## FOREWORD BY THE PUBLISHER

Publishing the 90<sup>th</sup> edition of this landmark reference is a true milestone in the history of CRC Press. Since its first publication in 1913 – as a 116-page pocket-sized book priced at \$2 – the *CRC Handbook of Chemistry and Physics* has developed into a 2800 page tome that no longer fits anyone's pocket but still finds a place on every scientist's bookshelf.

Certainly, the tremendous advances in science and technology over the past 96 years have fuelled the increase in the *Handbook's* contents, but the immense task of data selection, compilation, and organization has been expertly performed by a succession of Editors, Advisory Board members, and Contributors. These people have played a significant role in shaping the *Handbook* that we see today, and it is to them that I wish to pay tribute in this Foreword.

Covering such large subject areas, the Editors have always relied on a team of subject experts from around the world to contribute articles and tables. A cursory glance over the names credited through the years provides an interesting historical roll call of renowned chemists and physicists who have given their time and scientific expertise to the *Handbook*. These contributors include leaders such as Nobel Laureate Glenn T. Seaborg, space science pioneer James Van Allen, and C. S. "Speed" Marvel, considered the father of synthetic polymer chemistry.

Originally conceived by the Ohio-based Chemical Rubber Company as an incentive to encourage sales of their laboratory supplies, the *Handbook* started life as a small booklet of useful mathematical formulae and laboratory data. By 1913, it had grown to 116 pages and was published in its own right as the *Handbook of Chemistry and Physics*. The Editor was William R. Veazey, an Associate Professor of Chemistry at the (then) Case School of Applied Science. Who could have predicted that this pocket book was to become so well known that its users came to refer to it as the 'Rubber Bible' or, simply, the 'CRC'? To paraphrase a review of the 88<sup>th</sup> edition – "if you can't find a copy in your lab, that's because someone in the next lab has stolen it."

Veazey's successor was Charles D. Hodgman, his Assistant Editor for the first edition and an Associate Professor of Physics at Case. Hodgman went on to hold the position of Editor from 1915 to 1963, overseeing 42 editions of the *Handbook*. Under his

Editorship the *Handbook* grew to over 3000 pages and the coverage expanded to include x-ray crystallography, nuclear physics, synthetic polymers, and other fields that did not exist when his first edition appeared.

Following Hodgman's retirement Robert Weast took over the Editorship and published the 45<sup>th</sup> edition in 1964. Noticeably bigger with an 8" by 10" page size, the *Handbook* continued to expand in both scope and magnitude over the next few years. In 1972, The Chemical Rubber Company first published it under the CRC Press imprint, and in the late 1970's sold off its laboratory supply business, moved to new headquarters in Florida, and began building its book publishing business.

David R. Lide became the *Handbook's* fourth Editor in 1989, and took the opportunity to radically overhaul the organization and content to reflect the needs of the modern user. He added, merged, and deleted tables, and during the period of his editorship, updated 100 percent of the content. Staying within the confines of a single volume has always meant difficult decisions on which tables to include – often at the expense of others –but with the advent of electronic media, the *Handbook* is now available electronically and space constraints are less of a problem. Modern production techniques and the move to a larger page size have given the current *Handbook* a cleaner and more user-friendly look.

Publication of the 90<sup>th</sup> edition marks David Lide's final edition as Editor-in-Chief, and the publisher wishes to take this opportunity to thank him for his tremendous expertise and enthusiasm that has helped make the *Handbook* so indispensable to today's scientists.

Starting with the 91<sup>st</sup> edition, the *Handbook* editorship transfers to W.M. "Mickey" Haynes, Editor-in-Chief of the *International Journal of Thermophysics*, Scientist Emeritus at the National Institute of Standards and Technology (NIST), and former Chief of the NIST Physical and Chemical Properties Division. We look forward to a new era in the *Handbook's* long and illustrious history.

## PREFACE

The 90th Edition of the *CRC Handbook of Chemistry and Physics* marks a milestone for this reference work, which first appeared in 1913. For almost a century the *Handbook* has been updated annually, except for a few wartime years, and has served several generations of R&D professionals, engineers, and students. Its aim has always been to provide broad coverage of all types of physical science data commonly encountered by scientists and engineers, with as much depth as can be accommodated in a one-volume format. The data contained in the *Handbook* have been carefully selected by experts in each field; quality control is a high priority and the sources are documented. The annual updates make it possible to add new and improved data in a timely fashion, and references to more detailed data sources have helped to establish the *Handbook* as the first place to look for physical and chemical data.

This edition also marks the retirement of the current Editor-in-Chief after 20 years in that post. The reception to the changes I have made in the book is very gratifying, and I greatly appreciate the suggestions that have come from the Editorial Board, the contributors, and many users. The new Editor will be W. M. "Mickey" Haynes, who has had long experience in providing physical and chemical data through the National Institute of Standards and Technology and through his service as Editor of the *International Journal of Thermophysics*. I am confident that he will continue the tradition of excellence the *Handbook* has achieved.

Many new tables and updates are included in the 90th Edition, especially in the following areas:

Fluid properties (Sec. 6) - new data over a wider temperature and pressure range for

- Water (including D<sub>2</sub>O) and steam
- Air
- Refrigerants and other important industrial fluids

Biochemistry (Sec. 7) – new tables on

- Enzyme catalyzed reactions
- Structure and functions of common drugs
- Chemical constituents of human blood

Analytical chemistry (Sec. 8) – new and expanded tables on

- Proton NMR shifts for solvents and other fluids
- Mass spectral peaks
- Nuclear moments and other data for NMR spectroscopy
- Aqueous solubility of organic compounds

Astronomy and geophysics (Sec. 14) – new data on

- Properties of the planets and their satellites
- Major world earthquakes, 850 AD to 2008
- Interstellar molecules

Other new and expanded tables

- International recommendations for the expression of uncertainty of measurements
- Description of the new IUPAC chemical identifier (InChI)
- Nobel prize winners in physics and chemistry
- Threshold limits for airborne contaminants

In addition to offering the full text of the print edition in searchable pdf format, this Internet Version 2010 presents the major tables of numerical data in the form of interactive tables that can

be sorted, filtered, and combined in various ways. Substances in these tables can be retrieved by searching on name, formula, CAS Registry Number, or chemical structure, and such a search can be combined with a request for a desired property. Thus one can request a specific property of a specific substance (for example, viscosity of benzene) and receive a customized table with exactly that information. In addition, the Internet version includes a section with pdf files of many older tables that have been removed from the print edition to make space for new material.

Suggestions on new topics for the *Handbook* and notification of errors are always appreciated. Input from users plays a key role in keeping the book up to date. Address all comments to Editor-in-Chief, *CRC Handbook of Chemistry and Physics*, Taylor & Francis Group, 6000 Broken Sound Parkway NW, Suite 300, Boca Raton, FL 33487.

The *Handbook of Chemistry and Physics* is dependent on the efforts of many contributors throughout the world. The list of current contributors follows this Preface. The assistance and support of Dr. Fiona Macdonald, Chemical and Biological Sciences Publisher for CRC Press/Taylor & Francis Books, is greatly appreciated. Finally, I want to thank Mimi Williams, Pam Morrell, Glen Butler, James Yanchak, and Theresa Delforn for their outstanding work in production of the book and Ronel Decius, Robert Morris, and Aviel Alkon for producing the Internet version.

# CODATA RECOMMENDED VALUES OF THE FUNDAMENTAL PHYSICAL CONSTANTS: 2006

Peter J. Mohr, Barry N. Taylor, and David B. Newell

These tables give the 2006 self-consistent set of values of the basic constants and conversion factors of physics and chemistry recommended by the Committee on Data for Science and Technology (CODATA) for international use. The 2006 adjustment takes into account the data considered in the 2002 adjustment as well as the data that became available between 31 December 2002, the closing date of that adjustment, and 31 December 2006, the closing date of the new adjustment. The new data has led to a significant reduction in the uncertainties of many recommended values. The 2006 set replaces the previously recommended 2002 CODATA set and may also be found on the World Wide Web at [physics.nist.gov/constants](http://physics.nist.gov/constants).

This report was prepared by the authors under the auspices of the CODATA Task Group on Fundamental Constants. The members of the task group are:

- F. Cabiati, Istituto Nazionale di Ricerca Metrologica, Italy
- K. Fujii, National Metrology Institute of Japan, Japan
- S. G. Karshenboim, D. I. Mendeleyev All-Russian Research Institute for Metrology, Russian Federation
- I. Lindgren, Chalmers University of Technology and Göteborg University, Sweden
- B. A. Mamyurin (deceased), A. F. Ioffe Physical-Technical Institute, Russian Federation
- W. Martienssen, Johann Wolfgang Goethe-Universität, Germany

- P. J. Mohr, National Institute of Standards and Technology, United States of America
- D. B. Newell, National Institute of Standards and Technology, United States of America
- F. Nez, Laboratoire Kastler-Brossel, France
- B. W. Petley, National Physical Laboratory, United Kingdom

<sup>3</sup>Value recommended by the Particle Data Group (Yao *et al.*, 2006).<sup>4</sup>Based on the ratio of the masses of the W and Z bosons  $m_W/m_Z$  recommended by the Particle Data Group (Yao *et al.*, 2006). The value for  $\sin^2 \theta_W$  they recommend, which is based on a particular variant of the modified minimal subtraction ( $\overline{\text{MS}}$ ) scheme, is  $\sin^2 \hat{\theta}_W(M_Z) = 0.231\,22(15)$ .

<sup>1</sup> The relative covariance is  $u_r(x_i, x_j) = u(x_i, x_j)/(x_i x_j)$ , where  $u(x_i, x_j)$  is the covariance of  $x_i$  and  $x_j$ ; the relative variance is  $u_r^2(x_i) = u_r(x_i, x_i)$ ; and the correlation coefficient is  $r(x_i, x_j) = u(x_i, x_j)/[u(x_i)u(x_j)]$ .

<sup>6</sup>The numerical value of  $F$  to be used in coulometric chemical measurements is 96 485.3401(48) [ $5.0 \times 10^{-8}$ ] when the relevant current is measured in terms of representations of the volt and ohm based on the Josephson and quantum Hall effects and the internationally adopted conventional values of the Josephson and von Klitzing constants  $K_{J-90}$  and  $R_{K-90}$  given in Table IV.

<sup>7</sup>The entropy of an ideal monoatomic gas of relative atomic mass  $A_r$  is given by  $S = S_0 + \frac{3}{2} R \ln A_r - R \ln(p/p_0) + \frac{5}{2} R \ln(T/K)$ .

TABLE IV: Internationally adopted values of various quantities.

Quantity	Symbol	Numerical value	Unit	Relative std. uncert. $u_r$
relative atomic mass <sup>1</sup> of <sup>12</sup> C	$A_r(^{12}\text{C})$	12		(exact)
molar mass constant	$M_u$	$1 \times 10^{-3}$	kg mol <sup>-1</sup>	(exact)
molar mass of <sup>12</sup> C	$M(^{12}\text{C})$	$12 \times 10^{-3}$	kg mol <sup>-1</sup>	(exact)
conventional value of Josephson constant <sup>2</sup>	$K_{\text{J}-90}$	483 597.9	GHz V <sup>-1</sup>	(exact)
conventional value of von Klitzing constant <sup>3</sup>	$R_{\text{K}-90}$	25 812.807	$\Omega$	(exact)
standard atmosphere		101 325	Pa	(exact)

<sup>1</sup> The relative atomic mass  $A_r(X)$  of particle  $X$  with mass  $m(X)$  is defined by  $A_r(X) = m(X)/m_u$ , where  $m_u = m(^{12}\text{C})/12 = M_u/N_A = 1 \text{ u}$  is the atomic mass constant,  $M_u$  is the molar mass constant,  $N_A$  is the Avogadro constant, and  $\text{u}$  is the unified atomic mass unit. Thus the mass of particle  $X$  is  $m(X) = A_r(X) \text{ u}$  and the molar mass of  $X$  is  $M(X) = A_r(X)M_u$ .

<sup>2</sup> This is the value adopted internationally for realizing representations of the volt using the Josephson effect.

<sup>3</sup> This is the value adopted internationally for realizing representations of the ohm using the quantum Hall effect.

TABLE V: Values of some x-ray-related quantities based on the 2006 CODATA adjustment of the values of the constants.

Quantity	Symbol	Numerical value	Unit	Relative std. uncert. $u_r$
Cu x unit: $\lambda(\text{CuK}\alpha_1)/1\,537.400$	$x_u(\text{CuK}\alpha_1)$	$1.002\,076\,99(28) \times 10^{-13}$	m	$2.8 \times 10^{-7}$
Mo x unit: $\lambda(\text{MoK}\alpha_1)/707.831$	$x_u(\text{MoK}\alpha_1)$	$1.002\,099\,55(53) \times 10^{-13}$	m	$5.3 \times 10^{-7}$
ångstrom star: $\lambda(\text{WK}\alpha_1)/0.209\,010\,0$	$\text{\AA}^*$	$1.000\,014\,98(90) \times 10^{-10}$	m	$9.0 \times 10^{-7}$
lattice parameter <sup>1</sup> of Si (in vacuum, 22.5°C)	$a$	$543.102\,064(14) \times 10^{-12}$	m	$2.6 \times 10^{-8}$
{220} lattice spacing of Si $a/\sqrt{8}$ (in vacuum, 22.5°C)	$d_{220}$	$192.015\,5762(50) \times 10^{-12}$	m	$2.6 \times 10^{-8}$
molar volume of Si $M(\text{Si})/\rho(\text{Si}) = N_A a^3/8$ (in vacuum, 22.5°C)	$V_m(\text{Si})$	$12.058\,8349(11) \times 10^{-6}$	m <sup>3</sup> mol <sup>-1</sup>	$9.1 \times 10^{-8}$

<sup>1</sup> This is the lattice parameter (unit cell edge length) of an ideal single crystal of naturally occurring Si free of impurities and imperfections, and is deduced from measurements on extremely pure and nearly perfect single crystals of Si by correcting for the effects of impurities.

## STANDARD ATOMIC WEIGHTS (2007)

This table of atomic weights includes the changes made in 2007 by the IUPAC Commission on Isotopic Abundances and Atomic Weights. Those changes affected the following elements: Lu, Mo, Ni, Yb, and Zn.

The Standard Atomic Weights apply to the elements as they exist naturally on Earth, and the uncertainties take into account the isotopic variation found in most laboratory samples. Further comments on the variability are given in the footnotes.

The number in parentheses following the atomic weight value gives the uncertainty in the last digit. An atomic weight entry in brackets indicates that the element that has no stable isotopes; the

value given is the atomic mass in u (or the mass number, if the mass is not accurately known) for the isotope of longest half-life. Thorium, protactinium, and uranium have no stable isotopes, but the terrestrial isotopic composition is sufficiently uniform to permit a standard atomic weight to be specified.

<sup>a</sup> No stable isotope exists. The atomic mass in u (or the mass number, if the mass is not accurately known) is given in brackets for the isotope of longest half-life.

<sup>b</sup> Commercially available Li materials have atomic weights that range between 6.939 and 6.996; if a more accurate value is required, it must be determined for the specific material.

<sup>c</sup> Geological specimens are known in which the element has an isotopic composition outside the limits for the normal material. The difference between the atomic weight of the element in such specimens and that given in the table may exceed the stated uncertainty.

<sup>m</sup> Modified isotopic compositions may be found in commercially available material because it has been subject to an undisclosed or inadvertent isotopic fractionation. Substantial deviations in atomic weight of the element from that given in the table can occur.

<sup>r</sup> Range in isotopic composition of normal terrestrial material prevents a more precise atomic weight being given; the tabulated value should be applicable to any normal material.

## ATOMIC MASSES AND ABUNDANCES

This table lists the mass (in atomic mass units, symbol u) and the natural abundance (in percent) of the stable nuclides and a few important radioactive nuclides. A complete table of all nuclides may be found in Section 11 ("Table of the Isotopes").

The atomic masses were taken from the 2003 evaluation of Audi, Wapstra, and Thibault (References 2, 3). The number in parentheses following the mass value is the uncertainty in the last digit(s) given. An asterisk \* after an entry indicates the mass value was derived not purely from experimental data, but at least partly from systematic trends.

Natural abundance values were taken from the IUPAC Technical Report "Atomic Weight of the Elements: Review 2000" (Reference 4); these entries are also followed by uncertainties in the last digit(s) of the stated values. This uncertainty includes both the estimated measurement uncertainty and the reported range of variation in different terrestrial sources of the element (see Reference 4 for full

details and caveats regarding elements whose abundance is variable). The absence of an entry in the Abundance column indicates a radioactive nuclide not present in nature or an element whose isotopic composition varies so widely that a meaningful natural abundance cannot be defined.

# ELECTRON CONFIGURATION AND IONIZATION ENERGY OF NEUTRAL ATOMS IN THE GROUND STATE

William C. Martin

The ground state electron configuration, ground level, and ionization energy of the elements hydrogen through rutherfordium are listed in this table. The electron configurations of elements heavier than neon are shortened by using rare-gas element symbols in brackets to represent the corresponding electrons. See the references for details of the notation for Pa, U, and Np. Ionization energies to higher states (and more precise values of the first ionization energy for certain elements) may be found in the table "Ionization Energies of Atoms and Atomic Ions" in Section 10 of this *Handbook*.

# CONVERSION OF TEMPERATURES FROM THE 1948 AND 1968 SCALES TO ITS-90

This table gives temperature corrections from older scales to the current International Temperature Scale of 1990 (see the preceding table for details on ITS-90). The first part of the table may be used for converting Celsius temperatures in the range  $-180$  to  $4000$  °C from IPTS-68 or IPTS-48 to ITS-90. Within the accuracy of the corrections, the temperature in the first column may be identified with either  $t_{68}$ ,  $t_{48}$ , or  $t_{90}$ . The second part of the table is designed for use at lower temperatures to convert values expressed in kelvins from EPT-76 or IPTS-68 to ITS-90.

The references give analytical equations for expressing these relations. Note that Reference 1 supersedes Reference 2 with respect to corrections in the 630 to 1064 °C range.

# INTERNATIONAL SYSTEM OF UNITS (SI)

The International System of Units, abbreviated as SI (from the French name *Le Système International d'Unités*), was established in 1960 by the 11th General Conference on Weights and Measures (CGPM) as the modern metric system of measurement. The core of the SI is the seven base units for the physical quantities length, mass, time, electric current, thermodynamic temperature, amount of substance, and luminous intensity. These base units are:

Base quantity	SI base unit	
	Name	Symbol
length	meter	m
mass	kilogram	kg
time	second	s
electric current	ampere	A
thermodynamic temperature	kelvin	K
amount of substance	mole	mol
luminous intensity	candela	cd

The SI base units are defined as follows:

**meter:** The meter is the length of the path travelled by light in vacuum during a time interval of  $1/299\,792\,458$  of a second.

**kilogram:** The kilogram is the unit of mass; it is equal to the mass of the international prototype of the kilogram.

**second:** The second is the duration of 9 192 631 770 periods of the radiation corresponding to the transition between the two hyperfine levels of the ground state of the cesium 133 atom.

**ampere:** The ampere is that constant current which, if maintained in two straight parallel conductors of infinite length, of negligible circular cross-section, and placed 1 meter apart in vacuum, would produce between these conductors a force equal to  $2 \cdot 10^{-7}$  newton per meter of length.

**kelvin:** The kelvin, unit of thermodynamic temperature, is the fraction  $1/273.16$  of the thermodynamic temperature of the triple point of water.

**mole:** The mole is the amount of substance of a system which contains as many elementary entities as there are atoms in 0.012 kilogram of carbon 12. When the mole is used, the elementary entities must be specified and may be atoms, molecules, ions, electrons, other particles, or specified groups of such particles.

**candela:** The candela is the luminous intensity, in a given direction, of a source that emits monochromatic radiation of frequency  $540 \cdot 10^{12}$  hertz and that has a radiant intensity in that direction of  $1/683$  watt per steradian.

## SI derived units

Derived units are units which may be expressed in terms of base units by means of the mathematical symbols of multiplication and division (and, in the case of °C, subtraction). Certain derived units have been given special names and symbols, and these special names and symbols may themselves be used in combination with those for base and other derived units to express the units of other quantities. The next table lists some examples of derived units expressed directly in terms of base units:

Physical quantity	SI derived unit	
	Name	Symbol
area	square meter	m <sup>2</sup>
volume	cubic meter	m <sup>3</sup>
speed, velocity	meter per second	m/s
acceleration	meter per second squared	m/s <sup>2</sup>
wave number	reciprocal meter	m <sup>-1</sup>
density, mass density	kilogram per cubic meter	kg/m <sup>3</sup>
specific volume	cubic meter per kilogram	m <sup>3</sup> /kg
current density	ampere per square meter	A/m <sup>2</sup>
magnetic field strength	ampere per meter	A/m
concentration (of amount of substance)	mole per cubic meter	mol/m <sup>3</sup>
luminance	candela per square meter	cd/m <sup>2</sup>
refractive index	(the number) one	1 <sup>(a)</sup>

<sup>(a)</sup> The symbol "1" is generally omitted in combination with a numerical value.

For convenience, certain derived units, which are listed in the next table, have been given special names and symbols. These names and symbols may themselves be used to express other derived units. The special names and symbols are a compact form for the expression of units that are used frequently. The final column shows how the SI units concerned may be expressed in terms of SI base units. In this column, factors such as m<sup>0</sup>, kg<sup>0</sup> ..., which are all equal to 1, are not shown explicitly.

Physical quantity	Name	Symbol	SI derived unit expressed in terms of:	
			Other SI units	SI base units
plane angle	radian <sup>(a)</sup>	rad	$m \cdot m^{-1} = 1^{(b)}$	
solid angle	steradian <sup>(a)</sup>	sr <sup>(c)</sup>	$m^2 \cdot m^{-2} = 1^{(b)}$	
frequency	hertz	Hz	s <sup>-1</sup>	
force	newton	N	$m \cdot kg \cdot s^{-2}$	
pressure, stress	pascal	Pa	N/m <sup>2</sup>	$m^{-1} \cdot kg \cdot s^{-2}$
energy, work, quantity of heat	joule	J	N · m	$m^2 \cdot kg \cdot s^{-2}$
power, radiant flux	watt	W	J/s	$m^2 \cdot kg \cdot s^{-3}$
electric charge, quantity of electricity	coulomb	C	s · A	
electric potential difference, electromotive force	volt	V	W/A	$m^2 \cdot kg \cdot s^{-3} \cdot A^{-1}$
capacitance	farad	F	C/V	$m^{-2} \cdot kg^{-1} \cdot s^4 \cdot A^2$
electric resistance	ohm	Ω	V/A	$m^2 \cdot kg \cdot s^{-3} \cdot A^{-2}$
electric conductance	siemens	S	A/V	$m^{-2} \cdot kg^{-1} \cdot s^3 \cdot A^2$
magnetic flux	weber	Wb	V · s	$m^2 \cdot kg \cdot s^{-2} \cdot A^{-1}$

magnetic flux density	tesla	T	Wb/m <sup>2</sup>	kg · s <sup>-2</sup> · A <sup>-1</sup>
inductance	henry	H	Wb/A	m <sup>2</sup> · kg · s <sup>-2</sup> · A <sup>-2</sup>
Celsius temperature	degree Celsius <sup>(d)</sup>	°C		K
luminous flux	lumen	lm	cd · sr <sup>(e)</sup>	m <sup>2</sup> · m <sup>-2</sup> · cd = cd
illuminance	lux	lx	lm/m <sup>2</sup>	m <sup>2</sup> · m <sup>-4</sup> · cd = m <sup>-2</sup> · cd
activity (of a radionuclide)	becquerel	Bq		s <sup>-1</sup>
absorbed dose, specific energy (imparted), kerma	gray	Gy	J/kg	m <sup>2</sup> · s <sup>-2</sup>
dose equivalent, ambient dose equivalent, directional dose equivalent, personal dose equivalent, organ equivalent dose	sievert	Sv	J/kg	m <sup>2</sup> · s <sup>-2</sup>
catalytic activity	katal	kat		s <sup>-1</sup> · mol

<sup>(a)</sup> The radian and steradian may be used with advantage in expressions for derived units to distinguish between quantities of different nature but the same dimension. Some examples of their use in forming derived units are given in the next table.

<sup>(b)</sup> In practice, the symbols rad and sr are used where appropriate, but the derived unit “1” is generally omitted in combination with a numerical value.

<sup>(c)</sup> In photometry, the name steradian and the symbol sr are usually retained in expressions for units.

<sup>(d)</sup> It is common practice to express a thermodynamic temperature, symbol  $T$ , in terms of its difference from the reference temperature  $T_0 = 273.15$  K. The numerical value of a Celsius temperature  $t$  expressed in degrees Celsius is given by  $t/°C = T/K - 273.15$ . The unit °C may be used in combination with SI prefixes, e.g., millidegree Celsius, m°C. Note that there should never be a space between the ° sign and the letter C, and that the symbol for kelvin is K, not °K.

The SI derived units with special names may be used in combinations to provide a convenient way to express more complex physical quantities. Examples are given in the next table:

Physical Quantity	SI derived unit		
	Name	Symbol	As SI base units
dynamic viscosity	pascal second	Pa · s	m <sup>-1</sup> · kg · s <sup>-1</sup>
moment of force	newton meter	N · m	m <sup>2</sup> · kg · s <sup>-2</sup>
surface tension	newton per meter	N/m	kg · s <sup>-2</sup>
angular velocity	radian per second	rad/s	m · m <sup>-1</sup> · s <sup>-1</sup> = s <sup>-1</sup>
angular acceleration	radian per second squared	rad/s <sup>2</sup>	m · m <sup>-1</sup> · s <sup>-2</sup> = s <sup>-2</sup>
heat flux density, irradiance	watt per square meter	W/m <sup>2</sup>	kg · s <sup>-3</sup>
heat capacity, entropy	joule per kelvin	J/K	m <sup>-3</sup> · kg · s <sup>-2</sup> · K <sup>-1</sup>
specific heat capacity, specific entropy	joule per kilogram kelvin	J/(kg · K)	m <sup>2</sup> · s <sup>-2</sup> · K <sup>-1</sup>
specific energy	joule per kilogram	J/kg	m <sup>2</sup> · s <sup>-2</sup>
thermal conductivity	watt per meter kelvin	W/(m · K)	m · kg · s <sup>-3</sup> · K <sup>-1</sup>
energy density	joule per cubic meter	J/m <sup>3</sup>	m <sup>-1</sup> · kg · s <sup>-2</sup>
electric field strength	volt per meter	V/m	m · kg · s <sup>-3</sup> · A <sup>-1</sup>
electric charge density	coulomb per cubic meter	C/m <sup>3</sup>	m <sup>-3</sup> · s · A
electric flux density	coulomb per square meter	C/m <sup>2</sup>	m <sup>-2</sup> · s · A
permittivity	farad per meter	F/m	m <sup>-3</sup> · kg <sup>-1</sup> · s <sup>4</sup> · A <sup>2</sup>
permeability	henry per meter	H/m	m · kg · s <sup>-2</sup> · A <sup>-2</sup>
molar energy	joule per mole	J/mol	m <sup>2</sup> · kg · s <sup>-2</sup> · mol <sup>-1</sup>
molar entropy, molar heat capacity	joule per mole kelvin	J/(mol · K)	m <sup>2</sup> · kg · s <sup>-2</sup> · K <sup>-1</sup> · mol <sup>-1</sup>
exposure (x and γ rays)	coulomb per kilogram	C/kg	kg <sup>-1</sup> · s · A
absorbed dose rate	gray per second	Gy/s	m <sup>2</sup> · s <sup>-3</sup>
radiant intensity	watt per steradian	W/sr	m <sup>4</sup> · m <sup>-2</sup> · kg · s <sup>-3</sup> = m <sup>2</sup> · kg · s <sup>-3</sup>
radiance	watt per square meter steradian	W/(m <sup>2</sup> · sr)	m <sup>2</sup> · m <sup>-2</sup> · kg · s <sup>-3</sup> = kg · s <sup>-3</sup>
catalytic (activity) concentration	katal per cubic meter	kat/m <sup>3</sup>	m <sup>-3</sup> · s <sup>-1</sup> · mol

In practice, with certain quantities preference is given to the use of certain special unit names, or combinations of unit

names, in order to facilitate the distinction between different quantities having the same dimension. For example, the SI unit of frequency is designated the hertz, rather than the reciprocal second, and the SI unit of angular velocity is designated the radian per second rather than the reciprocal second (in this case retaining the word radian emphasizes that angular velocity is equal to  $2\pi$  times the rotational frequency). Similarly the SI unit of moment of force is designated the newton meter rather than the joule.

In the field of ionizing radiation, the SI unit of activity is designated the becquerel rather than the reciprocal second, and the SI units of absorbed dose and dose equivalent the gray and sievert, respectively, rather than the joule per kilogram. In the field of catalysis, the SI unit of catalytic activity is designated the katal rather than the mole per second. The special names becquerel, gray, sievert, and katal were specifically introduced because of the dangers to human health which might arise from mistakes involving the units reciprocal second, joule per kilogram and mole per second.

### Units for dimensionless quantities, quantities of dimension one

Certain quantities are defined as the ratios of two quantities of the same kind, and thus have a dimension which may be expressed by the number one. The unit of such quantities is necessarily a derived unit coherent with the other units of the SI and, since it is formed as the ratio of two identical SI units, the unit also may be expressed by the number one. Thus the SI unit of all quantities having the dimensional product one is the number one. Examples of such quantities are refractive index, relative permeability, and friction factor. Other quantities having the unit 1 include “characteristic numbers” like the Prandtl number and numbers which represent a count, such as a number of molecules, degeneracy (number of energy levels), and partition function in statistical thermodynamics. All of these quantities are described as being dimensionless, or of dimension one, and have the coherent SI unit 1. Their values are simply expressed as numbers and, in general, the unit 1 is not explicitly shown. In a few cases, however, a special name is given to this unit, mainly to avoid confusion between some compound derived units. This is the case for the radian, steradian and neper.

## SI prefixes

The following prefixes have been approved by the CGPM for use with SI units. Only one prefix may be used before a unit. Thus  $10^{-12}$  farad should be designated pF, not  $\mu\mu\text{F}$ .

Factor	Name	Symbol	Factor	Name	Symbol
$10^{24}$	yotta	Y	$10^{-1}$	deci	d
$10^{21}$	zetta	Z	$10^{-2}$	centi	c
$10^{18}$	exa	E	$10^{-3}$	milli	m
$10^{15}$	peta	P	$10^{-6}$	micro	$\mu$
$10^{12}$	tera	T	$10^{-9}$	nano	n
$10^9$	giga	G	$10^{-12}$	pico	p
$10^6$	mega	M	$10^{-15}$	femto	f
$10^3$	kilo	k	$10^{-18}$	atto	a
$10^2$	hecto	h	$10^{-21}$	zepto	z
$10^1$	deka	da	$10^{-24}$	yocto	y

## The kilogram

Among the base units of the International System, the unit of mass is the only one whose name, for historical reasons, contains a prefix. Names and symbols for decimal multiples and submultiples of the unit of mass are formed by attaching prefix names to the unit name “gram” and prefix symbols to the unit symbol “g”.

*Example* :  $10^{-6}$  kg = 1 mg (1 milligram) but not 1  $\mu\text{kg}$  (1 microkilogram).

## Units used with the SI

Many units that are not part of the SI are important and widely used in everyday life. The CGPM has adopted a classification of non-SI units: (1) units accepted for use with the SI (such as the traditional units of time and of angle); (2) units accepted for use with the SI whose values are obtained experimentally; and (3) other units currently accepted for use with the SI to satisfy the needs of special interests.

### (1) Non-SI units accepted for use with the International System

Name	Symbol	Value in SI units
minute	min	1 min = 60 s
hour	h	1 h = 60 min = 3600 s
day	d	1 d = 24 h = 86 400 s
degree	$^\circ$	$1^\circ = (\pi/180)$ rad
minute	'	$1' = (1/60)^\circ = (\pi/10\,800)$ rad
second	"	$1'' = (1/60)' = (\pi/648\,000)$ rad
liter	l, L	1 L = $1\text{ dm}^3 = 10^{-3}\text{ m}^3$
metric ton	t	1 t = $10^3$ kg
neper <sup>(a)</sup>	Np	1 Np = 1
bel <sup>(b)</sup>	B	1 B = $(1/2) \ln 10$ Np

<sup>(a)</sup> The neper is used to express values of such logarithmic quantities as field level, power level, sound pressure level, and logarithmic decrement. Natural logarithms are used to obtain the numerical values of quantities expressed in nepers. The neper is coherent with the SI, but is not yet adopted by the CGPM as an SI unit. In using the neper, it is important to specify the quantity.

<sup>(b)</sup> The bel is used to express values of such logarithmic quantities as field level, power level, sound-pressure level, and attenuation. Logarithms to base ten are used to obtain the numerical values of quantities expressed in bels. The submultiple decibel, dB, is commonly used.

### (2) Non-SI units accepted for use with the International system, whose values in SI units are obtained experimentally

Name	Symbol	Value in SI Units
electronvolt <sup>(b)</sup>	eV	1 eV = 1.602 176 53(14) · $10^{-19}$ J <sup>(a)</sup>
dalton <sup>(c)</sup>	Da	1 Da = 1.660 538 86(28) · $10^{-27}$ kg <sup>(a)</sup>
unified atomic mass unit <sup>(c)</sup>	u	1 u = 1 Da
astronomical unit <sup>(d)</sup>	ua	1 ua = 1.495 978 706 91(06) · $10^{11}$ m <sup>(a)</sup>

<sup>(a)</sup> For the electronvolt and the dalton (unified atomic mass unit), values are quoted from the 2002 CODATA set of the Fundamental Physical Constants (p. 1-1 of this Handbook). The value given for the astronomical unit is quoted from the IERS Conventions 2003 (D.D. McCarthy and G. Petit, eds., IERS Technical Note 32, Frankfurt am Main: Verlag des Bundesamts für Kartographie und Geodäsie, 200). The value of ua in meters comes from the JPL ephemerides DE403 (Standish E.M. 1995, “Report of the IAU WGAS Sub-Group on Numerical Standards”, in “Highlights of Astronomy”, Appenzler ed., pp 180-184, Kluwer Academic Publishers, Dordrecht). It has been determined in “TDB” units using Barycentric Dynamical Time TDB as a time coordinate for the barycentric system.

<sup>(b)</sup> The electronvolt is the kinetic energy acquired by an electron in passing through a potential difference of 1 V in vacuum.

<sup>(c)</sup> The Dalton and unified atomic mass unit are alternative names for the same unit, equal to 1/12 of the mass of an unbound atom of the nuclide  $^{12}\text{C}$ , at rest and in its ground state. The dalton may be combined with SI prefixes to express the masses of large molecules in kilodalton, kDa, or megadalton, MDa.

<sup>(d)</sup> The astronomical unit is a unit of length approximately equal to the mean Earth-Sun distance. It is the radius of an unperturbed circular Newtonian orbit about the Sun of a particle having infinitesimal mass, moving with a mean motion of 0.017 202 098 95 radians/day (known as the Gaussian constant).

### (3) Other non-SI units currently accepted for use with the International System

Name	Symbol	Value in SI Units
nautical mile		1 nautical mile = 1852 m
knot		1 nautical mile per hour = (1852/3600) m/s
are		1 a = $1\text{ dam}^2 = 10^2\text{ m}^2$
hectare	ha	1 ha = $1\text{ hm}^2 = 10^4\text{ m}^2$
bar	bar	1 bar = 0.1 MPa = 100 kPa = $10^5$ Pa
ångström	Å	1 Å = 0.1 nm = $10^{-10}$ m
barn	b	1 b = $100\text{ fm}^2 = 10^{-28}\text{ m}^2$

## Other non-SI units

The SI does not encourage the use of cgs units, but these are frequently found in old scientific texts. The following table gives the relation of some common cgs units to SI units.

Name	Symbol	Value in SI units
erg	erg	1 erg = $10^{-7}$ J
dyne	dyn	1 dyn = $10^{-5}$ N
poise	P	1 P = 1 dyn · s/cm <sup>2</sup> = 0.1 Pa · s
stokes	St	1 St = 1 cm <sup>2</sup> /s = $10^{-4}$ m <sup>2</sup> /s
gauss	G	1 G $\triangleq$ $10^{-4}$ T
oersted	Oe	1 Oe $\triangleq$ (1000/4 $\pi$ ) A/m
maxwell	Mx	1 Mx $\triangleq$ $10^{-8}$ Wb
stilb	sb	1 sb = 1 cd/cm <sup>2</sup> = $10^4$ cd/m <sup>2</sup>
phot	ph	1 ph = $10^4$ lx
gal	Gal	1 Gal = 1 cm/s <sup>2</sup> = $10^{-2}$ m/s <sup>2</sup>

*Note:* The symbol  $\triangleq$  should be read as “corresponds to”; these units cannot strictly be equated because of the different dimensions of the electromagnetic cgs and the SI.

Examples of other non-SI units found in the older literature and their relation to the SI are given below. Use of these units in current texts is discouraged.

Name	Symbol	Value in SI units
curie	Ci	1 Ci = $3.7 \cdot 10^{10}$ Bq
roentgen	R	1 R = $2.58 \cdot 10^{-4}$ C/kg
rad	rad	1 rad = 1 cGy = $10^{-2}$ Gy
rem	rem	1 rem = 1 cSv = $10^{-2}$ Sv
X unit		1 X unit $\approx 1.002 \cdot 10^{-4}$ nm
gamma	$\gamma$	1 $\gamma$ = 1 nT = $10^{-9}$ T
jansky	Jy	1 Jy = $10^{-26}$ W $\cdot$ m <sup>-2</sup> $\cdot$ Hz <sup>-1</sup>
fermi		1 fermi = 1 fm = $10^{-15}$ m
metric carat		1 metric carat = 200 mg = $2 \cdot 10^{-4}$ kg
torr	Torr	1 Torr = (101325/760) Pa
standard atmosphere	atm	1 atm = 101325 Pa
calorie <sup>(a)</sup>	cal	1 cal = 4.184 J
micron	$\mu$	1 $\mu$ = 1 $\mu$ m = $10^{-6}$ m

<sup>(a)</sup> Several types of calorie have been used; the value given here is the so-called "thermochemical calorie".

## CONVERSION FACTORS

The following table gives conversion factors from various units of measure to SI units. It is reproduced from NIST Special Publication 811, *Guide for the Use of the International System of Units (SI)*. The table gives the factor by which a quantity expressed in a non-SI unit should be multiplied in order to calculate its value in the SI. The SI values are expressed in terms of the base, supplementary, and derived units of SI in order to provide a coherent presentation of the conversion factors and facilitate computations (see the table "International System of Units" in this section). If desired, powers of ten can be avoided by using SI prefixes and shifting the decimal point if necessary.

Conversion from a non-SI unit to a different non-SI unit may be carried out by using this table in two stages, e.g.,

$$1 \text{ cal}_{\text{th}} = 4.184 \text{ J}$$

$$1 \text{ Btu}_{\text{IT}} = 1.055056 \text{ E}+03 \text{ J}$$

Thus,

$$1 \text{ Btu}_{\text{IT}} = (1.055056 \text{ E}+03 \div 4.184) \text{ cal}_{\text{th}} = 252.164 \text{ cal}_{\text{th}}$$

Conversion factors are presented for ready adaptation to computer readout and electronic data transmission. The factors are written as a number equal to or greater than one and less than ten with six or fewer decimal places. This number is followed by the letter E (for exponent), a plus or a minus sign, and two digits that indicate the power of 10 by which the number must be multiplied to obtain the correct value. For example:

$$3.523 \ 907 \ \text{E}-02 \text{ is } 3.523 \ 907 \times 10^{-2}$$

or

$$0.035 \ 239 \ 07$$

Similarly:

$$3.386 \ 389 \ \text{E}+03 \text{ is } 3.386 \ 389 \times 10^3$$

or

$$3 \ 386.389$$

A factor in boldface is exact; i.e., all subsequent digits are zero. All other conversion factors have been rounded to the figures given in accordance with accepted practice. Where less than six digits after the decimal point are shown, more precision is not warranted.

It is often desirable to round a number obtained from a conversion of units in order to retain information on the precision of the value. The following rounding rules may be followed:

1. If the digits to be discarded begin with a digit less than 5, the digit preceding the first discarded digit is not changed.

Example: 6.974 951 5 rounded to 3 digits is 6.97

2. If the digits to be discarded begin with a digit greater than 5, the digit preceding the first discarded digit is increased by one.

Example: 6.974 951 5 rounded to 4 digits is 6.975

3. If the digits to be discarded begin with a 5 and at least one of the following digits is greater than 0, the digit preceding the 5 is increased by 1.

Example: 6.974 851 rounded to 5 digits is 6.974 9

4. If the digits to be discarded begin with a 5 and all of the following digits are 0, the digit preceding the 5 is unchanged if it is even and increased by one if it is odd. (Note that this means that the final digit is always even.)

Examples:

$$6.974 \ 951 \ 5 \text{ rounded to 7 digits is } 6.974 \ 952$$

$$6.974 \ 950 \ 5 \text{ rounded to 7 digits is } 6.974 \ 950$$

<sup>11</sup> The Fifth International Conference on the Properties of Steam (London, July 1956) defined the International Table calorie as 4.1868 J. Therefore the exact conversion factor for the International Table Btu is 1.055 055 852 62 kJ. Note that the notation for the International Table used in this listing is subscript "IT". Similarly, the notation for thermochemical is subscript "th." Further, the thermochemical Btu, Btu<sub>th</sub>, is based on the thermochemical calorie, cal<sub>th</sub>, where cal<sub>th</sub> = 4.184 J exactly.

centimeter of mercury (0 °C) <sup>13</sup>	pascal (Pa)	1.333 22 E+03
centimeter of mercury (0 °C) <sup>13</sup>	kilopascal (kPa)	1.333 22 E+00
centimeter of mercury, conventional (cmHg) <sup>13</sup>	pascal (Pa)	1.333 224 E+03

<sup>12</sup> The kilogram calorie or "large calorie" is an obsolete term used for the kilocalorie, which is the calorie used to express the energy content of foods. However, in practice, the prefix "kilo" is usually omitted.

<sup>13</sup> Conversion factors for mercury manometer pressure units are calculated using the standard value for the acceleration of gravity and the density of mercury at the stated temperature. Additional digits are not justified because the definitions of the units do not take into account the compressibility of mercury or the change in density caused by the revised practical temperature scale, ITS-90. Similar comments also apply to water manometer pressure units. Conversion factors for conventional mercury and water manometer pressure units are based on ISO 31-3.

ounce [Canadian and U.K. fluid (Imperial)] (fl oz).....	cubic meter (m <sup>3</sup> ) .....	2.841 306 E-05

<sup>18</sup> The exact conversion factor is 10<sup>4</sup>/π.

<sup>19</sup> This conversion factor is based on 1 d = 86 400 s; and 1 Julian century = 36 525 d. (See *The Astronomical Almanac for the Year 1995*, page K6, U.S. Government Printing Office, Washington, DC, 1994.)

<sup>20</sup> In 1964 the General Conference on Weights and Measures reestablished the name "liter" as a special name for the cubic decimeter. Between 1901 and 1964 the liter was slightly larger (1.000 028 dm<sup>3</sup>); when one uses high-accuracy volume data of that time, this fact must be kept in mind.

<sup>21</sup> The value of this unit, 1 nautical mile = 1852 m, was adopted by the First International Extraordinary Hydrographic Conference, Monaco, 1929, under the name "International nautical mile."

<sup>22</sup> For converting fuel economy, as used in the U.S., to fuel consumption.

<sup>25</sup> The therm (EC) is legally defined in the Council Directive of 20 December 1979, Council of the European Communities (now the European Union, EU). The therm (U.S.) is legally defined in the Federal Register of July 27, 1968. Although the therm (EC), which is based on the International Table Btu, is frequently used by engineers in the United States, the therm (U.S.) is the legal unit used by the U.S natural gas industry.

<sup>26</sup> Defined (not measured) value.

## CONVERSION OF TEMPERATURES

<b>From</b>	<b>To</b>	
Celsius	Fahrenheit	$t_F/^{\circ}\text{F} = (9/5) t/^{\circ}\text{C} + 32$
	Kelvin	$T/\text{K} = t/^{\circ}\text{C} + 273.15$
	Rankine	$T/^{\circ}\text{R} = (9/5) (t/^{\circ}\text{C} + 273.15)$
Fahrenheit	Celsius	$t/^{\circ}\text{C} = (5/9) [(t_F/^{\circ}\text{F}) - 32]$
	Kelvin	$T/\text{K} = (5/9) [(t_F/^{\circ}\text{F}) - 32] + 273.15$
	Rankine	$T/^{\circ}\text{R} = t_F/^{\circ}\text{F} + 459.67$
Kelvin	Celsius	$t/^{\circ}\text{C} = T/\text{K} - 273.15$
	Rankine	$T/^{\circ}\text{R} = (9/5) T/\text{K}$
Rankine	Fahrenheit	$t_F/^{\circ}\text{F} = T/^{\circ}\text{R} - 459.67$
	Kelvin	$T/\text{K} = (5/9) T/^{\circ}\text{R}$

Definition of symbols:

$T$  = thermodynamic (absolute) temperature

$t$  = Celsius temperature (the symbol  $\theta$  is also used for Celsius temperature)

$t_F$  = Fahrenheit temperature

### Designation of Large Numbers

	U.S.A.	Other countries
$10^6$	million	million
$10^9$	billion	milliard
$10^{12}$	trillion	billion
$10^{15}$	quadrillion	billiard
$10^{18}$	quintillion	trillion
$100^{100}$	googol	
$10^{\text{googol}}$	googolplex	

## CONVERSION FACTORS FOR ENERGY UNITS

If greater accuracy is required, use the *Energy Equivalents* section of the *Fundamental Physical Constants* table.

	Wavenumber $\bar{\nu}$ cm <sup>-1</sup>	Frequency $\nu$ MHz	Energy $E$ aj	Energy $E$ eV	Energy $E$ $E_h$	Molar energy $E_m$ kJ/mol	Molar energy $E_m$ kcal/mol	Temperature $T$ K
$\bar{\nu}$ : 1 cm <sup>-1</sup>	$\doteq 1$	$2.997925 \times 10^4$	$1.986447 \times 10^{-5}$	$1.239842 \times 10^{-4}$	$4.556335 \times 10^{-6}$	$11.96266 \times 10^{-3}$	$2.85914 \times 10^{-3}$	1.438769
$\nu$ : 1 MHz	$\doteq 3.33564 \times 10^{-5}$	1	$6.626076 \times 10^{-10}$	$4.135669 \times 10^{-9}$	$1.519830 \times 10^{-10}$	$3.990313 \times 10^{-7}$	$9.53708 \times 10^{-8}$	$4.79922 \times 10^{-5}$
1 aj	$\doteq 50341.1$	$1.509189 \times 10^9$	1	6.241506	0.2293710	602.2137	143.9325	$7.24292 \times 10^4$
$E$ : 1 eV	$\doteq 8065.54$	$2.417988 \times 10^8$	0.1602177	1	$3.674931 \times 10^{-2}$	96.4853	23.0605	$1.16045 \times 10^4$
$E_h$	$\doteq 219474.63$	$6.579684 \times 10^9$	4.359748	27.2114	1	2625.500	627.510	$3.15773 \times 10^5$
$E_m$ : 1 kJ/mol	$\doteq 83.5935$	$2.506069 \times 10^6$	$1.660540 \times 10^{-3}$	$1.036427 \times 10^{-2}$	$3.808798 \times 10^{-4}$	1	0.239006	120.272
1 kcal/mol	$\doteq 349.755$	$1.048539 \times 10^7$	$6.947700 \times 10^{-3}$	$4.336411 \times 10^{-2}$	$1.593601 \times 10^{-3}$	4.184	1	503.217
$T$ : 1 K	$\doteq 0.695039$	$2.08367 \times 10^4$	$1.380658 \times 10^{-5}$	$8.61738 \times 10^{-5}$	$3.16683 \times 10^{-6}$	$8.31451 \times 10^{-3}$	$1.98722 \times 10^{-3}$	1

Examples of the use of this table:

$$1 \text{ aj} \doteq 50341 \text{ cm}^{-1}$$

$$1 \text{ eV} \doteq 96.4853 \text{ kJ mol}^{-1}$$

The symbol  $\doteq$  should be read as meaning corresponds to or is equivalent to.

$$E = h\nu = hc\bar{\nu} = kT; E_m = N_A E; E_h \text{ is the Hartree energy}$$

To convert a pressure value from a unit in the left-hand column to a new unit, multiply the value by the factor appearing in the column for the new unit. For example:

$$1 \text{ kPa} = 9.8692 \times 10^{-3} \text{ atm}$$

$$1 \text{ Torr} = 1.33322 \times 10^{-4} \text{ MPa}$$

**Notes:** μmHg is often referred to as “micron”  
 Torr is essentially identical to mmHg  
 psi is an abbreviation for the unit pound–force per square inch  
 psia (as a term for a physical quantity) implies the true (absolute) pressure  
 psig implies the true pressure minus the local atmospheric pressure

## VALUES OF THE GAS CONSTANT IN DIFFERENT UNIT SYSTEMS

In SI units the value of the gas constant,  $R$ , is:

$$\begin{aligned} R &= 8.314472 \text{ Pa m}^3 \text{ K}^{-1} \text{ mol}^{-1} \\ &= 8314.472 \text{ Pa L K}^{-1} \text{ mol}^{-1} \\ &= 0.08314472 \text{ bar L K}^{-1} \text{ mol}^{-1} \end{aligned}$$

$$1 \text{ torr (mmHg)} = 133.322 \text{ Pa [at } 0 \text{ }^\circ\text{C]}$$

$$1 \text{ in Hg} = 3386.38 \text{ Pa [at } 0 \text{ }^\circ\text{C]}$$

$$1 \text{ in H}_2\text{O} = 249.082 \text{ Pa [at } 4 \text{ }^\circ\text{C]}$$

$$1 \text{ ft H}_2\text{O} = 2988.98 \text{ Pa [at } 4 \text{ }^\circ\text{C]}$$

This table gives the appropriate value of  $R$  for use in the ideal gas equation,  $PV = nRT$ , when the variables are expressed in other units. The following conversion factors for pressure units were used in generating the table:

$$1 \text{ atm} = 101325 \text{ Pa}$$

$$1 \text{ psi} = 6894.757 \text{ Pa}$$

The new IUPAC format numbers the groups from 1 to 18. The previous IUPAC numbering system and the system used by Chemical Abstracts Service (CAS) are also shown. For radioactive elements that do not occur in nature, the mass number of the most stable isotope is given in parentheses. Elements 112, 114, and 116 have been reported but not confirmed.

## UNITS FOR MAGNETIC PROPERTIES

Quantity	Symbol	Gaussian & cgs emu <sup>a</sup>	Conversion factor, C <sup>b</sup>	SI & rationalized mks <sup>c</sup>
Magnetic flux density, magnetic induction	$B$	gauss (G) <sup>d</sup>	$10^{-4}$	tesla (T), Wb/m <sup>2</sup>
Magnetic flux	$\Phi$	maxwell (Mx), G · cm <sup>2</sup>	$10^{-8}$	weber (Wb), volt second (V · s)
Magnetic potential difference, magnetomotive force	$U, F$	gilbert (Gb)	$10/4\pi$	ampere (A)
Magnetic field strength, magnetizing force	$H$	oersted (Oe), <sup>e</sup> Gb/cm	$10^3/4\pi$	A/m <sup>f</sup>
(Volume) magnetization <sup>g</sup>	$M$	emu/cm <sup>3</sup> <sup>h</sup>	$10^3$	A/m
(Volume) magnetization	$4\pi M$	G	$10^3/4\pi$	A/m
Magnetic polarization, intensity of magnetization	$J, I$	emu/cm <sup>3</sup>	$4\pi \times 10^{-4}$	T, Wb/m <sup>2</sup> <sup>i</sup>
(Mass) magnetization	$\sigma, M$	emu/g	1	A · m <sup>2</sup> /kg
			$4\pi \times 10^{-7}$	Wb · m/kg
Magnetic moment	$m$	emu, erg/G	$10^{-3}$	A · m <sup>2</sup> , joule per tesla (J/T)
Magnetic dipole moment	$j$	emu, erg/G	$4\pi \times 10^{-10}$	Wb · m <sup>i</sup>
(Volume) susceptibility	$\chi, \kappa$	dimensionless, emu/cm <sup>3</sup>	$4\pi$	dimensionless
			$(4\pi)^2 \times 10^{-7}$	henry per meter (H/m), Wb/(A · m)
(Mass) susceptibility	$\chi_p, \kappa_p$	cm <sup>3</sup> /g, emu/g	$4\pi \times 10^{-3}$	m <sup>3</sup> /kg
			$(4\pi)^2 \times 10^{-10}$	H · m <sup>2</sup> /kg
(Molar) susceptibility	$\chi_{mol}, \kappa_{mol}$	cm <sup>3</sup> /mol, emu/mol	$4\pi \times 10^{-6}$	m <sup>3</sup> /mol
			$(4\pi)^2 \times 10^{-13}$	H · m <sup>2</sup> /mol
Permeability	$\mu$	dimensionless	$4\pi \times 10^{-7}$	H/m, Wb/(A · m)
Relative permeability <sup>j</sup>	$\mu_r$	not defined		dimensionless
(Volume) energy density, energy product <sup>k</sup>	$W$	erg/cm <sup>3</sup>	$10^{-1}$	J/m <sup>3</sup>
Demagnetization factor	$D, N$	dimensionless	$1/4\pi$	dimensionless

<sup>a</sup>. Gaussian units and cgs emu are the same for magnetic properties. The defining relation is  $B = H + 4\pi M$ .

<sup>b</sup>. Multiply a number in Gaussian units by C to convert it to SI (e.g.,  $1 \text{ G} \times 10^{-4} \text{ T/G} = 10^{-4} \text{ T}$ ).

<sup>c</sup>. SI (*Système International d'Unités*) has been adopted by the National Bureau of Standards. Where two conversion factors are given, the upper one is recognized under, or consistent with, SI and is based on the definition  $B = \mu_0(H + M)$ , where  $\mu_0 = 4\pi \times 10^{-7} \text{ H/m}$ . The lower one is not recognized under SI and is based on the definition  $B = \mu_0 H + J$ , where the symbol  $I$  is often used in place of  $J$ .

<sup>d</sup>. 1 gauss =  $10^5$  gamma ( $\gamma$ ).

<sup>e</sup>. Both oersted and gauss are expressed as  $\text{cm}^{-1/2} \cdot \text{g}^{1/2} \cdot \text{s}^{-1}$  in terms of base units.

<sup>f</sup>. A/m was often expressed as "ampere-turn per meter" when used for magnetic field strength.

<sup>g</sup>. Magnetic moment per unit volume.

<sup>h</sup>. The designation "emu" is not a unit.

<sup>i</sup>. Recognized under SI, even though based on the definition  $B = \mu_0 H + J$ . See footnote c.

<sup>j</sup>.  $\mu_r = \mu/\mu_0 = 1 + \chi_r$ , all in SI.  $\mu_r$  is equal to Gaussian  $\mu$ .

<sup>k</sup>.  $B \cdot H$  and  $\mu_0 M \cdot H$  have SI units J/m<sup>3</sup>;  $M \cdot H$  and  $B \cdot H/4\pi$  have Gaussian units erg/cm<sup>3</sup>.

# SYMBOLS AND TERMINOLOGY FOR PHYSICAL AND CHEMICAL QUANTITIES

The International Organization for Standardization (ISO), International Union of Pure and Applied Chemistry (IUPAC), and the International Union of Pure and Applied Physics (IUPAP) have jointly developed a set of recommended symbols for physical and chemical quantities. Consistent use of these recommended symbols helps assure unambiguous scientific communication. The list below is reprinted from Reference 1 with permission from IUPAC. Full details may be found in the following references:

1. Ian Mills, Ed., *Quantities, Units, and Symbols in Physical Chemistry*, Blackwell Scientific Publications, Oxford, 1988.
2. E. R. Cohen and P. Giacomo, *Symbols, Units, Nomenclature, and Fundamental Constants in Physics*, Document IUPAP-25, 1987; also published in *Physica* 146A, 1-68, 1987.
3. *ISO Standards Handbook 2: Units of Measurement*, International Organization of Standardization, Geneva, 1982.

The symbol for a physical quantity is always given in italic (sloping) type, while symbols for units are given in roman type. Column headings in tables and axis labels on graphs may conveniently be written as the physical quantity symbol divided by the unit symbol, e.g.:

$$\begin{aligned} T/K \\ V/\text{cm}^3 \\ C_p/J \text{ mol}^{-1} \text{ K}^{-1} \end{aligned}$$

The values in the table or graph axis are then pure numbers. Subscripts to symbols for physical quantities should be italic if the subscript refers to another physical quantity or to a number, e.g.:

$$\begin{aligned} C_p - \text{heat capacity at constant pressure} \\ B_n - \text{nth virial coefficient} \end{aligned}$$

Subscripts that have other meanings should be in roman type:

$$\begin{aligned} m_p - \text{mass of the proton} \\ E_k - \text{kinetic energy} \end{aligned}$$

## GENERAL RULES

The value of a physical quantity is expressed as the product of a numerical value and a unit, e.g.:

$$\begin{aligned} T &= 300 \text{ K} \\ V &= 26.2 \text{ cm}^3 \\ C_p &= 45.3 \text{ J mol}^{-1} \text{ K}^{-1} \end{aligned}$$

The following tables give the recommended symbols for the major classes of physical and chemical quantities. The expression in the Definition column is given as an aid in identifying the quantity but is not necessarily the complete or unique definition. The SI Unit gives one (not necessarily unique) expression for the coherent SI unit for the quantity. Other equivalent unit expressions, including those that involve SI prefixes, may be used.

Name	Symbol	Definition	SI unit
<i>Space and Time</i>			
cartesian space coordinates	$x, y, z$		m
spherical polar coordinates	$r, \theta, \phi$		m, 1, 1
generalized coordinate	$q, q_i$		(varies)
position vector	$r$	$r = xi + yj + zk$	m
length	$l$		m
special symbols:			
height	$h$		
breadth	$b$		
thickness	$d, \delta$		
distance	$d$		
radius	$r$		
diameter	$d$		
path length	$s$		
length of arc	$s$		
area	$A, A_x, S$		m <sup>2</sup>
volume	$V, (v)$		m <sup>3</sup>
plane angle	$\alpha, \beta, \gamma, \theta, \phi, \dots$	$\alpha = s/r$	rad, 1
solid angle	$\omega, \Omega$	$\omega = A/r^2$	sr, 1
time	$t$		s
period	$T$	$T = t/N$	s
frequency	$\nu, f$	$\nu = 1/T$	Hz
circular frequency, angular frequency	$\omega$	$\omega = 2\pi\nu$	rad s <sup>-1</sup> , s <sup>-1</sup>
characteristic time interval, relaxation time, time constant	$\tau, T$	$\tau =  dt/d\ln x $	s
angular velocity	$\omega$	$\omega = d\phi/dt$	rad s <sup>-1</sup> , s <sup>-1</sup>
velocity	$v, u, w, c, \dot{r}$	$v = dr/dt$	m s <sup>-1</sup>

Name	Symbol	Definition	SI unit
speed	$v, u, w, c$	$v =  v $	$\text{m s}^{-1}$
acceleration	$\mathbf{a}, (g)$	$\mathbf{a} = d\mathbf{v}/dt$	$\text{m s}^{-2}$
<b>Classical Mechanics</b>			
mass	$m$		kg
reduced mass	$\mu$	$\mu = m_1 m_2 / (m_1 + m_2)$	kg
density, mass density	$\rho$	$\rho = m/V$	$\text{kg m}^{-3}$
relative density	$d$	$d = \rho/\rho$	1
surface density	$\rho_A, \rho_S$	$\rho_A = m/A$	$\text{kg m}^{-2}$
specific volume	$v$	$v = V/m = 1/\rho$	$\text{m}^3 \text{kg}^{-1}$

mobility	$\mu$	$\mu = v_{\text{drift}}/E$	$\text{m}^2 \text{ V}^{-1} \text{ s}^{-1}$
mobility ratio	$b$	$b = \mu_n/\mu_p$	1
diffusion coefficient	$D$	$dN/dt = -DA(dn/dx)$	$\text{m}^2 \text{ s}^{-1}$
diffusion length	$L$	$L = \sqrt{D\tau}$	m
characteristic (Weiss) temperature	$\theta, \theta_w$		K
Curie temperature	$T_C$		K
Néel temperature	$T_N$		K
<b>Statistical Thermodynamics</b>			
number of entities	$N$		1
number density of entities, number concentration	$n, C$	$n = N/V$	$\text{m}^{-3}$
Avogadro constant	$L, N_A$		$\text{mol}^{-1}$
Boltzmann constant	$k, k_B$		$\text{J K}^{-1}$
gas constant (molar)	$R$	$R = Lk$	$\text{J K}^{-1} \text{ mol}^{-1}$
molecular position vector	$\mathbf{r} (x, y, z)$		m
molecular velocity vector	$\mathbf{c}(c_x, c_y, c_z), \mathbf{u}(u_x, u_y, u_z)$	$\mathbf{c} = d\mathbf{r}/dt$	$\text{m s}^{-1}$
molecular momentum vector	$\mathbf{p}(p_x, p_y, p_z)$	$\mathbf{p} = m\mathbf{c}$	$\text{kg m s}^{-1}$
velocity distribution function (Maxwell)	$f(c_x)$	$f(c_x) = (m/2\pi kT)^{1/2} \times \exp(-mc_x^2/2kT)$	$\text{m}^{-1} \text{ s}$
speed distribution function (Maxwell-Boltzmann)	$F(c)$	$F(c) = (m/2\pi kT)^{3/2} \times 4\pi c^2 \exp(-mc^2/2kT)$	$\text{m}^{-1} \text{ s}$
average speed	$\bar{c}, \bar{u}, \langle c \rangle, \langle u \rangle$	$\bar{c} = \int cF(c)dc$	$\text{m s}^{-1}$
generalized coordinate	$q$		(m)
generalized momentum	$p$	$p = \partial L/\partial \dot{q}$	$(\text{kg m s}^{-1})$
volume in phase space	$\Omega$	$\Omega = (1/h) \int p dq$	1
probability	$P$		1
statistical weight, degeneracy	$g, d, W, \omega, \beta$		1
density of states	$\rho(E)$	$\rho(E) = dN/dE$	$\text{J}^{-1}$
partition function, sum over states, for a single molecule	$q, z$	$q = \sum_i g_i \exp(-\varepsilon_i/kT)$	1
for a canonical ensemble (system, or assembly)	$Q, Z$		1
microcanonical ensemble	$\Omega$		1
grand (canonical ensemble)	$\Xi$		1
symmetry number	$\sigma, s$		1
reciprocal temperature parameter	$\beta$	$\beta = 1/kT$	$\text{J}^{-1}$
characteristic temperature	$\Theta$		K

Name	Symbol	Definition	SI unit
<b>General Chemistry</b>			
number of entities (e.g. molecules, atoms, ions, formula units)	$N$		1
amount (of substance)	$n$	$n_B = N_B/L$	mol
Avogadro constant	$L, N_A$		mol <sup>-1</sup>
mass of atom, atomic mass	$m_a, m$		kg
mass of entity (molecule, or formula unit)	$m_e, m$		kg
atomic mass constant	$m_u$	$m_u = m_a(^{12}\text{C})/12$	kg
molar mass	$M$	$M_B = m/n_B$	kg mol <sup>-1</sup>
relative molecular mass (relative molar mass, molecular weight)	$M_r$	$M_{r,B} = m_B/m_u$	1
molar volume	$V_m$	$V_{m,B} = V/n_B$	m <sup>3</sup> mol <sup>-1</sup>
mass fraction	$w$	$w_B = m_B/\Sigma m_i$	1
volume fraction	$\phi$	$\phi_B = V_B/\Sigma V_i$	1
mole fraction, amount fraction, number fraction	$x, y$	$x_B = n_B/\Sigma n_i$	1
(total) pressure	$p, P$		Pa
partial pressure	$p_B$	$p_B = y_B p$	Pa
mass concentration (mass density)	$\gamma, \rho$	$\gamma_B = m_B/V$	kg m <sup>-3</sup>
number concentration, number density of entities	$C, n$	$C_B = N_B/V$	m <sup>-3</sup>
amount concentration, concentration	$c$	$c_B = n_B/V$	mol m <sup>-3</sup>
solubility	$s$	$s_B = c_B$ (saturated solution)	mol m <sup>-3</sup>
molality (of a solute)	$m, (b)$	$m_B = n_B/m_A$	mol kg <sup>-1</sup>
surface concentration	$\Gamma$	$\Gamma_B = n_B/A$	mol m <sup>-2</sup>
stoichiometric number	$\nu$		1
extent of reaction, advancement	$\xi$	$\Delta\xi = \Delta n_B/\nu_B$	mol
degree of dissociation	$\alpha$		1
<b>Chemical Thermodynamics</b>			
heat	$q, Q$		J
work	$w, W$		J
internal energy	$U$	$\Delta U = q + w$	J
enthalpy	$H$	$H = U + pV$	J
thermodynamic temperature	$T$		K
Celsius temperature	$\theta, t$	$\theta/^{\circ}\text{C} = T/\text{K} - 273.15$	°C
entropy	$S$	$dS \geq dq/T$	J K <sup>-1</sup>
Helmholtz energy (Helmholtz function)	$A$	$A = U - TS$	J
Gibbs energy (Gibbs function)	$G$	$G = H - TS$	J
Massieu function	$J$	$J = -A/T$	J K <sup>-1</sup>
Planck function	$Y$	$Y = -G/T$	J K <sup>-1</sup>
surface tension	$\gamma, \sigma$	$\gamma = (\partial G/\partial A_s)_{T, p}$	J m <sup>-2</sup> , N m <sup>-1</sup>
molar quantity $X$	$X_m$	$X_m = X/n$	(varies)
specific quantity $X$	$x$	$x = X/m$	(varies)
pressure coefficient	$\beta$	$\beta = (\partial p/\partial T)_V$	Pa K <sup>-1</sup>
relative pressure coefficient	$\alpha_p$	$\alpha_p = (1/p)(\partial p/\partial T)_V$	K <sup>-1</sup>
compressibility,			
isothermal	$\kappa_T$	$\kappa_T = -(1/V)(\partial V/\partial p)_T$	Pa <sup>-1</sup>
isentropic	$\kappa_S$	$\kappa_S = -(1/V)(\partial V/\partial p)_S$	Pa <sup>-1</sup>
linear expansion coefficient	$\alpha_l$	$\alpha_l = (1/l)(\partial l/\partial T)$	K <sup>-1</sup>
cubic expansion coefficient	$\alpha, \alpha_V, \gamma$	$\alpha = (1/V)(\partial V/\partial T)_p$	K <sup>-1</sup>
heat capacity,			
at constant pressure	$C_p$	$C_p = (\partial H/\partial T)_p$	J K <sup>-1</sup>
at constant volume	$C_V$	$C_V = (\partial U/\partial T)_V$	J K <sup>-1</sup>
ratio of heat capacities	$\gamma, (\kappa)$	$\gamma = C_p/C_V$	1
Joule–Thomson coefficient	$\mu, \mu_{JT}$	$\mu = (\partial T/\partial p)_H$	K Pa <sup>-1</sup>
second virial coefficient	$B$	$pV_m = RT(1 + B/V_m + \dots)$	m <sup>3</sup> mol <sup>-1</sup>
compression factor (compressibility factor)	$Z$	$Z = pV_m/RT$	1
partial molar quantity $X$	$X_B, (X'_B)$	$X_B = (\partial X/\partial n_B)_{T, p, n_j \neq B}$	(varies)
chemical potential (partial molar Gibbs energy)	$\mu$	$\mu_B = (\partial G/\partial n_B)_{T, p, n_j \neq B}$	J mol <sup>-1</sup>
absolute activity	$\lambda$	$\lambda_B = \exp(\mu_B/RT)$	1

Name	Symbol	Definition	SI unit
standard chemical potential	$\mu^\ominus, \mu^\circ$		J mol <sup>-1</sup>
standard partial molar enthalpy	$H_B^\ominus$	$H_B^\ominus = \mu_B^\ominus + TS_B^\ominus$	J mol <sup>-1</sup>
standard partial molar entropy	$S_B^\ominus$	$S_B^\ominus = -(\partial\mu_B^\ominus/\partial T)_p$	J mol <sup>-1</sup> K <sup>-1</sup>
standard reaction Gibbs energy (function)	$\Delta_r G^\ominus$	$\Delta_r G^\ominus = \sum_B \nu_B \mu_B^\ominus$	J mol <sup>-1</sup>
affinity of reaction	$A, (\mathcal{A})$	$A = -(\partial G / \partial \xi)_{p,T} = -\sum_B \nu_B \mu_B$	J mol <sup>-1</sup>
standard reaction enthalpy	$\Delta_r H^\ominus$	$\Delta_r H^\ominus = \sum_B \nu_B H_B^\ominus$	J mol <sup>-1</sup>
standard reaction entropy	$\Delta_r S^\ominus$	$\Delta_r S^\ominus = \sum_B \nu_B S_B^\ominus$	J mol <sup>-1</sup> K <sup>-1</sup>
equilibrium constant	$K^\ominus, K$	$K^\ominus = \exp(-\Delta_r G^\ominus / RT)$	1
equilibrium constant, pressure basis	$K_p$	$K_p = \prod_B p_B^{\nu_B}$	Pa <sup><math>\sum \nu</math></sup>
concentration basis	$K_c$	$K_c = \prod_B c_B^{\nu_B}$	(mol m <sup>-3</sup> ) <sup><math>\sum \nu</math></sup>
molality basis	$K_m$	$K_m = \prod_B m_B^{\nu_B}$	(mol kg <sup>-1</sup> ) <sup><math>\sum \nu</math></sup>
fugacity	$f, \tilde{p}$	$f_B = \lambda_B \lim_{p \rightarrow 0} (p_B / \lambda_B)_T$	Pa
fugacity coefficient	$\phi$	$\phi_B = f_B / p_B$	1
activity and activity coefficient referenced to Raoult's law, (relative) activity	$a$	$a_B = \exp\left[\frac{\mu_B - \mu_B^*}{RT}\right]$	1
activity coefficient	$f$	$f_B = a_B / x_B$	1
activities and activity coefficients referenced to Henry's law, (relative) activity, molality basis	$a_m$	$a_{m,B} = \exp\left[\frac{\mu_B - \mu_B^\ominus}{RT}\right]$	1
concentration basis	$a_c$	$a_{c,B} = \exp\left[\frac{\mu_B - \mu_B^\ominus}{RT}\right]$	1
mole fraction basis	$a_x$	$a_{x,B} = \exp\left[\frac{\mu_B - \mu_B^\ominus}{RT}\right]$	1
activity coefficient, molality basis	$\gamma_m$	$a_{m,B} = \gamma_{m,B} m_B^\ominus / m^\ominus$	1
concentration basis	$\gamma_c$	$a_{c,B} = \gamma_{c,B} c_B^\ominus / c^\ominus$	1
mole fraction basis	$\gamma_x$	$a_{x,B} = \gamma_{x,B} x_B$	1
ionic strength, molality basis	$I_m, I$	$I_m = \frac{1}{2} \sum m_B z_B^2$	mol kg <sup>-1</sup>
concentration basis	$I_c, I$	$I_c = \frac{1}{2} \sum c_B z_B^2$	mol m <sup>-3</sup>
osmotic coefficient, molality basis	$\phi_m$	$\phi_m = (\mu_A^* - \mu_A) / (RTM_A \sum m_B)$	1
mole fraction basis	$\phi_x$	$\phi_x = (\mu_A - \mu_A^*) / (RT \ln x_A)$	1
osmotic pressure	$\Pi$	$\Pi = c_B RT$ (ideal dilute solution)	Pa

*(i) Symbols used as subscripts to denote a chemical process or reaction*

These symbols should be printed in roman (upright) type, without a full stop (period).

vaporization, evaporation (liquid → gas)	vap
sublimation (solid → gas)	sub
melting, fusion (solid → liquid)	fus
transition (between two phases)	trs
mixing of fluids	mix
solution (of solute in solvent)	sol
dilution (of a solution)	dil
adsorption	ads
displacement	dpl
immersion	imm

reaction in general	r
atomization	at
combustion reaction	c
formation reaction	f

*(ii) Recommended superscripts*

standard	$\ominus, \circ$
pure substance	*
infinite dilution	$\infty$
ideal	id
activated complex, transition state	‡
excess quantity	E

Name	Symbol	Definition	SI unit
<b>Chemical Kinetics</b>			
rate of change of quantity $X$	$\dot{X}$	$\dot{X} = dX/dt$	(varies)
rate of conversion	$\dot{\xi}$	$\dot{\xi} = d\xi/dt$	mol s <sup>-1</sup>
rate of concentration change (due to chemical reaction)	$r_B \nu_B$	$r_B = dc_B/dt$	mol m <sup>-3</sup> s <sup>-1</sup>
rate of reaction (based on amount concentration)	$\nu$	$\nu = \dot{\xi} / V = \nu_B^{-1} dc_B/dt$	mol m <sup>-3</sup> s <sup>-1</sup>
partial order of reaction	$n_B$	$\nu = k \Pi c_B^{n_B}$	1
overall order of reaction	$n$	$n = \sum n_B$	1
rate constant, rate coefficient	$k$	$\nu = k \Pi c_B^{n_B}$	(mol <sup>-1</sup> m <sup>3</sup> ) <sup>n-1</sup> s <sup>-1</sup>
Boltzmann constant	$k, k_B$		J K <sup>-1</sup>
half life	$t_{1/2}$	$c(t_{1/2}) = c_0/2$	s
relaxation time	$\tau$	$\tau = 1/(k_1 + k_{-1})$	s
energy of activation, activation energy	$E_a, E$	$E_a = RT^2 d \ln k/dT$	J mol <sup>-1</sup>
pre-exponential factor	$A$	$k = A \exp(-E_a/RT)$	(mol <sup>-1</sup> m <sup>3</sup> ) <sup>n-1</sup> s <sup>-1</sup>
volume of activation	$\Delta^\ddagger V$	$\Delta^\ddagger V = -RT \times (\partial \ln k / \partial p)_T$	m <sup>3</sup> mol <sup>-1</sup>
collision diameter	$d$	$d_{AB} = r_A + r_B$	m
collision cross-section	$\sigma$	$\sigma_{AB} = \pi d_{AB}^2$	m <sup>2</sup>
collision frequency	$Z_A$		s <sup>-1</sup>
collision number	$Z_{AB}, Z_{AA}$		m <sup>-3</sup> s <sup>-1</sup>
collision frequency factor	$z_{AB}, z_{AA}$	$z_{AB} = Z_{AB} / L c_A c_B$	m <sup>3</sup> mol <sup>-1</sup> s <sup>-1</sup>
standard enthalpy of activation	$\Delta^\ddagger H^\ominus, \Delta H^\ddagger$		J mol <sup>-1</sup>
standard entropy of activation	$\Delta^\ddagger S^\ominus, \Delta S^\ddagger$		J mol <sup>-1</sup> K <sup>-1</sup>
standard Gibbs energy of activation	$\Delta^\ddagger G^\ominus, \Delta G^\ddagger$		J mol <sup>-1</sup>
quantum yield, photochemical yield	$\phi$		1
<b>Electrochemistry</b>			
elementary charge (proton charge)	$e$		C
Faraday constant	$F$	$F = eL$	C mol <sup>-1</sup>
charge number of an ion	$z$	$z_B = Q_B/e$	1
ionic strength	$I_c, I$	$I_c = \frac{1}{2} \sum c_i z_i^2$	mol m <sup>-3</sup>
mean ionic activity	$a_\pm$	$a_\pm = m_\pm \gamma_\pm / m^\ominus$	1
mean ionic molality	$m_\pm$	$m_\pm^{(v_+ + v_-)} = m_+^{v_+} m_-^{v_-}$	mol kg <sup>-1</sup>
mean ionic activity coefficient	$\gamma_\pm$	$\gamma_\pm^{(v_+ + v_-)} = \gamma_+^{v_+} \gamma_-^{v_-}$	1
charge number of electrochemical cell reaction	$n, (z)$		1
electric potential difference (of a galvanic cell)	$\Delta V, E, U$	$\Delta V = V_R - V_L$	V
emf, electromotive force	$E$	$E = \lim_{I \rightarrow 0} \Delta V$	V
standard emf, standard potential of the electrochemical cell reaction	$E^\ominus$	$E^\ominus = -\Delta_r G^\ominus / nF = (RT/nF) \ln K^\ominus$	V
standard electrode potential	$E^\ominus$		V
emf of the cell, potential of the electrochemical cell reaction	$E$	$E = E^\ominus - (RT/nF) \times \sum \nu_i \ln a_i$	V
pH	pH	$\text{pH} \approx -\lg \left[ \frac{c(\text{H}^+)}{\text{mol dm}^{-3}} \right]$	1
inner electric potential	$\phi$	$\nabla \phi = -E$	V
outer electric potential	$\psi$	$\psi = Q/4\pi\epsilon_0 r$	V

Name	Symbol	Definition	SI unit
surface electric potential	$\chi$	$\chi = \phi - \psi$	V
Galvani potential difference	$\Delta\phi$	$\Delta_{\alpha}^{\beta}\phi = \phi^{\beta} - \phi^{\alpha}$	V
volta potential difference	$\Delta\psi$	$\Delta_{\alpha}^{\beta}\psi = \psi^{\beta} - \psi^{\alpha}$	V
electrochemical potential	$\tilde{\mu}$	$\tilde{\mu}_{\text{B}}^{\alpha} = (\partial G/\partial n_{\text{B}}^{\alpha})$	J mol <sup>-1</sup>
electric current	$I$	$I = dQ/dt$	A
(electric) current density	$j$	$j = I/A$	A m <sup>-2</sup>
(surface) charge density	$\sigma$	$\sigma = Q/A$	C m <sup>-2</sup>
electrode reaction rate constant	$k$	$k_{\text{ox}} = I_{\text{a}}/(nFA\prod_i c_i^{n_i})$	(varies)
mass transfer coefficient, diffusion rate constant	$k_{\text{d}}$	$k_{\text{d,B}} =  v_{\text{B}} I_{\text{L,B}}/nFcA$	m s <sup>-1</sup>
thickness of diffusion layer	$\delta$	$\delta_{\text{B}} = D_{\text{B}}/k_{\text{d,B}}$	m
transfer coefficient (electrochemical)	$\alpha$	$\alpha_{\text{c}} = \frac{- v RT\partial \ln I_{\text{c}} }{nF \partial E}$	1
overpotential	$\eta$	$\eta = E_i - E_{i=0} - IR_{\text{u}}$	V
electrokinetic potential (zeta potential)	$\zeta$		V
conductivity	$\kappa, (\sigma)$	$\kappa = j/E$	S m <sup>-1</sup>
conductivity cell constant	$K_{\text{cell}}$	$K_{\text{cell}} = \kappa R$	m <sup>-1</sup>
molar conductivity (of an electrolyte)	$\Lambda$	$\Lambda_{\text{B}} = \kappa/c_{\text{B}}$	S m <sup>2</sup> mol <sup>-1</sup>
ionic conductivity, molar conductivity of an ion	$\lambda$	$\lambda_{\text{B}} =  z_{\text{B}} Fu_{\text{B}}$	S m <sup>2</sup> mol <sup>-1</sup>
electric mobility	$u, (\mu)$	$u_{\text{B}} = v_{\text{B}}/E$	m <sup>2</sup> V <sup>-1</sup> s <sup>-1</sup>
transport number	$t$	$t_{\text{B}} = j_{\text{B}}/\sum_i j_i$	1
reciprocal radius of ionic atmosphere	$\kappa$	$\kappa = (2F^2I/\epsilon RT)^{1/2}$	m <sup>-1</sup>
<b>Colloid and Surface Chemistry</b>			
specific surface area	$a, a_{\text{s}}, s$	$a = A/m$	m <sup>2</sup> kg <sup>-1</sup>
surface amount of B, adsorbed amount of B	$n_{\text{B}}^{\text{s}}, n_{\text{B}}^{\text{a}}$		mol
surface excess of B	$n_{\text{B}}^{\sigma}$		mol
surface excess concentration of B	$\Gamma_{\text{B}}, (\Gamma_{\text{B}}^{\sigma})$	$\Gamma_{\text{B}} = n_{\text{B}}^{\sigma}/A$	mol m <sup>-2</sup>
total surface excess concentration	$\Gamma, (\Gamma^{\sigma})$	$\Gamma = \sum_i \Gamma_i$	mol m <sup>-2</sup>
area per molecule	$a, \sigma$	$a_{\text{B}} = A/N_{\text{B}}^{\sigma}$	m <sup>2</sup>
area per molecule in a filled monolayer	$a_{\text{m}}, \sigma_{\text{m}}$	$a_{\text{m,B}} = A/N_{\text{m,B}}$	m <sup>2</sup>
surface coverage	$\theta$	$\theta = N_{\text{B}}^{\sigma}/N_{\text{m,B}}$	1
contact angle	$\theta$		1, rad
film thickness	$t, h, \delta$		m
thickness of (surface or interfacial) layer	$\tau, \delta, t$		m
surface tension, interfacial tension	$\gamma, \sigma$	$\gamma = (\partial G/\partial A_{\text{s}})_{T,p}$	N m <sup>-1</sup> , J m <sup>-2</sup>
film tension	$\Sigma_{\text{f}}$	$\Sigma_{\text{f}} = 2\gamma_{\text{f}}$	N m <sup>-1</sup>
reciprocal thickness of the double layer	$\kappa$	$\kappa = [2F^2I_{\text{c}}/\epsilon RT]^{1/2}$	m <sup>-1</sup>
average molar masses			
number-average	$M_{\text{n}}$	$M_{\text{n}} = \sum n_i M_i / \sum n_i$	kg mol <sup>-1</sup>
mass-average	$M_{\text{m}}$	$M_{\text{m}} = \sum n_i M_i^2 / \sum n_i M_i$	kg mol <sup>-1</sup>
Z-average	$M_{\text{z}}$	$M_{\text{z}} = \sum n_i M_i^3 / \sum n_i M_i^2$	kg mol <sup>-1</sup>
sedimentation coefficient	$s$	$s = v/a$	s
van der Waals constant	$\lambda$		J
retarded van der Waals constant	$\beta, B$		J
van der Waals–Hamaker constant	$A_{\text{H}}$		J
surface pressure	$\pi^{\text{s}}, \pi$	$\pi^{\text{s}} = \gamma^0 - \gamma$	N m <sup>-1</sup>
<b>Transport Properties</b>			
flux (of a quantity X)	$J_{\text{X}}, J$	$J_{\text{X}} = A^{-1} dX/dt$	(varies)
volume flow rate	$q_{\text{v}}, \dot{V}$	$q_{\text{v}} = dV/dt$	m <sup>3</sup> s <sup>-1</sup>
mass flow rate	$q_{\text{m}}, \dot{m}$	$q_{\text{m}} = dm/dt$	kg s <sup>-1</sup>
mass transfer coefficient	$k_{\text{d}}$		m s <sup>-1</sup>
heat flow rate	$\phi$	$\phi = dq/dt$	W
heat flux	$J_{\text{q}}$	$J_{\text{q}} = \phi/A$	W m <sup>-2</sup>
thermal conductance	$G$	$G = \phi/\Delta T$	W K <sup>-1</sup>
thermal resistance	$R$	$R = 1/G$	K W <sup>-1</sup>
thermal conductivity	$\lambda, k$	$\lambda = J_{\text{q}}/(dT/dl)$	W m <sup>-1</sup> K <sup>-1</sup>

Name	Symbol	Definition	SI unit
coefficient of heat transfer	$h, (k, K, \alpha)$	$h = J_d/\Delta T$	$\text{W m}^{-2} \text{K}^{-1}$
thermal diffusivity	$a$	$a = \lambda/\rho c_p$	$\text{m}^2 \text{s}^{-1}$
diffusion coefficient	$D$	$D = J_d/(dc/dl)$	$\text{m}^2 \text{s}^{-1}$

The following symbols are used in the definitions of the dimensionless quantities: mass ( $m$ ), time ( $t$ ), volume ( $V$ ), area ( $A$ ), density ( $\rho$ ), speed ( $v$ ), length ( $l$ ), viscosity ( $\eta$ ), pressure ( $p$ ), acceleration of free fall ( $g$ ), cubic expansion coefficient ( $\alpha$ ), temperature ( $T$ ), surface tension ( $\gamma$ ), speed of sound ( $c$ ), mean free path ( $\lambda$ ), frequency ( $f$ ), thermal diffusivity ( $a$ ), coefficient of heat transfer ( $h$ ), thermal conductivity ( $k$ ), specific heat capacity at constant pressure ( $c_p$ ), diffusion coefficient ( $D$ ), mole fraction ( $x$ ), mass transfer coefficient ( $k_d$ ), permeability ( $\mu$ ), electric conductivity ( $\kappa$ ), and magnetic flux density ( $B$ ).

Name	Symbol	Definition	SI unit
Reynolds number	$Re$	$Re = \rho v l / \eta$	1
Euler number	$Eu$	$Eu = \Delta p / \rho v^2$	1
Froude number	$Fr$	$Fr = v / (lg)^{1/2}$	1
Grashof number	$Gr$	$Gr = l^3 g \alpha \Delta T \rho^2 / \eta^2$	1
Weber number	$We$	$We = \rho v^2 l / \gamma$	1
Mach number	$Ma$	$Ma = v / c$	1
Knudsen number	$Kn$	$Kn = \lambda / l$	1
Strouhal number	$Sr$	$Sr = lf / v$	1
Fourier number	$Fo$	$Fo = at / l^2$	1
Péclet number	$Pe$	$Pe = vl / a$	1
Rayleigh number	$Ra$	$Ra = l^3 g \alpha \Delta T \rho / \eta a$	1
Nusselt number	$Nu$	$Nu = hl / k$	1
Stanton number	$St$	$St = h / \rho v c_p$	1
Fourier number for mass transfer	$Fo^*$	$Fo^* = Dt / l^2$	1
Péclet number for mass transfer	$Pe^*$	$Pe^* = vl / D$	1
Grashof number for mass transfer	$Gr^*$	$Gr^* = l^3 g \left( \frac{\partial p}{\partial x} \right)_{T,p} \left( \frac{\Delta x p}{\eta} \right)$	1
Nusselt number for mass transfer	$Nu^*$	$Nu^* = k_d l / D$	1
Stanton number for mass transfer	$St^*$	$St^* = k_d / v$	1
Prandtl number	$Pr$	$Pr = \eta / \rho a$	1
Schmidt number	$Sc$	$Sc = \eta / \rho D$	1
Lewis number	$Le$	$Le = a / D$	1
magnetic Reynolds number	$Rm, Re_m$	$Rm = v \mu \kappa l$	1
Alfvén number	$Al$	$Al = v(\rho \mu)^{1/2} / B$	1
Hartmann number	$Ha$	$Ha = Bl (\kappa / \eta)^{1/2}$	1
Cowling number	$Co$	$Co = B^2 / \mu \rho v^2$	1

## NOMENCLATURE FOR CHEMICAL COMPOUNDS

The International Union of Pure and Applied Chemistry (IUPAC) maintains several commissions that deal with the naming of chemical substances. In general, the approach of IUPAC is to present rules for arriving at names in a systematic manner, rather than recommending a unique name for each compound. Thus there are often several alternative "IUPAC names," depending on which nomenclature system is used, each of which may have advantages in specific applications. However, each of these names will be unambiguous.

Organizations such as the Chemical Abstracts Service and the Beilstein Institute that prepare indexes to the chemical literature must adopt a system for selecting unique names in order to avoid excessive cross referencing. Chemical Abstracts Service uses a system which groups together compounds derived from a single parent compound. Thus most index names are inverted (e.g., Benzene, bromo rather than bromobenzene; Acetic acid, sodium salt rather than sodium acetate).

Recommended names for the most common substituent groups, ligands, ions, and organic rings are given in the two following tables, "Nomenclature for Inorganic Ions and Ligands" and "Organic Substituent Groups and Ring Systems." For the basics of macromolecular nomenclature, see "Nomenclature for Organic Polymers" in Section 13.

Some of the most useful recent guides to chemical nomenclature, prepared by IUPAC and other organizations such as the International Union of Biochemistry and Molecular Biology (IUBMB) and the American Chemical Society are listed below. These books contain citations to the more detailed nomenclature documents in each area. Two very useful web sites providing links to nomenclature documents are:

[www.iupac.org/publications/index.html](http://www.iupac.org/publications/index.html)

# NOMENCLATURE FOR INORGANIC IONS AND LIGANDS

Willem H. Koppenol

The entries below were selected from Table IX of Connelly, N. G., Damhus, T., Hartshorn, R. M. and Hutton, A. T., Eds., *Nomenclature of Inorganic Chemistry. IUPAC Recommendations 2005*, The Royal Society of Chemistry, 2005. Two changes were made: in the case of the hypohalides, the oxidohalogenate names are listed, not the new halooxygenate names. Thus, for BrO<sup>-</sup> the still acceptable name “oxidobromate(1-)” is listed, not the more correct, but less palatable, “bromooxygenate(1-)”. Similarly, and for reasons of consistency, ClO<sup>•</sup> is not named oxygen (mono)chloride, but chlorine mono(o)oxide. The symbol '⊂' is used for dividing names when this is made necessary by a line break. When the name is reconstructed

from the name given in the table, this symbol should be omitted. Thus, all *hyphens* in the table are true parts of the names. The symbols ‘>’ and ‘<’ placed next to an element symbol both denote two single bonds connecting the atom in question to two other atoms. For a given compound, the various systematic names, if applicable, are given in the order: stoichiometric names, substitutive names, additive names and hydrogen names. Acceptable names which are not entirely systematic (or not formed according to any of the systems mentioned above) are given at the end after a semicolon. No order of preference is implied by the order in which formulae and names are listed. Reprinted by permission of IUPAC.

Formula for uncharged atom or group	Name			
	<i>Uncharged atoms or molecules (including zwitterions and radicals) or substituent groups<sup>a</sup></i>	<i>Cations (including cation radicals) or cationic substituent groups<sup>a</sup></i>	<i>Anions (including anion radicals) or anionic substituent groups<sup>b</sup></i>	<i>Ligands<sup>c</sup></i>
H	hydrogen H <sup>•</sup> , hydrogen(●), monohydrogen (natural or unspecified isotopic composition) <sup>1</sup> H <sup>•</sup> , protium(●), monoprotrium <sup>2</sup> H <sup>•</sup> = D <sup>•</sup> , deuterium(●), monodeuterium <sup>3</sup> H <sup>•</sup> = T <sup>•</sup> , tritium(●), monotritium	hydrogen (general) H <sup>+</sup> , hydrogen(1+), hydron (natural or unspecified isotopic composition) <sup>1</sup> H <sup>+</sup> , protium(1+), proton <sup>2</sup> H <sup>+</sup> = D <sup>+</sup> , deuterium(1+), deuteron <sup>3</sup> H <sup>+</sup> = T <sup>+</sup> , tritium(1+), triton	hydride (general) H <sup>-</sup> , hydride (natural or unspecified isotopic composition) <sup>1</sup> H <sup>-</sup> , protide <sup>2</sup> H <sup>-</sup> = D <sup>-</sup> , deuteride <sup>3</sup> H <sup>-</sup> = T <sup>-</sup> , tritide	hydrido   protido deuterido tritido
H <sub>2</sub>	H <sub>2</sub> , dihydrogen D <sub>2</sub> , dideuterium T <sub>2</sub> , ditritium	H <sub>2</sub> <sup>••</sup> , dihydrogen(●1+) <sup>1</sup> H <sub>2</sub> <sup>••</sup> , diprotium(●1+) D <sub>2</sub> <sup>••</sup> , dideuterium(●1+) T <sub>2</sub> <sup>••</sup> , ditritium(●1+)		
D, see H				
D <sub>2</sub> , see H <sub>2</sub>				
T, see H				
T <sub>2</sub> , see H <sub>2</sub>				
F	fluorine F <sup>•</sup> , fluorine(●), monofluorine -F, fluoro	fluorine (general) F <sup>+</sup> , fluorine(1+)	fluoride (general) F <sup>-</sup> , fluoride(1-); fluoride	fluorido (general) F <sup>-</sup> , fluorido(1-); fluorido
F <sub>2</sub>	F <sub>2</sub> , difluorine	F <sub>2</sub> <sup>••</sup> , difluorine(●1+)	F <sub>2</sub> <sup>•-</sup> , difluoride(●1-)	F <sub>2</sub> , difluorine
Cl	chlorine (general) Cl <sup>•</sup> , chlorine(●), monochlorine -Cl, chloro	chlorine (general) Cl <sup>+</sup> , chlorine(1+)	chloride (general) Cl <sup>-</sup> , chloride(1-); chloride	chlorido (general) Cl <sup>-</sup> , chlorido(1-); chlorido
Cl <sub>2</sub>	Cl <sub>2</sub> , dichlorine	Cl <sub>2</sub> <sup>••</sup> , dichlorine(●1+)	Cl <sub>2</sub> <sup>•-</sup> , dichloride(●1-)	Cl <sub>2</sub> , dichlorine Cl <sub>2</sub> <sup>•-</sup> , dichlorido(●1-)
Br	bromine (general) Br <sup>•</sup> , bromine(●), monobromine -Br, bromo	bromine (general) Br <sup>+</sup> , bromine(1+)	bromide (general) Br <sup>-</sup> , bromide(1-); bromide	bromido (general) Br <sup>-</sup> , bromido(1-); bromido
Br <sub>2</sub>	Br <sub>2</sub> , dibromine	Br <sub>2</sub> <sup>••</sup> , dibromine(●1+)	Br <sub>2</sub> <sup>•-</sup> , dibromide(●1-)	Br <sub>2</sub> , dibromine
I	iodine (general) I <sup>•</sup> , iodine(●), monoiodine -I, iodo	iodine (general) I <sup>+</sup> , iodine(1+)	iodide (general) I <sup>-</sup> , iodide(1-); iodide	iodido (general) I <sup>-</sup> , iodido(1-); iodido
I <sub>2</sub>	I <sub>2</sub> , diiodine	I <sub>2</sub> <sup>••</sup> , diiodine(●1+)	I <sub>2</sub> <sup>•-</sup> , diiodide(●1-)	I <sub>2</sub> , diiodine

ClO	ClO, chlorine mon(o)oxide ClO <sup>•</sup> , oxidochlorine(•); chlorosyl –ClO, oxo-λ <sup>3</sup> -chloranyl; chlorosyl –OCl, chlorooxy		ClO <sup>–</sup> , oxidochlorate(1–); hypochlorite	ClO <sup>–</sup> , oxidochlorato(1–); hypochlorito
ClO <sub>2</sub>	ClO <sub>2</sub> , chlorine dioxide ClO <sub>2</sub> <sup>•</sup> , dioxidochlorine(•) ClOO <sup>•</sup> , chloridodioxygen $\curvearrowright$ (O–O) (•), –ClO <sub>2</sub> , dioxo-λ <sup>3</sup> -chloranyl; chloryl –OClO, oxo-λ <sup>3</sup> -chloranyloxy	ClO <sub>2</sub> <sup>+</sup> , dioxidochlorine(1+) (not chloryl)	ClO <sub>2</sub> <sup>–</sup> , dioxidochlorate(1–); chlorite	ClO <sub>2</sub> <sup>–</sup> , dioxidochlorato(1–); chlorito
ClO <sub>3</sub>	ClO <sub>3</sub> , chlorine trioxide ClO <sub>3</sub> <sup>•</sup> , trioxidochlorine(•) –ClO <sub>3</sub> , trioxo-λ <sup>7</sup> -chloranyl; perchloryl –OClO <sub>2</sub> , dioxo-λ <sup>5</sup> -chloranyloxy	ClO <sub>3</sub> <sup>+</sup> , trioxidochlorine(1+) (not perchloryl)	ClO <sub>3</sub> <sup>–</sup> , trioxidochlorate(1–); chlorate	ClO <sub>3</sub> <sup>–</sup> , trioxidochlorato(1–); chlorato
ClO <sub>4</sub>	ClO <sub>4</sub> , chlorine tetraoxide ClO <sub>4</sub> <sup>•</sup> , tetraoxidochlorine(•) –OClO <sub>3</sub> , trioxo-λ <sup>7</sup> -chloranyloxy		ClO <sub>4</sub> <sup>–</sup> , tetraoxidochlorate(1–); perchlorate	ClO <sub>4</sub> <sup>–</sup> , tetraoxidochlorato(1–); perchlorato
IO	IO, iodine mon(o)oxide IO <sup>•</sup> , oxidiodine(•); iodosyl –IO, oxo-λ <sup>3</sup> -iodanyl; iodosyl –OI, iodoxy	IO <sup>+</sup> , oxidiodine(1+) (not iodosyl)	IO <sup>–</sup> , oxidiodate(1–); hypoiodite IO <sup>2–</sup> , oxidiodate(•2–)	IO <sup>–</sup> , oxidiodato(1–); hypoiodito
IO <sub>2</sub>	IO <sub>2</sub> , iodine dioxide IO <sub>2</sub> <sup>•</sup> , dioxidiodine(•) –IO <sub>2</sub> , dioxo-λ <sup>3</sup> -iodanyl; iodyl –OIO, oxo-λ <sup>3</sup> -iodanyloxy	IO <sub>2</sub> <sup>+</sup> , dioxidiodine(1+) (not iodyl)	IO <sub>2</sub> <sup>–</sup> , dioxidiodate(1–); iodite	IO <sub>2</sub> <sup>–</sup> , dioxidiodato(1–); iodito
IO <sub>3</sub>	IO <sub>3</sub> , iodine trioxide IO <sub>3</sub> <sup>•</sup> , trioxidiodine(•) –IO <sub>3</sub> , trioxo-λ <sup>7</sup> -iodanyl; periodyl –OIO <sub>2</sub> , dioxo-λ <sup>5</sup> -iodanyloxy	IO <sub>3</sub> <sup>+</sup> , trioxidiodine(1+) (not periodyl)	IO <sub>3</sub> <sup>–</sup> , trioxidiodate(1–); iodate	IO <sub>3</sub> <sup>–</sup> , trioxidiodato(1–); iodato
IO <sub>4</sub>	IO <sub>4</sub> , iodine tetraoxide IO <sub>4</sub> <sup>•</sup> , tetraoxidiodine(•) –OIO <sub>3</sub> , trioxo-λ <sup>7</sup> -iodanyloxy		IO <sub>4</sub> <sup>–</sup> , tetraoxidiodate(1–); periodate	IO <sub>4</sub> <sup>–</sup> , tetraoxidiodato(1–); periodato
O	oxygen (general) O, monooxygen O <sup>2•</sup> , oxidanylidene, monooxygen(2•) >O, oxy, epoxy (in rings) =O, oxo	oxygen (general) O <sup>•+</sup> , oxygen(•1+)	oxide (general) O <sup>•–</sup> , oxidanidyl, oxide(•1–) O <sup>2–</sup> , oxide(2–); oxide –O <sup>•</sup> , oxido	O <sup>2•</sup> , oxido
O <sub>2</sub>	O <sub>2</sub> , dioxygen O <sub>2</sub> <sup>2•</sup> , dioxidanediyl, dioxygen(2•) –OO–, dioxidanediyl; peroxy	O <sub>2</sub> <sup>•+</sup> , dioxidanilyumyl, dioxygen(•1+) O <sub>2</sub> <sup>2+</sup> , dioxidanebis(ylum), dioxygen(2+)	O <sub>2</sub> <sup>•–</sup> , dioxidanidyl, dioxide(•1–); superoxide (not hyperoxide) O <sub>2</sub> <sup>2–</sup> , dioxidanediide, dioxide(2–); peroxide	dioxido (general) O <sub>2</sub> , dioxygen O <sub>2</sub> <sup>•–</sup> , dioxido(•1–); superoxido O <sub>2</sub> <sup>2–</sup> , dioxidanediido, dioxido(2–); peroxido
O <sub>3</sub>	O <sub>3</sub> , trioxygen; ozone –OOO–, trioxidanediyl		O <sub>3</sub> <sup>•–</sup> , trioxidanidyl, trioxide(•1–); ozonide	O <sub>3</sub> , trioxygen; ozone O <sub>3</sub> <sup>•–</sup> , trioxido(•1–); ozonido
HO	HO <sup>•</sup> , oxidanyl, hydridooxygen(•); hydroxyl –OH, oxidanyl; hydroxy	HO <sup>+</sup> , oxidanylium, hydridooxygen(1+); hydroxylum	HO <sup>–</sup> , oxidanide, hydroxide	HO <sup>–</sup> , oxidanido; hydroxido
HO <sub>2</sub>	HO <sub>2</sub> <sup>•</sup> , dioxidanyl, hydridodioxygen(•) hydrogen dioxide –OOH, dioxidanyl; hydroperoxy	HO <sub>2</sub> <sup>+</sup> , dioxidanilyum, hydridodioxygen(1+)	HO <sub>2</sub> <sup>–</sup> , dioxidanide, hydrogen(peroxide)(1–)	HO <sub>2</sub> <sup>–</sup> , dioxidanido, hydrogen(peroxido)(1–)
S	sulfur (general) S, monosulfur =S, sulfanylidene; thioxo –S–, sulfanediyl	sulfur (general) S <sup>•+</sup> , sulfur(1+)	sulfide (general) S <sup>•–</sup> , sulfanidyl, sulfide(•1–) S <sup>2–</sup> , sulfanediide, sulfide(2–); sulfide –S <sup>•</sup> , sulfido	sulfido (general) S <sup>•–</sup> , sulfanidyl, sulfido(•1–) S <sup>2–</sup> , sulfanediido, sulfido(2–)

S <sub>2</sub>	S <sub>2</sub> , disulfur –SS–, disulfanediyl >S=S, sulfanylidene-λ <sup>4</sup> -sulfanediyl; sulfinothioyl	S <sub>2</sub> <sup>•+</sup> , disulfur(•1+)	S <sub>2</sub> <sup>•-</sup> , disulfanidyl, disulfide(•1-) S <sub>2</sub> <sup>2-</sup> , disulfide(2-), disulfanediide –SS <sup>-</sup> , disulfanidyl	S <sub>2</sub> <sup>2-</sup> , disulfido(2-), disulfanediido
HS	HS <sup>•</sup> , sulfanyl, hydridosulfur(•) –SH, sulfanyl	HS <sup>+</sup> , sulfanylium, hydridosulfur(1+)	HS <sup>-</sup> , sulfanide, hydrogen(sulfide)(1-)	HS <sup>-</sup> , sulfanido, hydrogen(sulfido)(1-)
SO	SO, sulfur mon(o)oxide [SO], oxidosulfur >SO, oxo-λ <sup>4</sup> -sulfanediyl; sulfinyl	SO <sup>•+</sup> , oxidosulfur(•1+) ( <i>not</i> sulfinyl or thionyl)	SO <sup>•-</sup> , oxidosulfate(•1-)	[SO], oxidosulfur
SO <sub>2</sub>	SO <sub>2</sub> , sulfur dioxide [SO <sub>2</sub> ], dioxidosulfur >SO <sub>2</sub> , dioxo-λ <sup>6</sup> -sulfanediyl; sulfuryl, sulfonyl		SO <sub>2</sub> <sup>•-</sup> , dioxidosulfate(•1-) SO <sub>2</sub> <sup>2-</sup> , dioxidosulfate(2-), sulfanediolate	[SO <sub>2</sub> ], dioxidosulfur SO <sub>2</sub> <sup>2-</sup> , dioxidosulfato(2-), sulfanediolato
SO <sub>3</sub>	SO <sub>3</sub> , sulfur trioxide		SO <sub>3</sub> <sup>•-</sup> , trioxidosulfate(•1-) SO <sub>3</sub> <sup>2-</sup> , trioxidosulfate(2-); sulfite –S(O) <sub>2</sub> (O), oxidodioxo-λ <sup>6</sup> -sulfanyl; sulfonato	SO <sub>3</sub> <sup>2-</sup> , trioxidosulfato(2-); sulfito
SO <sub>4</sub>	–OS(O) <sub>2</sub> O–, sulfonylbis(oxy)		SO <sub>4</sub> <sup>•-</sup> , tetraoxidosulfate(•1-) SO <sub>4</sub> <sup>2-</sup> , tetraoxidosulfate(2-); sulfate	SO <sub>4</sub> <sup>2-</sup> , tetraoxidosulfato(2-); sulfato
S <sub>2</sub> O <sub>3</sub>			S <sub>2</sub> O <sub>3</sub> <sup>•-</sup> = SO <sub>3</sub> S <sup>•-</sup> , trioxido-1κ <sup>3</sup> O-disulfate(S–S)(•1-), trioxidosulfidosulfate(•1-) S <sub>2</sub> O <sub>3</sub> <sup>2-</sup> = SO <sub>3</sub> S <sup>2-</sup> , trioxido-1κ <sup>3</sup> O-disulfate(S–S)(2-), trioxidosulfidosulfate(2-); thiosulfate, sulfurothioate	S <sub>2</sub> O <sub>3</sub> <sup>2-</sup> = SO <sub>3</sub> S <sup>2-</sup> , trioxido-1κ <sup>3</sup> O-disulfato(S–S)(2-), trioxidosulfidosulfato(2-); thiosulfato, sulfurothioato
Se	Se (general) Se, monoselenium >Se, selanediyl =Se, selanylidene; selenoxo	selenium	selenide (general) Se <sup>•-</sup> , selanidyl, selenide(•1-) Se <sup>2-</sup> , selanediide, selenide(2-); selenide	selenido (general) Se <sup>•-</sup> , selanidyl, selenido(•1-) Se <sup>2-</sup> , selanediido, selenido(2-)
SeO	SeO, selenium mon(o)oxide [SeO], oxidoselenium >SeO, seleninyl			[SeO], oxidoselenium
SeO <sub>2</sub>	SeO <sub>2</sub> , selenium dioxide [SeO <sub>2</sub> ], dioxidoselenium >SeO <sub>2</sub> , selenonyl		SeO <sub>2</sub> <sup>2-</sup> , dioxidoselenate(2-)	[SeO <sub>2</sub> ], dioxidoselenium SeO <sub>2</sub> <sup>2-</sup> , dioxidoselenato(2-)
SeO <sub>3</sub>	SeO <sub>3</sub> , selenium trioxide		SeO <sub>3</sub> <sup>•-</sup> , trioxidoselenate(•1-) SeO <sub>3</sub> <sup>2-</sup> , trioxidoselenate(2-); selenite	SeO <sub>3</sub> <sup>2-</sup> , trioxidoselenato(2-); selenito
SeO <sub>4</sub>			SeO <sub>4</sub> <sup>2-</sup> , tetraoxidoselenate(2-); selenate	SeO <sub>4</sub> <sup>2-</sup> , tetraoxidoselenato(2-); selenato
Te	tellurium >Te, tellanediyl =Te, tellanylidene; telluroxo	tellurium	telluride (general) Te <sup>•-</sup> , tellanidyl, telluride(•1-) Te <sup>2-</sup> , tellanediide, telluride(2-); telluride	tellurido (general) Te <sup>•-</sup> , tellanidyl, tellurido(•1-) Te <sup>2-</sup> , tellanediido, tellurido(2-)
CrO <sub>2</sub>	CrO <sub>2</sub> , chromium dioxide, chromium(IV) oxide			
UO <sub>2</sub>	UO <sub>2</sub> , uranium dioxide	UO <sub>2</sub> <sup>+</sup> , dioxidouranium(1+) [ <i>not</i> uranyl(1+)] UO <sub>2</sub> <sup>2+</sup> , dioxidouranium(2+) [ <i>not</i> uranyl(2+)]		

NpO <sub>2</sub>	NpO <sub>2</sub> , neptunium dioxide	NpO <sub>2</sub> <sup>+</sup> , dioxidoneptunium(1+) [not neptunyl(1+)] NpO <sub>2</sub> <sup>2+</sup> , dioxidoneptunium(2+) [not neptunyl(2+)]		
PuO <sub>2</sub>	PuO <sub>2</sub> , plutonium dioxide	PuO <sub>2</sub> <sup>+</sup> , dioxidoplutonium(1+) [not plutonyl(1+)] PuO <sub>2</sub> <sup>2+</sup> , dioxidoplutonium(2+) [not plutonyl(2+)]		
N	nitrogen N <sup>•</sup> , nitrogen(•), mononitrogen –N<, azanetriyl; nitrilo –N=, azanylylidene ≡N, azanylidyne	nitrogen (general) N <sup>+</sup> , nitrogen(1+)	nitride (general) N <sup>3-</sup> , nitride(3–), azanetriide; nitride =N <sup>–</sup> , azanidyldene; amidylidene –N <sup>2-</sup> , azanediidyl	N <sup>3-</sup> , nitrido(3–), azanetriido
N <sub>2</sub>	N <sub>2</sub> , dinitrogen =N <sup>+</sup> =N <sup>–</sup> , (azanidyldene)azani mylidene; diazo –N=N–, diazane-1,2-diylidene; hydrazinediylidene =NN=, diazene-1,2-diyl; azo	N <sub>2</sub> <sup>•+</sup> , dinitrogen(1+) N <sub>2</sub> <sup>2+</sup> , dinitrogen(2+) –N <sup>+</sup> ≡N, diazyn-1-ium-1-yl	N <sub>2</sub> <sup>2-</sup> , dinitride(2–) N <sub>2</sub> <sup>4-</sup> , dinitride(4–), diazanetraide; hydrazinetetraide	N <sub>2</sub> , dinitrogen N <sub>2</sub> <sup>2-</sup> , dinitrido(2–) N <sub>2</sub> <sup>4-</sup> , dinitrido(4–), diazanetraido; hydrazinetetraido
N <sub>3</sub>	N <sub>3</sub> <sup>•</sup> , trinitrogen(•) –N=N <sup>+</sup> =N <sup>–</sup> , azido		N <sub>3</sub> <sup>–</sup> , trinitride(1–); azide	N <sub>3</sub> <sup>–</sup> , trinitrido(1–); azido
NH	NH <sup>+</sup> , azanylidene, hydridonitrogen(2•); nitrene >NH, azanediyl =NH, azanylidene; imino	NH <sup>+</sup> , azanyliumdiyl, hydridonitrogen(1+) NH <sup>2+</sup> , azanebis(ylum), hydridonitrogen(2+)	NH <sup>–</sup> , azanidyl, hydridonitrate(1–) NH <sup>2-</sup> , azanediide, hydridonitrate(2–); imide –NH <sup>–</sup> , azanidyl; amidyl	NH <sup>2-</sup> , azanediido, hydridonitrato(2–); imido
NH <sub>2</sub>	NH <sub>2</sub> <sup>+</sup> , azanyl, dihydridonitrogen(•); aminyl –NH <sub>2</sub> , azanyl; amino	NH <sub>2</sub> <sup>+</sup> , azanylium, dihydridonitrogen(1+)	NH <sub>2</sub> <sup>–</sup> , azanide, dihydridonitrate(1–); amide	NH <sub>2</sub> <sup>–</sup> , azanido, dihydridonitrato(1–), amido
NH <sub>3</sub>	NH <sub>3</sub> , azane (parent hydride name), amine (parent name for certain organic derivatives), trihydridonitrogen; ammonia	NH <sub>3</sub> <sup>•+</sup> , azaniumyl, trihydridonitrogen(•1+) –NH <sub>3</sub> <sup>+</sup> , azaniumyl; ammonio	NH <sub>3</sub> <sup>–</sup> , azanuidyl, trihydridonitrate(•1–)	NH <sub>3</sub> , ammiane
NH <sub>4</sub>	NH <sub>4</sub> <sup>+</sup> , λ <sup>5</sup> -azanyl, tetrahydridonitrogen(•)	NH <sub>4</sub> <sup>+</sup> , azanium; ammonium		
H <sub>2</sub> NO	H <sub>2</sub> NO <sup>+</sup> , aminooxidanyl, dihydridooxidonitrogen(•); aminoxyl HONH <sup>+</sup> , hydroxyazanyl, hydridohydroxidonitrogen(•) –NH(OH), hydroxyazanyl, hydroxyamino –ONH <sub>2</sub> , aminooxy –NH <sub>2</sub> (O), oxo-λ <sup>5</sup> -azanyl; azinoyl		HONH <sup>–</sup> , hydroxyazanide, hydridohydroxidonitrate(1–) H <sub>2</sub> NO <sup>–</sup> , azanolate, aminooxidamide, dihydridooxidonitrate(1–)	NHOH <sup>–</sup> , hydroxyazanido, hydridohydroxidonitrato(1–) H <sub>2</sub> NO <sup>–</sup> , azanolato, aminooxidamido, dihydridooxidonitrato(1–)
N <sub>2</sub> H <sub>2</sub>	HN=NH, diazene –N=NH <sub>2</sub> <sup>+</sup> , diazen-2-ium-1-ide H <sub>2</sub> NN <sup>•</sup> , diazanylidene, hydrazinylidene =NNH <sub>2</sub> , diazanylidene; hydrazinylidene •HNNH <sup>•</sup> , diazane-1,2-diyl; hydrazine-1,2-diyl –HNNH–, diazane-1,2-diyl; hydrazine-1,2-diyl	HNNH <sup>2+</sup> , diazanylium	HNNH <sup>2-</sup> , diazane-1,2-diide, hydrazine-1,2-diide H <sub>2</sub> NN <sup>2-</sup> , diazane-1,1-diide, hydrazine-1,1-diide	HN=NH, diazene –N=NH <sub>2</sub> <sup>+</sup> , diazen-2-ium-1-ido HNNH <sup>2-</sup> , diazane-1,2-diido, hydrazine-1,2-diido H <sub>2</sub> NN <sup>2-</sup> , diazane-1,1-diido, hydrazine-1,1-diido

$N_2H_3$	$H_2NNH^+$ , diazanyl, trihydrido $\subset$ dinitrogen( $N-N$ )( $\bullet$ ); hydrazinyl - $NHNH_2$ , diazanyl; hydrazinyl $^2-NNH_3^+$ , diazan-2-ium-1,1-diide	$H_2N=NH^+$ , diazenium	$H_2NNH^-$ , diazanide, hydrazinide	$^2-NNH_3^+$ , diazan-2-ium-1,1-diido $H_2NNH^-$ , diazanido, hydrazinido
$N_2H_4$	$H_2NNH_2$ , diazane (parent hydride name), hydrazine (parent name for organic derivatives) - $NHNH_3^+$ , diazan-2-ium-1-ide	$H_2NNH_2^{2+}$ , diazaniumyl, bis(dihydridonitrogen) $\subset$ ( $N-N$ )( $\bullet 1+$ ); hydraziniumyl $H_2N=NH_2^{2+}$ , diazenediium		$H_2NNH_2$ , diazane, hydrazine - $NHNH_3^+$ , diazan-2-ium-1-ido

<sup>a</sup> Where an element symbol occurs in the first column, the unmodified element name is listed in the second and third columns. The unmodified name is generally used when the element appears as an electropositive constituent in the construction of a stoichiometric name (Sections IR-5.2 and IR-5.4). Names of homoatomic cations consisting of the element are also constructed using the element name, adding multiplicative prefixes and charge numbers as applicable (Sections IR-5.3.2.1 to IR-5.3.2.3). The sections mentioned refer to parts of Nomenclature of Inorganic Chemistry, IUPAC Recommendations 2005, see above.

<sup>b</sup> Where an element symbol occurs in the first column, the fourth column gives the element name appropriately modified with the ending 'ide' (hydride, nitride, etc.). The 'ide' form of the element name is generally used when the element appears as an electronegative constituent in the construction of a stoichiometric name (Sections IR-5.2 and IR-5.4). Names of homoatomic anions consisting of the element in question are also constructed using this modified form, adding multiplicative prefixes and charge numbers as applicable (Sections IR-5.3.3.1 to IR-5.3.3.3). Examples are given in the Table of names of some specific anions, e.g. chloride(1–), oxide(2–), dioxide(2–). In certain cases, a particular anion has the 'ide' form itself as an accepted short name, e.g. chloride, oxide. If specific anions are named, the 'ide' form of the element name with no further modification is given as the first entry in the fourth column, with the qualifier '(general)'. The sections mentioned refer to parts of Nomenclature of Inorganic Chemistry, IUPAC Recommendations 2005, see above.

<sup>c</sup> Ligand names must be placed within enclosing marks whenever necessary to avoid ambiguity, cf. Section IR-9.2.2.3. Some ligand names must always be enclosed. For example, if 'dioxido' is cited as is, it must be enclosed so as to distinguish it from two 'oxido' ligands; if combined with a multiplicative prefix it must be enclosed because it starts with a multiplicative prefix itself. A ligand name such as 'nitridocarbonato' must always be enclosed to avoid interpreting it as two separate ligand names, 'nitrido' and 'carbonato'. In this table, however, these enclosing marks are omitted for the sake of clarity. Note that the ligand names given here with a charge number can generally also be used without if it is not desired to make any implication regarding the charge of the ligand. For example, the ligand name '[dioxido(•1–)]' may be used if one wishes explicitly to consider the ligand to be the species dioxide(•1–), whereas the ligand name '(dioxido)' can be used if no such implications are desirable. The section mentioned refer to parts of Nomenclature of Inorganic Chemistry, IUPAC Recommendations 2005, see above.

## ORGANIC SUBSTITUENT GROUPS AND RING SYSTEMS

The first part of this table lists substituent groups and their line formulas. A substituent group is defined by IUPAC as a group that replaces one or more hydrogen atoms attached to a parent structure. Such groups are sometimes called radicals, but IUPAC now reserves the term radical for a free molecular species with unpaired electrons. IUPAC does not recommend some of these names, which are marked here with asterisks (e.g., *amyl*\*), but they are included in this list because they are often encountered in the older literature. Substituent group names which are formed

by systematic rules (e.g., methyl from methane, ethyl from ethane, etc.) are included here only for the first few members of a homologous series.

In the second part of the table a number of common organic ring compounds are shown, with the conventional numbering of the ring positions indicated.

The help of Warren H. Powell in preparing this table is greatly appreciated. Pertinent references may be found in the table "Nomenclature of Chemical Compounds."

### Substituent Groups

acetamido (acetylamino)	$\text{CH}_3\text{CONH-}$	cinnamoyl	$\text{C}_6\text{H}_5\text{CH=CHCO-}$
acetoacetyl	$\text{CH}_3\text{COCH}_2\text{CO-}$	cinnamyl (3-phenyl-2-propenyl)	$\text{C}_6\text{H}_5\text{CH=CHCH}_2\text{-}$
acetonyl	$\text{CH}_3\text{COCH}_2\text{-}$	cinnamylidene	$\text{C}_6\text{H}_5\text{CH=CHCH=}$
acetyl	$\text{CH}_3\text{CO-}$	cresyl* (hydroxymethylphenyl)	$\text{HO}(\text{CH}_2)\text{C}_6\text{H}_4\text{-}$
acryloyl* (1-oxo-2-propenyl)	$\text{CH}_2=\text{CHCO-}$	crotonoyl	$\text{CH}_3\text{CH=CHCO-}$
alanyl (from alanine)	$\text{CH}_3\text{CH}(\text{NH}_2)\text{CO-}$	crotyl (2-butenyl)	$\text{CH}_3\text{CH=CHCH}_2\text{-}$
$\beta$ -alanyl	$\text{H}_2\text{N}(\text{CH}_2)_2\text{CO-}$	cyanamido (cyanoamino)	$\text{NCNH-}$
allyl (2-propenyl)	$\text{CH}_2=\text{CHCH}_2\text{-}$	cyanato	$\text{NCO-}$
allylidene (2-propenylidene)	$\text{CH}_2=\text{CHCH=}$	cyano	$\text{NC-}$
amidino (aminoiminomethyl)	$\text{H}_2\text{NC(=NH)-}$	decanedioyl	$-\text{OC}(\text{CH}_2)_8\text{CO-}$
amino	$\text{H}_2\text{N-}$	decanoyl	$\text{CH}_3(\text{CH}_2)_8\text{CO-}$
amyl* (pentyl)	$\text{CH}_3(\text{CH}_2)_4\text{-}$	dialzo	$\text{N}_2=$
anilino (phenylamino)	$\text{C}_6\text{H}_5\text{NH-}$	diazooamino	$-\text{NHN=N-}$
anisidino	$\text{CH}_3\text{OC}_6\text{H}_4\text{NH-}$	disilanyl	$\text{H}_3\text{SiSiH}_2\text{-}$
anthranoyl (2-aminobenzoyl)	$2\text{-H}_2\text{NC}_6\text{H}_4\text{CO-}$	disiloxanyloxy	$\text{H}_3\text{SiOSiH}_2\text{O-}$
arsino	$\text{AsH}_2\text{-}$	disulfinyl	$-\text{S}(\text{O})\text{S}(\text{O})\text{-}$
azelaoyl (from azelaic acid)	$-\text{OC}(\text{CH}_2)_7\text{CO-}$	dithio	$-\text{SS-}$
azido	$\text{N}_3\text{-}$	enantioyl* (heptanoyl)	$\text{CH}_3(\text{CH}_2)_5\text{CO-}$
azino	$=\text{N=N=}$	epoxy	$-\text{O-}$
azo	$-\text{N=N-}$	ethenyl (vinyl)	$\text{CH}_2=\text{CH-}$
azoxy	$-\text{N}(\text{O})=\text{N-}$	ethynyl	$\text{HC}\equiv\text{C-}$
benzal* (benzylidene)	$\text{C}_6\text{H}_5\text{CH=}$	ethoxy	$\text{C}_2\text{H}_5\text{O-}$
benzamido (benzoylamino)	$\text{C}_6\text{H}_5\text{CONH-}$	ethyl	$\text{CH}_3\text{CH}_2\text{-}$
benzhydryl (diphenylmethyl)	$(\text{C}_6\text{H}_5)_2\text{CH-}$	ethylene	$-\text{CH}_2\text{CH}_2\text{-}$
benzoxy* (benzoyloxy)	$\text{C}_6\text{H}_5\text{COO-}$	ethylidene	$\text{CH}_3\text{CH=}$
benzoyl	$\text{C}_6\text{H}_5\text{CO-}$	ethylthio	$\text{C}_2\text{H}_5\text{S-}$
benzyl	$\text{C}_6\text{H}_5\text{CH}_2\text{-}$	formamido (formylamino)	$\text{HCONH-}$
benzylidene	$\text{C}_6\text{H}_5\text{CH=}$	formyl	$\text{HCO-}$
benzylidyne	$\text{C}_6\text{H}_5\text{C=}$	furmaroyl (from fumaric acid)	$-\text{OCCH=CHCO-}$
biphenyl	$\text{C}_6\text{H}_5\text{C}_6\text{H}_5\text{-}$	furfuryl (2-furanylmethyl)	$\text{OC}_4\text{H}_3\text{CH}_2\text{-}$
biphenylene	$-\text{C}_6\text{H}_4\text{-C}_6\text{H}_4\text{-}$	furfurylidene (2-furanylmethylene)	$\text{OC}_4\text{H}_3\text{CH=}$
butoxy	$\text{C}_4\text{H}_9\text{O-}$	glutamoyl (from glutamic acid)	$-\text{OC}(\text{CH}_2)_2\text{CH}(\text{NH}_2)\text{CO-}$
<i>sec</i> -butoxy (1-methylpropoxy)	$\text{C}_2\text{H}_5\text{CH}(\text{CH}_3)\text{O-}$	glutaryl (from glutaric acid)	$-\text{OC}(\text{CH}_2)_3\text{CO-}$
<i>tert</i> -butoxy (1,1-dimethylethoxy)	$(\text{CH}_3)_3\text{CO-}$	glycylamino	$\text{H}_2\text{NCH}_2\text{CONH-}$
butyl	$\text{CH}_3(\text{CH}_2)_3\text{-}$	glycoloyl; glycolyl (hydroxyacetyl)	$\text{HOCH}_2\text{CO-}$
<i>sec</i> -butyl (1-methylpropyl)	$\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{-}$	glycyl (aminoacetyl)	$\text{H}_2\text{NCH}_2\text{CO-}$
<i>tert</i> -butyl (1,1-dimethylethyl)	$(\text{CH}_3)_3\text{C-}$	glyoxyloyl; glyoxylyl (oxoacetyl)	$\text{HCOCO-}$
butyryl (1-oxobutyl)	$\text{CH}_3(\text{CH}_2)_2\text{CO-}$	guanidino	$\text{H}_2\text{NC(=NH)NH-}$
caproyl* (hexanoyl)	$\text{CH}_3(\text{CH}_2)_4\text{CO-}$	guanyl (aminoiminomethyl)	$\text{H}_2\text{NC(=NH)-}$
capryl* (decanoyl)	$\text{CH}_3(\text{CH}_2)_8\text{CO-}$	heptadecanoyl	$\text{CH}_3(\text{CH}_2)_{15}\text{CO-}$
capryloyl* (octanoyl)	$\text{CH}_3(\text{CH}_2)_6\text{CO-}$	heptanamido	$\text{CH}_3(\text{CH}_2)_5\text{CONH-}$

levulinoyl (from levulinic acid)	CH <sub>3</sub> CO(CH <sub>2</sub> ) <sub>2</sub> CO-	suberoyl (from suberic acid)	-OC(CH <sub>2</sub> ) <sub>6</sub> CO-
malonyl (from malonic acid)	-OCCH <sub>2</sub> CO-	succinyl (from succinic acid)	-OCCH <sub>2</sub> CH <sub>2</sub> CO-
mandeloyl (from mandelic acid)	C <sub>6</sub> H <sub>5</sub> CH(OH)CO-	sulfamino (sulfoamino)	HOSO <sub>2</sub> NH-
mercapto	HS-	sulfamoyl (sulfamyl)	H <sub>2</sub> NSO <sub>2</sub> -
mesityl	2,4,6-(CH <sub>3</sub> ) <sub>3</sub> C <sub>6</sub> H <sub>2</sub> -	sulfanilyl [(4-aminophenyl)sulfonyl]	4-H <sub>2</sub> NC <sub>6</sub> H <sub>4</sub> SO <sub>2</sub> -
methacryloyl (from methacrylic acid)	CH <sub>2</sub> =C(CH <sub>3</sub> )CO-	sulfeno	HOS-
methallyl (2-methyl-2-propenyl)	CH <sub>2</sub> =C(CH <sub>3</sub> )CH <sub>2</sub> -	sulfhydryl (mercapto)	HS-
methionyl (from methionine)	CH <sub>3</sub> SCH <sub>2</sub> CH <sub>2</sub> CH(NH <sub>2</sub> )CO-	sulfinyl	OS=
methoxy	CH <sub>3</sub> O-	sulfo	HO <sub>3</sub> S-
methyl	H <sub>3</sub> C-	sulfonyl (sulfuryl)	-SO <sub>2</sub> -
methylene	H <sub>2</sub> C=	terephthaloyl	1,4-C <sub>6</sub> H <sub>4</sub> (CO) <sub>2</sub>
methylthio	CH <sub>3</sub> S-	tetramethylene	-(CH <sub>2</sub> ) <sub>4</sub> -
myristoyl (from myristic acid)	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>12</sub> CO-	thienyl (from thiophene)	(C <sub>4</sub> H <sub>3</sub> S)-
myristyl (tetradecyl)	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>13</sub> -	thiocarbonyl (carbothionyl)	=CS
naphthyl	(C <sub>10</sub> H <sub>7</sub> )-	thiocarboxy	HOSC-
naphthylene	-(C <sub>10</sub> H <sub>6</sub> )-	thiocyanato (thiocyano)	NCS-
neopentyl (2,2-dimethylpropyl)	(CH <sub>3</sub> ) <sub>3</sub> CCH <sub>2</sub> -	thionyl* (sulfinyl)	-SO-
nitramino (nitroamino)	O <sub>2</sub> NNH-	threonyl (from threonine)	CH <sub>3</sub> CH(OH)CH(NH <sub>2</sub> )CO-
nitro	O <sub>2</sub> N-	toluidino [(methylphenyl)amino]	CH <sub>3</sub> C <sub>6</sub> H <sub>4</sub> NH-
nitrosamino (nitrosoamino)	ONNH-	toluoyl (methylbenzoyl)	CH <sub>3</sub> C <sub>6</sub> H <sub>4</sub> CO-
nitrosimino (nitrosoimino)	ONN=	tolyl (methylphenyl)	CH <sub>3</sub> C <sub>6</sub> H <sub>4</sub> -
nitroso	ON-	α-tolyl (benzyl)	C <sub>6</sub> H <sub>5</sub> CH <sub>2</sub> -
nonanoyl (from nonanoic acid)	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>7</sub> CO-	tolyene (methylphenylene)	-(CH <sub>2</sub> C <sub>6</sub> H <sub>3</sub> )-
oleoyl (from oleic acid)	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>7</sub> CH=CH(CH <sub>2</sub> ) <sub>7</sub> CO-	tosyl [(4-methylphenyl) sulfonyl]	4-CH <sub>3</sub> C <sub>6</sub> H <sub>4</sub> SO <sub>2</sub> -
oxalyl (from oxalic acid)	-OCCO-	triazano	H <sub>2</sub> NNHNH-
oxo	O=	trimethylene (1,3-propanediyl)	-(CH <sub>2</sub> ) <sub>3</sub> -
palmitoyl (from palmitic acid)	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>14</sub> CO-	trityl (triphenylmethyl)	(C <sub>6</sub> H <sub>5</sub> ) <sub>3</sub> C-
pentamethylene (1,5-pentanediy)	-(CH <sub>2</sub> ) <sub>5</sub> -	valeryl* (pentanoyl)	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>3</sub> CO-
pentyl	CH <sub>3</sub> (CH <sub>2</sub> ) <sub>4</sub> -	valyl (from valine)	(CH <sub>3</sub> ) <sub>2</sub> CHCH(NH <sub>2</sub> )CO-
tert-pentyl	CH <sub>3</sub> CH <sub>2</sub> C(CH <sub>3</sub> ) <sub>2</sub> -	vinyl (ethenyl)	CH <sub>2</sub> =CH-
phenacyl	C <sub>6</sub> H <sub>5</sub> COCH <sub>2</sub> -	vinylidene (ethenylidene)	CH <sub>2</sub> =C=
phenacylidene	C <sub>6</sub> H <sub>5</sub> COCH=	xylydino [(dimethylphenyl)amino]	(CH <sub>3</sub> ) <sub>2</sub> C <sub>6</sub> H <sub>3</sub> NH-
phenethyl (2-phenylethyl)	C <sub>6</sub> H <sub>5</sub> CH <sub>2</sub> CH <sub>2</sub> -	xylyl (dimethylphenyl)	(CH <sub>3</sub> ) <sub>2</sub> C <sub>6</sub> H <sub>3</sub> -
phenoxy	C <sub>6</sub> H <sub>5</sub> O-	xylylene [phenylenebis(methylene)]	-CH <sub>2</sub> C <sub>6</sub> H <sub>4</sub> CH <sub>2</sub> -
phenyl	C <sub>6</sub> H <sub>5</sub> -		

## Organic Ring Compounds

Benzoxazole

2,1-Benzisoxazole

Naphthalene

1,2,3,4-Tetrahydronaphthalene  
(Tetralin)Octahydronaphthalene  
(Decalin)2H-1-Benzopyran  
(2H-Chromene)2H-1-Benzopyran-2-one  
(Coumarin)4H-1-Benzopyran-4-one  
(Chromen-4-one)1H-2-Benzopyran-1-one  
(Isocoumarin)3H-2-Benzopyran-1-one  
(Isochromen-3-one)

Quinoline

Isoquinoline

Cinnoline

Quinazoline

1,8-Naphthyridine

1,7-Naphthyridine

1,5-Naphthyridine

1,6-Naphthyridine

2H-1,3-Benzoxazine

2H-1,4-Benzoxazine

1H-2,3-Benzoxazine

4H-3,1-Benzoxazine

2H-1,2-Benzoxazine

4H-1,4-Benzoxazine

Anthracene

Phenanthrene

Phenalene

Fluorene

Carbazole

Xanthene

Acridine

Norpinane  
(Bicyclo[3.1.1]heptane)

7H-Purine

Steroid ring system

R = Nearly always methyl  
 R' = Usually methyl  
 R'' = Various groups

## SCIENTIFIC ABBREVIATIONS, ACRONYMS, AND SYMBOLS

This table lists some abbreviations, acronyms, and symbols encountered in the physical sciences. Most entries in italic type are symbols for physical quantities; for more details on these, see the table “Symbols and Terminology for Physical and Chemical Quantities” in this section. Additional information on units may be found in the table “International System of Units (SI)” in Section 1. Many of the terms to which these abbreviations refer are included in the tables “Definitions of Scientific Terms” in Section 2 and “Techniques for Materials Characterization” in Section 12. Useful references for further information are given below.

Publication practices vary with regard to the use of capital or lower case letters for many abbreviations. An effort has been made to follow the most common practices in this table, but much variation is found in the literature. Likewise, policies on the use of periods in an abbreviation vary considerably. Periods are generally omitted in this table unless they are necessary for clarity. Periods should never appear in SI units. The SI prefixes (m, k, M, etc.) are included here, but they should never be used alone. Selected combinations of these prefixes with SI units (e.g., mg, kV, MW) are also included.

Abbreviations are listed in alphabetical order without regard to case. Entries beginning with Greek letters fall at the end of the table.

A	ampere; alanine; adenine (in genetic code)
Å	ångström
A	absorbance; area; Helmholtz energy; mass number
$A_H$	Hall coefficient
$A_r$	atomic weight (relative atomic mass)
a	atto (SI prefix for $10^{-18}$ )
$\alpha$	absorption coefficient; acceleration; activity; van der Waals constant
$a_0$	Bohr radius
A/D	analog to digital
AAA	acetoacetanilide
Aad	2-aminoadipic acid
AAO	acetaldehyde oxime
AAS	atomic absorption spectroscopy
ABA	abscisic acid
Abe	abequose
ABL	$\alpha$ -acetylbutyrolactone
abs	absolute
Abu	2-aminobutanoic acid
Ac	acetyl; acetate
ac, AC	alternating current
Aces	2-[(2-amino-2-oxoethyl)amino]ethanesulfonic acid
ACT	activated complex theory
ACTH	adrenocorticotrophic hormone
Ad	adamantyl
Ada	[(carbamoylmethyl)imino]diacetic acid
Ade	adenine
ADI	acceptable daily intake
Ado	adenosine
ADP	adenosine diphosphate; ammonium dihydrogen phosphate
ads	adsorption
AE	appearance energy

ae	eon ( $10^9$ years)
AEP	1-(2-aminoethyl)piperazine
AES	atomic emission spectroscopy; Auger electron spectroscopy
AF	audio frequency
AFM	atomic force microscopy
Ahx	2-aminohexanoic acid
AI	artificial intelligence
AIBN	2,2'-azobis[isobutyronitrile]
AICA	5-amino-1H-imidazole-4-carboxamide
AIM	atoms in molecules (method)
AIP	aluminum isopropoxide
Al	Alfén number
Ala	alanine
alc	alcohol
ALE	atomic layer epitaxy
aliph.	aliphatic
alk.	alkaline
All	allose
Alt	altrose
AM	amplitude modulation
Am	amyl
am	amorphous solid
AMP	adenosine monophosphate
AMPD	2-amino-2-methyl-1,3-propanediol
AMTCS	amyltrichlorosilane [trichloropentylsilane]
AMS	accelerator mass spectrometry
amu	atomic mass unit (recommended symbol is u)
AN	acetonitrile
anh, anhyd	anhydrous
ANOVA	analysis of variance
antilog	antilogarithm
ANTU	1-naphthalenylthiourea

AO	atomic orbital	Bé	Baumé
AOM	angular overlap model	BEBO	bond energy bond order (method)
APAD	3-acetylpyridine adenine dinucleotide	BEI	biological exposure index
Ape	2-aminopentanoic acid	BEM	biological effect monitoring
API	atmospheric pressure ionization	Bes	2-[bis(2-hydroxyethyl)amino]ethanesulfonic acid
Api	apiose	BET	Brunauer–Emmett–Teller (isotherm)
APM	atomic probe microanalysis	BeV	billion electronvolt
Apm	2-aminopimelic acid	BGE	butyl glycidyl ether
APPI	atmospheric pressure photoionization	BHA	<i>tert</i> -butyl-4-hydroxyanisole
APS	appearance potential spectroscopy; adenosine phosphosulfate	BHC	benzene hexachloride [hexachlorobenzene]
APW	augmented plane wave	Bhn	Brinell hardness number
aq	aqueous	BHT	butylated hydroxytoluene [2,6-di- <i>tert</i> -butyl-4-methylphenol]
Ar	aryl	Bi	biot
Ara	arabinose	Bicine	<i>N,N</i> -bis(2-hydroxyethyl)glycine
Ara-ol	arabinitol	BIRD	blackbody infrared radiative dissociation
Arg	arginine	Bistris	2-[bis(2-hydroxyethyl)amino]-2-(hydroxymethyl)propane-1,3-diol
ARPES	angular resolved photoelectron spectroscopy	Bistris-propane	1,3-bis[tris(hydroxymethyl)methylamino]propane
ASC	4-(acetylamino)benzenesulfonyl chloride	BLO	$\gamma$ -butyrolactone
ASCII	American National Standard Code for Information Interchange	BN	bond number; benzonitrile
ASE	aromatic stabilization model	BNS	nuclear backscattering spectroscopy
Asn	asparagine	BO	Born–Oppenheimer (approximation); bond order
Asp	aspartic acid	BOD	biochemical oxygen demand
at	atomization	BON	$\beta$ -hydroxynaphthoic acid
ATEE	<i>N</i> -acetyl- <i>L</i> -tyrosine ethyl ester	BP	base peak (in mass spectrometry)
ATLC	adsorption thin layer chromatography	bp	boiling point; base pair
atm	standard atmosphere	BPB	bromophenol blue
ATP	adenosine triphosphate	BPG	2,3-bis(phospho)- <i>D</i> -glycerate
ATR	attenuated total internal reflection	bpy	2,2'-bipyridine
at.wt.	atomic weight	Bq	becquerel
AU	astronomical unit (ua is also used)	Br	butyryl
AUC	area under the time-concentration curve	BRE	bond resonance energy
av	average	BrUrd	5-bromouridine
avdp	avoidrupois	BS	Birge–Sponer extrapolation
B	bel; asparagine or aspartic acid (unspecified)	BSE	back scattered electron(s)
<i>B</i>	magnetic flux density; second virial coefficient; susceptibility	BSSE	basis set superposition error
b	barn	BTMSA	1,2-bis(trimethylsilyl)acetylene
<i>b</i>	van der Waals constant; molality	Btu	British thermal unit
BA	benzyladenine	BTX	benzene, toluene, and xylene
BAL	British anti-Lewisite [2,3-dimercapto-1-propanol]	Bu	butyl
BAP, BaP	benzo[a]pyrene	bu	bushel
bar	bar (pressure unit)	Bz	benzoyl
bb1	barrel	Bzl	benzyl
BBP	benzyl butyl phthalate	C	coulomb; cysteine; cytosine (in genetic code)
BCB	bromocresol blue	°C	degree Celsius
bcc	body centered cubic	C	capacitance; heat capacity; number concentration
BCF	bioconcentration factor	c	centi (SI prefix for 10 <sup>-2</sup> ); combustion reaction
BCG	bromocresol green	<i>c</i>	amount concentration; specific heat; velocity
BCNU	<i>N,N'</i> -bis(2-chloroethyl)- <i>N</i> -nitrosourea	<i>c</i> <sub>0</sub>	speed of light in vacuum
BCP	bromocresol purple	CA	collisional activation
BCPB	bromochlorophenol blue	ca.	approximately
BCS	Bardeen–Cooper–Schrieffer (theory)	CADD	computer-assisted drug design
BDE	bond dissociation energy	cal	calorie
BDEA	butyldiethanolamine	calc	calculated
BDMA	benzyl dimethylamine	cAMP	adenosine cyclic 3',5'-(hydrogen phosphate)

CAN	ceric ammonium nitrate	COSY	correlation spectroscopy
CARS	coherent anti-Stokes Raman spectroscopy	COT	1,3,5,7-cyclooctatetraene
CAS	complete active space	cot	cotangent
CASRN	Chemical Abstracts Service Registry Number	coth	hyperbolic cotangent
CAT	computerized axial tomography; clear air turbulence	CP	chemically pure
CBE	chemical beam epitaxy	Cp	cyclopentadienyl
CBS	complete basis set (of orbitals)	Cp*	pentamethylcyclopentadienyl
CC	coupled cluster; combustion calorimetry	cP	centipoise
cc	cubic centimeter	cp	candle power
CCD	charge-coupled device	CPA	coherent potential approximation
CD	circular dichroism	CPC	centrifugal partition chromatography
cd	candela; condensed (phase)	cpd	contact potential difference
CDNO	complete neglect of differential overlap	CPL	circular polarization of luminescence
CDP	cytidine 5'-diphosphate	CPR	chlorophenol red
CDT	1,5,9-cyclododecatriene	cps	cycles per second
CDTA	(1,2-cyclohexylenedinitrilo)tetraacetic acid monohydrate	CPT	charge conjugation/space inversion/time inversion (theorem)
CDW	charge density waves	CPU	central processing unit
CEM	channel electron multiplier	cr, cryst	crystalline (phase)
CEP	counter electrophoresis	CRF	charge remote fragmentation
CEPA	coupled electron-pair approximation	CRU	constitutional repeating unit (in polymer nomenclature)
cf.	compare	CSA	camphorsulfonic acid
CFC	chlorofluorocarbon compound	csc	cosecant
cfm	cubic feet per minute	CSR	charge stripping reaction
cgs	centimeter-gram-second system	CT	charge transfer
Chaps	3-[3-(cholamidopropyl)dimethylammonio]-1-propanesulfonic acid	ct	carat
Ches	2-( <i>N</i> -cyclohexylamino)ethanesulfonic acid	CTEM	conventional transmission electron microscopy
CHF	coupled Hartree-Fock (method)	CTP	cytidine 5'-triphosphate
Chl	chlorophyll	CTR	controlled thermonuclear reaction
Cho	choline	cu	cubic
CHT	1,3,5-cycloheptatriene	CV	cyclic voltammetry
Ci	curie	CVD	chemical vapor deposition
CI	configuration interaction; chemical ionization; color index	cw	continuous wave
CID	charge-injection device; collision-induced dissociation	cwt	hundredweight (112 pounds)
CIDEP	chemically induced dynamic electron polarization	Cy	cyclohexyl
CIDNP	chemically induced dynamic nuclear polarization	Cya	cysteic acid
CIE	countercurrent immunoelectrophoresis	Cyd	cytidine
cir	circular	cyl	cylinder
CKFF	Cotton-Kraihanzel force field	Cys	cysteine
CL	cathode luminescence (spectroscopy)	Cyt	cytosine
CLT	central limit theorem	D	debye unit; aspartic acid
cm	centimeter	<i>D</i>	diffusion coefficient; dissociation energy; electric displacement
c.m.	center of mass	d	day; deuteron; deci (SI prefix for 10 <sup>-1</sup> )
c.m.c.	critical micelle concentration	<i>d</i>	distance; density; dextrorotatory
CMO	canonical molecular orbital	2,4-D	2,4-dichlorophenoxyacetic acid
CMP	cytidine 5'-monophosphate; chemical measurement process	D/A	digital to analog
CN	coordination number	Da	dalton
CNDO	complete neglect of differential overlap	DA	donor-acceptor (complex)
<i>Co</i>	Cowling number	da	deka (SI prefix for 10 <sup>1</sup> )
COD	chemical oxygen demand; 1,4-cyclooctadiene	DAA	diacetone alcohol
conc	concentrated; concentration	DAB	4-(dimethylamino)azobenzene
const	constant	Dab	2,4-diaminobutanoic acid
COOP	crystal orbital overlap population	DACH	<i>trans</i> -1,2-diaminocyclohexane
cos	cosine	DAP	diammonium phosphate
cosh	hyperbolic cosine	DART	direct analysis in real-time mass spectrometry

dB	decibel	DRE	Dewar resonance energy
DBA	dibenz[a,h]anthracene	dRib	2-deoxyribose
DBCP	1,2-dibromo-3-chloropropane	DRIFT	diffuse reflectance infrared Fourier transform
DBMS	database management system	DRP	dynamic reaction path
DBP	dibutyl phthalate	DRS	diffuse reflectance spectroscopy
DBPC	2,6-di- <i>tert</i> -butyl- <i>p</i> -cresol	DSC	differential scanning calorimetry
dc, DC	direct current	DTA	differential thermal analysis
DCB	dicyanobenzene	DTBP	di- <i>tert</i> -butyl peroxide
DCEE	dichloroethyl ether	DVB	divinylbenzene
DCHA	dicyclohexylamine	dyn	dyne
DCM	dichloromethane	DZ	double-zeta (type of basis set)
DCPD	dicyclopentadiene	E	exa (SI prefix for 10 <sup>18</sup> ); glutamic acid
DE	delocalization energy; delayed extraction	<i>E</i>	electric field strength; electromotive force; energy; modulus of elasticity; entgegen ( <i>trans</i> configuration)
Dec	decyl	<i>E<sub>h</sub></i>	Hartree energy
dec	decomposes	e	electron; base of natural logarithms
DEET	diethyltoluamide [ <i>N,N</i> -diethyl-3-methylbenzamide]	<i>e</i>	elementary charge; linear strain
deg	degree	EA	electron affinity
den	density	EAN	effective atomic number
DESI	desorption electrospray ionization (in mass spectrometry)	ECD	electron capture dissociation
det	determinant	ECP	effective core potential
dev	deviation	ECR	electron cyclotron resonance
DFT	density functional theory	ED	electron diffraction
dGlc	2-deoxyglucose	EDAX	energy dispersive analysis by x-rays
DHH	dehydroheliotridine	EDB	ethylene dibromide [1,2-dibromoethane]
DHU	dihydrouridine	EDC	ethylene dichloride [1,2-dichloroethane]
DHR	dehydroretroecine	EDI	estimated daily intake
DI	desorption ionization	EDS	energy-dispersive x-ray spectroscopy
diam	diameter	EDTA	ethylenediaminetetraacetic acid
dil	dilute; dilution	EEDQ	ethyl 2-ethoxy-1-(2 <i>H</i> )-quinolinecarboxylate
DIM	diatomics in molecules (method); digital imaging microscopy	EEL	environmental exposure level
dm	decimeter	EELS	electron energy loss spectroscopy
DMA	<i>N,N</i> -dimethylaniline	EES	excitation emission spectrum
DMAC	<i>N,N</i> -dimethylacetamide	EFF	empirical force field
DBMC	2,4-di- <i>tert</i> -butyl-5-methylphenol	EFFF	energy factored force field
DBP	2,3-dibromo-1-propanol	EG	equilibrium in the gas phase
DMF	<i>N,N</i> -dimethylformamide	EGA	evolved gas analysis
DMP	dimethyl phthalate	EHMO, EHT	extended Hückel molecular orbital (theory)
DMS	dimethyl sulfide	EIMS	electron impact mass spectrometry
DMSO	dimethyl sulfoxide	EIS	electron impact spectroscopy; electrochemical impedance spectroscopy
DMT	dimethyl terephthalate; dimethyl tartrate	ELISA	enzyme-linked immunosorbent assay
DN	donor number	ELS	energy loss spectroscopy
DNA	deoxyribonucleic acid	EM	extended molarity; electron microscopy
DNase	deoxyribonuclease	emf	electromotive force
DNMR	dynamic NMR spectroscopy	EMPA, EMA	electron probe microanalysis
DNP	dinitropyrene	emu	electromagnetic unit system
Dod	dodecyl	en	ethylenediamine
DOP	dioctyl phthalate	ENDOR	electron-nuclear double resonance
DOS	density of states; digital operating system	EOS	equation of state
doz	dozen	EPDS	electron photodetachment spectroscopy
d.p.	degree of polymerization	EPR	electron paramagnetic resonance
dpl	displacement	EPT-76	provisional low temperature scale of 1976
Dpm	2,6-diaminopimelic acid	EPTC	dipropylcarbamoithioic acid, <i>S</i> -ethyl ester
dpm	disintegrations per minute	EPXMA	electron probe x-ray microanalysis
dps	disintegrations per second	eq, eqn	equation
dr	dram		

<i>eqQ</i>	quadrupole coupling constant	ft	foot
erf	error function	ft-lb	foot pound
erg	erg (energy unit)	FTIR	Fourier transform infrared spectroscopy
ES	equilibrium in solution	FTMS	Fourier transform mass spectrometry
ESA	electrostatic energy analyzer	FTNMR	Fourier transform nuclear magnetic resonance
ESCA	electron spectroscopy for chemical analysis	fus	fusion (melting)
ESD	electron stimulated desorption	FVP	flash vacuum pyrolysis
e.s.d.	estimated standard deviation	FWHM	full width at half maximum
ESI	electrospray ionization	G	Gauss; guanine (in genetic code); giga (SI prefix for 10 <sup>9</sup> ); glycine
ESR	electron spin resonance	<i>G</i>	electrical conductance; Gibbs energy; gravitational constant; sheer modulus
est	estimated	g	gram; gas (phase)
esu	electrostatic unit system	<i>g</i>	acceleration due to gravity; degeneracy; Landé <i>g</i> -factor; statistical weight
ET	ephemeris time; electron transfer	GABA	γ-aminobutyric acid
Et	ethyl	Gal	gal; galactose
Etn	ethanolamine	gal	gallon
ETS	electron tunneling spectroscopy	GalN	galactosamine
<i>Eu</i>	Euler number	GB	gas-phase basicity
e.u.	entropy unit	GC	gas chromatography
eV	electronvolt	GC-MS	gas chromatography-mass spectrometry
EXAFS	extended x-ray absorption fine structure (spectroscopy)	GDMS	glow discharge mass spectroscopy
EXELFS	extended energy loss fine structure	GDP	guanosine 5'-diphosphate
exp	exponential function	<i>gem</i>	geminal (on the same carbon atom)
expt	experimental	GeV	gigaelectronvolt
ext	external	GIAO	gauge invariant atomic orbital
F	farad; phenylalanine	GIBMS	guided ion beam mass spectrometry
°F	degree Fahrenheit	gl	glacial
<i>F</i>	Faraday constant; force; angular momentum	Gla	4-carboxyglutamic acid
<i>f</i>	formation reaction; femto (SI prefix for 10 <sup>-15</sup> )	GLC	gas-liquid chromatography
<i>f</i>	activity coefficient; aperture ratio; focal length; force constant; frequency; fugacity	Glc	glucose
FAB	fast atom bombardment	GlcA	gluconic acid
FAD	flavine adenine dinucleotide	GlcN	glucosamine
FAIMS	high-field asymmetric waveform ion mobility spectrometry	GlcNAc	<i>N</i> -acetylglucosamine
FA-SIFT	flowing afterglow – selected ion-flow tube	GLP	good laboratory practice
fcc	face centered cubic	GlcU	glucuronic acid
FD	field desorption	Gln	glutamine
FEL	free electron laser	Glu	glutamic acid
FEM	field emission microscopy	Gly	glycine
FEMO	free electron molecular orbital	Glx	glutamine or glutamic acid (unspecified)
FET	field effect transistor	GMP	guanosine 5'-monophosphate
fid	free induction decay	GMT	Greenwich mean time
FI	field ionization	GPC	gel-permeation chromatography
FIM	field ion microscopy	gpm	gallons per minute
FIR	far infrared	gps	gallon per second
fl	fluid (phase)	<i>Gr</i>	Grashof number
FM	frequency modulation	gr	grain
<i>Fo</i>	Fourier number	Gra	glyceraldehyde
fp	freezing point	Gri	glyceric acid
fpm	feet per minute	Grn	glycerone [dihydroxyacetone]
fps	feet per second; foot-pound-second system	Gro	glycerol
Fr	franklin	GTO	Gaussian-type orbital
<i>Fr</i>	Froude number	GTP	guanosine 5'-triphosphate
Fru	fructose	Gua	guanine
FSGO	floating spherical Gaussian orbitals	Gul	gulose
FT	Fourier transform	Guo	guanosine

GUT	grand unified theory	I/O	input/output
GVB	generalized valence bond (method)	IAT	international atomic time
GWS	Glashow–Weinberg–Salam (theory)	IC	integrated circuit
Gy	gray; gigayear	ICD	induced circular dichroism
H	henry; histidine	ICP	inductive-coupled plasma
<i>H</i>	enthalpy; Hamiltonian function; magnetic field	ICR	ion cyclotron resonance
$H_0$	Hubble constant	ICVTST	improved canonical variational transition-state theory
h	helion; hour; hecto (SI prefix for $10^2$ )	ID	inside diameter
<i>h</i>	Planck constant	id	ideal (solution)
<i>Ha</i>	Hartmann number	Ido	iodose
ha	hectare	IdoA	iduronic acid
HAM	hydrogenic atoms in molecules	IDP	inosine 5'-diphosphate
hav	haversine	IE	ionization energy
Hb	hemoglobin	i.e.p.	isoelectric point
HCA	heterocyclic amine	IEPA	independent electron pair approximation
hcp	hexagonal closed packed	IF	intermediate frequency
Hcy	homocysteine	IGLO	individual gauge for localized orbitals
HDL	high-density lipoprotein	IKES	ion kinetic energy spectrometry
HDS	hydrodesulfurization	Ile	isoleucine
HEIS	high-energy ion scattering	Im	imaginary part
HEP	high energy physics	IMFP	inelastic mean free path (of electrons)
Hepes	4-(2-hydroxyethyl)-1-piperazineethanesulfonic acid	imm	immersion
Hepps	4-(2-hydroxyethyl)-1-piperazinepropanesulfonic acid	IMP	inosine 5'-monophosphate
HF	high frequency; Hartree–Fock (method)	IMPATT	impact ionization avalanche transit time
HFA	hexafluoroacetone	IMS	ion mobility spectrometry
HFO	Hartree–Fock orbital	in.	inch
hfs	hyperfine structure	InChI	IUPAC International Chemical Identifier
His	histidine	INDO	immediate neglect of differential overlap
HMO	Hückel molecular orbital	Ino	inosine
HMX	cyclotetramethylenetetranitramine	INS	inelastic neutron scattering; ion neutralization spectroscopy
HN1	2-chloro- <i>N</i> -(2-chloroethyl)- <i>N</i> -ethylethanamine	Ins	<i>myo</i> -inositol
HOAc	acetic acid	int	internal
HOC	halogenated organic compound(s)	IP	ionization potential
HOMAS	harmonic oscillator model of aromatic stabilization	IPA	isopropyl alcohol
HOMO	highest occupied molecular orbital	IPMA	ion probe microanalysis
HOSE	harmonic oscillator stabilization energy	IPN	interpenetrating polymer network
Hp	heptyl	IPR	isotope perturbation of resonance
hp	horsepower	IPTS	International Practical Temperature Scale
HPLC	high-performance liquid chromatography	IQ	2-amino-3-methyl-3 <i>H</i> -imidazo(4,5- <i>f</i> )quinoline
HPMS	high pressure mass spectrometry	IR	infrared
HQ	<i>p</i> -hydroquinone	IRAS	infrared reflection-absorption spectroscopy
hr	hour	IRC	intrinsic reaction coordinate
HRE	Hückel resonance energy	IRMPD	infrared multiphoton dissociation
HREELS	high resolution electron energy loss spectroscopy	IRMS	isotope ratio mass spectrometry
HREM	high resolution electron microscopy	IRS	infrared spectroscopy
HSAB	hard-soft acid-base (theory)	isc	intersystem crossing
HSE	homodesmotic stabilization energy	ISE	ion-selective electrode;isodesmic stabilization energy
Hse	homoserine	ISS	ion scattering spectroscopy
Hx	hexyl	IT	ion trap; information technology
Hyl	5-hydroxylysine	ITP	inosine 5'-triphosphate
Hyp	hypoxanthine; 4-hydroxyproline	ITS	International Temperature Scale (1990)
Hz	hertz	IU	international unit
I	isoleucine; inositol	J	joule; leucine or isoleucine (unspecified)
<i>I</i>	electric current; ionic strength; moment of inertia; nuclear spin angular momentum; radiant intensity	<i>J</i>	angular momentum; electric current density; flux; Massieu function
<i>i</i>	square root of minus one	<i>j</i>	angular momentum; electric current density
<i>i</i>	electric current		

JT	Jahn–Teller (effect)	LI	laser ionization
K	kelvin; lysine	lim	limit
<i>K</i>	absorption coefficient; bulk modulus; equilibrium constant; kinetic energy	LIMS	laser ionization mass spectroscopy; laboratory information management system
k	kilo (SI prefix for 10 <sup>3</sup> )	liq	liquid
<i>k</i>	absorption index; Boltzmann constant; rate constant; thermal conductivity; wave vector	LIT	linear ion trap
kat	katal (unit of catalytic activity)	LLCT	ligand to ligand charge transfer
kb	kilobar; kilobases (DNA or RNA)	lm	lumen
KC-MS	Knudson cell mass spectrometry	LMCT	ligand to metal charge transfer
kcal	kilocalorie	LMMS	laser microprobe mass spectrometry
KDP	potassium dihydrogen phosphate	LMO	localized molecular orbital
KE	kinetic energy	LMR	laser magnetic resonance
KERD	kinetic energy release distributions	ln	logarithm (natural)
keV	kiloelectronvolt	LNDO	local neglect of differential overlap
KG	kinetics in the gas phase	log	logarithm (common)
kg	kilogram	LOMO	lowest occupied molecular orbital
kgf	kilogram force	long.	longitude
KIE	kinetic isotope effect	LPG	liquid petroleum gas
kJ	kilojoule	LPHP	laser-powered homogeneous pyrolysis
km	kilometer	LPU	law of propagation of uncertainty
<i>Kn</i>	Knudsen number	LSFE	linear field stabilization energy
kPa	kilopascal	LSI	liquid secondary ionization
KS	kinetics in solution	LST	local sidereal time
kt	karat	LT	local time
KTP	potassium titanium phosphate	LTE	local thermodynamic equilibrium
kV	kilovolt	LUMO	lowest unoccupied molecular orbital
kva	kilovolt ampere	lx	lux
kW	kilowatt	ly	langley
kwh	kilowatt hour	l.y.	light year
L	liter; lambert; leucine	Lys	lysine
<i>L</i>	Avogadro constant; inductance; Lagrange function; angular momentum	Lyx	lyxose
l	liter; liquid (phase)	M	molar (as in 0.1 M solution); mega (SI prefix for 10 <sup>6</sup> ); methionine
<i>l</i>	angular momentum; length; mean free path; levorotatory	<i>M</i>	magnetization; molar mass; mutual inductance; torque; angular momentum component; median
Lac	lactose	<i>M<sub>r</sub></i>	molecular weight (relative molar mass)
LAH	lithium aluminum hydride	m	meter; molal (as in 0.1 m solution); metastable (isotope); milli (SI prefix for 10 <sup>-3</sup> )
lat.	latitude	<i>m</i>	magnetic dipole moment; mass; molality; angular momentum component; <i>meta</i> (locant on aromatic ring)
lb	pound	<i>Ma</i>	Mach number
lbf	pound force	MA	maleic anhydride
LC	liquid chromatography	Mal	maltose
LC-MS	liquid chromatography–mass spectrometry	Man	mannose
lc	liquid crystal (phase)	MASNMR	magic angle spinning nuclear magnetic resonance
LCAO	linear combination of atomic orbitals	max	maximum
LD	lethal dose; laser desorption	Mb	myoglobin
LDA	local density approximation; lithium diisopropylamide	MBE	molecular beam epitaxy
LDL	low-density lipoprotein	MBER	molecular beam electron resonance
LDV	laser-Doppler velocimetry	MBPT	many body perturbation theory
<i>Le</i>	Lewis function	MC	Monte Carlo (method)
LE	localization energy	MCAA	monochloroacetic acid
LEC	liquid exchange chromatography	MCD	magnetic circular dichroism
LED	light emitting diode	MCP	microchannel plate
LEED	low-energy electron diffraction	MCPA	(4-chloro-2-methylphenoxy)acetic acid
LEIS	low-energy ion scattering	MCPF	modified coupled pair functional
Leu	leucine	MCS	Monte Carlo simulation
LFER	linear free energy relationships		
LFL	lower flammable limit		

MCSCF	multiconfigurational self-consistent field (approximation)	MSDS	Material Safety Data Sheet
MD	molecular dynamics (method)	MS-K	mass spectroscopy – kinetic method
Me	methyl	MSL	mean sea level
MeCCNU	1-(2-chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea	MTBE	methyl <i>tert</i> -butyl ether
MeIQ	2-amino-3,4-dimethylimidazo[4,5-f]quinoline	MTD	maximum tolerable dose
MeIQx	2-amino-3,8-dimethylimidazo[4,5-f]quinoxaline	Mur	muramic acid
MEK	methyl ethyl ketone	mV	millivolt
MEP	molecular electrostatic potential	MVK	methyl vinyl ketone
MERP	minimum energy reaction path	MW	megawatt; microwave; molecular weight
Mes	4-morpholineethanesulfonic acid	mW	milliwatt
MESFET	metal-semiconductor field-effect transistor	Mx	maxwell
Met	methionine	N	newton; asparagine
MeV	megaelectronvolt	<i>N</i>	angular momentum; neutron number; number density
meV	millielectronvolt	<i>N<sub>A</sub></i>	Avogadro constant
MF	molecular formula	<i>n</i>	neutron; nano (SI prefix for 10 <sup>-9</sup> )
mg	milligram	<i>n</i>	amount of substance; number density; principal quantum number; refractive index; normal (in chemical formulas)
MHD	magnetohydrodynamics	NAA	nuclear activation analysis
mi	mile	NAAD	nicotinic acid adenine dinucleotide
MIAK	methyl isoamyl ketone	NAD	nicotinamide adenine dinucleotide
MIKES	mass-analyzed ion kinetic energy spectrometry	NADH	reduced NAD
min	minimum; minute	NADP	NAD phosphate
MINDO	modified INDO (method)	NANA	<i>N</i> -acetylneuraminic acid
MIPK	methyl isopropyl ketone	NAO	natural atomic orbital
MIR	mid infrared	NBO	natural bond orbital
misc	miscible	nbp	normal boiling point
MKS	meter–kilogram–second system	NEDOR	nuclear electron double resonance
MKSA	meter–kilogram–second–ampere system	Neu	neuraminic acid
mL, ml	milliliter	NEXAFS	near-edge x-ray absorption fine structure
MM	molecular mechanics	ng	nanogram
mm	millimeter	NHO	natural hybrid orbital
MMDR	microwave-microwave double resonance	NHOMO	next-to-highest occupied molecular orbital
mmf	magnetomotive force	NICI	negative ion chemical ionization
mmHg	millimeter of mercury	NICS	nuclear independent chemical shift
MNDO	modified neglect of diatomic overlap	NIR	near infrared; ribosylnicotinamide
MO	molecular orbital; methyl orange	nm	nanometer
MODR	microwave-optical double resonance	NMN	β-nicotinamide mononucleotide
mol	mole	NMR	nuclear magnetic resonance
mol.wt.	molecular weight	Nn	nonyl
mon	monomeric form	NNDO	neglect of nonbonded differential overlap
Mops	4-morpholinepropanesulfonic acid	NO	natural orbital
MOS	metal-oxide semiconductor	NOE	nuclear Overhauser effect
MOSFET	metal-oxide semiconductor field-effect transistor	NOEL	no-observed-effect level
mp	melting point	NOx	nitrogen oxides
MPa	megapascal	NP	nitropyrene
MPA	Mulliken population analysis	NPA	natural population analysis
Mpc	megaparsec	NQR	nuclear quadrupole resonance
MPI	multiphoton ionization	NRA	nuclear reaction analysis
MPTP	1,2,3,6-tetrahydro-1-methyl-4-phenylpyridine	ns	nanosecond
MR	methyl red	NSE	neutron spin echo
MRD	multireference double substitution (method)	NTP	normal temperature and pressure
MRI	magnetic resonance imaging	Nu	nucleophile
mRNA	messenger RNA	<i>Nu</i>	Nusselt number
MS	mass spectroscopy	<i>o</i>	<i>ortho</i> (locant on aromatic ring)
ms	millisecond	obs, obsd	observed
MSA	methanesulfonic acid	Oc	octyl
		OD	optical density; outside diameter

ODMR	optically detected magnetic resonance	PIV	particle-image velocimetry
Oe	oersted	PIXE	particle induced x-ray emission
OFGF	outer valence Green's function (method)	pK	negative log of ionization constant
ORD	optical rotatory dispersion	PLM	principle of least motion
Oro	orotate; orotidine	PLOT	porous-layer open-tabular (column)
oz	ounce	PLS	partial least squares
P	poise; peta (SI prefix for 10 <sup>15</sup> ); proline	pm	picometer
<i>P</i>	power; pressure; probability; sound energy flux	PMA	poly(methyl acrylate)
p	proton; pico (SI prefix for 10 <sup>-12</sup> )	PMMA	poly(methyl methacrylate)
<i>p</i>	dielectric polarization; electric dipole moment; momentum; pressure; bond order; <i>para</i> (as aromatic ring locant)	PMO	perturbation MO (theory)
Pa	pascal	PNDO	partial neglect of differential overlap
PA	proton affinity; pyrrolizidine alkaloid	PNO	pair natural orbitals
PABA	<i>p</i> -aminobenzoic acid	PNRA	prompt nuclear reaction analysis
PAC	photoacoustic calorimetry	POAV	$\pi$ -orbital axis vector
PAH	polycyclic aromatic hydrocarbon(s)	pol	polymeric form
PAM	polyacrylamide	POx	phosphorus oxides
PAN	1-(2-pyridylazo)-2-naphthol; polyacrylonitrile	ppb	parts per billion
PAR	4-(2'-pyridylazo)resorcinol	ppm	parts per million
PAS	photoacoustic spectroscopy	PPO	poly(phenylene oxide)
PBA	poly(butyl acrylate)	PPP	Pariser-Parr-Pople (method)
PBB	polybrominated biphenyl	ppt	parts per thousand; precipitate
PBD	poly(1,3-butadiene)	Pr	propyl
PBMA	poly(butyl methacrylate)	<i>Pr</i>	Prandtl number
PBT	poly(butylene terephthalate)	PRDDO	partial retention of diatomic differential overlap
PC	paper chromatography; photocalorimetry	Pro	proline
pc	parsec	PS	photoelectron spectroscopy
PCB	polychlorinated biphenyl	ps	picosecond
PCM	polarizable continuum model	PSD	photon stimulated desorption
PCR	polymerase chain reaction	psi	pounds per square inch
PD	potential difference	psia	pounds per square inch absolute
pdl	poundal	psig	pounds per square inch gage
PDMS	poly(dimethylsiloxane)	PT	perturbation theory
Pe	pentyl	PTFE	poly(tetrafluoroethylene)
<i>Pe</i>	Péclet number	pt	pint
pe	probable error	PTMS	propyltrimethoxysilane
PEA	poly(ethyl acrylate)	Pu	purine
PEG	poly(ethylene glycol)	PVA	poly(vinyl alcohol)
PEL	permissible exposure limit	PVAc	poly(vinyl acetate)
PES	photoelectron spectroscopy; potential energy surface	PVC	poly(vinyl chloride)
PET	positron emission tomography; poly(ethylene terephthalate)	PVD	physical vapor deposition
peth	petroleum ether	PVDF	poly(vinylidene fluoride)
pf	power factor	PVME	poly(methyl vinyl ether)
PFOA	perfluorooctanoic acid	PVT	pressure-volume-temperature
pg	picogram	Py	pyrimidine
Ph	phenyl	PyMS	pyrolysis mass spectrometry
pH	negative log of hydrogen ion concentration	p.z.c.	point of zero charge
Phe	phenylalanine	Q	electric charge; heat; partition function; quadrupole moment; radiant energy; vibrational normal coordinate; glutamine
PhIP	2-amino-1-methyl-6-phenylimidazo[4,5-b]pyridine	<i>q</i>	electric field gradient; flow rate; heat; wave vector (phonons)
PHPMS	pulsed high pressure mass spectrometry	QCD	quantum chromodynamics
pI	isoelectric point	QCI	quadratic configuration interaction
PIB	polyisobutylene	QCT	quasi-classical trajectory (method)
PIMS	photoionization mass spectrometry	QED	quantum electrodynamics
PIN	p-intrinsic-n (diode)	Q.E.D.	<i>quod erat demonstrandum</i> (which was to be proved)
Pipes	1,4-piperazinediethanesulfonic acid	QIT	quadrupole ion trap

QMRE	quantum mechanical resonance energy	S	siemens; serine
QMS	quadrupole mass spectrometry	S	area; entropy; probability current density; Poynting vector; symmetry coordinate; spin angular momentum
QSAR	quantitative structure–activity relations	s	second; solid (phase)
QSO	quasi-stellar object	s	path length; spin angular momentum; symmetry number; sedimentation coefficient; solubility; symmetrical (as stereochemical descriptor)
qt	quart	SAED	selected area electron diffraction
quad	quadrillion BTU (=1.055•10 <sup>18</sup> joules)	SALC	symmetry adapted linear combinations
Qui	quinovose	SALI	surface analysis by laser ionization
q.v.	<i>quod vide</i> (which you should see)	SAM	scanning Auger microscopy
R	roentgen; arginine; alkyl radical (in chemical formulas)	SAMS	self-assembled monolayers
°R	degree Rankine	SANS	small angle neutron scattering
R	electrical resistance; gas constant; molar refraction; Rydberg constant; coefficient of multiple correlation	SAR	structure–activity relationship
r	reaction (as in $\Delta_r H$ )	Sar	sarcosine
r	position vector; radius	sat, satd	saturated
RA	right ascension	SAXS	small angle x-ray scattering
rad	radian	Sc	Schmidt number
RAIRS	reflection-absorption infrared spectroscopy	SC	spin-coupled (method)
RAM	random access memory	SCD	state correlation diagram
RBS	Rutherford back scattering	SCE	saturated calomel electrode
Rbu, Rul	ribulose	SCF	self-consistent field (method); supercritical fluid
RCI	ring current index	SCP	single cell protein
RDA	rubidium dihydrogen arsenate	SCR	silicon-controlled rectifier
RDS	rate determining step	SCRf	self-consistent reaction field (method)
Re	real part	sd	standard deviation
RE	resonance energy	SDW	spin density wave
RED	radial electron distribution	SE	strain energy
REELS	reflection electron energy loss spectroscopy	SEC	size exclusion chromatography
REM	reflection electron microscopy	sec	secant; second
rem	roentgen equivalent man	sec	secondary (in chemical name)
REMPI	resonance-enhanced multiphoton ionization	SECSY	spin-echo correlated spectroscopy
REPE	resonance energy per electron	Sed	sedoheptulose
RF	radiofrequency	SEELFS	surface extended energy loss fine structure
RGA	residual gas analyzer	SEM	scanning electron microscopy; standard error of the mean
Rha	rhamnose	sepn	separation
RHEED	reflection high-energy electron diffraction	Ser	serine
RHF	restricted Hartree–Fock (theory)	SERS	surface-enhanced Raman spectroscopy
RI	resonance ionization	SET	single electron transfer
RIA	radioimmunoassay	SEXAF	surface extended x-ray absorption fine structure
Rib	ribose	SFC	supercritical fluid chromatography
Ribulo	ribulose	Sh	Sherwood number
rms	root–mean–square	Shy	thiohypoxanthine
RNA	ribonucleic acid	SI	International System of Units; surface ionization
RNase	ribonuclease	SID	surface-induced dissociation
ROHF	restricted open shell Hartree–Fock	SILAR	successive ionic layer adsorption and reaction
ROM	read only memory	SIM	selected ion monitoring
RPA	random phase approximation	SIMS	secondary-ion spectroscopy
RPH	reaction path Hamiltonian	sin	sine
RPLC	reversed-phase liquid chromatography	sinh	hyperbolic sine
rpm	revolutions per minute	SIPN	semi-interpenetrating polymer network
rps	revolutions per second	SLAM	scanning laser acoustic microscopy
RRK	Rice–Ramsperger–Kassel (theory)	SLUMO	second lowest unoccupied molecular orbital
RRKM	Rice–Ramsperger–Kassel–Marcus (theory)	SMILES	simplified molecular input line entry system
rRNA	ribosomal RNA	SMO	semiempirical molecular orbital
RRS	resonance Raman spectroscopy	SMOW	Standard Mean Ocean Water (Vienna)
RS	Raman spectroscopy		
RSC	reaction-solution calorimetry		
Ry	rydberg		

SNMS	sputtered neutral mass spectroscopy	TEELS	transmission electron energy loss spectroscopy
Sno	thiouridine	TEM	transverse electromagnetic; transmission electron microscope
SNU	solar neutrino unit	temp	temperature
SOJT	second-order Jahn–Teller (effect)	<i>tert</i>	tertiary (in chemical name)
sol	soluble; solution	Tes	2-{{[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]amino}-1-propanesulfonic acid
soln, sln	solution	TFD	Thomas–Fermi–Dirac (method)
SOMO	singly occupied molecular orbital	TGA	thermogravimetric analysis
Sor	sorbose	Thd	ribosylthymine
sp gr	specific gravity	THEED	transmission high energy electron diffraction
SPM	scanned probe microscopy	theor	theoretical
SPST	single-pulse shock tubes	thf, THF	tetrahydrofuran
sq	square	Thr	threonine
<i>Sr</i>	Strouhal number	Thy	thymine
sr	steradian	TI	thermal ionization
Srd	6-thioinosine	TL	thermoluminescence
SSMS	source spark mass spectroscopy	TLC	thin-layer chromatography
St	stoke	TLV	threshold limit value
<i>St</i>	Stanton number	TM	transverse magnetic
std, stnd	standard (state)	TMAB	tetrabutylammonium bromide
STEL	short-term exposure limit	TMS	tetramethylsilane
STEM	scanning transmission electron microscope	TOF	turnover frequency
STM	scanning tunneling microscopy	TOF-MS	time-of-flight mass spectrometer
STO	Slater-type orbital	tol	tolyl
STP	standard temperature and pressure	TON	turnover number
sub, subl	sublimes; sublimation	TOPO	trioctylphosphine oxide
Suc, Sac	sucrose	Torr	torr (pressure unit)
Sur	thiouracil	Tre	trehalose
Sv	sievert	TRE	topological resonance energy
SWIFT	stored waveform inverse Fourier transform	Tricine	<i>N</i> -[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]glycine
T	tesla; tera (SI prefix for 10 <sup>12</sup> ); threonine	Tris	2-amino-2-(hydroxymethyl)-1,3-propanediol
<i>T</i>	kinetic energy; period; term value; temperature (thermodynamic); torque; transmittance	TRMC	time-resolved microwave conductivity
t	metric tonne; triton	tRNA	transfer RNA
<i>t</i>	Celsius temperature; thickness; time; transport number	Trp	tryptophan
TAC	time-to-amplitude converter	trs	transition
TAI	International Atomic Time	TS	transition state
Tal	talose	TSS	transition state spectroscopy
tan	tangent	TST	generalized transition-state theory
tanh	hyperbolic tangent	TTF	tetrathiofulvalene
Taps	3-{{[2-hydroxy-1,1-bis(hydroxymethyl)ethyl]amino}-1-propanesulfonic acid	Tyr	tyrosine
TBE	1,1,2,2-tetrabromoethane	U	uracil (in genetic code)
TBP	tributyl phosphate	<i>U</i>	electric potential difference; internal energy
TC	titration calorimetry	u	unified atomic mass unit
TCA	trichloroacetic acid	<i>u</i>	Bloch function; electric mobility; velocity
TCE	trichloroethylene	ua	astronomical unit (AU is also used)
TCG	Geocentric Coordinated Time	UBFF	Urey–Bradley force field
TCNE	tetracyanoethylene	UDMH	1,1-dimethylhydrazine
TCNQ	tetracyanoquinodimethane	UDP	uridine 5′-diphosphate
TCP	tricresyl phosphate	UHF	ultrahigh frequency; unrestricted Hartree–Fock (method)
TCSCF	two configuration self-consistent field	UMP	uridine 5′-monophosphate
TDI	toluene diisocyanate	<i>uns</i> ,	unsymmetrical (as chemical descriptor)
tDNA	transfer DNA	<i>unsym</i>	
TE	transverse electric	UPS,	ultraviolet photoelectron spectroscopy
TEA	triethanolamine; triethylamine	UPES	
TED	transferred electron device; transmission electron diffraction	Ura	uracil
		Urd	uridine

USP	<i>United States Pharmacopeia</i>	Xyl	xylose
UT	universal time	Y	yotta (SI prefix for 10 <sup>24</sup> ); tyrosine
UTC	coordinated universal time	Y	admittance; Planck function; Young's modulus
UTP	uridine 5'-triphosphate	y	yocto (SI prefix for 10 <sup>-24</sup> )
UV	ultraviolet	y	mole fraction for gas (when <i>x</i> refers to liquid phase)
V	volt; valine	y, yr	year
V	electric potential; potential energy; volume	YAG	yttrium aluminum garnet
<i>v</i>	reaction rate; specific volume; velocity; vibrational quantum number; vicinal (as chemical descriptor)	yd	yard
v/v	volume per volume (volume of solute divided by volume of solution, expressed as percent)	YIG	yttrium iron garnet
Val	valine	Z	zetta (SI prefix for 10 <sup>21</sup> ); glutamine or glutamic acid (unspecified)
vap	vaporization	Z	atomic number; compression factor; collision number; impedance; partition function; zusammen ( <i>cis</i> -configuration)
VAT	vibration assisted tunneling	z	zepto (SI prefix for 10 <sup>-21</sup> )
VB	valence band; valence bond (theory)	z	charge number (of an ion); collision frequency factor
VCD	vibrational circular dichroism	ZDO	zero differential overlap
VDW	van der Waals interaction	ZINDO	Zerner's INDO method
VHF	very high frequency	ZPE, ZPVE	zero point vibrational energy
<i>vic</i>	vicinal (on adjacent carbon atom)	ZULU	Greenwich mean time
VIS	visible region of the spectrum	α	alpha particle
vit	vitreous (phase)	α	absorption coefficient; degree of dissociation; electric polarizability; expansion coefficient; fine structure constant
VLPP	very low pressure pyrolysis	β	beta particle
VOC	volatile organic compound(s)	β	reciprocal temperature parameter (= 1/ <i>kT</i> )
VOFF	valence orbital force field	γ	photon; gamma (obsolete mass unit = μg)
VPC	vapor phase chromatography	γ	activity coefficient; conductivity; magnetogyric ratio; mass concentration; ratio of heat capacities; surface tension
VSEPR	valence shell electron-pair repulsion (method)	Γ	Grüneisen parameter; level width; surface concentration
VSIP	valence state ionization potential	δ	chemical shift; Dirac delta function; Kronecker delta; loss angle
VSLI	very large scale integrated (circuit)	Δ	inertial defect; mass excess
VSMOW	Vienna Standard Mean Ocean Water	ε	emittance; Levi-Civita symbol; linear strain; molar absorption coefficient; permittivity
VUV	vacuum ultraviolet	ζ	Coriolis coupling constant; electrokinetic potential
W	watt; tryptophan	η	overpotential; viscosity
W	radiant energy; statistical weight; work	κ	compressibility; conductivity; magnetic susceptibility; molar absorption coefficient
<i>w</i>	energy density; mass fraction; velocity; work	λ	absolute activity; radioactive decay constant; thermal conductivity; wavelength
w/v	weight per volume (mass of solute divided by volume of solution, usually expressed as g/100 mL)	Λ	angular momentum; ionic conductivity
w/w	weight per weight (mass of solute divided by mass of solution, expressed as percent)	μ	muon; micro (SI prefix for 10 <sup>-6</sup> )
WAXS	wide angle x-ray scattering	μ	chemical potential; electric dipole moment; electric mobility; friction coefficient; Joule-Thompson coefficient; magnetic dipole moment; mobility; permeability
Wb	weber	μF	microfarad
<i>We</i>	Weber number	μg	microgram
WKB	Wentzel-Kramers-Brillouin (approximation)	μm	micrometer
WLF	Williams-Landel-Ferry (equation)	μs	microsecond
WLN	Wisswesser line notation	<i>v</i>	frequency; kinematic velocity; stoichiometric number
wt	weight	<i>v</i> <sub>e</sub>	neutrino
X	X unit; halogen (in chemical formula)	<i>v</i>	wavenumber
<i>X</i>	reactance	π	pion
<i>x</i>	mole fraction	Π	osmotic pressure; Peltier coefficient
X, Xaa	unspecified amino acid	ρ	density; reflectance; resistivity
XAFS	x-ray absorption fine structure		
Xan	xanthine		
XANES	x-ray absorption near-edge structure		
Xao	xanthosine		
Xle	leucine or isoleucine (unspecified)		
Xlu, Xul	xylulose		
XPS, XPES	x-ray photoelectron spectroscopy		
XRD	x-ray diffraction		
XRF	x-ray fluorescence		
XRS	x-ray spectroscopy		

$\sigma$	electrical conductivity; cross section; normal stress; shielding constant (NMR); Stefan–Boltzmann constant; surface tension; standard deviation	$\chi$	magnetic susceptibility
$\tau$	transmittance; chemical shift; shear stress; relaxation time	$\chi_e$	electric susceptibility
$\phi$	electrical potential; fugacity coefficient; osmotic coefficient; quantum yield; wavefunction	$\psi$	wavefunction
$\Phi$	magnetic flux; potential energy; radiant power; work function	$\omega$	circular frequency; angular velocity; harmonic vibration wavenumber; statistical weight
		$\Omega$	ohm
		$\Omega$	axial angular momentum; solid angle

## GREEK, RUSSIAN, AND HEBREW ALPHABETS

The following table presents the Hebrew, Greek, and Russian alphabets, their letters, the names of the letters, and the English equivalents.

	Hebrew <sup>1,3</sup>	Greek <sup>4</sup>	Russian
א	aleph ' 2	Α α alpha a	А а a
ב	beth b, bh	Β β beta b	Б б b
ג	gimel g, gh	Γ γ gamma g, n	В в v
ד	daleth d, dh	Δ δ delta d	Г г g
ה	he h	Ε ε epsilon e	Д д d
ו	waw w	Ζ ζ zeta z	Е е e
ז	zayin z	Η η eta ē	Ж ж zh
ח	heth ḥ	Θ θ theta th	З з z
ט	teth ṭ	Ι ι iota i	И и Й й i, ĭ
י	yodh y	Κ κ kappa k	К к k
כ	kaph k, kh	Λ λ lambda l	Л л l
ל	lamedh l	Μ μ mu m	М м m
מ	mem m	Ν ν nu n	Н н n
נ	nun n	Ξ ξ xi x	О о o
ס	samekh s	Ο ο omicron o	П п p
ש	ayin ʿ	Π π pi p	Р р r
פ	pe p, ph	Ρ ρ rho r, rh	С с s
צ	sadhe ṣ	Σ σ ς sigma s	Т т t
ק	qoph q	Τ τ tau t	У у u
ר	resh r	Υ υ upsilon y, u	Ф ф f
שׁ	sin ś	Φ φ phi ph	Х х kh
שׂ	shin sh	Χ χ chi ch	Ц ц ts
ת	taw t, th	Ψ ψ psi ps	Ч ч ch
		Ω ω omega ō	Ш ш sh
			Щ щ shch
			Ъ ъ <sup>5</sup> ”
			Ы ы y
			Ь ь <sup>6</sup> ’
			Э э e
			Ю ю yu
			Я я ya

<sup>1</sup> Where two forms of a letter are given, the second one is the form used at the end of a word.

<sup>2</sup> Not represented in transliteration when initial.

<sup>3</sup> The Hebrew letters are primarily consonants; a few of them are also used secondarily to represent certain vowels, when provided at all, by means of a system of dots or strokes adjacent to the consonated characters.

<sup>4</sup> The letter gamma is transliterated “n” only before velars; the letter upsilon is transliterated “u” only as the final element in diphthongs.

<sup>5</sup> This sign indicates that the immediately preceding consonant is not palatized even though immediately followed by a palatized vowel.

<sup>6</sup> This sign indicates that the immediately preceding consonant is palatized even though not immediately followed by a palatized vowel.

## DEFINITIONS OF SCIENTIFIC TERMS

Brief definitions of selected terms of importance in chemistry, physics, and related fields of science are given in this section. The selection process emphasizes the following types of terms:

- ◆ Physical quantities
- ◆ Units of measure
- ◆ Classes of chemical compounds and materials
- ◆ Important theories, laws, and basic concepts.

Individual chemical compounds are not included.

Definitions have taken wherever possible from the recommendations of international or national bodies, especially the International Union of Pure and Applied Chemistry (IUPAC) and International Organization for Standardization (ISO). For physical quantities and units, the recommended symbol is also given. The source of such definitions is indicated by the reference number in brackets following the definition. In many cases these official definitions have been edited in the interest of stylistic consistency and economy of space. The user is referred to the original source for further details.

An asterisk (\*) following a term indicates that further information can be found by consulting the index of this handbook under the entry for that term.

**Ab initio method** - An approach to quantum-mechanical calculations on molecules which starts with the Schrödinger equation and carries out a complete integration, without introducing empirical factors derived from experimental measurement.

**Absorbance (A)** - Defined as  $-\log(1-\alpha) = \log(1/\tau)$ , where  $\alpha$  is the absorbance and  $\tau$  the transmittance of a medium through which a light beam passes. [2]

**Absorbed dose (D)** - For any ionizing radiation, the mean energy imparted to an element of irradiated matter divided by the mass of that element. [1]

**Absorbance ( $\alpha$ )** - Ratio of the radiant or luminous flux in a given spectral interval absorbed in a medium to that of the incident radiation. Also called absorption factor. [1]

**Absorption coefficient ( $a$ )** - The relative decrease in the intensity of a collimated beam of electromagnetic radiation, as a result of absorption by a medium, during traversal of an infinitesimal layer of the medium, divided by the length traversed. [1]

**Absorption coefficient, molar ( $\epsilon$ )** - Absorption coefficient divided by amount-of-substance concentration of the absorbing material in the sample solution ( $\epsilon = a/c$ ). The SI unit is  $\text{m}^2/\text{mol}$ . Also called extinction coefficient, but usually in units of  $\text{mol}^{-1}\text{dm}^3\text{cm}^{-1}$ . [2]

**Acceleration** - Rate of change of velocity with respect to time.

**Acceleration due to gravity ( $g$ )\*** - The standard value ( $9.80665 \text{ m/s}^2$ ) of the acceleration experienced by a body in the earth's gravitational field. [1]

**Acenens** - Polycyclic aromatic hydrocarbons consisting of fused benzene rings in a rectilinear arrangement. [5]

**Acid** - Historically, a substance that yields an  $\text{H}^+$  ion when it dissociates in solution, resulting in a  $\text{pH} < 7$ . In the Brønsted definition, an acid is a substance that donates a proton in any type of reaction. The most general definition, due to G.N. Lewis,

classifies any chemical species capable of accepting an electron pair as an acid.

**Acid dissociation constant ( $K_a$ )\*** - The equilibrium constant for the dissociation of an acid HA through the reaction  $\text{HA} + \text{H}_2\text{O} \rightleftharpoons \text{A}^- + \text{H}_3\text{O}^+$ . The quantity  $\text{p}K_a = -\log K_a$  is often used to express the acid dissociation constant.

**Actinides** - The elements of atomic number 89 through 103, e.g., Ac, Th, Pa, U, Np, Pu, Am, Cm, Bk, Cf, Es, Fm, Md, No, Lr. [7]

**Activation energy\*** - In general, the energy that must be added to a system in order for a process to occur, even though the process may already be thermodynamically possible. In chemical kinetics, the activation energy is the height of the potential barrier separating the products and reactants. It determines the temperature dependence of the reaction rate.

**Activity** - For a mixture of substances, the absolute activity  $\lambda$  of chemical B is defined as  $\lambda_B = \exp(\mu_B/RT)$ , where  $\mu_B$  is the chemical potential of substance B,  $R$  the gas constant, and  $T$  the thermodynamic temperature. The relative activity  $a$  is defined as  $a_B = \exp[(\mu_B - \mu_B^\circ)/RT]$ , where  $\mu_B^\circ$  designates the chemical potential in the standard state. [2]

**Activity coefficient ( $\gamma$ )\*** - Ratio of the activity  $a_B$  of component B of a mixture to the concentration of that component. The value of  $\gamma$  depends on the method of stating the composition. For mole fraction  $x_B$ , the relation is  $a_B = \gamma_B x_B$ ; for molarity  $c_B$ , it is  $a_B = \gamma_B c_B/c^\circ$ , where  $c^\circ$  is the standard state composition (typically chosen as 1 mol/L); for molality  $m_B$ , it is  $a_B = \gamma_B m_B/m^\circ$ , where  $m^\circ$  is the standard state molality (typically 1 mol/kg). [2]

**Activity, of radioactive substance (A)** - The average number of spontaneous nuclear transitions from a particular energy state occurring in an amount of a radionuclide in a small time interval divided by that interval. [1]

- Acyl groups** - Groups formed by removing the hydroxy groups from oxoacids that have the general structure  $\text{RC}(=\text{O})(\text{OH})$  and replacement analogues of such acyl groups. [5]
- Adiabatic process** - A thermodynamic process in which no heat enters or leaves the system.
- Admittance ( $Y$ )** - Reciprocal of impedance.  $Y = G + iB$ , where  $G$  is conductance and  $B$  is susceptance. [1]
- Adsorption** - A process in which molecules of gas, of dissolved substances in liquids, or of liquids adhere in an extremely thin layer to surfaces of solid bodies with which they are in contact. [10]
- Albedo\*** - The ratio of the light reflected or scattered from a surface to the intensity of incident light. The term is often used in reference to specific types of terrain or to entire planets.
- Alcohols** - Compounds in which a hydroxy group,  $-\text{OH}$ , is attached to a saturated carbon atom. [5]
- Aldehydes** - Compounds  $\text{RC}(=\text{O})\text{H}$ , in which a carbonyl group is bonded to one hydrogen atom and to one R group. [5]
- Aldoses** - Aldehydic parent sugars (polyhydroxyaldehydes  $\text{H}[\text{CH}(\text{OH})]_n\text{C}(=\text{O})\text{H}$ ,  $n > 1$ ) and their intramolecular hemiacetals. [5]
- Aldoximes** - Oximes of aldehydes:  $\text{RCH}=\text{NOH}$ . [5]
- Alfvén number ( $Al$ )** - A dimensionless quantity used in plasma physics, defined by  $Al = v(\rho\mu)^{1/2}/B$ , where  $\rho$  is density,  $v$  is velocity,  $\mu$  is permeability, and  $B$  is magnetic flux density. [2]
- Alfvén waves** - Very low frequency waves which can exist in a plasma in the presence of a uniform magnetic field. Also called magnetohydrodynamic waves.
- Alicyclic compounds** - Aliphatic compounds having a carbocyclic ring structure which may be saturated or unsaturated, but may not be a benzenoid or other aromatic system. [5]
- Aliphatic compounds** - Acyclic or cyclic, saturated or unsaturated carbon compounds, excluding aromatic compounds. [5]
- Alkali metals** - The elements lithium, sodium, potassium, rubidium, cesium, and francium.
- Alkaline earth metals** - The elements calcium, strontium, barium, and radium. [7]
- Alkaloids** - Basic nitrogen compounds (mostly heterocyclic) occurring mostly in the plant kingdom (but not excluding those of animal origin). Amino acids, peptides, proteins, nucleotides, nucleic acids, and amino sugars are not normally regarded as alkaloids. [5]
- Alkanes** - Acyclic branched or unbranched hydrocarbons having the general formula  $\text{C}_n\text{H}_{2n+2}$ , and therefore consisting entirely of hydrogen atoms and saturated carbon atoms. [5]
- Alkenes** - Acyclic branched or unbranched hydrocarbons having one carbon-carbon double bond and the general formula  $\text{C}_n\text{H}_{2n}$ . Acyclic branched or unbranched hydrocarbons having more than one double bond are alkadienes, alkatrienes, etc. [5]
- Alkoxides** - Compounds, ROM, derivatives of alcohols, ROH, in which R is saturated at the site of its attachment to oxygen and M is a metal or other cationic species. [5]
- Alkyl groups** - Univalent groups derived from alkanes by removal of a hydrogen atom from any carbon atom:  $\text{C}_n\text{H}_{2n+1}$ -. The groups derived by removal of a hydrogen atom from a terminal carbon atom of unbranched alkanes form a subclass of normal alkyl ( $n$ -alkyl) groups. The groups  $\text{RCH}_2$ -,  $\text{R}_2\text{CH}$ -, and  $\text{R}_3\text{C}$ - (R not equal to H) are primary, secondary, and tertiary alkyl groups, respectively. [5]
- Alkynes** - Acyclic branched or unbranched hydrocarbons having a carbon-carbon triple bond and the general formula  $\text{C}_n\text{H}_{2n-2}$ .  $\text{RC}\equiv\text{CR}$ -. Acyclic branched or unbranched hydrocarbons having more than one triple bond are known as alkadiynes, alkatriynes, etc. [5]
- Allotropy** - The occurrence of an element in two or more crystalline forms.
- Allylic groups** - The group  $\text{CH}_2=\text{CHCH}_2$ - (allyl) and derivatives formed by substitution. The term 'allylic position' or 'allylic site' refers to the saturated carbon atom. A group, such as  $-\text{OH}$ , attached at an allylic site is sometimes described as "allylic". [5]
- Amagat volume unit** - A non-SI unit previously used in high pressure science. It is defined as the molar volume of a real gas at one atmosphere pressure and 273.15 K. The approximate value is 22.4 L/mol.
- Amides** - Derivatives of oxoacids  $\text{R}(\text{C}=\text{O})(\text{OH})$  in which the hydroxy group has been replaced by an amino or substituted amino group. [5]
- Amine oxides** - Compounds derived from tertiary amines by the attachment of one oxygen atom to the nitrogen atom:  $\text{R}_3\text{N}^+-\text{O}^-$ . By extension the term includes the analogous derivatives of primary and secondary amines. [5]
- Amines** - Compounds formally derived from ammonia by replacing one, two, or three hydrogen atoms by hydrocarbyl groups, and having the general structures  $\text{RNH}_2$  (primary amines),  $\text{R}_2\text{NH}$  (secondary amines),  $\text{R}_3\text{N}$  (tertiary amines). [5]
- Amino acids\*** - Compounds containing both a carboxylic acid group ( $-\text{COOH}$ ) and an amino group ( $-\text{NH}_2$ ). The most important are the  $\alpha$ -amino acids, in which the  $-\text{NH}_2$  group is attached to the C atom adjacent to the  $-\text{COOH}$  group. In the  $\beta$ -amino acids, there is an intervening carbon atom. [4]
- Ampere (A)\*** - The SI base unit of electric current. [1]
- Ampere's law** - The defining equation for the magnetic induction  $B$ , viz.,  $dF = Idl \times B$ , where  $dF$  is the force produced by a current  $I$  flowing in an element of the conductor  $dl$  pointing in the direction of the current.
- Ångström (Å)** - A unit of length used in spectroscopy, crystallography, and molecular structure, equal to  $10^{-10}$  m.
- Angular momentum ( $L$ )** - The angular momentum of a particle about a point is the vector product of the radius vector from this point to the particle and the momentum of the particle; i.e.,  $L = r \times p$ . [1]
- Angular velocity ( $\omega$ )** - The angle through which a body rotates per unit time.
- Anilides** - Compounds derived from oxoacids  $\text{R}(\text{C}=\text{O})(\text{OH})$  by replacing the  $-\text{OH}$  group by the  $-\text{NHPh}$  group or derivative formed by ring substitution. Also used for salts formed by replacement of a nitrogen-bound hydrogen of aniline by a metal. [5]
- Anion** - A negatively charged atomic or molecular particle.
- Antiferroelectricity\*** - An effect analogous to antiferromagnetism in which electric dipoles in a crystal are ordered in two sublattices that are polarized in opposite directions, leading to zero net polarization. The effect vanishes above a critical temperature.
- Antiferromagnetism\*** - A type of magnetism in which the magnetic moments of atoms in a solid are ordered into two antiparallel aligned sublattices. Antiferromagnets are characterized by a zero or small positive magnetic susceptibility. The

susceptibility increases with temperature up to a critical value, the Néel temperature, above which the material becomes paramagnetic.

**Antiparticle** - A particle having the same mass as a given elementary particle and a charge equal in magnitude but opposite in sign.

**Appearance potential\*** - The lowest energy which must be imparted to the parent molecule to cause it to produce a particular specified parent ion. This energy, usually stated in eV, may be imparted by electron impact, photon impact, or in other ways. More properly called appearance energy. [3]

**Appearance potential spectroscopy (APS)** - See Techniques for Materials Characterization, page 12-1.

**Are (a)** - A unit of area equal to 100 m<sup>2</sup>. [1]

**Arenes** - Monocyclic and polycyclic aromatic hydrocarbons. See aromatic compounds. [5]

**Aromatic compounds** - Compounds whose structure includes a cyclic delocalized  $\pi$ -electron system. Historical use of the term implies a ring containing only carbon (e.g., benzene, naphthalene), but it is often generalized to include heterocyclic structures such as pyridine and thiophene. [5]

**Arrhenius equation** - A key equation in chemical kinetics which expresses the rate constant  $k$  as  $k = A \exp(-E_a/RT)$ , where  $E_a$  is the activation energy,  $R$  the molar gas constant, and  $T$  the temperature.  $A$  is called the preexponential factor and, for simple gas phase reactions, may be identified with the collision frequency.

**Arsines** - AsH<sub>3</sub> and compounds derived from it by substituting one, two or three hydrogen atoms by hydrocarbyl groups. RAsH<sub>2</sub>, R<sub>2</sub>AsH, R<sub>3</sub>As (R not equal to H) are called primary, secondary and tertiary arsines, respectively. [5]

**Aryl groups** - Groups derived from arenes by removal of a hydrogen atom from a ring carbon atom. Groups similarly derived from heteroarenes are sometimes subsumed in this definition. [5]

**Astronomical unit (AU)\*** - The mean distance of the earth from the sun, equal to  $1.49597870 \times 10^{11}$  m.

**Atomic absorption spectroscopy (AAS)** - See Techniques for Materials Characterization, page 12-1.

**Atomic emission spectroscopy (AES)** - See Techniques for Materials Characterization, page 12-1.

**Atomic force microscopy (AFM)** - See Techniques for Materials Characterization, page 12-1.

**Atomic mass\*** - The mass of a nuclide, normally expressed in unified atomic mass units (u).

**Atomic mass unit (u)\*** - A unit of mass used in atomic, molecular, and nuclear science, defined as the mass of one atom of <sup>12</sup>C divided by 12. Its approximate value is  $1.66054 \times 10^{-27}$  kg. Also called the unified atomic mass unit. [1]

**Atomic number (Z)** - A characteristic property of an element, equal to the number of protons in the nucleus.

**Atomic weight (A<sub>r</sub>)\*** - The ratio of the average mass per atom of an element to 1/12 of the mass of nuclide <sup>12</sup>C. An atomic weight can be defined for a sample of any given isotopic composition. The standard atomic weight refers to a sample of normal terrestrial isotopic composition. The term relative atomic mass is synonymous with atomic weight. [2]

**Attenuated total reflection (ATR)** - See Techniques for Materials Characterization, page 12-1.

**Auger effect** - An atomic process in which an electron from a higher energy level fills a vacancy in an inner shell, transferring the released energy to another electron which is ejected.

**Aurora** - An atmospheric phenomenon in which streamers of light are produced when electrons from the sun are guided into the thermosphere by the earth's magnetic field. It occurs in the polar regions at altitudes of 95—300 km.

**Avogadro constant (N<sub>A</sub>)\*** - The number of elementary entities in one mole of a substance.

**Azeotrope** - A liquid mixture in a state where the variation of vapor pressure with composition at constant temperature (or, alternatively, the variation of normal boiling point with composition) shows either a maximum or a minimum. Thus when an azeotrope boils the vapor has the same composition as the liquid.

**Azides** - Compounds bearing the group -N<sub>3</sub>, viz. -N=N<sup>+</sup>=N<sup>-</sup>; usually attached to carbon, e.g. PhN<sub>3</sub>, phenyl azide or azidobenzene. Also used for salts of hydrazoic acid, HN<sub>3</sub>, e.g. NaN<sub>3</sub>, sodium azide. [5]

**Azines** - Condensation products, R<sub>2</sub>C=NN=CR<sub>2</sub>, of two moles of a carbonyl compound with one mole of hydrazine. [5]

**Azo compounds** - Derivatives of diazene (diimide), HN=NH, wherein both hydrogens are substituted by hydrocarbyl groups, e.g., PhN=NPh, azobenzene or diphenyldiazene. [5]

**Balmer series** - The series of lines in the spectrum of the hydrogen atom which corresponds to transitions between the state with principal quantum number  $n = 2$  and successive higher states. The wavelengths are given by  $1/\lambda = R_H(1/4 - 1/n^2)$ , where  $n = 3, 4, \dots$  and  $R_H$  is the Rydberg constant for hydrogen. The first member of the series ( $n = 2 \rightleftharpoons 3$ ), which is often called the H $\alpha$  line, falls at a wavelength of 6563 Å.

**Bar (bar)** - A unit of pressure equal to 10<sup>5</sup> Pa.

**Bardeen-Cooper-Schrieffer (BCS) theory** - A theory of superconductivity which is based upon the formation of electron pairs as a result of an electron-lattice interaction. The theory relates the superconducting transition temperature to the density of states and the Debye temperature.

**Barn (b)** - A unit used for expressing cross sections of nuclear processes, equal to 10<sup>-28</sup> m<sup>2</sup>.

**Barrel** - A unit of volume equal to 158.9873 L.

**Baryon** - Any elementary particle built up from three quarks. Examples are the proton, neutron, and various short-lived hyperons. Baryons have odd half-integer spins.

**Base** - Historically, a substance that yields an OH<sup>-</sup> ion when it dissociates in solution, resulting in a pH > 7. In the Brønsted definition, a base is a substance capable of accepting a proton in any type of reaction. The more general definition, due to G.N. Lewis, classifies any chemical species capable of donating an electron pair as a base.

**Becquerel (Bq)\*** - The SI unit of radioactivity (disintegrations per unit time), equal to s<sup>-1</sup>. [1]

**Beer's law** - An approximate expression for the change in intensity of a light beam that passes through an absorbing medium, viz.,  $\log(I/I_0) = -\epsilon cl$ , where  $I_0$  is the incident intensity,  $I$  is the final intensity,  $\epsilon$  is the molar (decadic) absorption coefficient,  $c$  is the molar concentration of the absorbing substance, and  $l$  is the path length. Also called the Beer-Lambert law

**Binding energy\*** - A generic term for the energy required to decompose a system into two or more of its constituent parts. In nuclear physics, the binding energy is the energy differ-

ence between a nucleus and the separated nucleons of which it is composed (the energy equivalent of the mass defect). In atomic physics, it is the energy required to remove an electron from an atom.

**Biot (Bi)** - A name sometimes used for the unit of current in the emu system.

**Birefringence** - A property of certain crystals in which two refracted rays result from a single incident light ray. One, the ordinary ray, follows the normal laws of refraction, while the other, the extraordinary ray, exhibits a variable refractive index which depends on the direction in the crystal.

**Black body radiation\*** - The radiation emitted by a perfect black body, i.e., a body which absorbs all radiation incident on it and reflects none. The wavelength dependence of the radiated energy density  $\rho$  (energy per unit volume per unit wavelength range) is given by the Planck formula

$$\rho = \frac{8\pi hc}{\lambda^5 (e^{hc/\lambda kT} - 1)}$$

where  $\lambda$  is the wavelength,  $h$  is Planck's constant,  $c$  is the speed of light,  $k$  is the Boltzmann constant, and  $T$  is the temperature.

**Black hole** - A very dense object, formed in a supernova explosion, whose gravitational field is so large that no matter or radiation can escape from the object.

**Bloch wave function** - A solution of the Schrödinger equation for an electron moving in a spatially periodic potential; used in the band theory of solids.

**Bohr magneton ( $\mu_B$ )\*** - The atomic unit of magnetic moment, defined as  $eh/4\pi m_e$ , where  $h$  is Planck's constant,  $m_e$  the electron mass, and  $e$  the elementary charge. It is the moment associated with a single electron spin.

**Bohr, bohr radius ( $a_0$ )\*** - The radius of the lowest orbit in the Bohr model of the hydrogen atom, defined as  $\epsilon_0 h^2 / \pi m_e e^2$ , where  $\epsilon_0$  is the permittivity of a vacuum,  $h$  is Planck's constant,  $m_e$  the electron mass, and  $e$  the elementary charge. It is customarily taken as the unit of length when using atomic units.

**Boiling point** - The temperature at which the liquid and gas phases of a substance are in equilibrium at a specified pressure. The normal boiling point is the boiling point at normal atmospheric pressure (101.325 kPa).

**Boltzmann constant ( $k$ )\*** - The molar gas constant  $R$  divided by Avogadro's constant.

**Boltzmann distribution** - An expression for the equilibrium distribution of molecules as a function of their energy, in which the number of molecules in a state of energy  $E$  is proportional to  $\exp(-E/kT)$ , where  $k$  is the Boltzmann constant and  $T$  is the temperature.

**Bond strength** - See Dissociation energy.

**Born-Haber cycle\*** - A thermodynamic cycle in which a crystalline solid is converted to gaseous ions and then reconverted to the solid. The cycle permits calculation of the lattice energy of the crystal.

**Bose-Einstein distribution** - A modification of the Boltzmann distribution which applies to a system of particles that are bosons. The number of particles of energy  $E$  is proportional to  $[e^{(E-\mu)/kT} - 1]^{-1}$ , where  $\mu$  is a normalization constant,  $k$  is the Boltzmann constant, and  $T$  is the temperature.

**Boson** - A particle that obeys Bose-Einstein Statistics; specifically, any particle with spin equal to zero or an integer. This includes

the photon, pion, deuteron, and all nuclei of even mass number.

**Boyle's law** - The empirical law, exact only for an ideal gas, which states that the volume of a gas is inversely proportional to its pressure at constant temperature.

**Bragg angle ( $\theta$ )** - Defined by the equation  $n\lambda = 2d\sin\theta$ , which relates the angle  $\theta$  between a crystal plane and the diffracted x-ray beam, the wavelength  $\lambda$  of the x-rays, the crystal plane spacing  $d$ , and the diffraction order  $n$  (any integer).

**Bravais lattices\*** - The 14 distinct crystal lattices that can exist in three dimensions. They include three in the cubic crystal system, two in the tetragonal, four in the orthorhombic, two in the monoclinic, and one each in the triclinic, hexagonal, and trigonal systems.

**Breakdown voltage** - The potential difference at which an insulating substance undergoes a physical or chemical change that causes it to become a conductor, thus allowing current to flow through the sample.

**Bremsstrahlung** - Electromagnetic radiation generated when the velocity of a charged particle is reduced (literally, "braking radiation"). An example is the x-ray continuum resulting from collisions of electrons with the target in an x-ray tube.

**Brewster angle** - The angle of incidence for which the maximum degree of plane polarization occurs when a beam of unpolarized light is incident on the surface of a medium of refractive index  $n$ . At this angle, the angle between the reflected and refracted beams is  $90^\circ$ . The value of the Brewster angle is  $\tan^{-1}n$ .

**Brillouin scattering** - The scattering of light by acoustic phonons in a solid or liquid.

**Brillouin zone** - A region of allowed wave vectors and energy levels in a crystalline solid, which plays a part in the propagation of waves through the lattice.

**British thermal unit (Btu)** - A non-SI unit of energy, equal to approximately 1055 J. Several values of the Btu, defined in slightly different ways, have been used.

**Brownian motion** - The random movements of small particles suspended in a fluid, which arise from collisions with the fluid molecules.

**Brunauer-Emmett-Teller method (BET)** - See Techniques for Materials Characterization, page 12-1.

**Buffer\*** - A solution designed to maintain a constant pH when small amounts of a strong acid or base are added. Buffers usually consist of a fairly weak acid and its salt with a strong base. Suitable concentrations are chosen so that the pH of the solution remains close to the  $pK_a$  of the weak acid.

**Calorie (cal)** - A non-SI unit of energy, originally defined as the heat required to raise the temperature of 1 g of water by  $1^\circ\text{C}$ . Several calories of slightly different values have been used. The thermochemical calorie is now defined as 4.184 J.

**Candela (cd)\*** - The SI base unit of luminous intensity. [1]

**Capacitance (C)** - Ratio of the charge acquired by a body to the change in potential. [1]

**Carbamates** - Salts or esters of carbamic acid,  $\text{H}_2\text{NC}(=\text{O})\text{OH}$ , or of N-substituted carbamic acids:  $\text{R}_2\text{NC}(=\text{O})\text{OR}'$ , ( $\text{R}' = \text{hydrocarbyl}$  or a cation). The esters are often called urethanes or urethans, a usage that is strictly correct only for the ethyl esters. [5]

**Carbenes** - The electrically neutral species  $\text{H}_2\text{C}$ : and its derivatives, in which the carbon is covalently bonded to two univa-

lent groups of any kind or a divalent group and bears two non-bonding electrons, which may be spin-paired (singlet state) or spin-non-paired (triplet state). [5]

**Carbinols** - An obsolete term for substituted methanols, in which the name carbinol is synonymous with methanol. [5]

**Carbohydrates** - Originally, compounds such as aldoses and ketoses, having the stoichiometric formula  $C_n(H_2O)_n$  (hence "hydrates of carbon"). The generic term carbohydrate now includes mono-, oligo-, and polysaccharides, as well as their reaction products and derivatives. [5]

**Carboranes** - A contraction of carboranes. Compounds in which a boron atom in a polyboron hydride is replaced by a carbon atom with maintenance of the skeletal structure. [5]

**Carboxylic acids** - Oxoacids having the structure  $RC(=O)OH$ . The term is used as a suffix in systematic name formation to denote the  $-C(=O)OH$  group including its carbon atom. [5]

**Carnot cycle** - A sequence of reversible changes in a heat engine using a perfect gas as the working substance, which is used to demonstrate that entropy is a state function. The Carnot cycle also provides a means to calculate the efficiency of a heat engine.

**Catalyst** - A substance that participates in a particular chemical reaction and thereby increases its rate but without a net change in the amount of that substance in the system. [3]

**Catenanes, catena compounds** - Hydrocarbons having two or more rings connected in the manner of links of a chain, without a covalent bond. More generally, the class catena compounds embraces functional derivatives and hetero analogues. [5]

**Cation** - A positively charged atomic or molecular particle.

**Centipoise (cP)** - A common non-SI unit of viscosity, equal to mPa s.

**Centrifugal distortion** - An effect in molecular spectroscopy in which rotational levels are lowered in energy, relative to the values of a rigid rotor, as the rotational angular momentum increases. The effect may be understood classically as a stretching of the bonds in the molecule as it rotates faster, thus increasing the moment of inertia.

**Ceramic** - A nonmetallic material of very high melting point.

**Cerenkov radiation** - Light emitted when a beam of charged particles travels through a medium at a speed greater than the speed of light in the medium. It is typically blue in color.

**Cgs system of units** - A system of units based upon the centimeter, gram, and second. The cgs system has been supplanted by the International System (SI).

**Chalcogens** - The Group VIA elements (oxygen, sulfur, selenium, tellurium, and polonium). Compounds of these elements are called chalcogenides. [7]

**Chaotic system** - A complex system whose behavior is governed by deterministic laws but whose evolution can vary drastically when small changes are made in the initial conditions.

**Charge** - See Electric charge.

**Charles' law** - The empirical law, exact only for an ideal gas, which states that the volume of a gas is directly proportional to its temperature at constant pressure.

**Charm** - A quantum number introduced in particle physics to account for certain properties of elementary particles and their reactions.

**Chelate** - A compound characterized by the presence of bonds from two or more bonding sites within the same ligand to a central metal atom. [3]

**Chemical potential** - For a mixture of substances, the chemical potential of constituent B is defined as the partial derivative of the Gibbs energy  $G$  with respect to the amount (number of moles) of B, with temperature, pressure, and amounts of all other constituents held constant. Also called partial molar Gibbs energy. [2]

**Chemical shift\*** - A small change in the energy levels (and hence in the spectra associated with these levels) resulting from the effects of chemical binding in a molecule. The term is used in fields such as NMR, Mössbauer, and photoelectron spectroscopy, where the energy levels are determined primarily by nuclear or atomic effects.

**Chiral molecule** - A molecule which cannot be superimposed on its mirror image. A common example is an organic molecule containing a carbon atom to which four different atoms or groups are attached. Such molecules exhibit optical activity, i.e., they rotate the plane of a polarized light beam.

**Chlorocarbons** - Compounds consisting solely of chlorine and carbon. [5]

**Chromatography\*** - A method for separation of the components of a sample in which the components are distributed between two phases, one of which is stationary while the other moves. In gas chromatography the gas moves over a liquid or solid stationary phase. In liquid chromatography the liquid mixture moves through another liquid, a solid, or a gel. The mechanism of separation of components may be adsorption, differential solubility, ion-exchange, permeation, or other mechanisms. [6]

**Clapeyron equation** - A relation between pressure and temperature of two phases of a pure substance that are in equilibrium, viz.,  $dp/dT = \Delta_{\text{trs}} S / \Delta_{\text{trs}} V$ , where  $\Delta_{\text{trs}} S$  is the difference in entropy between the phases and  $\Delta_{\text{trs}} V$  the corresponding difference in volume.

**Clathrates** - Inclusion compounds in which the guest molecule is in a cage formed by the host molecule or by a lattice of host molecules. [5]

**Clausius (Cl)** - A non-SI unit of entropy or heat capacity defined as cal/K = 4.184 J/K. [2]

**Clausius-Clapeyron equation** - An approximation to the Clapeyron equation applicable to liquid-gas and solid-gas equilibrium, in which one assumes an ideal gas with volume much greater than the condensed phase volume. For the liquid-gas case, it takes the form  $d(\ln p)/dT = \Delta_{\text{vap}} H / RT^2$ , where  $R$  is the molar gas constant and  $\Delta_{\text{vap}} H$  is the molar enthalpy of vaporization. For the solid-gas case,  $\Delta_{\text{vap}} H$  is replaced by the molar enthalpy of sublimation,  $\Delta_{\text{sub}} H$ .

**Clausius-Mosotti equation** - A relation between the dielectric constant  $\epsilon_r$  at optical frequencies and the polarizability  $\alpha$ :

$$\frac{\epsilon_r - 1}{\epsilon_r + 2} = \frac{\rho N_A \alpha}{3M\epsilon_0}$$

where  $\rho$  is density,  $N_A$  is Avogadro's number,  $M$  is molar mass, and  $\epsilon_0$  is the permittivity of a vacuum.

**Clebsch-Gordon coefficients** - A set of coefficients used to describe the vector coupling of angular momenta in atomic and nuclear physics.

**Codon** - A set of three bases, chosen from the four primary bases found in the DNA molecule (uracil, cytosine, adenine, and guanine), which specifies the production of a particular amino

acid or carries some other genetic instruction. For example, the codon UCA specifies the amino acid serine, CAG specifies glutamine, etc. There are a total of 64 codons.

**Coercive force** - The magnetizing force at which the magnetic flux density is equal to zero. [10]

**Coercivity\*** - The maximum value of coercive force that can be attained when a magnetic material is symmetrically magnetized to saturation induction. [10]

**Coherent anti-Stokes Raman spectroscopy (CARS)** - See Techniques for Materials Characterization, page 12-1.

**Colloid** - Molecules or polymolecular particles dispersed in a medium that have, at least in one direction, a dimension roughly between 1 nm and 1  $\mu$ m. [3]

**Color center** - A defect in a crystal that gives rise to optical absorption, thus changing the color of the material. A common type is the F-center, which results when an electron occupies the site of a negative ion.

**Compressibility ( $\kappa$ )\*** - The fractional change of volume as pressure is increased, viz.,  $\kappa = -(1/V)(dV/dp)$ . [1]

**Compton wavelength ( $\lambda_c$ )\*** - In the scattering of electromagnetic radiation by a free particle (e.g., electron, proton),  $\lambda_c = h/mc$  is the increase in wavelength, at a 90° scattering angle, corresponding to the transfer of energy from radiation to particle. Here  $h$  is Planck's constant,  $c$  the speed of light, and  $m$  the mass of the particle.

**Conductance ( $G$ )\*** - For direct current, the reciprocal of resistance. More generally, the real part of admittance. [1]

**Conductivity, electrical ( $\sigma$ )\*** - The reciprocal of the resistivity. [1]

**Conductivity, thermal** - See Thermal conductivity.

**Congruent transformation** - A phase transition (melting, vaporization, etc.) in which the substance preserves its exact chemical composition.

**Constitutional repeating unit (CRU)** - In polymer science, the smallest constitutional unit, the repetition of which constitutes a regular macromolecule, i.e., a macromolecule with all units connected identically with respect to directional sense. [8]

**Copolymer** - A polymer derived from more than one species of monomer. [8]

**Coriolis effect** - The deviation from simple trajectories when a mechanical system is described in a rotating coordinate system. It affects the motion of projectiles on the earth and in molecular spectroscopy leads to an important interaction between the rotational and vibrational motions. The effect may be described by an additional term in the equations of motion, called the Coriolis force.

**Cosmic rays\*** - High energy nuclear particles, electrons, and photons, originating mostly outside the solar system, which continually bombard the earth's atmosphere.

**Coulomb (C)\*** - The SI unit of electric charge, equal to A s. [1]

**Coulomb's law** - The statement that the force  $F$  between two electrical charges  $q_1$  and  $q_2$  separated by a distance  $r$  is  $F = (4\pi\epsilon_0)^{-1} q_1 q_2 / r^2$ , where  $\epsilon_0$  is the permittivity of a vacuum.

**Covalent bond** - A chemical bond between two atoms whose stability results from the sharing of two electrons, one from each atom.

**Cowling number (Co)** - A dimensionless quantity used in plasma physics, defined by  $Co = B^2 / \mu \rho v^2$ , where  $\rho$  is density,  $v$  is velocity,  $\mu$  is permeability, and  $B$  is magnetic flux density. [2]

**CPT theorem** - A theorem in particle physics which states that any local Lagrangian theory that is invariant under proper

Lorentz transformations is also invariant under the combined operations of charge conjugation, C, space inversion, P, and time reversal, T, taken in any order.

**Critical point\*** - In general, the point on the phase diagram of a two-phase system at which the two coexisting phases have identical properties and therefore represent a single phase. At the liquid-gas critical point of a pure substance, the distinction between liquid and gas vanishes, and the vapor pressure curve ends. The coordinates of this point are called the critical temperature and critical pressure. Above the critical temperature, it is not possible to liquefy the substance.

**Cross section ( $\sigma$ )\*** - A measure of the probability of collision (or other interaction) between a beam of particles and a target which it encounters. In rough terms it is the effective area the target particles present to the incident ones; however, the precise definition depends on the nature of the interaction. A general definition of  $\sigma$  is the number of encounters per unit time divided by  $n\nu$ , where  $n$  is the concentration of incident particles and  $\nu$  their velocity.

**Crosslink** - In polymer science, a small region in a macromolecule from which at least four chains emanate, and formed by reactions involving sites or groups on existing macromolecules or by interactions between existing macromolecules. [8]

**Crown compounds** - Macrocyclic polydentate compounds, usually uncharged, in which three or more coordinating ring atoms (usually oxygen or nitrogen) are or may become suitably close for easy formation of chelate complexes with metal ions or other cationic species. [5]

**Crust\*** - The outer layer of the solid earth, above the Mohorovicic discontinuity. Its thickness averages about 35 km on the continents and about 7 km below the ocean floor.

**Cryoscopic constant ( $E_f$ )\*** - The constant that expresses the amount by which the freezing point  $T_f$  of a solvent is lowered by a non-dissociating solute, through the relation  $\Delta T_f = E_f m$ , where  $m$  is the molality of the solute.

**Curie (Ci)** - A non-SI unit of radioactivity (disintegrations per unit time), equal to  $3.7 \times 10^{10} \text{ s}^{-1}$ .

**Curie temperature ( $T_c$ )\*** - For a ferromagnetic material, the critical temperature above which the material becomes paramagnetic. Also applied to the temperature at which the spontaneous polarization disappears in a ferroelectric solid. [1]

**Cyanohydrins** - Alcohols substituted by a cyano group, most commonly, but not limited to, examples having a CN and an OH group attached to the same carbon atom. They are formally derived from aldehydes or ketones by the addition of hydrogen cyanide. [5]

**Cycloalkanes** - Saturated monocyclic hydrocarbons (with or without side chains). See alicyclic compounds. Unsaturated monocyclic hydrocarbons having one endocyclic double or one triple bond are called cycloalkenes and cycloalkynes, respectively. [5]

**Cyclotron resonance** - The resonant absorption of energy from a system in which electrons or ions that are orbiting in a uniform magnetic field are subjected to radiofrequency or microwave radiation. The resonance frequency is given by  $\nu = eH/2\pi m^* c$ , where  $e$  is the elementary charge,  $H$  is the magnetic field strength,  $m^*$  is the effective mass of the charged particle, and  $c$  is the speed of light. The effect occurs in both solids (involving electrons or holes) and in low pressure gases (involving ions)

**Dalton (Da)** - A name sometimes used in biochemistry for the unified atomic mass unit (u).

**De Broglie wavelength** - The wavelength associated with the wave representation of a moving particle, given by  $h/mv$ , where  $h$  is Planck's constant,  $m$  the particle mass, and  $v$  the velocity.

**De Haas-Van Alphen effect** - An effect observed in certain metals and semiconductors at low temperatures and high magnetic fields, characterized by a periodic variation of magnetic susceptibility with field strength.

**Debye equation\*** - The relation between the relative permittivity (dielectric constant)  $\epsilon_r$ , polarizability  $\alpha$ , and permanent dipole moment  $\mu$  in a dielectric material whose molecules are free to rotate. It takes the form

$$\frac{\epsilon_r - 1}{\epsilon_r + 2} = \frac{\rho N_A}{3M\epsilon_0} \left( \alpha + \frac{\mu^2}{3kT} \right)$$

where  $\rho$  is density,  $N_A$  is Avogadro's number,  $M$  is molar mass, and  $\epsilon_0$  is the permittivity of a vacuum.

**Debye length** - In the Debye-Hückel theory of ionic solutions, the effective thickness of the cloud of ions of opposite charge which surrounds each given ion and shields the Coulomb potential produced by that ion.

**Debye temperature ( $\theta_D$ )\*** - In the Debye model of the heat capacity of a crystalline solid,  $\theta_D = hv_D/k$ , where  $h$  is Planck's constant,  $k$  is the Boltzmann constant, and  $v_D$  is the maximum vibrational frequency the crystal can support. For  $T \ll \theta_D$ , the heat capacity is proportional to  $T^3$ .

**Debye unit (D)** - A non-SI unit of electric dipole moment used in molecular physics, equal to  $3.335641 \times 10^{-30}$  C m.

**Debye-Waller factor (D)** - The factor by which the intensity of a diffraction line is reduced because of lattice vibrations. [1]

**Defect** - Any departure from the regular structure of a crystal lattice. A Frenkel defect results when an atom or ion moves to an interstitial position and leaves behind a vacancy. A Schottky defect involves either a vacancy where the atom has moved to the surface or a structure where a surface atom has moved to an interstitial position.

**Degree of polymerization** - The number of monomeric units in a macromolecule or an oligomer molecule. [8]

**Dendrite** - A tree-like crystalline pattern often observed, for example, in ice crystals and alloys in which the crystal growth branches repeatedly.

**Density ( $\rho$ )\*** - In the most common usage, mass density or mass per unit volume. More generally, the amount of some quantity (mass, charge, energy, etc.) divided by a length, area, or volume.

**Density of states ( $N_E, \rho$ )** - The number of one-electron states in an infinitesimal interval of energy, divided by the range of that interval and by volume. [1]

**Dew point\*** - The temperature at which liquid begins to condense as the temperature of a gas mixture is lowered. In meteorology, it is the temperature at which moisture begins to condense on a surface in contact with the air.

**Diamagnetism** - A type of magnetism characterized by a negative magnetic susceptibility, so that the material, when placed in an external magnetic field, becomes weakly magnetized in the direction opposite to the field. This magnetization is independent of temperature.

**Diazo compounds** - Compounds having the divalent diazo group,  $=N^+=N^-$ , attached to a carbon atom, e.g.,  $CH_2=N_2$  diazomethane. [5]

**Dielectric constant ( $\epsilon$ )\*** - Ratio of the electric displacement in a medium to the electric field strength. Also called permittivity. [1]

**Dienes** - Compounds that contain two fixed double bonds (usually assumed to be between carbon atoms). Dienes in which the two double-bond units are linked by one single bond are termed conjugated. [5]

**Differential scanning calorimetry (DSC)** - See Techniques for Materials Characterization, page 12-1.

**Differential thermal analysis (DTA)** - See Techniques for Materials Characterization, page 12-1.

**Diffusion\*** - The migration of atoms, molecules, ions, or other particles as a result of some type of gradient (concentration, temperature, etc.).

**Dioptr** - A unit used in optics, formally equal to  $m^{-1}$ . It is used in expressing dioptric power, which is the reciprocal of the focal length of a lens.

**Dipole moment, electric ( $p, \mu$ )\*** - For a distribution of equal positive and negative charge, the magnitude of the dipole moment vector is the positive charge multiplied by the distance between the centers of positive and negative charge distribution. The direction is given by the line from the center of negative charge to the center of positive charge.

**Dipole moment, magnetic ( $m, \mu$ )** - Formally defined in electromagnetic theory as a vector quantity whose vector product with the magnetic flux density equals the torque. The magnetic dipole generated by a current  $I$  flowing in a small loop of area  $A$  has a magnetic moment of magnitude  $IA$ . In atomic and nuclear physics, a magnetic moment is associated with the angular momentum of a particle; e.g., an electron with orbital angular momentum  $l$  exhibits a magnetic moment of  $-el/2m_e$  where  $e$  is the elementary charge and  $m_e$  the mass of the electron. [1]

**Disaccharides** - Compounds in which two monosaccharides are joined by a glycosidic bond. [5]

**Dislocation** - An extended displacement of a crystal from a regular lattice. An edge dislocation results when one portion of the crystal has partially slipped with respect to the other, resulting in an extra plane of atoms extending through part of the crystal. A screw dislocation transforms successive atomic planes into the surface of a helix.

**Dispersion** - Splitting of a beam of light (or other electromagnetic radiation) of mixed wavelengths into the constituent wavelengths as a result of the variation of refractive index of the medium with wavelength.

**Dissociation constant\*** - The equilibrium constant for a chemical reaction in which a compound dissociates into its constituent parts.

**Dissociation energy ( $D_0$ )\*** - For a diatomic molecule, the difference between the energies of the free atoms at rest and the minimum in the potential energy curve. The term bond dissociation energy ( $D_0$ ), which can be applied to polyatomic molecules as well, is used for the difference between the energies of the fragments resulting when a bond is broken and the energy of the original molecule in its lowest energy state. The term bond strength implies differences in enthalpy rather than energy.

- Domain** - A small region of a solid in which the magnetic or electric moments of the individual units (atoms, molecules, or ions) are aligned in the same direction.
- Domain wall** - The transition region between adjacent ferromagnetic domains, generally a layer with a thickness of a few hundred ångström units. Also called Bloch wall.
- Doppler effect** - The change in the apparent frequency of a wave (sound, light, or other) when the source of the wave is moving relative to the observer.
- Dose equivalent ( $H$ )** - The product of the absorbed dose of radiation at a point of interest in tissue and various modifying factors which depend on the type of tissue and radiation. [1]
- Drift velocity** - The velocity of charge carriers (electrons, ions, etc.) moving under the influence of an electric field in a medium which subjects the carriers to some frictional force.
- Dyne (dyn)** - A non-SI (cgs) unit of force, equal to  $10^{-5}$  N.
- Ebullioscopic constant ( $E_b$ )\*** - The constant that expresses the amount by which the boiling point  $T_b$  of a solvent is raised by a non-dissociating solute, through the relation  $\Delta T_b = E_b m$ , where  $m$  is the molality of the solute.
- Eddy currents** - Circulating currents set up in conducting bulk materials or sheets by varying magnetic fields.
- Effinghausen effect** - The appearance of a temperature gradient in a current carrying conductor that is placed in a transverse magnetic field. The direction of the gradient is perpendicular to the current and the field.
- Eigenvalue** - An allowed value of the constant  $a$  in the equation  $Au = au$ , where  $A$  is an operator acting on a function  $u$  (which is called an eigenfunction). In quantum mechanics, the outcome of any observation is an eigenvalue of the corresponding operator. Also called characteristic value.
- Einstein** - A non-SI unit used in photochemistry, equal to one mole of photons.
- Einstein temperature ( $\theta_v$ )** - In the Einstein theory of the heat capacity of a crystalline solid,  $\theta_v = hv/k$ , where  $h$  is Planck's constant,  $k$  is the Boltzmann constant, and  $v$  is the vibrational frequency of the crystal.
- Einstein transition probability** - A constant in the Einstein relation  $A_{ij} + B_{ij}\rho$  for the probability of a transition between two energy levels  $i$  and  $j$  in a radiation field of energy density  $\rho$ . The  $A_{ij}$  coefficient describes the probability of spontaneous emission, while  $B_{ij}$  and  $B_{ji}$  govern the probability of stimulated emission and absorption, respectively ( $B_{ij} = B_{ji}$ ).
- Elastic limit** - The greatest stress which a material is capable of sustaining without any permanent strain remaining after complete release of the stress. [10]
- Elastic modulus** - See Young's modulus.
- Electric charge ( $Q$ )** - The quantity of electricity; i.e., the property that controls interactions between bodies through electrical forces.
- Electric current ( $I$ )** - The charge passing through a circuit per unit time. [1]
- Electric displacement ( $D$ )** - A vector quantity whose magnitude equals the electric field strength multiplied by the permittivity of the medium and whose direction is the same as that of the field strength.
- Electric field strength ( $E$ )** - The force exerted by an electric field on a point charge divided by the electric charge. [1]
- Electric potential ( $V$ )** - A scalar quantity whose gradient is equal to the negative of the electric field strength.
- Electrical conductance** - See Conductance.
- Electrical resistance** - See Resistance.
- Electrical resistivity** - See Resistivity.
- Electrochemical series\*** - An arrangement of reactions which produce or consume electrons in an order based on standard electrode potentials. A common arrangement places metals in decreasing order of their tendency to give up electrons.
- Electrode potential\*** - The electromotive force of a cell in which the electrode on the left is the standard hydrogen electrode and that on the right is the electrode in question. [2]
- Electrolysis** - The decomposition of a substance as a result of passing an electric current between two electrodes immersed in the sample.
- Electromotive force (emf)** - The energy supplied by a source divided by the charge transported through the source. [1]
- Electron\*** - An elementary particle in the family of leptons, with negative charge and spin of  $1/2$ .
- Electron affinity\*** - The energy difference between the ground state of a gas-phase atom or molecule and the lowest state of the corresponding negative ion.
- Electron cyclotron resonance (ECR)** - See Techniques for Materials Characterization, page 12-1.
- Electron energy loss spectroscopy (EELS)** - See Techniques for Materials Characterization, page 12-1.
- Electron nuclear double resonance (ENDOR)** - See Techniques for Materials Characterization, page 12-1.
- Electron paramagnetic resonance (EPR)** - See Techniques for Materials Characterization, page 12-1.
- Electron probe microanalysis (EPMA)** - See Techniques for Materials Characterization, page 12-1.
- Electron spectroscopy for chemical analysis (ESCA)** - See Techniques for Materials Characterization, page 12-1.
- Electron spin ( $s$ )** - The quantum number, equal to  $1/2$ , that specifies the intrinsic angular momentum of the electron.
- Electron stimulated desorption (ESD)** - See Techniques for Materials Characterization, page 12-1.
- Electron volt (eV)\*** - A non-SI unit of energy used in atomic and nuclear physics, equal to approximately  $1.602177 \times 10^{-19}$  J. The electron volt is defined as the kinetic energy acquired by an electron upon acceleration through a potential difference of 1 V. [1]
- Electronegativity\*** - A parameter originally introduced by Pauling which describes, on a relative basis, the power of an atom or group of atoms to attract electrons from the same molecular entity. [3]
- Electrophoresis** - The motion of macromolecules or colloidal particles in an electric field. [3]
- Emissivity ( $\epsilon$ )\*** - Ratio of the radiant flux emitted per unit area to that of an ideal black body at the same temperature. Also called emittance. [1]
- Emu** - The electromagnetic system of units, based upon the cm, g, and s plus the emu of current (sometimes called the abampere).
- Enantiomers** - A chiral molecule and its non-superposable mirror image. The two forms rotate the plane of polarized light by equal amounts in opposite directions. Also called optical isomers.
- Energy ( $E, U$ )\*** - The characteristic of a system that enables it to do work.

**Energy gap\*** - In the theory of solids, the region between two energy bands, in which no bound states can occur.

**Enols, alkenols** - The term refers specifically to vinylic alcohols, which have the structure  $\text{HO-CR}'=\text{CR}_2$ . Enols are tautomeric with aldehydes ( $\text{R}' = \text{H}$ ) or ketones ( $\text{R}'$  not equal to  $\text{H}$ ). [5]

**Enthalpy ( $H$ )\*** - A thermodynamic function, especially useful when dealing with constant-pressure processes, defined by  $H = E + PV$ , where  $E$  is energy,  $P$  pressure, and  $V$  volume. [1]

**Enthalpy of combustion\*** - The enthalpy change in a combustion reaction. Its negative is the heat released in combustion.

**Enthalpy of formation, standard\*** - The enthalpy change for the reaction in which a substance is formed from its constituent elements, each in its standard reference state (normally refers to 1 mol, sometimes to 1 g, of the substance).

**Enthalpy of fusion\*** - The enthalpy change in the transition from solid to liquid state.

**Enthalpy of sublimation** - The enthalpy change in the transition from solid to gas state.

**Enthalpy of vaporization\*** - The enthalpy change in the transition from liquid to gas state.

**Entropy ( $S$ )\*** - A thermodynamic function defined such that when a small quantity of heat  $dQ$  is received by a system at temperature  $T$ , the entropy of the system is increased by  $dQ/T$ , provided that no irreversible change takes place in the system. [1]

**Entropy unit (e.u.)** - A non-SI unit of entropy, equal to 4.184 J/K mol.

**Ephemeris time** - Time measured in tropical years from January 1, 1900.

**Epoxy compounds** - Compounds in which an oxygen atom is directly attached to two adjacent or non-adjacent carbon atoms of a carbon chain or ring system; thus cyclic ethers. [5]

**Equation of continuity** - Any of a class of equations that express the fact that some quantity (mass, charge, energy, etc.) cannot be created or destroyed. Such equations typically specify that the rate of increase of the quantity in a given region of space equals the net current of the quantity flowing into the region.

**Equation of state\*** - An equation relating the pressure, volume, and temperature of a substance or system.

**Equilibrium constant ( $K$ )\*** - For a chemical reaction  $aA + bB \rightleftharpoons cC + dD$ , the equilibrium constant is defined by:

$$K = \frac{a_C^c \cdot a_D^d}{a_A^a \cdot a_B^b}$$

where  $a_i$  is the activity of component  $i$ . To a certain approximation, the activities can be replaced by concentrations. The equilibrium constant is related to  $\Delta_r G^\circ$ , the standard Gibbs energy change in the reaction, by  $RT \ln K = -\Delta_r G^\circ$ .

**Equivalent conductance** - See Conductivity, electrical

**Erg (erg)** - A non-SI (cgs) unit of energy, equal to  $10^{-7}$  J.

**Esters** - Compounds formally derived from an oxoacid  $\text{RC}(=\text{O})(\text{OH})$  and an alcohol, phenol, heteroarenol, or enol by linking, with formal loss of water from an acidic hydroxy group of the former and a hydroxy group of the latter. [5]

**Esu** - The electrostatic system of units, based upon the cm, g, and s plus the esu of charge (sometimes called the statcoulomb or franklin).

**Ethers** - Compounds with formula  $\text{ROR}$ , where  $\text{R}$  is not equal to  $\text{H}$ . [5]

**Euler number ( $Eu$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Eu = \Delta p / \rho v^2$ , where  $p$  is pressure,  $\rho$  is density, and  $v$  is velocity. [2]

**Eutectic** - The point on a two-component solid-liquid phase diagram which represents the lowest melting point of any possible mixture. A liquid having the eutectic composition will freeze at a single temperature without change of composition.

**Excitance ( $M$ )** - Radiant energy flux leaving an element of a surface divided by the area of that element. [1]

**Exciton** - A localized excited state consisting of a bound electron-hole pair in a molecular or ionic crystal. The exciton can propagate through the crystal.

**Exosphere** - The outermost part of the earth's atmosphere, beginning at about 500 to 1000 km above the surface. It is characterized by densities so low that air molecules can escape into outer space.

**Expansion coefficient** - See thermal expansion coefficient.

**Extended electron energy loss fine structure (EXELFS)** - See Techniques for Materials Characterization, page 12-1.

**Extended x-ray absorption fine structure (EXAFS)** - See Techniques for Materials Characterization, page 12-1.

**Extinction coefficient** - See Absorption coefficient, molar.

**F-Center** - See Color center.

**Fahrenheit temperature ( $^\circ\text{F}$ )** - The temperature scale based on the assignment of  $32^\circ\text{F} = 0^\circ\text{C}$  and a temperature interval of  $^\circ\text{F} = (5/9)^\circ\text{C}$ ; i.e.,  $t/^\circ\text{F} = (9/5)t/^\circ\text{C} + 32$ .

**Farad ( $\text{F}$ )\*** - The SI unit of electric capacitance, equal to  $\text{C/V}$ . [1]

**Faraday constant ( $F$ )\*** - The electric charge of 1 mol of singly charged positive ions; i.e.,  $F = N_A e$ , where  $N_A$  is Avogadro's constant and  $e$  is the elementary charge. [1]

**Faraday effect\*** - The rotation of the plane of plane-polarized light by a medium placed in a magnetic field parallel to the direction of the light beam. The effect can be observed in solids, liquids, and gasses.

**Fatty acids** - Aliphatic monocarboxylic acids derived from or contained in esterified form in an animal or vegetable fat, oil, or wax. Natural fatty acids commonly have a chain of 4 to 28 carbons (usually unbranched and even-numbered), which may be saturated or unsaturated. By extension, the term is sometimes used to embrace all acyclic aliphatic carboxylic acids. [5]

**Fermat's principle** - The law that a ray of light traversing one or more media will follow a path which minimizes the time required to pass between two given points.

**Fermi (f)** - Name sometimes used in nuclear physics for the femtometer.

**Fermi level** - The highest energy of occupied states in a solid at zero temperature. Sometimes called Fermi energy. The Fermi surface is the surface in momentum space formed by electrons occupying the Fermi level.

**Fermi resonance** - An effect observed in vibrational spectroscopy when an overtone of one fundamental vibration closely coincides in energy with another fundamental of the same symmetry species. It leads to a splitting of vibrational bands.

**Fermi-Dirac distribution** - A modification of the Boltzmann distribution which takes into account the Pauli exclusion principle. The number of particles of energy  $E$  is proportional to  $[e^{(E-\mu)/kT} + 1]^{-1}$ , where  $\mu$  is a normalization constant,  $k$  the Boltzmann constant, and  $T$  the temperature. The distribution is applicable to a system of fermions.

**Fermion** - A particle that obeys Fermi-Dirac statistics. Specifically, any particle with spin equal to an odd multiple of  $1/2$ . Examples are the electron, proton, neutron, muon, etc.

**Ferrimagnetism\*** - A type of magnetism in which the magnetic moments of atoms in a solid are ordered into two nonequivalent sublattices with unequal magnetic moments, leading to a nonzero magnetic susceptibility.

**Ferrite** - A ferrimagnetic material of nominal formula  $MFe_2O_4$ , where  $M$  is a divalent metal; widely used in microwave switches and other solid state devices.

**Ferroelectricity\*** - The retention of electric polarization by certain materials after the external field that produced the polarization has been removed.

**Ferromagnetism\*** - A type of magnetism in which the magnetic moments of atoms in a solid are aligned within domains which can in turn be aligned with each other by a weak magnetic field. Some ferromagnetic materials can retain their magnetization when the external field is removed, as long as the temperature is below a critical value, the Curie temperature. They are characterized by a large positive magnetic susceptibility.

**Fick's law** - The statement that the flux  $J$  of a diffusing substance is proportional to the concentration gradient, i.e.,  $J = -D(dc/dx)$ , where  $D$  is called the diffusion coefficient.

**Field** - A mathematical construct which describes the interaction between particles resulting from gravity, electromagnetism, or other physical phenomena. In classical physics a field is described by equations. Quantum field theory introduces operators to represent the physical observables.

**Field emission microscopy (FEM)** - See Techniques for Materials Characterization, page 12-1.

**Field ion microscopy (FIM)** - See Techniques for Materials Characterization, page 12-1.

**Fine structure** - The splitting in spectral lines that results from interactions of the electron spin with the orbital angular momentum.

**Fine structure constant ( $\alpha$ )\*** - Defined as  $e^2/2hc\epsilon_0$ , where  $e$  is the elementary charge,  $h$  Planck's constant,  $c$  the speed of light, and  $\epsilon_0$  the permittivity of a vacuum. It is a measure of the strength of the electromagnetic interaction between particles.

**First radiation constant ( $c_1$ )\*** - Constant ( $= 2\pi hc^2$ ) in the equation for the radiant exitance  $M_\lambda$  of a black body:

$$M_\lambda = \frac{c_1 \lambda^{-5} \Delta\lambda}{e^{c_2/\lambda T} - 1}$$

where  $\lambda$  is the wavelength,  $T$  is the temperature, and  $c_2 = hc/k$  is the second radiation constant.

**Flash point** - The lowest temperature at which vapors above a volatile combustible substance will ignite in air when exposed to a flame. [10]

**Fluence ( $F$ )** - Term used in photochemistry to specify the energy per unit area delivered in a given time interval, for example by a laser pulse. [2]

**Fluorocarbons** - Compounds consisting solely of fluorine and carbon. [5]

**Fluxoid** - The quantum of magnetic flux in superconductivity theory, equal to  $hc/2e$ , where  $h$  is Planck's constant,  $c$  the velocity of light, and  $e$  the elementary charge.

**Force ( $F$ )** - The rate of change of momentum with time. [1]

**Force constants ( $f, k$ )\*** - In molecular vibrations, the coefficients in the expression of the potential energy in terms of atom displacements from their equilibrium positions. In a diatomic molecule,  $f = d^2V/dr^2$ , where  $V(r)$  is the potential energy and  $r$  is the interatomic distance. [2]

**Fourier number ( $Fo$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Fo = at/l^2$ , where  $a$  is thermal diffusivity,  $t$  is time, and  $l$  is length. [2]

**Fourier transform infrared spectroscopy (FTIR)** - A technique for obtaining an infrared spectrum by use of an interferometer in which the path length of one of the beams is varied. A Fourier transformation of the resulting interferogram yields the actual spectrum. The technique is also used for NMR and other types of spectroscopy.

**Fractals** - Geometrical objects that are self-similar under a change of scale; i.e., they appear similar at all levels of magnification. They can be considered to have fractional dimensionality. Examples occur in diverse fields such as geography (rivers and shorelines), biology (trees), and solid state physics (amorphous materials).

**Franck-Condon principle** - An important principle in molecular spectroscopy which states that the nuclei in a molecule remain essentially stationary while an electronic transition is taking place. The physical interpretation rests on the fact that the electrons move much more rapidly than the nuclei because of their much smaller mass.

**Franklin (Fr)** - Name sometimes given to the unit of charge in the esu system.

**Fraunhofer diffraction** - Diffraction of light in situations where the source and observation point are so far removed that the wave surfaces may be considered planar.

**Fraunhofer lines** - Sharp absorption lines in the spectrum of sunlight, caused by absorption of the solar blackbody radiation by atoms near the sun's surface.

**Free radical** - See Radicals. The term "free radical" is often used more broadly for molecules that have a paramagnetic ground state (e.g.,  $O_2$ ) and sometimes for any transient or highly reactive molecular species.

**Freezing point** - See Melting point.

**Frequency ( $\nu$ )\*** - Number of cycles of a periodic phenomenon divided by time. [1]

**Fresnel diffraction** - Diffraction of light in a situation where the source and observation point are sufficiently close together that the curvature of the wave surfaces must be taken into account.

**Froude number ( $Fr$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Fr = v/(lg)^{1/2}$ , where  $v$  is velocity,  $l$  is length, and  $g$  is acceleration due to gravity. [2]

**Fugacity ( $f_B$ )** - For a gas mixture, the fugacity of component B is defined as the absolute activity  $\lambda_B$  times the limit, as the pressure  $p$  approaches zero at constant temperature, of  $p_B/\lambda_B$ . [2]

**Fullerenes** - Compounds composed solely of an even number of carbon atoms, which form a cage-like fused-ring polycyclic system with twelve five-membered rings and the rest six-membered rings. The archetypal example is [60]fullerene, where the atoms and bonds delineate a truncated icosahedron. The term has been broadened to include any closed cage structure consisting entirely of three-coordinate carbon atoms. [5]

**Fulvalenes** - The hydrocarbon fulvalene and its derivatives formed by substitution (and by extension, analogues formed

by replacement of one or more carbon atoms of the fulvalene skeleton by a heteroatom). [5]

**Fulvenes** - The hydrocarbon fulvene and its derivatives formed by substitution (and by extension, analogues formed by replacement of one or more carbon atoms of the fulvene skeleton by a heteroatom). [5]

**Fundamental vibrational frequencies\*** - In molecular spectroscopy, the characteristic vibrational frequencies obtained when the vibrational energy is expressed in normal coordinates. They determine the primary features of the infrared and Raman spectra of the molecule.

$\gamma$  - Name sometimes used for microgram.

**$\gamma$ -rays\*** - Electromagnetic radiation (photons) with energy greater than about 0.1 MeV (wavelength less than about 1 pm).

**$g$ -Factor of the electron\*** - The proportionality factor in the equation relating the magnetic moment  $\mu$  of an electron to its total angular momentum quantum number  $J$ , i.e.,  $\mu = -g\mu_B J$ , where  $\mu_B$  is the Bohr magneton. Also called Landé factor.

**Gal** - A non-SI unit of acceleration, equal to 0.01 m/s. Also called galileo.

**Gallon (US)** - A unit of volume equal to 3.785412 L.

**Gallon (UK, Imperial)** - A unit of volume equal to 4.546090 L.

**Gauss (G)** - A non-SI unit of magnetic flux density ( $B$ ) equal to  $10^{-4}$  T.

**Gaussian system of units** - A hybrid system used in electromagnetic theory, which combines features of both the esu and emu systems.

**Gel** - A colloidal system with a finite, but usually rather small, yield stress (the shear stress at which yielding starts abruptly). [3]

**Genetic code\*** - The set of relations between each of the 64 codons of DNA and a specific amino acid (or other genetic instruction).

**Gibbs energy ( $G$ )\*** - An important function in chemical thermodynamics, defined by  $G = H - TS$ , where  $H$  is the enthalpy,  $S$  the entropy, and  $T$  the thermodynamic temperature. Sometimes called Gibbs free energy and, in older literature, simply "free energy". [2]

**Gibbs phase rule** - The relation  $F = C - P + 2$ , where  $C$  is the number of components in a mixture,  $P$  is the number of phases, and  $F$  is the degrees of freedom, i.e., the number of intensive variables that can be changed independently without affecting the number of phases.

**Glass transition temperature\*** - The temperature at which an amorphous polymer is transformed, in a reversible way, from a viscous or rubbery condition to a hard and relatively brittle one. [10]

**Glow discharge mass spectroscopy (GDMS)** - See Techniques for Materials Characterization, page 12-1.

**Glueon** - A hypothetical particle postulated to take part in the binding of quarks, in analogy to the role of the photon in electromagnetic interactions.

**Glycerides** - Esters of glycerol (propane-1,2,3-triol) with fatty acids, widely distributed in nature. They are by long-established custom subdivided into triglycerides, 1,2- or 1,3-diglycerides, and 1- or 2-monoglycerides, according to the number and positions of acyl groups. [5]

**Glycols** - Dihydric alcohols in which two hydroxy groups are on different carbon atoms, usually but not necessarily adjacent. Also called diols. [5]

**Grain (gr)** - A non-SI unit of mass, equal to 64.79891 mg.

**Grain boundary** - The interface between two regions of different crystal orientation.

**Grashof number ( $Gr$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Gr = l^3 g \alpha \Delta T \rho^2 / \eta^2$ , where  $T$  is temperature,  $\rho$  is density,  $l$  is length,  $\eta$  is viscosity,  $\alpha$  is cubic expansion coefficient, and  $g$  is acceleration of gravity. [2]

**Gravitational constant ( $G$ )\*** - The universal constant in the equation for the gravitational force between two particles,  $F = G m_1 m_2 / r^2$ , where  $r$  is the distance between the particles and  $m_1$  and  $m_2$  are their masses. [1]

**Gray (Gy)\*** - The SI unit of absorbed dose of radiation, equal to J/kg. [1]

**Gregorian calendar** - The modification of the Julian calendar introduced in 1582 by Pope Gregory XII which specified that a year divisible by 100 is a leap year only if divisible by 400.

**Grignard reagents** - Organomagnesium halides,  $RMgX$ , having a carbon-magnesium bond (or their equilibrium mixtures in solution with  $R_2Mg + MgX_2$ ). [5]

**Gruneisen parameter ( $\gamma$ )** - Defined by  $\gamma = \alpha_v / \kappa c_v \rho$ , where  $\alpha_v$  is the cubic thermal expansion coefficient,  $\kappa$  is the isothermal compressibility,  $c_v$  is the specific heat capacity at constant volume, and  $\rho$  is the mass density.  $\gamma$  is independent of temperature for most crystalline solids. [1]

**Gyromagnetic ratio ( $\gamma$ )** - Ratio of the magnetic moment of a particle to its angular momentum. Also called magnetogyric ratio.

**Hadron** - Any elementary particle that can take part in the strong interaction. Hadrons are subdivided into baryons, with odd half integer spins, and mesons, which have zero or integral spin.

**Hall effect\*** - The development of a transverse potential difference  $V$  in a conducting material when subjected to a magnetic field  $H$  perpendicular to the direction of the current. The potential difference is given by  $V = R_H B J t$ , where  $B$  is the magnetic induction,  $J$  the current density,  $t$  the thickness of the specimen in the direction of the potential difference, and  $R_H$  is called the Hall coefficient.

**Halocarbon** - A compound containing no elements other than carbon, hydrogen, and one or more halogens. In common practice, the term is used mainly for compounds of no more than four or five carbon atoms.

**Halogens** - The elements F, Cl, Br, I, and At. Compounds of these elements are called halogenides or halides. [7]

**Hamiltonian ( $H$ )** - An expression for the total energy of a mechanical system in terms of the momenta and positions of constituent particles. In quantum mechanics, the Hamiltonian operator appears in the eigenvalue equation  $H\psi = E\psi$ , where  $E$  is an energy eigenvalue and  $\psi$  the corresponding eigenfunction.

**Hardness\*** - The resistance of a material to deformation, indentation, or scratching. Hardness is measured on various scales, such as Mohs, Brinell, Knoop, Rockwell, and Vickers. [10]

**Hartmann number ( $Ha$ )** - A dimensionless quantity used in plasma physics, defined by  $Ha = Bl(\kappa/\eta)^{1/2}$ , where  $B$  is magnetic flux density,  $l$  is length,  $\kappa$  is electric conductivity, and  $\eta$  is viscosity. [2]

**Hartree ( $E_h$ )\*** - An energy unit used in atomic and molecular science, equal to approximately  $4.3597482 \times 10^{-18}$  J.

**Hartree-Fock method** - A iterative procedure for solving the Schrödinger equation for an atom or molecule in which the equation is solved for each electron in an initial assumed po-

tential from all the other electrons. The new potential that results is used to repeat the calculation and the procedure continued until convergence is reached. Also called self-consistent field (SCF) method.

**Heat capacity\*** - Defined in general as  $dQ/dT$ , where  $dQ$  is the amount of heat that must be added to a system to increase its temperature by a small amount  $dT$ . The heat capacity at constant pressure is  $C_p = (\partial H/\partial T)_p$ ; that at constant volume is  $C_v = (\partial E/\partial T)_v$ , where  $H$  is enthalpy,  $E$  is internal energy,  $p$  is pressure,  $V$  is volume, and  $T$  is temperature. An upper case  $C$  normally indicates the molar heat capacity, while a lower case  $c$  is used for the specific (per unit mass) heat capacity. [1]

**Heat of formation, vaporization, etc.** - See corresponding terms under Enthalpy.

**Hectare (ha)** - A unit of area equal to  $10^4$  m<sup>2</sup>. [1]

**Heisenberg uncertainty principle** - The statement that two observable properties of a system that are complementary, in the sense that their quantum-mechanical operators do not commute, cannot be specified simultaneously with absolute precision. An example is the position and momentum of a particle; according to this principle, the uncertainties in position  $\Delta q$  and momentum  $\Delta p$  must satisfy the relation  $\Delta p \Delta q \geq h/4\pi$ , where  $h$  is Planck's constant.

**Heitler-London model** - An early quantum-mechanical model of the hydrogen atom which introduced the concept of the exchange interaction between electrons as the primary reason for stability of the chemical bond.

**Helicon** - A low-frequency wave generated when a metal at low temperature is exposed to a uniform magnetic field and a circularly polarized electric field.

**Helmholz energy (A)** - A thermodynamic function defined by  $A = E - TS$ , where  $E$  is the energy,  $S$  the entropy, and  $T$  the thermodynamic temperature. [2]

**Hemiacetals** - Compounds having the general formula  $R_2C(OH)OR'$  ( $R'$  not equal to H). [5]

**Henry (H)\*** - The SI unit of inductance, equal to Wb/A. [1]

**Henry's law\*** - An expression which applies to an ideal dilute solution in which one or more gasses are dissolved, viz.,  $p_i = H_i x_i$ , where  $p_i$  is the partial pressure of component  $i$  above the solution,  $x_i$  is its mole fraction in the solution, and  $H_i$  is the Henry's law constant (a characteristic of the given gas and solvent, as well as the temperature).

**Hermitian operator** - An operator  $A$  that satisfies the relation  $\int u_m^* A u_n dx = (\int u_n^* A u_m dx)^*$ , where  $*$  indicates the complex conjugate. The eigenvalues of Hermitian operators are real, and eigenfunctions belonging to different eigenvalues are orthogonal.

**Hertz (Hz)** - The SI unit of frequency, equal to s<sup>-1</sup>. [1]

**Heterocyclic compounds** - Cyclic compounds having as ring members atoms of at least two different elements, e.g., quinine, 1,2-thiazole, bicyclo[3.3.1]tetrasiloxane. [5]

**Heusler alloys** - Alloys of manganese, copper, aluminum, nickel, and sometimes other metals which find important uses as permanent magnets.

**Holography** - A technique for creating a three-dimensional image of a object by recording the interference pattern between a light beam diffracted from the object and a reference beam. The image can be reconstructed from this pattern by a suitable optical system.

**Homopolymer** - A polymer derived from one species of (real, implicit, or hypothetical) monomer. [8]

**Hooke's law** - The statement that the ratio of stress to strain is a constant in a totally elastic medium.

**Horse power** - A non-SI unit of energy, equal to approximately 746 W.

**Hubble constant** - The ratio of the recessional velocity of an extragalactic object to the distance of that object. Its value is about  $2 \times 10^{-18}$  s<sup>-1</sup>.

**Huckel theory** - A simple approximation for calculating the energy of conjugated molecules in which only the resonance integrals between neighboring bonds are considered. Also called CNDO method (complete neglect of differential overlap).

**Hume-Rothery rules** - A set of empirical rules for predicting the occurrence of solid solutions in metallic systems. The rules involve size, crystal structure, and electronegativity.

**Hund's rules** - A series of rules for predicting the sequence of energy states in atoms and molecules. One of the important results is that when two electrons exist in different orbitals, the state with their spins parallel (triplet state) lies at lower energy than the state with antiparallel spins (singlet).

**Hydrazines** - Hydrazine (diazane),  $H_2NNH_2$ , and its hydrocarbyl derivatives. When one or more substituents are acyl groups, the compound is a hydrazide. [5]

**Hydrocarbon** - A compound containing only carbon and hydrogen. [5]

**Hydrolysis** - A reaction occurring in water in which a chemical bond is cleaved and a new bond formed with the oxygen atom of water.

**Hyperfine structure** - Splitting of energy levels and spectral lines into several closely spaced components as a result of interaction of nuclear spin angular momentum with other angular momenta in the atom or molecule.

**Hysteresis\*** - An irreversible response of a system (parameter  $A$ ) as a function of an external force (parameter  $F$ ), usually symmetric with respect to the origin of the  $A$  vs.  $F$  graph after the initial application of the force. A common example is magnetic induction vs. magnetic field strength in a ferromagnet.

**Ideal gas law** - The equation of state  $pV = RT$ , which defines an ideal gas, where  $p$  is pressure,  $V$  molar volume,  $T$  temperature, and  $R$  the molar gas constant.

**Ideal solution** - A solution in which solvent-solvent and solvent-solute interactions are identical, so that properties such as volume and enthalpy are exactly additive. Ideal solutions follow Raoult's law, which states that the vapor pressure  $p_i$  of component  $i$  is  $p_i = x_i p_i^*$ , where  $x_i$  is the mole fraction of component  $i$  and  $p_i^*$  the vapor pressure of the pure substance  $i$ .

**Ignition temperature\*** - The lowest temperature at which combustion of a material will occur spontaneously under specified conditions. Sometimes called autoignition temperature, kindling point. [10]

**Imides** - Diacyl derivatives of ammonia or primary amines, especially those cyclic compounds derived from diacids. Also used for salts having the anion  $RN_2^-$ . [5]

**Impedance (Z)** - The complex representation of potential difference divided by the complex representation of current. In terms of reactance  $X$  and resistance  $R$ , the impedance is given by  $Z = R + iX$ . [1]

**Index of refraction (n)\*** - For a non-absorbing medium, the ratio of the velocity of electromagnetic radiation *in vacuo* to the phase velocity of radiation of a specified frequency in the medium. [1]

- Inductance** - The ratio of the electromagnetic force induced in a coil by a current to the rate of change of the current.
- Inductive coupled plasma mass spectroscopy (ICPMS)** - See Techniques for Materials Characterization, page 12-1.
- Inertial defect** - In molecular spectroscopy, the quantity  $I_c - I_a - I_b$  for a molecule whose equilibrium configuration is planar, where  $I_a$ ,  $I_b$ , and  $I_c$  are the effective principal moments of inertia. The inertial defect for a rigid planar molecule would be zero, but vibration-rotation interactions in a real molecule lead to a positive inertial defect.
- Insulator** - A material in which the highest occupied energy band (valence band) is completely filled with electrons, while the next higher band (conduction band) is empty. Solids with an energy gap of 5 eV or more are generally considered as insulators at room temperature. Their conductivity is less than  $10^{-6}$  S/m and increases with temperature.
- Intercalation compounds** - Compounds resulting from reversible inclusion, without covalent bonding, of one kind of molecule in a solid matrix of another compound, which has a laminar structure. The host compound, a solid, may be macromolecular, crystalline, or amorphous. [5]
- International System of Units (SI)\*** - The unit system adopted by the General Conference on Weights and Measures in 1960. It consists of seven base units (meter, kilogram, second, ampere, kelvin, mole, candela), plus derived units and prefixes. [1]
- International Temperature Scale (ITS-90)\*** - The official international temperature scale adopted in 1990. It consists of a set of fixed points and equations which enable the thermodynamic temperature to be determined from operational measurements. [9]
- Ion** - An atomic or molecular particle having a net electric charge. [3]
- Ion exchange** - A process involving the adsorption of one or several ionic species accompanied by the simultaneous desorption (displacement) of one or more other ionic species. [3]
- Ion neutralization spectroscopy (INS)** - See Techniques for Materials Characterization, page 12-1.
- Ionic strength ( $I$ )** - A measure of the total concentration of ions in a solution, defined by  $I = 1/2 \sum_i z_i^2 m_i$ , where  $z_i$  is the charge of ionic species  $i$  and  $m_i$  is its molality. For a 1-1 electrolyte at molality  $m$ ,  $I = m$ .
- Ionization constant\*** - The equilibrium constant for a reaction in which a substance in solution dissociates into ions.
- Ionization potential\*** - The minimum energy required to remove an electron from an isolated atom or molecule (in its vibrational ground state) in the gaseous phase. More properly called ionization energy. [3]
- Irradiance ( $E$ )** - The radiant energy flux incident on an element of a surface, divided by the area of that element. [1]
- Isentropic process** - A thermodynamic process in which the entropy of the system does not change.
- Ising model** - A model describing the coupling between two atoms in a ferromagnetic lattice, in which the interaction energy is proportional to the negative of the product of the spin components along a specified axis.
- Isobar** - A line connecting points of equal pressure on a graphical representation of a physical system.
- Isochore** - A line or surface of constant volume on a graphical representation of a physical system.
- Isoelectric point\*** - The pH of a solution or dispersion at which the net charge on the macromolecules or colloidal particles is zero. In electrophoresis there is no motion of the particles in an electric field at the isoelectric point.
- Isomers** - In chemistry, compounds that have identical molecular formulas but differ in the nature or sequence of bonding of their atoms or in the arrangement of their atoms in space. In physics, nuclei of the same atomic number  $Z$  and mass number  $A$  but in different energy states. [3]
- Isomorphs** - Substances of different chemical nature but having the same crystal structure.
- Isotactic macromolecule** - A tactic macromolecule, essentially comprising only one species of repeating unit which has chiral or prochiral atoms in the main chain in a unique arrangement with respect to its adjacent constitutional units. [8]
- Isotherm** - A line connecting points of equal temperature on a graphical representation of a physical system.
- Isothermal process** - A thermodynamic process in which the temperature of the system does not change.
- Isotones** - Nuclides having the same neutron number  $N$  but different atomic number  $Z$ . [3]
- Isotopes** - Two or more nuclides with the same atomic number  $Z$  but different mass number  $A$ . The term is sometimes used synonymously with nuclide, but it is preferable to reserve the word nuclide for a species of specific  $Z$  and  $A$ . [3]
- Jahn-Teller effect** - An interaction of vibrational and electronic motions in a nonlinear molecule which removes the degeneracy of certain electronic energy levels. It can influence the spectrum, crystal structure, and magnetic properties of the substance.
- Johnson noise** - Electrical noise generated by random thermal motion of electrons in a conductor or semiconductor. Also called thermal noise.
- Josephson effect** - The tunneling of electron pairs through a thin insulating layer which separates two superconductors. When a potential difference is applied to the superconductors, an alternating current is generated whose frequency is precisely proportional to the potential difference. This effect has important applications in metrology and determination of fundamental physical constants.
- Joule (J)\*** - The SI unit of energy, equal to N m. [1]
- Joule-Thomson coefficient ( $\mu$ )** - A parameter which describes the temperature change when a gas expands adiabatically through a nozzle from a high pressure to a low pressure region. It is defined by  $\mu = (\partial T / \partial p)_H$ , where  $H$  is enthalpy.
- Julian calendar** - The calendar introduced by Julius Caesar in 46 B.C. which divided the year into 365 days with a leap year of 366 days every fourth year.
- Julian date (JD)** - The number of days elapsed since noon Greenwich Mean Time on January 1, 4713 B.C. Thus January 1, 2000, 0h (midnight) will be JD 2,451,543.5. This dating system was introduced by Joseph Scaliger in 1582.
- Kaon** - One of the elementary particles in the family of mesons. Kaons have a spin of zero and may be neutral or charged.
- Kelvin (K)\*** - The SI base unit of thermodynamic temperature. [1]
- Kepler's laws** - The three laws of planetary motion, which established the elliptical shape of planetary orbits and the relation between orbital dimensions and the period of rotation.

- Kerr effect\*** - An electrooptical effect in which birefringence is induced in a liquid or gas when a strong electric field is applied perpendicular to the direction of an incident light beam. The Kerr constant  $k$  is given by  $n_1 - n_2 = k\lambda E^2$ , where  $\lambda$  is the wavelength,  $E$  is the electric field strength, and  $n_1$  and  $n_2$  are the indices of refraction of the ordinary and extraordinary rays, respectively.
- Ketenes** - Compounds in which a carbonyl group is connected by a double bond to an alkylidene group:  $R_2C=C=O$ . [5]
- Ketones** - Compounds in which a carbonyl group is bonded to two carbon atoms:  $R_1R_2C=O$  (neither R may be H). [5]
- Kilogram (kg)\*** - The SI base unit of mass. [1]
- Kinetic energy ( $E_k$ ,  $T$ )** - The energy associated with the motion of a system of particles in a specified reference frame. For a single particle of mass  $m$  moving at velocity  $v$ ,  $E_k = 1/2mv^2$ .
- Kirchhoff's laws** - Basic rules for electric circuits, which state (a) the algebraic sum of the currents at a network node is zero and (b) the algebraic sum of the voltage drops around a closed path is zero.
- Klein-Gordon equation** - A relativistic extension of the Schrödinger equation.
- Klein-Nishima formula** - An expression for the scattering cross section of a photon by an unbound electron, based upon the Dirac electron theory.
- Knight shift** - The change in magnetic resonance frequency of a nucleus in a metal relative to the same nucleus in a diamagnetic solid. The effect is due to the polarization of the conduction electrons in the metal.
- Knudsen number ( $Kn$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Kn = \lambda/l$ , where  $\lambda$  is mean free path and  $l$  is length. [2]
- Kondo effect** - A large increase in electrical resistance observed at low temperatures in certain dilute alloys of a magnetic metal in a nonmagnetic material.
- Kramers-Kronig relation** - A set of equations relating the real and imaginary parts of the index of refraction of a medium
- Lactams** - Cyclic amides of amino carboxylic acids, having a 1-azacycloalkan-2-one structure, or analogues having unsaturation or heteroatoms replacing one or more carbon atoms of the ring. [5]
- Lactones** - Cyclic esters of hydroxy carboxylic acids, containing a 1-oxacycloalkan-2-one structure, or analogues having unsaturation or heteroatoms replacing one or more carbon atoms of the ring. [5]
- Lagrangian function ( $L$ )** - A function used in classical mechanics, defined as the kinetic energy minus the potential energy for a system of particles.
- Lamb shift** - The small energy difference between the  $^2S_{1/2}$  and  $^2P_{1/2}$  levels in the hydrogen atom, which results from interactions between the electron and the radiation field.
- Laminar flow** - Smooth, uniform, non-turbulent flow of a gas or liquid in parallel layers, with little mixing between layers. It is characterized by small values of the Reynolds number.
- Landé g-factor** - See g-Factor of the electron
- Langevin function** - The mathematical function  $L(x) = (e^x + e^{-x}) / (e^x - e^{-x}) - 1/x$ , which occurs in the expression for the average dipole moment of a group of rotating polar molecules in an electric field:  $\mu_{av} = \mu L(\mu E/kT)$ , where  $\mu$  is the electric dipole moment of a single molecule,  $E$  is the electric field strength,  $k$  is the Boltzmann constant, and  $T$  is the temperature.
- Lanthanides** - The elements of atomic number 57 through 71, which share common chemical properties: La, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu. [7]
- Larmor frequency ( $\nu_1$ )** - The precession frequency of a magnetic dipole in an applied magnetic field. In particular, a nucleus in a magnetic field of strength  $B$  has a Larmor frequency of  $\gamma B/2\pi$ , where  $\gamma$  is the magnetogyric ratio of the nucleus.
- Laser\*** - A device in which an optical cavity is filled with a medium where a population inversion can be produced by some means. When the resonant frequency of the cavity bears the proper relation to the separation of the inverted energy levels, stimulated emission occurs, producing a highly monochromatic, coherent beam of light.
- Laser ionization mass spectroscopy (LIMS)** - See Techniques for Materials Characterization, page 12-1.
- Lattice constants\*** - Parameters specifying the dimensions of a unit cell in a crystal lattice, specifically the lengths of the cell edges and the angles between them.
- Lattice energy\*** - The energy per ion pair required to separate completely the ions in a crystal lattice at a temperature of absolute zero.
- Laue diagram** - A diffraction pattern produced when an x-ray beam passes through a thin slice of a crystal and impinges on a detector behind the crystal.
- Lenz's law** - The statement that the current induced in a circuit by a change in magnetic flux is so directed as to oppose the change in flux
- Leonard-Jones potential** - A simple but useful function for approximating the interaction between two neutral atoms or molecules separated by a distance  $r$  by writing the potential energy as  $U(r) = 4\epsilon\{(r_0/r)^{12} - (r_0/r)^6\}$ , where  $\epsilon$  and  $r_0$  are adjustable parameters. In this form the depth of the potential well is  $\epsilon$  and the minimum occurs at  $2^{1/6}r_0$ . The  $(1/r)^{12}$  term is often replaced by other powers of  $1/r$ .
- Lepton** - One of the class of elementary particles that do not take part in the strong interaction. Included are the electron, muon, and neutrino. All leptons have a spin of  $1/2$ .
- Lewis number ( $Le$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Le = a/D$ , where  $a$  is thermal diffusivity and  $D$  is diffusion coefficient. [2]
- Ligand field theory** - A description of the structure of crystals containing a transition metal ion surrounded by nonmetallic ions (ligands). It is based on construction of molecular orbitals involving the  $d$ -orbitals of the central metal ion and combinations of atomic orbitals of the ligands.
- Light year (l.y.)** - A unit of distance used in astronomy, defined as the distance light travels in one year in a vacuum. Its approximate value is  $9.46073 \times 10^{15}$  m.
- Lignins** - Macromolecular constituents of wood related to lignans, composed of phenolic propylbenzene skeletal units, linked at various sites and apparently randomly. [5]
- Ligroin** - The petroleum fraction consisting mostly of  $C_7$  and  $C_8$  hydrocarbons and boiling in the range 90-140 °C; commonly used as a laboratory solvent.
- Lipids** - A loosely defined term for substances of biological origin that are soluble in nonpolar solvents. They consist of saponifiable lipids, such as glycerides (fats and oils) and phospholipids, as well as nonsaponifiable lipids, principally steroids. [5]
- Lipoproteins** - Clathrate complexes consisting of a lipid enwrapped in a protein host without covalent binding, in such a way that

the complex has a hydrophilic outer surface consisting of all the protein and the polar ends of any phospholipids. [5]

**Liter (L)\*** - A synonym for cubic decimeter. [1]

**Lithosphere\*** - The outer layer of the solid earth, extending from the base of the mantle to the surface of the crust.

**Lorentz contraction** - The reduction in length of a moving body in the direction of motion, given by the factor  $(1-v^2/c^2)^{1/2}$ , where  $v$  is the velocity of the body and  $c$  the velocity of light. Also known as the FitzGerald-Lorentz contraction.

**Lorentz force** - The force exerted on a point charge  $Q$  moving at velocity  $v$  in the presence of external fields  $E$  and  $B$ . It is given (in SI units) by  $F = Q(E + v \times B)$ .

**Loss angle ( $\delta$ )** - For a dielectric material in an alternating electromagnetic field,  $\delta$  is the phase difference between the current and the potential difference. The function  $\tan \delta$  is a measure of the ratio of the power dissipated in the dielectric to the power stored.

**Low energy electron diffraction (LEED)** - See Techniques for Materials Characterization, page 12-1.

**Lumen (lm)\*** - The SI unit of luminous flux, equal to cd sr. [1]

**Luminous flux ( $\Phi$ )** - The intensity of light from a source multiplied by the solid angle. The SI unit is lumen. [1]

**Lux (lx)\*** - The SI unit of illuminance, equal to cd sr m<sup>-2</sup>. [1]

**Lyddane-Sachs-Teller relation** - A relation between the phonon frequencies and dielectric constants of an ionic crystal which states that  $(\omega_T/\omega_L)^2 = \epsilon(\infty)/\epsilon(0)$ , where  $\omega_T$  is the angular frequency of transverse optical phonons,  $\omega_L$  that of longitudinal optical phonons,  $\epsilon(0)$  is the static dielectric constant, and  $\epsilon(\infty)$  the dielectric constant at optical frequencies.

**Lyman series** - The series of lines in the spectrum of the hydrogen atom which corresponds to transitions between the ground state (principal quantum number  $n = 1$ ) and successive excited states. The wavelengths are given by  $1/\lambda = R_H(1-1/n^2)$ , where  $n = 2, 3, 4, \dots$  and  $R_H$  is the Rydberg constant for hydrogen. The first member of the series ( $n = 1 \leftrightarrow 2$ ), which is often called the Lyman- $\alpha$  line, falls at a wavelength of 1216 Å, and the series converges at 912 Å, the ionization limit of hydrogen.

**Mach number ( $Ma$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Ma = v/c$ , where  $v$  is velocity and  $c$  is the speed of sound. [2]

**Macromolecule** - A molecule of high relative molecular mass (molecular weight), the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass. [8]

**Madelung constant\*** - A constant characteristic of a particular crystalline material which gives a measure of the electrostatic energy binding the ions in the crystal.

**Magnetic field strength ( $H$ )** - An axial vector quantity, the curl of which is equal to the current density, including the displacement current. [1]

**Magnetic induction ( $B$ )** - An axial vector quantity such that the force exerted on an element of current is equal to the vector product of this element and the magnetic induction. [1]

**Magnetic moment** - See Dipole moment, magnetic.

**Magnetic susceptibility ( $\chi_m, \kappa$ )\*** - Defined by  $\chi_m = (\mu - \mu_0)/\mu_0$ , where  $\mu$  is the permeability of the medium and  $\mu_0$  the permeability of a vacuum. [1]

**Magnetization ( $M$ )** - Defined by  $M = (B/\mu_0) - H$ , where  $B$  is magnetic induction,  $H$  magnetic field strength, and  $\mu_0$  the permeability of a vacuum. [1]

**Magnetogyric ratio ( $\gamma$ )** - Ratio of the magnetic moment of a particle to its angular momentum. Also called gyromagnetic ratio.

**Magneton** - See Bohr magneton, Nuclear magneton.

**Magnetostriction\*** - The change in dimensions of a solid sample when it is placed in a magnetic field.

**Magnon** - A quantum of magnetic energy associated with a spin wave in a ferromagnetic or antiferromagnetic crystal.

**Mantle** - The layer of the earth between the crust and the liquid outer core, which begins about 2900 km below the Earth's surface.

**Maser** - A device in which a microwave cavity is filled with a medium where a population inversion can be produced by some means. When the resonant frequency of the cavity bears the proper relation to the separation of the inverted energy levels, the device can serve as an amplifier or oscillator at that frequency.

**Mass ( $m$ )\*** - Quantity of matter. Mass can also be defined as "resistance to acceleration".

**Mass defect ( $B$ )** - Defined by  $B = Zm(^1\text{H}) + Nm_n - m_a$ , where  $Z$  is the atomic number,  $m(^1\text{H})$  is the mass of the hydrogen atom,  $N$  is the neutron number,  $m_n$  is the rest mass of the neutron, and  $m_a$  is the mass of the atom in question. Thus  $Bc^2$  can be equated to the binding energy of the nucleus if the binding energy of atomic electrons is neglected. [1]

**Mass excess ( $\Delta$ )** - Defined by  $\Delta = m_a - Am_u$ , where  $m_a$  is the mass of the atom,  $A$  the number of nucleons, and  $m_u$  the unified atomic mass constant ( $m_u = 1$  u). [1]

**Mass fraction ( $w_B$ )** - The ratio of the mass of substance B to the total mass of a mixture. [1]

**Mass number ( $A$ )** - A characteristic property of a specific isotope of an element, equal to the sum of the number of protons and neutrons in the nucleus.

**Mass spectrometry** - An analytical technique in which ions are separated according to the mass/charge ratio and detected by a suitable detector. The ions may be produced by electron impact on a gas, a chemical reaction, energetic vaporization of a solid, etc. [6]

**Massieu function** - A thermodynamic function defined by  $J = -A/T$ , where  $A$  is the Helmholtz energy and  $T$  the thermodynamic temperature. [2]

**Matthiessen's rule** - The statement that the electrical resistivity  $\rho$  of a metal can be written as  $\rho = \rho_L + \rho_i$ , where  $\rho_L$  is due to scattering of conduction electrons by lattice vibrations and  $\rho_i$  to scattering by impurities and imperfections. If the impurity concentration is small,  $\rho_i$  is temperature independent.

**Maxwell (Mx)\*** - A non-SI unit of magnetic field strength ( $H$ ) equal to  $10^{-8}$  Wb. [1]

**Maxwell's equations** - The fundamental equations of electromagnetism. In a form appropriate to SI units, they are:

$$\begin{aligned}\text{curl } H &= \partial D / \partial t + j \\ \text{div } B &= 0 \\ \text{curl } E &= -\partial B / \partial t \\ \text{div } D &= \rho\end{aligned}$$

where  $H$  is the magnetic field strength,  $B$  the magnetic induction,  $E$  the electric field strength,  $D$  the electric displacement,  $j$  the current density,  $\rho$  the charge density, and  $t$  is time.

**Maxwell-Boltzmann distribution** - An expression for the fraction of molecules  $f(v)$  in a gas that have velocity  $v$  within a specified interval. It takes the form

$$f(v) = 4\pi(M/2\pi RT)^{3/2} v^2 e^{-Mv^2/2RT}$$

where  $M$  is the molar mass,  $R$  the molar gas constant, and  $T$  the temperature.

**Mean free path\*** - The average distance a gas molecule travels between collisions.

**Meissner effect** - The complete exclusion of magnetic induction from the interior of a superconductor.

**Melting point\*** - The temperature at which the solid and liquid phases of a substance are in equilibrium at a specified pressure (normally taken to be atmospheric unless stated otherwise).

**Mercaptans** - A traditional term abandoned by IUPAC, synonymous with thiols. This term is still widely used. [5]

**Meson** - Any elementary particle that has zero or integral spin. Mesons are responsible for the forces between protons and neutrons in the nucleus.

**Mesosphere** - The part of the Earth's atmosphere extending from the top of the stratosphere (about 50 km above the surface) to 80–90 km. It is characterized by a decrease in temperature with increasing altitude.

**Metal** - A material in which the highest occupied energy band (conduction band) is only partially filled with electrons. The electrical conductivity of metals generally decreases with temperature.

**Metalloenes** - Organometallic coordination compounds in which one atom of a transition metal such as iron, ruthenium or osmium is bonded to and only to the face of two cyclopentadienyl ligands which lie in parallel planes. [5]

**Meter (m)\*** - The SI base unit of length. [1]

**Methine group** - In organic compounds, the  $-C=$  group. [5]

**Mho** - An archaic name for the SI unit siemens (reciprocal ohm).

**Micelle** - A particle formed by the aggregation of surfactant molecules (typically, 10 to 100 molecules) in solution. For aqueous solutions, the hydrophilic end of the molecule is on the surface of the micelle, while the hydrophobic end (often a hydrocarbon chain) points toward the center. At the critical micelle concentration (cmc) the previously dissolved molecules aggregate into a micelle.

**Micron ( $\mu$ )** - An obsolete name for micrometer.

**Mie scattering** - The scattering of light by spherical dielectric particles whose diameter is comparable to the wavelength of the light.

**Milky way** - The band of light in the night sky resulting from the stars in the galactic plane. The term is also used to denote the galaxy in which the sun is located.

**Miller indices ( $hkl$ )** - A set of indices used to label planes in a crystal lattice. [2]

**Millimeter of mercury (mmHg)** - A non-SI unit of pressure, equal to 133.322 Pa. The name is generally considered interchangeable with torr.

**Mobility ( $\mu$ )\*** - In solid state physics, the drift velocity of electrons or holes in a solid divided by the applied electric field strength. The term is used in a similar sense in other fields.

**Molality ( $m$ )** - A measure of concentration of a solution in which one states the amount of substance (i.e., number of moles) of solute per kilogram of solvent. Thus a 0.1 molal solution (often written as 0.1 m) has  $m = 0.1$  mol/kg.

**Molar mass** - The mass of one mole of a substance. It is normally expressed in units of g/mol, in which case its numerical value is identical with the molecular weight (relative molecular mass). [1]

**Molar quantity** - It is often convenient to express an extensive quantity (e.g., volume, enthalpy, heat capacity, etc.) as the actual value divided by amount of substance (number of moles). The resulting quantity is called molar volume, molar enthalpy, etc.

**Molar refraction ( $R$ )** - A property of a dielectric defined by the equation  $R = V_m [(n^2 - 1)/(n^2 + 2)]$ , where  $n$  is the index of refraction of the medium (at optical wavelengths) and  $V_m$  the molar volume. It is related to the polarizability  $\alpha$  of the molecules that make up the medium by the Lorenz-Lorentz equation,  $R = N_A \alpha / 3\epsilon_0$ , where  $N_A$  is Avogadro's constant and  $\epsilon_0$  is the permittivity of a vacuum.

**Molarity ( $c$ )** - A measure of concentration of a solution in which one states the amount of substance (i.e., number of moles) of solute per liter of solution. Thus a 0.1 molar solution (often referred to as 0.1 M) has a concentration  $c = 0.1$  mol/L.

**Mole (mol)\*** - The SI base unit of amount of substance. [1]

**Mole fraction ( $x_B$ )** - The ratio of the amount of substance (number of moles) of substance B to the total amount of substance in a mixture. [1]

**Molecular orbital** - See Orbital.

**Molecular weight ( $M_r$ )\*** - The ratio of the average mass per molecule or specified entity of a substance to 1/12 of the mass of nuclide  $^{12}\text{C}$ . Also called relative molar (or molecular) mass. [1]

**Moment of inertia ( $I$ )** - The moment of inertia of a body about an axis is the sum (or integral) of the products of its elements of mass and the squares of their distances from the axis. [1]

**Momentum ( $p$ )** - The product of mass and velocity. [1]

**Monomer** - A substance consisting of molecules which can undergo polymerization, thereby contributing constitutional units to the essential structure of a macromolecule. [8]

**Monosaccharides** - A term which includes aldoses, ketoses, and a wide variety of derivatives. [5]

**Mössbauer effect** - The recoilless emission of  $\gamma$ -rays from nuclei bound in a crystal under conditions where the recoil energy associated with the  $\gamma$  emission is taken up by the crystal as a whole. This results in a very narrow line width, which can be exploited in various types of precise measurements.

**Muon\*** - An unstable elementary particle of spin 1/2 and mass about 200 times that of the electron.

**Naphtha** - The petroleum fraction consisting mostly of  $C_6$  to  $C_8$  hydrocarbons and boiling in the range 80–120 °C. Solvents derived from this fraction include ligroin and petroleum ether.

**Nautical mile** - A non-SI unit of length, equal to exactly 1852 m.

**Navier-Stokes equations** - A set of complex equations for the motion of a viscous fluid subject to external forces.

**Néel temperature ( $T_N$ )\*** - The critical temperature above which an antiferromagnetic substance becomes paramagnetic. [1]

**Nernst effect** - The production of an electric field in a conductor subject to an applied magnetic field and containing a transverse temperature gradient. The electric field is perpendicular to the magnetic field and the temperature gradient.

**Network** - In polymer science, a highly ramified macromolecule in which essentially each constitutional unit is connected to each other constitutional unit and to the macroscopic phase boundary by many permanent paths through the macromolecule, the number of such paths increasing with the number of intervening bonds. The paths must on the average be coextensive with the macromolecule. [8]

**Neutrino** - A stable elementary particle in the lepton family. Neutrinos have zero (or at least near-zero) rest mass and spin 1/2.

**Neutron\*** - An elementary particle on spin 1/2 and zero charge. The free neutron has a mean lifetime of 887 seconds. Neutrons and protons, which are collectively called nucleons, are the constituents of the nucleus.

**Neutron activation analysis (NAA)** - See Techniques for Materials Characterization, page 12-1.

**Neutron number (N)** - A characteristic property of a specific isotope of an element, equal to the number of neutrons in the nucleus.

**Newton (N)\*** - The SI unit of force, equal to  $\text{m kg s}^{-2}$ . [1]

**Nitriles** - Compounds having the structure  $\text{RC}\equiv\text{N}$ ; thus C-substituted derivatives of hydrocyanic acid,  $\text{HC}\equiv\text{N}$ . [5]

**Nitrosamines** - N-Nitroso amines: compounds of the structure  $\text{R}_2\text{NNO}$ . Compounds  $\text{RNHNO}$  are not ordinarily isolatable, but they, too, are nitrosamines. The name is a contraction of N-nitrosoamine and, as such, does not require the N locant. [5]

**Nuclear magnetic resonance (NMR)\*** - A widely used technique in which the resonant absorption of radiofrequency radiation by magnetic nuclei in a magnetic field is measured. The results give important information on the local environment of each nucleus.

**Nuclear magneton ( $\mu_N$ )\*** - The unit of nuclear magnetic moment, defined as  $eh/4\pi m_p$ , where  $h$  is Planck's constant,  $m_p$  the proton mass, and  $e$  the elementary charge.

**Nuclear quadrupole resonance (NQR)** - See Techniques for Materials Characterization, page 12-1.

**Nuclear reaction analysis (NRA)** - See Techniques for Materials Characterization, page 12-1.

**Nuclear spin (I)** - The quantum number that specifies the intrinsic angular momentum of a particular nucleus. The magnitude of the angular momentum is given by  $[I(I+1)]^{1/2} h/2\pi$ , where  $h$  is Planck's constant.

**Nucleic acids\*** - Macromolecules, the major organic matter of the nuclei of biological cells, made up of nucleotide units, and hydrolyzable into certain pyrimidine or purine bases (usually adenine, cytosine, guanine, thymine, uracil), D-ribose or 2-deoxy-D-ribose. [5]

**Nucleon** - A collective term for the proton and neutron.

**Nucleosides** - Ribosyl or deoxyribosyl derivatives (rarely, other glycosyl derivatives) of certain pyrimidine or purine bases. They are thus glycosylamines or N-glycosides related to nucleotides by the lack of phosphorylation. [5]

**Nucleotides** - Compounds formally obtained by esterification of the 3' or 5' hydroxy group of nucleosides with phosphoric acid. They are the monomers of nucleic acids and are formed from them by hydrolytic cleavage. [5]

**Nuclide** - A species of atoms in which each atom has identical atomic number  $Z$  and identical mass number  $A$ . [3]

**Nusselt number (Nu)** - A dimensionless quantity used in fluid mechanics, defined by  $Nu = hl/k$ , where  $h$  is coefficient of heat transfer,  $l$  is length, and  $k$  is thermal conductivity. [2]

**Nyquist theorem** - An expression for the mean square thermal noise voltage across a resistor, given by  $4RkT\Delta f$  where  $R$  is the resistance,  $k$  the Boltzmann constant,  $T$  the temperature, and  $\Delta f$  the frequency band within which the voltage is measured.

**Octanol-water partition coefficient (P)\*** - A measure of the way in which a compound will partition itself between the octanol and water phases in the two-phase octanol-water system, and thus an indicator of certain types of biological activity. Specifically,  $P$  is the ratio of the concentration (in moles per liter) of the compound in the octanol phase to that in the water phase at infinite dilution. The quantity normally reported is  $\log P$ .

**Oersted (Oe)** - A non-SI unit of magnetic field ( $H$ ), equal to 79.57747 A/m.

**Ohm ( $\Omega$ )\*** - The SI unit of electric resistance, equal to V/A. [1]

**Ohm's law** - A relation among electric current  $I$ , potential difference  $V$ , and resistance  $R$ , viz.,  $I = V/R$ . At constant temperature the resistance for many materials is constant to high precision.

**Olefins** - Acyclic and cyclic hydrocarbons having one or more carbon-carbon double bonds, apart from the formal ones in aromatic compounds. The class olefins subsumes alkenes and cycloalkenes and the corresponding polyenes. [5]

**Oligomer** - A substance consisting of molecules of intermediate relative molecular mass (molecular weight), the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass. In contrast to a polymer, the properties of an oligomer can vary significantly with the removal of one or a few of its units. [8]

**Oligopeptides** - Peptides containing from three to nine amino groups. [5]

**Onsager relations** - An important set of equations in the thermodynamics of irreversible processes. They express the symmetry between the transport coefficients describing reciprocal processes in systems with a linear dependence of flux on driving forces.

**Optical rotary power** - Angle by which the plane of polarization of a light beam is rotated by an optically active medium, divided by path length and by concentration of the active constituent. Depending on whether mass or molar concentration is used, the modifier "specific" or "molar" is attached. [2]

**Orbital** - A one-electron wavefunction. Atomic orbitals are classified as  $s$ -,  $p$ -,  $d$ -, or  $f$ -orbitals according to whether the angular momentum quantum number  $l = 0, 1, 2,$  or  $3$ . Molecular orbitals, which are usually constructed as linear combinations of atomic orbitals, describe the distribution of electrons over the entire molecule.

**Oscillator strength (f)** - A measure of the intensity of a spectroscopic transition, defined by

$$f = \frac{8\pi^2 M e v}{3 h e^2} |\mu_{ij}|^2$$

where  $\nu$  is the frequency,  $\mu_{ij}$  the transition dipole moment,  $m_e$  the mass of the electron,  $e$  the elementary charge, and  $h$  Planck's constant.

**Osmosis** - The flow of a solvent in a system in which two solutions of different concentration are separated by a semipermeable membrane which cannot pass solute molecules. The solvent will flow from the side of lower concentration to that of higher concentration, thus tending to equalize the concentrations. The pressure that must be applied to the more concentrated side to stop the flow is called the osmotic pressure.

**Osmotic coefficient ( $\phi$ )** - Defined by  $\phi = \ln a_A / (M_A \sum m_B)$ , where  $M_A$  is the molar mass of substance A (normally the solvent),  $a_A$  is its activity, and the  $m_B$  are molalities of the solutes. [1]

**Osmotic pressure ( $\Pi$ )** - The excess pressure necessary to maintain osmotic equilibrium between a solution and the pure solvent separated by a membrane permeable only to the solvent. In an ideal dilute solution  $\Pi = c_B RT$ , where  $c_B$  is the amount-of-substance concentration of the solute,  $R$  is the molar gas constant, and  $T$  the temperature. [1,2]

**Ostwald dilution law** - A relation for the concentration dependence of the molar conductivity  $\Lambda$  of an electrolyte solution, viz.,

$$\frac{1}{\Lambda} = \frac{1}{\Lambda^\circ} + \frac{\Lambda c}{K(\Lambda^\circ)^2}$$

where  $c$  is the solute concentration,  $K$  is the equilibrium constant for dissociation of the solute, and  $\Lambda^\circ$  is the conductivity at  $c\Lambda = 0$ .

**Ounce (oz)** - A non-SI unit of mass. The avoirdupois ounce equals 28.34952 g, while the troy ounce equals 31.10348 g.

**Overpotential ( $\eta$ )** - In an electrochemical cell, the difference between the potential of an electrode and its zero-current value.

**Oximes** - Compounds of structure  $R_2C=NOH$  derived from condensation of aldehydes or ketones with hydroxylamine. Oximes from aldehydes may be called aldioximes; those from ketones may be called ketoximes. [5]

**Oxo compounds** - Compounds containing an oxygen atom, =O, doubly bonded to carbon or another element. The term thus embraces aldehydes, carboxylic acids, ketones, sulfonic acids, amides and esters. [5]

**Ozonides** - The 1,2,4-trioxolanes formed by the reaction of ozone at a carbon-carbon double bond, or the analogous compounds derived from acetylenic compounds. [5]

**Pair production** - A process in which a photon is converted into a particle and its antiparticle (e.g., an electron and positron) in the electromagnetic field of a nucleus.

**Paraffins** - Obsolescent term for saturated hydrocarbons, commonly but not necessarily acyclic. Still widely used in the petrochemical industry, where the term designates acyclic saturated hydrocarbons, and stands in contradistinction to naphthenes. [5]

**Paramagnetism\*** - A type of magnetism characterized by a positive magnetic susceptibility, so that the material becomes weakly magnetized in the direction of an external field. The magnetization disappears when the field is removed. In the simplest approximation (Curie's law) the susceptibility is inversely proportional to temperature.

**Parity** - The property of a quantum-mechanical wave function that describes its behavior under the symmetry operation of coordinate inversion. A parity of +1 (or even) is assigned if the wave function does not change sign when the signs of all the coordinates are changed; the parity is -1 (or odd) if the wave function changes sign under this operation.

**Parsec (pc)** - A unit of distance defined as the distance at which 1 astronomical unit (AU) subtends an angle of 1 second of arc. It is equal to 206264.806 AU or  $3.085678 \times 10^{16}$  m.

**Particle induced x-ray emission (PIXE)** - See Techniques for Materials Characterization, page 12-1.

**Partition function ( $q, z$ )** - For a single molecule,  $q = \sum_i g_i \exp(\epsilon_i/kT)$ , where  $\epsilon_i$  is an energy level of degeneracy  $g_i$ ,  $k$  the Boltzmann constant, and  $T$  the absolute temperature; the summation extends over all energy states. For a system of  $N$  non-interacting molecules which are indistinguishable, as in an ideal gas, the canonical partition function  $Q = qN/N!$ .

**Pascal (Pa)\*** - The SI unit of pressure, equal to  $N/m^2$ . [1]

**Paschen series** - The series of lines in the spectrum of the hydrogen atom which corresponds to transitions between the state with principal quantum number  $n = 3$  and successive higher states. The wavelengths are given by  $1/\lambda = R_H(1/9 - 1/n^2)$ , where  $n = 4, 5, 6, \dots$  and  $R_H$  is the Rydberg constant. The first member of the series ( $n = 3 \leftrightarrow 4$ ), which is often called the  $P_\alpha$  line, falls in the infrared at a wavelength of 1.875  $\mu m$ .

**Paschen-Back effect** - In atomic spectroscopy, the decoupling of electron spin from orbital angular momentum as the strength of an external magnetic field is increased.

**Pauli exclusion principle** - The statement that two electrons in an atom cannot have identical quantum numbers; thus if there are two electrons in the same orbital, their spin quantum numbers must be of opposite sign.

**Pearson symbol** - A code for designating crystallographic information, including the crystal system, the lattice type, and the number of atoms per unit cell.

**Péclet number ( $Pe$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Pe = vl/a$ , where  $v$  is velocity,  $l$  is length, and  $a$  is thermal diffusivity. [2]

**Peltier effect** - The absorption or generation of heat (depending on the current direction) which occurs when an electric current is passed through a junction between two materials.

**Peptides** - Amides derived from two or more amino carboxylic acid molecules (the same or different) by formation of a covalent bond from the carbonyl carbon of one to the nitrogen atom of another with formal loss of water. [5]

**Permeability ( $\mu$ )** - Magnetic induction divided by magnetic field strength; i.e.  $\mu = B/H$ . The relative permeability  $\mu_r = \mu/\mu_0$ , where  $\mu_0$  is the permeability of a vacuum. [1]

**Permittivity ( $\epsilon$ )** - Ratio of the electric displacement in a medium to the electric field strength. Also called dielectric constant. [1]

**Peroxides** - Compounds of structure ROOR in which R may be any organic group. In inorganic chemistry, salts of the anion  $O_2^{-2}$  [5]

**Peroxy acids** - Acids in which an acidic -OH group has been replaced by an -OOH group; e.g.,  $CH_3C(=O)OOH$  peroxyacetic acid,  $PhS(=O)_2OOH$  benzeneperoxy sulfonic acid. [5]

**Petroleum ether** - The petroleum fraction consisting of  $C_5$  and  $C_6$  hydrocarbons and boiling in the range 35–60 °C; commonly used as a laboratory solvent.

**pH\*** - A convenient measure of the acid-base character of a solution, usually defined by  $pH = -\log [c(H^+)/mol L^{-1}]$ , where  $c(H^+)$  is the concentration of hydrogen ions. The more precise definition is in terms of activity rather than concentration. [2]

**Phenols** - Compounds having one or more hydroxy groups attached to a benzene or other arene ring. [5]

**Phonon** - A quantum of energy associated with a vibrational mode of a crystal lattice.

**Phosphines** -  $PH_3$  and compounds derived from it by substituting one, two or three hydrogen atoms by hydrocarbyl groups.

$\text{RPH}_2$ ,  $\text{R}_2\text{PH}$  and  $\text{R}_3\text{P}$  (R not equal to H) are called primary, secondary and tertiary phosphines, respectively. [5]

**Phosphonium compounds** - Salts (and hydroxides)  $[\text{R}_4\text{P}]^+\text{X}^-$  containing tetracoordinate phosphonium ion and the associated anion. [5]

**Phosphonium ylides** - Compounds having the structure  $\text{R}_3\text{P}^+-\text{C}=\text{R}_2 \rightleftharpoons \text{R}_3\text{P}=\text{CR}_2$ . Also known as Wittig reagents. [5]

**Phosphorescence** - The process by which a molecule is excited by light to a higher electronic state and then undergoes a radiationless transition to a state of different multiplicity from which it decays, after some delay, to the ground state. The emitted light is normally of longer wavelength than the exciting light because vibrational energy has been dissipated.

**Photoelectric effect** - The complete absorption of a photon by a solid with the emission of an electron.

**Photon** - An elementary particle of zero mass and spin 1/2. The photon is involved in electromagnetic interactions and is the quantum of electromagnetic radiation.

**Photon stimulated desorption (PSD)** - See Techniques for Materials Characterization, page 12-1.

**Pinacols** - Tetra(hydrocarbyl)ethane-1,2-diols,  $\text{R}_2\text{C}(\text{OH})\text{C}(\text{OH})\text{R}_2$ , of which the tetramethyl example is the simplest one and is itself commonly known as pinacol. [5]

**Pion** - An elementary particle in the family of mesons. Pions have zero spin and may be neutral or charged. They participate in the strong interaction which holds the nucleus together.

**pK\*** - The negative logarithm (base 10) of an equilibrium constant  $K$ . For  $\text{pK}_a$ , see Acid dissociation constant.

**Planck constant ( $h$ )\*** - The elementary quantum of action, which relates energy to frequency through the equation  $E = h\nu$ .

**Planck distribution** - See Black body radiation

**Planck function** - A thermodynamic function defined by  $Y = -G/T$ , where  $G$  is Gibbs energy and  $T$  thermodynamic temperature. [2]

**Plasma** - A highly ionized gas in which the charge of the electrons is balanced by the charge of the positive ions, so that the system as a whole is electrically neutral.

**Plasmon** - A quantum associated with a plasma oscillation in the electron gas of a solid.

**Point group\*** - A group of symmetry operations (rotations, reflections, etc.) that leave a molecule invariant. Every molecular conformation can be assigned to a specific point group, which plays a major role in determining the spectrum of the molecule.

**Poise (P)** - A non-SI unit of viscosity, equal to 0.1 Pa s.

**Poiseuille's equation** - A formula for the rate of flow of a viscous fluid through a tube:

$$\frac{dV}{dt} = \frac{(p_1^2 - p_2^2)\pi r^4}{16l\eta p_0}$$

where  $V$  is the volume as measured at pressure  $p_0$ ;  $p_1$  and  $p_2$  are the pressures at each end of the tube;  $r$  is the radius and  $l$  the length of the tube; and  $\eta$  is the viscosity.

**Poisson ratio ( $\mu$ )** - The absolute value of the ratio of the transverse strain to the corresponding axial strain resulting from uniformly distributed axial stress below the proportional limit (i.e., where Hooke's law is valid). [10]

**Polariton** - A quantum associated with the coupled modes of photons and optical phonons in an ionic crystal.

**Polarizability ( $\alpha$ )\*** - The change in dipole moment of a molecule produced by an external electric field; specifically,  $\alpha_{ab} = \partial p_a / \partial E_b$ , where  $p_a$  is the dipole moment component on the  $a$  axis and  $E_b$  is the component of the electric field strength along the  $b$  axis. [2]

**Polymer** - A substance composed of molecules of high relative molecular mass (molecular weight), the structure of which essentially comprises the multiple repetition of units derived, actually or conceptually, from molecules of low relative molecular mass. A single molecule of a polymer is called a macromolecule. [8]

**Polypeptides** - Peptides containing 10 or more amino acid residues. See also Peptides. [5]

**Polysaccharides** - Compounds consisting of a large number of monosaccharides linked glycosidically. This term is commonly used only for those containing more than ten monosaccharide residues. Also called glycans. [5]

**Porphyryns** - Natural pigments containing a fundamental skeleton of four pyrrole nuclei united through the  $\alpha$ -positions by four methine groups to form a macrocyclic structure (porphyrin is designated porphine in Chemical Abstracts indexes). [5]

**Positron** - The antiparticle of the electron. It has the same mass and spin as an electron, and an equal but opposite charge.

**Positronium** - The hydrogen-like "atom" formed from a positron nucleus and an electron. Its lifetime is very short because of annihilation of the positron and electron.

**Potential** - See Electric potential.

**Potential energy ( $E_p$ ,  $V$ ,  $U$ )** - The portion of the energy of a system that is associated with its position in a force field.

**Pound (lb)** - A non-SI unit of mass, equal to 0.4535924 kg.

**Power (P)** - Rate of energy transfer. For electrical circuits, this is equal to the product of current and potential difference,  $P = IV$ . [1]

**Poynting vector (S)** - For electromagnetic radiation, the vector product of the electric field strength and the magnetic field strength. [1]

**Prandtl number (Pr)** - A dimensionless quantity used in fluid mechanics, defined by  $Pr = \eta/\rho a$ , where  $\eta$  is viscosity,  $\rho$  is density, and  $a$  is thermal diffusivity. [2]

**Pressure\*** - Force divided by area. [1]

**Proteins** - Naturally occurring and synthetic polypeptides having molecular weights greater than about 10,000 (the limit is not precise). See also Peptides. [5]

**Proton\*** - A stable elementary particle of unit positive charge and spin 1/2. Protons and neutrons, which are collectively called nucleons, are the constituents of the nucleus.

**Pulsar** - A neutron star which rotates rapidly and emits electromagnetic radiation in regular pulses at a frequency related to the rotation period.

**Purine bases\*** - Purine and its substitution derivatives, especially naturally occurring examples. [5]

**Pyrimidine bases\*** - Pyrimidine and its substitution derivatives, especially naturally occurring examples. [5]

**Q-switching** - A technique for obtaining very high power from a laser by keeping the  $Q$  factor of the laser cavity low while the population inversion builds up, then suddenly increasing the  $Q$  to initiate the stimulated emission.

**Quad** - A unit of energy defined as  $10^{15}$  Btu, equal to approximately  $1.055056 \times 10^{18}$  J.

- Quadrupole moment** - A coefficient of the third term (after monopole and dipole) in the power series expansion of the electric potential of an array of charges. A nucleus of spin greater than 1/2 has a non-vanishing nuclear quadrupole moment which can interact with the electric field gradient of the surrounding electrons. Molecular quadrupole moments have an influence on intermolecular forces.
- Quality factor (Q)** - The ratio of the absolute value of the reactance of an electrical system to the resistance; thus a measure of the energy stored per cycle relative to the energy dissipated.
- Quantum yield** - In photochemistry, the number of moles transformed in a specific process, either physically (e.g., by emission of photons) or chemically, per mole of photons absorbed by the system. [3]
- Quark** - An elementary entity which has not been directly observed but is considered a constituent of protons, neutrons, and other hadrons.
- Quasar** - An extragalactic object emitting electromagnetic radiation at a very high power level and showing a very large red shift, thus indicating that the object is receding at a speed approaching the speed of light.
- Quasicrystal** - A solid having conventional crystalline properties but whose lattice does not display translational periodicity.
- Quaternary ammonium compounds** - Derivatives of ammonium compounds,  $\text{NH}_4^+ \text{Y}^-$ , in which all four of the hydrogens bonded to nitrogen have been replaced with hydrocarbyl groups. Compounds having a carbon-nitrogen double bond (i.e.  $\text{R}_2\text{C}=\text{N}^+\text{R}_2\text{Y}^-$ ) are more accurately called iminium compounds. [5]
- Quinones** - Compounds having a fully conjugated cyclic dione structure, such as that of benzoquinones, derived from aromatic compounds by conversion of an even number of  $-\text{CH}=\text{}$  groups into  $-\text{C}(=\text{O})-$  groups with any necessary rearrangement of double bonds. [5]
- Racemic mixture** - A mixture of equal amounts of a pair of enantiomers (optical isomers); such a mixture is not optically active.
- Rad** - A non-SI unit of absorbed dose of radiation, equal to 0.01 Gy.
- Radiance (L)** - The radiant intensity in a given direction from an element of a surface, divided by the area of the orthogonal projection of this element on a plane perpendicular to the given direction. [1]
- Radiant intensity (I)** - The radiant energy flux leaving an element of a source within an element of solid angle, divided by that element of solid angle. [1]
- Radicals** - Molecular entities possessing an unpaired electron, such as  $\cdot\text{CH}_3$ ,  $\cdot\text{SnH}_3$ ,  $\cdot\text{Cl}$ . (In these formulas the dot, symbolizing the unpaired electron, should be placed so as to indicate the atom of highest spin density, if this is possible). [5]
- Raman effect** - The inelastic scattering of light by a molecule, in which the incident photon either gives up to, or receives energy from, one of the internal vibrational modes of the molecule. The scattered light thus has either a lower frequency (Stokes radiation) or higher frequency (anti-Stokes radiation) than the incident light. These shifts provide a measure of the normal vibrational frequencies of the molecule.
- Rankine cycle** - A thermodynamic cycle which can be used to calculate the ideal performance of a heat engine that uses a condensable vapor as the working fluid (e.g., a steam engine or a heat pump).
- Rankine temperature** - A thermodynamic temperature scale based on a temperature interval  $^\circ\text{R} = (5/9) \text{K}$ ; i.e.,  $T/^\circ\text{R} = (9/5)T/\text{K} = t/^\circ\text{F} + 459.67$ .
- Raoult's law** - The expression for the vapor pressure  $p_i$  of component  $i$  in an ideal solution, viz.,  $p_i = x_i p_{i0}$ , where  $x_i$  is the mole fraction of component  $i$  and  $p_{i0}$  the vapor pressure of the pure substance  $i$ .
- Rare earth elements** - The elements Sc, Y, and the lanthanides (La, Ce, Pr, Nd, Pm, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu). [7]
- Rayleigh number (Ra)** - A dimensionless quantity used in fluid mechanics, defined by  $Ra = \beta g \alpha \Delta T \rho / \eta a$ , where  $l$  is length,  $g$  is acceleration of gravity,  $\alpha$  is cubic expansion coefficient,  $T$  is temperature,  $\rho$  is density,  $\eta$  is viscosity, and  $a$  is thermal diffusivity. [2]
- Rayleigh scattering** - The scattering of light by particles which are much smaller than the wavelength of the light. It is characterized by a scattered intensity which varies as the inverse fourth power of the wavelength.
- Rayleigh wave** - A guided elastic wave along the surface of a solid; also called surface acoustic wave.
- Reactance (X)** - The imaginary part of impedance. For an inductive reactance  $L$  and a capacitive reactance  $C$  in series, the reactance is  $X = L\omega - 1/(C\omega)$ , where  $\omega$  is  $2\pi$  times the frequency of the current. [1]
- Red shift** - A displacement of a spectral line toward longer wavelengths. This can occur through the Doppler effect (e.g., in the light from receding galaxies) or, in the general theory of relativity, from the effects of a star's gravitational field.
- Reflectance (p)** - Ratio of the radiant or luminous flux at a given wavelength that is reflected to that of the incident radiation. Also called reflection factor. [1]
- Reflection high energy electron diffraction (RHEED)** - See Techniques for Materials Characterization, page 12-1.
- Relative humidity\*** - The ratio of the partial pressure of water vapor in air to the saturation vapor pressure of water at the same temperature, expressed as a percentage. [10]
- Relative molar mass** - See Molecular weight.
- Rem** - A non-SI unit of dose equivalent, equal to 0.01 Sv.
- Resistance (R)** - Electric potential difference divided by current when there is no electromotive force in the conductor. This definition applies to direct current. More generally, resistance is defined as the real part of impedance. [1]
- Resistivity (p)** - Electric field strength divided by current density when there is no electromotive force in the conductor. Resistivity is an intrinsic property of a material. For a conductor of uniform cross section with area  $A$  and length  $L$ , and whose resistance is  $R$ , the resistivity is given by  $\rho = RA/L$ . [1]
- Reynolds number (Re)** - A dimensionless quantity used in fluid mechanics, defined by  $Re = \rho v l / \eta$ , where  $\rho$  is density,  $v$  is velocity,  $l$  is length, and  $\eta$  is viscosity. [2]
- Rheology** - The study of the flow of liquids and deformation of solids. Rheology addresses such phenomena as creep, stress relaxation, anelasticity, nonlinear stress deformation, and viscosity.
- Ribonucleic acids (RNA)** - Naturally occurring polyribonucleotides. See also nucleic acids, nucleosides, nucleotides, ribonucleotides. [5]
- Ribonucleotides** - Nucleotides in which the glycosyl group is a ribosyl group. See also nucleotides. [5]

**Roentgen (R)** - A unit used for expressing the charge (positive or negative) liberated by x-ray or  $\gamma$  radiation in air, divided by the mass of air. A roentgen is defined as  $2.58 \times 10^{-4}$  C/kg.

**Rotational constants** - In molecular spectroscopy, the constants appearing in the expression for the rotational energy levels as a function of the angular momentum quantum numbers. These constants are proportional to the reciprocals of the principal moments of inertia, averaged over the vibrational motion.

**Rutherford back scattering (RBS)** - See Techniques for Materials Characterization, page 12-1.

**Rydberg constant ( $R_\infty$ )**\* - The fundamental constant which appears in the equation for the energy levels of hydrogen-like atoms; i.e.,  $E_n = hcR_\infty Z^2\mu/n^2$ , where  $h$  is Planck's constant,  $c$  the speed of light,  $Z$  the atomic number,  $\mu$  the reduced mass of nucleus and electron, and  $n$  the principal quantum number ( $n = 1, 2, \dots$ ).

**Rydberg series** - A regular series of lines in the spectrum of an atom or molecule, with the spacing between successive lines becoming smaller as the frequency increases (wavelength decreases). The series eventually converges to a limit which usually corresponds to the complete removal of an electron from the atom or molecule.

**Sackur-Tetrode equation**\* - An equation for the molar entropy  $S_m$  of an ideal monatomic gas:  $S_m = R \ln(e^{5/2} V/N_A \Lambda^3)$ , where  $R$  is the molar gas constant,  $V$  is the volume, and  $N_A$  is Avogadro's number. The constant  $\Lambda$  is given by  $\Lambda = h/(2\pi mkT)^{1/2}$ , where  $h$  is Planck's constant,  $m$  the atomic mass,  $k$  the Boltzmann constant, and  $T$  the temperature.

**Salinity (S)**\* - A parameter used in oceanography to describe the concentration of dissolved salts in seawater. It is defined in terms of electrical conductivity relative to a standard solution of KCl. When expressed in units of parts per thousand,  $S$  may be roughly equated to the concentration of dissolved material in grams per kilogram of seawater.

**Salt** - An ionic compound formed by the reaction of an acid and a base.

**Scanned probe microscopy (SPM)** - See Techniques for Materials Characterization, page 12-1.

**Scanning electron microscopy (SEM)** - See Techniques for Materials Characterization, page 12-1.

**Scanning laser acoustic microscopy (SLAM)** - See Techniques for Materials Characterization, page 12-1.

**Scanning transmission electron microscopy (STEM)** - See Techniques for Materials Characterization, page 12-1.

**Scanning tunneling microscopy (STM)** - See Techniques for Materials Characterization, page 12-1.

**Schiff bases** - Imines bearing a hydrocarbyl group on the nitrogen atom:  $R_2C=NR'$  ( $R'$  not equal to H). Considered by many to be synonymous with azomethines. [5]

**Schmidt number (Sc)** - A dimensionless quantity used in fluid mechanics, defined by  $Sc = \eta/\rho D$ , where  $\eta$  is viscosity,  $\rho$  is density, and  $D$  is diffusion coefficient. [2]

**Schottky barrier** - A potential barrier associated with a metal-semiconductor contact. It forms the basis for the rectifying device known as the Schottky diode.

**Schrödinger equation** - The basic equation of wave mechanics which, for systems not dependent on time, takes the form:

$$-(\hbar/2m)\nabla^2\psi + V\psi = E\psi$$

where  $\psi$  is the wavefunction,  $V$  is the potential energy expressed as a function of the spatial coordinates,  $E$  is an energy eigenvalue,  $\nabla^2$  is the Laplacian operator,  $\hbar$  is Planck's constant divided by  $2\pi$ , and  $m$  is the mass.

**Second (s)**\* - The SI base unit of time. [1]

**Second radiation constant ( $c_2$ )**\* - See First radiation constant.

**Secondary ion mass spectroscopy (SIMS)** - See Techniques for Materials Characterization, page 12-1.

**Seebeck effect** - The development of a potential difference in a circuit where two different metals or semiconductors are joined and their junctions maintained at different temperatures. It is the basis of the thermocouple.

**Selenides** - Compounds having the structure RSeR (R not equal to H). They are thus selenium analogues of ethers. Also used for metal salts of  $H_2Se$ . [5]

**Semicarbazones** - Compounds having the structure  $R_2C=NNHC(=O)NH_2$ , formally derived by condensation of aldehydes or ketones with semicarbazide  $[NH_2NHC(=O)NH_2]$ . [5]

**Semiconductor** - A material in which the highest occupied energy band (valence band) is completely filled with electrons at  $T = 0$  K, and the energy gap to the next highest band (conduction band) ranges from 0 to 4 or 5 eV. With increasing temperature electrons are excited into the conduction band, leading to an increase in the electrical conductivity.

**Semiquinones** - Radical anions having the structure -O-Z-O- where Z is an ortho- or para-arylene group or analogous heteroarylene group; they are formally generated by the addition of an electron to a quinone. [5]

**SI units**\* - The International System of Units adopted in 1960 and recommended for use in all scientific and technical fields. [1]

**Siemens (S)**\* - The SI unit of electric conductance, equal to  $\Omega^{-1}$ . [1]

**Sievert (Sv)**\* - The SI unit of dose equivalent (of radiation), equal to J/kg. [1]

**Silanes** - Saturated silicon hydrides, analogues of the alkanes; i.e., compounds of the general formula  $Si_nH_{2n+2}$ . Silanes may be subdivided into silane, oligosilanes, and polysilanes. Hydrocarbyl derivatives are often referred to loosely as silanes. [5]

**Silicones** - Polymeric or oligomeric siloxanes, usually considered unbranched, of general formula  $[-OSiR_2-]_n$  (R not equal to H). [5]

**Siloxanes** - Saturated silicon-oxygen hydrides with unbranched or branched chains of alternating silicon and oxygen atoms (each silicon atom is separated from its nearest silicon neighbors by single oxygen atoms). [5]

**Skin effect** - The concentration of high frequency alternating currents near the surface of a conductor.

**Slater orbital** - A particular mathematical expression for the radial part of the wave function of a single electron, which is used in quantum-mechanical calculations of the energy and other properties of atoms and molecules.

**Small angle neutron scattering (SANS)** - See Techniques for Materials Characterization, page 12-1.

**Snell's law** - The relation between the angle of incidence  $i$  and the angle of refraction  $r$  of a light beam which passes from a medium of refractive index  $n_0$  to a medium of index  $n_1$ , viz.,  $\sin i/\sin r = n_1/n_0$ .

**Solar constant**\* - The mean radiant energy flux from the sun on a unit surface normal to the direction of the rays at the mean

distance of the earth from the sun. The value is approximately  $1373 \text{ W/m}^2$ .

**Solar wind** - The stream of high velocity hydrogen and helium ions emitted by the sun which flows through the solar system and beyond.

**Soliton** - A spatially localized wave in a solid or liquid that can interact strongly with other solitons but will afterwards regain its original form.

**Solubility\*** - A quantity expressing the maximum concentration of some material (the solute) that can exist in another liquid or solid material (the solvent) at thermodynamic equilibrium at specified temperature and pressure. Common measures of solubility include the mass of solute per unit mass of solution (mass fraction), mole fraction of solute, molality, molarity, and others.

**Solubility product constant ( $K_{sp}$ )\*** - The equilibrium constant for the dissolution of a sparsely soluble salt into its constituent ions.

**Space group\*** - A group of symmetry operations (reflections, rotations, etc.) that leave a crystal invariant. A total of 230 space groups have been identified.

**Spark source mass spectroscopy (SSMS)** - See Techniques for Materials Characterization, page 12-1.

**Specific gravity** - Ratio of the mass density of a material to that of water. Since one must specify the temperature of both the sample and the water to have a precisely defined quantity, the use of this term is now discouraged.

**Specific heat** - Heat capacity divided by mass. See Heat capacity.

**Specific quantity** - It is often convenient to express an extensive quantity (e.g., volume, enthalpy, heat capacity, etc.) as the actual value divided by mass. The resulting quantity is called specific volume, specific enthalpy, etc.

**Specific rotation  $[\alpha]_D^\theta$**  - For an optically active substance, defined by  $[\alpha]_D^\theta = \alpha/\gamma l$ , where  $\alpha$  is the angle through which plane polarized light is rotated by a solution of mass concentration  $\gamma$  and path length  $l$ . Here  $\theta$  is the Celsius temperature and  $\lambda$  the wavelength of the light at which the measurement is carried out. Also called specific optical rotatory power. [2]

**Spin ( $s, I$ )\*** - A measure of the intrinsic angular momentum of a particle, which it possesses independent of its orbital motion. The symbol  $s$  is used for the spin quantum number of an electron, while  $I$  is generally used for nuclear spin.

**Spiro compounds** - Compounds having one atom (usually a quaternary carbon) as the only common member of two rings. [5]

**Stacking fault** - An error in the normal sequence of layer growth in a crystal.

**Standard mean ocean water (SMOW)** - A standard sample of pure water of accurately known isotopic composition which is maintained by the International Atomic Energy Agency. It is used for precise calibration of density and isotopic composition measurements.

**Standard reduction potential ( $E^\circ$ )** - The zero-current potential of a cell in which the specified reduction reaction occurs at the right-hand electrode and the left-hand electrode is the standard hydrogen electrode. Also called Standard electrode potential.

**Standard state** - A defined state (specified temperature, pressure, concentration, etc.) for tabulating thermodynamic functions and carrying out thermodynamic calculations. The standard

state pressure is usually taken as  $100,000 \text{ Pa}$  (1 bar), but various standard state temperatures are used. [2]

**Stanton number ( $St$ )** - A dimensionless quantity used in fluid mechanics, defined by  $St = h/\rho v c_p$ , where  $h$  is coefficient of heat transfer,  $\rho$  is density,  $v$  is velocity, and  $c_p$  is specific heat capacity at constant pressure. [2]

**Stark effect** - The splitting of an energy level of an atom or molecule, and hence a splitting of spectral lines arising from that level, as a result of the application of an external electric field.

**Statistical weight ( $g$ )** - The number of distinct states corresponding to the same energy level. Also called degeneracy.

**Stefan-Boltzmann constant ( $\sigma$ )\*** - Constant in the equation for the radiant exitance  $M$  (radiant energy flux per unit area) from a black body at thermodynamic temperature  $T$ , viz.  $M = \sigma T^4$ . [1]

**Stibines** -  $\text{SbH}_3$  and compounds derived from it by substituting one, two or three hydrogen atoms by hydrocarbyl groups:  $\text{R}_3\text{Sb}$ ,  $\text{RSbH}_2$ ,  $\text{R}_2\text{SbH}$ , and  $\text{R}_3\text{Sb}$  (R not equal to H) are called primary, secondary and tertiary stibines, respectively. [5]

**Stochastic process** - A process which involves random variables and whose outcome can thus be described only in terms of probabilities.

**Stoichiometric number ( $\nu$ )** - The number appearing before the symbol for each compound in the equation for a chemical reaction. By convention, it is negative for reactants and positive for products. [2]

**Stokes (St)** - A non-SI unit of kinematic viscosity, equal to  $10^{-4} \text{ m}^2/\text{s}$ .

**Stokes' law** - The statement, valid under certain conditions, that the viscous force  $F$  experienced by a sphere of radius  $a$  moving at velocity  $v$  in a medium of viscosity  $\eta$  is given by  $F = -6\pi\eta av$ .

**Strain** - The deformation of a body that results from an applied stress.

**Stratosphere** - The part of the earth's atmosphere extending from the top of the troposphere (typically 10 to 15 km above the surface) to about 50 km. It is characterized by an increase in temperature with increasing altitude.

**Stress** - Force per unit area (pressure) applied to a body. Tensile stress tends to stretch or compress the body in the direction of the applied force. Shear stress results from a tangential force which tends to twist the body.

**Strong interaction** - The short range (order of 1 fm) attractive forces between protons, neutrons, and other hadrons which are responsible for the stability of the nucleus.

**Strouhal number ( $Sr$ )** - A dimensionless quantity used in fluid mechanics, defined by  $Sr = lf/v$ , where  $l$  is length,  $f$  is frequency, and  $v$  is velocity. [2]

**Structure factor** - In x-ray crystallography, the sum of the scattering factors of all the atoms in a unit cell, weighted by an appropriate phase factor. The intensity of a given reflection is proportional to the square of the structure factor.

**Sublimation pressure** - The pressure of a gas in equilibrium with a solid at a specified temperature.

**Sulfides** - Compounds having the structure  $\text{RSR}$  (R not equal to H). Such compounds were once called thioethers. In an inorganic sense, salts or other derivatives of hydrogen sulfide. [5]

**Sulfones** - Compounds having the structure,  $\text{RS(=O)}_2\text{R}$  (R not equal to H), e.g.  $\text{C}_2\text{H}_5\text{S(=O)}_2\text{CH}_3$ , ethyl methyl sulfone. [5]

**Sulfonic acids** -  $\text{HS(=O)}_2\text{OH}$ , sulfonic acid, and its *S*-hydrocarbyl derivatives. [5]

**Sulfoxides** - Compounds having the structure  $\text{R}_2\text{S=O}$  (R not equal to H), e.g.,  $\text{Ph}_2\text{S=O}$ , diphenyl sulfoxide. [5]

**Superconductor** - A material that experiences a nearly total loss of electrical resistivity below a critical temperature  $T_c$ . The effect can occur in pure metals, alloys, semiconductors, organic compounds, and certain inorganic solids.

**Superfluid** - A fluid with near-zero viscosity and extremely high thermal conductivity. Liquid helium exhibits these properties below 2.186 K (the  $\lambda$  point).

**Supernova** - A star in the process of exploding because of instabilities which follow the exhaustion of its nuclear fuel.

**Surface analysis by laser ionization (SALI)** - See Techniques for Materials Characterization, page 12-1.

**Surface tension ( $\gamma, \sigma$ )\*** - The force per unit length in the plane of the interface between a liquid and a gas, which resists an increase in the area of that surface. It can also be equated to the surface Gibbs energy per unit area.

**Surfactant** - A substance which lowers the surface tension of the medium in which it is dissolved, and/or the interfacial tension with other phases, and accordingly is positively adsorbed at the liquid-vapor or other interfaces. [3]

**Susceptance ( $B$ )** - Imaginary part of admittance. [1]

**Svedberg** - A non-SI unit of time, used to express sedimentation coefficients, equal to  $10^{-13}$  s.

**Syndiotactic macromolecule** - A tactic macromolecule, essentially comprising alternating enantiomeric configurational base units which have chiral or prochiral atoms in the main chain in a unique arrangement with respect to their adjacent constitutional units. In this case the repeating unit consists of two configurational base units that are enantiomeric. [8]

**Tacticity** - The orderliness of the succession of configurational repeating units of a macromolecule or oligomer molecule. In a tactic macromolecule essentially all the configurational repeating units are identical with respect to directional sense. See Configurational repeating unit, Isotactic, Syndiotactic. [8]

**Tautomerism** - Isomerism of the general form  $\text{G-X-Y=Z} \rightleftharpoons \text{X=Y-Z-G}$ , where the isomers (called tautomers) are readily interconvertible; the atoms connecting the groups X, Y, Z are typically any of C, H, O, or S, and G is a group which becomes an electrofuge (i.e., a group that does not carry away the bonding electron pair when it leaves its position in the molecule) or nucleofuge (a group that does carry away the bonding electrons when leaving) during isomerization. The commonest case, when the electrofuge is  $\text{H}^+$ , is also known as prototropy. A common example, written so as to illustrate the general pattern given above, is keto-enol tautomerism, such as

In some cases the interconversion rate between tautomers is slow enough to permit isolation of the separate keto and enol forms. [5]

**Tensile strength\*** - In tensile testing, the ratio of maximum load a body can bear before breaking to original cross-sectional area. Also called ultimate strength. [11]

**Terpenes** - Hydrocarbons of biological origin having carbon skeletons formally derived from isoprene [ $\text{CH}_2=\text{C(CH}_3\text{)CH=CH}_2$ ]. [5]

**Terpenoids** - Natural products and related compounds formally derived from isoprene units. They contain oxygen in various functional groups. The skeleton of terpenoids may differ from strict additivity of isoprene units by the loss or shift of a methyl (or other) group. [5]

**Tesla (T)\*** - The SI unit of magnetic flux density ( $B$ ), equal to  $\text{Vs/m}^2$ . [1]

**Thermal conductivity\*** - Rate of heat flow divided by area and by temperature gradient. [1]

**Thermal diffusivity** - Thermal conductivity divided by density and by specific heat capacity at constant pressure. [1]

**Thermal expansion coefficient ( $\alpha$ )\*** - The linear expansion coefficient is defined by  $\alpha_l = (1/l)(dl/dT)$ ; the volume expansion coefficient by  $\alpha_v = (1/V)(dV/dT)$ . [1]

**Thermionic emission** - The emission of electrons from a solid as a result of heat. The effect requires a high enough temperature to impart sufficient kinetic energy to the electrons to exceed the work function of the solid.

**Thermodynamic laws** - The foundation of the science of thermodynamics:

**First law:** The internal energy of an isolated system is constant; if energy is supplied to the system in the form of heat  $dq$  and work  $dw$ , then the change in energy  $dU = dq + dw$ .

**Second law:** No process is possible in which the only result is the transfer of heat from a reservoir and its complete conversion to work.

**Third law:** The entropy of a perfect crystal approaches zero as the thermodynamic temperature approaches zero.

**Thermoelectric power** - For a bar of a pure material whose ends are at different temperatures, the potential difference divided by the difference in temperature of the ends. See also Seebeck effect.

**Thermogravimetric analysis (TGA)** - See Techniques for Materials Characterization, page 12-1.

**Thermosphere** - The layer of the Earth's atmosphere extending from the top of the mesosphere (typically 80–90 km above the surface) to about 500 km. It is characterized by a rapid increase in temperature with increasing altitude up to about 200 km, followed by a leveling off in the 300–500 km region.

**Thiols** - Compounds having the structure  $\text{RSH}$  (R not equal to H). Also known by the term mercaptans (abandoned by IUPAC); e.g.,  $\text{CH}_3\text{CH}_2\text{SH}$ , ethanethiol. [5]

**Thomson coefficient ( $\mu, \tau$ )** - The heat power developed in the Thomson effect (whereby heat is evolved in a conductor when a current is flowing in the presence of a temperature gradient), divided by the current and the temperature difference. [1]

**Tonne (t)** - An alternative name for megagram (1000 kg). [1]

**Torque ( $T$ )** - For a force  $F$  that produces a torsional motion,  $T = r \times F$ , where  $r$  is a vector from some reference point to the point of application of the force.

**Torr** - A non-SI unit of pressure, equal to 133.322 Pa. The name is generally considered interchangeable with millimeter of mercury.

**Townsend coefficient** - In a radiation counter, the number of ionizing collisions by an electron per unit path length in the direction of an applied electric field.

**Transducer** - Any device that converts a signal from acoustical, optical, or some other form of energy into an electrical signal (or vice versa) while preserving the information content of the original signal.

**Transistor** - A voltage amplifier using controlled electron currents inside a semiconductor.

**Transition metals** - Elements characterized by a partially filled  $d$  subshell. The First Transition Series comprises Sc, Ti, V, Cr, Mn, Fe, Co, Ni, Cu. The Second and Third Transition Series include the lanthanides and actinides, respectively. [7]

**Transition probability\*** - See Einstein transition probability.

**Transmittance ( $\tau$ )** - Ratio of the radiant or luminous flux at a given wavelength that is transmitted to that of the incident radiation. Also called transmission factor. [1]

**Tribology** - The study of frictional forces between solid surfaces.

**Triple point\*** - The point in  $p, T$  space where the solid, liquid, and gas phases of a substance are in thermodynamic equilibrium. The corresponding temperature and pressure are called the triple point temperature and triple point pressure.

**Troposphere** - The lowest part of the earth's atmosphere, extending to 10–15 km above the surface. It is characterized by a decrease in temperature with increasing altitude. The exact height varies with latitude and season.

**Tunnel diode** - A device involving a p-n junction in which both sides are so heavily doped that the Fermi level on the p-side lies in the valence band and on the n-side in the conduction band. This leads to a current-voltage curve with a maximum, so that the device exhibits a negative resistance in some regions.

**Ultraviolet photoelectron spectroscopy (UPS)** - See Techniques for Materials Characterization, page 12-1.

**Umklapp process** - A process involving the interaction of three or more waves (lattice or electron) in a solid in which the sum of the wave vectors does not equal zero.

**Unified atomic mass unit ( $u$ )\*** - A unit of mass used in atomic, molecular, and nuclear science, defined as the mass of one atom of  $^{12}\text{C}$  divided by 12. Its approximate value is  $1.66054 \times 10^{-27}$  kg. [1]

**Universal time ( $t_U$ , UT)** - Mean solar time counted from midnight at the Greenwich meridian. Also called Greenwich mean time (GMT). The interval of mean solar time is based on the average, over one year, of the time between successive transits of the sun across the observer's meridian.

**Vacancy** - A missing atom or ion in a crystal lattice.

**Van Allen belts** - Two toroidal regions above the earth's atmosphere containing protons and electrons. The outer belt at about 25,000 km above the surface is probably of solar origin. The inner belt at about 3000 km contains more energetic particles from outside the solar system.

**Van der Waals' equation\*** - An equation of state for fluids which takes the form:

$$pV_m = RT \left( \frac{1}{V_m - b} - \frac{a}{V_m^2} \right)$$

where  $p$  is pressure,  $V_m$  is molar volume,  $T$  is temperature,  $R$  is the molar gas constant, and  $a$  and  $b$  are characteristic parameters of the substance which describe the effect of attractive and repulsive intermolecular forces, respectively.

**Van der Waals' force** - The weak attractive force between two molecules which arises from electric dipole interactions. It can lead to the formation of stable but weakly bound dimer molecules or clusters.

**Van't Hoff equation** - The equation expressing the temperature dependence of the equilibrium constant  $K$  of a chemical reaction:

$$\frac{d \ln K}{dT} = \frac{\Delta_r H^\circ}{RT^2}$$

where  $\Delta_r H^\circ$  is the standard enthalpy of reaction,  $R$  the molar gas constant, and  $T$  the temperature. Also called van't Hoff isochore.

**Vapor pressure\*** - The pressure of a gas in equilibrium with a liquid (or, in some usage, a solid) at a specified temperature.

**Varistor** - A device that utilizes the properties of certain metal oxides with small amounts of impurities, which show abrupt nonlinearities at specific voltages where the material changes from a semiconductor to an insulator.

**Velocity ( $v$ )** - Rate of change of distance with time.

**Verdet constants ( $V$ )\*** - Angle of rotation of a plane polarized light beam passing through a medium in a magnetic field, divided by the field strength and by the path length.

**Virial equation of state\*** - An equation relating the pressure  $p$ , molar volume  $V_m$ , and temperature  $T$  of a real gas in the form of an expansion in powers of the molar volume, viz.,  $pV_m = RT(1 + BV_m^{-1} + CV_m^{-2} + \dots)$ , where  $R$  is the molar gas constant.  $B$  is called the second virial coefficient,  $C$  the third virial coefficient, etc. The virial coefficients are functions of temperature.

**Viscosity ( $\eta$ )\*** - The proportionality factor between sheer rate and sheer stress, defined through the equation  $F = \eta A(dv/dx)$ , where  $F$  is the tangential force required to move a planar surface of area  $A$  at velocity  $v$  relative to a parallel surface separated from the first by a distance  $x$ . Sometimes called dynamic or absolute viscosity. The term kinematic viscosity (symbol  $\nu$ ) is defined as  $\eta$  divided by the mass density.

**Volt ( $V$ )\*** - The SI unit of electric potential, equal to W/A. [1]

**Volume fraction ( $\phi$ )** - Defined as  $V_j/\sum_i V_i$ , where  $V_j$  is the volume of the specified component and the  $V_i$  are the volumes of all the components of a mixture prior to mixing. [2]

**Watt ( $W$ )\*** - The SI unit of power, equal to J/s. [1]

**Wave function** - A function of the coordinates of all the particles in a quantum mechanical system (and, in general, of time) which fully describes the state of the system. The product of the wave function and its complex conjugate is proportional to the probability of finding a particle at a particular point in space.

**Weak interaction** - The weak forces (order of  $10^{-12}$  of the strong interaction) between elementary particles which are responsible for beta decay and other nuclear effects.

**Weber ( $Wb$ )\*** - The SI unit of magnetic flux, equal to V s. [1]

**Weber number ( $We$ )** - A dimensionless quantity used in fluid mechanics, defined by  $We = \rho v^2 l / \gamma$ , where  $\rho$  is density,  $v$  is velocity,  $l$  is length, and  $\gamma$  is surface tension. [2]

**Weight** - That force which, when applied to a body, would give it an acceleration equal to the local acceleration of gravity. [1]

**Wiedeman-Franz law** - The law stating that the thermal conductivity  $k$  and electrical conductivity  $\sigma$  of a pure metal are related by  $k = L\sigma T$ , where  $T$  is the temperature and  $L$  (called the Lorenz ratio) has the approximate value  $2.45 \times 10^{-8}$  V<sup>2</sup>/K<sup>2</sup>.

**Wien displacement law** - The relation, which can be derived from the Planck formula for black body radiation, that

$\lambda_{\max} T = 0.0028978 \text{ m K}$ , where  $\lambda_{\max}$  is the wavelength of maximum radiance at temperature  $T$ .

**Wigner-Seitz method** - A method of calculating electron energy levels in a solid using a model in which each electron is subject to a spherically symmetric potential.

**Wittig reagents** - See phosphonium ylides.

**Work (W)** - Force multiplied by the displacement in the direction of the force. [1]

**Work function ( $\Phi$ )\*** - The energy difference between an electron at rest at infinity and an electron at the Fermi level in the interior of a substance. It is thus the minimum energy required to remove an electron from the interior of a solid to a point just outside the surface. [1]

**X unit (X)** - A unit of length used in x-ray crystallography, equal to approximately  $1.002 \times 10^{-13} \text{ m}$ .

**X-ray photoelectron spectroscopy (XPS)** - See Techniques for Materials Characterization, page 12-1.

**Yield strength** - The stress at which a material exhibits a specified deviation (often chosen as 0.2% for metals) from proportionality of stress and strain. [11]

**Young's modulus (E)** - In tension or compression of a body below its elastic limit, the ratio of stress to corresponding strain. Since strain is normally expressed on a fractional basis, Young's modulus has dimensions of pressure. Also called elastic modulus. [11]

**Zeeman effect** - The splitting of an energy level of an atom or molecule, and hence a splitting of spectral lines arising from that level, as a result of the application of an external magnetic field.

**Zener diode** - A control device utilizing a p-n junction with a well defined reverse-bias avalanche breakdown voltage.

**Zeotrope** - A liquid mixture that shows no maximum or minimum when vapor pressure is plotted against composition at constant temperature. See Azeotrope.

**Zero-point energy** - The energy possessed by a quantum mechanical system as a result of the uncertainty principle even when it is in its lowest energy state; e.g., the difference between the lowest energy level of a harmonic oscillator and the minimum in the potential well.

**Zeta potential ( $\zeta$ )** - The electric potential at the surface of a colloidal particle relative to the potential in the bulk medium at a long distance. Also called electrokinetic potential.

**Zwitterions** - Neutral compounds having formal unit electrical charges of opposite sign. Some chemists restrict the term to compounds with the charges on non-adjacent atoms. Sometimes referred to as inner salts, dipolar ions (a misnomer). [5]

## THERMODYNAMIC FUNCTIONS AND RELATIONS

$p$  = pressure       $V$  = volume       $T$  = temperature

$n_i$  = amount of substance  $i$

$x_i = n_i / \sum_j n_j$  = mole fraction of substance  $i$

Energy	$U$
Entropy	$S$
Enthalpy	$H = U + pV$
Helmholtz energy	$A = U - TS$
Gibbs energy	$G = U + pV - TS$
Isobaric heat capacity	$C_p = (\partial H / \partial T)_p$
Isochoric heat capacity	$C_v = (\partial U / \partial T)_v$
Isobaric expansivity	$\alpha = V^{-1}(\partial V / \partial T)_p$
Isothermal compressibility	$\kappa_T = -V^{-1}(\partial V / \partial p)_T$
Isentropic compressibility	$\kappa_S = -V^{-1}(\partial V / \partial p)_S$
	$\kappa_T - \kappa_S = T\alpha^2 V / C_p$
	$C_p - C_v = T\alpha^2 V / \kappa_T$
Gibbs-Helmholtz equation	$H = G - T(\partial G / \partial T)_p$
Maxwell relations	$(\partial S / \partial p)_T = -(\partial V / \partial T)_p$
	$(\partial S / \partial V)_T = -(\partial p / \partial T)_v$
Joule-Thomson expansion	$\mu_{JT} = (\partial T / \partial p)_H = -\{V - T(\partial V / \partial T)_p\} / C_p$
	$\Phi_{JT} = (\partial H / \partial p)_T = V - T(\partial V / \partial T)_p$
Partial molar quantity	$X_i = (\partial X / \partial n_i)_{T,p,n_j \neq i}$
Chemical potential	$\mu_i = (\partial G / \partial n_i)_{T,p,n_j \neq i}$
Perfect gas [symbol <sup>pg</sup> ]	$pV = (\sum_i n_i)RT$
	$\mu_i^{pg} = \mu_i^\theta + RT \ln(x_i p / p^\theta)$
Fugacity	$f_i = (x_i p) \exp\{(\mu_i - \mu_i^{pg}) / RT\}$
Activity coefficient	$\gamma_i = f_i / (x_i f_i^\theta)$
Gibbs-Duhem relation	$0 = SdT - Vdp + \sum_i n_i d\mu_i$

[Superscript  $\theta$  in above equations indicates standard state]

Notation for chemical and physical changes ( $X = H, S, G$ , etc.):

Chemical reaction	$\Delta_r X$
Formation from elements	$\Delta_f X$
Combustion	$\Delta_c X$
Fusion (cry $\rightarrow$ liq)	$\Delta_{fus} X$
Vaporization (liq $\rightarrow$ gas)	$\Delta_{vap} X$
Sublimation (cry $\rightarrow$ gas)	$\Delta_{sub} X$
Phase transition	$\Delta_{trs} X$
Solution	$\Delta_{sol} X$
Mixing	$\Delta_{mix} X$
Dilution	$\Delta_{dil} X$

# REPRESENTATION OF CHEMICAL STRUCTURES WITH THE IUPAC INTERNATIONAL CHEMICAL IDENTIFIER (INCHI)

Stephen R. Heller and Alan D. McNaught

The IUPAC International Chemical Identifier (InChI) is a freely available, non-proprietary identifier for chemical substances that can be used in both printed and electronic data sources. It is generated from a computerized representation of a molecular structure diagram, which can be produced by chemical structure-drawing software. Its use enables linking of diverse data compilations and unambiguous identification of chemical substances. A full description of the Identifier and software for its generation are available from the IUPAC Web site (Ref. 1), and a helpful compilation of answers to frequently asked questions has been put together at the Unilever Centre for Molecular Science Informatics (Ref. 2). Commercial structure-drawing software that will generate the Identifier is available from several organizations, listed on the IUPAC Web site.

The conversion of structural information to the Identifier is based on a set of IUPAC structure conventions, and rules for normalization and canonicalization (conversion to a single, predictable sequence) of an input structure representation. The resulting InChI is simply a series of characters that serve to uniquely identify the structure from which it was derived. The InChI uses a layered format to represent all available structural information relevant to compound identity. InChI layers are listed below. Each layer in an InChI representation contains a specific type of structural information. These layers, automatically extracted from the input structure, are designed so that each successive layer adds additional detail to the Identifier. The specific layers generated depend on the level of structural detail available and whether or not allowance is made for tautomerism. Of course, any ambiguities or uncertainties in the original structure will remain in the InChI.

This layered structure design offers a number of advantages. If two structures for the same substance are drawn at different levels of detail, the one with the lower level of detail will, in effect, be contained within the other. Specifically, if one substance is drawn with stereo-bonds and the other without, the layers in the latter will be a subset of the former. The same will hold for compounds treated by one author as tautomers and by another as exact structures with all H-atoms fixed. This can work at a finer level. For example, if one author includes double bond and tetrahedral stereochemistry, but another omits stereochemistry, the latter InChI will be contained in the former.

The InChI layers are

1. Formula
2. Connectivity (no formal bond orders)
  - a. disconnected metals
  - b. connected metals
3. Isotopes
4. Stereochemistry
  - a. double bond (Z/E)
  - b. tetrahedral (sp<sup>3</sup>)
5. Tautomers (on or off)

Charges are not part of the basic InChI, but rather are added at the end of the InChI string.

Two examples of InChI representations are given below. It is important to recognize, however, that InChI strings are intended for use by computers and end users need not understand any of their

details. In fact, the open nature of InChI and its flexibility of representation, after implementation into software systems, may allow chemists to be even less concerned with the details of structure representation by computers.

guanine

InChI=1/C5H5N5O/c6-5-9-3-2(4(11)10-5)7-1-8-3/h1H,(H4,6,7,8,9,10,11)/f/h8,10H,6H2

monosodium glutamate

InChI=1/C5H9NO4.Na/c6-3(5(9)10)1-2-4(7)8;/h3H,1-2,6H2,(H,7,8)(H,9,10);/q;+1/p-1/t3-;/m1./s1/fC5H8NO4.Na/h7H;/q-1;m

The layers in the InChI string are separated by the '/' character followed by a lowercase letter (except for the first layer, the chemical formula), with the layers arranged in predefined order. In the examples the following segments are included

InChI version number

/- chemical formula

/c connectivity-1.1 (excluding terminal H)

/h connectivity-1.2 (locations of terminal H, including mobile H attachment points)

/q charge

/p proton balance

/t sp<sup>3</sup> (tetrahedral) parity

/m parity inverted to obtain relative stereo (1 = inverted, 0 = not inverted)

/s stereo type (1 = absolute, 2 = relative, 3 = racemic)

/f chemical formula of the fixed-H structure if it is different

/h connectivity-2 (locations of fixed mobile H)

/q charge

/t sp<sup>3</sup> (tetrahedral) parity

/m parity inverted to obtain relative stereo (1 = inverted, 0 = not inverted, . = inversion does not affect the parity)

/s stereo type (1 = absolute, 2 = relative, 3 = racemic)

One of the most important applications of InChI is the facility to locate mention of a chemical substance using Internet-based search

engines. This is made easier by using a shorter (compressed) form of InChI, known as InChIKey. The InChIKey is a 27-character representation that, because it is compressed, cannot be reconverted into the original structure, but it is not subject to the undesirable and unpredictable breaking of longer character strings by some search en-

gines. The usefulness of the InChIKey as a search tool is enhanced by its derivation from a "standard" InChI. i.e., an InChI produced with standard option settings for features such as tautomerism and stereochemistry. An example is shown below; the "standard" InChI is denoted by the letter "S" after the version number.

InChI=1S/C8H10N4O2/c1-10-4-9-6-5(10)7(13)12(3)8(14)11(6)2/h4H,1-3H3 (caffeine)

Use of InChIKey also allows searches based solely on atomic connectivity (first 14 characters). Software for generating InChIKey is available from the IUPAC Web site (Ref. 1).

The enormous databases compiled by organizations such as PubChem (Ref. 4), the U.S. National Cancer Institute (NCI), and ChemSpider (Ref. 5) contain millions of InChIs and InChIKeys, which allow sophisticated searching of these collections. PubChem provides InChI-based structure-search facilities for both identical and similar structures (Ref. 6), and ChemSpider offers both search facilities and Web services enabling a variety of InChI and InChIKey conversions (Ref. 7). The NCI Chemical Structure Lookup Service (Ref. 8) provides InChI-based search access to over 39 million chemical structures from over 80 different public and commercial data sources.

## EXPRESSION OF UNCERTAINTY OF MEASUREMENTS

In general, the result of a measurement is only an approximation or estimate of the true value of the quantity subject to measurement, and thus the result is of limited value unless accompanied by a statement of its uncertainty. Much (but not all) of the scientific data appearing in the literature does include some indication of the uncertainty, but this may be stated in many different ways and is often explained poorly. In an effort to encourage consistency in uncertainty statements, the International Committee for Weights and Measures (CIPM) initiated a project, in collaboration with several other international organizations, to prepare a set of guidelines expressing international consensus on the recommended method of stating uncertainties. This project resulted in the publication of the *Guide to the Expression of Uncertainty in Measurement* (Reference 1), which is often referred to as *GUM*. The recommendations of *GUM* have been summarized by the National Institute of Standards and Technology in *NIST Technical Note 1297, Guidelines for Evaluating the Uncertainty of NIST Measurement Results* (Reference 2).

In the notation of *GUM*, we are concerned with the **measurand**, i.e., the quantity that is being measured. In physics and chemistry this is usually called a **physical quantity** and represents some inherent characteristic of a material, system, or process that can be expressed in numerical terms — specifically as the product of a number and a reference, commonly called a **unit**. Thus the density of water at room temperature is (approximately) 0.998 g/mL (grams per milliliter) or, alternatively 998 kg m<sup>-3</sup> (kilograms per meter cubed). This statement gives the most likely value of the measurand, to this level of precision, but gives no information on how much the stated value might differ from the true value.

It is important to differentiate between the terms **error** and **uncertainty**. The error in a measurement is the difference between the measured value and the true value; the error can be stated if the true value is known (to some level of accuracy). The uncertainty is an estimate of the maximum reasonable extent to which the measured value is believed to deviate from the true value, in a situation where the true value is not known (most often the case). The result of a measurement can unknowably be very close to the true value, and thus have negligible error, even though its uncertainty is large.

The uncertainty of the result of a measurement generally consists of several components, which may be grouped in two types according to the method used to estimate their numerical values:

**Type A. Those which are evaluated by statistical methods**

**Type B. Those which are evaluated by other means**

The terms “random uncertainty” and “systematic uncertainty” are often used, but these terms do not always correspond in a simple way to the A and B categories. This is because the nature of an uncertainty component is conditioned by how the quantity appears in the mathematical model that describes the current measurement process. An uncertainty component arising from a systematic effect may in some cases be evaluated by methods of Type A while in other cases by methods of Type B.

In the *GUM* formulation, each component of uncertainty, whether in the A or B category, is represented by an estimated standard deviation, termed **standard uncertainty**, symbol  $u_j$ , and equal to the positive square root of the estimated variance  $u_j^2$ .

For an uncertainty component of Type A,  $u_i = s_i$ , where  $s_i$  is the statistically estimated standard deviation, as determined from a

series of observations by appropriate statistical analysis. Any valid statistical method may be used. Examples are calculating the standard deviation of the mean of a series of independent observations; using the method of least squares to fit a curve to data in order to estimate parameters of the curve and their standard deviations; and carrying out an analysis of variance (ANOVA) in order to identify and quantify random effects in certain types of measurements. Details of statistical analysis are given in References 4–7 and many other places.

In a similar manner, each uncertainty component of Type B is represented by a quantity  $u_j$ , which is obtained from an assumed probability distribution based on all the available information about the measurement process. Since  $u_j$  is treated like a standard deviation, the standard uncertainty in each Type B component is simply  $u_j$ . The evaluation of  $u_j$  is usually based on scientific judgment using all the relevant information available, which may include

- previous measurement data
- experience with, or general knowledge of, the behavior and properties of relevant materials and instruments
- manufacturer’s specifications
- data provided in calibrations and other reports
- uncertainties assigned to reference data taken from handbooks.

The specific approach to evaluating the standard uncertainty  $u_j$  of a Type B uncertainty will depend on the detailed model of the measurement process. The following are examples of steps that may be used:

1. Convert a quoted uncertainty (for example, in a calibration factor) that is a stated multiple of an estimated standard deviation to a standard uncertainty by dividing the quoted uncertainty by the multiplier.
2. Convert a quoted uncertainty that defines a “confidence interval” having a stated level of confidence, such as 95% or 99%, to a standard uncertainty by treating the quoted uncertainty as if a normal distribution had been used to calculate it (unless otherwise indicated) and dividing it by the appropriate factor for such a distribution. These factors are 1.960 and 2.576 for the two levels of confidence given.
3. Model knowledge of the quantity in question by a normal distribution and estimate lower and upper limits  $a_-$  and  $a_+$  such that the best estimated value of the quantity is  $(a_- + a_+)/2$  (i.e., the midpoint of the limits) and there is 1 chance out of 2 (i.e., a 50 percent probability) that the value of the quantity lies in the interval  $a_-$  to  $a_+$ . Then  $u_j \approx 1.48 a$ , where  $a = (a_+ - a_-)/2$  is the half-width of the interval.
4. Model knowledge of the quantity in question by a normal distribution and estimate lower and upper limits  $a_-$  and  $a_+$  such that the best estimated value of the quantity is  $(a_- + a_+)/2$  and there is about a 2 out of 3 chance (i.e., a 67 percent probability) that the value of the quantity lies in the interval  $a_-$  to  $a_+$ . Then  $u_j \approx a$ , where  $a = (a_+ - a_-)/2$ .
5. Estimate lower and upper limits  $a_-$  and  $a_+$  for the value of the quantity in question such that the probability that the value lies in the interval  $a_-$  to  $a_+$  is, for all practical purposes, 100 percent. Provided that there is no contradictory information, treat the quantity as if it is equally probable for its value to lie anywhere within the interval  $a_-$  to  $a_+$ ;

that is, model it by a uniform or rectangular probability distribution. The best estimate of the value of the quantity is then  $(a_+ + a_-)/2$  with  $u_j = a/\sqrt{3}$  where  $a = (a_+ - a_-)/2$ . If the distribution used to model the quantity is triangular rather than rectangular, then  $u_j = a/\sqrt{6}$ . The rectangular distribution is a reasonable default model in the absence of any other information. But if it is known that values of the quantity in question near the center of the limits are more likely than values close to the limits, a triangular or a normal distribution may be a better model.

When all the standard uncertainties of Type A and Type B have been determined in this way, they should be combined to produce the **combined standard uncertainty** (suggested symbol  $u_c$ ), which may be regarded as the estimated standard deviation of the measurement result. This process, often called the *law of propagation of uncertainty* or “root-sum-of-squares,” involves taking the square root of the sum of the squares of all the  $u_i$ . In many practical measurement situations, the probability distribution characterized by the measurement result  $y$  and its combined standard uncertainty  $u_c(y)$  is approximately normal (Gaussian). When this is the case,  $u_c(y)$  defines an interval  $y - u_c(y)$  to  $y + u_c(y)$  about the measurement result  $y$  within which the value of the measurand  $Y$  estimated by  $y$  is believed to lie with a level of confidence of approximately 68 percent. That is, it is believed with an approximate level of confidence of 68 percent that  $y - u_c(y) \leq Y \leq y + u_c(y)$ , which is commonly written as  $Y = y \pm u_c(y)$ .

In fundamental metrological research (involving physical constants, calibration standards, and the like) the combined standard uncertainty  $u_c$  is normally used as the statement of uncertainty in a measurement. In most cases, however, it is desirable to use a measure of uncertainty that defines an interval about the measurement result  $y$  within which the value of the measurand  $Y$  is confidently believed to lie. The measure of uncertainty intended to meet this requirement is termed **expanded uncertainty**, suggested symbol  $U$ , and is obtained by multiplying  $u_c(y)$  by a **coverage factor**, suggested symbol  $k$ . Thus  $U = ku_c(y)$  and it is believed with high confidence that  $y - U \leq Y \leq y + U$ , which is commonly written as  $Y = y \pm U$ . The value of the coverage factor  $k$  is chosen on the basis of the desired level of confidence to be associated with the interval defined by  $U = ku_c$ . Typically,  $k$  is in the range 2 to 3. When the normal distribution applies,  $U = 2u_c$  (i.e.,  $k = 2$ ) defines an interval having a level of confidence of approximately 95 percent, and  $U = 3u_c$  defines an interval having a confidence level greater than 99 percent. In current international practice it is most common to use  $k = 2$ , corresponding to about 95 percent confidence, but the

value of  $k$  should be stated in each case to avoid confusion. See References 1 and 2 for methods of calculating  $k$  when a value other than  $k = 2$  is needed for a specific requirement.

## Summary of Key Steps

- Group the uncertainty components into Type A (can be evaluated by statistical methods) and Type B (must be evaluated by other means).
- Determine the standard uncertainty for each component of Type A by statistical methods and for each component of Type B by other suitable methods, based on modeling the measurement process.
- Take the square root of the sum of the squares of all the standard uncertainties to get the combined standard uncertainty  $u_c$ .
- Specify a coverage factor  $k$  which, when multiplied by  $u_c$ , gives the expanded uncertainty  $U$ . In fundamental metrological research  $k = 1$  is usually chosen; in other cases,  $k = 2$  (corresponding to a confidence level of about 95%) is the most common choice.

## NOBEL LAUREATES IN CHEMISTRY AND PHYSICS

Full details on nationality and basis of the awards can be found at <[nobelprize.org/](http://nobelprize.org/)>.

### Chemistry

2008	Martin Chalfie, Osamu Shimomura, Roger Y. Tsien	1954	Linus Pauling
2007	Gerhard Ertl	1953	Hermann Staudinger
2006	Roger D. Kornberg	1952	Archer J.P. Martin, Richard L.M. Synge
2005	Yves Chauvin, Robert H. Grubbs, Richard R. Schrock	1951	Edwin M. McMillan, Glenn T. Seaborg
2004	Aaron Ciechanover, Avram Hershko, Irwin Rose	1950	Otto Diels, Kurt Alder
2003	Peter Agre, Roderick MacKinnon	1949	William F. Giauque
2002	John B. Fenn, Koichi Tanaka, Kurt Wüthrich	1948	Arne Tiselius
2001	William S. Knowles, Ryoji Noyori, K. Barry Sharpless	1947	Sir Robert Robinson
2000	Alan Heeger, Alan G. MacDiarmid, Hideki Shirakawa	1946	James B. Sumner, John H. Northrop, Wendell M. Stanley
1999	Ahmed Zewail	1945	Artturi Virtanen
1998	Walter Kohn, John Pople	1944	Otto Hahn
1997	Paul D. Boyer, John E. Walker, Jens C. Skou	1943	George de Hevesy
1996	Robert F. Curl Jr., Sir Harold Kroto, Richard E. Smalley	1942	<i>No prize awarded</i>
1995	Paul J. Crutzen, Mario J. Molina, F. Sherwood Rowland	1941	<i>No prize awarded</i>
1994	George A. Olah	1940	<i>No prize awarded</i>
1993	Kary B. Mullis, Michael Smith	1939	Adolf Butenandt, Leopold Ruzicka
1992	Rudolph A. Marcus	1938	Richard Kuhn
1991	Richard R. Ernst	1937	Norman Haworth, Paul Karrer
1990	Elias James Corey	1936	Peter Debye
1989	Sidney Altman, Thomas R. Cech	1935	Frédéric Joliot, Irène Joliot-Curie
1988	Johann Deisenhofer, Robert Huber, Hartmut Michel	1934	Harold C. Urey
1987	Donald J. Cram, Jean-Marie Lehn, Charles J. Pedersen	1933	<i>No prize awarded</i>
1986	Dudley R. Herschbach, Yuan T. Lee, John C. Polanyi	1932	Irving Langmuir
1985	Herbert A. Hauptman, Jerome Karle	1931	Carl Bosch, Friedrich Bergius
1984	Bruce Merrifield	1930	Hans Fischer
1983	Henry Taube	1929	Arthur Harden, Hans von Euler-Chelpin
1982	Aaron Klug	1928	Adolf Windaus
1981	Kenichi Fukui, Roald Hoffmann	1927	Heinrich Wieland
1980	Paul Berg, Walter Gilbert, Frederick Sanger	1926	The Svedberg
1979	Herbert C. Brown, Georg Wittig	1925	Richard Zsigmondy
1978	Peter Mitchell	1924	<i>No prize awarded</i>
1977	Ilya Prigogine	1923	Fritz Pregl
1976	William Lipscomb	1922	Francis W. Aston
1975	John Cornforth, Vladimir Prelog	1921	Frederick Soddy
1974	Paul J. Flory	1920	Walther Nernst
1973	Ernst Otto Fischer, Geoffrey Wilkinson	1919	<i>No prize awarded</i>
1972	Christian Anfinsen, Stanford Moore, William H. Stein	1918	Fritz Haber
1971	Gerhard Herzberg	1917	<i>No prize awarded</i>
1970	Luis Leloir	1916	<i>No prize awarded</i>
1969	Derek Barton, Odd Hassel	1915	Richard Willstätter
1968	Lars Onsager	1914	Theodore W. Richards
1967	Manfred Eigen, Ronald G.W. Norrish, George Porter	1913	Alfred Werner
1966	Robert S. Mulliken	1912	Victor Grignard, Paul Sabatier
1965	Robert B. Woodward	1911	Marie Curie
1964	Dorothy Crowfoot Hodgkin	1910	Otto Wallach
1963	Karl Ziegler, Giulio Natta	1909	Wilhelm Ostwald
1962	Max F. Perutz, John C. Kendrew	1908	Ernest Rutherford
1961	Melvin Calvin	1907	Eduard Buchner
1960	Willard F. Libby	1906	Henri Moissan
1959	Jaroslav Heyrovsky	1905	Adolf von Baeyer
1958	Frederick Sanger	1904	Sir William Ramsay
1957	Lord Todd	1903	Svante Arrhenius
1956	Sir Cyril Hinshelwood, Nikolay Semenov	1902	Emil Fischer
1955	Vincent du Vigneaud	1901	Jacobus H. van't Hoff

## Physics

2008	Makoto Kobayashi, Toshihide Maskawa, Yoichiro Nambu	1957	Chen Ning Yang, Tsung-Dao Lee
2007	Albert Fert, Peter Grünberg	1956	William B. Shockley, John Bardeen, Walter H. Brattain
2006	John C. Mather, George F. Smoot	1955	Willis E. Lamb, Polykarp Kusch
2005	Roy J. Glauber, John L. Hall, Theodor W. Hänsch	1954	Max Born, Walther Bothe
2004	David J. Gross, H. David Politzer, Frank Wilczek	1953	Frits Zernike
2003	Alexei A. Abrikosov, Vitaly L. Ginzburg, Anthony J. Leggett	1952	Felix Bloch, E. M. Purcell
2002	Raymond Davis Jr., Masatoshi Koshihira, Riccardo Giacconi	1951	John Cockcroft, Ernest T.S. Walton
2001	Eric A. Cornell, Wolfgang Ketterle, Carl E. Wieman	1950	Cecil Powell
2000	Zhores I. Alferov, Herbert Kroemer, Jack S. Kilby	1949	Hideki Yukawa
1999	Gerardus't Hooft, Martinus J.G. Veltman	1948	Patrick M.S. Blackett
1998	Robert B. Laughlin, Daniel C. Tsui	1947	Edward V. Appleton
1997	Steven Chu, Claude Cohen-Tannoudji, William D. Phillips	1946	Percy W. Bridgman
1996	David M. Lee, Douglas D. Osheroff, Robert C. Richardson	1945	Wolfgang Pauli
1995	Martin L. Perl, Frederick Reines	1944	Isidor Isaac Rabi
1994	Bertram N. Brockhouse, Clifford G. Shull	1943	Otto Stern
1993	Russell A. Hulse, Joseph H. Taylor Jr.	1942	<i>No prize awarded</i>
1992	Georges Charpak	1941	<i>No prize awarded</i>
1991	Pierre-Gilles de Gennes	1940	<i>No prize awarded</i>
1990	Jerome I. Friedman, Henry W. Kendall, Richard E. Taylor	1939	Ernest Lawrence
1989	Norman F. Ramsey, Hans G. Dehmelt, Wolfgang Paul	1938	Enrico Fermi
1988	Leon M. Lederman, Melvin Schwartz, Jack Steinberger	1937	Clinton Davisson, George Paget Thomson
1987	J. Georg Bednorz, K. Alex Müller	1936	Victor F. Hess, Carl D. Anderson
1986	Ernst Ruska, Gerd Binnig, Heinrich Rohrer	1935	James Chadwick
1985	Klaus von Klitzing	1934	<i>No prize awarded</i>
1984	Carlo Rubbia, Simon van der Meer	1933	Erwin Schrödinger, Paul A.M. Dirac
1983	Subramanyan Chandrasekhar, William A. Fowler	1932	Werner Heisenberg
1982	Kenneth G. Wilson	1931	<i>No prize awarded</i>
1981	Nicolaas Bloembergen, Arthur L. Schawlow, Kai M. Siegbahn	1930	Sir Venkata Raman
1980	James Cronin, Val Fitch	1929	Louis de Broglie
1979	Sheldon Glashow, Abdus Salam, Steven Weinberg	1928	Owen Willans Richardson
1978	Pyotr Kapitsa, Arno Penzias, Robert Woodrow Wilson	1927	Arthur H. Compton, C.T.R. Wilson
1977	Philip W. Anderson, Sir Nevill F. Mott, John H. van Vleck	1926	Jean Baptiste Perrin
1976	Burton Richter, Samuel C.C. Ting	1925	James Franck, Gustav Hertz
1975	Aage N. Bohr, Ben R. Mottelson, James Rainwater	1924	Manne Siegbahn
1974	Martin Ryle, Antony Hewish	1923	Robert A. Millikan
1973	Leo Esaki, Ivar Giaever, Brian D. Josephson	1922	Niels Bohr
1972	John Bardeen, Leon N. Cooper, Robert Schrieffer	1921	Albert Einstein
1971	Dennis Gabor	1920	Charles Edouard Guillaume
1970	Hannes Alfvén, Louis Néel	1919	Johannes Stark
1969	Murray Gell-Mann	1918	Max Planck
1968	Luis Alvarez	1917	Charles Glover Barkla
1967	Hans Bethe	1916	<i>No prize awarded</i>
1966	Alfred Kastler	1915	William Bragg, Lawrence Bragg
1965	Sin-Itiro Tomonaga, Julian Schwinger, Richard P. Feynman	1914	Max von Laue
1964	Charles H. Townes, Nicolay G. Basov, Aleksandr M. Prokhorov	1913	Heike Kamerlingh Onnes
1963	Eugene Wigner, Maria Goeppert-Mayer, J. Hans D. Jensen	1912	Gustaf Dalén
1962	Lev Landau	1911	Wilhelm Wien
1961	Robert Hofstadter, Rudolf Mössbauer	1910	Johannes Diderik van der Waals
1960	Donald A. Glaser	1909	Guglielmo Marconi, Ferdinand Braun
1959	Emilio Segrè, Owen Chamberlain	1908	Gabriel Lippmann
1958	Pavel A. Cherenkov, Il'ja M. Frank, Igor Y. Tamm	1907	Albert A. Michelson
		1906	J.J. Thomson
		1905	Philipp Lenard
		1904	Lord Rayleigh
		1903	Henri Becquerel, Pierre Curie, Marie Curie
		1902	Hendrik A. Lorentz, Pieter Zeeman
		1901	Wilhelm Conrad Röntgen

## PHYSICAL CONSTANTS OF ORGANIC COMPOUNDS

The basic physical constants and structure diagrams for about 10,900 organic compounds are presented in this table. An effort has been made to include the compounds most frequently encountered in the laboratory, the workplace, and the environment. Particular emphasis has been given to substances that are considered environmental or human health hazards. In making the selection of compounds for the table, added weight was assigned to the appearance of a compound in various lists or reference sources such as:

- Laboratory reagent lists, e.g., the *ACS Reagent Chemicals* volume (Ref. 1)
- The DIPPR list of industrially important compounds (Ref. 2) and the (much larger) TSCA inventory of chemicals used in commerce
- The *Hazardous Substances Data Bank* (Ref. 3)
- The UNEP list *Persistent Organic Pollutants* (Ref. 4)
- Chemicals on Reporting Rules (CORR), a database of about 7500 regulated compounds prepared by the Environmental Protection Agency (Ref. 5)
- The EPA Integrated Risk Information System (IRIS), a database of human health effects of exposure to chemicals in the environment (Ref. 6)
- Compendia of chemicals of biochemical or medical importance, such as *The Merck Index* (Ref. 10)
- Specialized tables in this *Handbook*

It should be noted that the above lists vary widely in their choice of chemical names, and even in the use of Chemical Abstracts Registry Numbers. To the extent possible, we have attempted to systematize the names and registry numbers for this table.

Clearly, criteria of this type are somewhat subjective, and compounds considered important by some users have undoubtedly been omitted. Suggestions for additional compounds or other improvements are welcomed.

The data in the table have been derived from many sources, including both the primary literature and evaluated compilations. The *Handbook of Data on Organic Compounds, Third Edition* (Ref. 7) and the *Chapman & Hall/CRC Combined Chemical Dictionary* (Ref. 8) were important sources. Other useful compilations of physical property data for organic compounds are listed in Refs. 9–19. Many boiling point values (and some melting point and density values) were taken from recent physical chemistry literature dealing with fluid properties. Where conflicts were found, the value deemed most reliable was chosen.

The table is arranged alphabetically by substance name, which generally is either an IUPAC systematic name or, in the case of pesticides, pharmaceuticals, and other complex compounds, a simple trivial name. Names in ubiquitous use, such as acetic acid and formaldehyde, are adopted rather than their systematic equivalents. Synonyms are given in the column following the primary name, and structure diagrams are given on the page facing the data listing. The explanation of the data columns follows:

- **No.:** An identification number used in the indexes.
- **Name:** Primary name of the substance.
- **Synonym:** A synonym in common use. When the primary name is non-systematic, a systematic name may appear here.
- **Mol. Form.:** The molecular formula written in the Hill convention.

- **CAS RN:** The Chemical Abstracts Service Registry Number for the compound.
- **Mol. Wt:** Molecular weight (relative molar mass) as calculated with the 2001 IUPAC Standard Atomic Weights.
- **Physical Form:** A notation of the physical phase, color, crystal type, or other features of the compound at ambient temperature. Abbreviations are given below.
- **mp:** Normal melting point in °C. A value is sometimes followed by “dec,” indicating decomposition is observed at the stated temperature (so that it is probably not a true melting point). The notation “tp” indicates a triple point, where solid, liquid, and gas are in equilibrium.
- **bp:** Normal boiling point in °C, if it is available. This is the temperature at which the liquid phase is in equilibrium with the vapor at a pressure of 760 mmHg (101.325 kPa). A notation “sp” following the value indicates a sublimation point, where the vapor pressure of the solid phase reaches 760 mmHg. When a notation such as “dec” or “exp” (explodes) follows the value, the temperature may not be a true boiling point. A simply entry “sub” indicates the solid has a significant sublimation pressure at ambient temperatures. The boiling point at reduced pressure is listed in some cases, with or without the normal boiling point. Here the superscript indicates the pressure in mmHg.
- **den:** Density (mass per unit volume) in g/cm<sup>3</sup>. The temperature in °C is indicated by a superscript. Values refer to the liquid or solid phase, and all values are true densities, not specific gravities. The number of decimal places gives a rough estimate of the accuracy of the value.
- **n<sub>D</sub>:** Refractive index, at the temperature in °C indicated by the superscript. Unless otherwise indicated, all values refer to a wavelength of 589 nm (sodium D line). Values are given only for liquids and solids.
- **Solubility:** Qualitative indication of solubility in common solvents. Abbreviations are:

i	insoluble
sl	slightly soluble
s	soluble
vs	very soluble
msc	miscible
dec	decomposes

Abbreviations for solvents are given below.

In order to facilitate the location of compounds in the table, three indexes are provided:

- **Synonym Index:** Includes common synonyms, but not the primary name by which the table is arranged.
- **Molecular Formula Index:** Lists compounds by molecular formula in the Hill Order (see Preface to this *Handbook*).
- **CAS Registry Number Index:** Lists compounds by Chemical Abstracts Service Registry Number. Note there is some redundancy in this index, because many compounds have several Registry Numbers associated with them. Thus the CAS RN in a table entry may differ from the CAS RN that points to it in the index. For example, CAS RN 1319-77-3 in the index points to all three cresol isomers, each of which has its own specific CAS RN.

The assistance of Fiona Macdonald in checking names and formulas is gratefully acknowledged, as well as the efforts of Janice

Shackleton, Trupti Desai, Nazila Kamaly, Matt Griffiths, and Lawrence Braschi in preparing the structure diagrams.

## List of Abbreviations

Ac	acetyl	mcl	monoclinic
Ac <sub>2</sub> O	acetic anhydride	Me	methyl
AcOEt	ethyl acetate	MeCN	acetonitrile
ac	acid	MeOH	methanol
ace	acetone	misc, msc	miscible
al	alcohol (ethanol)	mp	melting point
alk	alkali	n	refractive index
amor	amorphous	nd	needles
anh	anhydrous	oct	octahedra, octahedral
aq	aqueous	oran	orange
bipym	bipyramidal	orth	orthorhombic
bl	blue	os	organic solvents
blk	black	pa	pale
bp	boiling point	peth	petroleum ether
br	brown	Ph	phenyl
bt	bright	PhCl	chlorobenzene
Bu	butyl	PhNH <sub>2</sub>	aniline
BuOH	1-butanol	PhNO <sub>2</sub>	nitrobenzene
bz	benzene	pl	plates
chl	chloroform	pow	powder
col	colorless	Pr	propyl
con, conc	concentrated	PrOH	1-propanol
cry	crystals	pr	prisms
ctc	carbon tetrachloride	purp	purple
cy, cyhex	cyclohexane	py	pyridine
dec	decomposes	pym	pyramids, pyramidal
den	density	reac	reacts
dil	dilute	rhom	rhombic
diox	dioxane	s	soluble
dk	dark	sat	saturated
DMF	dimethylformamide	sc	scales
DMSO	dimethyl sulfoxide	sl	slightly soluble
efflor	efflorescent	soln	solution
Et	ethyl	sp	sublimation point
EtOH	ethanol	stab	stable
eth	diethyl ether	sub	sublimes
exp	explodes	sulf	sulfuric acid
fl	flakes	syr	syrup
fir	fluorescent	tab	tablets
fum	fumes, fuming	tcl	triclinic
gl	glacial	tetr	tetragonal
gr	gray	tfa	trifluoroacetic acid
gran	granular	thf, THF	tetrahydrofuran
grn	green	tol	toluene
hex	hexagonal	tp	triple point
HOAc	acetic acid	trg	trigonal
hp	heptane	unstab	unstable
hx	hexane	vap	vapor
hyd	hydrate	viol	violet
hyg	hygroscopic	visc	viscous
i	insoluble	vol	volatile
i-	iso-	vs	very soluble
iso	isooctane	w	water
lf	leaves	wh	white
lig	ligroin	xyl	xylene
liq	liquid	ye	yellow
lo	long

N-(2-Chloroethyl)dibenzylamine hydrochloride

Chloroethyl dimethylsilane

2-Chloroethyl ethyl ether

2-Chloroethyl isocyanate

1-(2-Chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea

5-(2-Chloroethyl)-4-methylthiazole

N-(2-Chloroethyl)morpholine

4-(2-Chloroethyl)morpholine, hydrochloride

1-Chloro-2-(ethylthio)ethane

2-Chloroethyl vinyl ether

3-Chloro-4-fluoroaniline

1-Chloro-2-fluorobenzene

1-Chloro-3-fluorobenzene

1-Chloro-4-fluorobenzene

1-Chloro-1-fluoroethane

1-Chloro-2-fluoroethane

Chlorofluoromethane

1-Chloro-3-fluoro-2-methylbenzene

2-Chloro-1-fluoro-4-nitrobenzene

4-Chloro-1-(4-fluorophenyl)-1-butanone

3-Chloro-2,5-furandione

1-Chloro-1,2,2,3,3,4,4-heptafluorocyclobutane

1-Chloroheptane

2-Chloroheptane

3-Chloroheptane

4-Chloroheptane

7-Chloro-1-heptanol

1-Chlorohexadecane

1-Chlorohexane

2-Chlorohexane

3-Chlorohexane

6-Chloro-1-hexanol

4-Chloro-17-hydroxyandrost-4-en-3-one, (17β)

5-Chloro-2-hydroxybenzaldehyde

4-Chloro-α-hydroxybenzeneacetic acid

3-Chloro-4-hydroxybenzoic acid

5-Chloro-2-hydroxybenzoic acid

2-Chloro-5-hydroxybenzophenone

3-Chloro-4-hydroxy-5-methoxybenzaldehyde

1-Chloro-2-iodobenzene

1-Chloro-3-iodobenzene

1-Chloro-4-iodobenzene

1-Chloro-4-iodobutane

Chloriodomethane
