Editorial Board

List of Entries

Reader's Guide

The Reader's Guide provides a way to locate related entries in the encyclopedia. For example, if you look under Information Governance, you will find a list of the main entries on that topic, including Cyberspace, Data Protection, Internet Governance, and Public Information. Alternatively, if you are interested in global warming, you will find the entry under the heading Environmental Governance, where you also will find other related entries, including Climate Change, Kyoto Protocol, and Sustainability. The Reader's Guide also provides an overview of all the entries in the encyclopedia. You can look through all the headings, including Information Governance or Environmental Governance, pick one of particular interest to you, and then choose entries you might want to read.

About the Editor

Mark Bevir is a professor in the Department of Political Science, University of California, Berkeley, USA. He is the author of *The Logic of the History of Ideas* (1999) and *New Labour: A Critique* (2005) and coauthor, with R. A. W. Rhodes, of *Interpreting British Governance* (2003) and *Governance Stories* (2006). He is also the editor of *Public Governance* (2007, 4 vols.); coeditor, with Robert Adcock and Shannon Stimson, of *Modern Political Science: Anglo-American Exchanges since 1880* (in press); and coeditor, with Frank Trentmann, of *Critiques of Capital in Modern Britain and America* (2002) and *Markets in Historical Contexts: Ideas and Politics in the Modern World* (2004).

Preface

The language of governance has spread rapidly in the last thirty years. It describes changes in the nature and role of the state—a shift from bureaucracy to markets and networks. It also denotes a program for global reform—addressing poverty, gender equality, fair trade, and sustainable environments.

Governance provides us with a language to describe and theorize changes in our world. This language has spread across numerous disciplines, including political science, economics, sociology, and public administration. It has also become a topic of concern for political actors: Good governance is among the lending criteria used by the World Bank. Moreover, because governance can refer to the ways political authorities govern alongside associations in civil society, it encourages us to recognize that the activity of governance occurs in schools and colleges, professional organizations, businesses, and the media. The language of governance thus extends to patterns of rule found throughout our daily lives. Businesses and nonprofit organizations are preoccupied with issues of corporate governance, Internet governance, clinical governance, and accountable governance.

Governance also provides us with a language to remake our world. Democracy requires us to think about how we are governed in terms of how we govern ourselves. We might ask how to make markets, networks, international organizations, corporations, and other associations democratically accountable. We might also ask what values we want to uphold in our practices of governance. It is important for us to address these questions because, by doing so, we shape the future. We collectively forge new patterns of rule based on new ideas and new values.

Although governance has arisen as a ubiquitous language in which to discuss and act in our world, few works translate it into the familiar, commonsense vocabulary of our daily lives. This encyclopedia unpacks the jargon that characterizes much writing in the field to make it more intelligible to researchers, professionals, students, and, I profoundly hope, those citizens who want to pass democratic judgment on the patterns of governance in which they find themselves. Researchers and professionals can refer to it for concise, accurate information on diverse topics. Students will find it offers a clear and accessible introduction and companion to a vast and growing literature. Journalists can refer to it for background information on developments in current affairs. Citizens will find it offers detailed accounts of the ideas and institutions often invoked in political debate. Everyone will gain from it new insights into the global community of which we are all part.

Scope and Coverage

The encyclopedia has a determinedly global scope. Governance is itself a global phenomenon. Global institutions, such as the United Nations and the World Bank, debate and act on global dilemmas, such as the environment, HIV, human rights, the Internet, and poverty. Besides, the language of governance highlights the ties of localities to the broader global context. Governments act with and through associations that are typically embedded in transnational networks. National boundaries get scant respect from trade, policy transfer, and intellectual debate. Indeed, one theme of the encyclopedia is the rise of new regional and global

institutions that attempt to regulate such transnational flows. Even when governance refers to specific public-sector reforms, such as privatization or new public management, these often have been pursued in one country and then had an influence on others.

Global phenomena, transnational links, and cross-national influences are covered in several ways within the encyclopedia. First, a host of entries explicitly address global, regional, and transnational topics. Second, yet other entries cover theories and concepts that are debated globally, or ideas and policies that have been implemented in diverse countries. Third, entries on specific regions often highlight similarities and differences around the world. Fourth, entries include information and examples from diverse regions and countries. And, fifth, the contributors themselves come from all over the world.

The encyclopedia has almost 550 entries, totaling more than 625,000 words written by some 230 international experts. The Reader's Guide provides one way of navigating this comprehensive coverage. It highlights general topics, such as policy analysis, public-sector management, sociological theory, economic governance, democratic theory, security, and global governance. Each topic heading is followed by a list of the entries that address that topic.

User Aids

The right way to use the encyclopedia is, of course, that which you find most helpful and convenient. That said, two of the main ways of accessing entries on a given topic are to

- look up relevant words in the index and
- browse the Reader's Guide.

And two of the main ways of pursuing further study on a given topic are to

- follow the cross-references and
- read the books and articles listed as Further Readings and References.

Entries are arranged A–Z (although there are no entries for X, Y, and Z). They are cross-referenced when appropriate so as to guide readers to related material. Blind entries cover general topics that are dealt with in more specific entries, as well as specific topics that have common, alternative headings. As the editor, I have written both an entry on governance and a brief introduction that provides a more personal overview of the encyclopedia.

Acknowledgments

Introduction

Readers might want to ask, what is governance? If so, I suggest they dive straight into the encyclopedia. Let them turn first to the lengthiest entry—that on governance. From there, let them go wherever their curiosity leads. Perhaps they will explore various topics associated with governance, including public-sector reform, policy networks, new public management, and the hollow state. Perhaps they will look at theories of governance, including rational choice and interpretive theory, or specific concepts associated with these theories, such as prisoner's dilemma and tradition. Perhaps they will explore issues of public debate into which the language of governance has spread, including global governance or good governance. Perhaps they will look at the way governance is addressed within academic fields as diverse as public administration, organization theory, and economic sociology. I can think of no better way to learn what governance is than by exploring the contents of this encyclopedia.

Because the entry on governance offers a general account of the term, I will offer here some more personal reflections. Governance can seem to be just a new term for government. However, there are differences between them. Conceptually, governance is less orientated to the state than is government, and it evokes the conduct of governing at least as much as it does the institutions of government. Temporally, governance captures changes in government since the latter quarter of the twentieth century. Although these conceptual and temporal differences between government and governance are not exact mirrors of one another, they do overlap: The changes in the state are attempts to replace hierarchic, rule-bound institutions with interactive processes in markets and networks.

The concept of governance opens up that of government. It suggests that patterns of rule are not formal institutions based on fixed laws or norms. Rather, patterns of rule are changing practices arising from interactive processes. One attraction of the concept of governance is that it can remind us that collectively we do much to determine how we are governed, albeit that we do so with widely differing resources. Contemporary governance is something we produced collectively through our activities, and it is also something we might strive to reform through future actions. The encyclopedia includes entries that explain the ideas, bodies of knowledge, and traditions that inspired the actions by which people constructed the patterns of rule we now live under. It also includes entries that explain alternative ideas, bodies of knowledge, and traditions, all of which might inspire us to reform those same patterns of rule.

The language of governance informs contemporary practices of rule, while also giving us resources with which to challenge those practices. Consider the examples provided by two contributors to the encyclopedia. As scholars, practitioners, and citizens, they have written entries on the theory and practice of contemporary governance at the same time as they have been acting to remake it. Anna Schmidt is a political scientist who works on the role of local networks in implementing and thereby formulating an international refugee regime. Much of her initial fieldwork was undertaken among the Burundi refugees in Tanzania. Anna wrote entries for the encyclopedia on some of the theoretical concepts that inform her work, including embeddedness, regime, and social network theory. These concepts direct her studies of

the export of international, democratic norms and practices to political systems that are structured very differently. Anna's interest in such matters also appears in her employment as an election monitor for the European Union. She observed the elections in Burundi and the Ukraine, and when she submitted her entries to the encyclopedia, she was on her way to act as a monitor in Liberia.

Andrew McDonald is a senior official in the UK Civil Service where he provided the strategic lead on a wide-ranging program of constitutional reform. He was Constitution Director in the Department for Constitutional Affairs, with responsibility for the reform of the House of Lords, the establishment of a new Supreme Court, the development of human rights policy, the modernization of the electoral system, and the implementation of freedom of information. Andrew has also offered expert advice to various international groups. He advised the International Council on Archives on the legal implications of electronic records, and he acted as expert adviser to a Transparency International project to introduce an

information access regime to the Novgorod region of Russia. For the encyclopedia, Andrew has written a whole batch of entries on topics such as data protection, electronic records, and freedom of information. These entries include accounts of best practice. They draw on his experience of delivering relevant legislation. And they chart a path for future reform.

No doubt Anna and Andrew are unusual in the deliberate intent with which they seek to understand and change contemporary governance. Nonetheless— to reiterate—one of the advantages of the concept of governance is that it suggests we all contribute to the creation of patterns of rule through our diverse activities; we do so whether or not we know it. As readers explore the encyclopedia, they will learn more about the concepts, beliefs, and theories that inform contemporary governance. Perhaps they also will reflect on these concepts, beliefs, and theories in ways that will lead them to try to reform and improve contemporary governance.

—*Mark Bevir*

A

ACCOUNTABILITY

Although the term *accountability* has been in common use for several centuries, it has only recently become a key concept in discussions of governance and democratic government. Strictly speaking, it means that someone (X), who has been put in a position of responsibility (*r*) in relation to the interests of someone else (Y), is required to give an account (to Y) of how he has discharged his duties, and that, concomitantly, Y is in a position to either punish or reward X's conduct in relation to (*r*). Such a meaning would seem both precise and uncontroversial. Actually, this is no longer the case in either common usage or in the specialized literature.

Family Resemblances: Accountability, Responsibility, Liability

The term *accountable* originates from the Latin *computare:* to count. To be accountable required a person to produce "a count" of either the properties or money that had been left in his or her care. This meaning has endured in all those forms of accountability that are exercised through financial bookkeeping or budgetary records. But more discursive meanings of being accountable, in the sense of "giving an account," also emerged early in the history of the term. Accountability as an abstract noun therefore refers to both the capacity of, and the obligation on, someone to produce an account. Yet, it was not in political or legal discussions that accountability first developed as a term of art, or as a fully developed and self-standing concept. In politics and administration, responsibility was the technical term that was preferred to indicate the duty that persons in public authority had to "respond" in their conduct and actions as public officials. In law, liability was (and is) preferred to indicate that by doing a certain action (or entering into a certain contract), a person has put himself or herself under an obligation and is therefore answerable for the consequences following from that action (or from entering into that contract). Thus, for a considerable time, accountability was part of a family of words in English that covered a number of interrelated meanings that had to do with issues of political representation, executive and administrative responsibility, and, more loosely, legal liability. The relationships between and within these semantic fields, however, have lately been transformed, with accountability taking a life of its own.

Two facts stand to indicate the late emergence of accountability as a specific concept. One is its absence from dictionaries and encyclopedias until fairly recently (the 1980s). The other is the lack of precise equivalents in most other languages. This has been noted in the literature because of the internationalization of academic life and the increasing dominance of English as a lingua franca (particularly in international organizations). As accountability has acquired a more

prominent role in discussions conducted in English about governance, public administration reform and the quality of democracy, it has become evident how the semantic field covered by the various uses of accountability cannot easily be captured in other languages, where it was traditionally translated by a group of words that had a closer affinity to the term *responsibility*: *responsabilité* (French), *responsabilidad* (Spanish), *Verantwortlichkeit* (German). Interestingly, in the romance languages there is no specific word for liability either, which is similarly rendered by contextual uses of the equivalents of responsibility.

One interpretation of this peculiarity has been to suggest that English, unlike other languages, has developed the concept of accountability to capture at a semantic level a series of practices and institutional structures typical of democracies of the Anglo-American type. Such an interpretation fails to appreciate how closely interrelated the developments of the meanings of accountability and responsibility are in English. It also shows a lack of appreciation (or indeed basic knowledge) of the constitutional and administrative discourses and practices of other countries, where the conceptual elements conveyed by accountability were rendered by a different constellation of terms. It is, however, true—as this entry suggests—that recent developments in politics and management have contributed to the redefinition of accountability, and that, as this term has tended to acquire new connotations and normative force, attempts at a direct translation have become more problematic and, nonetheless, more imperative because of the increasing dominance of English as an international language.

Some Rough Distinctions

To understand the original applications of accountability, some distinctions may be in order. The first set of distinctions refers to the areas to which the idea of accountability may apply. Normally, accountability is said to apply to positions of public office. These comprise both political positions where representatives or people covering other institutional roles deal with public affairs in the name and interest of the

citizens, and administrative positions, where the link with the citizens is mediated by the government. The chain of accountability is different in the two cases, and so is the form that accountability takes. Political accountability is of a more inscrutable nature. In democracies, it depends, on the one hand, on the form and mechanisms of political representation, linking citizens to their legislators, and, on the other hand, on the formalized relationship between executive and legislative powers. Both types of political accountability rely on a rather weak power of control because the position of the "agents" in those two relationships is comparatively stronger in either their knowledge or their ability to control the agenda. Ultimately, legislators can be voted out of office by their constituencies, although governments can be brought down by parliaments (though this does not apply in presidential systems), but whether this is the result of the process of strict accountability for what legislators or governments do while in office, or of a more general political evaluation, subject to opinion's trends, by the electorate, remains a moot point. Administrative accountability is apparently more straightforward because it operates within a more definite hierarchical structure where there is a certain division of labor and competencies, and where both the content and the process of public decision making, and hence, the role played by individuals, can be examined in more detail. There is another area of political and administrative accountability that is concerned less with how well (or badly) public officials operate in the public interest, and more with whether they abuse their position of authority. Accountability is here concerned with reducing the opportunities for corruption, maladministration, or legal impropriety that come to people in positions of power. Political and administrative institutions have a series of mechanisms and internal instruments for policing abuses of power, but ultimately, accountability relies on more traditional legal instruments and the operations of the legal system and the courts at large. Much of the effectiveness of this kind of legal accountability depends on the nature of the legal system itself, as well as on the level of independence of the judiciary from political power.

The second set of distinctions regards the process of accountability. This is concerned with three different questions: who is accountable, to whom, and for what? In the case of political accountability, where this operates as a general mechanism through which citizens hold their legislators accountable through the electoral process, the questions who and to whom would seem straightforward. The answer to the question for what is less clear. Indeed, the relationship between the actions and decisions of politicians and their direct consequences is a matter of intense political contention. Besides, no simple mechanism can be devised to hold politicians and governments accountable for the series of often-unrelated decisions that they take during the period they are in office. The issue is somewhat simpler in the case of ministerial and administrative accountability because it may be easier to apportion responsibility and blame when dealing with more specific policy issues or administrative decisions, and when the chain of causes and effects can be more easily isolated from the context of other policies and decisions, and from the general circumstances of economic and social life. Even so, ministerial and administrative accountability is often easier to deal with (at least conceptually) in cases of maladministration than when trying to establish how well or badly people in public office have operated—an issue that, as we shall see in the following section, has become increasingly central to the definition of public accountability.

When dealing with administrative responsibility, the questions of who is accountable, and to whom, are rather complex. They suffer, respectively, from the problems that come from "many hands" and "many eyes." It is indeed often difficult to identify with precision where responsibility lies in decisions taken about complex problems in complex organizations. No single person would have been involved, and it is not easy to apportion either praise or blame if not in the most obvious instances. The principle of ministerial responsibility, often invoked in many constitutional systems, would suggest that responsibility moves upward, and that some degree of knowledge and intervention by people higher in the decision-making hierarchy would put on them, rather than on

their subordinates, the onus of responsibility and accountability. This is, of course, the theory. The practice of modern governments rarely conforms to such a standard, relying on the obvious (and occasionally self-serving) justification that too many hands were involved and that higher officials should not take the blame for operational mishaps. Moreover, it is often difficult to distinguish between political and administrative decisions, so that—as put forth by critics of the justifications adduced by the U.S. and the UK governments for the Iraq War—these combined failures tend to cover each other up, with no one ultimately being either accountable or taking the blame. A similar problem arises when we consider accountability from the reverse perspective of the identification of the people "to whom" officials (particularly in the public administration) should be accountable. It would seem that, in the most immediate sense, public servants are directly accountable to politicians and the government of the day. Yet, public servants' accountability to their political "masters," or to their superiors in the bureaucratic hierarchy, can only be justified as part of a longer chain making themselves ultimately accountable to the citizens and the public at large. This longer chain becomes both evident and problematic when dealing with issues such as whistleblowing, where the public interest is pitched against the duty of confidentiality in acts of government, and where "private" judgment is weighed against the role one has in the public chain of command and responsibility. Furthermore, as the traditional hierarchical structure of government becomes more diffuse, the problem of "many eyes"—who the "principals" in the accountability relationship are—becomes more acute.

Democratic and Public Accountability

Our understanding of accountability in government and public law has changed as the effect of two concomitant processes, concerning the quality of democracy and that of public management. Although the two processes have developed separately (and sometimes in opposite directions), they have had a cumulative effect on the uses of accountability. At a more

political level, the traditional forms of electoral and ministerial accountability have increasingly been regarded as limited instruments for controlling political power and making it responsive to the wishes of the electorate. Demands for more effective accountability have therefore tended to expand the instruments of political accountability, looking for ways in which political control can be exercised procedurally and in the course of decision making, and not simply ex post facto. One can observe three tendencies in such a process of expansion. The first is the importance given to both administrative transparency and citizens' right of information. By opening up the process of decision making to the public scrutiny, it is hoped that representatives and public officials will be forced to act in the public interest. The second is the introduction of various forms of more direct control or input from the citizens. Institutions such as the ombudsman, who can act as the direct voice of the individual citizen vis-à-vis the public administration, or the recall of public officials, which approximates to a form of imperative mandate, or the more frequent use of referenda on controversial issues are all ways in which public officials and public decision making in general are supposed to be brought into more immediate contact with the wishes of the citizens. More generally, the use of public opinion surveys, focus groups, and other forms of deliberative polling, though often intended for partisan purposes, are other ways in which politicians tend to connect with the citizens and consider their views. The third avenue taken in the expansion of accountability, particularly as a way of curbing corruption and regulating private interest in public affairs, has been the introduction of stricter standards of conduct and the development of various registers of interests. Whether the proliferation of such instruments for the regulation of private conduct has in fact achieved the scope of reducing maladministration is not clear, and it may ultimately depend on the cultural context in which regulation operates. Similarly, the extent to which public officials' private interests and private life are deemed publicly relevant, and therefore matters of public accountability, varies greatly across both space and time. The impeachment of President Bill Clinton is a

case in point, for his "misdemeanors" may well not have been considered constitutionally relevant in other places and other times.

Changes in administrative culture and practices have arguably been even more important as contributing factors in the transformation of both the concept and the institutions of accountability. The greatest impact has come from the paradigm shift introduced by the new public management. Whereas accountability in traditional public administration and administrative law mainly worked procedurally, being concerned with the regular and effective implementation of the substantive policies decided at the political level, the revolution in public management has shifted the emphasis to performance and policy output. This shift has meant a blurring of the distinction between political and administrative competencies, a distinction that has further been weakened by the way in which policy implementation has become more autonomous from the legislative process in modern complex societies, where social legislation takes a more substantive form. The new emphasis on the new public management, and on public administration's capacity to deliver good services to the citizens, has paradoxically inverted the roles of politics and administration in relation to accountability. Whereas political accountability has become more procedural, administrative accountability has become more focused on output. In principle, this has meant a greater autonomy for the public managers in the way in which they organize service provision, but also a greater reliance on a quasi-market form of accountability, where performance is judged, as in the market, by customers' satisfaction. In truth, however, this is not the whole story. For assessing performance and customers' satisfaction in relation to the public sector (which is still meant to provide public goods, even though in the form of privately enjoyed services) is not easy in the absence of standard market indicators such as profit levels, the equilibrium between supply and demand, hard budgets, and so forth. Hence, accountability has taken the form of a complex series of exogenous indicators of performance and output, such as "targets," "benchmarks," and various proxies for consumers' choice. Together with the proliferation of performance

indicators, there has also been a steady increase in monitoring and audit exercises, which in themselves require considerable effort and have considerable costs. In short, the emphasis on output and quasi-market–based forms of accountability has tended to increase, rather than diminish, procedural requirements.

The most evident conceptual innovation of these recent developments in democratic and public accountability is the change from vertical to horizontal conceptions. Whereas traditional accountability was based on the agent's obligation to give an account to the principal, and for the latter to judge the agent's conduct, both democratic and administrative accountability have developed a series of instruments that are meant to produce agent's accountability independently from the principal's judgment and action, though ostensibly in the principal's own interest. Guillermo O'Donnell, for instance, has introduced the notion of horizontal accountability, as a way of describing the operations of checks and balances that various nonmajoritarian institutions perform in democratic systems. Increasingly, particularly in the literature on democratic transformation, democratic accountability is meant loosely as an aspect of the quality of democracy, deriving not so much from the electoral process and from the enjoyment of political rights, but from the protection of individual rights in general, the rule of law, and the probity, openness, and performance of the public sector.

The New Governance Agenda and the Culture of Accountability

The other important change in present conceptions of accountability is their transmigration from the public to both the private and the "third" sector, and, at the same time, their application to the international and global sphere. This extension of what was a concept of internal public law to these new areas is the result of both the increasingly normative understanding of accountability as tantamount to democratic legitimacy and the recognition that globalization provides a different map of political power, where the nation-state and its institutions are no longer in full control of decision making.

The study of accountability in these new areas has only recently started. The extensive use of "regulation" and "delegation" that characterizes many democratic regimes after the neoliberal revolution of the last three decades of the twentieth century has causal links with the transformations of accountability described in the previous section. As more traditional public services areas have been privatized, there has been an attempt to devise institutions of accountability in a nonhierarchical environment by mixing mechanisms of voice (traditional in the public sector) with those of exit (more appropriate to the market). Moreover, the proper context for accountability has become uncertain because the borders between private and administrative law, on the one hand, and public accountability and legal liability, on the other, have become blurred; at the same time, the internationalization of regulation has created possible conflicts between constitutional and international law. Delegation of important areas of the economic and political process to nonmajoritarian institutions and to agencies of experts, both at the national and international levels, has contributed to new problems of accountability by moving it away from the hierarchical structures of law and politics in the nation-state to a networklike form of governance. Regulation, delegation, and internationalization have thus contributed to create new regimes of accountability where the new nonmajoritarian institutions of economic and political governance are seen as playing an important part in horizontal accountability, but also as being in need of control, to be made answerable to their own stakeholders or to the citizens of one or more nations.

The "circle of accountability" in which nonmajoritarian institutions are caught is also relevant to the role that nongovernmental organizations (NGOs) are playing in the new accountability regimes. The so-called third sector (or civil society organizations), particularly in the form of international NGOs and advocacy organizations, has increasingly taken on itself the task of monitoring the operation of both governments and intergovernmental institutions in relation to a number of fields where the rights of individuals and groups are concerned, or where international public goods, such as environmental sustainability, are at stake. But as the

role of NGOs has become more prominent as an instrument of accountability, they themselves have been made the object of new demands of accountability, which, however, involve the complex operation of identifying who are the "accountees": those who finance them, their membership, the professional workers running them, or the people whose interests are the object of the NGOs' activities. A similar conundrum also applies to the accountability of a number of international organizations mainly financed by developed countries, but whose purpose is to help alleviate poverty and welfare problems in poor countries.

Finally, there is the application of ideas and mechanisms of accountability to private corporate governance. Demands for corporate accountability are the effect of the disproportionate power that corporations wield in the modern world, affecting, both directly and indirectly, the life chances of millions, who, despite the great stake they may have in the corporations' decisions, have little or no chance to influence these decisions, either individually or collectively. Straddling the divide between private and public, corporate accountability has many faces. In instances of malpractice and illegal dealings, issues of liability apply. In other instances where legality is of no particular concern, issues of accountability still apply. In one specific sense, issues of accountability can be raised in relation to the rights of the small shareholders whose investments often make the bulk of the corporation's investments and finances, but have little influence on the corporation's boardroom and its decisions. In another sense, it applies to the employees whose bargaining power is insignificant vis-à-vis big international corporations. But it may also apply to clients, customers, and the millions of others affected by externalities, whose interests are unrepresented and who have no power of redress against decisions affecting their lives. Although in the first two instances (of shareholders and workers), more traditional mechanisms for accountability toward direct stakeholders can be easily devised (even though effective implementation is a different matter), in the latter case, the only proper redress seems to come from either governmental intervention or the action and campaigns of civil society groups. In this sense,

accountability is nothing different than a form of protest and resistance.

The issue of corporate accountability is revealing of what has been called the iconic status of the idea of accountability, which is often used in the generic rhetorical sense of "good and responsible" governance. This takes us back to the beginning of the recent history of the term *accountability* and how it has increasingly tended to assume some of the meanings more readily associated with responsibility. Indeed, some authors refer to external and internal accountability to distinguish respectively between those instances when there is a specific power of external control (a principal) over the person who provides the account, and those instances when there is not such an external power, and accountability relies entirely on some kind of internalization of rules of conduct, or on the identification of objective standards of good governance. This distinction raises the important idea that the recent progress of the culture of accountability may have obscured the crucial role that the culture of responsibility plays in good and democratic governance. One of the ways in which we can ensure that people in authority are accountable is also, and crucially, that they are, and feel, responsible, in the sense of treating the power they have over their fellow citizens (or other human beings in general) with the utmost seriousness. It would be wrong to think that accountability is a matter of institutions and mechanisms of control, whereas responsibility (in this subjective and moral sense) is only a virtue or disposition. In democratic societies, they can be thought as interlocking practices and institutions. In her 2002 Reith Lectures on trust in society, Onora O'Neill criticized some of the manifestations of the "culture of accountability" introduced by the new public management revolution across many professions as sapping trust in society. Instead of producing better government, the multiplication of control, regulation, monitoring, and exogenous indicators of performance across public life risked having the unintended consequence of creating mistrust, disaffection, and ultimately cynicism, undermining responsible conduct, and consequently accountability. There may therefore be something to be said in favor of keeping both

words and concepts alive, while stopping short from making accountability mean everything and nothing.

ACTION RESEARCH

Action research is best seen not so much as a methodology but, rather, as an overall approach to knowledge and inquiry. As such, action research has two faces: one is practical, concerned with providing processes of inquiry that are useful to people in the everyday conduct of their lives; the other is philosophical and political, part of a movement to change what is taken as knowledge in directions that are nondualist, participatory, and pragmatic. Action research is concerned with forging a direct link between intellectual knowledge and moment-to-moment personal and social action, so that inquiry contributes directly to the flourishing of human persons, their communities, and the ecosystems of which they are part.

Action research practices aim to open communicative spaces where people can come together in open dialogue to address issues of concern, and to engage in cycles of action and reflection, so that ideas that are tentatively articulated in reflection phases can be checked out systematically in phases of active experimentation. In more detail, we can describe action research by these dimensions:

Pragmatic

A primary purpose of action research is to produce practical knowledge that addresses issues of concern in personal and professional life. A wider purpose is to contribute through this to the increased well-being— economic, political, psychological, spiritual—of human persons and communities, and to a more equitable and sustainable relationship with the wider ecology of the planet of which we are an intrinsic part.

Participatory

Action research is a participative and democratic process that seeks to do research with, for, and by people; to redress the balance of power in knowledge creation; and to do this in an educative manner that increases participants' capacity to engage in inquiring lives. At a methodological level, participation is important because one cannot study and improve practice without the deep involvement of those engaged in that practice—the necessary perspective and information are simply not available—and one can only study persons if one approaches them as persons, as intentional actors and meaning makers. But participation is also an ethical and political process: People have a right and ability to contribute to decisions that affect them and to knowledge that is about them, and action research has an important place in the empowerment of people.

Many Ways of Knowing

Action research draws on a wide range of ways of knowing as we encounter and act in our world. This "extended epistemology" starts with everyday experience and is concerned with the development of living knowledge; it thus includes the experiential and the tacit; presentational forms drawing on story, theatre, graphic arts, and so forth; propositional knowing through theory and models; and practical knowing as expressed in skill and accomplishment.

Worthwhile Purposes

The focus on practical purposes draws attention to the moral dimension of action research—that it is not a value-free process but inquiry in the pursuit of worthwhile purposes, raising questions of values, morals, and ethics. Here there can be no absolutes; moral choice is always a matter of balance between competing goods. So in the practice of action research, we must continually ask what worthwhile purposes we are pursuing, and whether they continue to be appropriate and relevant.

Emergent Form

Good action research emerges over time in an evolutionary and developmental process, as individuals develop skills of inquiry, as communities of inquiry develop, as understanding of the issues deepens, and as practice grows, develops, shifts, and changes over time. Emergence means that the questions may change, the relationships may change, the purposes may change, what is important may change. This means action research cannot be programmatic and cannot be defined in terms of hard and fast methods but is in a sense a continually emerging work of art.

First-, Second-, and Third-Person Research

Action research has encompassed the individual, the small group, and wider organization and social entities. At an individual level—first-person research—action research has addressed questions of personal

and professional change, addressing questions such as "How can I improve my practice?" At the level of the face-to-face group, second-person action research has allowed people to come together to address issues of common concern. Current debate is focused on how action research can address issues at wider social and organizational levels, for example, through networks of inquiry and a variety of large-group processes and dialogue conferences as vehicles of inquiry.

Methodological Practices

These broad principles of inquiry are applied in practice with different emphases by the various schools and traditions. Included under the broad rubric of action research are variations including action science, action inquiry, appreciative inquiry, cooperative inquiry, participatory action research, and others.

ADHOCRACY

Adhocracy describes an organizational design whose structure is highly flexible, loosely coupled, and amenable to frequent change. The adhocracy arises out of a need for formal organizations able to recognize, understand, and solve problems in highly complex and turbulent environments. The concept is of recent origin. Alvin Toffler coined the term in 1970 to define an

emerging system of organization appropriate to a world of swiftly advancing technology, and societal impatience with the multilayered authority structure of the typical hierarchy. Henry Mintzberg more fully elaborated adhocracy as a type in 1979, arguing its status as an important addition to the well-known forms, such as the simple structure, the professional bureaucracy, and the divisionalized form of organization.

Adhocracy tends to be far less hierarchical than other formal structures are. This is for two reasons. First, because adhocracy's purpose is to address specific, often urgent problems that other organizational types have failed to solve, more decisional authority rests with highly trained technical experts whose reputations identify them as both skilled problem solvers and as unconventional. Second, the units and work groups of the adhocracy in which experts operate are fairly fluid. The adhocracy tolerates and sometimes even promotes ongoing changes in its subunits. Consequently, incumbent authority is accorded relatively less status in the adhocracy than in other formal organizations. Examples of adhocracy include most project or matrix organizations. Among private-sector organizations, high-technology firms—particularly young firms facing fierce competition—are sometimes organized as adhocracies. The survival of these companies depends on the success of decisionmakers in predicting which shifts in market conditions really matter, and what technologies and strategies need to be developed to respond quickly and effectively. Occasionally, among larger multidivisional organizations, one or more units may be constituted as adhocracies, whereas the other units, performing more routinized tasks, remain more hierarchical. Although most of the Xerox Corporation was designed as a typical multidivisional firm, its Palo Alto Research Center (Xerox PARC) was an adhocracy with a flat authority structure that functioned as a semi-autonomous, innovative research unit.

Public-sector adhocracies are not common, partly because of the emphasis placed on short-term accountability by political leaders. The managerial and technical units of adhocracies require a degree of autonomy that political masters seldom permit. However, important examples of adhocracy do exist in government. In its first dozen or so years, the National Aeronautics and Space Administration (NASA) functioned as an adhocracy. It was created in the wake of failures and bureaucratic turf fights by the branches of the U.S. military at the beginning of the space race. NASA was given considerable autonomy and a clear problem-solving mandate to land men on the moon safely within a decade. Similarly, the Defense Advanced Research Projects Agency (DARPA), created by the U.S. Congress as a "black box" research and development agency in the Pentagon (directly in response to Sputnik), is perhaps the best example of a federal agency in the United States designed as an adhocracy. DARPA's core task is to identify emerging innovative technologies critical to national security. DARPANET, which evolved into the Internet, was one of its creations. Other examples of public-sector adhocracies include government-funded arts agencies, such as Canada's National Film Board.

As a design, adhocracy is malleable and relatively nonhierarchical, rendering it suitable for addressing the complex and ill-structured problems in its environment. As long as those to whom the adhocracy is accountable regard its tasks as necessarily ill structured and critical, the unconventional nature of authority relationships and decision-making styles is tolerated. Over time, however, institutional leaders and governance boards often seek to reign in the discretion of decisionmakers in adhocracies. This generally happens when resources shrink, when the adhocracy makes serious errors, or when conditions in the adhocracy's environment are regarded as either quiescent or no longer critical. In any case, the work of the adhocracy is usually risky, and it often invites controversy.

Adversarial Legalism

Contemporary governance is pervaded and structured by law, judicial rulings, and the prospect of litigation. Yet even as law's domain expands and its density increases, legal institutions and processes vary considerably across nations. The concept of adversarial legalism stems from a typology devised by Robert A. Kagan to characterize this variation, and particularly to distinguish governance and legal processes in the United States from other economically advanced democracies.

Adversarial Versus Bureaucratic Legalism

In Kagan's typology, adversarial legalism is contrasted with bureaucratic legalism—a method of policy implementation and dispute resolution exemplified most clearly by Western European countries with a civil law tradition. In bureaucratic legalism, government agencies and courts are organized hierarchically. The emphasis is on uniform implementation of legal rules, centralized recruitment and supervision of politically neutral legal decisionmakers (judges, prosecutors, police officers, regulatory officials), and judge-dominated adjudicative processes. The influence of disputing parties and their legal advocates is muted. Judges are regarded as neutral "law-appliers," rather than legal policymakers.

Adversarial legalism, in contrast, is a style of policy implementation and dispute resolution in which litigation (or the threat of it) is common, as is judicial policy making. In litigation and adjudication, disputing parties and their lawyers play influential parts. Compared with bureaucratic legalism, authority is more fragmented. Those dissatisfied by governmental decisions can challenge them more readily in court. Whereas bureaucratic legalism emphasizes legal uniformity, adversarial legalism encourages judicial responsiveness and instrumental problem solving. American judges are popularly elected or selected through partisan political processes. Hence, compared with Western Europe, court decisions in the United States more often depend on whether a judge is politically liberal or conservative. Court outcomes also are affected by variability in the efforts and abilities of the disputing parties' lawyers.

The distinction between adversarial and bureaucratic legalism applies not merely to case-by-case decision making but also to modes of policy implementation. Thus, American lawyers and courts play major roles in making and enforcing legal norms concerning the practices of locally selected police and prosecutors—in contrast to the more hierarchical systems of Western Europe and Japan, where supervision is the responsibility of national or provincial police and prosecutorial bureaucracies.

Adversarial legalism and bureaucratic legalism are ideal types. Contemporary democracies use some mixture of both. Politically driven litigation sometimes occurs in countries primarily committed to bureaucratic legalism. In the United States, decision making in some government agencies reflects a mixture of bureaucratic legalism, adversarial legalism, and professional judgment. Because adversarial litigation is especially costly and fearsome, disputing parties in the United States negotiate settlements of most cases, both civil and criminal, before trial. Thus, adversarial legalism is not omnipresent in the United States—although it is more prevalent there than in other common law countries, including those (such as Australia, Canada, and the United Kingdom) that rely on the adversarial system of adjudication.

Causes

In the United States, adversarial legalism has grown from a political culture permeated by individualism, populism, and distrust of concentrated political and economic power. These attitudes have found

expression in the constitutional fragmentation of governing authority (federalism, separation of powers, local finance of municipal government), judicially enforceable constitutional rights, political selection of judges and prosecutors, and resistance to the growth of central government. In economic structure, the result has been a preference for private provision of many basic services and for open, competitive markets—which has fostered private litigation and legalistic regulation, rather than hierarchical control, to counter unacceptable business behavior. Beginning in the 1960s, adversarial legalism further increased because of the combination of (a) political demands for social and environmental justice, and (b) politically divided government and partisan mistrust of how new governmental regulatory powers would be deployed. To ensure that new welfare, anti-discrimination, environmental, and due process standards would be implemented by politically influenced administrative agencies, local governments, schools, and police departments, the new laws empowered businesses and advocacy groups to hold those bodies accountable through litigation.

Conversely, adversarial legalism has been far less prominent in polities where political authority is concentrated in national parliamentary governments with disciplined political parties and with strong, politically neutral national bureaucracies and corporatist bodies. There, internal administrative or political mechanisms, rather than lawsuits and judicial review, provide the dominant mode of accountability. Yet some of the same causal factors mentioned previously—growing distrust of government and fragmentation of political authority, privatization, and more competitive markets—have expanded the realm of judicial activity in countries traditionally dominated by bureaucratic legalism. In recent decades, constitutional courts have become prominent policymakers in many democracies, as has the European Court of Justice in the politically fragmented European Union. In the 1980s, Jeffery Sellers found that land use projects in France and Germany were challenged in (administrative) courts as often as in the United States. Nevertheless, the continuing strength of national bureaucratic states suggests that convergence on American-style adversarial legalism remains unlikely in most other countries.

Consequences

Based on the experience of the United States, adversarial legalism has both positive and negative effects. It encourages judicial flexibility and creativity, opening legal systems to new justice claims and to the values espoused by political and social minorities. Because of adversarial legalism, American lawyers, litigation, and courts have served as powerful checks on official corruption and arbitrariness, as protectors of individual rights, and as deterrents to racial discrimination and corporate heedlessness.

At the same time, compared with bureaucratic legalism and less formal modes of governance, adversarial legalism is a more complex, unpredictable, costly, punitive, and inefficient method of policy implementation and dispute resolution. Based on the American experience, adversarial legalism, though sometimes effective in advancing justice, also inspires legal defensiveness and contentiousness, impeding socially constructive cooperation, governmental action, and development projects. Precisely how to calculate and compare the positive and negative consequences of adversarial legalism, however, is difficult and contested.

Advocacy Networks

An advocacy network is a form of organization consisting of independent groups that collaborate in the pursuit of political change. Advocacy networks are made up primarily of nongovernmental organizations, but may also include individuals or groups from the public or private sector, foundations, academia, and the media. Nationally and internationally, advocacy networks focus on the mobilization, interpretation, and strategic dissemination of information to change the behavior of governments, private firms, or international organizations. Advocacy networks share many of the characteristics of social movements, but the latter are generally less institutionalized and more likely to use disruptive tactics. Although advocacy networks have long been an important force in domestic governance, the last two decades have witnessed their rapid expansion across international borders. In both domains, advocacy networks have become effective drivers of social and political change.

Unlike governments and firms, advocacy networks generally have limited access to traditional sources of power. Instead, advocacy networks rely on the strength of information, membership numbers, organizational structure and leadership, and symbolic power. Their organizational form is characterized by voluntary, reciprocal, and horizontal patterns of collaboration, which allows for flexibility, adaptability, and quick reaction to political exigencies. Advocacy networks are more likely to emerge where personal and working relationships among key individuals and leaders already exist.

The most important assets at the disposal of advocacy networks are information and communication. Information is deployed to change actors' perceptions, preferences, and ultimately their behaviors. Information is invariably a critical component of conventional and unconventional campaign tactics, including education and capacity building, public relations, petitions, lobbying, and product or producer boycotts.

Advocacy networks use information in three different ways. First, they generate and disseminate new or different information to change the underlying logic of a policy issue. Such information may revise the evaluation of an existing policy, increase the cost of an undesirable policy option, or change the public view of a key actor. Second, information can draw attention to new issues or reframe existing issues in ways that resonate with a greater audience; this often involves the creative use of symbols, performances, and narratives. Third, advocacy networks use information to enlist the support of allies that individual network members could not leverage on their own.

The success and tactics of advocacy networks depend significantly on the system of governance in which they operate. The nature of state-society relations (accommodation or repression), extent of direct democratic institutions (initiative, referendum, and recall), electoral system (majority or proportional), openness of policy-making processes, and access to political leaders significantly affect outcomes of advocacy network efforts. Where advocacy networks meet obstacles at the domestic level, they may expand their efforts to the international level.

African Governance

The term *African governance* refers to two salient trends in political analysis. First, the perceived crisis of African states has led observers to set out a range of models and prescriptions concerning political renewal or, less ambitiously, the reestablishment of centralized political order. Second, the generalized interest in governance has strongly shaped academics' understandings of state reform or renewal in Africa; the broad

governance agenda has provided the tools through which many researchers and institutions have made sense of state "crisis" and shaped a range of lending and policy interventions throughout the continent.

The Emergence of Governance in Africa

The term *governance*, and its more explicitly normative companion—good governance—entered political discourse concerning Africa in the early 1990s. This was an auspicious time for governance concepts to engage with African politics: The 1980s had witnessed the collapse of statist socialism (which had previously been a referent for some African states as a nonliberal or non-Western state form) and an increasing inability of African states to function as a result of economic recession and crippling levels of external indebtedness. Thus, from 1992, major European donors began to associate their aid allocation with good governance, meaning adherence to liberal models of political life such as the introduction of a multiparty constitution, the legalization of various kinds of civic association, and the introduction of more transparent and accountable procedures within state administration. The U.S. Agency for International Development (USAID), which had always had relatively "political" criteria informing its lending, re-emphasized democratization as a condition for aid. Finally, the World Bank adopted the term *governance* in its research literature and policy-based lending from the mid-1990s. Interestingly, the World Bank, directed by its Articles of Agreement not to intervene in the sovereign politics of its members, had to ensure that its operationalization of a governance agenda did not resemble the imposition of a specific model of polity upon African states. This rendered the World Bank's understanding of governance in Africa rather a technical affair, at one remove from the bilateral donor's more openly normative and culturally embedded exhortations to universalize the political goods of liberal democracy.

Thus, one can see that African governance, rather paradoxically, gained its entrée largely as a result of developments outside the continent. Governance became an international development policy, a global

set of political desiderata, and a set of conditionalities that accompanied aid and soft loan allocation. Nevertheless, developments within African countries intertwined with these international patterns, albeit in complex ways. All African states experienced significant turbulence during the 1980s and 1990s, one result of which has been the formal democratization of many states. New parties and civic organizations have emerged, some labor unions have regained their independence from state machineries, and religious and cultural organizations have gained greater public prominence in many countries. There is no easy way to make general comments on this diverse and complex bundle of political forces, but one important trend for our purposes is to note the selective incorporation of governance ideals into invigorated public realms.

Governance Politics in Africa

What have been the principal effects of governance politics in Africa? We can identify three key features:

1. Donors have become increasingly willing to intervene in the way states organize themselves and relate to their societies. Aid-dependent African states must at least make a public commitment to governance: Donor-funded anticorruption agencies, administrative reform programs, and externally funded technical assistance to introduce new forms of audit and record-keeping strongly shape the nature of state reform in many parts of the continent. In more extreme cases, external agencies have withdrawn funding from states that refuse to democratize or to deal with large corruption scandals or human rights violations.

2. A relatively recent civil society organization sector has emerged in many countries, largely concerned with rights, empowerment, and development. These organizations typically depend on external funding and work to monitor or pressurize governments to make specific rights demands.

3. A nongovernmental organization (NGO) sector has established itself as an auxiliary to government, providing social services such as primary education,

health care, agricultural development, or the provision of water. These NGOs are based in communities, notably around churches and mosques, and work independently of the government, or are contracted by the government to provide certain social services. Again, these African NGOs are often keyed to external networks, often working with partner international NGOs or the World Bank.

In sum, Africa governance has produced a novel form of politics, based in donor agendas of state reform, emerging liberal and civic advocacy groups, and nongovernmental service providers.

The Ambiguities of African Governance

African governance is far from straightforward, conceptually or in practice. What does it mean to promote a liberal form of political life largely through structures of external intervention and high levels of financial dependence? Although stopping short of coercion, governance programs can hardly be represented as a choice by African states or societies: There are no immediate alternatives, and the context of extreme indebtedness means that to displease Western donors is to risk the financial collapse of the state. Bearing in mind the normative centrality of freely operating agencies and the selection of one option from a range of choices to liberal tropes of politics, one might argue that the basic premises of liberalism are absent and that governance is largely fuelled by overbearing international Leviathans, whether people or governments like it or not.

This raises the issue of the genuineness of governance politics within African countries. Some states make a "show" or "perform" good governance to maintain flows of external funds; whether these reforms make any difference to ordinary people is another matter. Certainly, governance politics has largely remained an urban affair; in the countryside—where most people live—authority and political processes can be far removed from liberal ideals. Also, many NGOs and civil society organizations are reflections of African entrepreneurialism in winning external funds.

Donors, keen to support "new" civil societies, have funded so-called suitcase NGOs, which showcase themselves as an exciting new initiative, but function largely to give access to international patronage to middle-class adventurers who know governance-speak but know far less about the constituencies they claim to be empowering. There is also a question about the genuineness of the commitments of Western agencies: Evidence suggests that democracy and good governance are at best part of a broader agenda of intervention, which also involves considerations of security, economic interest, and relationships with governing elites.

Finally, to what extent does governance work as a political aspect of economic liberalization? Removing the state from the economy, establishing more robust property rights, opening economies to foreign capital, and promoting business organizations and their influence on governments are all partly issues of governance and economic liberalization. Given that economic liberalization in Africa was so unpopular during the 1980s, does governance legitimize *laissez faire* in African countries?

AGENCY

In the language of contemporary governance, agencies are independent administrative authorities that participate in running specific parts of economies and societies. More precisely, these bodies undertake analysis and make decisions to regulate economic and social issues for which steering by the "invisible

hand" of the market is judged to be either ineffective or inappropriate and where direct governmental intervention is considered undesirable. Indeed, to grasp the importance of agencies within a large number of today's polities, one must first understand their inextricable link with the growth of regulatory public policies. Only then can one begin to tackle the complex set of governance challenges created by the establishment and proliferation of agencies.

Agencies and the Politics of Regulation

Although often considered new phenomena, agencies first came into being in the 1870s in the United Kingdom and the United States as a means to referee and encourage economic competition in sectors such as the railways and electricity. During the next century, agencies grew in piecemeal fashion as quasi-governmental bodies designed to ensure laws and rules were respected even in areas such as the "quality" of broadcasting. However, in the 1980s—a decade marked by fundamental, neoliberal criticism of the role of public authority in the economy and society—agencies were given a new lease on life as a means of promoting the regulation of an ever-extending number of markets and sectors.

At the heart of the diagnoses of the failure of the state to intervene effectively in the economy lay a deep-seated critique of a redistributive type of public policy associated with the interventionist welfare state. Such policies had three principal characteristics. First, they frequently entailed a transfer of ownership of the means of production and the provision of services through the nationalization of industry. Second, economic planning was engaged in by governments to politically direct investment to key sectors or prioritized geographical areas. Third, governments intervened directly, and often heavily, in markets and sectors through systems of subsidies, quotas, and taxes to encourage certain policy outcomes over others. Since 1980, governments inspired instead by neoliberal conceptions of the economy and society have abandoned nationalization and planning while seriously tempering their respective forms of interventionism.

Indeed, in many if not most cases, interventions are no longer legitimized by the goal of redistribution but, rather, by highlighting how regulatory-type policies can bring about more efficient policy outcomes.

Agencies have thus been reinvented as a means of implementing a "new" approach to economic and social governance. This approach depends heavily on faith in the efficiency of markets as a means of distributing wealth and life chances. But it also recognizes that in some issue areas markets fail as a regulatory mechanism, thereby necessitating the intervention of bodies that must be expert in their respective fields and independent from political interference. Three types of market failure have frequently been tackled through the establishment of agencies: the emergence of monopolies (e.g., in the telecommunications sector), negative externalities (e.g., damage to the environment by intensive agriculture), or the production of deficient public goods (e.g., poor public health caused by unscrupulous food manufacturers). Agencies have been devised as an antidote to such problems either by becoming watchdogs that alert governments to the abuse of laws and regulations or by regulating governments themselves in the name of efficiency, consumer protection, and, less frequently, the citizen.

Challenges for Governance and Democracy

Today, if most public actors either champion agencies enthusiastically as defenders of the public good or, at the least, defend them reluctantly as a necessary evil, it is generally accepted that these bodies pose at least four series of challenges for governance and even for democracy.

The Thin Line Between Implementation and Policy Making

As specialists of public policy never cease to underline, a great deal of decisions about regulation are taken during the implementation of laws and policies. Consequently, most agencies are frequently called on to overstep the line and actually make policy, not least by developing doctrines and instruments with which to put into practice often vague primary legislation.

The Complexity of Regulation and Problems of Transparency

Many policy areas regulated by agencies are highly complex and possess large amounts of detailed legislation. Specialists therefore are needed within the agencies, but also within the public and private organizations that they regulate. At worst, interactions between these specialists can produce sets of rules that only they can decipher, thus excluding wide ranges of practitioners and consumer representatives.

Political Control and Democratic Legitimacy

Be it genuine or perceived, lack of transparency within agencies clearly poses problems for elected politicians in general and officeholders in particular. This problem is less acute in polities such as the United States, where public congressional auditions of agency representatives are commonplace. Elsewhere, however, and in Europe in particular, agencies often have less direct linkages to elected assemblies. Consequently, it is feared that these bodies will become autonomous of governmental structures and pursue either their own agenda or that of the dominant actors they ostensibly regulate.

Intersectoral Policies and Holistic Governance

Finally, excessive agency autonomy in turn begs the question of the capacity of contemporary public administrations to develop and apply coherent political goals across a wide range of economic and social sectors. This question has been raised, for example, in the European Union over the case of competition policy. Many actors consider that regulating competition should be taken out of the hands of the European Commission and given to a Europe-wide agency specialized uniquely in this issue area. Defenders of the Commission reply that this administration must continue to regulate competition because it alone has the necessary information and political legitimacy to ensure that decisions over this issue are made on the basis of values rather than just on the basis of legal or economic expertise.

In summary, studying agencies and their challenges provides a means of tackling the following crucial question: Is governance just revamped public management or a genuinely new form of politics?

AMERICAN GOVERNANCE

The American regime was not designed to secure efficiency. Rather, it deeply fragmented political authority and power to protect against the emergence of tyranny. As such, the U.S. constitutional structure divides authority between a central or national government and (now) fifty state governments. The Founders expected that each level of governance would prevent the potential usurpation of citizen rights by the other. If the federal government went too far afield and acted to deprive citizens of their rights, states could be expected to demand that it return to its rightful role. If one or more states denied citizens their rights, the national government could rein them in. In recent decades, for example, the national government has acted to ensure African American and disabled citizens their full political rights against frequent state-level claims to the contrary.

The nation's constitution divides political power via federalism and within the central government. The national legislature—Congress—was organized to allocate authority to two bodies, each of which was assigned specific functions. In addition, the House and Senate share responsibilities and powers with the executive authority or presidency. Third, neither the president nor Congress can act authoritatively without the assent of the other. Finally, both the executive and the legislature are subject to popular control through regular elections. The actions of each institution are also subject to review by an independent judiciary that is itself accountable to Congress and the president and to the rule of law. All these institutions are also subject to popular control through—at minimum—periodic elections. This assigns a vital role to the character or virtues of the voting population.

Indeed, for the nation's constitution to function as devised, voters need to exercise prudence consistently over time as they assess the claims of their leaders and would-be officeholders. Should voters fail to do so for any significant period, the cardinal aim of the regime, the freedom of its citizens, could be jeopardized. This basic requirement of democratic governance convinced political theorists for hundreds of years that popular rule simply was not possible. America's founders staked their hope that popular rule could occur in the United States on two anchors: a constitutional design that divided and shared power among multiple institutions, actors, and levels of governance and a belief that the nation's citizens could consistently choose prudent leaders and ensure that they acted wisely over time. The first secured against too-easy capacity to tyrannize whereas the second gave the body politic ultimate sovereignty.

Analysts of U.S. governance today have suggested that at least two basic challenges now test the ability of this political framework to deliver its desired results. Both are serious and both are linked ultimately to concerns about citizen capacities for thoughtful choice. The first might be labeled a crisis of legitimacy of the American state. Following the Vietnam War, the perceived failure of government action to remedy the ills identified by President Lyndon Johnson's Great Society initiative of the 1960s and Watergate, citizens grew increasingly disaffected with their public institutions. Indeed, by 1981, incoming President Ronald Reagan could declare famously in his first inaugural address that government was the major problem confronting society.

Reagan offered the market as a palliative to overcome the perceived failures of the regime. Since then, and reflecting widespread cynicism about governmental capacity at all scales to deliver desired results, voters have increasingly embraced leaders who offer the view that government's role in society should be displaced or augmented by private action. In a sense, this desire is not new because it is rooted in an always-rightful democratic concern that government not grow so large as to tyrannize. What is new, however, is the view that private agents, particularly market-centered ones, could and should displace the state in many domains of public service delivery. The national version of the administrative structures that result from these beliefs often resembles Rube Goldberg contraptions as, for example, when national grants are provided to the states with their varying political cultures, interests, and capacities, and states then rely upon localities or private agents finally to deliver services to citizens. The resultant extraordinarily complicated forms of policy action diffuse accountability widely.

The other major challenge to American governance identified by many recent analysts is the apparently waning interest of the citizenry in public and civic affairs. This trend is evidenced in declining levels of voter knowledge of American history, institutions, politics, and policies as well as in relatively low election-turnout rates and levels of participation in many civic organizations. These developments suggest a population that may not be as well equipped or inclined to judge its officials with prudence or to demand deliberative consideration of policy choices as may be necessary for the long-term health of American democracy. An ill-informed and unengaged citizenry deeply skeptical of the significance and efficacy of public action is potentially more subject to manipulation by the nefarious or by those who rationalize their self-interested policy or

political actions to themselves and others as necessary on grounds of ideology or other beliefs. Observers have argued that the relative lack of knowledge and engagement among large numbers of the nation's citizens may arise from the pervasive and privatizing influence of television, from an equally pervasive consumerism, or from the decline of the acculturating role of the nuclear family. Whatever the origins, lack of knowledge and disengagement represent a profound test of the capacity of the body politic to make and demand deliberative choices aimed at securing the rights and opportunities of all Americans for the future. The twin-barreled and related realities of declining state legitimacy and decreasing citizen knowledge of, and engagement in, political affairs now represent significant challenges to the U.S. system of governance.

ANARCHY

Anarchy is an ordered state of society without government and domination. Anarchists argue that domination opposes human interests and that all aspects of society should not be ruled by authorities, but can be voluntarily organized based on self-organization, self-management, self-government, bottom-up decision making, grassroots democracy, decentralized networks, free agreements, and free associations.

Anarchists see capitalism and the nation-state as limitations to self-determination, freedom, and the full development of human faculties. The basic idea of anarchism is that decisions shouldn't be taken by minorities but, instead, in bottom-up processes by all those who are affected by them. Utopian socialists such as William Godwin, Charles Fourier, or Robert Owen didn't call themselves anarchists, but anticipated the idea of a society without government. Pierre-Joseph Proudhon was the first scientist who systematically developed the idea of anarchism, defining it in 1840 in *What Is Property?* as the absence of a master, of a sovereign. There are different types of anarchist thought; the basic difference is the one between individual and collective forms of anarchism.

Individual anarchism stresses that domination limits the free development of the individual and that all domination should be abolished. This line of thought goes back to the ideas of Max Stirner, who advocated the supremacy of the individual, individual freedom and self-determination, the uniqueness of the "I," the abolition of all social and moral bonds on the individual, and an association of egoists. Another form of individual anarchism is Proudhon's mutualism, which is based on the idea of an equal distribution of private property among individuals.

Historically, collective forms of anarchism have been more influential than individualistic ones. Mikhail Bakunin considered capitalism, the nation-state, and religion as forms of domination that should be abolished. He described his approach as collective anarchism that is based on the idea that the means of production and the structures of decision should be controlled in collective processes of self-organization by communes that freely associate themselves in federations. The ideas of anarchy and communism as forms of society are homologous insofar as they both conceive a free society as a self-organized association where all human beings live in peace, wealth, and social security, where people can fully participate in society, which is based on the principle "to each according to his needs, from each according to his ability." The main historical difference between anarchists and communists that fuelled a controversy between Karl Marx and Bakunin and resulted in the

apparent that there was a strong structural asymmetry within the bloc, resulting in the three Northern states of Colombia, Ecuador, and Venezuela dominating intra-bloc trade with a market share of seventy percent. This distorted trade pattern was not helped by Peru's reluctance to engage fully in the first common external tariff project, persistent border conflicts between Ecuador and Peru, or the recession that struck Bolivia and Peru in the 1980s. The Andean Pact consequently languished as an ineffective integration movement until the increasing pressures of accelerating globalization in the 1990s forced a reaction from the member states. In an effort to cope with the pressures of the Free Trade Area of the Americas (FTAA) negotiations, the growing strength of Mercosur to the South, and the fragmenting nature of the international economy, the Andean Pact members signed the Protocols of Trujillo and Sucre, which in turn led to the birth of the Andean Community on August 1, 1997. The result is an open regionalist movement with defensive origins that seeks to exploit internal synergies to maximize the possibilities of external economic interaction. Despite the political will that the bloc's presidents have brought to the project, the central challenge that plagued the Andean Pact remains: geography. The member states are stretched along the forbidding terrain of the Andean Cordillera, a situation that is exacerbated by the parlous state of transnational infrastructure linkages. Although the Andean Community is devoting serious effort to improving transportation and energy networks, the combination of a lack of intra-bloc production chains and the distances between national production centers suggests that the bloc will have more importance in the future as a political coordination mechanism than as a dynamic engine for economic growth.

ANTIGLOBALIZATION

The antiglobalization movement is a new social movement that emerged at the turn of the millennium and that questions neoliberal globalization. It can be considered as a reaction to the frictions and stratifications that have been caused by neoliberal globalization.

Looking at definitions of globalization by important social scientists such as Anthony Giddens, David Held and colleagues, and Roland Robertson shows that they concentrate on quite similar aspects. Giddens portrayed globalization in 1990 as intensified worldwide social relations where local events are shaped by distant occurrences. Held and colleagues wrote in 1999 that globalization exemplifies interconnectedness of regions near and far, allowing for enhanced social-activity and power networking. Robertson noted in 1992 that the term *globalization* denotes both a compression of the world and greater consciousness of the world as an entity.

These definitions show that the central aspects of globalization are interconnection, intensification, time-space distanciation, deterritorialization, supraterritoriality, time-space compression, action at a distance, and accelerating interdependence. Globalization might be defined as the stretching of social relationships in space and time: A globalizing social system enlarges its border in a way that means social relationships can be maintained across larger spatial and temporal distances. Globalization is based on processes of disembedding, that is, the production of time-space distanciation of social relationships. Yet processes of disembedding are accompanied by processes of reembedding—processes that adapt the newly disembedded social relationships to local (temporal and spatial) conditions. Globalization involves the stretching of practices and structures that constitute social systems in time and space; it results in an increase of the intensity, extensity, reach, and velocity of social relationships; that is, there is a faster and wider flow of more artifacts, people, and symbols over networks across space-time. Disembedding and reembedding are interconnected processes that are an

expression of the dialectic of the global and the local. The global is based on the interaction of localities; the local is adapted to local circumstances. Robertson spoke of this with the term *glocalization* in 1994.

The common theme underlying Giddens's concept of disembedding, Manuel Castells's 1996 concepts of timeless time and the space of flows, and David Harvey's 1990 concept of time-space compression is that modern technologies such as the computer both accelerate social relationships and make them more flexible. The history of modern society is a history of globalization and of the technological acceleration of transportation (of data, capital, commodities, people) that makes the world a smaller place: Technologies increasingly mediate social relationships more efficiently so that distances appear to shrink. Technological progress has resulted in an increasing separation of the movement of information from that of its carriers; the movement of information gathered speed on a pace much faster than the travel of bodies. Transportation and communication technologies (railway, telegraph, broadcasting, automobile, television, aviation, digital computer-based communication technology, and most recently digital network technology) especially have increased the speed of global flows of capital, commodities, power, communication, and information. The earth has been increasingly transformed into a global communication network that affects all realms of society. Knowledge is today quite substantially detached from territorial space: It cannot be situated at a fixed and limited territorial location, it operates largely without regard to territorial distance, and it transcends territorial space. New knowledge-based technologies such as the computer facilitate the delocalization and disembedding of communication in the sense of the generation of spatial and temporal distance.

The dominant form of globalization is neoliberal globalization; there is a global hegemony of neoliberalism. Neoliberal policies aim at creating a framework for the economy that makes it possible to raise profits by minimizing the costs of investment, reducing social security, and preaching individualism. All subsystems of society are increasingly dominated and penetrated by economic logic, that is, the logic of commodities and accumulating finance capital. Aspects of neoliberalism include the following:

- The state withdraws from all areas of social life.
- The welfare state and collective responsibility are destroyed.
- Self-help, self-responsibility of the individual for his or her problems, and the capability of the market to regulate itself without human intervention are preached.
- Growth, productivity, and competition are presented as the only goals of human actions.
- Old ultraliberal ideas are presented as modern and progressive.
- Homogenization of money and finance markets under the dominance of a few nations.
- A kind of new Social Darwinism, which puts across the message that only the strong and remarkable survive in society and on the market.
- A permanent insecurity of wage and living conditions ("flexploitation"), an individualization of work contracts, and state assistance and state subsidies for large corporations are all established and institutionalized.
- Neoliberal ideologies claim that the economy is independent from society, that the market is the best means of organizing production and distribution efficiently and equitably, and that globalization requires the minimization of state spending, especially on social security.
- These developments are presented as something inescapable, self-evident, and without alternatives.
- The neoliberal state creates the legal framework for flexible wages and flexible working times.
- Collective bargaining systems are increasingly superseded by systems at a sectoral, regional, or company level.
- The state tries to facilitate capital investment and technological progress by subsidies, research and development (R&D) programs, funds, and institutional support.
- The state increasingly tries to activate entrepreneurial thinking by creating new forms of self-dependence and self-employment, reducing unemployment benefits and welfare, tightening eligibility criteria, installing sanctions and coercive activation programs (workfare, welfare to work).
- Pensions are increasingly cut and the retirement age lifted; private pension funds are encouraged.
- Universities are considered as enterprises and cooperation between universities and corporations is encouraged.

- Regulation is increasingly important on, and shifted to, the supranational, regional, and local level, and networks or links between cities, regions, and federal states are established (also on a cross-border basis).
- Certain state functions are shifted to civil society (neocorporatism).
- Public enterprises and services are increasingly privatized and commercialized.
- Welfare is increasingly shifted from the private to the corporate level.
- Transnational corporations introduce increasingly flexible ways of producing commodities, and they themselves are organized as globally distributed firms that are political as well as economic actors.
- The nation-state is transformed into a competitive state: There is competition for good conditions of economic investment between nation-states and, hence, nation-states are frequently forced to facilitate privatization, deregulation, and the deterioration of wages, labor legislation, and welfare policies to attract the interest of transnational capital. Whereas capital and transnational corporations operate at a global level, the state is forced to enforce political action at a national level.

There are both Right-wing and Left-wing antiglobalization activists. Extreme Right-wing groups such as the British National Party, the Nationaldemokratische Partei (NPD) in Germany, Front National in France, and the Austrian Freedom Party (FPÖ) see globalization as a threat to national economies and national identity and argue that the economy should be nationally controlled and immigration should be strictly restricted to guarantee national identity. Right-wing antiglobalism tends to argue that globalization is an ideology advanced by Zionism, Marxism, and Liberalism. Globalization is presented as a worldwide conspiracy against national identity, Western culture, or the White man. Such arguments frequently have racist and anti-Semitic implications. For Right-wing exponents of antiglobalism, neoliberal globalization is not the result of the structural logic of capitalism but, rather, the result of a conspirative political plan of powerful elites. These Right-wing exponents of antiglobalism don't argue in favor of an alternative globalization, but suggest nationalism and particularism as cures for the problems caused by the dominant form of globalization.

Far more important in number of activists and public attention than Right-wing antiglobalism has been Left-wing antiglobalism. It has come to public attention through protests such as at the gathering of the World Trade Organization (WTO) in Seattle in November 1999, at the gatherings of the International Monetary Fund (IMF) and the World Bank in Washington in April 2000 and in Prague in September 2000, at the G8 (Group of Eight) countries' gathering in Genoa in July 2001, and by annually organizing the World Social Forum in Porto Alegre as a counter event to the meetings of the World Economic Forum.

Capitalist logic has resulted in a global dominance of commodity logic and asymmetrical political power. Global economic and political capital flows and structures of decision making increasingly control the lives of humans. And money and power are considered as estranging and controlling forces. Left-wing antiglobalism can be considered in the terminology of Jürgen Habermas as a reaction to the increasing colonization of the life-world by capital and power. The term *antiglobalization movement* is misleading because the movement is not purely defensive and reactive but, rather, a proactive movement for global democracy and global justice. Hence, it can better be characterized by terms such as movement for an alternative globalization or movement for democratic globalization. The insurgency of the Mexican Ejército Zapatista de Liberación Nacional (EZLN) against impoverishment, neoliberalism, North American Free Trade Agreement (NAFTA), and land expropriation, and for freedom, dignity, justice, human rights, and democracy has resulted in the emergence of a global solidarity movement that uses the Internet. The EZLN has been characterized as the first informational guerrilla, and as the germ cell of the antiglobalization movement.

The movement is a transnational protest movement that is global in character and has a decentralized, networked form of organization that mediates the production of common values, identities, goals, and practices that transcend spatial and temporal boundaries. This movement communicates mainly with the help of the Internet, which is used to organize worldwide protests and online-protests, to discuss strategies, to reflect political events and past protests, and to build identities. Internet-based protest forms

that can be termed cyberprotest or cyberactivism, mailing lists, Web forums, chat rooms, and alternative online media projects such as Indymedia are characteristic of this movement, which has a high degree of openness, accessibility, and globality.

The movement is pluralistic and to a certain extent contradictory. Groups that are involved include traditional and autonomous labor unions, art groups, landless peasants' groups, indigenous groups, socialists, communists, anarchists, autonomous groups, Trotskyists, parts of the ecology movement and the feminist movement, Third World initiatives, civil rights groups, students, religious groups, human rights groups, groups from the unemployment movement, traditional Left-wing parties, critical intellectuals, and so forth from all over the world. This network includes groups from different social movements. It is a global network of networks, a movement of social movements, a universal protest movement, and a coalition of coalitions. It aims at reclaiming the common character of goods and services that are increasingly privatized by agreements such as General Agreement on Trade and Services (GATS) and Trade-Related Aspects of Intellectual Property Rights (TRIPS).

Michael Hardt and Toni Negri have used the term *multitude* to describe the antiglobalization movement as a whole of singularities that act in common, a decentered authority, a polyphonic dialogue, a constituent cooperative power of a global democracy from below, an open-source society, and a direct democratic government by all for all. The multitude, according to Hardt and Negri, is a wide-open, unrestrained network that promotes working and living in common.

Because of its structure and diversity, the movement is rather undogmatic and decentralized—it can't be controlled and dominated. The unity of this plurality emerges by the common mobilization against the neoliberal intensification of global problems. The different issues and concerns of the involved groups are connected because they all consider problems that have been caused by the logic of capitalistic globalization. The goals and practices of the movement are not homogeneous; there is a large difference between reformist and revolutionary activists and between nonviolent and militant methods of protest. Another difference concerns those parts that argue in favor of

the strengthening of the regulation of capitalism at a national level and those parts that want to put a global democracy in place of national sovereignty.

As a collective actor that is composed of many interconnected non-identical parts, the movement can as a whole be considered as striving for global democracy, global justice, and the global realization of human rights. The movement tries to draw public attention to the lack of democracy of international organizations and puts pressure to support democratization on dominant institutions. This global nonparliamentary opposition acts and thinks globally.

The movement is spontaneous, decentralized, networked, self-organizing, and based on grassroots democracy. The organizational form is an expression of the changing organizational features of society that is increasingly transformed into a flexible, decentralized, transnational, networked system of domination. Capitalist globalization has resulted in the constitution of a worldwide system of domination that is strictly shaped by economic interests. Hardt and Negri call this decentralized, flexible, networked global capitalistic system empire. Empire would be a global system of capitalistic rule; it would be based on a crisis of the sovereignty of nation-states, the deregulation of international markets, an intervening global police force, as well as mobility, decentralization, flexibilization, and the network character of capital and production. The emergence of a decentralized global empire has been challenged by a decentralized global protest movement that calls for global participation and global cooperation and suggests that the degree of democracy, justice, and sustainability of globalization should be increased. The organizing principle of the movement is one of global networked self-organization. For many of the activists, the protests anticipate the form of a future society as a global integrative and participatory democracy. The movement is a yearning for a society in which authorities don't determine the behavior of humans, but humans determine and organize themselves. The movement opposes globalization from above with self-organized forms of globalization from below.

Probably the most well-known antiglobalization group is Association Pour La Taxation Des Transactions Financières Pour L'Aide Aux Citoyens (Association for the Taxation of Financial Transactions for the

Benefit of the People, ATTAC), which exists in more than thirty countries. ATTAC, according to its Web site (www.attac.org), holds that financial globalization leads to a less secure and a less equal playing field for people, favoring instead the interests of global corporations and financial markets. The main demand of ATTAC is the Tobin Tax, a sales tax on currency trades across borders. At this writing, ATTAC claims more than 90,000 members in forty countries.

ARAB INTEGRATION

The concept of Arab integration broadly refers to efforts aiming to achieve closer cooperation and assimilation between different Arab countries and subregions. Depending on the context in which the concept is used, integration could be meant as political, economic, or institutional. The term has been used in various frameworks, and its meaning has evolved and shifted over time. Originally employed as part of a larger project aimed at unifying the numerous Arab countries into a single Arab nation, Arab integration has lately been discussed in strictly economic terms, often associated with efforts by Arab countries to liberalize their economies and connect with the global markets.

Pan-Arab Conceptions of Arab Integration

Arab integration was first employed within the discourse of Arab nationalism and parallel to the evolution of the Arab state system in the aftermath of World War II. The Arab nationalist (or Pan-Arab) ideology posited that the multitude of Arab states represents a coherent historical and political national community and that this nation should be realized within a unified Arab state. Following from that, Arab nationalists argued that the Arab nation is a natural unit that was artificially divided into unsustainable entities and that political and economic development can only be achieved through the rapprochement, cooperation, and, ultimately, the unification of these states. The League of Arab States was founded in 1945 as a tool for the realization of Arab integration and unity, even though in practice it was paralyzed by political divisions and institutional deficiencies. Furthermore, from the 1950s through the 1970s, several attempts were made to unify two or more Arab countries, most of which were discontinued. The most famous of these endeavors was the formation of the United Arab Republic, a political union between Egypt and Syria that lasted from 1958 to 1963. Other attempted unifications occurred between Libya and Egypt, Egypt and Sudan, and Jordan and Iraq.

In the late 1960s, the idea of Arab unity through political fusion was mostly abandoned as an immediate goal and new forms of Arab regional integration were initiated. This included the establishment of institutions promoting inter-Arab trade, cultural exchange, common industrial projects, common educational policies, and military cooperation. In addition, Arab states signed many bilateral agreements and formed

subregional organizations to facilitate trade and political cooperation. The most notable of these organizations were the Gulf Cooperation Council, the Arab Maghreb Union, the Arab Common Market, and the Arab Organization for Industrialization.

The idea behind these projects was to further economic and political integration within the system of existing Arab states in the hope of achieving greater political weight on the world scene and accomplishing economic objectives (that individual Arab states might not be able to realize). The rhetoric of pan-Arabism was not completely divorced from such attempts, and many of these institutions had the stated goal of achieving higher degrees of rapprochement and complementarity between different Arab states, which would eventually pave the way for Arab unity.

This latter notion of Arab integration differed from the traditional Arab nationalist model in several respects. First, it recognized the Arab state system and accorded a greater importance to the Arab states in the process of Arab integration, whereas the orthodox pan-Arab discourse viewed these entities as illegitimate colonial constructs and an obstacle to Arab rapprochement. Second, this notion implied a belief in an incremental route to Arab integration based on institutional cooperation that was greatly influenced by the experience of the European Community and the building of a common European market. Conversely, the orthodox nationalist view favored a more direct approach to Arab unity inspired by European cases of national unification in the late nineteenth century (especially those of Germany and Italy). Finally, the more recent notion of Arab integration believed in cooperation being designed and effectuated on the level of state bureaucracies and diplomatic agreements, whereas the Arab nationalist perspective believed in the promotion of Arab integration through mass movements and party politics.

Despite the multitude of institutions designed to promote Arab integration, autarkic economic policies and political differences kept the levels of Arab cooperation and trade at a minimum. Trade barriers were rarely removed, and the movement of people and goods between Arab states was often restricted. Inter-Arab regional trade never exceeded eight percent of the total of foreign trade in the Arab region in the past

four decades. Furthermore, the Gulf War of 1990 created deeper political divisions among the Arab countries and marginalized the Arab nationalist discourse.

Arab Integration as a Globalizing Tool

Since the mid-1990s, the concept of Arab integration has been revived within a different context. The wave of economic liberalization initiated by several Arab states and supported by international lending institutions has pushed Arab economies to lift trade barriers and liberalize monetary policies. In tandem with these changes in economic governance, international agencies—specifically the World Bank and the United Nations Development Programme (UNDP)—have been pushing for greater regional integration and trade as a step toward economic integration on the global level.

The market-oriented approach views regional integration as a necessary element for the creation of trading blocs that would allow individual countries to enter the global economy better prepared and under more favorable terms. Citing the experiences of the North American Free Trade Agreement (NAFTA), the Association of Southeast Asian Nations (ASEAN), and Southern Cone Common Market (Mercosur), the proponents of regionalization see these blocs as a useful tool for fostering the movement of capital and labor within a region, which would lead to lower poverty rates and the building of internationally competitive institutions.

Similarly, several regional institutions have been created to promote trade among Arab countries under the supervision and support of international agencies, most significantly the Greater Arab Free Trade Agreement (GAFTA), which aims at removing tariff and custom barriers between Arab countries and is being promoted as an essential tool to prepare for the introduction of Arab states into the World Trade Organization and the Euro-Med partnership.

ARMS CONTROL

Arms control is the adjustment of military forces given the capability and intent of a state's adversaries. Although the adjustment of military forces according to strategic ends has always been a part of statecraft, arms control did not become a coherent idea and a potential means of maintaining national security until the advent of nuclear weapons. The logic encapsulated under the term *arms control* originated among physical and social scientists involved in the development and implementation of nuclear weapons in the United States during the late 1950s and early 1960s.

The core assumptions of the arms control logic held by American proponents deal with the origin of interstate conflict and the impact of nuclear weapons. First, the cause of conflict between states is misperception of intention and behavior. Second, the scale of destruction incurred by those involved in a nuclear exchange precludes the possibility of victory. The first implication of these two assumptions is that cooperating with adversaries via treaties and conferences allows for communication, reduces the likelihood of misperception, and thus, decreases the chance for conflict. The second implication is that nuclear force structure should be designed and maintained to prevent an advantageous first strike while ensuring an invulnerable second strike. And the third implication is that advancements in technology providing a final nuclear advantage is unlikely, leaving politics as the best means of maintaining security in a nuclear environment.

Examples of prominent arms control agreements include U.S.–Soviet efforts to manage the nuclear arms race by signing and adhering to the Partial Test Ban Treaty, the Strategic Arms Limitation Treaty, and the Anti-Ballistic Missile Treaty. The Biological and Chemical Weapons Conventions represent multilateral treaties limiting nonnuclear weapons, although the Nonproliferation and Comprehensive Test Ban treaties are agreements at the center of contemporary international debates.

American opponents of arms control challenge the cause of military conflict and subsequently the effect of nuclear weapons on military planning. First, opponents assume conflict occurs when a state fails to develop the military capability necessary to make credible threats to its adversaries. Second, the potential for destruction on a scale unprecedented in the history of military affairs does not preclude political leaders from the obligation to plan for military victory. The first implication is that cooperation with adversaries only allows them to gain an advantage and thus invites attack. The second implication is that a nuclear force structure must provide the capability for a first strike or deterrent threats will lack credibility. And the third implication is that technological advances may provide the means for gaining military advantage and thus enhance national security.

ASIAN FINANCIAL CRISIS

The 1997 and 1998 Asian financial crisis began in Thailand and then quickly spread to neighboring economies. The crisis began as a currency crisis when

Bangkok unpegged the Thai baht from the U.S. dollar, setting off a series of currency devaluations and massive flights of capital. In the first six months, the value of the Indonesian rupiah was down by eighty percent, the Thai baht by more than fifty percent, the Korean won by nearly fifty percent, and the Malaysian ringgit by forty-five percent. Collectively, the economies most affected saw a drop in capital inflows of more than US$100 billion in the first year of the crisis. Unparalleled both in its magnitude and its scope, the Asian financial crisis became a global crisis when it spread to Russian and Brazilian economies.

A Crisis of Governance

The significance of the Asian financial crisis is multifaceted. Though the crisis is generally characterized as a financial crisis or economic crisis, what happened in 1997 and 1998 can also be seen as a crisis of governance at all major levels of politics: national, global, and regional. In particular, the Asian financial crisis revealed the state to be most inadequate at performing its historical regulatory functions and unable to regulate the forces of globalization or the pressures from international actors. Although Malaysia's controls on short-term capital were relatively effective at stemming the crisis in Malaysia and attracted much attention for Prime Minister Mahathir bin Mohamed's ability to resist International Monetary Fund (IMF)–style reforms, most states' inability to resist IMF pressures and reforms drew attention to the loss of government control and general erosion of state authority. Most illustrative was the case of Indonesia, where the failures of the state helped to transform an economic crisis into a political one, resulting in the downfall of Haji Mohammad Suharto, who had dominated Indonesian politics for more than thirty years.

Debates about the causes of the financial crisis involved competing and often polarized interpretations between those who saw the roots of the crisis as domestic and those who saw the crisis as an international affair. The economic crisis focused much attention on the role of the developmental state in East Asian development. Proponents of neoliberalism, who saw the crisis as homegrown, were quick to blame interventionist state practices, national governance arrangements, and crony capitalism for the crisis. Assistance from the IMF all came with conditions aimed at eliminating the close government-business relationships that had defined East Asian development and replacing Asian capitalism with what neoliberalists saw to be an apolitical and, thus, more efficient neoliberal model of development.

The early neoliberal triumphalist rhetoric, however, also gave way to a more profound reflection about neoliberal models of development. Perhaps most of all, the 1997–1998 financial crisis revealed the dangers of premature financial liberalization in the absence of established regulatory regimes, the inadequacy of exchange rate regimes, the problems with IMF prescriptions, and the general absence of social safety nets in East Asia.

Echoing these concerns were those who saw the crisis as a function of systemic factors. In contrast with neoliberal theorists who focused on technical questions, however, critics of neoliberalism focused on political and power structures underlying the international political economy. Mahathir's characterization of the financial crisis as a global conspiracy designed to bring down Asian economies represented the far extreme of these views, though his views did have some popular appeal in East Asia.

Mostly, the widely held perception that IMF prescriptions did more harm than good focused particular attention on the IMF and other global governance arrangements. The IMF was criticized for a "one size fits all" approach that uncritically reapplied prescriptions designed for Latin America to East Asia, as well as its intrusive and uncompromising conditionality. Fiscal austerity measures were criticized as especially inappropriate for the East Asian case and for prolonging and intensifying both economic and political crises. In addition to the criticism leveled at the technical merits of IMF policies, the politics of the IMF and the general lack of transparency of its decision making were also challenged. Limited East Asian representation in the IMF and World Bank underscored the powerlessness of affected economies, as well as their lack of recourse within existing global governance arrangements. Combined, the criticisms of the IMF diminished the prestige, if not the authority, of the

IMF, resulting in heightened calls for a new international architecture to regulate the global economy.

The Asian financial crisis also revealed the inadequacies of regional organizations, especially the Asia-Pacific Economic Cooperation (APEC) and the Association of Southeast Asian Nations (ASEAN), generating much debate about the future of both organizations. Criticism focused especially on the informal, nonlegalistic institutionalism of both organizations. However, though ASEAN has displayed greater receptiveness to institutional reform, informal institutionalism remains the norm with respect to regional forums in East Asia.

The crisis also has intensified other regional activities. In particular, unhappiness and resentment toward the IMF and U.S. handling of the crisis intensified interest and activity in an East Asian regionalism that excludes the United States. The most prominent example is the ASEAN Plus Three framework.

Last, the Asian financial crisis' significance for governance also played into debates about convergence versus divergence. East Asian governance at national and regional levels displays elements of both. Although global pressures clearly structure development in key ways, the persistence of certain domestic practices and relationships shows that there remains an important heterogeneity in the global system. The same can be said for the persistence of different regional institutional arrangements.

Asian Governance

Asian governance is an ambiguous and often-contested term used to describe or distinguish governance arrangements in East Asia (defined as Northeast plus Southeast Asia). In general, Asian governance refers to political systems and economic development defined by an interventionist state and corporatist political arrangements involving close coordination between public and private (especially government-business) actors. Governance in East Asia is distinguished by a personalistic and particularistic style of governance and capitalism that contrasts with the legalism, impersonalism, and universalism of Western liberalism and capitalism. Often associated with Asian authoritarianism because of the number of nonliberal democracies in East Asia, Asian governance is characterized as state-led and top-down, rather than grassroots and bottom-up in structure.

Values and Development Debates

Asian governance is part of larger debates about development and in particular the emergence of East Asia's "miracle economies" (Singapore, Korea, Taiwan, Hong Kong) and later the newly exporting economies of Thailand, Malaysia, and Indonesia. The term gained salience in the late 1980s and early 1990s because East Asia's economic growth challenged established theories of development. Questions about Asian governance arrangements also attracted attention because of both changing geo-economic and geo-strategic forces, in particular, sluggish U.S. and European growth and heightened post–Cold War attention to human rights concerns.

As an explanation for East Asian growth, Asian governance draws on both developmental state arguments about the necessary role played by interventionist states and cultural arguments about "Asian values," especially Confucianism. The tremendous growth of these economies has posed a special challenge to dependency theorists who identify structural obstacles for later-developing economies moving up the global economic hierarchy and in from the periphery. Proponents of neoliberalism offered contrasting criticism for the role played by interventionist states and praise for East Asia's embrace of, and integration into, the global economy.

Those who use the term *Asian governance* often draw on ideas about culture and specifically Asian values to explain economic development and authoritarian governance in East Asia. "Asian values" are generally understood to be a cultural preference for stable leadership over political pluralism, consensus over dissent and confrontation, communitarian over individualist values, duties and responsibilities over rights, the primacy of order and harmony over competition. It has been argued that Asian values facilitate a more activist or interventionist state. Such cultural-relativist claims are perhaps most associated with Singapore's former prime minister and senior statesman Lee Kuan Yew. According to the "Singapore school," Asian values provided a needed antidote against unrestrained capitalism of the West. In the early 1990s when Western economies were sluggish, those like Lee, comparing East Asia's dynamism with what they saw to be Western decline, further argued that Asian governance may be illiberal and authoritarian but at least it was governance that worked.

The relationship between culture and development is a contentious one, however, not least because it overgeneralizes a region that is extremely diverse. For example, Asian values are frequently associated with Confucianism despite the fact that states like Malaysia, which has played one of the more vocal and prominent roles in the Asian values debate, are not Confucian. Another common criticism is that if Asian values explain economic growth, then they must also explain periods of nongrowth and decline in earlier periods, for example, China during the nineteenth and twentieth centuries.

Nevertheless, until the Asian financial crisis in 1997 and 1998, the idea of Asian governance continued to feature prominently in discussions of East Asian development. In part, Asian governance remained mostly an elite discourse and reflected the self-interest of status-quo actors and states. Critics, for example, maintain that cultural arguments in defense of existing practices are a convenient tool of governments to ensure compliance, control, and conformity. On the other hand, such criticisms should not negate the larger point that governance and development may vary given important differences—timing and historical context of development, as well as culture—between Asian and Western systems. At the least, Asian governance challenges the widely held notion that economic development necessarily leads to liberal democracy.

It also must also be acknowledged that arguments about Asian governance—whether Asian values in domestic politics or Asian institutionalism (i.e., "the Asian way") in international politics—did have a broad appeal in the sense that they expressed a "rare pride in being Asian," as Khoo Boo Teik commented in 1999. After centuries of domination and emulating the West, Asian values and Asian governance expressed a sense that Asia too had something to offer in the way of models and historical development.

Governance After the Crisis: Asian Governance and "Bad" Governance

Asian governance had always had critics on both economic and political grounds. Even Lee Kuan Yew acknowledged that Asian governance suffered from important problems, with nepotism being a major one. Intertwined public-private relations can also make accountability difficult. The 1997–1998 Asian financial crisis, however, renewed and intensified external criticism and domestic reflection. Longtime critics of Asian development saw the crisis as vindications of both neoliberal development and liberal democracy.

Straying from its historical role and into debates about "good governance," the International Monetary Fund implicated Asian governance as "bad governance" in which the financial crisis was seen to be a product of Asian-style crony capitalism and a general lack of respect for the rule of law. It followed that democracy and neoliberalism were the cure for East Asia's economic troubles.

Attempts to equate Asian governance with bad governance should be treated with the same caution as those that attribute Asia's economic success entirely to culture. Just as levels and quality of development vary widely from state to state, so do levels of corruption. The crisis did provide strong impetus for leaders and elites in East Asia to reexamine their governance arrangements and to introduce economic and political reforms, but it is premature to conclude that the East Asian developmental model has been completely delegitimated. In East Asia, blame is leveled as much on the absence of effective (and democratic) global level governance arrangements as on arrangements at the national level. Mostly, Asian governance arrangements continue to adapt, while retaining some of their distinctive characteristics. Local mores and local expectations about the importance of social obligations, for example, will continue to filter external influences and pressures.

ASIA-PACIFIC ECONOMIC COOPERATION

The Asia-Pacific Economic Cooperation (APEC) is a multilateral economic organization. It aims to enhance economic cooperation among its member states and, in particular, to improve trade and facilitate investment throughout the Asia-Pacific region. Its twenty-one members are Australia, Brunei, Canada, Chile, China, Hong Kong, Indonesia, Japan, the Republic of Korea, Malaysia, Mexico, New Zealand, New Guinea, Peru, Philippines, Russia, Singapore, Taipei, Thailand, United States, and Vietnam. Collectively these states control some 47 percent of world trade and create some 60 percent of world gross domestic product.

APEC was formed in 1989, and its secretariat (administrative branch) was established in 1992. The creation of APEC was controversial. Critics argued that the Asia-Pacific was already the most economically advanced region in the world and that the creation of APEC would further increase its dominance to the detriment of other parts of the global economy. Supporters claimed that the creation of APEC would help renew economic alliances between the United States and East Asia following their fracturing during World War II and the Cold War.

Many commentators describe APEC as one of the trading groups that constitute a new pattern of regional governance in the international economy. Yet APEC differs from many similar bodies, such as the Association of Southeast Asian Nations, in that it relies on nonbinding commitments rather than obligations established by formal treaty. Some commentators have described this voluntary and consensual approach as a kind of open regionalism. Critics argue that APEC and its policies are thus ineffectual and irrelevant. They have even described it as "transregionalism without a cause" and suggested that it lacks the institutional basis needed to be a major economic grouping and to implement and enforce its policies. In contrast, APEC's supporters argue that a loose confederation is sufficient to accomplish its goals, especially the Bogor Goals for Free and Open Trade and

Investment, which require the removal of trade barriers by 2010 for industrialized member states and by 2020 for poorer or developing countries.

ASSOCIATION

An association is any group of individuals that exists for a shared purpose. Associations can be formal organizations such as labor unions and business groups, or they can be informal organizations such as charity leagues, social clubs, and cultural groups. The sum of associations within a state constitutes what is generally referred to as civil society.

Although some academic literature has paid attention to associations in nondemocratic regimes, most scholarship has examined how associations facilitate or hinder governance in a democratic context. This entry will provide a partial survey of the literature on associations in democratic regimes.

Models of Democratic Order

In their principles of organization, associations are so varied that broad comparisons are difficult to make. They may be governed according to either formal or informal procedures. Associations may be organized either along strictly hierarchical lines or based on more egalitarian principles. Decision-making power may be either centralized in one body or decentralized according to different tasks.

Some scholars suggest that participation in associations is an important element of democratic societies because it inculcates citizens with democratic values. Through experience with the democratic rules that govern membership and representation in many associations, citizens learn to value broader constitutional rules. Through group activities, participation in associations teaches citizens how to engage in public debate and cooperate with one another to accomplish shared goals. Associations help citizens develop basic civic values by teaching them to value public goods in addition to purely private individual interests, by helping them to develop a sense of trust in each other, and by teaching them to value political equality. The nineteenth-century French philosopher Alexis de Tocqueville praised the high degree of associational membership in American society as creating an exceptionally high degree of "civic virtue" among American citizens.

Recent literature on civic engagement in the United States highlights a significant decline in the traditional associational life of American citizens since the mid-twentieth century. Most famously, Robert Putnam expressed concern that the decrease in regular face-to-face interaction among individuals through participation in civic associations has produced a tear in the American social fabric. More specifically, whereas civic associations once put Americans in the regular practice of good citizenship, the decline of associational life has eroded Americans' ability to work together to achieve community goals. This rise in individualism has led to increases in crime and political corruption, as well as declines in community and individual health.

More optimistic accounts of modern civic engagement in the United States suggest that news types of affiliations are replacing traditional forms of membership associations. Most prominently, Theda Skocpol argued that associations have not experienced decline but, rather, an evolution into advocacy organizations. An increase in federal and philanthropic funding for associations has decreased the reliance of associations on membership dues. In response, associations have become more professionalized, centralized, and

advocacy oriented. Although the new types of organizations do not require active participation by individual members, and some do not have members at all, they are working to bridge class, racial, and gender divides on a national political scale. At the individual level, Skocpol suggested that communication through the Internet may be replacing the face-to-face interaction once provided by membership in civic associations.

Political Interest Intermediaries

A large body of literature also highlights the role of associations as intermediary organizations that link individuals to political leaders. This literature focuses on "interest associations" or "interest groups," which are associations whose goals involve making political claims. In the political sense, associations are vehicles that channel citizen interests into organized political demands, both by shaping public opinion around an issue and by influencing policy decisions.

One group of scholars views democratic pluralism—the diverse array of interest associations operating to influence politics—as the key to the functioning of American democracy. They share the basic assumption that associations broaden the spectrum of interests that would otherwise be represented through the democratic electoral process, and they see the role that associations play as necessary for citizens to fully exercise their rights in a democratic political system. Similarly, pluralists highlight the role that associations play in protecting members of society against abuses of power by the state, by giving a concentrated voice to minorities, and by providing a mechanism for citizens to form a political response when the state threatens their interests.

At the same time, not all associations embody civic virtues. Most famously, James Madison in the *Federalist Paper #10* warns of the danger of "factions," which he defines as citizens united by some common interest that opposes the rights of other citizens or the aggregate interests of the community. What then prevents factions from dominating the democratic political process? Pluralist scholars such as Arthur Bentley and David Truman argued that groups will naturally check each other's influence by

mobilizing in response to new radical influences. In the same way that groups emerge to protect citizens against the abuse of state power, individuals will also form new associations in response to radical societal groups that threaten their common interests. Consequently, in a pluralist society, so many kinds of associations represent such a wide variety of interests that no one association can dominate other interests. Pluralist scholars also emphasize the constraining role of public opinion, which they consider a large potential group that can mobilize to mitigate radical influences.

However, several prominent scholars have questioned the capacity for public opinion or "potential groups" to protect against radical influences, arguing that collective action depends not just on grievances but also on the availability of resources. Most famously, Mancur Olsen coined the "free rider" problem, which he defines as the natural inclination of individuals not to participate in group activity when they are likely to receive the benefits regardless of their individual participation. In contrast to pluralist scholars, Olson suggests that people's behavior is motivated more by individual interests than by group interests, and consequently, despite the presence of political grievances or threats posed by factions, interest associations will not form unless their leaders also provide individual incentives to join. This argument suggests that a large number of interests will never achieve political representation in the American democratic system for lack of resources, and it has led a number of scholars to examine whose interests are represented and whose are excluded from the American interest group system.

Stratification theorists such as E. E. Schattschneider and C. Wright Mills pointed out an elite bias to the group of associations that wields political power in the United States, suggesting that the interest group system tends to replicate and exacerbate societal inequalities by representing only the interests of the already powerful. According to stratification theorists, the American interest group system privileges economic, military, and political elites over the rest of society, in addition to privileging the interests of large corporations over small businesses and consumers.

Pluralists, however, counter that many different kinds of resources are available to citizens who want to influence politics and that almost everyone has access to some type. Consequently, pluralists argue, the relevant division in the interest group system lies not between the haves and the have-nots but, rather, between those who are interested in politics and those who are not. Robert Dahl labeled these two groups *homo politicus* and *homo civicus,* and he suggests that *homo politicus* is just as likely to exist at every income level, although it is always a small minority relative to *homo civicus.* Nelson Polsby further argues that skills, education, and hard work play key roles in the movement from *homo civicus* to *homo politicus.*

Another group of pluralist critics argues that an overabundance of interest groups has produced gridlock in the American policy-making process. According to these scholars, such as Theodore Lowi and Jonathan Rauch, a major problem with American democracy is the large number of organized interests that are entrenched in the political system, all of which lobby to protect their pet programs. New government programs catalyze the organization of constituencies that mobilize to protect, preserve, and expand their new entitlements. As the size and scope of government purview has expanded, so too has the number of and power of associations campaigning to protect the status quo, leaving the government little room for policy innovation.

Neocorporatism

Scholars who focus on the Northern European political context suggest, however, that coordination among interest associations, and between associations and the state, may increase the effectiveness of governance in times of economic crisis. In contrast to democratic pluralism, the neocorporatist system of interest intermediation limits the number of claims that are made on the state. Under this system, a small group of labor and business associations enters into a formal bargaining relationship with the state to negotiate the outcome of macroeconomic policies. According to scholars such as Philippe Schmitter, Gerhard Lembruch, and Peter Katzenstein, restricting the range of competing interests at the political bargaining table facilitates effective negotiation, and furthermore, formalizing the special relationship between a select group of interests and the state encourages both business and labor associations to occasionally sacrifice short-term interests for long-term political or economic gains.

Despite the fact that neocorporatism narrows the spectrum of demands made on the state, these scholars point out that a sense of broad political representation is maintained in Northern European countries. Most importantly, each individual association that is selected to participate in policy making typically represents a wide range of political and economic interests. With respect to labor, the encompassing associations that bargain on behalf of all workers constitute umbrella organizations that hold together a highly coordinated and hierarchically organized alliance of smaller unions. The need to unify the interests of labor from a diverse array of economic sectors encourages unions to balance the alternative costs of different economic policies against each other before formulating their demands on the state. By deradicalizing the demands of labor, neocorporatism facilitates policy reform and innovation. Thus, a significant number of scholars suggests that neocorporatist bargaining systems have allowed the small economies of Northern Europe to adjust rapidly and effectively to global economic shocks.

Authors such as Schmitter, however, point out that several characteristics of the state and society are critical to the neocorporatist bargaining system. A strong and relatively autonomous state is needed to prevent the overaccumulation of power by associations, which according to some scholars characterizes the American political system. An organized and autonomous society is necessary to facilitate negotiation with the state and to check the power of the state. For example, Southern Europe and Latin America throughout much of the twentieth century were characterized by the combination of a strong state and weakly organized society. In this context, corporatism functioned as a way for the state to co-opt interest groups into an unequal bargaining relationship, demanding the political cooperation of labor in return for only minor or symbolic concessions.

Associational Networks

A nascent strain of literature is beginning to suggest that the twin forces of globalization and decentralization are disintegrating corporatist alliances. According to this literature, loose networks of associations are emerging that form alliances among themselves and with the state around specific issues. This system of interest intermediation lies in stark contrast to the corporatist system of bargaining in a number of ways. First, alliances are temporary, formed around specific short-term goals. Second, the coordination between interest groups tends to be informal and less strictly hierarchical than are corporatist alliances. Finally, state-society negotiations tend to be decentralized, either divided among relatively autonomous government bureaucracies or among state and local governments.

In the developing world context and particularly in Latin America, some scholars promote associational networks as the new alternative to the exclusionary corporatist system that predominated in the earlier part of the century. These authors suggest that interest associations may be expanding political representation to include a broad swath of societal interests that were previously excluded from politics. However, other authors suggest that national and interventionist international organizations have responded to these societal alliances by creating new political institutions to co-opt them. At the same time, one outcome of the decentralization of policy making has been to produce broad subnational variation in the kinds of political alliances that form, both among associations and between associations and the state. Thus far, the degree to which these emergent associational networks represent a more egalitarian form of interest intermediation or a repetition of the cooptation that characterized the old corporatist system remains unclear.

ASSOCIATION OF GOVERNMENTS

See COUNCILS OF GOVERNMENTS

ASSOCIATION OF SOUTHEAST ASIAN NATIONS

The Association of Southeast Asian Nations (ASEAN) was founded in 1967. Founding members were Indonesia, Malaysia, Philippines, Singapore, and Thailand. Brunei joined in 1984, Vietnam in 1995, Laos and Myanmar (Burma) in 1997, and Cambodia in 1999. Though not a military alliance, ASEAN is best characterized as a political-security organization

focused on regional stability-mitigating intra-regional tensions, self-strengthening, and preventing foreign intervention or interference. Early efforts at trade and industrial cooperation were limited, but intra-ASEAN trade liberalization efforts have intensified since the late 1980s.

ASEAN has been distinguished by its quiet diplomacy and informal institutionalism, especially its avoidance of binding agreements, the relative absence of conflict resolution mechanisms, and its preference for consensual decision-making processes. ASEAN's informalism is related to its norm of non-interference, considered one of ASEAN's defining norms and certainly an early point of agreement among members. These norms and practices are often characterized as the "ASEAN way."

As exemplified by the works of Michael Leifer, early scholarship has tended toward realist themes—the influence of great powers and great power conflict on regional processes and narrowly conceived national interests as the explanation for ASEAN's informal institutionalism. Realist explanations have been challenged by constructivist accounts that focus on the normative foundations of regional order and the role of ideas, culture, and process in shaping ASEAN's institutional and security practices. ASEAN's security community status has been a particular preoccupation of constructivists like Amitav Acharya.

In debates about regionalism, ASEAN contrasts with the legalistic, formal institutionalism associated with regional arrangements in Western Europe and North America. ASEAN's informalism, which also characterizes wider regional arrangements (e.g., Asia-Pacific Economic Cooperation [APEC] and the ASEAN Regional Forum), has also been a source of tension between ASEAN states and other actors, especially the United States. These tensions have generated contrasts between the process-driven ASEAN way and the results-oriented American way.

Noninterference has received particular attention and recent criticism for limiting the organization's efficacy in managing regional affairs and for sheltering member governments from scrutiny. Troubles regarding the political instability and human rights situation of new members (Cambodia and Myanmar), domestic

changes (democratization, the rising influence of societal and transnational groups, globalization) in the politics of old members, as well as a series of crises (most notably the 1997–1998 Asian financial crisis) have strained ASEAN's state-centric regionalism. These problems have also contributed to the development of "Track III" processes involving societal groups (domestic and transnational) that parallel more established "Track I" (formal or official) and "Track II" (academics and think tanks) processes. Questions, however, remain about how much societal groups will be able to penetrate the formal decision-making process.

AUDIT

Audit performs an assurance and accountability function over the use of public resources and the veracity of financial accounts. Audits are undertaken to provide information about resource management and accounting to higher authorities and the electorate to enable them to have confidence that public resources have been used properly and effectively. Today, government auditing consists of two interrelated systems of review—public audit by external agents, and internal audit by agency management. In both cases, auditors report to a responsible authority (such as a democratic legislature, governing board, or a management team).

External auditing (generally regarded as the most important) involves the official examination of the public accounts and financial transactions by designated personnel who make their findings public. The duty of external auditors is to examine government finances to ascertain their validity, accuracy, and comprehensiveness. Crucially, although these audit officials often remain government employees, they are institutionally separated from the operational spheres of executive government (and may be supplemented by private audit firms). Once the public accounts are audited, they are, thus, externally verified and certified as true and correct.

External auditors have wide powers of search and information gathering—covering ministers and officials, documents and records, contracts and purchasing arrangements, premises and facilities, and stock or other stores. Auditors have access to virtually all government documents (even cabinet papers, commercial in-confidence information as well as performance and financial information generated and held by government agencies). They monitor and check whether public money was properly collected and recorded (legal taxation and receipts) and properly spent (legal appropriation). The auditors attest that government accounts and in-year transactions are accurate, fully recorded, and properly supported by documentation and that the final statement of accounts gives a true representation of the end-of-year government finances ("true and correct statements"). Auditors also provide opinions about whether government has adhered to the appropriate accounting standards and conventions. A key responsibility of the auditor is to uncover fraud, financial corruption, and maladministration and, if any fraud or deception has been uncovered, to make sure that it has been exposed and rectified. In many jurisdictions, these officials may also inquire into the efficient and effective use of public resources. Their assessments enter the public domain principally through reports or briefings to the legislature (and by working closely with legislative committees such as public accounts committees).

Internal audit, by contrast, concerns the monitoring of resources within public agencies by internal staff specially selected to perform this function. The importance of internal auditing has grown in recent decades, and it now usually constitutes part of the initial phase in the external auditing function. The internal audit function is now a vital aspect of modern corporate governance frameworks. Internal auditors verify internal revenues and expenses and assist external auditors with data, investigations, and reports. Although internal auditing is a management function (reporting issues to boards or senior management for information or action), it can also alert external auditors to problems or issues within the organization, as well as follow up or prosecute issues raised by external auditors over subsequent periods.

In most countries, the external audit function is governed by various separate statutes (audit acts, financial accountability acts, performance acts) that stipulate basic requirements about transparency and regularity, detail the appointment and dismissal of the principal auditor, outline the duties and powers of audit officials, and sometimes provide detail about how audits shall be conducted. These acts also stipulate requirements to be followed by public officials and agencies. Generally, the supreme audit official is a statutory officeholder, who enjoys certain legal rights and protections and has a degree of operational independence from the executive. These officeholders are variously termed the *auditor general* and *comptroller general* or combinations of the two.

Traditionally, the officeholder has been supported by a specialist agency, secretariat, or department—usually called the national audit office or general accounting office—that is either an arm of the legislature or a specialist executive agency reporting to the legislature. These audit officeholders typically report to a specialist audit committee of the legislature (public accounts committee or audit committees). Audit offices usually develop specialized divisions, depending on the types of audits performed or mirroring approximately the structure and functions of government itself.

In recent decades, many government auditors have actively sought the assistance of private accounting firms to perform the audit function of government (contract auditing), rather than relying solely on their in-house audit services. This helps spread the demanding workload and assists government auditors to

develop close working relations with other auditors—possibly leading to improvements in the skills and capacities of both parties. Where private auditing firms conduct audits of government bodies, these audits are first presented to the government auditor for inspection and, if that auditor concurs with the findings, are then forwarded or included in reports to the legislature. Many private audit firms are also contracted to perform internal audit roles by government agencies.

In most advanced democracies, the external audit function is carried out ex post facto—namely, after the expenditure or transactions have occurred and been expended. However, in some Asian nations, simultaneous or continuous audit is practiced as expenditures are occurring (e.g., over large infrastructural projects). Essentially, ex post facto auditing is a form of retrospective checking to verify compliance with approved procedures and practices (the term *compliance audits* is often used to denote this approach). It also means that any errors, system failures, or recommendations for change may not be brought to the public's attention until as long as two years after the event or decision occurred. This relatively long timeline can limit the effectiveness of ex post facto audits. By comparison, internal audits are generally performed in a more timely manner and, although the reports are not made public, the findings may be more effective and acted upon by management in proximity to the actual events or transactions. Both dimensions of audit are important to a holistic audit review and changing behavior in government agencies.

In the history of auditing, the audit function did not begin as an independent, external verification of government finances—it was performed in-house by treasury officials. In the *Ancien* monarchies, the exchequer and auditing functions began as a means of establishing accurately the magnitude of the royal treasury, verifying the state of the books and reconciling payments and receipts from the royal treasury. It was practiced at the heart of government by the most trusted senior officials of the monarch, in some cases (e.g., ancient Egypt) in a special language or using codified symbols. In republics, the audit function performed the role of verifying to the people the financial probity of their governments—but again, historically,

by internal officials. By the eighteenth and nineteenth centuries, in both constitutional monarchies and republics, early auditors were often located within the executive departments of government—most notably the treasury departments. Auditing then was essentially an internal form of checking and verification, and ensuring that the money was present to finance the activities of the crown or government. But gradually, nations considered it more appropriate to separate the auditor and audit staff from the direct control of the executive. Various provisions were put in place to enhance the independence of the audit opinion. These include dedicated statutes that provided statutory independence, protections against arbitrary dismissal, lengthy terms for auditors, separate audit organizations, the ability to report directly to the legislature (and not through the executive), wide investigatory powers, and perhaps even controls over the budget proposed to cover an adequate audit function.

The main types of public-sector audit have tended over time to be correlated with the size and scope of government and the technology and information systems available to government and management. Initially, auditors attempted to conduct comprehensive verification of all financial transactions—tracking every transaction and receipt and acquitting them against the ledger. This comprehensive audit technique was employed across the general government sector (departments and executive agencies) and in public enterprises. There are bizarre stories of auditors attempting to audit public banks on the basis of comprehensive compliance checks—only to find they could not keep up with the workload even if officers were permanently attached to the banks. As government activities grew, the comprehensive audit became impractical (although many auditors general attempted to retain this form of full audit for customary reasons). Gradually, sample survey audits were commissioned, based on broad checks with case studies or samples chosen for more detailed forensic or diagnostic auditing. The development of computers allowed external auditors to analyze comparative statistics to assist the process of auditing and still deliver the assurance function.

From the 1960s, auditors began to extend their interest in the broader dimensions of government

performance and "value for money" evaluations—based on resource use but not restricted to it. Auditors began to evaluate the design, resourcing, implementation, and management of programs against their objectives. At first, program evaluation focused largely on efficiency auditing—investigating how efficiently programs operated and what ratios of efficiency were found relative to outputs. By the 1980s, auditing in many jurisdictions had extended to performance auditing or effectiveness audits—where the main issue concerned how effective the program was at achieving its desired outcomes.

In addition to the functions of investigation and assurance (the watchdog role), audit also plays an educative role. This occurs at two levels. First, audit reports (and associated recommendations for change) have an educative and demonstration effect across government—auditors often claim that although they cannot physically check everything in government, well-directed diagnoses exposing some shortcomings can have much wider effects and keep everyone on their toes. Second, auditors have found themselves well placed to advise governments and individual agencies on improved practices, more accountable management, risk assessment, and the benefits of internal audit. Many modern audit organizations now issue guidelines and advisory standards, best practice guides, and recommended ways of treating resources.

The legislature or parliament receives external audit reports (receiving and tabling makes them publicly available) and has the opportunity to comment on reports, follow up any findings or recommendations, and ask for further audit investigation. Legislatures and their committees can conduct additional investigations in public or in camera, and many committee investigations in nonfinancial areas often benefit from or feed into the audit function. Public accounts committees often play "tag team" roles with auditors, where the auditor may expose shortcomings through the financial audits and the committee can then investigate further and cross-examine public officials on these and other matters. This enhances the intensity of public scrutiny of government resource usage. Many legislatures, through the public accounts committee,

now are involved in the formulation of the forward audit schedule for the year ahead and may even be involved in the process of appointing senior auditors and advising on their recommended budgets.

The key issues with audit today are the degree of real independence auditors enjoy, the skills and expertise of auditors, how far auditors can comment on policy, the effectiveness of the audit function, and compliance with recommendations. In many countries, supreme audit officials enjoy only limited independence from the executive—some are selected internally, positions are filled by grace-and-favor appointments, their budgets are constrained by the executive, and they are restricted in what types of reports they can produce. The mix of required skills and expertise of audit offices has also been questioned—especially by senior executives in government and sometimes by legislatures. Too often audit organizations are staffed by accountants and financial auditors who are not necessarily qualified to report on program performance, organizational capacities, or behavioral dynamics. Auditors have also traditionally restricted their comments and findings to the administration of government programs, rather than to the merit of the programs themselves. Yet, many auditors have strayed into the policy field, commenting on the appropriateness of policy decisions from an external vantage point. Governments generally regard this incursion into their prerogatives as exceeding the auditor's role. Finally, few auditors have formal capacities to rectify problems or failings in government. Their influence comes through public recommendations and commentary but they have no real power to impose changes on other parts of executive government. Governments can ignore or marginalize audit recommendations or qualifications to an audit report—sometimes seemingly with no sanction. Auditors can reexamine and re-report on the problems if they persist but are not in a position to effect change themselves. This is sometimes seen as a limitation of auditing in the public sector.

AUSTRALASIAN GOVERNANCE

Australia and New Zealand occupy distinctive places in debates about how governance could or should be conducted. In the latter stages of the twentieth century, New Zealand and Australia went further than most countries in embracing the policy prescriptions and rhetoric of neoliberalism and the concomitant reduction of the state's role in economic management this implies. Although the state is still actually a major player in political and economic affairs of Australia, and though New Zealand has retreated from its earlier radical embrace of neoliberalism, ideas about the appropriate role of government have changed profoundly in both countries. As the larger economy, and given New Zealand's recent policy reversals, the Australian experience is arguably of greatest long-term significance.

For much of the twentieth century, Australia had been a fairly insular, highly protected place, in which the government oversaw a particular accommodation between organized labor and various economic sectors. Restructuring in the global economy, the decreasing importance of Australian agriculture and the declining competitiveness of Australia's manufacturing sector forced change, however. By the 1980s, Australia's old model of "protection all round" was no longer sustainable. A consensus among economic and eventually political elites developed that the economy had to be opened to international competition.

Remarkably, it was the formerly Left-leaning Australian Labor Party that promoted this transformation, with the acquiescence of organized labor. All the key elements of the neoliberal agenda—a floating currency, trade liberalization, the phasing out of protection, and labor market reform—were pushed through during the 1980s and early 1990s. At the same time, major reforms to government itself and of Australia's foreign policy were put in place to consolidate these changes.

At one level, these changes were manifest in a reorganization of government departments and—especially under successive coalition governments during the 1990s—introducing the principles of "new public management" to Australia's public service. At another level, however, domestic and foreign policy were consciously linked in an effort to open both the Australian economy and workforce to international competitive pressures.

As a consequence, many areas of activity that were formerly the direct responsibility of government have either been passed to the private sector, as with job placements for the unemployed, or given to nominally independent institutions like the Reserve Bank of Australia (RBA), which has now assumed formal responsibility for the management of monetary policy. The RBA's seemingly permanent independence is emblematic of a new order in which particular ideas, generally imported from overseas, and specific economic interests, especially in the financial sector, exert a powerful influence over public policy.

New Zealand went even further and faster during the 1980s, as a technocratic elite sought to drive policy reform and turn abstract economic ideas into

political and social reality. Increasing skepticism about the economic and social impacts of the reform process has seen a significant retreat from the earlier wholesale embrace of neoliberalism and the rising inequalities it was frequently associated with. What is clear is that New Zealand's per capita gross domestic product (GDP) growth has been the slowest in the developed world since 1984 and notably poorer than that of Australia, which had a less radical reform process. At the very least, this is a reminder that the Australasian countries have had different policy experiences and outcomes, and that government reforms alone may not be able to overcome structural constraints of size and isolation.

AUTHORITARIANISM

The term *authoritarianism* has been employed in several different contexts. The two most prominent usages will be discussed in this entry: authoritarianism as a style of rule and as a personality type.

Authoritarianism as a Style of Rule

Authoritarianism refers to a style of rule characterized by limited political pluralism, little political mobilization, and few safeguards for individual rights. An authoritarian regime, sometimes called a dictatorship, is often contrasted with a democratic form of government.

The term *authoritarianism* was created to describe a middle ground between democratic regimes, such as the United States and United Kingdom, and totalitarian regimes, such as Germany, Italy, and the Soviet Union in the first half of the twentieth century. Totalitarian regimes use terror to maintain power and completely reorganize social and political life by banning pluralism, mobilizing mass demonstrations of support, and constructing ideologies around charismatic leaders. Authoritarian regimes, by contrast, allow for limited pluralism while banning political mobilization and de-emphasizing ideology and charisma.

Authoritarianism is a broad category, and various subtypes of authoritarian regimes have been identified. Bureaucratic authoritarianism describes various Latin American regimes led by coalitions of military officials and bureaucrats. Sultanism is a type of authoritarianism characterized by extreme patrimonialism, unrestrained personal rule often around a personality cult, and the use of terror and rewards. Competitive authoritarianism is a combination of democracy and authoritarianism, whereby formal democratic institutions are the main way that political authority is obtained, but incumbents often violate rules and employ bribery and harassment.

Several questions dominate the study of authoritarian regimes. Under what conditions do countries successfully transition from authoritarian to democratic regimes? Why do countries backslide from democracy toward authoritarianism? How do authoritarian regimes obtain and maintain legitimacy and power? Are authoritarian regimes more likely to make successful economic transitions than democratic countries are?

Authoritarianism as a Personality Trait

The Authoritarian Personality is a study of prejudice written by Theodor Adorno and his colleagues in 1950 as an effort to explain anti-Semitism during the rise of fascism, communism, and McCarthyism. The authoritarian personality is a particular type of disposition toward authority characterized simultaneously by submissiveness toward leaders above and harshness

and aggression toward those below. Additional characteristics of an authoritarian personality include a focus on power relationships and a pessimistic view of human nature. This psychoanalytical, cultural approach to understanding authoritarianism produced numerous tests and measures to study this personality characteristic.

Since its inception, the study of the authoritarian personality has opened doors to the following debates: Can we generalize about antidemocratic personalities (Left or Right)? Are there common psychological characteristics that lead to extremism? What is the relationship between the authoritarian personality and political behavior? Under what conditions will authoritarian predispositions arise? Should authoritarianism be understood as a personality trait rooted in Freudian psychology or a feature of collective in-group/out-group behavior?

AUTHORITY

Authority is the right to command obedience. Authority implies both one who commands and others who obey, the wielder and the subjects of authority being linked in a hierarchical relationship mutually recognized as legitimate and based on the shared norms of a collectivity. As a consequence of this relationship, authority endows the wielder with the right to issue commands that the subjects of this authority feel obligated to obey. Thus, authority is distinguished by the voluntary compliance of its subjects on the basis of the perceived legitimacy of a hierarchical relationship, rather than on the basis of persuasion,

calculations of self-interest, or physical coercion. Authority is also by definition limited in its scope, being constrained by a set of shared beliefs and norms that justify the hierarchical relationship between wielder and subjects.

Authority is a robust and efficient form of social and political order, as the voluntary obedience of subjects means that few resources need to be expended on eliciting compliance. In contrast, when physical coercion (or the threat thereof) is the basis of social control, compliance is the result of fear. Those seeking to exert control must expend immense resources on policing and enforcement of rules. Likewise, compliance on the basis of self-interested calculations suggests a tenuous form of social control because an individual's observance of the rules is open to constant reevaluation to determine if obedience still provides the greatest utility. Finally, securing obedience to rules through persuasion or appeals to reason, emotion, or norms may be more stable and less costly than either physical coercion or self-interest, but it is clearly less effective and more costly than the habitual obedience elicited by authority. In any complex social system, however, control is likely to be achieved through a combination of these methods.

Waning State Authority?

Current writing on governance often asserts that the authority of the state is declining. This could mean at least three things. First, states may be increasingly less able to rely on authority as a key method for exerting social control. This may be the result of individual crises of legitimacy or a more general trend associated with globalization or broad cultural changes that have undermined the normative foundations of hierarchical authority relationships. In this case, a loss of authority suggests that states are increasingly governing in networks with voluntary and private bodies either as a means of increasing legitimacy or to mitigate the costs associated with having to rely on less efficient forms of securing compliance. Second, decreasing state authority could refer to a narrowing scope for the exercise of authority. In this case, it may not be that states are less able to rely on authority for social control but, rather,

that normative changes have led to a redefinition of the range of areas where that control applies. Thus, new forms of governance may emerge as states seek to exercise influence in areas where they previously commanded obedience. Third, a loss of state authority could mean that authority has shifted to other levels. In response to economic, political, and normative changes, new governance forms may emerge as state authority is transferred upward to the supranational level, downward to the subnational level, or outward to the private realm. This could represent a voluntary delegation of authority (with the implication that states could take authority back), or an involuntary loss to bodies at other levels that are either actively "poaching" on state authority or merely willing and able to fill in for a retreating state.

Empirically, there is still much debate about to what extent and in what ways state authority is declining. What are the consequences of declining state authority for social and political control? Have states voluntarily delegated their authority, or is this happening against their wills? Can states regain lost authority, or is this an irreversible process?

Authority Outside the State?

Much of the writing on authority and governance has focused on this shift of authority to other levels. However, the concept of authority must not be confused with governance. Global economic integration and other challenges may be shifting the locus of governance beyond the state to supranational, subnational, or private arenas without creating hierarchical relationships that give one party a mutually recognized, legitimate right to command and receive obedience. This is especially relevant to arguments about authority in the private realm. Arguments about the authority of firms and markets, the "illicit" authority of transnational criminal groups, or the "moral" or "knowledge" authority of nongovernmental organizations (NGOs) or epistemic communities often confuse authority with the ability simply to elicit voluntary compliance. These groups' expertise, knowledge, or values may provide convincing reasons for obeying their directives, but being convinced is not the same as

being obligated to obey a socially legitimated authority. Will authority have a place in evolving forms of governance, or will governance instead rely on other forms of social control to deal with the consequences of fragmented or waning state authority?

AUTOPOIESIS

Autopoiesis refers to the continual "bringing forth" of self. It has its origins in systems theory and is closely associated with the work of the Chilean biologists Francisco Varela and Humberto Maturana. In their work, the term was used to mark the essential distinction between living and nonliving systems. An autopoietic system is therefore defined as a system of interrelated components that interact to produce themselves.

The concept of autopoiesis has had significant influence well beyond the field of theoretical biology. A detailed review and appraisal of the various implications and applications of autopoiesis can be found in the work of John Mingers, who demonstrates its impact in cognitive science, artificial intelligence, family therapy, law, and sociology. Autopoiesis receives its most significant reworking and extension for the domain of the social sciences in the work of Niklas Luhmann.

Autopoietic social systems are an evolutionary achievement of modern society. For Luhmann, they were nothing more than the communication systems that enabled the thematization of particular areas of social life. For example, the legal system is an autopoietic system that protects norms by deciding if something is legal or not. Such systems are not needed for society to function as a whole, as is the case in the functionalism of Talcott Parsons. These systems are there because they perform a function. There is no other justification for their existence. In this respect, Luhmann reversed Parsons's structural functionalism. In this view, society is not an integrated whole like an organism; rather, it is composed of a plurality of inter-acting systems. One of the interesting features of social autopoiesis is that people are no longer said to be contained within society but, rather, they exist in its environment. They can affect society because it would not exist without them, but the manner of their effect is said to be indirect and unpredictable.

Autopoietic systems are organized around the constant reproduction of a specific code; the economy, for example, achieves its autopoiesis because it generates the need to replace money that has been used by people to purchase end products such as food and electricity. These products are used up in the process of their consumption. The economy therefore continually reproduces the need to replace such goods, and this is its form of autopoiesis.

An important property of autopoietic systems is that they are organizationally closed. This means that they cannot "see" other systems. The economy cannot, for example, "see" political power nor can it ascertain legal decisions. It can, however, be affected by these in unpredictable ways. It follows then that such systems present special problems for steering and governance.

The significance of autopoietic social systems is of particular relevance to governance because such systems are not purposive or rational. A society composed of such systems is a process of social communicative evolution where systems such as the economy and law coevolve in complex ways. It is impossible to steer such a society in the form of governance.

B

BALTIC STATE COOPERATION

The Republics of Estonia, Latvia, and Lithuania are collectively known as the Baltic States and are located on the eastern littoral of the Baltic Sea in Northeastern Europe. Interstate cooperation between Estonia, Latvia, and Lithuania has its roots in the treaty on Understanding and Cooperation, which was signed in 1934 in Geneva. The treaty's principles of cooperation in foreign affairs were reaffirmed by the leaders of the Estonian, Latvian, and Lithuanian Socialist Republics when they established the Baltic Council in 1990. After regaining independence, the Baltic Assembly (BA) was founded in 1991 to facilitate interparliamentary cooperation. Intergovernmental cooperation is coordinated through the Baltic Council of Ministers (BCM), which was established in 1994. The Baltic Council now serves as a forum for enhancing cooperation between the BCM and the BA.

The role of the chairperson of the BCM rotates between the three states annually. The BCM consists of the Prime Ministers' Council, the Cooperation Council (chaired by the three Foreign Ministers), a Secretariat, and Committees of Senior Officials. In 2003, the Prime Ministers' Council announced that it would play the leading role in agenda and priority setting for intergovernmental cooperation and reduced the number of Committees of Senior Officials from twenty-one to five. These committees explore areas of common or potential interest and make recommendations in the following fields: energy, transport and communication, defense, environment, and home affairs.

The BA houses sixty parliamentarians, with the national delegations consisting of twenty parliamentarians drawn proportionally from the Estonian, Latvian, and Lithuanian parliaments. There are six standing committees, which draft declarations and statements on behalf of the assembly and also proposals and recommendations for the consideration of the Baltic Council and BCM on economic affairs, communication and informatics, education, science and culture, environmental protection and energy, legal affairs and security, social affairs, and budgets.

Interstate cooperation between Estonia, Latvia, and Lithuania in the post-Soviet era is deeper, broader, and more institutionalized compared with the interwar period. Efforts are currently underway to coordinate work on educational reforms, developing business and tourism prospects, border crossings, the fight against organized crime, defense, energy, and transport. Yet, there has been skepticism about the level of commitment given to Baltic State cooperation. It has been argued that it was merely a tool for advancing European Union (EU) and North Atlantic Treaty Organization (NATO) membership prospects, rather than addressing, promoting, and protecting common interests and concerns. The lack of progress in establishing a Baltic Customs Union and Common Baltic Economic Space has been used to support this view.

Yet cooperation in a number of fields is fairly well developed. The most frequently cited cases of enhanced cooperation are found in the military sphere. For example, the Baltic Battalion (BALTBAT), Baltic Naval Squadron (BALTRON), Baltic Air Surveillance Network (BALTNET), and Baltic Defence College (BALTDEFCOL) are regarded as positive instances of Baltic cooperation, which can operate within a broader multilateral framework, such as NATO. Therefore, the BA, BCM, and Baltic Council continue to function, despite the fact that the Baltic States are now members of the EU and NATO because there is still a need for institutionalized cooperation mechanisms for coordinating common positions to promote or defend shared foreign and defense policy interests.

BEAR MARKET

A bear market is characterized by falling prices for securities, usually stocks, within a context in which market participants are pessimistic about the chances of an imminent turnaround in prices. A bear market differs from a market correction, even during a correction in which the market index loses twenty percent of its value (the figure typically associated with a bear market). Corrections tend to follow dramatic events where the confidence of investors is shaken very badly for a short period, but where the impression quickly forms that the event is a one-off that should not alter investors' underlying outlook. The responses of North American and European stock markets to both the crash of 1987 and the fallout from the Asian financial crisis in 1997 represent two such

cases. On both occasions, following a record points fall in the market index, the underlying increase in stock prices soon returned to its pre-correction trend, amid the general perception among investors that market fundamentals remained sound. A bear market, by contrast, is one in which falling stock prices are not treated as a symptom of a one-off shock to the financial system, nor as evidence of temporary poor performances by the companies in question, but as a function of depressed expectations across the market as a whole. Bear markets therefore tend to be more protracted than market corrections, requiring a wholesale change in the confidence of market participants before they are brought to a conclusion. The most notable worldwide peacetime bear markets of the last one hundred years occurred (1) during the depression of the 1930s, (2) in and around the collapse of the Bretton Woods system in the early 1970s, and (3) following the bursting of the tech-stock bubble in 2000.

Public policymakers have few policy tools at their disposal to end a bear market (the same is true of a bull market). They can maintain low real rates of interest in an attempt to encourage investors to adopt a more optimistic attitude toward the market, but that is about all they can do. In recent times, however, public policymakers have shown a high degree of inflation aversion and, as such, they may be reluctant to reduce interest rates for fear of introducing inflationary tendencies into the economy. This leaves policymakers with the option of trying to talk the market up, to instill into investors the sense that all is well with the economy and that they should feel confident that they can realize their investment plans. Central bankers in particular are often called on to emphasize sound macroeconomic fundamentals during a bear market. The expertise that they have as central bankers, allied with their perceived autonomy from the political process, is assumed to lend additional authority to their pronouncements. However, one feature typical of bear markets is investors' unwillingness to act based on news about fundamentals, but to act instead because of their experiences of the depressed state of the market around them.

Benchmarking

Benchmarking is a technique of governance designed to improve the quality and efficiency of public services. In essence, benchmarking involves comparing specific aspects of treating a public problem with an ideal form of public action (the benchmark), then acting to make the two converge. By making comparisons in this way, public administration is supposed to improve through processes of learning and emulation.

Of course, public administrations have always learned in the sense that they have changed as a reaction to evolving political, social, and economic circumstances. Since the 1980s, however, the conceptualization and systematic application of benchmarking has accelerated this process using ideas from the management of private businesses. Subsequently, at least three levels of usage of benchmarking can be identified. First, this technique has been used to encourage learning and emulation within organizations such as ministries and local authorities. Second, benchmarking has been used to encourage competitive learning between service providers, such as schools in the United Kingdom. Third, benchmarking concerns the transfer of policy instruments between states. Benchmarks are used frequently, for example, by international organizations such as the World Bank when encouraging administrative reforms in African countries. The European Union also uses benchmarking to encourage a systematic form of policy transfer, particularly by using benchmarking within what it calls the "open method of co-ordination" in fields such as social policy, employment policy, and policing.

Two different methodological approaches to benchmarking can be discerned. The first involves the sharing of standardized data on performance in specific issue areas, for example, equal pay for women. Here, statistics are used to encourage, or even politically embarrass, protagonists into striving to reach or surpass a benchmark. A second method is more qualitative, involving either self-assessment (particularly through responses to questionnaires) or organizational analysis carried out by independent researchers or consultants.

Although superficially benchmarks appear uncontroversial, they can create at least three types of governance problems. First, setting a benchmark often proves problematical. For example, one cannot simply assume that policy instruments that appear to be similar across countries were actually designed to tackle the same public problem. For instance, the multiple meanings given to "community policing" in Europe makes it difficult to establish benchmarks for "police on the beat" ratios. Second, proponents of benchmarks need to be aware that the contexts within which their comparisons are taking place evolve over time. Benchmarks for employment rates in periods of economic boom must be handled with care in times of recession. Finally, benchmarks are tools for inciting political change that need to be handled with care. "Naming and shaming" with benchmarks may bring about change in the short term but also institutionalized tension and resistance in the longer term. Thus, as with so many tools of contemporary public management, research on governance concludes that benchmarks need to be used in a manner that is imaginative and appropriate rather than mechanical and imposed from above.

Border Theory

Border theory is concerned with the functions and characteristics of boundaries for social systems. For the modern political system, which is based on the principle of sovereign nation-states, geographic borders have played a constitutive role because they demarcated the basic entities of the system. Recently, processes of continental integration and globalization revealed the historical contingency of territorially based systems of governance and made the changing roles of state borders an important topic of theoretical reflections.

Borders, Boundaries, and Frontiers

In English, the terms *border, boundary,* and *frontier* carry different connotations. Analytically, four dimensions help us gain a more precise understanding of the terms. In a first dimension, we can distinguish between perceptions of borders as zones and conceptions of borders as lines. Whereas the former meaning highlights contact and overlap between entities the latter points to separation and clear-cut division between entities. In the second dimension, we can differentiate between border conceptions that stress flexibility from those that stress stability of boundaries. The former conceive borders as regions of transition and usually as the part that is "in front" of the rest. The latter conceive borderlands as strongholds of tradition and as backward areas. The third dimension is concerned with the importance of borders for the contained entities. Whereas some approaches put much emphasis on the border as being the main determent of what is inside, others put the inside first and see the border only as one of several markers. An example for the former is the notion frontier society, which means that the whole society is strongly influenced by the situation at the front. The fourth aspect differentiates symmetric boundary conceptions that conceive both sides of the border as principally equal from asymmetric conceptions in which there is no basic recognition of the "other" as a similar kind. This perception shows up in sharp ingroup versus outgroup distinctions (e.g., the religious separation of believers and heathens).

Overall, the meanings of zone, movement, centrality, and asymmetry are emphasized in the notion of frontier. In contrast, the terms *border* and *boundary* are closer to meanings of line, stability, marginality, and symmetry. Whereas boundary has very broad applications, the term *border(land)* is more closely connected to the territorial demarcation of political systems.

From Frontiers to Borders: The Territorial Base of the Modern Political Order

Historically, the transition toward Western modernity was accompanied by a transformation from frontiers to borders. Medieval Europe, with its complementary and competing rules of feudalism, of the Christian church, and of the Holy Roman Empire, was characterized by a political order based on personal bonds and shared authority. Landlords could be vassals of various superior rulers. Geographic boundaries of land did not represent a line that separated spheres of authority. This changed dramatically in the modern political system. Sovereignty, the monopolization and exclusiveness of authority, and territoriality, the geographic congruence of all rights to rule, are the cornerstones of this system. This led to formal and clear-cut borders but not necessarily to stable borders because power in a system of sovereign states depends more than before on the control over territory. The precursors of the modern state system, Great Britain and France, could channel the expansionist impulse of the new state system into extensive colonialism. The latecomer nation-state Germany found the world apportioned and its aggression against its European neighbors was partly based on expansionist imperatives of geopolitical thinking. After World War II, the Berlin Wall symbolized a world in which the dualism between East and West was manifested, locally pacified, and for decades stabilized by geographic lines of separation.

Blurring the Line: Perforation and Decomposition of Borders

At the same time and almost the same place where borders found its most drastic expressions as lines of separation, there also began a new process of border deconstruction. In the late 1950s, a process of pooling of sovereignty on a supranational level began in Western Europe. In the 1990s, the European Union (EU) implemented a far-reaching program to reduce all barriers for the free movement of goods, services, capital, and labor. In parallel, the European Commission launched a financial program for cooperation in border regions. Triggered by the discourses on regional competition in the larger market and facilitated by the financial incentives of this program, a broad wave of cross-border cooperation swept over Europe. Similar attempts for cross-border cooperation were triggered by free trade agreements in North

America. These processes of continental integration and discourses on globalization lead to diagnoses of and proposals for a borderless world. But the creation of many new borders by the break up of the Union of Soviet Socialist Republics into fifteen republics and attempts to strengthen the external border of the EU have made clear that there is no general process of political borders withering away. Some parts of the world are still in the stage of establishing nation-state borders. And in the Western world, the current transformations are better understood if we conceive them as the decomposition of a single geographic border into a multiplicity of functional boundaries. The modern nation-state bundles various functional systems (e.g., economic, cultural, social systems) on the same territory with congruent boundaries. Currently, these functional systems are becoming unbundled. For example, in Europe, the economic system is regulated on a wider scale (the EU level), but the system of social security is still regulated on the national level. Furthermore, some countries integrate their monetary systems, whereas another group of states cooperates in security policy. These kinds of differentiated integration lead to a system of variable geometry with different geographic scales and overlapping boundaries. In other parts of the world, decomposition of borders means something different because border areas are characterized by the copresence of contradictory types of boundaries. Economically, they serve as contact zones exploiting opportunities for arbitrage and synergy, while they are strengthened as lines of defense and exclusion. This kind of functional differentiation occurs especially at those borders that are characterized by strong asymmetries between neighboring societies (e.g., the United States and Mexico).

BOTTOM-UP APPROACH

The bottom-up approach takes the view that policy and action cannot simply be separated; hence, policy implementation is an essentially political process. It is concerned with the dynamism that bureaucrats and street-level service providers bring to the policy process.

Bottom-up approaches to governance emerged as an antidote to rationalist, prescriptive, top-down models where policy is devised by elites and mechanically implemented by passive bureaucrats and service providers. Bottom-up approaches examine the active impact of public servants on whether a policy is successfully realized and demonstrate that policy making does not stop once a policy is approved because it is continually being remade as it is administered. Conflict and bargaining, previously seen as dysfunctional, are embraced as inevitable features of the implementation process. Challenging traditional notions of a strict demarcation between politicians and bureaucrats in decision making and execution, implementation is thus understood as another form of politics within the sphere of unelected power.

This approach can be understood as a backward mapping of policy and problems from the end point of implementation. With an emphasis on cooperation rather than command, the actions of bureaucrats are understood as choices between conflicting or interacting demands. These actors are involved in a multiplicity of reciprocal, interdependent relationships, which they manage through resource sharing and dialogue aimed at mutually beneficial goals. Street-level bureaucrats, such as teachers and social workers, who encounter the public in service delivery, have a high level of discretion in how a policy is applied. Implementation is directed by the interests of these professionals, and may produce different outcomes to those originally desired by policymakers.

Successful implementation is judged in behavioral or human terms, and the role of political science is to focus on the nature of these interactions. One approach is to produce game theory models of self-interested people seeking to maximize their own power or influence. Alternatively, policy and action are dynamically linked and subject to interpretation, adjustment, and even subversion, which begs an interpretative approach to understanding how policies are enacted. Different actors view implementation from multiple standpoints, so interpretations of policy language or responses to dilemmas posed by the demands of competing programs introduce a decentered approach to analysis.

Bottom-up theory is criticized for removing traditional barriers between elected representatives and public servants in policy formulation and enactment, raising questions about democratic accountability and legitimacy. What counts as successful implementation? Is it legitimate for policy to be shaped by unelected bureaucrats? Does accountability entail responsibility to drive prescribed outcomes or trust to execute policy using discretion? If there is no clear policy path, then who is accountable? Can politicians shift responsibility for policy failure to those involved in implementation?

More recently, bottom-up approaches have been used in network analyses of actors and organizations focusing on policy networks and communities, steering, and network management, continuing the trend of decentralizing hierarchical approaches to implementation.

Bounded Rationality

A decisionmaker is said to exhibit bounded rationality when he or she violates some commonly accepted precept of rational behavior but nevertheless acts in a manner consistent with the pursuit of an appropriate set of goals or objectives. This definition is, of course, not entirely satisfactory, in that it specifies neither the precept being violated nor conditions under which a set of goals may be considered appropriate. But the concept of bounded rationality has always been somewhat ill defined in just these respects.

Some examples may help clarify these ideas. When the precept being violated is to "buy footwear that fits one's feet" (an admonition that will no doubt find wide acceptance), the consumer's action might be to purchase a pair of shoes that is instead one-half size too large. This behavior would be considered boundedly rational if the shoes being purchased were needed for a wedding this afternoon, and if a perfectly-fitting pair could be obtained for certain only by visiting each of ten geographically dispersed shoe shops. In this instance, thinking of the decisionmaker simply as an optimizer of comfort would lead to puzzlement at his or her selection, but the purchase of poorly fitting shoes looks reasonable enough when the consumer's limited knowledge of the retail environment is considered.

Alternatively, when the precept being violated is to "draw electoral boundaries in such a way as to equalize the populations within the voting districts created," the planner's action might be to try to ensure merely that no two populations differ by more than one percent. This behavior would be considered boundedly rational if the costs of computing an acceptable boundary configuration were to increase with the level of accuracy required because it would then be appropriate to tolerate small inequalities in district populations to save significant computational costs.

In each of the two previous examples, an action that is undoubtedly suboptimal in a certain narrowly defined choice problem (among pairs of shoes or electoral partitions) can be "rationalized" by considering

the totality of the decision-making environment. In the first case, purchasing a pair of shoes that is one-half size too large does not appear inappropriate given the consumer's time constraint and his or her ignorance of exactly where a better-fitting pair can be found. Similarly, creating voting districts with populations that are approximately but not exactly equal seems sensible given that improving the partitioning could be computationally expensive. This general phenomenon—that boundedly rational behavior can be made to look fully rational by broadening the scope of the choice problem to which it is seen as a response—has led some commentators to suggest that models of optimal decision making are adequate for social scientific purposes as long as the environment in which an agent chooses is always described "comprehensively." But even if this is true in principle (which is by no means obvious), for the claim to have any practical significance, we must be willing both to declare a particular description of the agent's environment to be comprehensive and to commit to a new, more general rationality precept such as, in the electoral partition example, to "minimize one thousand times the maximum absolute difference between district populations in percentage terms minus the cost of computation in dollars." If the planner fails to consistently obey any rule of this sort, or if repeated broadenings of scope are needed to preserve the appearance of optimal decision making, a good case can be made for restricting attention to the simple problem of creating voting districts (without reference to computational costs) and for imagining the planner to be boundedly rational.

Herbert A. Simon, an influential proponent of the concept of bounded rationality, used the terms "substantive" and "procedural" to distinguish between the notions of rational behavior commonly adopted in, respectively, economics and psychology. According to this usage, an agent is substantively rational if he or she has a clear criterion for success and is never satisfied with anything less than the best achievable outcome with respect to this criterion. For an agent to be procedurally rational, on the other hand, it is necessary only that his or her decisions result from an appropriate process of deliberation, the duration and intensity of which are free to vary according to the perceived importance of the choice problem that presents itself. The concepts of "procedural" and "bounded" rationality are thus roughly the same, and both are closely related to the idea of "satisficing," also promoted by Simon.

Of the numerous attempts to introduce boundedly rational decision making into the social sciences, most fall into one of two categories. The first of these encompasses the work of economic theorists and others who begin with models of optimal behavior and proceed by imposing new kinds of constraints on the decision-maker. For example, boundedly rational agents have been developed who do not always remember the past, nor adequately consider the future, nor understand the logical consequences of facts that they know. Other theories of this sort add costs of computation to otherwise standard models, and still others allow the decision-maker's cognitive capabilities to depend on the complexity of the choice problem at hand.

The second category of contributions to the literature on bounded rationality contains work that dispenses with optimal decision making entirely and seeks to construct new models on alternative principles. Writers in this vein speak the languages of neuroscience and evolutionary psychology; stress the impact on human behavior of emotions, heuristics, and norms; and maintain an especially close dialogue with experimentalists.

Bretton Woods

The Bretton Woods Agreement of July 1944 laid the foundations for the system of international economic management after World War II. The core of this new regime was based on a series of fixed exchange rates tied to the U.S. dollar and supported by a set of institutions and rules for maintaining financial order. These arrangements helped provide renewed stability and economic growth during the postwar period. The system collapsed during the early 1970s as a result of internal tensions and mounting difficulties within the global economy.

Managing the Postwar Global Economy

The Bretton Woods Agreement was designed to reinvigorate the global capitalist economy by establishing international financial stability, and by avoiding any return to the economic chaos and depression of the interwar period. The debate surrounding the nature of postwar economic management centered around the conflicting aims of Britain and the United States. Representing the British view, the economist John Maynard Keynes argued that the main aim of the postwar system should be to promote economic growth. International imbalances would be resolved with an adjustment by both surplus and deficit nations, and an international central bank would be established to provide global liquidity to help finance this process. The arrangements that were subsequently adopted, however, reflected the postwar dominance of the United States and were based on plans devised by Harry Dexter White, the chief international economist at the U.S. Treasury. These prioritized the avoidance of inflation and the maintenance of price stability and argued that the burden of adjustment for rectifying economic imbalances should fall solely on deficit nations.

The central feature of the postwar arrangements established in the Bretton Woods Agreement was an international system of fixed exchange rates. Participating nations agreed to ensure the free convertibility of their currencies and to maintain their value within one percent on either side of a centrally

defined ratio to the price of gold. Because four-fifths of the world's gold was now held in the United States, and because the price of gold was denominated in U.S. dollars, this effectively established a series of bilateral parities between participating currencies and the dollar. The stability of the system itself was underpinned by a credible commitment by the American government to allow the convertibility of the dollar into gold at $35 per ounce.

The Bretton Woods Agreement also established two new institutions. The first of these was the International Monetary Fund (IMF). This was designed to ensure orderly currency arrangements and cooperation between participating states. Countries wanting to adjust their exchange rate with the dollar could do so only with the permission of the IMF, and only in exceptional circumstances, defined loosely as conditions of fundamental disequilibrium. This aimed to ensure that countries pursuing unsound and inflationary economic policies could not simply devalue their way out of trouble. The IMF also provided liquidity to participating states in the form of loans, backed by surveillance measures, to help finance any temporary balance of payments difficulties. Accompanying the IMF was the creation of the International Bank for Reconstruction and Development. Better known as the World Bank, this was set up to promote international trade and to help finance the postwar reconstruction of Western Europe.

Bretton Woods in Practice

The Bretton Woods system proved to be remarkably successful. By the early 1950s, most of the world's major capitalist states had established currency convertibility with the dollar. Despite an initial shortage of dollars, the series of rules, procedures, and institutions enshrined in the Bretton Woods Agreement helped impart an impressive degree of stability to the postwar global economy. This was also accompanied by an increased liberalization of international trade and helped facilitate the greatest boom ever seen in the history of global capitalism.

Starting in the late 1950s, however, internal tensions began to undermine the operation of the system. The key to this was the asymmetrical nature of its

adjustment process. The high willingness of participating nations to hold U.S. dollars given the international dominance of the U.S. economy and the credibility of the American commitment to exchange dollars for gold, enabled the United States to run a persistent deficit in its balance of payments without producing a corresponding fall in the value of its currency. By the latter half of the 1960s, with the volume of dollars circulating outside the United States far in excess of its available gold reserves, the U.S. deficit was starting to put the international monetary system under increasing strain. At the same time, the postwar boom began to subside and national economic conditions began to diverge, putting the various exchange rates within the system under increasing strain. By the end of the 1960s, international confidence in the dollar was in decline, financial speculation was starting to rise, and the U.S. government was forced to introduce a series of measures designed to restrict capital outflows.

During the early 1970s, the strains on the Bretton Woods system became increasingly intense, and in 1973, the convertibility of the dollar was finally abandoned. Since then, the international monetary system has operated on an eclectic basis. Presently, about a quarter of countries (primarily developing or transitional economies) operate a floating exchange rate regime, more than a third are committed to the use of a fixed regime, and more than a third use a combination of the two by seeking to manage any movements in their exchange rate. The IMF and the World Bank continue to play an important role in the management of the world economy.

BROKERAGE

Brokerage is a process in which individuals (brokers) act as intermediaries between individuals or groups who do not have direct access to each other. The broker provides a link between these segmented or isolated groups or individuals, so that access to goods, services, or information is enabled. Brokers possess specialist knowledge or resources that enable them to act more effectively than individuals or groups could themselves. In some cases, brokers may have specialist knowledge that gives them access to resources or services that clients would not otherwise be able to access; in other cases, brokers may simply be trusted by different parties who do not trust each other or be able to operate across multiple cultural systems. A crucial element of brokerage is the broker's monopoly of exchanges between separate domains. Brokers facilitate exchanges, but their central position also confers power because they control information flows and communication between isolated groups or individuals.

Brokerage studies have developed out of various strands of research. One was the social network studies in social anthropology, sociology, and social psychology that focused on individual or ego-centered social networks and the ability conferred by a person's central position in a community or organizational network to control flows of information and communication between isolated groups or individuals. Another strand examined brokerage and social inequality, especially in developing societies. In these societies, brokerage linked citizens and elites via informal, voluntary, and asymmetrical relationships, and was part of a broader system of political clientelism. These exchanges fulfilled crucial economic functions, but were overlaid with imputed moral qualities such as friendship or kinship, which disguised the inequality that created the need for such exchanges. The distinction between broker and

patron is an analytic one; both have a monopoly over resources that clients need, but patrons directly control the resource whereas brokers provide the resources that are under someone else's control. Finally, studies of ethnicity highlighted brokerage links between ethnic groups. These studies of brokerage have been further elaborated by the work on social capital that focuses on the role of bridging capital in maintaining social consensus in culturally diverse societies. Brokerage has also been significant in electoral systems (especially urban political machines), as political brokers trade their control over allocations of public goods for clients' political and electoral support, and brokers may derive private advantage from their access to public resources.

In contemporary societies, brokers provide informal linkages within policymaking communities and link policy communities with external groups such as community groups and special-interest groups. Brokers act as proxies for groups whose interests or values they are familiar with, and the process makes it easier to get the support of outside groups. It is sometimes argued that diverse values and beliefs are inevitable in societies with distinctive ethnic, policy, or practice groups. In this context, brokers act as cultural translators and so reduce misunderstandings. Brokerage, as bridging capital, encourages cohesion and stability and maintains a broad social consensus in segmented societies. However, insofar as such segmentation implies inequality or power differentials, brokerage can also obscure such differentials.

BUDGETARY AUTONOMY

Budgetary autonomy refers to the relationship between the finances of different public entities. Most commonly, the budget refers to the central government as a consolidated institution in which the executive, legislative, and judicial branches follow accepted procedures to manage income and outflows for a given time period. For a variety of reasons, government entities may be granted a degree of independence in the management of their finances. This means that the same processes do not govern their revenues and outlays as the general government budget. Government entities are allowed to make their own decisions about how to raise financing, such as through taxes or loans, and to make decisions about the way in which they would like to allocate their expenditures, such as spending on personnel, investment, or maintenance.

There are different degrees of autonomy that are important to consider. In some cases, entities with budgetary autonomy are entirely outside the purview of the rest of government, and other branches of government have no formal authority to examine, approve, or evaluate their finances. In other cases, a periodic report must be submitted, usually to the legislature, which can decide if the finances of the autonomous agency should be approved or sent along to the judiciary for further examination.

Some of the reasons for budgetary autonomy can be traced to the ideas of public choice analyses of politics. According to public choice perspectives, government agents act as individuals responding to incentives, much as actors within a market. Budgetary autonomy provides a different set of incentives than traditional budget processes do and, in this way, opens the possibility of a new set of principal-agent

relationships. This can break with prior practice and introduce a new organizational culture and policy outcome. In particular, those who are skeptical of the political and partisan influence of legislatures frequently advocate budgetary autonomy to protect executive agencies from political considerations.

The drawbacks of such arrangements are predictable. Autonomous entities are not necessarily less prone to capture by powerful interests, distortion for political gain, and maladies such as bureaucratic rigidity. Indeed, some argue that entities with budgetary autonomy are more prone to these problems because they are outside normal legislative-executive relations and not subject to the same degree of oversight and control.

Examples of budgetary autonomy tend to include things such as state enterprises, pension funds, social programs, tax administrations, and local governments. Each of these entities could potentially manage its own inflows and outflows, and each could be taken off-budget, in the traditional sense. In a number of highly indebted poor countries, debt relief has freed resources that are then tied to social investment funds. These funds frequently operate off-budget, with a significant degree of autonomy, in the management of the allocation of these monies. Results vary.

Bull Market

A bull market is a market characterized by rising prices for securities, usually stocks, within a context in which market participants are optimistic that the trend increase in the value of the market index will continue for some time to come. It is therefore the exact opposite of a bear market, not only in the direction of price changes, but also in the psychology of investors.

A bull market is as much a state of mind exhibited by participants in the market as it is an indication of underlying economic conditions. The essential feature of a bull market is that investors make decisions based not on the value of the assets they are buying but, rather, on the general feel-good factor being displayed within the market. A bull market arises when investors develop a sense that the risk-return structure of the market has shifted in favor of higher rates of return. Such temporary losses of risk aversion can lead to self-fulfilling dynamics: The assumption that investors exist within a bull market leads to expectations that investments will prove profitable, such expectations lead investors to trade assets at increasingly inflated prices, the evidence of which deepens the assumption that bull market conditions are in operation.

As with bear markets, bull markets pose difficulties for public policymakers. Such problems have become particularly acute in recent years, as the social basis of stock market trading has changed throughout the advanced industrialized world. An ever-greater number of people have become increasingly exposed to the dominant pattern of stock market trading. For some, such exposure has been consciously accepted through attempts to diversify savings away from simple interest-bearing bank accounts. For others, increased exposure has been less conscious, being an unintended consequence of having a mortgage and a private pension plan. During a bull market, the upward momentum in prices gives the ostensible impression that investors have become relatively immune from taking losses. This encourages more people to invest more of their savings on the stock market; the period preceding the end of the bull run in 2000 coincided with the largest ever increase in household debt in the countries with the most liquid stock markets. Much of the bull run itself, particularly in the United States, was triggered by margin debt—that is, borrowing against other assets, often homes, to buy stocks. The concern for policymakers is that households may over-invest in a bull market, such that once confidence in the market ebbs and prices begin to fall, they are left with uncoverable levels of debt. Policymakers have few possible responses to prevent this happening. Bull markets have proved relatively immune to interest rate increases

designed to deter further money from being invested in the market. This leaves policymakers with only the option of urging caution, warning households of the risks they face if they over-invest in a bull market that comes to an abrupt end.

BUREAUCRACY

The term *bureaucracy* is one of those political concepts that have become part of our daily speech. Bureaucracy carries strong emotive overtones and elusive connotations that in everyday parlance evoke negative images of red tape, costly administrative inefficiencies, cumbersome procedures, and unresponsive public officials who are oblivious and unresponsive to the needs and wants of citizens. The very passions that the term raises in us, however, obscure a more specific and meaningful understanding of the sense in which it has been or should be used. Turning to the social sciences in hope for terminological clarification can produce further frustration and bewilderment because over time and across disciplines a great many authors have added to the wide array of—sometimes incompatible—concepts of bureaucracy. Although in some writings bureaucracy is used interchangeably with "public sector" or "public administration," in other contexts the term denotes a method of social coordination (as opposed to markets or networks). Still other authors see it as a specific mode of conduct based on the application of general rules to particular cases. Also, bureaucracy can refer to a social group—those who work in an office, be it a private or public one. More commonly, however, this usage is reserved for public employees, and especially for senior civil servants. In many respects, the concept of bureaucracy is irrevocably linked to

the exercise of political power and authority. The semantic roots of the term can be traced back to the word bureau—signifying a place where officials work—and the Greek word for rule. In eighteenth-century France, the economist Vincent de Gournay (1712–1759) popularized the usage of the term as a conceptual addition to the classical Greek typology of systems of government. Seen from this angle, bureaucracy is a system of rule in which officials dominate.

Without a doubt, the single most influential contribution to the debate on bureaucracy was made by the German social scientist Max Weber (1864–1920). He is generally acknowledged to have developed the most comprehensive classic formulation of the characteristics of bureaucracy. What follows is an attempt to put his elaborate conception of bureaucracy in its political and historical context and to explore the relevance of the Weberian bureaucratic state for contemporary public management.

Systems of Rule, Authority, and Bureaucracy

In his wide-ranging comparative and historical approach, Weber does not confine himself to the more narrowly defined field of organizational analysis but encompasses a wide spectrum of political, economic, and social thought. Although his translated work was largely perceived as part of the management science and organizational sociology literature, his overarching theme was no less ambitious than the evolution of civilization from the primitive and mystical to the rational and complex. Within this framework, his primary concern was with the exercise of domination based on political authority. Obedience in those systems of rule depends on the perception of legitimacy. As the evolution of human society progresses—driven by the process of rationalization, for Weber the most important of all social processes—the sources of legitimacy also tend to change in their relative importance. Weber distinguishes between three basic concepts of authority that explain why individuals throughout history have obeyed their rulers.

The established belief in the sanctity of tradition forms the basis of traditional authority. Respect for the

customary way of doing things legitimizes the personal authority of the ruler. Tribal or clan loyalties, but also absolute monarchs, can serve as examples to illustrate this system of rule. Under charismatic authority, characteristically a rather loose and unstable form, a ruler acquires his or her legitimacy through exceptional personal qualities. Accordingly, it is a form of rule over people to which they submit because of their belief in the almost magical powers or heroism of the leader. Military leaders, founders of religious movements, or popular party leaders can fall under this rubric. Their powers, however, can quickly fade away as the "routinization of charisma" sets in. In stark contrast to the aforementioned types of authority, in systems of rational-legal rule, legitimacy is based on a belief in reason. Here, the rights and obligations of both rulers and ruled are specified primarily through legal provisions. It flows from this that submission to authority constitutes deference to an impersonal order, rather than to an individual.

His historical analysis leads Weber to identify a general developmental trend toward rationalization. To the extent that the rational-legal type of authority has become the foundation of modern political systems, bureaucracy—as the archetypical manifestation of rational-legal rule in institutional form—claims a central role in steering and controlling modern societies. A bureaucratic system of rule is not to be confused with a system of government in which civil servants dominate; rather, a bureaucratic system is one in which government is carried out by means of a bureaucratic administrative staff.

Weber's Ideal-Typical Concept of Bureaucracy

A crucial aspect of Weber's methodology is his use of the ideal type construct. This is one of Weber's most celebrated concepts, but it can also be a source of confusion and misunderstanding. For the sake of conceptual clarity, an ideal-type is meant to capture the essence of a social phenomenon. In doing so, ideal-typical descriptions exaggerate and accentuate certain elements of reality. By definition, they are mental or conceptual constructs that exist in their purest form in

ideas only. Consequently, ideal-types are not to be confused with an "average type" conveying the common characteristics of a phenomenon. An ideal-type does not represent a normatively desirable state. Rather, the ideal type was intended as an analytical tool to help the researcher navigate in the vast sea of empirical facts by means of sharp distinction. For the purpose of comparative studies, for example, the ideal-type can be used as a yardstick against which we can measure actual empirical cases to see how they deviate from the ideal-type. Bureaucratic rule is an ideal-typical form of rule that can be applied to nonstate as well as state organizations, although here it will be discussed in the context of the state.

As laid out previously, the concept of bureaucracy is intimately linked to the related notion of legal authority. In a system of legal authority, legitimacy is based on the rule of law understood as abstract rules that are applied to particular cases. It is an impersonal order in which the legal code can claim obedience from members of the organization. The defining features of a bureaucratic staff fall into different categories. The first group of characteristic traits deals with the structural layout of the administration. A rigorous horizontal and vertical division of labor characterizes the organizational setting. Most importantly, a bureaucracy is organized as a hierarchy and the rights of control and complaint are clearly specified. Official tasks are organized on a permanent, regulated basis with offices being functionally divided into distinct spheres. Any administrative action that is taken is based on written documents that are supposed to be archived. A second group defines the terms of employment of the bureaucrat. Officials are personally free and owe their obedience only to the impersonal duties of their offices. They are appointed (not elected) and employed on the basis of a legal contract and devote their full activity to their work. Bureaucrats are selected on the grounds of their professional qualifications or technical training and join a career structure with a chance of advancement based either on seniority or merit. The resources of the bureaucratic organization are strictly separated from those of the office holders, so the official cannot appropriate the post or the resources that go with it. Rather, he or she is

paid with a fixed salary (with pension rights) that corresponds with his or her position in the hierarchy. In addition to the listed defining features, Weber's writings also point to some specific behavioral traits of bureaucratic officials. The administrator must ultimately be compliant and work in a spirit without anger or passion. Weber even adds one notch: Bureaucracy means to administer rules without regard for persons. The bureaucratic sense of duty is a cornerstone of officials' work ethic and adds to the social self-esteem of officials as a social group.

In Weber's picture, bureaucracies are frequently portrayed as efficient machines. This superior technical rationality makes bureaucratic organizations indispensable for modern mass administration, so he claims.

Bureaucracy: Vice or Virtue?

Weber theorized that bureaucracy as the purest form of rational-legal rule is bound to increase in importance. The attributes highlighted in his ideal-typical conception promote precision, continuity, calculability, and discipline, thus laying the foundation for his claim to bureaucracy's technical superiority as a tool to exercise political authority. Bureaucracy also resonates well with modern capitalism because it relies on dependable and predictable administrative decision making. Clearly defined lines of command and control allow, in principle, for rapid action and help pinpoint responsibility for those actions. In contrast to administration under charismatic or traditional authority, defined spheres of competence protect against arbitrary exercises of power or personal favoritism, and a system of formal rules ensures equal treatment and due process. The democratizing effect on society in historical perspective should also not be underestimated: Bureaucracy sweeps away aristocratic privileges and places administration in the hands of full-time professionals regardless of their economic or social position. Finally, the growth of bureaucracy can be attributed to its sheer organizational capacity to cope with the extension of administrative tasks: Work is divided and trusted with expertly trained, functional specialists to achieve the goals of society.

Not surprisingly for a highly contested concept such as bureaucracy, Weber's seminal statement on the subject has also attracted a fair amount of critical fire. His ideal-typical conception was mistakenly interpreted as suggesting that bureaucracy, as a system based on formal rules and the other characteristics he discusses, resulted in greater efficiency in the performance of any organizational task. The mainstream of the organizational sociological criticism in the 1950s and 1960s disputed this alleged linkage between the attributes of Weber's ideal-type and organizational efficiency. Actually, most studies succeeded in demonstrating that the empirical link between efficiency and this conception of bureaucracy was rather tenuous. More significantly, the critique has drawn our attention to the potentially self-defeating consequences of bureaucracy's defining features. The specialization of labor can lead to fragmented organizations with sub-units setting up goals of their own and fighting each other's turf, whereas the unified control and disciplinary systems also tend to stifle personal initiative and critical thinking. The emphasis on continuity and stability may breed organizational inertia and immobility just as the graded career structure may encourage an excessively disciplined and prudent behavior. Still other critics point to the inherent tensions between professional expertise and bureaucratic authority based on hierarchical position. The flipside of the norms of impersonality is that bureaucracies can become "dehumanized," as Weber himself noted. Administration "without regard for people" can cause conflict with individual citizens and is likely to alienate members of the organization. This is particularly true in monolithic, large-scale bureaucracies. Closest to the heart of rational-legal rule is the critique that abstract rules and formal procedures may well become ends in themselves (goal displacement) rather than being means to ends.

Bureaucracy and Modern Public Management

If compared with the prescriptive as well as descriptive models of public-sector reform currently advocated by scholarly writers and management consultants, the Weberian concept of bureaucracy appears

to be obsolete and oddly out of place. Actually, the characteristic traits of the Weberian state epitomize the essence of the old public management. Consequently, bureaucracy is often presented as a relic from an almost-forgotten era when hierarchy was still an accepted principle of organizational as well as political order, technological and social change came about relatively slowly, public organizations were trusted with a rather limited set of functions, and the days of industrialization and urbanization were still young. When societies grow more complex and are changing at a faster pace, so the argument continues, public organizations have to cope with increasingly unstable environments. Public authorities have to cooperate with the growing universe of commercial service providers and nonprofit organizations (not to mention other public agencies and "hybrid" cases growing out of public-private partnerships), and the portfolio of their tasks has also grown immensely to include welfare services, economic concerns, and planning functions in addition to the traditional defense and law and order. The emergence of the information society as well as the growing significance of the knowledge-based economy also calls for thoroughly redefined means of societal and political steering. By the same token, the prevailing patterns of political and work-related attitudes seem to be less and less conducive to most of the distinct features of bureaucratic organizations.

Although this view can easily be supported by empirical findings, we need to take a more multifaceted approach to adequately capture the relevance of the concept of bureaucracy for the contemporary public management discourse. Given the far-reaching administrative reform measures along the lines of the new public management—initially designed almost as an antidote to the pathologies of the Weberian approach to managing the public sector—it does not come as a surprise to see many characteristics of modern administrative systems moving away from the bureaucratic ideal-type. And yet, bureaucracy is not going to wither away—not because of the inertia of bureaucratic institutions and the highly developed survival instinct of those officials who populate them, but because it is worth it. Even though hierarchical conflict resolution and rule-bound decision making have often been augmented if not replaced by lateral negotiations and bargaining processes, we should not forget that most of those conflicts can only be resolved when they are being negotiated in the "shadow of hierarchy." Whether bureaucratic traits are seen as an asset or a liability is primarily a question of matching organizational forms and functions. The machinelike efficiency of bureaucratic organizations can still be brought to use in private- and public-sector administrations that process masses of routine cases, and most of us value rule-bound behavior and impartiality in the legal and law enforcement systems. The significance of bureaucratic organizational settings and methods is more than a function of policy sectors and administrative tasks; it also depends on the type of politico-administrative regimes. This linkage was (and still is) often neglected when international advisers and consultants rushed to transitional states in Central and Eastern Europe, Latin America, or developing nations in Africa or Asia to assist in public-sector modernization projects with prepared new public management blueprints for administrative reform. Rather than getting rid of bureaucratic rigidities and fostering market-style forms of service delivery, the most pressing need in those countries was to establish basic bureaucratic institutions: clear lines of political accountability, a professional merit-based career civil service, and a body of abstract rules to guide administrative behavior. This experience reminds us of the Weber's foremost intention when he developed his ideal-typical concept of bureaucracy: to analyze systems of political authority and rule in comparative and historical perspective. As we continue to grapple with the evolution of our contemporary systems of government (not limited to short-term changes in public management doctrines), the Weberian concept of bureaucracy will remain with us.

BUREAUCRATIC POLITICS APPROACH

The bureaucratic politics approach to understanding policy making argues that policy outcomes result from a game of bargaining among a small, highly placed group of governmental actors. These actors come to the game with varying preferences, abilities, and positions of power. Participants choose strategies and policy goals based on different ideas of what outcomes will best serve their organizational and personal interests. Bargaining then proceeds through a pluralist process of give-and-take that reflects the prevailing rules of the game as well as power relations among the participants. Because this process is neither dominated by one individual nor likely to privilege expert or rational decisions, it may result in suboptimal outcomes that fail to fulfill the objectives of any of the individual participants.

Most discussions of bureaucratic politics begin with Graham T. Allison's 1969 article in *The American Political Science Review,* "Conceptual Models and the Cuban Missile Crisis," although this work built on earlier writings by Charles Lindblom, Richard Neustadt, Samuel Huntington, and others. Allison provides an analysis of the Cuban missile crisis that contrasts bureaucratic politics bargaining with two other models of policy making. The first of these assumes that policy decisions are made by a unitary, rational decisionmaker, represented by "the state" in many formulations. Thus, bureaucratic politics is often offered as a counterpoint to realist or rationalist conceptions of policy decision making. The second alternative approach describes policies as guided by, even resulting from, previously established bureaucratic procedures, which leaves little room for autonomous action by high-level decisionmakers. Compared with these and other alternative conceptions of policy making, the bureaucratic politics model represents a significant and distinctive strain of organization- and state-level theory in international relations, organization theory, public policy, and American politics.

Perhaps the most abiding concept from the bureaucratic politics model, and the shorthand many have used to define it, is that actors will pursue policies that benefit the organizations they represent rather than national or collective interests. This idea, that "where you stand depends on where you sit," is often called Miles' Law after the Truman-era bureaucrat who coined the phrase. A central and intuitively powerful claim of bureaucratic politics explanations, this premise has been criticized for its narrow view of preference formation. For example, critics note that it fails to explain the role of many important actors in the original bureaucratic politics case study of the Cuban missile crisis. Yet even the early bureaucratic politics theorists, including Allison, were explicit in acknowledging that other factors, such as personality, interpersonal relations, and access to information, also play important roles in the bureaucratic politics process. For these theorists, three key questions guide one's understanding of the policy-making game: (1) Who are the actors?; (2) What factors influence each actor's position?; and (3) How do actors' positions come together to generate governmental policies?

Each of these queries masks a number of additional questions and hypotheses about the bureaucratic politics process. Whether actors are elected or appointed; high-, mid-, or low-level; and new to their stations or old hands can all affect their interests and bargaining positions. For example, actors who serve as part of a temporary political administration, such as political appointees of the U.S. president, might be likely to pursue shorter-term interests than would career civil servants with long-standing organizational affiliations. Many aspects of the policy environment also

influence the bureaucratic politics dynamic. Issues that are highly salient and visible to key constituencies, for instance, may cause politically ambitious actors to alter their bargaining positions. The venue in which bargaining takes place—cabinet room, boardroom, public news media, and so forth—may also privilege some actors and some interests over others.

Important implications can be drawn from this model. A main goal of Allison's initial analysis was to show that the assumption, common among practitioners of foreign policy, that governments act as rational, unitary actors is fundamentally flawed. To understand the actions of a state—indeed, of any large, complex organization—one must understand the rules governing its decision-making processes and the motivations of actors participating therein. The result of such a process may well indicate a compromise point without any clear internal strategic logic and may even reflect the unintended consequence of a dynamic tug-of-war among actors. Thus, it may be very difficult to interpret the intentions that underlie the seemingly strategic behavior of complex organizations, making interactions with these bodies less predictable and, in some spheres, such as international conflict, consequently more dangerous.

Though the bureaucratic politics model has been used to describe decision making in many different contexts, it is most commonly applied to national policy making in the United States, and particularly to U.S. foreign policy. This focus has meant that the theory remains underdeveloped in many policy areas, and the traditional, pluralistic view of bureaucratic politics has been challenged by critics who claim alternative paths to policy making. Some critics argue that in the American context the model underestimates the power of the president, who dominates policy through the selection and control of appointed officials. Others critique the model because it places too little emphasis on the power of lower-level administrators and structures to influence policy through the control of information and implementation. Because the bureaucratic politics approach has most often been applied to studies of crisis decision making, critics have also asserted that its value for explaining ordinary policy making, particularly over time, is limited. Finally,

some have expressed normative worries about the implications of the bureaucratic politics model for government accountability: If government decisions cannot be traced to individual policymakers but, rather, result from an opaque process of give-and-take among both elected and unelected leaders, assigning responsibility and therefore accountability for these activities becomes far more difficult.

BUREAU SHAPING

Bureau shaping involves molding a bureaucracy in a manner that maximizes the utility of a rational self-interested official.

Economic theories, in particular public choice theory, assumed an increasingly significant role in political science during the latter part of the twentieth century. Prominent within this was the analysis of bureaucracy. New-Right thinking advocated free market mechanisms in many areas of previously state-provided goods. New-Right thinkers argued that bureaucracy was wasteful and inefficient. Their

arguments were often premised on the neoclassical economic assumption of individuals as instrumentally rational utility maximizers. One of the primary claims was that bureaucrats were budget maximizers. That is, they were assumed to maximize the budgets of their departments so that they could achieve higher status and salaries. This highly influential work, and Anthony Downs's more pluralist account of the workings of bureaucracy in 1967, became the basis of the critique of public choice from which Patrick Dunleavy's bureau-shaping model was developed in 1985, which, he argued, provided explanation of changes in the British civil service in the 1980s. Dunleavy argued that bureaucrats were more concerned with enhancing the status and quality of their work; in addition, senior bureaucrats sought to play a policy advisory role. Utility maximization could therefore be achieved by maximizing core budgets, rather than the overall budgets suggested in earlier models. Dunleavy believed maximizing overall budgets for instrumentally rational bureaucrats would be a risky strategy, which would produce low payoffs. Therefore, top bureaucrats would be better served shaping departments into small agencies, removed from direct line management. They would consequently be less likely to be affected by spending reductions in their specific policy areas.

In the bureau-shaping model, Dunleavy differentiates between type of budget and type of agency. The former highlights a core budget, consisting of running costs; a bureau budget, which includes the core budget and payments made to private sector, for example, for contracts; a program budget, which includes the bureau budget and monies passed to other public-sector bureaucracies (and that can only be included if the bureau retains some control over the spending of this money); a super-program budget, comprising the agency's program budget and spending by other bureaucracies over which the bureau has some control. In contrast, type of agency includes delivery agencies, which directly deliver services and are labor intensive because they provide the manpower to implement policy; regulatory agencies, which are concerned with the regulation of other agencies or enterprises; transfer

agencies, which are money-moving organizations that handle payments of government subsidy or entitlement to individuals or enterprises; contracts agencies, which focus on developing service or capital specifications and then contracting out to private-sector firms; and control agencies, which supervise grant provision to other public-sector bureaucracies. These differing analytic categories highlight the complexity of government bureaucracies that are highly differentiated. This also suggests a less-hierarchical organizational structure of bureaucracy than earlier public choice accounts assumed. This is done, for example, by recognizing that policy responsibilities and implementation are fragmented between layers of government and decentralized to quasi-governmental agencies.

Having highlighted this complex framework, the bureau-shaping model then makes assumptions in respect of the bureaucrat, the individual within the bureaucracies. First, Dunleavy differentiates between different levels of bureaucrat. The bureau-shaping model then suggests that rational self-interested bottom and middle-level officials are more likely to be concerned with maximizing core budgets, whereas senior bureaucrats may be more inclined to increase bureau budgets, mainly to protect their core budgets from potential challenge. This model also suggested that the incentive to maximize core budgets is strongest in delivery agencies, given that they have the largest core budgets and staffs. Dunleavy believes that utility maximization is best achieved through bureau shaping, rather than through the maximization of generic budgets. Senior bureaucrats can shape bureaucracies in their favor. Bureaucrats pursue strategies to shape their bureaus that include the shaping of internal work practices and relationships with external partners. Bureaucrats may engage in reorganizational strategies and are able to assign less favorable, low-level work to others. This model also accounts for why senior officials may accept budget cuts; privatizing and hiving off routine work may enable the bureaucrat to shape their bureaus favorably so that their utility can be maximized. This model, then, draws attention to the focus of bureaucrats in increasing their policy advisory role. It also suggests that changes within the

British civil service were driven by utility maximizing officials.

Critics, such as David Marsh and colleagues, highlight two key theoretical difficulties with this model: These are structural and ideational. In doing so, Marsh and colleagues highlight how failure to specify the context within which actors operate can both facilitate and constrain behavior. For example, the model does not incorporate the broader social, political, and economic context within which bureaucrats operate. Failure to acknowledge this context, then, means the variables such as a "public service ethos," which can be said to be a characteristic of British bureaucracy, are also not admitted into the analysis.

BUSINESS CYCLE

The business cycle (or economic cycle) characterizes the dynamics of capitalist economy in time. In general, the business cycle is defined as a fluctuation in the level of economic activity around a longer-term trend. The business cycle is usually described in terms of the general pattern of prosperity, recession, depression, and recovery. Thus, the business cycle is considered to be complete when the level of output returns to the trend level after a period of cycling above then below the trend level.

Being rather descriptive in nature, the concept of business cycle is associated with a group of explanations of economic fluctuation. In contrast to neoclassical approaches to economics that conceive of recessions as the result of external interventions or disturbances leading an economy to deviate from a normal path of steady growth, continuous optimization of economic actors, and adjustment of prices to supply and demand, theories of business cycle claim that the succession of economic expansion and downturn is an intrinsic feature of the capitalist economy. Accordingly, periods of profitable accumulation give rise to factors that tend to undermine the basis of profitability. These factors are not considered as external disturbances, but rather as expressing contradictions of the process of capitalist reproduction or resulting from market failure. A downturn in the business cycle is seen as an adjustment mechanism by which the tensions and imbalances that emerge in the economic expansion are eliminated. Crisis or recession thus creates the basis for a new period of growth.

Mainly (post-)Keynesian and (post-)Marxist schools of thought theorize business cycle. There are four underlying explanations of business cycle in these theories. First, the profit-squeeze position argues that the economic expansion allows workers to push up their wages, which leads to decline in profitability. Second, the underconsumptionist positions refer to the problem of realization because of inadequate demand. Third, there are explanations associating business cycle with the tendency of the profit rate to fall. Finally, the disproportionality position refers to the problem of imbalance between different branches of economy as they expand at different rates. The existing explanations usually combine some of these factors.

Keynesian economists focus on the possibility of managing timing and shape of business cycles. They believe that the state can ameliorate the adverse effects of the business cycle by its monetary and fiscal policies. Thus, they attempt to sustain full or near-full employment over the duration of the business cycle by managing aggregate demand. Monetarist economists, on the other hand, largely discount the business cycle. Thus, the monetarist policies may be considered as

orchestrating the business cycle. Accordingly, social and economic policies can be assessed with respect to their effects on the business cycle: They can be procyclical or anticyclical.

CAIRNS GROUP

The Cairns Group of Fair Trading Nations was established in 1986 as part of the early phases of the Uruguay Round of the GATT trade negotiations. The group takes its name from the place of its formation in Northern Australia and reflects Australia's prominent role in bringing the grouping into existence.

The original intention of this group of highly diverse countries was to encourage reform of the international agricultural trading system, which was distinguished by high levels of trade protection and subsidization. The European Union (EU) and Japan had become preoccupied with economic security in the aftermath of a number of economic shocks in the 1970s, and this had led to an increasingly nationalistic and illiberal approach to agricultural trade. The influence of powerful domestic agricultural lobby groups meant that reform became increasingly difficult and countries like the United States felt bound to retaliate.

It was against this background of rising protectionism, and the corruption of international agricultural trade, that the Cairns Group was formed. The original members—Argentina, Australia, Brazil, Canada, Chile, Colombia, Fiji, Hungary, Indonesia, Malaysia, New Zealand, the Philippines, Thailand, and Uruguay—were highly politically and economically diverse, but united in their sense of vulnerability and a desire to free up international trade for their generally large, export-oriented agricultural sectors.

One of the most striking aspects of the Cairns Group was the intellectual leadership provided by Australia, and to a lesser extent Canada. Australia's commitment to trade liberalization was the outcome of a long domestic debate in which neoliberal ideas had supplanted protectionism and become the guiding rationale of foreign and domestic policy. The Cairns Group offered a mechanism to promote this agenda in a key multilateral forum.

Consequently, the Cairns Group's original goals focused on reducing tariff barriers, reducing or eliminating subsidies, and providing special concessions for agriculture-dependent, less-developed countries. The Cairns Group had some success in the 1980s in playing the role of honest broker and mediating between the United States and the EU in particular, and it also managed to keep trade liberalization on the international economic agenda at a time when it seemed as if it might succumb to nationalistic protectionist pressure.

By the early 1990s, the Cairns Group's influence was declining, as was its capacity to encourage multilateralism rather than bilateralism among the major powers. It is striking that Australia has recently negotiated a bilateral free trade agreement with the United States, symbolizing just how far both Australian attitudes have shifted and how much the status and importance of the Cairns Group has diminished of

late. At a time when such bilateral trade deals are proliferating and being linked to strategic concerns, it remains an open question whether coalitions of like-minded countries like the Cairns Group can wield an effective influence.

Nevertheless, the Cairns Group did help to promote trade liberalization and highlight the inequitable nature of the global trading system. The idea that agricultural trade ought to be freer has become widely accepted, and it appears that both the United States and the EU may finally be moving to do something about it. The Cairns Group can claim much of the credit for this.

Capacity Building

Capacity building refers to those sets of activities in which vested parties (individuals, organizations, communities, or nation-states) develop the ability to effectively take part in governance. The underlying assumption is that by enhancing the appropriate skills, attitudes, and knowledge, these parties will be more effective in their respective governing roles. The result is a greater equalization of power, access to decision-making venues, and a more even distribution of society's benefits.

One of the problems in defining capacity building is that the terminology does not imply a specific or unique target. For example, some scholars argue for building the expertise of individuals, while others focus on improving community organizations or institutions of the state. In an attempt to more fully understand capacity building, one might investigate the varied purposes and means associated with the general concept.

At the individual and organizational level, the focus is on increasing the availability of information and participation of underprivileged, underserved, or impoverished members of society. The purpose of these activities is to give voice and status to previously underrepresented populations. The mechanisms for building individual capacity are often leadership training, political activism, and community development. Programs that build awareness are also often highlighted. For nonprofit organizations and communities, capacity is built through technical assistance, organizational development, and interorganizational collaboration.

For some, however, building capacity is part of a much loftier goal of ensuring sustainable institutional arrangements. In the international development arena, scholars are concerned with increasing state competence to efficiently and effectively manage their affairs. In this context, capacity-building efforts may be quite broad and include development of roads and water resources, economic and legal institutions, health and education services, and mechanisms to increase public participation. The goal is to develop strong governing institutions that stabilize legal, economic, and social conditions.

Some argue that capacity-building efforts ignore the greater milieu of power, politics, and history. These critics challenge the underlying assumption that elite powerful interests will recognize, value, and support shared power arrangements. Because mechanisms for building capacity place the state or other powerful political interests in a central role, the result may be a corporatist arrangement whereby the governing body selectively enhances groups more favorable to its policies. This is also true for nonprofit organizations, whose work within communities to enhance political efficacy is structured within a larger political economy. Absent a sincere interest in reform, disingenuous efforts at capacity

building may create only the illusion of shared power without substantial implications for effective governance.

CAPITALISM

For a sizeable proportion of the world's population and, I suspect, for almost all of the people reading this entry, the word *capitalism* refers most obviously to the economic system in which they live. Moreover, many of the remainder currently have direct experience with development programs sponsored by the World Bank and the International Monetary Fund, through which a capitalist economy is that to which their countries aspire. Given the current conjuncture in international politics, in which all credible alternatives to the capitalist economy seem, at least temporarily, to have been exhausted, capitalism appears to reign supreme.

However, acknowledging its present dominance is not the same as saying what capitalism actually is. Here we encounter more difficulties because capitalism has many dimensions. At one level, it is nothing more tangible than an economic ideology, associated with a normative preference for private ownership and the delegation of production decisions to the individual. At another level, capitalism is a set of concrete institutions, associated with encouraging a particular pattern of exchange relations, such that the result is a distinctively market-based economy. In addition to this, capitalism is a legal structure, which enshrines the right to private property. Capitalism is also a set of sedimented practices, whose manifestation as embedded relations of production and distribution serve to reproduce the economic system in a distinctively capitalist form.

As is hopefully clear, there is no simple definition of capitalism. Any useful definition must be able to capture each of these aspects of the capitalist economy, but to attempt to do so necessarily complicates matters. Moreover, all definitions of capitalism reflect the political perspective from which they are constructed. For instance, those who are normatively opposed to the dominance of capitalist relations of production will choose a definition that suits this opposition. They are likely to define capitalism as a system of production in which individuals are required to subjugate themselves to the exploitative process of wage labor, as this creates the profits on which the maintenance of the system relies. Similarly, those who are normatively supportive of capitalism will choose a definition that evokes a much more positive image. They are likely to define capitalism as a system of production in which rewards accrue to the people who have been most able to harness their assets to the enrichment of society as a whole.

While these two definitions are describing exactly the same economic system, they could hardly be more different in their underlying political emphases. Where, then, given these definitional difficulties, should we start in our attempt to say what capitalism is?

Perhaps the best place to begin is with an assessment of the novel features of the capitalist economy, compared to what preceded it. In other words, we might learn more about what capitalism is by focusing on what distinguishes it from all previous systems of production. On this, the first thing to note is that individuals do not produce for their own consumption under capitalism; they produce for other people's consumption and, in turn, other people produce for their consumption. For capitalism to provide the basis for a functioning economy, then, some means must be created to ensure that goods can be transacted in order to

satisfy even the most basic of consumption needs. That mechanism is money. Capitalist economies are money economies, in which all circulating commodities are given a price denominated in a common monetary measure, and it is at this price that goods are exchanged. Therefore, money is the dominant medium of exchange within a capitalist economy: Workers give their labor in order to be paid in money, because this money can then be used to purchase necessary consumption goods. In modern times, the state has been charged with the task of both controlling the supply of money and protecting its ability to act as a medium of exchange.

The social institution of money provides the basis for a particular type of exchange: market exchange. Karl Polanyi noted in 1944 that market exchange has one defining feature—it is governed solely by demand, supply, and price. This suggests that the determinants of the price at which market exchange occurs are purely economic. They are shaped solely by the producer's costs in bringing the commodity to market and the consumer's assessment of the commodity's intrinsic economic worth. In other words, according to this standard, there are no social determinants of price, whereby a central political authority might make some goods (e.g., health care) available at a certain price in the interests of society as a whole.

The practice of actually existing capitalist economies suggests that Polanyi's standard may be too exacting, as we can point to numerous examples in which the government intervenes to influence the price at which market exchange takes place. For all public goods, such as health care, education, and the judicial system, the government typically intervenes in order to lower the price at which the transacting goods are exchanged. This ensures that access to such goods is not determined solely by ability to pay. Other goods, such as tobacco and alcohol, in which there are dangers in overconsumption to both the individual and society, also tend to be subjected to government intervention. Typically, they are highly taxed in order to raise the price at which market exchange takes place, which acts as a financial disincentive to consumption.

We are consequently drawn to a common misunderstanding. While it is usual to associate capitalism with the free workings of a system of market exchange, this association refers to a capitalist ideal-type only. In practice, actually existing capitalist economies tolerate sustained and systematic intervention in the process of market exchange.

Indeed, such intervention may be entirely necessary for the continued reproduction of the capitalist economy. The prospect of a pure market economy may be nothing more than an illusion, irrespective of the current dominance of both capitalist institutions and capitalist ideology. A functioning market economy is unlikely to be a pure market economy because a pure market economy is likely to undermine the social conditions of its own existence. At a bare minimum, a functioning market economy requires two social support structures, each of which is paid for by the tax receipts that result from government intervention in the system of market exchange.

First, the capitalist economy operates on a contractual basis: producers engage in contracts with component suppliers, employers engage in contracts with employees, consumers engage in contracts with vendors. The interworkings of the capitalist economy are, quite literally, the complex aggregation of myriad contractual relationships between one economic agent and another. Clearly, then, the reproduction of the capitalist economy relies on the continual enforcement of contracts.

But how does such enforcement take place? Over time, states have sponsored the creation of increasingly sophisticated deterrence mechanisms in order to disincentivize economic agents from reneging on their contractual obligations. These deterrence mechanisms take the form of a basic framework of law, through which sanctions can be levied against any economic agent who fails to fulfill the terms of their contract. A worker may take an employer to an industrial tribunal, for instance, if the employer fails to match the terms of a contractual wage agreement, or a consumer may take a vendor to a small claims court for failing to deliver a commodity as agreed. However, in order to provide the legal redress to which claimants are entitled in instances in which contracts are not respected, real resources have to be taken out of the economy. A framework of enforceable

law is far from costless and, as the costs of providing such a framework fall on the state, the state must in turn take resources out of the economy, usually in the form of taxation. A pure market economy can only ever be an ideal, then, as long as levying taxes is a precondition for sustaining the social basis of actual capitalist economies.

Capitalism also requires the development of relationships of trust if it is to flourish as a system. This stems from the fact that, within a capitalist economy, individuals do not produce for their own consumption. In this way, they are reliant on other people producing the goods that will help sustain even the most basic lifestyle. In order to consent to their continued incorporation into a complex division of labor, individuals must be willing to trust that other people will continue to produce the commodities that they consume in everyday life. In the absence of such trust, they are likely to release themselves from their incorporation into a division of labor so that they can concentrate, instead, on producing for their own consumption. However, a division of labor is one of the core institutional conditions of a functioning capitalist economy; the more that individuals opt out of a division of labor to produce for their own consumption, the less that capitalism is able to operate in any meaningful way.

Moreover, even if consent is secured for continued incorporation into a division of labor, further trust relationships must develop if the successful reproduction of capitalism is to be maintained. This is because individuals rarely work alone under capitalism; they are much more likely to work as part of a team. In turn, the success of the team depends upon each individual being able to trust every other individual to do what is expected of them. It only takes one individual not to pull their weight for the whole of the production process to be disrupted. A final product cannot be successfully assembled, for instance, if one of its component parts is missing or has been made to the wrong specification. Structures of managerial oversight may be introduced in order to act as a deterrent to free riding within the team, but this can never be an adequate substitute for the absence of trust relationships developing among the team members.

Trust relationships are socialized into the individual. The process of socialization begins at an early age, starting with the family and proceeding through formal state schooling. The education system teaches people the behavioral traits that they will need to exhibit if they are to be an integral part of a successful division of labor. It teaches them how to cooperate, how to be a member of a team, and how to trust others not to free ride. In other words, under capitalism, the education system enables people to learn how to act to the benefit of the capitalist economy as a whole. Without an education system of this nature, it would be a more arduous task to socialize individuals with the behavioral traits associated with a dynamic capitalist economy. As with the legal system, though, the education system costs money, and these costs are typically borne by the state. The state has no choice but to take money out of the economy, as tax receipts, in order to fund its own activities. So, once more, the image of a purely free market capitalism is shown to be an ideal only. The maintenance of the capitalist economy requires certain levels of government intervention in order to finance the socialization of individuals into the economic habits of capitalism.

State sponsorship of the means of existence of the capitalist economy also turns into state sponsorship of its dynamism. Karl Marx noted in 1867 that the truly revolutionary nature of capitalism lay in the competitive drive to accumulate capital assets. This also results from the fact that individuals do not produce for their own consumption under capitalism. Within such a system, the successful accumulation of capital assets leads to an ever-increasing range of consumption possibilities. To target enhanced accumulation is to be unsatisfied with what you have, but to have more is to increase your purchasing power within an economy in which money is a universal medium of exchange.

It is capitalism's underlying accumulation imperative that, for Marx, lies behind the individual capitalist's willingness to invest, and it is through increased levels of investment that the capitalist economy as a whole gains its dynamic features. Investment usually entails the application of higher levels of technology, which leads to increased rates of productivity. These

productivity advances, in turn, result in expanded accumulation.

Given Marx's assumption that the capitalist economy is an inherently competitive environment for the individual capitalist, the application of higher technology by one firm is likely to trigger a similar response by other firms in the same industry. Here, we see the origins of the capitalist growth dynamic. If the commitment to invest in new technology spreads throughout the economy, this will be the equivalent of upgrading the technological base of the economy as a whole, which is one of the ways in which economies grow. Therefore, the expanded reproduction of the capitalist economy arises from the desire of the individual capitalist for enhanced levels of accumulation.

This desire does not emerge simply out of economic instinct; it is encouraged by the social institutions of the capitalist system. Of prime importance in this respect is the social institution of private property. In the absence of an institutionalized structure of private property rights, there are few incentives to invest, because there is no guarantee that the returns to investment will necessarily accrue to the person undertaking that investment. The defense of private property rights provides a bulwark against the appropriation of assets, whether that is by another individual or by the state. An institutionalized structure of private property rights allows for the decision of what to produce and how to produce it to be a matter of personal initiative. The right to private property translates into the right to own and use wealth to earn income, as well as the right to purchase and use labor for productive purposes. The allocation of resources under capitalism results from private decision making.

This, perhaps more than anything, captures the essence of the capitalist mode of production. The capitalist system structures economic life in line with ideologies of individualism, and it accentuates the rights of individuals to dispose of their assets in whatever way they deem appropriate. The institutions of the capitalist economy reflect the dominance of ideologies of individualism, and they create a set of incentives that reward personally acquisitive behavior.

—Matthew Watson

CAPITAL MARKET INTEGRATION

The global integration of capital markets over the last three decades is at once a principal driver of globalization and a hallmark of the increasingly globalized economy. Capital markets are settings in which buyers and sellers of different kinds of capital—foreign currencies, corporate securities, government bonds, bank loans—meet to negotiate prices. Global capital markets are now open for business twenty-four hours a day and, thanks to information technologies, transactions can be carried out from anywhere in the world in a matter of seconds. International capital flows now routinely exceed international trade flows by a ratio of ten to one. Within global capital markets, portfolio and short-term investment now surpass foreign direct investment (FDI) and bank lending. The cross-border integration of increasingly volatile and dynamic capital markets creates obvious challenges for governance.

In contrast to international trade, there is no single international organization to provide governance for international capital markets. In part, this is because

there are many different kinds of capital (and capital markets), thus a central organization would make little sense. However, just as important is the fact that the boundary between domestic and international capital markets has become so blurred that centralized international governance would require substantial sovereignty transfers. Therefore, international capital markets feature a governance patchwork and have become a principal terrain for experimentation with new forms of global governance.

International organizations, such as the International Monetary Fund (IMF) and the Organisation of Economic Co-operation and Development (OECD) as well as intergovernmental forums such as the Group of Eight (G8), certainly play important coordination roles. But governance over integrating capital markets is primarily provided by networks of domestic regulatory agencies, such as the Basel Committee on Banking Supervision, the International Organization of Securities Commissions (IOSCO), and the International Association of Insurance Supervisors (IAIS), that develop international standards and diffuse best practices. On particular issues, regulatory networks and international organizations combine to form special task forces. The Financial Action Task Force (FATF) to combat money laundering and terrorist financing is one such instance. These networks emphasize the technical—and thus supposedly apolitical—character of international capital market governance in a world of sovereign states.

In addition to regulators and governments, the private sector actively contributes to capital market regulation. In many countries, stock exchanges play important supervisory roles. The integration of capital markets gives large exchanges a corresponding role in international market governance. The technical algorithms underpinning modern stock exchanges themselves provide market governance. Finally, private bond rating agencies exert powerful influence over capital market dynamics around the world.

Capital market integration has been a driver of the international diffusion of U.S. capital market governance practices over the past fifteen years. Many countries have created independent regulatory agencies

modeled on the U.S. Securities and Exchange Commission. Likewise, there has been a marked trend toward the adoption of U.S. standards ensuring market transparency and investor protection.

CARIBBEAN COMMUNITY

Caribbean Community (CARICOM) was established in 1973 to govern the relatively small states that make up the Caribbean region. Its mandate is to facilitate enhanced coordination of member states' policies in relation to issues of regional importance. The CARICOM Treaty has as its main goals the improvement of living standards, economic development, full employment, enhancement of international competitiveness, and effective foreign relations.

CARICOM is an intergovernmental, regional organization; its members are states. Its membership has increased over the years from four states in 1973 to fifteen in 2005. Members include Haiti, Jamaica, Trinidad and Tobago, Grenada, Antigua and Barbuda, the Bahamas, Barbados, Belize, Dominica, Guyanan, Montserrat, Saint Lucia, St. Kitts and Nevis, St. Vincent and the Grenadines, and Surinam. CARICOM also has five associate members: Bermuda, the Cayman Islands, Anguilla, British Virgin Islands, and the Turks and Caicos Islands.

CARICOM is a suprastate initiative in that it comprises regional bodies. Its principal administrative organ is the CARICOM Secretariat, which is headed

by a secretary general who is the chief executive officer of the Community. The Secretariat comprises offices such as the general counsel and directorates such as foreign and community relations. CARICOM also has fifteen institutions. A minister of government represents each member state at each institution. Institutions include the Caribbean Agriculture Research and Development Institute (CARDI), the Caribbean Community Climate Change Centre (CCCCC), and the Caribbean Court of Justice (CCJ). These bodies act in partnership with the Secretariat and civil society groups to formulate policies, promote the implementation of decisions, collect and store information, and provide technical assistance where needed. Thus, member states have transferred certain functions upward to the regional institutions and have also devolved certain decision-making input outward to national or international civil society groups, such as nongovernmental organizations (NGOs).

A notable regional initiative set up under the auspices of CARICOM in 1989 was the CARICOM Single Market and Economy (CSME). In response to the pressures of globalization, the CSME committed states to work toward a single market and economy where factors such as labor and capital move freely among participating member states as a basis for internationally competitive production of goods and provision of services. This shifts Caribbean states' traditional control over intraregional trade to market forces, although CARICOM has some way to go before the market is entirely liberalized.

CARICOM consistently addresses diverse matters ranging from the environment and health to economic performance and investment; however, development and foreign relations are thought of as its two most pressing, interrelated challenges. First, Caribbean states are classed as developing countries given the size of their economies and their poverty levels; in particular, since the 1990s, Caribbean economic growth rates have decreased and even shown negative real growth in some states. Therefore, CARICOM's main aim is to facilitate sustained economic development; it is argued that regional agreements, such as free trade zones or regional HIV/AIDS programs, will

further economic development. However, Caribbean states often disagree over whether development should be state-led or predominantly driven by market principles.

Second, CARICOM seeks to amplify the Caribbean's influence in global governance. Each Caribbean state has a small economy in comparison to the industrialized countries, such as the United States, Japan, and the United Kingdom; CARICOM was designed to overcome this imbalance by combining state forces and thus creating a more powerful regional bloc. For instance, Caribbean states are concerned about the erosion of developing-country trade preferences, such as the European Union's banana quotas. The states have taken such concerns to the World Trade Organization under the auspices of CARICOM. However, some critics point to the fact that CARICOM needs to maintain a higher level of political unity on all issues if it is to establish an effective negotiating position. CARICOM is thus faced with the challenge of attaining and maintaining regional consensus among states that often hold diverging opinions.

CARIBBEAN GOVERNANCE

The term *Caribbean governance* relates to the formal and informal ways in which Caribbean states have sought to respond to the changing nature of the

regional and global order. The Caribbean region consists of twenty-three small, independent islands, dependent territories, and sovereign states. These countries have developed governance mechanisms in order to deal with regional problems that are beyond the scope of any single state and in order to create an enabling environment for effective cooperation on intraregional economic interactions.

Caribbean governance dates back some years. Regional integration was set in motion with the establishment of the British West Indies Federation in 1958. The Federation ended in 1962, but this was a precursor for further initiatives. For instance, by 1968, a Caribbean Free Trade Association (CARIFTA) had been established; it aimed to reduce trade barriers to facilitate the free flow of goods in the region. However, Caribbean governance has evolved since the 1970s.

The Caribbean Community (CARICOM) is the principal governance mechanism existing today. It was established in 1973 to facilitate enhanced coordination of member states' policies in relation to issues of regional importance. CARICOM is an intergovernmental organization; its membership has increased from four states in 1973 to fifteen in 2005. CARICOM's main administrative organ is the CARICOM Secretariat; there are also fifteen CARICOM institutions. These bodies act in partnership with the Secretariat and civil society groups to formulate and implement CARICOM policies. Thus, member states have transferred certain functions upward to regional bodies yet have also devolved certain decision-making input outward to civil society groups, such as nongovernmental organizations (NGOs). Under the auspices of CARICOM, CARIFTA was transformed into a common market and then, in 1989, the common market was replaced by plans to work toward a CARICOM Single Market and Economy (CSME). CSME envisages a single market and economy where factors such as labor and capital move freely among participating states. This freeing up of markets effectively relinquishes the state's previous function of controlling the goods and services crossing its borders.

At the subregional level, the other notable governance initiative is the Organization of Eastern Caribbean States (OECS). It came into being in 1981 and has nine member states; states can be members of both CARICOM and OECS. It coexists alongside CARICOM in that it has separate administrative bodies, such as a Secretariat; yet both organizations collaborate closely and deal with broadly analogous issues.

CARICOM and OECS are blocs that constrain the policy orientation of their member states; they look to achieve political unity and consensus among members so the organizations can act with one voice. It is argued that the formation of such blocs engenders a greater degree of homogenization of state policy in the region.

Caribbean countries, through CARICOM and OECS, have identified various critical governance issues. First, economic development is of particular importance; Caribbean states are thought of as underdeveloped in terms of the size of their economies and poverty levels. Collective regional action, such as the establishment of regional free trade or regional HIV/AIDS programs, can further economic development.

Second, Caribbean governance seeks to enhance Caribbean influence in international relations. Regional blocs enable countries to combine their economic and political power in order to become a more consequential, international actor; a coalition is arguably more influential in global governance than if the same set of states were to act alone.

Third, the region is vulnerable to environmental challenges, such as climate change. These challenges do not respect state boundaries. Regional collaboration enables states to elaborate collective action plans and to harmonize their policies in line with regional standards. However, problems can arise when regional requirements clash with national or global requirements. This final problem raises further questions about Caribbean governance. How can the regional bloc be responsive to both national and global exigencies while retaining a regional voice? What should happen when regional requirements clash with subregional or national requirements?

CENTER-LOCAL RELATIONS

The notion of center-local (or central-local) relations refers to various aspects of the political and administrative relationship between central and local levels of government. The term captures the division of responsibilities and power, as well as patterns of interaction and instruments of control across these levels. The concept is closely associated with the broader notion of intergovernmental relations (IGR). Center-local relations are particularly interested in assessing and comparing the degree of local autonomy or, alternatively, the degree of centralization of intergovernmental relations. At the same time, the concept has played an important role in the development of the wider governance literature. In particular, critical reflections on the concept of center-local relations itself provided key contributions to the body of literature that is associated with governance.

This understanding sets center-local relations apart from concepts like center-periphery relations. The latter refers to the comparative assessment of different regions or subregions in terms of economic strength and relevance, including dependency relationships. While these concepts are broadly related, center-local relations focus on intergovernmental interaction rather than on socioeconomic dimensions.

Central-Local Governance and Networks

The concept of central-local relations (rather than center-local) emerged in the literature on the United Kingdom, where it was used to refer to domestic intergovernmental relations. The term was seen as appropriately describing the constitutional setting of a unitary state that lacked the more complex ("veto-point" rich) intergovernmental relationships that characterize federal states, such as the United States, Switzerland, and Germany (the latter associated with the literature on joint decision making rather than central-(state)-local relations). The literature revealed a growing degree of centralization since at least the 1970s, as well as increasingly adversarial relationships. At the same time, the analytical value of central-local relations has encountered increasing criticism. This criticism was particularly directed at the supposed bilateral focus (on central government vis-à-vis local authorities) of the central-local literature. In particular, it was argued that the increased use of private or third parties, as well as the growth of quasi-governmental organizations, added substantial complexity to the domain.

At the same time, it was recognized that representative institutions of local government played a relevant role in central-local relations, in the United Kingdom and more so in other countries. This "national world of local government" has always been a prominent feature of central-local relations in countries like Denmark, where bargaining over local government budgets between local government associations and the central government is a key feature of central-local relations.

Other trends that are said to qualify the centrality of the central-local relations perspective include the perceived shift toward multilevel governance, with its stress on increasing complexity and flexibility of intergovernmental relations. Different levels of government, including supranational levels (e.g., the European Union), interact simultaneously without necessarily being hierarchically ordered. Given cross-national trends toward political decentralization and devolution, as well as the growing importance of the European Union, any perspective that solely relies on the bilateral central-local relationship is likely to be severely limited. At the same time, the significance of these developments should not be overemphasized, and the relationship between the center and the local still remains politically important.

While these empirical developments have somewhat questioned the focus of (and on) central-local relations, the work by Rod Rhodes also challenged the underlying theoretical assumption of the central-local literature. He argued that the literature has displayed a bias toward formal institutional (or governmental) structures while neglecting advances in policy research. This critique has been the basis of a key contribution to the emerging policy network literature. Rhodes suggested policy networks as an alternative unit of analysis of subcentral government and its relation to central government. Such a perspective acknowledges the functional differentiation, if not fragmentation, of governmental activities at the central and local level. Also the approach emphasized low "relational distance" between policy bureaucrats and professionals in a particular policy domain at the central and local government levels. At the same time, it was acknowledged that specialized professionals or bureaucrats at both levels of government would not dominate invariably throughout all policy domains. "Territorial networks" populated by "topocrats" (chief executives and local political leaders) could prevail in some areas.

The relationship between policy professionals (or "technocrats") and topocrats in a given policy area is regarded as among the key factors shaping central-local relations. The network perspective allowed analyzing different patterns of intergovernmental relations in different policy domains. Rhodes developed a typology of policy networks that captures the variety of actor constellations in domains where subcentral governments are involved. (The typology differentiated among policy community/territorial community, professional network, intergovernmental network, producer network, and issue network.) While frequently criticized, this typology has been pivotal for the development of the wider policy network approach in Europe. Therefore, analyzing governance through the network perspective can, in part, be traced back to debates on central-local relations.

Autonomy

While this development of research on subcentral government suggests that the concept of center-local

relations has outlived its analytical usefulness, the perspective continues to play a key role in research on the degree of local autonomy. Local autonomy is, in turn, regarded as a major factor facilitating local democracy and responsiveness of services, as well as encouraging citizens' engagement and participation. Reforms in developing and developed countries alike, which aim to strengthen the local government and democracy, also renewed the interest in center-local relations as one dimension defining local autonomy.

Edward Page noted that the notion of local autonomy, as control by the local community over its own affairs, contrasts with the fact that local government is, in essence, regarded as a subordinate institution. Hence, the degree of local autonomy depends on the leeway granted by higher levels of government. That also applies to the federalist countries with a deep-rooted tradition of local self-government or self-administration, like the United States and Germany. However, others would question whether these ideas apply to cases like Switzerland, with the distinct tradition of communal autonomy (*Gemeindeautonomie*).

As these examples suggest, central-local relations are at the heart of any assessment of the degree of local government autonomy in an international comparative perspective. Such comparative assessments usually start from broad classifications of different "families of nations" with similar state traditions that are associated with specific patterns concerning the constitutional/legal setting of local government. Other dimensions include the division of functions and the financial regime underpinning this division.

In different state traditions—for example, the Nordic, Continental European, Anglo-Saxon, and Napoleonic state traditions—central-local relations are defined in different ways. For example, in the German state tradition, local "self-administration" rather than local "self-government" is connected with a strong local level that is responsible for conducting genuine local tasks as well as a wide range of tasks delegated from higher levels of government (which, today, amount to about two-thirds of local spending). This comes with a rather tight regulation of local government action, despite the constitutional guarantee of the right of local self-administration. This "mixing" of

tasks and responsibilities between central and local levels is less developed in countries with a strong tradition of local self-government.

While state traditions are regarded as having a long-term effect and are supposed to be reflected in immediate policy choices, such reforms have, nevertheless, transformed central-local relations in a substantial way (e.g., in the United Kingdom toward centralization). However, in other countries, central-local relations have not witnessed major changes, but reform themes have been filtered through the general institutional framework and the modes of interaction associated with these. For example, the Nordic countries provide evidence for such filtering of general reform themes that have strengthened the tradition of cooperative center-local relations and the (already strong) position of local government.

Some have argued that financial autonomy, defined by the legal competence to raise revenue and set spending priorities independent of the central government, lies at the heart of local autonomy because legal and organizational autonomy could only have an impact if financial resources are available to make use of these powers. A related interest is concerned with the independent impact of local and urban policies. By asking if urban politics matter, Harold Wolman and Michael Goldsmith move away from a focus on local discretion defined by central regulation and toward exploring the local capacity to initiate policies that have an independent impact.

Control

While local autonomy defines the bottom-up view on central-local relations, the concern with control can be associated with a top-down perspective on the relationship. In that context, the literature that highlights the variety of modes of governance has brought new insights into research on central-local relations. Such a view draws on the distinction between "hierarchy," "market," and "networks/cooperation" as three ideal-type modalities of control (or coordination) and explores mixes and shifts within, as well as across, modes.

This perspective allows the empirical assessment of claims regarding paradigmatic shifts toward new

localism or various new modes of governance associated with multilevel governance or the so-called new public management. Much of the governance literature assumes that intergovernmental relations in contemporary societies increasingly rely on cooperative modes of interaction. Empirically, this is reflected in the Scandinavian experience, where various reforms since the 1990s (e.g., Free Commune Experiments) have tended to weaken central control over the operation of local government—without, however, introducing far-reaching changes of the overall control regime. Other European countries (e.g., Belgium and France) provide corresponding evidence of modest shifts toward less-hierarchical control and various approaches of sharing responsibilities in policy development.

Some claims have emerged regarding the emergence of "markets" instead of hierarchical modes of control, for example through benchmarking exercises that compare local performance against uniform standards. However, other scholars have noted an increased use of market and hierarchical instruments at the same time. They have pointed out, for example, that the wave of reforms associated with new public management resulted in an increasing amount of central regulation and control over local government in the United Kingdom. Local government is described as having experienced a "double whammy," being exposed to both "old" bureaucratic regulation and new, "modern" control techniques, such as league tables, benchmarking, and audits.

In other countries, like Germany, the debate on new public management has not affected modes of control of local governments. Some state governments pay lip service to the new public management debate, but local government control continues to rely on a hybrid of hierarchical regulation and cooperative interaction. While financial pressures have triggered far-reaching changes in the internal administrative set-up of local governments and their political organization (for example, the introduction of directly elected mayors), the introduction of new modes of auditing was not an issue on the reform agenda.

The theme of control in center-local government relations is also relevant in the context of a number of developing countries that have witnessed a (frequently

externally induced or supported) shift toward decentralization and the strengthening of local government. However, evidence suggests that such a shift (if materialized) will not result in more responsive local service or inclusiveness of the wider population because decentralization allows the local elite, rather than the wider population, to control public governance. Therefore, the lack of effective central control could be regarded as one explanation for the perceived failure of decentralization to deliver the expected policy outcomes (e.g., in terms of poverty reduction).

Analyzing Central-Local Relations in the Context of Governance

The concept of central-local relations has played a major role in the development of the governance perspective since the 1980s. This may seem to be a paradox because at the core of the governance literature is the perception of a growing diversity of the institutional landscape at central, local, and regional levels of government that challenges the analytical value of the bilateral concept of center-local relations.

Although some of the contemporary literature has focused primarily on "multilevel governance," an interest in central-local relations remains of key importance when it comes to the assessment of recent reforms of the institutional set-up of local government or the introduction of new modes of control. Moreover, regulatory and policy reforms, such as privatization, the introduction of market-type governance mechanisms, and the move toward an "audit society" have a profound impact on intergovernmental relations. Central-local relations are increasingly complex and characterized by various new modes of control and patterns of interactions. However, generalizations in the sense of paradigmatic shifts toward "new" models of center-local relations have to be treated with care. In particular, comparative analysis of modes of control in center-local relations reveals the contingent and varying nature of control patterns. These depend on a number of different factors that vary across countries but also across policy domains. Moreover, general reform themes, like new public management or the challenging of the welfare state, have

triggered different responses in different countries—also in the domain of center-local relations. In that sense, center-local relations do not only constitute a major approach to the study of local governance. It is also a topic worth exploring in the context of changing patterns of statehood and governance.

For doing so, the concept of center-local relations offers a variety of analytical tools. While the (comparative) mapping of the country-specific tradition and setting of the local vis-à-vis the central level provides a first approach that remains relevant, the literature has highlighted more empirical criteria, like the size of local government, the share of spending on public service employment at different levels of government, or the allocation of tasks between levels. In order to move beyond these various ways of mapping diverse settings of central-local relations, the network approach developed by Rhodes and others has provided an important inspiration that has triggered a variety of network-oriented perspectives in center-local relations and intergovernmental or interorganizational coordination more widely. Also, the perspective that explores mixes and shifts in control relationships provides a fruitful analysis.

What sets center-local relations apart from the general intergovernmental literature is the central role of normative perspectives and debates about the (desirable) role of local government within a country's institutional architecture of democracy. This normative dimension will always be an undercurrent of more analytical approaches exploring governance arrangements in central-local relations.

Chiang Mai Agreement

The Chiang Mai Agreement, also known as the Chiang Mai Initiative, is a set of bilateral currency swap arrangements established at Chiang Mai, Thailand, in May 2000, by the members of the Association of Southeast Asian Nations (ASEAN) with the addition of Japan, China, and South Korea (collectively referred to as "ASEAN+3"). The Agreement is meant to complement the International Monetary Fund (IMF) by providing emergency infusions of foreign currency to member countries suffering from liquidity crises. It also establishes a mechanism to monitor capital flows and economic conditions through regular contacts among financial authorities in the region. Created in the wake of the 1997–1998 Asian financial crisis, the Agreement presents an important example of financial cooperation in the region.

The swap system comprises two main components: an expanded ASEAN Swap Arrangement and a network of bilateral swap and repurchase agreements. The former built upon a 1997 agreement involving five of the ASEAN countries and extended participation to the rest of ASEAN, increasing total reserves to $1 billion. As each participating member can only draw upon twice the amount it has contributed, the economic impact of a swap through this mechanism is likely to be insignificant. The network of bilateral swap and repurchase agreements provides significantly greater short-term liquidity. As of May 2004, a total of $36.5 billion had been pledged in these agreements. Under them, borrowing countries typically receive dollars in exchange for a local currency (an exception being the swap arrangement between China and Japan, which exchanges yen for renminbi) for a fixed period of time (usually three months), after which the borrower can renew the swap or pay it back to the lending country's central bank. Swap agreements can be reciprocal or unidirectional, depending on a country's reserves of foreign currency. For example, under Japan's agreements with the ASEAN states, only the ASEAN states can initiate a swap owing to Japan's large foreign reserves, while the agreement between Japan and China can be activated by either party. The Chiang Mai Agreement is explicitly designed to complement the IMF's lending practice. The activation of a currency swap is contingent upon the drawing state's acceptance of an IMF structural adjustment program, the exception being the agreement between Japan and China.

Critics have raised concerns that deepening regional integration could ultimately supplant international institutions in the region and isolate extra-regional states. Moreover, the 1997 Asian financial crisis showed that the region is susceptible to economic contagion, suggesting that liquidity should come from outside the region rather than from within it. Nevertheless, the Chiang Mai Agreement has fueled discussion about deeper cooperation in the future, such

as transforming the bilateral swap agreements into a true multilateral institution and creating a unified Asian currency.

CITIZEN-CENTRIC GOVERNMENT

The term *citizen-centric government* rose to popularity during the emergence of e-government in the 1990s and 2000s. It is based on the idea that communication technologies allow public services to be efficiently provided to distinct citizen client groups through discrete channels. It is most often presented as a rejection of what are perceived as old-fashioned, agency-centric approaches, in which services are presented through a single channel and according to the predefined physical or functional role of an agency or department. The overriding aim is to extend citizens' choices in how they interact with public-sector bureaucracies while targeting specific societal groups and reducing waste, inefficiency, and corruption.

Citizen-centric government is based on the assumption, first, that most citizens have little awareness of the functional organization of government; second, that they wish to use a variety of ways of finding government information and applying for and receiving services and benefits; and third, that agencies and departments themselves are better able to serve their key client groups if they develop discrete channels for interacting with them.

When combined with new information and communication technologies, especially Web portals, the overall effect of these assumptions is that government can "segment" its client groups according to their characteristic behaviors and needs. The dominant approach has been based upon a "life cycle" model, in which information and services are divided into key categories based on typical life events: giving birth, starting school, applying to college, registering a car, claiming a pension, and so on. However, more refined approaches have been based upon market research that identifies distinct social groups, such as working mothers, young disabled, likely to commit welfare fraud, and so on.

Citizen-centric government does not always revolve around new technologies. Specific service channels are designed to be accessible for specific groups. For example, because Internet use is lowest among elderly people, a citizen-centric approach would devote greater resources to face-to-face contact, telephone call centers, and letter handling. Services aimed at younger age groups, among whom levels of Internet use are higher, are more likely to move online.

A prime mover in implementing citizen-centric government is Singapore, but the idea has been highly influential across a number of countries. In an interesting twist, the UK government has sought to broaden the idea of delivery channels, through its "intermediaries" policy. This involves using Web technologies to involve firms, charity organizations, and other nonprofits in the delivery of services. Government Web portals bring together nongovernment organizations (Citizens' Advice Bureaus, for example) and present them to individual citizens as best qualified to deal with a particular request for advice or information.

CITIZEN PARTICIPATION

See EMPOWERMENT

CITIZENSHIP

Citizenship refers to the status of being a citizen, usually enshrined in law. Citizenship may entail rights and responsibilities or result as a consequence of being part of a polity or community. In modern democratic states, the basis of citizenship is in having the capacity to participate in the electoral process. Participation entails a legal membership of a polity premised upon universal suffrage. Citizenship is a relationship between the state and the individual that comprises a series of rights and responsibilities. It may be defined objectively, as a legal status, or subjectively, as comprising a sense of belonging and identity.

Legal citizenship defines the opportunity to vote, stand for public office, and the right to live and work in a given state. However, possessing legal rights does not necessarily encompass all that it means to be a citizen. The term *citizenship* also entails a subjective component; that is, the sense of identity and belonging that accompanies the legal definition. Hence, groups that feel alienated may well define themselves as "second-class" citizens. That is, while their entitlements are enshrined in legislation, and legally they are full citizens, the subjective component is not evident.

Rights

Citizenship is predominantly linked to the notion of rights. These can be both negative and positive. Positive rights are permissive and stress, for example, the opportunity for citizens to participate in their polity, vote, stand for office, and join organizations. Negative rights are restrictive and stress the protection of the individual from others, particularly from the state.

For early theorists of democracy, citizens were those who took part in public life. In Aristotle's *Politics,* he noted that citizens were those (men) who participated in deliberating upon and exercising power. In contemporary society, citizenship has been expanded to include all members of a political community, with the requisite legal standing. However, this understanding of the concept has been expanded. Thomas H. Marshall's influential 1950 study of citizenship in Britain, *Citizenship and Social Class and Other Essays*, identified three essential rights that comprised citizenship: civic, political, and social. Marshall wrote that all citizens should be considered equal in relation to their rights and duties, which accompany this notion of citizenship. This equality, though, was challenged by a citizen's position in the class system. Marshall highlighted that while rights might be enshrined in legislation, practically, the ability of citizens to exercise these rights may be compromised by their position in the polity. Those disadvantaged by their class status may be unable to participate in a community in which they have legal membership.

For Marshall, civil rights are considered a prerequisite for individual freedom. They provide for property rights; right of contract; the right to freedom of thought, speech, and religious practice; the right of assembly and association; and the right to equality before the law. These are positive rights—they permit action. Civil rights are premised upon the existence of civil society. Government and the state are necessary to maintain and protect these rights. Political rights include the right to vote and stand for public office. These are necessarily underpinned by a commitment to universal suffrage and democratic government. Social rights comprise a basic entitlement to a civilized existence commensurate with prevailing standards in society. This extends the responsibility of the state into areas of economic and social life. The

principle embodiment of these rights is in the institutions and policies of the welfare state.

Marshall described the historical development of these rights and included a normative aspect, and argued that in contemporary society, there should be something universally enjoyed by all citizens. Civil rights, he noted, were established between the Glorious Revolution, the first Reform Act, and the establishment of the rule of law in the eighteenth century. Individual freedom was embodied within this and became a universal feature as a result of the growth of the bourgeoisie. Political rights emerged in the nineteenth century as the franchise was extended. However, it was not until universal suffrage was achieved in Great Britain that these political rights became equally applicable to every individual and thus became entwined with the idea of citizenship. Finally, during the twentieth century, social rights were consolidated with state provision of welfare and a commitment to education and health. It should be noted that these categories are not confined to strict boundaries and are fluid. Freedom of expression is both a civil and political right, for example. Education is important for both social life and in order to be able to take part in political activities, such as voting. Many Western theorists have also emphasized the prerequisite of certain social and economic standards in order to fully realize the ideal of citizenship providing the capacity to participate in public life. Obligations were also entailed in the provision of these rights. As Marshall argued, a personal right to free expression also carries a public responsibility to exercise the right. These obligations provide a balance to the rights attached to citizenship. For example, the right to freedom of religion also entails respecting another person's freedom of religious choice. Political rights involve not only the right to vote, but the duty to do so as well. Social rights include the obligation to pay taxes, coupled with the right to expect a certain standard of welfare provision.

For Marshall, these rights tended to serve different class interest in different ways. There are tensions between these rights, and for Marshall, citizenship was ultimately a reflection of social status. Within his conception of social rights was the idea that in order

to be able to fully participate in public life, citizens must first be free from poverty and ignorance. For Marshall, citizenship is incompatible with the class inequalities of a capitalist system. Therefore, social citizenship was heavily directed toward the development of a welfare state to redress problems of poverty. Social citizenship has become part of the *lingua franca* of political debate, as civil rights movements articulate both political and social demands. For Marshall, all three types of rights were essential in comprising citizenship. Civil rights provided for the resolution of conflict or dispute within a society. This conflict was that of principles: especially with capitalism, a system of inequality and citizenship with a focus on equality, rather than social groups. Political rights, he argued, were necessary to ensure the functioning of democracy; that is, to keep elites accountable. Through the provision of social rights, the state was able to counter inequalities that may emerge as a result of the existence of market forces. Citizenship, then, is not only about a set of legal rights, but also relates to the provision of material conditions and the opportunities they provide for the individual.

However, in contemporary society, social citizenship in particular has come under heavy criticism from New Right thinking, specifically in relation to the welfare state. New Right theorists and practitioners are heavily critical of the economics of state intervention. They advocate free market thinking in all areas of public policy, in particular, in addressing the issue of societal welfare. This provision of state-sponsored welfare is thought to prevent the emergence of market incentives, rendering state provision uneconomical and inefficient, given that it is not subject to competition in a free marketplace. According to thinkers such as Milton Friedman (1962) and Friedrich Hayek (1944), collective provision limits the role of the free market. The free market, for them, is significant in providing political liberty. They regard the state as an infringement on individual rights, given that it is financed via taxation. This means the state interferes with private property and coerces contributions, thereby infringing individual liberty. This critique of the idea of welfare provision, though, raises a serious challenge to the way in which contemporary society has come to understand

what it means to be a citizen. Social rights have become as much a part of the notion of citizenship as political and civil rights. As such, this critique of the welfare state is not only an economic argument, but poses a fundamental challenge to the concept of citizenship. This implies that as the welfare state is "rolled back"; there should be a simultaneous rolling back of citizenship rights.

Active Citizenship

From this New Right thinking, the notion of active citizenship transpired in the latter half of the twentieth century. By combining the conservative emphasis upon duty with the liberal emphasis on individualism, the resulting neoliberal, New Right thinking has sought to remodel the notion of citizenship by downplaying rights and emphasizing obligations. This has involved a focus upon the manner in which too much intervention by the state undermines individual liberty. If the state does not intervene to provide welfare, then the economic argument is that this will encourage individuals to be self-sufficient, which, it is argued, is both beneficial to the state and the individual. From this emerges a moral aspect, New Right thinkers contend that this redefinition of citizenship in these individualistic terms promotes dignity and self-respect. However, there is a fundamental flaw in this notion of citizenship. Citizenship is premised upon membership in and participation within a community. As such, this removes any sense of "public" and so is unable to account for how an individual can be considered part of a community. Another distinctive feature of New Right thinking about citizenship is the focus on obligations. New Right thinking suggests that Marshall's emphasis upon rights has contributed toward a culture of entitlement, where citizens know their rights but not their responsibilities. Entitlements, they argue, are "earned." Lawrence Mead, in his 1982 article "Social Programs and Social Obligations," suggests that citizenship includes both a right and duty to work. This has been embodied in policy practice. Further criticism arises, though, in that if rights are granted only as a result of fulfilling obligations, then rights reside ultimately with the state. Rights and notions of citizenship, in Marshall's view, exist to protect the citizen from the excesses of the state. Further, this active notion of citizenship, with an emphasis upon individual rather than collective provision, reinforces the inequalities of class that Marshall's rights were concerned to address.

Gender and Citizenship

Feminists have also challenged the concept of citizenship, arguing that the mainstream is gender blind in its understanding of citizenship and class. In this sense, citizenship is a property of men. Civil rights movements have campaigned to establish the same rights for women that men possess, for example to remove barriers to entry into public life. For feminists, women's citizenship is particularly undermined through the notion of social rights. Feminists draw attention to the gendered characteristics of the welfare state and social politics and the manner in which welfare states reproduce male dominance and exploitation, thereby reinforcing patriarchy. They suggest that policies within modern welfare states disadvantage different groups, notably women. By gendering understandings of citizenship, they highlight the importance to full participation of the control over one's body and its functions (i.e., reproduction). Many institutions and processes of the state reinforce gender relations through policies, for example, those that highlight the sexual division of labor (including care of children and the elderly). Moreover, feminists claim, women are disadvantaged both as recipients of welfare provision and as workers within the welfare system. This occurs as a consequence of men being regarded as the norm. That is, social rights are linked to the male norm of continuous, full-time employment. Citizenship is viewed as premised upon the notion of the male as the breadwinner and the female as the caregiver in the home. The lower status of social rights has been linked to a low status in relation to political rights. Women, feminists argue, have less power and opportunities to gain power in society than men, particularly in relation to their representation in the decision-making processes in the welfare state and the institutions of government. Feminists have sought to advance and redefine understandings of citizenship to acknowledge

the imbalance and disproportionate balance of rights favored toward men.

Contemporary Development of Citizenship

Citizenship has generally been considered as within the remit of the nation-state. However, recent developments have witnessed the influence of actors external to the domestic borders of nation-states. The Maastricht Treaty, formerly the Treaty on the European Union (EU), establishes a common citizenship applicable to all citizens of member states. This includes the right of freedom of movement within the EU and the right to stand for election to the European Parliament. Minimal social rights have been defined, though, beyond the right to work in a labor market. While the rights conferred by the EU are still determined by the nation-state within which the individual lives, sovereignty has increasingly been ceded to the EU, which means that EU legislation overrides that of the nation-states. This poses a challenge to the existence of political rights, in that while politically accountable officials make legislation at the national level, unelected officials determine legislation at the EU level. The European Parliament plays only a consultative role in policy making.

Further, the United Nations (UN) Declaration of Human Rights, preserved in international law, has paved the way for the notion of a global citizenship. Treaties and covenants ratified by states require that legal migrants and residents who are not formal legal citizens are not distinguished against on the grounds of nationality in terms of civil political and social rights. As a result of these international agreements, the same rights are generally bestowed, except those political rights to vote or stand for public office. These rights suggest a move toward a universal understanding of citizenship, rather than as a direct result of membership to a particular nation. Individual rights are no longer directly linked to nationality, as individuals also have rights enshrined in international law. Environmentalists have also sought to develop the notion of global citizenship. Expanding upon Marshall's definition, they also argue that these rights should be extended further, in particular to recognize future generations. They suggest citizenship is a temporal, rather than spatially located, concept. Moreover, they emphasize the notion of responsibility, rather than rights, in that they highlight a responsibility toward protection of the environment. This perspective also emphasizes the political aspect, but suggests participation should be extended beyond the formal mechanisms of governments and states. Political participation also involves transnational social movements. These networks, then, may contribute toward a new global understanding of citizenship.

City-Region

City-regions represent the most advanced stage of urban development that exists today. Worldwide, the urban population is mainly concentrated in vast urban regions whose morphology and structure have moved further and further away from a model that can be

characterized as European and is based on city-centers wielding their domination and control (political, economic, and symbolic) over the suburbs that make up their hinterland. Although European cities are still strongly marked by their specific history, they are in fact increasingly moving toward a North American urban model. This model is characterized by extensive urban sprawl and the development of highly powerful economic poles located in the suburbs that are challenging the historical domination of city centers.

The new conditions of urban development pose problems of coordination and horizontal governance between municipalities in their development of public policies that are both effective and legitimate in the areas of urban planning, housing, transportation, and sustainable development. Indeed, in modern societies where hierarchical relations are being reconfigured in both the public and private spheres, these coordination problems can no longer be solved through the creation of major metropolitan institutions that merge municipalities, share resources, and generate economies of scale in the delivery of basic public services. The few examples of municipal mergers intended to solve this problem in a radical way (Montreal, Jacksonville, Nashville) rarely yielded conclusive results, either in terms of effectiveness or democratic control. From this perspective, the capacity of city-regions to face these challenges of governance at the metropolitan level largely depends on the specific local political contexts that may either favor or hamper cooperation between municipalities. It mainly depends on whether or not policies are carried out by the states (federated, federal, central, according to the nature of the national political system). Although in the United States, for example, the 1990s were marked by a mild revival of interest in new regionalism, the dynamic was stronger in countries like France, Great Britain, Germany, and even Mexico. However, in many cases (Italy, the Netherlands, Chile), these institutional dynamics are blocked either by resistance within states, which do not want to see the political and institutional weight of their country's principal city-regions strengthened, or by deep hostility displayed by the levels of subnational governments, which do not welcome the emergence of powerful and directly competitive metropolitan governments.

This issue of intergovernmental relations is essential for understanding the institutional dynamics that affect the governance of city-regions worldwide. Because city-regions are the ecosystems of advanced capitalism and generate wealth as well as social exclusion, they constitute spaces where the greatest challenges of modern societies (social justice, integration of immigrants, and economic competitiveness) are concentrated. Thus, their governance is a key issue and calls for renewed interest on the part of citizens and the political sphere in order to avoid the exacerbation of social and racial tensions.

Civic Capacity

Civic capacity may be understood as a property of individuals as well as communities, such as associations, neighborhoods, cities, or nations. Civic capacity understood as an individual characteristic refers to citizens' ability and aptitude for participation in the political decision-making process. It signifies skills of discerning facts and making judgments in the context of civic activism. It implies not only the ability to think and act, but to do so in the interest of public good. Civic capacity attributed to communities refers to their ability to mobilize their members (both individual and institutional) into collective action aimed at improving their circumstances. This collective civic capacity is also determined by available resources: Low-status communities have low civic capacity.

A certain degree of individually defined civic capacity is necessary for the existence of democracy, as citizens' presence in the public sphere and their influence on the decision-making processes are the key elements of a regime's democratic legitimacy. Therefore, levels of citizens' civic capacity are of interest to governments and nongovernmental institutions that promote programs and activities aimed at stimulating individual's civic capacity. Civic education projects run by schools and sponsored by governments as well as nongovernmental institutions, such as the American Center for Civic Education, are recognized ways of increasing individuals' civic capacity as they stimulate interest in the common good and positively influence levels of political competence. Also, participation in voluntary associations, while being a demonstration of civic capacity, enhances it further. An individual's resources, such as education and money, condition their political competence and awareness as well as their participation in the community. Therefore, individually defined civic capacity is strongly dependent on an individual's socioeconomic status.

The notion of civic capacity as a community feature has been recently popularized by the researchers from the Civic Capacity and Urban Education Project, who studied how local communities tackle the issue of educational reform. They focused on two major issues: how various agents with diverse interests and preferences develop the means for identifying common goals and what strategies they chose to pursue these goals. The formal and informal ways of reaching consensus and overcoming collective action problems, which constitute a community's civic capacity, may therefore become a key determinant of policy agenda. Levels of civic capacity are dependent on the degree of consensus reached by various agents. Communities with high levels of civic capacity more easily initiate reforms and maintain their consequences. Therefore, civic capacity is a key element of social sustainability.

CIVIC ENGAGEMENT

Civic engagement refers to a broad set of practices and attitudes of involvement in social and political life that converge to increase the health of a democratic society. The concept has assumed increasing importance as a means to reverse the balkanization of individual interests and the rapid disintegration of communal life. Civic engagement has been applied in a variety of contexts from business to community development. Its foundational concept is that both discursive and action-oriented involvement creates social and political bonds in a community. Through the process of engagement, the individual sees him or herself as an integral part of a community where civic judgment is enhanced. It is a means to achieve democratic values of equality and responsiveness in policy making, as well as to increase social capital.

Proponents of civic engagement accept the legitimacy of governing institutions but seek to use political and associational activities, both formal and informal, as conduits for promoting democratic health. Political engagement focuses on encouraging activities in public decisions, such as voting, testifying at public meetings, or volunteering for campaigns. Associational participation typically takes place in the social arena and encourages volunteering in nonprofit organizations or visiting an elderly neighbor. Increased engagement is assumed to push extreme interests to the periphery. The underlying assumption is that when citizens participate in meaningful ways,

many problems can be preempted or solved before reaching an adversarial stage.

Increasing civic engagement is a daunting task with real constraints. For example, civic engagement requires time and resources, but modern society pulls individuals in conflicting directions. In addition, many communities lack the social and political institutions needed to structure engagement, such as dialogic forums or community meetings. An approach to engagement that relies disproportionately upon citizens possessing ample time and resources risks favoring certain members of society over others. This encourages the dominance of extreme interests, outcomes that civic engagement seeks to avoid.

Despite common agreement related to the importance of civic engagement, research on this concept remains ambiguous. This stems from the wide variance in definitions of civic engagement and its concomitant lack of indicators. For example, scholars and practitioners may not distinguish properly between the context of participation where the common good may or may not be served. This also stems from a general trend among scholars and practitioners to focus on individuals' social relationships at the expense of considering the wider impact of political institutions and processes.

Enhancing civic engagement to ensure democratic health involves reshaping the individuals, organizations, and institutions in ways more conducive to democratic participation.

CIVIC REPUBLICANISM

The concept of civic republicanism is most easily understood as the form of government that contrasts with that of a monarchy, where the monarch rules over the state in his or her own interest. However, such an understanding belies an oversimplification that masks civic republicanism's complexity and rich heritage. As an approach to governance, the development of the principle ideals of civic republicanism can be traced back to the ancient works of Plato, Aristotle, Plutarch, and Cicero, among others, and in its more modern adherents such as Niccolo Machiavelli, Baron de la Brède et de Montesquieu, James Harrington, and James Madison.

The phrase *res publica* is most readily understood as "that which belongs to the people," where the people represent not just the masses but an organized society founded on justice and a concern for the common good. It follows, then, that a state founded on civic republican ideals is one whose political constitution is aimed at securing the common good of all its citizens. This task is chiefly fulfilled by the successful promotion of key ideals, such as mixed constitutions, civic virtue, and patriotism, and by institutions restrained by certain principles, such as the separation of powers and the principle of checks and balances.

Within civic republicanism there are two related, yet distinct, approaches. The first, often referred to as neo-Athenian republicanism, is inspired by the civic humanism of the ancient Greeks. This version of civic republicanism holds that individuals can best realize their essential social nature in a democratic society characterized by active participation in political life. From an institutional perspective, democratic participation, fostered by a rich sense of civic virtue and strong versions of citizenship and patriotism, is thought to be the primary means of maintaining the freedom of the state. In contemporary terms, this strand of civic republicanism is often associated with communitarianism.

While the second civic republican approach, often referred to as neo-Roman republicanism, stresses

many of the same principles as its neo-Athenian counterpart, it represents a decisive shift away from direct forms of democracy. Within this approach, the freedom of the individual is closely linked to the freedom of the state. Importantly, unlike its neo-Athenian counterpart, this version stresses the need to protect and promote individual freedom. Among neo-Roman republican writers such as Machiavelli and Madison, the ancient republics were viewed as unstable and susceptible to mob rule, factions, and tyrants. To counter this threat to freedom, its constitutional focus is on creating the institutional arrangements that preserve individual freedom by stressing, in additional to traditional republican ideals, more modern principles, such as certain antimajoritarian devices like judicial review, representative government, and a strong sense of the rule of law. The thought behind these principles is to ensure that the government does not exercise any arbitrary power over the citizenry.

CIVIC VIRTUE

Civic virtue refers to the dispositions of community members, which are deemed important for the effective functioning of the civil and political order. Attempts to define civic virtue vary as different political systems organize public life around alternative visions of the public good and the demands of citizens commensurate with this good. Understanding civic virtue has become increasingly urgent in recent years as scholars have sought to identify the causes for declining levels of civic engagement and the virtues that will reverse this trend.

Most discussions of civic virtue center on the obligation of citizens to participate in society by performing the minimally necessary activities in support of the state, such as paying taxes. However, political theorists agree that the sum total of a person's well-being is not solely attributable to his or her own talents, but is a product of social cooperation, or civic virtue. Even those who take a less-demanding view recognize that in a radically individualistic society, all people benefit from publicly supported goods, such as a transportation infrastructure or schools. To promote cooperation, Aristotle argued that civic virtue involved citizens taking part in ruling and being ruled. Others have highlighted the essential virtues of justice, courage, or honesty. However, specifically what counts for civic virtue depends on the kind of political order one aspires to create.

To illustrate the centrality of the state's purpose in civic virtue, it is useful to compare two dominant political traditions: the liberal and civic republican traditions. The liberal tradition makes minimal demands of citizens on the assumption that pursuing one's interests in the private sphere is more important than living a public life. It is sufficient under the liberal tradition for citizens to vote. The republican tradition demands that citizens be active on the assumption that high levels of civic engagement are necessary to protect against government abuses and to provide citizens with an outlet to satisfy their human yearning of creating a shared public good. Both the liberal and republican traditions share the view that civic virtue is not an inherent human quality, but needs to be developed.

The mechanisms to cultivate civic virtue depend on its place in the internal psyche. Scholars vary on whether it is a practice or a disposition. The development of civic virtue can be located in the internal world of the individual, where practice to achieve excellence produces internal goods of civic virtue. Otherwise its development can be located outside of the individual, where it is assumed that the state can foster allegiance through such activities as funding civic education. Interventions to cultivate civic virtue should consider the citizen's assumed role in society

and the means by which individuals acquire civic dispositions.

CIVIL RIGHTS

Civil rights are guarantees of equal social opportunities and equal protection under the law regardless of race, religion, or other personal characteristics. Examples of civil rights include the right to vote, the right to a fair trial, the right to government services, the right to a public education, and the right to access public facilities. Civil rights are an essential component of good governance; when someone is denied access to the opportunities of participation in political society, that person is being denied his or her civil rights. In contrast to civil liberties, which are freedoms that are secured by placing restraints on government, civil rights are secured by positive government action, often in the form of legislation. Civil rights laws attempt to guarantee full and equal citizenship for people who have traditionally been discriminated against based on some group characteristic. When the enforcement of civil rights is found by many to be inadequate, a civil rights movement may emerge in order to call for equal application of the laws without discrimination.

Unlike other rights concepts, such as human rights or natural rights, in which people acquire rights inherently, perhaps from God or nature, civil rights must be given and guaranteed by the power of the state. Therefore, they vary greatly over time, culture, and form of government, and tend to follow societal trends that condone or abhor particular types of discrimination. For example, the civil rights of homosexuals have only recently come to the forefront of political debate in some Western democracies.

The Black Civil Rights Movement

Civil rights politics in the United States has its roots in the movements to end discrimination against Blacks. Though slavery was abolished and former slaves were officially granted political rights after the Civil War, in most southern states, Blacks continued to be systematically disenfranchised and excluded from public life, leading them to become perpetual second-class citizens. By the 1950s, the marginalization of Blacks, often taking an extremely violent form, had spurred a social movement of epic proportions. The Black civil rights movement, based mainly out of the Black churches and colleges of the south, involved extensive efforts of civil disobedience, such as marches, boycotts, and sit-ins, as well as voter education and voting drives. Most of these efforts were local in scope, but the impact was felt at the national level—a model of civil rights organizing that has since spread all over the globe.

Other Movements Across the Globe

In the 1960s, the Catholic-led civil rights movement in Northern Ireland was inspired by events in the United States. Its initial focus was fighting discriminatory gerrymandering that had been securing elections for Protestant Unionists. Later, internment of Catholic activists by the British government sparked both a civil disobedience campaign and the more radical strategies of the Irish Republican Army (IRA).

A high-profile civil rights movement led to the end of the South African system of racial segregation known as Apartheid. The resistance movement began in the 1950s and 1960s when civil rights as a concept was sweeping the globe, but it was forced underground as most of its leaders were imprisoned and did not regain strength until the 1980s. International pressure combined with internal upheaval led to the eventual lifting of the ban on the African National

Congress, the major Black party in South Africa and the release from prison of beloved leader Nelson Mandela in 1990. Mandela later went on to become the first Black President of South Africa in 1994.

A current movement that has striking parallels to both the American civil rights movement and the South African struggle against Apartheid is the civil disobedience and political activism of the Dalits in India. Formerly known as the Untouchables, Dalits (though they make up about twenty-five percent of the Indian population) were forced to live as second-class citizens, and are not even considered to be a part of India's caste system of social hierarchy. Today, Dalit activism has led to great victories, including electing the first Dalit to political office.

In addition to these international movements, many groups in the United States have been inspired by the successes of the Black civil rights movement to fight for government protections, with varying degrees of success. Most notably, women gained the right to vote in 1920 via constitutional amendment and also have made many gains in the area of employment rights. The women's movement has thus far been stopped short of passage of the Equal Rights Amendment, which would have codified equal rights for women into the U.S. constitution. Since its failure to be ratified in 1982, women have seen many gains in court decisions that ruled against sex discrimination and the passing of legislation such as the Civil Rights Act of 1991, which established a commission designed to investigate the persistence of the "glass ceiling" that has prevented women from advancing to top management positions in the workplace.

A number of other groups have been the focus of civil rights movements since the 1960s. In 1968, Congress passed the Indian Civil Rights Act, designed to compensate for the forcible removal of many Native Americans from their land. Latinos and Asian Americans have fought for increased civil rights based on a history of discrimination over race, religion, language, and immigrant status. There have been some successes, in the form of provisions for bilingual education and affirmative action programs.

Most recently, Arab Americans and homosexuals have taken center stage in the struggle to achieve equal protection and equal opportunity in American society. After the terrorist attacks of September 11, 2001, Arab Americans suffered from heightened levels of discrimination and hate crimes and had to conform to government policies that restricted their liberties, as outlined in the controversial USA PATRIOT Act of 2001. Activism around this issue is in early stages of development.

The homosexual rights movement has made some major gains in the late 1990s and early 2000s, including a major Supreme Court decision that struck down legislation outlawing consensual sex between consenting adults. Some states currently allow gay and lesbian couples to apply for domestic partnership benefits, but there is mixed national opinion about whether or not homosexuals should be allowed to marry. Some local efforts, such as the San Francisco marriages of 2004, have spurred a backlash that may lead to a constitutional amendment banning gay marriage.

Almost all nations actively deny civil rights to some minority groups. Because civil rights are enforced by nations, it is difficult to establish an international standard for civil rights protection, despite the efforts of international governance bodies such as the United Nations. The Universal Declaration of Human Rights, which was adopted by the General Assembly of the United Nations in 1948, includes civil rights language, but is not binding on member states. Civil rights tend to increase as governments feel pressure, either from national movements or other nations, to enact change.

Civil Service

Civil service refers to the civilian, that is, nonmilitary employees of the public service, whether employed by the central, state, provincial, or local governments. Usually these employees are hired into merit systems through competitive processes, such as by testing or based on demonstration of relevant experience or by other competitive processes. However, noncompetitive influences continue to be rampant, especially in many developing nations, even where the trappings of formal merit systems exist. This is especially true of many nations of Africa, Latin America, and, to a lesser extent, Asia. For most countries of Western Europe and North America, job security follows a period of probation. Still other merit procedures, such as performance ratings, partially govern compensation increases and promotions, although all systems are subject to the tendency to increment pay based on seniority.

Three models of the merit system are common in Europe: general career systems, specialized career systems, and decentralized function-oriented systems. The first two emphasize rather restricted qualifications for entry and progression and remuneration over time and with assignments. Technically trained personnel are found in the specialized career systems or corps, such as those connected with science, engineering, fiscal services, and police. The general system is mostly the senior civil service, who are administrative generalists, such as those found in Great Britain, France, and the Netherlands, and are often deeply involved in policy formulation. Admission to the general career system is dominated by graduates of Oxford and Cambridge Universities in England. Technical educational preparation is requisite to specialized career system employment in Great Britain. The French versions of these two models are even more controlled at the entry level. The general career system is usually staffed by graduates of the National School of Administration and the specialized corps by the National Polytechnic School.

What Europeans refer to as the decentralized function-oriented system is basically the U.S. system applied with variations throughout North America, many countries in Latin America, as well as Norway and the Netherlands.

Most civilian employees of American governments are part of a classified service, which is a comprehensive system of occupational specialties related to a common set of pay ranges. However, many employees are appointed to other career and noncareer systems. For example, the Federal Bureau of Investigation (FBI), the Central Intelligence Agency (CIA), and the Foreign Service are three career systems separate from the federal classified service. Additionally, appointments are made of a noncareer nature by elected officials, policy-making officers, and, in general, by the legislative and judicial branches of government.

The Northcote and Trevelyan reforms in 1854 in Great Britain on the organization of the permanent civil service sought to create a largely self-sufficient career civil service that would train its own administrators so that they could, on merit, hold the highest positions in the service, instead of, as at the time, having to fill them from outside ranks and independent of ministerial politics. Though the reforms were not fully implemented in Great Britain until about 1920, the ideas involved greatly influenced American reformers of the federal civil service, where most government personnel appointments were political patronage, the so-called spoils system in which government jobs were rewards for political party membership, campaign support, and financial contributions to electoral candidates. Public support was growing for the idea that civil servants were actually supposed to perform the work of government based on their qualifications rather than hold office as political rewards. Urged on by the muckrakers in the press, such as Lincoln

Steffens and Ida Tarbell, the New York Civil Service Reform League, and public outrage following the assassination of President Garfield by a disappointed office seeker, Congress passed the Civil Service Act of 1883, also known as the Pendleton Act, named for the senator who proposed it. The law established the principle of merit in federal government employment and a civil service commission to administer the act and a body of rules governing the concepts of merit and political neutrality of federal employees.

For close to one hundred years, this civil service system established for the federal government also served as the model for states and local governments to reform their personnel systems. It was not until Congress passed the Civil Service Reform Act of 1978 that fundamental change was initiated for the federal government. The results again became the model for state and local governments. Without neglecting merit and political neutrality issues, the new emphasis of management and manageability of a complex organization was introduced. The functions of the United States Civil Service Commission were reallocated to two new agencies, the Merit Systems Protection Board and the Office of Personnel Management. The appeal system on dismissals was reorganized and simplified and the Office of Special Counsel was created with responsibility for investigations and prosecutions in the civil service.

During the intervening years between the two acts, much change and need for change occurred: Government employees became unionized, employee appeals systems needed to be simplified, overregulation and centralization reduced the incentive of managers to manage, for the first time the idea of monetary rewards to increase productivity was instituted, and the practice of contracting out government activities to the private sector has been extensive. All of this, known as new public management, became part of a global approach to civil service reform, the impact of which has been as significant in Europe as it has in the United States.

While these developments were taking place in Canada, the United States, and Western Europe, most developing nations languished. Among the salient reasons for lack of progress in modernization one finds: public employment patronage financing competition between political parties (e.g., Bolivia and Honduras), resistance to merit reform by the continued practice of employing friends and family (e.g., Jordan), growth of oversized welfare state bureaucracies, something learned from post–World War II advanced countries, which has made downsizing public sectors difficult (African and Middle Eastern countries).

CIVIL SOCIETY

The term *civil society* has carried a number of different associations in the history of political thought. Today, it tends to be used to signal the dense network of groups, communities, networks, and ties that stand between the individual and the modern state. Used in this way, it has become a familiar component of the main strands of contemporary liberal and democratic theorizing. In addition to its descriptive properties, the terminology of civil society carries a litany of ethical and political aspirations and implications. For some of its advocates, the achievement of an independent civil society is a necessary precondition for a healthy democracy, and its relative absence or decline is often cited as both a sign and cause of various contemporary sociopolitical maladies.

These two ways of thinking about civil society have been widely debated. As an analytical framework for interpreting the social world, the idea that civil society should be understood as, by definition,

separated from and opposed to the operations of the state and official public institutions has various downsides; not least because it inhibits appreciation of the complex interrelationships between state and society that characterize contemporary governance relationships. Equally, the notion that the hugely diverse group life of Western capitalist societies promotes social values that are separable from, and possibly opposed to, the market is hard to defend. The forms of combination and association that typify civil societies in the West are typically affected and shaped by the ideas, traditions, and values that also pertain in the economic sphere.

Traditions

Historians of the idea of civil society suggest that these contemporary reservations have their roots in the complex and multifaceted intellectual genealogy of this term and the different modes of thinking that underpin its usage in modern Western thought. Both of the conceptions outlined at the start of this entry stem from a way of thinking about Western modernity that emerged in European thought in the eighteenth and nineteenth centuries: Specifically, the idea that modern societies can be analyzed in terms of the development of three separate and rival orders—the political, the economic, and the social. Civil society is still invoked by many of its advocates as a synonym for the values of authenticity and belonging, neither of which, it is assumed, can be achieved in politics or economic life.

More generally, the entry of civil society into the language of modern European thought was bound up with the development and spread of liberal doctrines about society and politics. Since the eighteenth century, it appeared in the context of the broadly individualistic, autonomous, and rationalistic understanding of the human personality that liberal thinkers tended to promote. In this family of arguments, civil society is a vital underpinning of, and goal for, the "modular man," whom Ernest Gellner sees as the signature figure of Western modernity. For many liberals, it followed that social order and political obligation can be understood through the analogy of a social contract

between ruler and ruled, the rule of law is a precondition for the liberty of the citizen, and the achievement of a commercial order requires and bolsters an improvement in the overall character of the interrelationships of citizens. This broad understanding of civil society as both a precondition for and marker of the distinctive trajectory of Western liberal democracy remains the predominant interpretation of it. That is not to suggest that this view is shared or admired by all. Critics observe the differentials of power and resource that characterize relationships within civil society, the apparent inability of liberal thinking to address the fundamental character of some of these inequities, and the skill and willingness of some states to orchestrate and occasionally manipulate civil society organizations for their own ends.

Origins and Development

This skepticism about liberal ideas of civil society reflects, and has sustained, diverse conceptions of its meaning and potential: A host of more conservative, as well as more radical, ambitions have also been attached to this term. Its original meaning in Western thinking was rather different from its current protean status. For the Roman author Cicero, *societas civilis* (itself a translation of Aristotle's *koinonia politike*) signaled a political community of a certain scale (usually including more than one city in its compass) that was governed by the rule of law and typified by a degree of urbanity. This kind of community was understood in contrast to noncivilized or barbarian peoples. This conceptual usage was transformed by different European thinkers throughout the seventeenth and eighteenth centuries, with the result that civil society came to acquire a rather different set of connotations. Here, three of the prevalent modes of thinking are identified concerning this term that became established during this period, though this list is far from exhaustive.

A strand of thinking developed in the Enlightenment era in the writings of English figures like Thomas Hobbes and John Locke, which presented the social and moral sources of the legitimacy of the state in relation to the idea of civil society. Though internally

diverse, this tradition shared an aversion to the idea, widely held in Ancient Greek thought, that societies could be characterized according to the character of their political constitution and institutions. Society, however conceived, was prior to and formative of the establishment of political authority. A different mode of thinking about civil society, which found its most coherent expression in nineteenth-century German thought, separated civil society from state in both ethical and analytical terms and regarded the two as separable and perhaps as opposites.

Standing between and partially overlapping with these perspectives, there developed a different, long-lasting conception in the thinking of some of the major theorists of the Scottish political economy tradition of the eighteenth century—including Adam Smith and Frances Hutcheson. In their view, civil society should be conceived as emerging from the intertwined development of an independent commercial order, within which complex chains of inter-dependence between predominantly self-seeking individuals proliferated, and the development of an independent public sphere, where the common interests of society as a whole could be pursued. The development of the notion of a public that is in posses-sion of its own "opinion" in relation to matters of common concern became an increasingly prevalent way of thinking about civil society, particularly in connection with the emergence of forums and spaces where the free exchange of opinions—newspapers, coffee houses, political assemblies—was observable.

Contemporary Political Discourse

The second and third of these strands have been most influential in shaping the thinking of Western theorists in the last thirty years on this topic. After a period of relative philosophical disinterest in the term in the middle decades of the twentieth century, the terminol-ogy of civil society became ubiquitous in political thinking during the 1980s. Many of the ideas of this phase of its intellectual history can be connected to the three traditions previously identified.

The English strand has been powerfully reappro-priated in the contemporary period by various neoliberal theorists and ideologues. For them, civil society stands as a synonym for the ideal of the free market accompanied by a constitutionally limited, but powerful, state. This last idea figured powerfully in the idealization of civil society that prevailed in Eastern European intellectual circles following the fall of the Berlin Wall in 1989. In these settings, civil society signified either the survival (in countries like Czechoslovakia and Poland) of a web of autonomous associations that were independent of the state and that bound citizens together in matters of common concern or a necessary means of achieving the economic prosperity and civil freedoms of Western democracy.

The German strand's concern with the sources and importance of the ethical ends learned through partic-ipation in the corporations of civil society has reemerged in the work of a body of American politi-cal scientists and theorists who have come to view civil society organizations as sources of the stocks of social capital and mutual reciprocity that a successful democracy is supposed to require. And, third, the Scottish conception has been powerfully revived by Left-inclined thinkers who hoped to provide a more pluralist, and less statist, reformulation of a socialist ideology that was experiencing a profound political recession among Western publics.

As the Canadian philosopher Charles Taylor has observed, these and other influential ways of thinking about civil society have rested upon the twin assump-tions that, in empirical terms, independent civil soci-eties did come into existence at some point between the eighteenth and twentieth centuries, and that their existence depends, in part, upon the separation of the concepts of state and society in the Western political imagination. Neither of these assumptions is uncon-tentious. For while there clearly does exist a plethora of groups, communities, and associations that exist in relative separation from the state, the boundary between state and civil society in many countries is rarely as clear or firm as the first assumption suggests. In various democracies, the state and other public authorities have succeeded in incorporating institu-tions and organizations from civil society—for instance, trade unions, environmental groups, and

business associations—into key networks of influence and decision making. Equally, individual groups and even oppositional social movements often expend considerable resources and energy attempting to interact with government officials, elected politicians, and state bureaucracies. The notion that the state-civil society distinction exists in all Western societies therefore requires considerable clarification and qualification in empirical terms. In historical terms, this way of thinking about the development of even the most antistatist social cultures (for instance, the United States) has also been successfully challenged.

Likewise, the idea that a fundamental intellectual distinction between state and society underpins the model of liberal democracy begs some rather large questions. Quite different accounts of the distinction and interrelationship between society and the state have guided some of the major ideologies of the nineteenth and twentieth centuries and have sustained clashing theories about politics, sovereignty, and social order. Above all, the idea that a portion of any societal complex should be portioned off, endowed with ethical, even emancipatory significance, and understood as the fundamental opponent of political authority and institutional life looks increasingly problematic at the dawn of the twenty-first century.

One of the most interesting and contentious manifestations of the terminology of civil society arises from its increasingly common application to non-Western societies. Are supporters of civil society in the West and in newly democratizing states throughout the world talking about the same things when they invoke this term? Can a Western-derived term be usefully employed as a framework for analyzing societies with forms of sociability and state-society relationships that differ markedly from those of the West? Equally, the assumption of some Anglo-American theory that a network of independent associations, cultural practices, and organizations is a necessary feature of a stable democracy is open to considerable doubt when viewed from elsewhere in the world (think, for instance, of East Asian countries that have many of the features of civil societies but are not democratic in their political structures).

During the 1990s, in particular, many authors, politicians, and public authorities keen to find solutions to some of the different kinds of problems facing developing countries seized upon civil society as a kind of panacea. Relatedly, this term became a conceptual mainstay of academic thinking about democratic transitions and a familiar part of the discourse of global institutions, leading nongovernmental organizations and Western governments. The ideological character and political implications of such ideas have become increasingly clear over time. Such thinking has helped sustain various attempts to kick-start civil societies from "above" in different African countries, for example, and simultaneously serves to legitimize Western ideas about the kinds of political structure and economic order appropriate for developing states. In philosophical terms, applying civil society in this kind of way raises the profound question of whether it can be removed from its status within the Western political imagination and applied in ways that are appropriate for the indigenous developmental trajectories and political cultures of some of the poorest countries in the world.

It is impossible to divest the notion of civil society of normative connotations. The concept remains powerful, in part, because of its (often unstated) contrastive character. A civil society is typically seen as a superior alternative to a barbarian, natural, despotic, traditional, or premodern societal "other." This kind of idea constitutes an inexorable part of the term's appeal within the Western political imagination. The achievement of a dense forest of groups, networks, and organizations that appears to stand beyond the boundaries of the state and outside the reach of the family and clan remains, for many political thinkers, a major part of what makes Western modernity unique and desirable. When examined closely, this generic idea gives way to a host of different kinds of projects, fantasies, and anxieties about politics, society, and the economy.

In the last two decades, civil society has moved to the center stage of Western political debate, assuming the character of both the diagnosis for, and solution to, the various malaises of western society—rampant individualism, rising crime, consumerism, and the decline of community, among other maladies. In more philosophical terms, the term has held out two

different kinds of promise to intellectuals, political actors, and occasionally social movements. On one hand, it offers the dream of reconciling some of the major discursive tensions in Western thought: between, for instance, self-interest and the public good; the individual and community; freedom and social solidarity; and the private and public domains of life. And the second promise, the idea of civil society as a distinct third sector of Western societies, has come to fire parts of the radical imagination in contemporary ideological debate. In this context, it offers the thinly veiled promise of the achievement of a collective emancipation from the constraints, compromises, and disappointments of politics. With a growing awareness of the limitations and dangers of both of these ideas has come a desire to rethink the boundaries of civil society and reconsider which political and moral values it promotes. Some of the main accounts and theories of the new kinds of governance relationships that prevail in many of today's democracies have an important role to play in promoting more empirically and normatively sophisticated ideas about this term. In particular, the more fluid relationships associated with the kinds of network relationships orchestrated by contemporary states and the proliferation of examples of mutual influence and reconfigured relationships between public institutions and socially based actors that governance theory describes point to a more empirically sensitized and morally contingent account of the nature and future of civil society.

CLIENTELISM

Clientelism is a relationship between individuals with unequal economic and social status ("the boss" and his or her "clients") that entails the reciprocal exchange of goods and services based on a personal link that is generally perceived in terms of moral obligation. Defined in this way, clientelism is a phenomenon that has occurred in many different social contexts, be it between patricians and their henchmen in ancient Rome, between lords and their serfs in feudal times, or between large landowners and peasants in numerous rural communities. Clientelistic relations did not disappear with the advent of modern states or their democratization since the end of the nineteenth century. However, during this process, these relationships have been transformed in two ways. On the one hand, they have acquired a specifically political dimension through their insertion within the institutions of each regime. On the other hand, clientelistic relations have become increasingly denounced as obstacles to the efficiency of these institutions and to the respect of democratic values.

The Clientelism of Notables

At least initially, the introduction of elections reinforced the power of notables. In the French Third Republic, aristocrats, bourgeois landowners, or industrialists won political office by using their wealth and social standing as means of enhancing their electoral chances. Until the mid-twentieth century, the same phenomenon was commonplace in the peasant communities of southern Europe and for agrarian elites in numerous developing countries. Voting simply

reinforced social hierarchies. Votes were also "exchanged" for services that could be offered to loyal followers (land, employment, charitable donations, etc.). Democratization thus led to the formation of clientelistic networks that then became the notables' first political parties.

When mass parties came into being, these notables had to compete with new political entrepreneurs from the middle classes, the professions, or the trades unions. These professional politicians had no patrimony that could be converted into clientelistic resources. Instead, they sought electoral support through spreading the idea that voting and political affiliation should stem from the sharing of convictions, ideology, and the defense of collective interests. To these politicians, the self-interest-driven exchanges that characterized notable clientelism contravened democratic principles and were thus acts of corruption that one had to eradicate in order to moralize public life.

The Clientelism of Parties and Political Modernization

However, the increasing specialization of political activity did not bring an end to clientelistic practices. Of course, these were progressively depreciated as the norms of civic citizenship spread and legal sanctions for electoral corruption were put in place. Nevertheless, the expansion of interventions by states and local authorities generated new possibilities for politicians to control public resources and, in so doing, mobilize electoral support. Social policies, urban renewal, or subsidies for economic development could all be used to fuel these "political machines." Be they in the American cities during the first half of the twentieth century or southern regions of Italy after World War II, these machines coordinated clientelistic distribution of collective goods (housing, jobs, subsidies) on a large scale in order to support local "bosses."

Some political scientists have gone so far as to use the term *clientelistic state* to qualify political systems within which a dominant party takes over the bureaucracy, collective goods, and their distribution in order to preserve its hegemony. This analysis highlighted

cases such as the Mexican Institutional Revolutionary party, the Japanese Liberal Democratic party, and the Italian Christian Democrats, who all remained constantly in power between the 1950s and 1980s. In these cases, clientelistic relations developed within entire sectors (ministries, business organizations, lobbies, trade unions, etc.).

Contrary to what most specialists had predicted until the 1970s, clientelism thus survived the advent of democratic modernization. Until this time, however, clientelistic practices were generally considered part of a "traditional" stage of political and social evolution of which peasant societies in the periphery of Europe were considered prime examples. It was thought that urbanization would liberate individuals from community-type dependencies, that education would encourage civic citizenship, and that economic progress would generate social mobility and the uniformization of life chances.

Given the evidence that shows the perennial nature of clientelism even in modernized social contexts, many sociologists and political scientists have since modified their point of view. Clientelism is no longer seen as a relic from tradition but as a sign of malfunctioning democracy and as an anomaly of political systems caused either by a lack of "civic culture" or by the "capture" of institutions by politicians only interested in conserving power. Clientelism has thus come to be seen as a political "pathology," blocking the emergence of genuine democracy as well as its lasting legitimation.

The Unofficial Mechanisms of Governance

It is incontestable that clientelism goes against the values contemporary democracies claim to uphold. It involves a discretionary usage of public resources, which contradicts the rule of law and the principle of bureaucratic impartiality. It is also based upon personalized exchanges and instruments that are antithetical to the ethics of political conviction and disinterested engagement that lie at the heart of the civic ideal. However, the opposition between clientelism and democratic politics is not as clear cut as it seems. In

1848, it was through a form of "democratic patronage" that local republican elites spread a national political culture throughout the French countryside. Subsequently, mass parties frequently linked the provision of material goods with pedagogical and ideological efforts to ensure the loyalty of their electors and activists. In this case, clientelism was a vector for the formation of partisan identities and the social learning of democratic citizenship. Meanwhile, some state-driven infrastructure projects were carried out through the implication of local politicians, who thereby became mediators between the state and its citizens. The political and administrative networks set up during these projects were used by politicians in order to satisfy the demands of their electors but also to deeply modify public action and the socioeconomic conditions of their respective regions. In such cases, clientelism was an instrument used to foster political and administrative modernization, a process during which the state's activities were "translated" and adapted to the needs of local societies.

These examples suggest that clientelistic relations are not in complete contradiction with democratic governance or the bureaucratic logics of institutions. Although official representations of legitimate forms of politics lead clientelism to be discredited, and thus consigned to the realms of the unofficial "corridors of power," it nevertheless remains a structuring part of representative democracies.

CLIMATE CHANGE

The term *climate change* refers to increases in global mean surface temperatures brought about by human activity. It is considered an issue of global importance because the rise in temperature and the environmental consequences this might engender are transboundary—they do not respect the boundaries demarcated by the nation-state. It is a complex governance issue, especially because the nature and extent of the problem are contested.

Global warming is a natural phenomenon. Atmospheric gases—carbon dioxide, methane, and nitrous oxide, primarily—absorb infrared radiation, which is reflected from the Earth's surface as heat. This process is often labeled the greenhouse effect. The sources of greenhouse gases (GHGs) are varied. Carbon dioxide emissions arise primarily from the burning of fossil fuels. Methane is produced by agricultural processes, particularly rice cultivation and livestock. Nitrous oxides come from biomass burning, fertilizer use, and fossil fuel combustion. Without the greenhouse effect, average global temperatures would be considerably cooler than they are now. Concern arises when the effect is enhanced by increased concentrations of GHGs.

The atmospheric concentrations of carbon dioxide have increased by thirty-one percent since preindustrial times (the mid-1700s). About three-quarters of the increase is from fossil fuel burning, the rest from changes in land use, especially deforestation. These changes are linked to abnormal increases in global temperatures. Average surface temperatures could increase by as much as 1 degree Celsius (1.8 degrees Fahrenheit) by 2030 and by anything between 1.4 degrees Celsius (2.5 degrees Fahrenheit) and 5.8 degrees Celsius (10.4 degrees Fahrenheit) by 2100 (against a 1990 baseline). However, some scientists question whether the current temperature peaks merely represent the Earth's natural cycle of temperature peaks and troughs. Others rejoin that it is the rate and degree of contemporary change that is cause for concern.

The foreseen impact of climate change is disputed. Predicted impacts include rises in sea levels, due to

the melting of glaciers, and an increase in the frequency and intensity of extreme weather conditions. Coastal areas could be inundated, possibly displacing up to one billion people and affecting up to one-third of the world's croplands. However, predictions vary and scientists remain uncertain about how to precisely model the relative contribution of gases, how to identify the threshold level for concentrations, and whether, when that threshold level is reached, the inherent resilience of the climate system will be overwhelmed. Nonetheless, there is a high degree of consensus in the climatological community that climate change is happening and will have environmental implications, even if the extent of such implications remains contested.

The Global Governance of the Climate

In spite of the uncertainties surrounding climate change, it has been on the international political agenda for many years. The 1970s and 1980s witnessed increased attention to global atmospheric pollutants and their global consequences—namely climate change. This was reflected in a number of intergovernmental conferences. In 1972, the United Nations Conference on the Human Environment raised the issue of climate change. Similarly, in 1974 and 1976, the United Nations World Food Conferences discussed climate change as a pressing matter. However, it was not until the discovery of the hole in the ozone layer in 1985 that scientific concern on climate change seemed to be translated into calls for concrete political action.

In 1988, the Intergovernmental Panel on Climate Change (IPCC) was established under the auspices of the World Meteorological Organization (WMO) and the United Nations Environment Programme (UNEP). In 1990, the IPCC released its first assessment report, which confirmed the scientific evidence for climate change. In 1992, at the Rio Earth Summit, the United Nations Framework Convention on Climate Change (UNFCCC) was signed by 154 states. The UNFCCC aimed to stabilize GHGs at a level that would prevent further interference to the climate system. From 1995 on, an annual Conference of the Parties (COP) to the UNFCCC took place.

The principal global initiative to result from the COP is the Kyoto Protocol—named after the Japanese city where it was first inaugurated in 1997. It entails a commitment by industrial countries to reduce, on average, GHG emissions to five percent below 1990 levels by the period 2008–2012, even though individual country targets varied. To come into effect, the Kyoto Protocol needed the ratification of fifty-five countries.

Since the Kyoto Protocol, climate conferences have faltered, even collapsed, in the Hague in 2000 and Bonn and Marrakech in 2001. However, with Russia's ratification, the Kyoto Protocol came into force in 2005. To date, the United States has still not ratified the protocol, claiming it is flawed, not least because it does not include commitments for developing countries.

The Kyoto Protocol has been criticized on two notable grounds. First, certain critics question whether its targets are adequate. For instance, the IPCC has estimated that to stabilize concentrations to 1990 levels, emissions would need to be reduced by an average of sixty percent. Even then, stabilizing at 1990 levels would only reduce the estimated 0.3 degree Celsius (0.54 degree Fahrenheit) increase in global temperature per decade to 0.23 degree Celsius (0.41 degree Fahrenheit) because of the long-term impact of concentrations. Second, without the United States—responsible for more than one-quarter of all GHG emissions—some observers question whether the protocol could ever be truly effective, although 141 countries have signed the treaty.

The Challenges of Climate Governance

States face three interrelated challenges in their attempt to develop an effective system for governing the global climate regime. First, given that countries differ in terms of their political and economic structures and their emission levels, there is significant discord over how this can be reflected in a set of rules for governing GHG emissions. In particular, the responsibility of the developed world in relation to the developing world is a point of contention. Developed countries are responsible for the bulk of GHG

emissions. For example, per capita carbon dioxide emissions in industrialized countries average 12.4 tons per annum. In developing countries, the figure is around 1.0 ton. Hence, developing countries argue that the onus should be on the bigger contributors and that climate commitments should not interfere with their development. Yet, certain observers—including the United States, Japan, and the European Union—argue that developing country emissions are increasing and that it is unfair that they should be absolved of commitments, particularly those with rapidly expanding economies, such as India and China. These difficulties require state managers to devise measures for effectively and equitably reducing GHG emissions while taking into account the marked differences between countries in terms of their contribution to global emissions and their capacity to make GHG cuts.

Second, climate change brings into sharp focus the issue of state sovereignty. In international relations, states are considered to be sovereign; this means that states are the ultimate political authority, subject to no higher power with regard to political decisions within their territory. However, the effects of climate change transcend state boundaries, raising problematic questions about the principle of sovereignty. Should sovereign states be held accountable for their impact on the global environment? If so, should a climate regime be able to dictate how a state manages its political and economic development? How will compliance with climate change targets be enforced? Those involved in governing the climate regime are faced with the task of balancing respect for the freedoms of sovereign states with the need to develop global criteria for GHG reductions.

Third, even where states agree that climate change is happening, they often disagree on the precise measures needed to stabilize and reduce emissions. For example, certain countries, like the United States and the United Kingdom, argue that a reduction in emissions should not compromise economic interests, such as economic growth and national competitiveness. They argue that this can be achieved through the use of green technology and renewable energy sources, such as solar power. Various critics agree that technology and renewable resources are important, but argue

that a more radical solution is required. Economic growth must be decelerated and some living standards, notably in the industrialized world, will have to be sacrificed. They contend that striving to maximize national economic competitiveness is not always compatible with the preservation of the fragile global ecosystem. This highlights the difficulty of balancing economic goals with the need to ensure that the absorptive capacity of the global environment is not exceeded.

These challenges make climate change a highly politicized issue in contemporary governance. Given that recent reports from the UNFCCC reveal that, while emissions from industrialized countries declined overall during the 1990s, they have since risen and could increase to about seventeen percent over the 1990 level by 2010, it is necessary that concerted, collective action is needed sooner rather than later.

CLINICAL GOVERNANCE

Clinical governance is a term first used within the National Health Service (NHS)—the United Kingdom's state-funded health system—to describe a

process for maintenance, improvement, monitoring, and accountability for clinical standards. The responsibility for clinical governance rests with the chief executive of all NHS bodies. The development of clinical governance is important because it made chief executives responsible and accountable for clinical quality in their organization alongside business goals and budgetary control. Clinical governance also challenged the "clinical freedom" of doctors. Up to its inception, a doctor only needed to justify their actions in terms that would be seen reasonable by a group of peers. The onus has now changed to one where a clinician is expected to deliver best practice, usually as defined in evidence-based guidelines; and persistent deviation from guidelines or being an outlier in audit might be cause for review.

Although the implementation of clinical governance is formalized within UK legislation, this conceptual approach is also found internationally. It is similar to the mechanism for quality assurance discussed over two decades ago by the World Health Organization (WHO). There is an established clinical governance process in place in Australia, and the Institute for Healthcare Improvement (IHI) in the United States provides an example of an organization that promotes a similar agenda for quality improvement. The use of information systems to reduce errors and implement clinical governance has been recognized in France. Although they did not use the term *clinical governance*, the importance of best practice protocols and the use of information systems to reduce medical errors and improve patient safety were important components of the Institute of Medicine (IOM) reports of 2000 and 2001. However, these international approaches tend to focus on clinical and managerial commitment to quality through implementation of best evidence and clinical audit of outcomes. Although they recognize the need for a national informatics infrastructure, these reports do not propose statutory bodies to promote developing national evidence-based guidelines for clinical practice and the inspectorate to ensure that clinical governance is implemented in all health organizations. The legislative framework for clinical governance in the United Kingdom, including its standard setting and

regulatory bodies, are described in the following paragraphs.

This new role of implementing clinical governance in NHS organizations was outlined in the white paper, *The New NHS: Modern, Dependable,* and then passed into statute in 1998. Clinical governance was defined in terms of actions required to ensure that risks are avoided; it required that adverse events are rapidly detected, openly investigated, and lessons learned and that good practice is rapidly disseminated and systems are in place to ensure continuous improvements in clinical care. Clinical governance is intended to be systemic and embedded into all NHS organizations. The responsibility for it sits with the chief executive, who should appoint a lead clinician for clinical governance in that organization.

New structures were established at a national level to provide guidance as to what priorities and standards for care might be. These included National Service Frameworks (NSF), which are evidence-based guidance for the management of common conditions. A National Institute for Clinical Excellence (NICE) was created to produce more detailed guidance across a wide range of conditions and treatments. Finally, an independent body was established to carry out clinical governance reviews and to monitor that national standards set by government, largely through NSF and NICE, were being implemented. The initial body set up was called the Commission for Health Improvement (CHI)—possibly best known for its star rating of individual NHS healthcare organizations, also known as Trusts. The latter body has been superseded by the Commission for Healthcare Audit and Improvement (CHAI); it incorporates various other health standards organizations and includes value for money in its remit.

What constitutes the key components of a system of clinical governance has changed over time. The original white paper listed ten areas that can be summarized as follows: infrastructure to support best practice with monitoring of clinical data to see it is implemented; clinical leadership with adoption of good ideas and innovations with their dissemination as best practice; risk-reduction processes,

including that where adverse events occur they are captured and lessons are learned; and professional development reflecting the principles of clinical governance and the early detection of poor clinical performance.

The scope of clinical governance has broadened over time to include a wider range of organizations and more rigor. The private and voluntary sectors are expected to have clinical governance processes equivalent to those in NHS Trusts. There has also been a formalization of the mechanism of assessment into a process of registration (for the private sector), annual reporting, and inspection. There is much more emphasis on input from patients, their careers, and lay assessors and the increased use of information systems to inform patient-centered development of organizations.

The Health and Social Care (Community Health and Standards) Act of 2003 extended the remit of clinical governance to the private sector. It established CHAI (subsequently renamed the Healthcare Commission) by amalgamating a number of regulatory and health standards organizations. The Healthcare Commission has a process of registration, annual inspection, monitoring, and enforcement, where necessary. External assessment by a government-funded, independent body had always been part of the quality assurance mechanisms to ensure that clinical governance was implemented in NHS organizations, though the power of the Healthcare Commission has grown both in terms of the range of organizations they inspect and the scope of those inspections.

The importance of patients' and their caregivers' views has also increased. The Health and Social Care Act of 2001 made it a statutory responsibility of NHS bodies to consult with patients about their services and strategy. From consultation, this has grown to an expectation that the quality of the "patient experience," including involvement in strategy as well as decision making, is central to health care organizations. Health care organizations also need to understand the role of caregivers, how to communicate effectively with them, and take into account the impact of any changes they might make. Lay assessors should also be included in any assessment process, as they should help provide a patient-centered focus. Most importantly, the involvement of patients should not just be in reacting to problems or complaints, instead, patients' wishes should be incorporated into health care organizations' strategies.

Information systems have become much more important in clinical governance. Health care organizations need to know how they are performing and ideally should be able to do this from the use of routinely collected clinical data. These data should be used for clinical audit, providing feedback to clinicians and managers about performance against agreed criteria. They should also inform about the patient experience and enable organizations to develop patient-centered strategies.

Finally, the expression *clinical governance* has entered the vocabulary of the NHS. It is generally used to indicate that there are concerns about an individual or organization's clinical standards.

CLOSED REGIONALISM

See OPEN AND CLOSED REGIONALISM

COALITION

A coalition is a group of actors that coordinate their behavior in a limited and temporary fashion to achieve a common goal. As a form of goal-oriented political cooperation, a coalition can be contrasted with an alliance and a network. An alliance suggests a robust partnership of at least medium-term duration, as compared with the more fleeting coalition. Alternatively, a network is a more informal but potentially broader grouping, suggesting more ad-hoc cooperation than in a coalition but over a wider array of concerns. In coalitions, alliances, and networks, the actors involved—whether states in wartime, political parties in government, nongovernmental organizations (NGOs) in political movements—each retain its distinctive identity and interests, but the coalition remains the most ephemeral of the three. For each, however, the purpose of collaboration is ultimately the same: to aggregate actors' strengths to achieve some shared goal that none could achieve individually.

Coalitions generally form from the voluntary accession of their constituent members. However, because actors rarely have the same intensity of interests with regard to the given goal or goals, some actors may provide rewards or threats to induce others to participate. As such, differences in power among potential and actual coalition members matter, both in determining who becomes a member of the coalition and, after the coalition forms, who has the most influence in determining agendas, strategies, and the like. For instance, in prosecuting the war to oust Saddam Hussein in Iraq, the international coalition may have been a "coalition of the willing" or a "coalition of the coerced and the bribed," but either way, it was not a coalition of the equal—the United States was clearly leading the effort. As this example suggests, coalitions' internal structures often reproduce the structure of relationships among the actors more generally, though the cooperative nature of the endeavor may constrain the overt exercise of power within the coalition.

Although all coalitions tend to be temporary, disbanding after a goal has been achieved (or proven unachievable given the circumstances), some may persist longer than others. Duration may be a function of power relationships: a dominant coalition member or set of members may be able to either dissolve the coalition or maintain ongoing adherence. However, the degree of correspondence of interests among coalition members also affects duration. Participation over time in a coalition may cause individual members to perceive a broader set of shared interests and beliefs among them, leading them to transform the coalition into a more integrated political community (in which case it is no longer merely a coalition). For instance, repeated coordination in the great conflicts of the twentieth century transformed what was initially a loose *entente* among the Western democracies into a broader and deeper "Atlantic Community." Thus, while any one of a number of factors might determine whether coalitions actually achieve their goals, as much as anything it is the relative breadth and depth of shared interests that determine their capacity to persist and perhaps pursue other common goals.

COERCION

Coercion is the threat or use of punitive measures against states, groups, or individuals in order to force them to modify their behavior by undertaking or desisting from specified actions. In addition to the

threat of or limited use of force or both, coercion may entail economic sanctions, psychological pressures, and social ostracism. The concept of coercion should be distinguished from persuasion, which entails getting another party to follow a particular course of action or behavior by appealing to their reason and interests as opposed to threatening or implying punitive measures.

The use of coercion has, of course, been one of the key tools for acquiring dominion and sustaining governance by states, political groupings, and individuals. Vivid historical examples include the failed Athenian attempt at coercing Melos into giving up her neutrality during the Peloponnesian War by threatening the death and enslavement of the Melian population. While Thucydides recounted how the Athenians infamously carried out this threat, the attempt at coercion failed because it did not get the Melians to modify their behavior, short of their total defeat and destruction. A more successful use of such coercive threats was dramatized by William Shakespeare in *Henry V.* Henry V threatened to subject the French port of Harfleur to pillage, rape, and massacre if it did not surrender in short order to his army. In this case, the use of coercion was successful in getting the city to surrender without a last-ditch fight.

Significance of the Term

The use or threat of coercion has been central to international relations and domestic governance. This was again highlighted in the premodern political theories of Niccolo Machiavelli and Thomas Hobbes. Hobbes, in his *Leviathan,* famously portrayed the state as the "mortal god" whose coercive capacities instilled awe and obedience, leading in turn to peace and security. Max Weber drew directly upon Hobbes in providing his famous definition of the state as a political entity that enjoyed a monopoly of legitimate violence or coercion over a given territory. Following Weber, the contemporary sociologist and historian Charles Tilly has compared the process of state formation to organized crime. According to Tilly, at the core of state formation is the concentration of coercive power over a given territory and the subjugation of rival centers of

coercive capacity. In terms of establishing governance, it is important to note that the Weberian political notion of legitimacy or the Gramscian social cultural one of hegemony follows, rather than precedes, the successful establishment of coercive capabilities over a finite territory or group. The use of blunt coercion often faces the law of diminishing returns and, thus, successful and prolonged rule also must rely upon a degree of persuasion, including socioeconomic and spiritual-ideological inducements.

Contemporary Usage in the Study of Governance

In addition to the literature on state formation and rule, the concept of coercion has been central to the postwar studies on deterrence, crisis management, and statecraft in the political science subfield of international relations. However, international relations theorists have not used the concept of coercion in a consistent and well-defined manner, leading to unfortunate confusion and contradiction in the literature. Pioneering work was done on the use of coercion in strategies of conflict by Thomas Schelling. Schelling coined the term *compellance* to define the coercive threat or use of power in order to get an adversary to change its behavior. Here, the attempt to coerce or compel an adversary involves a bargaining and signaling process whereby it is hoped the adversary can be convinced that the cost of compliance is less onerous than that of defiance. Coercion is different from the use of brute force to completely defeat an adversary because it aims to modify the behavior of an opponent, ideally, through threats and, at most, the limited and demonstrative use of force. Schelling further drew a clear distinction between the coercive use of compellance and that of deterrence. The strategy of deterrence seeks to maintain a particular status quo and mode of behavior on the part of a potential adversary, rather than seeking its modification.

Alexander George built upon Schelling's work in developing his concept of coercive diplomacy. However, his work evinces some of the prevailing contradictory and confusing uses of the terms *coercion, persuasion, compellance,* and *deterrence.* George

insisted that coercive diplomacy is a defensive and deterrent strategy distinct from Schelling's notion of compellance. This is because in his use of the term, it does not entail offensive "blackmail strategies" designed to get an adversary to give up something of value. Rather, the use of coercive diplomacy is a defensive strategy to deter encroachments on the status quo. However, this definition begs the question of perception and how what one party may view as a defensive preservation of the status quo may be viewed by another as aggressive and aggrandizing behavior.

The success of coercive strategies has had a mixed record in the modern era. The United States sought to use gradually escalating strategic bombing in order to coerce North Vietnam into giving up its attempt to forcibly reintegrate South Vietnam. However, the government of Ho Chi Minh, with wide popular support throughout Vietnam, was willing to bear the terrible costs of American bombing in order to reunify the country under its leadership. In the recent cases of Apartheid South Africa and Libya, the use of economic sanctions as a tool of coercive diplomacy did manage to bring about the desired change in behavior after a prolonged period. However, it should be noted that the resort to coercive force may prove counterproductive and invite countercoercive actions. Operation Desert Storm and other American-led military interventions in the Middle East radicalized nationalist forces in the Muslim world and, in turn, led some of these radical national forces to attempt a massive punitive and coercive aerial attack against the United States on September 11, 2001.

Collaborative Governance

Collaborative governance is a way of conducting policies whereby a government involves its citizens, social organizations, enterprises, and other stakeholders in the early stages of the policy-making process. The contrast with more traditional public policy procedures is that parties are truly involved in the development of policy proposals, while in classic opportunities of public comment, citizen and interest group involvement only occurred once the policy proposal had been developed. Interactive decision making is a policy practice in which the involved actors try to reach a cooperative solution with broad consensus about the treatment of the issue at stake. Collaborative governance can be seen as a means of achieving more acceptable, rich, and resilient decisions and encourages a flexible decision-making process more open to divergent viewpoints and stakeholder involvement. Moreover, it is seen as a new style of governing, in which politicians, public managers, and public administrators have to adopt new ways of doing things, which can involve new roles, new procedures, and new institutions.

Background

Collaborative governance fits in the shift from "government" to "governance," from hierarchical and well-institutionalized forms of government toward less-formalized, bottom-up forms of governance in which state-authority makes way for an appreciation of mutual interdependence with different stakeholders. Public authorities recognize this interdependence

more and more as a basic governing principle in a continuous process of negotiating. Stakeholders are approached as knowledgeable actors in the policy-making process.

Collaborative governance takes place in different forms. An important type is the so-called collaborative dialogue. Collaborative governance practices are a reaction on traditional planning and policy-making approaches that are primarily top-down oriented, focusing on the government instead of the governed, mainly technocratically oriented and adversarially organized. Collaborative governance is used to realize collective decision making that builds on a solid basis of trust and consensus, enhances governmental legitimacy, and makes efficient use of the dispersed resources of the different stakeholders. By doing so, reaching effective policy solutions can be realized far more easily than in traditional governmental ways.

Potential Benefits

Collaborative decision making tries to provide a solution for a number of existing problems in complex decision-making processes, which are as follows:

- *Acceleration of the policy process:* By involving all kinds of actors at an early stage, it is hoped that the use of veto power will decrease and support for decisions will increase.

- *More flexible policies better suited to changed circumstances:* By involving more actors in the decision-making process, more and various aspects of the problem can be included in the search for solutions, and problem formulation becomes more flexible.

- *Enrichment of solutions:* Because not only different perspectives on and ideas about problems and solutions are let loose in the process, but also multiple types of knowledge, information, skill, and experience are employed, a better analysis of the problem area is possible, and better solutions can be created. Collaborative governance offers the potential to utilize the creativity and experience expertise of those involved in order to address issues on a broader, and possibly more innovative, way.

- *Enhancing democratic legitimacy:* Collaborative governance is often referred to as the solution to restore the bad relationship between citizens and decision makers. When the citizen can identify with the policy products of government, the expectation is that they will be more satisfied with government and politics, restoring and developing trust in government. Moreover, by involving more stakeholders, decision making acquires a less-closed character and more democratic legitimacy.

Criticism

Collaborative governance is not without problems. Its critics mention diverse shortcomings of the practice of collaborative governance, of which the following are mentioned the most. First, processes of collaborative governance have high transaction costs and take time and energy because processes get complex (many different actors) and difficult to manage. Second, there is the problem of biases in the representation of interests. Well-informed and organized interest groups are better equipped to participate in these processes than "weak actors," like unorganized citizens. Sometimes in collaborative governance, policy development leads to the concentration of power in the hands of those who oppose development, shout the loudest, and have the time to campaign. Third, traditional administrative procedures and practices are not suitable to facilitate collaborative governance practices. Collaborative processes are driven out by the traditional ways of doing things. Fourth, there is the problem of venue shopping. In practice, actors don't want to commit themselves exclusively to one collaborative process. When they think they can realize their ambitions via another way (the court or the representative democracy), collaborative processes often fail to enforce commitment. Fifth, the democratic anchorage of collaborative governance practices is often missing. Collaborative governance can be seen as a form of participatory democracy, which oftentimes runs parallel to existing representative forms of democracy. This missing link has the danger that outcomes from the collaborative governance

process vanish in the changeover to formal decision-making procedures.

COLLABORATIVE PLANNING

Collaborative planning is a process of engaging stakeholders in face-to-face dialogue to develop a plan that meets the interests of all affected parties. Collaborative planning involves negotiation among affected parties to achieve a consensus decision and often relies on an independent mediator or facilitator to assist in negotiations.

Collaborative planning is a relatively recent approach to planning that emerged in response to growing dissatisfaction with more traditional, expert-based planning models. The theory underlying collaborative planning is that planning is a value-based process that attempts to achieve diverse goals and tradeoffs that cannot be properly assessed by experts or scientific analysis. Diverse goals and tradeoffs can only be incorporated into plans by delegating responsibility for plan development and approval directly to stakeholders. Stakeholders include any groups or individuals affected by the plan.

Collaborative planning is a logical extension of recent trends in planning theory and practice. Beginning in the 1960s, the dominant model of technocratic planning, which relied on expert-based, scientific decision making, was increasingly under attack for its failure to adequately consider the interests of different stakeholders. The need for increased public involvement in setting goals and objectives for planning became well accepted. Public involvement in planning was extended beyond goal formulation by new models, such as advocacy planning and mediation planning, which stressed the need for public participation in the actual development and approval of plans, as well as in development of planning goals. Collaborative planning further extends these more participatory models by positing the need for a proactive initiative to delegate control of all aspects of the planning process to stakeholders who are formally organized around a "planning table" to prepare plans.

Advocates suggest that collaborative planning has several advantages over other planning models. First, collaborative planning will produce a plan that is more likely to be in the public interest because it attempts to meet the diverse goals and objectives of all stakeholders by relying on consensus agreement and consideration of more creative options developed through interactive dialogue. The inclusion of scientific experts as stakeholders can ensure that decisions are based on sound information. Collaborative planning is also more likely to lead to effective implementation because stakeholders actively support implementation

of a plan that they developed and that has benefits for all interests. Collaborative planning also creates additional benefits, including improved knowledge and skills of participants and improved stakeholder relationships. These additional benefits, sometimes referred to as social capital, can generate important gains to society, such as reduction in conflict and improved public decision making.

Collaborative planning is emerging as the preferred model of planning in both theory and practice. Collaborative planning is increasingly used in jurisdictions in North America, Europe, and Australia by agencies such as the U.S. Forest Service, the U.S. Environmental Protection Agency, and many other state and local planning agencies. The most comprehensive application of collaborative planning to date has been in British Columbia, Canada, where collaborative planning was used commencing in 1992 to develop land and resource management plans for the entire provincial land base. Despite intense differences among stakeholders, over three-fourths of the plans in British Columbia were approved by consensus agreement among all stakeholders.

Collaborative planning also faces challenges. To be effective, collaborative planning requires the presence of well-organized stakeholders representing the spectrum of society's interests who are able and willing to participate. When a broad spectrum of well-organized stakeholders exist, it is challenging to decide how many will be formally represented in the process. Too many representatives can make the process unwieldy, while too few will make the process unrepresentative. The consensus rule for decision making is difficult to achieve and may result in vague or second-best solutions in order to reach agreement. The ability to achieve consensus is reduced by the more challenging the planning problem and the larger the differences in values of stakeholders. Implementation of collaborative planning may also be resisted by dominant interests who do not want to give up power.

Effective design and management of collaborative planning is required to achieve benefits and overcome challenges. Recent research recommends several keys. All interests need to be represented in the planning process. To ensure that the number of participants is manageable, organizations with similar interests can be presented by only one party and the main planning table. A second subsidiary planning table can be used by the common interest organizations to ensure that their delegate fairly represents their interests. Collaborative planning processes also need clear objectives, clear structure of accountability and management, adequate support staff, adequate information, and training and financial support for stakeholders. Collaborative planning processes require sufficient time to reach decisions. Many processes can take over four years. Collaborative planning requires good facilitation and involvement of the public, who may not be represented at the planning table. Governments also need to retain their final statutory decision-making authority over planning proposals recommended by collaborative processes.

Collaborative planning is a relatively recent planning model. Although evaluation of performance of collaborative planning is still in its embryonic stages, evaluations to date confirm many of the significant benefits of the collaborative approach. Given the increasing popularity of collaborative planning, more evaluative research and development of best practice guidelines will be important to ascertain strengths and weaknesses of this new planning model.

Collaborative Problem Solving

Collaborative problem solving can be seen as a subset of governance practices focused on cooperative efforts of government, business, stakeholders, and citizens for solving concrete and urgent collective problems.

The concept comes from theories about education and pedagogical studies. In education, the concept is used to refer to a specific learning strategy in which the pupils jointly solve a specific theoretical or practical problem. In the public sector, the concept is frequently used in accounts of public participation in policy-making processes, especially in the new governance.

Compared to the concept of collaborative governance (see Collaborative Governance entry), emphasis is laid on the concrete character of the issue that is at stake. There is an urgent problem that has to be solved. By pooling together their resources, the different stakeholders (knowledge and expertise, power, money, to name a few) increase their collective problem-solving capacity, and thereby improve the chance of their developing a feasible policy option. Collaborative problem solving is more task specific than general purpose.

The way in which collaborative problem solving is conducted does not differ much from the practice of collaborative governance. There can be temporal arrangements for collaborative problem solving (organized around concrete and urgent policy problems), but also structural ones (as, for example, collaborative management regimes, comanagement, coproduction). Collaborative problem solving is used at all governmental levels, but mostly at the local level. It is used in all policy fields, especially the fields of spatial, environment, and infrastructure planning.

By stimulating practices of collaborative problem solving, governmental agencies can improve several aspects of their activities:

- the activation of actors and the mobilization of their resources,
- the development of a broadly supported and innovative policy solution that integrates different values and stakes, and
- the creation of support for government in general and conflict resolution in specific cases.

Along with the benefits of collaborative problem solving, there are also several shortcomings. The shortcomings include, for instance, the question of representation and democracy: Are all relevant stakeholders included and are the included stakeholders organized in a democratic way? Do they represent the interests of their grass roots in a correct manner? And what is the relation between this sort of participatory practices and the representative democracy? There are also shortcomings with regard to the content of the problem-solving practices. First of all, the solution can be a vague and ambivalent compromise between different conflicting ambitions. Second, the process can be time and energy consuming.

Collective Action

Collective action occurs when a number of people work together to achieve some common objective. However, it has long been recognized that individuals will often fail to work together to achieve some group goal or common good. Why? While each individual in any given group may share common interests with every other member, each also has conflicting interests. If taking part in a collective action is costly, then each person would sooner not have to take part. If each believes that the collective act will occur without their individual contribution, then they may try to free ride. David Hume pointed out the problem in 1772,

when he said that although two neighbors may agree to drain a common meadow, to have a thousand neighbors agree on such a project becomes too complex a matter to execute.

The problems of collective action were popularized by Mancur Olson, who wrote more pithily in 1965 that coercion or some other device must be present in order for a group of individuals to act in common interest. Olson suggested that collective action problems were solved in large groups by the use of selective incentives. These selective incentives might be extra rewards contingent upon taking part in the action or penalties imposed on those who do not. However, in order for positive selective incentives to work, individuals who take part in collective action must be identified; and for negative selective incentives, those who do not take part must be identified. Either way, a good deal of organization is required.

One aspect of the collective action problem is that posed by collective or public goods. A collective good is one from which it is economically infeasible to exclude people from using. Hence, if a collective good—such as collective wage bargaining for an industry—is provided by an organization such as a trade union, then the fruits of that bargaining will be enjoyed by all workers, not only the trade unionists. Other workers in the industry who gain the wage increases and better working conditions provided by that bargaining will not have to pay the union dues and will free ride upon the activities of the union. In order to encourage workers to join unions, most also provide a whole host of private excludable services, such as legal advice and help during individual disputes with employers, pension schemes, holiday deals, and other such activities. Of course, setting up a union in the first place is also a collective act, and Olson suggests that setting up such organizations requires the activities of entrepreneurs who also see private benefits (such as paid employment or a political career) from forming the union in the first place. Though, of course, altruistic individuals may also play a part in collective action.

Collective action problems have often been represented by simple game theory. The simple, one-shot prisoner's dilemma game represents a series of more complex situations, where individual rational action leads to a suboptimal outcome. It would be in the interests of both players to cooperate, but they end up not cooperating because they can see the advantages of free riding and fear the dangers of being taken for a ride. It is well known among game theorists that once the two-person game is repeated over and again, there is a multiplicity of stable equilibriums, some of which involve cooperation and some that do not. If the game is played by more than two people and network affects are allowed (that is players can see how others are playing with third parties), then we should expect both cooperation and free riding. Thus, game theory tells us that collective action is indeed a problem. People do not automatically work together to promote their collective interests, but neither is it impossible. Indeed, depending on the conditions, we should expect varying levels of collective action. In other words, there is not a single collective action problem, but a host of collective action problems that share common features. Therefore, as one would expect, there are numerous ways in which people learn to overcome the particular collective action problems they face in order to work together. The tedium of organizing a school fete is not the same as the dangers inherent in taking part in collective protest or revolution, but both are collective acts subject to free riding. We shall briefly describe the types of demand-side problems that arise in collective action and the sorts of supply-side solutions that are adopted to overcome them. It will be seen that both the problems and solutions are interlinked and interrelated.

We might define the free-rider problem as occurring wherever there is a collective good giving nonexcludabilty. Nonexcludability entails the free-rider problem because a person can enjoy the benefits of the good without having to pay for it (as long, of course, as the good is provided). A supply-side response is to attempt to convince would-be free riders that if they do not contribute, they will not receive the good, not through exclusion, but because the good will not be provided at all.

However, prior to free riding is the recognition of one's interests. In economic theory, it is usually assumed that people have well-defined preference

orderings and, hence, know their own interests. But a great deal of expenditure is spent on the supply side convincing people that something is in their own interest. In that sense, the first collective action problem is the recognition that we do share interests.

The more homogenous the group, the easier it is to discover any shared preferences, the fewer the cross-cutting cleavages, and, thus, sources of conflict within the group. Homogeneity in another sense may work in the opposite direction. If the group is heterogeneous in terms of wealth, then it may be easier to secure collective action because the rich members may provide the goods and allow poorer members to free ride.

The relative costs of taking part in collective action are important. In Olson's 1971 algebraic argument, individuals will not contribute toward a collective good if the extra benefits they accrue through receiving that good are worth less than the costs of their contribution. This argument depends crucially upon the nature of the production function. Under some production functions, Olson's algebra is irrelevant. Furthermore, it depends upon actors relating the extra increment of the good supplied with the contribution they make toward its provision. The richer each member of the group, the lower the relative costs. It is also worth noting that typically consumers assign parts of their expenditure to different types of good; some for needs, such as food and clothing, some for transport, for luxury items, and so on. They may be thought to assign some part for gifts, some for charitable donations, and some toward group aims. We should expect the assignations to be dependent, in part, upon the needs items being provided first. Thus, we should expect large asymmetries in amounts set aside for group aims across social classes.

Most agree that smaller groups are easier to organize than larger ones. However, the impact of group size has perhaps been exaggerated as other factors about groups may override this component. Group size is important in two senses. First, the degree of perceptibility of individual contributions increases the free-rider problem and may be considered a problem of coordination; and second, the actual importance of any given contribution. The larger the group, the less important an individual contribution may appear to group success. The degree of perceptibility is more dependent upon interactiveness than size as such.

The degree of interaction between group members is more important than group size per se. Face-to-face interaction among a small group of people may lead to subgroup mobilization, no matter how large the wider group, thus overcoming the perceptibility problem.

The opposition to a particular group forming is also important in the beginning of mobilization. The fact of a rival group organizing itself successfully can act as a spur to collective action. But opposing groups can also act to stultify the mobilization in the early stages. They can exploit cross-cutting cleavages within the group to try to break up the coalition of interests and can try to preference shape the group away from the common interest coagulation. They may also make the costs of mobilizing higher by numerous strategies, depending upon the relationship between the rival forces.

The number of other demands is also important to any specific group mobilization. Individuals have a large number of interests and causes they support. There might be a large number of charities that one might support in theory, but one only assigns a small proportion of one's budget to charitable contributions. Organizations try to encourage members to pay by direct debit or standing orders to lock in that contribution.

A finding in experimental psychology suggests that individuals have an S-shaped utility curve. This means that losses of a given amount matter more than gains of a similar amount. This seems to lead to the finding that it is easier to mobilize people when interests currently being satisfied are threatened, than to promote interests not yet satisfied.

One important aspect of the production function is created by the nature of the collective good. "One-off" goods are typified by a "step" function. Mobilization requires an action to provide the good, and once supplied, the action is over. Goods in continual supply require continuous collective action, which may be harder to sustain in the long run.

Coordinating activities is a key issue. The degree to which coordination is required is in part dependent upon many of the previously mentioned factors. A small group, where there are few cross-cutting cleavages and costs are small, may only require coordination

of activities. Larger groups, with a greater hetero-geneity and relatively high costs, may require much greater coordination. The coordination is a demand-side problem that provokes various supply-side answers.

Therefore, the characteristics of the group affect its ability to mobilize its members to secure common aims. Different groups in society have different pow-ers simply by virtue of group characteristics. Some of these characteristics are properties of the individuals that comprise the group, but others are properties of the group itself, rather than its individual members. Groups that are more sociable and have greater net-working and interlinked subgroup organizations find overcoming collective action problems much easier than ones without those qualities. Conversely, groups that are too hierarchical may find grass-roots organiz-ing more difficult. Even controlling for other features, Catholics in the United States seem to participate and collectively organize for non-Catholic interests to a lesser extent than non-Catholic groups. One possibil-ity is that the Catholic Church is more hierarchical, and so the civic skills needed to organize are less-developed as churchgoers rely more on the church to work on their behalf. An individual's own power (her human capital) to collectively organize may thus be affected by the characteristics of the group of which she is a member, as well as her own abilities.

In order to overcome coordination difficulties, some actor or set of actors may need to step in. Such political entrepreneurs may show a profit potential in coordinating collective action. This may be related to their other activities. David Chong argued in 1991 that Black church leaders found themselves drawn into the civil rights movement in the 1960s in order to secure the continued support of their parishioners. Church leaders who were vocal in organizing for civil rights drew greater congregations than those who were silent. The competition for congregations thus led church leaders into becoming civil rights leaders too. Generally speaking, charismatic leadership is impor-tant for revolutionary activity.

Selective incentives are Olson's solution to the col-lective action problem. Many organizations provide selective incentives on top of the collective good, but selective incentives cannot be the main motivation of members of an organization primarily devoted to lobbying.

One important source of mobilization occurs through joint action, where one group supports another. An organization may see benefits in creating another organization with convergent interests. Sears Roebuck, a major supplier of agricultural equipment, has long provided material support to various U.S. farmers' organizations. Joint action taken to its fur-thest extreme leads to mock organizations created by one group to further the aims of another. For example, major food manufacturers in Great Britain have set up several "consumers groups" concerned with quality of produce. Greater regulation of the quality of food is to the advantage of the larger food manufacturers. Here, consumer rights may be promoted as a by-product of the interests of large food manufacturers, though some would argue that such regulatory capture is, overall, against consumer interests.

The incentives vary for activists on the supply side. Some may be entrepreneurial, setting up organiza-tions largely for personal gain, much as entrepreneurs engage in economic activity in the private sector. Some may be less entrepreneurial and may set up an organization for group ends, still self-interested, in the sense that the "political mover" is a member of the group, but not purely for personal profit. Such politi-cal movers may prefer that some other actor formed the coordination role but take it on when they see that the role is not going to be performed and, therefore, the good not produced. The coordinator may be moti-vated by truly altruistic reasons.

Economic theory using rational-actor assumptions has shown that collective action is problematic. Game theory demonstrates that collective action is possible even without institutions supporting it. Empirical analyses of how people mobilize demonstrate the myriad ways in which collective action problems are overcome every day.

COLLECTIVE WAGE BARGAINING

Collective wage bargaining exists where wage rates, hours, and other general working conditions are set out in an agreement between the employers and a representative organization of the workforce. Organized representatives of workers in trades unions negotiate with employers or representative organizations of employers to reach agreements.

In standard economic theory, a firm in a perfectly competitive market will expand employment until the marginal value product of another worker exceeds the wage cost. But what sets the going wage rate for a firm? Many factors set the wage, including the skills demanded and the demand for workers in the firm's industry and other industries. In perfectly competitive markets, the demand for labor should be clear so there would be no involuntary unemployment. However, with ups and downs in the demand schedule for any industries' products, firms desire labor flexibility, that is, to reduce wages or employment during a recession and employing more workers when demand rises again. However, there is asymmetric information.

Individual workers do not know how well the firm is doing at any one time beyond what they may learn from annual balance sheets and stock market prices. Managers have an incentive to pretend that times are always hard to drive down wages. Thus, unless an individual worker is thought to be irreplaceable or very hard to replace, individual workers are poorly placed to negotiate for better working conditions or higher wages. Because all workers are similarly placed, they have a collective interest in forming an organization to represent them.

An organization that represents all workers is much better placed to negotiate with the employer. It can employ people to gain a better insight into the real state of the industry and the profit potential of the firm. It can use the bargaining strength of all workers together in order to negotiate for better working conditions and wages. Such a union of workers can coordinate a strike or other activity as part of the bargaining process. By using such threats, it can force firms to pay higher wages than they would desire and force them to provide better working conditions. Such activity often goes under the name of collective wage bargaining.

However, collective wage bargaining has become recognized in many countries, for example Germany and Canada, as a specific legal entitlement of both workers and employers, with rules governing the process of negotiation. The state has become involved in the wage negotiations between private firms and workers. The theory of collective wage bargaining in such countries is that the routinized and legalized process will reduce the likelihood of strikes and other industrial activity to give more efficient procedures for wage bargaining. Why is such state-regularized collective wage bargaining thought to be better than a more anarchic system?

When a union can force wages higher than the free market equilibrium for the industry, firms will shed workers. They may do so in ways agreed by the unions. Here, there will be involuntary unemployment. Unions may accept higher wages for lower employment because they are concerned only with the collective interests of their members. However, in a world of uncertainty, and with asymmetric information,

firms may go bust through the demands of collectivized workers that do not believe the dire warnings of managers. Firms and trade unions may find themselves in a prisoner's dilemma–type game and may find themselves locked into a noncooperative equilibrium. In other words, just as workers faced a collective action problem in forming a trade union, the union itself is in a collective action dilemma with the firms in the industry. If noncooperation increases conflict, such as strike activity, the difficulties of firms or an industry may be compounded. The theory of state-sponsored collective wage bargaining is designed to overcome that strife and solve the collective action problem.

Collective wage bargaining was part of the corporatist approach adopted in many European countries. Through negotiations between industry-level representatives at both employer and employee overseen by state actors, legally binding agreements could be reached over working conditions, employment levels, and training as well as wage levels. It allowed more information to workers about the state of their industry, ensured firms did not try to undercut, and allowed for greater training as firms could not free ride on the training facilities of their competitors. With greater stability and less uncertainty about expectations, collective wage bargaining may also have provided a more certain world for capital investment into industry to ensure firms can keep up with competitors abroad. With simplified coordinated price increases, advocates claimed it was even better for consumers.

While collective wage bargaining was a successful policy for many years, reducing industrial strife and maintaining higher levels of employment and greater price stability in countries adopting it, collective wage bargaining has come under increasing pressures with globalization. Collective wage bargaining, precisely because it is designed to bring greater stability, makes it harder for firms to be flexible in fast changing times and also makes it harder for new entrants into industries. Countries with collective wage bargaining agreements found their firms being undercut in terms of quality and price. Where firms abroad had switched to new, capital-intensive technologies, contracted-out aspects of the production process to low-labor-cost

firms in the developing world, those in countries with less-flexible labor forces have come under increasing strain.

COLLUSION

Collusion is a pejorative word. Collusion occurs when there is a secret agreement and cooperation that benefits those who collude. The agreement is kept secret because the activity may be fraudulent, deceitful, or illegal. It has been recognized for centuries. Adam Smith wrote in 1776 that any get-together of tradesmen in the same industry most likely ended in a conspiracy, resulting in either higher prices or another such conspiracy against the public.

Such collusion between firms that fixes prices may be illegal. Collusion may be reached without any formal agreement. Indeed, enforcing competitive practices may not even require evidence that the firms have any sort of contact at all. They may merely refrain from undercutting each other's prices or from selling in each other's market areas. Such collusion occurs when antimonopoly laws exist that prohibit formal agreements over such activities. Collusion is hard to prove and may involve enforcers arguing that the activity of firms colluding in setting prices and output targets only makes sense in terms of the benefits of collusion. In such cases, firms may be forced to reduce prices or to sell to suppliers in areas outside of their normal markets. In that manner, competitive

practices are forced on firms without actually demonstrating that they were engaging in illegal activity prior to those orders.

How can firms collude without ever meeting? In a competitive setting, each firm will market its goods until the marginal costs of producing the last good is equal to the selling price. However, if each restricts output, the price will be forced up and firms may enjoy their share of oligopoly profits. A firm can announce its price and output, which rivals might see is higher than is sustainable in a competitive situation. They can choose to follow suit. Such choices are difficult to sustain in large markets with many sellers because it is in the interests of each to sell at a slightly lower price, produce more, and take more of the market. Once one firm starts to behave competitively, all firms must follow suit or face losing their entire market. Sustaining prices and output at oligopolistic levels is thus a collective action problem that may be modeled similarly to a prisoner's dilemma game. In the prisoner's dilemma game, there is a strictly dominant strategy to defect from cooperation, hence collusion should fail.

However, collusion may be sustained just as collective action may be sustained in prisoner's dilemma–type situations. If the game is repeated, the folk theorem tells us that cooperative solutions are possible. If each firm sees that all other firms are keeping prices high and restricting output, then each may also do the same. Collusion is, thus, easiest in markets with fewer firms and where the price of the commodity is readily gauged by all firms. Therefore, collusion is much easier in markets for new cars, especially where firms control the outlets for their cars, than it is in markets for fresh fruit.

Commission on Global Governance

The Commission of Global Governance was established in 1992. Made up of twenty-six members all acting in their own individual capacity, the Commission sought to suggest new ways the international community could cooperate to further an agenda of global security. Their understanding of security took a broader definition that included human and planet well-being. Among the Commission's self-declared aims were securing peace, sustainable development, and universal democracy. Consulting past reports and international experts, the Commission analyzed global change and new challenges to global governance with the intention of mobilizing political collaboration on an international level. They hoped that their evaluation of the strengths and weaknesses of global governance would provide a framework for future effective governance and inspire nations to adopt a more global perspective.

The Commission of Global Governance came about at the end of the Cold War. As later explained by the Commission itself, they believed that the easing of East-West tension created a better environment for global cooperation. Therefore, they sought to reexamine the best means of achieving a new global order. The Commission was founded in the aftermath of two preceding meetings organized by West German Chancellor Willy Brandt. The first meeting held in January 1990 in Köningswinter, Germany, reunited members of the Independent Commission of Disarmament and Security Issues, the World Commission of Environment and Development, and the South Commission. The attendees believed that although there seemed to be overall improvement in world affairs, there was still a need for further commitment to multilateral action and global cooperation. *The Stockholm Initiative on Global Security and Governance,* issued in April 1991, articulated the desire for a more-proficient system of global governance. The Commission of Global Governance was thus set up in April 1992 to further explore the new challenges of global interdependence. Willy Brandt

invited former Swedish Prime Minister, Ingvar Carlsson, and former Secretary-General of the Commonwealth of Guyana, Shridath Ramphal, to cochair the Commission. Together, they presented the proposal for the Commission to the United Nation's Secretary-General Boutros Boutros-Ghali, who assured them of his support for their project of reassessing multilateral action.

The Commission of Global Governance's greatest contribution to international affairs was their report titled *Our Global Neighborhood.* First published in 1995, it presented the Commission's conclusions and recommendations for discussion at the General Assembly of the United Nation's fiftieth anniversary session. Divided into seven chapters, the report served as "a call to action," encouraging world leaders and nongovernmental actors to work together toward achieving the goals expressed by the Commission. The beginning of the report explored the changes to the global outlook that allowed for this reassessment of future governance. Once the idea of a new world was established, the Commission proposed a common world ethic and the adoption of international values, including the respect for life, liberty, justice, and equality. The Commission also presented new policies for improving global security, which incorporated military and nonmilitary factors, managing economic interdependence, reforming the United Nations, and strengthening the rule of international law. With its many innovative recommendations, *Our Global Neighborhood* has served as a blueprint for global governance and has become a key reference for discussions and debates on multilateral cooperation.

COMMON BUT DIFFERENTIATED RESPONSIBILITIES

Common but differentiated responsibilities (CBDR) is a principle of international environmental law establishing that all states are responsible in the face of global environmental destruction, yet not equally responsible. It balances out, on the one hand, the need for all states to take responsibility in the face of global environmental problems, with, on the other hand, the necessity to recognize the wide differences in the levels of economic development; for these, in turn, are linked to the states' contribution to, as well as their ability to address, these problems. It was formalized into international law at the 1992 United Nations (UN) Environment and Development Conference in Rio de Janeiro.

CBDR resolves a tension between two older notions of environmental governance. On the one hand, the idea of a "common responsibility" spoke directly to the notion of "common heritage of mankind," acknowledged by a 1967 UN resolution that had first emerged as an expression of concern for the loss of natural resources belonging to all (especially maritime, such as whales and tuna). The 1992 UN negotiations were organized around the four key themes of climate change, deforestation, desertification, and biodiversity degradation. All were environmental problems whose global repercussions brought home the need for a collective response, which needed, in turn, to be grounded in a common responsibility. In legal terms, CBDR describes the shared obligation of two or more states toward the protection of a particular environmental resource. On the other hand, the need to establish variegated levels at which different states can effectively enter into a collective response, according to both their capacities and their levels of contribution to the problem, was recognized since the first UN conference on the environment in 1972 (it was featured explicitly in the Stockholm Declaration).

At the practical level, CBDR emerged at the 1992 conference as a compromise between the positions of developed and developing countries with regard to

environmental protection. It aimed at bringing about the conditions of environmental governance that, to be effective, needed to be as inclusive as possible. At the ethical level, it is an expression of general principles of equity in international law. It recognizes the historic correlation between higher levels of development and a greater contribution to the degradation of global environmental resources, such as water and air, and enables the sharing of responsibility accordingly. It establishes that developed countries that have been able to develop for longer, unimpeded by environmental restrictions, now need to take a greater share of responsibility.

The various occurrences of the CBDR in international legal texts include the Rio Declaration, where it is enunciated as "Principle 7," and the Climate Change Convention, together with its 1997 Kyoto Protocol. It was retroactively incorporated into the Vienna Convention and Montreal Protocols on substances that destroy the ozone layer. Practically, it entails the deferral of developing countries' compliance with the objectives of these environmental conventions.

CBDR is not unanimously accepted among developed countries. At the Rio negotiations it was rejected by the United States, who have since conditioned its participation in any restrictive scheme on a specific commitment from developing countries to participate as well (the 1997 Byrd-Hagel Resolution). As a result of this lack of consensus, CBDR has been relatively sidelined in environmental governance debates.

Common Good

From the era of the ancient Greek city-states through contemporary political philosophy, the idea of the common good has pointed toward the possibility that certain goods, such as security and justice, can be achieved only through citizenship, collective action, and active participation in the public realm of politics and public service. In effect, the notion of the common good is a denial that society is and should be composed of atomized individuals living in isolation from one another. Instead, its proponents have asserted that people can and should live their lives as citizens deeply embedded in social relationships.

The notion of the common good has been a consistent theme in Western political philosophy, most notably in the work of Aristotle, Niccolo Machiavelli, and Jean-Jacques Rousseau. It has been most clearly developed in the political theory of republicanism, which has contended that the common good is something that can only be achieved through political means and the collective action of citizens participating in their own self-government. At the same time, the notion of the common good has been closely bound up with the idea of citizenship, a mutual commitment to common goods and the value of political action as public service. Therefore, it has played a prominent role in the defense of republican constitutional arrangements, notably the defense of the Constitution of the United States in *The Federalist Papers*.

In Book I of *The Politics,* Aristotle asserted that man is political by nature. It is only through their participation as citizens in the political community, or *polis,* provided by the state that men may achieve the common good of community safety. It is only as a citizen and through active engagement with politics, whether as a pubic servant, a participant in the deliberation of laws and justice, or as a soldier defending the *polis,* that the common good can be achieved. Indeed, Aristotle argued that only matters of the common good are right, matters for the rulers' good are wrong.

The notion of the common good was next taken up in the late fifteenth and early sixteenth centuries in the work of Machiavelli, and, most famously, in *The*

Prince. Machiavelli contended that securing the common good would depend upon the existence of virtuous citizens. Indeed, Machiavelli developed the notion of *virtù* to denote the quality of promoting the common good through the act of citizenship, be it through military or political action.

For Rousseau, writing in the mid-eighteenth century, the notion of the common good, achieved through the active and voluntary commitment of citizens, was to be distinguished from the pursuit of an individual's private will. Thus, the "general will" of the citizens of a republic, acting as a corporate body, should be distinguished from the particular will of the individual. Political authority would only be regarded as legitimate if it was according to the general will and toward the common good. The pursuit of the common good would enable the state to act as a moral community.

The importance of the common good to the republican ideal was notably illustrated with the publication of *The Federalist Papers,* in which Alexander Hamilton, James Madison, and John Jay provided a passionate defense of the new Constitution of the United States. Madison, for example, argued that political constitutions should seek out wise, discerning rulers in search of the common good.

In the modern era, instead of a single common good, an emphasis has been placed upon the possibility of realizing a number of politically defined common goods, including certain goods arising from the act of citizenship. The common good has been defined as either the corporate good of a social group, the aggregate of individual goods, or the ensemble of conditions for individual goods.

Because the common good has been associated with the existence of an active, public-spirited citizenry, which has acknowledged the duty of performing public service (whether political or, in the case of the ancient Greek city-states, militarily), its relevance to contemporary governance has been called into question. In the modern era, the dominant neoliberal tradition has placed overwhelming importance upon the maximization of the freedom of the individual as consumer and property owner, discovering that freedom in the private domain of liberalized markets,

rather than the individual as citizen achieving the common good in the public domain.

Nevertheless, for contemporary governance, the importance of the idea of the common good remains in that it identifies the possibility that politics can be about more than building an institutional framework for the narrow pursuit of individual self-interest in the essentially private domain of liberalized markets. The common good points toward the way in which freedom, autonomy, and self-government can be realized through the collective action and active participation of individuals, not as atomized consumers but as active citizens in the public domain of politics. It also affords the possibility that political participation can have an intrinsic value in its own right, in addition to its instrumental value of securing the common good.

COMMON MARKET FOR EASTERN AND SOUTHERN AFRICA

The Common Market for Eastern and Southern Africa (COMESA) is a regional economic grouping of twenty-one sovereign states in the Eastern and Southern Africa region. Its members include Angola, Ethiopia, Kenya, Madagascar, Namibia, Sudan, and Zimbabwe. COMESA countries are considered to be developing states. Thus, COMESA's central objective is the attainment of sustainable economic growth and development throughout the region.

COMESA was launched in 1993. Up until the late 1980s and early 1990s, most African countries

pursued an economic system that involved the state in nearly all aspects of production, distribution, and marketing, leaving the private sector to play a minor economic role. This system promoted state-led development, such as subsidized food production. However, in response to changes in the global order that witnessed globalization and an emerging consensus that market principles should drive development, COMESA envisaged a restructuring of state functions.

COMESA houses three principal policy directives with regards to regional governance. First, it calls for a gradual reduction of trade barriers among members; trade barriers include tariffs or duties on goods entering a country. Based on the liberal economic law of comparative advantage, it is thought that all participating states will benefit from free trade in the region and that the region will be more internationally competitive as overall production becomes more efficient. By 2005, eleven COMESA member states were trading at zero tariffs. Freer trade transfers the state's traditional control over imports and exports to markets and private national and international enterprises; the extent to which the state can steer development is arguably reduced.

Second, COMESA aims to promote joint development in all fields of economic activity and to foster closer relations among its member states. It is thought that this commitment to a regional bloc constrains individual member states; it encourages regional consensus and, thus, a certain harmonization of state policy. Certain development-related issues, such as the environment, can be transboundary and, thus, states often need to forfeit national policy autonomy for the regional good.

Third, COMESA looks to enhance relations between the Common Market and the rest of the world. Regional blocs enable countries to combine their economies in order to attract more investment. Equally, blocs enable countries to combine their political power in order to become a more consequential, international actor; most COMESA countries are too small to individually compete in a world market that is becoming increasingly dominated by large trading blocs.

COMESA is an intergovernmental institution; its formal members are states. However, reflecting ideas of contemporary governance, it is committed to dialogue with nonstate actors, such as companies, nongovernmental organizations (NGOs), and employment unions. It is a suprastate initiative insofar as participating states have transferred certain functions upward to regional bodies. Its principal body is the Secretariat, which works to fulfill COMESA's aims through policy formulation and administration. COMESA has also helped establish regional institutions that work toward further regional integration.

COMESA has received mixed reviews. It has given rise to an increase in intra-COMESA trade and an inflow of investment into the region. Nonetheless, certain critics highlight continued development problems in the region; it has experienced slow or negative growth rates and millions of people are still deprived of basic consumption needs. They argue that merely freeing up regional markets is not sufficient to facilitate development; each state should be more active in enacting regulations that ensure that private enterprises translate their gains into development-related benefits. As for the wider sphere of global governance, COMESA is the only regional African arrangement that has been notified to the World Trade Organization, so it is considered a good example of outward-oriented regionalism—outward oriented insofar as it seeks to continue economic relations with foreign states and companies. Yet, it often struggles to reconcile the political and economic differences among its member states with the need to harmonize regional policy.

COMMON-POOL RESOURCE

A common-pool resource is defined by two fundamental characteristics. On the one hand, one person's use of a unit of common-pool resource makes that same unit unavailable to anybody else. On the other, it is costly to exclude potential users of a common-pool resource. Some classic examples of common-pool resources include, but are not restricted to, fisheries, forests, underwater basins, and irrigation systems.

Common-pool resources pose important challenges to governance because they are susceptible to overuse. Thus, common-pool resources are prone to tragedies of the commons. A tragedy of the commons is present when individual and group interests are in conflict. In the case of fishing, fishermen face the temptation to harvest as many fish as possible because if they do not, someone else will. Collectively, this leads to tragedy, even though no one intended it and all realize that they would be better off if they avoided it.

However, the prediction that the tragedy of the commons model makes is that individuals' interests will always come ahead of those of the group, and because of that, they will not cooperate to devise solutions to the tragedies. In the 1980s, scholars challenged this assertion. As a result, a theory on common-pool resources emerged.

The first generation of research on common-pool resources centered its efforts on identifying resource systems where tragedies had been successfully avoided. They found a variety of institutional arrangements common to all successful cases and absent on those that failed. Cases varied across cultures and time, and the numbers of institutional arrangements found were many. Most of them, however, aimed at regulating individual action through rules that users agreed to abide by so that all users could take into account the social benefits and costs of using the common-pool resource. Although the specific rules adopted to govern a common-pool resource are extremely numerous, scholars have identified seven broad categories of rule types according to their function: boundary rules, authority rules, position rules, scope rules, aggregation rules, information rules, and payoff rules. The rule

taxonomy has helped scholars to understand that rules have a configurational nature. While some rule configurations tend to result in tragedies, others can achieve different policy outcomes.

While the initial wave of research allowed identifying institutional arrangements that are related to the emergence and sustainability of collective action for the governance of common-pool resources, today scholars are focusing their research efforts in finding the causal relationships among those institutional arrangements previously identified.

Since the emergence of the common-pool resources project in the mid-1980s, the study of common-pool resources has become a field in itself. After fifteen years of research, some of the most substantive lessons include (a) the recognition that the model of the tragedy of the commons is limited; (b) that autonomy to design and change rules, the ability of resource users to engage in direct communication, and their salience over the resource are necessary but not sufficient conditions for the emergence of self-organized institutions; (c) one policy form cannot ensure successful governance of all common-pool resources; and (d) the meaning of success will vary and be related to the group's interests.

Finally, some of the major key under-studied issues on common-pool resources that scholars are trying to draw attention to include the need to better understand the dynamics of resource management institutions, to extend insights to more kinds of common-pool resources, to understand the effects of context on resource management institutions, and to understand the role of linkages across institutions.

COMMONWEALTH OF INDEPENDENT STATES

The Commonwealth of Independent States (CIS) was established in 1991 as an agreement of regional economic and political cooperation after the dissolution of the Soviet Union. The organization was originally conceived of as an association to facilitate the disintegration of the Soviet Union and integration of the post-Soviet states economically and militarily. Participation by member states has varied based on the economies and military situation of each state. Lack of cohesion has characterized the union, as member states have been reluctant to yield sovereignty to the organization.

The CIS has no supranational powers. The members are independent and equal subjects. The original treaty established a common economic space and a joint defense force. However, each country still uses its own national currency and maintains its own national military. There have been gains in coordinating policies on health care, social security, migration, railways, and air traffic control.

The CIS was created in December 1991 by leaders of Russia, the Ukraine, and Belarus. Armenia, Moldova, Turkmenistan, Uzbekistan, Tajikistan, Kyrgyzstan, and Kazakhstan joined later that month, and Azerbaijan and Georgia were members by 1993. Of the former Soviet republics, only the Baltic countries have not joined the organization.

Headquartered in Minsk, Belarus, the structure of governance in the CIS is composed of several councils. The Councils of Heads of State and Heads of Government have decision-making power. Interministerial committees exist, such as the Councils of Foreign Ministers and Defense Ministers. Other parts of the organization include departmental councils, an Executive Secretariat, economic organs, and the Inter-Parliamentary Assembly. Problems encountered by the various organizational branches of the CIS include weakness, nonparticipation by certain countries, and lack of implementation of decisions.

Decisions are made by consensus, although members are allowed to abstain in any particular case without preventing adoption of the decision. This has resulted in few of the CIS agreements having been signed by all member states. The CIS also lacks monitoring or enforcement mechanisms.

Suspicion of Russia has fueled many of the difficulties the CIS has faced in developing a coherent system of regional governance. There is a rift among integrationists and those who are less interested in integration. Armenia, Belarus, Kyrgyzstan, and Tajikistan are known as the more enthusiastic supporters, partly due to reliance on Russia. Ukraine and Georgia are among the skeptical members, due to the distrust of Russian influence and desire for removal of Russian troops. Members have complained of Russia's disproportionate role in the union.

There have been several attempts at integration among members outside of the CIS framework, including the Central Asian Economic Community (CAEC) involving Kazakhstan, Uzbekistan, Kyrgyzstan, and Tajikistan, and GUUAM (the economic union comprised of Georgia, Ukraine, Uzbekistan, Azerbaijan, and Moldova).

COMMUNICATION

Communication, as the transmission, interpretation, and management of information, is one of the key concepts in the field of governance. Communication implies not only the meaning contained within ideas and language, but how these ideas are shaped, shared, organized, and altered throughout society. Communication is not limited to language, but also includes the actions and movements that communicate ideas. The French sociologist Emile Durkheim argued

that the most important feature of all social and political interaction is communication. For Durkheim, communication is both the transmission of information, as well as the forms of coordination, conflict, and cooperation between individuals. Most importantly, communication is about creating a consensus for how society is to be understood and organized.

The German political theorist Jürgen Habermas deepened and specified this definition of communication. He argues that communicative action is a type of political action that is oriented toward reaching common understanding. In an ideal, democratic political environment, communication is the means to achieve consensus. It operates through dialogic discussions that aim for resolution of a particular problem or conflict. This form of communication, one that is free from political coercion, will allow the best, or most rational, argument to triumph and produce agreement in the public sphere.

Scholars of governance, while agreeing that communication is a key foundation of political life, do not assume that communication will produce consensus about how society should be organized or agree on how conflict should be resolved. In governance, communication is not only about information and persuasion, but also about processing, managing, producing, and organizing information. Theories of communication in governance examine how changes in social and political life alter more traditional forms of political communication. These theories argue that power in contemporary society is shifting from institutional structures to fluctuating codes of information, and now includes the ability to manage and organize information. Communication becomes less of a medium for transmitting information than a mode of operation in which communication itself transforms and produces information. Therefore, communication is constitutive of the contemporary network society, in which information is the main resource of governance. Communication has itself become management and regulation and is now the form, as well as the medium, of contemporary governance.

Governance scholars disagree on whether communication networks operate through human agency or system structure. Scholars using structural theories of

governance argue that governance operates through organizational structures of communication, which include bureaucratic networks of information sharing, lines of hierarchical authority (or lack thereof), decision-making procedures, and functional roles of individuals within governance. Communication operates through these various networks that define and shape the nature of governance.

Scholars examining the human, as opposed to structural, side of governance, argue that people, not formal structures, are central to the process of communication. Personal influence and informal processes of information sharing are more crucial to the workings of governance than formal structures or bureaucratic procedures. These scholars find that shared interests, conflict, negotiation, personal relationships, power, and influence are the main forms through which communication networks operate in the area of governance.

Governance scholar Henrik Bang argued that communicative governance is neither hierarchical nor bureaucratic, but is comprised of the interactive modes of political communication between political authorities and lay people in a political community. The increased complexity of bureaucratic procedures and information sharing networks induces political leaders to engage in communication with civil society and community members in order to gather information on societal concerns. Contemporary governance operates through communication with the social communities it helps to govern, instead of through gathering and sharing information in formal procedures or informal power relationships within bureaucracy. While Bang argued that communication must be more dialogical and cooperative if it is to succeed in a complex governing system, he does not claim that this move is necessarily democratic. Although communication has become multilateral across public, private, and voluntary sectors of society, it often serves to standardize, rather than democratize, communication throughout society.

COMMUNICATIVE ACTION

Communicative action refers to a type of interaction between individual or collective actors (e.g., governments and nongovernmental organizations), characterized by a deliberative or argumentative exchange. Communicative action has entered governance debates as a means to explain dynamics and outcomes that contradict expectations of actors, who are commonly assumed to be predominantly oriented toward maximizing their egocentric interests. A core hypothesis is that communicative action can foster collective learning processes that can ultimately transform conflicting interpretations of an issue into areas of mutual understanding. Thus, research on this subject may determine whether the problem-solving capacity and legitimacy of governance systems may be increased.

Communication action refers to communication oriented toward establishing a consensual understanding, which does not imply that actors must be altruistically motivated to achieve consensus. Instead, communicative acts are seen as inherently consensus oriented because they entail validity claims that essentially call on others to confirm or challenge them. Such validity claims are generally of three kinds: objective truth (e.g., evidence proves global warming threat), the appropriateness of normative criteria (e.g., something should be done to address global warming), and a communicator's truthfulness (e.g., I am not disguising my real motives). Moreover, actors are thought to intuitively know what would invalidate their (often implicit) claims. This feature of communicative action is critical because it allows claims to be challenged on a speaker's own implicit terms. Not all communication falls into this category. For example, a state ceasing diplomatic relations with another does not call for deliberation. However, publicly communicating that a country risks invasion because it has secret weapons banned by international law raises the three kinds of validity claims previously mentioned (i.e., weapons exist, legal norm applies, speaker's statement is truthful).

The communicative action concept is generally linked, or even merged, with the concept of communicative rationality. While communicative acts may be ignored, increasing communicative action among actors is thought to evince a collective learning dynamic that follows the logic of communicative rationality, which acts to filter out flawed reasoning and expand the pool of shared beliefs.

The inherently noncoercive nature of this communicative logic does not require strategic goals and tactics to be entirely absent. For example, certain firms or governments may enter a discussion only in response to outside legal pressure. Even if they merely begin by denying the existence of a problem (e.g., corruption), either out of a genuine conviction or because they want to conceal something, their denial includes an implicit suggestion that certain evidence could potentially invalidate their denial. If strong evidence is produced, then they may or may not be persuaded. But pressure likely exists for them to appear at least concerned that their previous denial has been seriously challenged.

This example highlights some lingering questions about the relationship between governance and this hypothesized communicative logic. Which factors encourage communicative action or pressure actors to care if their claims are discredited? How can governance systems tap into this deliberative potential without becoming flooded by input or dominated by the best-funded perspectives?

COMMUNICATIVE RATIONALITY

Communicative rationality characterizes a particular logic of interaction among individual (or collective) actors that is determined by argumentative processes. This differs from cases in which payoff structures constrain the strategic calculations of actors (e.g., trade negotiations) or situations where actors unquestioningly adhere to social norms. Communicative rationality occurs via an argumentative process, in which actors come to a mutual consensus on the most persuasive arguments. The implication that institutional factors can facilitate collective learning and noncoercive coordination links this concept to debates about current challenges (e.g., globalization) and to the problem-solving capacity and democratic legitimacy of contemporary governance systems. Thus, communicative rationality provides a framework for understanding—and evaluating the moral status of—the governance of political and social institutions, which may range from narrow (e.g., committee procedures) to broad in scope (e.g., political systems).

Communicative rationality evokes a procedural logic that is rooted in argumentative exchange between actors in a social setting. This logic is expressed in a collective learning process, in which certain arguments become mutually recognized as the most persuasive. Because persuasion trumps all other forms of influence, this procedural rationality is thought to be consensus oriented. Thus, even the use of dubious arguments for strategic goals does not inhibit the procedural logic from filtering out the better arguments.

The roots of this logic are captured by the concept of communicative action. Unlike other forms of social action (e.g., threats), communicative—or speech—acts entail (often implicitly) validity claims about the following: factual truths, a norm's applicability, and the communicator's truthfulness. Actors are assumed to have an intuitive grasp of the conditions that would objectively determine their claims' validity, and this opens them to being criticized on their own terms.

These features of communicative action represent latent communicative potential. Just as improving legal structures can unleash entrepreneurial innovation and competition, the following three ideal conditions are thought to encourage communicative action and rationality: (1) open access to the discussion, (2) willingness of actors to accept the most persuasive arguments, and (3) willingness of actors to back their claims with reasons and an openness to having them challenged. These conditions serve as conceptual benchmarks and, like perfect markets, are not necessary to evince the hypothesized logic.

Various implications can be anticipated from interactions that come comparatively close to these ideal conditions. First, situations characterized by communicative rationality are decidedly egalitarian because all sources of influence (i.e., force, majority rule, bargaining power, status) are subordinated to the persuasive power of the "best argument." Second, unlike individualistic conceptualizations of cognitive learning, communicative rationality implies a form of social learning that can transform collective beliefs about how the world works (e.g., certain pollutants are lethal) or how norms should be applied to situations (e.g., civil rights should apply to all citizens). This hypothesized form of learning is a precursor to behavioral change and challenges the assumption that self-interest perceptions are unchanging. If empirically supported, it follows that institutional reforms to facilitate communicative rationality could reduce governance problems stemming from the appearance of irreconcilable interests.

COMMUNISM

The meaning of the term *communism* is more elastic than has often been supposed by commentators or by its detractors or defenders. It gained purchase as a concept largely because Karl Marx and Frederick Engels (bent on distinguishing their doctrine from the Socialism of the 1840s, which was overwhelmingly middle class, reformist, and French) insisted on calling their celebrated document of 1848 *The Manifesto of the Communist Party.* Marx and Engels also decisively redefined and set their seal on communism by divesting the term of its heretofore clandestine and conspiratorial connotations. (Marx and Engels consented to the use of the term *socialism* to refer to their doctrine only when socialism itself had undergone shifts in its meaning.)

Upon the success of the 1917 Bolshevik Revolution in Russia, Vladimir Lenin began calling Bolshevism (a term that had minoritarian connotations) communism, largely out of a felt need to distinguish it from the orthodox "evolutionary socialism" of the German Social Democratic Party and the Second International (1885–1914). The success of what was now called communism—which by contrast with evolutionary socialism owed nothing to parliamentarism or the ballot box—was foreseen by few and planned by fewer. (Much the same could be said of the ultimate demise of Soviet communism.) Lenin drew inspiration both from the Paris Commune of 1871, the most celebrated working-class uprising of the nineteenth century, and from Marx's *The Civil War in France* (1871), a spirited defense of the commune. In calling the commune the ideal political form in which to emancipate labor, Marx effectively set his seal on the nineteenth- and twentieth-century understandings of communism.

The revolutionary success of communism in its Leninist incarnation did little to rob the term of its elasticity or to reintroduce a pre-Marxian conspiratorialism. The meaning of communism was now stretched to cover not just insurrection and expropriation, but also the more positive tasks of political, social, and economic reconstruction in the absence of private property relations. It is along these lines that communism may be understood as the major political innovation or experiment of the twentieth century, especially during its expansionist phase after World War II. Communism may also be understood, internationally, as the main twentieth-century counterweight to the ideology of the U.S. national security state. Communism, again, may also be understood as Serge Halimi understands it (with reference to its Marxian roots)—as a thoroughgoing critique in advance of capitalist globalization. Recent developments in China, where the shift to capitalism was effected under otherwise rigidly communist rule, may be regarded as an illustration of this last understanding.

COMMUNITARIANISM

Communitarianism refers to various social and political theories that broadly share an emphasis on, first, the social nature of human existence, and, second, the advantages of a society based on strong, shared moral values. Many communitarians also emphasize the role of religion, work, and family in sustaining such a society. Communitarian ideas arose to prominence in the 1980s, in part as responses to neoliberal governments, which were seen as promoting individualism and,

according to some of their critics, thus condoning materialism and selfishness.

There are two main varieties of communitarianism—philosophical and sociological. Philosophical communitarians oppose abstract ideas that are prominent in contemporary liberalism (notably, the thin concept of self and the priority of the right over the good). They argue that we are embedded in communities, traditions, and ways of life, which give us our values, identities, and loyalties. They also argue that we can justify moral principles, at least initially, only from within communities and traditions. However, it is the sociological communitarians that have had an impact on contemporary governance, mainly by inspiring some policies of welfare reform. Sociological communitarians insist on the importance of strong, shared values as a prerequisite of a well-functioning society. The leading exponent of such communitarianism is Amitai Etzioni, who spent a year in the White House as a senior adviser on domestic affairs, and who later founded the Communitarian Network.

Sociological communitarians deploy a temporal narrative to explicate their main ideas. Etzioni argues that the 1950s were, at least in the United States, a time of stable values and so a viable community. A widely shared set of values, based to some degree on the dominance of Christianity, gave people a strong sense of duty to family, community, and society. Although the society based on these values involved coercive breaks on autonomy, especially for groups such as women and ethnic minorities, it had an admirable moral vitality. For Etzioni, moral vitality is the foundation of social order and so of primary importance, even though it involves a loss of autonomy. He argues that we need a balance between community and autonomy, between individual rights and social responsibilities. Whereas the 1950s exhibited an admirable community, the 1960s and 1970s brought an excess of autonomy, which was apparent in the growing sense of entitlement, the neglect of responsibilities, the decline in respect for authority, and consequent social problems, including a welfare dependency widely associated with the underclass. Communitarians often identify the source of this excess of autonomy in the countercultural movements

of the 1960s. They believe these movements undermined values such as hard work and thrift, while also encouraging new socioeconomic patterns, such as the entry of women into the labor market, which limited the time people could give to family and voluntary action in the community. The consequent excess of autonomy appeared in both welfare liberalism and neoliberalism.

Communitarians typically argue for a reassertion of strong values to stop the moral drift that they believe has occurred since the early 1960s. They associate strong values with religion, work, and family. In this view, work and family teach people responsibility and self-reliance, while also involving them in society. Work and family bolster self-esteem, purpose, and the sense of contributing to a community. And work and family encourage people to relate their individual choices to their collective responsibilities. Hence, many communitarians advocate welfare-to-work programs and measures to support families. William Galston has argued, for example, that the state should promote marriage actively, while making divorce more difficult for couples with children. Many communitarians suggest that just such an emphasis on work and family is the best way to attack poverty. They think that stable intact families offer the best solution to poverty for children. They also think that paid employment offers the best solution to the adult poverty of the underclass. More generally still, communitarians advocate policies to promote family and work as ways of ensuring a general shift from a culture of autonomy toward one of community. They want to reestablish a link between rights and responsibilities; they want to tie the rights we enjoy to our fulfillment of corresponding duties. In their view, much of the value of work and family derives from the fact that they are where we learn best to be responsible: The state is, in contrast, the paradigmatic institution from which we demand rights.

Critics point to a tension between the communitarians' invocation of strong values and their idea of an inclusive community. At times, communitarians elide inclusion with the activities through which we fulfill our duties: The unemployed are socially

excluded, so to bring them into the workforce is to enable them to participate in the economy. At other times, they suggest that the community consists of umbrella institutions that bind people together within civil society.

In the United Kingdom and United States, governments have drawn on communitarian ideas in their programs of welfare reform. The communitarian emphasis on work as a tutor of responsibility has inspired welfare-to-work schemes. With these schemes, the state attempts to tackle social exclusion by bouncing people into work where, it is hoped, they will learn responsibility and gain self-esteem, as well as becoming self-supporting financially. Governments have established "New Deals" under which they accept a responsibility to create opportunities for work and training, while in return, the unemployed accept the reciprocal responsibility to seek and accept such opportunities. Such "New Deals" sometimes require the unemployed to undertake full-time education or voluntary work, or else they have their benefits cut.

COMMUNITY ASSOCIATION

See NEIGHBORHOOD ASSOCIATION

COMMUNITY ORGANIZING

Community organizing is a method of engaging and empowering people. Its main purpose is to increase the influence of groups historically underrepresented in policies and decision making that affects their lives.

Community organizing is both a tactic to address specific problems and issues and a longer-term engagement and empowerment strategy. Longer-term objectives of community organizing are to develop the internal capabilities and to increase the decision-making power and influence of underrepresented groups.

Community organizing is often a place-based activity, used in low-income and minority neighborhoods. It is also used among common interest-based "communities" of people, such as new immigrant groups, who have limited participation and influence in decision making that affect their lives.

In community organizing, members of communities are organized to collectively act on their shared interests. Saul Alinsky is commonly recognized as the godfather of community organizing. Alinsky emerged as a community organizer in the second half of the 1930s. His thinking about organizing was strongly influenced by the militant labor movement in the United States emerging at the time. Alinsky's approach emphasized: democratic decision making, the development of indigenous leadership, the support of traditional community leaders, addressing people's self-interest, use of conflict strategies, and fighting for specific and concrete results. In the late 1960s and 1970s, many liberals and liberal-leaning foundations embraced his method of community organizing as an alternative to the radical activism and rebellion at the time in U.S. cities.

The focus of Alinsky-type organizing is on strengthening the internal ties among people sharing similar values and interests. Working mainly through established organizational networks, such as churches, these efforts mobilize residents for actions that confront powerful people and institutions in an effort to get them to act differently. In conflict organizing, strong internal community ties are thought to be sufficient to empower people and effect change. In

practice, some conflict organizers explicitly reject developing associations with those in power for fear of having group members coopted when sharing responsibilities with people in an advantaged positions.

An alternative approach to conflict-based community organizing is the consensus approach. Consensus organizing emerged in the last decade of the twentieth century. In contrast to conflict organizing, consensus organizing pays attention to the development of strong and weak ties; namely, both the nurturing of internal cooperation among communities of interest and creating working relationships to those in power and with influence. The goal is to create new organizations and leaders that are more broadly rooted, with an emphasis on establishing new positive linkages to government and other decision-influencing institutions.

COMPETITION POLICY

Competition policy aims to ensure that competition is not restricted or undermined in ways that are detrimental to the economy and society. It is predicated upon the idea that competitive markets are central to investment, efficiency, innovation, and growth. Competition policy emerged in the United States in the late nineteenth century, when it became apparent that competition was prompting larger firms to try to lessen the competitive pressures through the formation of cartels, with detrimental effects on smaller firms and consumers. Consequently, in the United States, it is more usually referred to as "antitrust." Since the 1990s, competition policy's importance has increased, both in its spread to ever more economies and in its prominence as a policy tool, as the popularity of policies to promote national champions has, in theory at least, decreased.

There are three main areas traditionally covered by competition policy: restrictive practices, monopolies, and mergers. Restrictive practices—for instance, collusion by competitor firms to fix prices—are generally prohibited under competition policy, though this is not the case with all collaboration; it is increasingly common for even the largest multinational firms to collaborate with competitors in areas such as research and development. With monopolies, it is the abuse of a monopoly position, rather than its existence per se, that is addressed through policy. The regulation of privatized utilities illustrates this point clearly: The transfer of large numbers of state-owned utilities into the private sector has necessitated regulatory strategies to maintain the benefits of economies of scale associated with a monopoly network provider, while combining this with the introduction of competition where possible. Mergers have traditionally been the most controversial, and consequently, the most politicized, of the areas of competition policy, not least because the judgment required as to whether a particular merger will result in a damaging reduction in competition that outweighs any potential benefits is, frequently, debatable.

From a governance perspective, the most notable development in competition policy is the trend toward devolving responsibility for its implementation to independent agencies, at arms length from government (though the degree of independence varies considerably). This is perhaps best explained as an attempt to "depoliticize" competition policy; to make it, or at least to make it appear, neutral, predictable, and rules based, and not subject to the short-term concerns of elected politicians. However, it has also increased the influence that these agencies have on the development of policy and its implementation as their expertise has grown.

Where once competition policy was contrasted with regulation—the idea of the promotion of competition was diametrically opposed to regulation in the eyes of many—the distinction is now less clear-cut. As the example of the privatized utilities shows, there is no strict boundary between the two. However, competition agencies can be distinguished from industry-specific regulators: The former are responsible for policy throughout the entire economy, setting overall policy, and normally have a reactive role in responding to suspected breaches; industry regulators will have a far-narrower scope but greater *ex ante* powers of rule setting. This has prompted the distinction between regulation of competition and regulation for competition.

COMPETITION STATE

Globalization is not just about economics—more open trade, financial globalization, or the internationalization of production. States and political actors are among the greatest promoters of globalization, leading to a transformation of the state itself—from the postwar national industrial welfare state (IWS) to a competition state. The essence of the IWS lay in the state's capacity to insulate key elements of economic life from international market forces—not merely protecting the poor and helpless from poverty and pursuing welfare goals such as full employment or public health, but also

- regulating business in the public interest,
- "fine tuning" business cycles,
- nurturing "strategic industries" and "national champions,"
- integrating labor movements into neocorporatist and collective bargaining processes, and
- managing international trade and capital movements so as to reinforce the previously mentioned—the "embedded liberal compromise."

But this compromise was eroded in the 1960s and 1970s by increasing domestic structural costs (the "fiscal crisis of the state"), as well as by growing external trade and international capital mobility. Today, the main aim of state actors is to make domestically based economic activities as competitive as possible in global markets. This mainly involves

- a move from macroeconomic to microeconomic interventionism in both regulatory and industrial policy,
- a shift from supporting "strategic" or "basic" economic firms and sectors to a strategy of flexible response to competitive conditions in a diversified and rapidly evolving international marketplace,
- a core focus on the control of inflation and monetarism as the touchstone of state economic management, and
- the transformation of party and governmental politics away from full employment, redistributive transfer payments, and social service provision to the promotion of enterprise, innovation, and profitability in both private and public sectors.

Potentially the most explosive issue area is regulation. Deregulation is not just the lifting of old regulations, but also the formulation of new, promarket regulatory structures based on general rules of economic behavior rather than specific outcomes. These are designed to cope with and anticipate shifts in competitive advantage, as well as to enforce global market-rational economic and political behavior on rigid and inflexible private-sector actors (as well as on state actors and agencies). The state itself is increasingly

marketized too, remodeled around practices copied from business—that is, the new public management or "reinventing government."

The dominant model of the competition state today is the neoliberal state, associated with the United States and the United Kingdom—instead of the developmental or strategic state model of Japan or France, on the one hand, or the neocorporatist or coordinated state model of Germany or Sweden. Competition states also play a crucial external role as enforcers of the rules and practices of the global political economy abroad as well as at home. Domestically, they negotiate distributive outcomes among the various winners and losers from globalization. Thus, paradoxically, the actual total amount of government economic interventionism and imbrication in social life can increase significantly. Promarket regulation can be even more intrusive than old-fashioned, liberal social redistribution. At the same time, the power of the state to control specific social and economic activities and market outcomes continues to diminish.

COMPETITIVENESS

The competitiveness of business is a function of a number of variables that are affected by public policies. Some determinants of competitiveness, such as the ability of management to allocate resources strategically, are primarily a function of private decisions, rather than public policy. The level and quality of education of the workforce, the level and efficacy of investments in research and development (R&D), the cost of capital, and economy-wide developments in communications and data processing technologies that companies can take advantage of are examples of the kinds of factors that help shape competitiveness. Some companies may prefer to make these investments themselves to ensure they recoup the benefits, but employee mobility may mean that those benefits are transferred to other employers, and publicly funded education is likely to play a role in preparing employees for productive work. Public goods, such as communications and transportation networks, are typically more efficiently built by governments using tax revenues than constructed by each company, and the transaction costs of companies negotiating partnerships may be greater than governments simply taking responsibility for these public goods. The benefits of research and development investments may be easier for individual companies to capture, but it is often more cost effective to pool resources for R&D and centralize efforts so that experience informs development, rather than having each company "reinvent the wheel."

The ability of companies to minimize costs plays a critical role in shaping their competitiveness. They can reduce costs by becoming more productive, as well as by reducing labor costs and externalizing as many of the costs of production and marketing as possible. Government regulations that seek to force companies to internalize these costs are particularly inviting targets for businesses. Businesses can blame government regulators for job losses if regulatory burdens are too high and demand reduces regulatory compliance costs in the name of competitiveness. A long-standing issue in public policy is how to balance the competitiveness of business with public pressure to protect other values, such as jobs and the environment. Regulatory rules, barriers to entry, difficulties in gaining credit, and other policies may stifle business activity in developing countries as well.

The globalization of markets and trade has made competitiveness a primary business and political goal.

Virtually every political and management decision is subject to the competitiveness test: How will it impact the relative position of the industries affected in global markets? Globalization has been widely heralded for producing a host of benefits, including dramatic economic growth, the spread of new technologies, the expansion of individual freedom and recognition of human rights, increased flow of information, and advances in democratic politics and government. Global competitiveness confirms Adam Smith's premise that an economy, if freed from political constraints so it can compete in global markets, will produce the greatest wealth of nations.

The globalization of the early twenty-first century poses a similar challenge: As economic power grows globally, what kinds of political ideas and institutions are required to deal with the consequences of that growth? Among all the trends associated with the increased emphasis on competitiveness, two are particularly important. First, while the globalization of markets and trade has produced significant benefits, including economic growth, the spread of new technologies, individual freedom, and the dissemination of information, globalization is quite selective and asymmetrical, and the benefits have largely been concentrated in the wealthy countries. In general, regions blessed with an educated workforce, an effective transportation and communications infrastructure, and high levels of income already established do much better than other areas. During the 1990s, the number of people earning one dollar a day or less has remained static at 1.2 billion, while the number earning less than two dollars a day increased from 2.55 billion to 2.8 billion people. The gap in incomes between the twenty percent of the richest and the poorest countries grew from 30 to 1 in 1960 to 82 to 1 in 1995; the average income of the wealthiest twenty countries is 37 times that in the poorest twenty countries—twice the ratio in 1970. Economic conditions worsened considerably in some twenty-five countries during the 1990s. Inequality is, proponents of markets argue, an inevitable outcome of globalization and a desirable one insofar as it creates competitive pressures that drive costs down. But inequality may become so problematic that it undermines support for policies aimed at promoting competitiveness.

Second, global competitive pressures are intertwined with growing global environmental threats. Some environmental indicators show dramatic improvement over the past decades. Air and water pollution in many areas, particularly in the wealthy world, are improving. The wealthier a region is, the more resources it has to invest in cleaner technologies and improved efficiency. Conversely, among the most pressing environmental problems are securing clean water and sanitation for the world's poorest residents. But other indicators suggest that globalization is not ecologically sustainable. Growth in greenhouse gas emissions and toxic wastes, the decline of biodiversity and habitat, the loss of topsoil, and the mining of aquifers are examples of environmental threats that inexorably expand with global economic growth.

Such results are not unexpected, given global competitiveness' emphasis on unfettered markets and blindness to the threats posed by market-based prices that fail to reflect the true costs of production and fail to provide the kind of signals essential for making efficient decisions about the use of resources. Proponents of competitiveness champion the idea of the end of ideology to promote an uncritical embrace of markets, free trade, powerful multinational corporations largely unregulated by public authority, and unrestrained technological innovation. But competitiveness requires strong, effective government to ensure that prices reflect true costs, companies compete rather than collude, and burdens and benefits are fairly distributed.

COMPLEXITY

Complexity theory or the science of complexity is the label for a collection of theories that are building blocks for a system-oriented approach to (social) reality. This body of theories challenges the ideas of linearity and order and focuses on nonlinearity, interconnectivity, unpredictability, and the major impact that may be caused by seemingly insignificant factors. Order is a characteristic of the practice of governance, with its rules and regulations, fixed schemes and schedules, assigned roles, and expectations concerning the behavior of actors. Chaos, on the other hand, can also be observed: projects that run out of control and do not finish, budgets that are exceeded despite strict bookkeeping, minor issues that—once raised—result in politicians resigning. The notion of complexity theory can help understand how and why the practice of governance is capricious, as it often is, despite attempts to control it. Complexity indicates situations where order and chaos in governance keep each other in balance. This is also called the edge of chaos.

Before turning to the application of complexity theory in social science in general, and governance in particular, the background of these theories is introduced.

Background and Development of Complexity Theory

Complexity theory originates in physics, mathematics, chemistry, biology, and branches of economics that focus on the dynamics of systems. A number of important observations in all these fields of science lead to the development of theoretical notions that later came to characterize complexity theory. For example, it was observed that the whole is more than the parts, and that, therefore, the properties of the whole cannot be predicted out of the properties of the constituent parts. Other observations include that elements can act without guidance of an authority and that processes are not time reversible. In other words, the mechanistic, Newtonian worldview that has dominated science for a long time was challenged by ideas about nonlinearity and became known as complexity theory.

Founding fathers of complexity theory include William Brian Arthur, Richard Dawkins, Murray Gell-Mann, John Holland, Stuart Kauffman, Chris Langton, Ilya Prigogine, and others. Their work encompasses ideas and concepts about how and why systems develop (e.g., Gell-Mann, Kauffman, Prigogine), as well as concepts about the behavior of elements in such systems (e.g., Langton, Holland). The concept of systems lies at the heart of complexity theory. It can be everything, from populations to chemical compositions or from stock market movements to a set of genes. These systems have been called complex adaptive systems (CAS) and consist of active elements that are different in form, capabilities, and behavior. According to the theory, these active elements are interconnected, which means that if one element develops, it will affect other elements. This brings about a chain of reactions, wherein the magnitude of the effects may be diminished by the resilience of the environment. This resilience comes from the capacity of other elements to absorb or because these elements were also triggered by other contravening events.

Elements are called agents or actors when complexity theory is applied to social reality. They act according to a limited set of rules that evoke self-organizing behavior. These rules are often referred to as simple rules of behavior or schemata. Self-organizing behavior emerges out of interaction with other agents by application of these rules. Using these schemata (in interaction) results in complex patterns of interaction called emergences and the subsequent complex development of the system of which the actors are part. This is why such systems are deemed complex. They are deemed adaptive because these

systems are able to adapt themselves to new situations through the flexibility or adaptiveness of their constituent parts, that is, the elements or agents, hence, complex adaptive systems.

The aforementioned mechanisms stem from observations of the development of populations, chemical responses, and economic and computed systems. In turn, they lead to the idea that the ability to adapt is crucial for systems, as lack of adaptiveness results in deadlocks. Adaptation to the environment happens through the mechanisms of negative and positive feedback loops. Negative feedback loops diminish the gap between the actual situation and the desired situation, whereas positive feedback loops increase this gap, sometimes unintentionally. Both forms of feedback can produce a positive or negative outcome. Feedback loops do not occur sequentially, but simultaneously, thereby adding to the complexity.

As time progresses, agents attempt to adapt themselves to the changing environment. This can be regarded as a "walk" of an agent through a space-of-possibilities, where the agent can select a certain possibility or be forced to do so. The number of possibilities to choose from is not unlimited. There are possibilities that are only theoretical possibilities: far from feasible or harmful for the agent in question. There are possibilities that disappear when time progresses or when a choice from an agent rules out other possibilities. Over time, possibilities that are more likely to be chosen will appear, and possibilities that are not that attractive will disappear. Certain possibilities that are chosen more frequently than others—for whatever reason—are called attractors in complexity theory. Attractors are states within the space-of-possibilities that appear to—literally—attract agents.

As time progresses and agents follow their rules, they may face the mechanism of path dependency, whereby history determines the actual position of agents. Lock-in effects refer to situations that are difficult to depart from because the effort needed to abandon the situation is exceedingly high. The circumstances of actors will make such situations appear rational, even though they are inferior to other solutions. Lock-in effects can be avoided by being adaptive.

Complexity theory recognizes that although systems develop toward an equilibrium, there is actually no single best equilibrium for a system. Rather, there are multiple equilibriums that provide temporally best situations—and this can change over time. If systems cannot keep themselves in a state of dynamic equilibrium, they tend toward a state of chaos (too much interconnected to its environment and too little stability) or inertia (too isolated from its environment, too much stability). Both situations are not optimal and provide less potential for prosperity. So far, the concepts of systems and agents have been used interchangeably. This is because of another characteristic of complexity theory, which recognizes that systems can be regarded as nested, that is, systems are elements or agents within bigger systems that are, then, also elements or agents in even bigger systems. The division into systems and agents is therefore fuzzy. The mutual interaction of systems and agents is called coevolution.

The mechanisms and developments previously described can be considered the basic features of complexity. So-called fitness landscapes can help to comprehend the development of complexity. A fitness landscape is a three-dimensional rendering where every agent (of a system) has a unique position on the x-, y-, and z-axis. In this landscape, each system (or agent) seeks a local optimum. It is a dynamic landscape because of the aforementioned mechanisms that ensure ongoing developments. The initial position of an agent, but also the subsequent actions from other agents in response to the move of that agent, determine new positions. A good position is depicted as peak, whereas an inferior position is depicted as a valley. As all agents move all the time, the fitness landscape moves accordingly, making it harder to reach a peak (i.e., an optimal situation) and to avoid a valley (i.e., a suboptimal situation).

Complexity Theory and Social Science

The main ideas and concepts of complexity theory began to be absorbed by the social sciences in the late 1990s. Prominent advocates of complexity theory in

the social sciences in general, and governance in particular, include David Byrne, Philip Haynes, Steve Maguire, Bill McKelvey, Eve Mittleton-Kelly, David Parker, and Ralph Stacey.

Benefits of Complexity Theory in Social Sciences

There are benefits of complexity theory for the social sciences, even though it has never been dominated by a Newtonian worldview in the same way as the disciplines from which complexity, theory has originated. Complexity theory challenges the ideas of linearity, predictability, certainty, and dichotomy between order and chaos. It focuses on the (co)evolutionary nature of systems and agents—often called actors in social science—and the mechanisms previously discussed. Complexity theory can be applied in all disciplines of the social sciences, providing opportunities for crossing the boundaries between disciplines. The limits to the application of complexity theory in social sciences are yet to be explored, but this way of thinking can require a thorough change of perspective on social processes. For governance, it may help to understand why and how matters appear to shirk away from order, no matter which instruments for control—such as laws—are applied.

Criticism on Complexity Theory in Social Sciences

Complexity theory has received considerable criticism from social scientists. There are two main lines of criticism. First, critics challenge the claim that complexity theory is something new. Second, they question whether concepts from scientific disciplines, such as physics and chemistry, apply to social phenomena. As far as the matter of new ideas is concerned: Complexity theory bears resemblance with systems theory. It also comes to certain conclusions concerning governance and public management that other authors have reached, although from different theoretical angles. This aside, complexity theory is still a new way of thinking with distinct concepts, even though the differences may sometimes lie in the details.

The second line of criticism concerns the appropriateness of applying scientific concepts to the problems of the social sciences. Concepts and methodologies from complexity theory that have value in natural science may not be valid in social science. It is argued, for example, that cells behave in fundamentally different ways than humans. This does not discount the possibility of using the principles of how cells behave in order to understand how humans behave. In the early applications of complexity theory to social science research, for example, concepts were used as an analogy rather than as an empirical description of behavior.

Complexity Theory and Governance

So far, we have discussed the fundamental principles of complexity and their role within the theory. It is also useful to illustrate applications of the theory in the analysis and practices of governance and public management. These practices include strategies, structures, and operational management approaches.

Governmental organizations can be seen as complex, adaptive systems, interacting with and within a dynamic environment of other organizations. By themselves, they are nested systems: agencies are part of ministries, which are part of the larger central government, which is part of a political system, which as such is part of international systems.

Public organizations try to influence each other and actors within society in order to realize their policy ambitions. The difficulty of realizing collective action and implementing policy can be explained through the logic of complex systems. Agents, or actors, within a policy system act according to their own schemata with which they interpret external messages. They can choose to respond to the messages in a number of ways. Sometimes, their response reinforces steering attempts of governmental organizations (positive feedback), sometimes they extinguish them (negative feedback).

Governance, then, is dealing with the complexity of coevolving agents and systems. The governing organization is not steering other actors but engages in an adaptive walk through different landscapes, such as

the landscape of international negotiation or the regional landscape of urban planning. Each landscape is populated by highly diverse actors: governmental organizations, societal organizations, interest groups, private businesses, and citizens. These actors all have their own schemata and ambitions. Strategic operations of one actor influence the position and possibilities of the other actors within this particular landscape. Agents need to effectively handle difficult dilemmas of cooperation versus competition, exploration versus exploitation, and openness versus closedness, if they are to reach their goals and collective action.

Managing Complexity in Public Organizations

Complexity demands a dedicated managerial approach in public organizations. The argument is that (public) managers find themselves in a qualitatively different world than in the past, where traditional managerial approaches are not suitable anymore. The traditional approach includes hierarchical structures, bureaucratic routines, centralization of power and decision making, and the desire to plan and to reduce uncertainty. This different world is characterized by uncertainty, nonlinearity, unpredictability, and high dynamics. Recognizing the complexity of the environment of public organization, and indeed the complexity of the organization itself, has important implications for public management. Complexity theory then turns from a descriptive theory into a prescriptive theory.

There are three motives to adopt managerial tools from complexity theory: to assert one's situation at the edge of chaos (because that is the condition in which organizations flourish), to stimulate self-organizing behavior (because one can't organize and control everything by oneself), and to deal with the inherent uncertainty of the dynamic environment (because denying or attempting to control these dynamics reduces one's capacity to move along with the dynamics).

These goals are demanding for public managers. Maintaining one's organization at "the edge of chaos" requires the ability to maintain enough order to avoid loss in chaos and, at the same time, to be open to chaos in order to progress and avoid getting stuck.

Governance is about influencing the behavior of citizens, societal and private actors, through the interactive development and implementation of policies. When public organizations, unilaterally, stick to their own ambitions, it is not likely that they get the support of their environment for realizing these ambitions. The same applies for other actors. Collective action is only possible through a process of mutual adaptation. Governance can be regarded as an attempt to organize a process of coevolution between the different ambitions and visions that are present in a dynamic society.

It is a traditional reflex from governmental organizations to attempt to control processes within and outside the organization. The dynamics of the environment as previously discussed teaches us that such attempts will be in vain. In such cases, self-organization can help to create a degree of order in the chaos without needing to control everything. In practice, this means that operating rules and regulations should not be too extensive or cover all eventualities, but rather act to give general directions and allow room for improvising in ever-changing conditions. Interactive processes are necessary because they will result in a joint vision on a specific policy problem that will be accepted by all actors, rather than imposed upon by the governmental organization. Managers should establish the boundaries of such a process in cooperation with other actors but should refrain from detailed regulations.

Managers also need to deal with uncertainty. Traditionally, this is done through planning and control and other techniques that are used in attempts to reduce uncertainty. However, complexity theory states that this uncertainty will never disappear and preferably should be taken advantage of when it opens up new, unforeseen possibilities.

By abandoning a linear and mechanistic worldview, complexity theory provides a different way of looking at (social) reality. It is also a way that is currently under development in social sciences and practices of governance.

Compliance Cost

Compliance cost is the money that businesses and individuals must put forth in order to abide by legislation. The case of the United States will be used here to exemplify this concept.

When a bill passes through Congress and is signed by the president, it has the force of law and supersedes any and all state and local laws on the same matter. These laws, though always well intentioned and meant to improve society, often force costs onto the more local governments, as well as private organizations and citizens. This has been especially true since the 1980s, with the introduction of privatization and marketization as a private agency that implements the government's will as opposed to a branch of the government. Though these organizations have a significant amount of independence in creating and providing goods, policymakers do not have control over them. When a federal law is passed, these private companies must make the subsequent changes within the company to be in compliance with the new law, and the money they spend in order to do so is known as the compliance cost.

While compliance costs were low in the 1980s, they began to rise drastically during the George H. W. Bush and Bill Clinton administrations. Laws were passed that had the potential to help American society, but it meant changes had to be implemented as well. The Clean Air Act and the Americans with Disabilities Act (ADA) in 1990 are the two commonly cited examples of federal legislation demanding high compliance costs. While environmental protection and antidiscrimination measures are ideas that everyone is in favor of, by the government passing a law at the national level and demanding its implementation on the state and local levels, costs are inevitability incurred. Today, if compliance costs were equally distributed among all American citizens, each household would pay approximately $7,000 annually, which would amount to $670 billion a year. In addition, these numbers do not count the money provided by the federal government itself. Often with such laws, there is some form of federal matching program, where the federal government does offer a certain amount of money for the program at hand, but never enough to cover all the costs.

Regulations and mandates, such as the one previously mentioned, are considered by many to be "stealth taxes." If the government does not have the money to pay for a program and does not want to formally increase taxes on the public, a piece of legislation such as the ADA is sometimes employed. These laws can create the changes the federal government wants on the local levels without having to dedicate as many resources. These costs are instead transferred to those the specific legislation affects. With the passage of the ADA, for example, all companies had to ensure that their place of business was handicap accessible and it was, therefore, their responsibility to make sure there are wheelchair ramps, handicap bathroom stalls, and other such physical amenities. For this specific law, the compliance cost was incredibly high for businesses around the country that had to make the necessary structural changes. Regulation is a necessary part of accountability and oversight;

without it, the elected government would be completely ineffectual. However, costs that come with these regulations sometimes outweigh the benefits of the legislation. Policymakers and businesses alike must determine what regulations are economically feasible and whether their results are worth the costs they incur.

CONFEDERALISM

Confederalism is widely considered as one of the many varieties among federal polities. Its main characteristic that makes it different from other forms of federalism is that it concerns cooperation between independent, (i.e., sovereign) states. Other types of federalism consider the constituent parts as a part of one whole representing them internationally and binding the parts by means of a constitution. Hence, a federal state is one sovereign state, whereas a confederation is not. The (close) cooperation between states in a confederation is always based on a binding agreement—based on an international treaty ratified by each participating state—which specifies the type of (functional) cooperation.

In the past there have been several confederations, such as Switzerland and the United States, that subsequently developed into fully fledged federal states. At present, the Benelux—Belgium, the Netherlands, and Luxembourg—and the European Union (EU) are

regarded as confederations. In short, there are few actual confederations, and it could well be considered to be a transitory type of state formation, or—as in the case of the EU—of an emerging polity with a constitution of its own.

The origins and development of confederalism can be understood by various contextual factors. On the one hand, there are sociopolitical factors, on the other hand, political economic ones. The first category concerns more often than not an urge either to "hold together" or to "come together" a certain territory. Holding together refers to countering centrifugal tendencies that would otherwise jeopardize both the existence of the parts and the whole (like for instance the Belgian case between 1970 and 1993). Coming together is often the result of centripetal tendencies due to geographical reasons and economics of scale (like, for instance the Australian case before 1901). These developments are almost always historically determined (path dependency) and strongly influenced by the geopolitical context (international status). In particular, during the process of decolonization, the formation of a confederation was considered as a means to create a new polity of culturally and economically heterogeneous constituencies (e.g., Indonesia, United Arab Emirates, and Central East Africa). Yet, most of these "postcolonial" constructions either do not exist any more or turned into quasi-unitary states (e.g., the Russian Federation, formally the Commonwealth of Independent States).

A formalized agreement between the member states limits the regulatory capacity of a confederation. Often the treaty underlying the confederal polity specifies the shared rules of decision making, on the one hand, and the authority for functional action, on the other hand. This distinction is particularly interesting, if one takes a closer look at the history and development of the coming and holding together of Europe. It can be contended that the present EU is an example of a confederation. The origins of the EU can easily be traced back in terms of centripetal and centrifugal tendencies that existed in twentieth century Europe. In other words, it can be argued that "European integration" is showing a strong

resemblance to the formation of a confederal polity in transit.

CONFIDENCE-BUILDING MEASURE

A confidence-building measure is an action that reflects goodwill or a willingness to exchange information with an adversary. The purpose of such is to decrease misunderstanding, tension, fear, anxiety, and conflict between two or more parties by emphasizing trust and limiting conflict escalation as a form of preventive diplomacy. Confidence-building measures have traditionally been discussed within issues of war, security, and peacekeeping, but can now be seen within political and diplomatic spheres.

The Henry L. Stimson Center has outlined four main types of confidence-building measures: communication, constraint, transparency, and verification. Communication prevents crisis through averting tension. The methods involved in communication measures are hotlines—either presidential or military based, regional communication centers, and consultations. Constraint measures control levels and types of power; this has been achieved in military spheres through decreasing deployment in certain areas—specifically borders and prenotification of military activities. Transparency measures generate openness between parties by establishing requirements for prenotification and information exchange. Verification

reduces vulnerability and mistrust of goodwill in the military sphere through aerial and ground-based sensors. In areas of diplomacy, verification is attained through written agreements, independent observations, inspections, and treaties.

Confidence-building measures originated during the Cold War, with hotlines established between various statesmen and military personnel in the United States and the Soviet Union. A central example of the use of a confidence-building measure can be given in reference to South Asia and the 1972 conflict between India and Pakistan. Following this conflict, the two countries established the following measures: communication hotlines, an agreement on prior notification of military exercises, and consensus on the nonattack of nuclear facilities. Following these agreements, confidence-building measures were first formally implemented in the 1975 Helsinki Conference of Security and Co-operation in Europe.

Beyond military use, the World Trade Organization introduced various confidence-building measures in response to the Seattle protests of 2000. The measures introduced by the then–Director General Mike Moore and Chairmen of the General Council Ambassador Bryn specifically focused upon transparency and communication initiatives: increased participation and communication to identify the difficulties facing developing countries, a reassessment of technical cooperation and capacity-building initiatives, and increased openness in regards to implementation issues and concerns.

Confidence-building measures have been criticized in both the military and diplomatic spheres for their lack of reciprocal effectiveness. Such measures have been undermined by the failed peace settlements in the Middle East and their ineffectiveness in sub-Saharan Africa and conflict zones where—in some areas—no shared beliefs, trust, or common interests exist. Methods of verification can also undermine communication, constraint, and transparency through a lack of trust. In regards to the World Trade Organization, it has been argued that such measures are mere rhetoric that adversely produces a lack of confidence among developing countries. It has been

argued that the concept is only relevant in specific regard to the Cold War.

CONFLICT MEDIATION

While governance is defined in myriad ways, particularly during this time of dramatic global transition, conflict mediation can be and is equated with governance. Likewise, democratic governance is advocated as effective conflict mediation. Simply defined, any force outside of a conflict mediates when it assists with that conflict's management, negotiation, resolution, or transformation—strengthening of relationships—without the use of force. If all parties to a conflict agree, a third-party individual, state, group, or organization not involved in the conflict and often described as impartial can intervene.

Conflict Mediation's Significance to Emerging Governance

Conflict mediation is growing dramatically, threefold or more, as state power declines. New regional, international, and civil society conflict mechanisms reframe global shifts from sovereigns to the international community, confrontation to negotiated collaboration, and control to shared capacities. Present definitions of good governance stress civil society rather than government. They deconstruct political will into articulation of interests, exercise of rights, and mediation of differences. Informal conflict mediation

can satisfy many needs and challenges outside the purview of formal governance at all levels of society. For example, the majority of significant global conflict is intrastate and ethnic—beyond international law's mandate. In response, new programs train activists and other members of civil society, along with international diplomats and lawyers, in the skills and attitudes of facilitative conflict mediation.

Contemporary Conflict Mediation

Multilevel analysis is necessary to understand evolving conflict mediation. Traditionally, heads of state and state representatives mediate conflict through exercising their power of authority and promising resources or other support. Distributive bargaining, or negotiating division, has predominated. Conflicts are framed as sovereignty or ethnic self-determination, for example. State-compelled mediation is still prevalent, particularly with a high-profile crisis, but increasingly complemented with more collaborative mediation initiated by civil society and international organizations like the United Nations. Integrative bargaining aims to avoid division through constructing innovative, collective possibilities. Conflict is framed as partnering to search for options that consider all interests—how we might respect sovereignty and ethnic self-determination, for example. Collaborative-governing mediation aspires to increase sustainable (durable) resolution through building civil society cooperation rather than dependence on state oversight. Restorative justice, another evolving global movement exemplified by truth and reconciliation, combines traditional state and emerging civil society mediation.

States and international organizations are attempting to respond to the changing global order by institutionalizing mediation. Transnational corporations are following this lead. As a result, conflict mediation is both centralized in government programs, domestic and international, institutionalized within transnational corporations, and decentralized. Any member of civil society is free to initiate informal, and sometimes formal, mediation. Conflict mediation is institutionalized, yet simultaneously acts as a means for

institutional reform, providing an alternative to untrustworthy, nonresponsive, and partial systems.

Some contend that civil society's roles with contemporary governance are providing broad, inclusive public participation and overseeing accountability; business's responsibility is promoting efficient effectiveness and government roles are facilitating rule of law with transparency. However, these lines are increasingly blurred. Civil society, for example, can participate in negotiated rule making and, thus, create rule of law.

Linkages Between Conflict Mediation and Governance

Many linkages, explicit and implicit, exist between conflict mediation and the changing nature of governance. Consequently, conflict mediation has the potential to build or erode governance. At its best, democratic mediation bridges legal systems, crosses cultures, promises transparency, and builds relationships rather than destroys them.

Citizen participation in conflict mediation is increasingly personal as well as representative. Multistakeholder process, like the negotiation of South Africa's Peace Accords, includes more of those affected by decisions, interested parties such as nongovernmental organizations and state representatives. The United Nations Economic Commission for Europe's *Convention on Access to Information, Public Participation in Decisionmaking and Access to Justice in Environmental Matter* also included nongovernmental organizations in the design of its negotiation process and negotiation. It is lauded as a model for multilateral policy making, or democratization of international institutions.

The office of ombudsmen is yet another form of conflict mediation and governance growing in popularity. The office created by the International Finance Corporation and Multilateral Investment Guarantee Agency is one well-studied example. Ethical principles and independent oversight prioritize civil society's interests in transparency, responsiveness, and robust accountability through a designated independent third party.

The model offered by international commercial arbitration is spreading as a preferred ombudsmen like governance structure. Parties in conflict select three member panels—one chosen by each party or approved by all parties. A nongovernmental representative with an established reputation for impartiality, like the International Red Cross, may be one of the trusted panelists. Panels mediate conflict and provide oversight to ensure good faith.

Interesting challenges and questions arise with changing governance and conflict mediation. What space do states and international organizations have for negotiating with civil society within mandates? Will increasing accountability with human rights quiet demands for ethnic self-determination? As civil society initiates sustained and collaborative conflict mediation, should state territorial integrity be subordinated to advancing democracy?

CONFUCIAN GOVERNANCE

Confucianism refers to the philosophy attributed to the fifth-century BCE. Chinese thinker, Confucius, and the schools of thought based on his teachings. While its dominance in Asian history can be overstated, Confucianism's emphases on mutual obligation, on the leader and elites as the bearers of moral authority, and on education and institutions as crucial to shaping

people's characters, do characterize widespread East Asian political ideals.

Confucianism as a political philosophy centers on the ability of the ruler to persuade by moral force (*de*), and on a series of five interlinked social relationships: parent-child, husband-wife, older brother-younger brother, ruler-subject, and friend-friend. It suggests that humans' moral potential is malleable and can be shaped by social and political institutions. If social relationships are conducted according to well-defined rituals and rules of propriety (*li*), if mutual obligations are fulfilled, and if institutions are properly constructed, everything—from the moral condition of individuals, to the relationships between inferiors and superiors, to the state itself—will be well-ordered. Thus, Confucian governance is said to rely on concentric circles of relationships, with virtue believed to spread outward from the self to permeate one's family, one's society, and eventually the universe. The task of creating institutions and education that promote people's moral self-cultivation falls to virtuous rulers and to the cadres of educated bureaucratic elites that advise them.

Because Confucian governance advocates clearly defined social hierarchies and emphasizes the importance of human relationships, it has been criticized as promoting a politically disengaged citizenry, focused on personal relationships, and a tyrannical, elitist government. Confucianism has also been viewed as presenting either an alternative or a hindrance to Western-style economic development, relying as it does on moral authority and mutual obligations rather than on rule of law. In the "Asian values" debates of the 1990s, Confucian governance's emphasis on paternalistic authority was often considered largely responsible for the rapid economic growth of several East Asian nations. Confucianism was seen as promoting "top-down" styles of governance in everything from government-led development policy to the relationships between company managers and their workers. Since the onset of economic troubles in East Asia in the late 1990s, this style of economic management has been equally blamed for the crises.

There have been several recent attempts to seek Confucianism support for democratic alternatives to the liberal forms of democracy dominant in the West, or for a form of constitutional government "locally appropriate" to East Asia. Most often, such scholars argue that Confucianism's emphases on humane (*ren*) treatment of others, reciprocal obligations, and tight-knit communities provide a powerful critique of and alternative to liberalism's atomizing tendencies. Others advocate elite-centered forms of governance that embody Confucianism's focus on education and moral virtue.

Consensus Democracy

Consensus democracy is a model of democracy designed to find and create common ground in pluralistic societies and to base decision making on consensus. Consensus democracies also seek to allow different political interests to share power. Some features of consensus democracy include: executive power sharing, proportional representation, a balance between executive and legislative power, bicameralism (having two legislative bodies), and multiple political parties. Instead of a "winner take all" system, executive power sharing ensures that one party or group does not dominate the leadership position. Proportional representation, reserving positions for minority membership in proportion to their constituencies, ensures that no parties or groups are completely excluded from decision-making bodies. Though consensus is the aim, such measures seek to

ensure that all voices are heard. Consensus democratic practices can be integrated to greater or lesser degrees into national and local governments, as well as in private decision-making bodies, such as workplaces. The aim of consensus decision making is the greater inclusion of a larger majority, resulting in a broader satisfaction with outcomes.

Consensus democracy is designed to correct for some of the problems in majoritarian democracies, which rely primarily on simple majorities to establish policies and to choose representatives. Majoritarian democracies are "winner take all" systems, leaving minority voters with no input into the outcome of the decision and no political representation. Majoritarian systems sometimes make decisions based on narrow majorities; this means that the will of large minorities is left out. Consensus democracy seeks to include the will of more people, arguably making consensus democracies more properly democratic.

Consensus democratic practices have several advantages. Increased consensus can enhance unity and decrease divisiveness. Participants in consensual processes tend to be more hopeful that their interests will be taken into account, therefore increasing participation. As a result of this participation, decisionmakers will likely feel a greater sense of commitment to the outcome. When processes aim at consensus, more information is generally gathered and more perspectives weighed and taken seriously, because a plurality of views is a part of the discussion. In addition, consensus democracies tend to reduce antagonism between opposing groups, in part because through the consensus-building process participants become less-wedded-to and less sure of their viewpoints.

Consensus democracies have some disadvantages. The primary objection to consensual processes is that they are inefficient. Developing a consensus takes considerably more time than taking a vote and declaring a winner. The compromise entailed in consensus decision making can dilute important principles that might otherwise be expressed in a decision. The results of consensus decision making are often ambiguous, making for potentially poorer policies. Attempts to secure consensus sometimes result in deadlock when groups are deeply conflicted. When

efforts to build consensus begin to fail, there is a risk that members may attempt to coerce each other in order to secure a decision. If the minority capitulates to the majority during the consensus-building process, there remains the problem of minority views being silenced in favor of the group decision.

CONSENT

When we grant consent, we permit something to be done: We relinquish some of our authority in a sphere of concern where our sovereignty ought otherwise to be respected. Consent is, under certain conditions, generally taken to have deep moral significance, but scholars disagree over what forms of consent generate what sorts of obligations and what conditions make consent morally and legally significant.

Consent is fundamental to social contract accounts of political legitimacy, arising as early as Plato's *Crito,* but most prominently in the seventeenth-century writings of Thomas Hobbes and John Locke. Both Hobbes and Locke based the legitimacy of state authority on the consent of those ruled. For Locke, authority is far more limited and provisional than for Hobbes, who argued that, in the absence of government, rational parties would find life so miserable that they would freely consent to an absolute authority that would secure and maintain order.

In modern moral and legal thought, actual consent—whether express or tacit—is of great importance in determining the force of moral obligations and the validity of contracts. In political thought,

however, hypothetical consent has increasingly played a central role in justifying particular accounts of justice and legitimacy. For example, theorists such as John Rawls imagine idealized situations in which parties must choose binding terms of social cooperation; the legitimacy of these terms is grounded not in anyone actually accepting them, but in the claim that agents with certain characteristics, under carefully specified conditions, would freely choose them.

These characteristics and conditions are important. Consent-based theories of legitimacy and obligation generally agree that consenting parties must be rational agents, capable of understanding moral categories such as right and wrong. We will, of course, often disagree about the substance, scope, and demands of reason and morality, but we must at least grasp such distinctions for our consent to be meaningful. And for consent to confer any sort of obligation, it must meet certain conditions: Consenting parties must be sufficiently informed about the terms they are consenting to, and their consent must be freely given. Disagreement ensues over what counts as sufficient information and what forms of coercion and constraint limit or nullify obligations arising from consent.

Few people, for instance, would argue that a person, forced at gunpoint to accept an exploitative contract, is legally or morally obligated to adhere to that agreement. In such a case, consent does not generate an obligation. But many cases are less obvious: In modern liberal democracies, are we obligated to obey a law that we find, after sincere and informed reflection, to be pointless and offensive, but which has emerged from an acceptable democratic process? If we challenge the law—as conscientious objectors—should we be punished?

Some scholars take a stringent libertarian, even anarchist position on such matters: Political authority is only legitimate insofar as it is grounded in the express consent of those affected by its exercise. Others allow that some actions can be taken as evidence of implicit agreement, but nonetheless emphasize the importance of actual consent, whether express or tacit. Other scholars argue that hypothetical consent is sufficient to confer legitimacy upon basic principles

of political order and that consent is not required for specific laws and policies: So long as there are effective means available for redress and reform, citizens must obey specific laws, which are legitimate if they are consistent with a fundamental constitutional structure that would win the consent of reasonable and sufficiently informed citizens. However, critics wonder if such hypothetical consent can ever really generate actual obligations. Still other scholars suspect that legitimacy and obligation are not ultimately grounded in consent, but instead in the deeper accounts of moral agency and the good life that make consent seem so important in the first place.

CONSOCIATIONALISM

The term *consociationalism* describes a stable democratic system in deeply divided societies that is based on an elite cartel. Consociational democracy can be found in countries that are deeply divided into distinct religious, ethnic, racial, or regional segments, usually considered as unfavorable conditions for stable democracy. The two central characteristics of consociationalism are government by grand coalition and segmental autonomy. Government by grand coalition describes the institutional setting in which representatives of all significant segments participate in common decision making with regard to common concerns, whereas decision making remains autonomous for all other issues. In all respects, consociationalism

contrasts profoundly with majority-rule democracy. While the notion of consociationalism has been known since the seventeenth century, it was conceptualized in the 1960s, in particular by Arend Lijphart and is used today as both an analytical and a normative category. Based on a number of factors, it takes different forms in different countries, and it has become widely criticized.

Profound social cleavages, such as ideological, religious, ethnic, class, or language, are generally accused of being obstacles to the establishment of stable democratic systems. When cleavages are cross-cutting, in the sense that an individual is member of a different social segments, the risk is considered to be limited, as this situation creates pressures that have a moderating effect on social conflicts. If the social cleavages and pressures coincide, however, the chances are rather poor to create stable democratic political systems. But it seemed that such systems did exist and had become stable. The explanation was that elite groups could coordinate in order to avoid conflict if social cleavages were not to be cross-cutting. Generalizing from a number of case studies and elaborating on the term used by a number of studies on African political regimes, Lijphart distinguished in the 1960s four characteristics that should be present in order to qualify for the label of consociationalism. First, there must be a government by coalition, as well as a second element of segmental autonomy, such as federal arrangements that allow for autonomy in policy fields (i.e., education policy for which responsibility lays with the German Länder, or states). Third, proportionality must prevail in the electoral system, but also with regards to civil service appointments and the allocation of public funds. Finally, consociationalism also foresees a minority veto for the protection of vital minority interests.

Whereas examples of consociational democracies can be found all over the world, they developed in Europe in particular. Thus, Switzerland has been characterized as a consociational democracy since 1943, Belgium after World War I, Austria from 1945 to 1966, and the Netherlands from 1917 to 1967. Czechoslovakia was a consociational democracy from 1989 until its partition in 1993. Where

consociationalism has ended, it often did so not because of its failure but because of its success: It worked so well that it was no longer needed. Whereas India since 1947, Colombia from 1958 to 1974, Malaysia from 1955, and South Africa since 1994 can be considered successes from a normative view, Cyprus and Lebanon's experiments ended in civil war. Some scholars actually consider the European Union as a consociational democracy.

Consociationalism is criticized both for its analytical and normative approach. Its large concepts, such as government by coalition or segmental autonomy, do not allow for clear-cut modelization or even definition. Do all elites always cooperate or only on some issues and some arrears? The country classification was another critical issue in the debate on consociationalism, such as the question whether the Swiss society's religious and class cleavages are cross-cutting or not.

However, pure consociationalism and pure majoritarianism are ideal types. Most political systems range between these forms. The conceptualization of consociationalism allows for a better understanding of the large number of nonmajoritarian political systems in comparative politics.

CONSTITUTIONALIZATION

Constitutionalization is seeking to entrench an institution, a law, or a process in a document that has democratic

legitimacy. Entrench means making it difficult to alter the document, generally through some type of super-majority requirement for amendments. Traditionally, a constitution is formed when individuals agree to a common form of government. With constitutionalization, however, it can be individuals, organizations, or nations entering into collective agreements that will ultimately provide some group benefits while limiting individual flexibility.

Constitutions frequently define multilevel systems of governments, such as the Canadian and American federal systems, where the national constitutions define the relationship between national and subnational units of government. Such systems create a sovereign national government along with subnational governments that are sovereign within specified policy and geographical jurisdictions. The result is similar when a number of nations constitutionalize an issue by creating a binding agreement. Once "local" approval for the agreement is granted by all parties, institutions created in the agreement take on a role akin to a sovereign supranational government. As with any constitution, democracy doesn't just have a role when creating the institution, but may have an ongoing role, such as members freely electing the leadership of the organization, members voting on issues akin to referenda, and so forth. As with the United Nations Security Council, such voting may provide veto votes or may differentially weight the vote of some members.

Constitutionalization generally refers to intentional attempts to embed issues within a constitutional framework. This can be done to create consistency on issues across a jurisdiction or across multiple jurisdictions, to limit the flexibility of other lawmakers or administrators, or to afford a long-term solution in a chaotic world. A frequent result is that power is shifted from elected lawmakers and other policy elites toward either elected or appointed judiciaries.

Amendments to existing regimes that already have binding authority may be back-door attempts to embed a solution in a constitution-like fashion. For example, an international trade agreement may be used as a back-door approach to require multiple jurisdictions to abide by certain principles (i.e., opening domestic markets, worker or environmental

protections, and so forth) by virtue of power previously delegated to a dispute resolution process. Current changes in an agreement, in other words, may have entrenched power because of a binding commitment to older parts of the agreement.

Constitutionalization is best described by example rather than abstract definitions. The issues of the World Trade Organization (WTO), morality in the United States, and interjurisdictional dispute resolution thus illustrate constitutionalization in the following paragraphs.

Example 1:
The World Trade Organization

Deborah Cass argued that the World Trade Organization needs a constitutionalized structure, which is democratic and representative. Such a structure could limit the power of member states to decide some matters of national economic interest, and thus would arise the need to ensure democratic legitimacy. Movement in this direction might have serious implications for the future of global economic governance by creating enforceable obligations outside of the direct control of national governments.

A critical argument for constitutionalization in this instance is that some nations have routinely been avoiding their responsibilities under what is currently a voluntary confederal arrangement. Another reason is that it might be possible to create a more significant voice for developing nations, thus appeasing the protesters and rioters at recent WTO meetings by increasing equity.

The European Union (EU) provides strong evidence that such supranational arrangements can develop into significant international forces with strong leadership and decades to mature. The EU also provides ample evidence that the road may be bumpy and discontinuous, and that success will remain tentative rather than assured as dominant actors play their trump card of domestic sovereignty.

Example 2: Morality

Why seek legislation when you can constitutionalize? The Eighteenth Amendment to the U.S. Constitution

is the classical example of seeking to enshrine a moral standard within a constitution. This amendment banned the manufacture, sale, and transportation of all intoxicating liquors in the United States from January 17, 1920, when it took effect, until December 5, 1933, when the Twenty-First Amendment overturned it and decided such laws would be a matter of local decision.

Recent trends in the United States suggest a strong desire to take such an approach with other moral issues, although by nearly all accounts prohibition was a disastrous exemplar. For example, on August 3, 2004, a ban on gay marriage was approved for the Missouri constitution by nearly seventy-one percent of voters. National organizations, such as the Campaign for Working Families and Focus on the Family Action, helped ensure that similar amendments to state constitutions—generally referred to as "ban same-sex marriage" amendments—made it on the ballot in eleven additional states in the November 2, 2004, statewide elections. These amendments were approved in all eleven states, by as many as eighty-six percent of voters.

While this movement was fueled by a Massachusetts Supreme Court decision that same-sex marriage was legal, many of the amendments also prohibit any concept of a civil union or other "marriagelike" legal status for gay and lesbian couples, thus entrenching discrimination in numerous state constitutions.

Example 3: Interjurisdictional Disputes

Why negotiate or work through intergovernmental networks when you can constitutionalize? Recent electoral decisions in Alaska, Montana, Oregon, Michigan, and elsewhere provide ample evidence that in jurisdictions where people have the power of the initiative or referendum, they may seek constitutional-level solutions to intractable interjurisdictional problems. Two clear examples are the legalization of marijuana (frequently limited to "for medical use") and control over the legalization of gambling. In the 2004 elections, sixty-two percent of Montana voters approved the use of medical marijuana. Voters in California and Arizona passed similar initiatives in

1996. As when cities such as Breckenridge, Colorado, approved such measures in the past, it seems likely that federal enforcement agencies will continue to treat medical marijuana use as illegal because regulating pharmaceuticals is federal jurisdiction. An uneasy truce has developed, where those who do not flaunt the use of marijuana for medical purposes are generally left alone.

While the marijuana issue is a local-state-federal dispute that has existed for decades, Michigan voters passed an initiative designed to stop the spread of gambling in the state. This specifically excluded tribal gaming, which is clearly outside of state jurisdiction. This initiative was approved overwhelmingly in 2004 and requires that new gaming be approved by statewide ballot measures rather than by the state legislature. The interjurisdictional element is that a proposed facility could be approved by a large margin in a statewide vote and still be denied if it failed to achieve fifty percent approval in the affected local area.

Consumption

At its most basic, consumption refers to the practice of using up something (a usage that persists in relation to a concern with fuel consumption in motor vehicles, for example). This basic usage does not differentiate between different forms, sites, or behaviors associated with consuming things (both subsistence economies and advanced capitalist societies involve consumption). During the twentieth century, however, its meaning became more identified with the personal consumption of goods and services acquired through market-mediated exchange (ideas of conspicuous consumption and consumer culture, for example). There are three main connections between governance and consumption: consumption as something to be regulated, concepts of collective consumption, and the imagery of individuals as consumers of public services.

Consumption as the Object of Governance

In this market-mediated form, consumption has been the object of various forms of governance. Minimally, it is thought to require the legal apparatus of private property so that things and money can be freely exchanged and to prevent theft and deception. More elaborately, such consumption may require forms of regulation by government or its agents: weights and measures standards, safety standards, forms of licensing of providers and venues, and varieties of taxation. These regulatory processes reflect the problems of market failure and the accommodation of popular protest, as well as providing a funding stream for the development of modern forms of state. In matters of quality, reliability, and safety, market dynamics have proved less-than-satisfactory means of guaranteeing the consumer's needs. Adulterated foods, variable measures, and unsafe products (ranging from toys to financial advice) have created substantial demands for public intervention to regulate the free market. Advocates of the free market have, in turn, called for deregulation and the liberation of entrepreneurial dynamism from the shackles of state regulation.

Collective Consumption

Despite the rise of market-mediated consumption, other forms of consuming have coexisted with it. Both economists and urban sociologists have been interested in collective consumption. For economists, some consumption practices deviate from the model of individualized market-mediated consumption. So, households may act as a collective unit of consumption, or there are "public goods" of various kinds (from national defense to public parks) that are not designed for individualized purchase and consumption. Urban sociology examined forms of public provision (from infrastructure to welfare services) as distinctive patterns of collective consumption and as the focus of political conflict and bargaining.

The concept of collective consumption draws attention to the importance of public provision of goods, benefits, and services during the second half of the twentieth century in particular. These provisions were more or less decommodified—that is, removed from the inequalities of market exchange by being provided as social rights. Public provision represented an alternative and supplement to, and infrastructural support for, market consumption. As alternatives and supplements, public provision served to remedy market failure and redress market-generated inequalities. But public provision also underpinned market-mediated consumption: benefits to create spending power, or infrastructural provision and taxation support for private housing.

Consuming Public Services

Public provision came under increasing attack from advocates of markets in the late twentieth century. Ideological claims about the innate superiority of the market form coincided with sociohistorical accounts of the rise of a "consumer society." From different starting points, a number of political and cultural strands came together to change the relationships between publics and public services toward a more "consumerist" orientation. Creating a more consumer-like relationship in public services was expected to: promote efficiency, create a more personalized or responsive mode of service provision, encourage more

responsible behavior on the part of users of public services, improve the experience of service use, and increase consumer satisfaction. For some critics, the drive toward consumerism threatened to undermine the public or decommodified character of services and benefits by reinstating the dynamics of markets. Such political choices would value profits over service, risk market failure, and reproduce market inequalities.

Constructing consumer choice in public services posed a number of governance issues. Despite the potent appeal of choice, its translation into policy and governance arrangements proved both difficult and controversial: Precisely who gets to choose what? In health care, does the consumer choose the intervention, the place, the doctor, or the timing? Who are the consumers of education—children, their parents, or the community?

Second, a critical condition for consumer choice is the availability of alternatives—at least, excess capacity in a system or the existence of competing providers. Such conditions require funding—either through extra government investment or by systems of copayment, individual "topping up" and the like. They also pose governance problems of how to coordinate complex systems, multiple organizations, and individuated choices (in the absence of the cash nexus of market exchange).

Third, effective choice making is understood to require accessible and adequate information. Most governments have developed systems of performance management and measurement, intended to provide information for citizens as taxpayers and service users. However, such quantitative information may not address the specific choices the user/consumer has to make. In some services, they may remain dependent on professional knowledge and expertise. These have been the established domain of service professionals and organizations—and the rise of consumerism challenges these established concentrations of knowledge and power. The search for stable models of choice or codetermination remains a major challenge for the governance of public services.

Contract Enforcement

Contract enforcement consists of the legal procedures or coercive actions intended to secure the compliance of the parties to the conditions of their agreement. Economic exchange is premised upon the enforcement of contracts, which is a task often performed by the legal and coercive organs of the state. Because contracts are constitutive of capital accumulation and property relations, the enforcement of contracts is a central function of governance for the continuation of economic activity. Where the state is unwilling or unable to enforce contracts, private actors may assume this role, with or without an official mandate.

Main Uses and Theoretical Relevance

The notion of contract enforcement is used by scholars critical of neoliberal economic analysis to emphasize the indispensability of violence-wielding agencies in the construction of markets and the protection of economic exchange. Because the function of contract enforcement is usually fulfilled by organs of the state, such as the courts and the police, discussions around this concept also highlight the centrality of political power in the construction of deregulated, free markets. Where the organs of the state that are officially

commissioned to enforce contracts are unable or unwilling to fulfill this function, other organs of the state or private actors and organizations may assume this role, with or without official sanction to do so. Contract enforcement can be undertaken illegally by organs of the state with coercive, violence-making capacities but without the legal authority to do so. These functions can also be performed by private protection agencies that are legally authorized to dispense coercive violence in the service of their customers within the bounds prescribed by the law. Finally, contract enforcement can be carried out by private agencies operating illegally, such as the so-called Mafia.

Contract enforcement is a contested notion in the debates between institutionalist and neoclassical (neoliberal) economists. Institutionalist scholars accuse neoliberal economists of underemphasizing the role of coercive violence in contract enforcement, which in turn underpins market exchange and property relations. The neglect of institution building necessary for contract enforcement, institutionalists claim, is responsible, in part, for the newly liberalizing economies' failure to live up to the expectations of neoliberal analysts. For example, the idea behind postcommunist reform in Russia was to implement economic reforms first, and perhaps engage in some political institutional development afterward. Another assumption was that the institutions would naturally emerge once the prices are liberalized and the markets are deregulated in general. Institutionalists claim the neglect of coercive organs of the state by the liberal politicians during Russia's transition from planned economy to market economy to be partly responsible for the disappointing performance of Russian economy in the 1990s. Other examples where nonstate or illegal organizations took over the function of contract enforcement include some other postcommunist countries and some African countries.

Following the global restructuring of the relationship between the state and the economy along neoliberal precepts, there was a limited delegation of state's authority as a contract enforcer to legal private agencies, along with an unofficial devolution of the same authority to extralegal public and illegal private agencies. The apparent erosion of some states' monopoly over the uses of violence since the 1970s led some neo-Marxist scholars to speculate that global capitalism has reached an impasse. This new stage of capitalist development is dubbed Mafioso capitalism by its critics for its reliance on extralegal and nonstate agencies for coercive violence in protecting property and exchange relations.

Differences and Changes in the Usage of the Term

The World Bank measures the efficacy of contract enforcement by the number of procedures and the amount of time it takes after the filing of a claim by the plaintiff until the resolution of the dispute between the contracting parties via legal authorities. Different understandings of contracting relationship allow for different theories about institutional origins, development, and change. The main mechanism in neoliberal accounts of contracting that explains the choice of one contract over another is voluntary agreement. The goal in this approach to contracting is to allocate the property under question to the person with the greatest incentive to maximize benefits from that property. Then, the problem appears to be a technical one of structuring incentives in such a way as to allow for this outcome. This approach holds that some factors external to the exchange relationship, such as information asymmetries, technological developments, and changes in the ratio of factor prices, may also influence the expected benefits from contracting. Though neoliberal approaches focus on legal reforms for improving contract enforcement, institutionalists focus on capacity building. Following the failure of economic reform in Russia and in some other postcommunist countries, liberal economists also started to increasingly recognize the importance of institutional capacity building for contract enforcement. References to the rule of law and governance failure are related to the success or the failure, respectively, of enforcing contracts.

CONTRACTING OUT

Contracting out can be defined as formally agreeing with a third party to perform tasks or activities that used to be carried out within an organization. Initially, contracting out, also known as outsourcing, was a businesslike management practice. The term designates a private company's transfer of support activities to a supplier. It permits a company to reduce its expenditure and structural cost by delegating activities that do not form a part of its core function. From this perspective, it is different from subcontracting, which is the practice of a contractor delegating part of its work to subcontractor. For policy analysis, contracting out consists of attributing to a private actor the accomplishment of an activity until then realized by the state or by another public authority. It necessitates the formulation of an agreement between the representative of this public authority and the private contractor. The contractor commits itself to procuring a result in return for a monetary reward. The agreement concerns a single service or can define the way contractors produce this service.

Contracting out is a longstanding practice that predates modern state building and the process of bureaucratization. Several functions or support necessary to the state have tended to be outsourced to private contractors. However, its contemporary form first appeared in the 1970s, when it told a new

meaning. At that time, various governments of Western democracies, particularly the United States and Great Britain, launched policies decreasing public expenditure and the number of civil servants. More recently, even parts of the core activity of the state, defense and military policies for example, have been outsourced. This process illustrates the contemporary reordering of the state and the spread of new public management theory among Western administrative and political elites.

Contracting out raises problems of state sovereignty, the identification of public needs, and evaluation. First, the efficiency of externalization practices implies a best-cost choice among various private candidates. Most often, there are few companies, often even only one company, able to supply a relevant service to a public authority. Second, the identification of public needs apt to be satisfied by a private company is a controversial question. Controversy rises in Western countries about the feasibility and legitimacy of such delegations of public services to private business. In some cases, such as defense activities, the content of core activity is brought into question. Third, evaluation problems reduce the efficiency of contracting out. On one hand, when evaluating the cost of the public service to be externalized, the state can have difficulties isolating and appreciating the economic viability of one of its services. Consequently, it cannot evaluate the economic advantage of such an operation. On the other hand, a state can also have difficulties evaluating its private contractor performances. Contracting out implies a loss of competences by the state that interfere with its capability to estimate service needs.

Another negative consequence that reduces the pertinence of contracting out for public management and control of public expenditure is that it produces financial liabilities for the state, often for a long period of time. From this perspective, it can cause management rigidity, and the impractical nature of reducing public investment in all the sectors of state activity. Contracting out thus becomes a restriction factor of the state's control over its own budget and, more generally, of its ability to decide on future courses of action. Opponents of contracting out accept

that it can initially introduce flexibility but that it can sap state capacity.

CONVERGENCE AND DIVERGENCE

The concept of convergence is used increasingly frequently in the analysis of contemporary governance. In an era of globalization, it is often assumed, increasingly strong selection mechanisms influence the choice and development of governance regime such that they tend to converge over time. In many conventional accounts, heightened competition between states and national economies in an ever-more-integrated global market pit governance regimes against one another in an ever-more-intense competitive struggle. Only those regimes capable of sustaining high growth rates under such conditions will survive and prosper. Over time, through this neo-Darwinian process of "survival of the fittest," the current diversity of governance regimes will be narrowed. The global diffusion of neoliberal governance is often predicted.

Though still deeply influential, this account has increasingly been challenged both theoretically and empirically. This has opened up as an area of considerable controversy the question of convergence, diversity, and divergence. Standard neoclassical models of an open and global economy do indeed predict convergence. Yet other more empirical perspectives, such as the new institutionalism and, in particular, the influential "varieties of capitalism" perspective, claim

to reveal a rather more complex process of dual or co-convergence. This latter account differentiates between liberal market economies (archetypally, the United States and the United Kingdom) and coordinated market economies (archetypally, Germany), arguing that that there is evidence of convergence within but not between each group. This claim is defended both theoretically and empirically (notably by Peter Hall and David Soskice in 2001 and Geoffrey Garrett in 1998). Others claim that even the co-convergence thesis is an exaggeration and that heightened competition between states and national economies has, in fact, served to promote continued diversity and, if anything, furthered divergence in governance regimes rather than convergence.

However, the debate has often been characterized by the rather imprecise appeal to the language of convergence. Indeed, a variety of rather different and often incompatible senses of the term are often conflated. It is important, then, to be clear what the term implies, what it does not imply, and to what it might be taken to refer.

Consider first the definition of convergence. Here we can usefully draw on the important intervention of Torben Iversen and Jonas Pontusson in 2000. Motivated by a clear sense of frustration at the misuse of the term *convergence*, they differentiate helpfully between, on the one hand, the identification of common trends and, on the other, the demonstration of cross-national patterns of convergence. As they make clear, one need not necessarily imply the other. Two states can both adopt neoliberal policies without their governance regimes converging by so doing. As Iversen and Pontusson note, if we consider a quantifiable variable, such as the level of social spending within an economy, it is perfectly possible for that index to move in a common direction in two economies without those economies converging. For those economies to converge, the difference between the values of the variable in the two cases would have to shrink over time; this is by no means guaranteed simply by the identification of a common trend (in this case for the value of the variable to fall). Convergence implies that the rate of change of social spending is greater in the economy characterized by the higher initial value.

The point is, in many respects, an entirely obvious one. Yet however mundane it may seem, its implications

for much of the existing literature are considerable. For instance, evidence of the adoption of neoliberal economic and social policies in a number of contemporary European polities is frequently reported and presented as unambiguous and incontrovertible evidence of convergence. It is not.

A schematic representation may help further to clarify the issue. Figure 1 shows all possible combinations of unilinear trends in a single variable (such as social spending) for two cases over a given time period. Social spending may rise or fall and may do so at a range of different rates. In Scenario 1, social spending falls in the state with the higher initial level and rises in that with the lower level at the outset; despite the absence of a common trend, this is a case of convergence. In Scenario 2, social spending in both states falls, though at a higher level in the state with the lower initial level; despite a common trend, this is a case of divergence. In Scenario 3, social spending again falls in both cases but this time at a higher rate in the state with the higher initial level; this is the only

case in which we see both a common trend and convergence. In Scenario 4, social spending rises in the state with the higher initial value, while falling in that with the lower initial value; here, there is neither a common trend nor convergence.

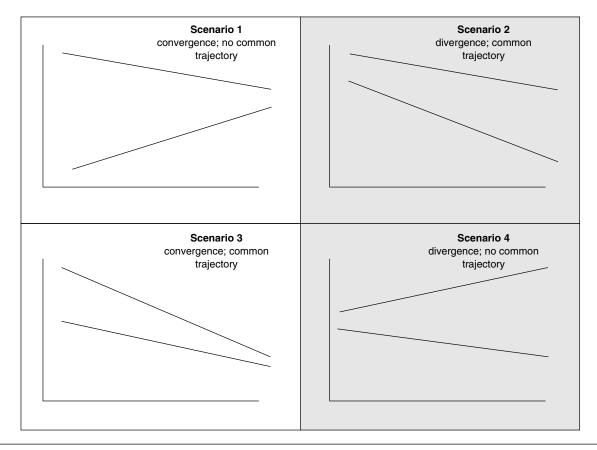
As this hopefully serves to make clear, the identification of a common trend is not only insufficient to demonstrate convergence, it is actually irrelevant to so doing. Whether states converge or not with respect to a particular variable is totally independent of whether they move in a common trajectory. Demonstrating the adoption of neoliberal policies is, then, irrelevant to the question of whether European welfare states have converged with respect to levels of social spending. Indeed, when it is considered that the uptake of neoliberal policies is invariably the strongest and most enthusiastic where existing social models are already the weakest (as in Scenario 2), divergence is more likely than convergence where states move to adopt common policies. This suggests divergence rather than convergence.


Figure 1　　Convergence, Divergence, and Common Trajectories

The converse also applies. Thus, the influential empirical argument (associated most clearly with Geoffrey Garrett) that social democratic regime types in Northern Europe became less distinctive in the 1980s, indicating their resilience in the face of pressures to adopt neoliberal policies is equally flawed. In fact Garrett's demonstration that, during the 1980s, social democratic corporatism became less distinctive as a regime type may demonstrate no more than that the pace of its neoliberalization was somewhat less than that for market liberal regimes. Garrett effectively confuses Scenarios 2 and 4 in the figure—and he is by no means alone in so doing.

If it is important to establish what, precisely, we mean by convergence, divergence, and common trajectories, it is perhaps also important that we are clear about the potential referents of convergence—about what is being said to converge. Conflations and confusions again abound. At least six rather different objects of convergence can be identified in the existing literature on the subject. Though each refers to a different stage in the process of policy making, they are used interchangeably. Thus, it is important that we differentiate clearly among the following:

1. Convergence in the pressures and challenges to which political-economic regimes are exposed (input convergence)

2. Convergence in the policy paradigms and cognitive filters in and through which such pressures and challenges are identified and understood (paradigm convergence)

3. Convergence in the policies pursued in response to such pressures and challenges (policy convergence)

4. Convergence in the ideas used to legitimate such policy choices (convergence in legitimate rhetoric)

5. Convergence in policy outcomes, usually gauged in terms of indicators of policy performance (outcome convergence)

6. Convergence in the process in and through which challenges are translated into policy outcomes (process convergence)

At this point, two additional and important observations need to be made. First, input convergence need not necessarily imply policy convergence, and

policy convergence need not necessarily imply outcome convergence, and neither necessarily implies process convergence. Each is (at least) relatively autonomous of the others.

Second, presenting the potential referents of convergence in this way serves to map out the rather complex and involved process in and through which external pressures are translated into specific policy outcomes. This exercise in process tracing is extremely useful, highlighting the open-ended nature of any process of convergence in either policy or policy outcomes.

It also serves to draw attention to a series of points of mediation, many largely overlooked in the conventional literature:

1. Even where common external pressures and challenges can be identified (such as those conventionally associated with globalization), these are likely to impact in a highly differential manner on different governance regimes.

2. Even where such regimes are similarly exposed to common challenges, the processes of cognitive filtering in and through which such challenges are identified, understood, and responded to may vary considerably, reflecting the prevalence of different policy paradigms and traditions.

3. Even where elite political actors may share common cognitive templates and policy paradigms to reach similar assessments of the policy responses desirable to a given set of external conditions, the policy-making process may serve to militate against the realization of such policy goals as a series of domestic political mediations steer outcomes in particular ways.

4. Even where similar policies are decided upon, the implementation process may lead to significant variation in substantive content.

5. Even similar policies implemented in similar ways may produce divergent outcomes in different institutional and cultural contexts.

With each additional mediation point identified, the likelihood of common pressures associated, for instance, with globalization drive processes of convergence, even in institutionally similar political and economic systems, recedes. Policy making, even in response to common external challenges and commonly perceived

imperatives, is a highly complex and differentiated process characterized by a succession of case-specific mediations. This makes the type of blanket convergence widely anticipated in response to globalization (or, indeed, other generic pressures) in the existing literature less likely than we tend to assume.

COOPERATION

Cooperation is the capacity to work or act with others for mutual benefit. It should not be viewed simply as the absence of conflict or the alternative to competition, but rather the product of a conscious decision by two or more actors to alter their behavior based on others' preferences,.

Cooperation therefore entails a process of negotiation between two or more parties and is generally held by political science to be a desirable aspect of the human condition. However, the propensity for two or more actors to cooperate, rather than conflict or compete with one another, tends to depend upon their calculation of the relative costs and benefits to be derived from cooperation when compared with the dividend from alternative courses of action. The motivation for cooperation remains essentially contested, with the debate focused upon the nature of the necessary or

sufficient political or institutional prerequisites for cooperation to emerge among individuals, communities, societies, and states.

The relative incentives and disincentives for cooperation have been encapsulated by game theory in terms of the notion of the prisoner's dilemma, where two prisoners must decide whether to confess that the other has committed a crime. If the first prisoner confesses that the other is guilty, but the second prisoner stays silent, the first prisoner will win his freedom. If both prisoners blame the other for the crime, both face punishment. If both prisoners remain silent, their cooperation will be rewarded by escaping punishment. The dilemma surrounds the fact that each actor must decide whether to cooperate or not, but without knowing the other's intended actions. Therefore, their cooperation depends upon whether they trust one another to act in a manner that serves their mutual self-interest.

In the field of international relations, cooperation was defined by Thomas Christiansen in 2005 as customary, continued, and potentially deepening interaction on policy issues among states. That cooperation is possible is manifested in the existence of institutions and regimes at a range of levels of governance from the local to the global. The possibility of cooperation, as opposed to conflict or competition, between the rival states that comprise the anarchical global order of sovereign nation states has been disputed among realists, neorealists, and contingent realists, on the one hand, and liberal institutionalists, on the other. This debate has become particularly vigorous following the collapse of communism.

For classical realists from Thucydides to Hans Morgenthau, the principal barrier to cooperation among states lies in the fact that their constant rivalry for power and frequent descent into conflict and war is simply a reflection of the characteristics of the human nature of their citizens. For structural realists, notably Kenneth Waltz, the propensity for conflict and rivalry, rather than cooperation, in human affairs is not attributable to human nature but rather the absence of an overarching political authority above states and the nature of the distribution of power in international politics.

During the post–Cold War era, the realist perspective on cooperation has been divided. On the one hand, neorealists, such as John Mearsheimer, have asserted that there remain strict limitations upon the prospects for cooperation among states arising from the problem of "relative gains." According to this perspective, rival states tend to measure cooperation in terms of their gains relative to those of the competitors, rather than focusing upon the absolute gains that cooperation can generate for all parties concerned. This preoccupation with relative gains is held to have resulted in an international environment characterized by mistrust and uncertainty, and perpetual competition and conflict, rather than cooperation.

On the other hand, contingent realists have challenged the realist orthodoxy that a propensity for competition, rather than cooperation, need necessarily be the logical outcome of rivalry among states. Contingent realists have identified a large number of scenarios in which the national interests and security objectives of rival states can best be accomplished through cooperation rather than competition. They have pointed to the Strategic Arms Reduction Agreements of the early 1990s and the extension of the Nuclear Non-Proliferation Treaty in 1995 as clear evidence that states will engage in cooperation precisely because it enables them to escape the dangers of proliferation and conflict that may arise from the pursuit of maximum advantage.

Neorealists have tended to downplay the importance of international institutions for cooperation, regarding them as the product of the exercise of national interests and the constraints operating upon the international system itself. By contrast, liberal institutionalism has placed a much greater importance upon the role of institutions in general and regimes in particular in helping to promote cooperation. Regimes have been defined by Stephen Krasner in 1983 as where implicit or explicit values, norms, policies, and decision-making measures surrounding actors' outlooks come together in international relations.

While hegemonic stability theory holds that cooperation in global politics will tend to be created by a single dominant political and economic power, and that the maintenance of an international regime to sustain cooperation among states will depend upon the continuing hegemony of that power, liberal institutionalists like Keohane have rejected the thesis that hegemony is either a necessary or sufficient condition from the emergence and maintenance of cooperation. Keohane has asserted that hegemony may promote cooperation, hegemons need cooperation to create and implement rules, but nonhegemonic cooperation is also possible because regimes can be created as the result of shared interests and also because maintaining international regimes is less demanding than creating them.

The process of cooperation has been enshrined in a range of political institutions and regimes that operate at different levels of governance and upon the basis of formal or informal cooperation. As an example of informal cooperation, the Organisation for Economic Co-operation and Development has provided a forum for thirty market democracies to reflect upon and discuss issues that may lead to formal agreements in other domestic or international arenas of cooperation. In a similar vein, the Asia-Pacific Economic Cooperation has provided a forum for its twenty-one members to operate on the basis of nonbinding commitments, open dialogue, and equal respect for the views of all participants. By contrast, and in terms of formal cooperation, the European Community, and later the European Union (EU), has successfully undertaken the transition from cooperation upon the basis of an economic community of six member states to cooperation as a political union of twenty-five member states. However, the demise of the EU's Constitutional Treaty has demonstrated the difficulty of engendering cooperation, even within a long-established framework of cooperation. While certain member states, notably Germany, have wanted the process of supranational cooperation to proceed upon the basis of an ever-closer political union, other Eurosceptic member states, notably the United Kingdom, have wished to proceed upon the basis of cooperation between sovereign member states.

The process of cooperation within the European Union has been progressively deepened through a series of treaties negotiated by the political elites of its member states. For example, the 1986 Single

European Act initiated cooperation in the fields of environmental policy and foreign policy, and introduced a "cooperation procedure" in a total of ten policy areas. The 1992 Treaty of Maastricht duly extended the principle of cooperation in the field of Justice and Home Affairs, while the 1997 Treaty of Amsterdam provided for closer cooperation between subgroups of member states, but abolished and replaced the cooperation procedure with a simplified and extended procedure of codecision. The 2001 Treaty of Nice then developed provisions for enhanced cooperation among member states as part of a broader process of institutional reform.

The Constitutional Treaty of June 18, 2004, was intended to deepen the process of supranational cooperation by replacing all existing treaties (with the exception of the Euratom Treaty) with a single constitution for Europe. For example, although the constitution would have preserved unanimity in vital fields such as taxation, the finances and membership of the EU, and citizenship, Articles I-44 and III-416–423 provided for the establishment of enhanced cooperation between member states within the framework of the EU's nonexclusive competences. However, the prospects for enhanced cooperation have been stalled for the foreseeable future by the rejection of the treaty in the French and Dutch referendums of May and June 2005, respectively. The majority of the "no" votes have also demonstrated the problems that can arise when cooperation among states evolves as a top-down, technocratic and elite-driven process that only retrospectively seeks democratic approval from its constituent populations.

The challenges presented by cooperation are no less problematic at the international and global levels of governance. With its formal establishment on January 1, 1995, the World Trade Organization (WTO) appeared to offer a more-effective model for international cooperation than its older sister institutions, the International Monetary Fund (IMF) and the World Bank. The WTO was established upon the basis of decision making by consensus, rather than the distribution of voting power according to the financial contribution made by each member state. At the IMF, around 60 percent of the voting power is controlled by only 24 of the 184 member states. Furthermore, because the most important categories of voting by the IMF's Executive Board require an 85 percent share of the votes, the United States' allocation of 17.4 percent has provided it with an effective veto over international cooperation. The boundaries of international cooperation have also been limited by the fact that the ten Presidents of the World Bank have always been Americans, while the Managing Directors have always been Europeans. Therefore, the WTO seemed to offer a more inclusive approach to cooperation.

Despite its commitment to cooperation through a consensual decision-making process, the WTO has also encountered major barriers to the deepening of cooperation in the governance of global trade. At its 2001 Ministerial in Doha, Qatar, the WTO committed itself to a "development" round of trade negotiations, to be completed by January 1, 2005. The developing countries among the WTO members were to open their economies to trade in services in return for greater access for their exports of agricultural produce and textiles to the markets of the industrialized economies. The deadline for completion of the Doha Round has had to be pushed back to the end of 2006. At successive biennial WTO Ministerial meetings from Seattle in 1999 to Hong Kong in December 2005, a majority of the WTO's 149 member states have accused a small minority of the richest, industrialized economies of drawing up trade agreements in secretive "green room" negotiations, rather than upon the basis of inclusive and consensual international cooperation. Indeed, the demands for greater transparency and inclusivity in global governance have made the process of multilateral cooperation more difficult to progress.

Further challenges to the capacity of states to cooperate has arisen from the increase in the number of states participating in international institutions and the process of liberalization and deregulation of markets, which has led to a greater emphasis upon competition among states for mobile resources, such as direct foreign investment by transnational corporations. For example, when the IMF was conceived in July 1944 at the Bretton Woods conference, the forty-five states in attendance agreed to create an institution to promote international monetary cooperation. Their

desire was to avoid a repetition of the damaging "beggar-thy-neighbor" devaluations, protectionism, and general economic instability of the 1930s that had culminated in World War II. They readily agreed to establish a multilateral framework for international monetary cooperation based upon fixed exchange rates and political controls on the movement of capital across national borders.

By the mid-1970s, following the move to floating exchange rates and against a background of rising unemployment and inflation, a new neoliberal orthodoxy had emerged to challenge the importance of cooperation for the governance of world markets. This argued that competition in the freedom offered by open markets would provide a discovery process through which entrepreneurs could discover profitable opportunities for innovation in the provision of goods and services. Consequently, states should compete to build the most effective institutions to govern the market by removing the barriers to the movement of capital that had previously formed the basis for international monetary cooperation. Moreover, with the quadrupling of the membership of the IMF and World Bank to 184 states, the process of successfully negotiating a new framework for international cooperation has become increasingly challenging.

However, the importance of market competition, rather than political and societal cooperation for prosperity, has been challenged by Francis Fukuyama. He has contended that social capital—how people work together for common goals—has become significant to economic life and most areas of social existence. According to this thesis, wealth creation appears dependent upon trust and cooperation rather than the simple pursuit of individual self-interest. It is the presence and active cultivation of this capacity to cooperate that can account for the successful industrial organization and economic performance of Japan during the postwar decades and the more recent rapid industrialization of the East Asian "Tiger" economies.

Therefore, despite the manifold challenges to international institutions and the importance of competition for trade, finance, and investment, cooperation remains a vital objective for those who contend that security, prosperity, and justice are worldwide public goods, not dictated by any one country or as a consequence of a country considering its interests but, rather, that they should be provided internationally and interdependently.

COOPTATION

Cooptation is a process whereby organizations incorporate dissenting elements into their leadership or policy-making structures in order to reduce environmental uncertainty or to mitigate threats to the survival or success of the organization. The internalizing of adversaries or adversarial elements can be either symbolic, having no significant effect on outcomes or processes, or can result in goal displacement, which occurs when group resources are deployed for purposes other than those for which they were originally

intended. Cooptation has been examined from two perspectives: from the perspective of state or policy-making bodies, as well as from the viewpoint of challengers to the state, in particular, social movement organizations.

From the perspective of the state, cooptation is typically seen as a rational and adaptive process that helps ensure the power of the dominant leadership. For instance, the Russian government designed its privatization process in a manner that passed most of the country's wealth to a power elite in order to create incentives for elites to support the transition from central planning to a market economy. Cooptation was also used to introduce the welfare state into Otto von Bismarck's Prussia. In contrast, much of the literature on social movements has focused on how social movements are able to gain access to the state or coopt it. This literature also examines how interactions with the state can both bolster movements' chances of success, as well as lead to internal dissention, goal displacement, or ideological shifts.

An organization's ability to engage in cooptation or to become coopted is largely a function of the network of relationships in which it is embedded, as well as the internal structure of the organization. Governments or agencies that have dense and overlapping ties to the organization that they are attempting to coopt are more likely to be successful at cooptation. In contrast, if the adversarial group has a high level of solidarity or internal processes, rules, or procedures that prohibit collaboration with nonaligned organizations, cooptation is less likely to occur. Hence, both the internal structure of an organization, as well as the network of organizations in which it is embedded, influence the probability of cooptation.

The concept of cooptation has been successfully deployed in order to understand governance in Eastern Europe and the former Soviet states. By gaining a better understanding of the conditions that enable and constrain cooptation, insight into patterns of governance in conditions of uncertainty can be ascertained.

COORDINATED MARKET ECONOMY

According to the approach laid out by Peter Hall and David Soskice in their research on capitalism, coordinated market economies (CMEs) are national economies that display a high share of nonmarket institutions in the governance of company relations. Focused on long-term outcomes, coordination among firms takes place largely through nonmarket means, such as extensive relational or incomplete contracting and network monitoring based on the exchange of private information inside of networks. These mechanisms of company governance tend to differ from those in countries that the authors describe as liberal market economies (LMEs), that is, systems in which competitive market arrangements are much more prevalent.

In each type of economy, strong complementarities exist between institutions from such realms as industrial relations, vocational training and education, corporate governance, interfirm links, and internal company relations. Conceived as tightly coupled institutional systems within which the presence of one institution increases the returns from another, both CMEs and LMEs endow their constitutive firms with a comparative institutional advantage for particular production strategies. While LME institutions provide an edge to service-sector companies and the establishment of new industries, CME institutions have proven particularly adept at supporting companies in mature industrial sectors (e.g., machine tools or automobiles). CME structures are most prevalent in Germany, many other continental European countries (Austria and Switzerland, the Benelux, and Scandinavia), as well

as in Japan. In contrast to the successes of LMEs in radical innovation, CMEs tend to be better in incremental innovation, which is sustained by large skill and capital investments in specific technologies and long-term relationships among economic actors.

The distinction between coordinated and liberal market economies is the most recent embodiment of a long-standing research tradition that has attempted to account for the distinctiveness of national models of capitalism among the advanced industrialized countries. Hall and Soskice's focus on the firm as a strategic actor contrasts with earlier literature that sought to explain national differences in economic structures and performance through national cultures, relative state strength, and the degree of corporatism in state-society relations. The authors claim to provide microfoundations for macrodivergences across economies by embracing the assumptions of the new institutional economics. While other contributors to the literature on the varieties of capitalism have questioned the need to provide microfoundations, the success of the authors' attempt to do so and the appropriateness of the LME/CME macrodistinction shows that the importance of the authors' contribution remains uncontested.

Germany is often invoked as the ideal typical case of coordinated market economies. Many areas of the German economy feature institutions that promote nonmarket coordination between and within the companies rather than market institutions that require companies to pursue unilateral strategies. For example, high levels of patient capital are available through a system of company finance dominated by universal banks. Labor market institutions, such as collective wage bargaining, codetermination, and restrictions on layoffs, promote labor flexibility internally within the company at the expense of external labor market flexibility. Rather than individual skill acquisition in the market, public tertiary education and apprenticeship schemes administered collectively by employers and unions are widely available.

COORDINATION

Coordination between individuals, organizations, and institutions is an essential element of governance. Because of the complexity and functional differentiation of modern societies, there is hardly any task that can be accomplished by one individual or even one single entity. Coordination occurs on various levels and various forms: among federal, state, and local agencies, between public agencies and private industry, or in coalitions of national and international nonprofit organizations. These entities, or actors, are dealing with all kinds of social, cultural, economic, environmental, and political matters. Coordination to address those large and small issues can be ad-hoc and as simple as a conversation over the phone or can take place in a long-term, complicated process involving working groups and planning meetings. There can be informal coordination between just a few decisionmakers over lunch or formalized coordination—for example, through a memorandum of understanding (MoU) or through the bylaws of a joint venture. It can take place in a permanent arrangement such as a Parent Teacher Association (PTA) or in one set up temporarily just for one particular purpose, such as an emergency operations center (EOC) for disaster relief.

The term *coordination* itself is often used synonymously and interchangeably with other concepts such as cooperation, collaboration, and communication. In everyday governance practice, the difference may be only a semantic one indeed. They all refer to the process of interaction among more or less diverse stakeholders in the interest of a common goal. Yet, the idea of coordination of actors or resources generally conveys a more abstract notion

and has considerable theoretical significance in political science.

Three Modes of Coordination

Governance theory distinguishes between three basic forms, or modes, of coordination: markets, hierarchies, and networks (sometimes also referred to as communities). There are some fundamental differences in how these modes of coordination work. The mechanism through which markets function is price—it balances between supply and demand and between sellers and buyers. Hierarchies function because of command and control—it links subordinates and superiors. Networks, on the other hand, rely on trust—they connect members that do not have a clearly defined relationship and may not even have a direct incentive to cooperate. The principles underlying coordination are different as well: In hierarchies, it is centralized authority; in markets, it is dispersed competition; and in networks, it is spontaneous solidarity.

The analytic distinction between the different modes of coordinating actors and resources is as follows: In a market, the actions of competitors are supposed to be independent because no one, singular action can have a traceable effect. In a hierarchy, on the other hand, the actors are bound by hierarchical coordination that makes their choices asymmetrically predictable, depending on the structure of legitimate authority and coercive capability. In a network, actor preferences and choices are interdependent, based on shared norms and jointly produced outcomes.

The first mode, coordination by way of markets and price, is the most frequent coordinating mechanism among private actors—between two individuals, between consumers and producers, and within companies and firms. Economists have long examined coordination through markets, from Adam Smith's eighteenth-century writings on corporate self-interest, to rational actor assumptions, to transaction cost models. But markets are just as important for the functioning of public agencies and governments. In effect, markets and prices have a coordinating effect whenever resources are allocated and whenever the conditions for this exchange are negotiable. The resources can be people, goods, or information, and the costs of exchange can be measured both in monetary and nonmonetary terms.

The importance for governance lies in the fact that, ideally, free markets are assumed to produce an optimal level of social welfare for everybody involved, also called a Pareto optimum. A Pareto-optimal outcome is achieved when one individual's welfare cannot be increased without decreasing someone else's and vice versa. With price being the mechanism through which resources are allocated in the marketplace, a welfare-optimizing, Pareto-optimal price would be the ideal form of coordination for individuals and society. Unfortunately, real markets often do not have the ideal conditions necessary for achieving a Pareto optimum. In reality, there are a large number of goods for which there are no functioning markets (public safety or clean air, for example). There is no perfect competition, either—in part because of incomplete information, and in part because of institutional conditions that lead to monopolies or oligopolies. In addition, transaction costs are often significant and, thus, skew the actual price. All these factors contribute to markets and prices being imperfect and, thus, insufficient for being the sole mode of coordination.

The second mode, coordination by way of hierarchies and authority, is most often associated with public actors—local, state, and federal agencies; the executive, legislative, and judicative branches of government; and nation-states. Authority defined as legitimate power of political entities is indeed the traditional domain of political science—from Plato's rules for the Greek polity, to the *Federalist Papers* on the Constitution of the United States, to modern theories of international relations. That authority can be personalized, such as a traditional ruler or charismatic leader, or institutionalized, such as in a bureaucracy or a legal system. However, hierarchy and power are equally relevant for coordination between nonstate, nonpublic actors.

This is obvious when thinking about the relationships among family members, where there is usually an adult in charge of coordinating the rest of the family and their contributions to the family unit.

Hierarchies are also the basis of most companies, as evident in horizontal and vertical organization charts. Even with new forms of coordinating the division of labor and the flow of money and goods within firms, those so-called flat hierarchies are still just that—hierarchies. Employer-employee relationships are also dominated by a difference in power. On the individual level, virtually all companies have a system of supervisors that defines responsibilities and directs the work process. On the aggregate level, the collective bargaining agreements between unions and industry representatives still coordinate vital interests of large parts of society.

The third mode, coordination by way of networks and trust, has gained considerable attention in governance research and practice because it seems to provide a framework to explain instances of coordination between individuals and in society that the logic of markets and hierarchies does not capture.

The research interest is focused on understanding how coordination exactly works in the absence of a functioning marketplace or a centralized authority. In general, it can be said that in order for coordination to happen through networks, there are three main prerequisites: First, members in a network need to be linked through a common interest or goal. Second, they have to be able to communicate and share information among each other related to the common goal. Third, members in a network need to be sufficiently confident that the other members are working in that common interest. That common goal can be a certain project or product, a particular policy or piece of legislation, or any other collective endeavor that one single entity could not achieve by itself. Such network structures may be based on familial or friendship ties, or they may arise from administrative decrees, legislation, or explicit agreement. They may also arise from repeated interactions among actors that are not connected other than by a common goal or interest. If and how such repeated interactions evolve into stable and efficient arrangements is examined in game theory. There are several main types of coordination games and an almost infinite number of iterations. In a conflict-free pure coordination game, the actors are aligned in a Nash equilibrium (named after John

Nash, in game theory, a set of strategies, one per player, where no player has incentive to change actions) and achieve coordination with minimum effort and high payoff. In a so-called battle of the sexes game, on the other hand, actors might chose conflictive strategies even though they maintain a common interest overall.

The practical importance is because problem solving in a fast-changing society and a globalizing world relies on a multitude of actors—from individuals to organizations to institutions. Policy issues, such as improving schools, are often taken on by small-scale, grassroots groups that coordinate activities among residents on the local level. Another example is private-sector infrastructure providers, such as energy distributors that coordinate their services across regions. On the national level, associations are a ubiquitous means to coordinate interests of large sections of society. There are highly organized labor, industry, trade, and professional groups alongside small, grassroots initiatives—a total of more than 300,000 registered nonprofit associations in the United States alone. Internationally, states coordinate in various bodies to address global concerns, such as environmental degradation or human rights. The most prominent multilateral forum is the United Nations, but there are numerous arrangements, such as standards setting organizations, where not only states but also private actors cooperate.

The role of coordination can be exemplified using the case of partnerships among regional actors and using the case of cooperation among private actors. These cases illustrate the conditions for evolution, stability, and change of coordinating institutions.

Collaboration in Regional Partnerships

In modern societies, the land is divided up into a plethora of geographical and functional units, some of them independent, some overlapping, and some almost identical. There are counties, cities, states, countries, and military and congressional districts. In addition, localities in the United States and other countries are defined—or define themselves—as regions, zones, and

urban and metropolitan areas. While the first are about coordinating jurisdictions—local, state, and federal— the latter are about coordinating stakeholders—public, private, not-for-profit, and even international. They are populated not only by people but by organizations: partnerships, initiatives, alliances, forums, roundtables, coalitions, and networks.

With this abundance of arrangements and configurations, coordination among the actors becomes imperative. At the same time, a clear designation of authority and responsibility is becoming more and more complicated. In fact, it is often this ambiguity of an uncharted territory that spurs the formation of a coordinating institution.

Coordinating institutions thus bridge gaps that are left by even the most elaborate federalist structures and divisions of power within and among governments, and between the public and private sectors. Indeed, many of the most urgent coordination needs, such as disaster response, regularly cut across the boundaries of hierarchical jurisdictions and are interorganizational, intersectoral, interstate, and international in character.

Two broad types of institutions can be distinguished that coordinate public-private governance efforts:

1. Institutions that are established to perform functions or take over certain powers from another level of public or private authority. The most prominent examples are the so-called Metropolitan Planning Organizations (MPO). In 1962, federal highway and transit legislation required the establishment of planning bodies in every urbanized area in the United States to ensure continuing, comprehensive, and coordinated efforts when it became clear that the construction of major transportation projects cannot be isolated geographically or functionally, but needs to include local and state authorities, as well as transit owners and operators. Currently, there are more than 340 such MPOs.

2. Institutions that are established as voluntary collaborations of actors that address problems using their own resources. The traditionally strongest section of this type is comprised of community and economic development corporations and executive-level forums.

Many of those corporations were founded in the 1970s in response to the decline of inner cities and old industrialized areas. As such, they are often led jointly by county and city officials and business representatives through the chamber of commerce, while others still retain a smaller, grass roots community focus.

In the absence of a defined marketplace or a centralized authority, coordination through either form of regional networks depends on the possibility of no hierarchy whatsoever. However, there is still considerable skepticism that governance through pure network coordination can be sustained without some last-resort backup of some authority. The trust among actors in network arrangements may not be sufficient to meet the accountability and reliability requirements in making decisions for most governance issues.

Cooperation Among Nonstate Actors

While traditional political science, with its emphasis on the public sphere, does not pay much attention to the roles and responsibility of nonstate actors, governance theory is defined by its inclusion. Thus, the question of effective and equitable coordination among those actors becomes central.

Governance through coordination by communities, clans, and associations is also referred to as self-governance. Self-governance requires collective action, which entails the ability to organize interests. It is presumed to be low in large populations, especially if the interests are heterogeneous and of relatively low priority to the individual. This is why, for example, consumer interests are generally harder to organize than those of producers.

Another instance of coordination is government's self-interests. It describes the genesis and organization of interest associations and their role in balancing markets and states. These types of contract-based collectivities are characterized by some degree of symmetry in their respective resources, especially in their capability for representing the interests and controlling the behavior of their members (and, where necessary, outside mavericks), and an effective monopoly in their status as intermediaries for a given class, sector, or profession.

From a normative point of view, self-governance and private interest government can only claim equivalency to hierarchical coordination through states if the results do not harm the common good. Because private interest government cannot employ the state's authority, it has to rely on the stakeholders' consent in order to be effective. This is especially crucial if the institution regulates problems that do not only affect its members, but also external groups and individuals.

Conclusion

As demonstrated in the discussion and the examples, all typical modes of coordination—hierarchy, markets, and networks—are equally relevant in governance practices on all levels. There is no neat distinction that would have all private actors coordinate through markets and price, all public actors coordinate through hierarchies and authority, and all communities coordinate through networks and trust. Individuals, and public and private organizations and institutions, in modern societies rely on all three modes to make decisions and achieve shared goals. Given the ubiquity and frequency of such decision-making processes in everyday life, it is thus important to be able to distinguish the mechanisms and principles, as well as the practice of coordination, for governance to be effective.

CORE EXECUTIVE

A core executive is a network of institutions and informal practices that endeavors to coordinate government policy. Theories of governance often draw our attention to the diverse organizations that are involved in the formulation and implementation of public policy. These organizations often have divergent motivations, visions, resources, and time horizons. The core executive consists of those institutions that seek to integrate government policies by negotiating with, and arbitrating between, such organizations. It is, however, understood as a fragmented network rather than a unitary agent.

The Anglo school of governance developed the idea of a core executive within its general account of a differentiated polity. The big contrast here is that between the differentiated polity and the Westminster model of British politics. The Westminster model includes a strong executive composed of the prime minister and cabinet. In contrast, the concept of a core executive points to a more fragmented view of the executive, which is also seen as being characterized by weakness as much as strength. The concept thereby contributes to a general account of a differentiated

polity that is composed of various interdependent departments and agencies.

Core executive studies have developed in two main ways. First, the concept has been used to describe states other than Great Britain, especially states that have a cabinet government. Public-sector reforms, such as contracting out, typically result in multiple governments, departments, and agencies being involved in service delivery. As a result, the executive has often become fragmented and also increasingly focused on issues of coordination. The key features of the core executive thus appear to have wide applicability. Second, the concept has been theorized in terms of meanings rather than functions. Originally, the core executive was defined functionally in terms of the need to secure coordination. The process of fragmentation was understood, likewise, as one of differentiation into more and more institutions, each of which performed a discrete function. More recently, the core executive has been conceived as being composed of a number of practices with fuzzy boundaries. These practices are contingent and contested. Actors within them interpret them and try to mold them in different ways in large part because they attach different meanings to them.

CORPORATE CODES OF CONDUCT

Corporate codes of conduct (CCC) relate to codified sets of ethical standards to which corporations aim to adhere. Commonly generated by the corporations themselves, such codes vary extensively in design and objective. Crucially, they are not directly subject to legal enforcement. In an era acutely aware of the dramatic social and environmental effect of corporate activity across the world, such codes of conduct have become the focus of considerable attention.

A Wider Corporate Agenda

Strictly speaking, there is no fixed consensus on what CCC should cover. Stated objectives generally relate to the particular concerns of the corporation, and authors are likely internal managers and serving consultants (although sometimes in consultation with nongovernmental organizations (NGOs) and the UN's Global Compact). Accordingly, the codes are produced in numerous formats, ranging from detailed best-practice guidelines on social and environmental issues to broad proclamations by the corporation to uphold a range of values (such as the recognition of human rights). A familiar theme is corporate social responsibility (CSR), introduced to promote the idea that corporate activities should, at the very least, avoid disruption to the wider society and preferably generate positive effects. Examples of CSR practices include the preservation of the environment through low pollution and energy-efficient measures, the production of merchandise that is recyclable and biodegradable, and the promotion of uniform treatment of employees across labor markets, thus ensuring acceptable working conditions irrespective of local market standards (such as the refusal of child labor).

Given the formidable power of corporations and the profit motives that shape their priorities, questions remain as to the degree to which they will genuinely prioritize socially responsible behavior and facilitate stakeholder input in corporate governance. The corporate sector's most prominent response to these issues is CCC.

Advocates of CCC argue that it is in the interest not only of society to harness at least some of the inordinate wealth and power that corporations wield and reorient it toward societal benefit, but that it also makes good business sense. Motivated by the primary corporate objectives of minimizing risk and enhancing returns, the corporation seeks to project an attractive

public image and increase shareholder investment. Codes of conduct that prescribe ethical behavior are deemed to positively influence purchasing decisions and thus boost shareholder profit and secure new investors. They are seen as a way to mainstream ethical concerns into the core of business procedures. However, the efficacy of such codes depends upon their reliability as a gauge for actual corporate behavior and whether stakeholders (such as consumers, governments, advocacy groups, and unions), as well as investing shareholders, can rely on their accuracy. Central to the credibility of CCC then is comprehensive monitoring, enforcement, and transparency of corporate conduct. The corporate sector has long resisted the call for tighter centralized regulation of its activities, claiming that this would unacceptably reduce competitive capacity and depress financial growth. Instead, there is an increasing trend to produce publicly available CCC and related CSR reports for the inspection of the public and shareholders alike. Certainly the last few years have seen a number of major corporations adopt this strategy, including McDonalds, GAP, Mattel, Hewlett Packard, Dell, and IBM.

CCC in Question

Symptomatic of the criticisms leveled at the notion of CCC is the claim that they are merely an astute public relations exercise and there is, in fact, a wide chasm between rhetoric and reality. Seemingly generous gestures, such as the donation to "good causes" of £57million by Shell and £50 million by BP in 2004, for example, are seen as postgame philanthropic strategies aimed at sanitizing their reputation as industrial polluters.

Reports of corporate malpractice from NGOs, such as Oxfam and Amnesty International, argue that CCC, including CSR, is at best peripheral, exerting little influence over companies' core business activities. Certainly CCC and CSR reporting is still relatively scarce. In spite of notorious scandals, from General Electric in the 1980s through to Enron and WorldCom in the early 2000s, only between 1,500 and 2,000 businesses currently produce such material—a small proportion of the global total. It is argued, moreover,

that while the risk to reputation is a compelling reason for high-profile companies like Nestlé or Nike to produce CCC, the vast majority of companies largely unknown to the general public (irrespective of their impact on society) are not subject to the same rationale. Many "behind the scenes" corporations and small- and medium-sized businesses may have much looser connections with stakeholders and are instead motivated by the idea that "value for money" is related to baseline costs and prices unencumbered by the "extra costs" of social considerations.

Moreover, critics hold the view that corporations often give the impression that they are self-regulating bodies open to public scrutiny and yet, despite the apparent "institutionalization of ethics" in the form of CCC, they are seldom subject to detailed enquiry. In a voluntary framework, it is reckoned that corporations are more likely to publish self-congratulatory statements, rather than the hard data that would enable stakeholders to correctly assess corporate operations. Subsequently, it is argued that only legal measures obliging corporations to disclose the relevant material will establish a true incentive for genuinely responsible corporate behavior.

There is little doubt that corporations are vitally important social, economic, and environmental actors and that CCC have radically improved the quality of dialogue between corporations and stakeholders. However, the degree to which CCC transform fundamental business practices remains an open question.

CORPORATE GOVERNANCE

Corporate governance refers to the way that companies are governed or run. Corporate governance is important because it refers to the governance of what is arguably the most important institution of the capitalist economy. Johnston Birchall argues that it is useful to focus on three main issues when considering how organizations are governed. First, which individuals or groups are provided with membership rights. Membership rights might only be given to one class of people. The shareholder system of corporate governance is probably the most prominent example of this approach within the corporate realm. In these organizations, membership rights are only provided to those who supply financial capital to the firm. Membership rights might alternatively be provided to more than one class of people or groups. In the corporate arena, these bodies are usually said to have a stakeholder system of corporate governance. Alongside shareholders, typical stakeholders include employees, members of the local population, representatives from supplier firms, customers, and local government.

Second, it is valuable to examine the content of the rights provided to members. Two broad sets of rights are of significance here. On one hand, it is useful to focus on the precise character of the rights members enjoy over governance. For example, do members only have a right to be consulted about the direction of corporate policy or are they allowed to make decisions alongside managers? On the other hand, it is important to examine the rights over the surplus generated by the organization. Not-for-profit companies do not permit any part of the surplus to be distributed to members. For-profit firms are allowed to distribute the surplus to members, usually in the form of dividend payments.

Third, it is useful to study the modes of representation available to members. Direct representation might be used to represent members' interests. Members might vote directly for a representative on the board of governors. Indirect representation occurs when organizations are used to represent members. For instance, a consumer council might be used to represent the views of customers. Proxy representation

occurs when a self-appointed board is used to represent the stakeholder constituency.

Shareholder Governance

In liberal models of capitalism, such as Great Britain and the United States, shareholder governance is the dominant company form. On this model, companies exist to serve the interests of shareholders. Shareholders are deemed to be the owners of a firm, which means that they are supposed to enjoy rights over governance as well as the surplus generated from the firm. One prominent justification for shareholder ownership resides in risk-based considerations. This argument insists that having an efficient allocation of risk within a firm is essential for overall efficiency. The argument continues that shareholders are better placed at absorbing risk than other stakeholders. By holding a diverse portfolio of shares in different companies, shareholders can spread the risks associated with a specific company (such as the risks associated with capital investment projects) in ways unavailable to other stakeholders. Gaining an efficient allocation of risk implies that shareholders should be charged with handling risk. Shareholder ownership guarantees that shareholders become the bearers of the risk of a firm.

Shareholders are not a homogenous body of individuals, but instead exhibit different characteristics. From a governance perspective, one important difference is that between institutional and noninstitutional shareholders. The former refers to financial bodies—such as pension funds—that purchase shares in companies. Financial institutions often display a concentrated pattern of shareholder ownership, owning substantial amounts of shares within a particular company. Noninstitutional shareholders are individuals such as members of the public or staff that buy shares in companies. Noninstitutional investors typically hold small amounts of shares. Share ownership among noninstitutional investors tends to be dispersed among a wide range of individuals.

In the 1930s, Adolf Berle and Gardiner Means argued that the nature of the rights that shareholders enjoyed changed importantly during the early stages of the twentieth century. In particular, during the

nineteenth century, those who supplied financial capital to a firm also tended to be those who ran the firm's operations. Berle and Means argued that this tradition of owner management changed as firms grew during the twentieth century. Ownership lost control as those individuals who were thought to be owners were no longer the same people as those who ran the operations of the company. Shareholders delegated decision making to a set of managers who are supposed to act in the best interests of shareholders.

Although there are grounds for believing that the nature of ownership changed during the opening stages of the twentieth century, it is arguable whether this signifies the divorce of ownership from control. The principal reason for this is that control rights are perhaps properly seen as part of ownership, so what transpired was not the splintering off of control from the concept of ownership, but rather a change in the relationship between different components of ownership (relating particularly to rights over surplus and control). Nevertheless, important changes in the nature of shareholder ownership did seem to occur, whether or not it is accurate to refer to this as a separation of ownership from control. For many observers, this change gives rise to the key issue of corporate governance, namely how to ensure managers act in the best interests of shareholders. In particular, managers and shareholders are assumed to value different things. It is usually thought that shareholders want to maximize profits, while managers seek simply to satisfy their personal goals. The argument continues that as executives are responsible for the daily operations of firms, they will pursue their private goals rather than the goals of the shareholders. In the literature on shareholder governance, much attention is devoted to trying to resolve this agency problem. For some commentators, the key is to have a well-functioning market for corporate control. On this view, the threat of takeover from a different firm puts pressure on an incumbent set of managers to maximize profits. If executives are not maximizing profits, then the firm will be subject to a takeover bid from a firm that sees an opportunity to make money. The bidding firm could replace the incumbent directors with a new set of managers that will maximize profits. For some, the

mere threat of a takeover is enough to ensure that managers maximize profits.

Other commentators are more skeptical about the value of this market discipline. Critics, for example, allege that takeover activity is not necessarily motivated by a desire to maximize profits (and so meet shareholder objectives), but other considerations (for instance to maximize the size of a firm). An alternative to relying on the market for corporate control is to focus on the internal governance of companies. Emphasis is placed on encouraging more active shareholder involvement in the firm. For example, the British government has looked recently at proposals that would allow shareholders to vote at annual general meetings on the pay packages of executives. This is intended to address shareholder disquiet at cases in which managers have awarded themselves large pay increases, even though this has not gone alongside improved corporate performance.

The attempt to encourage shareholders to monitor managers more actively raises the issue of what sort of representation is available for shareholders. Shareholders might be allowed to elect a representative on the committees that help set executive pay. Differences between shareholders may be important for the nature of any proposed institutional change. It is probably easier to motivate those with concentrated shareholdings to monitor managers than those who hold small amounts of shares. Concentrated shareholding is less prone to free rider problems than dispersed patterns of shareholding. This means that institutional shareholders might be better placed than small investors as monitoring managers.

Stakeholder Governance

A string of high-profile corporate failures in liberal models of capitalism, such as Great Britain and the United States, has fueled attempts to reform the shareholder governance model. Enron, Polly Peck, and Mirror Group pensions have all played their part in stimulating this reform agenda. An important part of the reform effort focuses on trying to make shareholder governance operate more effectively through a combination of governance reform and enhancing the

market for corporate control. However, a different strand of reform activity focuses on replacing shareholder governance with an alternative stakeholder approach. Many of those that advocate stakeholder governance are on the Left of the political spectrum. For much of the twentieth century, socialists and social democrats did not pay much attention to issues concerning how firms are governed and run. Although there were figures that did develop policies toward corporate governance, for the most part these efforts were overshadowed by the emphasis that the rest of the Left placed on common or state ownership as the way of achieving socialist goals. The collapse of state socialism in the former Soviet Union and Eastern Europe during the late 1980s and early 1990s helped alter all of this. Many lost faith in state ownership and came to accept that there is no viable alternative to capitalism. However, most remained critical of capitalism and believed that the task now was to create a more just and efficient form of capitalism. In places such as Great Britain, the reform of shareholder corporate governance was one of the main ways that social democrats tried to create a new model of capitalism.

A variety of rationales are advanced in favor of stakeholding. Some put forward efficiency arguments. John Kay suggests that the relationships that managers develop with stakeholders endow the firm with social capital that helps minimize transaction costs. Moving beyond a shareholder approach increases the social capital that is generated and so allows for a greater reduction in transaction costs that are associated with a shareholder approach. A greater reduction in transaction costs points to greater efficiency gains under stakeholding. Some observers use the sorts of risk-based arguments used to justify shareholder ownership to press the case for other stakeholders. For example, Margaret Blair argues that shareholders are not the only people who take on risk within a firm. Employees are bearers of risk because they develop firm-specific skills that can inhibit their mobility in the wider labor force. As the fortunes of workers are tied in to the fortunes of their company, staff are susceptible to risk. Employees should be given governance rights in recognition of the risks they face.

Others develop ethical justifications for stakeholding. Some say that the power exercised by a firm provides a case for those that are affected by this power to have some degree of control of the firm's operations.

Public Services

The Left has not confined its attention to advocating reforms to those organizations that inhabit the marketplace. In places such as Great Britain, stakeholder ideas have also been applied to the sphere of public services. Stakeholding surfaces in policies such as foundation hospitals. The best performing hospitals in the National Health Service have been allowed to apply for foundation status. Although the funding for these hospitals continues to come mainly from the public's purse, these hospitals enjoy considerable local autonomy from central control. These hospitals provide membership rights to a range of stakeholders. Those entitled to become members are those individuals that belong to the population served by the hospital (the public constituency), people that have attended the hospital as a patient or a career of a patient within a time period specified by the constitution (the patient constituency), and those who have an employment contract with the hospital (the staff constituency). In addition, membership rights are provided to those that perform functions for the hospital other than under an employment contract. This category includes those that belong to a Primary Care Trust, local authority or authorities, or a university whose dental or medical schools are affiliated with the hospital.

Foundation hospitals have a board of governors and the members previously cited have a role in picking these governors. The public and patient constituencies are responsible for choosing more than half of the governors. The staff constituency chooses at least three members of the board of governors. A Primary Care Trust, local authority, and university each choose at least one of the governors. Furthermore, a body seen as a partnership organization within the hospital's constitution may also choose a member of the board. In relation to rights over surplus, no members of the foundation trust have rights over the surplus.

The mode of representation within foundation hospitals is through a mix of elections and direct appointment. The public, patient, and staff constituencies each elect their representatives on the board of governors. The Primary Care Trust, local authority or authorities, university, and partner organizations each appoint their own representative on the board of governors. Governors serve three-year terms and are allowed to stand for office again once their term ends.

Criticisms of Stakeholding

The emphasis on stakeholding has not gone unchallenged. Elaine Sternberg alleges that stakeholding is unworkable and destroys accountability within a firm. Sternberg argues that stakeholders are usually seen as all those who affect or are affected by a corporation. She argues that a key problem is that the understanding can be stretched so that virtually everyone can be presented as a stakeholder. Managers will find it impossible to reach decisions that satisfy all stakeholders because of the sheer numbers involved. Stakeholding is a recipe for managerial paralysis. Furthermore, Sternberg says that accountability can only function well when those to whom the managers are accountable agree on what ought to be the purpose of corporate policy. Under shareholder governance, this is usually assumed to be profit. Sternberg suggests that the stakeholder model fractures this single, clear purpose. Different stakeholders value different ends. Rather than being subject to some overriding organizational goal, managers have to balance stakeholder benefits. As managers cannot be judged against a single purpose, they are effectively accountable to no one. Stakeholding destroys accountability.

Sternberg's criticisms are not the end of the matter, and instead open up a new set of debates. If stakeholding means that managers have to take everyone into account, then there are grounds to believe that stakeholding will be unworkable. However, stakeholding does not necessarily have to take everyone into account. While some understandings of stakeholding may be elastic, not all are. Thus, managers are unlikely to be overwhelmed by the numbers of stakeholders they have to consider. It is true that the cut-off point for those to be considered stakeholders is not easy to fix. However, these difficulties apply to all systems of corporate governance, including those that restrict their attention to shareholders. It is likely that those denied stakeholder status would lobby managers to be viewed as stakeholders. This feature is not unique to stakeholding and also applies to those excluded from shareholder models of the firm.

Stakeholder firms might also be charged with meeting a clear purpose, delivering a specified level of service. For example, foundation hospitals are responsible for delivering health care services to a specified population. Of course, the best way in which this may be achieved may be a subject of considerable debate. But this applies equally to what policies firms have to follow in order to maximize profits. Empirical evidence is needed to see whether or not stakeholding is unworkable and destroys accountability. What can be said is that corporate governance reform is high on the agenda, and there is likely to be a more complex and varied system of corporate governance in the future, as the impact of public service reform and dissatisfaction with corporate failings gathers momentum.

CORPORATISM

Corporatism can be defined as a political system in which selected social and economic groups enjoying a monopolistic status of representation participate authoritatively in the decision-making and implementation processes of public policies. Corporatism and the different approaches linked to it have made the changes in the national and international economic environment one of its central explanatory variables. In particular, postwar corporatism involved the inclusion of organized labor not only at the workplace but also in national politics. Thus, the corporations on which corporatism is based are not large firms, but intermediary associations of individuals or firms in similar position and, as such, competing with one another. In this context, these corporations can suspend competition and are considered legitimate to participate in certain decision-making and implementation processes.

While these empirical processes can be traced back to the middle ages, the theoretical approaches of corporatism date back to the second half of the twentieth century. From the 1970s on, political and social sciences discovered corporatism as a new way to represent sectoral interests and conceptualized it under the term of neocorporatism. It was considered a European anomaly from what had become a predominantly American pluralist theory of interest politics. In many perfectly democratic European countries, interest groups were organized and behaved in ways reminiscent of corporatist systems. This development coincides with a more general analysis in the social sciences of the evolution of national economic systems. However, the high days of neocorporatism research have met with criticism as the technological and international developments increasingly challenged the stable relationships of corporations and the state.

Forms of Corporatism

Corporatism has a long history. The modern territorial state superseded a political and economic order that consisted of numerous corporate communities endowed with traditional rights and obligations, such as churches, estates, cities, or guilds. In this context, organized collectivities regulated cooperation and competition among themselves and their members without or with limited influence of the state.

However, these corporations ultimately proved unable to prevent the victory of the state form of political organization. For political and economic liberalism, corporations are furthermore illegitimate to mediate between the individual and the state. Nevertheless, collective organizations continued to exist, so they could be included in the political order of the state. The political solution for this problem can particularly be found in nineteenth-century Germany, where, based on Georg Wilhelm Friedrich Hegel's *Philosophy of Right,* corporate associations were considered necessary to participate alongside the Parliament in political negotiations. Corporatist thinking deplored social conflict brought about by party competition and market economy. In the same vein, the Catholic social doctrine favored political representation on the basis of professional groups. This political structuration was considered limiting of class divisions. Modernity should be reached by compulsory organization of society along lines of industrial sectors and producer groups. Fascist regimes, such as Benito Mussolini's (Italy), Francisco Franco's (Spain), and António de Oliveira Salazar's (Portugal) fascist regimes, were examples where the political structure of the state was considered to be the reflection of the organic structure of the society. This so-called state corporatism attempted to use corporatist organizations as an instrument of state rule. The particular structure was favored as it helped to avoid uncontrollable parliamentary democracy. However, antiparliamentarist state corporatism was only one of two forms of corporatism—societal corporatism was

developed after 1945 through democratic state building and collective bargaining and theorized under the term of neocorporatism.

Neocorporatism

Contrary to corporatism, generally used in a descriptive endeavor, neocorporatism has been developed as a normative as well as empirical theory. However, as with pluralism, neocorporatism is far from being a unified and coherent approach. It constitutes, according to its main defendants such as Claus Offe, Philippe C. Schmitter, and Gerhard Lehmbruch, an answer to national and international economic problems of the 1970s. The neocorporatism dialogue was the attempt to reconcile capitalist economy with mass democracy. Collective national political and institutional arrangements were used or created to remedy problems whose origins lay, more often than not, at the international level. The essential element of neocorporatism is that government grants a monopoly of representation to certain peak associations in exchange for their cooperation in developing policy. Also, government intervenes substantially in the economy in order to achieve particular goals. One central goal is to develop an income policy; that is, the attempt to control inflation by influencing wage bargaining and the prices of goods and services.

Empirically speaking, both labor and employer's organizations are included in free collective bargaining. Unions and employers are to set the terms of employment between themselves, under legal immunities, protection, and facilitation. This situation of political exchange is the basis for a situation where unions give up their attempt to replace the state, government refrains from direct wage setting, and employer's organizations accept to sit with both the state and the unions to bargain over economic policy. The unions increasingly refrain from striking as a political action repertoire, and both employers and labor organizations were considered legitimate monopolistic interlocutors by the state. It was the particular context of the 1970's economic crisis that relaunched the political and academic debate on traditional corporatism. The state was confronted with contradictory demands in a situation of stagflation in which it progressively increased its prerogatives in economic politics. In order to legitimate these prerogatives, the state associates the social partners more closely. Thus, confronted with increasingly international competition, the concentration mechanisms described by neocorporatist scholars are means to resolve or at least calm down the class conflict at the national level.

According to the theoretical definition developed by Schmitter, neocorporatism is a system of representation in which individuals are part of a limited number of economic organizations, where membership is compulsory. These organizations are structured differently according to the economic sector they belong to. Their status is recognized or even established by the state. It allows for a monopolistic status in a given economic field in exchange for a certain control by the state over the choice of their leaders and the demands they can formulate. Some groups are by definition stronger than others and might gain control over public policy domains, thus representing the phenomenon of policy capture that pluralists feared. Large groups based on social class structures tend to bureaucratize. They develop a more or less efficient organizational structure, based on expertise in a specific policy field. Based on this know-how, the state may thus transfer a certain number of decision-making and implementation powers to these organizations.

Contrary to pluralist approaches, however, not all cleavages have the same value. Thus, "market participants" can be differentiated from "policy takers." Class organizations belong to the first category, representing either the offer or the demand side of the labor market or services: business organizations or trade unions but also consumers or banking associations. These organizations exercise pressure in order to enlarge their part of the market. They are able, despite their more or less important position in the political system, to influence governmental policies and to have a destabilizing effect on the political, social, and economic order of the state. This destabilizing capacity assures that they enjoy a central role in a political system compared to other groups. Organizations belonging to the second category, on the contrary, are

subject to the effects of these policies. While they also participate in a political market, this market has no direct influence on the stability of the political order. Automobile or student associations are examples of these groups, which participate in the public debate, influence government, but are rarely the cause of political upheaval.

If the state delegates power in the two cases, it does so for different reasons. Thus, in the case of class organizations, the objective is to restrain and to discipline the organization members in order to achieve a higher predictability of behavior patterns in the case of conflict. In the case of pluralist groups that obtain public status and thus gain the right of self-administration, the principal motive is delegation, devolution, and the transfer of political debates to an arena that does not directly affect the stability of the central government or the ruling parties. This type of delegation reduces, on the contrary, the overload of the state.

Structural and Functional Aspects of Neocorporatism

Differentiating between the structural and the functional aspect of interest representation with regard to neocorporatism and pluralism clarifies the definition further. Whereas the structural aspect concerns the organization of group interests in established intermediary associations (logic of membership), the functional aspect refers to the political coordination between interest associations and the state (logic of influence). Thus, in structural terms, pluralist theory most commonly conceives of interest politics as free competition among a variety of groups in a market for political representation, whereas in corporatist systems, selected organizations enjoy a representational monopoly. But the state also intervenes directly in the internal affairs and structures of these organizations, favoring a particular leader, depending on who is expected to be more reasonable from the perspective of the actual state actors. With regard to the functional aspect, under pluralist theory, private interests are only tamed by competition and public regulation, whereas under corporatism the state offers incentives

for interest groups to cooperate. Moreover, corporatist theory blurs the boundary between the state and civil society, as the state shares authority with interest groups not only in the decision-making process but also in the implementation phase. Moreover, as interest groups assume the responsibility for compliance of their members, they help the state to make its decisions accepted.

From an empirical point of view, Sweden, the Netherlands, Austria, Germany, France, and Great Britain are classified as neocorporatist countries, in rather different terms, however. Whereas Germany belongs to the category of strong corporatist states, just after Sweden, the Netherlands, and Austria, the United Kingdom seems to have both neocorporatist and pluralist elements. It has only sometimes been classified as "medium corporatist," at least with regard to agricultural policies. British politics after World War II are considered to be Keynesian, with a pluralist bias. France is categorized as a weak corporatist state in some policy areas, in particular agriculture. Economic policies, however, follow a statist pattern. It is important to note that in a normative debate, the French political system is often called "corporatist" in a classical sense. Thus, specific professions, such as teachers, are thought to be similar to guilds as they cling to their old prerogatives. The German system has both defenders among pluralist scholars with regard to associations and social movements, as well as neocorporatist analysts researching business and trade union patterns. However, the latest studies seriously question the neocorporatist label for Germany.

The Empirical and Theoretical Limits of Neocorporatism

At the end of the 1980s, Schmitter came to a rather negative and pessimistic conclusion with regard to neocorporatist patterns in Western Europe. Globalization, the development of welfare state arrangements, and the level of unemployment are leading to the end of neocorporatist arrangements based on equality. Full employment cannot be assured anymore in highly independent economies and, thus,

wage moderation cannot be "bought" any longer. Therefore, it is the end of organized capitalist systems. The tendency leads to micronegotiations at the firms level; mesocorporatism continues to exist only in specific or sheltered policy sectors.

However, the short life of neocorporatism should not conceal the fact that this approach has allowed new analytic frames to develop to study the relationship between the economy, politics, and society. It has contributed to the development of other types of research, in particular studies on comparative capitalism (varieties of capitalism) and middle-range theories on the socioeconomic organization of states. Furthermore, whereas corporatism was originally used to characterize entire societies in terms of their being more or less corporatist, the reflection on the micro- and mesolevels of policies allowed for a new sociological approach to corporatism. Associations active in a corporatist system used both corporatist and pluralist strategies in pursuit of their objectives.

Finally, corporatism and neocorporatism have also found new applications in political theory, particularly through the concept of associative democracy. Associative democracy links elements of pluralism and neocorporatism in underlining the freedom to associate, as well as the policy implementation tasks associations performed in political systems. It stresses new forms of responsibility and accountability at the local level, reducing the role of the central state. Associations seek a "dispersed centralized democracy" that combines individual choices of liberalism with the public provision of collectivism. In the logic of this argument, the abnormalities of the classic model of collective representation can be considered as modern forms of democratic systems. As in consensual systems, the central decisions are taken unanimously, and the political process is more generally characterized by a consensual approach rather than by a search for majorities. To guarantee citizens' participation in these consensual and corporatist systems, one must take into account two options: on the one hand, the strengthening of interest groups' organizational capacities to control political power and, on the other hand, institutional checks and balances. The model of associative democracy, by binding the

neocorporatist agenda to the requirements of the theory of liberal democracy, assumes that associations can be at the same time instruments to improve the efficiency of policy making and assure citizens' participation. In situations where political parties do not supply adequate access to citizens to allow them to participate in the decision-making processes, interest groups can offer opportunities for such participation.

While the neocorporatist approach was conceived to analyze as well as theorize the increasing interdependence of economies in the 1970s, it is also this particular interdependence that is responsible for the decline of the approach, as it has difficulties to include the limited autonomy of nation-states in its research patterns. However, neocorporatism has generated a large number of comparative studies in political economy and has helped classify the organizations of sectoral interests in Western Europe. Its social bias, that is, this interest in class groups, is, nevertheless, problematic today as these differentiations seem to lose their explanatory character. Here, the normative approach of associative democracy might be able to use elements of neocorporatism in its research design. Finally, it is also at the international level that neocorporatism shows its limits. Transnational pluralism seems to be the majoritarian pattern linking societal groups to state actors. However, "islands of corporatism" can still be observed in a number of policy sectors.

CORRUPTION

Corruption can be defined as the paying and receiving of bribes for preferential treatment. At the most basic level, the fees demanded and paid are used to subvert normal processes for the procurement and provision of public-sector goods and services. At more sophisticated levels, payments are used to secure undue access to, and influence over, policymakers whose decisions affect economic outcomes. But the line that separates undue influence and legitimate policy advocacy is often blurry. Money can buy favors as surely as it finances legitimate policy advocacy.

Where legitimate advocacy ends and bribery begins is partly a matter of definition, determined by culture, values, political systems, and institutional arrangements. Traditionally, responsibility for defining the rules has resided with national (and sometimes local) law- and rule-making bodies. Globalization changes that. Competing values now easily seep across borders, challenging traditional authority, customs, and governing institutions. Rule-making powers that were previously the exclusive province of nation-states are now partly invested in supranational bodies. Moreover, the technology infrastructure that facilitates global finance makes it easy for the fruits of corruption to travel across borders to be laundered. Money laundering and corruption go hand in hand.

An incentive for corruption is created when public officials have discretion over factors that influence private-sector costs or benefits. The magnitude of the impact, the probability of discovery, and the severity of punishment are likely determinants of the extent of actual corrupt behavior.

Beyond the traditional payment/extortion model that covers transactions between public and private actors, new variants have begun to emerge. Officials of international governmental organizations (IGOs) may dispense illegal favors to national government officials, either for private gain or to secure preferred policy outcomes. For instance, smuggling of arms, weapons of mass destruction precursors, illegal drugs, currency, and other contraband is sometimes directed by governments for strategic purposes. For policy reasons, or in return for financial incentives, officials of IGOs may turn a blind eye to cross-border illegal activity or may actively aid national government officials in circumventing treaties, covenants, regimes, and other obligations.

The demarcation between public and private responsibility is further blurred by the fact that national governments have increased reliance on private actors, including nongovernmental organizations (NGOs), to set standards and police behavior. For instance, many governments require banking officials to report suspicions of money laundering to the authorities. Chief financial officers and accounting firms sometimes have an affirmative duty to report financial wrongdoing. Consequently, private-sector actors face corruption incentives analogous to the ones traditionally faced by public officials.

Types of Corruption

The three most common types of corruption are: paying to receive a benefit, paying to avoid a cost, or paying to secure a government position. Governments can create tiered markets in which some customers receive favorable prices, while others are required to transact at market prices. Similarly, preferential treatment may be given to favored individuals or groups when governments lease property, sell assets, award contracts, or hand out subsidies. Circumstances like these create incentives to bribe public officials in exchange for preferential treatment.

Bribes are also paid to avoid the imposition of costs or to shift costs onto competitors. Governments

can impose substantial costs on private actors when they act (or sometimes fail to act) to levy taxes, implement regulations, and enforce the criminal law. As compliance costs rise, so does the incentive to avoid them. Firms are more likely to consider bribery worth the risk of getting caught when compliance costs are high and penalties for noncompliance are low. Moreover, when compliance costs are high, it is economical to pay large bribes to avoid them. As the scale of bribery increases, so does the incentive for bribe seeking.

Public-sector employment is a source of corrupt practice when pay scales vary significantly from the private sector. Pay scales that are too high create an incentive to pay bribes to secure public-sector jobs. Pay scales that are too low make public employees more easily susceptible to bribe offers. Low-paid public-sector employees may assume that taking payments to grease the skids is tacitly accepted and expect bribes as a perquisite of the job.

The issue is more subtle at the higher reaches of public policy-making organizations. It concerns access. Large donors are more likely than others to gain access to present their case to high-level decision makers. Senior policymakers also gain exposure to powerful networking opportunities. Even without an explicit *quid pro quo,* senior level officials may, nevertheless, be tempted to use their offices to ingratiate themselves with people and industries they regulate, hoping the favor will be returned at some later time. However, the revolving door between high-level regulators and executive positions does not necessarily signify corrupt practice. Senior regulators, cabinet ministers, and elected officials may possess specialized knowledge (and contacts) that private-sector firms find extremely valuable. Consequently, they may be recruited for high paying positions in private industry without corrupt intent or result.

Finally, criminal organizations, terrorist organizations, and rogue states use corruption as a weapon to further strategic aims. International terrorist organizations have set up nominal charities whose actual function is to direct and fund terror around the globe. Traditional criminal organizations have bought and corrupted banks have been used as vehicles to launder criminal proceeds. For instance, the Bank of Credit & Commerce (BCCI) had, at its core, a massive international money laundering enterprise. It involved the illegal purchase of a U.S. banking company, facilitated by a former U.S. defense secretary. It reportedly made payments to prominent politicians in many of the countries in which it did business and it illicitly acquired deposits from third-world central banks.

The Globalization of Corruption

Technology has transformed corruption from a local affair into a global problem. Highly sophisticated criminal enterprises run international businesses, motivated by financial gain, that depend on corruption for their survival. Trafficking in people and illicit rare animals, trading in illegal drugs, bootlegging software, and distributing weapons on the black market are highly profitable activities. They thrive on lax enforcement by, and corruption of, border guards, customs officials, law enforcement, and banking officials.

Globalized corruption depends on the international banking system to launder its criminal proceeds. Money laundering, which seeks to remove the taint of crime from ill-gotten cash, is the *sine qua non* for economic crimes. To evade detection and grow, criminal organizations need the ability to hide the source of their money and then reintegrate the proceeds back into the above-ground economy. Once dirty cash is deposited in the banking system, it is well on its way to being cleansed.

The emergence of easily accessible global financial markets makes money laundering comparatively easy. By conservative estimate, upwards of US$500 billion per year is laundered through global money markets. The effect is to increase the returns to crime in general, and corruption in particular, by reducing its costs and risks. Strict bank secrecy laws, usually found in tax havens, protect the identities of account holders, thus making it difficult for law enforcement authorities to follow the money trail left in the wake of illicit transactions.

The ease of electronic transactions exacerbates the problem and illustrates its complexity. It is no longer necessary to bribe public officials using envelopes

stuffed with cash; a bank account using a fictitious name in almost any bank will do. A deposit in a New York bank can easily be withdrawn from a Paris branch with an ATM card. The electronic transfer system allows proceeds of corruption to be sent effortlessly to jurisdictions where depositors' identities are hidden; where the underlying behavior may not be regarded as criminal, and where the money is easily cleansed.

It should also be noted that the technology that sends trillions of dollars around the globe daily may also make it easier for law enforcement to monitor and prosecute the money laundering on which corruption depends. There is a paper trail for each transaction. The main question centers on its availability to law enforcement agencies, both domestic and international. But corrupt political regimes are unlikely to acquiesce to opening their books.

The Costs of Corruption

The costs of corruption are both financial and political. Corruption distorts market prices, leading to resource misallocation. It increases production costs and lowers returns, thus stifling investment. Unchecked corruption challenges the legitimacy of the state, its institutions, and its claim to a legal monopoly on the use of violence.

Corruption's costs are inherently difficult to measure. Some states deemed to be corrupt have had high levels of economic growth. On balance, however, the research suggests that corruption has serious adverse economic consequences. Corruption tends to penalize investment, reduce economic growth, and reduce a nation's expenditure on education. Because corruption tends to reward inefficiency, it is likely to result in inferior provision of public services. Further, large capital projects, such as roads and bridges, whose true costs are hard to measure, provide relatively easy opportunities for public officials to seek bribes. Consequently, public infrastructure is likely to be inferior and more costly than necessary. In addition, the ease of extracting bribes from these projects makes it more likely that public officials will opportunistically promote them at the expense of better uses of public funds.

Contracts acquired through bribery are unlikely to produce the best results most efficiently. The results seen are increased taxes, reduced services, and increased public cynicism, particularly with respect to certain subsets of public goods. Though its pervasiveness varies widely, survey data indicate that customs, tax, and police departments are the most vulnerable to the enticements of corruption.

Economic efficiency is not the sole criterion for analyzing corruption. Widespread corruption leads to cynicism, impinges on market efficiency, erodes social trust, and undermines the rule of law. Trade depends on trust and the belief that customers and competitors are playing by the rules. When bribery tilts the playing field, honest players may withdraw for more inviting venues, leaving behind a vacuum filled by corrupt players.

Corruption can be pervasive and deep rooted or episodic. Petty corruption takes place at the level of the bureaucracy; grand corruption involves high government officials. Either way, it is corrosive when left unchecked and undermines the foundations of civil society. Judicial independence and the rule of law are challenged by drug and war lords (often the same), who buy immunity from prosecution and whose armies and militias put them beyond the reach of civil authorities. The collapse of legitimate state authority under the weight of corruption financed by drug traffickers presages the real possibility of the birth of lawless narco-states.

States that have succumbed to pervasive corruption (or are about to) threaten the security of their more law-abiding neighbors. Globalization makes it increasingly difficult to isolate the policy actions of one state from spilling over into the entire state system. Lawless and corrupt states, dominated by warlords and narcotics traffickers, provide safe havens for terrorists, gangsters, and illegal arms markets that include ingredients necessary for weapons of mass destruction.

Global Anticorruption Policies

Early efforts to reduce corruption in international business dealings centered on the United States

Foreign Corrupt Practices Act (FCPA), signed into law by President Jimmy Carter in 1977. The FCPA makes it illegal for U.S. firms to pay bribes to foreign government officials. In response to U.S. business firms, who argued that the FCPA put them at significant competitive disadvantage in international markets, Congress passed the 1988 Omnibus Trade and Competitiveness Act. The 1988 Act sought to reduce FCPA compliance costs for American businesses, and it called on the president to negotiate an agreement with other OECD states to make bribery illegal. (At the time, some OECD countries allowed domestic companies to treat bribes of foreign officials as tax-deductible business expenses). By 1996, the OECD declared that tax deductibility of bribes to foreign public officials should be banned and the practice criminalized.

In 1994, the justice ministers of member states of the Council of Europe determined that corruption was a serious threat to democracy, the rule of law, and human rights. Accordingly, the ministers formed a Multidisciplinary Group on Corruption, with the aim of drafting an international program to combat corruption. By 1997, the Committee of Ministers of the Council of Europe adopted a twenty-point program of guiding principles in the fight against corruption. These included criminalization of corruption, the promotion of ethical behavior, steps against money laundering, and eliminating tax deductibility for bribery. By 1999, the Group of States against Corruption (GRECO) was set up to monitor progress among member states through peer pressure and mutual evaluation.

The Organisation for Economic Co-operation and Development (OECD) has similarly taken action against corruption. In 1997, through its Working Group on Bribery in International Business Transactions, the OECD placed priority on examining five related issues: the foreign bribery of political parties, benefits promised in anticipation of becoming a foreign political official, bribery of foreign officials as a predicate offense for money laundering legislation, the role of foreign subsidiaries in the bribery of foreign public officials, and the role played by offshore tax havens in bribery transactions.

The OECD determined that foreign bribery of public officials raised serious moral and political concerns, that it undermined good governance and economic development, and that it distorted competition in international markets. Accordingly, the OECD established an antibribery convention that entered into force February 15, 1999. The convention has been signed by all thirty members of the OECD as well as four nonmembers.

The OECD convention stresses the importance of transparency in the procurement of public goods. The convention calls for eliminating the tax deductibility of bribes paid to public officials and makes bribery a predicate for money laundering. The OECD's Committee on Fiscal Affairs conducts self-evaluations of member's implementation of antibribery regulations. The chief implementation tools include monitoring domestic law to see if it meets agreed-upon standards, mutual evaluations among signatories, and mutual legal assistance. Standards and implementation processes against corruption and money laundering are now firmly established in OECD countries.

Recent attempts to minimize corruption have sought to emphasize best practices and good governance. Transparency in campaign finance, the award of contracts by competitive bidding, auditing of public agencies, and simplified tax codes are among the remedies suggested.

CORRUPTION PERCEPTIONS INDEX

The corruption perceptions index (CPI) is a measure created and used by Transparency International, an international nongovernmental organization established in 1993 with the aim of bringing together business, civil society, and government structures to combat corruption. The CPI rates countries on a scale from 0 (highly corrupt) to 10 (clean). The index was first used in 1995, and it covers a growing number of countries in annual surveys, growing from 41 in 1995 to 146 in 2004.

The index is based on the surveys of domestic and international businessmen, financial journalists, and risk analysts. Therefore, it reflects the perceptions of experts and business elites and not of the general public. The index represents average scores from several polls and surveys for each respective country from the two years prior to its release and the year of release (e.g., CPI 2004 is based on sources from 2002, 2003, and 2004). The minimum number of surveys used for each country is three, while some countries are evaluated with the use of as many as fourteen to fifteen surveys.

The CPI focuses on the public sector and evaluates the degree of corruption among public officials and politicians. Corruption is defined as an abuse of public position for a private gain, which in practice usually means bribe taking. Because in corrupt countries the quality and independence of judiciary and media are usually low, official statistics on the corruption exposure and prosecution underestimate the level of corruption in more corrupt countries. The CPI, being based on evaluations, is a valuable alternative source of information about the degree of illegal practices among civil servants and politicians in a given country.

There are some methodological problems related to CPI data reliability and comparability. While the information about the cross-national levels of corruption is compiled annually using a number of reliable and established sources, such as the World Bank and European Bank for Reconstruction and Development's (EBRD) *Business Environment and Enterprise Performance Survey,* the Economist's *Country Risk Service and Country Forecast,* or Freedom House's *Nations in Transit,* the exact set of sources used for a country's evaluation, as well as the wording of the questions put to experts, vary from year to year, making an actual net change in the levels of perceptions of corruption difficult to precisely estimate. Second, large differences in values given to a country by different sources (which is reflected by a high standard deviation of a CPI score), especially combined with a low number of surveys used for a country, signal a low reliability of an estimate. However, great care is taken to ensure the highest possible quality of sources and methodology used. Therefore, CPI is a reputable index widely used by academics, economists, journalists, and businessmen.

The results consistently show that countries with the highest scores (9 or higher) are predominantly rich countries, while countries with lowest scores are also the poorest ones. This relationship between country's level of economic development and its level of corruption has lead Transparency International to conclude that corruption is one of the key obstacles to sustainable development.

COSMOPOLITANISM

Cosmopolitanism is a school of thought in which the essence of international society is defined in terms of

social bonds that link people, communities, and societies. Derived from the term *cosmopolis,* it sees a natural order in the universe (the cosmos) carried through to human society, exemplified by the *polis.* More broadly, it presents a political-moral philosophy that posits people as citizens of the world, rather than of a particular nation-state.

In this regard, cosmopolitanism represents a spirited challenge to more traditional views that focus on age-old attachments of people to a place, customs, and culture. Cosmopolitan emphasis on social bonds rather than nation-states lays the foundation for its view of society ultimately evolving toward harmony and away from conflict. This relatively benign outlook stands in stark contrast to the analytic framework used by the dominant schools of thought in world politics: realism and liberalism.

The Dominant Schools of Thought

For both realists and liberals, Westphalian nation-states are the dominant actors in world politics. Both see states as internally sovereign over their own territory, possessing a legal monopoly on violence. To exercise internal sovereignty, states need to be free from externally imposed constraints. For liberals and realists alike, this implies that the international system—a society of states—is structurally anarchic. Domestic and world politics are clearly differentiated. This framework clearly delineates domestic and international politics. Domestic politics is law and administration; world politics is defined by power, struggle, and accommodation. States are Janus-faced, looking inward toward domestic society and outward at the anarchy of world politics.

For both realists and liberals, the state is the organizing unit of the international system. They agree that state behavior is rational and comprehensible. Realists go on further to argue that states are unitary actors that seek power both as a means and as an end. For realists, the "high" politics of security dominates the "low" politics of social welfare. Peace is the time between wars. States are autonomous and self-reliant. Cooperation among states is rare because there is little reason for it. International institutions, lacking independent authority, are powerless to shape state behavior.

Liberals share the realist assumption that the international system is state centric and structurally anarchic, but liberals find room for cooperation. For them, world politics is not a zero-sum game. It is partly distributive and partly productive. It is a Smithian world of trade and commerce in which mutual benefit creates an incentive for cooperation and coexistence. Realists, pointing to states' constant preparation for war, see conflict as the norm. Liberals view conflict as atypical, a result of misunderstanding or miscalculation. They stress the need for institution building.

How Cosmopolitanism Differs

Cosmopolitanism differs from realism and liberalism in its resistance to the idea of the semiautonomous sovereign state, with an exclusive right of self-government. In the realist view, states (in pursuit of their own interests) are locked in a struggle for survival. Conflict is inevitable because states have differing interests and there is no external sovereign to constrain behavior or mediate disputes.

Not only do they reject the conception of world politics as necessarily rooted in interstate conflict, cosmopolitan theorists do not draw a distinct line between domestic and international politics. They argue that states are bound by rules, norms, and the imperatives of law. Relations between people are not always and everywhere subsumed by interstate conflict.

Cosmopolitanism and liberalism both accept power as an important aspect of human existence but reject the idea that it is all encompassing. Many factors influence interstate relations: economic, cultural, technological, and military. Not only do many factors influence state behavior; their relative importance varies with circumstance, in part because of easy mobility of people and capital, which constrains the power of the state, whose power is limited by geographic borders.

At the nexus of power and geography, liberals and cosmopolitans begin to part company. Liberalism (unlike cosmopolitanism) accepts the primacy of the territorial state, both in domestic and world politics. Although liberals see the territorial state as the

fundamental organizing unit of politics, they believe conflict between states can be mediated by international institutions. International policy regimes can soften differences and coordinate policy where states have joint, but not identical, interests.

Beyond Liberalism

Cosmopolitanism moves beyond liberalism. Like liberalism, it sees international institutions and policy regimes as useful. But for cosmopolitans, international institutions are steps down on the evolutionary road toward full sovereignty being vested in people rather than states. Over time, the society of states will evolve into societies of people. States are not the law; they are bound by it. Politics and law are thus denationalized.

Rising interest in cosmopolitanism is coincident with the emergence of transnational organizations and epistemic communities, brought about partly by the technology revolution that allows nonstate actors to organize and coordinate behavior across borders. Global mobility of capital and labor makes states more accountable to markets, empowers nonstate actors, and challenges state capacity. The spread of networks as substitutes for hierarchies further reduces state power. Claims of universal jurisdiction by national courts have likewise weakened internal sovereignty. And international organizations have become increasingly adept at holding governments accountable to international norms of behavior, challenging the notion of the autonomous sovereign state.

The emergence of powerful nonstate actors on the global stage lends some credence to the cosmopolitan notion of an evolutionary process leading from the sovereignty of the state toward the sovereignty of people. What remains to be seen is whether cosmopolitanism is simply another variant of Western universalism, an important question in a world filled with intense religious and cultural rivalries.

COST-BENEFIT ANALYSIS

Cost-benefit analysis is an analytical decision support tool for defining and comparing costs and benefits. Cost-benefit analysis shapes a framework for decisions. It requires a formal reporting process and several evaluation techniques. Cost-benefit analysis, sometimes called benefit-cost analysis, is the process of weighing the total expected costs versus the total expected benefits of one or more products, actions, or programs in order to choose the most profitable option. Often, this process involves monetary calculations of initial expense versus expected return.

A cost-benefit analysis finds, quantifies, and adds all the positive factors. These are the benefits. Then it identifies, quantifies, and subtracts all the negative factors, the costs. The difference between the two indicates whether the planned action is advisable. In a cost-benefit analysis, all the costs and all the benefits need to be included and properly quantified. For example, a product manager may compare expenses to projected sales for a proposed product, and only decide to produce it if the expected revenues will eventually recoup the costs.

Cost-benefit analysis may be viewed as a way to calculate society's "return on investment" from an activity or program perspectives. These analyses attempt to calculate the actual costs of delivering services and the monetary value of improving particular

outcomes for society, and to measure whether the benefits exceed the costs, for example. Cost-benefit analysis is often used at a macrolevel to compare programs that achieve different outcomes (for example, deciding whether to fund a HIV/AIDS prevention program or a program to reduce youth violence) or to measure the value of a particular program's outcomes.

To do a cost-benefit analysis, programs must first accurately calculate their costs. Programs also must establish a causal relationship between the program and particular outcomes (benefits) through an outcome evaluation. Cost-benefit analyses then attach dollar values to those benefits. The program's costs can then be compared to its benefits. If benefits exceed costs, the program has established an economic justification for continuing these services.

The term *cost-benefit analysis* is widely used for planning, decision support, program evaluation, proposal evaluation, and other purposes in organizations of all kinds. A cost-benefit analysis will, on the one hand, attempt to quantify every benefit and cost for inclusion in the financial analysis, even the so-called intangible costs and benefits. On the other hand, it will not omit discussion of important nonquantified benefits and costs. Cost-benefit analyses usually represent incremental costs and benefits. This is because cost-benefit analysis is usually undertaken for decision support purposes. The objective, after all, is to understand the net effect of a decision.

COUNCIL FOR MUTUAL ECONOMIC ASSISTANCE

The Council for Mutual Economic Assistance (COMECON) was an organization created to foster economic and technical cooperation between communist countries in Eastern and East Central Europe (USSR, Bulgaria, Czechoslovakia, Hungary, Poland, Romania, East Germany, with Albania leaving in 1961), and, later, a number of Soviet allies in the third world (Mongolia in 1962, Cuba in 1972, and Vietnam in 1978). It served for four decades as the principal means of economic cooperation and coordination in the communist world before being disbanded in 1991 on the disintegration of the communist regimes of Eastern Europe.

COMECON was coordinated by an extensive hierarchy of institutions and organization. It was headed by the Session of the Council for Mutual Economic Assistance, consisting of high-ranking representatives of each member state (up to the prime minister), which set the agenda for and the tone of future economic integration and coordinated the activities of subordinate offices. The most important supervisory organ was the Executive Committee of the Council, responsible for overseeing the implementation of policy initiatives. Below this were some thirty advisory committees, conferences, sectoral commissions, and specialized research centers.

COMECON was established as a loose set of arrangements designed to share experience, technical expertise, and mutual aid among members, at the time struggling not only to rebuild their shattered economies but, moreover, to chart a previously unmapped path of economic development through the establishment of central planning. Following the death of Stalin, and later as a reaction to the establishment of the European Economic Community (EEC), interest in new forms of regional forms of economic cooperation emerged.

COMECON's charter was established in 1959, and with it the scope of activities began to expand, and its goals became more ambitious. Plans to further tighten integration were stepped up, and in 1971 COMECON

members adopted the Comprehensive Program for the Further Extension and Improvement of Cooperation and the Further Development of Socialist Economic Integration. The Comprehensive Program initiated the development of a set of increasingly complex institutions, coordination mechanisms, and planning strategies that covered trade (external as well as intra-COMECON), investment and production patterns, monetary relations, pricing procedures that facilitated closer tracking of world market prices, and plans to enhance research and development.

Therefore, despite a commitment to what it now described as socialist economic integration and an international socialist division of labor, many analysts and economic historians consider the evolution of COMECON as tacit acceptance that failure to use market price signals as a mechanism of allocating scarce resources, coordinating policy, and developing cost-effective production specialization in the pursuit of enhanced economic interdependence would result in failing to meet the overriding goal of economic modernization.

Mikhail Gorbachev's election to the position of General Secretary of the USSR marked the realization of the looming and deep economic crisis, symptoms of which included extensive shortages of essential goods, large-scale corruption and a flourishing black market, poor productivity, inability to meet consumer demands, high energy inefficiency and pollution levels, research and development failures, and a persistent and increasing technological gap.

Hence, in 1985, COMECON initiated the Comprehensive Program for Scientific and Technical Progress up to the Year 2000. The program was a broad-based plan to move in the direction of tighter economic integration, increasingly seen as necessary if the slide behind the Western economies was to be halted. However, as Western economies boomed following the recession of the early 1980s, the communist crisis deepened, and Gorbachev's attempts to reform the system stalled, largely because they failed to address the root cause of the crisis. With the failure of Gorbachev's reform initiatives clear by 1990, the disintegration of communism and the regimes it had cemented together was sealed, and COMECON,

whose rationale had essentially dissolved, was quietly disbanded early in 1991.

COUNCILS OF GOVERNMENTS

Councils of governments (COGs) are regional planning bodies that exist throughout the United States. Councils of governments (also called regional councils) are associations that consist of elected public officials that come from the major local governments within an urban or metropolitan area. They were developed during the 1970s and the 1980s as an appropriate tenet of public governance concerning local/regional issues. Their purpose is to establish a consensus between the needs of the concerning area and actions in order to solve local and interlocal problems.

COGs constitute voluntary associations that represent governments, but they are not governments themselves. They are voluntary because local units cannot be forced to join these associations and they can resign at any time. The council membership is drawn from the county, city, and other government bodies within its area. Councils of governments lack general government authority in that they are not directly elected, they do not have direct taxation powers, and they do not have police powers or regulatory authority.

COGs were created in order to develop consensus regarding metropolitan or regional needs and actions to be taken in solving area problems. COGs benefit the state by planning, coordinating, and overseeing the administration of the state and federal programs, assisting local governments in handling tasks set by

the state regulations, providing a flexible network for effective regional action and fostering cooperation that helps avoid duplication of efforts and thus helps take advantage of economies scale. A typical council is defined to serve an area of several counties and addresses issues such as regional planning, water use, pollution control, and transportation. Nevertheless, the nature and extent of the programs vary, depending on local needs and the priorities of the board that governs the operation of the individual council.

In 1960, there were only a half-dozen voluntary regional councils of elected officials. In the late 1960s and early 1970s, emphasis was increasingly placed on the need for long-range planning and closer coordination of program activities by governments at all levels. Federal requirements for planning in areas such as transportation, the environment, and human services furthered this need. The establishment of COGs emerged as the preferred approach to this need in many areas. Therefore, the number of COGs soared to over 660 by 1980 as a result of federal requirements and massive increases in federal aid to state and local governments between 1957 and 1977. Most regional planning commissions were converted to COGs during this period. With the advent of the Reagan administration and, over time, the reduction in federal aid to local governments, the number of COGs decreased to approximately 530.

To conclude, these councils consist of elected officials drawn from the local governments in metropolitan areas, or, in some cases, for more rural areas, they constitute a public attempt of local/regional governance developed in the United States in order to efficiently resolve local problems and to satisfy the regional needs increase in the 1970s. They are multicounty planning and development agencies serving different areas of the state. However, these regional bodies have provided a small measure of regional political leadership and policy-making authority.

CRISIS MANAGEMENT

Crisis management pertains to all activities aimed at preventing, mitigating, and terminating crises. We speak of crisis when a community of people—an organization, a town, or a nation—perceives an urgent threat to core values or life-sustaining functions, which must be urgently dealt with under conditions of deep uncertainty.

Crisis and the Modern Society

Public authorities face a variety of crises, such as natural disasters and environmental threats, financial meltdowns and terrorist attacks, epidemics and explosions, infrastructural dramas and information and communication technology (ICT) failures. Crises are not routine events (such as fires or traffic accidents). Crises are inconceivable events that often take politicians, citizens, and reporters by complete surprise.

These dramatic events create tough challenges for public authorities and their organizations. Critical decisions must be made and implemented under considerable time pressure and in the absence of essential information about causes and consequences. Even if the conditions for effective action are severely impeded, citizens expect governmental leaders and public authorities to safeguard them from the threat at hand.

Two factors make it increasingly hard for these organizations and their leaders to meet this expectation. First, the qualities that increase welfare and drive progress in modern societies make these societies vulnerable to crises. Second, citizens and politicians alike have become at once more fearful and less tolerant of major hazards to public health, safety, and prosperity.

The combination of these factors explains why relatively small disturbances can rapidly develop into deep crises and why the effects of crisis management are inherently limited.

Modern society has become increasingly complex and integrated. Complexity makes it hard to fully understand the manifold activities and processes that take place. As a result, emerging vulnerabilities can long go unrecognized; attempts to deal with them often produce unintended consequences (fueling rather than dampening the crisis). Tight coupling between a system's component parts and with those of other systems facilitates the rapid proliferation of disturbances throughout the system. Crises may, thus, have their roots far away (in a geographical sense) but rapidly snowball through the global networks, jumping from one system to another, gathering destructive potential along the way.

All this makes it hard to recognize a crisis before its consequences materialize. When a crisis begins to unfold, policymakers often do not see anything out of the ordinary. Everything is still in place, even though hidden interactions eat away at the pillars of the system. It is only when the crisis is in full swing and becomes manifest that policymakers can recognize it for what it is. Once a crisis has escalated into view, authorities can only try to minimize its consequences.

The contested nature of a crisis further complicates the situation. A crisis rarely, if ever, "speaks for itself." The definition of a situation is, as social scientists say, the outcome of a subjective process. In fact, we might say that crisis definitions are continuously subjected to the forces of politicization. One man's crisis is another man's opportunity.

For public authorities, this spells trouble: Many seemingly innocent events can be transformed into crises. Western citizens have grown impatient with imperfections; they have come to fear glitches and have learned to see more of what they fear. In this culture of fear—sometimes referred to as the "risk society"—the modern mass media plays an amplifying role.

Even if consensus would exist that a serious threat is emerging, the status of this new problem is far from assured. Governments deal with urgent problems everyday; attention for one problem takes away attention from another. For a threat to be recognized as a crisis, it must clear firmly entrenched hurdles.

Challenges of Crisis Management

Crisis management has two dimensions. The technical dimension pertains to the coping capacity of governmental institutions and public policies in the face of emerging threats. But there is also a political dimension: Crisis management is a deeply controversial and intensely political activity. A combination of these dimensions translates into five critical challenges of crisis management: sensemaking, decision making, meaning making, terminating, and learning.

Sensemaking

A crisis seems to pose a straightforward challenge: Once a crisis becomes manifest, crisis managers must take measures to deal with its consequences. However, reality is much more complex. Most crises do not materialize with a big bang; they are the product of escalation. Policymakers must recognize from vague, ambivalent, and contradictory signals that something out of the ordinary is developing. They must appraise the threat and decide what the crisis is about.

Crisis managers often have a hard time meeting this challenge. The bewildering pace, ambiguity, and complexity of a crisis can easily overwhelm normal modes of situation assessment. Stress may further impair sensemaking abilities. Organizational pathologies produce additional barriers to crisis recognition.

Some categories of people are known for their ability to remain cool and to stay clear headed under pressure. They have developed a mode of information processing that enables competent performance under crisis conditions. Veteran military officers, journalists, as well as fire and police commanders are known for this. Some organizations have developed a proactive culture of "looking for problems" in their environment. These so-called high-reliability organizations have somehow developed a capacity for thorough yet fast-paced information processing under stressful

conditions. The unresolved question is whether organizations can design these features into existing organizational cultures.

Making Critical Decisions

During a crisis, governments and public agencies must decide on critical issues. These can be of many kinds. Scarce resources may have to be prioritized. This is much like politics as usual, except that in crisis circumstances, the disparities between demand and supply of public resources are much bigger, the situation remains unclear and volatile, and the time to think, consult, and gain acceptance for decisions is highly restricted. Crises also confront governments and leaders with issues they do not face on a daily basis, for example, concerning the deployment of the military, the use of lethal force, or the radical restriction of civil liberties. Crisis decision making is making hard calls, which involve tough value trade-offs and major political risks.

An effective response requires interagency and intergovernmental coordination. After all, each decision must be implemented by a variety of organizations; effective implementation requires that these organizations work together. Getting public bureaucracies to adapt to crisis circumstances is a daunting—some say impossible—task. Most public organizations were originally designed to conduct routine business in accordance with such values as fairness, lawfulness, and efficiency. However, the management of crisis requires flexibility, improvisation, redundancy, and the breaking of rules.

Coordination is not a self-evident feature of crisis management operations. The question of who is in charge typically arouses great passions. In disaster studies, the "battle of the Samaritans" is a well-documented phenomenon: Agencies representing different technologies of crisis management find it difficult to align their actions. Moreover, a crisis does not make the sensitivities and conflicts disappear that governed the daily relations between authorities and others before the crisis.

A truly effective crisis response is, to a large extent, the result of a naturally evolving process. It cannot be managed in linear, step-by-step, and comprehensive fashion from a single crisis center, however full of top decisionmakers and stacked with state-of-the-art information technology. There are simply too many hurdles that separate a critical decision from its timely execution in the field.

Meaning Making

In a crisis, leaders are expected to reduce uncertainty and provide an authoritative account of what is going on, why it is happening, and what needs to be done. When they have made sense of the events and have formulated a strategy, leaders must get others to accept their definition of the situation. If they are not successful, their decisions may not be understood or respected.

Public leaders are not the only ones trying to frame the crisis. Their messages coincide and compete with those of other parties, who hold other positions and interests, who are likely to espouse various alternative definitions of the situation and advocate different courses of action. If other actors succeed in dominating the meaning-making process, the ability of incumbent leaders to decide and maneuver is severely constrained.

It is often difficult for authorities to provide correct information right away. They struggle with the mountains of raw data (reports, rumors, pictures) that are quickly amassed when something extraordinary happens. Turning them into a coherent picture of the situation is a major challenge by itself. Getting it out to the public in the form of accurate, clear, and actionable information requires a major public relations effort. This effort is often hindered by the aroused state of the audience: People whose lives are deeply affected tend to be anxious if not stressed. Moreover, they do not necessarily see the government as their ally. And preexisting distrust of government does not evaporate in times of crisis.

Terminating a Crisis

Crisis termination is twofold. It is about shifting back from emergency to routine mode. This requires some form of downsizing of crisis operations. At the strategic level, it also requires rendering account for

what has happened and gaining acceptance for this account. These two aspects of crisis termination are distinct, but in practice often closely intertwined. The system of governance—its rules, its organizations, its power holders—has to be (re)stabilized; it must regain the necessary legitimacy to perform its usual functions. Leaders cannot bring this about by unilateral decree, even if they possess the formal mandate to terminate crises in a legal sense. Formal termination gestures can follow, but never lead the mood of a community. Premature closure may even backfire: Allegations of underestimation and cover-up are quick to emerge in an opinion climate that is still on edge.

Accountability debates can easily degenerate into blame games with a focus on identifying and punishing culprits, rather than discursive reflection about the full range of causes and consequences. The challenge for leaders is to cope with the politics of crisis accountability without resorting to undignified and potentially self-defeating defensive tactics of blame avoidance.

Crisis leaders can be competent and conscientious, but that alone says little about how their performance will be evaluated when the crisis is over. Policymakers and agencies that failed to perform their duties prior to or during the critical stages may manage the crisis aftermath well, thus preventing losses to their reputation, autonomy, and resources. Crises have winners and losers. The political (and legal) dynamics of the accountability process determines which crisis actors end up where.

Learning

A crisis offers a reservoir of potential lessons for contingency planning and training for future crises. One would expect all those involved to study these lessons and feed them back into organizational practices, policies, and laws. This does not always happen, however. Lesson drawing is one of the most underdeveloped aspects of crisis management. In addition to cognitive and institutional barriers to learning, lesson drawing is constrained by the role of these lessons in determining the impact that crises have on a society.

Crises become part of collective memory, a source of historical analogies for future leaders. The depiction of crisis as a product of prevention and foresight failures would force people to rethink the assumptions on which preexisting policies and rule systems rested. Other stakeholders might seize upon the lessons to advocate measures and policy reforms that incumbent leaders reject. Thus, leaders have a big stake in steering the lesson-drawing process in the political and bureaucratic arenas. The crucial challenge here is to achieve a dominant influence on the feedback stream that crises generate into preexisting policy networks and public organizations.

CRITICAL POLICY ANALYSIS

See INTERPRETIVE POLICY ANALYSIS

CRITICAL THEORY

The term *critical theory* generally refers to the philosophy developed by Max Horkheimer, Theodor Adorno, and Herbert Marcuse, and later by Jürgen Habermas, as part of the *Institut für Sozialforschung—* the Institute for Social Research, founded in 1923 as an affiliate of the University of Frankfurt. Its parameters are imprecise, but critical theory gradually developed its own identity as a distinctive restatement and reinterpretation of Marxist thought through the common themes of the diverse and original writings that emerged from the institute. In recent years, however, agreement on what constitutes critical theory has become somewhat fragmented.

The term *critical theory,* although its theoretical orientation and spirit owe much to Kant, Hegel, and Marx, appears to have first been used by Horkheimer in his 1937 essay titled "On Traditional and Critical Theory." Horkheimer wanted to define critical theory as a radical, emancipatory form of Marxian theory distinct from the model of science put forward by logical positivism and also separate from what he and his colleagues perceived as the covert positivism and authoritarianism of orthodox Marxism and communism. Horkheimer contended that traditional theory focused on deriving generalizations about the world, whether these generalizations were derived deductively (as with Cartesian theory), inductively (as with John Stuart Mill), or phenomenologically (as with Husserlian philosophy). However, Horkheimer argued, the social sciences were different from the natural sciences: Generalizations could not easily be made from so-called experiences because the understanding of experience itself was being fashioned from ideas that were in the observer. The observer is simultaneously part of what he or she is observing and inextricably caught up in the historical context where contemporary ideologies shape one's thinking. Thus, theory would be conforming to the ideas in the mind of the observer rather than the experience itself.

In *Dialectic of Enlightenment,* Horkheimer and Adorno abandoned this interdisciplinary materialist approach with its emphasis on cooperation with the social sciences. Adorno and Horkheimer did not want to deny the achievements of the Enlightenment, but instead wanted to show that it had self-destructive tendencies that its specific social, cultural, and conceptual forms realized in modern Europe. Since Adorno and Horkheimer planned to offer a positive way out of the dialectic of Enlightenment at the time they wrote these words, this reversal was by no means considered inevitable. In avoiding the reversal of Enlightenment, it is not enough simply to reconstruct rational content of modernity. Philosophical and social theory must also acknowledge its self-critical and emancipatory capacity.

At the heart of critical theory is an aversion to closed philosophical systems and pretensions to absolute truth. It differs from "traditional" social theory in its societal function. Traditional theory allows existing society to reproduce itself, but critical theory was designed to bring the basic contradictions of capitalist society to light by placing itself outside the confines of the existing structure. Traditional social theory draws from the Cartesian separation of subject and object, relying on "scientifically" accumulated evidence to analyze society "objectively." Critical theory proceeds from the view of mankind as the creator of history and society; it seeks a society of free actors that transcends the tension between, and abolishes the opposition to, the individual's purposefulness, spontaneity, and rationality and the results of his or her labor. Critical theory offers a critique of other social theories from a standpoint that derives its ethical impulse and methodological framework from Marxism.

One of the most original contributions of first generation critical theory was the integration of Marxian and Freudian theories. The association of political orientation and sociopsychological processes was, for the founders of the Frankfurt School, an undeniable and vital linkage.

Early critical theory professed to be an instance of enlightened revolutionary praxis. Eventually, however, resignation set in, resulting in political abstinence. Most first generation members of the institute were also members of the academic intelligentsia with high bourgeois backgrounds. Their attraction to

radical theory resulted from a philosophical revulsion against capitalism's oppression and hypocritical denial. Their greatest strength—their theoretical framework—also became their greatest liability, in that the theory developed was so radical it was irreconcilable with praxis. The role of philosophy became one of voicing protest, unmasking reason, and articulating human suffering, but not effecting change.

Jürgen Habermas

The so-called second generation of critical theorists, led most notably by Jürgen Habermas, has attempted to find alternative endings to the intellectual cul-de-sac that paralyzed the earlier school. Habermas began by critiquing advanced capitalism, a condition in which the state intervenes to regulate the market, ending liberal capitalism, in which the state assumes a more neutral role. In advanced capitalism, he argues, the market remains the primary steering mechanism and investment decisions are still made on the basis of profit, but the state replaces the market mechanism in instances where it creates and improves the conditions for the accumulation of capital. When the state no longer functions merely to secure the general conditions for production, but in fact actively engages in production, it becomes politicized and must be relegitimated. This is done by instituting a system of formal democracy that elicits diffuse mass loyalty, but which discourages participation. Political abstinence is, in fact, encouraged, because substantive democracy would bring awareness of contradictions to the fore. The shift from liberal capitalism has left behind bourgeois ideologies (the belief in science, universalistic value systems) that are now dysfunctional, but have no replacements. As the motivation patterns necessary for capitalism break down, legitimation becomes impossible. Advanced capitalism has created new needs that it cannot satisfy.

Habermas's central contribution to critical theory became the analysis of communication and its role in democratic society. Against this skeptical predicament of the first generation of critical theory, it could be said without exaggeration that Habermas's basic philosophical endeavor from knowledge and human

interests to the theory of communicative action has been to develop a more modest, more fallible, empirical account of the philosophical claim to universality and rationality. This more modest approach rids critical theory of its vestiges of transcendental philosophy and identifies more specific forms of social scientific knowledge that help in developing an analysis of the general conditions of rationality manifested in various human capacities and powers. Habermas calls for sciences whose aim is to render theoretically explicit the intuitive, pretheoretical know-how underlying such basic human competences as speaking, understanding, judging, and acting. These sciences yield knowledge that is not necessary but hypothetical, not a priori but empirical, not certain but fallible. They are, nevertheless, directed to universal structures and conditions and raise claims to an account of practical reason. In this way, Habermas undermines both of the traditional Kantian roles for philosophy and brings them into a fully cooperative relation to the social sciences.

Such an approach can be applied to normative features of democratic practices. Rather than only providing a set of explicit principles of justification and institutional decision rules, democracy is also a particular structure of free and open communication. Ideology restricts or limits such processes of communication and undermines the conditions of success within them. Ideology as distorted communication affects both the social conditions in which democratic discussion takes place and the processes of communication that go on within them. The theory of ideology, therefore, analyzes the ways in which linguistic-symbolic meanings are used to encode, produce, and reproduce relations of power and domination, even within institutional spheres of communication and interaction governed by norms that make democratic ideals explicit in normative procedures and constraints. As a reconstruction of the potentially correct insights behind Marx's exaggerated rejection of liberalism, the theory of distorted communication is, therefore, especially suited to the ways in which meanings are used to reproduce power, even under explicit rules of equality and freedom.

Democratic norms of freedom can be made explicit in various rights, including civil rights of

participation and free expression. Such norms are often violated explicitly in exercises of power for various ends, such as wealth, security, or cultural survival. Besides these explicit rights, such coercion also violates the communicative freedom expressed in ignoring the need to pass decisions through the taking of yes or no attitudes by participants in communication. For example, powerful economic groups have historically been able to attain their agency goals without explicitly excluding topics from democratic discussion but by implied threats and other nondeliberative means. Similarly, biases in agenda setting within organizations and institutions limit scope of deliberation and restrict political communication by defining those topics that can successfully become the subject of public agreement.

This theory of ideology as distorted communication opens up the possibility of a different relation of theoretical and practical knowledge than Habermas has suggested so far. His approach uses formal pragmatic philosophy to reflect upon norms and practices that are already explicit in justifications in various sorts of argumentation or second-order communication. Such reflection has genuine practical significance in yielding explicit rules governing discursive communication (such as rules of argumentation), which in turn can be used for the purpose of designing and reforming deliberative and discursive institutions. It is easily overlooked that such rules are only part of the story; they make explicit and institutionalize norms that are already operative in correct language use. Such implicit norms of well-formed and communicatively successful utterances are not identical with the explicit rules of argumentation.

These claims about norms raise two difficulties. First, there is a potential explosion of rules, because explicit rules require further rules to apply them. Second, this approach does not capture or evaluate the manner in which norms are often implicit only in practices. Making such implicit norms explicit is, therefore, a potential source of social criticism; it is then the task of the participant-critic in the democratic public sphere to change them. Finally, as in the case of ideological speech, the reconstructive sciences

also note deviant cases and through this indirect authority acquire a critical function as well.

Contemporary Critical Theory

As previously noted, there is little agreement about what constitutes critical theory today. The influence of critical theory can be seen in a number of fields ranging from anthropology to library science, and information sciences to public affairs.

- Critical social scientists believe that it is necessary to understand the lived experience of real people in context. Critical theory shares the ideas and the methodologies of some interpretive theories.
- What makes critical scholarship different from interpretive scholarship is that it interprets the acts and the symbols of society in order to understand the ways in which various social groups are oppressed.
- Critical approaches examine social conditions in order to uncover hidden structures. Critical theory teaches that knowledge is power. This means that understanding the ways one is oppressed enables one to take action to change oppressive forces.
- Critical social science makes a conscious attempt to fuse theory and action. Critical theories are thus normative; they serve to bring about change in the conditions that affect our lives.

Culture Governance

Culture governance refers to a specific, top-down steering mechanism designed to improve elite control over the outputs of highly complex systems, like the modern democratic welfare state. Where once effective governance was a matter of a hierarchical, bureaucratic state exercising control, the demands placed on postindustrial governments require that their constituents perceive themselves as stakeholders to assure the continued functioning of the system. Consequently, leaders and managers create associations that span the traditional divide between state and civil society to draw in the knowledge and participation of citizens and groups at all levels in order to shape it into forms most disposed to their continued control. Strategies like "The Third Way" and "EU Good Governance" are examples of attempts at culture governance.

The rise of culture governance is a response to the challenges to modern political systems posed by the effects of globalization. Transnational and subnational political entities pull from above and below, respectively, eroding state sovereignty. The increasing integration of national economies into a world market has undermined the capacity of these systems to carry out expected responsibilities like public spending, welfare, and other social services. The rapid and free flow of people and ideas undermines traditional conceptions of identity based on nationality or location. Within this environment, there is a growing recognition that given their complex and highly differentiated nature, modern political systems can no longer govern in a coherent and effective manner only by means of commands, directives, warnings, or patriotic appeals. Instead, they must actively empower, mold, and incorporate the ideas and values of citizens and civil society into the governing process. By expanding the role of self and cogovernance among the populace, systems can more effectively deliver expected services and increase the legitimacy of their decision making.

While more cooperative and inclusive than traditional, hierarchical authority, culture governance is still an elite-directed steering tool. Citizens are empowered and courted, but for the sake of the system, not their own. Consequently, culture governance poses a unique challenge to the foundations of representative government. Culture governors seek to connect with the polity down to the individual level through new, dedicated networks to make it amenable to their policy directions. By bypassing established mechanisms like national parties and big interest groups, elites undermine the authority of traditional political institutions. Moreover, the efforts to preprogram public reasoning, even at the most basic level, imperil the necessarily spontaneous and freewheeling nature of political association at the grassroots level. As such, culture governance threatens to supplant the politics of the ordinary by coopting even the most mundane political discourse with an underlying imperative to maintain and improve the existing system.

Cyberspace

Cyberspace is the amorphous, supposedly "virtual" world created by links between computers, Internet-enabled phones, personal digital assistants, servers, routers, fiber optic cables, and wireless links throughout

the world. As opposed to the Internet itself, cyberspace is the place produced by these links existing, from the perspective of some, apart from any particular nation-state. The term *cyberspace* was used first by Canadian author William Gibson in 1982 in an *Omni* magazine story and then in his book *Neuromancer.* In this science fiction novel, Gibson described cyberspace as the creation of a computer network in a world awash with artificial intelligence beings and the demise of the nation-state. *The Matrix,* a film released in 1999, included references to *Neuromancer* in its depiction of our reality as false and the creation of intelligent machines of the future.

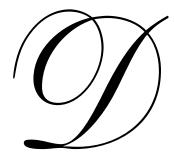
In the popular culture of the 1990s, cyberspace as a term was taken on to describe the "location" in which people interacted with each other while using the Internet. This is the place in which online games occur, the land of chat rooms, and the home of instant messaging conversations. In this sense, the location of the games or the chat room itself can be said to "exist" in cyberspace. Cyberspace has also become an important location for social and political discussion, with the popular emergence in the late twentieth and early twenty-first century of Web-based discussion boards and Internet Weblogs, or blogs. Blogs are typically produced by an individual who includes his or her personal writing and often offers running commentary and links to other locations on the Web they deem of interest. With the emergence of "blogging" software, even those people unfamiliar with software programming for the Web can create their own Weblog. Thus, blogs can be seen as offering an opportunity for public discussion in cyberspace that is not available in the offline world.

Early in the evolution of the Internet, in the middle of the 1990s, many users believed and argued that the world of cyberspace should be free from the regulations of any national government. John Perry Barlow's "A Declaration of the Independence of Cyberspace" proposed that current national governments should play no role in the governance of cyberspace. He argued that the community existing in cyberspace would create its own rules and manage conflicts apart from the laws and judiciary of any

particular country. Particularly important was the protection of free expression and exchange among the "bodiless" personalities of cyberspace. This perspective would be particularly relevant if it was possible to hide the physical location and identity of a person participating in an activity "in cyberspace."

Since the emergence of the Internet, however, national governments and their analysts have shown both the relevance of national regulations and international agreements on the character of cyberspace. Those bodiless actors in cyberspace must access this other realm through their corporeal form, and thus continue to be constrained by the laws governing their physical location. The Chinese government maintains strict controls on who is able to access the Internet and what content is available to them. The U.S. government limits certain online activities, such as the sharing of digital data, through the Digital Millennium Copyright Act. In addition, the United States has developed a strategy for the security of cyberspace in order to prevent and respond to attacks on the Internet infrastructure. The control of cyberspace is thus important not only because of the actions of individual participants, but because the infrastructure of cyberspace, the network linking everyone together, which is now fundamental to the functioning of national and international security systems, trade networks, emergency services, basic communications, and other public and private activities. Because national governments see potential threats to the security of their citizens and to the stability of their regimes arising within cyberspace, they act to control both access and content.

The Electronic Frontier Foundation (EFF), of which John Perry Barlow is a cofounder, and other organizations continue to make an effort to protect the opportunity to use cyberspace as a location for free sharing of knowledge, ideas, culture, and community. The EFF pursues this goal through a variety of activities, including opposition of legislation it sees in conflict with free use of technology, the initiation of court cases to preserve people's rights, and publicity campaigns to inform and engage the public on issues of cyberspace and technology. Organizations outside of

the United States are also acting to balance the efforts by governments to control cyberspace with movements to ensure people's opportunity to communicate and trade via networked technologies.


The development of cyberspace serves as an important example of the ways in which new technologies can produce unexpected governance questions. There are no established guidelines for how to regulate interactions in a virtual realm, and this has forced governments to analyze the characteristics of the technology and negotiate across borders in order to develop viable regulatory systems for interactions and commerce in cyberspace. These regulations play a large role in defining the boundaries of cyberspace activity, even when they are put into place to restrict activities that are already occurring. As a result, while some may argue that cyberspace should be free from government intervention, governments have responded by developing new regulatory models to ensure that the technologies that support cyberspace

and the activities they enable are tightly connected to existing governance structures.

D

Data Protection

Data protection is a species of privacy law that controls access to information relating to the individual. Typically, data protection provides an individual with the right to see data held about himself or herself and to require their correction. Beyond that, data protection determines how organizations holding data may—or may not—process them, and, in particular, it regulates access to personal data by third parties. Data protection regimes are customarily overseen by independent regulators with the power to impose penalties on organizations misusing data. Exemptions from the regime, of varying scope, are provided for such purposes as law enforcement and national security.

Data protection was originally promoted as a protection against tyranny in postwar Europe, and it should be understood as one expression of the desire to safeguard an individual's family and personal life (as enshrined in the European Convention on Human Rights). This concern was coupled with a growing awareness of the power of computers—in public and private sectors—to process and manipulate data about individuals. The 1980 Organisation for Economic Co-operation and Development (OECD) Guidelines on the Protection of Privacy and the Council of Europe's 1980 Convention on the Automatic Processing of Personal Data should be seen as products of this mindset.

The adoption of the European Union (EU)'s Data Protection Directive (95/46) gave added impetus to this emerging international legal regime. The directive established a comprehensive (and extremely complicated) system of information privacy whose impact was soon felt far beyond the EU itself. Mindful of the transfer of personal data across international boundaries, the EU has sought to police the handling of data in third-world countries. Its influence can be seen in Australia's Privacy Amendment Act 2000—which is modeled on the European principles—and in the 2000 personal data safe-harbor agreement between the EU and the United States.

In many countries, data protection systems now exist alongside freedom of information regimes. The latter are restricted to the public sector, whereas the former may or may not take in the private as well as public sector. The junction between the two regimes has proved problematic for legislators. Canada provides a relatively unusual example of an integrated regime; others have grafted one system onto another, with results that are difficult for the lay observer—or the specialist—to understand (see, for example, the United Kingdom's 2000 Freedom of Information Act).

Data protection will remain one of the most significant instruments regulating the global Information Society. The progressive extension of regulation to the private sector has proved contentious in a number of jurisdictions. Equally controversial has been governments' desire to share data between public-sector

agencies—to improve service delivery or to strengthen their fight against organized crime and terrorism. In reaction to these pressures, reformers have sought a system that is less burdensome and that is easier for all parties to understand.

Decentered Theory

To "decenter" is to analyze knowledge and practices as fragmented and complex products of individual activity. Decentered theory rejects the notion that there is a single, natural, or incontestable reading of a text, institution, or series of events. The theory asserts that we do not hold a mirror up to the world but, rather, employ a kaleidoscope of sometimes contrary, sometimes harmonious, but always contingent, individual viewpoints to construct our worlds. Hence, it implies that we cannot reduce beliefs and actions to social facts about people, but instead need to craft aggregate concepts out of the contingent beliefs, desires, and actions of individuals. Instead of seeking one core explanation or the facts of a matter, a decentered approach garners people's interpretations of events from multiple standpoints, and then offers an interpretation of these interpretations.

Decentered theory, like other interpretive approaches, lends itself to bottom-up studies. Governance is the contingent product of politicians, bureaucrats, and citizens—all formulating, implementing, and responding to policies in accord with their multiple, clashing beliefs. Indeed, a decentered theory of governance does not define governance as some kind of social fact apart from these clashing beliefs and actions. Theorists seek, instead, to reveal how governance is socially constructed both as a concept and a practice. Forms of governance can be unraveled by interpretations of the diverse beliefs of the policymakers, bureaucrats, service providers, or citizens who variously construct the meaning of policy language and events from their respective individual standpoints, and so encounter and react differently to the demands of these events. The course of governance, in practice, is the ungovernable outcome of the interactions of these various actors with their diverse beliefs.

According to decentered theory, there are no objective social facts because actions are based on contingent subjective beliefs. We understand forms of governance not as natural or inevitable with a fixed content but, rather, as the historical products of such actions. We explain these actions through interpretations of the relevant beliefs, which we can access by various strategies, most notably ethnographic ones. We then explain these beliefs by means of historical narratives that locate them against the background of relevant traditions and dilemmas. Decentered theory suggests, therefore, that political science is an interpretative discipline underpinned by hermeneutic philosophy rather than positivism. Indeed, a decentered approach disputes that there is a "science" of politics; it suggests, to the contrary, that all explanations, including those that deploy statistics and models, are best conceived as narratives.

Mark Bevir and R. A. W. Rhodes provide a detailed philosophical foundation for a decentered theory of governance. They argue that decentered theory pivots around the idea of situated agency: Institutions, practices, or socialization cannot determine how people behave, so any course of action is a contingent individual choice. People's actions are explained by their beliefs (or meanings or desires); any one belief is interpreted in the context of the wider web of a person's beliefs, and these beliefs are explained by traditions and modified by dilemmas. A tradition (or episteme or paradigm) is the set of theories against the background of which a person comes to hold beliefs and perform actions. A tradition is a first influence upon people—a set of beliefs that they inherit and

then transform in response to encounters with "dilemmas" (or problems or anomalies). A dilemma arises whenever novel circumstances generate a new belief that forces people to question their previously held beliefs. Change occurs through encountering such dilemmas: Although individual responses to dilemmas are grounded in traditions, they then modify just those traditions.

It follows that the role of political scientists is to use (a) ethnography to uncover people's beliefs and preferences and (b) history to uncover traditions as they develop in response to dilemmas. The product is a story of other people's constructions of what they are doing, which provides actors' views on changes in government, the economy, and society. So, for example, a political scientist may select a part of the governance process, and then explain it by unpicking various political traditions and how actors within these traditions encounter and act to resolve dilemmas. Governance is thus understood as the contingent and unintended outcome of competing narratives of governance.

Decentered theory has a growing number of practical applications. Bevir and Rhodes have applied the theory mainly to British governance. They highlight Tory, Liberal, Whig, and Socialist traditions as the background to competing patterns and narratives of civil service reform. They have also applied decentered analysis to Whitehall under Prime Minister Blair, the reform of the National Health Service, and police reform. Elsewhere Henrik Bang and Eva Sørensen interpret Danish actors' accounts of the meaning of their political engagement. Bang and Sørensen thereby identify "everyday makers" who eschew ideologies, party politics, and hierarchical government, and, in their own view, drop in and out of active political engagement in immediate day-to-day problems at the local level. The outcome is a decentered, bottom-up, opportunistic form of network governance based on the contingent mediation of difference through negotiated consent. Bang then uses the term *culture governance* to describe a type of sovereignty that has no fixed outcomes because it is an indirect rule that encourages self-generated self-governance through a decentered differentiated unity.

When compared with a traditional, hierarchical, top-down approach, a decentered theory of governance is anarchic, radical, and lawless, and revels in the uncertainty of contingency while embracing the ideal of bottom-up political empowerment through situated agency. Decentered theory draws predictable criticisms from positivist, institutionalist, and structuralist approaches. But these criticisms are deflected by its strong theoretical underpinnings.

1. The critics say decentered theory is concerned with beliefs, discourses, and understanding at the expense of actions, practices, and explanation, but decentered theory implies that these are false dichotomies because, for instance, actions embody beliefs.

2. Critics complain that power and social structure are sidelined by decentered theory; but a decentered theory's concept of tradition incorporates a concept of power, whereas the concept of social structure seems to neglect situated agency.

3. Critics say that decentered theory ignores quantitative data, but the theory actually allows that data can be derived from any method—what matters is that all data are treated in accord with the theory.

4. Critics dismiss decentered theory as "postmodern" or "relativist," but decentered theorists developed their concept of situated agency in opposition to postmodernism, and, far from being relativist, the theory encourages us to compare rival narratives and judge them against agreed facts.

5. Critics argue that decentered theory is not policy-relevant, but decentered approaches allow political scientists to make informed conjecture rather than all or nothing predictions, and policy advice can take the form of rules of thumb (or proverbs) to direct managerial practices.

6. Critics say that if governance is reducible to manifold, contingent constructions open to multiple interpretations, then we may question whether governance exists at all as an object in itself, but for a decentered theory of governance, this is entirely the point.

DECENTRALIZATION

In recent decades, decentralization has come to be regarded as an essential element of democratic governance and most Western states as well as some non-Western states have implemented decentralization reforms. There are, however, several distinct ways of understanding decentralization. We can distinguish between political, administrative, and economic types of decentralization. Political decentralization refers to processes where the power of political decision making and certain functions are transferred from a higher level of government to a lower one. This can be from the level of the central state to lower levels such as the meso (regions, provinces, or counties) and the local (communes or municipalities). It can also refer to the transfer of political decision-making powers and functions from the mesolevel—a region, for example—to the municipal level. Both kinds of political decentralization can be seen in the Spanish case, where a first wave of decentralization, following the transition to democracy in 1976 to 1978, involved transferring powers from Madrid to the Autonomous Communities (ACs). Although this decentralization is still not complete, a recently begun second wave of decentralization involves the transfer of competences from the ACs to the municipalities. In some political systems, such as in France and Sweden, there is no hierarchical relation among the levels of government below the national level. Administrative decentralization means the transfer of a number of tasks and functions from central departments to lower levels of the administration. This may take different forms. It might simply mean increasing the tasks of lower branches of the same department, which remains a central department. Or it might involve transferring tasks to different territorial administrations (that is, to a separate territorial civil service) as in France after the 1982 decentralization reforms. It may just be a dispersal of branches of the administrative system in provincial towns away from the capitol as happened in the United Kingdom where, for example, passport agencies or social security offices are found in different parts of the country, or as is happening currently in Ireland where the Irish government is shifting a number of administrative offices outside of Dublin. Finally, economic decentralization means the attempt to move industrial and other economic activities to the regions. This happens for two reasons. First, it reduces the industrial congestion and therefore high costs in centers such as London or Paris. Second, it is a part of regional policy aiming to bring jobs to the workers. These different forms of decentralization are not intrinsically related to each other although some forms imply the others. Administrative decentralization can take place without a corresponding political decentralization, although effective political decentralization will usually decentralize administrative resources as well. Among these resources are fiscal powers to enable the decentralized bodies to carry out the tasks that are assigned to them. Economic decentralization can occur without political decentralization although some administrative decentralization may be necessary if the central state is involved in the policy. Today, however, this form of decentralization is less common than in the 1980s and 1970s. Finally, decentralization is related to, but not identical with, regionalization. First, there can be decentralization, even of the political kind, without regionalization in the sense that local government may be strengthened through decentralization without setting up elected regional assemblies or even administrative regions. Second, regionalization is a form of political decentralization, but regions themselves might be highly centralized, as in the Flemish regions and communities or in Catalonia. In this sense, we can speak of Jacobin regionalism.

Recently, the term *devolution* has become prominent in political discourse because of the United Kingdom's devolution reforms instigated after the 1997 Labour Party victory led by Tony Blair. This vast program of reform has involved granting a parliament to Scotland, assemblies to Wales and Northern Ireland, and an assembly to the greater London area, all directly elected. In other languages, however, the term *devolution* is used in a different sense. In French, *la dévolution* is a legal term that refers to the transfer of possessions from one owner to another, as in the estate left in a legacy, or from one monarch to another. An example is the Guerre de Dévolution when Louis XIV went to war with Spain in support of the claim of his queen Maria Theresa to the Low Countries. The English term *devolution* is more accurately translated into French as *la decentralisation politique,* whereas administrative decentralization should be translated as *la déconcentration administrative.* In Italian, however, although the original meaning of *la devoluzione* was similar to the French, there has been an adoption of the English word, thanks to Umberto Bossi, the head of the Northern League, who used it to mean the "federalization" of the Italian state.

Periodization

Decentralization also has distinct meanings depending on the period of history in which it is used. During the period of the Trente Glorieuses, the thirty years of the welfare state (1945 to 1975), the state was in continual expansion as it sought to manage the postwar economic boom and to respond to the ever-increasing needs and aspirations of the population with expanding policy programs. This entailed a high degree of centralization and uniformity across the state's territory. Unitary states such as the United Kingdom, France, and Italy, as well as federal states such as Germany and the United States experienced such centralization. Regional and local governments even in states with a strong tradition of local government, such as the United Kingdom, tended to become local administrations. Central-local relations were marked by a principal-agent relationship in which the central state was the

principal one, and regional and local authorities were the agents whose task was to implement a number of welfare services on behalf of the state. During this period, decentralization mainly took the form of administrative decentralization, which left intact the role of the center in political decision making. This was true even for the so-called decentralized unitary states of Scandinavia and the Netherlands, where, although local government had an important role in implementing the welfare state programs, there was still a high degree of regulation by the central government or, in the Swedish case, the parliament.

The welfare state period was built on a consensus between the main political forces of the Left and Right as part of the general postwar reconstruction. Nonetheless, some political groups on both the Left and Right mounted significant critiques of the welfare state. Political decentralization became one element of these wide-ranging critiques. Among the Left were neo-Marxist thinkers from the Frankfurt School, such as Herbert Marcuse, who criticized the stifling bureaucracy of the state, which hindered the full development of individual freedom. In France, Michel Crozier attacked the French state and society for using the tools of organization theory, and the autonomy advocated by politicians such as Michel Rocard was under stress. These demands from the New Left in France and elsewhere became part of new social movements described by Alain Touraine—regionalist, feminist, and environmentalist groups. On the Right of the political spectrum, economists such as Milton Friedman and Friedrich von Hayek, philosophers such as Robert Nozick, and political scientists such as William Niskanen mounted a systematic critique of the welfare state, which implied reducing or even abolishing some of the powers of the central state. This led to the New Right, or neoliberal school approach, which became the basis of the political ideology of Ronald Reagan and Margaret Thatcher. Both these schools of thought advocated a form of political decentralization in the sense that they both wanted to reduce the power of the central state, but they clearly meant different things by the term.

These two critiques of the welfare state were effective in different ways. The Left-wing critique

found expression in the student revolts of the 1960s whose effects were mainly cultural, affecting values and lifestyle. This became known, retrospectively, as the neoliberal policy and administrative approach of the New Right, however, and had a deeper political impact. When the welfare state entered into crisis in the late 1960s and early 1970s, the ideas of the New Right came to the fore with the arrival to power of Thatcher in 1979 and Reagan in 1980. These ideas were put into practice as a way of responding to the crisis. There was now a systematic attempt to reduce the interventionism of the Keynesian and Beveridgian state through privatization and deregulation as well as separating functions that had previously been the responsibility of the state to private firms and to semi-independent agencies. This was a kind of political decentralization, although it was not necessarily a way of promoting local democracy. On the contrary, under Thatcher, the United Kingdom became, in certain respects, more centralized than it had ever been and the powers of local government were seriously reduced. On the other hand, there was a growth of governmental semi-autonomous agencies that operated at arm's length from central government although they were nominally under the control of the central departments. The Thatcherite notion of democracy was a consumer democracy. The neoliberal reforms had their greatest impact in the United Kingdom, but variations of them were carried out in almost all other developed states. In Denmark, for example, there were neoliberal type reforms even before Thatcher came to power in the United Kingdom. Furthermore, Thatcherism became popular in the states of Latin America and in the new democracies of the former Soviet Bloc.

The emergence of the neoliberal approach to policy and administration coincided with the "relaunch" of European integration in the mid-1980s. The events were related in that both were responses to the crisis of the old welfare state paradigm and to the challenges of globalization. What is important from the point of view of decentralization is that the strengthening of European integration also meant the introduction of the principles of subsidiarity and partnership. These were first introduced as principles of governance with the successive reforms of the Structural Funds. These principles were finally given full legal recognition with the Treaty on European Union signed at Maastricht in 1992. At the same time, the single market project was in line with Thatcher's neoliberal approach. The neoliberal reforms of the 1980s and 1990s were continued by Center-Left politicians such as Tony Blair in the United Kingdom, Gerhard Schroeder in Germany, and Lionel Jospin in France, each of whom developed a distinctive third way that attempted to combine the basic ideas of neoliberalism with the values of social democracy.

Tendencies Toward Decentralization

The movement toward political decentralization intensified in the 1980s. During this period, all of the large Western states, with the exception of the United Kingdom, and many of the smaller ones carried out decentralization reforms. In Spain, after the death of Franco in 1976, the Spanish Constitution of 1978 linked democratization, Europeanization, and decentralization in the form of the *Estado autonomico*. France launched major decentralization reforms in 1982. In 1993, Belgium made the final transition from its form of a Jacobin unitary state to a highly decentralized federal state. The Scandinavian states, although already described as decentralized and unitary, embarked in the late 1980s on a series of reforms as a self-regulating municipality designed to reduce some of the regulatory burdens, which impeded the municipalities. In the 1990s, Italy experienced a constitutional crisis that swept away at least part of the old corrupt political class and embarked on important reforms that strengthened the regions and local authorities. Accelerating European integration also encouraged at least administrative decentralization in the form of the establishment of administrative regions in small, traditionally highly centralized states such as Greece, Ireland, and Portugal.

The Codification of Regional and Local Democracy

Decentralization is today regarded as an essential element of good governance and of democratic practice,

and a number of international organizations have worked to establish this practice. One of the most important is the Council of Europe, one of whose key tasks is the promotion of democracy. The Council played, for example, an important role in overseeing the transition to democracy of the former communist states, most of which became members. The Congress of Local and Regional Authorities of Europe (CLRAE), a branch of the Council of Europe, has the task of promoting regional and local democracy. Already in 1985, the CLRAE promulgated the European Charter of Local Self-Government, which has since been signed and ratified by forty-one of its forty-six member states, and two others have signed but not ratified it. The charter describes some of the conditions for the exercise of local autonomy, seen as an essential element of democracy. It is currently working to produce a similar charter on regional self-government, although reaching agreement is proving more difficult. At the same time, the CLRAE has made a number of declarations approving the development of regional government. In the case of the transition countries of the former Soviet Bloc, the CLRAE ensured that regional and local democracy became enshrined in their constitutions and the design of their states. These had previously been highly centralized and the local level completely dominated by the ruling communist parties. In this way, political decentralization has become an essential element of democratization and regional and local democracy are now seen as essential elements of democracy itself. This perspective has also been adopted by the United Nations (UN) Habitat Program, which, in 2004, adopted a Declaration of Principles of Effective Decentralization, largely inspired by the European Charter of Local Self-Government. We have also noted that among the principles of governance of the European Union (EU), as expressed in the Maastricht Treaty on European Union, are subsidiarity and partnership.

Liberal representative democracy has been closely associated with the emergence of the nation-state as the primary form of state organization. Democracy has been understood as *national* democracy—democratic legitimacy is grounded on the decisions of assemblies that represent the nation—and the theory of democracy has been built on this assumption. As a result of the trends outlined previously—the actual decentralization reforms of most advanced states and the codification of decentralization by bodies such as the Council of Europe, the European Union, and the United Nations—the theory of democracy must now include a consideration of regional and local democracy (and also transnational democracy) and decentralization can be considered an instrument to achieve as well as a condition of its existence.

Decision Making

Individual-level decision making provides the microfoundations for organizational behavior and national policy. Different models of decision making lead to dramatically different analyses and predictions. Decision-making theories range from objective rational decision making, which assumes that individuals will make the same decisions given the same information and preferences, to the more subjective logic of appropriateness, which assumes that specific institutional and organizational contexts matter for the decisions that individuals make.

Rational Decision Making

In modern Western societies, the most common understanding of decision making is that it is rational—self-interested, purposeful, and efficient. During rational decision making, individuals will survey alternatives, evaluate consequences from each alternative, and finally do what they believe has the best consequences for themselves. The keys to a decision are the quality of information about alternatives and individual preferences. Modern economics is built on this understanding of how individuals make decisions.

Rational decision making becomes efficient when information is maximized and preferences are satisfied using the minimum of resources. In modern societies, rational decision making can occur in markets or firms. Both assume that individuals will act rationally, maximizing self-interest, but each works most efficiently under different conditions. Markets are most efficient when both buyers and sellers exist, when products or services are discrete so that the exchange can be one time, when information about a product or service (such as its technology or means of evaluation) is broadly understood, and when there are enforced penalties for cheating.

Lacking these conditions, consensual exchange cannot occur, and rational individuals will try to cheat others to maximize their gain. In these cases, a hierarchical organization is more efficient. Max Weber described how modern factories and bureaucracies became dramatically more efficient through growing technical expertise, and more importantly, a new division of labor, which divided work, specialized expertise, and coordinated individuals in a rule-based hierarchy. Bureaucracies decomposed complex technologies into manageable pieces, then allowed individuals to specialize and master a defined skill set. Using a clear hierarchy in which each position is controlled and supervised according to a stable and non-arbitrary system of rules, each individual's work and expertise could be coordinated to achieve organizational goals, ranging from winning wars to making dresses.

Satisficing and Bounded Rationality

In the 1940s, organization theorists began to challenge two assumptions necessary for rational decision making to occur, both of which were made obvious in cases where markets failed and hierarchies were necessary. First, information is never perfect, and individuals always make decisions based on imperfect information. Second, individuals do not evaluate all possible alternatives before making a choice. This behavior is directly related to the costs of gathering information because information becomes progressively more difficult and costly to gather. Instead of choosing the best alternative possible, individuals actually choose the first satisfactory alternative they find. Herbert Simon labeled this process satisficing, and concluded that human decision making could at best exhibit bounded rationality. Although objective rationality leads to only one possible rational conclusion, satisficing can lead to many rational conclusions, depending upon the information available and imagination of the decisionmaker.

Simon argued that otherwise irrational individuals can behave rationally in the right context, particularly within a formal organization. Organizations can structure, or bound, individuals' decisions by manipulating the premises on which decisions are made. Organizations can filter or emphasize information, bringing facts to an individual's attention and identifying certain facts as important and legitimate. Individuals in hierarchies can take most of what happens around them for granted, concentrating only on a few key decisions. Hierarchies are efficient because they ensure that the correct information gets to the correct decisionmakers, and that the correct person is making the decisions. At the same time, hierarchical organizations can socialize individuals to refrain from cheating by creating value decision premises that underlie decisionmakers' judgments on what is right or good to do. These values, beliefs, or norms can come from family, from school, or from within the organization, but the organization can structure environments so that the most desirable value will be most salient at the time of decision.

Hierarchical organizations can structure factual and value decision premises so that the range of action becomes so narrow that only one alternative remains: the rational choice. Structuring decision premises can be done by directly managing information, selectively recruiting members, training members, and creating closed promotion patterns.

Organizations become rational in pursuing their missions through what Simon called ends-means chains. Leaders set the organizational mission, find a set of means for achieving the mission, take each of these means as a subgoal, and then find means for the subgoals and so on, until goals exist for every member of the organization. Leaders thus create a hierarchy of goals, in which each organizational level's goals is an end relative to the levels below it and a means relative to the levels above it. Each individual's work thus becomes a small part of accomplishing the organization's mission.

Intra-Organizational Political Decision Making

Turning Simon's bounded rationality on its head, organization theorists such as Richard Cyert and James March saw organizations not as purposeful, cohesive actors but as a groups of competing coalitions made up of individuals with disparate interests. Individuals do not represent organizational interests; organizations represent individuals' interests. Cyert and March argued that organizations have no missions. Instead, organizations have goals set by a temporarily dominant coalition, which itself has no permanent goals and whose membership is subject to change. Members of the dominant coalition make decisions by bargaining, negotiating, and making side payments. Organizational decision making is the product of the game rather than a rational, goal-oriented process. Individual decision making is rational in the narrow sense that individuals pursue individual, self-interested goals, though this cannot always be accomplished directly. Individuals must pick their fights and use their influence carefully.

To understand and possibly predict what organizations will do, it is necessary to uncover and analyze the membership of dominant coalition. The formal organization chart is not a reliable map of organizational power. Instead, analysts must discover authority. Individuals gain authority by being able to resolve uncertainty. Individuals that can unravel technical problems, attract resources, or manage internal conflict demonstrate their usefulness to the rest of the organization and gain power. Working in concert with others who can perform similarly valuable functions, they become part of the dominant coalition. The size and composition of the dominant coalition depend on the types of environmental, technical, or coordinating uncertainty that must be resolved for the organization to survive. More technically complex, larger organizations in rapidly changing environments will tend to have larger dominant coalitions.

Incremental Decision Making and Routines

For rational decision making to occur, an individual must gather information and analyze potential choices by devising alternate and complete sets of ends-means goals for all members of the organization. If a single individual cannot do this, then the leadership must complete this planning function so an organization can be rational. Leaders must create logical ends-means chains, as well as set out clear subgoals supported by appropriate factual and value decision premises. Scholars such as Charles Lindblom believe the task is impossible. No group, no matter how clever or technically competent, can create subgoals and coordinate efforts at a place like IBM or the New York Public School System. The contexts and environments change too quickly, technology is too complicated and contingent, and the organizations are too large and unwieldy for leaders to effectively imagine and evaluate complete alternative plans of action for the entire organization.

If overall coordination and top-down guidance is impossible, then how do regular members make decisions? Lindblom argued that when faced with change, individuals will tend to continue doing what they already know how to do. Decisions are repetitive and similar because the guide to future action is past action. Bureaucrats are content to use the same procedures and forms, comfortable in their routines. If that regular behavior produces a result that they perceive as failure, individuals will adjust to avoid the failure. Change is reactive and incremental. In cases where feedback to individuals lags or no feedback exists at all, change may never occur. Bureaucracies exhibit incredible inertia, and reform is a mammoth undertaking, usually with modest results.

Other organization theorists such as March and Johan Olsen explained in more theoretical detail why individuals will tend to repeat decisions and follow routines. They argue that humans make sense of the world by using routines that frame experiences to make them intelligible. These informal routines absorb uncertainty, making it possible for humans to function by allowing them to focus on just a few important decisions. Formal organizations, especially hierarchical organizations, exaggerate this tendency toward routine and use it to achieve organizational rationality. As Simon noted, organizations focus individuals' attention and decompose complex tasks and problems so that one person can handle them. Practically speaking, organizations accomplish this by creating standard operating procedures. Although standard operating procedures allow individuals to function and cooperate at a high level, they also create the organizational inertia that Lindblom noted. Routines put blinders on individuals, absorbing uncertainty but also reducing the information they receive and perceive. Routines and particularly formal routines such as standard operating procedures often become disconnected from the actual requirements of the job at hand and even from individuals' immediate self-interest because individuals become so accustomed and dependent on their routines that they literally cannot imagine doing without them. What used to be rational decision making becomes irrational in new circumstances.

Appropriate Decision Making

Moving to the opposite end of the theoretical spectrum from rational decision making, a more sociological approach emphasizes social context over economic rationality as the key to decision making. According to the logic of appropriateness, individuals consider their situation, evaluate their role in that situation, weigh actions according to which is most appropriate, and finally do what is appropriate. Rational decision making assumes that individuals will act to maximize their preferences and engage in self-interested behavior, but the logic of appropriateness assumes that individuals will conform to external rules—norms,

routines, procedures, and roles—often without consciously realizing they are making a decision. Individuals tend to do the right thing.

Appropriate decision making emphasizes the fit between the context, especially social norms and roles, and individuals' perceptions, especially their self-perceptions. Behavior follows from how individuals fit the nested contexts and roles they inhabit. Predicting behavior is complicated because individuals inhabit many, many contexts and many roles. In any given situation, an individual must decide, even if subconsciously, which of several competing roles and related rules to apply. The key criterion is how appropriate the rule is to the situation.

March and Olsen showed how the logic of appropriateness inverts the causal logic of rational decision making. Individuals form opinions and make decisions to be appropriate in their surroundings, to fit in with those around them. This means that context precedes preference, and social interaction is more important than abstract self-interest. Instead of liking those we trust, we trust those we like. Instead of choosing our friends on the basis of what they value ("I like Carolyn because we both voted Democrat"), we choose our values to match with those we like ("I voted Democrat because I like Carolyn and she voted Democrat"). Of course, all decisions cannot be socially appropriate, and all preferences are not socially derived. But the first cause is social, rather than innate preference. Timing is important. Social contexts matter more when preferences are weak, as in childhood, or shaken, as during a crisis. Behaviors and structures will tend to replicate themselves, as new members are socialized and internalize the preferences, values, norms, beliefs, and ideas of those around them.

Temporal Decision Making

Finally, some scholars studying organizations and observing real decision making saw so much disorder and randomness that they came to believe there is little consequential, logical order to decision making. Instead, scholars such as Michael Cohen, March, and Olsen saw temporal order. Studying universities, they found problems, solutions, decisionmakers, and

choice opportunities coming together as the result of being simultaneously available. Timing is key. Decisions are produced by happy accidents, when all the necessary ingredients can be combined.

In what Cohen, March, and Olsen called garbage can processes, problems, solutions, opportunities, and decisionmakers swirl around independent of each other within organized anarchies, which act only to contain them. Organizations are organized anarchies when they have problematic preferences, unclear technology, and fluid participation. In other words, in organized anarchies, members are unclear and inconsistent about what they want to do, how they are supposed to do it, and who should make which decisions. As a result, people, solutions, and problems are independent, and a decision is only made when the four are connected by timing and attention. Attention is the key resource because most decisions are left unmade because no one is paying attention. Solutions search for problems, as people with pet ideas wait for the opportunity to spring them.

Evaluating Decision-Making Models

Some models are more appropriate to certain situations than to others. Universities will tend to be garbage cans, but armies will tend to be rational hierarchies. The nature of the task, the technology, the personnel, and the context provides clues about what type of decision making will occur. The more specific the goal, the better understood the technology, the less professionalized the personnel, and the more stable the context, the more likely rational decision making will occur.

The different models, however, reflect different fundamental assumptions about human interaction and behavior. Each has strengths and weaknesses. Rational decision making is an elegant and powerful model. But it also fails to accurately describe almost all actual decision making. Tinkering with it to accommodate psychology or politics makes it more realistic, but the model also loses elegance and analytic power, producing more description than prediction. The logic of appropriateness and temporal sorting may have the most intuitive appeal, but systematically applying

them can be difficult, and producing confident predictions is nearly impossible.

Decision-making models have real implications for strategy and policy making. For example, arguments for school vouchers in education rest on the assumption that parents are rational decisionmakers and will choose to send their children to the best schools. If Simon is right and they are satisficers, however, parents need substantial assistance with researching and evaluating schools if they are to make rational choices. If parents actually use logic of appropriateness, the experts' opinion of the best schools will not matter as much as their friends' and neighbors' opinions, which may have more to do with the basketball team or location than academics. Finally, if parents simply follow routines or are not paying attention, they will do nothing because they will not receive any penalty for not exercising school choice. Vouchers will only benefit those who are already paying attention: parents who send their children to private schools or home school their children.

DEINSTITUTIONALIZATION

Most theorists conceive of an institution as a set of rules or norms that shape individual or group behavior. Deinstitutionalization describes the weakening of the norms and rules that previously dictated individual and group behavior within organizations or, more generally, in the political arena. Institutions are often reinforced by a concrete set of formal organizations or procedures. When deinstitutionalization occurs, these formal organizations or procedures may breakdown as they lose broad support, funding, and other resources. Writing on deinstitutionalization falls into three broad categories: (1) studies of the breakdown of rational-legal institutions, (2) studies of the decline of formal organizations, and (3) studies of how and why norms change or weaken.

Certain scholars use the term *deinstitutionalization* to refer to the displacement or breakdown of the rules and formal procedures that Max Weber identified as the basis for the modern state. Weber argued that in modern states, formal procedures rather than personal prerogative govern state action because the state is organized around a set of rules embodied in law and bureaucratic procedure. Deinstitutionalization of a modern state, therefore, entails the breakdown of formal, impersonal rules and procedures and their replacement by a personalized or an informal system of governance. For example, the Senegalese bureaucracy today is being deinstitutionalized as civil service laws are being pushed aside in favor of recruitment based on personal contacts, and public policies are increasingly dictated by presidential prerogative rather than by bureaucratic policy-making procedures.

A second category of scholars equates an institution with a formal organization that plays a fundamental role in structuring political activity, such as a political party. For these scholars, deinstitutionalization refers to the weakening of specific organizations and their increasing irrelevance to political and social life. This concept of deinstitutionalization is used, for example, to describe the increasing political impotence of labor unions in Latin America.

Finally, scholars of organizational theory concentrate on institutions as shared sets of values that structure activity. As such, their concern with deinstitutionalism has primarily been with explaining under what circumstances values change and norms disappear.

Because there is no consensus about the definition of deinstitutionalization, it is difficult to hypothesize what causes it. Deinstitutionalization of a specific organization may be caused by endogenous forces such as a performance crisis or technological change, but most scholars agree deinstitutionalization likely comes from exogenous forces, such as large-scale economic, demographic, or social change. Latin American labor unions, for example, were deinstitutionalized in part because neoliberalism caused a change in the composition of the labor force. Why rules and norms weaken is difficult to assess. Some scholars use large-scale exogenous change to explain deinstitutionalization. Others see moments of crisis, learning, or technological innovation as sources of institutional change.

DELIBERATIVE DEMOCRACY

Deliberative democracy is a movement in political theory that claims that political decisions should be the product of fair and reasonable discussion and debate among citizens. In deliberation, citizens should exchange arguments and consider different claims that are designed to secure the public good. Through this conversation, citizens come to an agreement about what procedure, action, or policy will best produce the

public good. Deliberation is a necessary precondition for the legitimacy of democratic political decisions. Rather than thinking of political decisions as the aggregate of citizens' preferences, deliberative democracy claims that citizens should arrive at political decisions through reason and the collection of competing arguments and viewpoints. In other words, citizens' preferences should be shaped by deliberation in advance of decision making, rather than by self-interest. With respect to individual and collective citizen decision making, deliberative democracy shifts the emphasis from the outcome of the decision to the quality of the process.

Deliberation in democratic processes generates outcomes that secure the public or common good through reason rather than through political power. Deliberative democracy is not based on a competition between conflicting interests, but on an exchange of information and justifications supporting varying perspectives on the public good. Ultimately, citizens should be swayed by the force of the better argument rather than by private concerns, biases, or views that are not publicly justifiable to their fellow deliberators. In contrast to an agonistic view of democracy, deliberative democracy attempts to adjust for inequalities in social and economic power by emphasizing that all citizens are equal in their capacity to reason and participate.

Early Influences

Two of the early influences on deliberative democratic theory are John Rawls and Jürgen Habermas. Rawls advocated the use of reason in securing the framework for a just political society. For Rawls, reason curtails self-interest to justify the structure of a political society that is fair for all participants in that society and secures equal rights for all members of that society. These conditions secure the possibility for fair citizen participation in the future. Habermas claimed that fair procedures and clear communication can produce legitimate and consensual decisions by citizens. These fair procedures governing the deliberative process are what legitimate the outcomes.

Features of Deliberation

Deliberative theorists tend to argue that publicity is a necessary feature of legitimate democratic processes. First, issues within a democracy should be public and should be publicly debated. Second, processes within democratic institutions must be public and subject to public scrutiny. Finally, in addition to being provided with information, citizens need to ensure the use of a public form of reason to ground political decisions. The public nature of the reason used to ground political decisions generates outcomes that are fair and reasonable, but subject to revision if warranted by new information or further deliberation.

Some deliberative theorists claim that the deliberative process of exchanging arguments for contrasting viewpoints can and should produce a consensus. Others think that disagreement will remain after the deliberative process is completed, but that deliberation can produce legitimate outcomes without consensus. Even when the exchange of reason, arguments, and viewpoints does not seem to produce a clear outcome, many deliberative theorists suggest that the dissent produced, and the continuing debate, enhances the democratic process.

Because the deliberative process requires that citizens understand, formulate, and exchange arguments for their views, norms of clear communication and rules of argumentation are important to formulate. Citizens must be speaking the same language, both literally and figuratively. Citizens must be able to present their claims in understandable and meaningful ways to their fellow deliberators. These claims must also be supported by argumentation and reason that makes these views publicly justifiable to differently situated deliberators.

Most theories of deliberative democracy hold that the maximum inclusion of citizens and viewpoints generates the most legitimate and reasonable political outcomes. In addition to improving the level of discussion and accounting for the most arguments, more-inclusive deliberative processes are fairer because more people have their views considered. Whether or not a citizen's view is present in the outcome, it has at least been figured into the debate by fellow citizen deliberators.

Challenges to Deliberative Democratic Theory

Many theorists consider the following possible problems with theories of deliberative democracy. If only certain modes of expression, forms of argument, and cultural styles are publicly acceptable, then the voices of certain citizens will be excluded. This exclusion will diminish the quality and legitimacy of the outcomes of deliberative processes. Further, deliberation assumes the capacity of citizens to be reasonable, cooperate, unify, and shape their views based on rational debate and the views of others. Some argue that this may be more than human beings are capable of either because of human nature or because of already existing social inequalities and biases. Social conditions, such as already existing structural inequalities, pluralism, social complexity, the increasing scope of political concerns, and the impracticality of affected citizens having forums in which to deliberate are also reasons why some are skeptical of the viability of a deliberative form of democracy.

Deliberative democratic theory brings ethical concerns into the realm of democratic decision making. The ultimate aim of deliberative democratic practices is increased citizen participation, better outcomes, and a more authentically democratic society.

DEMOCRATIC DEFICIT

The notion of a democratic deficit refers to an insufficient level of democracy in political institutions and procedures in comparison with a theoretical ideal of a democratic government. The expression democratic deficit may be used to denote the absence or underdevelopment of key democratic institutions, but it may also be used to reflect the pathologies of how these institutions function (e.g., lack of transparency and accountability, technocratic decision making, inadequate participation of citizens in policy making). Evaluations of the level of democratic deficit focus on the procedural aspects of democracy, reflected in the mechanisms of representation and decision making. Therefore, it denotes distortions to the flow of influence from citizens to government, and as such, it is closely associated with the issue of democratic legitimacy.

Although any democratic system may potentially suffer from a democratic deficit, the concept is most often used in the context of supranational institutions, and the European Union (EU) in particular. The most popular criticism of the EU's levels of democracy refers to the dispossession of national institutions that is not sufficiently compensated for at the EU level. In particular, the EU structure has been criticized for an inadequate level of parliamentary control over decision-making processes. First, unlike in the EU's member-states, the role of European Parliament (EP) is marginal because the executive branch of government (the Council of Ministers and the Commission) plays a key role in the legislative process. Second, because of its size, the EU is criticized for being too far removed from the ordinary citizens to adequately support democratic deliberation and participation in decision making and to effectively represent their interests. Another criticism points to the activities of EU institutions, arguing that they lack coordination and that the focus of EU politics remains dominated by the national-level procedures and cleavages. Therefore, the EU is accused of being undemocratic mainly because the office holders are not directly dependent and accountable to their constituents, whose preferences are therefore unlikely to be reflected in the decisions made.

However, these negative assessments of the democratic character of the EU have recently been challenged by scholars who point out that a parliamentary model of European democracy is not a suitable benchmark for assessing democracy at the EU level because it is, like federalist states, a nonmajoritarian institution. Some scholars also argue that the level of the general public's satisfaction with their influence on the EU-level political processes is difficult to establish because the idea of European integration is still contested by a number of EU citizens. Moreover, democratic legitimacy in Europe is strongly linked to welfare issues, and because the models of welfare state vary radically across European states, it is impossible for the EU to take these welfare functions over and use them as a base for its democratic legitimacy. Therefore, although the increasing influence of the EU is recognized as a positive development, the conclusions about a democratic deficit in the EU seem to depend largely on the benchmarks used.

DEMOCRATIC THEORY

The history of democratic theory reaches back for thousands of years. There is no single democratic theory but, rather, a collection of approaches to democratic theory that have a small set of common values: participation, representation, popular elections, citizenship, and the ability to choose freely among political options or alternatives. The enactment of democratic theory into practice, however, has been problematic and uneven because disagreement persists regarding the exact meanings of these common terms.

Most Western philosophy, as well as practice, has emphasized maximum liberty over commitment to some form of the common good. This perspective does not mean that there are no common values; rather, the things that make us distinct as individuals are valued more highly than the elements that unite us, and our political systems reflect this.

Classical Democracy: Greece

The meaning of the ancient Greek word *demokratia* was somewhat ambiguous. Literally, it meant "people-power" or "people-rule"—but it was not entirely clear whether "people" meant only qualified citizens, or all persons (the masses). The Greek word *demos* could mean either.

By the time of Aristotle (fourth century BCE), there were hundreds of Greek democracies. Greece was not a single political entity but, rather, a collection of some 1,500 separate *poleis* or city-states. Not all city-states were democracies; some were oligarchies—where power was concentrated in the hands of the few richest citizens—whereas others were monarchies (classified as "tyrannies" if the sole ruler had taken power by force rather than inheritance). Of the democracies, the oldest, most stable, and most notable was found in Athens.

The origin of the Athenian democracy can be traced back to Solon, around 600 BCE. Although he was not a democrat, Solon's constitutional reform package laid the basis upon which democracy was pioneered one hundred years later by the progressive aristocrat Cleisthenes. Under this political system, Athens successfully resisted the Persian attacks of 490 and 480 through 479 BCE, most notably at the battles of Marathon and Salamis. Those successes in turn encouraged the poorest Athenians to demand a greater say in the running of their city, and in the late 460s BCE, Ephialtes and Pericles engineered a political shift that balanced power among economic classes. This democratic Athens laid the foundations of Western rational and critical thought.

Athenian democracy was not, however, universally inclusive. Slaves, foreigners, and women were barred from participation. Political power lay in the assembly,

to which all male, freeborn citizens belonged. The assembly made all major decisions and legislation. Rational, dispassionate thought did not always prevail, however; in many instances, the assembly would be dominated by a charismatic individual whose influence derived from his oratorical prowess or force of personality rather than his talent for governing. Democratic governments, in other words, were quite capable of making foolish and ill-conceived decisions. One theory speculates that the word *demokratia* was coined by the enemies of democracy—members of the aristocratic elite who did not want to be outvoted by commoners.

One interesting and distinctively Athenian democratic practice that generated particular criticism was the practice of ostracism. This was a kind of reverse election to decide which leading politician should be exiled for ten years. At least 6,000 citizens had to "vote" for an ostracism to be valid, and all the major politicians risked being "fired" in this arbitrary and unceremonious way. For nearly one hundred years, ostracism served the purpose of containing serious civil unrest. At the end of the fifth century, ostracism was replaced by a legal procedure administered by the jurors of the people's courts.

Representative Democracy

After the decline of Greece, the idea of democracy was abandoned until the Italian Renaissance and the age of the Italian city-states. Democracy was refined during the Age of Reason and European Enlightenment, culminating in the experiment that would become the American political system. Thomas Hobbes, John Locke, and Jean-Jacques Rousseau laid the foundations of social contract theory. Montesquieu elaborated a theory of separation of powers, and Jeremy Bentham, John Stuart Mill, Adam Smith, and Thomas Malthus explored the concepts of markets and utility. Within the broad practice known as representative democracy are two primary currents: republicanism and liberalism.

Republicanism

Republicanism is best defined as a commitment to the principle that there is a public element (*res publica*)

that can only be legitimately interpreted by the citizens at large. An influential, if irregular, stream of Western political thought since the city-states of ancient Greece and the Roman empire, republicanism is devoted to the development of political structures based on the participation of citizens at large demonstrating a willingness to undertake political action on the basis of commitment to the common good. Political activity based on individual self-interest, it follows, is doomed to degenerate into tyranny.

There are two broad kinds of republicanism. One is narrower, more protective, and found in smaller communities. Although the rule of law prevails and freedoms of speech, expression, and association are honored, participation is achieved through representatives to councils or other governing bodies. Historically in such communities, women, laborers, and dependents would have been excluded from citizenship and participation. Competition between groups could become quite intense. This form of republicanism prevailed in the Italian city-states of the Renaissance.

A second form of republicanism was more developmental. Citizens strove to enjoy political and economic equality so that none could become master of another and all could benefit from self-determination toward the common good. Property ownership is diffuse. Citizens participate directly in public meetings, and these meetings constitute the legislature; executive functions are in the hands of separate administrators either elected or chosen by lot. This form of republicanism is most closely associated with Rousseau.

The language of republicanism was widely spoken during the years of the American Revolution and is resurgent in much of the contemporary communitarian literature. Drawing on sources such as Lycurgus, Thucydides, Aristotle, Polybius, Cicero, Montesquieu, Richard Hooker, John Milton, James Harrington, Algernon Sidney, John Locke, Hugo Grotius, and Samuel Pufendorf, the American colonists emphasized three common elements: a commitment to republican (representative) government, a cyclical theory of corruption, and a belief in republican virtue. American colonists used these themes as foundations for a government structure theoretically capable of

ensuring justice and maximizing the general good of the entire community. Recognizing the tendency for republics to degenerate into corruption based on self-interest, American theorists tried to balance individualism and community to provide the independence necessary for virtue while maintaining commitment to the whole that excessive individualism corrodes. Active citizenship would keep corruption at bay.

A review of American antifederalist literature yields several themes consistent with the republican tradition: a belief in the dignity of the individual citizen, a focus on the public good, a desire for popular control of government, an insistence on equality as an ideal for society, an understanding of the importance of civic virtue, and participatory democracy. The history of compact, contract, and covenant traditions reflected an assumption that individual citizens are entitled to offer consent on the grounds of political equality.

Contemporary communitarian literature reflects these themes. The insistence on finding shared common virtues and the search for "deep community" and "thick democracy" reflect a rejection of atomistic human nature and the liberal belief that the conditions that separate us come before those that join us together as social beings. The notion of ethical citizenship incorporates commitment to the public good, popular control of government, some meaningful degree of substantive (material) equality, acceptance of civic virtue, and commitment to active participation by the citizenry in government. Some theorists have argued that ethical citizenship was eclipsed in the early twentieth century as government became increasingly professionalized.

Liberalism

Liberalism, argued by many to be the most pervasive "language" of democratic theory spoken in Anglo-Western (particularly American) political discourse, is also the most challenged and criticized. Appearing in Lockean, utilitarian, and Kantian varieties, liberalism promotes the most aggressive form of self-interest. At the same time, liberalism has been defined as primarily the rights of the individual that we have come to take for granted.

Liberalism exhibits an attachment to individual freedom as the preeminent value. At the heart of the liberal position is the idea that each individual is free to identify and pursue his or her own destiny in a pattern of freely configured, rationally determined choices. What is evoked is a collection of individuals, essentially unknowable to one another except as they act on each other, exercising their free will to find satisfaction. The closest understanding of common purpose is, as Adam Smith wrote, a "concord," not a union.

Historically, however, various liberal theorists have defined the individual differently, and it is unclear whether "personhood" was to be contingent upon ownership of property, the capacity to reason, or biblical injunction. Recent liberal theory has offered two primary strains of liberalism—one utilitarian, the other Kantian. Following John Stuart Mill, utilitarian liberals call for maximizing the general welfare and allowing individuals to pursue their own life preferences as long as this pursuit does not interfere with the freedom of others or deprive others of their happiness, however defined. In many respects, utilitarianism fits well with liberal purposes because maximizing utility does not involve the judging of others' choices. Theoretically, it allows room for a general will to emerge, along with the clearly undesirable possibility of a tyrannical majority, as put forth by James Madison.

Kantian critics of liberalism, such as John Rawls, reject utilitarianism in favor of an approach that gives individual rights more precedence. This interpretation of liberalism begins with the presumption that separate individuals necessarily and properly possess different conceptions of what constitutes the good life. To preserve the fundamental importance of certain liberties and rights, without dictating a particular vision that might compromise our ability as free moral agents to make our own choices (consistent with similar liberties for others), liberals of this persuasion seek a fair framework within which individuals and groups can choose their own values and ends, consistent with a similar liberty for others.

Reliance on free-market economics has pervasively influenced liberal interpretations of politics. From its inception, Lockean liberalism was appealing

because it dovetailed nicely with the growing numbers of the middle class seeking to make their own fortunes in a society increasingly free from its feudal past. Alexander Hamilton used the foundations of liberal philosophy to promote the growth of manufacturing and provide an engine of economic growth for an infant nation, producing citizen-capitalists whose enterprise and energy would help the republic to thrive.

Regarding citizenship, the liberal moment has produced what is often referred to as legal interpretations of the concept. The refusal of liberals to identify a purpose to society outside of allowing maximum individual liberty has led necessarily to a focus on process and institutions as the only neutral ground. But such a focus on process over substance seems by definition to preclude participatory, active, ethical components of citizenship.

Technocratic Democracy

In the twentieth century, new variations on democratic theory and practice arose to address contemporary challenges. One of the most compelling changes was the evolution of the technocratic, bureaucratic, or administrative state. Growing out of rationalist theories of efficiency and division of labor, the purpose was to recruit a cadre of public administrators that was professional and technocratic in its orientation and that would apply its expertise to furthering the public good.

Technocratic democracy was a response to the increasingly complex business of government. As Woodrow Wilson famously said, once America's democratic experiment was firmly entrenched, the challenge was "running" the Constitution. Although many countries had had a civil service, the key difference was to be found in the method of selection in a technocratic regime: merit, rather than social standing, became the determining factor.

Technocratic approaches to democracy and governance emerged in industrial societies with fragmented patterns of social and political conflict. Some range of differences of opinion was tolerated within the political culture, however. Even though extended or universal voting rights generally prevailed, the electorate was

often poorly informed or easily manipulated using an appeal to the emotions. Rival political elites or political parties competed for votes, and, despite a generally strong executive branch, legislative bodies were dominated by party politics.

A strong administrative branch became a check on the excesses of party power. Because public administrators were chosen on merit and often protected in their positions, they were empowered to act against party bosses and minority interests when necessary. Toward the end of the twentieth century, however, this system was generally agreed to have broken down. Instead of being technocratic and innovative, public administrators were perceived as inefficient and rule-bound. This breakdown fueled the rise of neoliberalism, described next.

Neoliberalism

A general characteristic of neoliberalism is the desire to intensify and expand the influence of market values. The emphasis on property in classic and market liberalism has been replaced by an emphasis on contract. In addition, the contract period is reduced, especially on the labor market, and so the frequency of contract is increased—especially visible on the labor market. Even within a contract period, an employee will be subject to continuous assessment. New transaction-intensive markets are created on the model of the stock exchanges—electricity exchanges, telephone-minute exchanges. New forms of auction are another method of creating transaction-intensive markets. Neoliberals now see these as the only valid method of making such allocations.

This expansion of interactivity means that neoliberal societies are network societies, rather than the open societies of classic liberals. Formal equality and access are not enough: They must also be used to create links to other members of the society.

Neoliberalism is not simply an economic structure. It is also a philosophy with particularly visible attitudes to society, the individual, and employment. Neoliberals tend to see the world in terms of market metaphors. Referring to nations as companies or to citizens as consumers is typically neoliberal, rather than

liberal. In such a view, Deutschland GmbH competes with Great Britain Ltd., BV Nederland, and USA Inc. However, when this is a view of nation-states, it is as much a form of neonationalism as neoliberalism. The view also looks back to the preliberal economic theory—mercantilism—which saw the countries of Europe as competing units. The mercantilists treated those kingdoms as large-scale versions of a private household, rather than as firms. Nevertheless, their view of world trade as a competition between nation-sized units would be acceptable to modern neoliberals.

The market metaphor is applied among cities and regions as well as among nations. In neoliberal regional policy, cities are selling themselves in a national and global marketplace of cities. They are considered equivalent to an entrepreneur selling a product, but the product is the city (or region) as a location for entrepreneurs. The successful sale of the product is the decision of an entrepreneur to locate there, rather than simply the sale of land or factories.

Democratic Theory and Governance

In the contemporary era, many theorists argue that the democratic state has become increasingly hollow. Accountability of elected representatives to the citizenry has worn thin. The involvement of most citizens is reduced to the act of voting, if that. Winner-take-all election rules have resulted in permanently marginalized minorities that cannot overcome financial barriers and manipulated voting districts.

Neoliberal criticisms of technocratic governance spurred the emergence of new governance, which contrasts with old governance in its focus on reducing rules and allowing expanded space for entrepreneurial activity in the public sector. New public management, privatization, and corporate management dominate thinking in this field.

Deliberative democracy, also sometimes called discursive democracy, is used to refer to any system of political decisions based on some tradeoff of consensus decision making and representative democracy. In contrast with the traditional economics-based theory of democracy, which emphasizes voting as the central institution, theorists of deliberative democracy argue that legitimate lawmaking can only arise from the public deliberation of the citizenry.

Deliberative democracy often recognizes tensions or conflicts of interest between the citizen participating, those affected or victimized by the process being undertaken, and the group or entity that organizes the decision-making process. For these reasons, deliberative democracy often involves extensive outreach efforts to include marginalized, isolated, and ignored constituencies, and to extensively document dissent, grounds for dissent, and future predictions of consequences of actions. Deliberative democracy focuses as much on the process as the results.

Alternatively, many practitioners of deliberative democracy attempt to be as neutral and open-ended as possible, inviting (or even randomly selecting) people who represent a wide range of views and providing them with balanced materials to guide their discussions. Examples include national issues forums, study circles, deliberative polls, and the 21st Century Town Meetings convened by America*Speaks*, among others. In these cases, deliberative democracy is intended to create a conversation among people of different philosophies and beliefs.

Although no major theorist sees deliberative democracy as supplanting representative democracy, little systematic attention has been paid to the conditions under which "deliberative complementarities" could improve democratic institutions and civic culture. Deliberative theory can tend to privilege speech that is too narrowly rationalistic and argumentative, and hence, marginalize those groups (women, minorities) whose styles of discourse might differ. Deliberative practice, by contrast, tends to be much more sensitive to variety in discourse, using storytelling, art, music, and expressions of hurt, anger, injustice, and healing.

The problems of voting are rarely addressed by theories of deliberative democracy. Yet some theorists have advocated mechanisms such as the deliberative opinion poll to apply deliberative democracy to real-world decision making. A deliberative opinion poll gathers a statistically representative sample of a group (from a small community to a country), polls that group on a particular issue or issues, and uses the poll's results to recommend future action.

Both the liberal and republican "moments" of democracy have coexisted in an uneasy dialogue with one another. At various historical points, one or the other would appear ascendant, in correlation with other social and economic events. Yet, for most of the past century, there has been growing recognition that Western frames of reference have been shifting. This shift has been termed *postmodernism*.

In addition to the problem of commodification, the situation in which everything becomes a commodity available for sale, postmodernism presents a dilemma for governance in that, as a philosophy, postmodernism is anti-subject. How can a concept of governance, which suggests identity and membership, survive without a sense of subjectivity?

Those postmodernists, often labeled skeptics, offer an image of the individual whose existence and constitution is a textual creation. Intentionality is dissolved in the liquor that is the text. The self has no referential status other than the text, and the familiar hallmarks of the Enlightenment—knowing, naming, and emancipation—are rejected or abandoned. The purpose is to suspend the good-bad moral hierarchy implied by the distinction between subject and object.

Although some postmodernists do attempt to envision a postmodern individual, this is a tricky task, for it must be accomplished within an antihumanist philosophy. But eliminating the subject has troubling implications for causality, intentionality, and agency. Disposing of the subject paves the way for a denial of any basis for critical judgment and moral responsibility. It suggests an exaggeration of the classic liberal position—taking the concept of negative liberty to a disturbing extreme, and turning the social contract into a caricature of itself. In its celebration of negative freedom, this postmodernism can only tear down a world; it cannot build it back up. The political consequence is a Hobbesian version of society as a war of all against all. The ethical consequence is a moral individualism incapable of challenging the ordering principles of modern society. The practical consequence is an atomistic, disengaged citizenry.

DEMOCRATIZATION

Democratization has established itself as perhaps the most normatively persuasive and contested concept in current political discourse. Both as a process and a concept, democratization draws on a long history. The intellectual origins of the concept of democracy stretch back to Athenian ideals of city governance and Roman republicanism. During the 1700s, the notion that sovereignty lay with the people, which emerged from Athens and Rome, became coupled with the modern ideologies of the Enlightenment, especially liberalism and socialism. The emergence of modern nation-states and capitalist social relations created the conditions under which ideals of citizenship, governmental accountability, and civil society established themselves as the common sense of Europe and later America. Democratization, then, might be most

readily understood as a concept that encapsulates the expansion of a set of related political ideals with different intellectual vintages that gain public prominence during the emergence of capitalist modernity. Relatedly, democratization is also a process in which various social groups have made claims on the state through protests, riots, strikes, and lobbies. The discourse of democracy had infused many struggles against monarchical absolutism, working class struggles, and the suffragette movement.

Out of this complex intellectual and political history has emerged a commonly accepted and simple formula that is closely associated with democratization: universal franchise, or "one person, one vote." Other aspects of democratization include the rise of a multiparty constitution, rights of expression and assembly, and mandated periodic elections.

But democratization is not just a story of political change in "the West"; rather, it has become a key reference point in understanding political change throughout the world. Some of the most prominent questions discussed in global politics today rely on the purchase of democratization as a concept; for example, how globalization might be regulated, whether countries have achieved democratic consolidation, or whether democratization enhances the prospects for peace. In essence, democratization contains at its core two distinct but closely related aspects: a process by which political life changes, and a normative view of political life making statements about how political communities should behave.

Defining is always closely related to understanding. Although democratization has currently accrued a widely held and relatively straightforward definition, this has not closed off theoretical or analytical controversy. There is no space to deal with this fully, but we can review some key points of departure here to reveal the different emphases and nuances that can be given to the meaning of democratization.

Democratization as the End of History

Francis Fukuyama, following his interpretation of G. W. F. Hegel, argues that liberal democracy constitutes

the historic victory of a metaphysical Idea over its contenders in the modern age. The Idea of individual rights, a product of liberal theories of the eighteenth century, has won out over its historic rivals, notably fascism and communism. Although Fukuyama has revised his judgments, democratization here is seen as the historic ascendance of an uncontested concept for thinking about the political good.

Democratization and Capitalism

Vladimir Lenin famously coined democracy as the best "political shell" for capitalism. Marxists have often tried to understand democratization as a political accompaniment to the establishment of a capitalist economy; democracy might even fulfill certain functions for capital, for example creating legitimacy for a certain social order, or removing certain aspects of social life from the political sphere and renaming them as private. Perhaps the best-known Marxist understanding of democratization has derived from Antonio Gramsci. Liberals have also associated democratization with capitalism, stressing the centrality of the emergence of the middle classes.

Democratization and State Building

Historical sociologists have identified the ways in which democratization has unfolded as part of the emergence of modern nation-states. Most important here are the following processes. As states introduced routine centralized personal taxes, people have demanded some influence over the way the public purse was used: no taxation without representation. As nation-states consolidated, people began to identify their interests with the sovereignty of the state as well as their local polities: National newspapers and wars between nation-states produced new formulations of the national interest in which the actions of one's state became of relevance to all.

Democratization and Liberalism

Liberals have understood democratization as the achievement of a society that treats each person as

endowed with basic political rights. Through a process of political discourse and persuasion, liberal societies move toward democracy as a way of respecting and realizing the rights of all to participate in a polity, subject to some basic conditions. In this theorization, democratization is expressed as the realization of an immanent human nature, whether acting in a republican or rational utilitarian spirit.

Intellectual interest in democratization has continued to grow throughout the last century, and shows no sign of stopping. It is striking that a great deal of the intellectual discussion of democratization and the political ferment that created historic democracies has been located in a small geopolitical space, namely Europe and North America. And yet, in the present day, many states have recently democratized or have democratization as their principal compass for the future. Democratization is associated with security, legitimacy, political order, and good relations between states. Democratization has grown from a political ideal engaged in the experiences of Western modernity to a kind of universal good.

Consequently, a significant body of literature on democratic transitions, or "transitology," has emerged. Perhaps the best-known starting point here is Samuel Huntington's waves of democratization approach. Samuel Huntington identifies three waves of democratic transition (1828–1926, 1943–1962, 1974–present) during which certain states (and their elites) gained the wherewithal of dealing with popular pressures on the state by democratizing. The true test of this transition is the "two turnover" test, which means that an incumbent party is voted out of office, then its successor is also voted out of office without a collapse in the democratic constitutional order. Whether or not Huntington's model stands up to scrutiny, the idea of an ever-expanding wave of democratization remains at the heart of much political analysis.

Multiparty politics has indeed coursed through formerly nondemocratic regions of the world: the retreat of military regimes during the 1980s in Latin America, the cautious democratization of East Asia, the holding of multiparty elections through Sub-Saharan Africa during the 1990s, and the adoption of multipartyism in the former Soviet Union and aligned states in eastern Europe. Few states have succeeded in avoiding the democratic waves altogether, and these states are increasingly represented as aberrations or even pariahs.

Democratization has never been a straightforward affair, and its current unprecedented global reach has only added to the questions that people have brought to bear on the world's most prominent language of political change and the prospects for democratization. Here, we can only note a selection of issues.

It is easy to define a certain kind of imperialism in the globalization of democratization. Western states condition aid on democratization, strongly condemn and ostracize (some) nondemocratic regimes, and sometimes ostensibly intervene coercively with a view to establishing multiparty constitutions in certain states. This produces two paradoxes: First is that democratization has become a project of powerful international actors that impose democratization on other parts of the world. Second, democratization is posed less as a choice for societies and increasingly as the presiding orthodoxy, outside of which little exists. However, there might be a range of alternative claims to democratization, embedded in other historic and cultural milieus: Islamic democracy, socialist democracy, or some forms of communitarianism.

Relatedly, perhaps the globalization of democratic discourse is ushering in a more ambitious period for democratization. Globalization has created the need not merely for the expansion of democratization to all states, but also a democratization above the nation-state: the creation of global civic constituencies, the democratization of multilateral organizations, perhaps even a global constitution. Some of these ideas are fleshed out in the concept cosmopolitanism.

Democratization's expansion has been accompanied by an increasing formalism. What historical sociologists had understood as a profound change in the nature of a society has been rendered more a matter of formal constitution building. All sorts of more substantive politics might work beneath the periodic organization of elections, ranging from unreconstructed authoritarianism to new forms of populism.

Furthermore, democratization—even if implemented more substantially—does not solve all the ills of all societies. Political economists have highlighted how democratization can avoid dealing with drastic economic inequalities and a wide range of forms of discrimination and oppression within the market and the workplace. This is part of the story of South Africa's transition from 1994. More radical commentators have seen the globalization of democracy as the circulation of elites, or low-intensity democracy that principally legitimates a free-market international order.

Finally, democratization is not solely an issue for countries outside the West. Despite their self-representations as bastions of democracy, all Western states have violated tenets of the liberal democracy ideal. This is all the more obvious and contentious since 9/11.

All these points combine strongly to suggest that democratization is best understood as a process, not an endpoint. Unless the democratization process itself is in some sense owned by the people, its prospects of moving toward what transitologists dub consolidation would appear to be drastically reduced.

DEPENDENCY

Dependency describes a process of economic development that is conditioned by external relations of domination. These relations are rooted in historical and ongoing processes of capitalist internationalization that concentrate economic and political power in the more developed countries. Developed countries actively perpetuate a state of dependency in less-developed countries through policies and initiatives that limit their developmental autonomy. They enforce these policies, sometimes by means of economic sanctions or military invasion and control, but mostly through the rules of international trade and commerce. The dependency perspective implies that the further internationalization of capital through globalization will reproduce structures of power that maintain and reproduce dependency and underdevelopment in the third world.

Dependency, Interdependence, and Dependence

Many people say that, as a result of the increasing internationalization or globalization of capital, the entire world is now economically tied together by complex webs of interdependence; consequently, and in virtually all states, the influence of international forces and factors on the operation of domestic economies has increased in importance relative to internal ones. However, dependency is neither similar to, or an outcome of interdependence, nor is it meant to describe a situation of external reliance, or dependence. These terms refer to interactions among well-integrated nation-states, whereas the outcome that dependency describes results from the interaction of less-developed, less-homogeneous states with well-integrated nation-states.

Because of their essential inequality, dominant states are able to determine the position of the less-developed countries in the global division of labor and to limit their developmental choices and autonomy, and thus their capacity for setting their own developmental course. This has produced a characteristic set of socioeconomic and political structures and

patterns of change in the less-developed countries: dualism and monopoly; a lack of internal structural integration; dependency on outside capital, labor, and markets; inequality; cultural distortions; national disintegration; and formal but inauthentic democracy.

Dependency Theory and Underdevelopment

This notion of dependency is at the center of a body of research and writing on underdevelopment called dependency theory. The core ideas and themes of dependency theory were first elaborated by an economist, Raul Prebisch, who served as secretary-general of the UN Economic Commission for Latin America and the Caribbean (ECLAC) and was the founding secretary-general of the UN Conference on Trade and Development (UNCTAD). Prebisch attributed the persistence of third-world poverty to the operation of international capitalism. He argued that the capitalist world economy was characterized by a center-periphery relationship among nations, in which third-world nations were producers of raw materials for first-world manufacturers and consequently locked into a peripheral and dependent position in the world economy. Prebisch developed, in collaboration with the economist Hans Singer, the thesis that the terms of trade for primary products tend to deteriorate over time because the prices of manufactured goods bought by the periphery were rising faster than were the prices of raw materials, cash crops, and foodstuff sold by the periphery to the center. Consequently, the structure of trade ensured the persistence of dependency and created an unbalanced process of development. These arguments became the basis of what became known as dependency theory.

Dependency theory explains underdevelopment as an outcome of the global division of labor and a process of synchronous regional differentiation. According to this perspective, in the global political-economic system that emerged beginning in the sixteenth century, some countries in the core were able to specialize in industrial production of manufactured goods because the peripheral areas of the world that they colonized provided the necessary primary goods, agricultural and mineral, for consumption in the center. Contrary to the assumptions of liberal economic theory, this international division of labor did not lead to parallel development through comparative advantage. The states at the center gained at the expense of the peripheral states. Thus, underdevelopment does not represent a phase in development through which the countries of the third world must pass on their way to becoming developed, as liberal theories maintain; rather, it is a consequence of the development of the core states and is continually being recreated and reproduced through the operation of the international economy.

Though a variety of schools of thought developed within dependency theory, all agreed that monopolistic control of the international market by developed countries enables them to extract the economic wealth of underdeveloped countries for their own use and that, because of this, international market structures perpetuate backwardness and dependency in the South and encourage dominance by the North. However, different views emerged about what would bring about a nondependent process of growth and the end of dependence. Relatively liberal and reformist theorists, like Prebisch, argued for a strategy of import-substitution, enabled by government policy and some degree of protectionism in trade, that would allow states, first, to achieve greater domestic industrial diversification, and then to export previously protected manufactured goods as economies of scale and low labor costs made domestic costs more competitive in the world market. However, neo-Marxist theorists argued that, because underdevelopment in third-world countries was the outcome of their subordinate position in the world capitalist system, underdevelopment would persist for as long as they remained part of that system. Neo-Marxist theorists, therefore, called for a self-reliant development based on the creation of counter-structures, policies, and values.

Dependency and International Structures of Power

Though international structures of power are seen as the primary element in the chain of causation that produces underdevelopment, conceptions of how these structures are constituted and maintained vary. One view sees states and interstate institutions as constituting the

world economy. This implies that a more equitable distribution of benefits within the international economy requires changes in the trade, aid, and development practices of powerful states and interstate institutions. Consistent with this view, the demand for a New International Economic Order (NIEO), an initiative presented by developing countries in the UN General Assembly in 1974, called for restructuring power relations between the North and the South through a reduction in northern trade barriers, an increase in foreign aid to developing countries, and a larger role for third-world states in the decision-making process of international economic organizations such as the World Bank, the World Trade Organization, and the International Monetary Fund. Another view sees international structures as constituted and maintained by dominant states and by elites in the dependent states. In this view, the relationship between external and internal forces forms a complex whole, with structural links forged on coincidences of interests between local dominant classes and international ones. What emerges from these theorizations is that the uneven pattern of growth throughout the world is most likely reproduced by a structure of power that is constituted and maintained by states and interstate institutions, but that represents the interests of an essentially transnational capitalist class.

DEREGULATION

See LIBERALIZATION

DERIVATIVE

A derivative is a set of financial instruments that includes futures, forwards, options, warrants, and swaps. A derivative is a financial product that could, conceivably, take any form whatsoever. There are only two constraints on the creation of such products: the willingness of market-makers to innovate in areas outside their technical expertise, and the willingness of market participants to be persuaded that new products offer greater advantages than established ones. The term *derivative* has a literal meaning. The price at which a derivative contract is traded is derived from the price of the underlying commodity, security, index, or event to which it is related. Derivatives are traded on secondary markets, which, under the influence of purely passive hedging strategies, respond solely to price changes exhibited by the underlying asset in the primary market.

There are two main reasons for the development of markets in derivative products. The first is that they provide opportunities for investors to reduce their risk exposure by hedging their position in a primary market with a countervailing investment in the related secondary market. This enables investors to protect the value of their existing asset holdings without recourse to regulatory devices whose origins are external to the market mechanism. Governments have been keen to promote derivatives markets that are used in this way. The hedging strategies that derivatives markets make possible provide a means of stability and self-governance for the financial system.

The second reason for the development of derivatives markets presents rather more governance dilemmas for public authorities. The demand for a derivative product is a derived demand for the characteristics embodied in it. One obvious characteristic of a new product is that it exists in an unregulated environment.

Given the potential for permanent innovation in the provision of financial instruments, regulators will always be one step behind the innovators. Whenever secondary markets have regulatory devices imposed on them, it is possible to create alternative products, which are identical in composition to the newly regulated products, offering the same investment opportunities, but which escape regulation.

One example relates to market regulation enacted through the tax system. Different rates of tax have historically been imposed on different sources of income. Derivatives have been used to translate the return from one income-bearing asset into the return from another. In particular, they have been used to transmute higher-taxed forms of income into lower-taxed forms of income. This has important implications, inter alia, for the likely success of a Tobin tax on short-term currency transactions. Any such tax is likely to be met with concerted financial innovation, whereby it becomes possible to avoid the tax by using a newly created derivative product, which bears all the economic characteristics of short-term currency transactions, but that is untaxed.

—Matthew Watson

DETERRENCE

Deterrence uses the anticipation of force to prevent an adversary from taking a particular action. The threatened force will increase the cost of the adversary's behavior and thus diminish the incentive for taking it. Deterrence is most likely to succeed when the threat is clearly conveyed, and when the actor does not allow itself an opportunity for exit, so that the adversary only has to make one choice.

The likelihood that a strategy of deterrence successfully prevents the adversary from taking an action is determined by the credibility of the threat. Credibility, in turn, is a function of the actor's capability, willingness, and reputation. The adversary must conclude that the actor can carry out the threat, that the actor will incur the cost associated with carrying out the threat, and that the past behavior of the actor presents a reputation for having the necessary capability and willingness.

Much of deterrence involves the actor attempting to convince the adversary of its capability and willingness while the adversary assesses the probability that the actor will carry out the threat. A successful strategy of deterrence requires a rational adversary that can assess the capability and willingness of the actor and calculate the cost of the threat versus the benefit of the particular action. However, much of the literature on deterrence qualifies rationalist analysis by invoking assumptions from cognitive psychology. These works argue that the assessment of credibility is affected by the fundamental attribution error, wherein the actor consistently perceives the adversary to be threatening while assuming the adversary perceives the actor's intentions as benign.

The advent of nuclear weapons elevated the importance of deterrence as a strategy for state security. The nature of nuclear weapons does not allow the state to defend its borders, and their use would irrevocably harm the spoils of conquest, leaving the threat of use as their only means of enhancing state security. Understanding the causal mechanisms of deterrence has dominated scholarship in international relations since 1945 and was central to the security strategy of the United States for most of the ensuing sixty years.

Contemporary challenges to the study and implementation of deterrence arise from the end of bipolarity, the growing significance of nonstate actors, and the proliferation of state's possessing nuclear weapons. The nature of these new actors challenges the rationality assumption and thus challenges the efficacy of deterrence as a strategy of national security. Regarding the new nuclear states, is it still

possible to communicate commitments credibly? Can an actor still assume that an adversary will not take an action where the costs are higher than the benefits? Regarding nonstate actors, is it possible to increase the cost of their behavior—how do you punish them?

DEVELOPMENT ASSISTANCE COMMITTEE

Acting under the auspices of the Organisation for Economic Co-operation and Development (OECD), the Development Assistance Committee (DAC) collects and analyzes development data and provides a forum where the world's major bilateral aid donors meet to discuss, review, and coordinate aid policy with the objective of expanding the volume and effectiveness of official resource transfers to developing nations. The DAC does not disburse aid but seeks to harmonize and encourage the development assistance policies of its members.

Originally conceived in January 1960 as the Development Assistance Group, the organization was reconstituted as the DAC following the creation of the OECD in 1961. As of 2004, membership of the DAC comprises twenty-two member states (Australia, Austria, Belgium, Canada, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Japan, Luxembourg, the Netherlands, New Zealand, Norway, Portugal, Spain, Sweden, Switzerland, United Kingdom, United States) and the European Commission. The World Bank, International Monetary Fund (IMF), and United Nations Development Program (UNDP) hold

observer status. Thus, although all DAC members belong to the OECD, not all OECD members belong to DAC.

The DAC's main achievement has been the evolution of codes of best practice that member countries are expected to observe in the framing and implementing of official development policy. Adherence to these guidelines is monitored through triennial peer reviews of donor countries' performance. These reviews examine, inter alia, the volume of aid, the general configuration and trajectory of national development policies, and the organizational coherence of national development strategies; they also make recommendations for improvement. Most of the DAC's work is undertaken by committees and working groups composed of officials from national capitals. The DAC also relies on the support of the OECD's Development Cooperation Directorate (DCD). This directorate, consisting of approximately forty officials, is split into four divisions: The Review and Evaluation Division, which supervises the process of peer review and provides ongoing monitoring of the aid programs of DAC members; the Policy Coherence Division, which examines the differing dimensions of poverty and their relationship; the Policy Coordination Division, which evaluates aid effectiveness and the connections between different policy areas; and the Statistics and Monitoring Division, which is responsible for collating and disseminating data on official development assistance.

The DAC has been criticized because it does not provide an official voice for developing countries and the persistent failure of most of its members to meet the target, initially set by United Nations Conference on Trade and Development (UNCTAD) in 1968, of allocating 0.7 percent of their GDP for official development assistance. Moreover, the role of the DAC is increasingly compromised by competition from other multilateral institutions and the growing significance of private capital flows to developing nations.

DEVELOPMENT THEORY

The use of the term *development* to refer to national economic growth emerged in the United States beginning in the 1940s and in association with a key American foreign policy concern: How to shape the future of the newly independent states in ways that would ensure that they would not be drawn into the communist Soviet Bloc. Motivated by this concern, the United States enlisted its social scientists to study and devise ways of promoting capitalist economic development and political stability in what was termed the developing world. Development theory refers to the research and writing that resulted from this effort.

As will be discussed later, there are different conceptions of development and, consequently, disparate approaches to the subject. However, all approaches are concerned with the relationship between development and governance: Development is usually seen as crucially determined by structures of governance; governance is interpreted through and shaped by the goal of development. Most development theory equates development with national economic growth and sees the state as its primary agent; consequently, one of its central concerns is to understand and explain the role of the state in development and the nature of government-market relations. Because these explanations relate development outcomes to the extent and form of the state's role in development, there is a close relationship between development theory and practice. It is not surprising, therefore, that

an identifiable development community and discourse has emerged from the interaction of academic and nonacademic consultants and researchers, and the staffs of government ministries, multilateral aid agencies, financial institutions, and nongovernmental organizations (NGOs).

Development theory has changed over time with changes in ideology and the international environment, and as it does, so do its conceptions of development and governance and how they are related. Changing conceptions of governance and its relation to development can be traced through the major perspectives on development that have emerged since World War II, as represented by theories of modernization and growth, dependency and world systems theories, the resurgence of neoclassical theory, and an array of newer critical perspectives.

Theories of Modernization and Growth

Development involves innumerable variables, including economic, social, political, gender, cultural, religious, and environmental factors. But though development theory integrates concepts and perspectives from a range of disciplines, it was highly influenced by economic thought from the start. Early theoretical models of development equated development with economic growth and industrialization, and theorists saw countries that had not yet achieved these as being at an earlier or lower stage of development relative to Europe and North America. The most influential proponent of this view was the American economic historian Walt W. Rostow. His 1960 book, *The Stages of Economic Growth: A Non-Communist Manifesto,* elaborated a linear-stages-of-growth model that defined development as a sequence of stages through which all societies must pass. This conception of the nature and process of development became the basic blueprint for modernization theory.

Modernization theory emerged following World War II to address the issue of how to shape the economies of states emerging from European colonization. Its implicit aim, as the subtitle of Rostow's book makes clear, was to shape the development of these

countries along capitalist lines. Modernization was, thus, conceived of as the relations of production and standards of living characteristic of Western Europe and the United States. In line with Rostow's model, modernization theorists treated underdevelopment as a stage common to all developing countries and a result of weaknesses in the various factors of production—land, labor, and capital. Theorists emphasized increased savings and investment as the key to development, and argued that international trade in products particularly suited to national factor endowments would enable more efficient resource allocation and greater earnings, and these could be translated into savings and then used to promote development. Theorists envisioned that, by disseminating technology, knowledge, managerial skills, and entrepreneurship; encouraging capital inflow; stimulating competition; and increasing productivity, foreign trade, together with foreign investment and aid, would be the engine of growth for developing countries.

Dependency and World Systems Theories

Modernization theory claimed that once developing societies come into contact with Western European and North American societies, they would be impelled toward modernization and, eventually, would achieve the economic, political, and social features characteristic of the nations of Western Europe and the United States. However, by the 1960s, it was apparent that the third world was not passing through a stage of underdevelopment, as envisioned by modernization theory, but remaining underdeveloped. Thus, a counterclaim was advanced—that developing countries today are structurally different from the advanced countries and so will have to develop along different lines. This claim became the core of the structuralist thesis developed by intellectuals from Chile, Argentina, Brazil, and Peru brought together by the UN Economic Commission for Latin America (ECLA; today known as Economic Commission for Latin America and the Caribbean, ECLAC). The main theoretical tenet of ECLA's approach was that former colonies and non-industrialized nations were structurally different from

industrialized countries and, therefore, needed different recipes for modernization. ECLA argued that colonization restructured former colonies' economies so that they specialized in producing raw materials, cash crops, and foodstuff for export at low prices to the colonizers' home countries. These structures created a dynamic that was continuing to impoverish former colonies and to thwart their modernization. According to ECLA, the international division of labor created by colonization had separated the international economy into a center, consisting of the industrialized countries, and a periphery that included all the rest of the countries around the world outside of the socialist camp. Because the prices of manufactured goods bought by the periphery were rising faster than those of raw materials, cash crops, and foodstuff sold by the periphery to the center, international trade ensured the persistence of an unbalanced process of development. Thus, in contrast to modernization theory, which emphasized the benefits of free trade, foreign investment, and foreign aid, these theorists argued that free trade and international market relations occur in a framework of uneven relations between developed and underdeveloped countries and work to reinforce and reproduce these relations.

This perspective formed the basis of what came to be known as dependency theory. Dependency theory rejects the limited national focus of modernization theory and emphasizes the importance of understanding the complexity of imperialism and its role in shaping postcolonial states. Its main tenet is that the periphery of the international economy is being economically exploited (drained) by the center. Building on ECLA's perspective, dependency theorists argued that colonialism recast economies in the third world in a highly specialized export-producing mold, creating fundamental and interrelated structural distortions that have continued to thwart development. Once this reshaping was accomplished, market forces worked to perpetuate the relationship of dominance and exploitation between center and periphery.

In the 1970s, theorists delineated a variety of alternative paths possible to capitalist development in the periphery, including the dependent, associated-dependent, and unequal paths. During this decade, there

also emerged a perspective that elaborated an account of capitalist exploitation of the periphery from the perspective of the system's core. This theoretical enterprise became known as world systems theory. It typically treats the entire world, at least since the sixteenth century, as a single capitalist world economy based on an international division of labor among a core that developed originally in northwestern Europe (England, France, Holland), a periphery, and a semi-periphery consisting of core regions in decline (e.g., Portugal and Spain) or peripheries attempting to improve their relative position in the world economy (e.g., Italy, southern Germany, and southern France). The division of labor among these regions determined their relationship to each other as well as their type of labor conditions and political system. In the core, strong central governments, extensive bureaucracies, and large mercenary armies enabled the local bourgeoisies to obtain control of international commerce and accumulate capital surpluses from this trade. The periphery, which lacked strong central governments or was controlled by other states, exported raw materials to the core and relied on coercive labor practices. Much of the capital surplus generated by the periphery was expropriated by the core through unequal trade relations. The semi-periphery had limited access to international banking and the production of high-cost, high-quality manufactured goods, but did not benefit from international trade to the same extent as the core.

Dependency and world systems theories share a common emphasis on global analysis and similar assumptions about the nature of the international system and its impact on national development in different parts of the world, but they tend to emphasize different mechanisms of governance. Dependency theorists tend to focus on the power of transnational classes and class structures in sustaining the global economy, whereas world systems analysts have tended, at least until recently, to focus on the role of powerful states and the interstate system.

Initially, the logic of these perspectives supported a strategy that came to be known as import substitution industrialization (ISI). The ISI strategy was to produce internally manufactured goods for the national market instead of importing them from industrialized countries. Its long-run objective was to first achieve greater domestic industrial diversification, and then to export previously protected manufactured goods as economies of scale and low labor costs make domestic costs more competitive in the world market. In the 1950s, 1960s, and 1970s, ISI strategies were pursued by countries such as Chile, Peru, Brazil, Mexico, Argentina, Ecuador, India, Pakistan, Philippines, Indonesia, Nigeria, Ethiopia, Ghana, Zambia, South Korea, Taiwan, and Japan. The strategy ultimately foundered because of the smallness of the domestic market and, according to many structuralist theorists, the role of transnational corporations in this system. These theorists concluded that ISI, carried out in conditions of capitalist relations of production dominated by the economic empires led by the United States, was a recipe for further colonization, domination, and dependency. Thus, beginning in the 1970s, theorists and practitioners heralded an export-oriented strategy as the way out of dependency. This strategy gives priority to the growth of manufacturing production aimed at world markets and the development of a particular comparative advantage as a basis for success in world trade. The strategy is based on lower wages and levels of domestic consumption (at least initially) to foster competitiveness in world markets, as well as to provide better conditions for foreign investment and foreign financing of domestic investment. By the 1980s, however, many countries that pursued this strategy ended up with huge foreign indebtedness, causing a dramatic decrease in economic growth. Though the theorization of types of peripheral development and their connection with the international system continued to undergo refinement in the 1980s and 1990s, structural theorists were never able to agree about what would end dependence and how a nondependent growth could be achieved.

The Neoclassical Counterrevolution

In the 1980s, a neoclassical (sometimes called neoliberal) counterrevolution in development theory and policy reasserted dominance over structuralist and other schools of thought in much of the world. The emergence of this counterrevolution coincided with

the abandonment by the developed countries of social democratic and Keynesian economic policies and, in particular, the policy of controlling capital movements, as well as the post–World War II trading regime. Critics have pointed out that this counterrevolution also coincided with and seemed to offer justification and support for a wave of market-oriented interventions by the World Bank and International Monetary Fund (IMF), and efforts to forge a unified global market regulated only by institutions reflecting the interests of transnational capital.

The neoclassical or neoliberal perspective represents a modification and further elaboration of modernization theory. However, in contrast to modernization theory, neoclassical theorists see development as the outcome, not of strategic state action, but of the action of market forces. The central claim is that failure to develop is primarily the result of too much government intervention and regulation of the economy. Neoclassical theory emphasizes the beneficial role of free markets, open economies, and the privatization of inefficient public enterprises. Its recommended strategy for development is to free markets from state control and regulation, so that capital, goods, and services can have total freedom of movement, and there can be greater openness to international trade. This is the basic blueprint for what has been termed *good governance.* The notion of good governance has been elaborated, in part, through a component of the neoclassical counterrevolution called the new institutionalism. The basic premise of this perspective is that development outcomes depend on institutions such as property rights, prices and market structures, money and financial institutions, firms and industrial organization, and relationships between government and markets. The essence of good governance is to ensure the existence of these institutions and their proper role and functioning, as seen from the perspective of neoliberal theory. According to neoliberal thought, good governance requires freeing the market from state control and regulation; reducing government expenditures for social services like education and health care; maintaining roads, bridges, the water supply, and so forth; and privatizing state-owned enterprises, goods, and services (including

banks, key industries, railroads, toll highways, electricity, schools, and hospitals) by selling them to private investors.

As evidence of the soundness of these policy prescriptions for the developing world, proponents point to the experience of the four Asian "Tigers": South Korea, Taiwan, Singapore, and Hong Kong. These were the most successful cases of the export-led industrialization strategy adopted by many countries in the 1970s. All were able to achieve economic growth based on export industries with comparative advantage in cheap but skilled labor. All have maintained high rates of domestic savings and investment (with correspondingly lower levels of consumption). However, many people point out that, in contradiction to the anti-statist, market-oriented reforms prescribed by neoliberal theory, this national development strategy in all the Tigers except Hong Kong has been planned and executed through the institutions of a centralized authoritarian state.

Critical Perspectives

A number of critical perspectives emerged in the 1970s that highlighted the cultural and ethical dimensions of development. Most prominent among these were the postmodern, postcolonial, and subaltern critiques of Western knowledge systems, their basis in Eurocentric and nationalist historiography, and their relationship to the exercise of Western power. Postmodern writing challenged grand narratives of the modern era—narratives of the inevitability of progress, the triumph of individuality, and the primacy of scientific truth—as oversimplified, oppressive, or tyrannical. Postcolonial theory focused on the legacy of colonial rule, and especially the difficulties faced by former colonial peoples in developing national identity. Working within this general perspective, subaltern studies sought to rethink history from the perspective of the subaltern and, in this way, bring to light and assert the value of alternative experiences and ways.

These critiques succeeded in drawing attention to the ethnocentric basis of the idea of what constitutes development and the potential limitations inherent within this development, the tension between universal

theories and a diverse developing world, the treatment of gender in conventional development theory, and the political content of economic development strategies as pursued by national governments, encouraged by international institutions and NGOs, and concealed behind the notion of aid. Eventually, these critiques helped focus attention on the need to broaden the concept of development to include a social development and human security dimension. One notable result has been the United Nations Development Program (UNDP)'s conceptualization of human development, which includes the capacity of people to lead long and healthy lives, acquire knowledge, and have access to the resources needed for a decent standard of living.

So far, the notion of human development has influenced development theory in at least two ways. First, it has clarified the inadequacy of theories that focus on whole nations or societies and that use macroeconomic factors to explain differences in development conditions and to measure development: These tell us nothing about whether the wealth and material well-being generated nationally are widely enough distributed to provide the conditions for human development. Second, the notion of development as human development reemphasizes the importance of the state. It assigns the state a major role in protecting and advancing sustainable human well-being and argues the need for just the socially oriented state policies that neoliberalism proscribes—policies that improve access of all people to human resource investments, productive assets, credit facilities, information flows, and physical infrastructure and protect the legitimate interests of producers, consumers, workers, and vulnerable groups in society. Thus, alongside the neoliberal call to dismantle public ownership, statist planning, and government regulation of economic activities, there is a perspective that reinvigorates the call for a larger state role in development. These contending perspectives will likely continue to inform political debates about growth and governance and, in particular, what constitutes good governance in the new global context of development.

The growing field of globalization studies is likely to play an important role in shaping the future of development theory. Under its impact, development theory is likely to focus increasingly on interactions and encounters that are varied and worldwide and, drawing on the insights of world historians, to extend this focus backward in time. Eventually, evidence of cross-setting similarities in processes and outcomes of growth in world history may dissolve conventional views of Western and non-Western historical development, and of developed and developing worlds, and give way to a notion of one world, both in history and in the contemporary world. The study of global development, the development of all regions in interaction with each other, may then generate new theories of governance as well as of development.

Devolution

Devolution is defined as the transfer of power from higher to lower units of any system. In its broad form, devolution resembles decentralization, but is often regarded as being more complete and permanent than decentralization. Most frequently, devolution is used with reference to the transfer of responsibilities and authority from central to subnational (or regional to local) levels of government. Beyond this minimal definition, the understanding of what devolution includes and excludes and how it differs from other forms of delegating responsibilities varies across contexts. A general distinction can be made between devolution as an umbrella term for various ways of shifting down responsibilities and devolution as one specific mode of decentralization.

In the sense of the latter understanding, the World Bank distinguishes between deconcentration, delegation, and devolution as three distinct modes of administrative decentralization of the redistribution of authority, responsibility, and financial resources for providing public services. The three types are differentiated according to the degree of transfer, with deconcentration being the weakest form and delegation coming next. Delegation is referred to as the transfer of responsibilities to semi-autonomous bodies, such as executive agencies, public enterprises, regional development corporations, and so forth. Hence, devolution is regarded as the strongest mode of decentralization in the sense that powers are devolved to political entities with a separate corporate status, such as local or regional governments. Therefore, devolution is political in the twofold sense that the receiving end of devolution is directly legitimated by popular or indirect elections and that the devolution includes decision-making power rather than pure transfer of responsibilities for service delivery. That is why devolution is also referred to as political decentralization.

Although other international organizations (such as the Organisation for Economic Co-operation and Development) use devolution as an umbrella term (in the sense of decentralization used by the World Bank), devolution is more frequently used as a process of moving down political decision-making power rather than merely shifting administrative responsibilities downward. Motivations for devolution in that sense include the perception that devolved governments are best placed to develop and implement policies that exploit endogenous local or regional capabilities and are, hence, an appropriate reaction to increased competition between regions in a globalized economy. Although it is a matter of debate under which conditions devolution can deliver improved policies and enhance regional competitiveness, concerns against devolution are also connected to the positive effects of national uniform regulations and levels of taxation.

Devolved Systems

To qualify as a devolved system, the subnational levels of government should be legally established as institutions that exercise power within clearly recognizable geographical boundaries. Other criteria include democratic institutions such as popular elections and the existents of assemblies. Whether these criteria also include financial powers, such as the power of taxation (e.g., in the United Kingdom, taxation is excluded from devolution), is contested.

Given these criteria, a rather different meaning of devolution comes into focus. In many unitary countries, such subnational bodies did not exist or have not been developed to full-fledged political entities. In that context, devolution is less about transferring particular areas of responsibilities; instead, it is first about creating political authorities at the local or regional level. When used that way, devolution is associated with change at the constitutional level of a country and is frequently a reaction to demands to politically recognize ethnic or cultural diversity within a particular country rather than an exercise of administrative reform policy.

Devolution as a notion in this sense has been prominent in the UK context, where popularly elected authorities have been established in Scotland, Wales, and, although in a different context, Northern Ireland. Other examples of major political decentralization, including constitutional change, include Spain, Belgium, and Mexico. Devolution has transformed some of these countries—for example, Belgium—into fully fledged federal states. In other cases, such as the

United Kingdom or Spain, the process has, so far, resulted in a pattern of asymmetric devolution with different regions possessing different degrees of autonomy, and the final settlement of these ongoing processes remains an open question. Devolution therefore should not be regarded as an automatic process leading to federalism or confederalism.

Although devolution in the sense of creating devolved systems is a process of political reform linked to demands for local, regional, or ethnic self-government, it is also used in federal systems to indicate major shifting of responsibilities between levels of government in specific policy domains. In that sense, the substantial shifting of policy responsibilities in the welfare sector in the United States in the 1990s has been discussed as part of the wider devolution revolution.

Devolved Governance

What links the different dimensions of devolution is the perception that these trends give way to new forms of governance between levels of government. Given the weakened capacity for top-down governance, the hierarchical layering of levels of government is said to be replaced by increasing reliance on cooperative forms of interaction. Therefore, devolution is frequently regarded as part of the move toward multi-level governance—that is, a system, where different levels of government, including supranational levels (e.g., the European Union), simultaneously interact with each other without necessarily following the hierarchical chain of levels (e.g., regional government directly interacting with the European Commission).

Any analysis of governance in devolved systems has to consider the difference (and potential divergence) between the formal devolution of authority and responsibilities on the one hand and the actual balance of power between levels of government and the degree of autonomy of subnational levels of government on the other hand. Criteria for measuring administrative and political decentralization, as used by the World Bank and in the field of fiscal federalism, provide one way of assessing the degree of autonomy. However, from the perspective of the governance

literature, these criteria alone do not provide a complete picture. For example, Rod Rhodes' analysis in *Beyond Westminster and Whitehall* showed a considerable degree of dispersion of power in the United Kingdom long before devolution was pursued. At the same time, more recent analysis of the UK case shows that devolution goes hand-in-hand with diverse ways of controlling regional government activities, particularly based on the financial powers of central government. Correspondingly, research on the United States provides evidence that devolution in some domains has been accompanied by a significant flow of new federal regulations.

DIALOGIC PUBLIC POLICY

Dialogic public policy invokes the possibilities of a participatory democracy in which citizens are active partners with government throughout the policy

process. This form of participation emphasizes deliberation, joint learning, and building agreements toward mutually identified public goals. Dialogic public policy seeks to put greater control over policy in the hands of citizens where input is proactive and involved, rather than reactive and passive. As a result of increased globalization, complexity, and gradual shifts toward governing networks, involving citizens through dialog has become increasingly important to achieving workable and accepted solutions.

Dialogic public policy requires environments that are conducive to jointly forming and implementing policies. Such environments are town hall forums, citizen juries, and advisory groups. Dialogic public policy is iterative, meaning that even though consensus may not be evident at the outset of a policy process, dialog moves participants closer toward substantive agreement. As a result, individual interests are negotiated with the common good, as distinct from processes whereby interests are static and aggregated.

Dialogic public policy assumes that citizens and government take on roles not normally assigned in liberal schemes. It characterizes citizens as active, not passive; passionate, but not overly so. The foundation of a dialogic public policy process sets the conditions for joint learning, which generates shared meaning among citizens and government. As decisionmakers, participants are placed on an equal footing with experts, where diverse forms of knowledge are equally valid. When value is placed on shared decisions, relationships among members are increasingly important. These relationships facilitate habits of civic judgment, where citizens learn to negotiate their preferences in the context of the common good. The role of government in dialogic public policy is intended to facilitate citizen involvement in decisions where citizens act as co-learners in the process.

Dialogic public policy is not without its critics, who are chiefly concerned with its functionality and appropriateness of scale and capacity for solving problems in the public interest. Because of its heavy reliance on relationships, questions arise about the practicality of the concept at anything larger than the community level. At a national scale, certain policy decisions, such as national security, are inappropriate for mass input. Also, dialogic public policy assumes that all citizens have equal capacity to engage. The wide disparity in free time, education, and interest allows for the possibility that agencies will be captured by special interests that have the resources to steer decisions. Only a government that is willing to be creative about its techniques for involvement and is sincere about its willingness to share power can mitigate these dangers.

DIFFERENTIATED POLITY

A differentiated polity consists of various interdependent governments, departments, and agencies. Political integration and administrative standardization are limited. Rule takes place through a maze of institutions and a complex pattern of decentralized functions. Governance is thus fragmented between organizations that cover different territories or deliver different functions. It occurs in and through networks composed of the relevant governments, departments, agencies, and other social and political actors. The groups within the networks are interdependent. Each relies on cooperative exchanges with the others to secure parts of its agenda. The networks themselves are often self-organizing. They have at least some autonomy from the center.

Beyond the Unitary State

Perhaps the main use of the term *differentiated polity* is to draw a sharp contrast with concepts of a unitary state. A unitary state is characterized here by the presence of an identifiable polity with clear boundaries and with a sovereign will that formulates law. In contrast, a differentiated polity is characterized by fuzzy boundaries and by the flow of power and authority downward, upward, and outward. It is often suggested that these flows of power have increased recently as a result of devolution, globalization, and contracting out.

The contrast between a differentiated polity and a unitary state is especially important for the Anglo-governance school. The Westminster Model portrayed the government of the United Kingdom in terms that privileged parliamentary sovereignty, cabinet government, executive authority, and a neutral civil service. The Anglo-governance school counters this portrait with one of the United Kingdom as a differentiated polity characterized by a hollow state, a core executive, and multiple networks. This school draws on theories of governance that arose in discussions of the European Union (EU) and the new public management. These theories inform an account of governance in which power is diffuse. Central government is just one of several public, voluntary, and private bodies involved in the policy process. Although the core executive typically has a preeminent place within networks, it rarely can dictate and control policy. Rather, the center tries to steer and regulate networks by means such as financial control, negotiation, and audit. This analysis of a differentiated polity draws attention to gaps between the Westminster model and the actual practice of governance in the United Kingdom. It highlights, for example, the importance of links between the EU and subnational authorities in the administration of structural funds.

Related Concepts

Concepts such as networked polity or disaggregated state closely resemble that of the differentiated polity. These other concepts are often used to describe emerging patterns of European and global governance. Hence, they refer to territories that few people ever imagined to be governed by a unitary state. The EU resembles a networked polity in that it relies on a complex web of committees and societal associations to advise, manage, and regulate varied aspects of governance. Similarly, global governance seems to resemble a disaggregated state in that it relies on various transgovernmental networks. States and nonstate actors collaborate here within diverse networks to address shared concerns. Although some global networks are composed of states and constituted by legal treaties, others are informal networks composed of, say, national regulators and the main private organizations they regulate. Indeed, transnational groups and corporations often generate private governance regimes of rules, norms, and principles that then guide their actions. Global governance consists partly of attempts to regulate and coordinate such private governance regimes.

Governance at the national, regional, and global levels can be described as differentiated, networked, and disaggregated. These descriptions combine to offer a vivid alternative to the idea of sovereign states located in a largely anarchical international society. They evoke instead a world that is composed of networks of networks. Individuals and groups organize themselves into multiple, overlapping, and interdependent networks to address common problems. States and international organizations are just groups within these diverse networks.

The Ambiguity of Differentiation

It is often unclear whether the differentiated polity represents a fundamental change in patterns of rule, a gradual process of change, or an abstract concept that seeks to rectify simplistic concepts of the state. We can distinguish here between two accounts of the differentiated polity according to their respective analyses of differentiation. On the one hand, differentiation can refer to a process based on functional differences. This concept of differentiation inspires accounts of governance as a complex set of institutions defined by their various social roles. The differentiated polity thus appears to be a recent outcome of the process of specialization within government: Institutions and the links between them have multiplied to serve

increasingly specialized purposes. On the other hand, differentiation can refer to the different interpretations, beliefs, or meanings that are often within an institution or practice. This concept of differentiation inspires decentered accounts of governance. Patterns of governance arise from contingent and competing actions inspired by distinct webs of belief. In this view, the differentiated polity is certainly not just a description of recent changes in the world. It is an abstract account of how we should think about all states, perhaps even all patterns of rule.

DILEMMA

The term *dilemma* plays a significant role in political science in general and in theories of public governance. The objectives of public governance are numerous and multifarious, and this increases the potential for conflicts between policy objectives in the governing process. Hence, governors often face dilemmas in the performance of societal governance. Kenneth Arrow's famous impossibility theorem, which claims that public governance cannot at the same time be democratic and efficient and inexpensive, synthesizes what traditional political science has regarded as one of the most prominent dilemmas of public governance that constantly threatens to reduce the possibility of governing democratic societies. This idea that there exists a fundamental trade off between democracy, efficiency, and costs is closely linked to the idea that governments must find ways to adjust the democratic demands on the input side so that they do not exceed the output and outcome that the political system is capable of producing.

Governance theorists confront this view on dilemmas of public governance in two ways. First, they tend to give up the idea that the presence of a dilemma necessarily has a negative impact on the ability to govern. Mark Bevir and R. A. W. Rhodes in particular see dilemmas instead as a constructive driving force for change and innovation. People modify their beliefs and so actions in response to dilemmas whether these come from the environment or from their own reflection. Second, governance theorists give up the idea that there necessarily is a dilemma between the desire to enhance democracy and efforts to increase governance efficiency. They argue that a decisive input from stakeholders in many cases increases governance efficiency. Therefore, the relationship between democracy, efficiency, and costs might turn out to be a plus-sum game. This does not mean that governance theorists regard public governance as dilemma free. Rather, they regard the most pressing dilemma in processes of public governance to be of another sort.

Governance theorists claim that one of the most pressing dilemmas in public governance today is that we need both centralized governance and decentered self-governance. Governance theorists emphasize the considerable governance capacity of self-governing networks, groups, and organizations. When stakeholders are granted space to govern themselves, they develop a sense of ownership that transforms them from pressure groups to responsible, resourceful, and cooperating coproducers of public governance. However, this transformation will not take place unless the stakeholders are given a considerable amount of autonomy vis-à-vis government. But if self-governing networks, groups, and organizations gain too much autonomy,

there is considerable risk that the aggregated outcome of the governance process will become fragmented and chaotic. Accordingly, there is a pressing need for centralized governance of self-governance. Governance theorists regard this double need for centralized governance and self-governance as a basic dilemma in contemporary governance processes that cannot be overcome, but only handled and balanced more or less successfully. They suggest that this balance should be established through various forms of metagovernance. Metagovernance can be exercised in three ways: hands on through the facilitation of self-governance; hands off through political, financial, institutional, and discursive framing of self-governing networks, organizations, and groups; or indirectly through the presence of a strong shadow of hierarchy. This shadow has an indirect effect on the self-governing actors if they think that if they themselves do not find solutions to a given problem, government will take over. A core issue for governance theorists is the search for new forms of metagovernance that can contribute to handling the difficult dilemma between the need for centralized governance and the need for decentered self-governance.

Dirigisme

The term *dirigisme* is derived from the French word *diriger* (to direct), which signifies the control of economic activity by the state. Preventing market failure was the intellectual basis of the planning syndrome. Dirigisme originated in France following World War II to promote industrialization and protect against foreign competition and was then mimicked in East Asia. Although still a capitalist economy, dirigiste policies often include centralized economic planning, directing investment, controlling wages and prices, and supervising labor markets. Even though countries with dirigiste political economies experienced some economic success, dirigisme has since been challenged.

Postwar planning became a widespread activity following economic stagnation before World War I and the Great Depression. In France, dirigisme took the form of indicative planning, which entailed government credit policies and subsidies, developing new technologies, and the regulation of employment overseen by a special planning commission, the Commissariat au Plan. The French government also embarked on ambitious projects, encouraging the formation of national champions in large industry groups, such as the transportation system. Long-term plans were guided by state technocrats composed of commission members, high-ranking civil servants in the ministries, and leaders of financial institutions and businesses. Furthermore, an elite university for public administration, the *École Nationale d'Administration,* was established to train future state planners.

Similar to France, state authorities in Japan also pursued dirigiste policies prioritizing selected sectors for rapid development and recruiting technocrats from the nation's elite schools for positions as planners in the state administration. Following the Japanese and French models, Korea promoted its version of national champions, the *chaebol,* providing long-term subsidized credit to a few industrial groups. In Taiwan, the government chose to support capital-intensive industries, such as shipbuilding and petrochemicals.

Many attribute the collapse of dirigisme to the increased complexities of a highly competitive and internationalized economy as strategic planning capacities of state technocrats became severely limited. Dirigisme flourished in the 1950s and 1960s in

France, but sour economic results, uncompetitive enterprises, and declining sectors forced the government to largely renounce dirigisme in the 1980s. Dirigisme was also largely blamed for the bursting of the Asian bubble economy in the late 1990s. Financial crisis and recession in Japan was seen to have been a result of its failure to change long-established institutional patterns of behavior. In Korea, state activism in the market economy was considered as crony capitalism. Although dirigisme has undoubtedly given way to more market-centered political economy in these countries, the state is still arguably active in various ways.

DISCOURSE

There are various definitions of the term *discourse:* Discourse can refer to verbal expression between speakers, to a form of democratic dialogue in which all participants present their views in a forum free from political domination, or to a system of ideas or knowledge that make meaning in a particular context. The most prominent form of discourse theory today is perhaps that of the structuralists and poststructuralists. In this view, discourse is the way meaning is produced and organized in a particular social field: Discourse encompasses the language, meanings, and beliefs through which the world is constructed and becomes understandable. Such discourse theory builds on the linguistics of Ferdinand de Saussure to claim that language is constitutive of all human experience. In this structuralist model, reality is understood as an effect of the formal language systems used to explain the world. Discourse creates reality through processes of inclusion—delimiting what can be made intelligible in a social context—and exclusion—determining what cannot be said or cannot be understood in this context. Discourse is thus both a productive and a repressive form of meaning making. In the structuralist system, discourse creates society and stands analytically before its formation.

As discourse theory has become less structural and more sociological, so it has become more relevant to the study of governance. In particular, Michel Foucault moved away from a structuralist theory to a poststructuralist one in which discourse came to include language as well as the institutions, economic relations, and political events that help to create meaning in any social context. Poststructuralist concepts of discourse retain many structuralist echoes. Language is still the primary way to understand society, and the units of language are still defined in relational terms. But language does not stand outside of society. Rather, language is developed from the specific historical, cultural, and political formations of the social field it organizes. Therefore, poststructuralist discourse theory includes more objects of study than did its structuralist predecessor. It also makes less totalizing claims about discursive power. Multiple discourses can interact in any given society. And discourses are always in a process of change. Furthermore, discursive formations cannot exist alone. They rely on a society's technological and material practices for their operation. For poststructuralists, discourse does not create the social field or stand analytically before it. Rather, discourse is embedded in and arises out of the practices and events that define society.

Several approaches to governance draw on ideas about discourse and discursive practices. Typically, these approaches suggest that administrative networks and even whole patterns of rule operate partly through the meanings, languages, and traditions that are at

play within them. They challenge attempts to examine politics on the assumption that humans are autonomous actors who make decisions based on calculated self-interest. Yet, discursive theories differ among themselves over the nature of human action. Governmentality theorists often suggest, following structuralism and poststructuralism, that subjects are merely the effect of discourse: Subjects are no longer accorded any agency, but rather viewed as being produced by the discursive regimes that position them within the social field. Other interpretive approaches to governance, such as decentered theory, allow for agency while seeking to pluralize its forms. In this view, although subjects are formed within the context of traditions and discursive practices, they retain the capacity to shape and transform their social context.

DISINTERMEDIATION

Disintermediation means removing intermediaries from a supply chain, a transaction, or, more broadly, any set of social, economic, or political relations.

The term *disintermediation* was first used in the early 1980s to describe change in the financial sectors of capitalist economies, especially the impact on broker firms of new technology in the stock market. It then became popular during the dot-com boom of the 1990s when it was commonly used to capture the ways in which the Internet is reducing the role of previously powerful organizations in social, economic, and political life; in one view, Internet communication networks reduce the need for those who have some traditional claim to expert knowledge or market dominance.

An excellent example of disintermediation in action is the online computer retailer, Dell. The company sells goods through its Web site but has no physical presence in shopping centers. The overhead cost savings enable it to offer a wide range of goods at cheaper prices than traditional retailers can. Equally significant is its network model of internal governance, which rests on fine-grained management of supply chains, just-in-time manufacturing and distribution, and a global division of labor based on outsourcing.

In politics, some have argued that virtual communities and electronic voting might undermine traditional intermediaries such as parties, interest groups, legislatures, and bureaucracies. For example, a criticism of e-government and e-democracy is that opening up public bureaucracies to direct citizen influence disintermediates elected representatives whose traditional role is to scrutinize unelected officials.

Yet it is by no means clear that intermediaries are being undermined by new information and communication technologies. The claim needs to be assessed alongside an appreciation of broader institutional concentrations of power. Old intermediaries have found their skills highly relevant to the Internet age. They have at their disposal forms of knowledge, expertise, and wealth that are not distributed evenly throughout society. In some areas, new intermediaries are mushrooming. Consultants specializing in spreading the gospel of e-government, e-democracy, or online campaigning abound. Existing power brokers are often just as likely to have their position enhanced by the Internet as they are to have it reduced as a result of competition with smaller or newly emergent players.

Indeed, some scholars have pointed to the multiple ways in which new technologies are adapted to conform with existing power structures. These researchers suggest that those in positions of power are likely to shape the adoption and implementation of

a new information and communication system in such a way that it enhances rather than undermines their power. Such technologies reinforce inequalities based on other sources, such as an individual's or a group's position in a formal hierarchy, their expertise, experience, or control over strategically significant areas of decision making.

DIVERGENCE

See CONVERGENCE AND DIVERGENCE

DOMESTIC LEVEL THEORIES

Changing patterns of governance within national arenas have led to the application of new tools and concepts at the domestic level. Pre-governance concepts are increasingly being challenged to capture the degree to which the state can be described as hollow and, related to this, the extent to which substate and nonstate actors have become more powerful. Although there are a number of different models of domestic governance, cutting-edge work in this area is best explored by looking at the Westminster Model and the pressure that has been brought to bear on it: The case of Britain illustrates that even the strongest and most centralized state formations have been confronted.

The Westminster Model has provided the dominant lens through which the organization of the British state has traditionally been viewed. Although it may have stopped short of being a fully fledged theory, the Westminster Model has nonetheless been influential in capturing key aspects of the British state and political system. As the dominant paradigm, it provided an organizing perspective, or at least a starting point, for the deliberations and researches of academics. On a more practical level, the Westminster Model also provided a framework for understanding for the politicians, policymakers, and organized interests working with and around the governing system. It also seeped into the consciousness of the broader public by framing expectations of politicians and political possibilities.

The Westminster Model was an analytical lens through which many shaped their understanding of British government and politics, but it also had a powerful normative dimension. That is, for many, the Westminster Model was a template for how government and politics should be organized and became a model that was emulated, imitated, and transferred elsewhere.

For governing elites in particular, the Westminster Model had a number of advantages. In particular, it was a relatively simple hierarchical model where the location of authority and responsibility was generally clear, and thus, accountability could be relatively easily applied. The starting point was a centralized state in which parliament was sovereign. Some described this as a unitary state; others, recognizing the component parts of the United Kingdom, preferred the term "union state." The key point here is that state power resided largely in Westminster and Whitehall, the London locations of parliament and the civil service. Although Britain had a long history of local government, its powers were ascribed by the central state, and autonomy was closely monitored. For the most part, local government existed to deliver central government policies according to central priorities.

The first-past-the-post electoral system generally provided a clear majority for the governing party and, thus, a strong executive within parliament. In principle, this meant that a clear political steer guided a unified

civil service. The British constitution was unwritten or, more properly, uncodified. There was a strong emphasis on established norms and past practice in guiding political conduct.

This governing system captured by the term *Westminster Model* emerged gradually over centuries rather than being the product of grand design. However, it was deeply embedded in British practice and consciousness and was perceived as successful by governing elites. Throughout the nineteenth and much of the twentieth centuries, Britain was a world power both economically and militarily, and its political system was seen as a key component of its success. Although the system always had undoubted weaknesses, the association of the political system with national success ensured its survival, at least in some respects, into the twenty-first century. However, developments in the second half of the twentieth century challenged the British system of government and politics and, thus, challenged the analytical lens through which it had generally been viewed.

Academically, the Westminster Model had been criticized in some quarters for its over-emphasis on political elites and its relative neglect of wider political activity beyond Westminster and Whitehall. This emphasis led to a narrow focus on questions of power; for example, between the relative power of the prime minister vis-à-vis the cabinet, which for some distracted debate away from more significant fissures, such as those between social classes. The model was also a lens that was particularly insular in its focus; it did not seek to place an understanding of British politics in the context of Britain's place in the world. This was particularly problematic for the model when Britain's place in the world began to change significantly in the second half of the twentieth century, with consequences for domestic government and politics.

Cracks were apparent in the Westminster Model from the 1950s and 1960s, but the model continued intact beyond this period for two reasons: First, because it was perceived as successful by the political elites who were most socialized by its contours and whose interests most depended on it, and second, because no alternative that captured the imagination appeared.

From the 1970s onward, however, a range of developments combined to place great strain on the Westminster Model, in both theory and practice. In the 1973, Britain's accession to the European Community (EC) had both symbolic and practical significance domestically. Symbolically, EC membership was recognition by British political elites of Britain's declining position in the world, particularly in economic terms. Practically, EC membership would, in the longer term, bring pressures for change in the organization of British politics and government that were largely out of step with mainstream practices of other member states and emerging EC (and later European Union) norms.

Shortly after acceding to the EC, economic recession resulting primarily from oil price shocks hit Britain particularly badly. Ironically, given that EC membership was largely an attempt to arrest Britain's poor economic performance, accession to the EC became associated with recession in the public mind. However, Britain's relative economic decline had other, deeper roots: Its investment levels, management practices, and employee-worker relations lagged behind its postwar competitors. Thus, even though many states faced problems of overload in the 1970s and failed to deliver welfare commitments to citizens, Britain faced a particular crisis that was brought home sharply in 1976 in a widely publicized request for aid from the International Monetary Fund.

The economic crisis of the 1970s shifted the parameters of British politics. From the end of World War II until the 1970s, welfare spending had increased and the public expectation was that it would continue to increase. The late 1970s and early 1980s was, in contrast, a period of retrenchment in welfare spending. This had implications for the size and structure of the state, as well as for the consensual politics on which the British postwar settlement had been founded as the dominant parties of Left and Right diverged profoundly for a period on how best to resolve the problems. Thus, for a time, British economic crisis was accompanied by a political crisis in which Left and Right became polarized and extra-parliamentary politics (especially employer/state–trade union conflict) became more prominent.

On a conceptual level, these developments challenged several features of the Westminster Model, especially its insularity and its narrow political focus. On a more practical level, the public appeal of the governing system declined. If the Westminster Model had, in part, been sustained by a permissive consensus in the postwar period while it continued to provide employment and improve public services, this consensus began to change into various forms of dissent and apathy as unemployment grew and public services declined.

From the 1980s, conceptual challenges to the Westminster Model grew and new forms of governance began to emerge. Conceptually, the policy networks approach and the related notions of the core executive and differentiated polity presented alternative tools for understanding the governance of Britain. On a practical level, the 1980s saw the hollowing out of the state in the form of privatizations of state industries and the creation of the first arms-length agencies, as well as the introduction of market mechanisms in the delivery of public services. The remainder of this discussion focuses on conceptual alternatives to the Westminster Model.

The Differentiated Polity

The narrative of the differentiated polity starts from the view that in the postwar period, the institutions of the Westminster Model have been eroded or transformed so that much governing takes place somewhat removed from government. It is a critique of the notion of a strong center and unified polity, emphasizing instead a complex maze of institutional arrangements making up a differentiated polity.

An account of Great Britain as a differentiated polity emphasizes the interaction between government units of different types and at all levels. It also emphasizes interdependence between actors to explain relationships between different government units and between the state and nonstate actors. Each actor or organization is seen as dependent on others for some resources, and therefore, these actors enter into exchange relationships. Resources can be of several types: constitutional-legal, financial, informational,

organizational, or political. The differentiated polity narrative appeals to policy networks to analyze the aggregation and intermediation of relations between different actors. These networks are often seen to limit participation in the policy process, define the role of actors, decide which issues will be included on the policy agenda, shape the behavior of actors, privilege certain actors, and replace public accountability with private government. Finally, the differentiated polity challenges the notion of the strong and unified executive by suggesting that the center is equally characterized by fragmentation and interdependence.

The differentiated polity narrative challenged the assumptions of coherence and unity central to the Westminster Model. However, even though the differentiated polity emphasized constraints on executive power, it also suggested that centralization and fragmentation would coexist in tension with each other. The center would continue to seek to impose its authority, although in a different context requiring new tools and skills.

Multilevel Governance

Multilevel governance describes the dispersion of authoritative decision making across multiple territorial levels. It emerged to explain the changing nature of the European Union (EU) and, particularly, the changing relations between supranational, national, and subnational actors. Like the differentiated polity, multilevel governance raised questions about the power and role of the state. Specifically, it argued that decision-making competencies within the EU were shared and contested rather than monopolized by national governments; that collective decision making in the EU implied a significant loss of power for individual governments; and that political arenas are interconnected and overlapping rather than being nested, with supranational, national, and subnational actors involved in exchange relationships in transnational policy networks. Thus, multilevel governance emphasized both the increased vertical interdependence of actors organized at different territorial levels and the growing horizontal interdependence between governments and nongovernmental actors.

Liesbet Hooghe and Gary Marks have identified two different types of multilevel governance. The first type conceives the dispersion of authority as being restricted to a limited number of non-overlapping jurisdictional boundaries at a limited number of levels. This type is characterized by relatively stable authority, and analysis is focused on particular levels of government rather than on specific functions or policies. The second type emphasizes fluidity and a complex patchwork of innumerable overlapping jurisdictions. Here, authority is located around particular functions, and jurisdictions are more flexible to cope with changing demands.

The Multilevel Polity

Ian Bache and Matthew Flinders drew on the insights of both multilevel governance and the differentiated polity to develop a framework for analyzing the changing nature of British government and politics in the context of political and administrative devolution and the growing influence of the EU.

Aspects of multilevel governance overlap with those of the differentiated polity, most obviously in emphasizing policy networks and challenges to state power demanding new methods of coordination and conflict resolution. However, multilevel governance emphasizes vertical interactions and, in particular, challenges the traditional separation between the domestic and international arenas, highlighting the intersection of internal and external jurisdictions.

This multilevel dimension has been criticized for over-emphasizing vertically layered interactions to the detriment of no less important horizontal interrelationships. However, in the changing context of British government and politics characterized by political and administrative devolution and the increasing influence of supranational elements, the multilevel dimension is valued for highlighting the increasing importance of vertical interactions.

The multilevel polity approach acknowledges that aspects of the Westminster Model were always something of a diversionary tactic to be validated or falsified in empirical research and that key components of it had long been problematic. However, the approach suggests that by the end of the twentieth century, devolution and EU membership in particular had instigated fundamental changes in the nature, scale, and intensity of inter-organizational relationships in British politics. Despite this, the extent to which central state power had been weakened rather than transformed remained an empirical question, the answer to which was likely to vary across time, policies, and domestic territories.

Despite these practical developments and conceptual challenges, the Westminster Model has not entirely evaporated. At the start of the twenty-first century, the model continued to condition aspects of the British political culture, underpinned the belief

Table 1 Contrasting Organizing Perspectives: Westminster Model and Multilevel Polity

Westminster Model	Multilevel Polity
Centralized state	Disaggregated state
General Principles	
Hierarchy	Heterarchy
Control	Steering
Clear lines of accountability	Multiple lines of accountability
External Dimensions	
Absolute sovereignty	Relative sovereignty
British foreign policy	Multiple foreign policies
Internal Dimensions	
Unitary state	Quasi-federal state
Parliamentary sovereignty	Inter-institutional bargaining
Strong executive	Segmented executive
Direct governance	Delegated Governance
Unified civil service	Fragmented civil service
Political constitution	Quasi-judicial constitution
British foreign policy	Multiple foreign policies

systems of ministers and civil servants, and provided them with a legitimating foundation for their actions. However, the alternative conceptualizations had increasing resonance, speaking to the emergence of a quasi-federal state rather than a unitary state that was enmeshed in complex web of relationships with non-state and supra-state actors. More ominously, these perspectives raised new and important questions about the nature of democracy in fragmented domestic arenas, where relatively simple and clear lines of accountability had become more complex and opaque.

DUE PROCESS

Due process is a legal concept referring to the guarantee that a government will follow fair procedures when depriving a person of life, liberty, or property.

A key element of the rule of law is the idea that government must follow written guidelines that restrict the actions it can take against individuals. Due process suggests that an established set of uniform legal procedures will be used to ensure a just outcome, as opposed to arbitrary or individualized judgment. The most basic level of due process includes individuals' rights to be notified of charges against them, to speak in their own defense, and to be judged by a jury of their peers. It also includes the right to just compensation for the seizure of property and public disclosure of relevant laws.

Due process is a long-standing concept in the Anglo-American legal tradition, originating from the British Magna Carta of 1215. Today, many nations have some form of due process protected by their constitutions. In the United States, due process is guaranteed by the Fifth Amendment, which refers to the federal government, and Fourteenth Amendment, which applies to the states and was passed after the Civil War.

In more recent history, due process has expanded in its scope and is now associated with an increased role of the judiciary via judicial review. Courts are often called upon to examine legislation that limits people's liberty or affects their property and verify whether due process has been achieved. Courts in this position must balance the interest of the state in curtailing life, liberty, or property against the interest of the individual. The default measure that courts use is known as the rational basis test. In this test, judges will determine if a statute is rationally related to a legitimate state interest. If it is, the legislative process is considered adequate and due process achieved.

In some cases, however, legislation is written that is seen by the courts as unreasonable, discriminatory, or in violation of a fundamental right to the extent that no amount of procedural measures could be taken to make that law legitimate. In these cases, courts may overturn legislation based on the substance of the law, rather than the procedures used to develop or enforce it. This is known as substantive due process. Throughout the twentieth century, great controversy

surrounded the orthodoxy of substantive due process as a way in which the courts could prevent what they viewed as legislative malpractice.

Courts have used substantive due process to read values into the constitution that are not explicitly stated there. For example, the due process clause of the Fourteenth Amendment was used extensively in the early part of the twentieth century to protect individual economic interests (such as *Allgeyer v. Louisiana,* 1897, and *Lochner v. New York,* 1905). Since the second half of the twentieth century, the amendment has been used by courts to strike down state laws that infringe upon individual privacy (such as *Griswold v. Connecticut,* 1965; *Roe v. Wade,* 1973; and *Lawrence v. Texas,* 2003). In these cases, courts argue that due process cannot be met by laws that violate personal privacy because they infringe upon the important liberty interest of the individual.

$$\mathcal{E}$$

EAST ASIAN ECONOMIC GROUPING

Proposed in 1990 by Malaysia's former Prime Minister Mahathir bin Mohamed, the East Asian Economic Group (EAEG) represented the idea of an exclusivist East Asian regionalism. As conceived by Mahathir, the EAEG would be Japan-led and would serve as a much-needed counter to emerging regional blocs in Europe and North America. The proposed group included the ten Southeast Asian states, China, and Korea, in addition to Japan, but notably excluded both the United States and Australia. The creation of the European Union (EU) under the 1992 Maastricht Treaty and the signing of the 1992 North American Free Trade Agreement (NAFTA) were important factors behind Mahathir's argument that East Asia needed its own bloc.

The EAEG encountered strong opposition from the United States and Australia. Under President George H. W. Bush, the United States successfully pressured key Asian allies, especially South Korea and Japan, not to support the EAEG. Fear of U.S. protectionism or a U.S. backlash was enough to persuade most East Asian states, whose economic and political survival depended on access to the U.S. market, to withhold their support for the EAEG. East Asian states subsequently rejected the EAEG proposal in favor of an East Asian Economic Caucus (EAEC) within the Asia-Pacific Economic Cooperation forum (APEC). Under President Clinton, the United States continued to oppose the EAEG but did so mainly by giving new support to APEC. U.S.

support for APEC is widely seen as a successful preemptive move against the EAEG and any other East Asia-type arrangements. The EAEG and APEC are often conceptualized as rivals.

Seven years later, the Asian financial crisis gave new life to Mahathir's East Asia ideas. Regional resentment toward the International Monetary Fund (IMF) and U.S. handling of the crisis intensified interest in an East Asian group, which took the form of the Association of Southeast Asian Nations (ASEAN) Plus Three (APT) framework. Though the APT framework precedes the Asian financial crisis (it emerged from the Asia-Europe meetings), most consider the APT framework "the EAEG by another name."

Significance of the EAEG

The EAEG is considered significant as an early signal of what many see to be a (re)ascendant East Asia. It is additionally significant in the context of literature on the new regionalism, in which the new regionalism is characterized by its rejection of protectionist forms of regionalism in favor of a nondiscriminatory open regionalism, best represented in Asia by APEC. The EAEG's exclusivist and racially defined regionalism provided contrast and challenge to the dominant rhetoric of open regionalism at the time.

ECONOMIC COMMUNITY OF WEST AFRICAN STATES

The Economic Community of West African States (ECOWAS) was enshrined in the ECOWAS Treaty of May 28, 1975. The origins of ECOWAS came from the recognition of sixteen West African states that their self-imposed economic isolation and interstate differences needed to be reformed. ECOWAS reflected the region's postcolonial independence and the importance of trading blocs within the international system as a means to reconcile political difference and poverty. The central focus of ECOWAS was therefore economic cooperation, specifically the harmonization of trade policy, underpinned by a need to alleviate poverty within the region.

Economic cooperation within ECOWAS was to be pursued by a common external tariff system and the elimination of trade barriers. Central to the realization of these objectives are the five institutions that run the community. These institutions, as enshrined in Article 4 of the Treaty, are the Authority of Heads of State and Government, the Council of Ministers, the Executive Secretariat, the Tribunal of the Community, and the Technical and Specialized Commissions. The institution encompasses the following member states: Benin, Burkina Faso, Cape Verde, Cote d'Ivoire, Gambia, Ghana, Guinea, Guinea-Bissau, Liberia, Mali, Niger, Nigeria, Senegal, Sierra Leone, and Togo. Mauritania

was a founding member of the organization, but left in 2002 because of single currency concerns.

Since its inception, ECOWAS has expanded its initial mandate to concentrate on issues of sociopolitical integration, development, and defense. The ECOWAS Defense Pact outlines its involvement in multinational peacekeeping; however, its military involvement in Liberia—Operation Liberty—in August 1990 reflected a new role for ECOWAS in military intervention to bring about peace in a member state. The ECOWAS experience in Liberia has led the organization to concentrate on issues of small arms trafficking across the region, and to reassess its peacekeeping mandate and member state sovereignty.

ECOWAS has been seen as successful in its positive impact upon increased production, economic efficiency, and transport systems within West Africa. It has promoted a joint effort to eradicate illegal trade and established the seeds of a customs union. Furthermore, it has drawn up a comprehensive trade liberalization program to reduce trade barriers and encourage investment.

The community continues to be undermined by state sovereignty, interregional conflict, poverty, and an expanding mandate. Larger states within the community are able to dominate its mandate, states continue to compete with each other in trade exports, and many states are only beginning to assert independent sovereignty free from corruption. Expressions of sovereignty and state identity are pursued through alternative regional organizations such as the West African Economic Community (CEAO), which in turn undermines ECOWAS's regional integration and cooperation. In focusing on issues of defense and politics, the community risks expanding its mandate too soon for its institutional capabilities and therefore undermining its initial purpose. Furthermore, economic prosperity in West Africa continues to be juxtaposed with famine and poverty.

ECONOMIC GOVERNANCE

Economic governance in market-based economies such as that of the United States is largely a question of when and how governments should intervene in those markets. Neoclassical liberal theory suggests that interventions should be minimized, limited to ensuring that markets function efficiently and providing public goods that markets fail to provide. Various forms of democratic theory argue, in contrast, that political rather than market processes should play a primary role in allocating resources and setting economic priorities. This debate has engendered a voluminous literature in economics, political science, and public policy, and has been at the heart of many elections as candidates vie for voters oriented toward less government and more market-based freedoms and those who favor increased equality of resources and aggressive regulation of markets.

Globalization has undoubtedly contributed to global economic growth. Throughout the 1980s, according to World Bank data, the world economy grew by an average of 3.3 percent a year, but during the 1990s, it grew by an average of 2.7 percent a year. Even in 2001, when global growth was only 1.1 percent, that translated into an increase of more than $300 billion in economic output. Total global household consumption grew from US$12.9 trillion to US$18.9 trillion between 1990 and 2001, a 3.3 percent rate of growth.

But economic growth has been uneven: The high growth rates in China and other East Asian and Pacific countries mask much more modest improvements in the economies of other poor countries, and economic prospects continue to weaken in Sub-Saharan Africa. World Bank data on the growth in household expenditures between 1980 and 2001, for example, show that growth has occurred in South Asia and the East Asia and Pacific region in contrast to little growth in Latin America and a decline in Sub-Saharan Africa.

In the United States, economic governance is central to debate between Republicans and Democrats regarding public policy. Republicans have been champions of tax cuts and supply-side economics, reduced regulation of business, and subsidies to key industries. Democrats counter with more redistributive tax policies, increased regulation to protect environmental and other values, and increased investment in programs to help low-income residents. Republicans champion an ownership society that maximizes individual freedom; Democrats focus on equal opportunity and empowering those who cannot compete in labor markets without some help. Some argue that economic issues are eclipsed by concern with moral values or that the similarities between the two parties and their pursuit of campaign contributions and support from industry dwarf any differences, but economic governance is clearly a contested issue.

Table 1   Average Annual Growth in Per–Capita Household Expenditure

	1980–1990	*1990–2001*

The apparent polarization of this debate in the United States masks a fundamental truth of economic governance—that markets depend on a variety of public policies to ensure they actually produce the important and valuable benefits they promise, to secure the stability and public order required for economic activity to flourish, and to guarantee the health of the natural environment on which it depends. Regardless of the ideological debate between Republicans and Democrats and proponents and critics of globalization, capitalism inescapably depends on institutions of government for a host of functional policy prerequisites of markets, including the following:

- Securing law and order so that production, marketing, and distribution of goods and services can occur in a stable environment
- Creating private property rights by providing courts and other mechanisms to define and vindicate rights
- Enforcing contracts so that commerce can occur
- Ensuring fair competition through enforcement of antitrust policies
- Establishing currency and credit for the efficient conduct of commerce
- Providing for the conveying of the public domain to private ownership
- Requiring disclosure of information so that consumers and investors can make informed choices
- Providing public goods such as communications and transportation infrastructure and national defense
- Allocating responsibility for injury and dependency and indemnifying injuries
- Preventing externalities that harm third parties or those not part of market transactions
- Regulating production and distribution so that prices include true costs
- Facilitating economic activity through licensing of professions and corporations
- Developing basic workplace skills through compulsory public education
- Reducing risk by indemnifying producers and sellers of products against responsibility for at least some of the uses of the products they produce and sell

Capitalism simply cannot produce the expectations of efficient allocation of resources and satisfying human needs without effective public policies. A brief review of the leading institutions for economic governance reinforces the importance of capitalism's policy prerequisites. In Congress, the House and Senate Budget Committees, the House and Senate Appropriations Committees, the Senate Finance Committee, and the House Ways and Means Committee are potent forces in economic governance as they develop tax legislation, authorize spending levels, appropriate funds, and develop fiscal or budgetary policy. The Congressional Budget Office, established in 1974, serves members of Congress by providing an overview of the federal budget and its economic impacts and assessing the fiscal and budgetary implications of legislative policy options and alternatives. Its most important tasks include preparing cost estimates for implementing any public bill or resolution passed by a congressional committee and keeping score of the costs of authorization, appropriation, and revenue bills relative to the targets provided in the federal budget.

A host of executive branch agencies are involved in economic governance. Some are located in the executive office of the president. The Council of Economic Advisers, for example, is made up of three members, who advise the president on economic issues, evaluate federal economic programs and policies of the federal government, and issue an annual report on the economy. The Office of Management and Budget, originally created as the Bureau of the Budget in 1939, serves the president by formulating the executive branch's annual budget and overall fiscal policy, evaluating the management and programmatic efforts of federal agencies, coordinating departmental advice to the president on proposed legislation, monitoring paperwork and regulatory impacts imposed by federal agencies, and improving procurement practices of federal agencies.

The range of economic activities that comes under the jurisdiction of cabinet departments sweeps across all sectors. The Department of the Treasury, created in 1789, is the most important institution of economic governance in the United States. It provides advice to the president on economic, financial, tax, and fiscal policies; manufactures the nation's coins and currency; enforces policies governing taxation of alcoholic beverages and tobacco; and serves as the financial agent for the federal government. As the government's agent, the department controls the flow of funds and trade to

foreign countries whose assets are "blocked," manages the government's debt, conducts financial diplomacy with other nations, oversees U.S. participation in the International Monetary Fund (IMF) and bilateral and multilateral development institutions, analyzes balance of trade and other economic data, formulates and implements international tax agreements and regulations, and collects taxes through the Internal Revenue Service. The department is responsible for implementing domestic tax policies; overseeing government trusts and accounts; supervising the 2,100 national banks, issuing bank charters, and examining bank operations; and regulating federal and state-chartered savings institutions. The Bureau of the Public Debt borrows the money needed to finance the federal government and manages the nation's debt.

In addition to executive office of the president and cabinet agencies, an array of independent regulatory commissions helps govern economic activity. The Federal Reserve System or Fed, established in 1913, is the nation's central bank, responsible for formulating and implementing credit and monetary policy. The Fed, along with the Treasury Department, is tremendously important in economic governance. The system consists of the Board of Governors in Washington, DC; the twelve Federal Reserve Banks, their twenty-five branches and other facilities situated throughout the country. The Fed seeks to foster the strength and vitality of the nation's economy by managing the cost and availability of money and credit, stabilizing prices, maintaining equilibrium in America's international balance of payments, ensuring the stability of the nation's banks, and acting as a lender of last resort to banks. The Fed's board of governors, composed of seven members appointed by the president with the advice and consent of the Senate, determines overall monetary policy and influences the conditions under which credit is available by determining the requirements concerning reserves depository institutions must maintain on transaction accounts or nonpersonal time deposits and the discount rate charged by the Federal Reserve Banks.

The Fed's open market operations include the purchases and sales of federal government and agency securities in the open market to shape bank reserves;

the Fed lends money to banks so they can meet the reserve requirements, and the interest rate it charges helps shape interest rates economywide. The Federal Bank of New York is responsible for protecting the value of the dollar in international exchange markets. Other regulatory agencies play key roles, from the Securities and Exchange Commission, which implements Federal securities laws aimed at protecting investors and ensuring that securities markets operate fairly, to the Federal Trade Commission (as well as the Department of Justice) that regulates companies to ensure that they do not collude in setting prices or other business decisions that concentrate economic power or reduce competition in violation of the nation's antitrust laws.

Economic governance requires effective governance to ensure regulatory rules protect workers, investors, environmental quality, and other important public values. Despite some rigid ideological thinking, the importance of effective economic governance in the United States has been well established for decades and largely withstood attacks from the Right since the 1980s. Globally, however, the need for effective economic governance is much less recognized. A World Bank report in late 2004 stated that the widening gap between rich and poor nations is partly the result of the quality of business regulation; excessive regulation in some countries, particularly poor nations in Sub-Saharan Africa, stifles business activity and contributes to poverty. Rather than recognizing the complex forces unleashed by global competition and the need for effective public policies to ensure markets function efficiently and effectively, however, globalist market ideology seeks to weaken governmental capacity and authority and insulate industries from regulatory authority.

One way globalism challenges the kind of economic governance that is actually required for well-functioning markets is through its neoliberal ideology of growth, individual freedom, and prosperity. Globalist discourse promises to replace irrational politics with rational markets, replace political authority with unfettered freedom, and integrate the poor into a global marketplace. Globalization is touted as benefiting everyone, creating wealth and opportunity, disseminating information

and culture, and reducing poverty. In practice, critics argue, globalism primarily advances the material interests of those entities that benefit most from minimal government intervention in economic activity.

Another way globalism threatens economic governance is by stigmatizing politics and government as an unnecessary burden blocking the acceleration of economic growth. One current strategy of stigmatization is the privatization of services that have traditionally been seen as governmental functions, such as energy production and prisons (this does not raise the same issues as privatizing previously nationalized industries). Another strategy of stigmatization utilizes deregulation and reduction of government licensing and control of economic activity to leave more market activity unregulated. Yet another relevant strategy is to devolve regulatory power to local governments—welfare reform, for example, has increased regulatory controls over poor women by local governments, while local police forces have sometimes been expanded well beyond that required to match population growth.

Devolution, for example, concerned with the scope of government and its jurisdiction, is promoted as a way to ensure that government is close to the people so that they can hold government accountable and that there is sufficient knowledge to make good policy and guide its implementation. The U.S. experience with devolution is instructive. Under the Constitution, the powers of the national government were limited to the husbandry of commerce and patronage policies, aimed at fostering economic activity. States exercised the police power, the power to control health, safety, and morals. States regulate property, corporate formation, marriage and divorce, compulsory education, and professional licensing. As a result, the national government became the home of liberalism, and state governments became the home of conservatism. National policies have traditionally been primarily liberal, instrumental, and generally free from moral imperatives. State policies have typically been imbued with moral purpose, regulating harmful conduct—conduct deemed inherently harmful as well as those deemed harmful because of their effects. Most state-level laws are conservative, aimed at preserving law and order, sexual morality, and other values.

The political consequence of devolution is to strengthen conservatism: local governments are inherently conservative, focused on maintaining social order, keeping classes and groups in their place, and keeping the poor invisible through segregation. Federal block grants to cities have been used to segregate groups through urban development and redevelopment. Cities used their discretionary power and resources to contain people in their places and to maintain social relationships. Globalization, then, has a Rightward tilt in rejecting redistributive policies and requiring local government to control the spillover effects of inequalities. During the past fifteen years, the Rightward shift is evident world wide, in the most industrialized countries as well as those transitioning to industrialization. Left parties have moved to the center and beyond. Cities throughout the world are segregated along class, ethnic, and religious lines and designed and organized for social control. A corollary of the maxim, all politics is local, is that all social control is local. As cities become more tied to their tax bases, they become more oriented toward the interests of property owners and those with wealth. The devolution that may be most important is the police power and increases in the number of police officers. Although the response to globalization is national, social control policies are expressed and implemented locally. Economics may drive globalization, but politics must pick up the pieces. And globalization weakens the ability of government to provide the preconditions that make capitalism possible.

ECONOMIC INTEGRATION

Economic integration refers to a process that sees two or more states in a broadly defined geographic area reducing a range of barriers to trade to advance or protect a set of economic goals. The level of integration involved in an economic regionalist project can vary enormously from loose association all the way through to the creation of a sophisticated, deeply integrated, transnationalized economic space. Where economic integration differs from the broader idea of regionalism in general is in the political dimension. Although economic decisions go directly to the intrinsically political question of resource allocation, an economic region can be deployed as a technocratic tool by the participating government to advance a clearly defined and limited economic agenda without requiring more than minimal political alignment or erosion of formal state sovereignty. The unifying factor in the different forms of economic regionalism is thus the desire by the participating states to use a wider, transnationalized sense of space to advance national economic interests.

Forms of Economic Integration

Although there are many different forms of economic integration, perhaps the most convenient way to order the concept is to think of a continuum that ranges from loose association at one end to an almost-complete merging of national economies at the other end. Although it is far from a given that positive experiences in the simpler forms of economic integration will lead to a deepening of the process to increasingly integrated shared economic spaces, the more complex forms incorporate and are founded on the substantive elements of the earlier forms. The significant point is that although economic integration is explicitly framed by trading relationships, it acquires an increasingly political character as it reaches deeper forms.

Simple Free Trade Area

The most basic type of economic integration is a simple free trade area. In this form, attention is focused almost exclusively on a reduction of the tariffs and quotas that restrict trade. Emphasis is placed almost entirely on increasing the exchange of goods. The articulation of transnationalized production chains, trade in services, labor mobility, and more sophisticated forms of economic integration are not an explicit goal and emerge as merely tangential to the primary goal of securing access to foreign markets for domestic firms.

Second-Generation Free Trade Area

In a second-generation free trade area, the basic nature of simple free trade is expanded to include trade in nongoods such as services. Where a simple free trade area need only address the question of tariffs and quotas, the trade in services and a widening of trade in goods raises questions of regulatory convergence and the harmonization of rules of operation and governance. At this stage, attention needs to be turned to such things as the transferability of professional certifications as well as questions of labor mobility, particularly for the highly skilled professions such as legal, accounting, technology, and medical services. The increased interdependence between the participating economies that comes with expanded trade in all economic areas, and a measure of regulatory convergence can lead to an increased distribution of production chains across national boundaries.

Customs Union

As national production structures transnationalize across the regional space, the next stage is to deepen regulatory harmonization to present a common stance to the extra-regional market. The result is the formation of a customs union relying upon a common external tariff. One of the key attractions of this regulatory convergence between participating economies is that it reduces the challenges of monitoring and taxing external inputs that are used to produce goods and services that circulate within the region. Implicit in the adoption of a common external tariff is a further harmonization of national rules and regulations, particularly those relating to the control and flow of external trade into the regional economic space.

Common Market

The idea of a common market grows from the possibilities presented by the adoption of a common external tariff. As trade flows increase and factor inputs imported into the integrating economies begin to circulate freely, production chains crossing the intra-regional national boundaries begin to form. This results in sustained pressure to reduce the costs of transporting finished and semi-finished goods between the states participating in the integration project. The solution is the harmonization of border procedures, which in its ultimate form leads to the virtual elimination of national boundaries as internal barriers to trade and the formation of a free-flowing regional economic space. A concomitant change with this complete opening of internal trade is a liberalization of labor mobility, allowing the inhabitants of one member state to work in all the other member states of the region.

Monetary Union

With the evolution of a common market and the concomitant surge in intraregional trade comes a new source of expenses for business: the costs of transnational transactions. Even though borders may be open to the free transit of goods and services, the need to constantly engage in foreign exchange operations to settle payments as well as the differing relative costs caused by different national economic policies impose a constant financial and administrative expense on firms operating within the region. The solution and next stage in the integration progression is some form of monetary union, be it through an agreed fixing of relative exchange rates or the more commonly discussed adoption of a common currency. At this point, the economic aspects of integration also begin to take on a strong political flavor. Adoption of a common currency or monetary policy by all members of the project also requires a strong convergence in macroeconomic policy, which imposes external restraints on the domestic fiscal and expenditure policies that a government may pursue. The result is a gradual blurring of the political as well as economic lines that separate the states participating in the integration project.

Economic Community or Union

In an economic community or union, the logic of common external tariffs, regulatory approximation, and the harmonization of macroeconomic policy is taken to its full conclusion through the construction of an overarching governance framework that imposes a common economic policy system on all countries in the region. In effect, the member states surrender a significant degree of economic sovereignty to the whole in the expectation of significantly expanded opportunities presented by a much larger, fully integrated economic space facilitating the full mobility of finished products, factors of production, and labor. The harmonization of regulations and procedures is facilitated through the creation of an overarching legislative and legal system that trumps national laws and rules and also ensures that economic actors will face the same treatment throughout the region.

Why Form an Economic Region?

The extent to which a region will deepen its economic integration and adopt the characteristics of a supranational state is partially influenced by the factors prompting states to start the regionalization process. Four broad reasons for pursuing economic integration can be identified.

Reactive Regionalism

Reactive regionalism is also referred to as defensive regionalism, suggesting that states choose to pursue economic integration to protect their shared interests from a specific or nebulous external threat. In an historical context, reactive regionalism was viewed by developing countries as a technique for providing the large internal markets needed to support nascent industrial sectors. Although the decline of import-substitution industrialization strategies and the rise of neoliberalism have greatly reduced the protectionist aspect of reactive regionalism, the idea of providing a common level of shelter for internal producers does remain in integration projects such as the South American trade bloc, Mercosur.

The more common motive for contemporary economic integration projects lies in the logic of defensive regionalism. Here the participating states are reacting to perceived threats in the international economic environment. In some instances, such as Canadian participation in the North American Free Trade Agreement (NAFTA), the regional economic integration route is pursued to prevent a country from becoming isolated in a global economic system that appeared to be increasingly drifting toward a series of large economic blocs. Other regional groupings such as the Andean Community and Mercosur have emerged partly as an attempt to use the expanded internal market as a lure to attract foreign direct investment (FDI) in an increasingly competitive international investment climate. Either way, the common element is that the participating states are seeking to use their combined economic mass and density to protect shared interests and to mitigate external vulnerabilities.

Peace and Security Seeking

The most prevalent example of an economic integration emerging as part of an effort to ensure peace and security is the European Union (EU). As the neofunctionalist school suggests, the idea is to increase economic interpenetration between erstwhile hostile countries, seeking to raise the level of interdependence to the point where armed conflict and sustained mutual isolation become economically unsupportable. This underlying rationale can either emerge as a consensus position between participating states, as was partly the case in Argentine-Brazilian approximation in the 1980s and the formation of the South Asian Association for Regional Cooperation (SAARC), or be suggested as a solution to simmering hostilities by mediating actors as an effective method for diffusing potential conflicts, as has sometimes been the case with the South American infrastructure integration program launched in 2000.

Efficiency Seeking

The defensive character of many integration projects is in some cases eclipsed by a desire to reduce transaction costs within a regional space that is seeing the growth in transnational production structures. Here the example of the Association of Southeast Asian Nations (ASEAN) is instructive, with a sustained rise in the regional distribution of production structures creating pressure for increased logistical and regulatory cooperation to facilitate the exchange of production factors. Significantly, an efficiency-seeking rationale to economic integration will not necessarily bring about pressure for labor mobility and often completely rejects the sorts of political approximations implicit in the deeper forms of economic integration. The profit-making potential of economic cooperation within the regional remains the dominant factor with only tangential attention being given to notions of social or political integration.

Externalization

Although rarely explicitly framed as the need to externalize the rationale for politically contentious policies, economic integration has emerged as a device used on the domestic political stage. In South America, the pursuit of an economic integration project was one justification used by pro-democracy factions in Argentina and Brazil in the late 1980s to neutralize lingering calls for a return to authoritarianism. Democratic governments in developing countries have also used the need to adhere to regional commitments as the justification for the pursuit and implementation of

the Washington Consensus model of neoliberalism. Particularly important in this respect has been the reduction of state supports for local industries, the lowering of high tariff walls, and the privatization of state-owned firms. The pattern is thus one of domestic governments placing the blame for some of the politically difficult neoliberal economic programs pursued in the 1990s on the need to meet the country's regional commitments, with the integration project being presented as the source of long-term and sustainable economic advantages as well as a collectively improved insertion into the international economy.

The Political Factor

Although economic integration leads to regionalism as a method of organizing interstate relations that focuses on economic questions, it is in the end a politically motivated concept. States do not fall into economic regionalism by accident. Rather, they engage in long, sustained, and highly technical discussions to carefully delimit the policy and geographical boundaries of the region. Management of the region, irrespective of the extent to which it has resulted in economic integration, also emerges as a potential source of sustained political tension between member states. Different levels of relative economic strength, sophistication, and global competitiveness provide a basis for divergent views over how the integration project should operate and how it should evolve over time. Particularly contentious can be the role of the anchor state, the state with the large market that is often present in an economic integration project and effectively provides the membership rents to the other members by absorbing an increased proportion of their exports. The point is that even though an economic region is founded on and discussed in terms of the technocratic language of economics, the power relations and equations typically found in international relations remain, although manifest in different and sometimes indirect form.

The formation and pursuit of economic integration can also present new international challenges for participating states. Developing states engaged in a defensive regionalist project to improve their collective negotiating power with predominant states in the global political economy can be faced with a divide and conquer strategy in interregional and multinational negotiations. This places additional strains on the anchor state to maintain the solidity of the region. In some instances, this is not a particularly significant challenge because the benefits of collective negotiation in international fora quickly outweigh the economic benefits offered by the group. In some respects, this reflects the EU's quiet strategy of encouraging economic integration and regionalism as a strategy for internally driven development and enhanced political stability in developing areas.

ECONOMIC OPENNESS

The term *economic openness* appeared in comparative political economy in the early 1980s. However, as a concept, it has a much longer history, particularly in the field of international economics. Actually, the

history of studying the causes and effects of the open economy dates back as far as the eighteenth century and figures prominently in the work of classical economists such as Adam Smith and David Ricardo. These classical economists were concerned about the consequences of international trading on the domestic economy, on the one hand, and the positive and negative effects of free trade, on the other hand. Originally, the focus of analysis was on commodity exchange and exchange rates; at present, the focus is more on the ramifications of economic openness on domestic economic systems per se.

Economic openness can be defined as the degree to which nondomestic transactions take place and affect the size and growth of the national economy. The degree of openness is measured by the actual size of registered imports and exports within a national economy, also known as the Impex rate. This measure is presently used by most political economists in analyzing empirically the impact and consequences of trading on the social-economic situation of a country.

Openness of an economy is not a recent phenomenon, having existed since the heydays of economic liberalism and industrial development in the second half of the nineteenth century. For instance, Angus Maddison reported in 1995 that the volume in world trade grew from 3.4 percent (average between 1870 and 1913) to 3.7 percent (1973 to 1992) in volume. During the same time span, however, prices (constant

dollars of 1990) went up twelve times. In addition, the number of countries involved grew dramatically across the world during this period. Labor costs were falling simultaneously, so the locus of industry shifted and economic liberalism (or free trade) prevailed, and this implied that national economic growth became more dependent in the movements on the world market. Conversely, but simultaneously, democratization took place, albeit in various waves over time, which changed the role of the state in most countries. The results of these changes included the emergence of the welfare state as well as the idea of welfare economics. This interaction has been at the core of political economists researching the effects of economic openness. Some authors fear the crowding out effect of public expenditures, harming the national economy and its competitive nature. Others have argued that welfare economics is more important than the welfare state. In this view, the beneficial effects of international trade and related domestic activities would prevail and produce welfare in terms of income redistribution, affluence in terms of a higher level of per capita gross domestic product (GDP) and welfare in general.

Table 1 shows some comparative indicators with regard to openness and socioeconomic developments, based on Maddison's 1995 work.

The levels are comparatively quite similar with respect to economic openness (Impex) with the exception of Latin America in the 1980s and Southeast Asia

Table 1 Comparative Indicators with Regard to Openness and Socioeconomic Developments

Region	Impex		Growth Economy		Inequality	
	1980	1998	1970	1998	1960	1989
OECD Members	70.5	76.4	5.2	2.6	46.9	40.6
Central-Eastern Europe	65.4	92.2	6.8	−4.2	38.5	46.9
Southeast Asia	110.8	117.1	7.4	5.2	49.2	45.1
Latin America	53.5	63.7	5.2	3.8	59.6	52.7
Sub-Saharan Africa	71.2	67.8	4.6	2.5	45.6	49.0
Averages	74.3	83.4	5.8	1.95	47.9	46.8

Source: Adapted from Maddison, A. (1995). *Monitoring the World Economy 1820–1992.* Paris: Organisation for Economic Co-operation and Development.

Notes: Impex = Import + Export/GDP in %; Economic Growth = Annual change in %; Inequality = income share of top 20% of population.

throughout. Hence, one would expect higher levels of economic growth almost everywhere and a certain reduction of inequalities across most regions. This is, however, not the case. International trade does indeed link a country with the world economy. However, it does not reduce its level of affluence and does not always produce more economic growth and income inequality. The literature accounts for this weak relationship by pointing to demographic and geographic factors, on the one hand, and to political factors on the other hand.

The size of a country and its population is negatively correlated with the extent of economic openness. Population growth, which is often high(er) in less developed parts of the world, tends to eat higher outputs. Larger economies tend to produce more for internal markets (e.g., the United States has an Impex of 25.6; Russia, 44.4; Argentina, 23.3; and Japan, 21.0). In the past, this led to forms of autarchy by means of protection. At present, this is less the case because of the globalization of economic relations, the dissolution of the Communist world, and the postwar creation of intentional institutions such as the World Trade Organization (WTO) and the General Agreement on Tariffs and Trade (GATT). Hence, most, if not all, countries are by now more or less integrated into the world economy, although the extent varies according to certain political circumstances:

1. Variations of political systems, such as democracy versus nondemocracy.

2. Institutionalization of politics and related behavior of organized interests.

3. Domestic politics in relation to state capacities (welfare statism).

The analysis of the relationship between democracy and economic development is a long-standing one. Democratic conditions and the "rule of law" would be beneficial for domestic outputs, would spill over into trade advantages, and thus eventually produce more affluence and prosperity. Although this appears a tenable proposition, comparative analysis

shows that this relationship is not a direct one. Intervening variables affect the relationship between system characteristics (e.g., type and quality of the democratic polity) and openness of the economy. For instance, organized interests (such as business and labor), on the one hand, and political parties and types of government, on the other hand, are mentioned. In other words, the institutional design of the polity and the behavior of political actors are considered to affect economic development and its relation to the world economy. The more open an economy is, the more vital the role of politics and institutions will be.

There has been much discussion about the relationship of an open economy to political vitality. Some scholars argue that the emergence and embeddedness of interest groups has negatively affected economic growth and competitiveness (i.e., institutional sclerosis). Conversely, other scholars argue that the more a country's economy depends on international trade, the stronger is the need for institutions that promote cooperation between organized interests and the state (i.e., corporatism). All these scholars conceive of political institutions as crucial for economic development and, consequently, for coping with economic openness. Many of them also argue that party government produces volatile conditions because changes in the ruling party lead to changes of policy.

Summary

Economic openness has been important for understanding a country's economic development. At present, the relationship between the domestic economy (level and growth of outputs) and international trade (exchange patterns on the world market) is omnipresent and affects affluence and prosperity of a society (for income generation and its redistribution).

Economic openness, albeit influenced by factors like geographic variables (population size and resources), appears to contribute to the wealth of a nation. The various literature on political economy suggest that the features of a political system (democratic or not), its institutional design (mode of governance), and the role of organized interests and political parties

are important for understanding how economic openness affects a country's performance for economic viability and social consequences.

ECONOMIC SOCIOLOGY

Economic sociology is the application of the sociological perspective to the analysis of the production, distribution, exchange, and consumption of goods and services. Special attention is given to the relationships between this activity, the rest of society, and changes in the institutions that contextualize and condition this activity. Although traditional economic analysis takes the atomistic individual as its starting point, economic sociology generally begins with groups, or whole societies, which it views as existing outside of and partially constituting the individual. When economic sociologists do focus on individuals, it is generally to examine the ways in which their interests, beliefs, and motivations to act are mutually constituted through the interactions between them. This focus on economic action as social—that is, as oriented toward other people—allows economic sociologists to consider power, culture, organizations, and institutions as being central to an economy.

The themes of power, and culture, as well as the focus on organizations and institutions in economic sociology have naturally led its practitioners to examine the relationship between the state and the economy. Economic sociology has generally asserted that the state and economy exist in a symbiotic relationship: the state depends on the economy for revenue, and the economy depends on the state for the rule of law. This runs counter to much of the economic literature on markets in economics, which tends to portray markets and states as existing in opposition to one another. The symbiotic relationships between economies, the state, and civil society are what economic sociologists mean when they say that economies are embedded in social and political structures. The relationship between the state and the economy has been an area of inquiry central to economic sociology since its genesis.

Economic Sociology: A Brief History

The birth of economic sociology can be found in the writings of Karl Marx. Marx made it his mission to combat the German historicist emphasis placed on G. W. F. Hegel's idealism. The historicist tendency to give causal primacy to idealist factors was replaced by the emphasis Marx and Frederick Engels placed on the material roots of social change. Marx worked to provide a general theoretical framework for understanding the dynamics of capitalism, but criticized the political economists for their naïve understanding of how the market produced class antagonism. The general theory of economic development Marx proposed placed class at the center of analysis and posited the inevitable decline of capitalism to be replaced by socialism. Marx did not champion the idea of the mutual constitution of

state and economy but, rather, saw the political structure of a society as growing out of, legitimating, and obscuring the exploitation upon which an economic order is based.

Although Marxist historical materialism was a powerful strain of economic sociology, Max Weber developed another distinct strand. Weber disliked both the overly rigid theoretical framework of Marxist historical materialism and the atheoretical just-so studies of his German historicist predecessors. Weber's work refocused analysis on the institutions that condition the motivations, goals, and possibilities for economic action ignored by Marx, and, as such, Weber's concern with the state was much deeper than was Marx's. Weber's focus on "social action," or action oriented toward another person, made him consider power, belief, habit, and the role that organizations play in economic life as central to his economic sociology. Weber emphasized that the political order was linked with the legal order that provided the basis for the economic order in a given society.

Although Weber had a more nuanced understanding of the relationship between state and economy than Marx did, his concern with how institutions condition the meanings that individuals attach to economic action obscured the ways in which economic and political institutions are systemically linked at a level above the individual. Émile Durkheim was not explicitly concerned with economies in most of his writings, but his positivist institutionalism forced him to consider the relationships between the state and the economy. Durkheim criticized the utilitarian vision of human action and placed a much greater emphasis on the institutional preconditions of market-oriented action. Durkheim went through great pains to show that the division of labor is not the result of individually based action but, rather, a precondition for such action. Durkheim was especially concerned with the negative effects of capitalism arising from the lack of development of the proper institutional structure, especially the state, which he thought was needed to support healthy market exchange. Durkheim saw an underdeveloped state as likely resulting in compulsory labor and labor conflict, as well as anomie and social disintegration.

After the Great Depression, a new economic sociology began to develop that dealt explicitly with the decline and transformation of liberal capitalism. Karl Polanyi crystallized the idea of an economic system as the object of study for economic sociologists. An economic system is how economic activity is conditioned by an institutional form of integration. These forms of integration were connected to institutions that defined the goals of economic action and the appropriate means to achieve these ends. It must be stressed here that these forms are ideal types. Polanyi thought that various forms of integration might be present in a given economic system to a greater or lesser degree. Thus, primitive societies were characterized primarily by a system based on reciprocity. Under this system, production, distribution, and exchange are regulated by the direct social obligations of parties involved with one another over an extended period. Meanwhile, feudal systems were characterized by redistribution. In this form of economic integration, political institutions regulate the production and distribution of goods. Production is regulated through forms of directly controlled labor, the products of which are distributed through norms of honor and through administrative means. The nineteenth century was characterized by an economic system based on the market. Market trade as a form of integration involves the production of goods for sale in a market and the distribution of goods through market means. Polanyi's key point, however, is that society and economy are not separate, and thus, he emphasized how early markets were price-regulated markets rather than free markets. In the Great Depression and the two world wars, Polanyi saw the collapse of a civilization in which the market had become increasingly independent from social regulation. The destruction that the self-regulating market caused was met by attempts to assert social control over market processes.

Contemporary Economic Sociology

Economic sociology experienced a remarkable revival in the 1980s. The flurry of articles in the subfield formed what is now called the new economic sociology. This term was coined by the economic sociologist

Mark Granovetter, who emphasized the embeddedness of economic action in concrete social relations. Granovetter contended that institutions are actually congealed social networks, and because economic action takes place within these networks, social scientists must consider interpersonal relationships when studying the economy. These ideas naturally led to a much greater role for social network analysis in economic sociology. Indeed, network approaches gained wide currency among economic sociologists following the pioneering work of Harrison White. White proposed a view of markets as networks of producers watching each other, and trying to carve out niches. Such network perspectives explicitly account for interrelationships, theorizing about the implications of network structures for economic activity and organization. Although networks have been at the core of new economic sociology, other economic sociologists criticized network analysis for its inability to account for the interactions of economies with politics and culture.

Other economic sociologists began to examine cultural strains in economic action, regulation, and organization. Sociologists have seen culture as an important component of economic life since Weber, but this point of view has gained greater currency recently. Culture becomes important to economic activity through frames, categories, scripts, and concepts as well as norms, values, and routinized practice. Viviana Zelizer examined how children were once regarded as providing the family with a certain economic value, but increasingly became seen as without fiscal benefit, and she has also examined how money is defined and categorized socially. Meanwhile, Frank Dobbin in 1994 examined the ways in which prior political institutions shape the structure of industry. He approached different conceptions of how polities should be and are organized as cultural templates that influence the ways that industry develops. And he explored the operation of such cultural templates in the construction of railroads in the United States, France, and Britain. The United States was organized into self-governing communities with the federal government as referee. This template was applied to the construction of railroads by allowing autonomous companies to build the railroads with the

state merely enforcing the rules. France, on the other hand, was a centralized polity, and this template was applied to the construction of the railroads, which was coordinated and planned by the state.

New economic sociology has also made extensive use of organization theory. Organization theory has contributed to economic sociology primarily through its variant of new institutionalism, which overlaps extensively with the new institutionalism in economic sociology. New institutionalism in organization theory and in economic sociology operates on multiple levels. At the microlevel, individuals are linked to one another by their relational ties; they form groups and organizations on the basis of these ties. Organizations in turn may be linked to one another through a network of relations. These relationships constitute an organizational field, or a set of organizations that, considering one another, engage in repeated strategic interaction resulting in a stable set of relations in which some organizations dominate others. The stability of an organizational field depends on the relative power of the organizations involved and on the legitimacy of the rules of interaction and strategies employed. The organizational field, then, exists in an institutional environment composed of the formal regulatory rules enforced by the state, of cognitive scripts and schemas, and accepted or legitimate templates for acting and organizing that circumscribe the strategies available. New institutionalism in economic sociology has produced an abundance of recent research. Two areas with direct relevance to issues of governance are the development-market transition and globalization-economic integration.

Since Polanyi, economic sociologists have contended that the birth of the free market was an institutional transformation necessarily supported by the state. This has become generally accepted and has led to the idea that development is essentially about institutional change. Although this is generally accepted, it leads policymakers in a variety of directions. Economic sociologists, however, generally point to the impact that the relationship between local private elites and the political elites in the state have on economic development. The interconnection of the state and the economy does not mean that the state's role is simply to destroy local institutional structures, which may be

perceived as a hindrance to growth, in favor of free market structures. Instead, economic sociologists have pointed to the importance of "embedded autonomy." The idea is that to provide an institutional environment in which economic growth can occur, the state must be connected to local private elites while remaining independent from them in important respects. This allows the state to make public investments that are generally beneficial and to encourage local investment and entrepreneurship, while avoiding being captured by local interests. The ability of states to remain simultaneously connected to and distanced from local elites is facilitated by a dedicated, meritocratic civil service reaping long-term rewards equal to those found in the private sector. Although related to development, the work done by economic sociologists on market transition constitutes its own distinct field of inquiry. Despite this separation, the conclusions drawn are strikingly similar. Disregard for local institutions and the imposition of market structures with the simultaneous hamstringing of state regulatory capacity results in predatory capitalism of one sort or another.

Economic sociology has also made crucial contributions to the study of global economic integration and particularly to the debate over an argument asserting that global economic integration will force institutional convergence in many areas of life. This is of course, again, predicated on the opposition between state and economy, as well as the notion that there is a single, most efficient solution to the various problems of governance. Actually, international economic integration gives dramatic evidence for the mutual constitution of state and economy. Although theories opposing state and economy predict that with increases in free trade the role of the government would be reduced, numerous empirical studies show that government regulation has increased substantially with increases in free trade. The extension of markets across international borders has been accompanied by various international governmental bodies that seek to ensure the property rights, and rules of exchange, necessary for markets to operate. Often, the regulations these bodies provide are minimal, but they are crucial for establishing these markets, and the amount of regulation tends to increase over time as markets become more integrated. Economic sociologists have emphasized the ways in which states and economies, including markets, depend on one another. This insight has allowed economic sociologists to make important contributions to the study of governance.

ECOSYSTEMIC APPROACH

The ecosystemic approach is a specific form of environmental governance that places ecosystemic dynamics at the heart of environmental policymaking. It thus grounds policy making in a scientific understanding of the environment, the ecosystem paradigm. An ecosystem is a functional unit or complex of relations wherein living organisms (plants, animals, fungi, and microorganisms) interact with one another and with their physical environment, forming a dynamic yet broadly stable system. It may be of any size. The paradigm emphasizes the structure and functioning of the unit as a whole and highlights the fundamental interdependence of the components within it. Each species fulfills a specific function within an ecosystem, and depends on its interactions with the other components for its survival. An important implication is that the degradation of one element of the ecosystem or the disappearance of one species could modify the whole ecosystem, and subsequently damage other components (or species) as well. (The new state may not be suited to all species integrated in the previous one). In policy-making terms, this translates into the necessity to develop comprehensive, integrated policies that protect the ecosystem as a whole, by ensuring that none of its components are overexploited or depleted beyond renewable levels.

Historically, the rise of the ecosystem paradigm was coterminous with the establishment of ecology as an autonomous scientific discipline and with the development of a scientific approach to natural resource management. Conceptually, the ecosystem paradigm substituted the focus on the individual organism, hitherto the main unit of analysis in the natural sciences, which fostered a static and monadic conception of nature, with an attention to the milieu in which the individual organism is integrated. Discursively, this paradigm was accompanied by scientization of nature discourses, which saw the word nature increasingly replaced by the environment, and which went hand in hand with a progressive rationalization of natural resource use.

In environmental governance debates, the ecosystemic approach is contrasted with the species-by-species approach, both of which coexist today in natural resource management. The species-by-species approach is associated with the preservationist perspective, which tends to single out individual species for protection. The species-by-species approach has been criticized for offering too narrow a model of natural resource management; critics complain that because the approach targets one species alone, it often obscures the role of that particular species in the broader ecosystem, thereby neglecting the ecosystem itself (or other parts of it), which may sometimes need to be protected more urgently than the particular species. For example, it is argued that whales, sole focus of the International Whaling Commission, are more threatened by the state of the current oceans than they are by whaling. This has also been a major criticism addressed toward the Convention on International Trade on Endangered Species. By contrast, the ecosystemic approach (sometimes also evoked by terms such as *biosphere*) is offered as a more efficient alternative to natural resource management.

The ecosystemic approach was reinvigorated by the attention given to questions of global biodiversity degradation by the 1992 Convention on Biological Diversity. This approach, in which humans, in their cultural diversity, feature as integral components of ecosystems, is also considered well suited to the objectives of sustainable development.

E-DEMOCRACY

E-democracy (electronic democracy) refers to the use of information and communication technologies to enhance and in some accounts replace representative democracy. Theorists of e-democracy vary, but most unite around the belief that some of the traditional limits to citizenship in contemporary liberal democratic polities—problems of scale, scarcity of time, the decline of community, and the lack of opportunities for policy deliberation—can be overcome by new forms of online communication.

Theoretical Origins

A distinct body of ideas forms the backdrop to e-democracy in both theory and practice. During the 1960s, a generation of political theorists, including Benjamin Barber, C. B. Macpherson, and Carole Pateman, established an agenda for participatory democracy that has persisted well into the twenty-first century.

During the 1980s, many sociologists and political scientists reconsidered the concept of community. Some, such as Robert Bellah and colleagues, bemoaned the intensification of individualism in American society and called for a new communitarian ethic. Others, such as Amitai Etzioni, argued in favor of strong, emotionally powerful community bonds based around family and locality.

The final theoretical inspiration for e-democracy is Jürgen Habermas's concept of the public sphere: an idealized autonomous sphere of communication in which citizens can freely engage in reasoned debate away from the controlling influence of the state, large media corporations, and structures of social inequality. The idea of citizens deliberating in freely formed associations in civil society before taking that knowledge up to the level of government recalls the direct democracy of ancient Athens, but e-democracy updates this by focusing on how political discourse is mediated. The Internet emerges as a communication medium uniquely suited to providing multiple arenas for public debate that are relatively spontaneous, flexible, and above all, self-governed.

Community Networks

Community networks first emerged during the 1970s, but proliferated in many liberal democracies during the 1990s, as the costs of software, computers, and networking equipment began to fall. Early networks, such as the Berkeley Community Memory Project near San Francisco and the Santa Monica Public Electronic Network near Los Angeles, used basic technologies such as text-based bulletin boards, e-mail, and public access terminals in physical public spaces such as stores, community centers, and libraries. Most community networks are public-private schemes that incorporate three main features: a high-speed network offered free of charge or at a subsidized rate to households; some form of community technology center, often based in a community building; and an emphasis on creating content specific to the local community.

Community networks are based on the voluntarist idea that by handing to ordinary people the power to shape the production of online information about their local neighborhood, virtual communities can improve geographical communities by creating new social ties and reciprocal trust: the ingredients of social capital.

From Community to Politics

Some e-democracy projects have attempted to connect social networks with broader political processes, while remaining independent of government, parties, or interest groups. Foremost among these is Minnesota E-Democracy, one of the world's largest subnational-level political discussion forums. Established in 1994, this nonprofit organization is focused on a central e-mail discussion list—MN-Politics-Discuss.

In the early 2000s, there was a significant shift toward attempting to plug online networks into formal political processes. Central and local government agencies as well as legislatures slowly but surely started to experiment with online policy discussions and citizen consultations. These initiatives attempted to provide a bridge between informal online deliberations among citizens and structures of governance that provide an interface with "real" decision-making processes. The deliberative turn in governance has

already generated a range of non-Internet methods for involving citizens in policy making, such as citizens' juries, peoples' panels, local policy forums, focus groups, mini-referendums, and petitions. E-democratic projects introduce the Internet into the mix. These have generally followed two broad models: consultative and deliberative.

Consultative approaches stress the communication of citizen opinion to government. The assumption is that information is a resource that can be used to provide better policy and administration. Probably the best example of the consultative model in action is the U.S. federal government's e-rulemaking program. This is designed to allow interest groups and individual citizens to comment on department and agency rules as they are being developed.

Deliberative models conceive of a more complex, horizontal, and multidirectional interactivity. Somewhat surprisingly, the United Kingdom has been a pioneer in experimental attempts to integrate online deliberative forums directly into policy discussions. The UK Hansard Society has conducted several experiments since the late 1990s, including a discussion on flood management, a path-breaking forum on experiences of domestic violence involving more than 200 women in interactive discussion, and the online evidence and discussion forum on the 2002 Draft Communications Bill. The latter was the first genuine attempt to integrate an online forum with an established parliamentary committee.

E-democracy has provoked much theoretical discussion. Yet, its main themes are increasingly embedded in political practice. They have been enshrined in a wide variety of national and local experiments, in many different settings, using different forms of computer-mediated communication, in countries as diverse as Australia, Canada, Denmark, Estonia, Finland, France, Germany, Italy, the Netherlands, and Sweden.

EFFECTIVENESS

Effective governance means that goals are met. Said differently, something is effective to the extent that the actual performance matches the desired performance. Whether effectiveness is achieved has received increasing attention in debates about the quality of public policy in various areas. Notable examples in the United States and elsewhere are health care and education. The analysis of effectiveness is often associated with mechanical models of public service systems that distinguish goals, inputs, outputs, and outcomes. Outputs and outcomes then provide alternative standards for the extent to which goals are met. However, effectiveness does not have to be about output or outcome quality. More traditional notions of what matters in public administration focus on the quality of the process of producing the outputs. In addition, there is a clear difference between outputs of a public policy system and any outcomes it may contribute to in society. Finally, what output is actually taken into account and what is not can matter to the perception of effectiveness.

Goals and Results

The goals of an organization and the results of the organization can be compared to determine the extent of the organization's effectiveness. In an elementary school, a traditional goal is that students have to know how to read by the time they leave the school. Whether or not this goal is achieved is measured by testing reading capabilities of students when they are about to graduate. The effectiveness of the school is then the extent to which students in fact read when they graduate.

Effectiveness in this sense can be assessed at varying levels of aggregation. One level is the individual school. A higher level is an individual school district or municipality. A level above that may be the national level. To continue the example, reading remains a goal at each level. The extent to which the level achieves this goal can be measured by aggregating scores at that level. Aggregation allows entire systems to be evaluated for the quality of their outputs.

This type of exercise has been widely adopted in various national contexts to evaluate the quality of social policy programs. Some exercises target individual social service organizations. The British National Health Service (NHS) has made progressively wider use of quality measurements to assess the hospitals in its system. The rankings that result (called star ratings) are the basis for national government allocations of authority and independence to individual hospitals. The concept is that hospitals that prove effective (i.e., have high star ratings) receive autonomy. Hospitals that prove ineffective are placed under administration until they improve. In the NHS example, effectiveness concerns are used for domestic sector governance.

Other exercises compare national systems. In education, the Programme for International Student Assessment (PISA) rankings measure national school systems on a range of outputs, including average math and reading scores. The resulting indices can be ranked because they provide internationally comparable statistics on the systems. These rankings profess to show the relative effectiveness of national systems of education.

Outputs Versus Outcomes

An important concern in discussions of effectiveness is to distinguish between results that are outputs and results that are outcomes. Outputs are the immediate products of what an organization or a system of organizations does. Outcomes are wider social consequences that are related to the activity of the organization or system. The difference here is that organizations can be held accountable for failing to produce an output. But failure to produce an outcome is not as easy to attribute to a single source. Hence, including outcomes in discussions of effectiveness is difficult because a bad outcome may not be the result of a bad organization or system.

To illustrate this, a social objective of health care policies is high standards of health in the population. One indicator of high standards of health is longevity. Yet, when scholars compare national life expectancy at birth, there are notable differences between countries that have similar health care policy regimes. For instance, late twentieth-century Sweden and Denmark had similar systems of health care. In 2001, the average lifespan for Swedish women was eighty years, and for Swedish men it was seventy-three years. But in neighboring Denmark, women could expect to live just seventy-eight years and men seventy years, according to Organisation for Economic Co-operation and Development (OECD) health data. Because the two systems are similar but the general health outcomes in lifespan are better in Sweden, the difference in health outcomes cannot be attributed to the health care systems. Hence, these health outcomes do not unequivocally show how effective the Danish or Swedish health care systems are, even though analysts might agree that long citizen life spans is an important target for health care policy.

Measuring Effectiveness

When effectiveness is assessed, the analyst chooses a set of indicators of organizational or systemic quality. The choice of one set of standards for effectiveness leaves other standards out of specific assessments. These choices have given repeated rise to debates about the appropriateness of analyses of effectiveness.

An example is the recent No Child Left Behind initiative to reform the U.S. system of public primary and secondary education. With this reform, a series of standardized test scores are now collected for public schools. These scores are published for all citizens to see. They are also linked to decisions about school closures, administrative interventions, and funding. Critics of this approach attack the way school performance is assessed. They contend that the tests focus teaching on a few skills related to test taking and undermine less tangible but equally or more important results of education. Critics fear that as the testing regime works to define one standard of effectiveness, other outputs or outcomes of education will suffer neglect.

Despite the complexity of effectiveness, analysts of public-sector reform agree that there has been a significant rise in the attempts to quantify and measure it. In particular, reforms associated with the new public management wave have emphasized the results of the work of the public sector. In these reforms, making effectiveness visible and actionable is a pillar of improving the public sector. Reform advocates often counter critics by pointing out that measures they introduce replace situations where little or nothing was known about the effectiveness of public organizations or systems.

Output Effectiveness and Process Effectiveness

The notion of effectiveness covered here reflects a relatively modern understanding of effective governance. Here, outputs or outcomes constitute the important standard for the performance of an organization or system. In this view, organizations or systems consist of series of goals, inputs, outputs, and outcomes. Goals define the desired outputs and outcomes. Inputs are selected to achieve these. The system translates goals and inputs into actual outputs and outcomes. Effectiveness is then the degree to which desired and actual outputs or outcomes match each other.

The more traditional alternative to output-focused effectiveness is a focus on internal processes. In the understanding of public organizations or bureaucratic systems reflected in analyses by Max Weber and others, features of the system or organization itself are the focus of assessments. Here, the standard for effectiveness is the degree to which desired and actual features of the organization match each other. For instance, equitable treatment of all citizens when they arrive at a public service facility could be a desired feature of the organization. Transparency of decision making could also be desired. In these cases, the system is effective to the extent that it is equitable or transparent, regardless of the quality of its output.

EFFICIENCY

Efficiency is a favorite objective of economists and administrators, but you can never be sure that everyone agrees on its meaning. Claims of inefficiency are submitted regularly in many policy debates, but each participant believes that his or her proposal is the most efficient. In all cases, the disputants agree that efficiency should be desired. Whatever the goals, they should be achieved with as little input or cost as

necessary. When it comes to measuring efficiency or creating an efficient system, however, the consensus quickly evaporates. Judging means to ends is a difficult prospect and arguments disguised as conflicts over efficiency are often deeper conflicts over appropriate goals, social systems, or views of human nature.

Most textbooks define efficiency as limiting the input required to achieve an unspecified output. A system that uses few resources to achieve its goals is efficient, in contrast to one that wastes much of its input. There is a fundamental disciplinary debate about the likelihood of efficiency in organizations, however. Economists generally believe that organizations are efficient; they rationally allocate resources and optimally respond to their environments. Sociologists often believe that organizations are merely effective; they aim for survival and often use suboptimal arrangements that satisfy the social needs of participants and surrounding institutions. This empirical debate about the likelihood of efficiency often creeps into the differing applications of the term.

In economic contexts, measuring efficiency means asking whether the monetary evaluation of the inputs used to produce some goal are the minimal possible costs associated with achieving that goal. If something is inefficient, it means that the goal could have been reached with less cost or that the goal could have been better achieved (in some monetarily measurable fashion) with the same costs. Economists assume that costs and benefits will be measured in some currency, but the proper weighting of costs and benefits is left to another debate. This notion is more specifically measured via the concept of x-efficiency, which is defined as the degree to which a group of inputs achieves the maximal level of outputs possible with those inputs. Market theory predicts that all firms will be x-efficient under perfect competition because competitors would drive x-inefficient firms out of business over long periods.

Common theories in social welfare economics use more specific types of efficiency to evaluate allocation systems. A system is called Pareto optimal if no exchange can be made that will make one person better off without making someone else worse off. Unequal allocations are typically still Pareto optimal because those endowed with resources would lose something if their wealth was redistributed. A system is called Kaldor-Hicks efficient if resources are put in the hands of those that value them the most, measured by whether one person could theoretically compensate another for the same resources at a cost that would be worth it to them but worth more than the traded resources to the seller. This criterion is one way to think about allocative efficiency, or maximizing the aggregate value of a resource allocation. Economists will evaluate potential changes based on whether the net benefit of resources increases as the resources are put to use by all individuals.

Other precise notions of efficiency are used in many different contexts. In statistics, efficiency measures the extent to which a mathematical estimator of some unknown value measures that value with the minimal variance that any possible unbiased estimator could achieve. In several policy areas, government agencies and private organizations measure progress by using specific measures of efficiency. Fuel efficiency in automobiles, for example, compares the gas required to go a certain distance. Electrical efficiency, in parallel, compares the power created by a system to the power it consumes. Additional measures of specific notions of efficiency are created frequently. All are ratios of output for a given input, but the measurements and objectives differ.

Relation to Governance

Efficiency is a common catchphrase in debates about government reform. It is often given as a criterion for preferring one policy to another, especially those that rely on private enterprise rather than government. The primary policy conflicts at stake are how to measure the value and cost of service delivery and whether one form of organization is more efficient than another. Policy disputants place different values on government services and are willing to bear different types of costs. In social welfare program debates, we often lack information about alternatives to government provision of services. The effect of policy changes on welfare users, other levels of government, charities, and the labor market may be unpredictable. Interested

parties can thus advance many conflicting claims about the relative efficiency of service delivery.

Using economic notions of efficiency in policy debates, participants sometimes emphasize the value of private ownership and market exchange. This set of ideas originates in the theory of the market as voluntary exchange among self-interested actors. Problems arise with this view in situations where individuals lack full information, where activities create externalities or costs not borne by the participants, and where we want to produce public goods that no one has an individual incentive to produce.

One category of major policy debates over taxes and social welfare is about the alleged tradeoff between efficiency and equality. The major questions are whether wealth redistribution is an efficient resource allocation strategy and whether we should give up more efficient allocations to equalize wealth. Another category of debates involving efficiency surrounds the notion of whether administration inevitably creates waste; is bureaucracy inefficient by nature? This argument takes place both in debates about service privatization and contracting and in debates about whether reorganization and administrative reforms can achieve their goals. Efficiency is usually a stated aim of these reforms; evaluating their success depends on whose notion of efficiency you choose.

E-GOVERNMENT

E-government (electronic government) refers to the impact of information and communication technologies, particularly the Internet, on the values, processes, and outcomes of public bureaucracies. A popular way of conceptualizing e-government is to distinguish between three spheres of technologically mediated interactions. Government-to-government interactions are concerned with the use of technologies to enhance the internal efficiency of public bureaucracies, through, for example, the automation of routine tasks and the rapid sharing of information between departments and agencies. Government-to-business interactions typically involve the use of the Internet to reduce the costs to government of buying and selling goods and services from firms. Government-to-citizen interactions involve using the Internet to provide public services and transactions online, and to improve the design and delivery of services by incorporating rapid electronic feedback mechanisms, such as instant polls, Web surveys, and e-mail.

Beyond this simple approach, defining e-government is more difficult; it is in a constant state of evolution, and an enormous "gray literature" of white papers, consultation documents, consultancy reports, corporate brochures and league tables has emerged. There are also different national interpretations of the term, though it undoubtedly crosses borders with remarkable ease, making it arguably one of the fastest-spreading public-sector reform ideas in history.

Use of information and communication technology in government first expanded during the 1950s and 1960s, the heyday of ideas of scientific administration. However, e-government as it is most commonly understood today emerged as an agenda for general reform of the public sectors of liberal democratic political systems during the early 1990s. U.S. President Bill Clinton's administration led the way with the 1993 National Performance Review of the federal bureaucracy. The explosion of Internet use in the mid-1990s gave impetus to the idea, and countries such as the United Kingdom, Canada, Australia, and New Zealand soon followed with their own versions. In the

United Kingdom, the Labour Party, elected in 1997, put electronic service delivery at the center of its program of Modernizing Government.

In common with other programs of organizational reform, the claims made about e-government differ quite substantially. They can, however, be divided into two main schools of thought.

In one far-reaching perspective, the principal aim is to use digital network technologies to open the state to citizen involvement. The ubiquity of computer networks offers the potential to increase political participation and reshape the state into an open, interactive, network form, as an alternative to both traditional, hierarchical, bureaucratic organizations and more recent, marketlike forms of service delivery based on the contracting out of public-sector activities (usually termed the new public management). Proponents of this perspective argue that widespread use of the Internet means that the traditional application of information and communication technologies in public bureaucracies, based on inward-facing mainframe computer systems that originated in the 1960s, should now be superseded by outward-facing networks in which the division between an organization's internal information processing and its external users effectively becomes redundant. Government becomes a learning organization, able to respond to the needs of citizens, who are in turn able to influence public bureaucracies by rapid, aggregative feedback mechanisms such as e-mail, online discussion forums, and interactive Web sites.

A second, less radical school of thought suggests that e-government does not necessarily require greater public involvement in shaping how services are delivered, but instead, indirectly benefits citizens through the efficiency gains and cost savings produced by the reduction of internal organizational friction, chiefly via the automation of routine tasks. Networks are also at the core of this perspective, but it is essentially concerned with the potential of the Internet and intranets (internal organizational computer networks) to join and coordinate the activities of previously disparate government departments and services that is seen as its most attractive feature. In this view, citizens are perceived mainly as the consumers of public services such as health care information, benefits payments, passport applications, tax returns, and so on. This has been the dominant model in those countries that have taken the lead in introducing e-government reforms.

E-government is not without its critics. Some suggest that changes are limited to a managerial agenda of service delivery more consistent with the new public management and that the opportunities offered by the Internet for invigorating democracy and citizenship might be missed. Other criticisms are that the conservatism of existing administrative elites will scupper any prospects of decisive change; that issues of unequal access (both within and between states) to online services are being neglected; that large corporate IT interests are exercising an undue influence on the shape of e-government; that traditional face-to-face contacts with public servants, especially those associated with welfare systems, cannot be satisfactorily replaced by Internet communication; that the cost savings promised by reforms have been difficult to demonstrate; and that disintermediation (bypassing) of traditional representative bodies (parliaments, local councils) may occur, to the detriment of democracy.

Early government responses to the Internet often went little further than placing information on the Web in a simple electronic version of traditional paper-based means of dissemination. The arrival of e-government, which signaled the acceptance of Internet connectivity as a tool that could be used to improve efficiency, cut costs, and change the way governments have traditionally interacted with citizens, constitutes an important shift in the dominant ethos of public administration and governance.

ELECTIONS

According to a view broadly held by political scientists, free and competitive elections are a key characteristic of democratic governance. Democracy is regarded as a type of a political regime resting on the principle of responsiveness of the governing to the governed with the latter considered as equals. To ensure leadership responsiveness, various institutional arrangements have been implemented through the history of democracy. They all were aimed at giving citizens a certain degree of influence on the shaping of public affairs. In complex societies, as have existed in the twentieth and twenty-first centuries, casting one's vote in parliamentary elections is the most basic and widespread type of citizens' influence on authoritative decision making. No democratic regime exists without competitive popular elections, but the institutions and practice of electoral democracy show a considerable variation among the democratic regimes.

The Institutional Setting: The Scope and Procedures of Electoral Democracy

The impact of elections on democratic governance depends on institutional arrangements that shape the public's political behavior and the resulting political processes. Most fundamentally, elections must conform to fundamental democratic values. From the viewpoint of the elite groups competing for governmental power, the electoral process needs to be open and competitive and no group should be discriminated

against regarding its access to the electoral game. As a civic right, free, universal, equal, and secret suffrage aims to ensure that individual voters have an effective choice between competing groups of leaders and policy proposals, so that each voice has the same weight and that voters are not subject to external pressures when casting their ballots. The institutionalization of democratic elections was a long, contested process, starting in colonial America in the seventeenth century and ending in the 1990s, when elections became competitive in once-communist countries. Between the beginning and the end of the process, barriers to universal franchise were successively removed and the group of enfranchised people grew considerably. Today, democratic elections are held in more than 150 nations of the world.

Different from the basic requirements of electoral democracy, other institutional characteristics of elections vary from one nation to another. Depending on the allocation of legislative and executive power to different layers of the state, democratic elections are only held at the national and local levels of the political system (unitary system) or, additionally, at the state level (federal systems). In parliamentary systems, at least the members of first chamber of the national parliament are recruited by popular vote, and in some nations, this applies also to the second chamber (if existing). In all presidential and some parliamentary systems, the head of the executive is elected directly or indirectly. Israel has the only parliamentary system where the prime minister is directly selected by the electorate instead of by the parliament. Further differences refer to the election of state governors or prime ministers, local mayors, and other executive officers. In the United States, popular elections serve as a basis for recruiting a large number of state and local leaders. In other nations, members of local and national parliaments are the only political leaders owing their positions to popular vote. The electoral terms also differ a great deal. Finally, regarding the way votes are transferred into seats in parliament, we can roughly differentiate between two main types of electoral rules: Proportional systems, where the seats in the legislature are allocated more or less closely

according to the share of the votes received by the competing parties versus majority systems working according to the principle the winner takes all.

Elections and the Democratic Process

In modern democracies where broad and direct citizen participation in the decision on political issues is largely impossible for practical reasons, elections have evolved into the main form of citizens' influence on politics. Taking part in elections is by far the most widely used type of political participation: Almost two-thirds of the adult population of the world cast a vote in one or another democratic election during the 1990s. Nonetheless, there is no clear trend toward increased electoral participation in modern societies: In thirty-five of the fifty-nine states in which democratic elections have been held more or less continuously since 1950, the trend was toward greater participation, but in the other twenty-four states, the trend was toward less participation. The factors most strongly influencing electoral turnout are proportional representation, small electoral districts, regular but relatively infrequent national contests, and moderately competitive party systems. Political interest, party identification, and political efficacy appear to be the most important predictors of electoral participation at the individual level.

Why and how do elections matter? In representative democracies where the decision-making competencies are attributed to political elites, elections are instrumental in the recruitment of political elites, the legitimation of authoritative decisions, and the control and limitation of political power. By transferring decisional power to elected leaders and by disposing of the possibility to replace the incumbent authorities after a couple of years, the electorate is endowed with a fundamental democratic right contributing to legitimacy of rule and to leadership responsiveness. Although electoral participation is not an adequate means of choosing between specific policy proposals, the electorate may influence the general policy profile of a nation by voting for one of the competing parties instead of another. Irrespective of the formal and informal institutional arrangements, no other form of political participation is more broadly used than voting in national elections.

ELECTRONIC RECORDS

Electronic records are the evidence, in digital form, of transactions undertaken by individuals or by organizations. At first glance, they may seem to differ only in their physical medium from paper records. But the creation of records in electronic form has created practical, legal, and technological obstacles to public accountability that have yet to be fully overcome.

The challenges are simple to illustrate. The creation since the 1960s of ever-larger databases and, subsequently, of unstructured office systems has been driven by business need—whether in government or in the private sector. But when the systems used to store the data have become obsolete, those responsible for the data have been faced with formidable challenges if they are to continue to retrieve the data and to make them available. The originating software may no longer be supported by software suppliers, or it may be necessary to migrate data onto new software platforms. Each migration of data customarily involves some loss in data quality. Either way, organizations struggle to maintain accountability over time—whether they are pharmaceutical companies demonstrating the lineage of their products or governments responding to freedom of information requests.

Attempts to resolve these problems by saving records in paper form have been found to be unsatisfactory. Paper records do not have the same functionality as their electronic counterparts. In the United States, for example, the courts have held that e-mail records of the U.S. President Ronald Reagan White House should not be destroyed because paper printouts are not acceptable substitutes for the electronic records. In 1993, the trial judge in *Armstrong v. Executive Office of the President* commented that the two versions were not interchangeable.

During the last two decades of the twentieth century, government and private agencies came to recognize that electronic records represented a significant challenge to business effectiveness and to accountability. By the turn of the century, most organizational responses to the challenge proceeded from a delineation of the essential characteristics of electronic records—a characterization that emphasizes the record's authenticity (it is what it says it is), its reliability (it is authoritative and trustworthy), its integrity (whether it is complete and unaltered), and its usability (the ability to locate, retrieve, and present the record). This focus on "recordness" is now finding its way into statutory definitions of records and into national and international standards.

Software houses have responded to the challenge by developing specialized electronic records management (ERM) tools that sit alongside office systems—and other primary software—and capture not just evidence of business transactions, but the associated metadata needed to interpret those transactions (e.g., evidence of who sent what to whom, when). The prize in this branch of systems development is to achieve a better integration of ERM tools with desktop software and to reduce dependence on the user—whose focus will rarely be on the archiving of the data he or she has just processed.

It is now commonly accepted that if records are to be captured and stored in accessible form, it requires much earlier intervention by archivists and information managers than was the case with paper records. Within government, one has seen national archives reorient themselves to focus much more than before on proactive records management, working with software developers and with records-creating agencies to influence how records are created. Archives failing to do this will struggle to maintain an accessible record of government in the late twentieth century and beyond.

EMBEDDEDNESS

The term *embeddedness* is generally used to describe the contingency of economic action on its social environment. More broadly, the concept functions as a heuristic to indicate the contingent nature of one phenomenon—be it a sphere of activity such as the economy or the market, a set of relationships, an organization, or an individual—on its environment, which may be defined alternatively in institutional, social, cognitive, or cultural terms. In short, analyses using the concept focus on the different conditions within which various modes of social action take place and upon which they depend.

Most prominently, the economic historian Karl Polanyi argued that the functioning of an economy could not be understood disassociated from the social world in which it was embedded. Specific organizations and institutions, and ultimately the economy as a whole, need to be understood as parts of larger, historically derived, institutional, or social structures.

More generally, the concept of embeddedness helps describe and explain how, although each seemingly follow their own distinct logics and rules, different surrounding institutions and contexts interact and may complement or conflict with each other. In recent years, this has been further developed particularly within the field of new economic sociology, which has investigated the linkages and interdependencies of economic phenomena and organizations to other social structures through social network analysis.

The resurgence of the notion of embeddedness has been accompanied by a diversification of its analytical or conceptual understandings. This has also led to a re-reading of many classic works in economic sociology for their commitment to the idea of embeddedness, irrespective of their diverse ontological commitments. For instance, Max Weber's *The Protestant Ethic and the Spirit of Capitalism* has been revisited as a study of sociocultural embeddedness: Weber argued that modern capitalist behavior could only develop and extend in favorable cultural contexts fashioned by the Protestant ethic and worldview.

At the same time, with its emphasis on context, the resurgent interest in embeddedness is sometimes criticized as a mere restatement of truisms recognized in many classical works of the social sciences. Yet, embeddedness approaches are typically associated with a set of ontological commitments that distinguish themselves sharply from both under- and oversocialized accounts of economic life. Embeddedness entails that actors' preferences can only be understood and interpreted within relational, institutional, and cultural contexts. This is in direct contrast to the basic ontological assumptions that inform neoclassical economic analysis, rational choice theory, and important strands of new institutional economics. These are based on the notion of undersocialized, atomized decision makers who aim to maximize their own, predetermined utilities. Specifically, and different from rational institutionalism, sociocultural embeddedness does not merely regulate behavior by shaping the way in which actors pursue their self-interest, but constitutes these interests.

On the other end of the spectrum, strong structural positions, where social conditions exist a priori to behaviors, are equally challenged. Instead, relationships

between the embedded unit and its contextual world are neither fixed nor determinate or directly causal, and many analysts thus prefer to argue in terms of Weberian elective affinities or configurations.

Researchers who emphasize the utility of the concept of embeddedness cohere around the notion that multiple phenomena—be they individual preferences, organizational behavior, or societal spheres—all may be better understood by their ever-present, if historically variegated, modes of commitment to their social, institutional, or cognitive environment. Where analysts may differ is on the specific forms and effects of embeddedness, that is, relative to what is embedded in what and to what consequence. Different studies have moved in different ways to tighten the concept by specifying and disaggregating its various components or creating various subtypes such as cultural, cognitive, or community embeddedness.

Studies using the concept also differ, often widely, about the possibilities for intentional adaptation or embedding of different spheres of life. Especially in the study of varieties of capitalism or welfare states, work on social networks has often focused on embeddedness relative to a planned process, a strategy of governance, and a highly varied outcome.

Origins

The concept of embeddedness was pioneered by Polanyi. In *Trade and Market in the Early Empires* he argued, "The human economy . . . is embedded and enmeshed in institutions, economic and noneconomic." His lifelong study of these institutions and their interlinkages ranged from anthropological studies of small communities in the South Pacific to the political economy of the institutions regulating the global economy in the nineteenth century.

Polanyi argued that because individuals were always primarily social beings, rather than economic ones, embeddedness is a necessary and basic condition of the economy. In *The Great Transformation,* he analyzed the consequences of the eighteenth- and nineteenth-century expansion of capitalism, namely the effort to create an economic sphere increasingly separate from noneconomic institutions that would

function only to maximize profit. Similar to themes found in E. P. Thompson's studies of the food riots in eighteenth-century Britain, Polanyi argued that before the nineteenth century, the economic system had been conceived of as a part of the broader society governed by social customs and norms as much as by market principles of profit and exchange. The rise of capitalism, however, involved political efforts to de-link the economy from this social environment. However, this disembedding of the economy necessarily meant changing its social environment and, thus, society. In a market society, basic aspects of social life would be treated as pure market commodities (the fictitious commodities) and humans redefined as purely economically rational (i.e., profit-maximizing) actors. Polanyi argued that these efforts of embedding society in the market, instead of the market in society, were ultimately bound to fail, bringing in their wake dangerous societal reactions of different magnitude and character, most prominent among them fascism. More abstractly, he named the attempted transformation and its eventual backlash the double movement, defining a continuing and semi-automatic process of embedding and disembedding. Polanyi thus posed the question of how to reconcile the expansion of the market with a social order that can sustain it.

This early treatment of embeddedness sees the social sphere as necessarily primary to the economic sphere. This view is echoed in Jürgen Habermas's notion of the lifeworld, that is, the shared understandings and values that are established by face-to-face contacts over time and form the basis for identity, values, and beliefs that may be tacit, or taken for granted, rather than explicitly reasoned. For Habermas, the legitimacy of both the official economy and the administrative state are threatened by the colonization of the lifeworld through materially based relationships.

The notion of embeddedness as both an ever-existing condition and a matter of degree and variation is taken up by the influential work of the French-based regulation school. Here, the basic assumption that economies are embedded in social relations identifies the task of economic analysis as to uncover and compare both explicit and implicit types of regulation and their social and economic repercussions. For example,

Fordism is analyzed as a mode of social reproduction based on conventions in which constantly increasing output makes it possible to pay increasing wages for jobs that are guaranteed over the long term. In exchange, class conflict is subdued and organized labor weakened.

Applications: Embedded Liberalism and Globalization

On a global level, Polanyi's initial focus on processes of global economic governance has been echoed in John Ruggie's analysis of the Bretton Woods system as one governed by the principle of embedded liberalism. Here, a compromise between a commitment to liberal economic policies internationally (free trade, economic openness) and a commitment to the necessity of domestic social embeddedness was expressed via the welfare state and the principle that governments would cushion their publics from the harmful effects of economic openness through Keynesian fiscal policy. Through this compromise, social purpose controlled economic rules, not vice versa. New forms of economic protectionism should be seen in this continuity, namely as new efforts of embedding under the constraints of globalization. The main threat to economic liberalism here is not protectionism but, rather, the risk that the global economy may become disembedded through the dismantling of social safety nets and the welfare state, creating the potential for an international backlash against economic liberalism.

Embeddedness, Social Networks, and Fields of Governance

At a different level of analysis, the work of the new economic sociology has sought to operationalize and make concrete the notion of embeddedness, teasing out the specific relational mechanisms that underlie its various degrees and forms with the aim of offering sociological explanations for economic outcomes.

Mark Granovetter pioneered the usage of the social network theory in this specific context to specify the impact of social connections among businesspersons or other participants in the economic sphere on market outcomes.

Classical economic theory conceives of markets as spot interactions between unitary actors whose rationality is defined by their immediate self-interest, itself formed on the basis of basic information about price and quality of a set number of goods. Prices are the result of competitive relationships codified in formal contracts. In contrast, embeddedness uncovers the relevance of other types of longer-term relationships among market actors, be they friendship, trust, or animosity, which are structured by geographical distance as much as by time. This leads to expanded definitions of both actor interests and the information available to them. Embeddedness, defined as these longer-term relationships, therefore shapes organizational and economic outcomes and is seen to promote economies of time and integrative agreement based on negotiation, tacit knowledge, and non-price-related preferences. Where some have seen this as a generally positive condition that enables complex adaptation and the buffering of market failure, others have identified it as leading to a lack of openness, potential inefficiencies, and collusion.

The more formal approaches to capturing and defining embeddedness of the new economic sociology, focusing on middle-range outcomes in the economic sphere, have reignited debate about the concept.

Some analysts have questioned how networks and systems of social relations are linked to institutional and macrosocial regulation of behavior where embeddedness defined in terms of relational networks congeals into systems of governance or institutions. Others have criticized the new economic sociology for retaining a narrow conception of embeddedness, defining it only in terms of immediately measurable social configurations or, alternatively, for ultimately having too wide a conception of the social, taking it to refer to all non-economic phenomena.

Analysts have argued that economic action is embedded in other cultural or political contexts as well as in the social structure. These may operate at both the individual and the collective level. Whereas structural embeddedness is widely used in reference to the contingency of firm- or organizational-level strategies on interpersonal, interorganizational, and status networks, this work has differentiated other political and cultural contexts of embeddedness.

These may emphasize either the different logics structuring social relationships or the specific societal fields that are concerned and interrelated, with the latter often borrowing the notion of a field from the works of the French sociologist Pierre Bourdieu. Among the different types of embeddedness identified are cognitive embeddedness, often defined at the individual level as the dependence of decision making on a range of fundamental heuristic biases; cultural embeddedness, that is, the role of shared collective understandings in structuring action and outcomes; and political embeddedness, defined as the influence of nonmarket-related institutional structures.

Embeddedness and the State-Society Relationship

Linking embeddedness to changing notions of governance, another strand of work has moved from the economic realm to that of politics or social movements to define the way in which different measures of embeddedness impact on modes of organization, information sharing, or conflict resolution. Here, embeddedness is a variable that explains or defines governance structures. Its close association with research on social networks—which have often served as an operationalization of the concept—has also meant that this type of approach has been identified with the idea of network governance, that is, the coordination of policies and articulation of rules through negotiation and agreement rather than hierarchical decision making or competitive markets. Similar to some themes raised in the new economic sociology, here too, opinions differ about the consequences of this type of embedded governance for traditional democratic governance and interest mediation.

Some see embeddedness defined in these terms as an inherently more coordinated and open form of social regulation that promotes collaborative governance and leads to problem solving by dialogue and mutual adjustments. Others see its informal aspects as hindering transparency, dissimulating existing power relations, and diffusing responsibility or facilitating corruptions and hindering the rationalization and professionalization of a range of political and social institutions.

An example for the substantive policy areas in which these debates are reflected is that of transition economies, where the interaction of social, cultural, economic, and political spheres can be analyzed as processes of disembedding and re-embedding and policymakers debated the comparative advantages of a big-bang strategy or a path of gradual adjustment to economic and political reform for countries of the former Soviet Union. Recent work on the outcomes of these transitions indicates that a neglect of the social structures behind economic relationships has in many cases led to a re-embedding of these relationships by often-corrupt business networks with close ties to political elites.

Peter Evans' work on embedded autonomy similarly illustrates the ways in which social networks can both enable and hinder state development. Evans asks the question of how states can be embedded in society yet formulate a separate institutional integrity and Weberian bureaucracy. State institutions, not a sphere of activity, are analyzed in terms of embeddedness and the notion of embeddedness refers to the dense networks between state actors, bureaucrats and officials, and private business actors that increase or decrease the state's ability to formulate and implement its objectives.

The revival of embeddedness as an analytical tool can also be seen as linked to a new governance agenda that focuses more directly on the societal sources of institutions and power. In this respect, the recent interest in global governance and the development of universal standards of policy and policy making leads to an awareness of the ways in which different spheres and power resources are interlinked in different societies. In this respect, embeddedness directly conditions modes of governance and the institutional forms through which power is negotiated and through which it, in a given moment, comes into play.

Theoretical Contribution and Outlook

As a concept, embeddedness is similar to notions of structure or regime, rather than a phenomenon whose existence can be proven or disproven, even where its use in explaining real outcomes can be evaluated.

Proponents of the concept thus point to the promise of the relational ontology it is linked to. First, by emphasizing the role of networks and other social and institutional structures, the concept of embeddedness underscores the multilevel quality of both strategic and other forms of conduct. It thus offers ways, if not solutions, to approach the linking of multiple levels of analysis in the social sciences. Moreover, by explicitly relating and linking developments in different societal spheres, the concept promotes research across different disciplines and the traditional boundaries of economics, sociology, psychology, and history. Especially in relation to the latter, the concept of embeddedness is increasingly used in relation to research that investigates different forms of historical contingency of outcomes for path dependence.

—Anna Schmidt

EMERGENCY POWERS

The need for powers that exceed ordinary limits emerged along with the concept of limited, republican, or constitutional government in the Roman era. When confronted with a direct threat to the constitutional system itself, the Roman Senate could decide to appoint a dictator for a period of no more than six months. During that time, however, the dictator exercised unrestrained power, limited only by that individual's own commitment to the republic itself. The dictator was appointed not to destroy or replace the existing system, but to save or conserve it. This provision was revived in the modern era first by Niccolò Machiavelli, who defended the assignment of extraordinary power to a ruler to make it possible to save the society as well as its political institutions. The conviction that a constitutional system required the ability to cope with unexpected, and immediate, threats to the system itself was embraced by John Locke and Jean-Jacques Rousseau.

But how would these powers be invoked, and how might they be controlled differed in different systems. Some—including Germany and France—made explicit provisions for the assignment of extraordinary power to the executive in a crisis. This practice was particularly essential in the constitution of Weimar Germany, which came into effect after World War I. The emergency provisions in the Weimar constitution were invoked more than 200 times, initially to combat violent insurrection and direct threats to the maintenance of the constitutional system itself. In the early 1930s, however, these provisions were invoked with increasing frequency to combat a wide range of social and domestic problems, including economic failure. Although these provisions probably allowed Weimar Germany to survive, ultimately, these provisions also allowed Adolf Hitler to seize and consolidate his power, formally exercising the constitution's emergency powers as chancellor in 1933. Hitler's exercise of power found intellectual support in the writing of Carl Schmitt, who insisted that no constitution can possibly provide for all contingencies, and who insisted that the executive must be able to act beyond the limits of ordinary law if liberal democracy itself is to survive.

Modern Germany has made provisions for a constitutional court empowered to check the abuse of emergency power, but, along with France, continues the practice of constitutionally defined emergency powers to be assigned to the executive. Others, like Great Britain, insist on legislative sovereignty and provide for emergency power through ordinary legislation, though legislation that can and does formally delegate extraordinary power to the executive, as the British Parliament has done on a number of occasions. The U.S. Constitution provides limited emergency power, allowing for the suspension of ordinary judicial process in the event of war, invasion, or rebellion—but this authority is granted to Congress, rather than to the president.

The attacks on New York City and Washington, DC, on September 11, 2001, and in London on July 7, 2005, ushered in a new wave of concern about the need for emergency power. Both nations passed new statutes delegating new power to the executive, and in the United States, the battle against terrorism has generated an extended discussion on the reach of (and limits to) executive power. Emergency powers debates are not limited to the West, of course, and have been particularly relevant in Eastern Europe, Africa, Latin America, and South Asia, where newly consolidating democracies have struggled with challenges to their survival and with the abuse of delegated power, notably in India in 1971, Russia in the 1990s, and in the former Yugoslav Republic.

EMPOWERMENT

Empowerment is a term with a history that has emerged recently in modified and revitalized form. Its origins can be found in the politics of recognition in liberal societies during the 1960s. The civil rights struggle of Black people in America, and the emergence of feminist theory both relied on the notion of empowerment to portray liberal democracies as incomplete or insufficient in recognizing the full rights of all citizens. One repercussion of the radical formulations of empowerment in the West during the 1960s and early 1970s was that empowerment also entered the vocabulary of some Left-leaning development organizations, such as Oxfam, during that period. Throughout the 1970s, empowerment became a mainstay for thinking about progressive practice in a number of public service professions such as medical care and education, influenced by Paolo Freire's *Pedagogy of the Oppressed.* In education, progressive workers took from Freire a desire not solely to transfer knowledge, but to facilitate an expanded self-realization of the student as a person capable of transforming society as much as integrating into it.

After a period of abeyance in the 1980s, empowerment has once again become a key political term, but it has reemerged changed. There is no straightforward definition of empowerment. It serves as a normative and evaluative tool to understand the politics of the role of ordinary people. Perhaps the best way to gain ready purchase on the term is to situate it in a growing lexicon of complementary and supportive terms: participation, democratization, and ownership. We can explore the meaning of empowerment by looking at some specific political processes and reflecting on its more problematic aspects.

Empowerment has become a reference in three key areas of contemporary governance. However, even after a brief review of these, our understanding of empowerment will remain rather slippery as the term fixes itself in different forms depending on the context.

1. Throughout the 1990s, a widespread revival in civic activism challenged military regimes, swept away communist states, and forced self-declared life presidents to the ballot box. A sensibility that societies were reinvigorated with civic energy because of the end of the Cold War led people to revive the notion of empowerment as a process that promoted liberal democratic politics throughout the world. "Empowering civil society" came to constitute a contemporary (John) Lockean ideal to discipline the state and promote liberal-civic cultures, whether in the form of velvet revolutions, national conferences, or public demonstrations. In this context, empowerment is based in a revival of liberalism on a global scale, expressed as a desire to see (proto) citizens voluntarily acting in nonviolent ways to enhance their democratic rights and to exercise some form of check on state power.

2. As part of this broad liberal *zeitgeist,* empowerment reenters the vocabulary of development politics and policy during the 1990s. Here, it attains a more practical meaning. Development policy has been mostly formulated in apolitical terms: Questions of technical proficiency, bureaucratic planning, and socioeconomic returns have dominated development policy thinking. It is striking that an integration of explicitly political concerns became development policy in the 1990s. One can see this most readily in the profusion of World Bank (the leading development policy and research agency) research on governance and related phrases. In 2002, the World Bank published the *Empowerment Sourcebook,* which details the ways in which empowerment—particularly of the poor—is key to successful development policy. Briefly, the political logic is as follows: Successful development projects require a fuller engagement by the targets of the project. This engagement requires that recipients of a project attain the requisite level of awareness of mobilization to support the project. This

process of attainment is encapsulated by empowerment here. The process relates to practical concerns about information sharing, local contributions to support the project, and the generation of local resources, whether tangible or in the form of social capital.

3. Finally, empowerment has become a buzzword for contemporary public service reform in the West—especially the United Kingdom. As service provision has been privatized, devolved, and subject to intensified financial discipline, governments have sought to increase the involvement of service users in the management of those services. In the United Kingdom, this is most prominent in the notion of parents' empowerment in the running of schools, or the empowerment of patients in seeking access to health services. This approach to public service provision comes with cynicism about state bureaucracies (not necessarily private bureaucracies) and a faith in ordinary individuals' capacities to make a productive input into the way public services are managed. Neighborhood Watch, Patients Charters, the involvement of user groups on hospital and school management committees, and the introduction of new forms of choice into health and education all express practical manifestations of this approach.

Although empowerment has emerged in different settings, one can readily see a certain liberal—or neoliberal—provenance working through all three areas. Contemporary notions of empowerment are, unlike their forebears in the 1960s, largely formed around individual agency and moderate reformism. Empowerment aims not to change society in any bold fashion, but to make it work better. Images of popular empowerment, based in historical collective interests and focused on a future structural change in power relations, are distant from contemporary approaches to empowerment.

A critical approach might derive from this that empowerment has become a rather bland liberal norm, poorly defined and easily captured within existing political relations. Furthermore, one might question the universal scope of empowerment. Empowerment

as practice is about shaping subjectivities, and it is not self-evident that all humankind desires to become empowered in the liberal frame—especially if the main objective of empowerment is to encourage conformity toward new policy innovations, whether in the West or in postcolonial regions of the world. What would we call it if a collectivity mobilized against contemporary understandings of empowerment?

ENDANGERED SPECIES PROTECTION

Endangered species protection is the subfield of environmental governance concerned with developing policies to address the loss of species (both plants and animals) caused by human activities. Historically, threatened species constituted the first environmental issue, in that this issue first brought home the realization of the need to protect a natural environment threatened by excessive exploitation. This issue also projected environmental governance onto the international level. Moreover, the first protective policies emerged from the combined efforts of governments and nongovernmental organizations (NGOs). Endangered species protection thus exemplifies two broader trends of environmental governance, an increasing involvement of nongovernmental actors, and the change of governance scale to the international. Current international conventions concerned with the protection of endangered species include the 1975 Convention on International Trade in Endangered Species (CITES), together with a range of conventions aimed at a particular species or at specific geographic areas (such as the 1971 Ramsar Wetlands Convention, the 1979 Bonn Convention on Migratory Species, and the various

international and regional conventions on whales, tuna, seabirds, or seals, etc.).

The endangered species debate is divided between those who want to preserve endangered species from human exploitation at all costs, commonly referred to as preservationists, and the conservationists, who contend that sound conservation policies need to balance out the necessity to ensure the long-term survival of the species with the demands to exploit it. Against what they see as the hubris of modern societies, preservationists emphasize the importance of respecting nonhuman species, as a way of respecting nature, including human nature. Their argument is often couched in terms of the intrinsic value of the species, rather than its market value. Their intellectual influences extend from the American romantics (Ralph Waldo Emerson, Henry David Thoreau, and Walt Whitman) and their notions of wilderness to the deep ecology literature. The preservationists underline the impossibility of effectively restraining exploitation, as illustrated by the history of the whaling case, a line of argument that often taps into the "tragedy of the commons" logic. The preservationist approach is associated with the development of "green tourism" (for example, whale watching), which leaves the species intact. For conservationists, this focus has tended to obliterate the human component—humans too, they argue, are part of the ecosystem. Moreover, this position is affordable only at higher levels of economic development. The conservationists thus denounce an inequitable approach to conservation. Against what they see as conservation from afar, they argue for the need to involve the local populations that both live with and depend on the species (as a raw material or as a food). Their argument, which emphasizes human needs, is germane to the sustainable development discourse.

Endangered species protection has come under increasing criticism for the narrow, species-by-species approach it perpetuates. CITES, for one, has tended to single out "favorite" species for protection (such as elephants or whales), often at the expense of other species (including human), or especially, of leaving out of the policy focus the deeper factors that may have led to

endangerment in the first place. In contrast, the ecosystemic approach enables a broader perspective.

ENVIRONMENTAL GOVERNANCE

How, as a global society, we manage the resource base upon which all depend for our future existence is one of the most serious governance challenges the world currently faces. Successful stewardship of natural resources on behalf of current and future generations implies key roles for a range of societal actors, governmental and nongovernmental, operating across a number of levels and employing a broad array of governance tools. When considering what we mean by environmental governance and what forms it might take, a series of key questions arise. Who does the governing? In what ways is the function of governing changing? By what means is it changing and what forms does this take? Finally, what are the implications of this?

What Is Governance in This Context?

Governance describes how social activity is rule-bound and socially regulated. James Rosenau defined

governance broadly as effectively functioning regulation mechanisms, devoid of formal authority, in a field of activity. This reflects the fact that governance is increasingly provided by a spectrum of nongovernmental market, civil society, and supranational organizations in addition to the ongoing key role played by nation-states. The governance literature increasingly recognizes both governing mechanisms that do not rest on recourse to the authority and sanctions of government and the shifting negotiation of responsibilities between the state and civil society.

Environmental governance can be provided by the state (as regulatory control), through the market (as a price mechanism) or by civil society, generating norms and expectations backed by moral sanctions. In reality, there is a great deal of intersection between each of these categories because markets rarely operate without some form of regulation and civil society increasingly plays a key role in state-based regulation.

At both national and international level, the traditional approach to environmental governance has been characterized by top-down, command-and-control mechanisms that prescribe targets for reducing pollution and employ state sanctions to secure compliance with them. Most of the high-profile global environmental regimes employ this approach, including the international ozone and climate regimes, even if they increasingly rely on market mechanisms to achieve the goals they set for themselves. For example, the Montreal Protocol, the centerpiece of the ozone regime, restricts trade between those countries party to the agreement and those that are not, and the Kyoto Protocol contains the possibility of an emissions trading scheme where carbon entitlements are traded in the marketplace. State-based environmental regulation, in general, however, has been subject to sustained criticism from key development actors such as the World Bank on the grounds that it is excessively inflexible, inefficient, and often ineffective at delivering the change in behavior that it intends. Therefore, increasing attention has been paid to voluntary and market mechanisms that are said to capture the potential of markets to produce environmental gains in a more efficient and cost-effective fashion.

Shifting Patterns of Governance in a Context of Globalization

Marketization of Environmental Policy

At the most general level, marketization, in this context, refers to a trend toward viewing the market as the source of innovation, efficiency, and incentives necessary to combat environmental degradation without compromising economic growth. This shift toward the marketization of environmental governance should be understood not just as an attempt to move beyond the limitations imposed by strict command-and-control models of regulation but also as part of broader challenges to state authority from above and from below. One manifestation of this is the increasing degree of power sharing between state and market actors.

In policy arenas, marketization is advanced as a practice by key actors such as the World Bank that are able to use their economic power to promote the marketization of environmental policy within national systems of environmental governance. The marketization of environmental policy is certainly not universal, however. There are deviations from it in the form of different national and regional approaches to regulation, and customary patterns of resource stewardship predominate, existing alongside market structures or in opposition to them in everyday practice around the world.

Despite this, there is increasingly evidence of the use of market tools for creating incentives for positive action and deterring polluting activities. Examples of pollution charging in China, Colombia, and the Philippines show that pollution from factories has been successfully reduced when steep, regular payments for emissions have been enforced. Familiar problems of tax collection and corruption may yet undermine the effectiveness of some such initiatives, but their increasing use indicates a shift in policy direction. Market tools such as labeling have also been accepted in many countries as a means by which to ensure global buyers of the environmentally responsible way in which a product has been produced.

Certification has been used in the fisheries and forestry sectors in this way through the Forestry Stewardship Council (FSC) and Marine Stewardship Council (MSC) schemes.

Another general trend in environmental governance is the popularity of self-regulation or voluntary measures by industry. Codes of conduct among leading companies are now commonplace in the global north, and many of those firms investing overseas are insisting that their suppliers and partners adopt the same principles. The trend follows a rejection of the efficiency and effectiveness of central government command-and-control policy measures, and reflects the preference of firms to set their own standards appropriate to their own circumstances in a way that avoids state intervention. In the environmental context, environmental management systems such as ISO 14001, created by the International Organization for Standardization (ISO), are increasingly popular. Although traditionally such standards have tended only to apply to larger firms that can afford the compliance costs and those seeking access to developed country markets, increasing evidence indicates that even small and medium-sized enterprises are seeking ISO certification to serve as subcontractors for ISO-certified enterprises.

Many leading companies that have courted controversy regarding their activities in the past have been attracted to these approaches, producing statements of principles and codes of conduct proclaiming how their businesses advance environmental protection. The chemical industry's Responsible Care program, which has been adopted by chemical companies around the world, can be seen as an attempt to reassure an anxious public in the wake of the Bhopal gas disaster and, at the same time, to preempt the need for regulatory intervention by demonstrating responsible leadership. Global market pressures from buyers and consumers increasingly exercise a significant influence on environmental policy practice in many parts of the world as seen in the international agreements that governments enter into.

The problem is that although voluntary tools work for some companies, especially those seeking to demonstrate renewed commitment to an aspect of their operations for which they have been criticized in the past, or that are vulnerable either to shareholder activism or brand name damage, this is not the case for most firms around the world for whom other approaches to environmental governance remain appropriate. A reliance on voluntarism and self-regulation assumes both high levels of trust and a responsible company serious about regulating the social and environmental impacts of its activities.

Civil Regulation

As a reaction to the limitations of market-based and voluntary mechanisms, there has also been a growth in what has been termed civil regulation. Civil regulation refers to a range of activities undertaken by civil society actors aimed at creating new frameworks of expectation and obligation for companies. The increasing use of tools such as shareholder activism and boycotts and the growth of groups set up to monitor the activities of particular firms such as BayerWatch that tracks the activities of the company by that name, provide examples of the tools of civil regulation. New forms of engagement in constructing codes of conduct and building partnerships also come under the umbrella of civil regulation. Although concern has been expressed that many of these tools are only available to well-resourced groups with good access to the media and in societies with strong traditions of free speech, evidence seems to indicate that these strategies are being employed more widely across the world. There has also been a notable proliferation in the number of groups adopting these strategies across the entire spectrum from confrontation to collaboration. Many of these groups are also increasingly globally connected, so that companies engaging in environmentally controversial activities overseas can also expect to face shareholder resolutions and embarrassing media publicity in their home countries.

It is unclear at this stage what the net effect of these forms of civil regulation will be on the environmental performance of firms. The hope is that groups with the expertise and capabilities to plug gaps and weaknesses

in systems of government pollution control and monitoring can play an important complementary role as informal regulators. Their presence may encourage firms to respect the environmental standards of the countries in which they operate to a greater degree than if they were not there, and so help deter the exploitation of double standards by firms when they operate in developing countries. The extent to which groups will be allowed to perform this role will depend on the strength of civil society in a given setting and the extent to which its activities are tolerated or encouraged by the state. Issues of who the groups represent and who they are accountable to will also have to be faced if they are to be seen as legitimate actors in environmental governance.

Supranationalization of Environmental Governance

A third key trend in environmental governance has been the supranationalization of environmental governance in which decisions about resource use and protection are increasingly taken at regional and international, rather than exclusively national, levels. Regional trade blocs such as the European Union (EU) have elaborate systems of environmental regulation that can be binding on their member states. Regional trade accords such as North American Free Trade Agreement (NAFTA) and Mercosur also contain environmental provisions to manage the potential for environmental measures to be undermined by mobile industries moving to areas of weaker protection or enforcement.

At the international level, there has been a lot of interest in the role of international regimes in contributing to global governance. The focus is on the norms, rules, and decision-making procedures that international institutions create as incentives for international cooperation on environmental problems that affect all states, but none has the incentive (or ability) to tackle on its own. The idea is that by enabling information-exchange, providing forums for interstate bargaining, and having procedures for compliance and monitoring, international institutions will be able to

reduce the incentives that governments otherwise receive to free ride on the efforts that others make, benefiting from preventative action but not assuming the costs of action. There are now active international regimes addressing a range of environmental issues from acid rain to whaling. Key UN summits on the environment such as the UN Conference on Environment and Development (UNCED) in 1992 and the World Summit on Sustainable Development (WSSD) in 2002 have sought to provide renewed momentum to efforts to bridge environment and development concerns and to ensure that adequate funds are available to deliver on targets for the achievement of sustainable development. Missed targets and noncompliance with the terms and conditions of treaties, amid an absence of effective sanctions, have led some observers to call for the creation of a world environment organization.

Broadening this narrow equation of environmental governance with formal political institutions, others have suggested that environmental governance covers, in reality, a much broader range of actors and activities. In addition to rule creation, institution building, and monitoring and enforcement, environmental governance can imply a soft infrastructure of norms, expectations, and social understandings of acceptable behavior toward the environment, in processes that engage the participation of a broad range of stakeholders. This broader approach recognizes the significance of private actors and informal, normative structures and goes beyond official interstate and supranational arrangements. It would include purely market-based forms of governance, in which environmental impacts flow from private firms as they choose which products to develop, manufacture, and sell. In other cases, industry associations might promulgate their own sets of standards, as noted previously. Even when there is no direct governmental regulation of environmental impacts, patterns of research and production are structured and mediated by systems of property rights and market institutions, by norms and laws that regulate trade and investment, and by the strategic interaction of firms in competition for markets and resources within specific industry structures.

Decentralization of Authority

Besides these challenges to traditional state-based models of environmental governance from above and sideways (from the market), evidence also increasingly indicates decentralized patterns of decision making. Strengthening local institutions of decision making to improve both efficiency and the accountability of state actors to poorer groups has been an increasingly central feature of development orthodoxy. There is also a strong emphasis in green political theory on political and economic decentralization for both democratic and ecological reasons.

There is also increasing interest in the role of local communities themselves in strengthening those forms of environmental governance provided by the state. Community-driven regulation can play a key role in plugging gaps and improving existing forms of state pollution control. In this scenario, community actions play a central role in pressuring state agencies to improve their monitoring and enforcement of environmental regulations. Community mobilizations essentially begin a dialogue between affected stakeholders and the state, leading to debate, conflict and sometimes bargaining over developmental and environmental trade-offs. In this sense, the result is practices of coproduction of regulation, requiring both the energies and actions of average community members and the responses of front-line environmental agencies. The dynamics tend to be informal and have not been codified in new laws or regulatory processes.

Forms of co-regulation or civil regulation, as described previously, have flourished in the absence of state interventions in market activities generating environmental harm. Corporate-community compacts and good neighborhood agreements (GNAs) have become more common, for example, as a result of the weakening of state policy-making authority and the increasing role of corporations as policy makers. GNAs provide a vehicle for a community organization and a corporation to recognize and formalize their roles within a locality aimed at fostering sustainable development. They have become popular as a nonlitigious method of dispute resolution among companies, workers, environmentalists, and local communities following an increase in industrial disasters.

The responsiveness of firms to these new practices of governance depends to some extent on their size and whether they are public or private enterprises. State enterprises are insulated from community pressures and from state regulators in different ways than are foreign multinationals. Foreign companies claim they are subject to more scrutiny, but also have greater resources to respond to outside pressures. State companies often have close relations to state agencies but are then also expected to justify the benefits they provide to society. Companies are therefore vulnerable to pressures for reform in different ways.

Conclusion

There has been an enormous proliferation in the forms of environmental governance coexisting in global politics. Although there has been a discernible shift toward the role of market mechanisms as the preferred solution to tackling environmental problems, state-based regulation remains key in its own right and as a necessary enabling environment for the effective and equitable functioning of market and voluntary systems. The systemic governance challenge is to ensure that the plurality of environmental governance forms, across multiple levels from global to local and operating within the public and private sphere, operate in ways that are mutually supportive rather than undermining one another's effectiveness. Acknowledging this interdependency is an important starting point for understanding how to improve the multilevel governance system we have, rather than fashioning one model that trumps all others in its alleged ability to tackle environmental degradation.

EPISTEMIC COMMUNITY

An epistemic community is a network of professionals with recognized expertise and authoritative claims to policy-relevant knowledge in a particular issue area. These professionals may have different disciplinary and professional backgrounds and may be located in different countries, but they share a set of norms that motivate their common action, a set of causal beliefs about central problems in their area of expertise, shared criteria for evaluating knowledge, and a common policy enterprise. The concept of epistemic community was first introduced by John Ruggie and then refined by P. M. Haas. These scholars focused on the role played by networks of actors with consensual knowledge about causes and effects on state policy and interstate cooperation.

Epistemic communities contribute to international and national governance in a number of ways. Globalization and increasing interdependence have made the world much more complex. States increasingly depend on each other's policy choices in trying to coordinate common policy responses and solve common problems on issues such as ecological degradation, economic and monetary policy, and strategic security. Uncertainty about how to respond to these complex problems generates demand for informed advice about the causes and interrelationships among particular social or physical processes and the consequences of possible responses. Epistemic communities are one provider of this information. Epistemic communities exercise influence by interpreting these complex problems and possible responses for decisionmakers within national governments and international organizations. Their influence comes partly from their claim to authoritative and consensual knowledge based on their professional expertise. Epistemic communities influence governance in more direct ways as well because they shape many of the stages of policy making, both domestically and internationally. Epistemic communities can first frame an issue so that policymakers understand that it is a problem, as Haas demonstrates in the issue of ozone depletion and C. W. Thomas explains in the case of California biodiversity management. Epistemic communities then help set the political agenda by clarifying the importance of the problem and the consequences of not acting. Their causal knowledge about the sources and remedies of a problem contribute to policy formulation as well as policy innovation. For example, scientific evidence demonstrated that chlorofluorocarbons (CFCs) were depleting the stratospheric ozone layer. A transnational epistemic community of atmospheric scientists and policymakers gathered and spread this information to governments and the manufacturers of CFCs. Epistemic communities also shape the stage of policy choice because they use their professional expertise to lay out the consequences of

different courses of action as well as of not acting. The ozone epistemic community used its expertise and causal knowledge to help policymakers develop domestic and international regulations on CFC manufacture and consumption. In the case of California biodiversity, epistemic communities demonstrated that because of the interrelated nature of biodiversity, management of natural resources could not be achieved unilaterally and required interagency cooperation. Epistemic communities then suggested how such cooperation might take place. Their causal knowledge provides a basis for social learning about what constitutes a problem, why, and what can and should be done about it. This learning, mediated by epistemic communities, occurs through international negotiations and cooperation in formal and informal institutional settings. The influence of epistemic communities outlasts their direct involvement when they create institutions that reflect their cause-and-effect understanding of a particular issue. These causal ideas become institutionalized in organizations and continue to shape how problems are defined and solutions identified.

The epistemic community literature lies at the nexus of two broad trends in the study of governance. The first trend was the study of the impact of ideas, including scientific knowledge, on the development of international regimes and institutions, on domestic and international policy processes, and more fundamentally, on how states define their interests. The second broad trend was increased attention to the role that transnational and national nongovernmental networks play in generating international and domestic policy. The epistemic community literature deliberately rejected approaches that took interests as given, and sought to understand how states came to have particular interests and make particular choices. Emanuel Adler and Haas, who led the research on epistemic communities, emphasized that states always interpret their interests, and that ideas, especially causal knowledge, influence those interpretations. Adler and Haas's work sought to focus on the importance of both ideas and agency in shaping international outcomes. Drawing on earlier work on transnational relations, these scholars emphasized that human actors made these ideas about causation available to

policymakers. Thomas has broadened the application of the concept to the domestic level, noting the importance of local and national legislation in setting the conditions under which epistemic communities can and cannot successfully alter interests and policy. Epistemic communities parlay their professionalism and expertise into political access and interpreting and framing issues for policymakers. The work on epistemic communities thus helped re-launch the study of transnational and subnational actors and networks, and their influence on political governance. It also provided empirical, actor-based studies with which to ground the claim that ideas matter. The epistemic community literature has been absorbed into the broader literature on social constructivism. Studies of epistemic communities have occurred in a number of fields, including environment, public administration, economics, security studies, European monetary and legal integration, scientific and technological innovation, and public administration.

EQUILIBRIUM THEORY

Equilibrium is a central concept in neoclassical economic theory and game theory with a precise mathematical definition and an interpretive connotation of self-reinforcing stability. Although the concept draws on the character of human agents as having expectations about future states of affairs when used in the social sciences, originally the idea referred to a mechanical system in which forces are balanced, resulting in a stationary state. Social scientists who study equilibriums are interested in their existence, uniqueness, and stability. The equilibrium concept most useful to contemporary political science is that of the game theoretic Nash equilibrium (by John Forbes Nash). This mathematical definition refers to a competitive interaction in which each agent pursues personal advantage, expects that others will do the same, and no individual has the incentive to deviate from his chosen strategy of action, given the joint outcome of everyone's strategy.

The combination of the mathematical precision of the equilibrium concept, and its connotation of social stability, makes it of great interest to social scientists who are attracted to explanations of social phenomena that may be stated as general laws of human action. Even though he did not use the term "equilibrium," Adam Smith's famous "invisible hand" argument in essence implies this central idea. Smith proposed that a system of natural liberty, defined as a system predicated on individual self-interest embedded in a framework of commutative justice, will tend toward uniform rates of return from capital investments and uniform wages for labor. In neoclassical economic theory from the late nineteenth-century marginalism to mid-twentieth-century general equilibrium theory, the achievement of an equilibrium denotes that supply and demand across all markets is perfectly balanced, given a certain set of prices.

Even though an equilibrium is defined mathematically and itself is a nonnormative concept, because it describes social stability, it conveys a sense of positive value. This is because most people believe that constancy is superior to chaos and unpredictability and,

further, that instability signifies an imbalance between individuals' expectations and the actual outcomes of their actions. Therefore, the Great Depression, marked by overproduction and a collapse of the pricing system because of widespread inability to pay for goods, is deemed to represent disequilibria and to be detrimental. By contrast, according to general equilibrium theory developed in the 1950s, the existence of a general equilibrium is defined by X. This state X guarantees Y and Z. (Two fundamental theorems of welfare economics are Pareto optimality, and the fixed-point theorem.)

Social science is distinct from natural science because it is widely believed that in markets and politics, agents act purposively both in anticipation of how others will act and what the expected outcome of joint actions will be. Thus, it is well appreciated in economics that if individuals expect an en masse cash withdrawal of savings from banks, and act accordingly, the ensuing collapse of the banking system will be the result of a self-fulfilling prophesy. General equilibrium theory did not do full justice to mutually interdependent strategic interactions, and game theory was articulated to address this deficiency. Game theory, which relies on the idea of equilibrium to the same extent that neoclassical economics does, made it possible to address outcomes of interdependent decision processes in nonmarket interactions wherein monetary prices are either irrelevant, or exogenous to the model.

Nash contributed the central game theoretic equilibrium concept that, as does general equilibrium theory, relies on a mathematical fixed-point theorem; it is also interpreted to convey the idea of mutual best reply. A Nash equilibrium refers to a set of individuals' strategies in a given game that when played against each other result in an outcome such that no individual can improve his or her outcome by playing an alternative strategy. Nash proved that a finite game, with finite players, is guaranteed to have at least one such equilibrium, although its existence may depend on players adopting statistically randomized strategies as though they selected courses of action by rolling dice. Given that the Nash equilibrium by definition has the property of stability, and that agents are believed to act in accordance with their anticipations of others' strategies and the expected gain of joint outcomes, game theorists

devote considerable attention to understanding the conditions under which such an equilibrium state may arise. Nash equilibrium mathematically identifies strategies sets that resemble self-reinforcing agreements in that no single individual could do better by altering his or her course of action. However, if more than one Nash equilibrium exists, an important question arises of how agents may gravitate toward a single mutually reinforcing outcome.

In tracing the development of the equilibrium concept from physics, through classical economics and neoclassical economics, to game theory, we can see that its trajectory evinces a transition from the optimism that agents who coordinate their actions without centralized planning will achieve a generally good outcome to a pessimism that an equilibrium outcome may not necessarily be optimal. Thus, it is important to recognize that even though a Nash equilibrium demonstrates the achievement of systemic stability that arises from individual decision making, this stability may not reflect the best possible joint outcome that agents may achieve. For example, the Nash equilibrium of a prisoner's dilemma game is objectively suboptimal from all agents' perspectives. In addition, it is important to keep in mind that "equilibrium" is a mathematical property of a model that is thought to describe agents' actions, but does not have an ontological status independent from the model. An equilibrium can only be defined as an attribute of a mathematical system and is not an actual feature of the social world.

EQUITY

In its original formulation, equity was a rectification of, or supplement to, rigid law. In its modern form, it has lost this concrete relation to rigid law and is used to describe either the "essence" of good law or an independent value that good law takes into consideration. Where equity was originally outside the law, it has come to describe a way in which the law itself ought to treat people. We say that the law is equitable, that it treats people fairly, or perhaps that it promotes equity. We no longer say that the law requires equity as a remedy. Furthermore, an original distinction between equity and equality in ancient Greece has given way to the modern interchangeable use of equity and equality. Tracing the evolution of the concept is instructive; the loss of its original meaning suggests we have lost sight of (a) a fundamental problem of governance by law and (b) an alternative to governance by law.

Definition and Etymology

The English word equity comes from the Greek *epieikeia* and the Latin translation of *epieikeia, aequitas.* The Greek *epieikeia* had a relatively specific meaning that was partially transformed and later forgotten through its Latinization. The modern English use of the word equity is closer to the Latin *aequitas.* Two English terms, *epiky* and *equity,* capture the distinction between the original Greek and later Latinized meanings. *Epiky* is less frequently used and has perhaps dropped out of our ordinary language. *Epiky* is derived directly from the Greek *epieikeia,* whereas *equity* likely comes from the Latin *aequitas.*

Epieikeia

The term *epieikeia* was of both philosophical and practical importance to the ancient Greeks; the term was central for Athenian self-definition. The main sources for the meaning of Greek *epieikeia* are Thucydides, the fragment of Gorgias's funeral oration, Sophocles, and most prominently, Aristotle's *Nichomachean Ethics.* The term *epieikeia* originally

had two concretely related meanings: (1) what is appropriate, convenient, or fitting and (2) what is opposed to strict law.

The concept of *epieikiea* originally pointed to a fundamental problem of governance by law. Aristotle, and much later, Thomas Aquinas, both identified the same problem. Simplified a bit, the problem is that laws necessarily take the form of general statements meant to apply to large classes of persons. A law that reads, "All persons who steal shall be punished" is exemplary of the generality of most laws. Such general statements speak to, or are meant to be applied to, cases that generally arise. We might say that in most cases, when someone steals, it is appropriate that they be punished. Occasionally, however, exceptional cases arise. When a starving orphaned child steals a loaf of bread to survive, should the general law be applied? There are exceptional cases where the application of general laws seems inappropriate. Another example suffices to make the point. Imagine a law that states, "All teachers who corrupt the youth are to die by poison hemlock." Now imagine that an exceptional case arises in which the great Socrates is accused of being a teacher who corrupts the youth. It would seem to follow that he ought to be condemned to death by poison hemlock. We might think, and certainly many in Athens thought, that Socrates' case was so exceptional that a strict application of the general law in his case would be inappropriate.

In cases like these, both Aristotle and Aquinas thought it was bad to follow the law and that it was good to set aside the letter of the law to follow the dictates of justice and the common good. This is the object of *epieikeia,* which was later called equity. For both Aristotle and Aquinas, *epieikeia* was a rectification of law in exceptional cases where law is defective because of its generality. The two original meanings of the word are concretely united in the claim that *epieikeia* requires a deviation from strict law to ensure that an exceptional case is treated appropriately.

The question immediately arises, however, on what basis should judges make an equitable or appropriate determination in exceptional cases? For Aristotle, *epieikeia* required that exceptional cases be judged in light of the requirements of *dike.* Though often

translated as "justice," *dike* is better understood as a higher law, in the sense of divine or natural law, corresponding to the Roman *ius,* German *recht,* and French *droit.* In exceptional cases where *epieikeia* requires that the strict letter of the law be broken, a decision or judgment must be made in light of *dike.* This judgment is to be adequate to the particular exception and cannot take the form of applying a separate set of rules. A set of rules to be applied in exceptional cases would be inadequate to the requirement of *epieikeia* and would simply repeat the problem of applying general rules to particular cases. *Epieikeia* requires the exercise of *phronesis,* or judgment aiming at *dike* given a unique circumstance. There are no rules for such judgment; rather, it is a capacity or virtue (either natural or acquired) of good judges. Aristotle suggested that what is required is the combination of a system of justice and law with capacities for practical wisdom and virtue.

The problem then becomes one of producing citizens who are reasonable, possessing practical wisdom and virtue, to complement strict law. Thus for early thinkers such as Aristotle, Plato, and Aquinas, the best arrangement was one in which strict law was rectified by *epieikeia,* by leaders (or citizens) virtuous in exercising *phronesis,* capable of judging exceptional cases without the guidance of rules. This concept, of general law supplemented by *epieikeia,* requiring wise judgment by virtuous leaders (or citizens) in light of a higher law (*dike*), has been lost in modern thinking.

Aequitas

Aequitas is the standard Latin translation of the Greek *epieikeia.* The Latin *aequitas* also has two main meanings: (1) essence of law and (2) the antithesis to strict law (*ius strictum*). The second definition retains a close relation to the original Greek meaning whereas the first is best seen as the first step in a gradual transformation or perhaps forgetting of the original meaning. As a characteristic or essence of general law, *aequitas* means uniformity, evenness, equanimity, impartiality, or fairness. Equitable law is law that shows no favoritism and that is fair to all those who come before the law. As such, it is exactly what Aristotle and Aquinas thought was impossible. Perhaps a clue to the

shift in meaning lies in the fact that in Roman mythology, Aequitas is the goddess of fair trade and honest merchants. She is depicted with a cornucopia representing wealth from commerce, and a balance, representing equity and fairness. What is the connection between trade, commerce, wealth, and the transformation of equity as rectification of law to equity as characteristic or essence of good law? Perhaps as expanding empire and trade lead to the spread of ever more encompassing general law, contextually sensitive rectification became practically impossible?

Equity in English Law

The ambiguous meaning of Latin *aequitas* is maintained in early English usage as well. "Equity" in English law can mean simply "fairness," but it is also the name given to the system of law developed originally by the Court of Chancery (the Lord Chancellors Court) to provide relief in cases applying the rules of the common law would have seemed too strict or unfair. Although "fairness" represents a departure from the original Greek understanding of *epieikeia,* the usage by the Courts of Chancery represents a clear continuation of the original meaning. By the fourteenth century, common law had become the ordinary law of the land, administered through courts independent of the crown. The king, however, retained the power to administer justice outside the regular system if a party could not obtain justice from common law. Although the rules of common law were bound by tradition and statute, the Chancellor was not bound by rigid procedures or rules.

The parallel with Greek *epieikeia* is obvious. Lord Ellesmere, following precisely the arguments of Aristotle and Aquinas, justified the Chancery Court as a means of softening the extremity of general laws. He too saw that general rules could never be adequate to the infinite diversity of human actions under complex circumstances. The Chancellors' form of justice acquired the name of "equity" corresponding to the original Greek meaning. As in the Roman case, however, a gradual transformation occurred. Resentment of the Chancellors' Court (and the non-rule-bound decision making it exercised) grew. After the

Reformation, the Chancellors Court lost its original form (consisting mostly of intuitive and common-sense judgments); equity gradually became "bound" by precedent (prior decisions), thus becoming more rule governed. The 1873 Judicature Acts reduced the Court of Chancery to a division of the High Court of Justice, and judges were empowered to administer both law and equity.

With few exceptions, independent courts of equity have also disappeared in American law. Like the English case, equity has come to be administered within the regular courts of law by judges bound by "principles of equity." That is, equity consists of a further set of guiding rules and is not a rectification of shortcomings of all rule-guided decisions. The main distinctions between equitable rulings and standard rulings is the absence of a jury in the former. The distinction falls within rule-guided decision making and differs only in the sense of who makes the decision and what rules apply. In both the English and American systems, equity has become a body of rules or principles; as such, it is not what Aristotle, Aquinas, or Lord Ellesmer had in mind when they spoke of equity.

Modern Forgetting or Transformation of Equity?

The modern obscuring or forgetting of the original meaning of equity is captured by the shift from equity as a rectification of general law to equity as essence of good law, or alternatively, equity as a body of rules. Such a shift can be partially explained by the pragmatic needs of law (and rulers) under conditions of empire and trade spreading across larger spaces and more diverse people. A second explanation for the shift can be found in the historical founding of both the French and American Republics. Both republics aspired to a "government of laws, not of men." This entailed doing away with discretionary judgment by absolute rulers in favor of a system of general rules (positive law). Arbitrary despotic decision was to be replaced by general, reliable, fair rules to be applied automatically to all cases that might arise. Although both the French and American founding documents are arguably grounded in higher law, they expressly forbid

judges from deciding particular cases in light of higher moral principles. By forbidding judges from resting decisions on considerations other than positive law (*lex, loi, Gesetz*), *epieikeia,* requiring an exercise of *phronesis* aiming at *dike* in exceptional circumstances, becomes impossible. The promise of a government of laws, not men, entails the forgetting of *epieikeia.* A deeper explanation of the forgetting of *epieikiea* would show the connection between the emergence of modern science and an increased confidence in legal "science" (the reduction of law to knowable rules). The rise of a legal "science" corresponds to the parallel decline of *epieikeia, phronesis, dike,* and the need for practical judgment unguided by rules.

What evidence is there of the modern forgetting of *epieikeia* and what are the consequences of this forgetting? The standard dictionary definition of equity we began with is the best evidence of the (at best) ambiguous modern meaning of equity. Furthermore, the problem of equity has all but disappeared from law books. Contemporary legal philosophy has almost nothing to say about the issue. With the exception of a few marginal critics of liberal constitutionalism, such as Carl Schmitt, the problem had been forgotten within political theory until recently.

The insight of earlier thinkers, represented by their concept of *epieikeia,* is that a system of general laws can never do justice to each particular case. In exceptional cases, justice requires rectification of general rules by human judgment in light of higher (moral) considerations. Modern law holds out the postulate of the completeness of positive law, of a law functioning independently of ongoing moral judgment by man. As such, only positive law can be used by judges to justify particular decisions. What this means is that in exceptional cases, where application of the strict letter of the law would lead to absurd consequences, judges are put in a bind. Rather than providing a straightforward correction of the law (*epieikeia)* by exercise of transparent moral judgment (*phronesis, dike*), judges are forced to either (a) manipulate the letter of the law through interpretive practices, thus leading to rule skepticism, or (b) stick to the letter of the law, resulting in a harsh legal formalism. As such, the law ceases to speak or it speaks in an overly harsh voice. Both contribute to the undermining of (a) legal authority, (b) the legitimacy of law, and (c) the possibility of governance by or through law.

Ethical Consumerism

Ethical consumerism extends from the premise that purchasers in markets consume not only goods, but also, implicitly, the process used to produce them. Consumption, in this view, is a political act that sanctions the values embodied in a product's manufacture. By choosing certain products over others, or even whether to purchase at all, consumers can embrace or reject particular environmental and labor practices and make other value claims based on the ethical vision they hold. Exercising choice in this way creates incentives for producers to bring production practices in line with consumer values. Successful campaigns waged by ethical consumer movements have brought about dolphin-free tuna, genetically modified organisms (GMO)–free food, sweatshop-free clothing, fair trade coffee, cosmetic products free from animal testing, and, most recently, conflict-free diamonds.

The idea of using consumption as a lever of political change has roots in boycotts organized by social movements against products, firms, and even countries, including apartheid South Africa and the military junta in Burma. As production continues to migrate from the developed to the developing world, thereby escaping the regulatory spheres of Western nation-states, consumer activists increasingly see ethical consumerism as an extra-legal way to influence labor and environmental practices in far away places. Ethical

consumerism, according to its most ardent advocates, potentially stands as a novel form of postnational governance in which consumer-citizens reshape the practice of global capitalism from the bottom up.

Ethical consumerism entails two key shifts in how markets are conceived. First, consumer goods, once thought of as objects without a history, are redefined to include the normative commitments built into their production. Second, the act of consumption itself becomes a political choice, not unlike voting, so that democratic values come to be exercised in the market. Redefining consumption in this way challenges the premise underlying current market structures, in which legal mechanisms such as confidentiality agreements and intellectual property rights are often invoked to shroud the details of production from the inquiring public. The protest lodged by the ethical consumerism movement against these dominant arrangements constitutes an explicit attempt to renegotiate the boundary between politics and the market.

The codes of conduct created by ethical consumerist movements to ensure that production practices remain true to certain values themselves embody controversial notions of political representation. What counts as a fair wage or environmentally sustainable practice remains contested across political, cultural, and socioeconomic contexts. Critics see ethical consumerism as a dangerous marketization of ethics whereby the values of wealthy consumers "go global," unfairly constraining the freedom of others. These critics charge that consumerist movements in advanced countries are too quick to equate their preferences with the best interest of the laborers and environmental concerns on whose behalf they purport to act. Underpinning the practice of ethical consumerism is thus the presumption that consumption, a process driven by the global distribution of wealth, can serve as an effective surrogate for other more traditional forms of democratic representation, such as voting. Whether ethical consumerism becomes an effective means of economic governance in the postnational order remains to be seen.

ETHNIC GROUPS

The definition of ethnic groups is widely contested, and no commonly accepted definition exists. A good starting point is, however, a subjective definition that regards an ethnic group as the largest human group with a common consciousness of shared origins. This group will often, but not necessarily, share objective characteristics such as language and religion. Most states contain more than one ethnic group, and this can raise important issues of governance: How is the state best structured to accommodate such ethnic heterogeneity?

The term *ethnic* is derived from the Greek word *ethnos,* which translates into people or nation and denotes a group characterized by common descent. But the concept of ethnic group is arguably different from the concept of a nation: Political sovereignty is not implied, and some authors would further argue that a nation can have a civic as well as an ethnic basis, whereas others contend that an ethnic group need not have a shared identity; it is a proto-nation. An ethnic group is, finally, not the same as an ethnic minority: An ethnic group can be the dominant group in a state and need, furthermore, not be limited by a state border.

During the last couple of decades, ethnic groups have become increasingly effective foci for group mobilization for concrete political ends. But the existence of more than one ethnic group within a state does not automatically entail instability. The overwhelming majority of the world's states are multiethnic, but ethnic strife is, nevertheless, the exception. In the instances when demands are made on behalf of ethnic groups, several strategies exist for accommodating them. One can distinguish between strategies that seek

to eliminate or reduce ethnic differences and strategies that seek to preserve and accommodate them, and that may even strengthen ethnic differences.

The strategies that seek to eliminate ethnic differences range from the clearly unacceptable, such as genocide and expulsion, to more contested ones, such as assimilation and integration. A wide range of strategies seeks to accommodate ethnic groups, and the extent to which the structure of the state will be defined in ethnic terms varies considerably: from cultural autonomy to extensive political and territorial autonomy, from federalism to confederalism. The key to these strategies is that different ethnic groups can be accommodated within the same state, even if relations have turned conflictual. The problem is, however, that none of the strategies are a panacea and timing is crucial: The strategies will only be successful if the political leaders, who have used the ethnic group as a focus for political mobilization, are willing to accept them and are able to bring their followers along.

ETHNIC INCLUSION

See SOCIAL INCLUSION

ETHNONATIONALISM

The term *ethnonationalism* refers to a particular strain of nationalism in which the referent object is an ethnic group. This ethnic group, or rather its leaders, makes demands based on dissatisfaction with the existing political arrangement. Such demands can involve the pursuit of statehood, although more limited demands, such as cultural autonomy, are also encompassed by the term. Ethnonationalism has been an important and powerful force during the last couple of decades, particularly after the end of the Cold War. Its potency has been illustrated in the outbreak of violent conflicts and the creation of new states, but it can have serious implications for democratic governance even in milder forms.

Ethnonationalism is closely associated with the work of Walker Connor, who argues that nationalism and ethnicity are so closely intertwined that we should use the term *ethnonationalism* rather than merely *nationalism* to avoid confusing it with loyalty to the state. Connor further emphasizes the psychological and subjective elements of nationalism and the continued importance of its political implications. However, in common academic and nonacademic usage, ethnonationalism is often used to denote a specific form of nationalism—a form of nationalism that is associated with an ethnic group that does not presently have its own state, but is politically mobilized to pursue this goal. In addition, it is often implied that this form of nationalism has a strong irrational or even primordial element. More importantly, this form of nationalism is closely linked with politics; the essence is that a political goal is pursued and this goal is not static, but will likely change over time. This development in the stated goal of an ethnonational movement will be strongly influenced by both reactions by the dominant group, or the state, to which the demands are addressed, as well as by the dynamics of competition within the ethnic group: Do hardliners or moderates emerge victorious?

During the last couple of decades, there has been an upsurge of ethnonational activities. This has showed that ethnonationalism is a global force that is not limited to specific, less-developed parts of the world, but is also of great importance in the heart of Western Europe, such as in Northern Ireland and the Basque Country. The end of the Cold War, and the power vacuum created by the fall of communism, created powerful ethnonationalist movements in the former Soviet Union and Eastern Europe, which led to the break-up

of multiethnic federations and the outbreak of a bloody war in the former Yugoslavia. Despite this upsurge in ethnonationalism and the accompanying growing academic interest in its dynamics, little agreement exists about its underlying causes and about the best ways to prevent its violent manifestations.

EUROPEAN COAL AND STEEL COMMUNITY

The European Coal and Steel Community (ECSC) was founded by the Treaty of Paris in 1951 by Belgium, the Netherlands, Luxembourg, Italy, France, and West Germany (referred to as the Six) to pool the coal and steel production of its member states into a European organization with supranational powers, in the aim of preventing another European war. The ECSC is one of the three founding treaties of the European Union (EU).

ECSC was the fulfillment of the ideas of French civil servant Jean Monnet, publicized by the French Minister for Foreign Affairs Robert Schuman in a now-celebrated speech on May 9, 1950. This proposal of an organized Europe, essential to the maintenance of peaceful relations, is known as the Schuman Declaration, and is considered the beginning of the creation of what is now the EU.

The Shuman declaration proposed Franco-German production of coal and steel as a whole placed under a common High Authority within the framework of an organization open to the participation of the other countries of Europe. The coal and steel industries, mostly situated in the Ruhr Area, were chosen because of their strategic and military importance in times of war. With these key industries under supranational control, Schuman said a war between France and Germany was rendered substantially impossible.

Before this initiative, France's policy toward Germany had been mostly to make sure Germany did not gain its previous economic and military power. The United States and the United Kingdom already favored a strong and democratic Germany as a key in both the rebuilding of Europe after World War II and in the struggle with the Soviet Union. In a speech in 1946, Sir Winston Churchill presented the vision of a united Europe with the unification of France and Germany as the first step. The ECSC was also heavily promoted by the United States.

The ECSC treaty was unique because it introduced a new form of international cooperation in which the member states hand over parts of their sovereignty to a common body. It was the precursor of the original form of organization that characterizes the EU today, consisting of an autonomous regulatory system run by independent institutions vested with the power and authority needed to make the system work.

Although the ECSC treaty expired in July 2002, its spirit lives on in so far as it was one of the three organizations that came together to form the EU. In 2002, the common economic resources of the ECSC were channeled into a research fund supporting the coal and steel industry of today—mainly the German and French automobile producers.

EUROPEAN FREE TRADE ASSOCIATION

The European Free Trade Association (EFTA) is an international organization promoting free trade and

consisting of four European member states: Iceland, Lichtenstein, Norway, and Switzerland. The EFTA Secretariat is headquartered in Geneva, Switzerland.

EFTA was founded January 3, 1960, by the Stockholm Convention as a counterbalance and alternative for European countries that for different reasons did not join the European Community (EEC and later EC), now the European Union (EU). From the onset, EFTA was an organization with a more modest integrationist agenda than that of the EC.

As an alternative European organization, EFTA has experienced a rather high turnover in its member states. The original member states were Austria, Denmark, Norway, Portugal, Sweden, Switzerland, and the United Kingdom. Hence, they were often also referred to as the Seven, in contrast with the Six (original members of the EEC). Finland joined as an associated member in 1961 (full member in 1986), Iceland in 1970, and Lichtenstein in 1991 (previously represented by Switzerland).

During the 1960s, Denmark, Ireland, the United Kingdom, and Norway applied for membership of the EEC, and in 1973, the first three joined the EEC. Norway, however, stayed in EFTA because a referendum on membership in the EC ended in a "No." Portugal left EFTA in 1985 to join the EEC. Finally, Austria, Finland, and Sweden followed into the EU in 1995. At that point, approximately eighty percent of the EFTA population, production, and trade had left the organization and joined the EC.

In a speech given in the European Parliament in January 1989, the former president of the European Commission, Jacques Delores, proposed a more structured partnership between the EC and EFTA. The main aim was to allow EFTA members to participate in the Single Market (the free movement of goods, persons, services and capital) without also having to join the European political integration.

In 1992, the agreement on the European Economic Area (EEA) was signed in Porto, Portugal, between the EU and the EFTA states. However, 50.3 percent of the Swiss people rejected the ratification of the EEA in a referendum held on December 6, 1992. As a consequence, the Swiss government decided not to join the EEA and suspended its ongoing negotiations for EC

accession. Nevertheless, it is still linked to the EU by a vast set of bilateral agreements, some of which are mostly comparable in content to the EEA agreement.

The EEA agreement came into force on January 1, 1994, and has been amended continuously to ensure that relevant EU legislation is extended to the EEA-EFTA states (Iceland, Lichtenstein, and Norway). Still, there are exceptions to the agreement. Fisheries and agricultural products are sensitive goods, and some remain regulated by quotas and tariffs. The participation of these countries in the EU single market has led to an intense political debate within EFTA countries about the fact that they must align with the EU legislation without any direct influence about its content.

EUROPEAN GOVERNANCE

European governance refers to the collective political action that regulates social relationships within the European political context generating effective, legitimate, and durable collective solutions. Most often, the term is used in relation to the European Union (EU) and its specific form of integration politics and political system-construction. However, the term can also refer to other international and transnational arrangements on the European continent in different functional fields, such as military security, free trade, scientific cooperation, or nongovernmental arrangements. Nevertheless, this notion has generated substantial scholarly debate in the context of the study of the EU since the mid-1990s (both in theoretical and empirical terms) in relation to the undefined nature of the EU as a political order and relative to the rapidly changing nature of collective EU public action.

The Governance Approach in EU Studies

Rather than a theory in its own right, the notion of European governance has been largely portrayed as an approach that brings together different perspectives concerning the same phenomena, namely the complexity, diversity, and dynamism of interactions among a variety of actors generating collective and public action within this supranational or international polity, a polity which is in a permanent systemic development. Despite the wide spectrum of empirical areas in which it has been used, all uses of the governance approach within EU studies share one important feature, namely that the object of study is not the process of integration as such, but mainly the problems and questions that arise about how this new type of political system operates. Thus, the interest is not on the factors that explain the process of supranational institution building by the further transfer of national competences to Brussels but, rather, on the issues associated with the effectiveness, legitimacy, and sustainability of the collective political action undertaken in this new political order.

From the creation of the European Community in the 1950s until the mid-1990s, scholarly attention was overwhelmingly on explaining the advancement of the European integration process. The alternative theoretical frameworks, most notably neofunctionalism, liberal intergovernmentalism, and historic institutionalism, that had been developed during those years (particularly by U.S. scholars) have been largely related to wider debates within the field of international relations. Here, the rapid institution-building process of the European Communities or Union was seen as an advanced example of international cooperation and economic regionalization worldwide, whose study could provide answers to wider questions about international politics. In the 1990s, however, a new approach started to emerge. Acknowledging that the EU had now developed substantive public action in a wide variety of policy areas (such as agriculture, competition, trade, technology, consumer safety, environmental protection, transport, and foreign affairs), a growing number of scholars (particularly European scholars) became more concerned with issues related to decision-making and implementation processes in those policy areas, and also to the new and emerging patterns of collective public action at the EU level. This research focus is not primarily related to the area of international relations, but to the studies of public administration, policy analysis, and comparative politics, traditionally focused at the national level. Admittedly, the governance approach within EU studies has tended to use the analytical tools provided by those studies, by adapting them to the specific problems related to supranational and transnational political dynamics. Nevertheless, the true novelty of the governance approach within EU studies is that it has linked the analysis of these low-politics processes to the constitutional-systemic level by examining the normative dimensions and forms of political contestation that are involved in the constant polity construction of the EU as a postnational political order.

Naturally, the governance approach has been concerned with the question of what kind of political order the EU is. The most commonly accepted answer is that it is not a federal state nor an international organization, but something in between. This is so because the EU has a double nature. On the one hand, the EU is a supranational political order because in many policy areas the decisions are taken by qualified majority voting among member states and because these decisions override those at national level (by the supremacy of EU law over national law). On the other hand, in some other policy areas (i.e., defense, foreign affairs, police cooperation), the EU is an international political order where member states have equal veto powers. This special nature poses many conceptual and theoretical questions when one is studying public action at this level. Governance scholars have tended to disagree about this "exceptionalism" problem. For some, the special nature (also known as the *sui generis* nature) of the EU political system has the logical analytical consequence that it shall not be compared with any other political system or international organization because such an exercise will never provide satisfactory answers about the double dimension of the EU, the supranational and the international dimensions. For others, this special nature is not a hurdle for undertaking substantial comparative

analysis of the processes of public action with other political systems of federal or semi-federal structure. On the contrary, a systematic comparison of the EU governance system with that of the United States and Germany can provide interesting insights, particularly regarding the interaction between the center and the constituent parts in the day-to-day political processes.

Multilevel Governance and Europeanization

One of the aspects of the EU as a political system that has received substantial scholarly attention is the complex relationship between the EU level and the national and subnational levels in the EU political processes. This refers in particular to the notion that the EU is a multilevel governance system, where political processes entail complex bargaining and adaptation dynamics among a wide range of public-private actors cutting across different levels of authority (EU, national, and subnational). This understanding of the EU as a fluid multilevel governance system is close to acknowledging the semi-federal or quasi-federal nature of the EU as a political system in how different levels interact with each other. Developed in the mid-1990s, this notion soon gained a firm foothold in EU studies, mainly because it contrasted sharply with the understanding of the EU as a two-level game of intergovernmentalism. The notion of the two-level game sees the interaction between member states and the EU institutions such that national governments are crucial political gatekeepers in the definition and negotiation of national preferences in the multilateral arena of EU politics. By questioning this gatekeeper role and the actual capacity of the states to contain the multiple and complex political policy processes, the authors supporting the notion of multilevel suggest that real political interactions are typically more fluid and intertwined than previously assumed. This is exemplified by the numerous situations where subnational levels tend to "bypass the state" in their interaction with Brussels, establishing semi-formalized channels of policy and political interaction with great practical impact, both in the decision-making and in the implementation of EU measures. Another version of the multilevel

perspective is the understanding that the EU is a networked or differentiated polity. The assumption is that in the EU context, public action and the subsequent coordination of actors are no longer mainly achieved by hierarchical authority mechanisms but increasingly by heterarchical interactions among different actors exchanging different resources. We will come back to this in relation to the discussions regarding the new modes of governance in the EU context.

Another analytical perspective concerning the interaction between the EU and its constituent parts has been devoted to studying the impact of the EU in a national context, or Europeanization. The recent enlargement rounds (from twelve to twenty-five members in just one decade) have launched important debates about intra-EU diversity. The main questions in this regard are these: What explains the observable diversity of effects and implementation enforcement of EU legislation in national contexts? Is there a tendency toward converging institutional, organizational, and political patterns across EU member states as a result of EU action? And how far is the ideal of "unity in diversity" reflected in real political processes at national or subnational levels? This research agenda is based on a comparative analysis of cross-national institutional dynamics and political processes, providing answers about the polity-construction of the EU. However, the existing literature is careful about identifying substantial trends of convergence and is still debating the nature of the EU's impact on national political structures. Further, empirical research might provide more conclusive answers to these Europeanization questions.

New Modes of Governance

The EU, similar to many other political orders worldwide, has recently started to develop forms of public action that use instruments other than legislation. These new instruments are a wide variety of arrangements typically based on flexible and partly self-regulatory deals such as voluntary agreements, contractual networks, voluntary standards, regulatory agencies, and the open method of coordination. These new instruments are different in their nature and in the context

they are used. Nevertheless, they have at least two important points in common, namely, their self-regulatory and voluntary nature, and the fact that they are largely decentralized from the European Commission, the executive branch in EU politics. This is why the new instruments have collectively been considered as the "new modes of European governance," in contrast with the traditional "community method" established in the 1950s. The community method, largely based on legislative instruments of binding and nonbinding nature (respectively "hard law" and "soft law"), was initiated and steered by the Commission, which was successful in generating "European integration by law."

Arguably, the rationale behind the new modes of governance is a combination of factors, most importantly, the need to introduce more flexible mechanisms in a highly diversified EU, the fact that European integration has reached the core of national welfare regimes and member states are not prepared to transfer more sovereignty to the EU level (hence, nonlegislative instruments are a reasonable way to move ahead), and the deep legitimacy crisis of the Commission in the late 1990s. As a response to these dynamics, and the increasing interest of member states to use nonlegislative instruments, the Commission itself initiated a political debate regarding this matter, which resulted in the Commission's White Paper on Governance in 2001.

The current theoretical debates revolving around the new modes of governance are mainly focused on their effectiveness and problem-solving capacity. Some commentators argue that these new voluntary instruments will only be effective if they operate "under the shadow of hierarchy" (a real threat that failure to change behavior on a voluntary basis will result in universally binding legislative action). But other commentators argue that the "shadow of hierarchy" is not a requisite of effectiveness because actors also can change their behavior through noncoercive adaptation processes.

The Democratic Governance of the EU

The democratic governance of the EU has been a central matter of debate among politicians and scholars since the mid-1980s, when the idea that the EU suffered from a "democratic deficit" was widely endorsed. The successive treaty reforms have consequently given more powers to the European Parliament in the understanding that this democratic deficit was essentially a problem for realizing the ideal of representative democracy. However, since the late-1990s, this democratic ideal has also expanded to include two further aspects. One is the inclusion of participatory theories of democracy, with the result that the new Constitutional Treaty envisages several modes of popular participation. The other aspect is the question of introducing more mechanisms of openness, transparency, and accountability of public administration at the EU level. However, the issue of whether and how to democratize the EU is still a matter hotly debated among scholars.

European Economic Governance

The concept of governance has also been increasingly used in relation to the economic dimension of the European integration project. The studies about the governance of the single market project focus on the complex process of formal and informal institution building and steering procedures of this transnational market and polity. Likewise, the creation of the single currency in the late 1990s (the euro) has initiated a heated scholarly debate about its governance mechanisms, particularly in relation to its democratic dimension, the sustainability of its monetarist approach, and its role in the global financial system. This coincides with the growing attention of scholars of European political economy to issues of governance, and the growing number of publications dedicated to the study of the European economic governance in an interdisciplinary manner. Here, such economic governance implies not just the examination of the single market and the euro, but also of other policy areas such as trade, agriculture, or technological innovation.

European Governance Beyond the EU

The Old World has been experiencing a tremendous process of functional and political integration since the

end of the Cold War. The EU has become a central institutional arrangement in this process; however, it is not the sole one. The so-called European architecture is a series of international governmental organizations and agreements in the fields of security, free trade, and scientific and cultural cooperation. The number of full members and associated members has been expanding exponentially after the fall of the Berlin Wall, knitting closer together the highly interdependent European countries. Besides these governmental organizations, a multitude of unknown nongovernmental arrangements of cross-national nature have also been expanding significantly, indicating the tendency of civil society to organize itself cross-nationally. In any case, general agreement is that the overall dynamics and governance patterns of this new European architecture are an issue that deserves further scholarly attention.

EUROPEAN UNION

The European Union (EU) is the largest regional organization in the world, comprises twenty-five member states, and forms the world's largest economy. The EU performs both economic and political activities. These are primarily based around the operation of a single market and the management of interstate relations through a variety of supranational institutional structures. Tensions concerning the political direction of the EU persist.

The EU began life as the European Economic Community (EEC), which was established under the Treaty of Rome in 1957. Initially containing six members, a series of expansions increased the number of member states to fifteen by 1995. Ten new members (known as "accession states") were admitted to the EU in May 2004, and a further expansion is planned for 2007. The EU itself came into being in 1993 following the ratification of the Maastricht Treaty. Its various processes and functions have recently been formalized in the creation of an EU constitution. This was signed by the leaders of all EU states in November 2004 but to date still has to be ratified. High levels of popular discontent with the constitution, including rejections in French and Dutch referenda, mean that it has an uncertain future.

The EU performs a range of economic and political functions. Its economic activities are principally based around the management of a single market. A long-standing goal of many European states, the drive toward establishing a single market began in earnest with the Single European Act of 1986 and was largely completed by 1992. This established a common customs union with a common external tariff, set up common agricultural and fisheries policies, permitted the free movement of capital, and allowed the relatively free movement of labor, subject to certain national restrictions.

The regulation of the single market involves coordinating the economic activities of member states. Primarily, this focuses on the harmonization of trading and consumer standards. In January 1999, twelve member states also took the historic step of adopting a single currency (the euro) as the final step toward complete economic integration. Management of the single currency is undertaken by the European Central Bank, based in Frankfurt, which sets common interest rates for all economies within the Eurozone. Efforts to extend the euro, however, have been undermined by the relatively poor economic performance of many EU states in recent years. Moreover, successive governments of the United Kingdom, the most economically developed member state to remain outside the Eurozone, have remained skeptical about the prospects for joining the single currency.

The political activities of the EU have progressively increased since its inception, largely in response to the process of economic integration. Some of the key political functions of the EU concern the issues of social welfare, regional development, health and safety, and the promotion of human and civic rights. The key political institutions of the EU are the European Parliament, comprising directly elected representatives from each member state; the European Commission, which provides the EU with a civil service headed by nationally appointed commissioners; and the Council of Ministers, which brings together ministerial representatives from each member state. A European Court of Justice also provides an overarching legal jurisdiction across the EU.

From the outset, the overall political direction of the EU has been a constant source of tension between member states. For some, such as France and Germany, the overall objective of the EU has traditionally been to secure an ever-closer degree of political integration, leading ultimately to the creation of a federal superstate. Since the end of the Cold War, this has also been fuelled by a desire to create a counterweight to the United States in international political affairs. In contrast, for other member states, such as Britain, the main political objective has been to maintain a union of independent nations operating according to the

principle of subsidiarity. The recent wave of enlargement has tilted the political complexion of the EU away from federalism, and toward a vision of wider rather than deeper political integration.

These political tensions over the direction of the EU are reflected in disputes concerning its decision-making structure. In particular, the main divide is between those who favor a process of intergovernmentalism, in which executive authority continues to reside with member states, and those who favor "supranationalism," with decision-making power increasingly passing to national representatives at EU level. Although the EU possesses no capacity to accumulate greater competencies or powers for itself, member states have provided it with increased powers over a wide range of policy areas in recent years, indicating an increased shift toward supranationalism. This has established an increasingly central role for EU law in member states, has produced a greater degree of policy coordination, and has led to an extension of qualified majority voting (QMV) on EU policy issues. Under this system, proposals require the support of at least half the EU member states, representing at least half the EU population, to be adopted. Issues passing into the area of QMV under the Treaties of Amsterdam in 1997 and Nice in 2001 include foreign and security policy (excluding military issues), and certain matters relating to justice, asylum, and home affairs. Although politically sensitive issues such as taxation levels and immigration have so far remained under direct national control, the process of enlargement is likely to increase the pressure for extending this decision-making principle to avoid the emergence of "euro-sclerosis" or gridlock. As the pressure increases, and as decision making becomes further distanced from the citizenry of the EU itself, questions concerning a widely perceived democratic deficit within the EU are likely to become more intense, especially given the relatively weak powers of the European Parliament and the continually low voter turnout for European elections. In turn, this is likely to raise difficult questions about the political legitimacy upon which a successful union must ultimately rest.

EVALUATION RESEARCH

Evaluation is the assessment of activities of administrative entities relative to their design, implementation, efficiency, effectiveness, and costs in reaching goals. Activities might include routine service delivery and improvements, projects, programs, and alternatives. The study of comparative outcomes might be analyzed as well as what might have happened without the program.

Definitions and Delimitations

Programs and Projects

Programs are activities or groups of activities undertaken by a government to serve the public. Programs are usually continuing activities such as routine service delivery in local governments. Projects, on the other hand, are combinations of human and nonhuman resources pulled together in a temporary organization to achieve a specified purpose.

Inputs and Outputs

Outputs are the amount of products and services delivered (completed) during a reporting period. Outputs result from the type of processing or technology employed by the agency. Thus, number of students vaccinated is an output resulting from the delivery of immunizations. The work of most organizations involves chains of processors (sub-units, individuals, machines, etc.) that convert resource inputs (money, person-hours of effort, etc.) into outputs. The output of one processor may become the input of another processor in sequences that produce the final output.

Outcomes

Outcomes are events, occurrences, or changes in conditions, behavior, or attitudes that indicate progress toward achievement of the mission and objectives of a program. There may be intermediate outcomes and end outcomes. An intermediate outcome might be the percentage of persons completing smoking cessation training who have continuously ceased smoking for six months. An end outcome could be the percent of reduction in reported cases of lung disease that can be attributed to smoking following an extensive anti-smoking campaign. Improvements in some service quality characteristics are treated as intermediate outcomes because they are important to the public. Examples are timeliness in delivery of a service, accessibility, or convenience; accuracy of assistance; courteousness; safety; and customer satisfaction.

Efficiency and Productivity

The ratio of the amount of input to the amount of output (or outcome) is labeled *efficiency*; for example, the dollar cost per customer assisted. The reverse of this ratio is labeled *productivity* (customers assisted per dollar). These are equivalent numbers. Efficiency and productivity are important criteria for judging efficacy in evaluation research.

Demographics and Workload Characteristics

Demographic and workload characteristics are most important in evaluation research to discriminate among affected persons, areas, or objects. Thus, age and medical problems of senior citizens who receive

"meals on wheels" service may be important controls on effectiveness of program delivery or other outcomes studied. Workload characteristics, especially where there is variance in quality, quantity, or other differences, are important similarly. Subtle differences in inputs vitiate research design because not all participants receive exactly the same treatment.

Types of Evaluation Activities

Research for Program Planning and Development

This is the category of getting started in evaluation research. Its purpose is to design programs in conformity with intended goals. It seeks answers to questions such as, What is the extent of the target problem population? What research and development program planning and implementation issues need attention?

The specification of target populations often is difficult. Too rigorous or too narrow a definition may result in exclusions from a project of target units that have exceptional or unusual levels of need for the program services, or whose potential for benefiting from the program is high. Too broad a definition may result in uneconomical investments in targets with low potentials for benefiting from the intervention.

In selecting the target population, whether individuals, groups, or organizations, it is important to consider total program resources available for the research and the size of the potential target population, as well as to conceptualize and clearly define the units of analysis. An example of an individual or group target might be the percent of income expended for food by employed single mothers with two or more dependent children receiving food stamps in a particular geographic area.

Several techniques can be employed in estimating the scope of problems requiring intervention efforts and to estimate the target population implied for the most effective deployment of available resources and staff. The following are examples. The key informant technique employs interviews with knowledgeable leaders and experts. This approach works best when specific, concrete information is asked. The community forum approach is like a town meeting. Problems

surface through comments of individuals. Sample surveys may also be useful in estimating scope of investigation and the nature of the target population.

The formal planning of program delivery where an organizational infrastructure does not exist requires a more formidable task than would be adaptation of the processes of an existing organizational unit. For the latter, administrative requirements may be as simple as substitution of equipment or use, reassignment or addition of personnel, or contracting certain tasks. However, when no basis for processing of final outputs exists, a systems approach to planning is necessary. This requires precise identification of final output(s) and the conditions under which delivery is made (e.g., geographical locations, variation in what is to be received by different targets). This is followed by a process of backward planning from the final output delivery through a series of processors or production steps. In either case, resources required at each phase must be planned and budgeted.

Monitoring Evaluation

Monitoring research is conducted to answer two questions: (1) Are program outputs reaching planned targets? (2) Is delivery of services in accordance with program design specifications?

It is essential to define target populations precisely, and it is critical to monitor the extent to which actual participation of targets takes place. Efficient management requires relevant and timely information on participation of subgroups, including those participating through different geographically located facilities. The same applies to relevant target subjects that may vary by attributes such as age, sex, household composition, income, occupational data, and so on. Voluntary participation or self-selection can vitiate project validity and can lead to practices such as "creaming" (allowing participation of those who make the program look better than it is by needing it least). Extent of coverage, or participation by targets, may be measured as the number in need of the intervention less the actual number served as a percent of the number in need.

Record-keeping integrity can perhaps best be measured through sampling of recorded data on records.

Surveys of sampled participants may assist in quality control of data and participation. They also may reveal problems such as those resulting in nonparticipation or dropout. Entire communities might be surveyed, especially when target specificity is not part of the methodology. Other monitoring methods might include direct observation by evaluators and questioning program staff who are service providers.

Outcome Assessment: Models and Limitations

The objective of outcome assessment is to establish, with as much certainty as possible, whether or not an intervention is producing its intended effects. This involves ruling out other explanations of results or lack of results. It is often important to assess outcomes to rule out the occurrence of unintended, undesired additional effects. Outcomes can be assessed in one of three ways:

1. The numeric effects (e.g., scores on a test) on targets after exposure to the intervention (e.g., literacy training) minus scores on the measure before intervention, plus or minus stochastic effects.

2. Scores on measures of targets after exposure to intervention minus scores on measures of a presumably equivalent control group not exposed to the intervention, plus or minus stochastic effects.

3. Differences in scores before and after targets are exposed to intervention minus differences in scores at the two time points of a presumably equivalent control group not exposed to intervention, plus or minus stochastic effects.

The third is the recommended formula. Stochastic effects are measurement fluctuations attributable to chance. By applying the results of appropriate tests of statistical significance, one can judge how often a given result would occur by chance alone. The statistical significance of a particular outcome is therefore compared against what is to be expected by chance when sampling from a hypothetical set of trials in which the true effect is zero.

Validity and reliability are two fundamental tests in social research that must be attended to if outcome data are to be acceptable measures of substantiation or rejection. Reliability is the extent to which the application of a measure to a given situation produces the same results repeatedly. To be reliable, the measured phenomena must not change greatly, for example, in a test-retest situation. Validity, as the extent to which measured research results reflect what is intended to be measured, is more difficult to assess. Research findings should be consistent with other studies measuring the same outcome, especially when several studies have been completed.

Outcomes may be subject to explanations that compete as causes of results. The following are a few of these: endogenous self-directed change, or hypothesized change in target group participants, the effects of long-term change (secular drift) that affect results, short-term interference such as the impact of disasters, and the problem of self-selection involving persons who are most likely to change whether they receive the treatment of the program or not.

Randomized experiments are restricted to assessing the impact of projects that can be legitimately administered on the basis of chance selection to some portions of a target population and withheld from others. Randomization may be carried out by assigning research subjects to experimental and control groups using published tables of random values or computer generated random number tables.

Quasi-Experimental Designs

Alternatives to randomized or true experimental designs are frequently used because sometimes they overcome many of the competing explanations for results of true experimental designs. Quasi-experimental designs often use constructed control groups either for situations in which experimental design or randomization of experimental subjects is not possible. Use of constructed control groups is particularly useful when there are competing explanations of experimental findings. Here, experimental findings may be compared with groups not receiving the treatment, but, say, under varying conditions. For example, outpatient versus inpatient treatment involving the same procedure is compared in groups with similar family, health, and other variables, but the constructed control group, an inpatient group, is evaluated on variables such as ward

atmosphere, client satisfaction, and rehospitalization rate. The question is, Do any of the control group variables explain differences between outpatient and inpatient treatment? For example, does the rehospitalization rate account for the experimental findings?

Another type of quasi-experimental design uses a reflexive control, or measurement of the experimental group findings against the same group before they received the treatment. This design works best when considerable time series data exist.

Cost-Benefit and Cost-Effectiveness Analysis

Cost-benefit analysis requires estimates of the benefits of a program, both tangible and intangible, and the costs of undertaking the program, both direct and indirect. An example of a tangible benefit is increased revenue from a new parking structure; an intangible benefit would be greater willingness of shoppers to patronize city center business. Direct costs of the new structure would be those of construction; however, an indirect cost might be more traffic. Both costs and benefits are usually translated into monetary terms. Benefits and costs can then be compared, usually by computing either a benefit-to-cost ratio (total benefits divided by total costs), the net benefits (total benefits minus total costs), or some other value such as internal rate of return (which applies alternative economic discount rates through trial and error until costs and benefits are equal; the resulting rate is applied to solutions). Discounting is generally used in economic analyses. Total costs and benefits are reduced to their net present value over time by applying the appropriate discount rate. The effects of interventions vary over time and must be brought to a common measure. Discounting does this.

Cost-effectiveness analysis is a more appropriate technique for resource allocation considerations of projects and programs. It would be helpful in program planning and development and monitoring types of research previously discussed.

Cost-effectiveness requires only costs to be monetized. Ratios would be developed using the outcomes of programs or projects. Thus, results of a program to educate new mothers about disease prevention in infants might be expressed as reduction in reported cases of childhood diseases, infant diarrhea, and so on per one hundred target persons educated during the project divided by total program costs.

Statistical Significance in Evaluation Research

The primary test of outcome research is the plausibility that the research could not have happened by chance rather than by the intervention (statistical significance). Frequently, levels of statistical significance are set at .05 and .01, meaning that the research results would have occurred by chance no more than five times in 100 trials (.05) or one time in 100 trials (.01). Although these significance levels are traditional in social science research, many experts caution that errors of judgment might have been made that may dictate the need for higher significance levels such as .0001 (chance outcomes once in 10,000 trials).

Setting the levels of statistical significance in evaluation research involves making judgments about the importance of two inversely related types of errors:

1. Type I Error: False positives—Making a positive decision when the correct decision should have been negative (concluding the program has an effect when it actually does not)

2. Type II Error: False negatives—Making a negative decision when the correct decision should have been positive (failure to detect a real program effect)

A rule of thumb might be that in projects where there is risk of harm to individuals, households, or communities, the possibility of false positives should be minimized, thus a higher test of significance would be applied.

Two common tests of statistical significance are chi-square (χ^2) and *t*-tests. Chi-square is a statistic for nominal level data. Nominal data can be categorized and labeled but cannot be ordered, such as data in measurement or interval scales. They are usually applied in contingency tables. *T*-tests examine the differences between the means of two groups, that is, the relationship between an interval dependent variable and a nominal independent variable. These tests are perhaps most commonly used in social science research. For

descriptions of their calculation, as well as other inferential statistics, the reader is directed to textbooks on research methods and statistical analysis.

Everyday Maker

An everyday maker is an ideal typical model of democratic citizenship in a governance society where voluntary organizations, firms, and citizens work closely together with public authorities in the governing of society. The emergence of the governance society has changed the image of what it means to be a democratic citizen from that of being a spectator to that of being a co-producer of governance. Traditionally, a democratic citizen has been perceived as a spectator who critically observes how governance processes are being performed by elected elites, public administrators, and professionals to make a sound and qualified judgment on Election Day. This image of the citizen as a critical spectator fits well with the traditional institutions of representative democracy and their focus on voting as the primary form of political participation. However, in a governance society, a multitude of alternative channels of influence are available that, in one way or the other, grant affected citizens, groups, and organizations direct access to participating in the governing process. Consequently, voting is being downgraded in the construction of what democratic citizenship means. New images of citizenship emerge in which it is not considered enough to participate in the traditional institutions of representative democracy to be a good democratic citizen. Citizens are also expected to take an active part in governance processes that affect them. The more directly you are affected, the more you are expected to participate. The image of the democratic citizen is becoming that of the coproducer of governance.

The everyday maker is an ideal-typical model of the democratic citizenship that emerges in a governance society. The ideal-type has been constructed by Henrik Bang and Eva Sørensen on the basis of an empirical study of images of democratic citizenship in Denmark. Empirically speaking, the everyday makers vote, but are not seriously interested in "big" politics and parliamentary democracy. They are more interested in governance processes that have direct relevance for their everyday lives at home, in their neighborhood, at work, and in their ongoing interaction with various public and private institutions. When they act, they do so to solve concrete problems. They are not interested in more abstract or ideological political involvement. Their active engagement is driven by a feeling of necessity and responsibility: "This problem needs to be solved and I feel obliged to do my share." Everyday makers are more active than the voter but less active than the politician. They engage themselves either ad hoc in a short but concentrated period, or part time over a longer period. Everyday makers insist that their engagement in concrete problem solving related to their everyday lives is a political engagement. Hence, they reject a narrow perception of politics as something that has to do with party politics and ideology and that takes place in the formal institutions of representative democracy.

EVIDENCE-BASED POLICY

The evidence-based policy movement (sometimes, evidence-based policy and practice) is a call for grounding public policies, programs, and practices in empirical evidence. It is an outgrowth of a movement in the United Kingdom in the 1990s calling for "evidence-based medicine," which argued that only those treatment modalities (such as drugs) that are grounded in laboratory (experimental) evidence should be used. Extended to other public policy areas, the question of what the concept of evidence means in this discussion has often been unnamed and unspoken, especially in the initial shift to this discourse. The concept and its arguments can be linked to older, 1970s concerns for a proper evaluation of policy outcomes. They also appear to be tied, however, to the much broader contemporary organizational and management studies concerned with knowledge and learning in organizations—the learning organization is a particular buzzword—and whether such organizational knowing and learning can be managed. These themes also emerge in the new public management that seeks to professionalize management practices and ground them in scientific findings.

Origins

The evidence-based policy movement in various public policy issues and other areas of practice originated in the United Kingdom, according to the preponderance of published work, in the context of medical practices (although at least one source traces its origins, without attribution or designation of place, year, or issue, to the United States; the reference may be to an earlier call in the United States to provide experimental evidence for prescribing particular drugs that were claimed to cure certain illnesses). The problem appears to have been, and currently to be, the professional practice of administering various medical treatments whose application and use are not necessarily grounded in empirical research—specifically, in the randomized controlled trials (RCT) that serve as the basis for experimental testing in medicine and other such areas.

As the movement has spread beyond medicine to other policy issue areas and beyond the United Kingdom to the United States, Australia, and elsewhere, various policies and practices have come under attack for their lack of grounding—as their critics claim—in empirical research. In some sense, the evidence-based movement might be seen as a reiteration of the 1960s and 1970s call for enhanced accountability by public-sector organizations—especially in policy implementation by local governmental organizations—that led to institutionalizing various forms of assessment within the policy cycle a desire to know that governmental funding—taxpayers' sterling or dollars or euros—was achieving desired ends. The evidence-based movement would seem to be a renewed call for accountability through a particular kind of policy and program evaluation, although using different terminology and instituted before implementation rather than during or after it.

The effort to connect social scientific knowledge with policy programs and practices is certainly desirable. Policy evaluation efforts have had their own difficulties, however, including problems in measurement and problems in determining what is capable of being assessed. The periodic expression of frustration with seemingly intractable or insoluble social problems appears now to be turning to questions of knowledge and its management, a current concern within organizational and management studies, expressed in policy arenas through the language of evidence. There has, however, been little reflexivity in the midst of these debates: Proponents of evidence-based policy have, on the whole, used the term uncritically, as if there were only one sort of evidence that can produce scientific results. The kind of evidence they adduce is experimental evidence expressed through statistical analyses—not surprising, perhaps, given the movement's origins in medical practices where experimentation is much at home. However, the experimental and statistical character of evidence assumed in this usage excludes observational evidence derived from local knowledge that emerges from the lived experience of participants in the situation under study, such as might be obtained through clinical or field research.

Conceptualization

In issue areas other than physical medicine where evidence-based movements have developed, such as mental health, education, welfare, and criminal justice, it is not always possible to conduct RCTs, and so policies, programs, and practices do not—and cannot—rest on the same sort of evidentiary claims. For example, county-based mental health departments in the United States have been called to task for administering psychotherapeutic interventions for troubled children if they cannot provide empirical evidence for their effectiveness, even when these programs have been used for several years, with demonstrated case-by-case clinical success. One reading of U.S. President George W. Bush's administration's No Child Left Behind educational policy—which mandates school-wide testing at several grades and ties funding to test-based performance—sees it as an effort to institute evidentiary grounding for teaching practices. One analyst notes that a specific research report reviewing this policy refers more than one hundred times to scientifically based research supporting its claims, without, however, ever defining what it means to be scientifically based or discussing who should conduct such research. Contemporary welfare policy reforms may be seen similarly: The 1996 U.S. Personal Responsibility and Work Opportunity Reconciliation Act may be understood as an effort to ground federal assistance in demonstrable evidence that financial and other support were achieving their intended goals.

Although observational methods such as those used in field research follow the scientific canons of interpretive research, the dominant understanding of evidence in the context of policy practices does not include clinical observations such as those made by teachers in classrooms or social workers and therapists in counseling sessions, or field research observations such as those made by participant-observers or ethnographers doing community studies. In these and other nonmedical policy issue areas, such as welfare and education, experimentation is much less common—and its use might violate the protection of human subjects principles that have been encoded in much social scientific research ethics and practices. Other types of study that yield statistical analyses, such as attitude and other surveys, might also not be appropriate ways to address relevant research questions. This makes the narrowing of the domain of what constitutes acceptable evidence problematic.

The evidence-based policy discourse ties in with contemporary concerns about the character of science and the ability of research methods to produce knowledge and findings that are trustworthy. Critics of the movement argue that the language of evidence works in metaphoric fashion as a kind of shorthand or proxy through which these methodological concerns about truth claims are slipped in to the conversation. Critics note that without critical reflexivity to this language use, it can serve, rhetorically, to foreclose debate. Without explicit discussion of what constitutes scientific evidence, there is also little discussion of what constitutes validation of research findings. They note that evidence derived from experiment-based observations—methodologically positivist procedures—is allowed into the arena of discourse and debate, whereas evidence derived from field-based observations—methodologically interpretive procedures, for example from local knowledge emerging from the lived experience of participants in the situation under study—is implicitly disallowed. That clinical and interpretive research also follows indicators of trustworthiness (the equivalent of validity and reliability in the context of experimental research design) that are different from those used in experimental research has not become part of the evidentiary conversation.

These questions touch on some of the central issues in contemporary political science, including its standing as a science, and its methodologies. The unreflective use of evidence narrows the range of otherwise accepted and legitimate scientific procedures for conducting research. In the context of social policies, arguments that limit funding to those programs based on evidence imply that without complete scientific proof (of whatever the subject is), no action can legitimately be taken. Policy analysts and scholars who focus on the use of language to shape policy debates point out that these terms are being used as if they were neutral descriptions of objective facts, whereas from a critical reflexive perspective, they are avenues for argumentative, rhetorical purposes. Tacitly, the language of evidence lays claim to a domain of scientific practice that is associated with an approach that

sees the possibility of objective research in the human sciences, much as has been established in the natural and physical sciences, including the possibility of a clear separation of facts from values. From this perspective, the evidence-based policy movement is no more likely to solve, or escape, the questions of social values and human decision-making than the program evaluation movement of the 1970s because both ultimately rest on human judgment.

EXCHANGE-RATE REGIME

The exchange rate represents the price at which one currency can be bought by another. Currency trading takes place on auction markets, known as foreign exchange markets, where annual turnover now exceeds global domestic product (GDP) by a factor in excess of forty. The exchange-rate regime refers to the public management of exchange rate relations, and thus shapes the context for trading on the foreign exchange market. The prevailing exchange-rate regime is determined by the decisions of governments, usually acting collectively under the auspices of an international agreement. On certain occasions, however, economically powerful countries have been able to reconfigure the exchange-rate regime while acting unilaterally.

The academic literature tends to focus on the difference between two types of exchange-rate regime: fixed versus floating. A fixed regime locks in the relative value of domestic currencies, hence determining the price at which they are exchanged. The classical gold standard, in operation in its purest form between 1870 and 1914, provided the basis for one fixed exchange-rate regime. Each currency had a set price in relation to gold and, because gold acted as a common denominator, each currency also had a set price in relation to one another. The postwar international economic order, which was negotiated at Bretton Woods in 1944, was also underpinned by a fixed exchange-rate regime. This time, however, the relationship between the U.S. dollar and gold, rather than gold alone, acted as the lynchpin of the system. By 1971, inflationary pressures in the United States undermined the effective value of the dollar, prompting investors to attempt to convert dollars into gold to protect the value of their assets. U.S. reserves, depleted by the country's first trade deficit of the twentieth century, plus the financial cost of the Vietnam War, were insufficient to meet the demand for dollar convertibility. As a response, U.S. President Richard Nixon reneged on his country's Bretton Woods' commitments by suspending the convertibility of the dollar into gold. With the central coordinating mechanism of the fixed exchange-rate regime thus disabled, the international currency system increasingly took on the characteristics of a floating regime. The international support structure for fixed exchange rates was formally dismantled in incremental stages throughout the 1970s, making the public management of exchange rate relations once again a matter of national policy. Over the following decade, an increasing number of governments decided to liberalize their exchange rates, thus allowing currencies to float freely.

The economic case for floating exchange rates is that they facilitate more flexible management of the international economy. A fixed exchange-rate regime provides asymmetric incentives for governments to negotiate realignments in their currencies' official value. If underlying economic conditions suggest that a currency is pegged at too high a price, it is in the economic interests of both the government in question and the system as a whole for negotiations to

be initiated to lead to the eventual devaluation of the currency. In this way, balance can be restored to the international economic system by reducing the price of the overvalued currency. This is likely to boost the volume of that country's exports, which would have been depressed during the period of overvaluation, and it will therefore enhance the overall level of economic activity within the international system.

By contrast, although it remains in the economic interests of the system as a whole for an undervalued currency to have its price increased relative to others, it is not in the interests of the government in question to have that realignment occur. Indeed, the government may attempt to frustrate negotiations to that end. A country whose currency continues to be undervalued under a fixed exchange-rate regime is likely to enjoy greater levels of exports than would be the case following a revaluation. Consequently, there are few incentives for a government in this position to negotiate a currency revaluation, even though the continued existence of an undervalued currency imparts instability into the international economic system as a whole. Revaluations are therefore always likely to be delayed, possibly until much damage has been done to established patterns of trade within the international economy. A floating exchange-rate regime, by comparison, is likely to speed the process of adjustment. Under such a regime, the value of a currency is determined by trading on an open auction market. Investors are in a better position than are governments to respond to changing economic circumstances because all they have to do is buy or sell their currency holdings on the foreign exchange market as circumstances suggest, and they do not have a strategic interest in maintaining an undervalued currency.

However, the theoretical advantages of a floating exchange-rate regime only hold as long as investors use the foreign exchange market to hedge passively against observed changes in underlying economic conditions. The textbook case for floating exchange rates breaks down because the foreign exchange market is dominated by the speculative trade in currencies. As such, the relative price at which currencies are exchanged may reflect the state of underlying economic conditions, but only coincidentally so. Certainly, currency values are not determined solely by economic fundamentals. They are shaped to a considerable extent by the dominant speculative position within the market. Insofar as there is an economic justification for the prevailing value of a currency, that justification relates primarily to the dynamics of the market itself: Prices follow where the money is within the market. Public policymakers still attempt to influence the value of the domestic currency, even under floating exchange rates, by authorizing the official buying or selling of the currency. Yet, they are constrained in this endeavor by the vast turnover within the foreign exchange market. Official reserves are only sufficient to have a marginal impact on where the money is within the foreign exchange market.

EXECUTIVE

In the classical political thought of John Locke or Charles de Secondat (Baron de la Brède et de Montesquieu), a sharp distinction was drawn between a polity's executive and its legislature. According to theories of democracy that advocate a strict separation of powers, a legislature should formulate, debate, amend, and adopt laws, whereupon an executive should then implement them. In practice, executives throughout the world have developed much greater power by becoming governments that contain a political dimension (heads of government and ministers) as well as an administrative one (civil services). However, the power of executives has recently been questioned and even decreased in countries where governance now genuinely describes the nature and extent of public authority.

Historically, and within each form of democracy, executives quickly developed more autonomy to make decisions than initially expected. Through taking the form of governments, they gained in authority by developing a legitimacy to make decisions when implementing laws adopted by the legislature. More fundamentally still, executives became more powerful because they soon developed the capacity to propose draft legislation to the legislature and marshal parliamentary majorities to ensure much of it would pass into the statute books. In the late nineteenth century and throughout much of the twentieth century, this process accelerated alongside and because of the emergence and consolidation of interventionist welfare states. As increasing numbers of laws and secondary legislation were required to run the public policies set up to fulfill interventionist and welfarist goals, in most countries the executive was granted more autonomy to make decisions with less and less reference to its respective legislature. Indeed, by the 1960s, the power of parliaments in certain polities had receded to such an extent that commentators spoke of "cabinet government" in the United Kingdom, "presidential government" in the United States, and "administrative government" in France.

Since the crisis of governability experienced by many Western states in the 1970s, the power of executives is being more systematically reviewed and criticized. So far, little evidence shows that legislatures have regained ground against them. However, five series of trends brought together in the narrative of governance strongly suggest that during the last twenty years, executive power has generally been on the wane.

The Fragmentation of Central Administrations

As interventionist welfare states grew, parts of each executive specialized in its respective subject area. Centered on ministries in countries such as the United Kingdom and on departments in the United States, this sectorization of public policy making and implementation exacerbated the challenge for executives to coordinate horizontal, cross-sectoral policies. Centralization of power in the hands of a president or

prime minister was one response to this problem of coordination. However, the experiences of countries such as France (e.g., under General Charles de Gaulle) or Britain (e.g., under Margaret Thatcher) reveal that centralization creates great opposition and that, more generally, the notion of a tightly organized executive is largely a myth.

Interest Intermediation

One reason why sectoralization has grown within executives is the proximity between ministries and dominant interest groups. As specialists of interest intermediation have shown, these relationships can become so close as to forge policy communities of a neocorporatist character. From the point of view of the overall evolution of executives, the deepening of these arrangements tends strongly to sap the coherence of governmental action and even challenge the existence of one single central government.

Decentralization

A further challenge to the autonomy and authority of executives has been the considerable changes in center-periphery relations that have taken place in many Western polities during the last twenty years. In Britain, for example, devolution has created new subnational governments in Scotland and Wales, whereas decentralization in France and the autonomous process in Spain have created regional forms of government in two other countries that were previously highly centralized. Although central governments have tended to retain a certain number of key competences (e.g., taxation), each form of decentralization has yet again reduced the authority of its respective executive by creating regional executives.

The Emergence of Supranational Political Systems

If executives have frequently delegated "down" some of their power, in certain countries they have also passed "up" other parts of their authority to supranational bodies. The clearest instance of this phenomenon

is provided by the European Union (EU). Within this set of institutions, national executives are no longer to make policy as they want because EU law trumps that of its member states. If certain studies show that being part of the EU has strengthened executives regarding their respective legislatures (e.g., the UK government versus the House of Commons), the overall balance of power has shifted in favor of a European-wide form of government that contains a multifaceted executive.

The Advent of the World Trade Organization

Throughout the world, the invention of the World Trade Organization (WTO) has created a final and pervasive force that shapes and limits the autonomy of executives. By producing laws and norms through which the world economy is increasingly regulated, this organization now obliges all national governments to consider their interdependence with other states when making a wide range of policies. If the WTO is still finding its way and has yet to develop strong powers of enforcement, it has already become yet another challenge to the power of traditional executives.

In summary, the clear separation of powers between executives and legislatures has long been proven to be political fiction. What the governance perspective on politics enables one to see is that since the 1970s, executives all over the world have been losing their power to make law and policy unilaterally. Indeed, the sharing of power has developed to such an extent that what constitutes an executive today is no longer clear-cut. Consequently, for political science, the concept of an executive could even be said to have lost its analytical purchase.

EXPORT PROCESSING ZONES

Also known as free trade zones, export processing zones (EPZs) are industrial areas within a country designed to encourage the establishment of a labor-intensive export manufacturing sector. Firms that locate in EPZs depend on a high proportion of imported inputs that are processed by a (low-cost) local labor force and then exported. Many of the firms located in EPZs are either multinational corporations or are local firms linked to the supply chains of multinationals.

The number of EPZs worldwide has grown rapidly since the establishment of the Shannon Free Trade Zone in Ireland in 1959. In 1970, 10 countries hosted EPZs, but by 2003, the International Labour Organization documented that 106 countries in the world hosted some form of EPZ.

EPZs now play an important role in the export-led development strategies that have been pursued by a number of states across the developing world. States seek to attract investment in EPZs by granting of incentives such as exemption from import duties, tax concessions, removing restrictions on offshore borrowing, exempting various national laws (these often include laws relating to labor rights), and providing high-quality infrastructure in the zones.

There is considerable debate concerning the pros and cons of EPZs. Supporters point to the role that EPZs have played in promoting rapid economic growth and highlight how EPZs bring employment opportunities and the potential role that these firms play in transferring new technologies into the local economy. Critics have argued, however, that levels of technology transfer are limited because the firms remain largely insulated from the local economy. Furthermore, the jobs found in EPZs are mainly low-skill, assembly-line production jobs paying

low wages. One worry is that because a key motivation for firms to invest in EPZs is the low cost of labor in the local economy, they will relocate to an EPZ in another country once labor costs start to rise. Concerns have also been raised about the lack of labor rights, long working hours, low pay, and harsh working conditions.

Around eighty percent of workers in EPZs are women. Firms have often deliberately targeted women workers in their recruitment strategies and may even establish hostels to house female workers migrating to industrial regions. Female workers are the employees of choice because they are regarded as better suited to monotonous assembly-line production; by viewing women as secondary income earners (working to supplement the family income rather than as the major breadwinner), employers can justify low rates of pay. Although the EPZ firms generally pay better than other forms of employment available to women such as domestic service, women working on EPZs are generally confined to the lowest paid, most labor-intensive forms of employment. Indeed, some would suggest that the EPZ model perpetuates, and even globalizes patterns of gender inequality.

EXTERNALITIES

Market systems work most efficiently when the prices at which goods and services are exchanged accurately incorporate information about social preferences, in which case, the price in question is called the efficiency price or scarcity price. When a price deviates from the efficiency price, it is an arbitrary price, and the transaction in question either imposes costs or confers benefits that are not reflected in the actual market price. These costs and benefits are called externalities.

Pollution is a prime example of a negative externality. When a factory discharges pollutants into water or air, it imposes costs on those affected by the pollutants. If those costs are not counted in the factory's costs of production, as has often occurred in the absence of government regulation, then the factory sells at arbitrary rather than efficient prices, and market efficiency is undermined.

Positive externalities occur when people benefit from the actions of others without paying for that benefit. For example, if I maintain the exterior of my house in impeccable condition, my actions confer an aesthetic benefit on my neighbors and other passersby as well as a monetary benefit to any of my neighbors who choose to sell his or her house. If I can neither charge a fee to those who enjoy the consequences of my actions nor exclude them from that enjoyment, then the benefit I confer on them is called a public good.

Public goods are at the heart of the free rider problem. In general, if people can enjoy benefits without paying the costs of those benefits, they will do so. Lighthouses are a classic example. Because it was often impossible to exclude ship owners who refused to pay for lighthouse services from enjoying the benefits of those services, fewer than the socially optimal number of lighthouses were built and manned. In general, if a good or service possesses the characteristics of a public good—if at least some people can obtain access to the good without paying for it—then the actual price received by the provider of the good will be lower than the efficiency price, and the good is likely to be undersupplied by the market.

Externalities are imperfections in a market system and thus constitute one kind of market failure. When such failures occur, it is often possible for governments to correct them, for example by taxing polluters and other producers of negative externalities and by subsidizing those who provide public goods. These

actions, if calibrated accurately, can bring prices into line with total social costs and benefits, thereby enhancing the efficiency of markets.

It is important to note that externalities constitute only one kind of market failure. Most notably, even if it were possible to devise a perfectly efficient market system, such a system still would fail to supply even the most basic needs of some people because markets supply goods only to those who have something to offer for exchange in the market. This defect can be made good only by some kind of nonmarket corrective.

EXTERNALIZATION

See CONTRACTING OUT

F

FAILED STATE

A failed state is unable to perform the two fundamental functions of the sovereign nation-state in the modern world system: It cannot project authority over its territory and peoples and cannot protect its national boundaries. Its governing capacity is attenuated such that it is unable to fulfill the administrative and organizational tasks required to control people and resources and can provide only minimal quantities of public services. Its citizens no longer believe their government is legitimate, and the state becomes illegitimate in the eyes of the international community.

A failed state is composed of feeble and flawed institutions. Often, the executive barely functions, while the legislature, judiciary, bureaucracy, and armed forces have lost their capacity and professional independence. A failed state suffers from crumbling infrastructures, faltering utility supplies and educational and health facilities, and deteriorating basic human development indicators, such as infant mortality and literacy rates. Failed states create an environment of flourishing corruption and negative growth rates, where honest economic activity cannot flourish.

The dynamics leading to and compounding state failure are many and varied, including civil war, ethnic violence or genocide, and predatory government and bureaucratic behavior. State failure comes in degrees and is often a function of both the collapse of state institutions and societal collapse. A strong state provides core guarantees to its citizens and others under its jurisdiction in the three interrelated realms of security, economics, and politics. A failed state cannot maintain a monopoly on the legitimate use of violence and minimize internal conflict. It cannot formulate or implement public policies to effectively build infrastructure and deliver services or effective and equitable economic policies. In addition, it cannot provide for the representation and political empowerment of its citizens or protect civil liberties and fundamental human rights. Thus state failure manifests itself when a state can no longer deliver physical security, a productive economic environment, and a stable political system for its people.

The total collapse of the state marks the final, extreme phase of state failure, and very few states can be described as completely failed or collapsed. Yet analysts have estimated that 20 to 50 states suffer from various degrees of weakness and are therefore potential candidates for failure. Weak states have been failing with increasing frequency in recent times, most of them in Africa but also a handful in Asia and the Middle East. Failed states are known to be hospitable to and harbor dangerous nonstate actors such as warlords and terrorist groups. For example, Somalia descended into state collapse under rival warlords, and Afghanistan, a failed state under the Taliban regime, harbored the al-Qaeda terrorist group. Furthermore, state failure poses pressing humanitarian issues and possible emergency relief and state-building

responsibilities for the international community. Consequently, understanding the dynamics of state failure and strengthening weak nation-states in the developing world has assumed new urgency.

FEDERALISM

See INTERGOVERNMENTAL RELATIONS

FEMINIST THEORY

Governance—understood as the shift from hierarchical and bureaucratic forms of decision making to self-organization, networks, and negotiation—has remained elusively immune to a comprehensive feminist analysis at local, state, and international levels. Gendered theories of governance are absent in the conventional literature and are neglected by feminist scholars. There are, however, feminist critiques of theories of international relations, the state, and public policy, all of which touch on governance, and they provide us with an entry point into feminist theories of governance.

A feminist theory of governance will have two main components. The first will be the perspective that informs the theory. Hence, a gendered approach to governance may be liberal and focus on resolving inequalities perpetuated by the private-public sphere dichotomy, it may be radical and seek gender equality through institutional and ideological reform, or it may draw on interpretive theory and view the state as a construction of discourses and practices so that sexual domination is a contingent product of history and not immutable. The second component will be its focus, drawn from the common themes and concerns when gender and governance converge in the fields identified—international relations, the state, and public policy.

Feminist International Relations

Feminist international relations is the field most removed from conventional state-bound or local analyses of governance. It provides critiques of globalization, development, and democratization and addresses the impact of global governance institutions on women. A particular feature is an emphasis on neoliberalism and the role of markets, which is understood as a gendered discourse that has become the paradigm for global governance.

Feminist Theories of the State

Feminist state theory maintains that political processes reflect and reproduce patriarchy, which will not change simply by increasing female representation in political institutions. A fraternal contract, based on essentialist understandings of gender, makes male political participation "natural," and treats women as incidental to the process of governing so that they are marginalized and excluded from decision-making and agenda-setting processes. The token representation of women in the state parallels the token representation of women within gender-blind mainstream state theory. Women are very underrepresented in state structures. The gendering of the state ensures that women's interests are articulated in "feminine" spheres such as welfare and education (opposed to the state's violent and repressive spheres). There is little recognition that state actions reproduce gender relations and identities through regulating marital relations, reproduction, wage discrimination and male violence, so that men are continually favored. However, although these processes reflect and reproduce patriarchy, feminist theorists believe the processes are open to change, rather than fixed.

This notion underpins poststructuralist approaches that assert feminist state theory rests on the illusion that the state is inherently male. The state is not structurally given but, rather, the product of erratic and disconnected discourses and the contingent success of various groups in articulating interests and homogenizing claims. Politics is therefore a set of contests about meanings rather than about objective interests. The importance of discourses is also recognized by standard feminist state theory: fraternal discourses construct the state on the assumption that the subject is male, so rather than explicitly defending male interests, government is conducted as if only men's interests exist and in the belief that men are acting in the interests of society as a whole.

Feminist Critiques of Public Policy

Feminist critiques of public policy are concerned with the role of women, the fate of women's issues in the policy process, and how policy affects women's interests. From a liberal perspective, public policy is framed by male perceptions of the public domain, and the boundaries of the public sphere are positioned so that private problems that all women face in social and economic life are not viewed as public issues. Areas that affect women more than men are badly resourced and do not have a high profile in the public sphere. A more radical reading is that the liberal public-private dichotomy conceals the fact that women are subjugated by patriarchal and class relations with a universalist, egalitarian, individualist gloss.

Gender mainstreaming is the push to institutionalize gender equity in all policy areas at all levels of government, where national machineries or centralized coordinating units ensure the design, implementation, monitoring, and evaluation of all policies and programs so that inequalities are not propagated. However, such initiatives are easily undermined by using public discourse to portray gender mainstreaming as an elite agenda serving special interests, or a rent-capturing agenda of people wanting to live off other people's taxes. Hence, neoliberal or rational choice discourses can sideline equity issues, demonstrating the power of language to shape what can and cannot be seen. Another concern is that successful mainstreaming

allows the state to commandeer the drive for gender justice so that it loses its edge. Gender policy is merely symbolic policy, which is unsynchronized with other policies and will result in only incremental gains at best. A gendered policy proposal will be placed at the bottom of the political agenda, will be marginalized in the formulation process, and thus will not attract adequate policy feedback: This is, for example, why equal pay policies have not been integrated within general employment policy. A radical interpretation is that equity policies are seen as a threat and are actively undermined by male bureaucratic resistance, and the only way female agendas can inform policy is by international feminist movements challenging masculinist actions and discourse to transform the underpinning ideologies of states and bureaucracies.

Most apposite to governance—understood as the shift from bureaucracies to networks—is the work of Adam Tickell and Jamie Peck. They employed a feminist lens to study the regendering of local governance in Manchester, United Kingdom, and found the growth of non- or quasi-state bodies in the decision-making process has naturalized business power and male power as the legitimate conduit for effective local governance. At the national level, Janet Newman assessed the impact of contracting out caring services on women and work in the United Kingdom, and finds a reduction in women's public-sector jobs, whereas competition between service providers drives lower wages and more part-time and insecure employment for women. This spiral reflects the negative value placed on women's labor as jobs such as social care work represent a marketized version of traditional domestic tasks.

Toward a Feminist Theory of Governance

It follows that a feminist theory (or theories) of governance will variously be concerned with the following:

1. How governance institutions and the contracting out of services affect women

2. The representation of women in political institutions, elites, and networks, though recognizing a gendered division of labor, and marginalization and exclusion from agenda setting and decision making

3. Gender mainstreaming of policy and successful routes to implementation through the programming of the bureaucracy

4. The impact of masculinist discursive practices, particularly neoliberalism and markets as a gendered discourse

5. Sexual domination as the outcome of contingent discourses and practices

However, we must be aware of potential inconsistencies or contradictions within such theories. They raise several questions. If there is reduced direct service provision, how can gender accountability be enforced? Does a largely top-down view of implementation neglect the discretion of bureaucrats and service providers to frustrate gendered policy goals and overlook empowering women as citizens in the policy process? Even when gender advocacy networks are in operation, how can the contingency of governance outcomes square with driving women's interests? As Newman observed, networks can disguise issues of equality and formalized power, and rights are rendered less significant than patterns of influence in interpersonal and interorganizational relationships.

FINANCIAL MARKET

A financial market is an arena in which prices form to enable the exchange of financial assets to be executed. Given the advent of electronic trading systems, financial markets can now be structured in many ways. Historically, they were physical meeting places in which traders came into face-to-face contact with one another, and trading occurred on the basis of prices being "cried out" on the market floor. Today, many financial markets have lost this intensely human dimension. Instead, prices are displayed across a network of computer screens, and assets are bought and sold at the click of a mouse attached to a computer keyboard. In such instances, the market place has become increasingly virtual, as physical proximity between traders is no longer necessary for trade in assets to commence.

Despite this change in the physical configuration of financial marketplaces, the rationale for establishing financial markets remains much as it ever was. Financial markets exist as a means of redistributing risk from the more risk-averse to the less risk-averse. Some risk is attached to holding all financial assets because the value of those assets can depreciate or appreciate. The more risk-averse the asset-holders, the more that they will seek to use financial markets to find an intermediary who is willing to accept that risk on their behalf. This, of course, will not be a costless exercise. An intermediary's willingness to accept a proportion of the risk embodied in an asset will have to be rewarded through the payment of a fee.

This, for instance, is the principle through which money is raised on the capital market to provide the resources for investment in new productive capacity. An investor with cash reserves may choose to invest that cash in an asset that has a minimal risk attached to it—say, an interest-bearing bank account, which is an extremely safe asset because the bank has almost a zero default risk. Alternatively, those investors may choose to make their cash available to entrepreneurs via the capital market. Entrepreneurs will approach the capital market to raise additional resources when they have insufficient cash reserves of their own to fund their activities, and they will seek investors to

accept some of the risk inherent in their entrepreneurial activities. Investors who make their cash available in such a way will clearly require recompense—that is, a fee—for the additional risks that they are taking, and this recompense takes the form of higher returns than would be available from less-risky investments. The entrepreneur must pay a return in excess of the prevailing rate of interest that the investor would earn from a simple bank account.

Financial markets, then, match the risk-averse with the less risk-averse and savers with borrowers. A smoothly functioning market environment will, in theory, exhibit a symmetrical distribution of risk-aversion around the mean, and it will be populated by an equal number of savers and borrowers. In practice, though, the situation is rather more complicated because of the dominance of the speculative motive for holding assets. Following the liberalization of trade in financial assets from the 1970s onward, financial markets have increasingly become an arena of speculation.

The textbook financial market allows for unproblematic risk pooling, which leads in turn to an efficient structure of risk management. However, the textbook financial market contains no destabilizing speculation. Indeed, in the classic statement of the case for efficient markets, made in the 1950s, Milton Friedman ruled out the possibility of the very existence of destabilizing speculation. He argued that, to destabilize markets, speculators would have to buy assets for more than the prevailing price in the spot market and sell them for less. This strategy is a money-loser, and the continual losses that a destabilizing speculator would make are sufficient to cleanse the market environment of any such actor.

Yet, the speculative trade of assets still dominates contemporary financial markets. In general, investment returns are assumed to be directly proportional to the risks that an investor bears by holding a particular asset. The greater the risks are that an investment may not be profitable, the greater will be the expected returns if it proves to be profitable. Speculative positions are adopted in the search for higher than average levels of return. Investors would hedge rather than speculate if the returns to the two strategies were equal because hedging is a safer strategy than speculating.

However, in attempting to increase their expected rate of return, speculators must also accept an enhanced risk that there may be no realized returns at all. Far from speculative financial markets following the textbook model of risk pooling, in reality they multiply the risks of holding financial assets, by subjecting the price of those assets to the vagaries of momentum trading. Speculative financial markets do not present investors with a predictable price structure that minimizes investment risk. Instead, they offer a means of acquiring additional risk, via the uncertainties of speculative price movements, in the search for higher profits.

Speculative financial markets tend to function relatively smoothly as long as participants in the market remain confident that the price of the assets they hold represents fair value. However, such markets are also prone to moments during which that confidence evaporates. In such circumstances, a flurry of selling activity tends to ensue. This is triggered by investors' attempts to off-load assets to which returns are unlikely to accrue. But all it does is expose the risks that are embedded in assets that are traded speculatively. A market that is bereft of confidence is one in which there is no escape from the enhanced investment risks associated with speculative trading.

Fiscal Crisis

A fiscal crisis may occur when a deficit develops between a state's expenditures and its tax revenues, which result in a rising and unsustainable level of

government debt. Fiscal crises are characterized by a financial, economic, and technical dimension, on the one hand, and a political and social dimension, on the other. The latter dimension tends to have the major implication for governance, especially when a fiscal crisis necessitates painful and frequently simultaneous cuts in government expenditure and increases in taxes on individuals, households, and companies.

A financial and economic crisis will tend to arise from a fiscal deficit if government debt levels contribute to a loss of market confidence in a national economy, reflected in turn in instability in currency and financial markets, and stagnation in domestic output. A political and social crisis will tend to arise if both the fiscal deficit itself and the necessary corrective measure implemente to eliminate that deficit result in further losses of employment and output, falling living standards, and rising poverty.

The concept of a fiscal crisis first came to prominence in both developed and developing economies during the early 1970s, largely as a consequence of the breakdown of the Bretton Woods international economic order, the October 1973 Arab-Israeli War, and the resulting oil crisis. These events combined to produce inflationary world energy and commodity prices, resulting in declining output and employment, and a simultaneous demand for higher government expenditure at a time of falling government revenues. The concept of a fiscal crisis of the state arose in relation to this fall in government revenues. James O'Connor, a political economist influenced by Karl Marx, argued that the capitalist state was in crisis because of its need to fulfill two fundamental but contradictory functions, namely accumulation and legitimization. To promote profitable private capital accumulation, the state was required to financed expenditure on social capital, that is, investment in projects and services to enhance labor productivity, lower the reproduction costs of labor, and thereby increase the rate of profit. To promote legitimization, the state was required to finance expenditure on social expenses, notably on the welfare state, and thereby maintain social harmony among the workers and the unemployed. However, because of the private appropriation of profits, the capitalist state would experience a growing structural gap, or fiscal crisis, between its expenditures and revenues, which would lead in turn to an economic, social, and political crisis.

O'Connor asserted that the fiscal crisis of the state was actually a crisis of capitalism, for which the only lasting solution was socialism. Although the inflation and recession of the mid 1970s failed to deliver the downfall of capitalism, it did lead to a political crisis for the Keynesian social democratic welfare state. The increasing incidence of budget deficits became associated with the idea that government had become overloaded; that full employment was not a legitimate objective of macroeconomic policy; that the state had become unduly influenced by powerful interest groups, notably trades unions in the public sector; and that society had become ungovernable. The corrective action proposed was that the role of the public domain of the state should be rolled back, to thereby reduce the popular expectations on government, and the role of the private domain rolled forward, to enhance economic freedom and unleash the creative energy of the entrepreneur.

This ideological assault on big government was led by Margaret Thatcher in the United Kingdom and Ronald Reagan in the United States. Such thinking was given powerful credence by the fiscal crises and growing economic and political instability experienced in several major industrialized economies. This was most evident in the United Kingdom when, in September 1976, Chancellor of the Exchequer Denis Healey announced his application to the International Monetary Fund (IMF) for $3.9 billion, the largest credit that had been extended by the IMF. The conditionality that accompanied the IMF loan demanded cuts in government spending of £1 billion in 1977 to 1978 and £1.5 billion in 1978 to 1979, and the sale of £500 million of state assets to redress the fiscal crisis that had arisen largely as a consequence of the 12.5 percent real terms increase in government spending that had occurred in 1974 to 1975.

In the subsequent era of increasingly liberalized financial markets, the consequences of fiscal crises for national economies, and their investors and creditors, including the IMF, have been even more severe, especially when government debt has been denominated in

foreign currency and held by overseas investors, who in turn operate in volatile market conditions. When a fiscal crisis has combined with a currency crisis to create a systemic financial crisis, the consequences have been devastating. In Argentina, for example, weaknesses in fiscal policy and three years of recession led to the ratio of government debt to gross domestic product (GDP) increasing from 37.7 percent at the end of 1997 to 62 percent at the end of 2001. Despite the provision of no fewer than five successive IMF financing arrangements totaling $22 billion, and $39 billion of additional official and private finance, the loss of market confidence in the Argentinean peso in January 2002 was so severe that, having been pegged at parity against the dollar since 1991, the peso's convertibility regime collapsed. Argentina defaulted on its sovereign debt, the economy contracted by 11 percent in 2002, unemployment rose higher than 20 percent, and the incidence of poverty increased dramatically. To avoid the risk of further expensive and destabilizing fiscal crises, the World Bank and IMF have built an extensive framework of best practice and transparency in fiscal policy into their frameworks for good governance in general, and public-sector governance in particular. This framework has sought to limit the role of the state to building institutions for the market and to identifying at an early stage the full fiscal costs associated with public intervention.

Fiscal Federalism

The concept of fiscal federalism refers to the financial relations between units of governments in a federal government system. Fiscal federalism is part of broader public finance discipline. The term was originally developed and used first by Richard Musgrave in 1959. Fiscal federalism deals with the division of governmental functions and financial relations among levels of government.

In the early years of federalism, geographic separation, slow communication, and clear division of labor made it possible for each level of government to function without significant interactions with other levels of government. Several reasons caused more interactions and central planning among the levels of government: world wars and the Cold War, improvement in transportation and communication technologies, the New Deal, and the war against poverty. These developments increased the interactions among levels of governments and helped the development of national policy making and state local policy implementation. This also changed traditional intergovernmental relations. National fiscal policies and financial decisions have been the predominant vehicle forming the intergovernmental relations.

The theory of fiscal federalism assumes that a federal system of government can be efficient and effective at solving problems governments face today such as just distribution of income, efficient and effective allocation of resourses, and economic stability. Economic stability and just distribution of income can be done by federal government because of its flexibility in dealing with these problems. Because states and localities are not equal in their income, federal government intervention is needed. Allocation of resources can be done effectively by states and local governments. Musgrave argues that the federal or central government should be responsible for the economic stabilization and income redistribution but the allocation of resources should be the responsibility of state and local governments.

The following are benefits of fiscal decentralization: regional and local differences can be taken into account; lower planning and administrative costs; competition among local governments favors organizational and political innovations; and more efficient politics as citizens have more influence. There are several disadvantages of fiscal federalism as well: the lack

of accountability of state and local governments to constituents; the lack of availability of qualified staff; the possibility for people to choose where to reside; a certain degree of independence of the local governments from the national government; and unavailability of infrastructure of public expenditure at the local level.

Fiscal federalism in a mature federal system, such as the United States, refers to the development of a centralized federal budgetary and financial system including all members of the system. In the United States, fiscal federalism operates through the various federal taxes, grants, and transfers that occur in addition to states and localities. The federal government regulates, subsidizes taxes, provides goods and services, and redistributes income. The government has recently shifted its fiscal federalism practices to empowering the states through a series of reforms and deregulations.

Fordism and Post-Fordism

Fordism and post-Fordism are apparently complementary concepts that describe successive stages in economic development in the twentieth century. However, although Fordism has a positive content, post-Fordism has often signified nothing more substantial than an economic organization that follows Fordism. Recent work offers more substantive analyses of the successor regime(s) to Fordism and less reference is made to post-Fordism.

Fordism is widely used to describe (a) the system of mass production that was pioneered in the early twentieth century by the Ford Motor Company or (b) the typical postwar mode of economic growth and its associated political and social order in advanced capitalism. Henry Ford helped popularize the first meaning in the 1920s, and Fordism came to signify modernity in general. For example, writing in prison in the interwar period, the Italian Communist, Antonio Gramsci, discussed the economic, political, and social obstacles to the transfer of Americanism and Fordism to continental Europe and highlighted its potential transformative power when controlled by workers rather than conservative forces. Gramsci's comments inspired research on postwar Fordism and its crisis. In its second meaning, Fordism has been analyzed along four dimensions. First, as an industrial paradigm, it involves mass production of standardized goods on a moving assembly line using dedicated machinery and semi-skilled labor. Second, as a national accumulation (or growth) regime, it involves a virtuous cycle of mass production and mass consumption. Third, as a mode of regulation, Fordism comprises (a) an institutionalized compromise between organized labor and big business whereby workers accept management prerogatives in return for rising wages; (b) monopolistic competition between large firms based on cost-plus pricing and advertising; (c) centralized financial capital, deficit finance, and credit-based mass consumption; (d) state intervention to secure full employment and establish a welfare state; and (e) the embedding of national economies in a liberal international economic order. Fourth, as a form of social life, we find mass consumption, mass media, mass transport, and mass politics in a mass society.

The Fordist mode of growth became dominant in advanced capitalism during postwar reconstruction and is often credited with facilitating the long postwar boom. During the 1970s, however, its underlying crisis-tendencies became more evident. The growth potential of mass production was gradually exhausted, and there was intensified working-class resistance to its alienating working conditions; the market for mass consumer durables became saturated; a declining profit rate coincided with stagflation; a fiscal crisis developed; internationalization made state economic management less effective; clients began to reject

standardized, bureaucratic treatment in the welfare state; and American economic dominance and political hegemony were threatened by European and East Asian expansion. These phenomena prompted a wide-ranging search for solutions to the crisis of Fordism, either by restoring its typical growth dynamics to produce a neo-Fordist regime or by developing a new post-Fordist accumulation regime and mode of regulation.

Post-Fordism is used both to describe a relatively durable form of economic organization that happened to emerge after Fordism or a new form of economic organization that actually resolves the crisis-tendencies of Fordism. In neither case does the term as such have any real positive content. This is why some theorists propose substantive alternatives such as Toyotism, Fujisuism, Sonyism, and Gatesism or, again, informational capitalism, the knowledge-based economy, and the network economy. Social scientists have adopted three main approaches to identifying the post-Fordist regime: (a) focus on the transformative role of new technologies and practices regarding material and immaterial production—especially new information and communication technologies and their role in facilitating a new, more flexible, net-worked global economy; (b) focus on the leading economic sectors that enable a transition from mass industrial production to postindustrial production; and (c) focus on how major crisis-tendencies of Fordism are resolved through the consolidation of a new and stable series of economic and extra-economic institutions and forms of governance that facilitate the rise and consolidation of profitable new processes, products, and markets. However, even thirty years after the crisis of Fordism emerged in the mid-1970s, debates continue about whether a stable post-Fordist order has emerged and, indeed, whether Fordist stability was a parenthesis in an otherwise disorderly, crisis-prone capitalist system.

Those who believe that a stable post-Fordism has already emerged or, at least, is feasible, see its key features as (a) flexible production based on flexible machines or systems and a flexible workforce; (b) a stable mode of growth based on flexible production, economies of scope, rising incomes for skilled workers and the service class, increased demand among the better off for differentiated goods and services, increased profits based on permanent innovation and the full utilization of flexible capacity, reinvestment in more flexible production equipment and techniques and new sets of products, and so on; (c) growing economic polarization between multiskilled workers and the unskilled together with a decline in national or industrial collective bargaining; (d) the rise of flexible, lean, and networked firms that focus on their core competences, build strategic alliances, and outsource many other activities; (e) the dominance of hypermobile, rootless, private bank credit and forms of cybercash that circulate internationally; (f) the subordination of government finance to international money and currency markets; (g) a shift from postwar welfare states (as described by John Maynard Keynes) to political regimes that are more concerned with international competitiveness and innovation, with full employability as opposed to jobs for life, and with more flexible, market-friendly forms of economic and social governance; and (h) increasing concern with governing local, regional, supranational, and even global economies.

These features of post-Fordism are unevenly developed, and there are important continuities with Fordist conditions even in the advanced capitalist economies. Post-Fordism can also assume different forms in different contexts: neoliberal, neostatist, or "third way." And although some commentators believe that post-Fordism will prove stable, others argue that capitalism's inherent contradictions mean that it is no more likely to prove stable than Fordism before it.

FORECASTING

The activity of forecasting as a means of generating knowledge continues to engender enthusiasm in our modern societies. The principal objective of this field of study is to predict the future in an accurate manner to anticipate and to analyze upcoming events and predict future outcomes using the past and the present as tools to do so.

The polysemic character of this term is obvious: Forecasting concerns the economy and foreign affairs and even the field of legislative elections as well as the weather. Consequently, there is a close relationship between politics and the will to explore the future. In particular, the practice of forecasting has strategic interest within economics through the establishment of economic trend indicators that contribute to the elaboration of future economic and monetary policies. What is the particularity of economic forecasting if we compare it with other mechanisms? To answer this question, one has to get into the meanders of the economic forecasting concept to show that this instrument is not only about figures but also, and possibly most importantly, one of changing actors, of power relations, and consequently, issues of governability. To discern contexts of governance, one needs to identify the large number of actors who intervene in forecasting. Is there a hierarchy between the different organizations that intervene in this activity? What explains the dogmatism often held by large organizations regarding forecasting that leads them, for example, to influence the management practices of the monetary policy of many developing countries heavily? Finally, an attempt will be made to clarify the close relationships that exist between the notion of economic forecasting and the concept of governance.

Concept Identification and a Brief Review of Practices

The rapid expansion of economic forecasting during the twentieth century is mainly the result of the development of statistics and the publication of John Maynard Keynes's general theory in 1936. Moreover, the emergence of globalized economies and societies has added complexity and interdependence to the economic system and has favored some forecasting aspirations that attempt to overcome uncertainty regarding the capability of the states to face up to economic upheaval.

To manage economic policy as well as to prepare and execute public budgets, governments have understood that they should take advantage of expertise in economic forecasting. Based on model building (structural, Keynesian, statistics, econometrics) or on economic trend survey, economic forecasting is based on strict scientific methodologies that distinguish it from the divinatory estimations suggested by clairvoyants or other fortune-tellers. Thus, this wide range of instruments permits forecasters to establish several short-term growth scenarios, generally for the next two years.

In several countries, the places and the levels where forecasting is practiced are fragmented: public administrations, essentially through specialized services of the ministry in charge of finances; autonomous research institutes and expert commissions reporting to the government; and economic services of the banking and financial sector.

In France, the weight that the administration represents within the forecasting function is clearly identifiable and significative (Institut National de la Statistique et des Études Économiques and Direction de la prévision et de l'analyse au Ministère de l'Economie). In the United Kingdom (Economic Assessment Team) and in Italy (Attuazione della programmazione economica), this is also the case. Concerning the recourse to the expertise of research institutes, the cases of the United Kingdom and Germany deserve particular attention because of the utilization and compilation of economic forecasting produced by the main organizations of the economic sector. In addition, in the United States, think tanks have intervened in the field of economic anticipation.

At the same time, the constellation of forecasting organizations at the public level is also accompanied at the international level by the main intergovernmental organizations acting in the economic field. In this way, entities like the International Monetary Fund, the

Organisation for Economic Co-operation and Development, and the European Central Bank have forecasting structures at their disposal.

Toward Coproduced Forecasting?

The explosion and the plurality of participants involved in economic forecasting make it possible to consider that this instrument depends more and more on multiple actors with different perspectives. But economic forecasting at the national level is not an abstract process, built independently from influence and pressure. The stakes involved in this practice involve a considerable sum of actors motivated by their ability to produce challenging arguments, by their mode of mobilization, and by the possibility that forecasting takes place within the public action chain created by economic forecasting.

Therefore, the definition of governance as the process of coordination between actors, social groups, and institutions to achieve their own goals that have been previously discussed and defined collectively within fragmented environments seems to find an echo in economic forecasting mechanisms. As the wielding of power is no longer about domination but, rather, one of exchanges through networks, this often places official and non-official actors on more equal terms than before.

Similarly, forecasting makes it possible to elaborate and to conduct public discussion about monetary policy that today results from the coordination of multiple entities. Again, one sees the importance of each actor's place within the forecasting process. Indeed, the mobilization of resources resulting from the estimations issued by public authorities can often be the source of genuine competition between the organizations, their aim being to put forward the best growth scenario and, consequently, to consolidate a place in the forecasting scene.

Analyzing the repercussions of the domination of economic forecasting orchestrated by large international organizations appears thus to supplant the activity of the other organizations within the economic scene. In this sense, a greater interaction between the competing organizations in the forecasting sector

would perhaps be desirable so that the economic guidelines that result from the forecasting process could be dictated at the international level and be the result of a combination of intellectual opinions.

FOREIGN DIRECT INVESTMENT

Foreign direct investment (FDI) conventionally refers to an investment in an enterprise resident in a country other than that of the foreign direct investor. A long-term relationship is taken to be the crucial feature of this investment. Thus, the investment is made to acquire lasting interest and control of the economic entity, with an implied influence on the management of the enterprise. Some degree of equity ownership is usually considered to be associated with an effective voice. Basic forms of FDI are greenfield investment, mergers and acquisitions, and joint ventures. Three components of FDI are usually identified: equity capital, reinvested earnings, and intra-company loans. Other than having an equity stake in an enterprise,

foreign investors may acquire a substantial influence in many other ways. Those include subcontracting, management contracts, turnkey arrangements, franchising, leasing, licensing, and production sharing.

Foreign direct investment is considered to be both an important indicator and driving force of what is called economic globalization (global integration of production, including qualitative change in the nature of the international political economy). It is not a new phenomenon, though its importance has grown only since the second half of the 1980s. The growth of foreign direct investment cannot be attributed to the technological change only; it has been facilitated by various political actors, including national governments and international organizations. The basic motivations of capital to invest abroad are the pursuit of market, efficiency, or knowledge. Investors are mainly attracted by strong economic fundamentals in the host economies.

The geographical distribution of FDI is highly uneven. The great bulk of it is exchanged between the rich nations. Only a fraction goes to the newly industrializing countries. FDI continues to circulate between the three main blocs of the Triad (Europe, the Americas, Southeast Asia), leaving most of the world population excluded.

FDI inflow is considered as a crucial presupposition of economic development. For instance, it has been presented as a "Marshall Plan for Eastern Europe" in the post-communist transformation. Foreign direct investment has potentially both positive and negative effects on host economies. These effects depend on a number of factors, including a host economy's level of development, the type of investment, and the position of the particular investment site in the investors' business strategy.

States increasingly enter into competition to attract or keep mobile capital in the locality. The aim of attracting investment (or threat of its departure) thus frames different policies and regulations, including social ones. In this respect, what preferences policy makers attribute to the mobile capital are crucial. Significantly, cost-competitiveness and the neoliberal environment are often considered to attract FDI, which leads to deregulation and liberalization. This assumption may not entirely correspond to the actual locational preferences of the investors.

FOREIGN EXCHANGE MARKET

A foreign exchange market is the institution for the exchange of one state's currency with that of another state; actually, "the market" is made up of many different markets because the trade between individual currencies—say, the euro and the U.S. dollar—each constitutes a market. The foreign exchange (or forex or FX) markets are the original and oldest financial markets and remain the basis upon which the rest of the financial structure exists and is traded in: Foreign exchange markets provide international liquidity, preferably with relative stability. There are two key related governance issues: (1) systemic governance, that is, the international monetary system, and (2) the governance problems faced by individual governments given the currency markets.

The foreign exchange market is a twenty-four-hour over-the-counter (OTC) and dealers' market, meaning that transactions are completed between two participants via telecommunications technology. The currency markets are also further divided into spot markets—which are for two-day settlements—and the forward, swap, interbank futures, and options markets. London, New York, and Tokyo dominate foreign exchange trading. The currency markets are the largest and most liquid of all the financial markets; the latest triennial figures from the Bank of International Settlements (BIS) put daily global turnover in the

foreign exchange markets at $1.9 trillion in April 2004. It is sobering to consider that an annual world trade's foreign exchange is traded in just less than every five days on the currency markets, although the widespread use of hedging and exchanges into and out of vehicle currencies—as a more liquid medium of exchange—means that such measures of financial activity can be exaggerated.

The original demand for foreign exchange arose from merchants' requirements for foreign currency to settle trades. However, now, as well as trade and investment requirements, foreign exchange is also bought and sold for risk management (hedging), arbitrage and for speculative gain. Therefore, financial, rather than trade, flows act as the key determinant of exchange rates; for example, interest rate differentials act as a magnet for yield-driven capital. Thus, the currency markets are often held to be a permanent and ongoing referendum on government policy decisions and the health of the economy; if the markets disapprove, they will vote with their feet and exit a currency. However, debates about the actual versus potential mobility of capital remain contested, as do those about whether exchange rate movements can best be characterized as rational, "overshooting," or speculatively irrational. Certainly more needs to be done on the actual causes of foreign exchange movements.

The increasingly asymmetric relationship between the currency markets and state governments represents a classic autonomy problem. The "trilemma" of economic policy options available to governments are laid out by the Mundell-Fleming model. The model shows that governments have to choose two of the following three policy aims: (1) domestic monetary autonomy (the ability to control the money supply and set interest rates and thus control growth); (2) exchange rate stability (the ability to reduce uncertainty through a fixed, pegged, or managed regime); (3) capital mobility (allowing investment to move in and out of country).

Historically, different international monetary systems have emphasized different policy mixes; for instance, the Bretton Woods system emphasized the first two at the expense of free capital movement. The collapse of the system destroyed the stability and predictability of the currency markets. The resultant large fluctuations meant a rise in exchange rate risk (as well as in profit opportunities). Governments now face numerous challenges that are often captured under the term *globalization* or *capital mobility:* the move to floating exchange rates, the political liberalization of capital controls, and technological and financial innovation. In addition to these, the rise of the Eurocurrency markets—the exchange of currencies outside the home state (and thus unregulated)—has also increased the pressure on governments.

In the contemporary international monetary system, floating exchange rates are the norm; however, different governments are pursuing a variety of alternative policy mixes or are attempting to minimize exchange rate fluctuations through different strategies. For example, the United States has displayed a preference for ad hoc international coordination, such as the Plaza Agreement in 1985 and the Louvre Accord in 1987, to intervene and manage the price of the dollar; Europe has responded by forging ahead with a regional monetary union, based on the desire to eliminate exchange rate risk, whereas many developing governments with smaller economies have chosen the route of "dollarization," that is, either fixing to or choosing to have the dollar as their currency.

The international governance regime is a complex and multilayered bricolage of institutions, with private institutions taking an important role in governance: witness the large role for private institutions, such as credit rating agencies, in guiding the markets. Also, banks remain the major players in the market and are supervised by the national monetary authorities. These national monetary authorities follow the international guidelines promulgated by the Basle Committee on Banking Supervision, which is part of the BIS. Capital adequacy requirements are to protect principals against credit risk, market risk, and settlement risk. Crucially, the risk management, certainly within the leading international banks, is now largely a matter for internal-setting and monitoring.

The recent series of contagious currency crises in the 1990s—in Mexico, Brazil, East Asia, and Argentina—has again focused policymakers' minds on the problems of the international monetary system.

Moves, albeit limited, have been made toward a new international financial architecture. Most importantly, this has seen the establishment of the Financial Stability Forum, which investigates the problems of offshore, capital flows, and hedge funds, and the G20, which attempts to broaden the international regime's membership and thus deepen its legitimacy. In addition, there have been calls for a currency transaction tax, named after Nobel Laureate James Tobin's proposal, from many civil society nongovernmental organizations as well as some governments. The success of international monetary reform is a crucial issue for governments and their autonomy, firms and the stability of their investment, and citizens who ultimately are those who absorb these effects as they are transmitted into everyday life.

FORMAL ORGANIZATION

Formal organization is the component of an organization's social structure designed to guide and constrain the behavior of organizational participants. The label "formal" is used because the concept encompasses the officially sanctioned rules, procedures, and routines of the organization, as well as the role-defined authority relationships among organizational participants. Standard operating procedures and organization charts, which are essentially maps of formal authority relationships, are two of the most important symbols (and products) of formal organization.

Formal organization is, arguably, the concept most often evoked when envisioning any general organization. From a conceptual standpoint, however, formal organization is best described as a type of organizational social structure, rather than a general or specific type of organization. Moreover, formal organization is not simply a collection of rules, procedures, and routines—the concept derives its meaning from how each of these elements is used to guide and constrain the behavior of organizational participants. As a result, formal organization often has important implications for anyone, at any level, seeking to control the members of an organization.

As many scholars have observed, however, not all behavior within an organization can be controlled through formal rules, procedures, and routines. In any organization, rules get bent, procedures are modified to accommodate the task at hand, and nonstandard routines are adopted, often without any formal directive from the organization's leadership. Additionally, the web of relationships in any organization rarely resembles the formal organization chart, as friendship networks, advice networks, and communication networks inevitably develop across intra-organizational boundaries. These observations of nonformal organizational behavior have led scholars to argue that where one finds formal organization, one should also expect to observe informal organization. One cannot exist without the other.

Scholars dispute the proper balance between formal and informal organization. All recognize the importance of informal organization in influencing participants' behavior, but they differ with respect to how much influence it actually has. Thus, scholars who conceptualize organizations as rational systems tend to argue that organizations can be designed in such a way that informal processes can be adequately controlled through formal procedures and routines. Scholars writing in the natural system tradition, on the

other hand, tend to argue that informal organization more strongly influences behavioral patterns than formal organization, and, therefore, creating new rules and procedures or establishing well-defined lines of authority may not always have the intended effect.

Regardless of which perspective one adopts, the interplay between formal and informal organization has important implications for the leadership of any organization—both at the design stage and in the day-to-day coordination of organizational activities. This is because the ability to design formal organizations and manipulate them on a regular basis to achieve defined goals depends on the type of organization and the nature of activities being coordinated as well as on the skills of the executives or governing body running the organization.

FRAME ANALYSIS

Frame analysis is a broadly applied, relatively flexible label for a variety of approaches to studying social constructions of reality. Erving Goffman, who is credited with developing the phrase in his 1974 book *Frame Analysis,* understood frames to mean the culturally determined definitions of reality that allow people to make sense of objects and events. Goffman envisioned frame analysis to be an element of ethnographic research that would allow analysts to read identifiable chunks of social behavior or strips, so they could understand the frameworks participants were using to make sense of the behavior. This inquiry into framing and its role in social life has had wide effects across the spectrum of social science research interests.

Social psychology and economics found common ground in Daniel Kahneman and Amos Tversky's Nobel Prize–winning research into how the framing of problems influences decision making. Social movement researchers have developed more specific uses for frame analysis, turning the general ethnographic method into a more specified tool for understanding the particular dynamics of activist movements. Media scholars have emphasized the political role played by frames in mass communication, examining the use of frames to guide audiences to preferred conclusions by simultaneously highlighting particular aspects of reality and hiding others.

Social movement research and political communication have been the two main subfields of political science to consider the role of frames. However, work in both areas has moved substantially away from Goffman's formulation by reconsidering the role of intentionality in framing. Goffman saw frames as being either "primary frameworks"—the product of larger culture and shared by all within a culture—or as intentionally fabricated by individuals—a "transformation" of the primary frameworks. Individuals who intentionally deploy frameworks transform a culturally constructed social reality and do so either in play or to deceive. Goffman's reading of intentional framing thus cast it as a move away from a more "authentic," consensual reality, rather than as an element that revealed the struggles for power constituting or maintaining that reality. Meanwhile, both social movement and political communication scholars view the question of intentionality in framing in a substantially different way. Both lines of research see frames as relevant to politics precisely because they can be intentionally deployed to create a change in attitudes. Moreover, many agree with William Gamson's assessment that policy issues can be understood principally as competing symbolic packages, with a particular organizing frame at the heart of each package.

Along with resource mobilization and opportunity structures, framing is now recognized to be one of the three critical pillars of organization activity by American social movement theorists. These theorists moved quickly to recognizing that the intentional deployment of frameworks was an important function played by organizations to mobilize adherents and constituents. Rather than a deception enacted between two people, they recognized the process of frame alignment—the linkage of individual and organizational interpretive frameworks—to be a legitimate means to organizational ends. Typically scholars distinguish four processes that operate within this construct: frame bridging, in which organizations reach out to individuals who already have ideologically congruent interpretive frames; frame amplification, in which organizations must emphasize the significance of a value or belief already held by potential constituents to bring them into alignment; frame extension, in which organizations add goals or programs to their core program to attract potential constituents who might not be attracted to the core elements of the program but would be interested in the new elements; and frame transformation, where potential adherents are converted to an entirely new set of beliefs and values.

In the study of political communication, scholars began to see frames as relevant within the broader context of media persuasion: along with agenda setting and priming, framing is one way that media (or the elites who manipulate them) can influence audiences' political attitudes. Some theorists have developed definitions that point explicitly to framing as an instrument of power. Framing exerts power over audiences by highlighting certain elements of a shared reality in such a way as to define problems, diagnose causes, make moral judgments, or suggest solutions. Although audiences can potentially interpret texts in a number of different ways, people are most likely, in the absence of having additional information, to interpret problems, causes, and solutions for issues in terms of the way that those issues have been framed.

Because it originated in media studies, this perspective on framing has been studied most often in the context of political news, rather than in Goffman's context of interpersonal communication or social movement theory's context of targeted outreach. Primary responsibility for the generation of frames is commonly ascribed to journalists or television production companies. Journalists are believed to generate frames as a result of their particular training, their class and racial affinities, and the present processes of media production. It seems, for instance, that news-frames episodes—which present social issues in terms of individual cases—lead audiences to attribute blame for social problems to individuals rather than to political bodies. However, other scholars deemphasize the role of journalists and, rather, base their analyses on the observation that political elites, providing "spin," create preferred frameworks that media then adopt and transmit.

Finally, Kahneman and Tversky's perspective on framing—although generally quite distinct from the approach of media and social movement researchers—continues to provide a useful point of reference for scholars interested in modifying rational accounts of decision making. Although a rational account of decision making would suggest that the style of presenting information makes no difference as long as the content of the information remains consistent, Kahneman and Tversky demonstrated that decisions under conditions that emphasized potential subjective gains were routinely different from decisions under conditions that emphasized potential subjective losses. This insight, together with several other elements from Kahneman and Tversky's prospect theory, spurred the development of a new area of economics research known as behavioral finance.

FREEDOM OF INFORMATION

Freedom of information (FOI) is a presumptive right of access to official information, qualified by exemptions and subject to independent adjudication by a third party. The adjudicator may be a court, tribunal, commissioner, or ombudsman and may have the power to require actions be taken, or to recommend that the parties should act in a certain way.

Thus defined, FOI is a sufficiently capacious term to allow for much international variation. The definition excludes permissive and administrative access codes and should also exclude statutes—such as the one adopted in Zimbabwe—that purport to be about improved access but are really about suppression of the press. But the definition still accommodates wide variations in the scope of coverage, in the breadth of exemptions, in its temporal range, and in the enforceability of rights.

This diversity becomes even more striking if we consider the evolution of FOI laws. There is room for argument about the precise pattern of spread of modern FOI statutes, but there are three broad phases. First, their adoption begins with the United States in 1966 or, more substantively, with the strengthening of the Freedom of Information Act following the Watergate scandal. Initially, the American lead was not followed—at least not outside Scandinavia and northern Europe. The second wave of FOI did not begin until in the early 1980s. Canada, Australia, and New Zealand all adopted FOI statutes in 1982, and during the next decade, the spread of legislation gathered pace in Europe and the Commonwealth. Throughout the decade, countries were beginning to borrow from one another's experience. But FOI did not become an international norm until the 1990s. Championed by the Organisation for Economic Cooperation and Development, the World Bank, the Council of Europe, and other supranational bodies, FOI is perceived as an essential component of good governance.

The motives for adopting FOI statutes vary widely between jurisdictions and across time. Historians of FOI in the 1960s and 1970s correctly point to the intellectual origins of the new laws in the citizens' rights movement, in consumerism, in distrust of an overmighty bureaucracy, and in the struggle for press freedom. But, by the 1990s, many countries were adopting FOI for quite different reasons: to win credit with donors and, in particular, to fight corruption. This is indicative of a broader pattern. Individual FOI statutes are commonly the product of local political struggles, and their design is influenced by the objectives of the campaigners and legislators engaged in those struggles. They do not follow one, universal template; rather, they are tools shaped for particular purposes and crafted in accordance with local compromises.

Many of the earlier FOI regimes were passed into law before data protection laws were on the statute books (for example, in the United States and New Zealand). Others began as integrated regimes. A third, later, category has been enacted in countries well used to data protection. These sequential differences are not trivial. For some jurisdictions, it has meant that privacy—first in the field—has emerged as the dominant value, more likely to trump access rights when the two are in tension. In other cases, it means, more simply, that the later FOI statute has been grafted onto a legislative framework originally designed for data protection.

And so we have FOI statutes that were conceived for different purposes, that were variously designed to meet local need (or to respond to international pressure or enticement), that make different judgments on the balance between access and release, that reflect local legislative traditions, and that respond to a changing information policy context.

Any attempt to compare and contrast FOI regimes must be rigorous if it is to be meaningful. Rather than asking which statutes have the most elegant or most liberal provisions, we should ask what the laws deliver in practice. Do citizens know more as a result of their implementation? And that is simply a question of whether administrations push more information in the direction of the citizen: effective communication requires more of the communicator than bulk provision of data of questionable intelligibility and quality.

If one is to reach any meaningful conclusions on the efficacy of FOI laws, then the analysis must include,

inter alia, assessments of the speed and quality—both of responses to requests and of the appeals process—including the adherence of authorities to the adjudicator's rulings. But in any rigorous evaluation, we must also take a view on the information infrastructure of the public authorities within the scope of the legislation. Information rights are worthless without good record keeping: The question is whether public authorities are creating and retaining records in a way that enables them to be retrieved later.

But this does not mean that comparative analysis is bound to fail. On the contrary, FOI offers fertile territory for comparative policy making and for comparative policy analysis. But any such comparisons should be informed by an understanding of the political context in which FOI was framed and implemented, the bureaucratic culture within which it is administered, the scope of the legislation (and its relationships with other access provisions), its practical value to applicants (do they get what they request?), and the limitations of FOI statistics. Furthermore, we should acknowledge that we have relatively little empirical research on which we can draw, so any conclusions we may reach now are necessarily provisional. We have much to learn about FOI—within jurisdictions and between jurisdictions.

Having said all of this, what can we say about the first forty years of FOI in the modern era? First, it has been a bumpy ride. FOI has not defined the boundary between access and retention; it has simply provided the context in which arguments may be had about the release of official information. And there may even have been an intensification of a rhetoric of secretiveness: The advent of statutory access rights is accompanied by unflattering stories about public authorities and a stronger focus by the media on governments' denial of access requests. In short, campaigners complain when they lose, journalists write about government refusals and government has to suffer the consequences. By contrast, stories about governments' virtue in releasing information rarely command headlines.

Governments have taken action that has inhibited FOI demand—for example, the fee increases introduced in the Australian Commonwealth system in 1986, or the wide-ranging reform package enacted by the Irish in 2003. Both cut the level of FOI requests

significantly. But it has also been suggested that governments have engaged in more surreptitious resistance to FOI. The charges customarily leveled at officials include manipulation of the record, failure to create records, centralized manipulation of sensitive requests, under-resourcing of FOI administration, and failures of FOI to keep up with the restructuring of the public services.

It is important to disentangle deliberate attempts to undermine FOI from changes in the public sector that may have had an incidental (and deleterious) impact on FOI. Let us take an example from the charge sheet. The disciplines of record keeping are commonly held to be in decline in Western bureaucracies. Any evidence of this decline may be explained by the transition to electronic record keeping—and by the premature removal of posts for staff that kept paper records in order. Bureaucrats may feel the temptation not to document their actions for fear of exposure, but they are also subject to countervailing pressures to leave an audit trail of their actions for fear that they may face charges of maladministration. And the document management systems that most bureaucracies now use have far greater capacity to store information than the paper systems that preceded them. It remains an open question whether that information will remain available over the long term, but in the short term, it is not clear that the FOI user is worse off.

Thus, we may safely conclude that FOI has not been a comfortable regime for government—and that it has not delivered all that its advocates may have sought. Why should this have been so?

The first—and most important—reason is that an FOI statute does not solve anything by itself. Nor is it intended to. It is not like a finance act, which states, definitively, that the standard rate of income tax will be set at a certain level. Rather, an FOI statute provides the context for an argument—or, more accurately, innumerable arguments.

Seen through a different lens, FOI is a species of those American laws of the 1960s and 1970s in which legislators set out broad—and competing—principles, and then left it to the courts to decide on individual outcomes. It exemplifies adversarial legalism. FOI has been expressed in national statute books in many

different ways, but the common feature of such laws is the underlying, and unresolved, tension between competing interests.

To make matters more unsettling for government, the administration of FOI is an inherently unpredictable business. Precedents may serve as a guide, but outcomes can surprise both parties, not least in those (more recent) systems that require adjudicators to examine the public interest—a concept that, inevitably, evolves over time and is case-specific.

FOI statutes are commonly used by a small part of the population, and their purpose is little understood by citizens. If government does not put forward a clear narrative about the value of FOI, it may find itself proclaiming FOI as a public good, but without clear evidence of the benefits that it has delivered to the wider public. Government needs that narrative not just for public consumption, but to maintain its own resolve when FOI proves to be uncomfortable. And that narrative needs to develop over time if it is to win out in an ever-more complex policy environment, where the merits of FOI are increasingly contested. Some now characterize FOI as a product of a simpler age, when security threats were more predictable, the media less oppositional, and government-citizen relations less complex. Advocates of FOI are challenged to refresh the narrative—or to modify their policy prescriptions—to fit the new context.

As if the politics of FOI were not difficult enough, government also faces challenges in administering FOI. This is not a statute that runs itself. It is inherently complex, precedents change over time, it can generate tension between administrators and elected politicians, and it can seem like a distraction from the real business of government. Consequently, a career in FOI administration may seem unattractive: It is difficult work to do well, it offers conflict with external stakeholders, the prospect of delivering unwelcome advice to senior staff, and the sense that one is an unwelcome overhead. For these simple, quotidian reasons, FOI administration has often gone into decline. Starved of resources, central units have been unable to give guidance or to promulgate case notes. Administrative staff unable to cope with the complexity of their casework have been deemed surplus requirements. In their absence,

the more difficult cases are either neglected or passed to lawyers—whose early intervention necessarily legalizes the case and might also inject an element of adversarialism.

It is probably fair to say that it is more difficult to implement FOI successfully now than it was at the time of the Freedom of Information Act of 1966. The delivery of state functions is now in the hands of a much wider range of agencies—many of them outside the boundaries of the formal state. Hence, legislators are faced with a choice between either accepting that FOI will have limited scope and effectiveness or trying to draw in para-state corporations, private companies, and voluntary sector agencies. The latter option is necessarily difficult, although there are examples to demonstrate that it can be done; the extension of access rights to private agencies paying welfare benefits in Australia is a case in point. But the information policy context is now much more complex. FOI statutes have to interact with many more access statutes and regulations (originating from local or state government, from nations themselves, and from supranational organizations). And the statutory regulation of access to information is necessarily more challenging because the advent of the Web has meant that information is stored, managed, and accessed on a scale and in ways that were unimaginable in 1966. This makes the legislator's role technically more demanding, makes the statutes more difficult to implement, and makes it more difficult to explain the particular value of FOI legislation. Once FOI had an iconic value as the tool with which citizens could secure access to information held by government on their behalf. Now our understanding of FOI is more nuanced, and FOI is simply one among many routes that citizens may use to see the official record.

FREE RIDING

Free riding means to benefit from a collective good, without having incurred the costs of participating in its production. This problem was articulated analytically by Mancur Olson in 1965 in *The Logic of Collective Action.* Here, he noted that where collective action is required to secure a common, or public good, rational individuals have the incentive to free ride. His thesis challenged pluralist assumptions in respect of group mobilization, which asserted that groups mobilized to represent sectional interests. His critique demonstrated that although people may feel strongly about an issue, group mobilization to advance a common interest may be difficult. Underpinned by the economic instrumental conception of rationality, Olson argued that individuals have little incentive to participate, given the costs that are incurred, because they will still receive the benefits of the provision of that public good. One of the defining characteristics of a public good is that nobody is excluded; once it is produced, everyone will benefit, whatever their contribution. As such, the pursuit of collective goods will not in and of itself secure members: Rational individuals will free ride. Olson offers the example of trade unions. For example, benefits that result from trade union activity (such as improved working conditions and pay rises) will benefit all employees in an organization. Provision of the good is compromised, indeed threatened, if each individual behaves in this rational manner, but individuals have no incentive to contribute to the costs of providing the collective good. Olson sought to overcome this difficulty by reference to the provision of selective incentives. These are benefits available only to members of the group. Organizations and groups also devise rules in relation to membership to limit the effects of free riding, for example, the closed shop of trade unions.

Others besides organizations and groups face the problem of free riding. The state, for example, also seeks to address this issue by taxing citizens to fund public goods and services. Anthony Downs's 1957 *An Economic Theory of Democracy* implicitly highlights the problem of free riding in relation to democracy. It is rational for an individual voter not to vote, given the costs associated with voting and the infinitesimal chance of influencing the electoral outcome. The concept of free riding has also been used to analyze problems of environmental politics. Garret Hardin wrote in 1968 in "The Tragedy of the Commons" that the exploitation and degradation of the environment is set to continue. It is rational for corporations to free ride given the costs of individual action, which, in an international economy, affect competitiveness and profits. For states, managing environmental concerns places an individual burden on them relative to regulation and expenditure from taxes. Therefore, there is little incentive for individual states or corporations to do anything other than free ride. Yet, collectively, this is the worst possible outcome for the environment. This highlights the fundamental concern at the heart of Olson's identification of this issue—that individually rational behavior (i.e., free riding) is likely to produce collectively irrational outcomes.

FREE TRADE AREA

See ECONOMIC INTEGRATION

FREE TRADE AREA OF THE AMERICAS

Formal negotiations to create the Free Trade Area of the Americas (FTAA) commenced in Santiago, Chile,

in April 1998. Thirty-four countries from the region have since been involved in negotiations to create a single free trade area spanning the hemisphere in which barriers to trade and investment will be progressively eliminated. These countries are Antigua and Barbuda, Argentina, Bahamas, Barbados, Belize, Bolivia, Brazil, Canada, Chile, Colombia, Costa Rica, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, United States, Uruguay, and Venezuela.

The proposal for the FTAA has its roots in the Enterprise for the Americas Initiative, announced by U.S. President George H. W. Bush in 1990. With the successful negotiation of the North American Free Trade Agreement by 1994, the earlier proposal was renewed under the aegis of the President Bill Clinton administration at a summit of the thirty-four participating states in Miami. By 1998, the preparatory work was completed and the formal negotiations began. The FTAA negotiations have been carried out under an agreed structure and timetable. Earlier phases of the FTAA negotiations took place in seven ministerial meetings between 1998 and 2002 and produced three draft proposals. The last proposal contained provisions regarding market access, agricultural subsidies, investment, antidumping measures, competition policy, intellectual property, dispute settlement, government procurement, and services. The final anticipated phase of the negotiations was placed under the co-chairmanship of Brazil and the United States in November 2002, with a view to concluding all negotiations by January 1, 2005, and implementing the agreement no later than December 2005.

However, the January deadline passed with no completion of the agreement. A major stumbling block in the negotiations has been the Latin American countries' disapproval of U.S. continued use of domestic subsidies, particularly in the agricultural sector. Also, the Latin American countries are less willing than is the United States to extend the agreement beyond issues of market access to include rules regarding trade in services and intellectual property.

Since 2002, newly elected Center-Left governments in Brazil and Argentina, among others, have increased resistance to the United States during the negotiations and further contributed to the apparent impasse. It remains to be seen whether the FTAA negotiations will be successfully relaunched, or whether the United States will follow recently signed bilateral agreements with a more concerted strategy of progressively implementing a "hub and spoke" model of trade for the Americas, with itself as the hub.

FUNCTIONALISM

Functionalism is an approach to the formation of international organizations that advocates international cooperation on scientific, humanitarian, social and economic issues. Functionalism argues that discrete public-sector responsibilities, or functions, such as exchanging meteorological data, coordinating international air-traffic control, the prevention of pandemic diseases, and promoting sustainable development, are the issues most likely to encourage mutual trust and habits of cooperation between governments rather than attempts to cooperate on more sensitive issues of sovereignty such as citizenship, monetary union, or national defense. The central thesis of the functional

approach is to create international agencies with limited and specific powers defined by the function that they perform. Functional agencies could only operate within the territory of those member-states that choose to join them and do not therefore threaten state sovereignty. The nearly global membership and operations of the specialized United Nations (UN) agencies such as the International Civil Aviation Organization (ICAO), the World Meteorological Organization (WMO), and the World Health Organization (WHO) are typical examples of the functional approach in operation. Under Articles 56 and 57 of the UN Charter, the various specialized agencies were brought into relationship with the UN, which can make recommendations for the coordination of their policies and activities.

The UN itself has created programs such as the UN Children's Fund (UNICEF), the UN Development Program, and the UN Environmental Program, which are also based on functional principles. The UN Charter makes explicit reference, in Article 55, to promoting conditions of stability and the promotion of higher living standards, economic and social progress, and development. Functionalism therefore underpins the UN system's entire range of activities outside of the collective security role.

The period of 1945 to 1975 represented the most successful period for the application of the functional approach, when a broad consensus about the theories of John Maynard Keynes on the provision of international public-goods in sectors prone to market failure prevailed. The last quarter of the twentieth century proved to be problematic. Political disputes occasionally disturbed the technocratic rationale of the agencies. The rise of nongovernmental organizations (NGOs) also challenged the democratic credentials of the agencies. Latterly, globalization in the form of privatization, deregulation, and marketization has challenged the public-sector monopoly basis on which the original functional scheme relied. At the turn of the twenty-first century, the combined growth of global civil society and the transnational business sector appeared to progressively narrow the range of services historically and uniquely associated with the functional agencies. The core functions of technical cooperation and development remain.

New functional issues such as combating HIV/AIDS and promoting wider access to information technologies have arisen, but will most likely combine the traditional role of the functional agencies with NGO and corporate partnerships. A variant form of functionalism, known as neofunctionalism, has been applied at a regional level to explain the early stages in the formation of those institutions that later evolved to form the European Union (EU). The European Coal and Steel Community, European Economic Community, and European Atomic Energy Community (EURATOM) were initially limited to technical, scientific, and tariff reduction mandates. Considerable disputes among academic and policy communities has since ensued as so-called neofunctionalist ideas attempt to use these original limited, functional successes to advance the larger quasi-federal project of the EU. Key indicators of quasi-federal integration, that is, using functional methods to advance federalist objectives, may be detected in the 2002 adoption of the Eurozone single currency and current attempts to create a common foreign and defense policy. Other regional organizations such as the Association of Southeast Asian Nations (ASEAN) have explicitly limited their cooperation to functional issues by emphasizing the sovereignty of the members and doctrines of non-interference in each other's internal affairs.

Rationale

David Mitrany, a Romanian-born British scholar, is most closely associated with promoting a functional approach. Mitrany was employed in the British Foreign Office during World War II, planning postwar reconstruction, and was inspired in part by the New Deal public works programs of U.S. President Franklin Delano Roosevelt's administration. Mitrany was also influenced by observing the elaborate processes of inter-allied collaboration made in preparation for D-Day and the plans for the postwar administration of Europe. The Tennessee Valley Authority (TVA) was an example of a new institution providing a particular public service that was separated from the territorial basis of state-authority. In the TVA case,

seven state governments renounced their authority over the river-watershed and agreed to create one specific agency to plan and execute an ambitious plan of dam construction, hydraulic engineering, electricity generation, and job-creation in an area subject to regular flood damage. Mitrany advocated the creation of a range of similarly constituted technical and scientific agencies with potentially global reach to implement infrastructure and reconstruction programs, organized on a technical or functional basis rather than on a territorial basis.

Many of the specialized agencies actually predate Mitrany's writing and the formation of the UN. An earlier variety of so-called public international unions, such as the International Telecommunications Union founded in 1865 and the Universal Postal Union created in 1874, sought both to promote and to regulate these new technologies. In 1919, the creation of the International Labour Organization (ILO) institutionalized a role for organized labor within the international human rights standard setting. The contribution of Mitrany's writing and advocacy was to promote the expansion of both the number and tasks of the existing agencies, the creation of new ones and their coordination through the auspices of the UN. The construction of what Mitrany called "a working peace system" lay in a two-fold process. James Sewell coined the term "task expansion" to describe the progressive transfer of programs to these agencies. This process would enlarge the mandate and competence of the agencies relative to those of national governments. Thereafter, the network of interdependent relationships that these agencies would come to manage, a process called spillover, would create a so-called working peace system between the members. This argument matured later in many writers on regime theory during the 1970s and after. These writers often described the process of enlarging the competence of the agencies in terms of international organizations progressively acquiring normative, rule creating, rule enforcing, and finally programmatic responsibilities. For example, the International Atomic Energy Agency founded in 1957 gradually expanded its task from low-key technical assistance to the extraordinary legal powers of inspections developed under the auspices of the Treaty on the Non-Proliferation of Nuclear Weapons. The so-called safeguards system administered by the International Atomic Energy Agency (IAEA) in more than 170 countries is the most fully developed example of a functional scheme of regulation. Mitrany also argued that the agencies could apply sanctions to countries that were judged to be acting contrary to international law. Again, the IAEA is a good example through its role in the UN Special Commission (UNSCOM) program to detect and destroy Iraq's chemical and biological weapons program after 1991.

After 1945, the focus of creating new functional agencies shifted from scientific cooperation toward economic development. In addition to the Bretton Woods organizations founded in 1944, subsidiary agencies such as the International Finance Corporation (IFC) of 1956 and International Development Association (IDA) of 1960 represented task expansion for the World Bank group. Further specialization occurred with the creation of the UN Industrial Development Organization in 1967. These agencies and programs were deliberately created to segregate functional cooperation from political and security disputes conducted in the UN General Assembly and Security Council. However, this attempt to distinguish and segregate a technical-managerial approach to the functional agencies, as if a category of low politics could be kept separate from high politics proved problematic in the later development of the functional agencies. After 1970, when the global south acquired a voting majority in the UN General Assembly, and on the governing boards of the specialized agencies, their mandates were increasingly adapted to developmental priorities. In this way, task expansion and spillover acquired new meanings to promote and to disseminate multilateral aid programs. The agencies also became subject to increasingly political disputes in defining their scope of operations.

Critique

The functional scheme was created for a planned recovery and reconstruction of the post-1945 international order. The Anglo American parentage of the specialized agencies derived partly from the U.S. New Deal model

clearly identified them as agencies of Keynesian intervention. Although Functionalism is widely acknowledged as an influence in founding the post-1945 system of economic, technical and welfare cooperation, the approach has also attracted criticism. Inis Claude queried the basic assumption that it is possible to separate functional and political issues, and so insulate functional cooperation from political disputes between member-states. Claude argued that peace creates the conditions for functional cooperation between states, rather than functional cooperation creating the peace.

Robert McLaren highlighted the budgetary issues that all decisions on public policy involve fund raising, resource allocation, and prioritization. So-called technical decisions therefore always have political implications. James Sewell, Charles Pentland, and Ernst Haas suggested that functionalism relied too much on an almost deterministic belief in the ability of technical solutions to resolve political disputes. Mitrany's writings are certainly embedded in what was to become known as modernization theory. Faith in scientific progress was a core liberal value of the middle twentieth century. Mitrany wrote in an era yet to encounter postmodernism, environmentalism, and other constraints on developmental imperatives and faith in scientific progress.

Finally, the UN system of creating numerous development agencies charged with separate functional responsibilities has been criticized as creating sectoralism. This has created problems of coordination, duplication, and bureaucratic competition, which have been the subject of numerous academic and internal debates on reform and efficiency. In their turn, Robert Jackson, Maurice Bertrand, and later the Agenda 21 adopted by the Rio Earth Summit of 1992 all identified the issue and recommended reforms.

In addition to these methodological criticisms, the functional approach has also been subject to ideological, political criticism. As the period of liberal multilateralism, 1945 to 1975, began to break down, the New Deal lineage left the functional agencies vulnerable to critics of both the Right and Left. For conservatives whose criticisms dominated the 1980s, the agencies were too closely tied to social-democratic models of public-sector welfare-bureaucracy.

The agencies attracted substantial criticism after 1975 from successive U.S. administrations. U.S. Secretary of State Henry Kissinger's correspondence with the ILO in 1975 alleged extraneous political decisions and failures of due process. The United States withdrew from the ILO between 1977 and 1980 and briefly suspended its participation in IAEA from 1982 to 1983. In both cases, U.S. criticism turned crucially on accusations that the agencies were adopting discriminatory practices against Israel's rights to participation. The United States left the UN Educational, Scientific and Cultural Organization (UNESCO) on the last day of 1984, citing a wider range of issues concerning budgetary efficiency, overlapping programs, and limited pace of reforms. The U.S. absence from UNESCO continued for more than fifteen years until a review initiated under President Bill Clinton led to President George W. Bush choosing to rejoin after 2001. The agencies were in turn subject to criticism from the Left during the 1990s, especially the Bretton Woods financial institutions, on the grounds that as agents globalization they were neglecting their mandates in poverty reduction and environmental protection.

Future?

Taken collectively these criticisms limit rather than refute the functional model. The agencies have been in existence for more than half a century. They were created, funded, and mandated by a nearly universal membership of 192 sovereign governments. This suggests that most member-states continue to view the agencies as valuable instruments to further multilateral policy goals.

However, the accelerated pace of globalization after 1990 has eroded many distinctive characteristics of the functional approach. The size and scope of the public sector in many countries has been greatly reduced by privatization, deregulation, and marketization. Therefore, some of the functions associated with public-sector provision and, hence, intergovernmental cooperation have passed into the private sector. Intellectual property rights and advanced research in fields of potential international regulation such as

computing and information technology or genetically modified organisms are located in the private sector. Other social changes since 1975 have further eroded the Keynesian consensus on welfare in the Western democracies, and with it the incentive to sustain international cooperation in these fields. The decline of trade unionism and collective bargaining across the Western world has led to the weakening of the ILO's central task of promoting collective bargaining rights. The declining role of official development assistance in third-world development, and the decline of public-sector–led models of economic planning, has led to a downgrading of the UN Industrial Development Organization (UNIDO), and other developmental agencies. The post-Chernobyl decline in civil nuclear power-plant orders has constrained the promotional and developmental aspects of the IAEA mandate, at a time when that agency's safety role and Nuclear Proliferation Treaty (NPT) safeguard responsibilities have acquired greater significance, in relation to Iraq, North Korea, and Iran.

On the other hand, new functional tasks have emerged since the 1990s, in which continued instances of market failure and prisoner's dilemmas continue to create the need for multilateral agreements, most obviously in environmental regulation. The Global Environmental Facility (GEF), the Montreal Protocol, and the Kyoto Protocol of the Framework Agreement on Climate Change are each serviced and enforced by agencies established on functional principles. The Kyoto Protocol will establish a mechanism for international carbon trading, illustrating the creation of a new functional agenda. Issues such as the international control of pandemic disease have been thrust into new levels of activity—most obviously HIV/AIDS, tuberculosis, and malaria. The Joint United Nations Programme on HIV/AIDS (UNAIDS), formed by the merger of numerous sectoral programs within the UN system, each with some responsibility in the field, represents a new generation of multi-agency programs, combining numerous functional sectors.

FUTURES MARKET

The issue of how best to regulate futures markets has recently come to the fore of public policy debates about financial governance. However, futures markets themselves are not new. They were first instituted in Japan in the eighteenth century for trading rice and silk at a set price, and in the 1850s, they were introduced in the United States for markets in cotton, corn, and wheat. Their rationale remains much the same now as then. A futures market is a continuous auction market in which participants buy and sell commodities contracts for delivery on a specified date. The price of the futures contract is a derivative of the price in the spot market for the related commodity. The only real difference between early

and later futures markets is the nature of the commodity against which the contract is drawn. Although the original futures markets traded in agricultural products, today they trade primarily in financial instruments. Contemporary futures contracts relate overwhelmingly to a predetermined exchange of financial products at a price that may or may not diverge significantly from the price of that product in the spot market. If a trader has accepted a contract to buy a product at a particular time for a particular price, this contract is legally binding. That trader is obliged to execute the exchange, irrespective of whether a loss is incurred by doing so.

The likely existence of price differentials between the spot market and the futures market suggests that there are two reasons for operating on the futures market. The first is a form of insurance against financial risk. Traders may attempt to offset the risk from forward price volatility in any financial product—such as foreign exchange, company shares, or the stock market index—by entering the relevant futures markets as a buyer. In this way, traders lock in the price they will pay for a product at a specified date. This hedges the risk of adverse price changes in the interim, and it makes the process of financial planning more predictable.

However, price differentials between the spot market and the futures market also provide traders with incentives to buy futures contracts as speculative assets. Profits can be made either by holding the futures contract until maturity and being on the right side of the market, or by selling the contract to another party at a higher price before it matures. Only a small proportion of futures contracts are held until maturity by the person purchasing the original contract. This suggests that the overwhelming motive for operating on the futures market is to speculate. Moreover, futures markets tend to be highly liquid, encouraging more and more speculators to use them. Trading volumes in futures markets now comfortably exceed trading volumes in related spot markets, and they dwarf levels of activity within the productive economy.

GAME THEORY

Game theory is applied mathematics analyzing conflicting interests, assessing gains and losses, and explaining strategic behavior. Game theory can be interpreted literally, viewing conflict as a game with moves and countermoves and aiming to theoretically understand and predict conflict's dynamics. The overriding and necessary assumption of game theory at its most idealistic is that human beings act in rational ways. Economics' model of self-interest is also presumed, specifically, that human beings act rationally to maximize self-interest or reward. Conversely, parties to conflict are presumed to act in ways that minimize risk and cost. Pragmatically, game theory reminds us that parties to conflict have choices. These choices will determine, or at least influence, outcomes. At its most basic, game theory acknowledges parties' interdependence.

Much research on negotiation has been conducted from the perspective of game theory. Simple distributive bargaining, where parties must somewhere find a compromise or a way to split the difference between offers and demands, predictably emulates game theory. Sophisticated negotiators with little to negotiate, such as the price of a good, will often seek to maximize gain and minimize loss. The distributive dance of concessions results.

Global Critique

More complex circumstances, however, inevitably challenge attempts at prediction. Here, game theory does not readily translate to actual conflict. Critics of game theory face no shortage of evidence to disprove and challenge basic premises. First, as the challenges of quantifying international development exemplify, much escapes simple linear analysis. Although measuring an increase in societal schools may be straightforward, attempting to do the same with that same society's political system raises tough questions. How do we measure, for instance, good governance and democratization in its numerous variables? Quantifying outcomes with complex conflict presents similar challenge and debate. Costs, risks, and benefits are not routinely apparent. How do we even begin quantifying the value of interethnic understanding, for example, even though few would dispute its value.

Most conflict, as it is practiced, cannot be equated with chess or any model of rationality. If only genius and years of mastery could result in knowledge of all available options, or moves and countermoves, in our most intractable conflicts, elementary game theory would lead to utopia. Yet human beings, particularly those from diverse and dynamic cultures, inevitably defy prediction.

If anything, human beings from around the world prove again and again their capacity to act irrationally—as their own worst enemies. Perhaps globalization will spread economics' faith in maximizing self-interest, but research shows simultaneous rise in destructive distributive dynamics, increasing impasse, and costs rather than the promotion of productive conflict. Research of the prisoner's dilemma paradigm exemplifies. In this dilemma, winning depends on one's decision to cooperate or compete. The best outcomes occur when the players choose to cooperate; the worst if both compete. Less-skilled negotiators are found to have less capacity for understanding complex information and tolerance for ambiguity. Losing players are also found to lack awareness that their own behavior might influence the other side's response, or lead the other to change. Specifically, losers create a self-fulfilling prophecy with their presumption that cooperation is impossible. Apparently, they equate maximizing self-interest with pure competition.

The Promise of Integrative Negotiation and Mixed Motives

Integrative bargaining is one popular response to many people's propensity for destructive competition, against their own self-interest, given conflict. In-depth analysis of underlying interests is promoted as the means for recognizing common ground and generating creative options that benefit all. With this approach, there is less need to predict or even understand what the other side will do. Attempting to work against the other party is naturally discouraged because competition, explicit and covert, routinely hurts integrative outcomes.

More recent research studies mixed motives as well as straight competition. Like the prisoner's dilemma, the results indicate that with mixed motives, cooperation creates the greatest mutual rewards.

Generous tit-for-tat mathematical research indicates optimal strategy. Parties to conflict who offer the opportunity for an aggressive opponent to shift into cooperation can maximize their gains. Generous tit-for-tat concludes that if only one percent of the population adopted the strategy of offering an olive branch

in response to their opponent's aggression, while being prepared to protect themselves if their opponent does not accept the branch, they have the power to shift an aggressive negotiation climate. This shift to cooperation maximizes profit.

Other research and experience support this view. Evaluating the perceived effectiveness of leaders to multicultural conflict resolution process in the Balkans, Cameroon, Nepal, and Ukraine, participants repeatedly appreciated their leaders' commitment to understanding diverse perspectives. Likewise, a seminal study regarding the effectiveness of lawyer negotiators in the United States found the most effective are assertive and empathetic. Empathetic negotiators are more likely to interpret their opponent's behavior accurately. Participants in dialogue regarding Israel's future requested more than anything the need for flexibility, or the ability to change opinions with new understanding.

Flexibility is one of the key distinguishing characteristics between less skilled and skilled players. Poor negotiators know exactly what they want and refuse to change, whereas the best of negotiators do the opposite as they gather information. Actually, the best negotiators will exercise both competition and cooperation. When they attack, they do so strategically—rarely but hard. Perhaps their excellence in negotiation reflects game theory in its purest form. As in chess, winning strategy, competitive and cooperative, is discerned rationally, move-by-move.

Garbage Can Theory

Michael Cohen, James March, and Johan Olsen originally proposed the garbage can theory of organizational choice to extend Herbert Simon's discussion of factors comprising the rational model of organizational decision making. The rational model suggests that decisionmakers define a problem, come up with a variety of alternative solutions, then identify and choose the best alternative. Simon observed that although organizations try to make rational decisions to achieve their goals, their capacity to do so is ultimately limited by two main problems. First, decisionmakers may have unclear or ambiguous preferences—within a group of decisionmakers, individuals may have different ideas about what the goal of the decision should be, or an individual may even be unclear about the precise nature of his or her own preferences. Second, decisionmakers have too little information about their options to make perfectly rational decisions. This leads to an element of randomness or trial and error in their decision outcomes.

Extrapolating from Simon's observations, Cohen, March, and Olsen described an ideal-typical organizational form called the organized anarchy, which is characterized by the constant presence of these two problems as well as the additional complication of the fluid participation of decision-making members. In the organized anarchy, decisions are not rational; rather, each decision opportunity resembles an irrational "garbage can" made up of a random draw from each of four elements (or "streams") of decision making. Instead of being defined through group deliberation, problems arise from both inside and outside of the organization. Solutions, instead of being generated in response to the statement of a problem, exist independently and can be said to go actively in search of problems to which they can be applied. Choice opportunities, rather than emerging after the consideration of various alternatives, occur regularly as a result of structural processes and not on a timetable controlled by decisionmakers. Finally, participants in the decision-making process come and go, depending on the time they have available and their interest in

individual problems or solutions. As a result of these assumptions, choice opportunities often do not result in a problem being solved. Rather, the authors claim, decisions either do not result in a solution being offered for a problem, or solutions are offered where there is no existing problem.

The garbage can model has served several purposes in studies of organizations and public administration. Most directly, Cohen, March, and Olsen identified the university as an organization often exemplifying the conditions of organized anarchy and, in several books, analyzed the implications of garbage can model for university decision making. However, their basic theory has been applied to several other organizational contexts, including military decision making, the development of psychological research programs, and the social construction of intergovernmental organizations. Scholars have also investigated the effects of such variables as strong hierarchies, planning, and organizational learning on the basic model.

The model gained new currency with John Kingdon's influential revision of the garbage can model for the decision arena of public policy making. Kingdon identified similarities between Cohen, March, and Olsen's organized anarchy and the United States policy-making process. However, Kingdon reformulated the streams entering the garbage can, naming instead three major processes of governmental agenda setting—problem recognition, policy formulation, and politics—and then specifying two additional elements: policy entrepreneurs and policy windows. The process of problem recognition can occur in a number of locations, including individual political offices, parties, or governmental agencies. Policies, as in the original garbage can model, do not develop in response to problems but, rather, have mysterious, complicated origins. Specific policies are often brought out of this soup by policy entrepreneurs, who are members of the policy community with an attachment to particular policies. The political stream—the environment in which policy is made—is made up of larger, external political conditions including the national mood, organized interest group pressure, and changes resulting from elections. The coupling of problem, policy, and political streams can

only occur during the opening of a policy window—a particular moment of opportunity when an issue is salient because of a change in administration (a "political window") or because of a pressing problem (a "problem window"). The process of coupling policies to problems is performed by policy entrepreneurs, who attach problems to their preferred policies, pay attention to the opening of policy windows, and find appropriate political forums for discussing their new problem-policy formulations.

In addition to the direct application of its original and revised formulations, the garbage can model continues to interest scholars because of the fundamental challenge the model poses to rational accounts of organizational decision making. In its original formulation, the garbage can model envisions organizational decision making as occurring, essentially, by chance. Problems and solutions may find each other during a moment of decision making, or they may not. The connection between problems and solutions is extremely arbitrary. Kingdon's revised model places greater emphasis on the role of intentional actors (the policy entrepreneurs), which introduces the possibility of individual-level rationality. However, even Kingdon's model does not provide any basis for conceiving a rational process at the organizational level, and thus, outcomes remain highly random. In addition to enlarging on the skepticism toward organizational rationality found in Simon's work, the garbage can model may be seen to build on other, earlier theoretical perspectives that challenged the possibility of rational organizational action such as Graham Allison's bureaucratic politics model and Charles Lindblom's theory of "muddling through." Meanwhile, further work on nonrational decision making following the original statement of the garbage can model has deepened and legitimized this original project. Karl Weick's enactment theory and Nils Brunsson's action rationality, for example, provide detailed prescriptions for organizational action in the nonrational decision-making environment.

GENDER EQUALITY

Gender equality usually refers to a condition of parity between men and women. However, given the widespread tendency to ascribe different roles and status to each in various settings across societies, what should constitute gender equality has provoked fierce debate. Based on the premise that females and males are inherently different in their reproductive, psychophysiological, and consequently social functions, the question remains whether men and women can ever be truly "equal." Answers depend on the degree to which one thinks women's and men's capacities differ, what should be equalized, and by what means.

The Roots of Gender Inequality

The roots of gender inequality are hotly contested (not least within feminist thought itself). Irrespective of any consensus that gender equality should be the overall sociopolitical objective, causal interpretations of why it is such a perennial problem are located along a broad spectrum. These range from essentialist

arguments (including biological reductionism and evolutionary psychology) whereby women's societal experience, with and in relation to men, is a reflection of innate biological or physiological and psychological sex differences, through to more cultural accounts of gender inequality that claim that men and women are largely herded into different or unequally valued roles because of constructed social norms, and legal and institutional obstacles.

Gender in Context

The manifestation of gender inequality is multidimensional, and illustrations of it vary extensively depending on context. In industrialized democracies with highly developed legal systems, there is a contemporary preoccupation with women's employment experience, in particular the perpetual issue of pay and status gaps between men and women in labor-market hierarchies (vertical occupational segregation) and the problems of balancing the demands of paid work and domestic life. In developing countries, the onus has been on educational opportunity, independent financial means for subsistence (particularly relative to motherhood), and health.

Amartya Sen delineates seven forms of gender inequality:

Mortality inequality—a disproportionate female death rate, particularly in North Africa and Asia compared with other less gender-biased societies.

Natality inequality—the consequences of parents' preference for male children facilitated by fetal sex selection technology, particularly in East Asia, China, and South Korea.

Basic facility inequality—the underrepresentation of females in state-coordinated services such as schooling, prevalent in Asia, Africa, and Latin America.

Special opportunity inequality—even where both sexes have access to basic facilities, in many environments substantive opportunities to acquire specialized knowledge and skills such as higher education and professional training are more likely to be open to men. This is a tendency found even in environments framed by extensive gender equality initiatives, such as in the United States.

Professional inequality—gender inequality in employment is a universal phenomenon and relates to the persistent pay inequities between men and women and to the fact that women are more likely to be clustered in low-status occupations with diminished career opportunities, irrespective of the quality of equality legislation. Even after approximately thirty years of progressive gender equality policies across European Union (EU) member states for example, women are still heavily underrepresented in political posts and high-powered positions in public life.

Ownership inequality—this refers to the fact that most privately owned property across the world is held by men, illustrating domestic inequity and the limitations on women's capacity to prosper commercially and even socially.

Household inequality—this form of inequality is often the most difficult to quantify because it may not be blatant. Even in an environment where women and men are equally represented in educational, monetary, and professional terms, the division of labor within households is still likely to be heavily skewed between the sexes. Women predominate as the primary domestic workers and child carers irrespective of other roles they may have outside of the home. This again is a global phenomenon, and many argue it is the most fundamental form of unequal gender relations.

Policy Approaches

Many of Sen's seven forms of gender inequality—for example, mortality inequality or basic facility—could be called issues of human rights and that in attempts to increase the well-being of humans, it is vital that women are not subject to less concern and respect than men—nominally the equal treatment approach. Gender mainstreaming, another general policy, relates to the systematic incorporation of gender issues at both the planning and implementation stage of all organizational policies. In the context of less extreme forms of gender inequality, such as professional inequality, particularly in environments where equality legislation is long-standing and sophisticated, the major debate lies in the degree to which women should be granted special provision and exclusive benefits to equalize background conditions. These provisions take the form of, for example, affirmative

action programs that aim to implement specific measures to boost women's chances of success in employment, and specific protection rights such as paid maternity leave with a right to return to work. The emphasis here shifts from equality of access and of opportunity to creating conditions deemed more likely to result in equality of outcome. However, skeptics of this approach grapple with the extent to which exclusive benefits for women lend themselves to the exacerbation of gender divides without the comparable provision of benefits for men.

Problems of Terminology

The term *gender equality* is, in and of itself, a point of contention. *Gender* and *sex* have recently come to be deployed indiscriminately (or *gender* is increasingly being used to cover both terms). It is, however, worth re-establishing the quintessential difference between the two concepts. Sex as a category of analysis relates to the identification of an individual by biological endowments and functionings (although even this is contested). Gender is concerned with the ascription of social characteristics such as "womanly," "manly," "feminine," and "masculine" that can be seen as culturally variable and not necessarily associated with the sex of an individual. Previously, sex invoked an analysis of men and women based on an a priori set of assumptions about the behavior of each sex. In an attempt to overcome this crude reductionism, the term *gender* was introduced as a way of classifying individuals socially rather than just biologically. This, however, presents some problems for the concept gender equality because its common usage connotes the equality of men and women rather than equality of cultural codes. Moreover, gender also can relate to issues of sexuality, for example, homosexuality, bisexuality, and transsexuality. Accordingly, gender equality is sometimes also used to mean universal equality irrespective of gender, sex, or sexuality.

GENERALIZED EXCHANGE

Generalized exchange is a type of social exchange system in which the rewards that an individual receives from others do not depend on the resources provided by that individual. The exchange can occur between persons, organizations, countries, or other social groups. Participants in generalized exchange systems are not in a position to make individual rewards conditional on giving behavior. An individual may give goods or services to one or more others, but the rewards that the individual receives may or may not come from the same others. Examples of such systems include helping a stranded motorist (who may, in turn, help someone else in the future), donating to a public good such as a community park, or passing news to one or more others through some form of communication. In each of these examples, goods or services are exchanged indirectly between at least three or more participants.

The earliest research on generalized exchange is primarily based in anthropology and sociology. One of the first empirical examples of generalized exchange is Bronislaw Malinowski's 1922 study of the Kula Ring Exchange among the Trobriand Islanders of New Guinea in the southwest Pacific. Malinowski found that handmade necklaces and bracelets were traded in opposite directions among the various islands in the region. Thus, these exchanges had ceremonial and symbolic significance for the community even if there were no direct economic benefits to the

participants. This type of generalized exchange that links individuals indirectly to one another is also called network-generalized or chain-generalized exchange. In addition, this form of generalized exchange is sometimes referred to as a gift economy. However, generalized exchange systems do not have explicit reciprocity between participants (as some gift economies do). The indirect nature of generalized exchange distinguishes it from similar forms of exchange such as reciprocal social exchange.

Another major form of generalized exchange deals with participants who choose to contribute to a public good or not. In this form of generalized exchange, individuals provide resources to the public good, and any value comes from the collective good. Thus, individuals benefit indirectly from one another even though goods or services are given to a central location. This type of generalized exchange is also called group-focused or group-generalized exchange. Because benefits come from a public good, this type of generalized exchange is often synonymous with the problem of collective action.

In all forms of generalized exchange, individuals can potentially receive benefits without ever contributing anything (see the Free Riding entry). Thus, generalized exchange systems contain inherent social dilemmas. In network or chain-generalized exchange, free riding occurs when individuals receive goods or services, but fail to give anything to others. In group-generalized exchange, free riding occurs when individuals receive benefits from the public good without contributing to it. Much of the theory and research in generalized exchange systems deals with overcoming these social dilemmas for the benefit of the community.

With particular attention to issues of policy and governance, research in generalized political exchange (GPE) extends some of the principal ideas of generalized exchange to explain outcomes in the political economy. In this view, exchange becomes generalized when expectations about the effects of behavior persist over time and with different exchange partners. This perspective maps the socio-anthropological concept of generalized exchange onto the larger industrial, organizational, and national levels in an effort to understand policy development and societal self-regulation and governance.

GLOBAL CITY

The term *global city* refers to an urban center that is considered to occupy a nodal position within a globalizing world economic system. The term has its origins in research carried out into "world cities" during the 1980s. However, with increased attention being paid to processes of globalization during subsequent years, world cities were widely re-termed global cities. Linked with globalization was the idea of spatial reorganization and the hypothesis that cities were becoming key loci within global networks of production, finance, and telecommunications. In some formulations of the global city thesis, then, such cities are seen as the building blocks of globalization. Simultaneously, these cities have become newly privileged sites of local governance within a broader reconfiguration of state institutions in recent years.

Early research on global cities concentrated on key urban centers such as London, New York, and Tokyo. With time, however, research has been completed on emerging global cities outside of this triad, such as Amsterdam, Frankfurt, Houston, Los Angeles, Mexico City, Paris, São Paolo, Sydney, and Zurich. Such cities are said to knit together to form a global

city network serving the requirements of transnational capital across broad swathes of territory.

Within the literature, the rise of global cities has been linked with two globalization-related trends: first, the expansion of the role of transnational corporations (TNCs) in global production patterns and, second, the decline of mass production along Fordist lines and the concomitant rise of flexible production centered within urban areas. These two trends explain the emergence of networks of certain cities serving the financial and service requirements of TNCs while other cities suffer the consequences of deindustrialization and fail to become "global." Global cities are those that therefore become effective command-and-coordination posts for TNCs within a globalizing world economy. Such cities have also assumed a governance role at the local scale and within wider configurations of what some commentators have termed the glocalization of state institutions. This refers to processes in which certain national state functions of organization and administration have been devolved to the local scale. An example of this would be London. Since the 1980s, London has consolidated its position as a global banking and financial center, de-linked from the national economy. Local governance reforms initiated by the Thatcher government have also ceded London a degree of autonomy relative to national state institutions.

The global city thesis poses a challenge to state-centric perspectives on contemporary international political economy because it implies the disembedding of cities from their national territorial base, so that they occupy an extraterritorial space. Global cities, it is suggested, have more interconnectedness with other cities and across a transnational field of action than with the national economy. Global cities are also said to share many of the same characteristics because of their connectedness and shared experiences of globalization. They all exhibit clear signs of deindustrialization. They possess the concentration of financial and service industries within their spatial boundaries, as well as the concentration of large pools of labor. On the downside, many also share experiences of class and ethnic conflict. They often have segmented labor markets in which employees of key industries enjoy well-paid and consumerist lifestyles

while a lower stratum of workers staffs less well-paid, more precarious, and less attractive positions within the urban economy. It has been further argued that the promotion of global cities runs the risk of economically marginalizing non-urban populations within the national economy.

Although global cities are interconnected, embedded as they are in global production and financial networks, they are also locked into competition with one another to command increasing resources and to attract capital. To successfully compete, local governments have been keen to promote their city as global. Such cities have been marketed as "entrepreneurial" centers, sites of innovation in the knowledge economy, and as being rich with cultural capital. A common strategy has been to stress the multi-ethnic qualities of a city, for example. This is intended to stress its cosmopolitan and global character and to disassociate the city from its actual territorial, ethnic, or cultural setting. Such cities also regularly compete to host world events of considerable prestige that present further economic opportunities, such as the Olympic Games.

There has been some skepticism regarding the global city thesis in its simplest formulation. On a qualitative level, some scholars have questioned whether global cities are indeed new phenomena and have pointed to the long-standing existence of similar economic centers over time. One can think of Florence during the Renaissance, or Manchester during the Industrial Revolution, for example. Other commentators have questioned whether the ascendance of global cities implies state decline along zero-sum lines. These skeptics have argued that a more complex and interdependent relationship exists between the state and cities under its national jurisdiction. Indeed, national governments can play a proactive role in the promotion of key urban centers as global cities. Correspondingly, it is possible that global cities occupy the forefront position within a hierarchy of cities and local spaces that together constitute the national economy. Such a perspective would appear to transcend a dichotomizing view of global cities and the national state.

GLOBAL CIVIL SOCIETY

Most broadly, civil society is the set of institutions and values that help reconcile the needs of community with individual autonomy. Global civil society is both when these institutions take direct actions in multiple countries by providing services, education, or policy advocacy and when they take indirect actions by funding the development of organizations in other nations or seeking different governmental policies toward other nations.

At its core, the term *civil society* owes a debt to those Greek philosophers who wrote about *polis*—a city-state with a developed sense of community that embodied the organization and fulfillment of the social relations of humans. That made sense in an era where nearly all people spent their entire lives within one small community. Globalization, because of the steadily declining time and cost of communications and transportation since the 1950s, has lead to a rapid growth in global civil society. Relatively few people in developed nations now spend their entire lives in one community, and many of them are not even bound to one nation. Their interests are thus more global.

One part of global civil society is the array of nongovernmental organizations (NGOs) that have grown out of the United Nations concept, and another key part is civil society organizations that were grounded in one nation and have grown to take on a multinational or even global agenda. Since 1960, such cross-border organizations have expanded dramatically in scope and number, partly because of regional governance institutions and trading blocks such as the European Union (EU), the North American Free Trade Agreement (NAFTA), and the Central American Common Market and partly because of the interests of major philanthropists.

Two Views of Global Civil Society

With this brief background, global civil society has two distinct variants: (1) libertarian global civil society is the view of civil society within a regional or international perspective, so that "community" is broadened beyond national borders, yet must still be reconciled with the needs of individuals; whereas (2) communitarian global civil society sees the balance as between various national or subnational actors as the individuals and community as the broader regional or global community. This latter view is most common. Both views are grounded in an ecological perspective in that the ecology of a particular policy issue drives both the definition of community and the sense of the relevant individuals or institutions. In either case, nongovernmental organizations play an active role in helping define and express the wishes of the general public, although it may be said that the public is inherently a limited stratum of society that is concerned about a specific policy issue.

Globalization and Interdependence

Robert L. Kahn argued that the interdependence of individuals and of nations is extensive, and that organizations mediate these relationships. The dynamics at play include

- corporations whose gross revenues exceed the gross national product of all but a few dozen nations;
- the mobility of goods and services fueled by drastically reduced shipping, transportation, and communications costs;
- foundations such as the Ford Foundation, the Pew Charitable Trusts, the W. K. Kellogg Foundation, and

others that use their assets to leverage change throughout the world;

- the creation of regional and international organizations such as the Pacific Salmon Commission, the North Atlantic Treaty Organization, the EU, the World Bank, and many others that bridge the gaps between national interests and the need for collective action; and
- a free flow of information throughout most of the world via the Internet and widely distributed news outlets such as newspaper, radio, and television news.

Although there are numerous supporters for both the globalization and antiglobalization movements, few would argue that individuals and NGOs do not play an active role in today's globalization. Rather than spell the end of the nation-state, a global civil society has clearly emerged wherein governments need private-sector and nonprofit supporters to get things done, and the private sector also needs government and nonprofit supporters to be productive and profitable. Ali Farazmand argued that in the modern international environment capitalism and democracy do not necessarily go hand-in-hand, and so corporate powers are colonizing some parts of the world in much the same way that Great Britain, France, Spain, and others originally colonized much of the world. Frequently, this occurs with the tacit consent and support of an authoritarian government or a government seeking to follow the Western model of privatization.

This, of course, puts a negative twist on global civil society, whereas organizations that support human rights, manage natural resources such as fish and lumber, ensure adequate food supplies, and fight diseases like HIV/AIDS take advantage of the same dynamics in an effort to promote a better world. The core of global civil society is thousands of nongovernmental organizations (NGOs) such as Amnesty International, Friends of the Earth, the Open Society Institute, and Greenpeace, working together with quasi-governmental organizations such as the UN Environment Program, the International Monetary Fund, the World Health Organization, and so on. Finally, a layer of official governmental representatives from various legislative bodies and bureaucratic departments is concerned

with a particular issue. These three types of organizations—NGOs, quasi-governmental institutions, and governments—interact to form the global civil society. In addition, on some issues the private sector is actively involved, and on some issues a number of influential individuals are involved.

These organizations and governments frequently interact in a horizontal fashion, with each bringing relevant expertise, relationships, and resources to the table, yet elements of the vertical relationship are seldom far from the surface. This is true because governments are sovereign and are the primary sources of funds to help solve highly complex problems. This need for official sanction is part of the reason so many policy issues develop in the direction of international agreements such as the Biodiversity Convention, the Kyoto Protocol on global warming, the International Whaling Convention, the Basel Convention on the Control of Transboundary Movements of Hazardous Wastes and Their Disposal, and so on. Some of these agreements create NGOs to help coordinate and implement the agreement, such as the Canada–U.S. Pacific Salmon Treaty that established the Pacific Salmon Commission. The danger, as has been seen repeatedly, is that such conventions and agreements, which represent extremely serious commitments by some governments and NGOs, frequently are symbolic policy for other governments and NGOs.

Finally, NGOs are, more or less, advocacy groups. Criticisms of domestic advocacy and public interest groups are thus also relevant to any analysis of global civil society. For example, it is unclear to what extent these organizations represent their members, some specific target population, or the broader society. This leads to a potential danger to democracy if governments step back and simply assume these organizations are doing good. Methods are needed to hold civil society accountable for positive outcomes and wise use of resources, and this is even truer in a global or international sense because multiple governments need to coordinate accountability systems.

GLOBAL COMPACT

The Global Compact is the idea of United Nations Secretary-General Kofi Annan and was initiated in response to widespread concerns about the impact of corporate practices on human, environmental, and labor standards. It was also intended to divert attention away from organizations like the World Trade Organization (WTO) that had become targets for the antiglobalization movement. The compact brings business, labor, and civil society together in a network of open, and Internet-facilitated, dialogue. At the core of the network are the Global Compact Office, the Advisory Council, the UN Environment Programme (UNEP), the International Labour Organization (ILO), the UN High Commissioner for Human Rights, the UN Development Program (UNDP), and the UN Industrial Development Organization (UNIDO).

The compact was announced at the January 1999 annual meeting of the World Economic Forum (WEF) and launched on July 26, 2000, by a UN high-level meeting, with the aim of promoting "good" corporate practices among the global business community through the voluntary adherence of firms to nine (later ten) principles drawn from three (later four) key international texts: the 1992 *Rio Declaration on Environment and Development;* the 1948 *Universal Declaration of Human Rights;* and the ILO's 1998 *Fundamental Principles on Rights at Work.* The tenth principle and fourth key text (the UN Convention Against Corruption) were added in June 2004.

These principles require that corporations support and respect the protection of international human rights within their sphere of influence, make sure they are not complicit in human rights abuses, uphold freedom of association and the effective recognition of the right to collective bargaining, support the elimination of all forms of forced and compulsory labor, promote the effective abolition of child labor, uphold the elimination of discrimination in respect of employment and occupation, support a precautionary approach to environmental challenges, undertake initiatives to promote greater environmental responsibility, encourage the development and diffusion of environmentally friendly technologies, and work against corruption in all its forms including extortion and bribery.

The compact is not, however, an enforceable commitment to good corporate practice, nor is it a code of conduct with monitoring or verification procedures; rather, it relies on public accountability, transparency, and enlightened self-interest to fulfill its aims. The idea is that participating corporations post information about their activities on the compact Web site (www.unglobalcompact.org). This information is then open to scrutiny by other participants.

By the end of 2004, corporate signatories to the compact numbered more than 1,700 and included BP, Danone, Deloitte Touche, GAP, HSBC, ICI, Nestlé, Nike, and Tata. The number of labor and civil-society participants has not, however, matched the enthusiasm with which the compact has been greeted in corporate quarters. Only a small number of these

organizations have signed up, reflecting some of the skepticism in civil society quarters about the compact's abilities to temper corporate malpractice.

GLOBAL GOVERNANCE

Global governance is a new and much contested area of scholarly enquiry. Situated principally in the discipline of international relations, global governance is broadly understood to be a term of reference for the various and collected ways in which life on this planet is managed. The absence of a world state (or other overarching political body) ensures that global governance is currently concerned with a host of actors—states, international and regional organizations, nongovernmental organizations (NGOs), multinational corporations, and financial markets, to name the most obvious—and the impact of their actions on the global environment, world economy, the international political system, and the social and cultural orders therein. The study of global governance also has a distinctly normative quality—that is, it is concerned with how the globe is governed and how it might be governed.

Interest in global governance emerged out of a dissatisfaction with existing ways of understanding world politics in the face of a series of changes that occurred in the closing years of the twentieth century. This interest was prompted by a need to better understand the changing role of the state, the growing significance of regional and international organizations, increasing global interdependence, the problems and possibilities presented by developments in information and communication technologies, and the increasing significance of nonstate actors—not just NGOs, but also private military companies, multinational corporations, business and legal associations, and credit rating agencies, among others—and their overall contribution to world politics in the post–Cold War era. Scholars explored changes in global governance in relation to developments such as growing global inequalities, accelerating environmental degradation, an upsurge in civil and regional conflicts, and increasing anxiety about the activities of some global "actors" (especially international organizations such as the World Trade Organization [WTO]). Similarly, scholars discussed changes in global governance in relation to concerns about a decline in global democracy (especially its accountability and transparency) and concerns about the inadequacy of existing intergovernmental machineries for dealing with crises such as mass human rights violations, global warming, and infectious disease.

Despite a widespread recognition of the events that sparked an interest in how global affairs are managed, scholarly attempts to wrestle with such a vast field of study have yet to produce a common definition. Moreover, little progress has been made on clearly delimiting the terrain of study. For instance, scholars have been unable to agree on whether global governance refers simply to the way in which interstate interaction is managed or whether it should be expanded to include the actions and activities of a host of nonstate actors. It is unsurprising to find, then, that global governance has been used as a term of reference for the study of, and everything associated with, international organizations; it has been used as shorthand for the growing array of nonstate actors and their increasing influence on the world stage; it has become a leitmotif for the need to find global solutions to problems of planetary significance (particularly those of an environmental nature); and it has come to be synonymous with the governance of globalization and neoliberalism.

Unsurprisingly, the apparently catch-all quality of global governance has ensured that it has been widely criticized. For instance, global governance has been criticized as a catch-all phrase for "virtually everything," a synonym for anything "post–Cold War," and shorthand for what has emerged that we can concisely and coherently explain. Questions have also been raised about the need for yet another addition to the vocabulary of international relations, as well as the value of adding "global" as a prefix to the word governance. Indeed, concerns have been raised that global governance is simply old wine in a new bottle, and a few scholars have commented that international relations traditionally understood is more than capable of exploring the phenomena with which global governance is concerned.

These criticisms aside, there exists a burgeoning literature on global governance that takes as a starting point an understanding that world order (that is, the current arrangement of global political power) is no longer shaped by (and some argue it never was) the actions and interactions of states alone; rather, a burgeoning array of actors, processes, and mechanisms (of which the state is one, albeit the most significant)—some new and some already-existing—have grown in significance and are, to varying degrees, influencing the way in which global life is organized. Within this literature, general agreement is that the term *governance* connotes a system of rule that is more informal, less tangible, and, in some instances, less legitimate than that associated with "government"; there is general acceptance that global governance and global or world government are not the same thing (though it is not inconceivable that one outcome of the former might be the development of the latter); and it is widely held that existing ways of conceptualizing international relations lack the explanatory power necessary to account for a changing global order. Where the literature diverges is in its emphasis on the actors, processes, and mechanisms involved; the manner in which governance is exercised; the role of the state; and how the most pressing problems of the early twenty-first century can be addressed.

Four broad themes have developed in the literature on global governance. Although some overlap exists among each of these themes, they can be thought of as referring to (a) studying international governance—the study of international institutions and regimes; (b) enhancing global governance—the means by which global governance can be made more effective; (c) globalization and the transformation of global governance; and (d) the refashioning of global governance. To get a better sense of the various ways in which global governance has come to be understood it is necessary to explore briefly each of these themes.

International Governance—Institutions and Regimes

The most familiar—to students of international relations at least—theme in the literature on global governance (albeit one only recently adopting the term) draws from long-established research programs into international regimes and institutions. In large measure, this literature is concerned with the various ways in which the interactions between states are governed, as well as with how more powerful states—and the United States as the most significant of them all—are able to influence the shape of the international system. The focus on states and their interaction suggests this theme is better understood as international rather than global governance because much of the work in this vein has been confined to the interstate level alone. Most scholars agree that a key dimension of global governance is the focus on a variety of actors including, but not limited to, states. International governance is nevertheless an important part of the wider puzzle that makes up global governance.

In much the same way that the study of global governance has sought to draw attention to the deficiencies of focusing too exclusively on states as the primary unit of analysis in world politics, research into international regimes and institutions grew out of an attempt to redress oversights in traditional conceptions of international politics that failed to account adequately for the role of international institutions (not just formal bodies but also informal rules, norms, and

decision-making procedures that produced regularized patterns of behavior) in shaping the interactions of states. Scholars working on international institutions and regimes (as particular instances of institutionalized behavior) have sought to explain why, in certain circumstances, states enter into arrangements that constrain their behavior in particular issues areas (such as nuclear proliferation; the global environment; law of the seas; landmines; international trade, finance, and development; human rights; and international labor standards), what the impact of such arrangements is, what holds these patterns of behavior together, and how they change over time. Unlike the term *global governance,* there is a common definition of what constitutes an international regime (as there is an international institution—see later). In 1983, Stephen Krasner produced the most widely accepted definition, suggesting that international regimes are best conceived as principles, norms, rules, and decision-making procedures in areas of international relations around which actor expectations converge. In this way, regimes are understood as intervening variables among causal factors and behavior and outcomes. As such, they have a governance function.

With the exception of some early work, much of the focus of the international regimes literature was on better understanding why states engage (or became entangled in) regimes and the impacts that flowed therefrom. More recently, scholars have begun to move away from a focus on the state to an understanding of regimes that includes a greater plurality of actors. This brings regime analysis much more closely into line with current thinking in global governance. Much of this work on regimes has been done with regard to instances of international environmental regulation. Oran Young's approach to international environmental regimes is indicative of this intellectual turn. Young's work moves beyond a concentration on the regularization of state behavior dominant in the early literature, to an examination of the increasing involvement of nonstate actors in the creation, maintenance, and functioning of regimes. For Young, states remain the central actors in international regimes, but in a host of functional areas—endangered species, hazardous waste, climate change, and ozone depletion

among others—the involvement of nonstate actors has been striking.

A related research program is that concerned with international institutions. Much of the work in this area sought to qualify orthodox assumptions about the nature of interstate relations (and in particular assumptions that genuine cooperation among states is rare and exists only in instances when it serves state need and even then only for a limited period of time) by suggesting that at moments in time state behavior is mitigated by international institutions—defined by Robert Keohane in 1990 as persistent, connected, formal, and informal rule sets that prescribe behavioral roles, restrict activity, and shape expectations. Keohane is the scholar most associated with this body of work. A related body of work has sought to refine thinking on international institutions by exploring the content of one of its manifestations—multilateralism. Here, scholars have been concerned principally with understanding what makes multilateral organizations and institutions qualitatively different from their bilateral and imperial counterparts, why they are preferred as forms of organization by small states, but also how such institutions can cloak, obscure, and reinforce relationships of power.

Enhancing Global Governance

A second theme in the literature is as familiar to students of international relations as the focus on international governance. This deals with enhancing the capacity of global governance to address problems of global concern. Here, global governance is defined more pluralistically encompassing a broader range of actors—NGOs, multinational businesses, international organizations as well as states—though it is nevertheless more often than not centered around improving the capacity of international organizations to deal with global crises. Indeed, much of this work grows out of a belief in, and a commitment to, the principles and values that underpin the United Nations (UN) system; a recognition of the changed circumstances in which the organization finds itself; and an acknowledgement of the problems associated with organizational overstretch, an absence of appropriate political leadership

among key member states and the shortfalls in the UN's operational capacities. A crucial difference between work in this area and that associated with international governance is that it seeks to go beyond a focus on interstate institutions to innovations that recognize as well as draw strength from combinations of actors to bring about more effective solutions to global problems.

The Report of the Commission on Global Governance, *Our Global Neighbourhood,* is perhaps the most familiar work in this vein. The report sought to identify the major challenges confronting humanity at the turn of the millennium and to think about ways in which these challenges could be met. The report argued that a measure of state authority had been eroded by increasing global interdependence. As a result, states had become less able to deal with challenges old and new. At the same time, states had been joined on the world stage by a host of other actors, all of which are able to exercise a measure of authority. Moreover, the commission noted, the arenas in which this burgeoning array of actors operated were no longer clearly delineated. Many fulfilled the roles formerly deemed the preserve of states, and others carved new roles. For the commission, the emergence of these new sources of authority represented an opportunity—to address the most pressing of global crises by harnessing the potential of these new sources of authority and, under the guidance of the UN, confront the most pressing of challenges: conflict, poverty, inequality, population growth, the environment, and democratic accountability.

Although the Commission on Global Governance focused specifically on reinvigorating the UN, others working in this vein have sought to draw on, and develop further, the idea of using networks of actors to solve global crises. One idea is the utilization of a subcontracting model wherein responsibility for the fulfillment of a particular task is devolved to an appropriate actor under the guidance of a particular international organization (normally the UN or one of its specialized agencies). Such a devolution of responsibilities is perceived to have a number of benefits: It overcomes the operational overstretch afflicting many international organizations (and the UN in particular),

it more appropriately addresses operational problems, it makes better use of limited resources, and it lends legitimacy to the actions of a range of nonstate (and often unaccountable) actors by bringing them under the umbrella of an international organization.

The idea of networks of governance has become particularly salient in the work of those scholars dealing with the global environment. Many scholars working in this vein see a central, coordinating role for the UN Environment Programme (UNEP) in a wider network of other actors—transnational corporations, NGOs, scientific communities—that would contribute to the agenda setting, issue framing, monitoring, verification, rule making, norm development, enforcement, capacity building, and financing of a more robust and appropriate form of global environmental governance. Other scholars have also begun to explore the utility of drawing other actors—primarily corporate and civil society institutions—into partnerships with international organizations. The idea of bringing together a range of actors in the pursuit of a specific goal has also found expression in various international public/private partnerships. The UN's Global Compact is perhaps the most well known of this group, though informal gatherings such as the World Economic Forum also have salience.

Transformation, Globalization, and Global Governance

A third theme in the literature connects global governance with processes of globalization and the rearticulation of political authority therein. The scholars working within this field share a perception that power is increasingly located within and exercised by a range of actors, processes, and mechanisms of which the state is just one, and most would subscribe to the notion that something like global governance has existed since at least the onset of industrialization, albeit manifest in different forms through time.

James Rosenau's work is perhaps the most well known of this group. He offers a view of global governance that draws on a more transformative depiction of world politics. His work clearly departs from approaches to global governance that emphasize the

continued centrality of states or the need to enhance global governance by drawing on the expertise of other actors under the guidance of world organizations. Rosenau sees a world wherein the nature of authority is fundamentally changing, where clear distinctions between international and domestic politics are no longer valid, and where the structures of global politics are in flux. He asks that we understand governance in this context and that we appreciate that the sources of governance, the mechanisms through which it is enacted, and the actors involved in its operationalization will be both recognizable and unfamiliar. Importantly, he warns that an inquiry into global governance should not focus exclusively on actors and structures that are global in reach. Instead, it should focus on how governance is organized "in the world," rather than "of the world."

The work of Robert Cox and Craig Murphy exemplify other important contributions in this theme. Cox offers an account of global governance that explores the role of ideology, among other things, in fashioning domestic, transnational, and increasingly global political and civil societies in a manner conducive to the expansion of capitalist production. He also identifies international organizations as key mechanisms in the dissemination of global ideologies and in regulating life in a manner conducive with the further expansion of capitalism. Murphy's examination of the relationship between international organization and industrial change picks up from and develops further some of the ideas developed by Cox. Murphy explores the role international organizations have played in facilitating the spread and development of industrial orders since the mid-nineteenth century. Like Cox, Murphy draws his analytical tools from the social theory of Antonio Gramsci. In doing so, both eschew a crude economic determinism as the driving force behind the rise and development of international organizations for a mutually constituted interplay between ideas, institutions, social forces, and material capabilities.

Refashioning Global Governance

The fourth theme in the literature deals with the kind of global governance that might be—though this is an endeavor quite distinct from the enhancing global governance theme. An important dimension of the work of the scholars herein is to offer a critique of prevailing patterns and systems of global governance and to explore the possibility for, as well as the form and function of, alternative scenarios. This literature differs markedly from themes one and two in that it seeks to build global governance from the ground up—that is, to harness the potential of a growing global civil society as a means for developing democratic, representative, and accountable systems of governance. In this way, it is closely related, and in some cases developed from, those working broadly under theme three. This literature also offers an important corrective to accounts that see the piecemeal inclusion of NGOs on the peripheries of the meetings of world organizations as substantive improvements in global governance.

Among the most well known of works in this theme is Robert O'Brien, Anne Marie Goetz, Jan Aart Scholte and Marc Williams's exploration of the development of relations between the World Bank, IMF, and WTO and global social movements (GSMs). Their sustained analysis reveals that the encounter between multilateral economic institutions (MEI) and GSMs has had only a modest impact on the practices and procedures of the MEIs, largely confined to small institutional modifications rather than to substantive policy innovations. These researchers suggest the continuation of such encounters is unlikely to have a significant impact in the short term, though they posit that in the long term, the possibility exists for continuing incremental change to result in a substantive pluralization of the governance structures of each MEI.

Other work in this vein has sought to determine what kinds of forms of governance ought to be put into place to ensure a more equitable and participatory system. Here, scholars have sought to work out the foundations of a workable system of governance that shows appropriate respect for human rights, is drawn from a widespread consensus among cultures, promotes peace and well being, and takes adequate account of the needs of the global environment as well as of marginalized groups within and across the world.

Conclusion

Despite the lack of a common definition, or indeed empirical terrain, global governance continues to gain purchase and spark interest among students, scholars, and practitioners alike. For many, the absence of an agreed upon terrain actually lends global governance strength. This strength lies in the capacity of global governance to offer an alternative way of looking at world politics that focuses on the role of multiple actors, a diffusion of power, and a terrain of processes, procedures, networks and relationships, all of which have yet to be properly understood. Moreover, global governance has at its core a normative concern for the state of the planet as well as how a more appropriate form of world governance might be constructed. Indeed, much of the current work on global governance is engaged in this vein.

GLOBALIZATION

Globalization is one of the most used terms in contemporary social science. It is also one of the most controversial and one of the most contested. Substantial literatures on globalization can be found within political science and international studies and prominently within the disciplines of sociology, anthropology, geography, economics, cultural studies, legal studies, and business studies. The presence of multiple disciplinary discourses on globalization is one reason why a straightforward and coherent definition is elusive. A second reason worthy of note is the ubiquity of the term within the everyday vernacular of policy, journalistic, and corporate communities. Consequently, the analysis of globalization is rendered problematic because multiple definitions give rise to many globalization hypotheses. In other words, globalization studies lack a "normal science." Meanwhile, that much contemporary policy is made in the name of an undefined prevailing condition called globalization demonstrates the limits of rigorous and sustained academic analysis on the subject.

The idea of globalization came to prominence during the 1990s, and it is probably fair to say that the term came to be used as a shorthand term to describe the quality of world order following the dissolution of

the Cold War after 1989. The term was used sporadically in both social science and corporate discussions before this period, but the recent explosion of academic work at least purporting to be about globalization suggests that the idea captured a set of contemporary perceptions about the changing nature of worldwide social relations.

Economic Globalization

Many definitions locate globalization as a phenomenon within the domain of the economy generally and more specifically within the circuits of production, trade, and finance. Thus, globalization is used to describe the increasingly transnational character of economic transactions. It follows that the significance of barriers and distinctions between discrete national economic spaces is diminished significantly. Moreover, the idea of globalization implies that physical distance is of declining importance to the possibility of human (economic) interaction. This last defining facet suggests that globalization is made possible by developments in information and communications technology that, for example, allow instantaneous financial interactions to take place between geographically distant localities. Beyond these broad features, there is significant variation in the precise meaning given to globalization. For some, globalization simply refers to dramatically increased volumes in international trade. For others, globalization is better thought of as global economic integration. Here, cross-border flows of capital, goods, labor, and firms are creating genuinely global markets, which in turn accentuate the permeability of national economic borders. In addition, globalization is sometimes treated as a form of corporate strategy, where firms denationalize the entire chain of production activities and thereby initiate de facto transnational economic spaces. Though these developments are sometimes seen as following the "hidden hand" logic of market capitalism, more often than not, globalization is understood to be prompted and underwritten by one or more of the following three prominent variables:

- The hegemonic role of the United States in the current world system, which acts as both ideological cheerleader and security guarantor for a globalized/globalizing world order.
- The growth of a set of global economic institutions (the International Monetary Fund, the World Bank, and the World Trade Organization) are held to be responsible for creating the formal rules and informal norms within which globalization is made possible.
- The rise to prominence across the world of neoliberal ideas, which emphasize the virtues of unfettered markets, privatization, and the retreat of the interventionist state.

These economistic definitions tend to provoke supplementary observations about the possibilities for economic governance. Sovereign governments, it is suggested, are losing the capacity to exercise effective economic governance over their own national jurisdictions. For example, the colossal volume of unfettered financial flows allows speculative attacks on national currencies. The prospect of these in turn narrows the range of policy choice for governments, which are forced to calibrate domestic economic strategies in accordance with the supposed preferences of global financial market actors. Extensive public expenditure (of the sort usually associated with the construction and maintenance of the European welfare state) is regarded as an increasingly unsustainable growth strategy. Similarly, the selection of national fiscal strategies—particularly in the realm of corporate taxation—is significantly constrained by the capacity of capital (in the form of inwardly investing firms) to relocate with relative ease. States, in both the developed and the developing world, are recast as "competition states" whose *raison d'être* becomes the adjustment of the domestic political economy to imperatives of a new range of powerful nonstate forces that dominate the contemporary global economy. Autarchic, developmental, and (traditional) social democratic growth models, which require a degree of economic closure, become implausible in an environment requiring market discipline and exposure to global forces.

It follows that such accounts of globalization imagine a significant rearrangement of global power relations. In particular, the discussion of (economic) globalization challenges significantly the view of the world of sovereign states that forms the basic imagery of international relations. Instead, a more variegated and multi-actor picture emerges, in which transnational firms, financial market actors, and global institutions acquire authority as power shifts markedly from the public to the private domain—in effect from states to markets.

These processes are usually read as sustained challenges to the agency of states, but two rather important qualifications can be made. First, it is often argued that states themselves are the primary authors of globalization. Indeed to trace the origins of capital mobility is to discover deliberate decisions by sovereign governments, beginning in the 1970s, to liberalize capital controls. Second, the growth of regional organizations and regional integration projects from the mid-1980s are often understood as collective responses of governments seeking to reclaim degrees of autonomy (albeit through the partial pooling of sovereign resources) in the face of powerful globalizing pressures. These qualifications in turn unleash further debates. With regard to the first of these, the move toward the deliberate loosening of capital controls could well have been the only maneuver available to states confronted with powerful financial market forces. Moreover, such decisions were undertaken by the most advanced states within the developed world, an observation that both illustrates power asymmetries in the international system and suggests that globalization might be best read as a project emanating from the most advanced capitalist states. The second qualification—regionalism as a deliberate response to globalization—raises multiple questions about the capacity for the agency of states. For example, regional projects—usually in the form of free trade agreements—can be understood less as efforts to contain the forces of globalization and more as methods for propagating their advancement through the deliberate creation of integrated liberal regional economic spaces. In any case, the rise of formal regional agreements might simply reflect states playing games of "catch up" given the *de facto* growth of regional transnational spaces. States become important to the creation of rule-bound orders compatible with the needs of globalizing capital, but they are far from being in control of that process.

Criticisms of the (Economic) Globalization Hypothesis

The foregoing represents the essence of what might be called the globalization hypothesis—a set of ideas found within both academic and policy discourse. Many criticisms have been leveled at this type of argument.

The bulk of these criticisms—at least within the literatures of political science and political economy—tend to operate within a broadly economistic understanding of globalization. Perhaps the most potent is the empirical argument that globalization is largely a myth and that the evidence in favor of the globalization hypothesis simply does not stack up. A large body of research results casts doubt on core claims about the prominence and extensive power of transnational firms and the near perfect mobility of capital. If these basic claims are no longer axiomatic, then it follows that governments have rather more room for maneuver in redistributive and fiscal policy than is commonly supposed. In addition, scholars working within the institutionalist tradition have assembled much evidence to suggest that, even if transnational economic processes are rife, the interception of globalization within domestic polities is often variable and occasionally subversive. Indeed, several studies support the counter-intuitive claim that national welfare institutions remain robust and that moves to dismantle them are misguided or ideologically driven. Evidence of the persistence of national variation supports many of the arguments of the "varieties of capitalism" school of thought and is used to caution against the assumption that globalization necessarily undermines the social contacts that reside

beneath distinctive historic national political economies. Further, the claim that economic activity has become globalized has been challenged consistently by those who prefer to advance the development of regionalization as a more plausible description of the contemporary world economy. Indeed, if globalization is understood in terms of rising volumes of world trade, then a significant proportion of globalization since the 1970s is straightforwardly explained by the growth of intra-European trade induced by the European Union (EU).

Another bout of skepticism follows from the work of numerous economic historians and historical sociologists. There are two broad lines of argument here. The first mobilizes empirical evidence to show that, in terms of key numeric indices, the late nineteenth century was considerably more globalized than the late twentieth and early twenty-first centuries. Aside from casting doubt upon the historical novelty of globalization (and by extension on the claims that we are living through a transformative moment), such analysis also carries significant implications for claims about the diminished autonomy of the state in the present period. Governments, it would seem, have confronted previous bouts of capital mobility, mass migration, and market integration of which they have been aware and that have threatened their capacity to act autonomously. Statecraft and the fashioning of collective institutions were able to secure policy-acceptable levels of state autonomy, and—in many ways—in the twentieth century, states claimed for themselves the capacity to construct national growth models and (after 1945) build a global institutional order that made this domestic autonomy possible. The second line of historical argument agrees with the idea that transnational economic exchange is ever present in human history and has certainly been integral to the evolution of the capitalist mode of production. However, the emphasis here pays more attention to the structure of the argument that proponents of globalization arguments tend to use. Central to these claims is the idea that globalization is tearing apart a state-centered world order that has been *in situ* since the 1648 Treaty of Westphalia. The historical sociological critique casts substantial doubt upon Westphalian order as the primary organizing dynamic

of world order, preferring instead to see transnational economic relations as nurtured by (rather than in contradiction to) the norm of territorial sovereignty. From this viewpoint, globalization may describe some of the dynamics of contemporary capitalism, but to advance globalization as a new form of social theory is seriously mistaken.

Beyond Economism

Some writers on globalization counter these criticisms by arguing that much of the debate is operating with a hopelessly elastic concept and further that the category globalization should be reserved for particular forms of social relations that are only discernible in the present period. Globalization should, therefore, be rendered analytically distinct from the likes of internationalization, Americanization, and liberalization. Instead, discussion of globalization should be confined to supraterritorial interactions where considerations of time and space and the constraints of territorial geography no longer apply. This amounts to a call for interdisciplinary or postdisciplinary work as the way ahead of globalization, implying in turn that much of the present literature runs into trouble because it is inserted unreflectively into ongoing disciplinary discourses.

The mainstream academic discourse on globalization tends, as suggested here, to confine itself to a series of processes that are taking place within the domain of the economy. Many scholars working within the sociological and anthropological tradition find this emphasis to strip their concept of much of its nuance. Instead of an unremitting process of liberalization leading to a world of near perfect factor mobility bound up with a singular logic of capitalism, globalization is thought of as a complex mixture of interacting cultural circuits and flows, the outcome of which is likely to be far from homogenous, coherent, and predictable. Nor does this literature necessarily envisage globalization as a negative or remorseless phenomenon. Increased transnationalization, the immanent possibilities of informational technology, and the supposed irrelevance of territorial space to human interaction include significant possibilities for

the construction of alternative globalizations organized around all sorts of political impulses.

One way in which the present period is sometimes differentiated is that human beings for the first time are aware of globalization. This leads some discussion to the conclusion that rather than trying to capture the objective, empirical essence of globalization, research should instead focus on the growth of ideas about globalization and the emergences of powerful discourses that seek to present globalization as a set of ineluctable realities from which certain policy logics follow. At one level, this adds up to studies that look to the ways in which strategically minded elites deploy the term *globalization* as a rhetorical device designed to legitimate their preferred courses of action. At a deeper level, this becomes a discussion of the performative qualities of globalization. Rather than being an analytical description of the world as it is, the term becomes embedded as a common sense set of assumptions about the world, which in turn lead actors to create a world resembling the norms of globalization.

GLOBAL JUSTICE

Global justice refers to a congeries of progressive causes exported from national politics into the global arena. They included environmentalism, climate change, humanitarian intervention, debt relief, and the impact of global capitalism on local affairs. At its core, the impetus for global justice is egalitarian.

Transnational spillovers feature prominently in global justice issues. Spillovers present built-in incentives to both export costs and free-ride benefits. Further, powerful states may be in a position to offload costs onto weaker states, violating the principal of vertical equity. Power, fairness, constraints, norms, and incentives are thus key aspects of global justice.

The concept of justice lies at the heart of the issue. It revolves around to whom justice is owed and by whom, whether it should be measured by process or outcome, and whether justice is exogenous (implying universality) or endogenous and therefore relative. An equal-regard standard that rejects asymmetric valuing of human life is global in its conception, independent of parochial concerns.

Both in practice and theory, the structure of world politics makes the universal-regard standard difficult to apply. It demands fair trials, the rule of law, enforcement of contracts, respect for the environment, action against genocide, and toleration for diversity. These require courts, police, military capability, and ways to choose leaders, all of which are directly connected to national sovereignty, and some of which represent values that are highly contested.

Stark differences in living standards, life expectancies, institutional arrangements, and cultural norms have led to different approaches to the demands for global justice. There are, however, some common threads. There is hesitance to embrace globalization, suspicion of liberal free-market economies, and a tendency to favor direct democracy. Global justice

political activists have tended toward grassroots organizing and strategic alliances with other like-minded groups. But some groups such as *Medecins Sans Frontieres* describe their humanitarian work as apolitical and have expressed concern about being co-opted by politics. Churches have incorporated and adapted traditional social-justice teachings into missionary work. At the institutional level, governments have formed international policy regimes that offer mutual legal assistance and enforce and monitor agreements.

The concept of global justice, and its mechanisms, has only recently begun to take shape. At one end of the spectrum, it resembles a loosely defined social movement, galvanized by the disruptions of globalization, fearful of corporate economic dominance. At the other, it represents cross-border legal arrangements between governments. In the middle are efforts by charities offering services to marginalized groups.

Global Market

A market is an institution that allows participants to exchange goods and services, in the process setting standard prices of exchange. Historically, marketplaces were situated in a physical location limiting involvement to participants who could physically be in that location at a given time. The idea of a global market or markets is linked to the concept of economic globalization, a problematic term that suggests a process heading toward, or an outcome already achieved, linking economic actors wherever they are physically located on the globe. This requires that the marketplace is no longer situated at a physical location, but is a virtual medium of exchange utilizing network technologies to link participants. Defining how we understand the terms *global* and *market* and the necessary conditions for the functioning of a global market is crucial to determining whether what is a theoretical ideal type exists in reality.

The market part of global market suggests symmetry in power relations between participants. The image of a market invoked by economic theory is of multiple individuals coming together as buyers and sellers, with no single agent having the power to determine prices. At its most de-territorial, the global part of global market implies that geographical location and distance between actors should be, or is becoming, irrelevant to the process of exchange. Therefore, exchange should be equally likely between agents that are situated on opposite sides of the world as between those situated next to one another (given nonprohibitive transport costs). This definition of the term *global* suggests instantaneous connections forming between buyers and sellers in every part of the globe. To be global, either buyers or sellers, or ideally both, would need to represent every part of the globe.

A nonterritorial global market must overcome certain informational problems that are more easily addressed in a physical marketplace. First, the products or services being traded must be standardized, with specifications available to all participants. Second, trust (which previously may have been based on a personal familiarity built on the common legal, social, and cultural backgrounds of actors) must now be based on a shared confidence that every party will adhere to the contractual rules of the particular virtual market. Third-party service providers are central to this process, providing information on transacting parties (for example, universally recognized credit ratings), and facilitating the transaction itself (for example, through the provision of insurance and

holding or escrow accounts). A global market is arms length for transacting parties' knowledge of one another, but reduces the physical and reputational barriers of entry of a physical marketplace to the ability of participants to create confidence in other parties that they will fulfill market rules and follow particular transactional mechanisms.

Having constructed an ideal type definition of a global market, we can ask whether any real world markets fulfill these criteria. Markets that span national territorial borders certainly exist in raw materials, energy, agricultural produce, manufactured intermediate and final goods, financial capital as either direct bank loans or foreign direct investment (FDI), financial assets such as shares, bonds, and national currencies, complex hedging or speculative instruments labeled derivatives, and other financial services such as insurance. Markets in many other services may be said to exist, but are extremely difficult to trade without a physical presence local to the purchaser. Global firms often provide a local presence; but where markets for such services exist, from a buyer's perspective they may be considered local rather than global. It is problematic to argue that there is a global market for labor, but for certain specialized occupations, such as informational technology or health care, there is state-supported competition between developed countries for skilled labor, and hence, an international market. Whether the international markets listed fit our ideal type definition of a global market is questionable.

It is first necessary to weaken the orthodox economic assumption of multiple individuals engaged in a market. With the exception of financial markets, it is highly unlikely that individuals acting as sellers and buyers are directly engaged in the markets listed. The main reason is that capitalist production tends toward economies of scale, necessitating the formation of large-scale producers, large volume wholesalers and distributors, and large retail groups in the supply chain linking producers with consumers. Examples exist both where the supply chain is fragmented into different global firms, referred to as "horizontal integration," and where companies are vertically integrated, controlling the entire supply chain. A rule of

thumb estimate is that at least one-third of international trade is intrafirm, therefore not arms length or subject to market prices. Where scale or access to products or consumers creates power asymmetries, then the market mechanism does not operate in the economic sense. Even in financial markets where individuals may be involved in buying and selling products, prices can be deliberately moved by the operations of large-scale brokers and traders.

The second part of the definition that requires weakening is the globalness of global markets. The flow of goods and services is not de-territorial but displays geographical patterns of direction and exclusion within the markets mentioned. World Trade Organization statistics demonstrate the significance of regional flows both within and between North America, Western Europe, and South East Asia, with 82.9 percent of merchandise exports and 85.5 percent of imports attributed to this triad in 2003. (Data for commercial services trade are available only to 2000, showing similar patterns of triadization, but for much smaller total values, approximately 25 percent of merchandise). As one measure of the market for investment, FDI also demonstrates the highly selective geographic nature of global markets, with 88 percent sourced from developed market economies, and 67 percent invested there in 2000. The predominant source of FDI from developing countries is the newly industrializing East Asian countries, with this group plus selected Latin American countries the main recipients.

In conclusion, the term *global market* is problematic for real-world exchanges, both for the market mechanism involved and the extent to which markets are global. The term obscures the particular structure of agents, power asymmetries, and flows occurring for the goods, services, and factors of production that must be considered. More accurately, exchange relationships are selective and uneven between specific geographic locations.

Global Warming

Global warming and climate variability occur as natural phenomena. The issue of governance relates to human-induced global warming as it is defined by the United Nations Framework Convention on Climate Change (UNFCCC) as climate change either directly or indirectly attributable to humans changing the global atmosphere's composition separate from expected climate changeability in a comparable period. The term typically evokes the effects on the climate of human activities, particularly the burning of fossil fuels (coal, oil, and gas) and large-scale deforestation, which cause emissions to the atmosphere of large amounts of greenhouse gases (carbon dioxide, methane, nitrous oxide, perfluorocarbons, hydrofluorocarbons, and sulfur hexafluoride). Such gases absorb infrared radiation emitted by the earth's surface and act as blankets over the surface, keeping it warmer than it would otherwise be. Global warming is often considered as the most important environmental problem the world faces and one of the major challenges for global governance and management.

Global Warming and the Science-Policy Interface

The global warming agenda has been pushed by a cooperative interaction between scientific inquiry and policy action. During the 1980s, intergovernmental and nongovernmental scientific organizations (such as the World Meteorological Organization and the International Council for Science) and international research initiatives (such as the World Climate Research Programme and the International Geosphere-Biosphere Programme) played a crucial role in constructing a consistent scientific discourse for communicating the dimensions and consequences of global warming. In 1988, the World Meteorological Organization and the United Nations Environmental Program established the Intergovernmental Panel on Climate Change (IPCC) to assess the state of climate science as a basis for informed policy action. The IPCC marked the entering of global warming in the political arena.

The scientific consensus on the reality of global warming is clearly expressed in the assessment reports of the IPCC. This explicit consensus has been crucial for advancing the global agenda for combating global warming. The IPCC, thus, exemplifies the relevance of organizations accountable to both science and policy in the task of building governance arrangements in which scientific information is effectively used for making decisions. However, global warming also shows the limitations of the mythic notion that governance consists of logical thinking based on complete scientific information. The vast complexity and uncertainties of the regional consequences of anthropogenic climate change, as well as adaptation and mitigation, pose enormous difficulties to global warming governance. For instance, evidence of causal relationships between global warming and hurricane activity is still inconclusive. Nonetheless, the high stakes involved demand action even if just counting on questionable data subjected to alternative interpretations. In this context, the precautionary principle (i.e., minimizing future regret) is often invoked as a guiding principle for policy making. Governance arrangements at the national level will also play important roles for adaptation and coping.

Global Warming and Global Governance

Global warming was fully incorporated in the international policy agenda through the coming into force of the UNFCCC in 1994. The Kyoto Protocol, including legally binding measures, and the European Union Emissions Trading System entered into force in 2005 as important additions to the UNFCCC. The

Kyoto Protocol marked an important shift in the governance arrangements for dealing with global warming. It overcame the usual soft approaches characterized by loose and largely undefined targets and introduced a regulatory framework under which countries get committed to implementing quantified targets (i.e., reducing emissions by around 5.2 percent below 1990 levels from 2008 to 2012).

The long process of negotiating the Kyoto Protocol evidenced the difficulties of establishing governance structures, in which individual countries share responsibilities for dealing with global problems, in a context characterized by inequity between South and North and strong political economy implications among developed countries. Its proponents argue that this type of negotiation might contribute to addressing global environmental problems while alleviating global inequities—for instance, through the clean development mechanisms included in the Kyoto Protocol in which developed countries will pay for reductions achieved in developing countries.

Since 2000, the governments of Australia and United States (the largest emitter of greenhouse gases) have consistently resisted the efforts to bring into force a global binding agreement for combating global warming. Initially, U.S. President George W. Bush's administration denied the existence of global warming regardless of the overwhelming scientific consensus. In its second mandate, the Bush administration opted for acknowledging the existence of anthropogenic climate change, but instead of joining the Kyoto Protocol, the United States is promoting bilateral and multilateral agreements for technology transfer among high emitting countries. In particular, a new pact known as the Asia-Pacific Partnership for Clean Development and Climate has been announced as a more flexible (non-enforcing) and supposedly more cost-effective mechanism than the Kyoto Protocol.

Global Warming and Global Action

The politics of the Kyoto Protocol illustrate the importance of power, equity, and efficiency in the formation of global governance regimes for preventing global warming and protecting humanity from climate change. Global warming prevention and adaptation require actions with a global reach, including close cooperation between North and South, as well as national initiatives.

General consensus is that global warming must be mitigated and adapted to its already inevitable consequences. This consensus is strengthening the formation of a global governance regime for climate change policy. However, economic concerns reduce the effectiveness of this new regime. Any action has inevitable costs as well as benefits, and the right balance between short- and long-term interests is not always evident. So far, only a few countries, such as Denmark, Germany, and the United Kingdom, have been (modestly) successful in translating its aspirations into substantive reductions in emissions, and post-2012 international governance regime is a "hot" issue.

GLOCALIZATION

The neologism glocalization highlights the simultaneity of both universalizing and particularizing tendencies in contemporary social, political, and economic systems. The term is used in the social sciences to

challenge simplistic notions of globalization processes as linear expansions of territorial scales. Glocalization indicates that the growing importance of the continental and global levels is occurring together with the increasing salience of the local and regional levels. Tendencies toward homogeneity and centralization appear alongside tendencies toward heterogeneity and decentralization. But the term *glocalization* entails an even more radical change in perspective. It points to the simultaneity of globalizing and localizing processes, and to the interconnectedness of the global and local levels. Local spaces are shaped and local identities are created by globalized contacts as well as by local circumstances. Globalization entails neither the end of geography nor declining heterogeneity.

Glocalization is a linguistic hybrid of globalization and localization. Not surprisingly, most users of the term assume a two-level system (global and local) and point to phenomena such as hybridization as the result of growing interconnectedness. But a more specific use of the term starts with a three-level system (supranational, national, and subnational) and analyzes primarily the consequences of growing contacts among supranational and subnational actors.

Glocalization in a Two-Level System

Sociologist Roland Robertson, who has popularized the term *glocalization,* believes Japanese economists invented it to explain Japanese global marketing strategies. In the marketing context, glocalization means the creation of products or services for the global market by adapting them to local cultures. For example, in France, McDonald's replaced its familiar Ronald McDonald mascot with Asterix the Gaul, a popular French cartoon character.

Robertson rejects essentialist polarities between the global and the local, such as between economic globalization and local culture. Traditionally, local identities have been invented and nurtured mainly through contacts with others. They have been stimulated and shaped primarily by translocal interaction, comparison, and trends. There are two typical reactions and results of this interplay of global and local forces—both encourage diversity. The opportunistic

reaction is the creation of hybrids. Especially in world cities where immigrants and elites must adjust to each other and maintain ties abroad, mixed cultures and identities arise. The rebellious reaction is to foster a resistance identity defending local history, traditions, and authentic cultures.

The local is fundamentally shaped by the global, but the opposite is also true. Location has never been as important for economic life as now, when free trade regimes have opened national boundaries to trade and investment. Similarly, the expanding information economy has not dispersed production and consumption across geographic space. The new economy is instead characterized by the clustering of companies in specific city-regions and by geographic concentration. The most popular examples are the financial districts in London and New York, or the Silicon Valley computer industry in the 1990s. Thus, globalization increases territorial differentiation in both cultural and economic terms. Local milieus play an important role in a networked economy and society by providing content and contextual support for innovations. Furthermore, there is leeway for local agency—there are many divergent scales and flows linking places and people. Certainly, the economy is at the forefront of glocalizing processes, but beyond the dynamics of capital accumulation, there are further motives. Culture and environment, for example, provide other focal points and perspectives for glocalized networking and innovation.

Glocalization in a Three-Level System

Glocalizing processes can also be understood in a three-level system containing subnational/local, national, and supranational/global levels. The modern political system has been fundamentally shaped by the norm of national sovereignty. National executives occupy a gatekeeper position between the international and the domestic political spheres because they are the only legitimate actors in both spheres. In this context, glocalization points to increasing transnational interactions among subnational entities from different countries and to contacts among subnational and supranational entities—both generally circumventing the national level and undermining the

gatekeeper position of national executives. In political science, these phenomena have been labeled paradiplomacy or studied as multilevel governance.

That subnational political entities such as states, provinces, and cities are getting involved in international activities can be interpreted as a reaction to the socioeconomic processes of glocalization. City regions that serve as nodal points for the information and network economy are becoming disembedded from the national context because their fates depend more on their international contacts than on their national ones. Diverging interests and autonomous activities in the international field are the consequences.

There is another line of argument for explaining the stronger involvement of subnational political entities in international activities. The starting point of this line of reasoning is the assumption that transnational socioeconomic integration has strengthened the roles of national executives. To regulate socioeconomic interactions on a larger scale, national executives have successfully acquired more competencies and have managed to reduce the restrictions and controls they usually face in purely domestic political processes. From this viewpoint, the transnational activities of subnational actors are strategies to either defend autonomy and competences or to compensate for the loss of regulatory leeway using nonregulatory means of governance.

GOOD GOVERNANCE

There are various definitions of the term *good governance*. These definitions are based on normative assumptions about how decisions should be made within organizations and the functioning of formal and informal structures for implementing such decisions. The United Nations' Commission on Human Rights identifies transparency, responsibility, accountability, participation, and responsiveness as key attributes of good governance. By linking good governance specifically to human rights and sustainable human development, the UN explicitly recognizes that governance issues are global in nature and consequently require a more nuanced and integrated approach. The Canadian International Development Agency defines good governance as the exercise of power by an organization (or government) in an effective, equitable, honest, transparent, and accountable way. This definition is consonant with a shift among member countries of the Organisation for Economic Co-operation and Development to respond to increasing pressure ushered in by fiscal crises, a globally coordinated economy, and dissatisfied citizens. Some of the trends that flow from this changing governance context include downsizing the public service, undertaking regulatory reforms, measuring performance, benchmarking progress, and linking more explicitly actions and outcomes. This approach to governance focuses on how organizations are directed, controlled, and shown to be acting responsibly.

Good governance is increasingly seen as essential for ensuring national prosperity by increasing the accountability, reliability, and predictability of decision making in governments, corporations, and nongovernmental organizations. Furthermore, this concept is being used in the development and management literature because "bad" governance is often identified as a root cause of social inequality, development failures, and corporate scandals.

The UN Development Program (1997) articulates eight principles of good governance. First, good governance involves equality of participation in decision making. All people, irrespective of sex, class, or race should be heard and allowed to participate in deliberations that affect them directly or indirectly. In

democratic societies, citizens can participate in various ways, ranging from voting to involvement in acts of civil disobedience. Unfettered participation is key to good governance since it counterbalances dominant actors in society with checks and balances that expand the discursive space in which societal debates can unfold. In many instances, participation must be informed and organized through civil society actors who can often leverage resources more successfully. Good governance implies that organizations encourage participation from those who may both benefit or be harmed by any decisions taken. Additionally, good governance involves sacrificing some decision-making authority by empowering other actors to seek and collectively achieve ends that maximize the public good. Lastly, participation also means that individuals have the rights of freedom of association and expression, and to participate in organized civil society without fear of retribution or the stigma of being labeled unfairly as a "special interest" group.

Second, organizations must be responsive to the needs of all stakeholders in a reasonable timeframe. Good governance is about building trust and ensuring that all stakeholders are treated fairly. To achieve these goals, organizations must have the technical and managerial competence to respond in a timely manner. On one level, this means that organizations must hire, train, and retain employees to achieve optimal response time and high quality outcomes. On a more general level, organizations must ensure that they have the capacity, and in some cases the autonomy, to implement changes to structure and management systems to maximize efficiency.

Third, organizations must mediate differences between stakeholders to reach a broad consensus. This implies that organizations, especially governments, work to achieve sustainable human development and fairness of outcomes. In many instances, consensus is difficult, if not impossible, to achieve. For example, current societal debates on morally charged issues such as abortion, stem-cell research, capital punishment, human cloning, and euthanasia demonstrate how problematic consensus formation can be. Nonetheless, good governance requires that organizations involved in divisive issues like those listed previously enter

such debates in the spirit of cooperation and mediation. To achieve this goal, organizations must treat all stakeholders consistently and fairly.

Fourth, organizations must be accountable to the stakeholders they serve. Good governance requires a broad definition of who such stakeholders may be. Many organizations limit intentionally the list of those they define as valid stakeholders to narrow the scope of decision-making authority, the range of topics addressed, and the nature of the decisions that are made. In general, organizations should be accountable to those affected by the entire range of decisions or actions made and implemented by an organization. Regulatory authority often proscribes this requirement of accountability in narrow ways that inevitably challenge organizations when additional stakeholders demand consideration. For instance, publicly traded corporations are accountable to shareholders. In some cases, this relationship between corporation and shareholder erects obstacles that interfere with the ideals of good governance. The desire of a publicly traded corporation to maximize return on investment in the form of increased share value and dividend payments may postpone or prevent some corporations from investing in other areas (e.g., environmental stewardship, community development) that could satisfy a wider range of stakeholders.

Fifth, organizations must strive for transparency in their decision-making processes so that interested parties can understand the bases of decisions and monitor progress. Information must be freely available and accessible to all stakeholders. Good governance requires that organizations justify decisions made by demonstrating how such decisions respect the precedent from previous decisions. Consistency and fairness in the application of rules and regulations are needed to ensure that stakeholders can appreciate that due diligence and the principle of equality were followed. To achieve this goal, some organizations have developed decision-making matrices that feed into other instruments such as the balanced scorecard approach for measuring and managing key indicators within an organization that correlate with various outcome metrics.

Sixth, organizations must work within legal frameworks that are crafted in fair ways, enforced

impartially, and attuned to human rights issues. The rule of law must prevail and be overseen by an independent judiciary and an incorruptible police force. Good governance means that a country's legal environment should be conducive to development. Investors must feel comfortable that due process will be followed in all countries of interest, and that a wide range of issues including protection of intellectual property, fair application of trade subsidies and sanctions, and a regulated financial marketplace exist. Organizations must also follow the laws of the land and ensure that all decisions made are consistent with such laws. However, good governance requires an additional step. To satisfy the other criteria discussed previously (e.g., accountability to all stakeholders, consensus orientation), organizations should also develop a set of voluntarily imposed regulations and best practices internally and through external bodies such as industry associations. Leadership in a field, policy realm, or industrial sector that goes beyond minimum criteria as specified by law is an indicator of an organization's willingness to adopt and expand on good governance practices.

Seventh, decisionmakers should have a broad and long-term vision on how to better the processes of governance to ensure continued economic and social development. Processes must be in place to ensure the most productive use of resources. Ideally, such decisions should be made within the context of environmentally responsible stewardship and be cognizant of criteria for sustainability.

And eighth, good governance involves guaranteeing the rights of all individuals to maintain and improve their well-being in an equitable and inclusive manner. This last point is perhaps the most important principle of the UN approach to good governance because it requires that all decisions of an organization be made within a framework that is outward looking and future-oriented. Moreover, this principle conveys the message that good governance is about stewardship and care and that it involves the highest ethical positioning possible.

Clearly, good governance is more political than technical in nature and emphasizes the primacy of equality and the value of vision, strategic thinking, and planning. Good governance is a tool for making organizations work more effectively in a world where trust is declining in government, industry, science, and other institutions.

Good governance is about fostering trust and ensuring the accountability of decisionsmakers. Trust implies a willingness to make oneself vulnerable to another by delegating certain functions to individuals or organizations to achieve mutual goals. Trust reduces complexity and uncertainty when it is high and creates anxiety or anomie when it is low. Because trust is usually given to an actor based on incomplete (or even absent) information, an assessment of trustworthiness is likely to be a function of informal and formal accountability mechanisms. In an informal sense, accountability implies that social sanctions can be directed toward actors that fail to meet the expectations of others. Such sanctions vary in their degree of intensity and duration, based on the nature of the relationships between actors; the seriousness of the situation (e.g., consequences, reversibility, alternative courses of actions) and cultural or subcultural differences. By contrast, formal accountability mechanisms include legally sanctioned audits, market mechanisms, regulations, and a range of criminal and civil code provisions. Trust is often difficult to build, yet easy to destroy. By its nature, trust falls along a continuum and is distributed according to the following considerations: (a) Trust is higher when values are shared. This provides a basis for comparing outcomes with expectations. (b) Trust is higher when intentions are known and understood, and when actors are consistent with their roles. (c) Trust is higher when individuals or organizations have the competence to carry out assigned tasks. (d) Trust is higher when such tasks can be verified independently in a transparent environment (e.g., when accountability exists).

Good governance is based on democratic values that stimulate administrative reforms that affect a range of organizations. A series of public-sector management reforms have been instituted on a global basis to improve the capacity of governments to respond to external demands for better and more responsive services, managing budget deficits and surpluses, and addressing competitive pressures

resulting from globalization. Additionally, these responses are often geared toward increasing the effectiveness of bureaucracies through a range of organizational, administrative, and policy reforms. The World Bank has compiled a list of six dimensions of public-sector governance that are used in an aggregate fashion to measure the quality of governance: voice and accountability, political stability and absence of violence, government effectiveness, regulatory quality, rule of law, and control of corruption. As new global standards of governance emerge, indicators like these can be used to diagnose failures and to suggest solutions to a range of performance and process issues. Performance measures assess the quality of governance by examining the severity of corruption within government, the degree to which civil liberties are supported, bureaucratic efficiency, and the predictability of policy making. Process measures describe how institutional inputs result in good governance outcomes and include measures such as how salaries of civil servants compare with equivalent private-sector employees, the nature of electoral rules and the type of political system, and the organization of government (e.g., the number of independent branches of government). Good governance is about recognizing those forces within a society or organization that may work against building capacity to undertake economic and social reforms.

Within the context of corporate and nongovernmental organizations, different models of governance prevail and generally focus on the function of the board of directors. The agency or stewardship model views the board's role as an auditing function where boards ensure that an organization's resources are safeguarded by identifying and minimizing risks and articulating strategic plans and executing them. The principles of good governance are critical for ensuring that boards can conduct their oversight function and so that individual members have the opportunity to practice due diligence in the performance of their duties. The political model assumes that boards function as intermediaries to represent the competing interests of multiple stakeholders. In this role, boards assist organizations by resolving disputes and aligning the organization's business and strategic plans to maximize the benefit of stakeholders. The managerial

model treats boards as the apex of an organization and directs board recruitment on the basis of the expertise and contacts that individual directors can bring to an organization's decision-making processes to maximize value. It has been suggested that a board's main functions are to act as trustees for ownership, set explicit policies for governance that reflect the values of the organization, and to ensure executive performance. These functions require good governance practices to assist boards in being proactive, forward thinking, and externally focused.

Good governance is an ideal that is difficult to achieve. Although good governance requires a systematic approach to ensure that organizations are transparent, honest, and oriented toward equity issues, its practice is uneven across organizations and sectors. To ensure that good governance prevails, elected representatives, corporative executives and boards of directors, professional bodies, and civil society groups need to become more active in learning about the perils associated with "bad" governance and push for stronger laws and policies that protect the public interest.

GOVERNABILITY

Governability is a concept borrowed from the hard sciences by the social sciences to refer to "governableness," which can be defined as the quality of being governable, that is, capable of being controlled or managed. Arising during the economic crisis of the mid-1970s in North America, Western Europe, and Japan, the question of modern industrial societies' governability has gradually given rise to further thought on the working-out of new policy-making devices in a globalized space. In this way, governance and its mechanisms, which are derived from new public management, appear to be a response to the governability crisis that confronts contemporary societies at a world level.

What Solution for What Governability Crisis?

Definition criteria and the meaning of the governability concept have evolved during their usage. First, the structural crisis that confronts industrial societies during the 1970s in Western Europe, North America and Japan was the subject of analysis in terms of a governability crisis. Subsequently, under the effects of globalization from the 1980s onward, such an analysis has both diversified and extended its area of application worldwide.

The relation between social demand and the action capacity of governments, as conceptualized in the input-output relation in David Easton's political system theory, became problematic in the context of economic crisis of the 1970s. The resources of governments did not allow them to respond to ever-increasing social demand. According to Michel Crozier, Samuel P. Huntington, and Joji Watanuki, the authors of the Trilateral Commission's report submitted in 1975, this crisis of governability had its origins in the democratic mechanisms as means of social demand expression in Western Europe, North America, and Japan. Here, the concept of governability was far from being ideologically and politically neutral, given that it could be used for justifying restrictions on democratic mechanisms. Toward the end of the 1970s, Richard Rose and Guy B. Peters took an interest in the relation between the governed and those in power, a relationship on which, according to them, political authority depends. The two essential components of the latter are effectiveness (of those in power through regulating institutions and allocating resources) and consent (of the governed). One of the effects of the economic crisis of the 1970s was to throw this relation off balance, so much so that a threat of political bankruptcy hung over governments. Reflecting no longer only about the governed and what could make them ungovernable, but also about the way political authority is exercised opened the way for a new use of the concept of governability.

Thus, since the 1980s, framing the question of governability in a globalized space had led one to think about new policy-making devices—in short, the problems of governance. According to this approach, the traditional linear model of policy making—that is, a top-down decision-making process—is no longer able to overcome the governability crisis of modern societies. That is why it must be replaced by a network-type taking part of public and private actors in policy-making processes focused on promoting both interaction and deliberation, and this from the creation to the implementation of policies. By linking public authorities, businesses, research centers, and all kinds of communities, a reticular governance model of this type, within the framework of the wider process of globalization, increases recourse to the concept of governability. This is currently diversifying and taking on a worldwide dimension: The question of governability is no longer exclusively considered at the level of states, or only asked about some of them as was the case originally in North America, Western Europe, and Japan. Indeed, the concept is applied to other cases such as India's, Latin America's, South Africa's, Australia's, China's, and so forth. As for the diversification of the use of the governability concept, it has occurred from both a societal and territorial angle. The governability concept is applied to all kinds of groups—that is, social, economic, or scientific, and so on, but the governability question is asked at the national levels and at the supranational levels—as is the case with the European Union—as well as at the local or regional level.

Related Concepts

Governability is a two-sided concept: Emphasis can be laid either on the governed or on those in power. In other words, by using such a concept, it is possible to consider both the aptitude of a group for being governed and the ways of governing this group. Considering the governability concept's duality is essential to understanding its connection with other fundamental concepts such as government, governance, and governmentality.

This dialectic relation between the governed and those in power varies according to economic, social, and political context. This also generates an oscillation between a normative approach and a functional approach to governability.

In the 1970s, when emphasis was laid on the ungovernability of the governed, the approach used for justifying a restriction of expression democratic mechanisms could be described as normative because it referred to the more general problems of "good government." Later, toward the end of the 1970s, laying emphasis on the relation between the governed and those in power became a functional approach because it expressed the governability question in terms of effectiveness (of government policies) and consent (of the governed).

Since the 1980s, the governed have been invited to take part in the policy-making process, according to a good governance approach, which could be described as normative. As for those in power, their failures to act are tackled in a functional approach of efficiency and legitimacy.

Finally, however this dialectic relation between the governed and those in power is considered, it is worth stressing the underlying power stakes behind it. These stakes are a central issue in Michel Foucault's works on governmentality, which raises the governability question again, no longer from the point of view of institutions, but from that of governmental practices, by conducting research on the internalization of group norms that is at the root of the government of conduct.

GOVERNANCE

The term *governance* can be used specifically to describe changes in the nature and role of the state following the public-sector reforms of the 1980s and 1990s. Typically, these reforms are said to have led to a shift from a hierarchic bureaucracy toward a greater use of markets, quasi-markets, and networks, especially in the delivery of public services. The effects of the reforms were intensified by global changes, including an increase in transnational economic activity and the rise of regional institutions such as the European Union (EU). So understood, governance expresses a widespread belief that the state increasingly depends on other organizations to secure its intentions, deliver its policies, and establish a pattern of rule.

By analogy, governance also can be used to describe any pattern of rule that arises either when the state is dependent upon others or when the state plays little or no role. For example, the term *international governance* often refers to the pattern of rule found at the global level where the United Nations (UN) is too weak to resemble the kind of state that can impose its will on its territory. Likewise, the term *corporate governance* refers to patterns of rule within businesses—that is, to the systems, institutions, and norms by which corporations are directed and controlled. So understood, governance expresses a growing awareness of the ways in which diffuse forms of power and authority can secure order even in the absence of state activity.

More generally still, governance can be used to refer to all patterns of rule, including the kind of

hierarchic state that is often thought to have existed before the public-sector reforms of the 1980s and 1990s. This general use of governance enables theorists to explore abstract analyses of the construction of social orders, social coordination, or social practices irrespective of their specific content. They can divorce such abstract analyses from specific questions about, say, the state, the international system, or the corporation. However, if we are to use governance in this general way, perhaps we need to describe the changes in the state since the 1980s using an alternative phrase, such as "the new governance."

Whether we focus on the new governance, weak states, or patterns of rule in general, the concept of governance raises issues about public policy and democracy. The increased role of nonstate actors in the delivery of public services has led to a concern to improve the ability of the state to oversee these other actors. The state has become more interested in various strategies for creating and managing networks and partnerships. It has set up all kinds of arrangements for auditing and regulating other organizations. In the eyes of many observers, there has been an audit explosion. In addition, the increased role of nonelected actors in policy making suggests that we need to think about the extent to which we want to hold them democratically accountable and about the mechanisms by which we might do so. Similarly, accounts of growing transnational and international constraints on states suggest that we need to rethink the nature of social inclusion and social justice. Political institutions from the World Bank to the EU now use terms such as *good governance* to convey their aspirations for a better world.

A Conceptual History of Governance

A general concept of governance as a pattern of rule or as the activity of ruling has a long lineage in the English language. Nonetheless, much of the current interest in governance derives from its specific use in relation to changes in the state since the late twentieth century. These changes date from neoliberal reforms of the public sector in the 1980s.

Neoliberalism

Neoliberals argue that the state is inherently inefficient when compared with markets. Often, they also suggest that the postwar Keynesian welfare state is in crisis; it has become too large to be manageable, it is collapsing under the burden of excessive taxation, and it is generating ever-higher rates of cyclical inflation. Neoliberals believe that the postwar state cannot be sustained any longer, especially in a world that is now characterized by highly mobile capital and by vigorous economic competition between states. Hence, they attempt to roll-back the state. They often suggest, in particular, that the state should concentrate on making policy decisions rather than on delivering services. They want the state to withdraw from direct delivery of services. They want to replace state provision of public services with an entrepreneurial system based on competition and markets. David Osborne and Ted Gaebler distinguish between the activity of making policy decisions, which they describe as steering, and that of delivering public services, which they describe as rowing. They argue that bureaucracy is bankrupt as a tool for rowing. And they propose replacing bureaucracy with an "entrepreneurial government," based on competition, markets, customers, and measurement of outcomes.

Because neoliberals deride government, many of them look for another term to describe the kind of entrepreneurial pattern of rule they favor. Governance offers them such a concept. It enables them to distinguish between "bad" government (or rowing) and necessary governance (or steering). The early association of governance with a minimal state and the spread of markets thus arose from neoliberal politicians and the policy wonks, journalists, economists, and management gurus who advised them.

The advisers to neoliberals often drew on rational choice theory. Rational choice theory extends a type of social explanation found in microeconomics. Typically, rational choice theorists attempt to explain social outcomes by reference to microlevel analyses of individual behavior; and they model individual behavior on the assumption that people choose the course of action that is most in accord with their preferences. Rational choice theorists influence

neoliberal attitudes to governance in large part by way of a critique of the concept of public interest. Their insistence that individuals, including politicians and civil servants, act in their own interest undermines the idea that policymakers act benevolently to promote a public interest. Indeed, their reduction of social facts to the actions of individuals casts doubt on the idea of a public interest beyond the aggregate interests of individuals. More specifically, rational choice theorists provide neoliberals with a critique of bureaucratic government. Often they combine the claim that individuals act according to their preferences with an assumption that these preferences are typically to maximize one's wealth or power. Hence, they argue that bureaucrats act to optimize their power and career prospects by increasing the size of their fiefdoms even when doing so is unnecessary. This argument implies that bureaucracies have an inbuilt tendency to grow even when there is no good reason for them so to do.

Because rational choice theory privileges micro-level analyses, it might appear to have peculiar difficulties explaining the rise of institutions and perhaps their persistent stability. Microeconomic analysis has long faced this issue in the guise of the existence of firms. Once rational choice theorists extend such micro-analysis to government and social life generally, they face the same issue with respect to all kinds of institutions, including political parties, voting coalitions, and the market economy itself. The question is, if individuals act in accord with their preferences, why don't they break agreements when these agreements no longer suit them? The obvious answer is that some authority would punish them if they broke the agreement and they prefer not being punished. But this answer assumes the presence of a higher authority that can enforce the agreement. Some rational choice theorists thus began to explore how they might explain the rise and stability of norms, agreements, or institutions in the absence of any higher authority. They adopted the concept of governance to refer to norms and patterns of rule that arise and persist even in the absence of an enforcing agent.

Social Science

The neoliberal concept of governance as a minimal state conveys a preference for less government. Arguably, it often does little else, being an example of empty political rhetoric. Indeed, when social scientists study neoliberal reforms of the public sector, they often conclude that these reforms have scarcely rolled back the state at all. They draw attention instead to the unintended consequences of the reforms. According to many social scientists, the neoliberal reforms fragmented service delivery and weakened central control without establishing proper markets. In their view, the reforms have led to a proliferation of policy networks in both the formulation of public policy and the delivery of public services.

The 1990s saw a massive outpouring of work that conceived of governance as a proliferation of networks. Much of this literature explores the ways in which neoliberal reforms created new patterns of service delivery based on complex sets of organizations drawn from all of the public, private, and voluntary sectors. It suggests that a range of processes—including the functional differentiation of the state, the rise of regional blocs, globalization, and the neoliberal reforms themselves—has left the state increasingly dependent on other organizations for the delivery and success of its policies. Although social scientists adopt various theories of policy networks, and so different analyses of the new pattern of rule, they generally agree that the state can no longer command others. In their view, the new governance is characterized by networks in which the state and other organizations depend on each other. Even when the state remains the dominant organization, it and the other members of the network are now interdependent in that they have to exchange resources if they are to achieve their goals. Many social scientists argue that this interdependence means that the state now has to steer other organizations instead of issuing commands to them. They also imply that steering involves a much greater use by the state of diplomacy and related techniques of management. Some social scientists also suggest that the proliferating networks often have a considerable degree of autonomy from the state. In

this view, the key problem posed by the new governance is that it reduces the ability of the state not only to command but even to steer effectively.

Social scientists have developed a concept of governance as a complex and fragmented pattern of rule composed of multiplying networks. They have done so partly because of studies of the impact of neoliberal reforms on the public sector. But two other strands of social science also gave rise to this concept of governance. First, a concept of governance as networks arose among social scientists searching for a way to think about the role of transnational linkages within the EU. Second, a concept of governance as networks appeals to some social scientists interested in general issues about social coordination and interorganizational links. These latter social scientists argue that networks are a distinct governing structure through which to co-ordinate activities and allocate resources. They develop typologies of such governing structures—most commonly bureaucracies, markets, and networks—and they identify the characteristics associated with each structure. Their typologies often imply that networks are preferable, at least in some circumstances, to the bureaucratic structures of the post-war state and to the markets favored by neoliberals. As we will see, this positive valuation of networks sometimes led to what we might call a second wave of public-sector reform.

Resistance and Civil Society

Radicals, socialists, and anarchists have long advocated patterns of rule that do not require the capitalist state. Many of them look toward civil society as a site of free and spontaneous associations of citizens. Civil society offers them a nonstatist site at which to reconcile the demands of community and individual freedom—a site they hope might be free of force and compulsion. The spread of the new governance has prompted them to distance their visions from that of the neoliberal rolling back of the state. Hence, we find two main uses of the word governance among radicals. They use it to describe new systems of force and compulsion associated with neoliberalism. And they use it to refer to alternative conceptions of a nonstatist democratic order.

There is disagreement among radicals about whether the new governance has led to a decline in the power of the state. Some argue that the state has just altered the way in which it rules its citizens; it makes more use of bribes and incentives, threats to withdraw benefits, and moral exhortation. Others believe that the state has indeed lost power. Either way, radicals distinguish the new governance sharply from their visions of an expansion of democracy. In their view, if the power of the state has declined, the beneficiaries have been corporations; they associate the hollowing out of the state with the growing power of financial and industrial capital. Radical analyses of the new governance explore how globalization—or perhaps the myth of globalization—finds states and international organizations acting to promote the interests of capital.

Radicals typically associate their alternative visions of democratic governance with civil society, social movements, and active citizenship. Those who relate the new governance to globalization and a decline in state power often appeal to parallel shifts within civil society. They appeal to global civil society as a site of popular, democratic resistance to capital. Global civil society typically refers to nongovernmental groups such as Amnesty International, Greenpeace, and the International Labour Organization as well as less formal networks of activists and citizens. Questions can arise, of course, as to whether these groups adequately represent their members, let alone a broader community. However, radicals often respond by emphasizing the democratic potential of civil society and the public sphere. They argue that public debate constitutes one of the main avenues by which citizens can participate in collective decision making. At times, they also place great importance on the potential of public deliberation to generate a rational consensus. No matter what doubts radicals have about contemporary civil society, their visions of democracy emphasize the desirability of transferring power from the state to citizens who would not just elect a government and then act as passive spectators but rather participate continuously in the processes of governance. The association of democratic governance with participatory and deliberative

processes in civil society thus arises from radicals seeking to resist state and corporate power.

These radical ideas are not just responses to the new governance; they also help to construct aspects of it. They inspire new organizations and new activities by existing social movements. At times, they influence political agreements—perhaps most notably the international regimes and norms covering human rights and the environment. Hence, social scientists interested in social movements sometimes relate them to new national and transnational forms of resistance to state and corporate power. To some extent, these social scientists again emphasize the rise of networks. However, when social scientists study the impact of neoliberal reforms on the public sector, they focus on the cooperative relations between the state and other institutionalized organizations involved in policy making and the delivery of public services. In contrast, when social scientists study social movements, they focus on the informal links among activists concerned to contest the policies and actions of corporations, states, and international organizations.

The New Governance

The current interest in governance derives primarily from reforms of the public sector since the 1980s. The new governance refers to the apparent spread of markets and networks following upon these reforms. It points to the varied ways in which the informal authority of markets and networks constitutes, supplements, and supplants the formal authority of governments. It has led many people to adopt a more diverse view of state authority and its relationship to civil society.

Recent public-sector reform has occurred in two principal waves. The first wave consisted of the new public management (NPM) as advocated by neoliberals; these reforms were attempts to increase the role of markets and of corporate management techniques in the public sector. The second wave of reforms consisted of attempts to develop and manage a joined-up series of networks informed by a revived public-sector ethos. They were in part responses to the perceived consequences of the earlier reforms.

Some advocates of NPM imply it is the single best way for all states at all times. The same can be said of some advocates of partnerships and networks. Studies of both waves of reform can imply, moreover, that change has been ubiquitous. It is thus worth emphasizing at the outset both the variety and the limits of public-sector reform. Reforms have varied from state to state. NPM is associated primarily with neoliberal regimes in the United Kingdom and United States, as well as a few other states, notably Australia and New Zealand. Although many other developed states introduced similar reforms, they did so only selectively, and when they did so, they often altered the content and the implementation of the reforms in accord with their institutions and traditions. Typically, developing and transitional states adopted similar reforms only under more or less overt pressure from corporations, other states, and international organizations. Public-sector reform has also varied across policy sectors within any given state. For example, even in the United Kingdom and the United States, there have been perilously few attempts to introduce performance related pay or outsourcing into the higher levels of the public service, which are responsible for providing policy advice. The varied extent of public-sector reform should itself make us wary of overstating the extent to which governance has been transformed. Of course, there have been extensive and significant reforms. But bureaucratic hierarchies still perform most government functions in most states.

The New Public Management

The first wave of public-sector reform was NPM. It is inspired by ideas associated with neoliberalism and public choice theory. At first, NPM spread in developed, Anglo-Saxon states. Later it spread through much of Europe—though France, Germany, and Spain are often seen as remaining largely untouched by it—and to developing and transitional states. In developed countries, the impetus for NPM came from fiscal crises. Talk of the overloaded state grew as oil crises cut state revenues, and the expansion of welfare services saw state expenditure increase as a proportion of gross national product. The result was a quest

to cut costs. NPM was one proposed solution. In developing and transitional states, the impetus for NPM lay more in external pressures, notably those associated with structural adjustment programs.

NPM has two main strands: marketization and corporate management. The most extreme form of marketization is privatization. Privatization is the transfer of assets from the state to the private sector. Some states sold various nationalized industries by floating them on the stock exchange. Other state-owned enterprises were sold to their employees through, say, management buyouts. Yet others were sold to individual companies or consortiums. Industries subject to dramatic privatizations included telecommunications, railways, electricity, water, and waste-services. Smaller privatizations have involved hotels, parking facilities, and convention centers, all of which are as likely to have been sold by local governments as by central states.

Other forms of marketization remain far more common than privatization. These other measures typically introduce incentive structures into public service provision by means of contracting out, quasi-markets, and consumer choice. Marketization aims to make public services not only more efficient but also more accountable to consumers, who are given greater choice of service provider. Prominent examples of marketization include contracting-out, internal markets, management contracts, and market testing. Contracting out (also known as outsourcing) involves the state contracting with a private organization, and on a competitive basis, to provide a service. The private organization can be for-profit or nonprofit; sometimes it is a company hastily formed by those who previously have provided the service as public-sector employees. Internal markets arise when departments are able to purchase support services from several in-house providers or outside suppliers who in turn operate as independent business units in competition with one another. Management contracts involve the operation of a facility—such as an airport or convention center—being handed over to a private company in accord with specific contractual arrangements. Market testing (also known as managed competition) occurs when the arrangements governing the provision of a service are decided by means of bidding in comparison with private-sector competitors.

Typically, marketization transfers the delivery of services to autonomous or semi-autonomous agencies. Proponents of NPM offer various arguments in favor of such agencies. They argue that service providers are then able to concentrate on the efficient delivery of quality services without having to evaluate alternative policies. They argue that policy makers can be more focused and adventurous if they do not have to worry about the existing service providers. And they argue that when the state has a hands-off relationship with a service provider, it has more opportunities to introduce performance incentives.

Corporate management reform involves introducing just such performance incentives. In general, it means applying to the public-sector ideas and techniques from private-sector management. The main ideas and techniques involved are management by results, performance measures, value for money, and closeness to the customer, all of which are tied to various budgetary reforms. Although these ideas and techniques are all attempts to promote effective management in the public sector, there is no real agreement on what would constitute effective management. To the contrary, the innocent observer discovers a bewildering number of concepts, each with its own acronym. For example, management by objectives (MBO) emphasizes clearly defined objectives for individual managers, whereas management by results (MBR) emphasizes the use of past results as indicators of future ones, and total quality management (TQM) emphasizes awareness of quality in all organizational processes. Performance measures are concrete attempts to assure effective management by auditing inputs and outputs and relating them to financial budgets. Such measures also vary widely because there is disagreement about the goals of performance as well as how to measure results properly. Nonetheless, value for money is promoted mainly through performance measures to influence budgetary decisions.

The success of NPM has been unclear and remains the source of considerable debate. Few people believe it proved the panacea it was supposed to. Studies suggest that it generates at best about a three percent

annual saving on running costs, which is modest, especially when one remembers that running costs are typically a relatively small component of total program costs. Even neoliberals often acknowledge that most savings have come from privatization, not reforms in public-sector organizations. The success of NPM also appears to vary considerably with contextual factors. For example, the reforms are often counterproductive in developing and transitional states because these states lack the stable framework associated with elder public disciplines such as credible policy, predictable resources, and a public service ethic. It is interesting to reflect that, in this respect, NPM appears to require the existence of aspects of just that kind of public service bureaucracy that it is meant to supplant.

Networks, Partnerships, and Inclusion

Although discussions of the new governance often highlight NPM, public-sector reform is a continuous process. Typically, managerial reforms have given way to a second wave of reform focusing on institutional arrangements—networks and partnerships—and administrative values—public service and social inclusion. The second wave of reforms includes a number of overlapping trends, which are often brought together under labels such as "joined-up governance," "one-stop government," "service integration," "whole-of-government," or "Aktivierender Staat" (activating state). Some commentators even describe this second wave as a "governance approach" or "new governance" defined in contrast to NPM.

Several connected reasons can be given for the altered nature of public-sector reform. One is the shifting tide of intellectual and political fortunes. To an extent, the fortunes of public choice theory and neoliberalism have ebbed, while those of reformist social democrats and network theorists have risen. The rise of New Labour within the United Kingdom is perhaps the most obvious example of this tide. A second reason is a growing sensitivity to a new set of external problems. These problems include terrorism, the environment, asylum seekers, ageing populations, and the digital divide. Many of these problems have

led people to turn to the state, rather than markets, and to do so with concerns about equity, rather than efficiency. Yet another reason for the changing content of public-sector reform resides in the unintended consequences of the earlier managerial reforms. Observers emphasize that NPM has led to a fragmentation of the public sector: Because public services are delivered by networks composed of a number of different organizations, there is a new need to coordinate and manage networks. Observers also emphasize that NPM has raised dilemmas of accountability: Even if the autonomous and semi-autonomous organizations now involved in delivering services are more efficient, they are not always easy to hold accountable on matters of equity. These worries about accountability have been exasperated by recent exposures of corruption in the private sector and by studies emphasizing the public's lack of trust in government.

The main thrust of the second wave of reforms is to improve coordination across agencies. This ambition to join-up networks reflects concerns that the earlier reforms have led to the fragmentation of public service delivery. Joined-up governance promotes horizontal and vertical coordination between the organizations involved in an aspect of public policy. Although the boundary between policy making and policy implementation is blurred, joined-up approaches look rather different in each case. Joined-up policy making brings together all the agencies involved in dealing with intractable problems such as juvenile crime or rural poverty. Joined-up policy implementation coordinates the actions of agencies involved in delivering services so as to simplify them for citizens: An example is one-stop shops at which the unemployed can access benefits, training, and job information.

Joined-up governance often draws on the idea that networks can coordinate the actions of a range of actors and organizations. Indeed, its proponents often suggest that networks offer a superior mode of coordination to both hierarchies and markets in many circumstances. For example, networks tie an enabling or facilitative leadership within a network to greater flexibility, creativity, inclusiveness, and commitment. Hence, joined-up governance is as much about fostering networks as it is about managing them. Indeed, the

second wave of reforms characteristically attempts to promote networks or partnerships rather than markets. These partnerships can be ones between public, private, and voluntary bodies, as well as between different levels of government or different state agencies. In many countries, the emphasis has shifted from competitive tendering to the public sector building long-term relationships based on trust with suppliers, users, and other stakeholders. Public-private partnerships are said to have a number of advantages based on their ability to combine the strengths of each sector. For example, they can ease the burden of capital investment on the public sector while reducing risks of development for the private sector.

Partnerships and joined-up governance are often advocated as ways of promoting social inclusion as well as increasing efficiency. Ideally, they increase citizen involvement in the policy process. Citizen groups participate as partners in aspects of policymaking and policy implementation. The second wave of public-sector reforms seeks to activate civil society. Partnerships and joined-up governance are supposed to provide settings in which public-sector bodies can engage stakeholders—citizens, voluntary organizations, and private companies—thereby involving them in democratic processes. It is also hoped that involving stakeholders in the policy process will build public trust in government.

Governance Beyond the State

The literature on the new governance highlights the role of markets, networks, and nonstate actors. It thereby weakens the distinction between states and other domains of social order. All social and political regimes appear to depend on a pattern of rule, or form of governance, no matter how informal it might be. Hence, the term *governance* has come to refer to social and political orders other than the state.

Some patterns of rule appear in civil society. The most discussed of these is corporate governance, which refers to the means of directing and controlling business corporations. Current interest in corporate governance owes something to theoretical questions within a microeconomic framework about how to

account for the stability of firms: Most responses to these questions parallel those that rational choice theorists give to questions about the origins of social norms, laws, and institutions. Yet, the main source of interest in corporate governance is probably public, shareholder, and governmental concerns about corporate scandals, corruption, abuse of monopoly power, and the high salaries paid to top executives. Three broad themes dominate the resulting literature on corporate ethics. They are openness through disclosure of information, integrity through straightforward dealing, and accountability through a clear division of responsibilities.

Although much has been written on corporate governance, it need not detain us longer. Our concern is with political orders. Hence, the main forms of governance beyond the state that interest us are regional governance and international governance.

Regional Governance

The rise of new regional regimes and institutions, such as the EU, plays two roles in discussions of the new governance. Many commentators suggest, first, that the cause of the new governance is that the rise of these regional regimes has eroded the autonomy of nation states. And, second, the new regional regimes are often taken to be examples of a networked polity and so of the new governance rather than an elder government.

The most prominent case of the new regional governance remains the EU. Studies of the EU gave rise to an extensive literature on multilevel governance: The EU is a level of governance above the nation state, which, in turn, often contains various levels of local and federal government. The literature on multilevel governance in the EU posits links in the EU between the Commission, national ministries, and local and regional authorities. It emphasizes the rise of transnational policy networks especially where policy making is depoliticized and routinized, supranational agencies depend on other agencies to deliver services, and there is a need to aggregate interests.

Transnational policy networks are arguably the defining feature of a new pattern of regional (and also

international) governance. We should recognize, though, that these transnational networks do not always lead to the deep linkages associated with the EU. Regional projects can consist of little more than loose preferential trading agreements. We should also recognize that transnational agreements do not always correspond to actual geographic regions. Much North-South regionalism consists, for example, of agreements between one or more developed state and one or more less developed state—agreements that secure access to one another's markets while also diffusing particular regulatory and legal standards.

International Governance

The concept of international governance has much the same relation to the new governance as does that of regional governance. On one hand, some commentators suggest that international processes are eroding the importance of the state; the relevant processes include the internationalization of production and of financial transactions, the rise of new international organizations, and the growth of international law. And, on the other hand, the international sphere is itself portrayed as being a case of governance in the total or near absence of the state or government.

Regional governance is, moreover, a prominent part of the pattern of rule that currently operates at the international level. Of course, global organizations, such as the United Nations (UN) or the World Bank, help to create and sustain the laws, rules, and norms that govern international politics. Nonetheless, even when we allow for these organizations, many of the interactions and agreements between states and other global actors are situated in the context of the transnational policy networks associated with the new regionalism. If the Cold War was a bipolar era based on the predominance of the United States and the Soviet Union, international governance now consists of a multipolar regionalism, albeit perhaps in the context of U.S. hegemony.

The new regional and transnational organizations appear to share certain broad characteristics. They are typically fairly open to countries from outside the region: They are perhaps less a series of protectionist

pacts and more a series of interconnected webs within an increasing global economy. Their policy objectives extend beyond the economy to areas such as security, the environment, human rights, and "good" governance. And last, they often incorporate a variety of nonstate actors as well as states themselves. This new type of regional governance has combined with increased economic flows and elder international organizations to transform the world order—that is, to create a new form of international governance.

Theories of Governance

As we have seen, while recent interest in governance owes much to public-sector reforms of the late twentieth century, these reforms and the interest they inspired cannot be easily separated from theories such as rational choice and the new institutionalism. It is important to recognize that the meaning of governance varies not only according to the level of generality at which it is pitched but also the theoretical contexts in which it is used.

Rational Choice

The neoliberal narrative of governance overlaps somewhat with rational choice theory. Both of them draw on microeconomic analysis with its attempt to unpack social life in terms of individual actions, and its attempt to explain individual actions in terms of rationality, and especially profit or utility maximization. Yet, although neoliberals deployed such analysis to promote marketization and the new public management, rational choice theorists were often more interested in exploring cases where institutions or norms were honored even in the absence of a higher authority to enforce them.

Rational choice theory attempts to explain all social phenomena by reference to the microlevel of rational individual activity. It unpacks social facts, institutions, and patterns of rule entirely by analyses of individuals acting. It models individuals acting on the assumption that they adopt the course of action most in accord with their preferences. Sometimes rational choice theorists require preferences to be

rational: Preferences are assumed to be complete and transitive. Sometimes they also make other assumptions, most notably that actors have complete information about what will occur following their choosing any course of action. At other times, however, rational choice theorists try to relax these unrealistic assumptions by developing concepts of bounded rationality. They then attempt to model human behavior in circumstances where people lack relevant information.

The dominance of the microlevel in rational choice theory raises issues about the origins, persistence, and effects of the social norms, laws, and institutions by which we are governed. One issue is the abstract one of how to explain the rise and stability of a pattern of rule in the absence of any higher authority. Rational choice theorists generally conclude that the absence of any effective higher authority means that such institutions have to be conceived as self-enforcing. Another issue is a more specific interest in the effects of norms, laws, and institutions on individuals' actions. Rational choice theorists argue that institutions structure people's strategic interactions with one another: Stable institutions influence individuals' actions by giving them reasonable expectations about the outcome of the varied courses of action from which they might choose. Another, more specific issue is in models of weakly institutionalized environments in which the absence of a higher authority leads people to break agreements and so create instability. Examples of such weak institutions include the international system and nation-states in which the rule of law is weak. Rational choice theorists explore self-enforcing agreements, the costs associated with them, and the circumstances in which they break down.

The New Institutionalism

An institutional approach dominated the study of the state, government, public administration, and politics up until sometime around the 1940s. Scholars focused on formal rules, procedures, and organizations, including constitutions, electoral systems, and political parties. Although they sometimes emphasized the formal rules that governed such institutions, they also paid attention to the behavior of actors within them. This institutional approach was challenged in the latter half of the twentieth century by a series of attempts to craft universal theories: behavioralists, rational choice theorists, and others attempted to explain social action with relatively little reference to specific institutional settings. The new institutionalism is often seen as a restatement of the elder institutional approach in response to these alternatives. The new institutionalists retain a focus on rules, procedures, and organizations: Institutions are composed of two or more people, they serve some kind of social purpose, and they exist over time in a way that transcends the intentions and actions of specific individuals. But the new institutionalists adopt a broader concept of institution that includes norms, habits, and cultural customs alongside formal rules, procedures, and organizations.

It has become common to distinguish various species of new institutionalism. Rational choice institutionalists examine how institutions shape the behavior of rational actors by creating expectations about the likely consequences of given courses of action. Such institutionalism remains firmly rooted in the type of microanalysis just discussed. Hence, we should focus now on other new institutionalists who eschew deductive models in which outcomes are explained by reference to rational actions. These institutionalists typically explain outcomes by comparing and contrasting institutional patterns. They offer two main accounts of how institutions shape behavior. Historical institutionalists tend to use metaphors such as path dependency and to emphasize the importance of macrolevel studies of institutions over time. Sociological institutionalists tend to argue that cognitive and symbolic schemes give people identities and roles.

Historical institutionalists focus on the way past institutional arrangements shape responses to political pressures. They argue that past outcomes have become embedded in national institutions which prompt social groups to organize along particular lines and thereby lock states into paths of development. Hence, they concentrate on comparative studies of welfare and administrative reform across states in which the variety of such reforms is explicable by path dependency.

Sociological institutionalists focus on values, identities, and the ways in which these shape actors' perceptions of their interests. They argue that informal sets of ideas and values constitute policy paradigms that shape the ways in which organizations think about issues and conceive of political pressures. Hence, they adopt a more constructivist approach to governance that resembles the interpretive theories we will consider later on. They concentrate on studies of the ways in which norms and values shape what are often competing policy agendas of welfare and administrative reform.

Systems Theory

Although sociological institutionalism can resemble interpretive theories, it often exhibits a distinctive debt to organizational theory. At times, its exponents conceive of cognitive and symbolic schemes not as intersubjective understandings, but as properties of organizations. Instead of reducing such schemes to the relevant actors, they conceive of them as a kind of system based on its own logic. In doing so, they echo themes that are developed more fully in systems theory. A system is the pattern of order that arises from the regular interactions of a series of interdependent elements. Systems theorists suggest that such patterns of order arise from the functional relations between, and interactions of, the elements. These relations and interactions involve a transfer of information. This transfer of information leads to the self-production and self-organization of the system even in the absence of any center of control.

The concept of governance as a socio-cybernetic system highlights the limits to governing by the state. It implies that there is no single sovereign authority. Instead, there is a self-organizing system composed of interdependent actors and institutions. Systems theorists often distinguish here between governing, which is goal-directed interventions, and governance, which is the total effect of governing interventions and interactions. In this view, governance is a self-organizing system that emerges from the activities and exchanges of actors and institutions. Again, the new governance has arisen because we live in a centerless society, or at

least a society with multiple centers. Order arises from the interactions of multiple centers or organizations. The role of the state is not to create order but to facilitate sociopolitical interactions, to encourage varied arrangements for coping with problems, and to distribute services among numerous organizations.

Regulation Theory

Just as sociological institutionalism sometimes draws on systems theory, so historical institutionalism sometimes draws on Marxist state theory. The main approach to governance derived from Marxism is, however, regulation theory. Karl Marx argued that capitalism was unstable because it led to capital over-accumulation and to class struggle. Regulation theorists examine the ways in which different varieties of capitalism attempt to manage these instabilities. They study forms of governance in relation to changes in the way these instabilities are masked.

Typically, regulation theorists locate the new governance in relation to a broader socioeconomic shift from Fordism to post-Fordism. Fordism refers to a combination of "intensive accumulation" and "monopolistic regulation"—a combination associated with the mass production pioneered by Henry Ford in the 1920s. Intensive accumulation rested on processes of mass production such as mechanization, the intensification of work, the detailed division of tasks, and the use of semi-skilled labor. Monopolistic regulation involved monopoly pricing, the recognition of trade unions, the indexing of wages to productivity, corporatist tendencies in government, and monetary policies to manage the demand for commodities. According to regulation theorists, intensive accumulation and monopolistic regulation temporarily created a virtuous circle: Mass production created economies of scale, thereby leading to a rise in productivity; increased productivity led to increased wages and so greater consumer demand; the growth in demand meant greater profits due to the full utilization of capacity; and the increased profits were used to improve the technology of mass production, creating further economies of scale, and so starting the whole circle going again.

Regulation theorists ascribe the end of Fordism to various causes. Productivity gains decreased because of the social and technical limits to Fordism. Globalization made the management of national economies increasingly difficult. Increased state expenditure produced inflation and state overload. Competition among capitalists shifted the norms of consumption away from the standardized commodities associated with mass production. All of these causes contributed to the end not only of Fordism but also the bureaucratic, Keynesian, welfare state associated with it. Although regulation theorists can be reluctant to engage in speculations about the future, they generally associate the new post-Fordist era with the globalization of capital, neoliberal politics, contracting-out, public-private partnerships, and the regulatory state.

Interpretive Theories

Interpretive approaches to governance often emphasize contingency. They reject the idea that patterns of rule can be properly understood in terms of a historical or social logic attached to capitalist development, functional differentiation, or even institutional settings. Instead, they emphasize the meaningful character of human actions and practices. In this view, because people act on beliefs, ideas, or meanings—whether conscious or not—we can explain their actions properly only if we grasp the relevant meanings. Some of the elder interpretive approaches suggest that beliefs, ideas, or meanings are more or less uniform across a culture or society. Hence, they inspire studies of the distinctive patterns of governance associated with various cultures. Other interpretive approaches place a greater emphasis on the contests and struggles over meaning that they take to constitute so much political activity. Hence, they inspire studies of the different traditions or discourses of governance that are found within any given society.

Although interpretive theorists analyze governance in terms of meanings, there is little agreement among them about the nature of such meanings. The meanings of interest to them are variously described, for example, as intentions and beliefs, conscious or tacit knowledge, subconscious or unconscious assumptions,

systems of signs and languages, and discourses and ideologies. Interpretive theorists often explore many of these varied types of meanings both synchronically and diachronically. Synchronic studies analyze the relationships between a set of meanings abstracted from the flux of history. They reveal the internal coherence or pattern of a web of meanings: they make sense of a particular belief, concept, or sign by showing how it fits in such a web. Diachronic studies analyze the development of webs of meaning over time. They show how situated agents modify and even transform webs of meaning as they use them in particular settings.

The diverse interpretive studies of the synchronic and diachronic dimensions of meaning all have in common a reluctance to reduce meanings to allegedly objective facts about institutions, systems, or capitalism. In this view, patterns of rule arise because of the contingent triumph of a web of meanings. The new governance arose, for example, alongside neoliberalism, which inspired much of the new public management, and discourses in the social sciences, which inspired the turn to networks and public-private partnerships. Sometimes interpretive studies relate the rise of neoliberalism and network theory to new relations of power, changes in the global economy, or problems confronted by states. Even when they do, however, they usually suggest that these social facts are also constructed in the context of webs of meaning.

Public Policy

Public policy refers generally to the set of actions—plans, laws, and behaviors—adopted by a government. Concern with the new governance draws attention to the extent to which these actions are often performed now by agents of the state rather than directly by the state. There are a vast number of studies of specific policy areas, and even specific policy problems and governmental responses to them. These studies offer detailed accounts of the impact of the new public management and the rise of the new governance within particular policy sectors, such as health care, social welfare, policing, and public security. However, policy analysis often includes a

prescriptive dimension as well as a descriptive one. Students of public policy attempt to devise solutions to policy problems as well as to study governmental responses to them. Of course, their solutions are sometimes specific proposals aimed at a particular policy problem. At other times, however, they concern themselves with the general question of how the state should seek to implement its policies.

The rise of the new governance raises the question: How should the state try to implement its policies given the proliferation of markets and networks within the public sector? Answers to this question typically seek to balance concerns over efficiency with ones over ethics. To some extent, the leading types of answer reflect the leading theories of governance. Rational choice theory tends to promote market solutions; its exponents typically want to reduce the role of the state in implementing policies. Institutionalists tend to concentrate on strategies by which the state can manage and promote particular types of organizations; its exponents typically offer advice about how the state can realize its policy agenda within a largely given institutional setting. Interpretive theory tends to promote dialogic and deliberative approaches to public policy; its exponents typically want to facilitate the flow of meanings, and perhaps thereby the emergence of a consensus.

Planning and Regulating

The stereotype of "old governance" is of a bureaucratic state trying to impose its plan on society. Formal strategic planning did indeed play a prominent role in much state activity in the latter twentieth century. However, there remains widespread recognition that strategic planning is an integral feature of government. Plans help to establish the goals and visions of the state and its agencies, and they facilitate the concentration of resources in areas where they are thought to be most likely to improve an organization's efficiency in relation to its dominant goals. Of course, plans are not set in stone. Rather, they are made on the basis of assumptions that might prove inaccurate, and visions that might change, in ways that require the plan to be modified.

Although planning remains an integral feature of government, there has been much debate over how the state should implement its plans and policies. Earlier we saw how neoliberals wanted the state to concentrate on steering not rowing. Sometimes they argued that a focus on steering would actually enable the state to plan more effectively: When state actors step back from the delivery of policies, they have more time to consider the big picture. Neoliberalism represented less a repudiation of planning than an attempt to contract out or otherwise devolve the delivery of policies to non-state actors. Typically, its advocates suggested that devolving service delivery would do much to foster a more entrepreneurial ethos within public services—they said that the new public management would free managers to manage. Nonetheless, if some neoliberals appear to think that market mechanisms can ensure non-state actors will do as the state (or citizens) wish (or should wish), others recognize that the state still has to structure and to oversee the policy process. The state still has to set the goals for other actors, and it has to audit and regulate these actors in relation to these goals. Even as the state forsook direct intervention, so it expanded arms-length attempts to control, coordinate, and regulate other organizations. The new governance includes expanded regimes of regulation. A growing number of agencies, commissions, and special courts enforce rules to protect competition and social protection.

Managing Networks

Social scientists often conclude that the withdrawal of the state from service delivery has led to a proliferation of networks as well as regulatory institutions. The spread of networks appears further to undermine the ability of the state to control and coordinate the implementation of its policies. Social scientists, notably institutionalists, thus argue that effective public policy now depends on mechanisms for controlling and coordinating networks. There are several different approaches to the management of policy networks. Some approaches attempt to improve the ability of the state to direct the actions of networks by means of law, administrative rules, or regulation. Others focus on the ability of the state to improve the cooperative

interactions between the organizations within networks; typically, they suggest the state can promote cooperation by altering the relevant incentive structures. Yet, other approaches concentrate on negotiating techniques by which the state might promote incremental shifts in the dominant norms and cultures within networks.

The different strategies of network management can be seen as complementing one another. In this view, the state should deploy different policy styles as appropriate in different settings. This perspective returns us to something like the idea that public policy is an incremental process of muddling through. Public-sector managers respond to citizen references and specific problems in concrete settings. Generally, they have to bear in mind multiple objectives, including meeting quality standards, promoting efficiency, remaining democratically accountable, and maintaining public trust and legitimacy. Their responses to problems are typically pragmatic ones that aim to satisfy all of these objectives rather than to maximize performance in relation to any one of them.

Many of the current approaches to network management reject the command and control strategies associated with hierarchic bureaucracies. In this view, because the state now depends on other organizations, it has to rely on negotiation and trust. Some social scientists thus suggest that the new governance requires a new ethic of public service. The state should neither row nor merely steer. It should act as a facilitator or enabler. It should help foster partnerships with and between public, voluntary, and private-sector groups. It will encounter citizens not merely as voters or as consumers of public services but as active participants within such groups and so policy networks. Instead of defining the goals of public policy in advance, it might even allow the public interest to emerge from dialogues within networks.

Dialogue and Deliberation

Sociological institutionalism and interpretive theory highlight the ways in which meanings, beliefs, cognitive symbols, and conceptual schemes impact upon the policy process. Some of their advocates suggest that the state might try to manage public policy by means of negotiation and other techniques designed to produce incremental shifts in the culture of networks. Others are less focused on the state; they advocate dialogue and deliberation as means to give greater control of the policy process to citizens. These latter advocate giving greater control to citizens partly for democratic reasons and partly because doing so can improve policy making and policy implementation. Some of them argue that the direct involvement of citizens has become both more important and more plausible as a result of the rise of the new governance and the emergence of new information technologies.

Advocates of dialogue and deliberation argue that they facilitate social learning. In their view, public problems are not technical issues to be resolved by experts. Rather, they are questions about how a community wants to act or govern itself. Dialogue and deliberation better enable citizens and administrators to resolve these questions as they appear in concrete issues of policy. They enable a community to name and frame an issue and so to set an agenda. They inform those involved about their respective concerns, preferences, and ideas for solutions. They help to establish trust and so cooperative norms within a community. And perhaps most important, they are said to help reveal common ground, even to generate a consensus about the public good. Hence, they appear to pave the way for common action.

Critics point to various problems with dialogic and deliberative policy making. They argue that it is unrealistic given the size of modern states, it ignores the role of expertise in making policy decisions, it inevitably excludes groups or viewpoints, it is slow, and it cannot respond to crises. Critics also suggest that some policy areas—such as national security—are particularly inappropriate for direct citizen involvement. Despite such criticisms, citizen involvement, even if only as voters, is surely a necessary requisite of good, democratic governance.

Democratic Governance

Questions about public policy are partly normative. We want the policy process to reflect our values.

Today these values are generally democratic ones. However, the new governance raises specific problems for our democratic practices. Democracy is usually associated with elected officials making policies, which public servants then implement. The public servants are answerable to the elected politicians who, in turn, are accountable to the voting public. However, the rise of markets and networks has disrupted these lines of accountability. In the new governance, policies are being implemented and even made by private-sector and voluntary-sector actors. There are often few lines of accountability tying these actors back to elected officials, and those few are too long to be effective. Besides, the complex webs of actors involved can make it almost impossible for the principal to hold any one agent responsible for a particular policy. Similar problems arise for democracy at the international level. States have created regulatory institutions to oversee areas of domestic policy, and the officials from these institutions increasingly meet to set up international norms, agreements, and policies governing domains such as the economy and the environment.

There is no agreement about how to promote democracy in the new governance. To some extent, the different proposals again reflect different theories of governance in general. Rational choice theorists sometimes suggest markets are at least as effective as democratic institutions at ensuring popular control over outcomes. Institutionalists are more likely to concern themselves with formal and informal lines of the accountability needed to sustain representative and responsible government. These institutional issues merge gradually into a concern to promote diverse forums for dialogue—a concern that is common among interpretive theorists.

"Good" Governance

Concerns about democratic governance first arose in discussions of economic development. Economists came to believe that the effectiveness of market reforms was dependent upon the existence of appropriate political institutions. In some ways, then, the quality of governance initially became a hot topic not because of normative, democratic concerns but because it impinged on economic efficiency, notably the effectiveness of aid to developing countries. International agencies such as the International Monetary Fund (IMF) and the World Bank increasingly made good governance one of the criteria on which they based aid and loans. Other donors followed suit.

The concept of good governance was thus defined by institutional barriers to corruption and by the requirements of a functioning market economy. It was defined as a legitimate state with a democratic mandate, an efficient and open administration, and the use of competition and markets in the public and private sectors. Various international agencies sought to specify the characteristics of good governance so conceived. They wanted checks on executive power such as an effective legislature with territorial (and perhaps ethno-cultural) representation. Likewise, they stressed the rule of law, with an independent judiciary, laws based on impartiality and equity, and an honest police. They included a competent public service characterized by clear lines of accountability and by transparent and responsive decision making. They wanted political systems effectively to promote a consensus, mediating the various interests in societies. And they emphasized the importance of a strong civil society characterized by freedom of association, freedom of speech, and the respect of civil and political rights. Some international agencies, such as the World Bank, also associated good governance with the new public management; they encouraged developing states to reform their public sectors by privatizing public enterprises, promoting competitive markets, reducing staffing, strengthening budgetary discipline, and making use of nongovernmental organizations. Other organizations, such as the UN, place greater emphasis on social goals, including inclusiveness, justice, and environmental protection.

Nonmajoritarian Institutions

It was perhaps ironic that international agencies and Western donors began to emphasize good governance just as the proliferation of markets and networks posed questions about their own democratic credentials. The

new governance sits oddly beside the ideal of representative and responsible government in accord with the will of the majority. It involves private and voluntary sector actors in policy processes even though these actors are rarely democratically accountable in as straightforward a way as are public-sector actors.

There are many responses to the tension between governance and democracy. These responses vary from the suggestion that we might benefit from less democracy, through proposals to make networks and markets more accountable to elected officials, and on to calls for a radical transformation of our democratic practices. The suggestion that we might benefit from less democracy generally comes from people indebted to rational choice theory. Their argument contrasts democracy, which allows citizens to express their preference by voting only once every few years and only by a simple "yes" or "no" for a whole slate of policies, with the market, which allows consumers to express their preferences continuously, across a range of intensities, and for individual items. In addition, they worry that democracy entails certain political transaction costs that make it prone to incessant increases in public expenditure: One problem is that the costs of any item of expenditure are thinly distributed across a large population, which thus has little reason to oppose them, whereas the benefits are often concentrated in a small population, which thus clamors for them. Hence, they advocate nonmajoritarian institutions as ways of protecting crucial policy areas, such as banking and budgeting, from democracy.

Democratic Visions

Many people are uncomfortable with the growing role of nonmajoritarian (or undemocratic) organizations in government. Often they associate the growing role of such organizations with growing public disinterest in or distrust of government. There has been much discussion about the democratic legitimacy of new forms of governance. Parts of this discussion have sought to reconcile the new governance with democracy by rethinking the concept of democratic legitimacy. Historically, this concept has privileged electoral accountability together with a bureaucratic

accountability in which the actions of unelected agents are controlled, evaluated, sanctioned, and answered for by elected officials. Perhaps we should expand this concept of democratic legitimacy to incorporate efficacy, legal accountability, or social inclusion.

So, perhaps the legitimacy of organizations and their decisions might rest on their effectiveness in providing public goods—a possibility that clearly resonates with the arguments for the efficiency of markets and nonmajoritarian institutions. Alternatively, we might ascribe legitimacy to organizations that are created and regulated by democratic states no matter how long and obscure the lines of delegation. In this view, democratic legitimacy is maintained whenever elected assemblies set up independent organizations in accord with rules that are monitored by independent bodies such as courts. Legitimacy is maintained here because the independent organizations are legally accountable, and a democratic government passed the relevant laws. Alternatively, the legitimacy of institutions and decisions might rest on their being fair and inclusive. Proponents of this view often emphasize the importance of a strong civil society in securing a form of accountability based on public scrutiny. Voluntary groups, the media, and active citizens monitor institutions and decisions to ensure that these are fair and inclusive. They thereby give or deny organizations the credibility required to participate effectively in the debates, negotiations, and networks that generate policy.

Discomfort with the democratic credentials of the new governance can also lead people to search for new avenues of citizen participation, or at least to try to enhance the elder avenues of participation. Here we might divide the democratic policy process into stages such as those of deliberation, decision, implementation, evaluation, and review. Typically, citizens already have avenues of participation at several stages. Citizens often can participate, for instance, by writing to newspapers, voting on ballot measures, and serving on advisory boards. Nonetheless, because many stages of the policy process are increasingly outside of the direct control of elected officials, there is a case for enhancing opportunities for participation even if one does not believe in participatory

democracy as a political ideal. Proposals for enhancing participation include: public hearings, town hall forums, referenda, deliberative polls, citizen representatives on committees, various types of self-steering, and citizens' juries. Advocates of more participatory democracy are often acutely aware that different citizens possess different resources for participating. Hence, they often attend carefully to process issues about who participates in what ways and under what circumstances. So, for example, they might advocate state support for underrepresented groups. Typically, their goal here is to increase equality and social inclusion in relation to participation.

Conclusion

We have seen how the term *governance* can be used at various levels of generality and within various theoretical contexts. The diversity of uses exceeds any attempt to offer a comprehensive account of governance by reference to a list of its properties. There does not appear to be a single feature shared by all those cases to which we might apply the term. Perhaps we would do well to look instead for a series of family resemblances between its various uses.

The concept of the new governance refers, most prominently, to an institutional shift at all levels of government—from the local to the international—from bureaucracy to markets and networks. Of course, it is important to remember that this shift is neither universal nor uniform, and that bureaucracy probably remains the prevalent institutional form. Nonetheless, the shift from bureaucracy to markets to networks means that the central state often adopts a less hands-on role. Its actors are less commonly found within various local and sectoral bodies, and more commonly found in quangos concerned to steer, coordinate, and regulate such bodies.

The concept of governance conveys, most important, a more diverse view of authority and its exercise. In the new governance, the neoliberal quest for a minimal state and the more recent attempts to promote networks are attempts to increase the role of civil society in practices of rule. Likewise, theories of governance generally suggest that patterns of rule

arise as contingent products of diverse actions and political struggles informed by the varied beliefs of situated agents. Some of these theories even suggest that the notion of a monolithic state in control of itself and civil society was always a myth. The myth obscured the reality of diverse state practices that escaped the control of the center because they arose from the contingent beliefs and actions of diverse actors at the boundary of state and civil society. In this view, the state always has to negotiate with others, policy always arises from interactions within networks, the boundaries between the state and civil society are always blurred, and transnational and international links and flows always disrupt national borders.

Governance Failure

There is much work on market failure and state failure but comparatively little on the forms and causes of governance failure. This involves the failure of the sort of self-reflexive deliberation and self-organization that occurs in networks, public-private partnerships, corporatism, private interest government, regulated deregulation, and so on. Yet, as such forms of governance become more important in contemporary societies, it becomes more urgent to consider if they too are prone to failure and what happens if they fail.

Different modes of governance fail in different ways. Market failure occurs when markets fail to allocate scarce resources efficiently in and through pursuit of monetized private interest. State failure is generally seen as a failure to secure substantive collective goals based on political divination of the public interest. The recurrence of market and state failure has prompted interest in networking, corporatism, partnerships, and other forms of reflexive self-organization. But it is not just market forces and imperative coordination that fail; so do continuing deliberation and negotiation even when conducted in good faith. The criterion for governance failure is nonetheless different. There is no pre-given formal maxim or reference point to judge its success, as there is with profits in the economy or the (imaginary) perfect market outcome. Nor is there a substantive criterion—realization of specific political objectives connected to the (imagined) public interest—as in top-down state command and control. However, insofar as governance is intended to modify goals in and through negotiation and reflection, it will fail when there is continuing disagreement about the continued validity of the shared objectives for networked cooperation for all the partners.

Bob Jessop distinguishes four more specific factors behind the failure of governance. First, the conditions of successful action may have been oversimplified or there may be deficient knowledge about causal connections affecting the object of governance. This raises the "governability" problem; that is, could the object of governance ever be manageable, even with adequate knowledge? At best, one finds partially successful governance of delimited objects of governance within specific spatial and temporal horizons of action—at the expense of deliberately neglected or unrecognized costs elsewhere. Second, coordination problems may occur within and across the interpersonal, interorganizational, and intersystemic levels where governance is adopted. These levels are often related in complex ways. Third, gaps can open between representatives engaged in communication (networking, negotiation, etc.) and those whose interests and

identities are being represented. This is common in corporatism, political parties, and social movements and raises questions of legitimacy, effectiveness, and resistance. Fourth, where several distinct governance arrangements exist to deal with interdependent issues, problems can arise due to inconsistent definitions of the objects of governance, different spatial and temporal horizons of action, and their association with different interests and balances of force.

These generic tendencies to governance failure may be reinforced in specific historical contexts. For example, capitalism requires a contradictory balance between marketized and nonmarketized organizational forms. Although this balance is often understood in terms of the relative weight of market and state in securing the conditions for economic growth and stability, governance adds another site where the balance between market and nonmarketized solutions can be contested rather than introducing a neutral third term. This is why the promise of symmetry in social partnership may not be realized and why governance arrangements cannot permanently suspend or harmonize the inherent contradictions and crisis-tendencies of capitalism. Similarly, problems arise from the overall institutional architecture and operations of the state. One alleged advantage of governance is that it can cut across different scales of government and their associated territorial boundaries, but this raises tensions over the ultimate location of sovereignty in multilevel systems with variable geometries. The European Union provides many examples of this. Analogous problems arise regarding temporal horizons of action. A major function of current forms of governance is to enable decisions with long-term implications to be divorced from short-term political (especially electoral) calculations. This separation is not always easy to maintain. Finally, even where coordination mechanisms have clearly specified functions, national territorial states typically monitor their effects on their own political capacities and their implications for social cohesion. In short, all forms of coordination—market, command, governance, solidarity—are liable to be exercised under the primacy of the political.

Failure is a routine feature of everyday life, and markets, states, and networks all fail regularly.

Nonetheless, the multiplicity of satisficing criteria and the range and variety of actors with potential vested interests in one or another outcome means that at least some aims will be realized to a socially acceptable degree for at least some of those affected. Unsurprisingly, actors will also reflect on their failures, adjust their projects, and consider whether individual modes of coordination should be modified or a new balance should be struck between them. This can be discussed relative to metagovernance, that is, the organization of the conditions for coordination. This can occur in relation to each mode of coordination (e.g., redesigning and reregulating markets, organizational innovation and constitutional change, reorganizing the conditions for governance through self-organization) and in relation to the overall balance between all forms of coordination. The latter response can be called collibration (rebalancing) or metagovernance. This involves the judicious mixing of market, hierarchy, and networks to achieve the best possible outcomes from the viewpoint of those engaged in metagovernance. Governments have a key role to play in this regard. However, because every practice is prone to failure, collibration or metagovernance is also likely to fail. Despite the temptations to fall into fatalism, stoicism, or cynical opportunism, metagovernance failure can also lead to a renewed search for an appropriate repertoire of modes of coordination rather than excessive reliance on just one, a continued monitoring of warning signs that failure is getting out of hand so that remedial action can be taken, and a positive commitment to recognition by those involved that, although failure is likely, they must proceed as if success were possible.

GOVERNANCE INDICATORS

Governance indicators quantify the quality of governance in countries. Their use has grown rapidly since the 1990s. Driving this growth are international investors, national and multilateral donors of public assistance to developing countries, and development analysts and academics, who are their main users.

Acting on the principle that one cannot manage what one cannot measure and on improved understanding of the importance of the quality of governance for the success of local development efforts in developing, emerging-market, and transition (ex-socialist) economies, investors and aid donors have greatly increased their use of governance indicators for their operational decision-making purposes; academics widely use them in regression analyses.

The most widely used governance indicators are composite perceptions-based indicators: *composite* in the sense that numerous underlying sources of information are combined into a single number for a given country in a given year; *perceptions-based* in the sense that the underlying sources of information are subjective perceptions of the quality of governance in one or more countries provided by reputed experts, business managers, and/or households. Both the composite and perceptions-based nature of most governance indicators mean that few governance indicators allow users—or governments whose governance is being assessed—either to identify specific ways to *improve* the quality of local governance or to *monitor progress* in their attempts to improve local governance. New initiatives have emerged in the production of governance indicators that seek to address these deficiencies.

Supply of Indicators

The production of governance indicators precedes the recent explosion of interest in governance. Freedom House, created in the United States in the 1940s to promote democracy around the world, has provided ratings of political rights and civil liberties in most countries since the 1970s. The private for-profit International Country Risk Guide was created in 1980, following the fall of the Shah of Iran and the large unforeseen costs it imposed on international investors, to help international investors assess the financial, economic, and political risks in and across countries. The explosive growth of financial flows to "emerging-market" economies in the 1990s and investors' correspondingly greater exposure to risk in those countries since then have driven growth of such commercial political-risk services that both use and produce governance indicators. Equally important were the launch in 1995 of Transparency International, which produces the widely recognized annual Corruption Perceptions Index, and the 1996 World Bank decision to radically reverse its policy of ignoring the high cost of corruption for economic development.

Governance indicators are either perceptions-based or facts-based. The former are constructed from data quantifying the subjective perceptions of individuals (mainly on the basic surveys of experts, business managers, or households) and commonly focus on the quality of government bureaucracy, the protection of individuals' political and civil rights, and levels of corruption. A further distinction among perceptions-based indicators is between those based on generic questions (e.g., "experts" are instructed to rate the level of corruption in a country on a scale of 1 to 7) and those calling for perceptions founded on people's concrete experience (e.g., business managers are asked, "In 2006, what do you believe is the total percentage of profits, on average, that a business like yours spends on bribes, favors, meals, parties, et cetera for public officials?").

Facts-based indicators are constructed on the basis of such objective phenomena as the existence or nonexistence in a country of specific anticorruption laws, labor market regulations (e.g., regulations that

make it more difficult or costly to fire employees), or the number of procedures required legally to start a new business. While facts-based indicators are thus *based* on objective phenomena, they nevertheless embody subjective *interpretations* of the significance of those phenomena for the quality of governance (e.g., a country with regulations that make it more difficult or costly to fire employees may be subjectively interpreted by the producer of the indicator as unfriendly to free markets and thus cause for a lower—that is, worse—governance score than a country lacking such regulations).

Producers of indicators, especially perceptions-based indicators, often combine data from many different sources into a single number. While such composite indicators (e.g., those produced since 1996 by the World Bank Institute, which are among the most carefully constructed and most widely used governance indicators) are more accurate in a statistical sense than indicators that draw on fewer underlying sources, they suffer from a lack of conceptual precision and biases of which users largely seem to remain unaware.

Demand for Indicators

Governance indicators are used primarily to judge the quality of governance in countries by people who do not reside in those countries; they use them to compare countries and/or monitor change in a country or among countries over time. They rely heavily on *composite* indicators because they facilitate comparison by reducing complex and often poorly understood governance realities to a single number for each country in a given year. They rely heavily on *perceptions*-based indicators because the data needed to construct facts-based indicators are often lacking, or lacking reasonable credibility, for too many developing, emerging-market, and transition countries—and in any case, facts-based indicators also embody significant elements of subjective interpretation.

Donors

Starting in 1996, when the World Bank reversed its long-standing policy (reflecting Cold War realities) of

ignoring problems of corruption and bad governance in borrowing countries, Organisation for Economic Co-operation and Development (OECD) countries' national aid agencies and multilateral financial organizations (including the World Bank and the Regional Development Banks) increasingly began to use governance indicators to identify and reward aid recipients that were perceived as improving their governance. Many national agencies now also use governance indicators with a view to increasing the transparency and consistency of their criteria for determining aid eligibility. Reinforcing this trend is the growing recognition both of the relative failure of the highly market-oriented policy reforms that developing countries were widely encouraged to undertake during the 1980s and 1990s and of the likelihood that in many countries poor governance goes far to explain that failure.

International Investors

International investors' use of governance indicators mirrors the growth of their assets in emerging-market economies and the unreliability of traditional macroeconomic-based country-risk indicators in predicting costly financial crises since 1995.

Development Analysts and Academics

Studies by development analysts and academics widely use governance indicators, and their results have been very influential in putting governance on the agenda of both national development agencies and multilateral financial organizations. The World Bank study by Burnside and Dollar (1997), "Aid, Policies and Growth," for instance, became a foundation for aid allocation according to governance criteria.

Governments

Governments, both within and outside the OECD, increasingly use governance indicators as a policy tool to identify governance problems and monitor reforms in developing countries. However, most available indicators are not precise enough to be used for this purpose.

Problems and Efforts to Overcome Them

Most widely used governance indicators can be criticized for their lack of transparency and comparability over time, for selection bias, and for their inability to help governments understand how specifically to improve the quality of local governance. It is also clear that many users are unaware of some or all of these limitations.

Seeking to respond to these criticisms, a number of initiatives are under way. For developing countries, more transparent methodologies (e.g., the World Bank Institute's *Governance Diagnostic Surveys,* the household surveys of the Paris-based organization Développement Institutions et Analyses de Long terme, or DIAL) are based on interviews of different population groups about their concrete experiences (e.g., frequency of corruption, quality of public service). Users of indicators will benefit from this approach to producing governance indicators, as will local governments and groups within developing countries that would like to improve their country's governance. For OECD countries, the OECD is starting to compile existing data and produce new, primarily facts-based, data on the efficiency of public services in member countries in order to make cross-country comparisons and monitor the success of domestic governance reforms in these countries.

GOVERNMENT

The term *government* comes from the Greek word *kubernân,* which means steering a ship. The analogy with navigation and technical expertise has since been maintained in Medieval Latin (*gubernare*) and in modern languages. Nevertheless, contemporary lexical developments have meant that government now has at least two main significations depending upon whether it is used in a strict (government as an institution) or in a broader sense (government as a process). It is only by examining each in turn that one can grasp the relationship between government and governance.

Government as an Institution

In a strict sense, the government (usually with the article) refers to the authoritative expression of the state and describes the group of persons that has authority in a given unit at a certain time. This governing community is opposed to the governed people. In non–Anglo-Saxon languages, government has an even more limited meaning because it refers precisely to the institution that exerts executive power within the political system, for example, the Italian government of Silvio Berlusconi. In many countries, executives possess two authorities: the government and the head of state (president or monarch). This restrictive definition of government thus corresponds to the British term cabinet or the American expression administration.

When understood as the center of power, the government exists in the majority of human communities, with the exception of some primitive tribes. Indeed, the institutionalization of government as a complex organization separated from the rest of society appeared alongside the division of social work in industrial countries. This development was parallel to the expansion of the administration within Western states during the nineteenth century. Since this period, bureaucracy has progressively been ruled by hierarchical principles, written procedures, and meritocracy. The activities of the administrative apparatus of governments grew dramatically during the nineteenth and twentieth centuries. New ministries appeared (environment, welfare), and expenditure and taxation levels increased. Whatever the type of political regime considered, the government expressed the sovereignty of the state by exercising its sole right to legitimately use force in a specific territory. As a result, the government regulates internal order by imposing behavioral norms, values, and rules between individuals. It also controls external relations between states by defining a certain type of relationship with foreign governments.

Types of government have also undergone evolution since the nineteenth century. Classical thinkers such as Aristotle have usually classified political regimes in three categories: monarchy, where one person exerts power; aristocracy, where a minority rules society; and democracy, where the whole people govern. However, as Aristotle underlined, these three forms of government can degenerate into three types of negative regime when rulers do not consider the well-being of the *polis*. Monarchy degenerates into tyranny, aristocracy transforms into oligarchy, and democracy deteriorates into demagogy.

Today, cleavages between types of government tend to concern the extension of governmental power with respect to citizens, rather than the number of rulers. In this way, liberal constitutional governments are commonly opposed to authoritarian governments.

The liberal constitutional category, which is still a minority group at the international level, can be divided into two subcategories corresponding to two forms of government. The first one comprises republican regimes where the head of state is an elected politician (e.g., the United States of America and France). The second one encompasses constitutional monarchies where the head of state is a hereditary monarch (case of the United Kingdom and Spain). Depending on the degree of concentration of power within a single institution of government, these regimes are said to be presidential (the president is the central piece of the institutional system such as in the United States) or parliamentary-cabinet governments (the cabinet is composed by members of the parliament from one or different parties as in the United Kingdom). In addition, depending on the relationship between territorial levels of government, political systems can be divided into federal regimes (United States) and unitary regimes (France).

In the authoritarian category, political regimes can be classified into two types of system. The first is made up of dictatorships where one person or a party patronage apparatus exerts control over citizens through the exercise of violence. This is the case of many southern American and African countries (Chile under Augusto Pinochet, the Congo under Mobutu Sese Soku), but some European countries have also corresponded to this description (Romania under Nicolae Ceausescu, Spain under Francisco Franco). Even if most of these regimes have a written constitution, decisions are taken in an autocratic way. The succession of governments is ruled by hereditary principles or through a *coup d'etat.* The second type corresponds to totalitarian governments where a dominant ruling party exerts complete control over the economy, politics, and citizens through ideology and physical constraint. Totalitarianisms appeared during the twentieth century in Germany under the leadership of the National Socialist Party, and in the Soviet Union when Joseph Stalin became General Secretary of the Communist Party, before expanding to China and North Korea. In such cases, the succession of governments is the product of elitist arrangements channeled by the unique party.

Traditionally, the functions of liberal constitutional government are defined in terms of the trinity: executives, legislatures, and judiciaries. According to philosophers such as Charles-Louis de Secondat, Baron de la Brède et de Montesquieu, legislatures

make laws, executives implement laws, and judiciaries apply these laws. The separation of these powers varies according to the political system: They are strongly separated in the United States and weakly separated in the United Kingdom. Although judicial power usually remains separated from either, the traditional functional division no longer corresponds to actual "organic" divisions.

First, the laws that are proposed by the members of the parliament are not entirely produced by the latter because most of them emerge from political parties or public opinion. Second, in contemporary regimes, executives have increasingly gained power. Since World War II, the equilibrium between efficiency and democratic representation has radically shifted toward efficiency. This means that executives tend to impose laws whereas legislatures merely formalize them. Third, in contemporary regimes the extent of governmental activities is larger than it was before the 1940s. Extensive advisory networks exist wherein deals with pressure groups, policy planning, and policy evaluation take place.

Government as the Act of Governing

In a broader sense, government (usually without the article) is the way of governing a given entity at a certain time. Government is an abstract term referring to the method, range, purpose, and degree of control of society by state. It is sometimes referred to as a synonym of governance in the Anglo-American literature. Some authors inspired by critical theory also use the term *governmentality*.

The analysis of the role of government vis-à-vis civil society varies greatly according to the philosophical approach of the authors. The development of bureaucratic states was accompanied by the rise of two main theories of the state: a mechanistic one that was rather conservative, and an organic one that was revolutionary.

In the mechanistic theory, government is a necessary activity for maintaining order in society. Government is seen as a mechanism and a goal, as an end in itself. G. W. F. Hegel's writings are probably the best example of this tendency. The state is the expression of the law, and the law is the most perfect illustration of rationality. The state allows the society to live in harmony by ruling over the individual behavior of citizens. Without a strong hierarchy imposed by the state, individual interests may dominate to the detriment of the general interest. That is why civil disobedience is considered as illegitimate as a means of maintaining the status quo. Critics of the mechanistic approach appeared in the 1970s. Philosophers such as Michel Foucault denounced the pressure exerted by social norms on citizens. They respectively demonstrated the evolution of social management of deviant behaviors (crime, homosexuality, and mental illness) and the alienation or limitation of individual personalities to a utilitarian dimension. These criticisms were not directed toward the government—as an institution—in particular but, rather, toward the general way in which Western industrial-capitalist societies were led.

In contrast, an organic approach to the state considers government as a way to guide humanity toward a better order. Government is understood as a process through which an *avant-garde* conducts the rest of society to advance to better social conditions, like the brain leads the rest of the body. Government is just a means to an end. In the scientific socialist theory of the state elaborated by Karl Marx and adapted by neo-Marxists, the state is the instrument of capitalist oppression to maintain the class division of society. After the revolution, the activity of government must be exerted by the state through the dictatorship of the proletariat. Several liberal critics of the socialist theory of the state point out that in all the experiences of implementation of communism, no regimes went beyond the phase of dictatorship of the proletariat. Furthermore, this popular dictatorship was generally largely monopolized by a reduced group of *apparatchiks* in the name of the proletariat.

Nowadays, the scope of government is much more extensive than a century ago in both developed and developing countries. The governing of society employs many more people and spends much more money than at the beginning of the twentieth century.

The major period of extension of governmental competences occurred after the crisis of 1929 and World War II. The growth of public expenditure in public services and infrastructures during these years brought about a new type of relation between the state and the citizens, a new type of government. Paradoxically, this expansion legitimated the role of the state as an organization of redistribution of the gross national product, but at the same time, it also transferred power to small groups of policy specialists to deal with the growing complexity of state issues. This transition toward a more technical fashion of government occurred to the detriment of traditional politicians elected by sovereign people. The strong and continuous development of Western economies from the 1940s to the 1970s also gave rise to the illusion that society can be administered as a technical issue through a procedure of fine-tuning.

Nevertheless, as the social conflicts of the end of the 1960s (for example, Berkeley, Paris, Milan, and Prague in 1968) and the rise of the oil price in 1973 (competition of Asian countries, high oil dependence, rise of unemployment) demonstrated, government has become a much more complex process than it once seemed to be. This social-economic-political crisis was illustrated by the rejection of the traditional hierarchy between the governing community and the citizens, and the incapacity of the overloaded states to reduce economic disparities. The way of governing had to change in a new context of globalization of movements of persons, goods, services, capital, and ideas. The lack of economic and political resources also demonstrated that the influence of government on society was much more marginal than before. This lower capability of redistribution, and the loss of legitimacy, had two main consequences.

First, from a functional point of view, a high level of taxation and spending was reduced in order to diminish the weight of the state. In the extreme cases of the United States under Ronald Reagan and of the United Kingdom under Margaret Thatcher, the state was seen as facing clear demands from voters for reducing government to the control of the respect of the rules of market. The role of the state as a redistributive organization decreased through the lower investments in public services (transport, education, health

care) during all the 1980s. This neoliberal watershed has become less intense in the 1990s perhaps because of the reduction of the quality of those services and the rise of social inequalities. However, the pendulum between economic efficiency and social welfare is still looking for a new equilibrium.

Second, from a territorial perspective, the lack of economic and political resources meant that in some cases states were no longer able to maintain a centralized concentration of power. This crisis was parallel to territorial claims for more autonomy. As a consequence, growing powers were transferred to substate and suprastate levels of government. During this process, particularly visible in Western Europe and Canada, local—and sometimes regional—tiers of government emerged and received new competencies from the 1980s on. As the case of the United Kingdom underlines, policy temporalities were not analogous in all the countries; nevertheless, a general trend of decentralization-devolution-federalization is observable. At the level of international relations, the constitution of suprastate regions also accelerated during the 1980s. The examples of the European Union, the North American Free Trade Agreement, the Common Market of the Southern Cone, or the Asia-Pacific Economic Cooperation reveal that this is a global movement involving big differences in levels of political integration.

Government and Governance

The result of this dual process of the contraction of economic and political resources and the spread of power toward substate and suprastate tiers of government has been the opening up of the notion of government to new actors. The hierarchical division between the formal government and the rest of society is no longer applicable. Many private actors collaborate with public entities—for example, nongovernmental organizations or private consultancy companies—but public actors from all territorial levels cooperate in policy making and implementation (e.g., in applying the Agenda 21 in the environmental field). New networks of actors have been constituted which cross the traditional border between governing community and civil society.

Scientific literature refers to this movement as a process of intellectual swing from government,

understood as a traditional hierarchical way of governing, to governance, a more decentralized-participative approach to political management. Through a semantic shift, governance is no longer a synonym of government, but has become an antonym.

Ultimately, government and governance are not theories; they only refer to different types of relationships between the state and citizens. These second-order concepts are nevertheless important for their serendipity, their heuristic capacity to criticize old analytical frameworks and uncover new directions for scientific investigation. For the moment, however, the opposition between government and governance has produced more interrogations than answers.

GOVERNMENTALITY

The concept of governmentality takes the definition of government as the exercise of organized political power by a nation or state, and expands it to include the active consent and willingness of individuals to participate in their own governance. This alters the commonly shared, but more limited concept of government by the state with its one-dimensional view of a centralized, top-down power relationship with a population. Governmentality redefines this relationship suggesting a more comprehensive approach for analyzing power relations in a population by examining both the organized practices the state employs to govern and those actions by which the population governs itself. It proposes that government by the state is only one form of governing, the terms *state* and *government* are not synonymous, and the actions taken by the state alone cannot bring about its desired ends.

Governmentality is an expression originally formulated by the twentieth-century French philosopher Michel Foucault combining the terms *government* and *rationality.* Government, in this sense, refers to conduct, or an activity meant to shape, guide, or affect the conduct of people. Conduct takes on meaning beyond the form of leading and directing. It also refers to the "conduct of oneself" where a sense of self-governance is a guiding force. Rationality, as a form of thinking that strives to be systematic and clear about how things are or ought to be, suggests that before someone or something can be controlled or managed, they must first be defined. Therefore, the state designs systems for defining populations, which make them known and visible. They include mechanisms of management and administration (work processes, procedures, rules) and ways of classifying individuals or groups (by income, race, professional and personnel categories), which allow for their identification, classification, ordering, and control.

Power Relations

Governmentality views power as productive. In this perspective, the objectives of power relations take on three forms fundamental to modern authority. Sovereign power is viewed as exercising authority over subjects within a territory or state (taxing, laws), disciplinary power is seen as regulating the ordering of people within a territory (schools, military, work)

and government as being concerned with the capacities and relations between people as resources to be fostered and optimized. Good government is seen as going beyond the exercise of sovereign power in order to foster the population's prosperity, health, longevity, productivity, and happiness. It is recognized that political power is exercised in a number of ways through different agencies, social groups, and techniques, which may be only loosely associated with the formal bureaucracy of the state. Governmentality, then, is interested in an analysis of the mechanisms of government and the specific and diverse processes or practices found inside and outside state institutions that cut across domains normally thought of as separate—for example the state, society, and family. Government is not viewed as a sole actor but, rather, as an assemblage of diverse elements, practices, and ways of thinking coming together to both frame and resolve problems.

Governing as Art

Governmentality does not intend to supplant the notions of state authority where power is typically exercised vertically through the application of decisions, bureaucratic structure, or rules. Governmentality does suggest, however, that an additional horizontal approach be taken to gain an understanding of underlying relationships, which constitute the people and institutions within a population. Its ultimate concern is how we govern others and ourselves, how a government becomes one for "each and all," or expressing a concern not only for the population as a whole but for every individual within the population as well. While the state may assign identities to those that govern, where conduct is more or less prescribed (e.g., executive, governor), there is the more subtle implication of how to influence the direction of the conduct of the governed. Thus viewed, governing is an art involving the imaginative application of intuition, knowledge, and skills to administration and management.

A Governmentality Lens

To analyze issues associated with higher education from a governmentality approach, one would need to examine a number of possible influences beyond state policies that regulate education. The state, as well as institutions of higher learning, promote education through the availability of low interest insured loans, tax incentives, advertising, recruitment efforts, and so on. Business enterprises often promote the pursuit of higher education credentials through job design and compensation, recruitment programs at universities, endowments to universities as resources for providing graduates who meet the needs of corporations, and incentives to help fund employee education (grants, tuition assistance). Social and family norms may expect members to pursue higher education—or conversely, not to pursue higher education. Primary and secondary education may encourage or discourage the pursuit of higher education through the use of examinations for classifying students as college bound or not. Examinations are used to categorize student performance and guide them to vocation or education. Universities use examination scores and other criteria to classify individuals, and they use these factors for admission decisions. Once admitted, students are classified and made visible using achievements on examinations, ordered in terms of class standings, major fields of study, or membership in academic societies. Media and popular culture may influence whether one pursues a higher education, as well as which are the most desirable institutions and why. An individual's conduct will likely be influenced by these myriad forces in choosing or not choosing higher education or in choosing a path within higher education. All of these represent forces of governmentality that cross between the concern for the population (welfare, productivity, resources) and influences regulating behavior within private realms such as families, subcultures, and agencies in a population. Such an analysis is intended to view with one lens the entire domain showing the operation and role of state agencies within a wider field of action.

GOVERNMENT BY PROXY

Government by proxy refers to administering government programs by network or contracted agencies. Government by proxy was widely voiced by scholars starting in the 1980s. Network government has grown enormously over time. The federal government increased its assistance to state and local governments through grants and loans. In addition to the contracted services and loans, the federal government also created some quasi-governmental agencies to deliver public services. Amtrak and the United States Postal Service are two examples of these quasi-governmental agencies. The interesting thing about the government by proxy is that each service delivery and production relies on proxies instead of the governmental responsibility or direct production or service delivery by the government. Thus, government effectiveness depends on the performance of so many proxy agencies, as well as on government performance.

Several factors contributed to development of government by proxy: changes in the nature and scope of the governmental mission, changes in technology, constraints in budget, and market forces. The several forms of government by proxy include contracts (federal government contracts its goods and services to private companies, recently to nonprofit organizations as well), grants to state and local governments (federal government provides grants to states and local governments so the services can be rendered at these government levels instead of the federal government), tax expenditures (tax breaks or tax incentives), loan programs (federal government makes loans available from student loans to mortgages), and regulation (federal government develops rules to govern activities of individual citizens and private entities). State and local governments also are adopting government by proxy in their services. Waste collection, for example, is mostly contracted to private companies in small and large cities.

Government officials at all levels of government make decisions on contracting services and the acquisition of materials and goods. Recently, public agencies have been depending on third parties for delivery and products. The contracted service has broader impacts on the economy and on nonprofit and private-sector organizations. It is not easy to measure the performance of the contracted services. It is also a significant challenge for public agencies to determine if they met their policy obligations by the contracted services.

Evaluating quality and performance of services rendered by a third party is a highly complex process. Efficiency, effectiveness, equity, high performance, responsiveness, and accountability are important criteria for contracted services. Public agencies should go beyond the traditional evaluation criteria in evaluating the performance of government by proxy. Public managers should consider the entire contract process and the relationships in their evaluation of the performance. The contract management can be seen as an essential tool for policy implementation by the contract managers in government agencies. Building capacity is an important issue for leaders of the public sector in managing the indirect government.

Government Department

To most readers, the term *government department* is a category that one uses in a telephone directory or a reference volume that lists an array of bureaucratic offices and agencies. But this assumption can be misleading. A straightforward dictionary-like definition actually obscures a range of complex and conflicting ideas.

The two words that are the subject of this entry seem, on their face, to be closely related. But like so many topics related to bureaucracy and governance, the two words should be analyzed separately because they reflect different lenses and values. The word department can be defined in a way that goes beyond public-sector activity and, instead, includes meanings that relate to generic organizations.

The concept of a department is embedded in the classical definition of a bureaucracy offered by Max Weber. A department is a specialized unit of a bureaucracy or organization found within a hierarchical structure. Departments can be found within private and nonprofit organizations as well as in public agencies although they may be organized differently. Like the functions in a factory, the units within the organization are defined as embodying separate and clear work responsibilities.

These units can be organized in terms of function or by jurisdiction. Functional responsibilities are the most common form where a major organization is assigned responsibilities to carry out specific functions. At the federal level in the United States, departments are organized to embody specific policy functions such as agriculture, labor, education, commerce, health and human services, justice, and others. These departments are usually called cabinet departments and are headed by political appointees of the current occupant of the White House. Departments in states and localities often follow this same pattern but are organized around particular jurisdictional boundaries. Thus, states and localities have departments of education, health, justice, environment, transportation, and others. Although we usually use the term *department* to refer to all of these units, sometimes they are called *agencies* or other terms.

The original concept of a department is linked to a specialized, separate set of functions, but increasingly these separate units do not adequately reflect current policy or program realities. The boundaries between policies or sectors have been blurred during the past few decades, and it is difficult to establish the kind of clear lines of specialization that have been traditionally found in departments.

For example, concern about rural issues is not limited to programs within departments of agriculture. Changes in the economy and society have resulted in rural communities that are isolated units and that are minimally related to agricultural issues. In the past, it was assumed that almost all rural issues were appropriately located in the Department of Agriculture. But now, instead, if one is concerned about rural programs, it is necessary to find ways to develop interdepartmental relationships involving education, health, environment, economic development, and other departmental units. The classical departmental organization emphasizes separate and discrete units and makes it difficult to develop horizontal relationships that cut across those units. Thus, to address rural issues, it is important to create venues that allow multiple departments to interact and to acknowledge that no single department has the resources or authority to address these issues. Similarly, policy networks also have been developed that cut across sectors.

To continue the rural example, it is difficult to devise rural policies without involving all three levels of government as well as for profit and nonprofit organizations. Efforts such as the National Rural Development Partnership have been created to provide opportunities for federal, state, local, for-profit, nonprofit, and tribal organizations to meet together to find ways to acknowledge that all these actors must be involved in attempts to deal with rural issues because no single actor has resources or authority to address current problems.

It is also relevant to focus on the first word in the phrase "government department," The term *department* can be used beyond the public sector; that is not true for the term *government.* The latter is used to describe the structure that has the power to make and enforce laws within a jurisdiction, an organization, or another

group. It has also been defined as the governing authority of a political unit and the political means of creating and enforcing laws. Some definitions are crafted to be inclusive of different ways of exerting authority; some, for example, include despots and others who exert authority without democratic processes. Political philosophers differ in how they treat rulers who have a monopoly on the legitimate use of force or use what seem to be legal processes to enforce their powers. Some define government as an organization that maintains control of a territory through activities such as collecting taxes, controlling entry and exit, protecting borders, and dealing with others outside the boundaries of the jurisdiction.

In recent years, it has become common to emphasize the ways in which individuals who exercise power in a government are constrained by both external and internal means. This is often termed "accountability" and focuses on ways in which those inside government are held to account for the use of resources and authority. In the United States, the basic approach to accountability within the Constitution stems from the checks and balances created through overlapping authorities between the legislative, executive, and judicial branches of government. Other systems have emphasized different processes that have been put into place to limit the authority of those inside of government. These include fiscal accountability, legal accountability, program accountability, professional accountability, outcome accountability, and political accountability. As the reach of government has increased in control and regulation, accountability has become increasingly important both to political leaders and to those inside of government agencies.

When the two words are combined, the separate definitions do not lead to clarity. The term *government* leads one to issues that are the purview of politics and the dimensions of a political system. One would emphasize distribution of power and predominant values that move the political actors within the system. As such, it is a normative concept. By contrast, the term *department* is more of a descriptive approach because it highlights different ways of sorting out specialized functions and jurisdictional boundaries. This latter term can be used outside of the

public sector and has been applied to private-sector and nonprofit settings.

GOVERNMENT PERFORMANCE AND RESULTS ACT

The Government Performance and Results Act (GPRA) of 1993 sought to address a variety of concerns about governmental accountability and performance. The statute demanded that federal agencies develop integrated frameworks that tied resource decision making to program performance measures that revealed the results of public programs and services. The law can be understood in light of two peculiarly American political forces that played critical roles in its enactment. It was primarily the product of the nation's propensity to run government more like a business. Mirroring an argument that dated prominently from the First Hoover Commission in 1949 (and arguably well before) and that launched a trend, the legacy of which included the program planning and budgeting system (1960s), management by objectives (early 1970s), and zero-based budgeting (late 1970s) reform efforts, GPRA sought to impose on federal programs a planning and evaluation model borrowed from the business sector. This statute, like its market-oriented predecessors, was presented as an efficiency-maximizing tool that would allow federal bureaucrats

and elected officials to focus on program results that had been set thoughtfully and on program goals and objectives that provided clear mechanisms by which each was to be evaluated. Second, lawmakers justified the law by arguing that the business model on which it was based was practical and successful in countless firms. Why, if businesses could plan and rank order priorities, should the government not do so?

This assumption notwithstanding and perhaps predictably given its pedigree, this initiative has encountered formidable obstacles during its implementation. This is so for many reasons. First, power is at issue. Congress mandated GPRA, and it is not clear that it is in the president's interest that agencies nominally under his purview set and pursue goals and objectives determined with congressional overseers. This difficulty is a consequence of separation of powers, but it is no less thorny for that. Second, many public programs pursue multiple aims that are not captured by wholesale optimization of efficiency, the criterion maximized by the management model underpinning GPRA. Many were not established to pursue efficiency at all. Third, numerous federal programs are implemented through other entities including states, nonprofit organizations, and for-profit institutions. These do not necessarily concur with federal aims and goals, however clearly specified, even when working with national agencies. Indeed, that independence of perspective is part of the rationale for involving them in policy delivery. Fourth, many national programs are not aimed at producing a good or service. Indeed, some, like much regulation, for example, are devoted to preventing certain outcomes. Finally, many public programs address concerns whose outcomes are not easily measured. Education, for example, is only partly the province of teachers and schools. Much depends on a child's readiness and willingness to learn, and these are the result of a bewildering array of variables well beyond the school or teacher's purview. In sum, GPRA was based on a paradox—a powerful and widely accepted mythology that fits the American institutional and political framework poorly.

GRAMSCIAN THEORY

Situated within a historical materialist problematic of social transformation and deploying many insights from the Italian Marxist Antonio Gramsci (1891–1937), a whole range of related yet diverse approaches within international political economy have led to a series of neo-Gramscian perspectives, which hold a normative dimension to theorizing as intrinsic to all understandings of the social world. In 1919 to 1920, Gramsci was active in the radical works council movement in Turin, Italy, as the editor of the newspaper *L'Ordine Nuovo* (New Order). Later he participated in the founding of the Italian Communist Party, of which he was the general secretary until his imprisonment by the fascist regime in 1926. He spent the rest of his life in captivity, where he wrote his famous *Prison Notebooks,* a collection of historical and philosophical observations about structural change and social transformation. Within the history of Marxist theory and practice, Gramsci occupied a privileged position in considering how forms of class consciousness might be organized in an attempt to overcome the conditions of capitalist society in a situation when the "objective" conditions of crisis do not automatically lead to revolution. Along with other figures prominent in the emergence of Western Marxism (*inter alia* Georg Lukács, Rosa Luxemburg, Karl Korsch, Evgeny Pashukanis), Gramsci therefore reflected on the practice of developing class

consciousness in order to challenge, if not overthrow, capitalist society.

A crucial break with mainstream international relations (IR) approaches emerged by the 1980s in the work of Robert Cox. Unlike conventional IR theory, which reduces hegemony to a single dimension of dominance based on the economic and military capabilities of states, debate shifted toward a critical theory of hegemony, world order, and historical change that directs attention to questioning the prevailing order of the world. Drawing on Gramsci's work, hegemony is understood as an expression of broadly based consent, manifested in the acceptance of ideas, and supported by material resources and institutions. This is initially established by social forces occupying a leading role within a state but is then projected outwards on a world scale.

Hegemony is therefore constituted on three spheres of activity: the social relations of production, encompassing the totality of social relations in material, institutional and discursive forms that engender particular social forces; forms of state, consisting of historically contingent state-civil society complexes; and world orders, which not only represent phases of stability and conflict but also permit scope for thinking about how alternative forms of world order might emerge. Social forces, as the main collective actors engendered by the social relations of production, operate within and across all spheres of activity. Through the rise of contending social forces, linked to changes in production, there may occur mutually reinforcing transformations in forms of state and world order. Within each of the three main spheres it is argued that three further elements reciprocally combine to constitute an historical structure: ideas, understood as inter-subjective meanings as well as collective images of world order; material capabilities, referring to accumulated resources; and institutions, which are amalgams of the previous two elements and are means of stabilizing a particular order. Overall, the aim is to break down over time coherent historical structures—consisting of different patterns of social relations of production, forms of state and world order—that have existed within the capitalist mode of production.

The Social Relations of Production and World Order

Importantly, Gramscian analysis commences with an investigation of the social relations of production, understood in a wide sense encompassing the production of physical goods as well as knowledge and the institutions necessary for the organization of physical production. This makes it possible to understand the historical specificity of capitalism. In contrast to mainstream IR approaches, the separation between the state and market, the political and economic, is not taken as the starting-point of analysis because of its historical overtones. Rather, state and market are regarded as two different expressions or forms of the same underlying configuration of the social relations of production. Thus, the apparent separation between state and market can be traced back to the way production is organized around the private ownership of the means of production and wage labor in capitalism. The extraction of surplus value is not politically enforced in such an arrangement but is the result of indirect enforcement of those who do not own the means of production to sell their labor power "freely." Through this analysis of the social relations of production, social forces, engendered by the production process, can be identified as the core actors. In capitalism, then, there is the main division between capital, or owners of the means of production, on one hand, and labor on the other. From a Gramscian perspective, however, this arrangement is also appreciated in terms of the transnationalization of the social relations of production in times of globalization. This is expressed in the organization of production across borders in transnational corporations and the emergence of a globally integrated financial market, which engenders new transnational social forces of capital and labor that are potentially in conflict with national capital and labor.

Transnational capital has recently attempted to establish a new transnational hegemonic order at the level of world order through the project of neoliberal restructuring. This order is based on the structural power of transnational capital at the material level implying politico-economic neoliberalism as the dominant set of ideas sustained through international

organizations such as the World Bank, International Monetary Fund, and Organisation for Economic Co-operation and Development. Besides a transnational managerial class that supports this neoliberal order, other elements of productive capital (involved in manufacturing and extraction), including small- and medium-sized businesses acting as contractors and suppliers and import-export businesses, as well as elements of financial capital (involved in banking insurance and finance), have been supportive of this transnationalization of production. Hence, there has been a rise in the structural power of transnational capital supported and promoted by forms of elite interaction that have forged common perspectives, or an "emulative uniformity," between business, state officials, and representatives of international organizations favoring the logic of capitalist market relations. Hegemony is thus understood as a form of class rule linked to social forces, as the core collective actors, engendered by the social relations of production.

In short, a leading class, engendered by the production process, can establish hegemony as an international phenomenon insofar as it represents the development of a particular form of the social relations of production. The way this is carried out, however, is instantiated in (and mediated through) the national level. Hegemony is constructed and contested domestically, before it can expand on a world scale to be "translated" or mediated through different state forms. This should not be read as a lapse into state-centrism but, instead, places a particular emphasis on forms of state and how social forces operate within and through national institutional set-ups to be dealt with in the next section.

Forms of State and Governance in Times of Globalization

Changes in the social relations of production give rise to new configurations of social forces. State power rests on these configurations. Therefore, rather than taking the state as a given or pre-constituted institutional category, Gramscian theory gives consideration to the historical construction of various forms of state and the social context of political struggle. The concept of form of state is concerned with the relationship between civil society and the state and is defined in terms of the apparatus of administration and the historical bloc or class configuration that defines the raison d'état for that form. This is accomplished by drawing on the concept of historical bloc and by widening a theory of the state to include relations within civil society. An historical bloc refers to the way in which leading social forces within a specific national context establish a relationship over contending social forces. It is more than simply a political alliance between social forces represented by classes or fractions of classes. It indicates the integration of a variety of different class interests that are propagated throughout society, which combines economic and political aims within a wider intellectual and moral unity. By considering different forms of state, it becomes possible to analyze the social basis of the state and to conceive of the historical "content" of different states. The notion of historical bloc aids this endeavor by directing attention to which social forces may have been crucial in the formation of an historical bloc or particular state; what contradictions may be contained within an historical bloc upon which a form of state is founded; and where potential might exist for the formation of a rival historical bloc (or counterhegemony) that may transform a particular form of state. In contrast, therefore, to conventional state-centric approaches in IR, a wider theory of the state emerges within this framework. Instead of underrating state power and explaining it away, attention is given to social forces and processes and how these relate to the development of states.

Of importance, Gramsci did not simply understand the state as an institution limited to the "government of the functionaries" or the "top political leaders and personalities with direct governmental responsibilities." Instead, he spoke of the integral state consisting of political society and civil society, through which ruling classes organize intellectual and moral functions as part of the political and cultural struggle for hegemony in the effort to establish an "ethical" state. Within this extended or integral conception of the state, there is a fusion between political and civil society within which ruling classes organize the political

and cultural struggle for hegemony, to the extent that distinctions between such spheres are "merely methodological." The state is thus understood not just as the apparatus of government operating within the public sphere (government, political parties, military) but also as part of the private sphere of civil society (church, media, education) through which hegemony functions. The ensemble of classes that constitutes the state has a formative activity in civil society to the extent that it uses its institutions to disseminate notions underpinning the hegemonic order.

Thus, it can be argued that the state in this conception is understood as a social relation. It is not unquestioningly taken as a distinct institutional category, or thing in itself, but conceived as a form of social relations through which capitalism is expressed. Social classes do not therefore exist in isolation from, or in some exterior relation to, the state. The state is present in the constitution and reproduction of the social relations of production and is thus founded on the perpetuation of class contradictions. The state is not a simple class instrument that directly represents the interests of dominant classes. Dominant classes consist of several class fractions that constitute the state, which thereby enjoys a relative autonomy with respect to classes and fractions of classes. Yet, lest the meaning of this phrase is misunderstood, it should be made clear that relative autonomy does not mean a distancing from the social relations of production but solely that the state experiences relative autonomy vis-à-vis the classes and fractions of classes that support it. Within the compromises of state policies, social forces organize hegemony by gaining certain concessions and sacrifices from the dominant classes in order to broaden the social basis and ensure long-term rule predominantly based on consensus.

In order to understand the restructuring of the form of state in times of globalization, Cox introduced the notion of the internationalization of the state. This theme captures such a dynamic by referring to the way transnational processes of consensus formation, underpinned by the transnationalization of production and the thrust of globalization, have been transmitted through the policy-making channels of states. As a result, those state agencies in close contact with the global economy—offices of presidents and prime ministers, treasuries, central banks—have gained precedence over those agencies closest to domestic public policy—ministries of labor and industry or planning offices. At the same time, though, critics have rightly noted that the notion of the internationalization of the state reduces the state to a transmission belt, conveying all too easily the neoliberal logic of capitalist competition from global to local spheres. Within this conception, globalization is thus reduced to a top-down process to which states can only yield by adjusting to the exigencies of transnational capital.

A more fruitful approach has therefore empirically stressed how different forms of state have become restructured by highlighting the social class struggles immanent to such adjustments. There are contradictory and heterogeneous relations internal to the state, which are induced by class antagonisms between nationally and transnationally based capital and labor. The state, then, is the condensation of a hegemonic relationship between dominant classes and class fractions. Rather than simply regarding the state as a transmission belt, what needs to be investigated is how particular transnational social forces of capital and their interests—the driving force behind the transnational restructuring of the social relations of production—have become internalized in particular national forms of state.

Such an understanding of the restructuring of the state goes right back to the aim of overcoming the separation between state and market. Whilst some have championed globalization as the "retreat of the state," or the emergence of a "borderless world," and others have decried the global proportions of such changes in production, Gramscian theory argues that the transnationalization of production has profoundly restructured—but not eroded—the role of the state. In other words, Gramscian theory does not think in terms of "the market" winning over "the state," or the state being able to retain a certain degree of control over the market. The state is not treated as an actor independent of the market and economic forces. Overcoming the separation between state and market, as outlined previously, allows Gramscian theory to analyze the internal relations between these spheres of

activity as they both express the same underlying configuration of the social relations of production. Hence, the focus on "how" and "to what extent" transnational forces of capital have become integrated into national forms of state can be realized by this focus on the social relations of production. Capital is not simply represented as an autonomous force beyond the power of the state but is represented by classes or fractions of classes within the constitution of the state. In other words, there are contradictory and heterogeneous relations internal to the state, which are induced by class antagonisms between different fractions of (nationally or transnationally based) capital. Hence "foreign" capital, represented by transnational corporations or so-called "footloose investment," does not simply put external pressure on states, enforcing restructuring from the outside. Instead, through a process of internalization, there is an induced reproduction of capital within different states. Globalization therefore represents the transnational organization of production relations that are internalized within states to lead to a modified restructuring (but not retreat) of the state in everyday life.

This stress on the internalization of class interests through the transnational expansion of social relations is different from assuming that various forms of state have become simple "transmission belts" from the global to the national level. At issue, instead, is the aim of establishing through empirical inquiry how concrete different forms of state have internalized the conflicting interests between national and transnational class fractions. In some instances, the state may indeed function as a transmission belt, adapting the national economy to the requirements of the global economy. But a redefined state purpose could equally well imply a protection of the national economy against global competition. In sum, the internalization of global class relations in concrete forms of state has to be established empirically for each different state form.

Finally, then, at the forefront of analysis is an emphasis on aspects of social class conflict. This can be manifest in the articulation of hegemonic projects represented by the interests of class fractions on a transnational scale and attempts to internalize elements of neoliberalism globally. Clearly, though,

social class conflict is also manifested in dialectically linked forms of resistance that combine elements of structure and agency. It is through contestation over the means of production and social reproduction that resistance is articulated in varied local, regional, and global settings. The basis for building an effective counterhegemony across these domains remains an open site of struggle to be determined by future strategies of political action. It remains important, then, within Gramscian theory to concentrate on the combination of structure and agency within the construction and contestation of hegemony and remain open to new and emerging forms of domination and resistance.

GROUP OF 7

Group of 7 (G7) is an assemblage of leading industrialized states. These states convene annually to discuss world economic problems. The grouping emerged in 1975 as the G5—France, Germany, Japan, United Kingdom, and the United States. It subsequently

expanded to include Canada and Italy. In 1998, Russia was included; since then the G7 has often been referred to as the G8.

The group first met in response to the global economic difficulties of the 1960s and 1970s. The period had witnessed economic stagnation and rising inflation, which precipitated the breaking down of the system of capital controls and fixed exchange rates that had been institutionalized in the post–World War II period. The major currencies were floated and international private and public financial flows grew considerably, creating global capital markets. The major industrialized states convened with a view to discussing how to manage such changes in the global order.

G7 government leaders meet in annual summits. These summits are for semiformal collaboration in which the member-states exchange views and seek to coordinate policy; they have become an institutionalized set of intergovernmental conferences. Each year, the summit is hosted in a different member's country. The G7 has developed a network of supporting ministerial meetings, which allow ministers to meet regularly throughout the year to continue the work set out at each summit.

The issues discussed at the meetings relate to major economic and political issues facing the member's domestic societies and the international community as a whole. Summits have consistently dealt with macroeconomic management, international trade, and relations with developing countries. Questions of energy, the environment, human rights, and terrorism have also been of recurrent concern. Such issues might previously have been regarded as "domestic"; G7 thus represents an attempt to govern those aspects of political life that escape the control of any single state. In contemporary governance, G7 forms part of an expanding institutionalization of global politics and economics. While it cannot enforce compliance with its decisions, it gives direction to the international community by setting priorities and defining new issues, thus steering global governance.

The G7 arrangement raises questions about inclusion and accountability. First, given that there are more than 190 states in the world, G7 is often criticized for being an exclusive club. Yet, proponents of G7 argue that the grouping should be at the helm of decision making because they have the biggest economies and thus the greatest impact on the global political economy. Proponents also highlight that G7 has made efforts to include more countries through the separate convening of the Group of 20 (G20) Finance Ministers; established in 1999, G20 comprises the G8 plus various developing countries such as Brazil, China, and India. However, certain critics rejoin that this still excludes too many other countries, not to mention nonstate actors such as nongovernmental organizations, and that new members have merely been included on G7 terms. Second, representative democracies typically hold their leaders to account. However, the countries excluded from G7 talks have no mechanisms by which they can hold the G7 to account, even though G7 decisions often have a marked global impact. These points highlight the difficulty of governing the global economy in a just and democratic manner while recognizing that the majority of economic transactions either take place in or originate from the G8.

The G7 has met with the criticism that it seeks to further its own interests to the detriment of other environmental, economic, and social issues. For example, G7 summits have been widely condemned for their failure to adequately increase overseas development aid or to propose measures to tackle climate change. However, recent summits are reputed to have become more sensitive to such matters; the G8 summit in the UK in 2005 gave considerable attention to development aid and developing country debt, although the commitments arising from talks were seen to be lacking. This criticism raises two further questions about the G7 and contemporary governance: (1) Should G7 states have a greater obligation to tackle global environmental and social issues than other states given the relative size of their economies and the resources at their disposal? (2) How should the G7 balance issues of global interest against their national interests?

GROUP OF 77

The 1960s were a time of tremendous global change as rapid decolonization occurred in Africa, Asia, the Caribbean, and the Pacific. These third-world countries at first concentrated on political collaboration in the Non-Aligned Movement, formed in 1961. However, attention soon turned to the economic problems of post-colonial economies, in particular the high levels of commodity concentration; the imbalance in the terms of trade for these primary producers vis-à-vis manufacturing countries; the vulnerability resulting from having few trading partners; the inadequate amount of aid—especially concessional aid—donated by industrial countries and the international financial institutions; and the decapitalization and other problems arising from uncontrolled foreign direct investment. As Africa and Asia turned to these economic issues, Latin American countries also found common ground with them.

The developing countries sought to effect changes within the United Nations. After a period of resistance from the industrial countries—except for the Soviet Union, which saw a chance to express its solidarity with the oppressed—the developing countries finally secured their goal of initiating a global debate on trade-related issues: The (first) UN Conference on Trade and Development (UNCTAD) was held in Geneva in 1964. The seventy-seven developing countries represented at the conference were dubbed the "Group of 77" (G77). This G77 became a permanent caucusing group for the developing nations when UNCTAD became institutionalized as a UN organ under the General Assembly. By 2004, the membership had climbed to 132, with China usually joining in endorsing the group's aims. The group is funded by member contributions and is headquartered in New York, with subsidiary offices in Geneva, Washington, DC, Rome, Vienna, Paris, and Nairobi.

The G77 has had several successes to its credit, the most recognized being the establishment of the generalized system of preferences (GSP) in 1968. Under this scheme, industrial countries agreed to eliminate import duties on selected manufactured products from the developing world. In the 1980s, a global system of preferences or trade concessions among developing countries (GSTP) was initiated. By the early 2000s, a GSTP agreement was in force among forty-four developing countries.

The G77 also had some success in the 1960s and 1970s in promoting commodity stabilization schemes in which buffer stocks, prices, or quotas were manipulated to ensure stable demand and supply. The group was also the main force behind the New International Economic Order, a comprehensive set of reformist proposals passed by the General Assembly in 1974. Among these proposals, the G77 espoused south-south collaboration both in the form of regional integration as well as trade and aid linkages between developing countries on the three continents. The G77 also helped develop a "code of conduct" for multinational corporations, and firmly pressed the idea of the annual transfer of 0.7 percent of GNP from developed to developing countries, a goal adopted by the UN during its successive "development decades."

By the mid-1980s, however, the G77's protectionist approach to trade and its strident demands for concessions from the North began to conflict with the reality of the global trend toward economic liberalization. Many third-world countries, stagnating from high debt and inefficiencies resulting from rigid state control, were pushed into structural reform by their international creditors. They began to move away from the protectionist UNCTAD agenda toward reluctant acceptance of the now-predominant liberal agenda represented by the General Agreement on Trade and Tariffs and its successor the World Trade Organization. In the circumstances, the G77 adapted and sought to ensure that developing countries were not disadvantaged in free trade negotiations. In particular, the G77 pushed for special and differential treatment for developing countries to enable them to adapt to

competitive trade gradually. Among other contentious issues being negotiated in the early to mid-2000s are the disadvantages to developing country producers arising from subsidization of farmers in industrial countries, issues impacting free trade in services, intellectual property rights (including pharmaceutical issues), and rules governing private investment. An informal subgroup of larger developing countries, the Group of 21, headed by China, India, Brazil, and South Africa, have led the negotiations with the WTO.

Although G77 countries are increasingly pursuing separate bilateral and regional agendas, the organization remains important for developing countries as an arena for collective debate and global bargaining. The global context may have changed and the G77 may not be as important as it was in the heyday of the 1970s; however, the group's goal of facilitating development clearly remains as essential as ever.

GROUPTHINK

Groupthink refers to a mode of thinking which reduces the efficiency of collective problem solving within small cohesive groups. To preserve unanimity, members of such a group will try to conform to a perceived group consensus, irrespective of whether or not they may individually believe it to be the optimum solution.

The theory of groupthink was first developed by the social psychologist Irving Janis in his classic 1972 study, *Victims of Groupthink: A Psychological Study of Foreign-Policy Decisions and Fiascos,* which focused on the psychological mechanism behind foreign policy decisions such as the Pearl Harbor bombing, the Vietnam War, and the Bay of Pigs invasion.

Janis's attempt to determine why groups consisting of highly intelligent individuals often made bad decisions renewed interest in the study of how group behaviors, biases, and pressures affect group decision making. Groupthink has become a widely accepted theory particularly in the fields of social psychology, foreign policy analysis, organizational theory, group decision-making sciences, and management. As such, the notion was most recently revived to help explain the interpretation of intelligence information regarding weapons of mass destruction before the second Iraq War.

Janis identified a number of structural conditions leading to groupthink, related to the cohesiveness of a given decision-making group, the formal rules governing its decision-making process, the character of its leadership, the social homogeneity of participants, and the situational context they face.

The eight symptoms of groupthink include an illusion of invulnerability or the inability to be wrong; the collective rationalization of the group's decisions; an unquestioned belief in the morality of the group and its choices; stereotyping of the relevant opponents or out-group members; the presence of "mindguards" who act as barriers to alternative or negative information as well as self-censorship and an illusion of unanimity. Decision making affected by groupthink neglects possible alternatives and focuses on a narrow number of goals, ignoring the risks involved in a particular decision. It fails to seek out alternative information and is biased in its consideration of that which is available. Once rejected, alternatives are forgotten and little attention is paid to contingency plans in case the preferred solution fails.

Proposals to prevent groupthink have included the introduction of multiple channels for dissent in decision making, mechanisms to preserve the openness and heterogeneity of a given group and have focused on the specific type of leadership required to prevent groupthink from occurring.

Critiques have underlined that decision-making processes do not always determine eventual outcomes. Not all bad decisions are necessarily the result of groupthink nor do all cases of groupthink end up as failures. In certain contexts, groupthink may also

positively enhance members' confidence and speed up decision-making processes.

GUEST WORKERS

The term *guest worker* is most commonly associated with its German translation, *Gastarbeiter,* a community of mainly Turkish migrants brought in after World War II to help rebuild German infrastructure. *Gastarbeiter* were intended to remain in Germany on a temporary basis for work purposes, but many remained and now constitute a large ethnic group within the country. In addition to Turkish migrants, sizable numbers of guest workers came from Spain and Yugoslavia and were employed across Western Europe. Recruitment began as early as 1955 after the first agreement between the Italian and West German governments. Similar agreements with Greece and Spain (1960), Turkey (1961), Morocco (1963), Portugal (1964), Tunisia (1965), and Yugoslavia (1968) followed. To facilitate recruitment the German government opened agencies in these countries that mediated between those looking for work and their future employers. In contrast to immigrants, guest workers were given a temporary right of residence in a state until they have completed the period of work

for which they were given leave to stay. Most of these migrants were men usually seeking work in Germany until they had saved enough to secure a comfortable living back home or so that they could support their families and fend for themselves once they had returned. Many of them left wives and children behind, and most left their home countries with the intention of returning after a few years of work abroad. Guest workers also existed in sizable numbers beyond Europe, for example, a large Korean community of guest workers existed in Japan.

In the United States, guest-worker programs have been developed to match immigrant workers to specified gaps in the labor market; this has particularly been the case in the agricultural sector. The H-2A program, for example, enables employers to import agricultural workers, while in recent years H-1B visas have been increased to allow recruitment of skilled workers. Many migrant workers have continued to work illegally in the United States, in particular, those who have entered the country from Mexico. In recent years, this has been a contentious issue for U.S. President George W. Bush's administration, with pressure mounting from those who seek to protect illegal workers by offering guest worker status and those seeking to protect U.S. jobs, especially in the agricultural sector. In his 2004 State of the Union address, Bush asked Congress for support for a temporary worker program which matches foreign workers with U.S. employers and which would provide illegal Mexican workers with temporary legal status and some civil rights protection.

Guest workers have historically been granted temporary residence to fill particular gaps in the labor market in a state. This has been in response to large-scale reconstruction programs or to growing demands of one particular sector of the economy such as agriculture or information technology. Many of these guest workers, however, have claimed permanent residence in the host country and now form long-established communities.

H

HEALTH CARE

Health care refers to services provided by medical professionals aimed at promoting physical and mental welfare, through the prevention, treatment, and management of illness. This includes care by the medical and allied health professionals, curative care for acute conditions, management of chronic disease, rehabilitation, and palliative care.

Although the aim of health care is to promote individual and public health, health care is a distinct concept from "health." Factors outside of the provision of health care (e.g., diet, genetics) play an important role in determining individual health, and the provision of health care is only one aspect of the governance of health. Equally though, governing health care extends beyond promoting health. Health care is a major industrial sector, a growing component of many developed countries' national economies, and an important component of their labor force. In 1960, Organization for Economic Co-operation and Development (OECD) countries spent an average of 3.79 percent of their gross domestic product (GDP) on health care, and in 2003, the corresponding number was 8.3 percent of GDP. In 2004, 12 percent of the nonfarm private labor force in the United States worked in the health care sector, with rapid and sustained job growth during the past two decades. Expenditure on pharmaceuticals and technology is also a central component of overall health care expenditure.

Governance of the health care sector, then, is complex and multifaceted. In many countries, the public sector plays a direct role in both financing and delivering services; however, public involvement extends to a range of policies from the regulation of medical malpractice to supporting technical innovation. Many welfare states incorporate a "health care state" in which the embedded nature of health care gives rise to complex forms of governance. These forms require balancing issues related to collective consumption of services and governing professionals and the production of a large industrial sector. State involvement in the health care sector is intricately entwined with governance of the labor market, industrial promotion, intellectual property rights, and technology policy, among other areas.

Variation in the Organization of the Health Care Sector

Most economists argue that health care is not a "perfect good" and unregulated markets may lead to inefficient and inequitable provision of health care—meaning some form of public involvement in the health care sector is necessary. However, countries vary in how they choose to coordinate public involvement in the organization of the financing and delivery of health care.

Many continental European health care systems operate on a social insurance model. In these systems, the provision of health care is organized around multiple quasi-public payers (the social insurance funds)

and is funded through statutory social insurance contributions on wages rather than actuarial risks. The public guarantee for health care was often layered onto the mutual society that provided insurance to lower-income workers at the end of the nineteenth century, formalizing and extending the position of social insurers in managing the system. In these systems, much of the care is also provided privately, often by nonprofit organizations with links to major social groups. In the past decade, a number of Eastern European and former Soviet states have moved toward a social insurance model, building on the logic of the systems in continental Europe.

The United Kingdom, the Scandinavian countries, and to a large part, Spain, Portugal, Italy, Canada, Australia, and New Zealand, operate national health insurance and service models, in which a large part of the expenditure on health care is financed via general taxation rather than via contributions raised through taxes on wages. In these countries, the public sector operates as a single payer for health care and much of the health care is financed through a single public purchaser at the national or subnational level. Although early health care coverage in these countries often developed through mutual societies similar to those in the Continental European countries, the government assumed a more extensive and direct government role as insurance or services were extended in the mid- to late-twentieth century. Many of these countries combine the central role of the public sector in financing and managing services with a direct role in delivering care, with only Canada combining a single-payer system with a primarily private not-for-profit provision.

The health care system in the United States combines a multipayer private insurance system with a large system of public financing based primarily on social insurance contributions. Direct public financing in the United States remains linked to programs that target particular social groups, namely Medicare, Medicaid, and benefits for veterans. Most of the working-age population and children are covered through private voluntary insurance or remain uninsured. However, governance of the private insurance sector remains extensive, namely through a policy that

aims at promoting private voluntary insurance through the tax system and ensuring some portability of benefits for workers changing jobs. The provision of health care in the United States is provided almost exclusively privately, by a combination of for-profit and not-for-profit providers.

Through much the 1960s and 1970s, health care policy in many advanced industrial countries aimed at expanding coverage and access to health care and at introducing tools of planning into the health care sector. However, growing economic difficulties and aging populations have produced rising costs alongside growing expectations, bringing a range of new issues onto the agenda in many countries. First, many countries have looked to control costs and have introduced reforms to do so through more direct state involvement in setting global budgets, the introduction of greater individual financing of services, and the increased use of incentives for micro-efficiency. These policies—which are often introduced in a single context—have a range of implications for public governance, simultaneously increasing state control, recasting state regulation, and reducing state responsibility for financing services. However, a second trend, which can lead to greater expenditure and new forms of public intervention, is toward greater emphasis on quality and innovation in the health care sector. Increasingly, issues of improving health care outcomes, reducing variation in quality, and improving patient satisfaction have become prominent in health policy debates. Many countries have begun gathering more performance information, setting targets, and monitoring the delivery of services, in an attempt to reform the delivery of health care services. Both trends have reshaped the role of the state vis-à-vis both patients and professionals, with the state assuming more responsibility for ensuring adequate quality and costs and often challenging professional autonomy over clinical processes to do so. In the United States, many private health care insurers have played a similar role, attempting to recast professional practices to cut costs and potentially improve quality. Thus, governance of the health care sector is in transition, with a tendency toward more

state control and responsibility as well as pressure for reducing state expenditure.

Hedging

Hedging is an investment strategy designed to reduce the potential volatility in the value of a portfolio by reducing the risk of having losses embedded within that portfolio. A perfect hedge eliminates the possibility of future losses and thus preserves the initial value of the portfolio. It involves the simultaneous initiation of equal and opposite positions in the spot and futures markets. This offers investors certain knowledge of their future financial position but, because a perfect hedge also rules out any chance of making gains, it is an investment strategy only for the most risk-averse. Investors are more likely to opt for an imperfect hedge, whereby they attempt to insure themselves against only a proportion of potential losses. If, for instance, investors hold shares in a company whose price volatility historically has almost exactly matched that of the stock market index, they can offset the risk of a general market downturn by buying a derivative contract that will return a profit on that eventuality. This does not eliminate the risk of the individual share price falling for reasons that are unrelated to a general market downturn—hence, it is not a perfect hedge—but it does leave open the possibility that gains can be made if the individual share price performance proves to be strong.

Hedging is therefore a means of minimizing the speculative dimension of an investment portfolio. Arguably, the most basic assumption of investment finance is that risks and returns are directly proportional to one another: the higher the level of risk, the higher the likely return. To speculate is willingly to acquire additional forms of risk, in the hope that this will lead to enhanced future returns. To hedge, by contrast, is to seek protection from risks, albeit at the expense of enhanced future returns.

If this implies that hedging and speculating are entirely independent functions of investment activity, this might be somewhat misleading. All hedgers require speculators to construct the position that they intend to adopt as their hedge. Financial markets would lack the necessary counterparties that are fundamental to their existence if all investment strategies tended toward perfect hedging. Speculators accept the exposure to price moves that hedgers attempt to insure themselves against. In the absence of speculators, financial markets would cease to function in the way they do today because there would be no mechanism for transferring risk away from the risk-averse, and such transfers are the condition upon which modern financial systems are based. The task for public policymakers intent on preserving such systems, while rendering them stable, is far from straightforward. They must devise forms of market governance that offer sufficient incentives for speculators to act as counterparties for hedgers, while avoiding turning the whole of the financial system into an arena for pure speculation.

HEGEMONY

In its most straightforward use, hegemony describes the dominance of one group over another. Increasingly, the term is used as shorthand to describe the relatively dominant position of a particular set of ideas and their associated capacity to become commonsensical and intuitive, thereby rendering alternative ideas contrary to the precepts of common sense, counterintuitive, irrational, and possibly even incapable of articulation. The associated term *hegemon* is used to identify the actor, group, class, or state that exercises hegemonic power or that is responsible for the dissemination of hegemonic ideas.

Hegemony derives from a Greek term that translates simply as "dominance over" and that was used to describe relations between city-states. Its use in political analysis was somewhat limited until Antonio Gramsci's intensive discussion of the concept in his political thought. Gramsci's discussion of hegemony followed from his attempts to understand the survival of the capitalist state in the most advanced Western countries. As a follower of Karl Marx, Gramsci understood the predominant mode of rule as class rule and was interested in explaining the ways in which concrete institutional forms and material relations of production came to prominence. The supremacy of a class and thus the reproduction of its associated mode of production could be obtained by brute domination or coercion. Yet, Gramsci's key observation was that in advanced capitalist societies, the perpetuation of class rule was achieved through largely consensual means—through intellectual and moral leadership. Gramsci's analysis of hegemony thus involves an analysis of the ways in which this cognitive domination is achieved, of the dissemination and acceptance of capitalist ideas as commonsensical and normal. A hegemonic class is one that is able to attain the consent of other social forces, and the retention of this consent is an ongoing project. To secure this consent requires a group to understand its own interests in relation to the mode of production, as well as the motivations, aspirations, and interests of other groups. Under capitalism, Gramsci observed the relentless contribution of civil society institutions to the shaping of mass cognitions. Via his concept of the national-popular, he also showed how hegemony required the articulation and distribution of popular ideas beyond narrow class interests.

Gramsci's analysis of bourgeois hegemony was grounded in detailed historical analysis, but it also carried clear implications for revolutionary socialist strategy. The acquisition of consent before gaining power is an obvious implication, and here Gramsci offered a distinction between two strategies: war of maneuver (in essence a full frontal assault on the bourgeois state) and war of position (engagement with and subversion of the mechanisms of bourgeois ideological domination). But it is important to recognize that Gramsci understood hegemony not simply in ideational terms. His idea of historic blocs was used to show how hegemonic classes combine their intellectual leadership of clusters of social forces with an increasing capacity to exercise control of the processes of production.

This understanding of hegemony derived from Gramsci acquired some followers interested in understanding the rise of (Margaret) Thatcherite political economy and the ascendancy of the New Right more generally during the 1970s and 1980s, but perhaps its most extensive application has been to the analysis of international relations and international political economy, via the so-called transnational historical materialism. Scholars within this tradition have been careful to distinguish their project from the way hegemony has been used within orthodox (predominantly) realist international relations (IR). In state-centered IR analysis, hegemony denotes the existence within the international system of a dominant state or group of states. In the branch of realist analysis known as hegemonic stability theory, the presence of a hegemon (say Britain in the nineteenth century and the United States after 1945) generates patterns of stability within the international system. The hegemon has a self-interest in the preservation of the system and is, therefore, prepared to underwrite the system's security with its military might. At the same time, the hegemon is responsible for the formulation of the rules that govern interaction within the international system.

The transnational historical materialist school sees states as important components of hegemonic orders, but associates hegemony with the economic, political, and social structures that facilitate particular patterns of production within the world economy. These world orders function via the propagation of rules and norms, many of which are given legitimacy through international organizations and institutions, and of which the most crucial tend to govern the conduct of monetary and trade relations. International institutions are thus seen as either conduits for the legitimation of particular regimes of capitalist accumulation or devices to absorb potentially counter-hegemonic ideas and social forces. Thus, the hegemonic order of the nineteenth century was underwritten by institutions such as the gold standard and norms such as free trade, as well as by British military power and the global reach of the British imperium. In the present period, the global emphasis on neoliberal policy logics is given expression by the likes of the World Trade Organization (WTO), the World Bank, the International Monetary Fund (IMF), and the Organisation for Economic Co-operation and Development (OECD). Such institutions articulate a nonnegotiable and particular vision of economic order, but through associated notions of "good governance," and they are able to lend an air of popular-democratic legitimacy to the preset regime of accumulation.

HEMISPHERIC INTEGRATION

Hemispheric integration refers to the process by which a majority of countries in the Americas are liberalizing their trade regimes, thereby contributing to the establishment of a hemisphere-wide free trade area. At present, liberalization has taken the form of numerous and coexistent bilateral and multilateral free trade agreements (FTAs) and customs unions. However, formal negotiations concerning a proposed Free Trade Area of the Americas (FTAA) have been underway since April 1998. The FTAA, if realized, will mark a significant step in the integration of the Western Hemisphere's economies.

The initial step toward hemispheric integration was taken in June 1990, when then President of the United States George H. W. Bush launched the Enterprise for the Americas Initiative (EAI), an ambitious project to establish a free trade area stretching from Anchorage to Tierra de Fuego. In addition to promoting extensive trade liberalization with the goal of establishing free trade throughout the Western Hemisphere, the EAI also envisaged the negotiation of agreements with selected Latin American countries that were to encourage market-led reforms and stimulate private investment and to relieve indebtedness to the United States, thereby releasing revenues for environmental programs. The North American Free Trade Agreement (NAFTA)—negotiated by the governments of Canada, the United States, and Mexico and launched in 1994—was to form the hub around which enlargement of the free trade zone would proceed. Since April 1998, the formal negotiations envisaged under the EAI have proceeded under a general agreement among thirty-four countries, which created a timetable for a series of multilateral summits aimed at introducing the FTAA by 2005.

Although the FTAA is also concerned with establishing a continental free trade zone, like the European Union (EU), it differs in that it is proceeding through the incorporation on already existing bilateral FTAs and regional trade associations, such as the Andean Community, the Caribbean Community and Common Market (CARICOM), the Central American Common Market (CACM), the Mercosur, and, of course, the

NAFTA. More recent FTAs and multilateral initiatives, such as the Central American Free Trade Agreement (CAFTA)—signed by the governments of the United States, Guatemala, El Salvador, Honduras, Costa Rica, Nicaragua, and the Dominican Republic in May 2004—are being negotiated with the view to future incorporation within the FTAA.

Although the FTAA was intended to come into effect by December 2005, recent negotiations have failed to result in a consensus. Several Latin American countries have recently elected Leftist governments opposed to various aspects of the hemispheric integration agenda, such as the U.S. government's continued subsidizing of domestic agriculture, and some Leftist Latin American governments—notably that of Hugo Chávez's Venezuela—are currently opposed to the entire principle of free trade. The FTAA negotiations have been tabled to resume in 2006.

The current agenda for hemispheric integration has also come under fire from a variety of civil society critics. Some see the FTAA, in particular, as a U.S.–led project aimed at locking the contracting countries' economies into an essentially neoliberal framework. The uneven impact of the NAFTA in development terms is often used an example of how the supposed benefits of free trade are by no means certain to materialize. Labor and environmental activists, in particular, have pointed to the potential "race to the bottom" in working and environmental protection standards as Latin American countries compete for investment from the United States. Initiatives such as the Plan Puebla Panama—a multibillion-dollar project aimed at, among other things, improving infrastructure links between the southern Mexican states and the Central American isthmus—are seen as being integral to the current hemispheric integration agenda. However, activists have opposed such projects on the grounds of their environmental costs and the impact on local communities, which include many indigenous subsistence farmers with no legal claim to lands being cleared or flooded for infrastructure development purposes. Meanwhile, there is a vocal anti-FTAA lobby within the United States. The EU is cited as a major regional initiative that, they argue, has eroded the sovereignty of its member states and made borders meaningless. They oppose the potential migration of jobs from the United States to other countries in the Americas where labor costs are lower. They also fear the increased influx of migrant labor into the United States.

In summary, the process of hemispheric integration—and the FTAA, in particular—is proving to be a major political issue and not just for developing countries within the hemisphere itself.

HETERARCHY

A governance mechanism that is neither hierarchy nor market (anarchy) is usually called a *network.* It is described as horizontal and nonhierarchical, but its basic organizing principle can more positively and appropriately be called *heterarchy.* Etymologically speaking, heterarchy consists of the Greek words *heteros,* the other, and *archein,* to rule. In a heterarchy, a unit can rule, or be ruled by, others depending on circumstances, and hence, no one unit dominates the rest.

The earliest academic discussion of the concept can be attributed to Warren S. McCulloch, a pioneer in cybernetics, who in the mid-1940s regarded a neural

network as an archetype of heterarchy. The value of the concept was rediscovered decades later by social scientists in as diverse disciplines as archeology, management, sociology, political science, and law.

James A. Ogilvy presented the simplest illustration of heterarchy as a game of rock, paper, and scissors, in which rock beats scissors, which beats paper, which in turn beats rock. A similar, though far more complex and dynamic, logic can apply to the checks and balances among three branches of a government as well as the relationship between sovereign states and international institutions such as the European Union (EU) and the World Trade Organization (WTO). Archeologists have also found heterarchies of power in certain ancient societies.

Heterarchy in a social system constitutes a circular relationship among actors variously ranked according to different metrics; thus, it is characterized by multiple hierarchies and distributed authority, rather than by the lack thereof. Gunnar Hedlund contended further that hierarchies and even markets could be observed in some multinational corporations, in which heterarchy could be conceived as a metagovernance mechanism of flexible coordination among transactions organized by variant governance modes. Other scholars have further advanced the concept of metagovernance at a national level.

Circularity in heterarchy presupposes direct links among nonadjacent levels, especially those between the highest and lowest. Kyriakos M. Kontopoulos argues that heterarchy, or tangled hierarchy, involves many-to-many relations among levels, in contrast with hierarchy—a layered and fully nested structure of one-to-many connections. Likewise, David Stark maintains that units in heterarchies are characterized by interdependence, whereas dependence and independence define hierarchies and markets, respectively. Heterarchy in this sense is a set of multiple and intricate links, usually across such conventional divides as levels, departments, and sectors, that form a multicentric network of heterogeneous actors with distinctive resources and capabilities.

Heterarchical networks are considered both flexible and dynamic; authorities therein are not institutionally fixed but, rather, change places as situations evolve.

Heterarchy is arguably the most efficient and effective governance mechanism for facilitating multilateral exchange of information and for vibrantly organizing and enabling distributed intelligence and innovation, with open source software development being a prominent example.

Heterarchy is envisaged as an increasingly influential organizing principle of regional and global governance, at least in some geographical and functional areas. Some scholars regard the EU as a heterarchical networked polity, and others have conducted research on emerging private authority and heterarchy in a global society. Global governance is one of the most fertile grounds for heterarchies because of the current development of transnational networks among actors within or across public, private, and civic sectors ranging from local to global levels, which deal with problems that cut across various issues.

HIERARCHY

Hierarchy is composed of the Greek words *hieros* (sacred), and *archein* (rule or order). Originally referring to an order of angels, the term came to signify an order of clergy. In modern societies, hierarchical

organizations have pervaded all aspects of life. Yet, they are increasingly under criticism because the features that have made them effective are now deemed to be sources of problems.

Conceptions of Hierarchy

Hierarchy has been conceptualized in two ways. A conventional usage, as epitomized by Max Weber's analysis of modern bureaucracy, highlights legal-rational authority in a formal organization. This view holds that hierarchy consists of a central authority and a tightly integrated chain of command and control and that authority is gradually transferred downward. The relationship between units at different levels is that of superordination and subordination, and each unit is accountable to only one superior at the next level.

Hierarchical organization is also characterized by both specialization and formalization of activities. Hierarchy is based on the division of labor: each unit is functionally differentiated and assigned a set of specific tasks. It is formalized in the sense that roles, relationships, and behaviors therein are prescribed in a set of rules, which serves as the cornerstone of rational-legal authority. Yet, hierarchy can also refer to an informal structure of inequality in power, such as class structure in society and hegemony in world politics.

Herbert A. Simon provided a broader notion of hierarchy in his analysis of complex systems. Simon believed that hierarchy need not be defined by its authority relations. Instead, it is to be distinguished by its nestedness, or an arrangement of units composed of several sub-units, each of which is further organized in the same fashion down to the bottom. This structure reduces complexity by making partitions within an organization to divide and conquer, as can be observed in configurations of congressional committees, governmental agencies, and corporate departments.

This instrumental conceptualization of hierarchy is tied with a voluntaristic view of authority. Here, authority is not imposed top-down; rather, it is based on mutual consent, especially that of subordinates, and is thus delegated upward. This alternative interpretation of hierarchy and authority paved the way for vast literature on organizational design. Agency theory, for example, focuses on the problems that accrue from the delegation of decision-making authority to an agent by a principal. Also at issue is the span of control: the number of subordinates directly supervised by a superior. A narrower span will render a direct control more effective while creating more levels; as a result, the overall management of an organization will likely be less effective.

The Prevalence of Hierarchical Organizations

How can we explain the prevalence of hierarchical organizations? There are three important approaches to this question. New institutional economics, as developed by Williamson, posited that hierarchy can be an efficient response to market failure. Given the assumption of bounded rationality and the possibility of opportunism, the higher the uncertainty and costs of transactions are, the more likely they are arranged hierarchically. Hendrik Spruyt extended this insight into a political realm to assert that sovereign state politics outmaneuvered alternative polities such as feudal state and empire because of its superior ability to reduce transaction costs, prevent opportunism of its members, and make credible commitments.

In contrast, sociological institutionalism argues that hierarchy has become widespread not so much because it is functional but because it is regarded as an appropriate way to coordinate interactions in a world dominated by modern Western culture. Thus, an institutional environment constrains but also constructs and empowers hierarchical organizations. On a similar note, Michael Barnett and Martha Finnemore maintain that international organizations exercise regulative and constitutive powers that derive from various kinds of authority based on their rational-legal status, ostensible impartiality and morality, and expertise. Barnett and Finnemore also show that these organizations can even exhibit dysfunctional behaviors because of their excessive formalization and specialization.

Historical institutionalists in political science and sociology pay much closer attention to both the sequences and varieties of organizational development while emphasizing the influence of domestic

political processes mediated by formal and informal institutions. These scholars demonstrate that the development of bureaucratic state and corporate capitalism was neither inevitable nor unilinear, but historically contingent. This approach also points out that organizations can have unintended consequences and that, therefore, theories of organizational design have a substantial limitation.

Hierarchy is, however, but one governance mechanism and is usually contrasted with the market, or anarchy. Another governance mechanism is network, which is organized according to the principle of heterarchy. Each organizing principle has ideal-typical modes of coordination such as authority, price, and trust; more specifically, command and control in hierarchy, bargaining and exchange in anarchy, and dialogue and diffused reciprocity in heterarchy. This categorization, however, is limited, as Williamson uncovers hierarchy in contractual relations that result from bargaining.

Hierarchical Organizations in a Dynamic and Globalizing World

At a time when hierarchical organizations have permeated domestically and internationally, publicly and privately, they have increasingly been challenged by ever-more complex problems in a rapidly globalizing world. Specialization and formalization in hierarchical organizations can stabilize expectations and behaviors of their members, but can also hinder flexible and adaptive governance. In addition, hierarchical organizations are controlled in a top-down and standardized manner, thereby making them seem inattentive to the diverse interests of their stakeholders despite the demand for participatory governance. The perceived inaptness and unresponsiveness of hierarchical organizations have cast doubt on their legitimacy as an effective governing mechanism.

In response, three measures have been taken. The first response is to restructure hierarchy, for example by slashing the number of its layers. The second recourse is the market solution: governments privatizing public services, and companies outsourcing their previously internalized transactions. Finally, some

organizations and their sub-units are experimenting with collaboration across traditional boundaries, variously called networks, partnerships, projects, teams, and communities of practice. Debates have ensued about how to make sense of the changing nature of governments and corporations, especially their authority, capability, and accountability. Some studies have also called attention to the importance of putting into perspective the mechanisms organized according to three principles—hierarchy, anarchy, and heterarchy—to see how they should work in tandem and coevolve.

HIGH-RELIABILITY ORGANIZATION

Increased dependence on high-performing technologies in critical infrastructures such as transportation, energy, and telecommunications is a hallmark of modern societies in a technological age. At the same time, many technologies, such as nuclear weapons, nuclear power plants, and large jet aircraft, are highly hazardous, with costly if not catastrophic consequences

attending accidents, failure, or, more recently, terrorist assault. The reliable management of these crucial or hazardous systems is now a major concern of the modern state.

The term *high-reliability organization* (HRO) has been used to refer to an organization charged with the management of a hazardous or crucial technical system under the highest level of operational reliability. For an HRO, avoiding accidents, failure, or the worst consequences of a terrorist attack is a requirement for societal safety and security, as well as for continued acceptance and possibly survival in an unforgiving political and regulatory niche it is forced to occupy. The special challenge for an HRO lies in a specific set of events that simply must not happen, that must be precluded by technological design and by organizational strategy and management. The responsibility to preclude a given set of events from occurring means that trial and error is sharply limited as an option for a high-reliability organization. The cost of key errors, should they occur, cannot be balanced by the learning that might come from them.

This nearly failure-free standard is a rare challenge for human organizations. Overwhelming evidence and dominant theoretical perspectives in the study of organization suggest that such performance may even be beyond the capacity of human organizations, given their inevitable imperfections and the predominance of trial and error learning in nearly all human undertakings. Yet, a group of organizational researchers have identified an unusual set of organizations that seem to be achieving this standard and thus surviving in highly precarious settings with respect to social demands for reliability. High reliability as a distinctive organizational property as well as social challenge has come into its own recently as a subject of careful analysis.

The High-Reliability Perspective

Individual case studies of nuclear aircraft carriers, nuclear power plants, and air-traffic control centers have been the cornerstone of the emergence of HRO research. In these organizations, reliability is not treated as a probabilistic property that can be traded off at the margins with other organizational values such as efficiency or market competitiveness. Instead, organizational design and management treat reliability in relation to occurrences that must, as nearly as possible, be deterministically prevented.

The distinctive features of these organizations as reported by high-reliability researchers, include (a) high technical competence throughout the organization; (b) a constant, widespread search for improvement across many dimensions of reliability; (c) a careful analysis of a set of core events that must be precluded from happening; (d) an analyzed set of "precursor" conditions that could leave operations a single contingency away from the precluded events or that would constitute conditions that lie outside prior analysis; (e) an elaborate and evolving set of procedures and practices that keep operations away from the zone of precluded events as well as precursor conditions; and (f) a formal structure of roles, responsibilities, and reporting relationships that can be transformed under conditions of emergency or stress into a team-based approach to problem solving. Further, these organizations develop (g) a culture of reliability under which the values of care and caution, respect for procedures, attentiveness, and individual responsibility for the promotion of safety are widely distributed among members throughout the organization. Finally, these organizations are characterized by (h) external supports, constraints, and regulations that allow for the development of the other features noted previously. The HROs analyzed so far all exist in closely regulated environments that constrain them to take reliability seriously but that also shield them from full exposure to market competition. Competitive demands would likely undermine the precluded event standard of reliability in favor of organizational strategy that would turn reliability into a "marginal" property.

HROs are further distinguishable from organizations that may value safety among other properties in their production processes. It is not the valuation of safety, per se, that seems to drive the pursuit of high reliability in an HRO. Rather, it is the intense disvaluing of error, particularly the misidentification, misspecification, or misunderstanding of activities and technical variables, that lies at the heart of an HRO.

A Conflicting Perspective

As it has reported more findings, HRO research has not been without controversy. Earlier work by sociologist Charles Perrow asserted that organizations charged with the management of complex and closely paired technical systems (the type typically studied in reliability research) could never hope to transcend an intrinsic vulnerability of these technologies to a highly interactive form of degradation. Complexity and tight coupling can induce and propagate failure in ways unfathomable by operators in real time. These technologies are, in effect, "normal" accidents waiting to happen, accidents that are inevitable outcomes of the failure probabilities that attend their structural features. In this perspective, frameworks of organization surrounding these systems cannot alter, and indeed are likely to add to, the risks embedded in their technical cores. From the normal accident viewpoint, organizational variables add little to risk reduction, and the idea that there are HROs that successfully fill a demanding niche based on the social protection they afford is at best a temporary illusion.

The controversy, in its most extreme form, centers on an assertion that cannot actually be disproved because of its tautological nature. No amount of good performance can falsify the theory of normal accidents because it can always be said that an organization is only as reliable as the first catastrophic failure that lies ahead, rather than the many successful operations that lie behind. Yet, ironically, this is precisely the perspective that many managers of HROs themselves share about their organizations. They are constantly seeking improvement because they are running scared about the accident ahead, rather than being complacent about the performance records compiled in the past. This prospective approach to reliability is actually a distinguishing feature energizing many of the extraordinary efforts undertaken within HROs.

This controversy aside, high-reliability researchers would have to concede that they have studied individual organizations in what amounts to a single snapshot in time. Whether features of HROs can persist throughout the life cycle of an organization is yet unknown.

Further, high reliability has been taken as a defining characteristic of the special organizations selected for study by HRO researchers. It remains for researchers to identify which subset of properties, and in what degree, might contribute to higher reliability among a wider variety of organizations. More recent research has begun to apply reliability analysis more broadly from structure to process, especially individual cognitive and sense-making processes, in understanding what promotes higher reliability among organizations.

The High-Reliability Challenge

Whatever the research perspective, high reliability is a major challenge in the management of the technologies and infrastructures on which modern society increasingly depends. The designers of these technical systems seldom design them to the requirements and tolerances of those organizational settings in which they must be managed. The managers and professionals in these organizations then must face the challenge of coping with the close error tolerances that engineers give them. That these managers do so with near heroic effort is seldom noticed by the public, which relies on them for livelihood and lives. An HRO, designable and sustainable or not, is increasingly an implicit mandate of a technological society.

Hindu Governance

Hindu governance refers to those governing practices whose legitimacy derives from Sanskrit texts. Such texts have been understood to describe a social order based on caste, providing each individual with duties whose fulfillment contributes to the fulfillment of the community as a whole. An argument establishing a particularly Hindu type of governance would trace such governing practices throughout history by focusing on the relationships among political, economic, and social forces.

Ancient texts describe a world of chaos in the absence of a king. Such texts were used to legitimate particular forms of rule. The Puranas, for example, celebrate the sanctity of the earlier Vedas and articulate the threat to society posed by those outside the caste system. Some claim that the Ramayana in medieval times was also used to mark outsiders, identifying Muslims with the villain Ravana and Hindus with the hero Rama. Others have stressed the large variety of regional responses to influences originating outside the subcontinent. Both kings and merchants heavily patronized priests in premodern times; such religious leaders in turn provided legitimacy for political and economic undertakings.

During the independence movement from British rule, Mohandas Gandhi mobilized ancient Sanskrit terms such as *dharma, swadeshi,* and *ramarajya* (the rule of Rama) for decolonization. He imbued such terms with a sense of self-reliance, self-actualization, and the removal of foreign influence. In 1948, Gandhi was assassinated by a member of a Hindutva organization, the Rakshatriya Swamasevak Sangh (RSS). This left Jawaharlal Nehru to lead the Indian National Congress and push forward policies of political non-alignment, economic socialism, and religious secularism.

In 1980, the Bharatiya Janata Party (BJP) was formed, relying for support on organizations like the RSS. The BJP steadily rose to power through coalitional and symbolic politics until forming the national government in 1996. The rise of the BJP was marked by a particular kind of *swadeshi*—the strength of Hindu India. Such *swadeshi* allowed the BJP to resist the reservation of jobs for Backward and Untouchable Castes, drawing the support of high-caste Hindus; to support the destruction in 1992 of the mosque occupying the alleged birthplace of Rama, drawing the support of low-caste Hindus against Muslims; to implement liberalization measures throughout the 1990s, drawing the support of middle-class entrepreneurs; and to stage the 1998 nuclear detonations, uniting Hindus in support of India's military strength. The BJP lost power in 2004.

Nehru's secularism, socialism, and non-alignment seem to deny the existence of any particularly Hindu type of governance. The BJP, however, suggests its persistence by deriving political legitimacy from religious figures like Rama and the sanctity of practices allegedly rooted in Sanskrit sources. Such departures from and returns to the authority of Sanskrit texts punctuate any history of Hindu governance. However, given the contested definitions of Hinduism, as well as the tensions within India along caste, regional, and religious lines, the meaning of Hindu governance is elusive and the phrase rarely used.

HIV/AIDS

Since coming to the attention of the international medical community in the mid-1970s, HIV/AIDS has killed

more than twenty-five million people and infected nearly forty million people worldwide according to the Joint United Nations Programme on HIV/AIDS (UNAIDS) estimates. Human immunodeficiency virus (HIV) is a virus that infects the immune system. By destroying the body's ability to protect itself against infections, HIV leads to the syndrome known as acquired immunodeficiency syndrome (AIDS). The virus spreads mainly through sexual contact, but it may also be transmitted through blood and through breast milk.

For social scientists, HIV/AIDS is intimately linked to the processes collectively known as globalization. The spread of HIV/AIDS is fueled by the decreasing salience of national boundaries and, by the same token, it poses a challenge for transnational actors who are increasing in salience. This entry will explore the specific challenges to governance brought about by the spread of HIV/AIDS and the roles that different state and nonstate actors may play in combating it.

Social and Economic Repercussions

HIV/AIDS presents a public-health threat that cuts across social and economic boundaries, both locally and globally. Relative to governance, however, HIV/AIDS is overwhelmingly a developing-world issue, where social, economic, and political instability has facilitated the spread of the virus.

HIV/AIDS has taken the most devastating social and economic toll in Sub-Saharan Africa, one of the earliest regions to be affected by the virus. In basic demographics, the virus has infected about seven percent of the region's total adult population and more than twenty percent in nearly all of the southern-most countries. Whereas the average life expectancy in Sub-Saharan Africa had increased significantly until about 1999, the spread of HIV/AIDS has dramatically reversed the trend. Similarly, the virus has dragged down the average standard of living by socially and economically overburdening individuals, families, and schools. Perhaps most strikingly, more than twelve million children in Sub-Saharan Africa have been orphaned by the HIV/AIDS crisis. In a society where orphans are typically cared for by members of the extended family and formal adoption is considered

taboo, HIV/AIDS presents an unprecedented and daunting challenge for child welfare. Poorly equipped orphanages are facing massive influxes of children, many of whom are likely to end up on the streets, where they are vulnerable to sexual exploitation, drug use, and consequently contracting and spreading HIV/AIDS themselves.

As a sexually transmitted virus, HIV/AIDS has been especially destructive to African economies by concentrating its spread among working-age adults. An area of particular devastation is the agricultural sector, where the high number of AIDS-related deaths among farm laborers has contributed to national food shortages. At the family level, the financial strains of caring for the sick and paying for funeral expenses have stretched already low monthly household incomes, thus further contributing to the cycle of poverty and declining living standards.

Governance Challenges

The social and economic destruction highlighted amounts to an overwhelming burden for the state. At the same time, HIV/AIDS has reduced state capacity for governance by infecting significant percentages of the people that operate the bureaucratic system. By simultaneously overburdening states and reducing state capacity, HIV/AIDS may plausibly contribute to state failure or collapse. The virus further presents a national security challenge by infecting the military at a disproportionately high rate, which leaves states vulnerable to both international and external conflict. Similarly, HIV/AIDS poses an international security challenge by threatening regional political instability while reducing the capacity of African military peace-keepers to resolve conflicts.

State, societal, and international actors play important roles in determining how quickly the virus spreads. The following section outlines the variety of roles that major political actors may play in combating the spread of HIV/AIDS.

The State

National responses to the HIV/AIDS epidemic have varied widely. In trying to define what contributes to

aggressive and effective state responses, social scientists have looked to a variety of institutional, cultural, and international factors. On the most basic institutional level, addressing HIV/AIDS is a question of state capacity, or in other words, of the ability of a state to implement and enforce policy. Regime type may also play a role in contributing to effective national HIV/AIDS policies, although its precise effects are unclear. Although formal democratic systems force governments to respond at least moderately to public health needs, strong authoritarian states may be better able than are weak democracies to implement and enforce effective policies. Cultural settings also shape state responses to HIV/AIDS by influencing the government's general willingness to address the problem, by shaping the kinds of policies that the government adopts and by influencing the effectiveness of the government's policies. Finally, international donors and nongovernmental organizations shape national HIV/AIDS policies by including policy requirements in loan packages, by mounting public opinion campaigns, and by providing policy guidelines and technical assistance.

Civil Society

Nongovernmental advocacy groups have enjoyed some striking successes at both the national and international levels in shaping HIV/AIDS policies, such as in reversing a wide range of discriminatory national laws and, most prominently, in forcing multinational pharmaceutical companies to reduce the price of AIDS treatments. Yet, the degree and type of civil-society response to the HIV/AIDS epidemic has varied widely across national contexts, from strong political activity to a focus on service provision, or even a general refusal to address the epidemic. One challenge for social scientists is to explain national differences in civil-society responses to the HIV/AIDS epidemic. Other important challenges are to understand the ways in which government policies can create or obstruct opportunities for civil-society groups to engage in HIV/AIDS advocacy and to explain the success or failure of attempts by advocacy groups to shape policy.

The International Community

The HIV/AIDS pandemic also highlights opportunities and challenges for global cooperation in promoting public health. The successful international effort to provide cheap antiretroviral drug therapy to citizens of the developing world illustrates the potential for an international alliance between states and civil society to advocate for the public good over the economic interests of multinational corporations. Similarly, the broad variation in on-the-ground outcomes of the international effort to combat HIV/AIDS reminds us that global governance paradigms are filtered through political and cultural patterns, both national and local.

HOLLOW STATE

The concept of a hollow state evokes a decline in the power of the state. The state is often thought of as a sovereign authority over a geographical area; it has the power to get much of what it wants done. In contemporary governance, the authority and power of the state are thought to have lessened. The state has become increasingly fragmented; it is less able to impose its will upon its territory.

Several processes have contributed to the hollowing out of the state. Some of the state's functions have moved upward to international and regional organizations such as the European Union (EU). Although nation-states remain important institutions, the growth

of regional blocs, international law, and economic globalization have combined to limit their autonomy. Some of the state's functions have moved downward to local levels of government and to special purpose bodies. Devolution takes control of activities away from the center. Finally, some of the state's functions have moved outward as a result of the increased use of markets and networks as means of service delivery. Even when the state retains a dominant role within networks, it still has to enter negotiated relationships with organizations in civil society if it is to implement policies effectively.

The hollowing out of the state raises problems of accountability, fragmentation, and steering. First, representative democracies typically hold civil servants and agencies accountable to citizens by way of elected politicians. If these politicians are no longer able to control agencies, how is such accountability to operate? Second, the hollow state is fragmented in that decisions and services are made by numerous organizations, which often have different cultures. This fragmentation makes communication and coordination especially difficult. Third, when functions are transferred to other organizations, the state arguably needs to find ways of influencing and coordinating the various actions of these organizations. These problems arguably require politicians and civil servants to adopt new roles and new techniques if they are to govern effectively.

The concept of the hollow state has met with several criticisms. It has been argued that because the state voluntarily gave up functions, they are no loss. But one might reply that the concept seeks to describe the effects of actions irrespective of the motives for them. It has also been suggested that the state remains powerful because it retains regulatory control over many of the functions it appears to have lost. This criticism raises further questions about contemporary governance. How many of the lost functions are covered by regulatory bodies? Is the state able to steer regulatory bodies effectively? Have regulatory bodies been "captured" by those they are supposed to oversee?

HUMAN CAPITAL

Human capital describes the intangible collective resources possessed by individuals and groups within a given population. These resources include all the knowledge, talents, skills, abilities, experience, intelligence, training, judgment, and wisdom possessed individually and collectively, the cumulative total of which represent a form of wealth available to nations and organizations to accomplish their purpose. Human capital is available to generate material wealth for an economy or a private firm. In a public organization, human capital is available as a resource to provide for the public welfare. How human capital is developed and managed may be one of the most important determinants of economic and organizational performance.

Human-Resource Capitalism

The concept of human capital stems from the economic model of human-resource capitalism, which emphasizes the relationship between improved productivity or performance and the need for continuous and long-term investments in the development of human resources. This model can be applied on a broad scale where investments in human capital are viewed as affecting national and global economic performance, or more narrowly, where investments in people are viewed as crucial to organization performance. This differs from a more traditional and instrumental approach where human resources are primarily seen as a cost to be contained beyond immediate and short-term needs. This short-term view often addresses change or poor performance by seeking government intervention to offset competition, and by

using cutback methods for keeping wages down, contracting out, and automating jobs.

A human-resource capitalism model argues that the principal source of productive capacity, whether in an economy or organization, rests in the capacity of people. Therefore, strategies need to be developed to capitalize on the potential of this resource by developing learning systems that will cause the capacity of human capital to grow into the future. For a national economy, this may entail reforming educational institutions to ensure the provision of a quality workforce that fits the needs of industry for high economic productivity and the maintenance or improvement of the national quality of life. For an organization, this model suggests that high productivity and performance depend on developing learning systems that reflect the commitment of an organization to its human resources. As a result, ongoing investments in training, skill development, and job enrichment (versus expansion) engender a reciprocal commitment among members to organizational goals and objectives.

This represents a shift in thinking away from the notion that human resources are to be consumed, as are other nonhuman resources, and that members of an organization need to be controlled to ensure compliance with organization norms. Instead, human resources are to be nurtured to arrive at a mutual commitment where tangible investments by the organization are favored and then reciprocated by its members with higher levels of performance. Human-resource capitalism recognizes that the key factors of performance depend on having an adequate supply of high-quality human resources, management strategies that emphasize quality and productivity, and patterns of work organization that foster both of these goals. The emphasis on human capitalism in an organization goes beyond recruiting and compensating the highest-qualified people possible, by investing in their development heavily, managing them wisely, and ultimately, retaining them for the long term.

Managing Human Capital

The management of human capital is diffused throughout an organization. All management decisions and actions that affect the nature of the relationship between the organization and its employees are seen as important. As a result, all management actions can positively or negatively affect the potential of human capital to influence organization performance. In this view, although the organization may contribute to the development of human capital, its ownership rests with each individual. Collectively, all the knowledge, skills, and abilities within an organization and available at any given time constitute a human capital pool. Although this talent is available to achieve positive performance, the totality of management practices needs to consistently tap this human capital pool in such ways as to influence individual and group attitudes and behavior toward the desired organizational goals.

Human Capital and Performance

Reciprocal commitment in an organization suggests that a relationship exists between certain management practices and performance. At a point where the total effort of human capital coalesces into a critical mass, high organizational performance seems possible. Here, human capital, fully developed and tapped appropriately, can influence organization level outcomes. Empirical research in the private sector appears to identify specific management practices as universally superior to others in achieving firm level outcomes such as market share and profitability. This universal perspective has led to benchmarking certain practices as "best" for contributing to high performance. Empirical research in the public sector establishing such a relationship is sparse. This may be the result of difficulties in measuring government level outcomes and being able to clearly establish this connection because outcomes are often influenced by a myriad of variables outside the control of public management. Even so, the same superior management practices thought to favorably influence human capital in private enterprise have been often adopted in public administration reforms.

Practices thought to result in a high-quality, committed, and flexible workforce in private enterprise are also seen as important contributors to productivity and

performance in the public sector. High levels of expenditures in training and development, empowering workers with decentralized decision-making authority, and encouraging participation, pay for performance, the use of self-managed work teams, and flexible job designs, among others, are commonly associated with improved performance in public agencies. Theories of motivation support such management practices where the first priority is to ensure workers have the skills and ability to perform (training and development), and the second priority is to afford them the opportunity to test their problem-solving skills (decentralized decision authority). The belief is that investing heavily in improving worker skills and abilities leads to a higher-quality workforce. This combined with valued rewards and a role in problem solving can result in greater effort, commitment, and motivation within a workforce that is more flexible and innovative. This combination then, it is thought, results in higher organization performance.

HUMAN CAPITAL MOBILITY

Human capital conventionally refers to accumulated knowledge, know-how, creativity, capability, capacity, education, or training possessed by people (workers). Sometimes, human capital is understood to include also health. The actual usage of the term usually refers to highly skilled workers. The definition of highly skilled differs according to the context. Traditionally, it has been understood as college or university graduates. Often, however, it also includes trained mechanics, carpenters, electricians, and others. Human capital is typically connected to increases in the productivity of workers or organizations as a result of its possession. The rise of the knowledge-based economy has increased demand for human capital, especially in the information technology industry. In the context of globalization, there is migration of skilled workers, who are attracted by better life conditions in wealthier countries.

So far, the United States has been the main destination country. After the World War II, the United Kingdom raised concerns about its human capital leaving. Recently, human capital emigration from developing countries is the main topic. Nevertheless, the geography of human capital mobility is complex and often regionally, industry, or skill specific. Flows from developing countries to developed ones are not the only pattern.

The effects of the migration of skilled workers on source countries are a matter of controversy. High-skilled emigration is often called brain drain to point out the adverse consequence of losing the best-trained workers. As an economy becomes reliant on human capital, the loss of skilled workers poses a serious threat to national productivity and output. Thus, brain drain may hinder economic growth and general development. Positive effects of human capital emigration are mentioned as well. Skilled mobility and networks of migrants may increase a developing country's ability to attract global investment, promote trade linkages, and stimulate technology transfer. Further, sending countries may benefit from remittances. From the internationalist labor market perspective, human capital mobility makes the distribution of skilled labor more efficient as some countries overproduce skilled labor.

Governments are increasingly concerned with attracting high-skilled workers or with keeping them in the locality. Policies of receiving countries generally exploit their attractiveness based on the living-standard difference, making immigration easier for

high-skilled migrants. Moreover, the United States and the European Union provide grants and scholarships in their competition for researchers and experts. The sending states, on the other hand, try to address the adverse effects of brain drain. Their policies include education to produce more skilled workers and to compensate for loss, retention by improving local conditions (may include selective treatment of high-skilled workers), support of Diaspora networks, and strategies to promote return and circulation.

HUMANITARIAN INTERVENTION

Humanitarian intervention refers to actions undertaken by an organization or organizations (usually a state or a coalition of states) that are intended to alleviate extensive human suffering within the borders of a sovereign state. Such suffering tends to be the result of a government instigating, facilitating, or ignoring the abuse of groups falling within its jurisdiction. This often takes the form of deliberate and systematic violations of human rights, including forced expulsions, "ethnic cleansing," and, in the most extreme cases, genocide. Humanitarian intervention can apply also in situations where there is no effective government and civil order consequently has collapsed.

Humanitarian intervention constitutes a calculated and uninvited breach of sovereignty (state rights) in the name of humanity (individual rights). Though humanitarian interventions do not necessarily require the employment of military force—as they could include, for example, the imposition of sanctions—the term refers normally to situations in which force (or the threat of force) is used. Humanitarian intervention is currently a major focus of debate in government departments, international organizations, think tanks, and across a variety of academic fields, including international and comparative law, international relations, political science, and moral and political philosophy.

A Brave New World?

The language and practice of humanitarian intervention is far from new. It has been the source of incessant argument by lawyers, theologians, and philosophers for generations, even centuries. But the recent debate has its origins in the Cold War and was motivated by a number of controversial military actions. Three in particular stand out: India's intervention in the Bangladesh War of 1971; Vietnam's intervention in Cambodia in 1978, which resulted in the overthrow of the genocidal Khmer Rouge regime; and Tanzania's intervention in Uganda in 1979, which ousted the dictator Idi Amin. These interventions were all condemned throughout the world. This criticism tended to be based on the contention that they undermined the notion of state sovereignty enshrined in Article 51 of the United Nations (UN) Charter. As such, these interventions offered a fundamental challenge to the stability of the post–World War II international system.

In the post–Cold War era, however, this conception of sovereignty as sacrosanct came under sustained attack. It was argued that despotic leaders should not be able to hide behind the shield of state rights and that the international community had an obligation to intervene to stop the widespread abuse of human rights. This contention garnered widespread support. It was an important theme, for example, in the writings of the UN Secretary-General, Boutros Boutros-Ghali. The 1990s was a decade of interventions: Iraqi "no-fly zones," Somalia, Bosnia, Sierra Leone, East Timor, and Kosovo. The 2003 Iraq war was classified as a humanitarian intervention by some of its advocates, demonstrating how wide the embrace of the term now is.

The doctrine of humanitarian intervention has been widely criticized. For many detractors, it represents a mode of liberal imperialism rather than being an integral element of liberal internationalism. Likewise, humanitarian intervention has been censured for coercively imposing Western ideas about rights onto other cultures. For others, humanitarianism is simply rhetorical cover either for the implementation of traditional geopolitical policies or for powerful economic interests. In particular, it is argued, the failure of the Western powers to intervene during the 1994 genocide in Rwanda, where there were no obvious economic or political interests at stake, demonstrated their hypocrisy. Indeed, Rwanda has become a lightning rod for the debate. For critics of interventionism, it proved that interventions were linked to self-interest. For advocates, Rwanda was a catastrophic failure and a spur for future action.

Sources of Contention

Numerous contentious issues frame the debate. Some are theoretical, others practical. Probably the most intractable relate to the question of legitimacy (both legal and moral). Who is to judge an intervention legitimate, and on what grounds? Much of the legal debate stems from the tension between Article 51 of the UN Charter and the provisions of Article 24(1) and Chapter VII, which grant the Security Council powers to take whatever measures it regards as necessary to reestablish international peace and security. If an act is deemed to threaten peace and security, the UN can empower agents to rectify this, as occurred in Bosnia. However, legal and moral obligations have clashed. In Kosovo, the North Atlantic Treaty Organization (NATO) intervened without UN authorization, claiming that although such authorization was unlikely to be granted, there was nevertheless an overwhelming ethical imperative to act.

Aside from questions of legitimacy, there are other problems to be confronted. There is a practical issue. Even if interventions were regarded universally as legitimate, there exists no consensus about whether they actually work, or whether they delay or even exacerbate the problems they seek to resolve. The question of

motivation is also problematic. Is it ever really possible to act solely for humanitarian reasons? Moreover, should motivation actually matter? This all depends on whether a deontological or consequentialist ethical system is employed. If it is simply a matter of consequences, as a utilitarian might argue, then an intervention conducted purely in the name of national self-interest that resulted in a "humanitarian" outcome (for example, the overthrow of a genocidal leader) could be classified as a humanitarian intervention. Likewise, an intervention conducted out of concern for human rights, if it failed in its primary goal, could not be classified as such. Such issues continue to drive the debate.

HUMAN RIGHTS

Human rights are entitlements that individuals enjoy in virtue of their status as human beings. Nonhumans often may be thought to possess certain rights in general, but not human rights. When a person has a particular right, he or she is entitled to a certain level of protection. For example, if someone possesses a right to freedom of expression, then that person possesses a capacity for freedom of expression that is protected from undue state interference. Several questions spring to mind: What is it about being human that

entitles someone to this special status? How do people know a human right when they see one? How many human rights are there? This article will begin by saying a few words about the origins of the concept of human rights, before turning to more contemporary discussions of it.

Natural Rights

The concept of human rights has its roots in thinking about natural rights. Natural rights adherents, such as Thomas Hobbes and John Locke, held that every individual person enjoys particular rights naturally. That is, human beings possess certain rights in virtue of their natural existence, for example, their status as human beings. Natural rights adherents claim that only human beings hold natural rights: all "rights" (in their terminology) were "human rights" (in our more modern language). It seems reasonable to suppose that such a view of natural rights originates from the belief that God gave pride of place to human beings over the earth and its creatures. Natural rights adherents do not tend to claim that nonhumans possess rights of any variety.

Natural rights became an important concept in Enlightenment political thought, helping map the boundaries of a monarch's political power over his people. For Hobbes, people all shared the right to self-preservation: All human beings held this right in virtue of being born. This was a major break from traditional Western thought, which held that individual people only held those rights granted to them by their king. For example, one might have a right to a particular property, but only in virtue of the monarch suspending his right over it. A person's rights are therefore held at the discretion of the monarch. In contrast, natural rights theorists claimed that each individual human being has rights independent of the monarch's discretion. These natural rights exist in virtue of an individual's status as a human being, and these rights set limits on the exercise of political power over individuals.

How does someone know he or she has natural rights? In keeping with prevalent Enlightenment thinking, natural rights theorists claimed that the use of "natural" (or God-given) reason could discern which rights human beings held, rights that placed justified limits on the political authority of monarchs. For example, philosophers, such as Hobbes and Locke, argued that one could discover a right to self-preservation. In their view, people living without being organized within some form of political community exist in an anarchic state of nature where their livelihood is insecure. People enter into a political community for a particular purpose, namely, to enjoy the security of their persons that is lacking in a state of nature. All political power then must know certain limits: It must not make the lives of citizens less secure than they would be—at the least—if there had not been a government in the first place.

One particular dispute among natural rights theorists is which rights they believe human beings possess. Hobbes thought our natural right lies in self-preservation. By contrast, Locke had a more expansive understanding of natural rights: Human beings held natural rights to their lives, liberty, and possessions. Government is restricted in what it can legislate with respect to these three fundamental natural rights. Modern natural rights theorists, such as John Finnis, expand these few natural rights into a dozen or more rights.

The Legacy of Natural Rights

The legacy of natural rights for contemporary thinking about human rights is severalfold. First, we normally think of human rights as something held by human beings in particular. We may well be sympathetic to the extension of certain rights to nonhumans, but probably not sympathetic to extending all human rights to all nonhumans (e.g., why claim that goldfish should enjoy the right to political expression?) or extending additional rights to nonhumans we do not grant to human beings. Thus, rights are entitlements: They are something every person is entitled to have in virtue of being a person.

Second, we normally think of human rights as something timeless. This has its origins in natural rights as something God-given and eternal. We do not tend to claim that our rights change over time. For

example, a right to liberty is an entitled protection from slavery. It is not the case that this right, say, exists on Mondays through Fridays, but does not exist on weekends. Indeed, recognition of the right to liberty leads many people to believe that slavery has always been wrong: The right to liberty is something every human being has held in the past and will continue to hold in the future.

Third, we normally think of human rights as limits on state power. Human rights signal a moral or legal domain upon which the government may never encroach. A human right to freedom of expression marks a space where individuals can act protected from state interference.

Fourth, we normally think of human rights as something possessed by individuals. For example, we have individual rights to freedom of expression or trial by jury. That is, they are rights that are enjoyed by individuals, a product of the liberal Western canon that spawned natural rights theory. Critics of human rights theories often disagree with the strong individualism that characterizes many theories even today.

In these four ways (among others), natural rights adherents were the first modern rights theorists, and the general positions they held have helped to shape more contemporary thinking about human rights. Modern rights theorists adhere to important differences. For example, most theorists today recognize that rights may well evolve and adapt over time. Theorists also recognize that rights may conflict with one another or be forfeited in particular instances (e.g., right to liberty for criminals). Finally, many recognize that rights are not entirely individualistic, as we normally recognize rights to self-determination or protections of groups from acts of genocide.

The Universal Declaration of Human Rights

Shortly after World War II, states across the world gave widespread approval to a document, the *Universal Declaration of Human Rights.* This document has been highly significant and important. Among other things, it helped bring into being international law, as well as a

moral standard. States became bound to abide by its provisions, and states could then be said to measure up to its standard of justice. This document also influenced the creation of the *European Convention of Human Rights* in 1950, a document that largely elaborated on the enumerated rights found in the *Universal Declaration of Human Rights,* although there are important differences as well.

What is perhaps most surprising about the *Universal Declaration of Human Rights* is the number of rights enshrined within its thirty articles. These rights include more classic natural rights, such as the right to life, liberty, and security of person, as well as the right to equal treatment and right to own property. There are also more controversial rights too, such as the right to freedom of movement and emigration, as well as the prohibition on forced marriages. All the rights listed in the document apply to all persons, regardless of nationality and gender.

The second most surprising feature is the lack of a legal mechanism. Signatories agree to extend a right to liberty or asylum to all people, but no procedure is put forward to address alleged or actual breaches of the various articles by signatories or any other state. Moreover, the *Universal Declaration of Human Rights* does not specify what precisely are the appropriate sanctions for particular breaches of its articles. In contrast, the *European Convention of Human Rights* (described by Francis Jacobs and Robin White) spells out the remit of the European Court of Human Rights.

It is also worth noting the significance of these documents for issues of governance. Contemporary good governance is often captured by respect for human rights at both domestic and international levels. A lack of respect for human rights is not an abstract philosophical statement, but a concrete criticism: Human rights serve as a standard of conduct for all states, regulating their relationship with citizens. States that are not thought to respect human rights properly are thought to be poorly governed, autocratic, and perhaps worse. A model of good governance is a state that takes all necessary measures to respect the human rights of its citizens. Good governance and human rights go hand in hand.

Contemporary Human Rights Theorists

Much discussion of human rights takes place in a legal context, concerned with the implementation, interpretation, and enforcement of human rights within international human rights law, as found in documents such as the *Universal Declaration of Human Rights* and *European Convention of Human Rights.* In addition, a lot of work by political and legal philosophers has helped illuminate how we think about rights.

The classic figure in philosophical discussions of contemporary human rights theory is Wesley Hohfeld. He discusses rights as falling under one or more of the following categories:

- *Claim*: If a person possesses a claim, she can demand something from another and the latter has a duty to perform whatever is demanded, all things considered.
- *Privilege*: A person has a privilege wherever there is the absence of a duty. A person can act how she likes whenever she does not have a duty to act contrariwise.
- *Powers*: A person has the capability of creating legal relationships, between himself and another. An example would be marriage: It is a legal union created by two people agreeing to live together.
- *Immunities*: A person possesses immunity when he need not be duty bound to follow the commands of his fellows.

Hohfeld's distinctions have been widely influential on human rights theorists ever since. His work brings to our attention the fact that different rights vary in character. At first glance, we may well think that all rights have a similar character. That is, the difference between a right to trial by jury and a right to marriage is that one right is to one state of affairs and the other right is to a second state of affairs. Instead, Hohfeld sensitizes us to the fact that one is a claim-right (e.g., the right to trial by jury is the right to demand a particular mode of trial that others are duty-bound to obey) and the second is a power-right (e.g., the right to marriage is the right to create legal relationships independent of the activities of the state). Many rights do not neatly fall into only one of the four categories. Indeed, there can be a number of different possibilities where a right satisfies two or more of the four categories at once. The use of his analytical system has many contemporary admirers, such as Leif Wenar, who have continued to help it expand and develop.

A major worry for many human rights theorists is the question of how we might know a human right when we see one. Classical natural rights thinkers thought our natural (practical) reason would lead all persons to particular conclusions. Thus, if you disagreed with a theory of rights, the implication was that you must not be thinking accurately enough. This approach has been challenged by pluralism and recognition of reasonable differences about substantive views of justice. That said, this approach is far from abandoned. For example, some contemporary theorists, such as Finnis or Joseph Raz, have tried to rethink the nature of practical reason and its ability to ascertain our rights and liberties.

Other contemporary theorists adopt a different strategy. Instead of starting from the use of practical reason, they instead point to a more obvious starting point for theorizing about human rights: international human rights documents, such as the *Universal Declaration* and the *European Convention on Human Rights.* The view is that Hohfeld's distinctions may well be helpful in clarifying how we think about rights more generally, but leave open the question of how we know a human right when we see one. International human rights documents, such as the *Universal Declaration,* have been drawn up by politicians with academics and accepted by a vast multicultural international community. They are not the final say, as it were, on which human rights exist. But they are the best place to start to think about them, given their origin and wide acceptance. These theorists then take these documents as a starting point for theorizing about human rights more generally, an approach that is gaining increasing favor and promise.

Criticisms

There have been a number of vocal critics of human rights theorists. The first charge against human rights theories is that they are inapplicable. These critics claim that talk of human rights assumes that one universal standard can be applied equally to all people everywhere

on the planet. Instead, standards cannot be thought to apply to all. This charge highlights the great differences between different communities on the priorities of certain rights and liberties. These critics claim there is no such thing as a "one size fits all" set of human rights applicable to all persons in all communities.

However, all persons across all communities have much in common. For example, in every community, acts of murder or theft are criminalized. We can say that there are rights to one's person and property, yet admit that we might each disagree on the extent of these rights. Equally, we might say that although some communities may recognize more, or different, rights in general than other communities do, this does not mean there is not a universal conception of human rights that captures those spaces all communities share in common.

A related second charge is that human rights theories are inapplicable—full stop and end of story. Absent a world government that could effectively implement international human rights laws, this task is a matter left with individual states. Such critics may not deny that effective enforcement of international norms is desirable. Instead, they need only point to the relative ineffectiveness of the United Nations in this task and the seeming impossibility of anything resembling a stronger intergovernmental body coming into being. Unless human rights are enacted in domestic legislation, they exist only as guiding normative principles and not as legal duties. This second charge relates to a motivation problem, namely, that people will not be motivated to enforce human rights internationally without some kind of international policing body or world state. Without such institutions, talk of human rights is an empty ideal that exists in journals and textbooks, rather than something concrete in our lives. It is only feasible then to enforce certain rights domestically; it is not feasible to enforce human rights across the globe.

A problem with this charge is that it commits the "is-ought" fallacy. That is, it assumes that because effective international enforcement of human rights is lacking in 2006, it ought to be the case that there are no human rights. Yet, in the near future, the empirical problem could disappear and effective enforcement could become possible. This charge is not therefore a claim against human rights but, rather, a worry about the enforcement of human rights.

A third charge against human rights theories is that they are imperial and fail to respect multiculturalism. Some of these critics claim that human rights are a Western imposition and product of a particular time in a specific part of the world. It is unduly paternalistic to force certain norms peculiar to one culture on another where such norms may not exist. In addition, some have claimed that human rights talk is contrary to "Asian values": group interests take priority over individual interests, with deference to authority.

We can respond to this charge. For one thing, can there be such a thing as Asian values given the incredible diversity between the peoples of India, China, Indonesia, and so forth? One would think not. Moreover, classic figures cited in defense of Asian values, such as Confucius, seem to be at odds with the view that groups matter more than individuals. In book eight of his *Analects,* he posited that "reciprocity" is one word that can be used as a rule of thumb for one's life. Thus, Confucius did not lend clear, unambiguous support to the view that individuals ought to defer to authority and the group above their own conscience or view of their good. In fact, he lends credence to the Golden Rule, an influential moral principle in the West as well.

Of course, disagreement between cultural communities is not proof that no common ground can be found. For example, one may disagree today about whether or not all humans have a right to fox hunting, but may find agreement tomorrow. Why should this disagreement be intractable? Moreover, it simply is not true that we disagree about everything. Most agree that murder, theft, and disease are bad things, all things considered. Why not claim human rights compose that set of rights we agree on, rather than claim that human rights do not exist because there are disagreements about particular, but not all, rights?

Conclusion

The concept of human rights is controversial insofar as there is vast disagreement about what these rights

are, but there seems wide agreement on at least a small core of less controversial rights found in most international human rights documents. Human rights theories have developed much since their more classic formulation in natural rights theory, although they still capture many similarities. Although one can expect criticisms of human rights theories to continue, one can also take some comfort in that human rights theories are capable of response and will likely continue to develop in future.

HUMAN SECURITY

The concept of human security represents a departure from orthodox neorealist security studies because it places human beings, rather than solely states, at the center of international and national security policies. The human security paradigm means that human beings and their complex social and economic interaction are given policy primacy with or over states. The referents of the human security approach are individuals and its end goal is the protection of people from traditional (i.e., military) and nontraditional threats such as poverty and diseases. Moving the security agenda beyond a merely statist conception does not mean to replace it but to complement and build on it. Central to this is the understanding that human security deprivations can undermine peace and stability within and between states, whereas an overemphasis on state security concerns can be detrimental to human welfare needs. The state remains a central provider of security but state security, although necessary, is not a sufficient condition for human welfare. In these terms, the human security approach is framed around theoretical and practical applications that go beyond considerations about unitary state actors; it requires a multidisciplinary approach that reflects on the totality of social, economic, and power structures embedded in the present world order.

Human security has fully entered the policy and academic debates in the early 1990s; nevertheless, despite its widespread usage within national and international policy circles, its definition remains highly contested. The holistic vision of protecting the security of people lends itself to a variety of interpretations shaped by relative understandings of what constitutes a threat to the security of individuals, how the intensity and repercussion of any given threat can be measured (i.e., historical data or forward-looking forecasts), and by what possible means the threat can be prevented or removed. In other words, the ambiguities surrounding the concept of human security remain anchored in the fundamentally interpretative and debatable nature of the concept itself. Substantively, the malleability of the approach has allowed scope for tailored pragmatic responses functional to the policy priorities of the states and intergovernmental organizations. A claim to be dismissed is that human security does not necessarily equate to empty rhetoric; the coalition of states and supranational organizations that have supported the approach can count numerous accomplishments such as the Ottawa

Convention (i.e., Mine Ban Treaty), the recent establishment of the International Criminal Court, and the Optional Protocol to the Convention of the Rights of the Child.

The Origin and Evolution of a Holistic Paradigm

The idea of extending the concept of security from state security to individual human beings was first articulated by the Independent Commission on Disarmament and Security Issues in 1982. The Common Security report provided the first comprehensive criticism of the purely military approach to security while highlighting the need to devote due attention to the relation between security and the well being of individuals. After years of latency, a crucial point in history for the development of the concept is the end of the Cold War and the revitalization of long-standing bottom-up arguments within progressive academic and policy circles, once it was realized that the disappearance of the superpowers' military threats did not necessarily entail an enhanced level of security for citizens within states. The successive debates fundamentally challenged neorealist theoretical foundations and aimed at extending the narrow security paradigm to a people-centered conception. The evolution of the security discourse was also molded by the need to address the global social problems arising within the context of a globalizing world. The potential threats to individuals' life and well-being were therefore extended from being primarily military to broadly encompass economic, social, environmental, and health concerns.

In connection with the immediate post–Cold War period and the new development agenda, the first authoritative definition of human security was provided in 1994 when Dr. Mahbub Ul Haq drew attention to the concept in the U.N. Development Program (UNDP) Human Development Report. Beyond territorial and military concerns, the report argued that human security is fundamentally concerned with human life and dignity. For analytical purposes, UNDP disentangled its four main characteristics—it is universal, its components are interdependent, it is

best ensured through prevention, and it is people centered. On the more substantive level, the definition of human security given in the report remains broad and all encompassing. For UNDP, human security means safety from chronic threats such as hunger, disease and repression, and it means the protection from sudden and hurtful disruptions in the patterns of daily life. Understood in these terms, human security has also been encapsulated in the "freedom from fear" and "freedom from want" policy axiom. Although acknowledging the varying intensity of possible threats to human welfare, UNDP grouped these threats in seven nonexhaustive and nonexclusive security categories—community, economic, environmental, food, health, personal, and political. Despite the broadness and the apparent conceptual weaknesses of the definition provided by the report, the general prescriptions outlined therein have provided a useful springboard for academic enquiry and have remained a useful organizing concept for the work of international organizations throughout the 1990s.

The Contested Nature of Human Security

The 1994 UNDP report opened an outlet for the academic redefinition of human security. Numerous scholars have attempted to disentangle the dimensions of what immediately appeared to be an overly unrestrained analytical tool, which, by virtue of its all-encompassing nature, could lose its meaning. A number of scholars worked toward a recategorization of what could be classified a threat to human security. Jorge Nef, for example, has advanced a fivefold format, which borrows from UNDP's initial list; he regroups the initial elements, expands the idea of personal security by including the notion discrimination, and adds onto it a fifth element—the notion of cultural security.

The reconceptualization of human security has engaged scholars in a fierce academic debate—some in favor of narrowing the concept to a valuable essence and some wanting to preserve its holistic character. On the grounds of analytical rigor, pragmatism, and policy relevance, Keith Krause has argued that the sole denominator for the human security

agenda should be a focus on violent threats. In his view, a listlike description of any possible "bad thing" that could happen to individuals is a peril to conceptual clarity and renders causal analysis virtually impossible. Advocates of the broad theorization have opposed this approach. They argue that once the referent of the security agenda becomes the individual, it is impossible to disentangle violent threats to individuals from other issues such as poverty, environmental degradation, and infectious diseases that directly impinge on the safety, freedom, and self-realization of human beings. Among the most cited proponents of this approach is Caroline Thomas. In her view, human security means not only meeting basic needs but also the realization of human dignity.

Gary King and Christopher Murray offer a middle approach bridging narrow and broad conceptualizations. They have produced an analytical scheme including only the elements that, in their view, human beings might fight over or put their lives at risk for. To assess the increased or decreased level of human security among individuals or groups, the key essential elements King and Murray individualize are poverty, health, education, political freedom, and democracy.

The debate is far from settled and remains a source of controversy. In particular, all the attempts that have been made to sharpen the definition of human security have had to confront the exclusive problems of either attaching a value and a priority to possible potential threats to human life and vaguely justifying such a choice, or of maintaining the undefined connotations embedded in the original proposal while losing analytical rigor. A precise definition is potentially unattainable given that human security has been created and developed as an approach in response to an obsolete security paradigm. The novelty of the approach is, above all, an open agenda for reforming security strategies and addressing the source of insecurity of people.

Human Security and Global Governance

Human security has entered the policy discourse of a number of governments. Notable examples are Canada and Japan—these are often referred to as the coalition of likeminded middle powers. Each has provided a slightly different definition of the concept and has customized its application to best suit its individual interests. The government of Japan subscribes to a comprehensive understanding of human security—one that covers all the aspects that potentially endanger survival, daily life, and human dignity. As a tangible commitment to the human security agenda, the government of Japan sponsored the Independent Commission on Human Security chaired by Sadako Ogata and Amartya Sen, which in 2003 produced the report *Human Security Now.* At the heart of the report there is a reinvigorated stimulus to think about human security as an integral paradigm aimed at protecting core freedoms fundamental to human existence and development. On the other hand, the Canadian government, led by former Foreign Minister Lloyd Axworthy, adheres to a narrower but still open-ended definition of human security that distinguishes "freedom from fear" from "freedom from want" while acknowledging their distinctiveness and mutual interdependence. Canada's human security priorities were further elucidated once the International Commission in Intervention and State Sovereignty (ICISS) was created in September 2000. The establishment of the ICISS suggests that Canada is more interested in exploring and advancing the "freedom from fear" aspect of human security than the human development agenda.

Beyond these leading examples, a further attempt to institutionalize the human security agenda internationally is the Human Security Network. The network is a result of a bilateral agreement between Canada and Norway in 1998; thirteen other countries and one observer have joined the initiative. The goal of this intergovernmental forum is that of advancing and embedding further the human security agenda within global governance, with the end goal of creating a more humane world free from fear and want, and where people can fully develop their human potential. The network is a forum for dialogue and research; above all, it is an avenue to share evolving understandings and practices to advance the development of the human security approach. Substantively, the policy proceedings resulting from the yearly ministerial meetings have, first, provided general guidelines for

states where the safety and well-being of citizens are endangered, and second, they have helped legitimize the UN's overarching framework for the human security approach. Yet beyond this "coalition of the willing," very few states have embraced the approach and used it as reference for their domestic and foreign policies. Most states in the world have not yet integrated or tangibly supported the new paradigm, favoring instead a security conception couched in wholly neorealists' terms.

In 1998, the concerted action of Canada and the Netherlands made inroads into the agenda of the Security Council thanks to the thematic entry point approach to peace and security issues adopted by the council in the 1990s. These two nonpermanent members catalyzed the support of the council and made other members aware of the need to concentrate the council's debates and resolutions around the new security agenda. In 1999, the protection of civilians in armed conflicts became the subject of discussion. The subsequent resolutions and presidential statements reflected a commitment to work toward the actualization of freedom from fear with a focus on how to deliver effective humanitarian aid and increase the protection of people in zones of conflicts. Thus, the Security Council appears to have slowly been shifting its attention from solely military action to work on the security of the individual. Nevertheless, whether the commitment will be translated into practice remains to be seen.

Within the broader apparatus of the UN, Secretary General Kofi Annan has provided continuous support and intellectual leadership for the new security agenda. Repeatedly in his annual reports and in the Millennium Report, he has highlighted the belief that the global order has shifted from a state-centered to a people-centered one. The changing nature of world conflict, from inter-state to increasingly intra-state, the displacement of civilians, gross abuse of human rights, the AIDS pandemic, drugs and arms trafficking are some of the most recurrent concepts and themes Annan has been using to illustrate that, in a global world, an approach to security must be people-centered and that prevention must be a core aspect of the advancement of human security. As a proactive follow up to this open endorsement, the Human Security Unit (HSU) was established in September 2004 in the UN Secretariat as part of the Office for the Coordination of Humanitarian Affairs (OCHA). The objective of the unit is to embed the approach, as proposed by the Commission on Human Security, within the UN operations and to translate the vision of human security into pragmatic activities.

At supranational level, the UN has played a crucial role in defining, supporting, and translating the new security paradigm from idea into practice. Alongside the UN, other international organizations have demonstrated interests in the agenda. Both the former president of the World Bank, James Wolfensohn, and the former managing director of the International Monetary Fund, Michael Camdessus, expressed a commitment to policy and institutional reforms in line with the human security paradigm by means of expanding representation within the respective institutions and by extending ownership of developmental policies to individual communities. The extent to which these people-centered reforms will have an effect in eliminating want remains questionable; having reached a certain maturity, the reforms have not resolved the gross distributional problems that lay at the heart of global inequality and individual security.

HYBRIDITY

Hybridity refers to a condition under which two or more modes of governance are incorporated into a public organization. Modes of governance are typically defined as hierarchy, market, and network. Public organizations normally demonstrate hierarchical governance, through the bureaucratic order they bring to work inside the organization and to their external relationships with clients, users, and citizens. A hybrid public organization exhibits market or network modes of governance alongside the hierarchical. Examples include requiring its own staff to compete against firms and nonprofits for a service delivery contract, or working cooperatively with other organizations to deliver outcomes that could not be achieved alone.

This general definition of hybridity is modified by the theoretical approach in different literatures. It is essential to understand these variations so that confusion is avoided. Transaction cost economics views hybridity as an intermediate mode of governance between the polar opposites of market and hierarchy. It is characterized by features such as long-term contracting and reciprocity. The hybrid mode contains the incentives and autonomy found in markets and the administrative controls and coordination found in hierarchy, but at less intense levels. This theory analyzes the choice of governance mode as a function of the incidence of transaction costs and helps explain public-private and public-nonprofit contractual relationships.

The public administration literature in the United States locates hybridity in the context of the credible commitment problem. This is the question of how the property rights arising from a government decision can be protected, especially in a political environment where pressure groups seek to undermine program implementation. A solution is to create part-public, part-private agencies operating at arm's length to government. They are defined as hybrids because of their combination of public and private characteristics. They are bodies that deliver public policy, but do so through a corporate status that gives them access to private finance. And although they are creatures of government, they also lobby politicians and civil servants as if they were private companies.

Management theory views hybridity as a combination of organizational design archetypes. The ideal-typical designs are simple structure (coordination through direct supervision), adhocracy (coordination by all staff through mutual adjustment), machine and professional bureaucracies, and divisions or departments. There are tensions among each ideal type, and consequently, theoretical hybrids can be defined. For example, the tensions between simple structure and adhocracy produce an "entrepreneurial adhocracy" in which small self-organizing teams are coordinated by an overall manager. This approach to hybridity contributes to understanding the changing forms of public organizations.

Hybrids can be analyzed as a cultural phenomenon where public policy making and management involve actors whose traditions of governance differ. For example, business actors come from an environment where objectives and outcomes are more easily defined than in the public sector, and where executive rather than consultative decision making is the norm. Hybridity is the outcome of negotiating these different governance cultures. The style of decision making and management will contain elements from a number of different cultures. This perspective highlights the problems that cultural hybridity presents for the underlying ethos of public governance because it potentially dilutes the core values of transparency, neutral competence, and democratic accountability.

—Chris Skelcher

HYBRID ORGANIZATION

Most simply, a hybrid organization shares characteristics of both public and private organizations. As with most social science concepts, things become slippery after that. Interest in hybrid organizations has grown as reformers seek to bring the perceived flexibility and efficiency of private organizations into the public sphere, but concerns about the accountability of these arrangements have grown as well.

The central question in defining hybrid organizations is, What distinguishes public organizations from private organizations? There are two general approaches to this task. The first places public and private at opposite ends of a continuum and then defines the characteristics that separate them. James L. Perry and Hal G. Rainey provided a typology of hybrid organizations based on this method in 1988 that focused on three variables: (1) public or private ownership of the organization, (2) public or private funding of the organization, and (3) the means of social control—that is, whether the organization is regulated by the market or through the governmental process (polyarchy). Private organizations are privately owned and financed, and the market provides the means of social control. Public organizations are owned, financed, and controlled by a government. Hybrid organizations share characteristics of both.

Perry and Rainey identified six kinds of hybrid organizations: Government corporation, government-sponsored enterprise, regulated enterprise, governmental enterprise, state-owned enterprise, and government

contractor. Government corporations, for example, are publicly owned and have a strong legal connection with the government but are funded through private sources. Government contractors, conversely, are privately owned and operate according to the market but get their funding from public sources.

The second method of defining hybrid organizations asks whether the organization is a governmental agency (defined by a statutory relationship) that is assigned some of the characteristics of private organizations, for example, increased discretion over hiring and firing, or a private organization that is provided characteristics normally associated with governmental agencies, usually the provision of a governmental service. The former are frequently called quagos or quasi-governmental organizations, and the latter called quangos or quasi-nongovernmental organizations.

Interest in hybrid organizations has grown as reformers have searched for ways to improve governmental performance, but their use by governments raises a number of questions. Hybrid organizations, and privatization more generally, appear to offer the flexibility and efficiency of the market with the resources and (at least implicit) coercive power of a government, thus delivering better performance than traditional governmental agencies. One tradeoff for this flexibility, however, is public accountability. To whom are these organizations responsible? Their shareholders? Their governmental overseers? The public at large? Additionally, many governmental agencies have to meet legal requirements, such as equitable treatment of applicants, that private organizations do not. At what point should these legal requirements give way to management flexibility?

I

IMMIGRATION

Immigration is the process through which individuals become residents in a new country of settlement. People migrate for a variety of reasons, and individual states have their own legal frameworks governing the immigration process. Immigration commonly refers to a permanent move, where one becomes a resident and a citizen of the country, rather than a visit or temporary period of settlement for work reasons, for example. This permanence helps distinguish *immigration* from the more general term *migration*, which covers a wider variety of experiences.

Historically, the process of immigration has been of great social, economic, and cultural benefit to states and has in many cases seen the development of multicultural societies. The immigration experience is long and varied with many modern states being characterized by a wide variety of cultures and ethnicities that have derived from previous periods of immigration. In the postwar period, immigration was largely the result of the refugee movement following World War II and, during the 1950s and 1960s, the end of colonization across Asia and Africa. Immigration from these areas to former imperial centers, such as the United Kingdom and France, increased. In the United Kingdom, for example, the 1948 British Nationality Act gave citizens in the former colonial territories of the Commonwealth (a potential figure of 800 million)

the right of British nationality. After World War II, immigrant workers, or guest workers, played a vital role in the rebuilding of Europe's infrastructure by working in heavy industry, in health services, and in transport. However, immigrants suffered discrimination during this time, and this has contributed in some countries to the isolation of ethnic groups and minority communities. Although some states attempted to deal with the social exclusion of immigrants by limiting future immigration, others approached it with a more inclusive "melting pot" approach, focusing on the amalgamation of diverse cultures into one coherent understanding of citizenship. This approach has been integral to the notion of citizenship in the United States, where immigrants taking U.S. citizenship swear allegiance to their new place of residence. Critics of this approach highlight the assimilation of diverse cultures and the repression of difference in the name of the state. Immigration is therefore closely related to citizenship and the social and political rights to which citizens of a state are entitled.

States maintain control of their borders and therefore are able to monitor and determine the number of immigrants who are able to remain permanently. This can vary across states, and in some areas, borders are more open than in others. In 1985, for example, European states signed an agreement in Schengen, Luxembourg, to end internal border checkpoints and controls, and subsequent European Union (EU) immigration and asylum law was agreed to by

the European Council in Tampere, Finland, in 1999. European Community law therefore states that European Economic Area (EEA) nationals are given the right to live and work (right of residence) in other member states. In many states, this entitles newly arrived immigrants to public services (housing and social services, for example). In the United States, the mechanism for selecting legal immigrants is complex, but all legal immigration flows have at least three components—family (spouses, parents, and children of U.S. citizens), employment (containing many different categories including unskilled workers and investors), and humanitarian (including refugees and asylum seekers).

IMPORT SUBSTITUTION INDUSTRIALIZATION

Import substitution industrialization (ISI) refers to a development strategy used primarily during the 1930s through 1960s in Latin America—particularly Brazil, Argentina, and Mexico—and in some parts of Asia and Africa. The general focus is on trade and economic strategies that promote domestic production of previously imported goods to foster industrialization. In theory, ISI is expected to incorporate three main stages: first, domestic production of previously imported simple nondurable consumer goods; second, extension of domestic production to a wider range of consumer durables and more complex manufactured products; and third, export of manufactured goods and continued industrial diversification.

Four major drivers of domestic goods production have been identified: First, decreases in the availability of imports, as occurred during the Great Depression and World War I; second, balance of payments difficulties that encourage governments to impose import controls; third, gradual income growth through exports that increases domestic market size; and fourth, official development policies aimed at promoting industrialization.

The latter case of ISI has received the most attention and critique from development analysts. The theoretical foundation for deliberate, government-promoted ISI emerged from critiques of the international division of labor in which developing countries largely exported primary products and imported finished, manufactured goods from Europe and the United States. Critics, such as the Argentine economist Raúl Prebisch, argued that this division of labor would ensure continued poverty for primary product producers. The subsequent deterioration in trade for poor countries could be explained through productivity gains in the north that resulted in increased wages, rather than lower demand for manufactured exports. In the south, lower productivity rates in agriculture and mining led to low and stagnant wages. In addition, the industrial countries were seen to have industrialized through use of high protective tariffs, which provided additional support for similar policies in Latin America.

Prebisch and others thus argued that developing countries must promote industrialization through practices that promote domestic manufacturing. Promotion policies involved both protection of "infant industries" for imports and incentives to encourage capital and technology imports. Tariffs were often used in addition to controls on the availability of foreign exchanges, exchange rate manipulation, and import licenses for particular products necessary for manufacturing.

Key to the implementation of these policies was an alignment that emerged between three key actors in these societies: the government, including state-owned firms, domestic private enterprises, and transnational corporations (TNCs). This "triple alliance" involved government investment in intermediate and capital goods sectors to support industrial

expansion, domestic enterprise production of import substitutes, and TNC production of high-tech goods needed for manufacturing that could not yet be produced domestically. Although promoters of ISI anticipated that this alignment would last only until access to capital improved and production spilled into additional industries, the interactions between these actors were often mutually reinforcing. Participation by other actors was then limited, as was continued industrial expansion.

By the 1960s, ISI strategies were seen to have important drawbacks. Results were different in every country, but general trends included production that often did not extend into industries other than consumer goods, slow employment growth, agricultural sector decline, and minimal productivity growth. Social strife also emerged and is seen in part as resulting from increased internal migration and greater inequality. Although large countries such as Brazil and Mexico produced at least short-term growth with ISI policies, smaller countries, including Ecuador and Honduras, were less successful in fully implementing these policies.

Critics within Latin America, particularly exiled Brazilians at the *Comisión Económica para América Latina* and the University of Chile in Santiago, condemned the dependent industrialization that emerged from the triple alliance and that failed in promoting egalitarian development. These scholars, and others in Mexico, often pushed for more socialist models free from TNC participation.

Promoters of free trade instead decried ISI's protective measures, arguing that they created distortions in capital appropriation and prevented developing countries from pursuing their comparative advantage in international trade. New, protected industries and government planning were deemed inefficient in comparison with those encouraged through market-led development strategies. These critiques, supported in part by early observations of export-led growth in East Asia, produced a strong emphasis by economic and development agencies on export promotion beginning in the 1960s.

A third perspective highlights the relevance of national social and political histories to the success, or lack thereof, of ISI strategies. The ability of the government to learn and adapt production strategies to local conditions depended highly on the character of local institutions and social organization. Also, even though the producers of consumer goods may have been initially successful, they had little incentive to support industrial expansion because this would require protection of those industries on which they relied for their production tools, thus potentially limiting their supply of high-quality inputs. In addition, the opportunities available to expand domestic production into new industries were limited by the lack of support by TNCs for domestic technological learning, compounded by low levels of technical training in the domestic population. In each country, the opportunity to expand industrial production often depended on variations in these social and political constraints.

These critiques raise important questions about development strategies and the role of the state in the twenty-first century. Although ISI policies are seen not to have accomplished their developmental goals, market-led and export-driven growth have also received criticism. In the context of international trade and with some recognition of a role for the state in development, what tools remain for national governments to use in pursuing development? How can the need for country-specific strategies be reconciled with pressures for multilateral trade agreements? Can TNCs be seen as partners with developing country governments in developmental strategies, or does "dependent" development continue to constrain broader social developmental goals?

IMPOSSIBLE JOB

A leader of a public organization holds an impossible job when external stakeholders expect that organization to accomplish goals that simply cannot be fully accomplished given the available means, technologies, and constraints. Most public organizations face a persistent discrepancy between formal goals and actual performance, but societal and political stakeholders understand and expect this. When stakeholders do not accept a performance deficit, the job becomes impossible.

The impossibility problem afflicts all public organizations to some degree. Most public organizations were initiated to solve intractable problems or pursue grand ambitions. They serve multiple, mutually contradicting, and highly controversial goals. Most lack the technology and the means to accomplish the imposed goals and labor under many constraints. When stakeholders do not consider these factors, it becomes hard, if not impossible, to defend persistent underperformance.

Some public organizations receive little empathy or sympathy from their stakeholders. This happens when an organization serves a clientele that many consider intractable and irresponsible (think of drug addicts and career criminals), when an organization harbors questionable expertise, or when there is doubt that the organization's activities will contribute to the public good.

The job of prison director provides a typical example. The prison director is expected to keep inmates inside, to provide a decent living environment that deters others from becoming a criminal, to offer rehabilitative programs, and to protect them against violence—all this with minimal funding and little political support. Routine incidents (an escape, a violent incident, a corrupt guard) underscore the dominant notion of a permanently failing operation. In a politically volatile environment and in the absence of objective performance indicators, it becomes hard for a prison director to command a minimal degree of legitimacy for the functioning of the prison(s).

The holders of these impossible jobs can apply two strategies to increase their chances of success. They can actively engage with their stakeholders to find common ground, to create a minimal consensus, to engineer coalitions, and to enhance the perceived authority of the profession. This strategy works best when it is accompanied by the second strategy of creating a strong-agency myth, which convincingly explains how the organization's activities contribute to the public good and the long-term health of society.

An impossible job requires from its occupant a high degree of institutional diplomacy: the ability to relate the organization and its goals to society's needs and ambitions without sacrificing organizational capacity.

IMPOSSIBILITY THEOREM

The first statement of the impossibility theorem is in Kenneth J. Arrow's *Social Choice and Individual Values,* 1951. This set theoretic theorem, based on the assumptions of rational choice theory, is a major social scientific finding that was partly responsible for Arrow's receipt of the Nobel Prize, shared with John R. Hicks, in economics in 1972, and the theorem served as the point of origin for the field of social choice. The theorem led to the dissolution of the early twentieth-century research paradigm of welfare economics, it led to a reevaluation of how democratic decision procedures arrive at representative expressions of individuals' preferences, and it proved that under most circumstances, it is impossible to have a valid statement of public interest or social welfare. The result has been used to challenge the cogency of the concept of "the public" as a meaningful social entity.

The impossibility theorem assumes that agents have complete and well-ordered preferences over all the outcomes under consideration in a collective choice situation. This requires that agents know whether they prefer, disprefer, or are indifferent between all two pairs of possible outcomes, and it requires that agents' preferences obey the logical relationship of transitivity requiring that if Adams is preferred to Madison, and Madison is preferred to Washington, that in turn Washington cannot be preferred to Adams. The impossibility theorem considers cases in which three or more agents make a collective choice from three or more alternatives in situations as diverse as democratic voting, establishing public policies that reflect social welfare, and the marketplace. The theorem is constructed to resolve the question of whether there is any mathematical procedure for amalgamating individual preferences that results in a collectively rational preference ordering of all the possible outcomes.

In addition to assuming that individuals' preferences are rational, the theorem stipulates that four minimal conditions must apply to the decision procedure so that its result is valid. The theorem requires that individuals be permitted to have any rational preference ordering over alternatives, that there not be a single dictator whose preference over a single pair of alternatives holds for the group decision, that the collective ranking over outcomes remains unchanged if one of the alternatives ceases to be considered, and that the collective choice uphold Vilfredo Pareto's condition holding that a unanimous preference over a pair of outcomes implies a collective preference over that pair. Most researchers agree that although these requirements are normative, they are sufficiently mild and beyond controversy.

The theorem proves that given these minimal assumptions, it is impossible to construct any procedure that results in a collectively rational expression of individual desires. Though highly technical in its statement, the theorem has important implications for philosophies of democracy and political economy. The theorem disregards the cogency of democratic will formation that rests on the assumptions of a "general will" suggested by Jean-Jacques Rousseau, or of a discursive public sphere advocated by John Dewey and Jürgen Habermas. The theorem rejects the possible formation of democratic will by relying on experts who paternalistically apply knowledge of what is best for a population. The theorem also denies that there could be either objective basic needs, or universal moral criteria, that any procedure for collective decision making should recognize, such as minimal nutrition standards or human rights.

INCENTIVE SYSTEMS

Incentives are motivational influences or stimuli aimed at modifying the actions of actors, organizations, or institutions. Incentives usually designate positive influences, whereas deterrents designate negative influences, but both are usually combined in an incentive system that will reward some actions and penalize others.

At the beginning of the twentieth century, social sciences' contemporary interest in incentives was triggered by the pioneering work of John Watson, which led to a whole branch of psychology—behaviorism. Watson argued that, although humans were indeed sophisticated animals, the underlying principle of their actions was not ontologically different from that of Ivan Pavlov's dog. According to behaviorism, human actions are mainly conditioned by learned

reactions to incentives and deterrents. Behaviorism has influenced most of the social sciences during the last century. For example, most postulates in economics are behaviorist, including those of agency theory in organizational economics, which rests mostly on the design and function of incentive systems as a means for creating convergence of interests between agents and principals, thereby inducing cooperation.

More broadly, in 1961, P. B. Clark and J. Q. Wilson wrote a classic paper on the topic ("Incentive Systems: A Theory of Organizations"), conceptualizing organizations primarily as exchange systems with properly designed incentive systems that reward individuals for their contribution in the activity of the organization. This perspective can be extended to any institution or even social system and thus has an obvious connection with the concept of governance itself. Clark and Wilson also provided a typology of natural incentives. Incentives can be material, solidary, or purposive. Material incentives are tangible rewards that have a monetary value, the most obvious being different kinds of remuneration. Solidary incentives are intangible and cannot easily be converted into tangible goods or monetary value. They are mostly linked to rewards for socializing, congeniality, social status, and the like. Usually, solidary incentives are not linked to the output or the goal of an organization or institution. Purposive incentives are also intangible and not easily converted to monetary value, but, contrarily to solidary incentives, they are directly linked to the ends being sought by the organization. For example, a community organization that successfully seeks safer streets or a cleaner environment can provide its members (and others) with these intangible commodities. Most incentive systems, organizations, and institutions will rely on an uneven mix of all three kinds of incentives.

The fact that the incentive system is a central part of any kind of governance system is now widely accepted. However, the design and fine-tuning of incentive systems that successfully modify people's or organizations' behavior in the desired way is no simple task. Many authors have convincingly argued that material incentives alone were limited in their capacity to motivate human actions. More generally, any incentive system will have breaches as well as unintended consequences. Moreover, although human behavior may be conditioned, this conditioning is so utterly complex that it is not easily influenced. Incentives systems are thus as central to any conception of governance as they are difficult to design or implement.

INCREMENTALISM

Incrementalism is a theory of public policy making originally developed by Charles E. Lindblom. Lindblom rejected the prevalent idea of policy making as a process of rational analysis culminating in a value-maximizing decision, arguing instead that policies result from a pluralistic process of interaction and mutual adaptation among a multiplicity of actors advocating different values, representing different interests, and possessing different information. Incrementalism falls within the pluralist tradition in political science, strongly resembling both interest group theory and the bureaucratic politics approach of foreign policy making, differing from these two models primarily in its prediction that policymakers will build on past policies and so focus on incremental policy alternatives. Incrementalism has been fruitfully applied to explain domestic policy making, foreign policy making, and public budgeting.

Lindblom regarded rational decision making as an unattainable ideal. To function properly, rational-comprehensive decision making must satisfy two conditions that are unlikely to be met for most issues: agreement on objectives and a knowledge base sufficient to permit accurate prediction of consequences

associated with available alternatives. Where these conditions are unmet (and they will be unmet, according to Lindblom, for most policy issues), the rational method provides no guidance whatever for policymakers. Incrementalism circumvents these problems, producing defensible policies where the rational method is paralyzed.

Incrementalism is remedial in orientation, emphasizing the amelioration of concrete problems rather than the pursuit of abstract ideals such as social justice. Affected publics bring problems to government through a process Lindblom termed the social fragmentation of analysis. No one actor possesses information sufficient to make a rational policy decision, and problems are often addressed without ever being fully defined.

Incrementalism builds on past policies. Because limitations on both time and information preclude examination of more than a few options, policymakers typically focus on alternatives differing only marginally from previous policies. This narrow focus confines attention to options that are well understood and politically feasible.

In practice, policymakers do not identify objectives and then examine alternative means as called for by the rational ideal. To the contrary, means and ends are typically considered simultaneously inasmuch as different policy alternatives represent different trade-offs among contending values.

Incremental outcomes are virtually inevitable given the need to bargain over a limited number of alternatives that differ only marginally from past policies. Large change is nevertheless possible through the accumulation of incremental steps resulting from repeated policy cycles. This serial nature of the policy process represents yet another advantage of incrementalism, according to Lindblom; it permits policymakers to learn through a process of trial and error, converging on a solution gradually through a process of successive approximations.

Because Lindblom believed most policy issues exhibit conflict over objectives and inadequate information, he expected that departures from incrementalism would be rare. The knowledge base will be sufficient to permit rational decision making only for minor technical or administrative decisions. Wars, revolutions, or other grand opportunities may serve as catalysts for major policy shifts, but the eventual consequences of these dramatic departures will be unpredictable.

Political scientist Charles O. Jones argued that an aroused mass public opinion demanding action on a particular problem can prod policymakers to enact non-incremental policies. An aroused mass public will not always produce policy escalation, however. Where policymakers with a long-term interest and expertise in an issue disagree among themselves, non-incremental policy making is effectively precluded by conflict over objectives and the inadequacy of the knowledge base. Under such circumstances, policymakers may distract mass public opinion through a symbolic drama, while negotiating an incremental solution to substantive issues out of public view.

Whatever the effects of public arousal on policy making, non-incremental policy departures are unlikely to yield effective public policies where the conditions for rational policy making are unmet. Jones characterized the Clean Air Act of 1970 as one such instance, noting that mass public arousal did nothing in that case to increase the knowledge base available to policymakers. The technology-forcing provisions of the 1970 legislation assuaged public opinion by setting goals for businesses that no one knew how to meet at the time the law was passed. The conditions for rational decision making are most likely to be met (if at all) late in the life cycle of policies, after policymakers have accumulated a great deal of experience with policies and crystallized their objectives.

One's evaluation of incrementalism will hinge on underlying assumptions about human nature and what it is possible to achieve through politics. Utopians of both the Right and the Left reject its slow operation and apparent incoherence. More pragmatic policymakers find incrementalism a realistic and practical way to pursue needed reforms gradually, through a pluralistic process of trial and error.

For incrementalism to work properly, at least two conditions have to be met. All or almost all affected interests must be represented in the policy equilibrium, and there must be no major imbalances in power

among the various participants. Later in his academic career, Lindblom argued that corporations occupy a privileged position within all capitalist societies, primarily because of their extraordinary legitimacy and their ability to provide or withhold economic prosperity. Although seeming to abandon pluralism for a power elite view of policy making, Lindblom argued that his primary concern remained the effective operation of incrementalism. Where corporations wield excessive power, incrementalism cannot work properly, as options threatening to business interests are ruled out of order in advance and politicians pursue policies favorable to business interests whether these groups actively seek them or not.

INDIGENOUS GOVERNANCE

Indigenous peoples are the original inhabitants of a geographic space that was subsequently taken from them by outside peoples either by conquest, occupation, settlement, or some combination of all three. Indigenous peoples most commonly refers to those peoples subjugated since the late fifteenth century by European powers and their colonies. Indigenous governance refers to the myriad ways in which these peoples continue to formulate, organize, and actualize their self-governance in formal and informal settings.

Such governance practices can be organized into three broad categories:

1. Practices that take place independent of, or prior to, the colonization by an external political entity. Indigenous peoples had already existing forms of political community before their domination and exclusion by foreign peoples. In many cases, these forms of governance continue and constitute an important part of the political lives of indigenous peoples. These forms of governance may include traditional pre-contact self-governance institutions; diplomatic practices in relation to other indigenous peoples; internal differentiation and collective organization of, for example, clans, families, bands, or tribes; and ceremonial activities.

2. Practices that take place in coordination with, or formally sanctioned by, the colonial power. In many cases, indigenous peoples have accommodated themselves to, and integrated themselves into, the political structures of the colonial power, either by force or choice, or both. The governance of indigenous peoples has historically been channeled into structures that typically continue to be controlled by the colonial power, formally and informally. Examples of such governance practices may include band-councils, quasi-judicial adjudicative panels, formal legal challenges, participation within the governing institutions of the colonial power (e.g., sitting in elective office of a legislative body of a colonial power), and treaty negotiations.

3. Practices that are specifically developed and exercised in opposition to colonial power. Indigenous peoples have always resisted colonialism and have practiced political governance to counteract the negative effects of exploitation and domination. These forms of resistance governance may include the organization and coordination of movements toward de-colonization, antiracist activism, and warrior societies.

Indigenous governance practices often take on more than one of these dimensions simultaneously, such as working within structures formally sanctioned by the colonial power but also simultaneously modifying and resisting them. Furthermore, because indigenous governance is a set of practices that is

always changing with the needs of indigenous peoples and with the colonial setting itself, it cannot be formalized as consisting of any particular one of these relationships, institutions, or goals.

INDIVIDUALISM

The term *individualism* refers to a strong ontological or moral trend in traditional political science that regards the individual as the constituting factor of social and political life. Ontological individualism sees society as being composed of individuals, whereas moral individualism argues that the assurance of individual rights is the highest of all goals. Seen from an individualist perspective, there is a strong tension between individualism and collectivism or collective rule. From an ontological perspective, collective rule is messy because it seeks to govern a group of atomistic individuals with different and conflicting agendas and desires. From a moral perspective, collective rule is problematic because it unavoidably reduces the autonomy—or freedom—of each individual.

Both ontological and normative individualism have played central roles in the development of the political systems known as liberal democracies. Liberal democracies have tried to establish a balance between individual autonomy and collective rule, partly by keeping the power of the state at bay, and partly by

limiting the realm of collective rule. General elections and a separation of powers within the state apparatus have prevented the state from becoming too powerful vis-à-vis the individual, and the realm of collective rule has been restricted by making a sharp demarcation between a public sphere of collective rule and a private sphere of individual autonomy and self-government.

The emergence of the governance society has undermined the traditional institutions of representative democracy, including the mechanisms that were intended to maintain and ensure the balance between individualism and collectivism. First, general elections are reduced to one of several channels of influence, and the price is likely to be a reduction in the influence of some individuals in comparison with others. Second, increased networking within the state apparatus is likely to undermine the separation of powers. Third, the integration of private actors in the governing of society undermines the borderline between the realm of collective rule and the realm of individual autonomy.

Some governance theorists have begun to challenge the image produced by ontological and moral individualism that individualism and collective rule are opposites and must be balanced just as they speak against the belief that the strongholds of traditional institutions of liberal democracy were to establish such a balance. Governmentality theorists such as Nicolas Rose and Michel Dean have argued, for instance, that the perception of how to govern society in liberal democracies does not place individualism in opposition to collective rule. On the contrary, individualism is seen as a central means of governing. Liberal societies have largely been governed through the shaping of freedoms where individuals govern themselves within an autonomous space organized by the state. In other words, the state has governed through the framing of self-governance. A clear example of this framing is the legal regulation of the market and the family as two realms of self-governance.

Governance theorists argue that the emergence of the governance society should be seen as an increase in the effort to govern by means of self-governance.

Hence, it has increasingly been recognized that self-governance should not necessarily be restricted to the private sector, but represents a promising means to improve the governing capacity of the public sector as well. Seen from this perspective, the governance society is the next step toward a society that governs itself through the shaping of spaces for individuality. Ontological and moral individualism serve primarily as legitimating narratives in the development of techniques of self-governance.

INDUSTRIALIZATION

Industrialization is a historical process of economic and social change whereby a society is transformed from a pre-industrial, agrarian economy to an industrial state. Industrialization is typically associated with technological innovation, particularly the development of large-scale production because of the use of new, inanimate energy sources (e.g., coal and steam engine). In addition to technological components, industrialization also entails broad political and social changes. The first known Industrial Revolution took place in Britain during the eighteenth and nineteenth centuries and became the prototype for the early industrializing nations of Western Europe and North America. Some place the Industrial Revolution as early as 1750 but others use the first quarter of the nineteenth century. In Great Britain, the textile industry is commonly seen as the starting point of industrialization.

Basic conditions of an industrial order are the following:

1. Production is geared to exchange rather than subsistence; in other words, agriculture must be able to produce a surplus of food suitable for mass distribution and consumption.

2. Inanimate sources of power in economic production largely replace humans and animals.

3. The application of scientific and engineering knowledge to production where mass production techniques become current knowledge.

4. Factors of production (e.g., labor, capital, and raw materials) are concentrated in large units (e.g., factories).

New social and economic relationships also developed in growing cities and factories as societies became more differentiated and complex in their social structure. Large numbers of workers concentrated in factories grew to be a strong political factor and created a material basis for civil society because resources were distributed away from the state into private hands. Industrialization also created an impetus for democracy as new social classes emerged, facilitating collective action.

Early industrializers became global economic leaders, creating a free market of labor and a pivotal role for the entrepreneur. Later industrializers, such as the Soviet Union (USSR) in the early twentieth century, attempted to industrialize in a few decades with predominately forced labor strategies. During the Cold War, several third-world countries industrialized guided by either the United States or the USSR. In the mid-twentieth century, industrialization spread to countries such as Japan, China, and India.

In the major industrialized nations of the late twentieth century, traditional large-scale industrial sectors, for various reasons, could no longer compete with flexible companies or high value-added industry as technological improvements and new industrial jobs required specialized skills, giving rise to mass unemployment. This shift away from manufacturing toward service industries aggravated by the increased liberalization of international trade has signaled what many see as the emergence of a postindustrial society.

INFORMAL ORGANIZATION

If the formal (or technical) organization is the distribution of roles and responsibilities within an organization as it appears on paper, then the informal (or social) organization is how the organization operates in reality. When emphasizing the informal organization, we draw attention to the patterns of activity and interpersonal relationships that develop inside an organization and that are not reflected in an organizational chart or personnel manual. We focus on what actually happens when organizational members perform (or do not perform) their jobs. The informal organization can work in conjunction with, parallel to, or against the formal organization.

The informal organization can be most directly contrasted with Max Weber's rational-legal bureaucracy, which is intentionally impersonal. There, responsibilities and functions reside in an office and are designed such that anyone with the necessary skills can occupy the office, learn how to perform its function, and do so with little variation in outputs. In contrast, the informal organization is intensely personal. Individuals may occupy roles and offices, but they bring to those offices their own interests, values, and assumptions. Their organizational behavior is as much a function of their personalities as it is their formal duties. Workers develop friendships (and enemies), trusted sources of information, and preferences for how to accomplish assigned tasks that may or may not support the formal organization.

The informal organization was first noted in the Hawthorne experiments of the early 1930s, where researchers noted the presence of a social organization in addition to the technical one that governed worker behavior. The social organization was structured and orderly, just as the formal organization was, and in this case worked to counter organizational efforts to structure the work process. Chester Barnard's work argues that an executive's work is chiefly concerned with shaping the social organization so that it works in conjunction with the technical organization. Indeed, the modern emphasis on organizational culture, mission statements, and efforts to empower workers can be seen as attempts by managers to structure the informal organization so that it reinforces rather than counteracts the technical core of the organization.

The informal organization fell out of favor as systems analysis in general declined in popularity in the 1960s. Its legacy, however, can be seen in more recent work on institutional theory and network analysis. Institutional theory views the organizational world as a construct of the ideas and conceptions of its members; socially created meanings and normative rules for acceptable behavior provide the basis for authority and decision making within the organization. Network analysis focuses on the interaction of culture, human agency, and social structure.

INFORMATION ACCESS LAWS

At its broadest, the family of information access laws may be taken to include all those statutes and

regulations that determine who may or may not see information held by organizations—governmental or otherwise. These laws fall within one or more of five categories:

1. Access to information—other than personal information—held by the state in all its forms (e.g., freedom of information, which has archival access legislation as a subcategory).

2. Access to information about the individual. The sectoral scope of such laws varies from one national jurisdiction to the next, but the trend is toward coverage of state, private, and voluntary sectors (e.g., data protection).

3. Power of state agencies to pass personal data from one to another for certain, specified purposes (e.g., data sharing; strictly speaking a subspecies of data protection, but worth distinguishing because of its growing social and political salience).

4. Protection for employees who make unauthorized disclosures of information whose release may be seen to be in the public interest (e.g., whistleblower).

5. Determination of when state officials may or may not disclose confidential information held by the state. They also identify the sanctions to be imposed on those who make unauthorized releases (e.g., official secrecy).

It will be immediately apparent that this typology is based both on the organizational scope of the laws and the character of the information to which they relate. They may be combined in many ways, and they have been adopted by states in quite different sequences. In many states, all five categories may now be found alongside one another, integrated with varying degrees of success.

A number of official secrecy regimes had been established by the middle of the twentieth century (e.g., the British Official Secrets Act 1911), but the development of the broader family of information access laws is mostly a phenomenon of the second half of the century. It has its origins variously in a reaction to totalitarianism, in a mistrust of the democratic state, in consumerism, and in libertarianism. There is a growing debate about whether the rights enshrined in these laws constitute fundamental human rights. International legal instruments do lend support to the argument that information privacy rights have this status (for example, the European Convention on Human Rights). But there was some suggestion in the latter part of the twentieth century that the European Court of Human Rights was also willing to infer a right to information, albeit a partial one, from other rights in the European Convention.

The spread of this family of laws across the Western world and beyond has been encouraged by donors and development agencies (who see freedom of information as a bulwark against corruption) and by trading blocs (notably the European Union, which has sought agreements with its trading partners to secure the application of data protection principles to transborder data flows).

The speed of development of information access laws increased sharply in the last two decades of the twentieth century. The advent of the information society meant that greater economic and social power was vested in the control of access to information. Technological change also brought with it a raft of new legal challenges, not least those governing the definition in statute of basic information concepts whose significance had been transformed in the electronic environment (e.g., "original" and "record"). It seems probable that technological change will drive the renewal of information access regimes within shorter and shorter cycles for the foreseeable future.

INFORMATIONALISM

All societies are to a certain extent shaped by human activity that produces subjective and objective information—cognition, communication, cooperation,

and the informational products produced by these processes can be found in all societies. All labor is based both on mental and manual aspects, that is, on a dialectic of mental labor and manual labor. Nonetheless, the terms *informationalism, information society, postindustrial society,* and *knowledge-based society* are reserved to characterize a social formation that is shaped by knowledge, information technology, science, and expertise as immediate factors of social production in its entire realm. Social production is increasingly shaped by mental and informational labor and less by manual labor. Informationalism is a mode of development of modern society that is structured by and based on knowledge, science, expertise, and information technologies.

Technologically achieved increases in productivity allow the reduction of the share of manual aspects and the increase of the share of mental aspects of labor, that is, the composition of labor shifts from the dominance of high-energy manual labor to the dominance of cognitive, communication, and cooperative labor (informational labor). Informational labor and informational production dominate and restructure all realms of the economy and society. The emergence of the information society is a multidimensional shift that involves the rise of knowledge as a strategic resource in all societal areas. Information has become, besides labor, capital, property, and power, a defining characteristic and mechanism of modern society. This shift has ecological, economic, political, and cultural dimensions and is accompanied by both new opportunities and new risks in all subsystems of society. Networked computer usage has resulted in a real-time globalization of social relationships; knowledge flows today transcend national borders; and they result in the globalization, intensification, and time-space-distanciation of social relationships and establish a more intensive and extensive interconnection of humans. The twentieth century has seen an unprecedented increase in intensity, extensity, and velocity of global communication that is closely related to the rise of radio, television, satellite transmission, the microelectronic revolution, and digital fiber-optic cable networks or digital data processing. We today live in an information society in the sense that information

and information technologies have become immediate forces of production that influence and change all subsystems of society. The increased informational character of society is the result of the rising importance of expertise, scientific knowledge, and information technologies.

The information economy can be characterized as an economy where labor is mainly cognitive, affective, communicative, and cooperative labor. Such labor produces symbols, social relationships, knowledge products, and expertise. Services, especially information-based services, have become the main sector of the economy. Networked electronic communication allows a reorganization of the corporation and mediates the emergence of transnational corporations, flexible production systems (lean production, outsourcing, just-in-time-production), and the decentralized, networked firm. Informational labor, communication, information products, research, expertise, and marketing have become central aspects of value production. There is an increasing importance of engineering, management, researchers, and technological jobs in firms. The information economy has a polarized social structure, both low-paid/low-qualified and high-paid/high-qualified informational labor have been rapidly increasing. Hence, one can also speak of the rise of a white-collar proletariat, a cybertariat, or cognitariat. The main antagonism of the information economy is the one between information as a public good (open source) and a commodity (intellectual property rights).

Characteristics of an informational polity include the emergence of e-government, electronically networked forms of surveillance, global virtual political communities, discussions about the potentials of e-democracy and the threats of e-populism, and new forms of protests and social movements that have been described as cyberprotest and cyberactivism. The main antagonism of informational polity is the one between the potentials of e-democracy and networked forms of political participation and digital, networked surveillance and control.

The Internet and the computer are the main technologies that shape informationalism. They both have their origin in military developments, but have been

generalized and commercialized. Capitalist restructuring has been the main driving force of informationalism—hence one can describe the dominant societal formation adequately as informational capitalism; without capitalism, the emergence of an informational mode of development would have taken place more slowly. Informationalism is a mode of development that allows capital accumulation in faster and more productive, flexible, efficient, and rational forms. Informationalism and capitalism are mutually connected, but can't be reduced to each other. Informationalism has enabled the post-Fordist restructuring of capitalism; the logic of capital accumulation has coined the rise informationalism.

INSTITUTION

In ordinary language, institutions signify core concepts of governance, such as the executive, parliament, and judiciary. In current political science, institutions take a broader meaning. They are formal rules (including constitutions), informal norms, and shared understandings that constrain and prescribe political actors' interactions with one another. Institutions are generated and enforced by both state and nonstate actors (such as professional and accreditation bodies). Within institutional frameworks, actors may have more or less freedom to pursue and develop their individual preferences and tastes.

Institutions have always been a major subject of social science research, particularly in political science and sociology. Their importance has been reinforced, since the 1980s, with the emergence of new institutionalism and its intellectual streams—rational choice, historical, normative, and sociological institutional theories.

Why do actors adhere to institutions? From a rational choice institutional perspective, with its instrumentalist logic, people follow norms because they want to avoid sanctions and maximize rewards. For instance, members of parliament, in a parliamentary regime with closed-list elections, are more likely to adhere to norms of party discipline, in hopes of being remunerated with a future executive position, than are members of the U.S. Congress, who are less dependent on the president for their future political career.

Normative institutionalism, however, explains actors' adherence to norms in reference to their perception of some actions as appropriate or inappropriate for people in their role. For instance, a minister may resign as a result of a crisis related to her ministerial department, following an informal norm of proper behavior in such circumstances, regardless of whether she perceives this action as instrumental to her future reelection prospects.

Sociological institutionalists claim that the strength of some institutions results from their taken-for-granted nature: Actors adhere to norms because they cannot conceive an alternative form of action. For example, a prime minister may respond to a political crisis by nominating an independent public inquiry, headed by a supreme court judge, because this has become the standard response to instances of crises.

Institutions have been shown to have a major impact on political processes and outcomes. Rational choice institutionalists emphasize institutions' role in shaping the degree of stability and change in a polity through the determination of the number of players whose consent is necessary for a change in the status quo. Historical institutionalists highlight institutions' path-dependent effect, whereby the contingent choice of one institution over another—for example, private over public provision of pensions—results in actors' investment in adaptation to the selected institution and therefore in its durability and in stable divergence of countries' institutional forms. Conversely, normative

and sociological institutionalists explain the convergence of governance regimes across counties (for example, privatization and the new public management reforms) as a result of the legitimacy of these institutional forms.

INSTITUTIONALISM

The study of institutions has a long pedigree. Contemporary institutionalism draws insights from older works in a wide array of disciplines including economics, political science, sociology, anthropology, and psychology. The reappearance of interest in institutions in the early 1980s follows a familiar pattern: a reaction to dominant strands of thought that neglected institutions, historical context, and process in favor of general theorizing. As a result, institutionalism is characterized by an epistemological preference for historicist rather than deductive-nomological approaches to research. The new institutionalism (NI) is less "new" than it is a restatement of previous scholarship. At the same time, the contemporary study of institutions has been reinvigorated by a concern for theoretical elaboration of microlevel processes. The following discussion traces the development of institutionalism from the nineteenth century until the emergence of the NI. Although the focus is on intellectual developments that occurred before the neoliberal turn, a historical understanding of institutionalism is useful for approaching contemporary problems of governance because the concepts used to discuss contemporary institutional arrangements originated in the past.

Nineteenth-Century European Institutionalism

A full overview of the institutionalist tradition would go back to Aristotle's discussion of regime types (*politeia*). More recent interest in institutions emerged during the nineteenth century among the German historical economists (GHE) or what Paul Pierson called the institutional economists. Providing a critical response to the universal theories of the classical economists, these scholars disparaged deductive work, which they considered to be self-referential mathematical modeling. They argued that economic life is better understood through empirical work rather than through logical philosophy.

Their key insight was the need for historically and sociologically informed empirical analysis of reality. The earliest figure from this group was Wilhelm Roscher. His work insisted on the importance of context—historical, social, and institutional—for understanding the laws of political economy, economic behavior, and the empirical diversity of social life. Early research focused on the relationship between the social and economic organization of society, stages of development, and evolutionary processes. Bitter conflicts with their Marxist contemporaries (followers of the theories of Karl Marx) notwithstanding, some scholars now see a close analytical affinity between the two traditions.

It is customary to divide the GHE into three generations: Early, Younger, and Last. The latter is noteworthy because it encapsulates some of the work of Max Weber, who was influenced by early GHE. Weber is perhaps the most influential modern institutionalist. Contemporary institutional works that posit institutions as an independent and non-epiphenomenal

variable are indebted to Weber's theorizing a political realm that is autonomous from economics and ideas. In his discussion of the state and bureaucracy, he proposes a macrosociological theory of institutions.

Institutionalist insights are also present in Weber's theory of authority. For Weber, charismatic authority, though magical in essence, is inherently transient. As charisma exhausts itself and becomes routinized, traditional or rational-legal forms of authority take its place. With routinization, social relations and interactions become increasingly regular, predictable, and impersonal. Under modern capitalism, these take on a rational-legal form and become more extensive and elaborate. Some usages of the term *institutionalization* are thus a subset of Weber's process of routinization. Later institutionalist insistence on the importance of the legitimacy of social action is informed by Weber's insight that social action is framed with reference to a "sacred" metaphysical principle.

Early Twentieth-Century American Institutionalism

Institutionalism appears in American scholarship during the late nineteenth and early twentieth centuries in the works of the American institutional economists (AIE). Thorstein Veblen was a pivotal figure who criticized the neoclassical approach for its focus on individuals and exogenous specification of preferences. He argued that individuals are shaped by their institutional and sociocultural context. He emphasized habit, instinct, and emulation as alternatives to utility calculation models of behavior. Veblen theorized institutional persistence, a product of lock-in, and developed several mechanisms of change, including conflict between institutions, exogenous shocks, and the interplay between routines and the variable and volatile action of agents.

Although Veblen embraced an organicist approach to social science, favoring the biological metaphor of evolution over the physical metaphor of mechanics deployed by economists, he was explicitly antifunctionalist. He raised the possibility of social breakdown, and his vision of history as an unfolding process that is cumulative but also crisis ridden, rather than as a

self-balancing smoothly changing system, marks an early appearance of both critical junctures and path dependence. Veblen's theory of institutions, though underdeveloped, already identified many concepts that are central to historical institutionalist (HI) research.

A later figure among the AIE was John R. Commons, who rejected the framework of the classical economists in which providence endows individuals with freedom to enter into relations of economic exchange and economics is separate from politics. Commons argued that economics was a series of transactions that were made possible by institutional supports. He identified three types of transactions: rationing, managerial, and negotiated (associated with communism, fascism, and capitalism respectively). Institutions have to guarantee liberty and property before negotiated transactions can occur. He defined institutions as the working rules of collective action that are laid down and enforced by various organizations including the state. Institutions produce order by creating expectations toward which individuals can orient their economic behavior. This interpretation of institutions is at the heart of rational choice institutionalism (RCI) and the new institutional economics (NIE) and can be seen in the recent works of authors such as Douglass North. (Commons also added that collective action occurs most frequently according to customs, which are later supplemented by formal rules that are more precise, elaborate, and carry sanction.)

Mid-Twentieth-Century American Institutionalism

An anthropological version of economic institutionalism emerged later in the work of Karl Polanyi. Influenced by the GHE, he argued that economic relations are historically contingent and cannot be understood outside of their social context. For Polanyi, economics is always embedded in society. Rather than economic relations producing social integration, Polanyi argued, the social background, and institutions in particular, integrated the economy. According to this logic, markets are not the product of spontaneous acts of exchange. Instead, personal-level acts of exchange produce prices only under a system of price-making

markets—a system that cannot arise solely from random acts of exchange. Historically, the market system is a relatively recent innovation and only one of several, contingent institutional solutions to the problem of economic integration. Additional forms of integration are reciprocity (e.g., lend-lease) and redistribution (e.g., the Soviet Union).

Polanyi defined institutions broadly as uniting, stabilizing, and giving structure to the economic process. Although economic institutions such as price and money are important, Polanyi also stressed the importance of non-economic institutions such as religion and government. Haggling over price and individual choice are understood as a product of institutions; this foreshadows later sociological institutionalists (SI) who see human behavior as following a "logic of appropriateness" and institutions as creating identities. Like his predecessors, Polanyi rejected the idea that contemporary economic science can universally capture economic relations.

Institutionalism also appears in political science during the mid-twentieth century when American political science was dominated by the study of democratic progress in the United States. Analysis of other countries was rare. Nevertheless, theorists such as Carl J. Friedrich focused on institutions in their cross-national work on constitutionalism. For Friedrich, constitutionalism was characterized by both a concern for individual autonomy and institutional arrangements—divided government and federalism—to prevent the concentration of power, especially in the state. Institutions are the rules of politics and the instruments of their enforcement. However, Friedrich is careful to note that institutions must reflect social and political reality, and without belief in their legitimacy, they are greatly weakened. Friedrich sharply contrasted modern constitutionalism from nonconstitutional systems such as totalitarianism, and his work on the latter influenced an entire generation of Sovietologists. Finally, he was also interested in questions of institutional crafting—a concern that re-emerges among institutional transitologists of the 1980s and 1990s—although he was agnostic about the existence of a "universal common denominator" for institutional design. Friedrich's insights can be seen in both HI and RCI.

Institutionalism appeared in sociology with the emergence of organizational science (OS), which was a response to the rapid growth in the size of firms starting in the 1860s. The earliest and most influential figure was Chester Barnard, who in the 1930s argued that an organization is a complex system of cooperation and highlighted the need to understand the behavior of the individuals that compose it. He identified a disconnect between an organization's conscious system of coordination (formal aspects) and its unconscious processes (informal aspects). The latter include customs, habits, attitudes, and understandings. The role of the executive is to create open communication and inducements for individual members.

Barnard stressed the importance of nonmaterial inducements, which facilitated individuals' carrying out orders without consciously questioning authority. From this perspective, a manager directs the values of the organization so that individuals work toward a common purpose. He also argued that organizational forms vary across organizations because the configuration of individuals is unique to each organization, as is the appropriate organizational solution. Starting in the 1950s, organizational theories by Philip Selznick and others combined Barnard's insights with ideas from structural functionalism; these are sometimes referred to as the "old sociological institutionalism."

After World War II, a group of behavioral economists known as the Carnegie School criticized neoclassical economics for deductive theorizing that relied exclusively on empirically untenable theories of rational choice. Influenced by the behavioral revolution in psychology, they offered alternative microfoundations for understanding human behavior. In his analysis of firm behavior, H. A. Simon remarked that both the internal organization of firms and their external decisions did not correspond to the predictions made by neoclassical economic theory. He theorized that emotional and cognitive processes interfered with goal-directed behavior, rendering rational choice difficult. Though institutions were not explicitly mentioned, patterned individual behavior was explained through "behavioral routines"; the new concept had an important influence on organizational theory.

Institutions Neglected

During the 1950s and 1960s, American social science was dominated by structural functionalism (SF), a universalistic approach developed by Talcott Parsons. Parsons was greatly influenced by European classical sociology and particularly by Weber's concept of legitimate authority and routinization. Rather than dealing with the difficulty of establishing their empirical boundaries, Parsons theorized institutions as constituting the political subsystem and performing functions to promote the stability of the larger social system. In this view, institutions are not autonomous but, rather, adapt to pressures that emerge from outside the subsystem. Institutional change is explained by analogy with Freud's ego psychology of the individual: Institutions undergo a process of character formation, which leads to symbolic and functional coherence. Structural functionalism is closely related to David Easton's systems theory (ST). Inspired by cybernetic science, the political system serves the function of authoritatively allocating values for society. Specifically, institutions converted inputs (demands and supports from outside the political system) into outputs (decisions that are universally binding for all of society). Both SF and ST were characterized by a modernization teleology that was subsequently criticized.

Starting in the 1940s, a behavioral research program emerged that focused on individuals and their location in the social structure. Relying on increasingly sophisticated statistical methods, these scholars sought to correlate political behavior with various socioeconomic variables. The implicit theory of politics is pluralist; macrolevel outcomes result from the aggregation of individual choices. Nevertheless, as in SF and ST, institutions are epiphenomenal. The state and political institutions are in the background and merely serve the function of allocating public goods to competing social groups.

Institutionalism Revisited

In response to theories that focused on social structure, the 1980s witnessed a resurgence of interest in institutions and the emergence of the NI. Theorists of comparative politics such as Peter Evans, Dietrich Reuschmeyer, and Theda Skocpol suggested that the state was autonomous and called for bringing the state back in as an explanatory variable. *Bringing the State Back In* became a seminal work that proposed an institutionalist research program that would sustain political science for more than two decades. The study of institutions was significantly advanced with research in political economy on the state-led development of the Asian NIEs, as well as institutional reforms in the developed countries. With the onset of the third wave of democracy, researchers also became increasingly interested in cross-national comparison of institutions, with a view to understanding the process of democratization. Finally, the global expansion of capitalism and European Union (EU) integration led to significant research demonstrating the role of institutions as intermediaries between structures and outcomes.

Paul DiMaggio and Walter Powell's call for a new institutionalism is noteworthy because it emphasizes the "taken for granted" nature of institutions. The inspiration for this concept comes from *The Social Construction of Reality,* in which Peter Berger and Thomas Luckmann argued that human beings create and recreate the social world themselves but experience it as an objective reality. Adopting the phenomenology of Alfred Schutz, Berger and Luckmann argued that the disconnect is because humans are introduced to knowledge of society through language that reduces all unique and concrete experiences of social encounters to generalized meanings. More broadly, "objective reality" is a product of the institutionalization of language, roles, and traditions.

Finally, James March and Johan Olsen's explicitly referenced earlier institutional works in their call for bringing institutions back in. In addition, they offered a specific critique of rational choice theories and rearticulated older concepts such as path dependence, unintended consequences, and critical junctures, and claimed that theoretical work remained to be done at the level of microprocesses. Finally, they adumbrated a research program to investigate among other things the interaction of society and institutions, the sources of institutional coherence, how historical processes lead to delayed outcomes, and nonutilitarian models of behavior.

Conclusion

Most of the concepts used to understand institutions in discussions of governance appeared in earlier institutionalist research. In response to ontological and epistemological changes in the social sciences, some concepts underwent various transformations. One example is the SI idea of "taken-for-granted," which is a phenomenological version of what behavioral economists called "routine," which is a cognitive version of what Veblen called habit. At the same time, the concepts that underpin institutionalism are becoming more theoretically elaborate. This is particularly true at the microtheoretical level and can be seen in the NI. From this perspective, one might say that our understanding of institutions is itself becoming institutionalized.

INSTITUTIONALIZATION

The process and development or changing of rules and procedures that influence a set of human interactions over time is called institutionalization. Hence, institutionalization is a process in which societies are "made" and "modified" by regulating societal behavior (i.e., supra-individual behavior). Three options can be distinguished: (1) rule making or their installment, (2) rule adaptation or developing "best practices," (3) rule change or replacing "old" rules by "new" ones.

The German social scientist Max Weber was already aware of processes of institutionalization and its subtle variations. He explicitly differentiated between rule configurations that were goal orientated (*zweckrationalität*) and those that were idea consolidating (*wertrationalität*). This nuance between purpose and value orientation is still relevant for studying institutionalization. Institutional processes that direct behavior with reference to a shared goal can be considered as organizational types of institutionalization, whereas modes of (preferred and stabilized) conduct of actors are based on mutual expectations. Institutionalization is thus a human activity that installs, adapts, and changes rules and procedures in both social and political spheres. It affects the interactive behavior of individuals and organizations as well as of political entities (e.g., states). This distinction between individuals, collective actors, and polities is important because the way rules and procedures are developed and subsequently become operational is different for each sphere. For example, the development and establishment of liberal democracy is actually an ongoing process of institutionalization. On the one hand, it reflects a shared value within a society as expressed in its appreciation of individual

political and civil rights (*wertrationalität*), but on the other hand, the relationship between state and society is organized by means of basic laws to define its mode of governance to make it work democratically (*zweckrationalität*).

With regard to social interactions, rules evolve more often than not in a nonbinding fashion, albeit depending on informal hierarchies and whether or not they are born out of necessity. Eventually, many practical rules are developed into institutionalized behavior that remains more or less stable over time: Practices become shared rules that in turn are formalized in supra-individual terms (e.g., the Ten Commandments in the Bible, but also Jean-Jacques Rousseau's idea of the social contract).

This type of institutionalization may well be typical of organizations and societal development as such. Yet, it is not typical if we consider the political space: Political systems are by definition characterized by the existence of binding rules that are formalized (e.g., by law or constitution) and can be enforced independently from individual actors (like enforcement by the police). Although procedures may differ to some extent, both rules and procedures are subject to scrutiny and external controls (by the judiciary, the legislative, electorates, etc.) that are characterized by a hierarchical relationship. In this view, the human interaction within a polity is prescribed and largely predictable. Hence, the process of institutionalization serves the purpose of a system's stability. Yet, it should immediately be noticed that also in the political sphere rules and procedures do change and are adapted if and when unintended consequences occur and the input legitimacy and output legitimacy of a political system is negatively affected by the relationship between rules and procedures, on the one hand, and political behavior and system's performance, on the other hand. Electoral reform (e.g., recently in Italy and New Zealand) and decentralization (e.g., in Belgium and Great Britain) are examples of restoring the institutional framework of the polity to enhance legitimacy. The debates on a constitution for the European Union (EU) and on establishing democracy in post-communist Europe reflect the attempt to regulate political behavior and to enhance responsible

government. Political institutionalization is therefore not a static but dynamic process.

Institutional analysis has produced various explanations for the emergence and change of rule configurations and related behavior with regard to political and social outcomes. Three types of explanation can be discerned:

1. *Rational choice:* Institutionalization is considered as the urge for establishing general welfare, where rules of behavior constrain the actor in choosing strategies of goal-attainment. This is a well-established and widespread approach within institutional analysis and is well suited to understanding the emergence of governance in all its variations (from public to private, etc.); that is, if and when the actors' preferences are stable and their interests are revealed in a transparent fashion (as is, for instance, assumed under democratic conditions in relation to party competition). However, although rational choice does perform quite well if these assumptions are met with respect to analyzing highly institutionalized systems and circumstances, it does less well in situations where conflict and values are prominent. It appears that this type of explanation is suitable for policy analysis and routinized behavior.

2. *Culture matters:* The embeddedness of values and norms and their influence on social and political relations is seen as constitutive of the process of institutionalization. The extant belief systems of a society and the related framing of reality are considered to promote forms of legitimate governance. In the cultural approach, mutual trust is the basis for acceptance and justification of rule making and perseverance. For instance, the process of democratization is thought to depend on the cultural context in which formal binding rules are operational: the logic of appropriateness—as James March and Johan Olson call this process—is developed in addition or in place of the formal ones (the logic of consequentiality). This approach appears suitable for understanding behavioral variation of political actors under seemingly similar institutional arrangements like liberal democracy.

3. *Shock and crisis:* Institutions change as a result of exogenous and indigenous shocks to a system. If we

limit ourselves to political systems, then rule adaptation or the installment of new rules and procedures is considered as a system's response to a (perceived) crisis. Apart from a breakdown, this can also mean adapting the existing framework of reference for problem solving by government. Alternatively, endogenous shocks are often seen as sources for radical institutional change. More often than not, this is conducive to institutional battles over the preferred direction of change and conflicts over the extent of change. Examples of this are the transformation of the Soviet Union into its present polity and the emergence and development of the EU. In this perspective, institutional change is analyzed with a view on shifting power relations among actors. The reorganization of a polity's rule-adaptation and related procedures is then considered as a redeployment of power resources.

Institutionalization is a complex process of evolving rules and procedures that is by definition dynamic. As institutions must be considered as humanly devised contracts of social and political actors, the actual working and related performance of institutions is conducive to changes in society and its type of governance.

INSTITUTIONALIZED ENVIRONMENT

The idea of the institutionalized environment is based on the more fundamental concept of the institution. The definition of institution has itself been subject to a reasonable amount of debate: Institutions may be defined narrowly—understood to mean formalized governmental structures (such as agencies) and written rules—or more broadly, in that all informal rules and practices that have been socially legitimized may be considered to be institutions. Using either definition, evoking an institutionalized environment is thus a way of examining the effects of a complex set of collectivities, rules, and practices on an individual or an organization. In general, the institutional perspective on governance provides a popular route for the application of sociological theory, allowing scholars to consider the combined effects of structural and cultural elements on their subject of inquiry. Prescriptively, such a perspective may suggest that familiarity and facility with existing institutions are the keys to effective political action.

Because the institutional environment represents such a potentially enormous set of influences, theorists have found different ways of breaking elements of the institutionalized environment into more usable pieces. One popular method is to define the effect of institutions against the dictates of rational, decontextualized efficiency. Where an organization or individual is perceived to act in a way that is not the most efficient for the direct achievement of a goal, the institutional environment may be examined for ways that it prompted an inefficient course of action. This form of analysis typically seeks to demonstrate that the action ultimately was rational in that it was the most efficient action available under the institutional circumstances, or that the legitimacy the actor gained by acting within the institutional guidelines ultimately most efficiently furthered the achievement of the actor's goals. A rational analysis may also consider the degree to which an environment is institutionalized—the number or power of individual institutions operating in an actor's environment. More provocatively, some theorists have pointed out that the valuation of rational efficiency is

itself a cultural institution—a position that invalidates the opposition of rationality against all other institutions and seeks, rather, to understand the interplay of institutions on actors.

Other approaches turn to the institutionalized environment to understand organizational isomorphism—the tendency of actors to conform to their environments. To explain this, some theorists differentiate the institutionalized environment according to the forms of pressure that are brought to bear on organizational actors. Coercive institutional pressure is the pressure to conform to the dictates of governmental regulations or laws and is the most stringent form. Normative institutional pressure describes pressures to conform to cultural values derived from social or professional groups. Finally, mimetic institutional pressure describes the tendency of organizational actors to resemble other actors in their environment without any obvious sanction driving them to do so. This last form is also described as the cognitive effects of institutions—the ability of institutions to manipulate symbolic systems in such a way as to alter social perceptions and interests.

INSTITUTIONAL PERFORMANCE

The concept of institutional performance refers to the quality of public service provision. It focuses on the performance of various types of formal organizations that formulate, implement, or regulate public-sector activities and private provision of goods for the public. Therefore, institutional performance is often referred to as "governmental performance" or "quality of government," and excludes other types of social institutions, such as family or religion. To perform well, institutions have to be responsive to citizens' demands and expectations and to be able to effectively design and implement policies reflecting these demands and expectations. Therefore, quality of institutional performance is assessed in reference to two broadly defined issues: responsiveness and efficiency.

Institutional performance is a matter of primary importance in democratic regimes because this is where accountability is necessary to maintain a government's legitimacy. Responsiveness, accountability, and impartiality of governmental agencies and equality of all citizens are among the main definitional features of democracy, whereas in nondemocratic regimes, coercion, religion, or tradition may serve as primary sources of regime reinforcement and legitimacy. Research shows that, indeed, nondemocratic regimes tend to have much worse performing institutions (i.e., less transparent, responsive, and efficient).

Indicators

Recently, there has been an increasing interest in developing indicators of institutional performance. There exist two major methods of assessing performance quality. The first one refers to the public's confidence in institutions, that is, to citizens' beliefs that institutions' agents are fair, are competent, and bring about desirable outcomes. This approach assumes that the general public recognizes whether institutions perform well or not and reacts to this. Therefore, this approach uses public opinion surveys, especially survey questions about respondents' confidence in various types of public institutions (such as parliament, police, government, the legal system). Public opinion–based indicators are relatively sensitive to short-term changes and isolated events, such as political scandals, and they tend to reflect evaluations of the current government policies and satisfaction with public services available to an average citizen. Therefore, they are particularly adequate to explore the institutions' degree of responsiveness.

The second approach uses expert surveys and conventional statistical measures (such as levels of spending, unemployment rates) to create objective indicators of performance. The paradigmatic example is World Bank Governance Indicators project, which looks at (among other issues) government effectiveness defined as the quality of public-service provision, quality of bureaucracy, competence, and independence of civil service and government's commitment to policies, and at regulatory quality, which is defined as the lack of excessive regulation and the low incidence of market-unfriendly policies. Objective indicators capture relatively stable institutional characteristics and are less sensitive to short-term changes. Both types of measures—public opinion and objective indicators—can be used to analyze trends over time in performance or to make comparisons between different institutions within the same country or equivalent institutions across countries. A simultaneous decline in the quality of several institutions is likely to be an indicator of a system-related political crisis.

Sources

There is significant interest in the possible determinants of good institutional performance. Most recently, the concept of social capital, linking institutional quality with the culture of trust and reciprocity and widespread civic activism among the general public, has become particularly popular among academics and policymakers. This concept suggests that where citizens are engaged in community affairs and public issues, and are willing to compromise over polarizing issues, overcoming collective action problems becomes easier and "rent-seeking" and patronage practices among public officials are less likely. Therefore, social capital promotes broad interest articulation and ensures active evaluation and verification of institutions' responsiveness. However, critics of the social capital approach argue that the relationship between social capital and institutional performance is in fact reversed, and that citizens' attitudes and engagement are determined by institutions' quality.

An alternative approach to understanding the determinants of institutional performance focuses on institutions' organizational features and places the issue of public-sector performance within the framework of private sector and business management. Proponents of this approach believe that to be efficient and profitable, firms must have the capacity to flexibly respond to customers' changing expectations. Therefore, proponents search for the determinants of institutional performance predominantly within the public administration's capability to reform itself efficiently to become more responsive to citizens' demands.

Implications

Quality of institutional performance has numerous important implications. Institutions that perform well are likely to elicit support, confidence, and compliance from citizens. Good institutional performance generates support for the government and, more generally, for the political regime. This is particularly important in the countries undergoing political transformation, where democracy has not yet fully consolidated. Poor performance undermines citizens' confidence in institutions, which may result in political apathy and decreased legitimacy of the regime. Citizens' perceptions of institutions as trustworthy and competent influence citizens' compliance with the law.

Economic growth is also dependent on institutional performance. The quality of bureaucracy and the regulatory framework reflecting government's general attitude toward business influence firms' productivity. They form an economic environment that strongly influences the degree of capital accumulation, skill acquisition, technology transfer, and invention. Law enforcement is the key element preventing private diversion of economic outputs, whereas government expropriation, confiscatory taxation, and corruption are the major means of public diversion in an economy. Therefore, the quality of government and institutional performance strongly affects national growth.

Interdependence

Actors (persons, organizations, groups, governments) are interdependent when they need resources, assistance, or efforts from other actors to realize their own ambitions. This interdependency consists in the fact that no actor can reach its goals solely with its own resources: The resources the actors need to reach their goals are divided among them.

Resources include the whole range of formal and informal means parties possess to achieve their objectives. This may include formal competencies and decision-making power (authority); clearly identifiable resources such as money, organization, and human resources; and less tangible resources such as authority, legitimacy, strategic capability, mobilization power, and the like. An actor's degree of dependence is determined by the importance this actor attaches to resources "owned" by others and by the possibility of substituting these resources or acquiring them through other actors. The importance and the substitutability of these resources thus determine dependency relations.

Backgrounds of Interdependency: The Network Society

Between government and society, but also between the different actors within society, the public and private sector, many forms of interdependence exist, and the widespread consensus is that these interdependencies have grown in number, variety, magnitude, and intensity.

Several authors have argued that these growing interdependencies are related to the dramatic changes in our society during the last decades. These changes can be summarized as a development toward a network society in which horizontal relations and networks have grown in importance partly as a result of information technologies but also because of specialization. According to some authors, other societal trends, such as individualization, have reinforced these developments. Individualization, considered as one of the major societal developments in Western society, results in a larger variety of values and seems to go hand in hand with a diminishing of the importance of traditional societal relations. The change toward a network society (and the growing variety of values) makes our society less governable from one point because resources are divided and there are no undisputed values for judging policy proposals and outcomes.

Manuel Castells has argued that our societies are increasingly formed in the bipolar tension between the net and the self. If we look at Castells's analysis, this development toward a network society is a gradual progression that started sometime in the 1970s but accelerated during the final decade of the twentieth century. The implicit assumption is that there is a growing need for interorganizational structures between organizations (in the private as well as the public sphere) to deal with this growing complexity of interactions in the public and private sphere (and the interfaces between those spheres) because of interdependencies. The growing number of strategic alliances between firms, the attention to chain management and networks of firms, and the growing attention to forms of co-governance and public-private partnerships gives ground for this assumption.

The consequence is that to solve the complex policy problems that government faces, government needs to involve various actors in policy-making and implementation processes. Private actors, social alignments, and citizens do have important resources or the

power to obstruct policy interventions, and only through joint efforts and collaborative action can policy problems in a modern society be solved. Thus, interdependency is much at the heart of the recent interest in governance as a new steering form.

Dependency as Source for Interactions

Complex problems require the combination of various resources owned by different actors. This means that actors have to exchange resources and interact with each other. Because each actor is autonomous and acts from its own perceptions of the problem, desired solutions, and perceptions of the other actors, and each actor chooses its own strategy, interactions around problem situations tend to become complex and difficult.

When actors control an important and irreplaceable resource, they can block the creation of a solution strived for by others. They can do this when their interests would be harmed by a certain solution or because they think that they will acquire a better negotiating position by creating barriers. When actors want to realize a solution, they must possess realization power: This is rarely concentrated by one party but usually requires the willingness of various parties to invest their resources in a mutual course of problem solving. When the interests and perceptions of parties involved in a game are convergent, then realizing a solution is not that difficult. In such a situation, the policy game can develop according to the phases of the rational model. But such a situation can hardly occur with complex problems engulfed in uncertainty. In this situation, a strategic game will develop where parties, on the basis of diverging or conflicting interests and perceptions, find themselves in a complex negotiation game that has quite a different dynamic.

Analyzing Interdependence

To analyze the dependency relations among actors, we have to look at the type of resources distributed among them and what these resources mean to other actors. A variety of resources are distinguished in the literature, but we limit our discussion here to five types:

1. *Financial resources:* These are often important for initiatives to solve complex problems. They provide opportunities to truly realize solutions and cover the (extra) organizational costs attached to complex decision-making processes for difficult problems.

2. *Production resources:* These are necessary for enabling policy initiatives. One can think of, for instance, owning land in an urban restructuring issue. In the same case, one can think of building capacity, and so on. In other cases, it might be the capacity of realizing production resources and services such as the number of beds of a hospital, medical equipment, and so forth. In many cases, production resources concern what actors have previously invested in, and these are often specialized by nature, such as the equipment and know-how of a construction company, the specific technology necessary for problem solving, and so on. On the one hand, this make the owners of these resources dependent on the initiators and decisionmakers because the owners seek opportunities for using their specialized resources in projects to earn a profit on their previous investments. On the other hand, the initiators cannot easily acquire these resources through other actors because they require a substantial investment.

3. *Competencies:* This concerns the formal-juridical authority to make certain decisions. For instance, the authority to decide planning and zoning, to issue permits for certain activities, and so forth. These resources generally rest with a public or semi-public actor (independent regulatory agency, etc.).

4. *Knowledge:* This is an important resource for developing solutions but also for investigating the nature of the problem. Knowledge can be available in various types of documents, but it can also be implicit (experience knowledge). This last type of knowledge is difficult to transfer, so it is necessary to activate the actor to use his implicit knowledge in the decision-making process.

5. *Legitimacy:* This is clearly a "vaguer" resource than the others, but it is certainly not unimportant. Some actors have the ability to give or withhold legitimacy from decisions made to solve difficult

problems. One example is, of course, elected political bodies whose support can give extra weight to a project or policy initiative. But also, societal groups can search the media to fulfill such a role. Thus, legitimacy in the network society, where the media has become increasingly important, has also become an important resource.

Every actor possesses a range of means, so an extensive overview is not helpful; what is important is mapping the most relevant resources given the problem situation. Next, when the degree of replaceability is assessed, we can determine the degree to which the problem owner depends on the actor. Critical actors are actors who possess resources that are important to the problem owner or own resources that can be used to hinder the activities of the problem owner (hindrance power) that the problem owner cannot bypass.

The dependency of other parties is influenced by the resources they control and by their subjective involvement with the problem and their willingness to use their resources. The interest that an actor attaches to a problem or solution can become clear from his problem perception. But that is not always the case. It might be useful to determine whether an actor is faced with clear costs and benefits. If so, he or she will probably be a dedicated actor or he or she might become one. When an actor does not perceive clear costs or benefits, or when these offset each other, he or she will be less inclined to work hard for the solution. It is then likely that we are dealing with a nondedicated actor.

An analysis of the objectives and interests of actors provides information that can be used for taking the next step: determining similarities and differences among actors' problem perceptions, interests, and objectives. We can distinguish different categories of actors on which the problem owner is more or less dependent, as shown in Table 1.

This overview provides an impression of an actor's possible responses to a specific problem formulation and the solution direction that is linked to the response. This can serve as a reason for parties to alter the problem solution, or to cash in potential support by making alliances especially with dedicated and nondedicated critical actors. We must keep in mind, though, that mustering support does not remedy the problem of dedicated critical actors who can block. Their status as critical actors gives them veto power over the majorities.

We also must keep in mind that by reformulating problem formulations and objectives, we can bridge contradictions among parties. In other words, the positions that actors occupy in this diagram are highly determined by the problem perception and the objectives taken as a starting point for the analysis. Changing that can make allies of potential blockers. Thus, this figure also provides suggestions about where one can find a substantive change of the problem formulation.

Table 1   Analyzing Dependency Positions: Differences Between Actors

	Dedicated Actors		Nondedicated Actors	
	Critical actors	*Noncritical actors*	*Critical actors*	*Noncritical actors*
Comparable perceptions, interests, and goals	Actors who are likely to participate and be potential allies	Actors who are likely to participate and be potential allies	Necessary potential actors who are hard to activate	Actors who will not have to be involved at first
Contradictory perceptions, interests, and goals	Potential blockers of (certain) changes (biting dogs)	Potential critics of (certain) changes (barking dogs)	Potential blockers who will not directly act (sleeping dogs)	Actors who do not require attention at first

Managing Interdependencies

Governance certainly has much to do with managing interdependencies and trying to find solutions that are attractive to the several actors from whom resources are necessary to realize collective action. But these solutions must also satisfy the various value judgments that are at stake in the decision-making process.

So it is not surprising that governmental organizations increasingly try to set up interactions between private actors, societal organizations, and citizens with important resources or potential obstruction power. Through forms of interactive policy making, negotiation, collaborative dialogues, and so on, governmental actors try to create consensus between the different involved actors about the problem definition, the desired solution, and how it will be implemented.

These new forms of governance need a quite different form of management than the image of management in the classical organizational handbooks, which tend to stress the unity of leadership and goals.

Managing interdependencies between actors and the interactions that go along with them needs a more interorganizational form of management that can be called network management. Network management is more focused on activating actors, promoting interesting solutions, and facilitating interaction. The network manager is more a mediator or facilitator than a top-down manager.

If we look at the characteristics of network management, we will find the following:

- *Power and authority.* Because the network manager is dependent for his initiative on the resources of other actors and mostly does not have any or only limited authority over other organizations, he operates in a divided power structure and there is no single authority where strategic decisions can be unilaterally made. The public manager as network manager simply does not have the position and authority to make unilateral decisions. His world is one with a divided authority structure in which he has to achieve coordinated action. This does not mean that there are no power differences or that power does not matter as some critics say. In a network or inter-organizational perspective, the power of an actor depends on his available resources and the way he is dependent on the resources of other actors. The more the various actors are mutually dependent on each other's resources, the more equal the power division in the network is. But even powerful actors have limited authority because they have no direct authority regarding the way other actors use their resources.

- *Goal structure.* Activities are not guided by uniform, clear goals because the various actors involved have different goals. Goals also emerge during the cooperation process. This makes a large part of decision and cooperation processes in networks a goal-seeking rather than a goal-setting process. It also makes the goal structure of interorganizational cooperation and decision making more like a package deal, where different actors find interesting elements that suit their interests and capacities, rather than a unified common goal.

- *Management role.* From an interorganizational network perspective, the role of the manager is a mediator, a process manager, or a facilitator because network management is in essence an interorganizational activity.

- *Management activities.* These are focused on bringing different actors together, adjusting and accommodating goals and perceptions, and building organizational arrangements to sustain and strengthen interactions. If we were to name three network management equivalents of classical management activities such as planning, organizing, and leading, these would probably be goal finding and perception accommodation, making organizational arrangements, and coordinating.

INTEREST GROUP

In its broadest definition, an interest group can be understood as an entity whose aim is to represent the interests of a specific section of society. More specifically, an interest group can be defined as an organization searching to influence public policies. Although the first definition allows us to conceive interest groups as actors influencing political actors and other interest groups or public opinion in general, the second definition insists mainly on the link that exists between political actors and interest groups, which refers more specifically to the term *pressure group*. These two understandings show the challenges a definition of interest groups faces, in particular in systems that move from government to governance. Three terms are central in this respect: interest, organization, and influence on political actors.

The Interest of a Group

The term *interest* constitutes the heart of the notion interest groups. Common interest is considered the constituent element of a group. According to one of the founding fathers of the pluralist approach of collective action, David B. Truman, social groups are the origin of politics. The group socializes the individual and offers the prism through which the individual perceives the world. Latent or unorganized groups mobilize when their members' interests are concerned, which guarantees that no group can exercise its domination forever. Thus, the groups control and neutralize each other. This approach faces at least two problems: First, it implicitly assumes that all interest groups have the same probability to emerge, and second, that to create an interest group, a common interest must exist. Mancur Olson's work opposed the second assumption particularly: Instead of leading to collective action, the existence of common interests leads to common inaction. Based on the hypothesis of a rational actor, Olson shows that the free-rider phenomenon applies to every collective action. To create interest groups, Olson proposes the appeal to incentives, positive and negative. Negative incentives are understood as costs imposed on actors in the case of noncompliance. This can be the refusal to exercise one's profession, as in the case of the British Dockers if they are not trade union members. Positive incentives concern the offer of economic and social advantages such as a guaranteed assistance of a lawyer in case of work problems.

The Group as Organized Entity

The second element that needs a closer look is the notion of an organized group. In this sense, interest groups are voluntary associations of joiners. They have members, either formal ones who sign up or informal supporters who routinely show up to assist their organization. Thus, an organized group is distinct from a movement or a latent group. However, it is important not to overestimate this organizational principle. Empirical research has shown that social movements or latent groups can be organized and hierarchically structured and are therefore only distinct from interest groups by name. It is important not to overestimate the

rigor, the transparency, and the foreseeable nature of interest group behavior. The organizational structure must be placed on a continuum of more or less structured situations. Thus, a certain number of transnational nongovernmental organizations (NGOs) are organized as real enterprises.

To Influence Public Policy?

Finally, interest groups influence public policy in using a certain number of action repertoires, such as strikes and protests, expertise, and institutionalized consultation. This element is usually put forward to differentiate between interest groups, searching to influence public policy, and political parties, searching for political power. This distinction also allows us to differentiate between interest groups and bureaucracy. Thus, interest groups should be nonstate or private actors. However, these distinctions pose a number of challenges, particularly in systems of governance.

First, an interest group can be tempted to institutionalize its structures to influence public policies and to gain political power, as shown by the developments of labor, environmental, or agricultural movements in Europe that were transformed into political parties. The second differentiation—between bureaucracy and interest groups—poses similar problems. The police officers' or teachers' strikes are only two of numerous examples. These groups play the role of an interest group while being administrative actors. The national or international bureaucracy also can be considered an access point for interest groups, but can become an interest group itself.

Thus, to define an interest group, it is necessary to understand what a group is authorized to do and what role it is expected to play in a system of governance. Therefore, a firm or a bureaucracy can play the role of an interest group in using specific action repertoires linked to interest group behavior. The firm's attempt to influence public policy at the national or international level transforms it temporarily into an interest group.

Action Repertoires

The action repertoires of interest groups are not neutral but, rather, correspond to a number of subjective elements, influenced by the national or international context in which interest groups emerge, the specific policy field, the role an interest group plays in society, its financial resources, social capital, its organizational structure as well as the group's political or social aims. In general, action repertoires can be differentiated into four ideal-types: negotiation and consultation, expertification, protests and strikes, and juridiciation.

Negotiation and consultation are action repertoires used by groups invited by political actors to participate in the policy formulation and implementation process. These action repertoires also lead to lobbying strategies when interest groups are not directly contacted by political actors, but nevertheless want to represent their interests. Expertification refers to an action repertoire widely used in governance systems. Political actors increasingly often call on expertise in the policy-making process. Interest groups providing expertise therefore possess strategic advantages in representing their interests. Protests and strikes are usually linked to governmental but less to governance systems because they aim to exercise societal pressure on a specific government. Governance structures are, on the contrary, rather horizontal, and no clear target for societal pressure can be identified. Finally, juridiciation refers to the use of law by interest groups. They appeal increasingly to national, supranational, and international courts to make their claims be heard.

Today, interest groups are considered increasingly important actors in international and regional governance systems such as the European Union. Transnational interest groups intervene regularly in international affairs as global governance relies on various transnational networks linking together state and nonstate actors and, thus, often generate private governance regimes parallel to state-centered and ruled regimes.

INTEREST INTERMEDIATION

One of the central pillars in theories of governance is that during the past thirty years, the relationship between the state and civil society has undergone significant change. More precisely, it is claimed that instead of the state imposing its government on the economy and society, public bodies now govern with and alongside groups who represent varying collective interests and, thus, engage in interest intermediation. In short, changes in interest intermediation are strongly linked to a conception of governance as a form of politics where public and private actors are more interdependent and equal than was previously the case.

Although it is far from clear that close relations between states and interest groups are new, research in many countries has indeed shown that these have tended to deepen and become a fundamental part of every democratic polity. To understand and study this trend, we must first grasp why public bodies and interest groups tend to become codependent and how this trait has recently evolved. The second part of this text then examines the public administration-interest group relationship "in action" by exploring how it contributes to the making and implementation of public policy.

Interest Groups and the State

The relationship between interest groups and public authorities has interested the social sciences for decades. Indeed, analysis of the depth and intensity of this relationship has frequently been used to compare and categorize states. Over recent years, however, many researchers consider that close relations between private and public actors have become generalized and that, consequently, "governance" involving both sets of protagonists has become a universal phenomenon.

Pluralism and Neocorporatism

In all democratic polities, social groups have generally created organizations charged with representing their respective interests. More precisely, these organizations are first, arenas within which these interests are defined and second, actors for defending them. If the aim of defining and defending interests has remained stable over time, it has nevertheless been carried out within territorial and sectoral environments that have differed widely. The principal aspect of these environments is the posture of the state regarding interest groups. Since the 1970s, political science has defined two ideal-types of state-interest group relations that constitute the two ends of a continuum used for comparative research: pluralism–neocorporatism.

According to this approach, "pluralist" relations between interest groups and states have three common traits. First, several interest groups exist in each sector (e.g., agriculture) or at national levels of intersectoral groups (such as trades unions' congresses or representatives of business). Second, these groups compete among themselves to affect public agenda setting and decision making. Third, the representatives of the state (e.g., civil servants working in ministries) keep themselves sufficiently distant from interest groups so they can choose those they want to favor at any given time.

In contrast to the pluralist model, neocorporatist relations between interest groups and states entail a close and continuous relationship between representatives of the state and their opposite numbers in interest groups. Generally, this form of relationship drastically reduces the number of groups that exist at either a sectoral or intersectoral level and, therefore, the degree of competition that takes place between them.

The pluralist–neocorporatist continuum provided a number of important insights for comparative politics. First, it allowed for the analysis of interest group power when undertaking comparisons between polities. At this macro or societal level, countries such as Austria and West Germany came to be categorized as neocorporatist states whereas the United States was seen as the epitome of societal pluralism. Second, this continuum also encouraged comparison between sectors either within or across countries. At this mesolevel of analysis, for example, neocorporatism was often identified in agricultural sectors throughout the Western world. In contrast, environmental politics has tended to be marked by more pluralist relations between interest groups and public authorities.

Causes of a Shift to Governance

Without losing all its pertinence, during the last fifteen years the pluralist–neocorporatist continuum has tended strongly to be replaced by analysis of state-interest group relations couched in the language of governance. Indeed, in considering both that neocorporatist relations have been opened up and that pluralist relations have tended to give way to concentrations of power among smaller numbers of societal groups, research has often concluded that governance is now the generalized condition under which political exchange now takes place. More precisely, it is now generally accepted that politics in Western societies takes place in contexts of neopluralism where closed networks of representatives of interest groups and the state interact with each other on relatively equal terms. Three causes of this trend have been identified.

The first of these causes is attributed to shifts in the structure of national economies, often labeled globalization. Whereas states were relatively autonomous in managing their respective economies before the 1980s, growing interdependence between industries from different countries has meant that public actors have had to devise new roles for themselves.

This breaking down of the force of national frontiers overlaps with a second cause of a trend toward analyzing interest groups in terms of governance: the growth of supranational public authorities such as the European Union (EU). By becoming involved in making law and public policy at this level, national governments are no longer able to guarantee to their respective interest groups that their voices will be heard at the supranational level. Consequently, interest groups and governments increasingly work closely together to have any chance of developing such influence.

A third cause of a shift toward governance-type relations between interest groups and public authority is best described as ideological. Western governments have increasingly abandoned the goals and policy tools of social democracy (regulation, interventionism) in favor of those of neoliberalism ("the market," deregulation). In so doing, relations between interest groups and states have narrowed to focus on the efficiency of the conditions under which economies and societies operate rather than on the justness of the direction toward which they ought to be moving.

It is still probably too early to identify with precision how the pluralist–neocorporatist has lost its analytical power. For the moment at least, governance provides an alternative perspective within which studies of interest groups and their involvement in politics can be updated and rethought.

Interest Groups and the Governance of Public Policies

A major advantage of analyzing interest groups as partners in the governance of societies is that research no longer has to answer the sterile question, Do interest groups matter? Instead, one can focus more immediately and directly on discovering which groups matter and why. To generate information on these questions, the most effective starting point is to examine how interest groups involve themselves in setting public policy, on the one hand, and in influencing its implementation, on the other.

Formulating Policy

Public action first entails the devising and adoption of laws and other policy instruments in the pursuit of certain goals. This process formally entails the executive setting such goals, devising draft forms of public

intervention, and getting them accepted or amended by the legislature. In practice, and particularly under conditions of governance, interest groups tend to be involved strongly in all three of these political activities.

Many of the goals set by executives are general, such as "reducing taxes" or "reforming the education system." At least if one reads election manifestos, these macro goals often appear to be the pure product of political parties. However, interest groups get involved in defining such objectives through high-level collusion (e.g., the British Conservative Party and the Confederation of British Industry in the 1980s), and many apparently macro goals are actually the product of an accumulation of more specific sectoral, or mesolevel, policy aims (e.g., transport policy as the cumulative result of innumerable demands made by different parts of a country's industry). At this level, interest groups are even more intensely involved because they can offer pertinent expertise while convincing their own membership that the course of action proposed by the executive is right and just. Indeed, at the sectoral level, interest groups are often the prime movers for establishing and revising policy goals. In the case of environmental policy, for example, such groups have consistently identified and alerted the media to issues such as air or water pollution as problems meriting public intervention.

In the language of policy analysis, the process of public problem definition does not just involve the stating of general policy objectives. On the contrary, intense political debates constantly take place within which interest groups compete to impose their definition of what the problem is over that of others. For example, in the case of European agricultural policy, groups that represent large farmers consider that the principal problem for the EU is to encourage intensive farming that provides food at a low cost to the consumer. Other farm groups argue that intensive farming does not necessarily produce good-quality food and gives rise to a series of negative social costs such as environmental damage. They thus define the public problem as one of seeking a balance between intensive and extensive agriculture.

Understanding how such groups engage with the executive to define public problems begs the question of how interest groups themselves set their policy goals. Internal consultation is generally constant and implies intermediation between group leaders and grassroots members. Traditionally, this was done through endless rounds of meetings. Over time, however, such meetings have become supplemented by contact that takes place through internal newsletters, magazines, and, more recently, through the Internet. Ultimately, the result of this process is that the interest of the group is defined. This in turn allows group leaders and their permanent staff to defend the process as representative of what their membership wants.

Once defined in this way, the interests of a group then need to be advanced in such a way as to be transformed into law or other forms of public commitment such as subsidies to farmers or tax cuts for small businesses. At this stage, the executive must be convinced of the appropriateness of these goals, and so must the legislature. This is therefore when interest groups tend most to seek support from other groups to aggregate a wider set of interests. Indeed their objective is to be able to argue convincingly that their shared policy goals are in the public interest. For example, in the 1980s, a confederation of European telecommunications operators argued strongly that privatizing public monopolies in this sector would be in the interests of the consumer and the taxpayer. Executives and legislatures throughout Europe adhered to this general objective, and they went on to accept many more detailed proposals for policy instruments put forward by the telecommunications operators.

In summary, a major part of interest intermediation under conditions of governance entails the definition of public problems and the formal, and often legal, adoption of forms of public intervention. Rather than being passive recipients of state-imposed policy ideas, interest groups in democracies are generally highly active in proposing goals for public action and then striving to institutionalize them in a durable manner.

Implementing Policy

The media tend to consider that all significant political activity takes place around the setting of policy and its translation into law. According to this view

of politics, "decisions" are taken at this stage and then simply administered by civil servants. In reality, the idea that the latter can simply tell social and economic actors what they can and cannot now do is simplistic and overlooks how and why decision making is an ongoing process during which policy setting and implementation constantly overlap. Indeed, interest groups are highly involved in implementing policies and invest in this process to try to maintain their levels of access to the executive.

Implementation is primarily a form of decision making because the management of public problems involves policy instruments such as standards (e.g., pollution norms), subsidies (e.g. agricultural price support), and tax reductions (e.g., for single parents). Once these policy instruments have been devised and adopted, they regularly need to be updated to account for changes in the context of the policy sector involved. For example, in the 1980s, the EU produced a wine surplus that caused many producer groups to demand that measures be brought in to reduce it (e.g., subsidies for grubbing out vines and distilling unsellable wine). In the 1990s, market conditions improved and the same producers requested that the subsidies be suspended. During this time, much decision making took place without recourse to the legislative process. Instead, the beneficiaries of the policy instrument sought and obtained its revision largely during implementation.

In other policy areas, implementation is an important form of decision making because policy goals have deliberately been left general to allow actors at local levels to fill in the gaps. This is so in the case of the EU's regional policy aimed at improving the social and economic conditions of Europe's least developed areas. Every six years, the EU sets out general objectives for this policy and defines which area should receive what budget. However, decisions are taken at the regional level, for example, about whether to favor the building of roads or the development of professional training. These decisions are taken in partnership between regional governments and local interest groups such as chambers of commerce or confederations of fishing cooperatives. Given the power of such groups in many areas, the governance of EU regional policy can thus be seen to depend heavily on the involvement of nonpublic actors in public decision making.

More generally, implementation is the daily activity around which interest intermediation takes place. Although public authorities and interest groups are continually in discussion about new proposals for public intervention, their most frequent cause for interaction is quite simply the need to make microdecisions regarding the policies already in place. This constant interaction gives rise to interdependencies that generally perpetuate a long-established relationship between representatives of the state and their opposite numbers in interest groups. Changes of government or the emergence of new interest groups can upset this stability and give rise to new forms of interest intermediation. Nevertheless, governance more typically features forms of state-interest group interaction that evolve slowly rather than change abruptly.

As for policy setting, when undertaking research, attention needs to be paid to two questions about the power distribution that emerges from any examination of the role of interest groups in governance. The first concerns the representativity of interest groups and why some are clearly more equal than others. The second question relates to the contemporary status of the state: What role remains for public bodies in polities cogoverned by interest groups?

INTERGOVERNMENTAL RELATIONS

The term *intergovernmental relations* is used in two senses. First, in the field of international relations, the term refers to relations among national governments that are members of an international regime or association. In European Union (EU) studies, for example, "intergovernmentalism" is a neorealist theory of European integration that argues that national governments, rather than the EU institutions (such as the Commission or the Parliament) or subnational governments, are the key actors in the EU system of governance. The other way in which the term is used is in public administration where it refers to the relations between levels of government within a nation-state, whether this is a federation or a unitary state. This second sense of the term will be analyzed in this article.

The U.S. Origins of Intergovernmental Relations

Intergovernmental relations (IGR) developed in the United States as a subbranch of public administration (itself a subbranch of political science) as a way of analyzing the U.S. federal system. Before World War II, political science studied IGR for its constitutional and legal structures and tended to assume that these structures expressed the totality of relations among levels of government. The growing size and complexity of government and the expanding federal policy programs that occurred in the twentieth century led a number of analysts to become aware that other types of relationships were hidden behind these formal structures. After World War II, these programs continued to expand, which raised questions regarding the formulation and implementation of public policy, the actors involved in the policy process, and the levels across which policies were made and delivered. This led to the growth of the policy sciences, which originated as a branch of political science and public administration but drew on other disciplines such as economics, fiscal studies, and sociology.

IGR may be considered as part of this broad theoretical thrust toward a deeper and more comprehensive understanding of the workings of government. Dale Krane and Deil Wright defined it as "the various combinations of interdependencies and influences among public officials—elected and administrative—in all types and levels of governmental units with particular emphasis on fiscal, policy and political issues." Wright also argued that IGR has a normative aspect and was to be preferred to federalism as a less value-laden way of referring to the multiple, complex, and interdependent jurisdictional relationships found in the United States. This normative direction of IGR theory led to an emphasis on implementation issues, itself a subbranch of public administration. In the U.S. context, the issue was how IGR affected the implementation of policy programs, and research emphasized the role of, and relationships between, policy actors operating across all governmental and administrative levels. The key question was how to coordinate and manage these relationships in such a way as to improve implementation, and this gave rise to the study of intergovernmental management. This was largely an empirical field of study concerned with examining the most effective policy instruments in an intergovernmental setting. In the United States, such instruments included reorganizing the formal roles and relationships of policy actors and redesigning the shape of organizations, new bodies such as commissions to facilitate horizontal coordination across levels of government, coordination mechanisms, regulatory as well as deregulation mechanisms at different periods of time, and devolution and decentralization.

Intergovernmental Relations Research Outside the United States

Although IGR research originated in the United States and could be considered almost synonymous with the study of federalism, it also became a field of study in Western Europe and Australia. The U.S. version was imported mainly through the work of R. A. W. Rhodes, who applied key concepts drawn from interorganizational theory and network interdependency theory to the centralized unitary state of the United Kingdom. This approach modified the traditional top-down view of the British system of governance as dominated by

the doctrine of Parliamentary sovereignty by pointing to the role of interdependent policy networks and the role of local authorities.

In France, too, in the 1960s and 1970s, sociologists such as Michel Crozier and his colleagues Pierre Grémion, Jean-Pierre Worms, and Jean-Claude Thoenig, applied organization theory, "borrowed" from the United States, to the study of central-local relations in that country. This was a break from the traditional method, rooted in public law, of studying government and administration in France, which interpreted central-local relations from the perspective of France as a "one and indivisible Republic." The organization school scholars developed the notion of "regulation croisée" to describe relations between the prefect, the local politicians or "notables," and the administration. This approach, also known as the honeycomb model in English, interpreted central-local relations as descending and ascending in a zigzag pattern of mutual interdependencies across the politico-administrative system.

A version of IGR could also be applied to European federal states. In Germany, Fritz Scharpf and others examined relations among the different levels of government, the federal, the Länder, and the local authorities, which they described as cooperative and negotiating characterized by functional interlocking and intertwining (*Politikverflechtung*). The close interlocking intergovernmental relationships are even stronger in Germany with its system of cooperative federalism than they are in the United States, which is characterized by dual federalism. In the German system of cooperative federalism, the federal government is responsible for the broad framework of policy making, with an important input from the Länder through the *Bundesrat,* whereas the Länder are responsible for implementation. Although the Scandinavian states are unitary states, there is a similar pattern of cooperative intergovernmental relations and a similar pattern of small central state bureaucracy and a large local government sector responsible for policy implementation. Public administration theorists in the Netherlands drew on both Anglo-American and German network theorists to analyze central-local relations that also revealed the Netherlands to be closer to the German

model of cooperative federalism than to its "official" form of a centralized unitary state inherited from the Napoleonic era.

Changing Patterns of Intergovernmental Relations: From the Welfare State to the Neoliberal Period

These analyses of IGR cover the period of the heyday of the welfare state in Europe of the great liberal policy programs in the United States that is from the 1960s until the 1970s. This period was characterized by the postwar economic boom, the optimism that the great problems of poverty and income inequalities, illiteracy, poor health, bad housing, and, in the United States, racial discrimination could be eradicated through rational policy programs. Central governments, whether in federal or unitary states, intervened in the economy using techniques developed by John Maynard Keynes of macroeconomic management, and expanded their bureaucracies at all levels to implement their policy programs. They also increased direct funding, usually in the form of earmarked grants, and the use of these funds by other levels of governments was highly regulated. IGR analysis during this period was largely concerned with how the different levels of government interacted in the delivery of these large-scale programs.

In the 1980s, the welfare state system went through a series of crises and faced a number of new developments and challenges that changed the nature of IGR in all developed states and even further afield (for example, in Latin America and in the new democracies of East and Central Europe). First, the economic crisis that occurred toward the end of the 1960s was exacerbated by the oil crises of the 1970s. Second, the state's fiscal crisis made it increasingly difficult for the state to pay for its policy programs, and which, in turn, fueled the tax protests that began in California in the 1970s. Third, these crises were an opportunity for politicians, such as Margaret Thatcher and Ronald Reagan, influenced by New Right thinkers to implement new approaches based on what subsequently became known as neoliberalism and to introduce important policy and administrative reforms. These

reforms included reducing public expenditure as well as deregulation, privatization, new public management, and, at least in the United States and other countries (if not in the United Kingdom), decentralization. The international context also changed with a new phase of globalization, encouraged by the collapse of the Bretton Woods Agreement, and the subsequent deregulation of exchanges. There was also a shift of economic production locations with the migration of heavy industries from the traditional core areas of Europe and North America to Asia and the development of service industries in the former. The European response to these challenges was to relaunch the European integration project in the 1980s with the development of the 1992 Single Market project and the consequent strengthening of the EU institutions following the Treaty of Maastricht. New paradigms of politics, policy, and administration were developed in response to these changes, which had a deep effect on IGR in all countries.

Redefining Intergovernmental Relations in the Era of Neoliberalism

The paradigm shifts in government, politics, and policy that have occurred under the influence of neoliberal theories have led to a redefinition of the nature, role, and functions of the nation-state itself and of national governments. Such a shift inevitably affects the central government's relations with other levels of government and in how the nature, role, and functions of subnational authorities are defined.

In the United States, the issue concerns the role of the federal government and that of the states. One school of thought has argued that, following the Reagan era, there has been a "devolution revolution," whereby the federal government has cut back on its interventions and the states have asserted their rights. Another has argued that, on the contrary, centralization has continued to grow. Both these positions are probably oversimplifications of a rather more complex reality, which is that there have been processes of both centralization and decentralization occurring simultaneously. This has made the IGR field much more obscure and complex where no one single model of policy or administration (interventionist or neoliberal) is dominant but

where there exist a number of competing models. Deregulation in some respects might be accompanied by reregulation in others where the state gives (e.g., freedom to develop policy initiatives) with one hand but takes it back (regulation of the fiscal aspects of these policies) with the other. This means that policy actors, such as administrators responsible at the state level for administering intergovernmental finance or policy issues, need to develop new skills of discernment and steering in a quite new situation compared with the previous periods of state expansion or contraction.

These contradictory aspects of IGR may also be observed in Europe. In the United Kingdom, the neoliberal project of Margaret Thatcher and the Conservative Party brought about real changes in the British politico-administrative system and policy programs (mainly through cutting back funding and introducing new public management techniques into the public sector). At the same time, the period of Tory government in Britain saw a massive increase in centralization with the emasculation of local government, the creation of semi-autonomous agencies that took over several local government functions, and the creation of new bureaucracies overseeing sections of the public sector. In France, the decentralization and regionalization reforms that began in 1982 and were relaunched in the 1990s have radically transformed the old French IGR system of regulation croisée, mentioned previously. Again, there are contradictory tendencies. On the one hand, there has been a real decentralization of political functions, which has particularly benefited the larger cities and towns and, to some extent, the new regions set up in 1986. The newfound power of subnational authorities has also been enhanced by the change in the role of the prefect who lost his position as executive of the regional and departmental councils, which was assumed by the elected presidents of these councils. Furthermore, relations between the central state and the subnational authorities, especially the regions, now happens on the basis of contracts signed between the different levels of government. But this does not mean the state has gone away. On the contrary, it remains the most powerful actor in the system where the contractual partners are quite unequal. The prefect, too, although he or she has lost some powers, has now gained complete control over the local administration

(previously the prefect controlled only part of it). Similar developments have occurred in other European unitary states. Italy began a series of constitutional and political reforms in the 1990s, which have significantly reformed the pattern of central-regional-local relations. Regions and local authorities were strengthened at the expense of the central state, and today there is much greater diversity across the Italian state. The Scandinavian countries have gone through a period where central regulation was decreased in the free commune experiments in the 1980s to increasing reregulation in the 1990s but with greater variation in what were once highly uniform states. Similar trends may be discerned in federal states such as Germany, although this country has been the most resistant to radical change of its federal system.

Current Trends in Territorial Governance

A number of common threads run through and underlie these experiments and reforms in different countries. First, there is the decline of the nation-state as the primary source of sovereignty, legitimacy, and decision making. This is a result of processes of globalization and internal administrative reforms and, in Europe, of accelerated European integration. Second, in the European case, the EU has become an important level of governance and policy actor, which both constrains the freedom of national governments and encourages subnational authorities by entering into direct relations with them. Third, partly as a result of the EU and partly because of the changing nature of national government, subnational authorities have, since the 1980s, emerged as important actors in their own right alongside both national government and the EU institutions. Fourth, there is now a new fiscal orthodoxy, partly mediated through international organizations such as the International Monetary Fund (IMF) and World Bank, partly through the European Central Bank and its policy on the euro (which affects even European countries not part of the Eurozone). These constrain the fiscal freedom of national governments, and they in their turn impose the constraints on local authorities. These trends underlie some of the contradictions noted previously.

Central governments withdraw from some policy fields and decentralize competencies to lower levels of governments but this policy "freedom" is somewhat hollow because it is the same central governments who reregulate subnational authorities to keep them in line with the new fiscal orthodoxy.

A final word might be said about multilevel governance (MLG), which is sometimes used as a synonym of IGR. Gary Marks coined MLG to describe how the EU formulated and implemented policy on the structural funds. MLG has stimulated much useful research on IGR in the EU in a specific policy area during a specific historical period (after the Single European Act and the expansion of structural funds). MLG has even been adopted by the EU and national governments to describe current systems of governance. The danger is that it may suffer from inflation of use by being overstretched and therefore becoming devalued. Given its specific origins in the analysis of a particular EU policy field, it probably should not be used as a synonym of IGR, which can be applied more generally.

INTERNAL MARKET

The notion of internal market refers to the introduction of market-type mechanisms within organizations. Such market mechanisms include internal contracts and the internal charging for and trading of particular services between units of the same organization. These units then act as purchaser or provider vis-à-vis other units—or both concerning different products and services. Internal markets belong to a cluster of market-type mechanisms, including outsourcing, vouchers, user chargers, and so forth.

This definition of internal market should not be confused with the European Union's internal market program.

The underlying assumption behind the development of internal markets is that the introduction of incentives leads to more efficient performance of organizations overall. In particular, information generated via the price mechanism is seen as an essential indicator of an organizational unit's performance. For example, the argument has been made that large organizations with considerable fragmentation and internal decentralization have inherent problems of centralized control over resource use. An internal market, with different parts of the organization competing for service orders, is said to allow for enhanced performance. In contrast, the view that organizations exist precisely to overcome the transaction costs of market systems or to provide for redundancies or other socially desired properties by avoiding market incentives is being downplayed.

Although competition (concerning promotion, resources, etc.) has a long tradition as a doctrine for organizational governance, the concept of a formalized internal market for products and services gained currency as a reform idea within private-sector corporations in the 1960s and 1970s. Within the public sector, the idea of internal markets ranked among the key themes of the so-called new public management.
