals Directory,* which indicates whether or not a journal is peer reviewed.

The fact that the Web has no comparable methods of control complicates the task of determining whether a website is appropriate for research purposes. While websites produced by certain types of agencies and organizations certainly undergo a form of *internal*

review, the Web is a free forum; people can post anything they want, and no one has the right to force to take it down if it fails to meet certain standards of quality or accuracy. To complicate the matter, inaccurate or inexpert information can hide like a wolf in the sheep's clothing of sophisticated graphics, layout, and design. The Web has no peer review process to ensure quality. While none of the evaluation criteria outlined below can provide the final word as to the suitability of a website for scholarly use, a researcher who searches the Web with multiple evaluation criteria in mind expedites the process of finding quality information.

Authorship

When determining the credibility of a website, researchers should use multiple techniques to determine the credentials of the author as well as the character of the organization hosting, or sponsoring, the site. If individuals are listed as authors, researchers should take steps to determine their credentials and reputation in the field by performing a search in a general search engine to find biographical information or other documents written about the author. This will also produce references to the author on the sites of other authors within a field. Researchers can also consult a number of biographical sources available at libraries, such as *Who's Who in the America* or sources tailored to particular fields of study, such as *Who's Who in Science and Engineering.*

Website addresses, or URLs (Uniform Resource Locators) can also provide hints as to author affiliations and potential bias. Personal websites are often hosted on commercial ISP (Internet Service Provider) Web servers such as aol.com, or geocites.com. URLs of personal websites often contain first or last names, as well as percent (%) or tilde (~) signs. While personal websites may contain authoritative information, researchers should question why the same content does not appear on a site sponsored by an educational or research organization.. Was the site created as a pastime or to serve as a forum for airing personal views? Or does the site reflect serious scholarship backed up by other credentials and research published in scholarly publications?

Every website URL ends with a *domain name*, usually a series of three letters preceded by a period. The domain name denotes the type of institution that hosts the website and can often provide clues as to the purpose or potential bias of a site. Common domain names include the following:

Educational sites: .edu
Government sites: .gov, .mil, or country codes (e.g., .uk = United Kingdom, .au = Australia, .do = Dominican Republic)
Nonprofit organization sites: .org
Commercial sites: .com

Most URLs contain multiple levels separated by slashes (e.g., http://www.nod.org/stats/). To learn more about the sponsor or publisher of a particular site, you can remove levels of the URL one by one to see where the site is hosted and determine the character of the sponsoring entity. For instance, if a site is hosted on the site of an association, viewing the mission statement on the home page of the association can provide clues as to the bias or purpose of the content. When judging the credentials of the publishing entity, researchers should look for contact information and institutional logos. In general, sites devoid of identifying information or contact numbers and addresses should raise suspicion.

Audience

When evaluating a site, researchers should determine whether the content succeeds in addressing the stated audience through tone and presentation. Sites for adults should not have a childlike appearance or tone. Likewise, sites may be deliberately overrun by technical language or jargon to confuse or mislead a particular audience. High-quality sites clearly define their intended purpose.

Currency

Medical research findings or population statistics may become obsolete at a faster rate than research in the humanities. Web researchers should check sites for copyright dates and the date of the last update. Broken links are a sign of neglect, as they may indicate that URLs have changed or become obsolete since the last update of the site. To verify the currency of information on a site, researchers should check for several sites covering the same subject matter.

Accuracy

Determining accuracy involves further research to ensure that the claims or findings on a site are substantiated by other sources. If a site presents original research, the methods of the research and instruments used should be clearly explained, as well as potential limitations of the research. If authors make claims or conclusions, they should cite their

sources, and these sources should be tracked down to ensure their existence and authenticity. Websites should contain a list of works cited or footnotes on par with any print book or article. Since websites sometimes include fabricated resources, and erroneous or incomplete citations, sources should be verified using library tools such as indexes and catalogs. Lists of works cited with multiple errors reflect irresponsible research. If a website contains links, the links should be checked. Researchers should be wary of websites populated by broken links or links to defunct websites.

Quality

In general, sites that are poorly organized or sloppy should be approached with caution. Shoddy design may point to further weaknesses. Poor grammar and spelling errors are also red flags.

Bias

While bias is not always a negative attribute, Web searchers should be cognizant of bias as the search for information. The bias of a website can be partially discerned by the domain name (as discussed above under "Authorship"). Commercial websites may be motivated by the goal to market a product or service. Nonprofit organizations may promote a political agenda. While bias may be clearly stated in mission statements and "about" pages, many websites deliberately shroud their bias. Thorough research involves consulting additional sources to determine the history and activities of a particular organization. If a site contains links to other sites, those links should be checked to discern the character and activities of the other organizations listed. If a site is sponsored by other organizations, researchers should consider the relationship between the sponsors and the creators of the site.

Special Considerations for Evaluating Health Information on the Web

The American Medical Association (AMA) has published "Guidelines for Medical and Health Information Sites on the Internet" outlining evaluation criteria for websites publishing health information, whether for consumers or health professionals. While these guidelines are technically enforced only on sites sponsored by the AMA or affiliated organizations, they could be applied to all sites containing health information. Many of these guidelines mirror the previously outlined criteria for evaluating all websites, but there are certain factors that are heavily emphasized in the AMA guidelines, including the importance of peer review by experts in the field, the importance of clearly identifying sources of funding, an explanation of the relationship between individual researchers and the institutions sponsoring the research, the importance of clearly stating the purpose and intended audience of a site, and the need to address the stated audience in a consistent and effective tone. Seven criteria for assessing the quality of health information on the Internet have been developed by the Health Summit Working Group (Health Information Technology Institute 1999).

Information on health-related websites should be verified by checking sources such as journal articles, books, and other websites. These measures are needed as health information on the Web frequently includes unsubstantiated claims.

OVERVIEW OF ACCESSIBILITY ISSUES ON THE WEB

Disability studies research is unique in that many scholars in the field have disabilities that may impact their ability to effectively search the Web. While in many ways the Web "evens the playing field" by making a vast number of resources available electronically, inaccessible design frequently places barriers on Web searchers with disabilities.

Principles of Web accessibility have been developed by the World Wide Web Consortium's (W3C) Web Accessibility Initiative (WAI). The WAI establishes guidelines for creating accessible websites, browsers, and authoring tools to increase the ease of use of the Web for users with disabilities. Multiple scenarios outlining potential challenges to Web searchers with disabilities are summarized in a W3C working draft titled "How People with Disabilities Use the Web" (2001). Among other scenarios, the document emphasizes that many Web searchers with cognitive or visual disabilities use OCR (optical character recognition) software, which reads Web page text and transmits the information to a speech synthesizer and/or refreshable Braille display. Many users with visual disabilities use text-based Internet browsers instead of standard graphical browsers. The successful use of these tools requires that images on websites be accompanied by descriptive text and *ALT tags*. ALT tags are textual labels that appear on the computer screen when a mouse moves over an image. Since visually impaired

Web searchers often enlarge Web-based text using screen magnification programs, Web designers must create pages with nonfixed font sizes that can be altered as necessary. These are only a few of the issues facing Web searchers with disabilities. Other population groups with disabilities discussed in the guidelines include individuals with cognitive disabilities, hearing impairment, and mobility-related disabilities. Readers should consult the WAI website for the complete guidelines (http://www.w3.org/WAI/).

To support the goals of WAI, an online tool called Bobby™ helps website developers test the accessibility of their sites and adhere to accessibility guidelines. By entering a URL into the Bobby website, a Web developer can generate a report outlining which features of the site need to be adjusted to make it "Bobby compliant" and adhere to both W3C accessibility guidelines and guidelines established by the U.S. government's Section 508, a 1998 amendment to the Rehabilitation Act requiring that all federal agencies make their electronic and information technology accessible to people with disabilities. Complete information about these guidelines can be found on the Section 508 website (www.section508.gov).

CONCLUSION

While "one-stop shopping" in Google may be tempting, there is no single search engine leading to everything on the Web. Comprehensive and effective research in disability studies involves consulting multiple search tools, including but not limited to general search engines, subject-specialized search engines, directories, and indexes. In addition to using multiple search tools, Web searchers should experiment with multiple search strategies to maximize the effectiveness of their searching. As there are no standards of quality on the Web, researchers should apply multiple evaluation criteria to every website, verifying that research findings posted on sites are supported by other sources. Web accessibility is a crucial component to disability studies, as the Web has the potential to deliver equal content to all users but frequently presents barriers to people with disabilities by failing to adhere to standards of accessible design. Researchers can develop an awareness of accessibility issues on the Web by familiarizing themselves with the standards outlined by W3C's Web Accessibility Initiative and Section 508.
