## ABUNDANCE OF ELEMENTS IN THE EARTH'S CRUST AND IN THE SEA

This table gives the estimated abundance of the elements in the continental crust (in mg/kg, equivalent to parts per million by mass) and in seawater near the surface (in mg/L). Values represent the median of reported measurements. The concentrations of the less abundant elements may vary with location by several orders of magnitude.

Element	Abundance	
	Crust mg/kg	Sea mg/L
Ac	$5.5 \times 10^{-10}$	
Ag	$7.5 \times 10^{-2}$	$4 \times 10^{-5}$
Al	$8.23 \times 10^4$	$2 \times 10^{-3}$
Ar	3.5	$4.5 \times 10^{-1}$

## SOLAR SPECTRAL IRRADIANCE

The solar luminosity (total radiant power emitted) is  $3.86 \cdot 10^{26}$  W, of which  $1373 \text{ W/m}^2$  reaches the top of the earth's atmosphere. To a zeroth approximation the sun can be considered a black body with an effective temperature of 5780 K, which implies a peak in the radiation at around  $0.520 \text{ }\mu\text{m}$  ( $5200 \text{ \AA}$ ). The actual solar spectral emission is more complex, especially at ultraviolet and shorter wavelengths. The graph below, which was taken from Reference 1, summarizes the solar irradiance at the top of the atmosphere in the range 0.3 to  $10 \text{ }\mu\text{m}$ .

## U.S. STANDARD ATMOSPHERE (1976)

A Standard Atmosphere is a hypothetical vertical distribution of atmospheric temperature, pressure, and density that is roughly representative of year-round, midlatitude conditions. Typical uses are to serve as a basis for pressure altimeter calibrations, aircraft performance calculations, aircraft and rocket design, ballistic tables, meteorological diagrams, and various types of atmospheric modeling. The air is assumed to be dry and to obey the perfect gas law and the hydrostatic equation which, taken together, relate temperature, pressure, and density with vertical position. The atmosphere is considered to rotate with the Earth and to be an average over the diurnal cycle, the semiannual variation, and the range from active to quiet geomagnetic and sunspot conditions.

The U.S. Standard Atmosphere (1976) is an idealized, steady-state representation of mean annual conditions of the Earth's atmosphere from the surface to 1000 km at latitude 45° N, as it is assumed to exist during a period with moderate solar activity. The defining meteorological elements are sea-level temperature and pressure and a temperature-height profile to 1000 km. The 1976 Standard Atmosphere uses the following sea-level values that have been standard for many decades:

Temperature — 288.15 K (15 °C)  
 Pressure — 101325 Pa (1013.25 mbar, 760 mm of Hg, or 29.92 in. of Hg)

Density — 1225 g/m<sup>3</sup> (1.225 g/L)  
 Mean molar mass — 28.964 g/mol

The parameters included in this condensed version of the U.S. Standard Atmosphere are:

$Z$  — Height (geometric) above mean sea level in meters  
 $T$  — Temperature in kelvins  
 $P$  — Pressure in pascals (1 Pa = 0.01 millibars)  
 $\rho$  — Density in kilograms per cubic meter (1 kg/m<sup>3</sup> = 1 g/L)  
 $n$  — Number density in molecules per cubic meter  
 $\nu$  — Mean collision frequency in collisions per second  
 $l$  — Mean free path in meters  
 $\eta$  — Absolute viscosity in pascal seconds (1 Pa s = 1000 cP)  
 $k$  — Thermal conductivity in joules per meter second kelvin (W/m K)  
 $\nu_s$  — Speed of sound in meters per second  
 $g$  — Acceleration of gravity in meters per second square

The sea-level composition (percent by volume) is taken to be:

N <sub>2</sub> — 78.084%	He — 0.000524
O <sub>2</sub> — 20.9476	Kr — 0.000114
Ar — 0.934	Xe — 0.0000087
CO <sub>2</sub> — 0.0314	CH <sub>4</sub> — 0.0002
Ne — 0.001818	H <sub>2</sub> — 0.00005

The  $T$  and  $P$  columns for the troposphere and lower stratosphere were generated from the following formulas:

	$T/K$	$P/Pa$
$H \leq 11000$ m	$288.15 - 0.0065 H$	$101325(288.15/T)^{-5.25577}$
$11000$ m $< H \leq 20000$ m	216.65	$22632 e^{-0.00015768832(H-11000)}$
$20000$ m $< H \leq 32000$ m	$216.65 + 0.0010(H-20000)$	$5474.87(216.65/T)^{34.16319}$

where  $H = rZ/(r + Z)$  is the geopotential height in meters and  $r$  is the mean Earth radius at 45° N latitude, taken as 6356766 m. For altitudes up to 32 km,  $\rho = 0.003483677(P/T)$  in the units used here. Formulas for the other quantities may be found in the references.

## GEOGRAPHICAL AND SEASONAL VARIATION IN SOLAR RADIATION

This table gives the amount of solar radiation reaching a unit area at the top of the earth's atmosphere per day as a function of latitude and approximate date. It is based upon a solar constant (total energy per unit area at the earth's average orbital distance) of 1373 W/m<sup>2</sup>. Absorption of radiation by the atmosphere is not taken into consideration.

## INFRARED ABSORPTION BY THE EARTH'S ATMOSPHERE

Several constituents of the earth's atmosphere absorb infrared radiation. At ground level the strongest absorbers are H<sub>2</sub>O and CO<sub>2</sub>, but 30 to 40 other compounds can make significant contributions. The centers of the most important absorption bands are listed below:

Molecule	Vibrational mode	Band center in cm <sup>-1</sup>
H <sub>2</sub> O	Bend	1595
H <sub>2</sub> O	Symmetric O-H stretch	3657
H <sub>2</sub> O	Antisymmetric O-H stretch	3756
CO <sub>2</sub>	Bend	667
CO <sub>2</sub>	Antisymmetric C-O stretch	2349
O <sub>3</sub>	Bend	701
O <sub>3</sub>	Antisymmetric O-O stretch	1042
O <sub>3</sub>	Symmetric O-O stretch	1103
N <sub>2</sub> O	Bend	589
N <sub>2</sub> O	N-O stretch	1285
N <sub>2</sub> O	N-N stretch	2224
CO	C-O stretch	2143
CH <sub>4</sub>	Degenerate deformation	1306
CH <sub>4</sub>	Degenerate stretch	3019

The HITRAN Molecular Spectroscopy Database (References 1 and 2) is a compilation of wavenumbers and intensities of more than 1.7 million spectral lines of atmospheric constituents. It is a valuable resource for calculating transmission of the atmosphere, radiative energy transfer, and other phenomena. The graph below, which was supplied by Walter J. Lafferty (Reference 3), gives the transmittance of the atmosphere for one set of conditions.

## ATMOSPHERIC CONCENTRATION OF CARBON DIOXIDE, 1958–2004

The data in this table were taken at the Mauna Loa Observatory in Hawaii and represent averages adjusted to the 15th of each month. The last column gives the average over the year. The concentration of CO<sub>2</sub> is given in parts per million by volume. Data from other measurement sites may be found in Reference 1.

The first graph illustrates the seasonal variation of CO<sub>2</sub> concentration and the steady increase over the last 45 years. The second graph summarizes the growth in the emissions of CO<sub>2</sub> into the atmosphere as a result of burning of fossil fuels (Reference 2).

## MEAN TEMPERATURES IN THE UNITED STATES, 1900–1992

Historical records of atmospheric temperatures have been analyzed to obtain mean temperatures in °C for 23 climatically distinct regions of the United States. The table below gives the average over these 23 regions, which cover completely the contiguous 48 states. Data for the individual regions and for other parts of the world may be found in the references.

The data are presented as temperature anomalies, i.e., as deviations (in °C) from the average temperature at each individual recording station over a 1961–1990 reference period. The trend in the temperature anomaly thus gives an indication of the long-term variation in average temperatures.

CY Mean: Calendar year mean (January–December)

Winter: December–February

Spring: March–May

Summer: June–August

Fall: September–November

## GLOBAL TEMPERATURE TREND, 1856–2004

This table and graph summarize the trend in annual mean global surface temperature from 1856 to 2004. The values were calculated from mean temperature anomalies by assuming an absolute global mean of 14.00°C, which is the best estimate for the 1961–1990 period. The 95% confidence interval for the annual mean temperature values since 1951 is  $\pm 0.12^\circ\text{C}$ ; prior to 1900 this interval is  $\pm 0.18^\circ\text{C}$ .

**Annual Mean Global Temperature in °C**

# ATMOSPHERIC ELECTRICITY

Hans Dolezalek, Hannes Tammet, John Latham, and Martin A. Uman

## I. SURVEY AND GLOBAL CIRCUIT

Hans Dolezalek

The science of atmospheric electricity originated in 1752 by an experimental proof of a related earlier hypothesis (that lightning is an electrical event). In spite of a large effort, in part by such eminent physicists as Coulomb, Lord Kelvin, and many others, an overall, proven theory able to generate models with sufficient resolution is not yet available. Generally accepted and encompassing text books are now more than 20 years old. The voluminous proceedings of the, so far, nine international atmospheric electricity conferences (1954 to 1992) give much valuable detail and demonstrate impressive progress, as do a number of less comprehensive textbooks published in the last 20 years, but a general theory as indicated above is not yet created. Only now, certain related measuring techniques and mathematical possibilities are emerging.

Applications to practical purposes do exist in the field of lightning research (including the electromagnetic radiation emanating from lightning) by the establishment of lightning-location networks and by the now developing possibility to detect electrified clouds which pose hazards to aircraft. Application of atmospheric electricity to other parts of meteorology seems to be promising but so far has seldom been instituted. Because some atmospheric electric signals propagate around the earth and because of the existence of a global circuit, applications for the monitoring of global change processes and conditions are now being proposed. Significant secular changes in the global circuit would indicate a change in the global climate; the availability of many old data (about a span of 100 years) could help detect a long-term trend.

The concept of the "global circuit" is based on the theory of the global spherical capacitor: both, the solid (and liquid) earth as one electrode, and the high atmospheric layers (about the ionosphere) as the other, are by orders of magnitude more electrically conductive than the atmosphere between them. According to the "classical picture of atmospheric electricity", this capacitor is continuously charged by the common action of all thunderstorms to a d.c. voltage difference of several hundred kilovolts, the earth being negative. The much smaller but still existing conductivity of the atmosphere allows a current flowing from the ionosphere to the ground, integrated for all sink areas of the whole earth, of the order of 1.5 kA. In this way, a global circuit is created with many generators and sink-areas both interspaced and distributed over the whole globe, all connected to two nodes: ionosphere and ground. Within the scope of the global circuit, for each location, the current density (order of several pA/m<sup>2</sup>) is determined by the voltage difference between ionosphere and ground (which is the same for all locations but varying in time) and the columnar resistance reaching from the ground up to the ionosphere (in the order of 10<sup>17</sup> Ωm<sup>2</sup>).

Natural processes, especially meteorological processes and some human activity, which produce or move electric charges ("space charges") or affect the ion distribution, constitute local generators and thereby "local circuits", horizontally and/or in parallel or antiparallel to the local part of the global circuit. In many cases, the local currents are much stronger than the global ones, making the measurement of the global current at a given location and/or during a period of time very difficult or, often, impossible. The strongest local circuits usually occur with certain weather conditions (precipitation, fog, high wind, blown-up dust or snow, heavy cloudiness) which make measurement of the global circuit impossible everywhere: but even in their absence local generators exist in varying magnitudes and of different characters. The separation

of the local and global shares in the measured values of current density is a central problem of the science of atmospheric electricity. Aerological measurements are of high value in this regard.

The above description is within the "classical picture" of atmospheric electricity, a group of hypotheses to explain the electrification of the atmosphere. It is probably fundamentally correct but certainly not complete; it has not yet been confirmed by systems of measurements resulting in no inner contradictions. In particular, extraterrestrial influences must be permitted; their general significance is still under debate.

Within this "classical picture" a kind of electric standard atmosphere may be constructed as shown in Table 1.

Values with a star, \*, are rough average values from measurement. A star in parentheses, (\*), points to a typical value from one or a few measurements. All other values have been calculated from starred values, under the assumption that at 2 km 50% and at 12 km 90% of the columnar resistance is reached. Voltage drop along one of the partial columns can be calculated by subtracting the value for the lower column from that of the upper one. Columnar resistances, conductances, and capacitances are valid for that particular part of the column which is indicated at the left. Capacitances are calculated with the formula for plate capacitors, and this fact must be considered also for the time constants for columns.

According to measurements,  $U$ , the potential difference between 0 m and 65 km may vary by a factor of approximately 2. The total columnar resistance,  $R_c$ , is estimated to vary up to a factor of 3, the variation being due to either reduction of conductivity in the exchange layer (about lowest 2 km of this table) or to the presence of high mountains; in both cases the variation is caused in the troposphere. Smaller variations in the stratosphere and mesosphere are being discussed because of aerosols there. The air-earth current density in fair weather varies by a factor of 3 to 6 accordingly. Conductivity near the ground varies by a factor of about 3 but only decreasing; increase of conductivity due to extraordinary radioactivity is a singular event. The field strength near the ground varies as a consequence of variations of air-earth current density and conductivity from about 1/3 to about 10 times of the value quoted in the table. Conductivity near the ground shows a diurnal and an annual variation which depends strongly on the locality: air-earth current density shows a diurnal and annual variation because the earth-ionosphere potential difference undergoes such variations, and also because the columnar resistance is supposed to have a diurnal and probably an annual variation.

Conductivities and air-earth current densities on high mountains are greater than at sea level by factors of up to 10. Conductivity decreases when atmospheric humidity increases. Values for space charges are not quoted because measurements are too few to allow calculation of average values. Values of parameters over the oceans are still rather uncertain.

Theoretically, in fair-weather conditions, Ohm's law must be fulfilled for the electric field, the conduction current density, and the electrical conductivity of the atmosphere. Deviations point to shortcomings in the applied measuring techniques. Data which are representative for a large area (in the extreme, "globally representative data", i.e. data on the global circuit), can on the ground be obtained only by stations on an open plane and only if local generators are either small or constant or are independently measured. Certain measurements with instrumented aircraft provide globally representative information valid for the period of the actual measurement.

**TABLE 1. Electrical Parameters of the Clear (Fair-Weather) Atmosphere, Pertinent to the Classical Picture of Atm. Electricity (Electric Standard Atmosphere)**

Part of atmosphere for which the values are calculated (elements are in free, cloudless atmosphere)	Currents, $I$ , in A; and current densities, $i$ , in A/m <sup>2</sup>	Potential differences, $U$ , in V; field strength $E$ in V/m; $U = 0$ at sea level	Resistances, $R$ , in $\Omega$ ; columnar resistances, $R_c$ , in $\Omega$ m <sup>2</sup> and resistivities, $\rho$ , in $\Omega$ m	Conductances, $G$ , in $\Omega^{-1}$ ; columnar conductances $G_c$ , in $\Omega^{-1}$ m <sup>2</sup> ; total conductivities, $\gamma$ , in $\Omega^{-1}$ m <sup>-1</sup>	Capacitances, $C$ , in F; columnar capacitances, $C_c$ , in F m <sup>-2</sup> and capacitivities, $\epsilon$ , in F m <sup>-1</sup>	Time constants $\tau$ , in seconds
Volume element at about sea level, 1 m <sup>3</sup>	$i = 3 \times 10^{-12}$	$E_0 = 1.2 \times 10^2$	$\rho_0 = 4 \times 10^{13}$	$\gamma_0 = 2.5 \times 10^{-14}$	$\epsilon_0 = 8.9 \times 10^{-12}$	$\tau_0 = 3.6 \times 10^2$
Lower column of 1 m <sup>2</sup> cross section from sea level to 2 km height	$i = 3 \times 10^{-12}$	At upper end: $U_1 = 1.8 \times 10^5$	$R_{c1} = 6 \times 10^{16}$	$G_{c1} = 1.7 \times 10^{-17}$	$C_{c1} = 4.4 \times 10^{-15}$	$\tau_{c1} = 2.6 \times 10^2$
Volume element at about 2 km height, 1 m <sup>3</sup>	$i = 3 \times 10^{-12}$	$E_2 = 6.6 \times 10^1$	$\rho_2 = 2.2 \times 10^{13(*)}$	$\gamma_2 = 4.5 \times 10^{-14}$	$\epsilon_2 = 8.9 \times 10^{-12}$	$\tau_2 = 2 \times 10^2$
Center column of 1 m <sup>2</sup> cross section from 2 to 12 km	$i = 3 \times 10^{-12}$	At upper end: $U_m = 3.15 \times 10^5$	$R_{cm} = 4.5 \times 10^{16}$	$G_{cm} = 5 \times 10^{-17}$	$C_{cm} = 8.8 \times 10^{-16}$	$\tau_{cm} = 1.8 \times 10^1$
Volume element at about 12 km height, 1 m <sup>3</sup>	$i = 3 \times 10^{-12}$	$E_{12} = 3.9 \times 10^0$	$\rho_{12} = 1.3 \times 10^{12(*)}$	$\gamma_{12} = 7.7 \times 10^{-13}$	$\epsilon_{12} = 8.9 \times 10^{-12}$	$\tau_{12} = 1.2 \times 10^1$

Total spherical capacitor area: $5 \times 10^{14}$ m <sup>2</sup>	$i = 1.5 \times 10^3$	$U = 3.5 \times 10^5$	$R = 2.4 \times 10^2$	$G = 4.2 \times 10^{-3}$	$C = 6.8 \times 10^{-2}$	$\tau = 1.64 \times 10^1$

Note: All currents and fields listed are part of the global circuit, i.e., circuits of local generators are not included. Values are subject to variations due to latitude and altitude of the point of observation above sea level, locality with respect to sources of disturbances, meteorological and climatological factors, and man-made changes. For more explanations, see text.

## II. AIR IONS

### Hannes Tamm

The term "air ions" signifies all airborne particles which are the carriers of the electrical current in the air and have drift velocities determined by the electric field.

The probability of electrical dissociation of molecules in the atmospheric air under thermodynamic equilibrium is near to zero. The average ionization at the ground level over the ocean is  $2 \cdot 10^6$  ion pairs  $m^{-3}s^{-1}$ . This ionization is produced mainly by cosmic rays. Over the continents the ionizing radiation from soil and from radioactive substances in the air each add about  $4 \cdot 10^6$   $m^{-3}s^{-1}$ . The total average ionization rate of  $10^7$   $m^{-3}s^{-1}$  is equivalent to 17  $\mu R/h$  which is a customary expression of the background level of the ionizing radiations. The ionization rate over the ground varies in space due to the radioactivity of soil, and in time depending on the exchange of air between the atmosphere and radon-containing soil. Radioactive pollution increases the ionization rate. A temporary increase of about 10 times was registered in Sweden after the Chernobyl accident in 1986. The emission of  $Kr^{85}$  from nuclear power plants can noticeably increase the global ionization rate in the next century. The ionization rate decreases with altitude near the ground and increases at higher altitudes up to 15 km, where it has a maximum of about  $5 \cdot 10^7$   $m^{-3}s^{-1}$ . Solar X-ray and extreme UV radiation cause a new increase at altitudes over 60 km.

Local sources of air ions are point discharges in strong electric fields, fluidization of charged drops from waves, etc.

The enhanced chemical activity of an ion results in a chain of ion-molecule reactions with the colliding neutrals, and, in the first microsecond of the life of an air ion, a charged molecular cluster called the *cluster ion* is formed. According to theoretical calcula-

tions in the air free from exotic trace gases the following cluster ions should be dominant:

A measurable parameter of air ions is the electrical mobility  $k$ , characterizing the drift velocity in the unit electric field. The mobility is inversely proportional to the density of air, and the results of measurements are as a rule reduced to normal conditions. According to mobility the air ions are called: fast or small or light ions with mobility  $k > 5 \cdot 10^{-5}$   $m^2V^{-1}s^{-1}$ , intermediate ions, and slow or large or heavy ions with mobility  $k > 10^{-6}$   $m^2V^{-1}s^{-1}$ . The boundary between intermediate and slow ions is conventional.

Cluster ions are fast ions. The masses of cluster ions may be measured with mass spectrometers, but the possible ion-molecule reactions during the passage of the air through nozzles to the vacuum chamber complicate the measurement. Mass and mobility of cluster ions are highly correlated. The experimental results<sup>5</sup> can be expressed by the empirical formula

$$m \approx \frac{850 u}{[0.3 + k / (10^{-4} m^2 V^{-1} s^{-1})]^3}$$

where  $u$  is the unified atomic mass unit.

The value of the transport cross-section of a cluster ion is needed to calculate its mobility according to the kinetic theory of Chapman and Enskog. The theoretical estimation of transport cross-sections is rough and cannot be used to identify the chemi-

cal structures of cluster ions. Mass spectrometry is the main technique of identification of cluster ions.<sup>2</sup>

Märk and Castleman<sup>4</sup> presented an overview of over 1000 publications on the experimental studies of cluster ions. Most of them present information about ions of millisecond age range. The low concentration makes it difficult to get detailed information about masses and mobilities of the natural atmospheric ions at ground level. The results of a 1-year continuous measurement<sup>6</sup> are as follows:

	+ ions	- ions	unit
Average mobility	1.36	1.56	$10^{-4}\text{m}^2\text{V}^{-1}\text{s}^{-1}$
The corresponding mass	190	130	u
The corresponding diameter	0.69	0.61	nm
The average concentration	400	360	$10^6\text{m}^{-3}$
The corresponding conductivity	8.7	9.0	fS

The distribution of tropospheric cluster ions according to the mobility and estimated mass is depicted in Figure 1.

The problems and results of direct mass spectrometry of natural cluster ions are analyzed by Eisele<sup>2</sup> for ground level and by Meyerott, Reagan and Joiner<sup>5</sup> for stratospheric measurements. Air ions in the high atmosphere are a subject of ionospheric physics.

During its lifetime (about 1 min), a cluster ion at ground level collides with nearly  $10^{12}$  molecules. Thus the cluster ions are able to concentrate trace gases of very low concentration if they have an extra high electron or proton affinity. For example, Eisele<sup>2</sup> demon-

$d$	3	10	30	100	300	1000	3000	nm
$P_0$	98	90	70	42	24	14	8	%
$P_{-1}+P_1$	2	10	30	48	41	25	15	%
$P_{-2}+P_2$	0	0	0	10	23	21	14	%
$P_{q>2}$	0	0	0	0	12	40	63	%
$k_1$	15000	1900	250	28	5.1	1.11	0.33	$10^{-9}\text{m}^2\text{V}^{-1}\text{s}^{-1}$

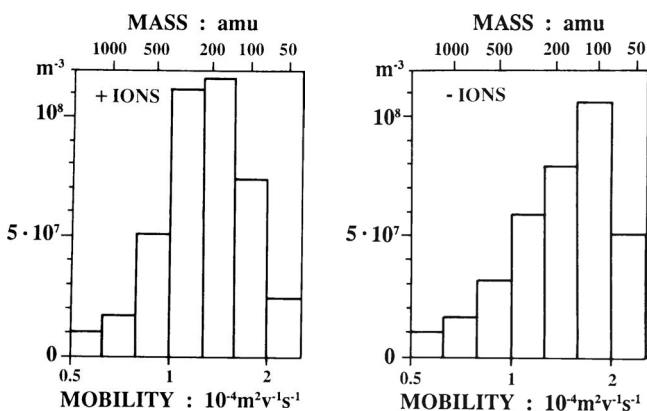

FIGURE 1. Average mobility and mass spectra of natural tropospheric cluster ions. Concentrations of the mobility fractions were measured in a rural site every 5 min over 1 year.<sup>6</sup> Ion mass is estimated according to the above empirical formula.

strated that a considerable fraction of positive atmospheric cluster ions in the unpolluted atmosphere at ground level probably consist of a molecule derived from pyridine. The concentration of these constituents is estimated to be about  $10^{-12}$ . Therefore, air-ion mass and mobility spectrometry is considered as a promising technique for trace analysis in the air. Mass and mobility spectrometry of millisecond-age air ions has been developed as a technique of chemical analysis known as “plasma chromatography”.<sup>1</sup> The sensitivity of the detection grows with the age of the cluster ions measured.

The mechanisms of annihilation of cluster ions are ion-ion recombination (on the average 3%) and sedimentation on aerosol particles (on the average 97% of cluster ions at ground level). The result of the combination of a cluster ion and neutral particle is a charged particle called an *aerosol ion*. In conditions of detailed thermodynamic equilibrium the probability that a spherical particle of diameter  $d$  carries  $q$  elementary charges is calculated from the Boltzmann distribution:

$$p_q(d) = (2\pi d/d_0)^{1/2} \exp(-q^2 d_0/2d)$$

where  $d_0 = 115$  nm (at  $18^\circ\text{C}$ ). The supposition about the detailed equilibrium is an approximation and the formula is not valid for particles less than  $d_0$ . On the basis of numerical calculations by Hoppel and Frick<sup>3</sup> the following charge probabilities can be derived:

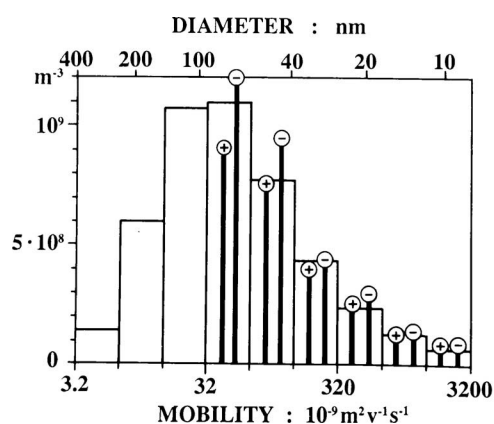

FIGURE 2. Mobility and size spectra of tropospheric aerosol ions.<sup>6</sup> The wide bars mark the fraction concentrations theoretically estimated on the basis of the standard size distribution of tropospheric aerosol. The pin bars with head + and - mark average values of positive and negative aerosol ion fraction concentrations measured in a rural site every 5 min during 4 months.

The last line of the table presents the mobility of a particle carrying one elementary charge. The distribution of the atmospheric aerosol ions over mobility is demonstrated in Figure 2.

Although the concentration of aerosol in continental air at ground level is an order of magnitude higher than the concentration of cluster ions, the mobilities of aerosol ions are so small that their percentage in air conductivity is less than 1%.

A specific class of aerosol ions are condensed aerosol ions produced as a result of the condensation of gaseous matter on the cluster ions. In aerosol physics the process is called ion-induced nucleation; it is considered as one among the processes of gas-to-particle conversion. The condensed aerosol ions have an inherent charge. Their sizes and mobilities are between the sizes and mobilities of cluster ions and of ordinary aerosol ions. Water and standard constituents of atmospheric air are not able to condense on the cluster ions in the real atmosphere. Thus the concentration of condensed aerosol ions depends on the trace constituents in the air and is very low in unpolluted air. Knowledge about condensed aerosol ions is poor because of measurement difficulties.

## III. THUNDERSTORM ELECTRICITY

**John Latham**

The development of improved radar techniques and instruments for in-cloud electrical and physical measurements, coupled with a much clearer recognition by the research community that establishment of the mechanism or mechanisms responsible for electric field development in thunderclouds, culminating in lightning, is inextricably linked to the concomitant dynamical and microphysical evolution of the clouds, has led to significant progress over the past decade.

Field studies indicate that in most thunderclouds the electrical development is associated with the process of glaciation, which can occur in a variety of incompletely understood ways. In the absence of ice, field growth is slow, individual hydrometeor charges are low, and lightning is produced only rarely. Precipitation — in the solid form, as graupel — also appears to be a necessary ingredient for significant electrification, as does significant convective activity and mixing between the clouds and their environments, via entrainment.

Increasingly, the view is being accepted that charge transfer leading to field-growth is largely a consequence of rebounding collisions between graupel pellets and smaller vapor-grown ice crystals, followed by the separation under gravity of these two types

of hydrometeor. These collisions occur predominantly within the temperature range  $-15$  to  $-30^{\circ}\text{C}$ , and for significant charge transfer need to occur in the presence of supercooled cloud droplets.

The field evidence is inconsistent with an inductive mechanism, and extensive laboratory studies indicate that the principal charging mechanism is non-inductive and associated — in ways yet to be identified — with differences in surface characteristics of the interacting hydrometeors.

Laboratory studies indicate that the two most favored sites for corona emission leading to the lightning discharge are the tips of ephemeral liquid filaments, produced during the glancing collisions of supercooled raindrops, and protuberances on large ice crystals or graupel pellets. The relative importance of these alternatives will depend on the hydrometeor characteristics and the temperature in the regions of strongest fields; these features are themselves dependent on air-mass characteristics and climatological considerations.

A recently identified but unresolved question is why, in continental Northern Hemisphere thunderclouds at least, the sign of the charge brought to ground by lightning is predominantly negative in summer but more evenly balanced in winter.

## IV. LIGHTNING

**Martin A. Uman**

From both ground-based weather-station data and satellite measurements, it has been estimated that there are about 100 lightning discharges, both cloud and ground flashes, over the whole earth each second; representing an average global lightning flash density of about  $6\text{ km}^{-2}\text{yr}^{-1}$ . Most of this lightning occurs over the earth's land masses. For example, in central Florida, where thunderstorms occur about 90 days/yr, the flash density for discharges to earth is about  $15\text{ km}^{-2}\text{yr}^{-1}$ . Some tropical areas of the earth have thunderstorms up to 300 days/yr.

Lightning can be defined as a transient, high-current electric discharge whose path length is measured in kilometers and whose most common source is the electric charge separated in the ordinary thunderstorm or cumulonimbus cloud. Well over half of all lightning discharges occur totally within individual thunderstorm clouds and are referred to as intracloud discharges. Cloud-to-ground lightning, however, has been studied more extensively than any other lightning form because of its visibility and its more practical interest. Cloud-to-cloud and cloud-to-air discharges are less common than intracloud or cloud-to-ground lightning.

Lightning between the cloud and earth can be categorized in terms of the direction of motion, upward or downward, and the sign of the charge, positive or negative, of the developing discharge (called a *leader*) which initiates the overall event. Over 90% of the worldwide cloud-to-ground discharges is initiated in the thundercloud by downward-moving negatively charged leaders and subsequently results in the lowering of negative charge to earth. Cloud-to-ground lightning can also be initiated by downward-moving positive leaders, less than 10% of the worldwide cloud-to-ground lightning being of this type although the exact percentage is a function of season and latitude. Lightning between cloud and ground can also be initiated by leaders which develop upward from the earth. These upward-initiated discharges are relatively rare, may be of either polarity, and generally occur from mountaintops and tall man-made structures.

We discuss next the most common type of cloud-to-ground lightning. A negative cloud-to-ground discharge or *flash* has an overall duration of some tenths of a second and is made up of vari-

ous components, among which are typically three or four high-current pulses called *strokes*. Each stroke lasts about a millisecond, the separation time between strokes being typically several tens of milliseconds. Such lightning often appears to “flicker” because the human eye can just resolve the individual light pulse associated with each stroke. A drawing of the components of a negative cloud-to-ground flash is found in Figure 3. Some values for salient parameters are found in Table 1. The negatively charged *stepped leader* initiates the first stroke in a flash by propagating from cloud to ground through virgin air in a series of discrete steps. Photographically observed leader steps in clear air are typically 1  $\mu$ s in duration and tens of meters in length, with a pause time between steps of about 50  $\mu$ s. A fully developed stepped leader lowers up to 10 or more coulombs of negative cloud charge toward ground in tens of milliseconds with an average downward speed of about  $2 \times 10^5$  m/s. The average leader current is in the 100 to 1000 A range. The steps have pulse currents of at least 1 kA. Associated with these currents are electric- and magnetic-field pulses with widths of about 1  $\mu$ s or less and risetimes of about 0.1  $\mu$ s or less. The stepped leader, during its trip toward ground, branches in a downward direction, resulting in the characteristic downward-branched geometrical structure commonly observed. The electric potential of the bottom of the negatively charged leader channel with respect to ground has a magnitude in excess of  $10^7$  V. As the leader tip nears ground, the electric field at sharp objects on the ground or at irregularities of the ground itself exceeds the breakdown value of air, and one or more upward-moving discharges (often called upward leaders) are initiated from those points, thus beginning the *attachment process*. An understanding of the physics of the attachment process is central to an understanding of the operation of lightning protection of ground-based objects and the effects of lightning on humans and animals, since it is the attachment process that determines where the lightning connects to objects on the ground and the value of the early currents which flow. When one of the upward-moving discharges from the ground (or from a lightning rod or an individual) contacts the tip of the downward-moving stepped leader, typically some tens of meters above the ground, the leader tip is effectively connected to ground potential. The negatively charged leader channel is then discharged to earth when a ground potential wave, referred to as the first *return stroke*, propagates continuously up the leader path. The upward speed of a return stroke near the ground is typically near one third the speed of light, and the speed decreases with height. The first return stroke produces a peak current near ground of typically 30 kA, with a time from zero to peak of a few microseconds. Currents measured at the ground fall to half of the peak value in about 50  $\mu$ s, and currents of the order of hundreds of amperes may flow for times of a few milliseconds up to several hundred milliseconds. The longer-lasting currents are known as *continuing currents*. The rapid release of return stroke energy heats the leader channel to a temperature near 30,000 K and creates a high-pressure channel which expands and generates the shock waves that eventually become thunder, as further discussed later. The return stroke effectively lowers to ground the charge originally deposited onto the stepped-leader channel and additionally initiates the lowering of other charges which may be available to the top of its channel. First return-stroke electric fields exhibit a microsecond scale rise to peak with a typical peak value of 5 V/m, normalized to a distance of 100 km by an inverse distance relationship. Roughly half of the field rise to peak, the so-called “fast transition”, takes place in tenths of a microsecond, an observation that can only be made if the field propagation is over a highly conducting surface such as salt water.

After the first return-stroke current has ceased to flow, the flash, including charge motion in the cloud, may end. The lightning is then called a single-stroke flash. On the other hand, if additional charge is made available to the top of the channel, a continuous or *dart leader* may propagate down the residual first-stroke channel at a typical speed of about  $1 \times 10^7$  m/s. The dart leader lowers a charge of the order of 1 C by virtue of a current of about 1 kA. The dart leader then initiates the second (or any subsequent) return stroke. Subsequent return-stroke currents generally have faster zero-to-peak rise times than do first-stroke currents, but similar maximum rates of change, about 100 kA/ $\mu$ s. Some leaders begin as dart leaders, but toward the end of their trip toward ground become stepped leaders. These leaders are known as *dart-stepped leaders* and may have different ground termination points (and separate upward leaders) from the first stroke. Most often the dart-stepped leaders are associated with the second stroke of the flash. Nearly half of all flashes exhibit more than one termination point on ground with the distance between separate terminations being up to several kilometers. Subsequent return-stroke radiated electric and magnetic fields are similar to, but usually a factor of two or so smaller, than first return-stroke fields. About one third of all multiple-stroke flashes has at least one subsequent stroke which is larger than the first stroke.

Cloud-to-ground flashes that lower positive charge, though not common, are of considerable practical interest because their peak currents and total charge transfer can be much larger than for the more common negative ground flash. The largest recorded peak currents, those in the 200- to 300-kA range, are due to the return strokes of positive lightning. Such positive flashes to ground are initiated by downward-moving leaders which do not exhibit the distinct steps of their negative counterparts. Rather, they show a luminosity which is more or less continuous but modulated in intensity. Positive flashes are generally composed of a single stroke followed by a period of continuing current. Positive flashes are probably initiated from the upper positive charge in the thundercloud charge dipole when that cloud charge is horizontally separated from the negative charge beneath it, the source of the usual negative cloud-to-ground lightning. Positive flashes are relatively common in winter thunderstorms (snow storms), which produce few flashes overall, and are relatively uncommon in summer thunderstorms. The fraction of positive lightning in summer thunderstorms apparently increases with increasing latitude and with increasing height of the ground above sea level.

Distant lightning return stroke fields are often referred to as sferics (called “atmospherics” in the older literature). The peak in the sferics frequency spectrum is near 5 kHz due to the bipolar or ringing nature of the distant return-stroke electromagnetic signal and to the effects of propagation.

Thunder, the acoustic radiation associated with lightning, is sometimes divided into the categories “audible”, sounds that one can hear, and “infrasonic”, below a few tens of hertz, a frequency range that is inaudible. This division is made because it is thought that the mechanisms that produce audible and infrasonic thunder are different. Audible thunder is thought to be due to the expansion of a rapidly heated return stroke channel, as noted earlier, whereas infrasonic thunder is thought to be associated with the conversion to sound of the energy stored in the electrostatic field of the thundercloud when lightning rapidly reduces that cloud field.

The technology of artificially initiating lightning by firing upward small rocket trailing grounded wire of a few hundred meters length has been well-developed during the past decade. Such “triggered” flashes are similar to natural upward-initiated discharges from tall structure. They often contain subsequent strokes which,

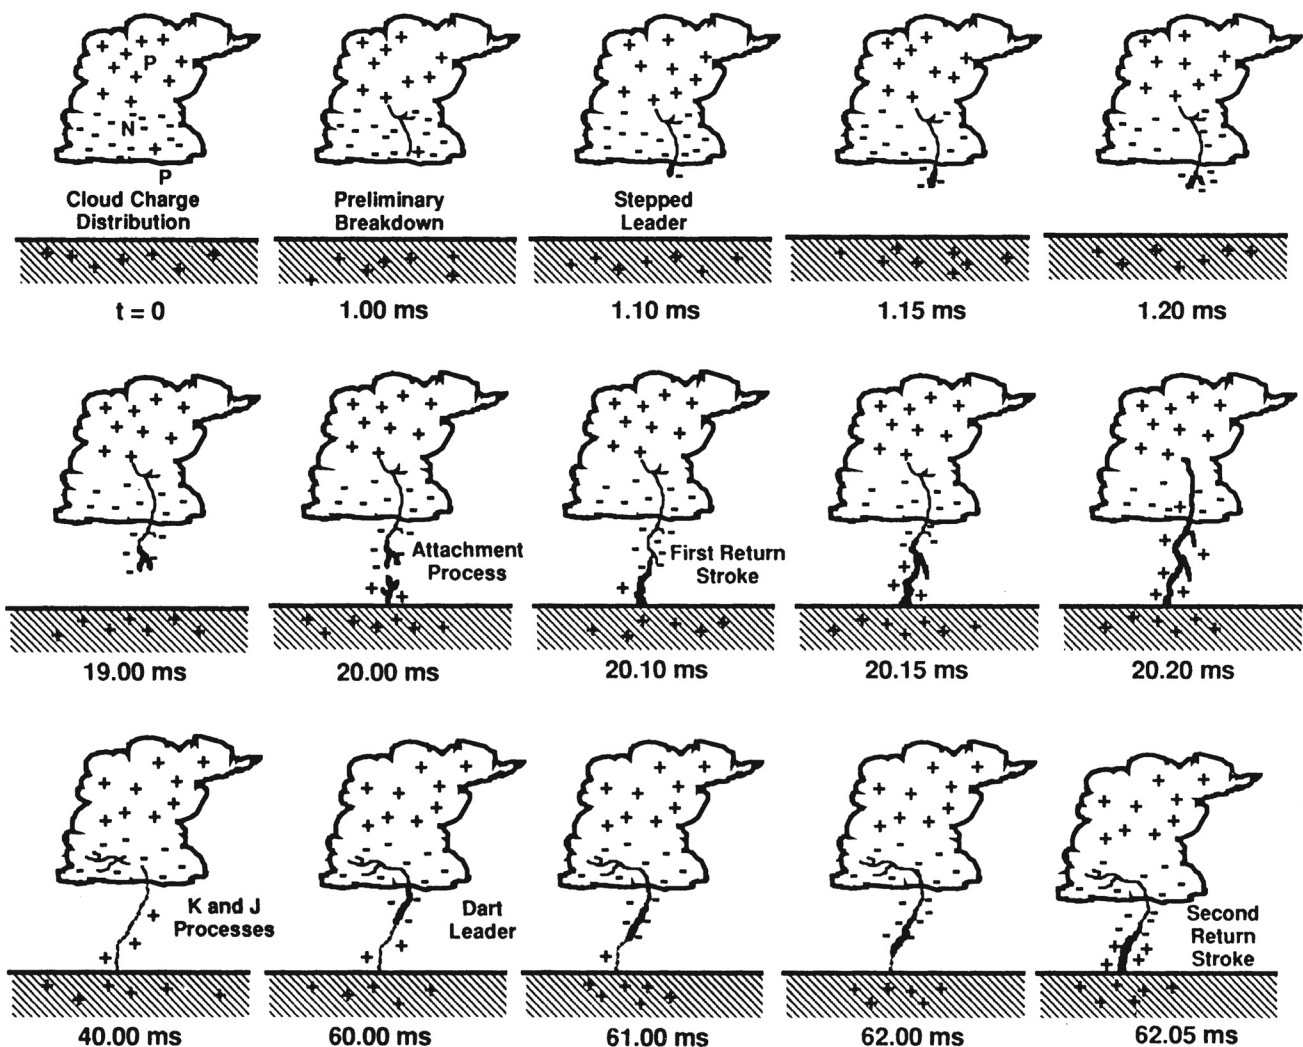

FIGURE 3. Sequence of steps in cloud-to-ground lightning.

when they occur, are similar to the subsequent strokes in natural lightning. These triggered subsequent strokes have been the subject of considerable recent research.

Also in the past 10 years or so sophisticated lightning locating equipment has been installed throughout the world. For example, all ground flashes in the U.S. are now centrally monitored for research, for better overall weather prediction, and for hazard warning for aviation, electric utilities and other lightning-sensitive facilities.

Information on lightning physics can be found in M. A. Uman, *The Lightning Discharge*, Academic Press, San Diego, 1987; on lightning death and injury in *Medical Aspects of Lightning Injury*, C. Andrews, M. A. Cooper, M. Darveniza, and D. Mackerras, Eds.,

CRC Press, 1992. Ground flash location information for the U.S., in real time or archived, is available from Geomet Data Service of Tucson, AZ, which is also a source of the names of providers of those data in other countries.

Table 2 has data for cloud-to-ground lightning discharges bringing negative charge to earth. The values listed are intended to convey a rough feeling for the various physical parameters of lightning. No great accuracy is claimed since the results of different investigators are often not in good agreement. These values may, in fact, depend on the particular environment in which the lightning discharge is generated. The choice of some of the entries in the table is arbitrary.

TABLE 2. Data for Cloud-to-Ground Lightning Discharges

	Minimum <sup>a</sup>	Representative values	Maximum <sup>a</sup>
Stepped leader			
Length of step, m	3	50	200
Time interval between steps, $\mu\text{s}$	30	50	125
Average speed of propagation of stepped leader, m/s <sup>b</sup>	$1.0 \times 10^5$	$2.0 \times 10^5$	$3.0 \times 10^6$
Charged deposited on stepped-leader channel, coulombs	3	5	20
Dart leader			
Speed of propagation, m/s <sup>b</sup>	$1.0 \times 10^6$	$1.0 \times 10^7$	$2.4 \times 10^7$
Charged deposited on dart-leader channel, coulombs	0.2	1	6
Return stroke <sup>c</sup>			
Speed of propagation, m/s <sup>b</sup>	$2.0 \times 10^7$	$1.0 \times 10^8$	$2.0 \times 10^8$
Maximum current rate of increase, kA/ $\mu\text{s}$	<1	100	400
Time to peak current, $\mu\text{s}$	<1	2	30
Peak current, kA	2	30	200
Time to half of peak current, $\mu\text{s}$	10	50	250
Charge transferred excluding continuing current, coulombs	0.02	3	20
Channel length, km	2	5	15
Lightning flash			
Number of strokes per flash	1	4	26
Time interval between strokes in absence of continuing current, ms	3	60	100
Time duration of flash, s	$10^{-2}$	0.5	2
Charge transferred including continuing current, coulombs	3	30	200

<sup>a</sup> The words maximum and minimum are used in the sense that most measured values fall between these limits.

<sup>b</sup> Speeds of propagation are generally determined from photographic data and are "two-dimensional". Since many lightning flashes are not vertical, values stated are probably slight underestimates of actual values.

<sup>c</sup> First return strokes have longer times to current peak and generally larger charge transfer than do subsequent return strokes.

## SPEED OF SOUND IN VARIOUS MEDIA

The speed of sound in various solids, liquids, and gases is given in these tables. While only a single parameter  $v$  is needed for liquids and gases, sound propagation in isotropic solids is characterized by three velocity parameters. For a solid of infinite extent (or of finite extent if all dimensions are much larger than a wavelength), there are two relevant quantities,

$v_l$ : velocity of longitudinal waves  
 $v_s$ : velocity of shear waves.

For a cylindrical rod with diameter much smaller than a wavelength,

$v_{ext}$ : velocity of extensional waves along the rod. (Torsional waves in the rod are propagated at the same speed as shear waves in an infinite solid.)

Table 1 lists values for a variety of solid materials. Table 2 covers gases liquids and gases; values for cryogenic liquids are given at the normal boiling point. Table 3 gives the speed of sound in pure

water and in seawater of salinity  $S = 3.5\%$  as a function of temperature. All values are in meters per second and are given for normal atmospheric pressure.

# ATTENUATION AND SPEED OF SOUND IN AIR AS A FUNCTION OF HUMIDITY AND FREQUENCY

This table gives the attenuation and speed of sound as a function of frequency at various values of relative humidity. All values refer to still air at 20 °C.

## SPEED OF SOUND IN DRY AIR

Eric W. Lemmon

These values were calculated from the equation of state for dry air (average molecular weight 28.96) treated as a real gas. Values refer to standard atmospheric pressure. The speed of sound varies only slightly with pressure; at two atmospheres and  $-100\text{ }^{\circ}\text{C}$  the value decreases by 0.16%, while at two atmospheres and  $80\text{ }^{\circ}\text{C}$  the speed increases by 0.05%. For additional values, see the table in Section 6 labeled "Thermophysical Properties of Air."

## CHARACTERISTICS OF HUMAN HEARING

The human ear is sensitive to sound waves with frequencies in the range from a few hertz to almost 20 kHz. Auditory response is usually expressed in terms of the *loudness level* of a sound, which is a measure of the sound pressure. The reference level, which is given in the unit *phon*, is a pure tone of frequency 1000 Hz with sound pressure of 20  $\mu\text{Pa}$  (in cgs units,  $2 \cdot 10^{-4}$  dyn/cm<sup>2</sup>); loudness level is usually expressed in decibels (dB) relative to this reference level. If a normal observer perceives an arbitrary sound to

be equally loud as this reference sound, the sound is said to have the loudness level of the reference. The sensitivity of the typical human ear ranges from about 0 dB, the threshold loudness level, to about 140 dB, the level at which pain sets in. The minimum detectable level thus represents a sound wave of pressure 20  $\mu\text{Pa}$  and intensity (power density)  $10^{-16}$  W/cm<sup>2</sup>.

The following figure illustrates the frequency dependence of the threshold for an average young adult.

The relation between loudness level and frequency for a typical person is expressed by the following table:

Sound pressure level in dB relative to 20 $\mu\text{Pa}$	Frequency in Hz					
	125	500	1000	4000	8000	10000
10			10	18		
20		16	20	28	11	
30	4	27	30	37	21	17
40	17	39	40	45	30	26
50	34	52	50	54	38	35
60	52	65	60	64	47	44
70	70	76	70	73	56	54
80	86	86	80	83	66	64
90	98	96	90	94	77	74
100	108	105	100	106	88	86

Thus, a 10,000 Hz tone at a pressure level of 50 dB seems equally loud as a 1000 Hz tone at a pressure of 35 dB.

The term *noise* refers to any unwanted sound, either a pure tone or a mixture of frequencies. Since the sensitivity of the ear is fre-

quency dependent, as illustrated by the above table, noise level is expressed in a frequency-weighted scale, known as A-weighting. Decibel readings on this scale are designated as dBa. Typical noise levels from various sources are illustrated in this table:

Source	Noise level in dBa
Rocket engine	200
Jet aircraft engine	160
Light aircraft, cruising	140
Tractor, 150 hp	115
Electric motor, 100 hp at 2600 rpm	105
Pneumatic drill	100
Subway train	90
Vacuum cleaner	85
Heavy automobile traffic	75
Conversational speech	65
Whispered speech	40
Background noise, recording studio	25-30

Recommended noise thresholds in the workplace have been established by the American Conference of Government Industrial

Hygienists. Some examples of the maximum safe levels for different daily exposure times are given below.

Duration of exposure	Max. level in dBa
24 h	80
8 h	85
4 h	88
1 h	94
30 min	97
15 min	100
2 min	109
28 s	115
0.11 s	139

No exposure greater than 140 dBa is permitted. Further details may be found in Reference 3.

# INTERSTELLAR MOLECULES

Frank J. Lovas and Lewis E. Snyder

A number of molecules have been detected in the interstellar medium, in circumstellar envelopes around evolved stars, and comae and tails of comets through observation of their microwave, infrared, or optical spectra. The following list gives the molecules and the particular isotopic species that have been reported so far. Molecules are listed by molecular formula in the Hill order. All species not footnoted otherwise are observed in interstellar clouds, while some are also found in comets and circumstellar clouds. The list was last updated in October 2008 and lists 162 molecules (298 isotopic forms).

## WEATHER-RELATED SCALES

### Saffir-Simpson Hurricane Scale

- **Tropical Storm**  
Winds 39–73 mph
- **Category 1 Hurricane** — winds 74–95 mph (64–82 knots); pressure greater than 980 mbar; storm surge 3–5 ft (1.0–1.7 m)  
No real damage to buildings. Damage to unanchored mobile homes. Some damage to poorly constructed signs. Also, some coastal flooding and minor pier damage.  
— Examples: Irene 1999 and Allison 1995
- **Category 2 Hurricane** — winds 96–110 mph (83–95 knots); pressure 979–965 mbar; storm surge 6–8 ft (1.8–2.6 m)  
Some damage to building roofs, doors and windows. Considerable damage to mobile homes. Flooding damages piers and small craft in unprotected moorings may break their moorings. Some trees blown down.  
— Examples: Bonnie 1998, Georges (FL & LA) 1998 and Gloria 1985
- **Category 3 Hurricane** — winds 111–130 mph (96–113 knots); pressure 964–945 mbar; storm surge 9–12 ft (2.7–3.8 m)  
Some structural damage to small residences and utility buildings. Large trees blown down. Mobile homes and poorly built signs destroyed. Flooding near the coast destroys smaller structures with larger structures damaged by floating debris. Terrain may be flooded well inland.  
— Examples: Keith 2000, Fran 1996, Opal 1995, Alicia 1983 and Betsy 1965

- **Category 4 Hurricane** — winds 131–155 mph (114–135 knots); pressure 944–920 mbar; storm surge 13–18 ft (3.9–5.6 m)  
More extensive curtainwall failures with some complete roof structure failure on small residences. Major erosion of beach areas. Terrain may be flooded well inland.  
— Examples: Hugo 1989 and Donna 1960
- **Category 5 Hurricane** — winds 156 mph and up (135+ knots); pressure less than 920 mbar; storm surge 19+ ft (5.7+ m)  
Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings blown over or away. Flooding causes major damage to lower floors of all structures near the shoreline. Massive evacuation of residential areas may be required.  
— Examples: Andrew (FL) 1992, Camille 1969 and Labor Day 1935

### Fujita Tornado Damage Scale

The original Fujita Scale was modified by NOAA in February 2007 and is now called the Enhanced Fujita Scale (EF). It is an operational scale based on the estimated speed of three-second wind gusts, as indicated by typical damage levels. The table below describes the damage levels according to the original scale. In the enhanced scale, the damage is measured by a more elaborate set of criteria (see <http://www.spc.noaa.gov/efscale/ef-scale.html>).

EF Number	3 s Gusts (mph)	Typical damage (according to the original Fujita Scale)
0	65–85	<b>Light damage.</b> Some damage to chimneys; branches broken off trees; shallow-rooted trees pushed over; sign boards damaged.
1	86–110	<b>Moderate damage.</b> Peels surface off roofs; mobile homes pushed off foundations or overturned; moving autos blown off roads.
2	111–135	<b>Considerable damage.</b> Roofs torn off frame houses; mobile homes demolished; boxcars overturned; large trees snapped or uprooted; light-object missiles generated; cars lifted off ground.
3	136–165	<b>Severe damage.</b> Roofs and some walls torn off well-constructed houses; trains overturned; most trees in forest uprooted; heavy cars lifted off the ground and thrown.
4	166–200	<b>Devastating damage.</b> Well-constructed houses leveled; structures with weak foundations blown away some distance; cars thrown and large missiles generated.
5	Over 200	<b>Incredible damage.</b> Strong frame houses leveled off foundations and swept away; automobile-sized missiles fly through the air in excess of 100 meters (109 yd); trees debarked; incredible phenomena will occur.

### Beaufort Wind Scale

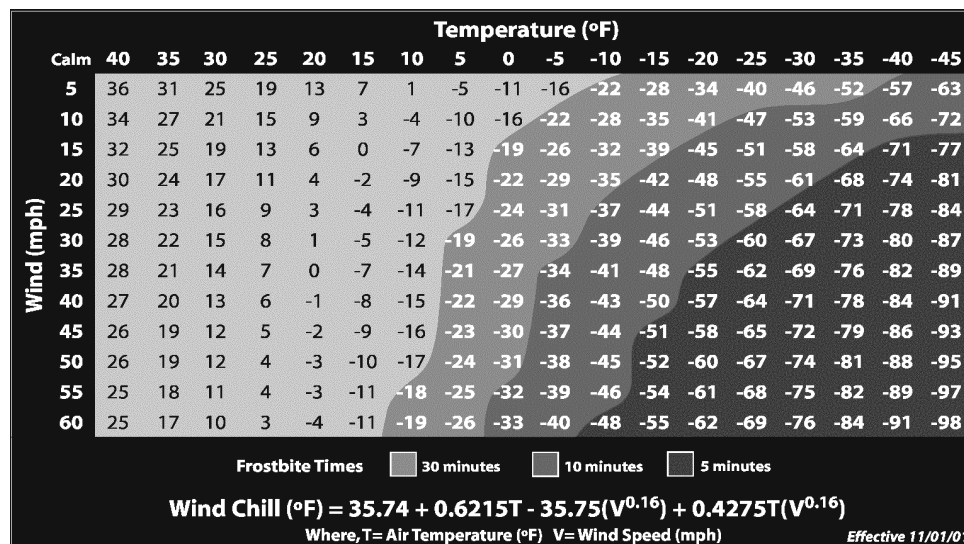

The Beaufort Wind Scale was devised by British Rear-Admiral Sir Francis Beaufort in 1805 based on observations of the effects of the wind.

Force	Wind (knots)	WMO classification	Appearance of wind effects	
			On the water	On land
0	< 1	Calm	Sea surface smooth and mirror-like	Calm, smoke rises vertically
1	1–3	Light Air	Scaly ripples, no foam crests	Smoke drift indicates wind direction, still wind vanes
2	4–6	Light Breeze	Small wavelets, crests glassy, no breaking	Wind felt on face, leaves rustle, vanes begin to move
3	7–10	Gentle Breeze	Large wavelets, crests begin to break, scattered whitecaps	Leaves and small twigs constantly moving, light flags extended

Force	Wind (knots)	WMO classification	Appearance of wind effects	
			On the water	On land
4	11–16	Moderate Breeze	Small waves 1–4 ft. becoming longer, numerous whitecaps	Dust, leaves, and loose paper lifted, small tree branches move
5	17–21	Fresh Breeze	Moderate waves 4–8 ft taking longer form, many whitecaps, some spray	Small trees in leaf begin to sway
6	22–27	Strong Breeze	Larger waves 8–13 ft, whitecaps common, more spray	Larger tree branches moving, whistling in wires
7	28–33	Near Gale	Sea heaps up, waves 13–20 ft, white foam streaks off breakers	Whole trees moving, resistance felt walking against wind
8	34–40	Gale	Moderately high (13–20 ft) waves of greater length, edges of crests begin to break into spindrift, foam blown in streaks	Whole trees in motion, resistance felt walking against wind
9	41–47	Strong Gale	High waves (20 ft), sea begins to roll, dense streaks of foam, spray may reduce visibility	Slight structural damage occurs, slate blows off roofs
10	48–55	Storm	Very high waves (20–30 ft) with overhanging crests, sea white with densely blown foam, heavy rolling, lowered visibility	Seldom experienced on land, trees broken or uprooted, "considerable structural damage"
11	56–63	Violent Storm	Exceptionally high (30–45 ft) waves, foam patches cover sea, visibility more reduced	
12	64+	Hurricane	Air filled with foam, waves over 45 ft, sea completely white with driving spray, visibility greatly reduced	

**Wind Chill**

The following chart prepared by the U. S. National Weather Service gives the temperature perceived by an average person as a function of the real air temperature and the wind speed. The current scale was adopted in 2001.

## GLOBAL WARMING POTENTIAL OF GREENHOUSE GASES

The Global Warming Potential (GWP) of a gas is a measure of the degree, relative to carbon dioxide, to which the presence of that gas in the atmosphere will contribute to a long-term increase in global temperature. The calculation of the GWP for a given gas takes into account the efficiency of the gas in absorbing solar radiation (primarily determined by the infrared spectrum of the compound) and the time the compound will remain in the atmosphere before it is removed by natural processes. Thus if a pulse of 1 kg of the gas is emitted to the atmosphere at the same time as a pulse of 1 kg of CO<sub>2</sub>, the GWP compares the warming effect of the gas relative to CO<sub>2</sub> over various time horizons.

This table, which is taken from the 2007 report of the Intergovernmental Panel of Climate Change (IPCC), gives the lifetime in years and the radiative efficiency in watts per square meter for a concentration of one part per billion for the major compounds identified in the Kyoto Protocol as contributing to global climate change. Radiative efficiency is a measure of the radiative forcing that influences the energy balance in the Earth-atmosphere system. The last four columns of the table give the Global Warming Potential, first as estimated in 1995 for a 100 year time horizon, and then as estimated with improved data in 2007 for 20-,

100-, and 500-year horizons. The calculation of a GWP involves a number of assumptions, and other measures have been proposed (see Reference).

The list of compounds includes those identified in the Montreal Protocol as contributing to ozone depletion, since these compounds also contribute to global warming. It also includes compounds used or proposed as replacements for the ozone-depleting compounds but which still have global warming potential.

## MAJOR WORLD EARTHQUAKES

The United States Geological Survey maintains a database of historic earthquakes throughout the world (Reference 1). The table below is extracted from that database; it includes about 300 major earthquakes, based upon the magnitude and the degree of destruction. All recorded earthquakes of magnitude 7.5 or greater are listed, even if the fatalities are unknown or small. The death toll is often a rough estimate; in many cases the true toll could be much greater. More details on the exact location and degree of destruction can be found in References 2 and 3.

The magnitude is given on the Richter scale, which was developed in 1935 by Charles F. Richter of the California Institute of Technology as a mathematical device to compare the size of earthquakes. The magnitude of an earthquake is measured by the logarithm of the amplitude of waves recorded by seismographs. Adjustments are included for the variation in the distance between the various seismographs and the epicenter of the earthquake. On

the Richter Scale, magnitude is expressed in whole numbers and decimal fractions, e.g. 6.3. Because of the logarithmic basis of the scale, each whole number increase in magnitude represents a ten-fold increase in measured amplitude; as an estimate of energy, each whole number step in the magnitude scale corresponds to the release of about 31 times more energy than the amount associated with the preceding whole number value.

## STANDARD ITS-90 THERMOCOUPLE TABLES

The Instrument Society of America (ISA) has assigned standard letter designations to a number of thermocouple types having specified emf-temperature relations. These designations and the approximate metal compositions which meet the required relations, as well as the useful temperature ranges, are given below:

Type B	(Pt + 30% Rh) vs. (Pt + 6% Rh)	0 to 1820°C
Type E	(Ni + 10% Cr) vs. (Cu + 43% Ni)	-270 to 1000°C
Type J	Fe vs. (Cu + 43% Ni)	-210 to 1200°C
Type K	(Ni + 10% Cr) vs. (Ni + 2% Al + 2% Mn + 1% Si)	-270 to 1372°C
Type N	(Ni + 14% Cr + 1.5% Si) vs. (Ni + 4.5% Si + 0.1% Mg)	-270 to 1300°C
Type R	(Pt + 13% Rh) vs. Pt	-50 to 1768°C
Type S	(Pt + 10% Rh) vs. Pt	-50 to 1768°C
Type T	Cu vs. (Cu + 43% Ni)	-270 to 400°C

The compositions are given in weight percent, and the positive leg is listed first. It should be emphasized that the standard letter

designations do not imply a precise composition but rather that the specified emf-temperature relation is satisfied.

The first set of tables below lists, for each thermocouple type, the emf as a function of temperature on the International Temperature Scale of 1990 (ITS-90). The coefficients in the equation used to generate the table are also given. The second set of tables gives the inverse relationships, i.e., the coefficients in the polynomial equation which expresses the temperature as a function of thermocouple emf. The accuracy of these equations is also stated.

Further details and tables at closer intervals may be found in Reference 1.

Temperature ranges and coefficients of equations used to compute the above table: The equations are of the form:  $E = c_0 + c_1 t + c_2 t^2 + c_3 t^3 + \dots + c_n t^n$ , where E is the emf in millivolts, t is the temperature in degrees Celsius (ITS-90), and  $c_0, c_1, c_2, c_3, \dots$  etc. are the coefficients. These coefficients are extracted from Reference 1.

NOTE—The above coefficients are extracted from Reference 1 and are for an expression of the form shown in Section 10.3.2. They yield approximate values of temperature that agree within  $\pm 0.04$  °C with the values given in Table 10.16.

## LABORATORY SOLVENTS AND OTHER LIQUID REAGENTS

This table summarizes the properties of 575 liquids that are commonly used in the laboratory as solvents or chemical reagents.

The properties tabulated are:

$M_r$ :	Molecular weight
$t_m$ :	Melting point in °C
$t_b$ :	Normal boiling point in °C
$\rho$ :	Density in g/mL at the temperature in °C indicated by the superscript
$\eta$ :	Viscosity in mPa s (1 mPa s = 1 centipoise) at 25 °C
$\epsilon$ :	Dielectric constant at ambient temperature (15 to 30 °C)
$\mu$ :	Dipole moment in D
$c_p$ :	Specific heat capacity of the liquid at constant pressure at 25 °C in J/g K
vp:	Vapor pressure at 25 °C in kPa (1 kPa = 7.50 mmHg)
FP:	Flash point in °C
Fl.Lim:	Flammable (explosive) limit in air in percent by volume
IT:	Autoignition temperature in °C
TLV:	Threshold limit for allowable airborne concentration in parts per million by volume at 25 °C and atmospheric pressure

Data on the temperature dependence of viscosity, dielectric constant, and vapor pressure can be found in the pertinent tables in this *Handbook*.

## DEPENDENCE OF BOILING POINT ON PRESSURE

The normal boiling point of a liquid is defined as the temperature at which the vapor pressure reaches standard atmospheric pressure, 101.325 kPa. The change in boiling point with pressure may be calculated from the representation of the vapor pressure by the Antoine Equation,

$$\ln p = A_1 - A_2/(T + A_3)$$

where  $p$  is the vapor pressure,  $T$  the absolute temperature, and  $A_1$ ,  $A_2$ , and  $A_3$  are constants. This table, which has been calculated using the Antoine constants in Reference 1, gives values of  $\Delta t/\Delta p$  for a number of liquids, in units of both °C/kPa and °C/mmHg. The correction to the boiling point is generally accurate to 0.1 to 0.2 °C as long as the pressure is within 10% of standard atmospheric pressure.

A slightly less accurate estimate of  $\Delta t/\Delta p$  may be obtained from the Clausius-Clapeyron equation, with the assumption that the

change in volume upon vaporization equals the ideal-gas volume of the vapor. This leads to the equation

$$\Delta t/\Delta p = RT_b^2/p_0 \Delta_{\text{vap}} H(T_b)$$

where  $R$  is the molar gas constant,  $p_0$  is 101.325 kPa,  $T_b$  is the normal boiling point temperature (absolute), and  $\Delta_{\text{vap}} H(T_b)$  is the molar enthalpy of vaporization at the normal boiling point. Values of the last quantity may be obtained from the table "Enthalpy of Vaporization" in Section 6.

## EBULLIOSCOPIC CONSTANTS FOR CALCULATION OF BOILING POINT ELEVATION

The boiling point  $T_b$  of a dilute solution of a non-volatile, non-dissociating solute is elevated relative to that of the pure solvent. If the solution is ideal (i.e., follows Raoult's Law), the amount of elevation depends only on the number of particles of solute present. Hence the change in boiling point  $\Delta T_b$  can be expressed as

$$\Delta T_b = E_b m_2$$

where  $m_2$  is the molality (moles of solute per kilogram of solvent) and  $E_b$  is the Ebullioscopic Constant, a characteristic property of

the solvent. The Ebullioscopic Constant may be calculated from the relation

$$E_b = R T_b^2 M / \Delta_{\text{vap}} H$$

where  $R$  is the molar gas constant,  $T_b$  is the normal boiling point temperature (absolute) of the solvent,  $M$  the molar mass of the solvent, and  $\Delta_{\text{vap}} H$  the molar enthalpy (heat) of vaporization of the solvent at its normal boiling point.

This table lists  $E_b$  values for some common solvents, as calculated from data in the table "Enthalpy of Vaporization" in Section 6.

Compound	$E_b/\text{K kg mol}^{-1}$
Acetic acid	3.22
Acetone	1.80

## CRYOSCOPIC CONSTANTS FOR CALCULATION OF FREEZING POINT DEPRESSION

The freezing point  $T_f$  of a dilute solution of a non-volatile, non-dissociating solute is depressed relative to that of the pure solvent. If the solution is ideal (i.e., follows Raoult's Law), this lowering is a function only of the number of particles of solute present. Thus the absolute value of the lowering of freezing point  $\Delta T_f$  can be expressed as

$$\Delta T_f = E_f m_2$$

where  $m_2$  is the molality (moles of solute per kilogram of solvent) and  $E_f$  is the Cryoscopic Constant, a characteristic property of the

solvent. The Cryoscopic Constant may be calculated from the relation

$$E_f = R T_b^2 M / \Delta_{\text{fus}} H$$

where  $R$  is the molar gas constant,  $T_b$  is the freezing point temperature (absolute) of the solvent,  $M$  the molar mass of the solvent, and  $\Delta_{\text{fus}} H$  the molar enthalpy (heat) of fusion of the solvent.

This table lists cryoscopic constants for selected substances, as calculated from data in the table "Enthalpy of Fusion" in Section 6.

Compound	$E_f/\text{K kg mol}^{-1}$	Compound	$E_f/\text{K kg mol}^{-1}$

## DETERMINATION OF RELATIVE HUMIDITY FROM DEW POINT

The relative humidity of a water vapor-air mixture is defined as 100 times the partial pressure of water divided by the saturation vapor pressure of water at the same temperature. The relative humidity may be determined from the dew point  $t_{\text{dew}}$ , which is the temperature at which liquid water first condenses when the

mixture is cooled from an initial temperature  $t$ . This table gives relative humidity as a function of the dew point depression  $t - t_{\text{dew}}$  for several values of the dew point. Values are calculated from the vapor pressure table in Section 6.

$t - t_{\text{dew}}$	$t_{\text{dew}}/^{\circ}\text{C}$					$t - t_{\text{dew}}$	$t_{\text{dew}}/^{\circ}\text{C}$

## DETERMINATION OF RELATIVE HUMIDITY FROM WET AND DRY BULB TEMPERATURES

Relative humidity may be determined by comparing temperature readings of wet and dry bulb thermometers. The following table, extracted from more extensive U.S. National Weather Service tables, gives the relative humidity as a function of air temperature

$t_d$  (dry bulb) and the difference  $t_d - t_w$  between dry and wet bulb temperatures. The data assume a pressure near normal atmospheric pressure and an instrumental configuration with forced ventilation.

$t_d/^\circ\text{C}$	$(t_d - t_w)/^\circ\text{C}$

# CONSTANT HUMIDITY SOLUTIONS

Anthony Wexler

An excess of a water soluble salt in contact with its saturated solution and contained within an enclosed space produces a constant relative humidity and water vapor pressure according to

$$RH = A \exp(B/T)$$

where  $RH$  is the percent relative humidity (generally accurate to  $\pm 2\%$ ),  $T$  is the temperature in kelvin, and the constants  $A$  and  $B$  and the range of valid temperatures are given in the table below. The vapor pressure,  $p$ , can be calculated from

$$p = (RH/100) \times p_0$$

where  $p_0$  is the vapor pressure of pure water at temperature  $T$  as given in the table in Section 6 titled "Vapor Pressure of Water from 0 to 370°C".

## STANDARD SALT SOLUTIONS FOR HUMIDITY CALIBRATION

Saturated aqueous solutions of inorganic salts are convenient secondary standards for calibration of instruments for measurement of relative humidity. The International Union of Pure and Applied Chemistry has recommended salt solutions for calibrations in the range of 10% to 90% relative humidity, and the American Society for Testing and Materials has published similar standards. The data in this table are taken from the IUPAC recommendations, except for  $K_2CO_3$  and  $K_2SO_4$ , which are ASTM recommendations.

Details on the preparation and use of these standards may be found in References 1 and 2. Data for other salts are given in Reference 3.

## LOW TEMPERATURE BATHS FOR MAINTAINING CONSTANT TEMPERATURE

A liquid-solid slurry is a convenient means of maintaining a constant temperature environment below room temperature. The following is a list of readily available organic liquids suitable for

this purpose, arranged in order of their melting (freezing) points  $t_m$ . The normal boiling points  $t_b$  are also given.

Compound	$t_m/^\circ\text{C}$	$t_b/^\circ\text{C}$
Isopentane (2-Methylbutane)	-159.9	27.8
Methylcyclopentane	-142.5	71.8
3-Chloropropene (Allyl chloride)	-134.5	45.1
Pentane	-129.7	36.0
Allyl alcohol	-129	97.0
Ethanol	-114.1	78.2
Carbon disulfide	-111.5	46
Isobutyl alcohol	-108	107.8
Toluene	-94.9	110.6
Acetone	-94.8	56.0
Ethyl acetate	-83.6	77.1
Dry ice + acetone	-78	
<i>p</i> -Cymene	-68.9	177.1
Trichloromethane (Chloroform)	-63.6	61.1
<i>N</i> -Methylaniline	-57	196.2
Chlorobenzene	-45.2	131.7
Anisole	-37.5	153.7
Bromobenzene	-30.6	156.0
Tetrachloromethane (Carbon tetrachloride)	-23	76.8
Benzonitrile	-12.7	191.1

## WIRE TABLES

The resistance per unit length of wires of various metals is tabulated here. Values were calculated from resistivity values in the tables "Electrical Resistivity of Pure Metals" and "Electrical Resistivity of Selected Alloys", which appear in Section 12. In prac-

tice, resistance may vary because of differing heat treatments and metal composition. The values in the table refer to 20°C, but values at other temperatures may be calculated from the following resistivity data:

Metal	Resistivity in $10^{-8} \Omega \cdot m$ at temperature			
	0°C	20°C	25°C	100°C
Aluminum	2.417	2.650	2.709	3.56
Brass (70% Cu, 30% Zn)	5.87	6.08	6.13	6.91
Constantan (60% Cu, 40% Ni)	45.43	45.38	45.35	45.11
Copper	1.543	1.678	1.712	2.22
Nichrome (79% Ni, 21% Cr)	107.3	107.5	107.6	108.3
Platinum	9.6	10.5	10.7	13.6
Silver	1.467	1.587	1.617	2.07
Tungsten	4.82	5.28	5.39	7.18

# DIELECTRIC STRENGTH OF INSULATING MATERIALS

L. I. Berger

The loss of the dielectric properties by a sample of a gaseous, liquid, or solid insulator as a result of application to the sample of an electric field\* greater than a certain critical magnitude is called *dielectric breakdown*. The critical magnitude of electric field at which the breakdown of a material takes place is called the *dielectric strength* of the material (or *breakdown voltage*). The dielectric strength of a material depends on the specimen thickness (as a rule, thin films have greater dielectric strength than that of thicker samples of a material), the electrode shape\*\*, the rate of the applied voltage increase, the shape of the voltage vs. time curve, and the medium surrounding the sample, e.g., air or other gas (or a liquid — for solid materials only).

## Breakdown in Gases

The current carriers in gases are free electrons and ions generated by external radiation. The equilibrium concentration of these particles at normal pressure is about  $10^3 \text{ cm}^{-3}$ , and hence the electrical conductivity is very small, of the order of  $10^{-16} - 10^{-15} \text{ S/cm}$ . But in a strong electric field, these particles acquire kinetic energy along their free path, large enough to ionize the gas molecules. The new charged particles ionize more molecules; this avalanche-like process leads to formation between the electrodes of channels of conducting plasma (streamers), and the electrical resistance of the space between the electrodes decreases virtually to zero.

Because the dielectric strength (breakdown voltage) of gases strongly depends on the electrode geometry and surface condition and the gas pressure, it is generally accepted to present the data for a particular gas as a fraction of the dielectric strength of either nitrogen or sulfur hexafluoride measured at the same conditions. In Table 1, the data are presented in comparison with the dielectric strength of nitrogen, which is considered equal to 1.00. For convenience to the reader, a few average magnitudes of the dielectric strength of some gases are expressed in kilovolts per millimeter. The data in the table relate to the standard conditions, unless indicated otherwise.

## Breakdown in Liquids

If a liquid is pure, the breakdown mechanism in it is similar to that in gases. If a liquid contains liquid impurities in the form of small drops with greater dielectric constant than that of the main liquid, the breakdown is the result of formation of ellipsoids from these drops by the electric field. In a strong enough electric field, these ellipsoids merge and form a high-conductivity channel between the electrodes. The current increases the temperature in the channel, liquid boils, and the current along the steam canal leads to breakdown. Formation of a conductive channel (bridge) between

the electrodes is observed also in liquids with solid impurities. If a liquid contains gas impurities in the form of small bubbles, breakdown is the result of heating of the liquid in strong electric fields. In the locations with the highest current density, the liquid boils, the size of the gas bubbles increases, they merge and form gaseous channels between the electrodes, and the breakdown medium is again the gas plasma.

## Breakdown in Solids

It is known that the current in solid insulators does not obey Ohm's law in strong electric fields. The current density increases almost exponentially with the electric field, and at a certain field magnitude it jumps to very high magnitudes at which a specimen of a material is destroyed. The two known kinds of electric breakdown are thermal and electrical breakdowns. The former is the result of material heating by the electric current. Destruction of a sample of a material happens when, at a certain voltage, the amount of heat produced by the current exceeds the heat release through the sample surface; the breakdown voltage in this case is proportional to the square root of the ratio of the thermal conductivity and electrical conductivity of the material. A semi-empirical expression for dependence of the breakdown voltage,  $V_b$ , on the physical properties and geometry of a sample of a solid material for the one-dimensional case is

$$V_b = [A\rho\kappa / a\phi(d)]^{1/2}$$

where  $A$  is a numerical constant related to the system of units used,  $\rho$  and  $\kappa$  are the volume resistivity and thermal conductivity of the sample material,  $a$  is a constant related to the chemical bond nature and crystal structure of the sample material, and  $\phi(d)$  is a function of the sample geometry, first of all, thickness,  $d$  (see, e.g., Ref. R6). In the majority of materials,  $\phi(d)$  increases with  $d$ , hence, the magnitude of  $V_b$  is greater in the thinner samples of a particular material.

The electrical breakdown results from the tunneling of the charge carriers from electrodes or from the valence band or from the impurity levels into the conduction band, or by the impact ionization. The tunnel effect breakdown happens mainly in thin layers, e.g., in thin p-n junctions. Otherwise, the impact ionization mechanism dominates. For this mechanism, the dielectric strength of an insulator can be estimated using Boltzmann's kinetic equation for electrons in a crystal.

In the following tables, the dielectric strength values are for room temperature and normal atmospheric pressure, unless indicated otherwise.

\* The unit of electric field in the SI system is newton per coulomb or volt per meter.

\*\* For example, the U.S. standard ASTM D149 is based on use of symmetrical electrodes, while per U.K. standard BS2918 one electrode is a plane and the other is a rod with the axis normal to the plane.

TABLE 1. Dielectric Strength of Gases

Material	Dielectric* strength	Ref.	Material	Dielectric* strength	Ref.
Nitrogen, N <sub>2</sub>	1.00		Trichlorofluoromethane, CCl <sub>3</sub> F	3.50	1

\* Relative to nitrogen, unless units of kV/mm are indicated.

TABLE 2. Dielectric Strength of Liquids

Material	Dielectric strength kV/mm	Ref.	Material	Dielectric strength kV/mm	Ref.
Helium, He, liquid, 4.2 K	10	9		20.4	15
Static	10	11		179	17,18
Dynamic	5	11	Ethylbenzene, C <sub>8</sub> H <sub>10</sub>	226	17,18
	23	12	Propylbenzene, C <sub>9</sub> H <sub>12</sub>	250	17,18
Nitrogen, N <sub>2</sub> , liquid, 77K			Isopropylbenzene, C <sub>9</sub> H <sub>12</sub>	238	17,18
Coaxial cylinder electrodes	20	10	Decane, C <sub>10</sub> H <sub>22</sub>	192	17,18
Sphere to plane electrodes	60	10	Synthetic Paraffin Mixture		
Water, H <sub>2</sub> O, distilled	65-70	13	Synfluid 2cSt PAO	29.5	37
Carbon tetrachloride, CCl <sub>4</sub>	5.5	14	Butylbenzene, C <sub>10</sub> H <sub>14</sub>	275	17,18
	16.0	15	Isobutylbenzene, C <sub>10</sub> H <sub>14</sub>	222	17,18
Hexane, C <sub>6</sub> H <sub>14</sub>	42.0	16	Silicone oils—polydimethylsiloxanes, (CH <sub>3</sub> ) <sub>3</sub> Si-O-[Si(CH <sub>3</sub> ) <sub>2</sub> ] <sub>x</sub> -O-Si(CH <sub>3</sub> ) <sub>3</sub>		
Two 2.54 cm diameter spherical electrodes, 50.8 μm space	156	17,18	Polydimethylsiloxane silicone fluid	15.4	20
Cyclohexane, C <sub>6</sub> H <sub>12</sub>	42-48	16	Dimethyl silicone	24.0	21,22
2-Methylpentane, C <sub>6</sub> H <sub>14</sub>	149	17,18	Phenylmethyl silicone	23.2	22
2,2-Dimethylbutane, C <sub>6</sub> H <sub>14</sub>	133	17,18	Silicone oil, Basilone M50	10-15	23
2,3-Dimethylbutane, C <sub>6</sub> H <sub>14</sub>	138	17,18	Mineral insulating oils	11.8	6
Benzene, C <sub>6</sub> H <sub>6</sub>	163	17,18	Polybutene oil for capacitors	13.8	6
Chlorobenzene, C <sub>6</sub> H <sub>5</sub> Cl	7.1	14	Transformer dielectric liquid	28-30	6
	18.8	15	Isopropylbiphenyl capacitor oil	23.6	6
2,2,4-Trimethylpentane, C <sub>8</sub> H <sub>18</sub>	140	17,18	Transformer oil	110.7	24
Phenylxylylethane	23.6	19	Transformer oil Agip ITE 360	9-12.6	23
Heptane, C <sub>7</sub> H <sub>16</sub>	166	17,18	Perfluorinated hydrocarbons		
2,4-Dimethylpentane, C <sub>7</sub> H <sub>16</sub>	133	17,18	Fluorinert FC 6001	8.0	23
Toluene, C <sub>6</sub> H <sub>5</sub> CH <sub>3</sub>	199	17,18	Fluorinert FC 77	10.7	23
	46	16	Perfluorinated polyethers		
	12.0	14	Galden XAD (Mol. wt. 800)	10.5	23
	20.4	15	Galden D40 (Mol. wt. 2000)	10.2	23
Octane, C <sub>8</sub> H <sub>18</sub>	16.6	14	Castor oil	65	25

TABLE 3. Dielectric Strength of Solids

Material	Dielectric strength kV/mm	Ref	Material	Dielectric strength kV/mm	Ref
Sodium chloride, NaCl, crystalline	150	26	Phlogopite, amber, natural	118	6
Potassium bromide, KBr, crystalline	80	26	Fluorophlogopite, synthetic	118	6
Ceramics			Glass-bonded mica	14.0-15.7	6
Alumina (99.9% Al <sub>2</sub> O <sub>3</sub> )	13.4	6,27a	Thermoplastic Polymers		
Aluminum silicate, Al <sub>2</sub> SiO <sub>5</sub>	5.9	6	Polypropylene	23.6	6
Berillia (99% BeO)	13.8	6,27b	Amide polymer nylon 6/6, dry	23.6	6
Boron nitride, BN	37.4	6	Polyamide-imide copolymer	22.8	6
Cordierite, Mg <sub>2</sub> Al <sub>4</sub> Si <sub>5</sub> O <sub>18</sub>	7.9	6,27c	Modified polyphenylene oxide	21.7	6
Forsterite, Mg <sub>2</sub> SiO <sub>4</sub>	9.8	28	Polystyrene	19.7	6
Porcelain	35-160	26	Polymethyl methacrylate	19.7	6
Steatite, Mg <sub>3</sub> Si <sub>4</sub> O <sub>11</sub> •H <sub>2</sub> O	9.1-15.4	6	Polyetherimide	18.9	6
Titanates of Mg, Ca, Sr, Ba, and Pb	20-120	3	Amide polymer nylon 11(dry)	16.7	6
Barium titanate, glass bonded	>30	36	Polysulfone	16.7	6
Zirconia, ZrO <sub>2</sub>	11.4	29	Styrene-acrylonitrile copolymer	16.7	6
Glasses			Acrylonitrile-butadiene-styrene	16.7	6
Fused silica, SiO <sub>2</sub>	470-670	26	Polyethersulfone	15.7	6
Alkali-silicate glass	200	26	Polybutylene terephthalate	15.7	6
Standard window glass	9.8-13.8	28	Polystyrene-butadiene copolymer	15.7	6
Micas			Acetal homopolymer	15.0	6
Muscovite, ruby, natural	118	6	Acetal copolymer	15.0	6
			Polyphenylene sulfide	15.0	6

Material	Dielectric strength kV/mm	Ref	Material	Dielectric strength kV/mm	Ref
Polycarbonate	15.0	6	Rigid, two-part	70.9	6
Acetal homopolymer resin (molding resin)	15.0	6	Semiflexible high-bond thixotropic	78.7	6
Acetal copolymer resin	15.0	6	Rigid high-bond high-flash freon-resistant	68.9	6
Thermosetting Molding Compounds			Baking type epoxy varnish		
Glass-filled allyl (Type GDI-30 per MIL-M-14G)	15.7	6	Solventless, rigid, low viscosity, one-part	90.6	6
Glass-filled epoxy, electrical grade	15.4	6	Solventless, semiflexible, one-part	82.7	6
Glass-filled phenolic (Type GPI-100 per MIL-M-14G)	15.0	6	Solventless, semirigid, chemical resistant, low dielectric constant	106.3	6
Glass-filled alkyd/polyester (Type MAI-60 per MIL-M-14G)	14.8	6	Solvable, for hermetic electric motors	181.1	6
Glass-filled melamine (Type MMI-30 per MIL-M-14G)	13.4	6	Polyurethane coating		
Extrusion Compounds for High-Temperature Insulation			Clear conformal, fast cure		
Polytetrafluoroethylene	19.7	6	Standard conditions	78.7	6
Perfluoroalkoxy polymer	21.7	6	Immersion conditions	47.2	6
Fluorinated ethylene-propylene copolymer	19.7	6	Insulating Films and Tapes		
Ethylene-tetrafluoroethylene copolymer	15.7	6	Low-density polyethylene film (40 μm thick)	300	31
Polyvinylidene fluoride	10.2	6	Poly- <i>p</i> -xylylene film	410-590	32
Ethylene-chlorotrifluoroethylene copolymer	19.3	6	Aromatic polymer films		
Polychlorotrifluoroethylene	19.7	6	Kapton H (Du Pont)	389-430	33
Extrusion Compounds for Low-Temperature Insulation			Ultem (GE Plastic and Roem AG)	437-565	33
Polyvinyl chloride			Hostaphan (Hoechst AG)	338-447	33
Flexible	11.8-15.7	30	Amorphous Stabar K2000 (ICI film)	404-422	33
Rigid	13.8-19.7	30	Stabar S100 (ICI film)	353-452	33
Polyethylene	18.9	28	Polyetherimide film (26 μm)	486	34
Polyethylene, low-density	21.7	6	Parylene N/D (poly- <i>p</i> -xylylene/poly- dichloro- <i>p</i> -xylylene) 25 μm film	275	6
	300	31	Cellulose acetate film	157	6
Polyethylene, high-density	19.7	6	Cellulose triacetate film	157	6
Polypropylene/polyethylene copolymer	23.6	6	Polytetrafluoroethylene film	87-173	6
Embedding Compounds			Perfluoroalkoxy film	157-197	6
Basic epoxy resin:	19.7	6	Fluorinated ethylene-propylene copolymer film	197	6
bisphenol-A/epichlorohydrin polycondensate			Ethylene-tetrafluoroethylene film	197	6
Cycloaliphatic epoxy: alicyclic diepoxy carboxylate	19.7	6	Ethylene-chlorotrifluoroethylene copolymer film	197	6
Polyetherketone	18.9	30	Polychlorotrifluoroethylene film	118-153.5	6
Polyurethanes			High-voltage rubber insulating tape	28	6
Two-component, polyol-cured	25.4	6	Composites		
Two-part solventless, polybutylene-based	24.0	6	Isophthalic polyester (vinyl toluene monomer) filled with		
Silicones			Calcium carbonate, CaCO <sub>3</sub>	15.0	38
Clear two-part heat curing electrical grade silicone embedding resin	21.7	6	Gypsum, CaSO <sub>4</sub>	14.4	38
Red insulating enamel (MIL-E-22118)			Alumina trihydrate	15.4	38
Dry	47.2	6	Clay	14.4	38
Wet	11.8	6	BPA fumarate polyester (vinyl toluene monomer) filled with		
Enamels			Calcium carbonate	6.1	38
Red enamel, fast cure			Gypsum	5.9	38
Standard conditions	78.7	6	Alumina trihydrate	11.8	38
Immersion conditions	47.2	6	Clay	12.6	38
Black enamel			Polysulfone resin—30% glass fiber	16.5-18.7	38
Standard conditions	70.9	6	Polyamid resin (Nylon 66)— 30% carbon fiber	13.0	38
Immersion conditions	47.2	6	Polyimide thermoset resin, glass reinforced	12.0	39
Varnishes			Polyester resin (thermoplastic)—		
Vacuum-pressure impregnated baking type solventless polyester varnish					

Material	Dielectric strength kV/mm	Ref	Material	Dielectric strength kV/mm	Ref
40% glass fiber	20.0	38	Room-temperature vulcanized silicone rubber	9.2-10.9	35
Epoxy resin (diglycidyl ether of bisphenol A), glass reinforced	16.0	40	Ureas (from carbamide to tetraphenylurea)	11.8-15.7	28
Various Insulators			Dielectric papers		
Rubber, natural	100-215	26	Aramid paper, calendered	28.7	6
Butyl rubber	23.6	6	Aramid paper, uncalendered	12.2	6
Neoprene	15.7-27.6	6	Aramid with Mica	39.4	6
Silicone rubber	26-36	6

# ALLOCATION OF FREQUENCIES IN THE RADIO SPECTRUM

In the United States the National Telecommunications and Information Administration (NTIA) has responsibility for assigning each portion of the radio spectrum (9 kHz to 300 GHz) for different uses. These assignments must be compatible with the rules of the International Telecommunications Union (ITU), to which the United States is bound by treaty. The current assignments are given in a wall chart (Reference 1) and may also be found on the NTIA web site (Reference 2). The list below summarizes the broad features of the spectrum allocation, with particular attention to those sections of scientific interest. The references should be con-

sulted for details of the allocations in the frequency bands listed here, which in some cases are quite complex.

Frequency range	Allocation
9 - 19.95 kHz	Maritime communication, navigation
19.95 - 20.05 kHz	Standard frequency and time signal (also at 60 kHz and 2.5, 5, 10, 15, 20, 25 MHz)
20.05 - 535 kHz	Maritime and aeronautical communication, navigation
535 - 1605 kHz	AM radio broadcasting
1605 - 3500 kHz	Mobile communication and navigation, amateur radio (1800-1900 kHz)
3.5 - 4.0 MHz	Amateur radio
4.0 - 5.95 MHz	Mobile communication
5.95 - 13.36 MHz	Mobile communication, amateur, short-wave broadcasting
13.36 - 13.41 MHz	Radioastronomy
13.41 - 25.55 MHz	Mobile communication, amateur, short-wave broadcasting
25.55 - 25.67 MHz	Radioastronomy
25.67 - 37.5 MHz	Mobile communication, amateur, short-wave broadcasting
37.5 - 38.25 MHz	Radioastronomy
38.25 - 50.0 MHz	Mobile communication
50.0 - 54.0 MHz	Amateur
54.0 - 72.0 MHz	TV channels 2-4
72.0 - 73.0 MHz	Mobile communication
73.0 - 74.6 MHz	Radioastronomy
74.6 - 76.0 MHz	Mobile communication
76.0 - 88.0 MHz	TV channels 5-6
88.0 - 108.0 MHz	FM radio broadcasting
108.0 - 118.0 MHz	Aeronautical navigation
118.0 - 174.0 MHz	Mobile communication, space research, meteorological satellites
174.0 - 216.0 MHz	TV channels 7-13
216.0 - 400.05 MHz	Mobile communication
400.05 - 400.15 MHz	Standard frequency and time satellite (also 20 and 25 GHz)
400.15 - 406.1 MHz	Meteorological aids (radiosonde)
406.1 - 410.0 MHz	Radioastronomy
410.0 - 470.0 MHz	Mobile communication, amateur
470.0 - 512.0 MHz	TV channels 14-20
512.0 - 608.0 MHz	TV channels 21-36
608.0 - 614.0 MHz	Radioastronomy
614.0 - 806.0 MHz	TV channels 38-69
806 - 1400 MHz	Mobile communication, navigation
1400 - 1427 MHz	Radioastronomy, space research
1427 - 1660 MHz	Various navigation and satellite applications
1660 - 1710 MHz	Radioastronomy, space research, meteorology
1710 - 2655 MHz	Various navigation and satellite applications
2655 - 2700 MHz	Radioastronomy, space research
2.7 - 4.99 GHz	Various navigation and satellite applications
4.99 - 5.0 GHz	Radioastronomy, space research
5.0 - 10.6 GHz	Various navigation and satellite applications
10.6 - 10.7 GHz	Radioastronomy, space research
10.7 - 15.35 GHz	Various navigation and satellite applications
15.35 - 15.4 GHz	Radioastronomy, space research
15.4 - 22.21 GHz	Various navigation and satellite applications

<b>Frequency range</b>	<b>Allocation</b>
22.21 - 22.5 GHz	Radioastronomy, space research
22.25 - 23.6 GHz	Various navigation and satellite applications
23.6 - 24.0 GHz	Radioastronomy, space research
24.0 - 31.3 GHz	Various navigation and satellite applications
31.3 - 31.8 GHz	Radioastronomy, space research
31.8 - 42.5 GHz	Various navigation and satellite applications
42.5 - 43.5 GHz	Radioastronomy
43.5 - 51.4 GHz	Various navigation and satellite applications
51.4 - 54.25 GHz	Radioastronomy, space research
54.25 - 58.2 GHz	Space research
58.2 - 59.0 GHz	Radioastronomy, space research
59.0 - 64.0 GHz	Satellite applications
64.0 - 65.0 GHz	Radioastronomy, space research
65.0 - 72.77 GHz	Various navigation and satellite applications
72.77 - 72.91 GHz	Radioastronomy, space research
72.91 - 86.0 GHz	Various navigation and satellite applications
86.0 - 92.0 GHz	Radioastronomy, space research
92.0 - 105.0 GHz	Various navigation and satellite applications
105.0 - 116.0 GHz	Radioastronomy, space research
116.0 - 164.0 GHz	Various navigation and satellite applications
164.0 - 168.0 GHz	Radioastronomy, space research
168.0 - 182.0 GHz	Various navigation and satellite applications
182.0 - 185.0 GHz	Radioastronomy, space research
185.0 - 217.0 GHz	Various navigation and satellite applications
217.0 - 231.0 GHz	Radioastronomy, space research
231.0 - 265.0 GHz	Various navigation and satellite applications
265.0 - 275.0 GHz	Radioastronomy
275.0 - 300.0 GHz	Mobile communications

## CORRECTION OF BAROMETER READINGS TO 0 °C TEMPERATURE

The following corrections are used to reduce the reading of a mercury barometer with a brass scale to 0 °C. The number in the table should be subtracted from the observed height of the mercury column to give the true pressure in mmHg (1mmHg = 133.322 Pa). The table is calculated from the formula

$$\Delta h = -0.0001634 ht / (1 + 0.0001818 t),$$

where  $h$  is the observed column height in mm and  $t$  the Celsius temperature. This relation is based on thermal expansion coefficients of  $181.8 \cdot 10^{-6} \text{ } ^\circ\text{C}^{-1}$  for mercury and  $18.4 \cdot 10^{-6} \text{ } ^\circ\text{C}^{-1}$  for brass.

$t/^\circ\text{C}$	Observed Height in mm																		
	620	630	640	650	660	670	680	690	700	710	720	730	740	750	760	770	780	790	800

Sn	100	100	231.9		

\* The useful expression for correlations between the atomic and weight concentrations of an alloy components are:

$$f(a, A_k) = \frac{f(w, A_k)}{M_k \sum_{i=1}^N \frac{f(w, A_i)}{M_i}} \quad \text{and} \quad f(w, A_k) = \frac{M_k \cdot f(a, A_k)}{\sum_{i=1}^N M_i \cdot f(a, A_i)} \quad (i = 1, \dots, k, \dots, N)$$

where  $f(a, A_i)$  and  $f(w, A_i)$  are the atomic and weight concentrations of component  $A_i$ , respectively, and  $M_i$  is the atomic weight of this component.

## FLAME TEMPERATURES

This table gives the adiabatic flame temperature for stoichiometric mixtures of various fuels and oxidizers. The temperatures are calculated from thermodynamic and transport properties under ideal adiabatic conditions, using methods described in the reference.

## DENSITY OF ETHANOL-WATER MIXTURES

This table gives the density of mixtures of ethanol and water as a function of composition and temperature. The composition is specified in weight percent of ethanol, i.e., mass of ethanol per 100 g of solution. Values from the reference have been converted to true densities.

## MISCIBILITY OF ORGANIC SOLVENTS

The chart below gives qualitative information on the miscibility of pairs of organic liquids. Two liquids are considered miscible (indicated by **M** in the chart) if mixing equal volumes produces a single liquid phase. If two phases separate, they are considered immiscible (**I**). An entry of **P** indicates two phases whose volumes dif-

fer appreciably, suggesting a partial miscibility of the components. The symbol **R** indicates a reaction between the components. All data refer to room temperature.

The codes for the columns are:

<b>A</b> Acetone	<b>J</b> Diethyl ether	<b>S</b> Methyl isopropyl ketone
<b>B</b> Benzaldehyde	<b>K</b> <i>N,N</i> -Dimethylaniline	<b>T</b> Nitromethane
<b>C</b> Benzene	<b>L</b> Dipentylamine	<b>U</b> 1-Octanol
<b>D</b> Butyl acetate	<b>M</b> Ethyl alcohol	<b>V</b> 1,3-Propanediol
<b>E</b> Butyl alcohol	<b>N</b> Ethylene glycol	<b>W</b> Pyridine
<b>F</b> Carbon tetrachloride	<b>O</b> Ethylene glycol monoethyl ether	<b>X</b> Triethylenetetramine
<b>G</b> 2-Chloroethanol	<b>P</b> Formamide	<b>Y</b> Triethyl phosphate
<b>H</b> Chloroform	<b>Q</b> Furfuryl alcohol	
<b>I</b> <i>o</i> -Cresol	<b>R</b> Glycerol

## DENSITY OF SOLVENTS AS A FUNCTION OF TEMPERATURE

The table below lists the density of several common solvents in the temperature range from 0°C to 100°C. The values have been calculated from the Rackett Equation using parameters in the reference. Density values refer to the liquid at its saturation vapor pressure; thus entries for temperatures above the normal boiling point are for pressures greater than atmospheric.

## COEFFICIENT OF FRICTION

The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the force pressing the two together. Thus if  $F$  is the minimum force needed to move one surface over the other, and  $W$  is the force pressing the surfaces together, the coefficient of friction  $\mu$  is given by  $\mu = F/W$ . A greater force is generally needed to initiate movement from rest than to continue the motion once sliding has started. Thus the static coefficient of friction  $\mu(\text{static})$  is usually larger than the sliding or kinetic coefficient  $\mu(\text{sliding})$ .

This table gives characteristic values of both the static and sliding coefficients of friction for a number of material combinations. In each case Material 1 is moving over the surface of Material 2.

The type of lubrication or any other special condition is indicated in the third column. All values refer to room temperature unless otherwise indicated. It should be emphasized that the coefficient of friction is very sensitive to the condition of the surface, so that these values represent only a rough guide.

## SECONDARY REFERENCE POINTS ON THE ITS-90 TEMPERATURE SCALE

The International Temperature Scale of 1990 is described in Section 1 of this *Handbook*, where the defining fixed points are listed. The Consultative Committee on Thermometry (CCT) of the International Committee on Weights and Measures (CIPM), which oversees the temperature scale, has recommended a number of secondary reference points whose values have been accurately determined with respect to the primary fixed points. The most accurate of these, referred to as “first quality points”, satisfy several criteria involving purity of the material, reproducibility, and documentation of the measurements. The CCT also lists “second quality points” that do not yet satisfy all the criteria but are still useful. Taken together,

these secondary reference points, help fill in the gaps between the primary fixed points.

The table below describes these secondary reference points. The best values resulting from the CCT evaluation are listed on both the Kelvin and Celsius scales, along with an estimate of uncertainty. Full details are given in the reference.

The entries within each quality group are listed in order of increasing temperature.

### Reference

# RELATIVE SENSITIVITY OF BAYARD-ALPERT IONIZATION GAUGES TO VARIOUS GASES

Paul Redhead

The ion current  $I_+$  in a hot-cathode ionization gauge is given by  $I_+ = KI_eP$ . The gauge constant is  $K = (I_+/I_e)(1/P)$ , where  $I_e$  is the electron current, and  $P$  the pressure. The sensitivity is given by  $S = KI_e = I_+/P$ . The constant  $K$  is independent of pressure below about  $10^{-3}$  Pa.

Relative sensitivities for different Bayard-Alpert ionization gauges may differ by as much as  $\pm 15\%$  as a result of differences in applied voltages, electron current, and electrode structure. The table below presents the average of the measurements of 12 experimenters on Bayard-Alpert ionization gauges in various gases. The sensitivity relative to nitrogen is tabulated.

Gas		Relative sensitivity $S/S(N_2)$
Helium	He	0.18
Neon	Ne	0.31
Argon	Ar	1.4
Krypton	Kr	1.9
Xenon	Xe	2.7
Nitrogen	$N_2$	1.00
Hydrogen	$H_2$	0.43
Oxygen	$O_2$	0.96
Carbon monoxide	CO	1.0
Carbon dioxide	$CO_2$	1.4
Water	$H_2O$	0.93
Sulfur hexafluoride	$SF_6$	2.3
Mercury	Hg	3.5
Methane	$CH_4$	1.6
Ethane	$C_2H_6$	2.6
Propane	$C_3H_8$	3.5
Butane	$C_4H_{10}$	4.3
Ethene	$C_2H_4$	1.3
Propene	$C_3H_6$	1.8
Acetylene	$C_2H_2$	0.61
Allene	$C_3H_4$	1.3
1-Propyne (Methyl acetylene)	$C_3H_4$	1.4
Benzene	$C_6H_6$	3.8

# HANDLING AND DISPOSAL OF CHEMICALS IN LABORATORIES

Robert Joyce and Blaine C. McKusick

The following material has been extracted from two books prepared under the auspices of the Committee on Hazardous Substances in the Laboratory of the National Academy of Sciences – National Research Council. Readers are referred to these books for full details:

*Prudent Practices for Handling Hazardous Chemicals in Laboratories*, National Academy Press, Washington, 1981.

*Prudent Practices for Disposal of Chemicals from Laboratories*, National Academy Press, Washington, 1983.

The permission of the National Academy Press to use these extracts is gratefully acknowledged.

## INCOMPATIBLE CHEMICALS

The term “incompatible chemicals” refers to chemicals that can react with each other

- Violently
- With evolution of substantial heat
- To produce flammable products
- To produce toxic products

Good laboratory safety practice requires that incompatible chemicals be stored, transported, and disposed of in ways that will prevent their coming together in the event of an accident. Tables 1 and 2 give some basic guidelines for the safe handling of acids, bases, reactive metals, and other chemicals. Neither of these tables is exhaustive, and additional information on incompatible chemicals can be found in the following references.

1. Urben, P. G., Ed., *Bretherick's Handbook of Reactive Chemical Hazards*, 5th ed., Butterworth-Heinemann, Oxford, 1995.
2. Luxon, S. G., Ed., *Hazards in the Chemical Laboratory*, 5th ed., Royal Society of Chemistry, Cambridge, 1992.
3. *Fire Protection Guide to Hazardous Materials*, 11th ed., National Fire Protection Association, Quincy, MA, 1994.

TABLE 1. General Classes of Incompatible Chemicals

A	B
Acids	Bases, reactive metals
Oxidizing agents <sup>a</sup>	Reducing agents <sup>a</sup>
Chlorates	Ammonia, anhydrous and aqueous
Chromates	Carbon
Chromium trioxide	Metals
Dichromates	Metal hydrides
Halogens	Nitrites
Halogenating agents	Organic compounds
Hydrogen peroxide	Phosphorus
Nitric acid	Silicon
Nitrates	Sulfur
Perchlorates	
Peroxides	
Permanganates	
Persulfates	

<sup>a</sup> The examples of oxidizing and reducing agents are illustrative of common laboratory chemicals; they are not intended to be exhaustive.

TABLE 2. Examples of Incompatible Chemicals

Chemical	Is incompatible with
Acetic acid	Chromic acid, nitric acid, hydroxyl compounds, ethylene glycol, perchloric acid, peroxides, permanganates
Acetylene	Chlorine, bromine, copper, fluorine, silver, mercury
Acetone	Concentrated nitric and sulfuric acid mixtures
Alkali and alkaline earth metals (such as powdered aluminum or magnesium, calcium, lithium, sodium, potassium)	Water, carbon tetrachloride or other chlorinated hydrocarbons, carbon dioxide, halogens
Ammonia (anhydrous)	Mercury (in manometers, for example), chlorine, calcium hypochlorite, iodine, bromine, hydrofluoric acid (anhydrous)
Ammonium nitrate	Acids, powdered metals, flammable liquids, chlorates, nitrites, sulfur, finely divided organic or combustible materials
Aniline	Nitric acid, hydrogen peroxide
Arsenical materials	Any reducing agent
Azides	Acids

Chemical	Is incompatible with
Bromine	See Chlorine
Calcium oxide	Water
Carbon (activated)	Calcium hypochlorite, all oxidizing agents
Carbon tetrachloride	Sodium
Chlorates	Ammonium salts, acids, powdered metals, sulfur, finely divided organic or combustible materials
Chromic acid and chromium trioxide	Acetic acid, naphthalene, camphor, glycerol, alcohol, flammable liquids in general
Chlorine	Ammonia, acetylene, butadiene, butane, methane, propane (or other petroleum gases), hydrogen, sodium carbide, benzene, finely divided metals, turpentine
Chlorine dioxide	Ammonia, methane, phosphine, hydrogen sulfide
Copper	Acetylene, hydrogen peroxide
Cumene hydroperoxide	Acids (organic or inorganic)
Cyanides	Acids
Flammable liquids	Ammonium nitrate, chromic acid, hydrogen peroxide, nitric acid, sodium peroxide, halogens
Fluorine	Everything
Hydrocarbons (such as butane, propane, benzene)	Fluorine, chlorine, bromine, chromic acid, sodium peroxide
Hydrocyanic acid	Nitric acid, alkali
Hydrofluoric acid (anhydrous)	Ammonia (aqueous or anhydrous)
Hydrogen peroxide	Copper, chromium, iron, most metals or their salts, alcohols, acetone, organic materials, aniline, nitro-methane, combustible materials
Hydrogen sulfide	Fuming nitric acid, oxidizing gases
Hypochlorites	Acids, activated carbon
Iodine	Acetylene, ammonia (aqueous or anhydrous), hydrogen
Mercury	Acetylene, fulminic acid, ammonia
Nitrates	Sulfuric acid
Nitric acid (concentrated)	Acetic acid, aniline, chromic acid, hydrocyanic acid, hydrogen sulfide, flammable liquids, flammable gases, copper, brass, any heavy metals
Nitrites	Acids
Nitroparaffins	Inorganic bases, amines
Oxalic acid	Silver, mercury
Oxygen	Oils, grease, hydrogen, flammable liquids, solids, or gases
Perchloric acid	Acetic anhydride, bismuth and its alloys, alcohol, paper, wood, grease, oils
Peroxides, organic	Acids (organic or mineral), avoid friction, store cold
Phosphorus (white)	Air, oxygen, alkalis, reducing agents
Potassium	Carbon tetrachloride, carbon dioxide, water
Potassium chlorate	Sulfuric and other acids
Potassium perchlorate (see also chlorates)	Sulfuric and other acids
Potassium permanganate	Glycerol, ethylene glycol, benzaldehyde, sulfuric acid
Selenides	Reducing agents
Silver	Acetylene, oxalic acid, tartaric acid, ammonium compounds, fulminic acid
Sodium	Carbon tetrachloride, carbon dioxide, water
Sodium nitrite	Ammonium nitrate and other ammonium salts
Sodium peroxide	Ethyl or methyl alcohol, glacial acetic acid, acetic anhydride, benzaldehyde, carbon disulfide, glycerin, ethylene glycol, ethyl acetate, methyl acetate, furfural
Sulfides	Acids
Sulfuric acid	Potassium chlorate, potassium perchlorate, potassium permanganate (similar compounds of light metals, such as sodium, lithium)
Tellurides	Reducing agents

## EXPLOSION HAZARDS

Table 3 lists some common classes of laboratory chemicals that have potential for producing a violent explosion when subjected to shock or friction. These chemicals should never be disposed of as such, but should be handled by procedures given in *Prudent Practices for Disposal of Chemicals from Laboratories*, National Academy Press, 1983, chapters 6 and 7. Additional information on these, as well as on some less common classes of explosives, can be found in L. Bretherick, *Handbook of Reactive Chemical Hazards*, 3rd ed., Butterworths, London–Boston, 1985.

Table 4 lists some illustrative combinations of common laboratory reagents that can produce explosions when they are brought together or that form reaction products that can explode without any apparent external initiating action. This list is not exhaustive, and additional information on potentially explosive reagent combinations can be found in *Manual of Hazardous Chemical Reactions, A Compilation of Chemical Reactions Reported to be Potentially Hazardous*, National Fire Protection Association, NFPA 491M, 1975, NFPA, 470 Atlantic Avenue, Boston, MA 02210.

## WATER-REACTIVE CHEMICALS

Table 5 lists some common laboratory chemicals that react violently with water and that should always be stored and handled so that they do not come into contact with liquid water or water vapor.

Procedures for decomposing laboratory quantities are given in *Prudent Practices for Disposal of Chemicals from Laboratories*, chapter 6; the pertinent section of that chapter is given in parentheses.

## PYROPHORIC CHEMICALS

Many members of the classes of readily oxidized, common laboratory chemicals listed in Table 6 ignite spontaneously in air. A more extensive list can be found in L. Bretherick, *Handbook of Reactive Chemical Hazards*, 3rd ed., Butterworths, London–Boston, 1985. Pyrophoric chemicals should be stored in tightly closed containers under an inert atmosphere (or, for some, an inert liquid),

and all transfers and manipulations of them must be carried out under an inert atmosphere or liquid. Suggested procedures for decomposing them are given in *Prudent Practices for Disposal of Chemicals from Laboratories*, chapter 6; the pertinent section of that chapter is given in parentheses.

## TABLE 3. Shock-Sensitive Compounds

Acetylenic compounds, especially polyacetylenes, haloacetylenes, and heavy metal salts of acetylenes (copper, silver, and mercury salts are particularly sensitive)
Acyl nitrates
Alkyl nitrates, particularly polyol nitrates such as nitrocellulose and nitroglycerine
Alkyl and acyl nitrites
Alkyl perchlorates
Ammine metal oxosalts: metal compounds with coordinated ammonia, hydrazine, or similar nitrogenous donors and ionic perchlorate, nitrate, permanganate, or other oxidizing group
Azides, including metal, nonmetal, and organic azides
Chlorite salts of metals, such as $\text{AgClO}_2$ and $\text{Hg}(\text{ClO}_2)_2$
Diazo compounds such as $\text{CH}_2\text{N}_2$
Diazonium salts, when dry
Fulminates (silver fulminate, $\text{AgCNO}$ , can form in the reaction mixture from the Tollens' test for aldehydes if it is allowed to stand for some time; this can be prevented by adding dilute nitric acid to the test mixture as soon as the test has been completed)
Hydrogen peroxide becomes increasingly treacherous as the concentration rises above 30%, forming explosive mixtures with organic materials and decomposing violently in the presence of traces of transition metals
<i>N</i> -Halogen compounds such as difluoroamino compounds and halogen azides
<i>N</i> -Nitro compounds such as <i>N</i> -nitromethylamine, nitrourea, nitroguanidine, and nitric amide
Oxo salts of nitrogenous bases: perchlorates, dichromates, nitrates, iodates, chlorites, chlorates, and permanganates of ammonia, amines, hydroxylamine, guanidine, etc.
Perchlorate salts. Most metal, nonmetal, and amine perchlorates can be detonated and may undergo violent reaction in contact with combustible materials
Peroxides and hydroperoxides, organic (see Chapter 6, Section II.P)
Peroxides (solid) that crystallize from or are left from evaporation of peroxidizable solvents (see Chapter 6 and Appendix I)
Peroxides, transition-metal salts
Picrates, especially salts of transition and heavy metals, such as Ni, Pb, Hg, Cu, and Zn; picric acid is explosive but is less sensitive to shock or friction than its metal salts and is relatively safe as a water-wet paste (see Chapter 7)
Polynitroalkyl compounds such as tetranitromethane and dinitroacetoneitrile
Polynitroaromatic compounds, especially polynitro hydrocarbons, phenols, and amines

**TABLE 4. Potentially Explosive Combinations of Some Common Reagents**

Acetone + chloroform in the presence of base  
 Acetylene + copper, silver, mercury, or their salts  
 Ammonia (including aqueous solutions) +  $\text{Cl}_2$ ,  $\text{Br}_2$ , or  $\text{I}_2$   
 Carbon disulfide + sodium azide  
 Chlorine + an alcohol  
 Chloroform or carbon tetrachloride + powdered Al or Mg  
 Decolorizing carbon + an oxidizing agent  
 Diethyl ether + chlorine (including a chlorine atmosphere)  
 Dimethyl sulfoxide + an acyl halide,  $\text{SOCl}_2$  or  $\text{POCl}_3$   
 Dimethyl sulfoxide +  $\text{CrO}_3$   
 Ethanol + calcium hypochlorite  
 Ethanol + silver nitrate  
 Nitric acid + acetic anhydride or acetic acid  
 Picric acid + a heavy-metal salt, such as of Pb, Hg, or Ag  
 Silver oxide + ammonia + ethanol  
 Sodium + a chlorinated hydrocarbon  
 Sodium hypochlorite + an amine

**TABLE 5. Water-Reactive Chemicals**

Alkali metals (III.D)  
 Alkali metal hydrides (III.C.2)  
 Alkali metal amides (III.C.7)  
 Metal alkyls, such as lithium alkyls and aluminum alkyls (IV.A)  
 Grignard reagents (IV.A)  
 Halides of nonmetals, such as  $\text{BCl}_3$ ,  $\text{BF}_3$ ,  $\text{PCl}_3$ ,  $\text{PCl}_5$ ,  $\text{SiCl}_4$ ,  $\text{S}_2\text{Cl}_2$  (III.F)  
 Inorganic acid halides, such as  $\text{POCl}_3$ ,  $\text{SOCl}_2$ ,  $\text{SO}_2\text{Cl}_2$  (III.F)  
 Anhydrous metal halides, such as  $\text{AlCl}_3$ ,  $\text{TiCl}_4$ ,  $\text{ZrCl}_4$ ,  $\text{SnCl}_4$  (III.E)  
 Phosphorus pentoxide (III.I)  
 Calcium carbide (IV.E)  
 Organic acid halides and anhydrides of low molecular weight (II.J)

**TABLE 6. Classes of Pyrophoric Chemicals**

Grignard reagents,  $\text{RMgX}$  (IV.A)  
 Metal alkyls and aryls, such as  $\text{RLi}$ ,  $\text{RNa}$ ,  $\text{R}_3\text{Al}$ ,  $\text{R}_2\text{Zn}$  (IV.A)  
 Metal carbonyls, such as  $\text{Ni}(\text{CO})_4$ ,  $\text{Fe}(\text{CO})_5$ ,  $\text{Co}_2(\text{CO})_8$  (IV.B)  
 Alkali metals such as Na, K (III.D.1)  
 Metal powders, such as Al, Co, Fe, Mg, Mn, Pd, Pt, Ti, Sn, Zn, Zr (III.D.2)  
 Metal hydrides, such as  $\text{NaH}$ ,  $\text{LiAlH}_4$  (IV.C.2)  
 Nonmetal hydrides, such as  $\text{B}_2\text{H}_6$  and other boranes,  $\text{PH}_3$ ,  $\text{AsH}_3$  (III.G)  
 Nonmetal alkyls, such as  $\text{R}_3\text{B}$ ,  $\text{R}_3\text{P}$ ,  $\text{R}_3\text{As}$  (IV.C)  
 Phosphorus (white) (III.H)

## HAZARDS FROM PEROXIDE FORMATION

Many common laboratory chemicals can form peroxides when allowed access to air over a period of time. A single opening of a container to remove some of the contents can introduce enough air for peroxide formation to occur. Some types of compounds form peroxides that are treacherously and violently explosive in concentrated solution or as solids. Accordingly, peroxide-containing liquids should never be evaporated near to or to dryness. Peroxide formation can also occur in many polymerizable unsaturated compounds, and these peroxides can initiate a runaway, sometimes explosive, polymerization reaction. Procedures for testing for peroxides and for removing small amounts from laboratory chemicals are given in *Prudent Practices for Disposal of Chemicals from Laboratories*, chapter 6, Section II.P.

Table 7 provides a list of structural characteristics in organic compounds that can peroxidize. These structures are listed in approximate order of decreasing hazard. Reports of serious incidents involving the last five structural types are extremely rare, but these structures are listed because laboratory workers should be aware that they can form peroxides that can influence the course of experiments in which they are used.

Table 8 gives examples of common laboratory chemicals that are prone to form peroxides on exposure to air. The lists are not exhaustive, and analogous organic compounds that have any of the structural features given in Table 7 should be tested for peroxides before being used as solvents or reagents, or before being distilled. The recommended retention times begin with the date of synthesis or of opening the original container.

## DISPOSAL OF TOXIC CHEMICALS

It is often desirable to precipitate toxic cations or hazardous anions from solution to facilitate recovery or disposal. Table 9 lists precipitants for many common cations, and Table 10 gives precipitants for some hazardous anions. Many cations can be precipitated as sulfides by adding sodium sulfide solution (preferable to the highly toxic hydrogen sulfide) to a neutral solution of the cation (Table 11). Control of pH is important because some sulfides will redissolve in excess sulfide ion. After precipitation, excess sulfide can be destroyed by addition of hypochlorite.

Most metal cations are precipitated as hydroxides or oxides at high pH. Since many of these precipitates will redissolve in excess

base, it is often necessary to control pH. Table 12 shows the recommended pH range for precipitating many cations in their most common oxidation state. The notation "1 N" in the right-hand column indicates that the precipitate will not dissolve in 1 N sodium hydroxide (pH 14).

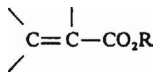

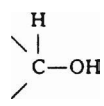

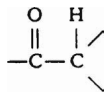

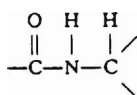

The distinctions between high and low toxicity or hazard are based on toxicological and other data, and are relative. There is no implication of a sharp distinction between high and low, or that any cations or anions are totally without hazard.

TABLE 7. Types of Chemicals That Are Prone to Form Peroxides

## A. Organic structures (in approximate order of decreasing hazard)

1.		Ethers and acetals with $\alpha$ hydrogen atoms
2.		Olefins with allylic hydrogen atoms
3.		Chloroolefins and fluoroolefins
4.		Vinyl halides, esters, and ethers
5.		Dienes
6.		Vinylacetylenes with $\alpha$ hydrogen atoms
7.		Alkylacetylenes with $\alpha$ hydrogen atoms
8.		Alkylarenes that contain tertiary hydrogen atoms
9.		Alkanes and cycloalkanes that contain tertiary hydrogen atoms

10.		Acrylates and methacrylates
11.		Secondary alcohols
12.		Ketones that contain $\alpha$ hydrogen atoms
13.		Aldehydes
14.		Ureas, amides, and lactams that have a hydrogen atom on a carbon atom attached to nitrogen

**B. Inorganic substances**

1. Alkali metals, especially potassium, rubidium, and cesium (see Chapter 6, Section III.D)
2. Metal amides (see Chapter 6, Section III.C.7)
3. Organometallic compounds with a metal atom bonded to carbon (see Chapter 6, Section IV)
4. Metal alkoxides

**TABLE 8. Common Peroxide-Forming Chemicals****LIST A****Severe Peroxide Hazard on Storage with Exposure to Air***Discard within 3 months*

- Diisopropyl ether (isopropyl ether)
- Divinylacetylene (DVA)<sup>a</sup>
- Potassium metal
- Potassium amide
- Sodium amide (sodamide)
- Vinylidene chloride (1,1-dichloroethylene)<sup>a</sup>

**LIST B****Peroxide Hazard on Concentration; Do Not Distill or Evaporate Without First Testing for the Presence of Peroxides***Discard or test for peroxides after 6 months*

- Acetaldehyde diethyl acetal (acetal)
- Cumene (isopropylbenzene)
- Cyclohexene
- Cyclopentene
- Decalin (decahydronaphthalene)
- Diacetylene
- Dicyclopentadiene
- Diethyl ether (ether)
- Diethylene glycol dimethyl ether (diglyme)
- Dioxane
- Ethylene glycol dimethyl ether (glyme)
- Ethylene glycol ether acetates
- Ethylene glycol monoethers (cellosolves)
- Furan
- Methylacetylene
- Methylcyclopentane
- Methyl isobutyl ketone
- Tetrahydrofuran (THF)
- Tetralin (tetrahydronaphthalene)
- Vinyl ethers<sup>a</sup>

**LIST C****Hazard of Rapid Polymerization Initiated by Internally Formed Peroxides<sup>a</sup>****a. Normal Liquids; discard or test for peroxides after 6 months<sup>b</sup>**

- Chloroprene (2-chloro-1,3-butadiene)<sup>c</sup>
- Styrene
- Vinyl acetate
- Vinylpyridine

**b. Normal Gases; discard after 12 months<sup>d</sup>**

- Butadiene<sup>c</sup>
- Tetrafluoroethylene (TFE)<sup>c</sup>
- Vinylacetylene (MVA)<sup>c</sup>
- Vinyl chloride

<sup>a</sup> Polymerizable monomers should be stored with a polymerization inhibitor from which the monomer can be separated by distillation just before use.<sup>b</sup> Although common acrylic monomers such as acrylonitrile, acrylic acid, ethyl acrylate, and methyl methacrylate can form peroxides, they have not been reported to develop hazardous levels in normal use and storage.<sup>c</sup> The hazard from peroxides in these compounds is substantially greater when they are stored in the liquid phase, and if so stored without an inhibitor they should be considered as in LIST A.<sup>d</sup> Although air will not enter a gas cylinder in which gases are stored under pressure, these gases are sometimes transferred from the original cylinder to another in the laboratory, and it is difficult to be sure that there is no residual air in the receiving cylinder. An inhibitor should be put into any such secondary cylinder before one of these gases is transferred into it; the supplier can suggest inhibitors to be used. The hazard posed by these gases is much greater if there is a liquid phase in such a secondary container, and even inhibited gases that have been put into a secondary container under conditions that create a liquid phase should be discarded within 12 months.

Note: Laboratory workers should label all containers of peroxidizable solvents or reagents with one of the following:

[LIST A]

Date	Peroxidizable compound	
	Received	Opened
	Discard 3 months after opening	

[LISTS B AND C]

Date	Peroxidizable compound	
	Received	Opened
	Discard or test for peroxides 6 months after opening	

TABLE 9. Relative Toxicity of Cations

High toxic hazard	Precipitant <sup>a</sup>	Low toxic hazard	Precipitant <sup>a</sup>
Antimony	OH <sup>-</sup> , S <sup>2-</sup>	Aluminum	OH <sup>-</sup>
Arsenic	S <sup>2-</sup>	Bismuth	OH <sup>-</sup> , S <sup>2-</sup>
Barium	SO <sub>4</sub> <sup>2-</sup> , CO <sub>3</sub> <sup>2-</sup>	Calcium	SO <sub>4</sub> <sup>2-</sup> , CO <sub>3</sub> <sup>2-</sup>
Beryllium	OH <sup>-</sup>	Cerium	OH <sup>-</sup>
Cadmium	OH <sup>-</sup> , S <sup>2-</sup>	Cesium	
Chromium (III) <sup>b</sup>	OH <sup>-</sup>	Copper <sup>c</sup>	OH <sup>-</sup> , S <sup>2-</sup>
Cobalt (II) <sup>b</sup>	OH <sup>-</sup> , S <sup>2-</sup>	Gold	OH <sup>-</sup> , S <sup>2-</sup>
Gallium	OH <sup>-</sup>	Iron <sup>c</sup>	OH <sup>-</sup> , S <sup>2-</sup>
Germanium	OH <sup>-</sup> , S <sup>2-</sup>	Lanthanides	OH <sup>-</sup>
Hafnium	OH <sup>-</sup>	Lithium	
Indium	OH <sup>-</sup> , S <sup>2-</sup>	Magnesium	OH <sup>-</sup>
Iridium	OH <sup>-</sup> , S <sup>2-</sup>	Molybdenum (VI) <sup>b,d</sup>	
Lead	OH <sup>-</sup> , S <sup>2-</sup>	Niobium (V)	OH <sup>-</sup>
Manganese (II) <sup>b</sup>	OH <sup>-</sup> , S <sup>2-</sup>	Palladium	OH <sup>-</sup> , S <sup>2-</sup>
Mercury	OH <sup>-</sup> , S <sup>2-</sup>	Potassium	
Nickel	OH <sup>-</sup> , S <sup>2-</sup>	Rubidium	
Osmium (IV) <sup>b,e</sup>	OH <sup>-</sup> , S <sup>2-</sup>	Scandium	OH <sup>-</sup>
Platinum (II) <sup>b</sup>	OH <sup>-</sup> , S <sup>2-</sup>	Sodium	
Rhenium (VII) <sup>b</sup>	S <sup>2-</sup>	Strontium	SO <sub>4</sub> <sup>2-</sup> , CO <sub>3</sub> <sup>2-</sup>
Rhodium (III) <sup>b</sup>	OH <sup>-</sup> , S <sup>2-</sup>	Tantalum	OH <sup>-</sup>
Ruthenium (III) <sup>b</sup>	OH <sup>-</sup> , S <sup>2-</sup>	Tin	OH <sup>-</sup> , S <sup>2-</sup>
Selenium	S <sup>2-</sup>	Titanium	OH <sup>-</sup>
Silver	Cl <sup>-</sup> , OH <sup>-</sup> , S <sup>2-</sup>	Yttrium	OH <sup>-</sup>
Tellurium	S <sup>2-</sup>	Zinc <sup>c</sup>	OH <sup>-</sup> , S <sup>2-</sup>
Thallium	OH <sup>-</sup> , S <sup>2-</sup>	Zirconium	OH <sup>-</sup>
Tungsten (VI) <sup>b,d</sup>			
Vanadium	OH <sup>-</sup> , S <sup>2-</sup>		

<sup>a</sup> Precipitants are listed in order of preference:  
 OH<sup>-</sup> = base (sodium hydroxide or sodium carbonate)  
 S<sup>2-</sup> = sulfide  
 Cl<sup>-</sup> = chloride  
 SO<sub>4</sub><sup>2-</sup> = sulfate  
 CO<sub>3</sub><sup>2-</sup> = carbonate

<sup>b</sup> The precipitant is for the indicated valence state.

<sup>c</sup> Maximum tolerance levels have been set for these low-toxicity ions by the U.S. Public Health Service, and large amounts should not be put into public sewer systems. The small amounts typically used in laboratories will not normally affect water supplies.

<sup>d</sup> These ions are best precipitated as calcium molybdate or calcium tungstate.

<sup>e</sup> CAUTION: OsO<sub>4</sub>, a volatile, extremely poisonous substance, is formed from almost any osmium compound under acid conditions in the presence of air.

TABLE 10. Relative Hazard of Anions

High-hazard anions			Low-hazard anions
Ion	Hazard type <sup>a</sup>	Precipitant	
Aluminum hydride, $\text{AlH}_4^-$	F	—	Bisulfite, $\text{HSO}_3^-$
Amide, $\text{NH}_2^-$	F,E <sup>b</sup>	—	Borate, $\text{BO}_3^{3-}$ , $\text{B}_4\text{O}_7^{2-}$
Arsenate, $\text{AsO}_3^-$ , $\text{AsO}_4^{3-}$	T	$\text{Cu}^{2+}$ , $\text{Fe}^{2+}$	Bromide, $\text{Br}^-$

## FIRE HAZARDS

Flammable solvents are a common source of laboratory fires. The relative ease with which some common laboratory solvents can be ignited is indicated by the following properties.

**Flash Point** — The lowest temperature, as determined by standard tests, at which a liquid emits vapor in sufficient concentration to form an ignitable mixture with air near the surface of the liquid in a test vessel. Note that many of these common chemicals have flash points below room temperature.

**Ignition Temperature** — The minimum temperature required to initiate self-sustained combustion, regardless of the heat source.

**Flammable Limits** — The lower flammable limit is the minimum concentration (percent by volume) of a vapor in air below which a

flame is not propagated when an ignition source is present. Below this concentration the mixture is too lean to burn. The upper flammable limit is the maximum concentration (percent by volume) of the vapor in air above which a flame is not propagated. Above this concentration the mixture is too rich to burn. The flammable range comprises all concentrations between these two limits. This range becomes wider with increasing temperature and in oxygen-rich atmospheres. Table 13 lists these properties for a few common laboratory chemicals.

## GLOVE MATERIALS

It is good safety practice (and mandated in some laboratories) to wear rubber gloves while handling chemicals that can cause injury when in contact with, or absorbed through, the skin. The various

common rubbers are not equally resistant to all chemicals. Table 14 provides guidelines for selecting the best, and avoiding the poorest, glove material for handling a given chemical.

## RESPIRATORS

In the event of a laboratory accident or spill, it will be necessary for someone to enter the contaminated area for cleanup. If significant quantities of a chemical are spilled, or even minor quantities of a known toxic material, it is essential to wear the correct kind of respirator equipment when entering the area. If it is not known

whether the contamination is of a chemical “immediately dangerous to life or health”, the prudent course is to assume that it is, and to use the corresponding type of respirator. Guidelines are presented in Table 15.

TABLE 13. Flash Points, Boiling Points, Ignition Temperatures, and Flammable Limits of Some Common Laboratory Chemicals

Chemical	Flash point (°C)	Boiling point (°C)	Ignition temp. (°C)	Flammable limit (percent by volume in air)	
				Lower	Upper
Acetaldehyde	-37.8	21.1	175.0	4.0	60.0

Triethanolamine	F	E	E	E
Trinitrotoluene	P	E	—	P

<sup>a</sup> Aromatic and halogenated hydrocarbons will attack all types of natural and synthetic glove materials. Should swelling occur, the user should change to fresh gloves and allow the swollen gloves to dry and return to normal.

<sup>b</sup> No data on the resistance to dimethyl sulfoxide of natural rubber, neoprene, nitrile rubber, or vinyl materials are available; the manufacturer of the substance recommends the use of butyl rubber gloves.

**TABLE 15. Guide for Selection of Respirators**

Type of hazard	Type of respirator
Oxygen deficiency	Self-contained breathing apparatus Hose mask with blower Combination of air-line respirator and auxiliary self-contained air supply or air-storage receiver with alarm
Gas and vapor contaminants	Self-contained breathing apparatus
Immediately dangerous to life or health	Hose mask with blower Air-purifying full-facepiece respirator with chemical canister (gas mask) Self-rescue mouthpiece respirator (for escape only) Combination of air-line respirator and auxiliary self-contained air supply or air-storage receiver with alarm
Not immediately dangerous to life or health	Air-line respirator Hose mask with blower Air-purifying half-mask or mouthpiece respirator with chemical cartridge
Particulate Contaminants	Self-contained breathing apparatus
Immediately dangerous to life or health	Hose mask with blower Air-purifying full-facepiece respirator with appropriate filter Self-rescue mouthpiece respirator (for escape only) Combination of air-line respirator and auxiliary self-contained air supply or air-storage receiver with alarm
Not immediately dangerous to life or health	Air-purifying half-mask or mouthpiece respirator with filter pad or cartridge Air-line respirator Air-line abrasive-blasting respirator Hose mask with blower
Combination of gas, vapor, and particulate contaminants	Self-contained breathing apparatus
Immediately dangerous to life or health	Hose mask with blower Air-purifying full-facepiece respirator with chemical canister and appropriate filter (gas mask with filter) Self-rescue mouthpiece respirator (for escape only) Combination of air-line respirator and auxiliary self-contained air supply or air-storage receiver with alarm
Not immediately dangerous to life or health	Air-line respirator Hose mask without blower Air-purifying half-mask or mouthpiece respirator with chemical cartridge and appropriate filter

Source: ANSI Standard Z88.2 (1969).

## FLAMMABILITY OF CHEMICAL SUBSTANCES

This table gives properties related to the flammability of about 900 chemical substances. The properties listed are:

- $t_B$ : Normal boiling point in °C (at 101.325 kPa pressure).
- FP: Flash point, which is the minimum temperature at which the vapor pressure of a liquid is sufficient to form an ignitable mixture with air near the surface of the liquid. Flash point is not an intrinsic physical property but depends on the conditions of measurement (see Reference 1).
- Fl. Limits: Flammable limits (often called explosive limits), which specify the range of concentration of the vapor in air (in percent by volume) for which a flame can propagate. Below the lower flammable limit, the gas mixture is too lean to burn; above the upper flammable limit, the mixture is too rich. Values refer to ambient temperature and pressure and are dependent on the precise test conditions. A ? indicates that one of the limits is not known.
- IT: Ignition temperature (sometimes called autoignition temperature), which is the minimum temperature required for self-sustained combustion in the absence of an external ignition source. As in the case of flash point, the value depends on specified test conditions.

Even in cases where very careful measurements of flash point have been replicated in several laboratories, observed values can differ by 3 to 6°C (Reference 4). For more typical measurements, larger uncertainties should be assumed in both flash points and autoignition temperatures. The absence of a flash point entry in this table does not mean that the substance is nonflammable, but only that no reliable value is available.

Compounds are listed by molecular formula following the Hill convention. Substances not containing carbon are listed first, followed by those that contain carbon. To locate an organic compound by name or CAS Registry Number when the molecular formula is not known, use the table "Physical Constants of Organic Compounds" in Section 3 and its indexes to determine the molecular formula.

## THRESHOLD LIMITS FOR AIRBORNE CONTAMINANTS

Several organizations recommend limits of exposure to airborne contaminants in the workplace. These include the Occupational Safety and Health Administration (OSHA), the National Institute for Occupational Safety and Health (NIOSH), and the non-governmental organization, American Conference of Governmental Industrial Hygienists (ACGIH). The threshold limit value (TLV) for a substance is defined as the concentration level under which the majority of workers may be repeatedly exposed, day after day, without adverse effects. The TLV recommendations are given in two forms:

- Time-weighted average (TWA) concentration for a normal 8-hr workday and 40-hr workweek.
- Short-term exposure limit (STEL), which should not be exceeded for more than 15 min.

Both kinds of limits are specified for some substances.

The following table gives threshold limit values for a number of substances that may be encountered in the atmosphere of a chemical laboratory or industrial facility. All values refer to the concentration in air at 25 °C and normal atmospheric pressure. Data for gases are given in parts per million by volume (ppm). Values for liquids refer to mists or aerosols, and those for solids to dusts or fumes; both are stated in mass concentration (mg/m<sup>3</sup>). A “C” preceding a value indicates a ceiling limit, which should not be exceeded even for very brief periods because of acute toxic effects of

the substance. The notation “levels as low as possible” in the Notes column indicates such a high level of hazard that no safe limit can be recommended.

Substances are listed alphabetically by systematic name. The Notes column gives further information on the form of the substance and the basis to which the TLV is referred. This column also includes common synonyms and acronyms in brackets (e.g., [MTBE]). The Formula column gives the molecular formula in the Hill convention for organic compounds and the customary line formula for inorganic compounds. The TWA and STEL limits appear in the last two columns.

Proposed changes in the limits are given in the Notes column with the notation “NIC”, which stands for Notice of Intended Changes. These are considered trial values in 2008, which may be adopted permanently in subsequent years.

## OCTANOL-WATER PARTITION COEFFICIENTS

The octanol-water partition coefficient,  $P$ , is a widely used parameter for correlating biological effects of organic substances. It is a property of the two-phase system in which water and 1-octanol are in equilibrium at a fixed temperature and the substance is distributed between the water-rich and octanol-rich phases.  $P$  is defined as the ratio of the equilibrium concentration of the substance in the octanol-rich phase to that in the water-rich phase, in the limit of zero concentration. In general,  $P$  tends to be large for compounds with extended non-polar structures (such as long chain or multi-ring hydrocarbons) and small for compounds with highly polar groups. Thus  $P$  (or, in its more common form of expression,  $\log P$ ) provides a measure of the lipophilic vs. hydrophilic nature of a compound, which is an important consideration in assessing the potential toxicity. A discussion of methods of measurement and accuracy considerations for  $\log P$  may be found in Reference 1.

This table gives selected values of  $\log P$  for about 450 organic compounds, including many of environmental importance. All values refer to a nominal temperature of 25°C. The source of each value is indicated in the last column. These references contain data on many more compounds than are included here.

Compounds are listed by molecular formula following the Hill convention. To locate a compound by name or CAS Registry Number when the molecular formula is not known, use the table "Physical Constants of Organic Compounds" in Section 3 and its indexes to determine the molecular formula.

# PROTECTION AGAINST IONIZING RADIATION

The following data and rules of thumb are helpful in estimating the penetrating capability of and danger of exposure to various types of ionizing radiation. More precise data should be used for critical applications.

## Alpha Particles

Alpha particles of at least 7.5 MeV are required to penetrate the epidermis, the protective layer of skin, 0.07 mm thick.

## Electrons

Electrons of at least 70 keV are required to penetrate the epidermis, the protective layer of skin, 0.07 mm thick.

The range of electrons in  $\text{g/cm}^2$  is approximately equal to the maximum energy ( $E$ ) in MeV divided by 2.

The range of electrons in air is about 3.65 m per MeV; for example, a 3 MeV electron has a range of about 11 m in air.

A chamber wall thickness of  $30 \text{ mg/cm}^2$  will transmit 70% of the initial fluence of 1 MeV electrons and 20% of that of 0.4 MeV electrons.

When electrons of 1 to 2 MeV pass through light materials such as water, aluminum, or glass, less than 1% of their energy is dissipated as bremsstrahlung.

The bremsstrahlung from 1 Ci of  $^{32}\text{P}$  aqueous solution in a glass bottle is about 1 mR/h at 1 meter distance.

When electrons from a 1 Ci source of  $^{90}\text{Sr} - ^{90}\text{Y}$  are absorbed, the bremsstrahlung hazard is approximately equal to that presented by the gamma radiation from 12 mg of radium. The average energy of the bremsstrahlung is about 300 keV.

## Gamma Rays

The air-scattered radiation (sky-shine) from a 100 Ci  $^{60}\text{Co}$  source placed 1 ft behind a 4 ft high shield is about 100 mrad/h at 6 ft from the outside of the shield.

Within  $\pm 20\%$  for point source gamma emitters with energies between 0.07 and 4 MeV, the exposure rate (R/h) at 1 ft is  $6C \cdot E \cdot n$  where  $C$  is the activity in curies,  $E$  is the energy in MeV, and  $n$  is the number of gammas per disintegration.

## Neutrons

An approximate HVL (thickness of absorber for which the neutron flux falls to half its initial value) for 1 MeV neutrons is 3.2 cm of paraffin; that for 5 MeV neutrons is 6.9 cm of paraffin.

## Miscellaneous

The activity of any radionuclide is reduced to less than 1% after 7 half-lives (i.e.,  $2^{-7} = 0.8\%$ ).

For nuclides with a half-life greater than 6 days, the change in activity in 24 hours will be less than 10%.

10 HVL (half-value layers) attenuates approximately by  $10^{-3}$ .

There is  $0.64 \text{ mm}^3$  of radon gas at STP in transient equilibrium with 1 Ci of radium.

The natural background from all sources in most parts of the world leads to an equivalent dose rate of about 0.04 to 4 mSv per year for the average person. About 84% of this comes from terrestrial sources, the remainder from cosmic rays. The U. S. average is about 3.6 mSv/yr but can range up to 50 mSv/yr in some areas. A passenger in a plane flying at 12,000 meters receives  $5 \mu\text{Sv/hr}$  from cosmic rays (as compared to about  $0.03 \mu\text{Sv/hr}$  at sea level).

The ICRP recommended exposure limit to man-made sources of ionizing radiation (Reference 2) is 20 mSv/yr averaged over 5 years, with the dose in any one year not to exceed 50 mSv.

A whole-body dose of about 3 Gy over a short time interval will typically lead to 50% mortality in 30 days assuming no medical treatment.

## Units

The gray (Gy) is the SI unit of absorbed dose; it is a measure of the mean energy imparted to a sample of irradiated matter, divided by the mass of the sample. Gy is a special name for the SI unit J/kg.

The sievert (Sv) is the SI unit of equivalent dose, which is defined as the absorbed dose multiplied by a weighting factor that expresses the long-term biological risk from low-level chronic exposure to a specified type of radiation. The Sv is another special name for J/kg.

1 curie (Ci) =  $3.7 \cdot 10^{10}$  becquerel (Bq); i.e.,  $3.7 \cdot 10^{10}$  disintegrations per second.

1 roentgen (R) =  $2.58 \cdot 10^{-4}$  coulomb per kilogram (C/kg); a measure of the charge (positive or negative) liberated by x-ray or gamma radiation in air, divided by the mass of air.

1 rad = 0.01 Gy

1 rem = 0.01 Sv

# ANNUAL LIMITS ON INTAKES OF RADIONUCLIDES

K. F. Eckerman

The following table lists, for workers, the annual limits on oral and inhalation intakes (ALI) for selected radionuclides based on the occupational radiation protection guidance of the International Commission on Radiological Protection (References 1 and 2). An intake of one ALI corresponds to an annual whole body dose of 0.02 Sv (2 rem).

The ALI is expressed in the SI unit of activity, the becquerel (Bq), and in the conventional unit, the microcurie ( $\mu\text{Ci}$ );  $1 \mu\text{Ci} = 3.7 \cdot 10^4 \text{ Bq}$ . The chemical form of inhaled radionuclides is, in most instances, stated in terms of the rate of absorption to blood from the lungs and the fractional absorption from the small intestine. Type F, M, and S denote chemical forms which are absorbed from the lungs at rates characterized as fast, moderate, and slow, respectively. The time to absorb 90% of the deposited radionuclide, in the absence of radioactive decay, corresponds to about 10 minutes, 150 days, and 7000 days for Type F, M, and S compounds, respec-

tively. Type F compounds can be considered to be more soluble than M or S, S being the most insoluble. Chemical form consideration for ingestion is specified by the fractional absorption from the small intestine, denoted as  $f_1$ . The  $f_1$  values range from  $10^{-5}$  to 1. Higher fractional absorption is associated with greater solubility of the compound.

## CHEMICAL CARCINOGENS

The following substances are listed in the 11th Report on Carcinogens 2004 released by the National Institute of Environmental Health Sciences (NIEHS) under the National Toxicology Program (NTP). Substances are grouped in two classes:

- **Known to be human carcinogens:** There is sufficient evidence of carcinogenicity from studies in humans which indicates a causal relationship between exposure to the substance and human cancer.
- **Reasonably anticipated to be human carcinogens:** There is limited evidence of carcinogenicity from studies in humans which indicates that causal interpretation is credible, but that alternative explanations, such as chance, bias, or confounding factors, could not be adequately excluded; or there is sufficient evidence of carcinogenicity from studies in experimental animals.

The NTP report also lists many poorly defined materials such as soots, tars, mineral oils, coke oven emissions, etc. These materials are not included here.

The table lists the name normally used in the *Handbook of Chemistry and Physics*, followed by additional names and acronyms by which the substance is known. In many cases the primary name given here is different from that used in the NTP report; however, names used in the NTP report appear in the Other Names column. The Chemical Abstracts Service Registry Number (CAS RN), given in the last column, is taken from the NTP report. Extensive details on each substance are given in the reference.

### Reference

Public Health Service, National Toxicology Program, 11th Report on Carcinogens, available on the Internet at <<http://ntp.niehs.nih.gov/>>.

Substance	Other Names	CAS RN
<i>Known to be Human Carcinogens</i>		
Aflatoxins		1402-68-2
4-Aminobiphenyl	<i>p</i> -Biphenylamine	92-67-1
Arsenic compounds, inorganic		
Asbestos		1332-21-4
Azathioprine	6-[(1-Methyl-4-nitro-1 <i>H</i> -imidazol-5-yl)thio]-1 <i>H</i> -purine	446-86-6
Benzene		71-43-2
<i>p</i> -Benzidine (includes dyes metabolized to benzidene)	[1,1'-Biphenyl]-4,4'-diamine	92-87-5
Beryllium and beryllium compounds		7440-41-7
Bis(2-chloroethyl) sulfide	Mustard gas	505-60-2
Bis(chloromethyl) ether		542-88-1
1,3-Butadiene		106-99-0
1,4-Butanediol dimethylsulfonate	Myleran; Busulfan	55-98-1
Cadmium and cadmium compounds		7440-43-9
Chlorambucil		305-03-3
Chloroethene	Vinyl chloride; Chloroethylene	75-01-4
1-(2-Chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea	MeCCNU	13909-09-6
Chloromethyl methyl ether		107-30-2
Chromium hexavalent compounds		
Cyclophosphamide	Cyclophosphane; 2 <i>H</i> -1,3,2-Oxazaphosphorin-2-amine, <i>N,N</i> -bis(2-chloroethyl)tetrahydro-, 2-oxide	50-18-0
Cyclosporin A	Cyclosporine	59865-13-3
Diethylstilbestrol		56-53-1
Erionite		66733-21-9
Estrogens, steroidal		
<i>N</i> -(4-Ethoxyphenyl)acetamide	Phenacetin	62-44-2
Melphalan	<i>L</i> -Phenylalanine, 4-[bis(2-chloroethyl)amino]-	148-82-3
Methoxsalen (with UV therapy)	PUVA; 9-Methoxy-7 <i>H</i> -furo[3,2- <i>g</i> ][1]benzopyran-7-one	298-81-7
2-Naphthylamine	2-Aminonaphthalene; $\beta$ -Naphthylamine	91-59-8
Nickel compounds		
Oxirane	Ethylene oxide	75-21-8

Substance	Other Names	CAS RN
Radon		10043-92-2
Silicon dioxide (respirable size)	Quartz; Silica	14808-60-7
Silicon dioxide (respirable size)	Cristobalite; Silica	14464-46-1
Silicon dioxide (respirable size)	Tridymite; Silica	15468-32-3
Sulfuric acid (strong acid mists)	Oil of vitriol	7664-93-9
Tamoxifen		10540-29-1
2,3,7,8-Tetrachlorodibenzo- <i>p</i> -dioxin	TCDD; Dioxin	1746-01-6
Thorium(IV) oxide	Thorium dioxide	1314-20-1
Triethylenethiophosphoramidate	Thiotepa; Tris(1-aziridinyl)phosphine, sulfide	52-24-4
<b>Reasonably Anticipated to be Human Carcinogens</b>		
Acetaldehyde	Ethanal	75-07-0
2-(Acetylamino)fluorene		53-96-3
Acrylamide	2-Propenamamide	79-06-1
Acrylonitrile	Propenenitrile	107-13-1
4-Allyl-1,2-dimethoxybenzene	Methyleugenol; 1,2-Dimethoxy-4-allylbenzene	93-15-2
2-Amino-9,10-anthracenedione	2-Aminoanthraquinone	117-79-3
1-Amino-2,4-dibromo-9,10-anthracenedione	1-Amino-2,4-dibromoanthraquinone	81-49-2
2-Amino-3,4-dimethylimidazo[4,5-f]quinoline	MeIQ	77094-11-2
2-Amino-3,8-dimethylimidazo[4,5-f]quinoxaline	MeIQx	77500-04-0
1-Amino-2-methyl-9,10-anthracenedione	1-Amino-2-methylantraquinone	82-28-0
2-Amino-3-methyl-3 <i>H</i> -imidazo[4,5-f]quinoline	IQ	76180-96-6
2-Amino-1-methyl-6-phenylimidazo[4,5-b]pyridine	PhIP	105650-23-5
Azacitidine	5-Azacitidine; 4-Amino-1- $\beta$ - <i>D</i> -ribofuranosyl-1,3,5-triazine-2(1 <i>H</i> )-one	320-67-2
Benz[a]anthracene		56-55-3
Benzo[b]fluoranthene	Benzo[e]acephenanthrylene	205-99-2
Benzo[j]fluoranthene		205-82-3
Benzo[k]fluoranthene	2,3,1',8'-Binaphthylene	207-08-9
Benzo[a]pyrene		50-32-8
2,2'-Bioxirane	Diepoxybutane	1464-53-5
Bis(4-amino-3-chlorophenyl)methane	4,4-Methylene-bis(2-chloraniline); MBOCA	101-14-4
2,2-Bis(bromomethyl)-1,3-propanediol	BBMP; Pentaerythritol dibromide	3296-90-0
Bis(2-chloroethyl)methylamine	Nitrogen mustard hydrochloride	55-86-7
<i>N,N'</i> -Bis(2-chloroethyl)- <i>N</i> -nitrosourea	BCNU; Carmustine	154-93-8
Bis[4-(dimethylamino)phenyl]methane	Michler's Base; 4,4-Methylenebis( <i>N,N</i> -dimethylbenzenamine)	101-61-1
1,3-Bis(2,3-epoxypropoxy)benzene	Diglycidyl resorcinol ether	101-90-6
Bis(2-ethylhexyl) phthalate	DEHP; Di(2-ethylhexyl) phthalate	117-81-7
Bromodichloromethane		75-27-4
Bromoethene	Vinyl bromide	593-60-2
<i>tert</i> -Butyl-4-hydroxyanisole	BHA; Butylated hydroxyanisole	25013-16-5
Chloramphenicol		56-75-7
Chlorendic acid	1,4,5,6,7,7-Hexachloro-5-norbornene-2,3-dicarboxylic acid	115-28-6
Chlorinated paraffins (C <sub>12</sub> , 60% Cl)		108171-26-2
4-Chloro-1,2-benzenediamine	4-Chloro- <i>o</i> -phenylenediamine	95-83-0
2-Chloro-1,3-butadiene	Chloroprene	126-99-8
1-(2-Chloroethyl)-3-cyclohexyl-1-nitrosourea	CCNU; Lomustine; Belustine	13010-47-4
4-Chloro-2-methylaniline	<i>p</i> -Chloro- <i>o</i> -toluidine	95-69-2
4-Chloro-2-methylaniline hydrochloride	<i>p</i> -Chloro- <i>o</i> -toluidine hydrochloride	3165-93-3

Substance	Other Names	CAS RN
1-Chloro-2-methylpropene	Dimethylvinyl chloride	513-37-1
3-Chloro-2-methylpropene		563-47-3
Chlorozotocin	2-[[[(2-Chloroethyl)nitrosoamino]carbonyl]amino]-2-deoxy- <i>D</i> -glucose	54749-90-5
Fuchsin	C.I. Basic Red 9, monohydrochloride	569-61-9
Cobalt(II) sulfate	Cobaltous sulfate	10124-43-3
Cupferron		135-20-6
Dacarbazine	5-(3,3-Dimethyl-1-triazenyl)-1 <i>H</i> -imidazole-4-carboxamide	4342-03-4
Decabromobiphenyl		13654-09-6
cis-Diaminedichloroplatinum	Cisplatin	15663-27-1
2,4-Diaminoanisole sulfate	1,3-Benzenediamine, 4-methoxy, sulfate	39156-41-7
4,4'-Diaminodiphenyl ether	4,4'-Oxydianiline	101-80-4
4,4'-Diaminodiphenylmethane	4,4'-Methylenedianiline	101-77-9
4,4'-Diaminodiphenylmethane dihydrochloride	4,4'-Methylenedianiline dihydrochloride	13552-44-8
4,4'-Diaminodiphenyl sulfide	4,4'-Thiodianiline	139-65-1
Dibenz[a,h]acridine		226-36-8
Dibenz[a,j]acridine	7-Azadibenz[a,j]anthracene	224-42-0
Dibenz[a,h]anthracene	1,2:5,6-Dibenzanthracene	53-70-3
7 <i>H</i> -Dibenzo[c,g]carbazole		194-59-2
Dibenzo[a,e]pyrene	Naphtho[1,2,3,4-def]chrysene	192-65-4
Dibenzo[a,h]pyrene	Dibenzo[b,def]chrysene	189-64-0
Dibenzo[a,i]pyrene	Benzo[ <i>rst</i> ]pentaphene	189-55-9
Dibenzo[a,l]pyrene	Dibenzo[def,p]chrysene	191-30-0
1,2-Dibromo-3-chloropropane		96-12-8
1,2-Dibromoethane	Ethylene dibromide; EDB	106-93-4
2,3-Dibromo-1-propanol	DBP	96-13-9
2,3-Dibromo-1-propanol, phosphate (3:1)	Tris(2,3-dibromopropyl) phosphate	126-72-7
<i>p</i> -Dichlorobenzene	1,4-Dichlorobenzene	106-46-7
3,3'-Dichloro- <i>p</i> -benzidine	3,3'-Dichloro[1,1'-biphenyl]-4,4'-diamine	91-94-1
3,3'-Dichloro- <i>p</i> -benzidine dihydrochloride	3,3'-Dichloro-[1,1'-biphenyl]-4,4'-diamine dihydrochloride	612-83-9
1,2-Dichloroethane	Ethylene dichloride	107-06-2
Dichloromethane	Methylene chloride	75-09-2
1,3-Dichloropropene (unspecified isomer)		542-75-6
Diethyl sulfate		64-67-5
2,3-Dihydro-6-propyl-2-thioxo-4(1 <i>H</i> )-pyrimidinone	Propylthiouracil	51-52-5
1,8-Dihydroxy-9,10-anthracenedione	Danthron; 1,8-Dihydroxyanthraquinone	117-10-2
3,3'-Dimethoxybenzidine (and dyes metabolized to 3,3'-Dimethoxybenzidine)	Dianisidine	119-90-4
<i>p</i> -(Dimethylamino)azobenzene		60-11-7
2,3-Dimethyl-4-aminoazobenzene	<i>o</i> -Aminoazotoluene; 4- <i>o</i> -Tolylazo- <i>o</i> -toluidine	97-56-3
Dimethylcarbamic chloride	Dimethylcarbamoyl chloride	79-44-7
1,1-Dimethylhydrazine	UDMH	57-14-7
Dimethyl sulfate		77-78-1
1,6-Dinitropyrene		42397-64-8
1,8-Dinitropyrene		42397-65-9
1,4-Dioxane		123-91-1
1,2-Diphenylhydrazine	Hydrazobenzene	122-66-7
1,3-Diphenyl-1-triazene	Diazoaminobenzene	136-35-6

Substance	Other Names	CAS RN
Disperse Blue No. 1	1,4,5,8-Tetraamino-9,10-anthracenedione	2475-45-8
Doxorubicin hydrochloride	Adriamycin	23214-92-8
Epichlorohydrin	(Chloromethyl)oxirane	106-89-8
1,2-Epoxy-4-(epoxyethyl)cyclohexane	4-Vinyl-1-cyclohexene dioxide	106-87-6
Ethyl carbamate	Urethane	51-79-6
Ethyl methanesulfonate		62-50-0

## QUADRATIC FORMULA

The solutions of the equation  $ax^2 + bx + c = 0$ , where  $a \neq 0$ , are given by:

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

## RELATION OF ANGULAR FUNCTIONS IN TERMS OF ONE ANOTHER

### Trigonometric Functions

Function	$\sin \alpha$	$\cos \alpha$	$\tan \alpha$	$\cot \alpha$	$\sec \alpha$	$\csc \alpha$
$\sin \alpha$	$\sin \alpha$	$\pm\sqrt{1-\cos^2 \alpha}$	$\frac{\tan \alpha}{\pm\sqrt{1+\tan^2 \alpha}}$	$\frac{1}{\pm\sqrt{1+\cot^2 \alpha}}$	$\frac{\pm\sqrt{\sec^2 \alpha - 1}}{\sec \alpha}$	$\frac{1}{\csc \alpha}$
$\cos \alpha$	$\pm\sqrt{1-\sin^2 \alpha}$	$\cos \alpha$	$\frac{1}{\pm\sqrt{1+\tan^2 \alpha}}$	$\frac{\cot \alpha}{\pm\sqrt{1+\cot^2 \alpha}}$	$\frac{1}{\sec \alpha}$	$\frac{\pm\sqrt{\csc^2 \alpha - 1}}{\csc \alpha}$
$\tan \alpha$	$\frac{\sin \alpha}{\pm\sqrt{1-\sin^2 \alpha}}$	$\frac{\pm\sqrt{1-\cos^2 \alpha}}{\cos \alpha}$	$\tan \alpha$	$\frac{1}{\cot \alpha}$	$\pm\sqrt{\sec^2 \alpha - 1}$	$\frac{1}{\pm\sqrt{\csc^2 \alpha - 1}}$
$\cot \alpha$	$\frac{\pm\sqrt{1-\sin^2 \alpha}}{\sin \alpha}$	$\frac{\cos \alpha}{\pm\sqrt{1-\cos^2 \alpha}}$	$\frac{1}{\tan \alpha}$	$\cot \alpha$	$\frac{1}{\pm\sqrt{\sec^2 \alpha - 1}}$	$\pm\sqrt{\csc^2 \alpha - 1}$
$\sec \alpha$	$\frac{1}{\pm\sqrt{1-\sin^2 \alpha}}$	$\frac{1}{\cos \alpha}$	$\pm\sqrt{1+\tan^2 \alpha}$	$\frac{\pm\sqrt{1+\cot^2 \alpha}}{\cot \alpha}$	$\sec \alpha$	$\frac{\csc \alpha}{\pm\sqrt{\csc^2 \alpha - 1}}$
$\csc \alpha$	$\frac{1}{\sin \alpha}$	$\frac{1}{\pm\sqrt{1-\cos^2 \alpha}}$	$\frac{\pm\sqrt{1+\tan^2 \alpha}}{\tan \alpha}$	$\pm\sqrt{1+\cot^2 \alpha}$	$\frac{\sec \alpha}{\pm\sqrt{\sec^2 \alpha - 1}}$	$\csc \alpha$

*Note:* The choice of sign depends upon the quadrant in which the angle terminates.

### Hyperbolic Functions

Function	$\sinh x$	$\cosh x$	$\tanh x$
$\sinh x =$	$\sinh x$	$\pm\sqrt{\cosh^2 x - 1}$	$\frac{\tanh x}{\sqrt{1-\tanh^2 x}}$
$\cosh x =$	$\sqrt{1+\sinh^2 x}$	$\cosh x$	$\frac{1}{\sqrt{1-\tanh^2 x}}$
$\tanh x =$	$\frac{\sinh x}{\sqrt{1+\sinh^2 x}}$	$\pm\frac{\sqrt{\cosh^2 x - 1}}{\cosh x}$	$\tanh x$
$\operatorname{cosech} x =$	$\frac{1}{\sinh x}$	$\pm\frac{1}{\sqrt{\cosh^2 x - 1}}$	$\frac{\sqrt{1-\tanh^2 x}}{\tanh x}$
$\operatorname{sech} x =$	$\frac{1}{\sqrt{1+\sinh^2 x}}$	$\frac{1}{\cosh x}$	$\sqrt{1-\tanh^2 x}$
$\operatorname{coth} x =$	$\frac{\sqrt{1+\sinh^2 x}}{\sinh x}$	$\frac{\pm\cosh x}{\sqrt{\cosh^2 x - 1}}$	$\frac{1}{\tanh x}$

Function	$\operatorname{cosech} x$	$\operatorname{sech} x$	$\operatorname{coth} x$
$\sinh x =$	$\frac{1}{\operatorname{cosech} x}$	$\pm\frac{\sqrt{1-\operatorname{sech}^2 x}}{\operatorname{sech} x}$	$\frac{\pm 1}{\sqrt{\operatorname{coth}^2 x - 1}}$
$\cosh x =$	$\pm\frac{\sqrt{\operatorname{cosech}^2 x + 1}}{\operatorname{cosech} x}$	$\frac{1}{\operatorname{sech} x}$	$\pm\frac{\operatorname{coth} x}{\sqrt{\operatorname{coth}^2 x - 1}}$
$\tanh x =$	$\frac{1}{\sqrt{\operatorname{cosech}^2 x + 1}}$	$\pm\sqrt{1+\operatorname{sech}^2 x}$	$\frac{1}{\operatorname{coth} x}$
$\operatorname{cosech} x =$	$\operatorname{cosech} x$	$\pm\frac{\operatorname{sech} x}{\sqrt{1-\operatorname{sech}^2 x}}$	$\pm\frac{\sqrt{\operatorname{coth}^2 x - 1}}{1}$
$\operatorname{sech} x =$	$\pm\frac{\operatorname{cosech} x}{\sqrt{\operatorname{cosech}^2 x + 1}}$	$\operatorname{sech} x$	$\pm\frac{\sqrt{\operatorname{coth}^2 x - 1}}{\operatorname{coth} x}$
$\operatorname{coth} x =$	$\sqrt{\operatorname{cosech}^2 x + 1}$	$\pm\frac{1}{\sqrt{1-\operatorname{sech}^2 x}}$	$\operatorname{coth} x$

Whenever two signs are shown, choose + sign if  $x$  is positive, - sign if  $x$  is negative.

## DERIVATIVES

In the following formulas  $u, v, w$  represent functions of  $x$ , while  $a, c, n$  represent fixed real numbers. All arguments in the trigonometric functions are measured in radians, and all inverse trigonometric and hyperbolic functions represent principal values. \*Let  $y = f(x)$  and  $\frac{dy}{dx} = \frac{d[f(x)]}{dx} = f'(x)$  define, respectively, a function and its derivative for any value  $x$  in their common domain. The differential for the function at such a value  $x$  is accordingly defined as

$$dy = d[f(x)] = \frac{dy}{dx} dx = \frac{d[f(x)]}{dx} dx = f'(x) dx$$

Each derivative formula has an associated differential formula. For example, formula 6 below has the differential formula

$$d(uvw) = uv dw + vw du + uw dv$$

$$1. \quad \frac{d}{dx}(a) = 0$$

$$2. \quad \frac{d}{dx}(x) = 1$$

$$3. \quad \frac{d}{dx}(au) = a \frac{du}{dx}$$

$$4. \quad \frac{d}{dx}(u + v - w) = \frac{du}{dx} + \frac{dv}{dx} - \frac{dw}{dx}$$

$$5. \quad \frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$$

$$6. \quad \frac{d}{dx}(uvw) = uv \frac{dw}{dx} + vw \frac{du}{dx} + uw \frac{dv}{dx}$$

$$7. \quad \frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} = \frac{1}{v} \frac{du}{dx} - \frac{u}{v^2} \frac{dv}{dx}$$

$$8. \quad \frac{d}{dx}(u^n) = nu^{n-1} \frac{du}{dx}$$

$$9. \quad \frac{d}{dx}(\sqrt{u}) = \frac{1}{2\sqrt{u}} \frac{du}{dx}$$

$$10. \quad \frac{d}{dx}\left(\frac{1}{u}\right) = -\frac{1}{u^2} \frac{du}{dx}$$

$$11. \quad \frac{d}{dx}\left(\frac{1}{u^n}\right) = -\frac{n}{u^{n+1}} \frac{du}{dx}$$

$$12. \quad \frac{d}{dx}\left(\frac{u^n}{v^m}\right) = \frac{u^{n-1}}{v^{m+1}} \left( n v \frac{du}{dx} - m u \frac{dv}{dx} \right)$$

$$13. \quad \frac{d}{dx}(u^n v^m) = u^{n-1} v^{m-1} \left( n v \frac{du}{dx} + m u \frac{dv}{dx} \right)$$

$$14. \quad \frac{d}{dx}[f(u)] = \frac{d}{du}[f(u)] \cdot \frac{du}{dx}$$

$$15. \quad \frac{d^2}{dx^2}[f(u)] = \frac{df(u)}{du} \cdot \frac{d^2 u}{dx^2} + \frac{d^2 f(u)}{du^2} \cdot \left(\frac{du}{dx}\right)^2$$

$$16. \quad \frac{d^n}{dx^n}[uv] = \binom{n}{0} v \frac{d^n u}{dx^n} + \binom{n}{1} \frac{dv}{dx} \frac{d^{n-1} u}{dx^{n-1}} + \binom{n}{2} \frac{d^2 v}{dx^2} \frac{d^{n-2} u}{dx^{n-2}} \\ + \dots + \binom{n}{k} \frac{d^k v}{dx^k} \frac{d^{n-k} u}{dx^{n-k}} + \dots + \binom{n}{n} u \frac{d^n v}{dx^n}$$

where  $\binom{n}{r} = \frac{n!}{r!(n-r)!}$  is the binomial coefficient,  $n$  non-negative integer, and  $\binom{n}{0} = 1$ .

$$17. \quad \frac{du}{dx} = \frac{1}{\frac{dx}{du}} \quad \text{if } \frac{dx}{du} \neq 0$$

$$18. \quad \frac{d}{dx}(\log_a u) = (\log_a e) \frac{1}{u} \frac{du}{dx}$$

19.  $\frac{d}{dx}(\log_e u) = \frac{1}{u} \frac{du}{dx}$
20.  $\frac{d}{dx}(a^u) = a^u(\log_e a) \frac{du}{dx}$
21.  $\frac{d}{dx}(e^u) = e^u \frac{du}{dx}$
22.  $\frac{d}{dx}(u^v) = v u^{v-1} \frac{du}{dx} + (\log_e u) u^v \frac{dv}{dx}$
23.  $\frac{d}{dx}(\sin u) = (\cos u) \frac{du}{dx}$
24.  $\frac{d}{dx}(\cos u) = -(\sin u) \frac{du}{dx}$
25.  $\frac{d}{dx}(\tan u) = (\sec^2 u) \frac{du}{dx}$
26.  $\frac{d}{dx}(\cot u) = -(\csc^2 u) \frac{du}{dx}$
27.  $\frac{d}{dx}(\sec u) = \sec u \cdot \tan u \frac{du}{dx}$
28.  $\frac{d}{dx}(\csc u) = -\csc u \cdot \cot u \frac{du}{dx}$
29.  $\frac{d}{dx}(\text{vers } u) = \sin u \frac{du}{dx}$
30.  $\frac{d}{dx}(\arcsin u) = \frac{1}{\sqrt{1-u^2}} \frac{du}{dx}, \quad \left(-\frac{\pi}{2} \leq \arcsin u \leq \frac{\pi}{2}\right)$
31.  $\frac{d}{dx}(\arccos u) = -\frac{1}{\sqrt{1-u^2}} \frac{du}{dx}, \quad (0 \leq \arccos u \leq \pi)$
32.  $\frac{d}{dx}(\arctan u) = \frac{1}{1+u^2} \frac{du}{dx}, \quad \left(-\frac{\pi}{2} < \arctan u < \frac{\pi}{2}\right)$
33.  $\frac{d}{dx}(\text{arc cot } u) = -\frac{1}{1+u^2} \frac{du}{dx}, \quad (0 \leq \text{arc cot } u \leq \pi)$
34.  $\frac{d}{dx}(\text{arc sec } u) = \frac{1}{u\sqrt{u^2-1}} \frac{du}{dx}, \quad \left(0 \leq \text{arc sec } u < \frac{\pi}{2}, -\pi \leq \text{arc sec } u < -\frac{\pi}{2}\right)$
35.  $\frac{d}{dx}(\text{arc csc } u) = -\frac{1}{u\sqrt{u^2-1}} \frac{du}{dx}, \quad \left(0 < \text{arc csc } u \leq \frac{\pi}{2}, -\pi < \text{arc csc } u \leq -\frac{\pi}{2}\right)$
36.  $\frac{d}{dx}(\text{arc vers } u) = \frac{1}{\sqrt{2u-u^2}} \frac{du}{dx}, \quad (0 \leq \text{arc vers } u \leq \pi)$
37.  $\frac{d}{dx}(\sinh u) = (\cosh u) \frac{du}{dx}$
38.  $\frac{d}{dx}(\cosh u) = (\sinh u) \frac{du}{dx}$
39.  $\frac{d}{dx}(\tanh u) = (\text{sech}^2 u) \frac{du}{dx}$
40.  $\frac{d}{dx}(\text{coth } u) = -(\text{csch}^2 u) \frac{du}{dx}$
41.  $\frac{d}{dx}(\text{sech } u) = -(\text{sech } u \cdot \tanh u) \frac{du}{dx}$
42.  $\frac{d}{dx}(\text{csch } u) = -(\text{csch } u \cdot \text{coth } u) \frac{du}{dx}$
43.  $\frac{d}{dx}(\sinh^{-1} u) = \frac{d}{dx}[\log(u + \sqrt{u^2 + 1})] = \frac{1}{\sqrt{u^2 + 1}} \frac{du}{dx}$
44.  $\frac{d}{dx}(\cosh^{-1} u) = \frac{d}{dx}[\log(u + \sqrt{u^2 - 1})] = \frac{1}{\sqrt{u^2 - 1}} \frac{du}{dx}, \quad (u > 1, \cosh^{-1} u > 0)$

45.  $\frac{d}{dx}(\tanh^{-1} u) = \frac{d}{dx} \left[ \frac{1}{2} \log \frac{1+u}{1-u} \right] = \frac{1}{1-u^2} \frac{du}{dx}, \quad (u^2 < 1)$
46.  $\frac{d}{dx}(\coth^{-1} u) = \frac{d}{dx} \left[ \frac{1}{2} \log \frac{u+1}{u-1} \right] = \frac{1}{1-u^2} \frac{du}{dx}, \quad (u^2 > 1)$
47.  $\frac{d}{dx}(\operatorname{sech}^{-1} u) = \frac{d}{dx} \left[ \log \frac{1+\sqrt{1-u^2}}{u} \right] = -\frac{1}{u\sqrt{1-u^2}} \frac{du}{dx}, \quad (0 < u < 1, \operatorname{sech}^{-1} u > 0)$
48.  $\frac{d}{dx}(\operatorname{csch}^{-1} u) = \frac{d}{dx} \left[ \log \frac{1+\sqrt{1+u^2}}{u} \right] = -\frac{1}{|u|\sqrt{1+u^2}} \frac{du}{dx}$
49.  $\frac{d}{dq} \int_p^q f(x) dx = f(q), \quad [p \text{ constant}]$
50.  $\frac{d}{dp} \int_p^q f(x) dx = -f(p), \quad [q \text{ constant}]$
51.  $\frac{d}{da} \int_p^q f(x, a) dx = \int_p^q \frac{\partial}{\partial a} [f(x, a)] dx + f(q, a) \frac{dq}{da} - f(p, a) \frac{dp}{da}$

## INTEGRATION

The following is a brief discussion of some integration techniques. A more complete discussion can be found in a number of good textbooks. However, the purpose of this introduction is simply to discuss a few of the important techniques which may be used, in conjunction with the integral table which follows, to integrate particular functions.

No matter how extensive the integral table, it is a fairly uncommon occurrence to find in the table the exact integral desired. Usually some form of transformation will have to be made. The simplest type of transformation, and yet the most general, is substitution. Simple forms of substitution, such as  $y = ax$ , are employed almost unconsciously by experienced users of integral tables. Other substitutions may require more thought. In some sections of the tables, appropriate substitutions are suggested for integrals that are similar to, but not exactly like, integrals in the table. Finding the right substitution is largely a matter of intuition and experience.

Several precautions must be observed when using substitutions:

1. Be sure to make the substitution in the  $dx$  term, as well as everywhere else in the integral.
2. Be sure that the function substituted is one-to-one and continuous. If this is not the case, the integral must be restricted in such a way as to make it true. See the example following.
3. With definite integrals, the limits should also be expressed in terms of the new dependent variable. With indefinite integrals, it is necessary to perform the reverse substitution to obtain the answer in terms of the original independent variable. This may also be done for definite integrals, but it is usually easier to change the limits.

**Example:**

$$\int \frac{x^4}{\sqrt{a^2 - x^2}} dx$$

Here we make the substitution  $x = |a| \sin \theta$ . Then  $dx = |a| \cos \theta d\theta$ , and

$$\sqrt{a^2 - x^2} = \sqrt{a^2 - a^2 \sin^2 \theta} = |a| \sqrt{1 - \sin^2 \theta} = |a \cos \theta|$$

Notice the absolute value signs. It is very important to keep in mind that a square root radical always denotes the positive square root, and to assure the sign is always kept positive. Thus  $\sqrt{x^2} = |x|$ . Failure to observe this is a common cause of errors in integration.

Notice also that the indicated substitution is not a one-to-one function; that is, it does not have a unique inverse. Thus we must restrict the range of  $\theta$  in such a way as to make the function one-to-one. Fortunately, this is easily done by solving for  $\theta$

$$\theta = \sin^{-1} \frac{x}{|a|}$$

and restricting the inverse sine to the principal values,  $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$ .

Thus the integral becomes

$$\int \frac{a^4 \sin^4 \theta |a| \cos \theta d\theta}{|a| |\cos \theta|}$$

Now, however, in the range of values chosen for  $\theta$ ,  $\cos \theta$  is always positive. Thus we may remove the absolute value signs from  $\cos \theta$  in the denominator. (This is one of the reasons that the principal values of the inverse trigonometric functions are defined as they are.) Then the  $\cos \theta$  terms cancel, and the integral becomes

$$a^4 \int \sin^4 \theta d\theta$$

By application of integral formulas 299 and 296, we integrate this to

$$-a^4 \frac{\sin^3 \theta \cos \theta}{4} - \frac{3a^4}{8} \cos \theta \sin \theta + \frac{3a^4}{8} \theta + C$$

We now must perform the inverse substitution to get the result in terms of  $x$ . We have

$$\begin{aligned} \theta &= \sin^{-1} \frac{x}{|a|} \\ \sin \theta &= \frac{x}{|a|} \end{aligned}$$

Then

$$\cos \theta = \pm \sqrt{1 - \sin^2 \theta} = \pm \sqrt{1 - \frac{x^2}{a^2}} = \pm \frac{\sqrt{a^2 - x^2}}{|a|}.$$

Because of the previously mentioned fact that  $\cos \theta$  is positive, we may omit the  $\pm$  sign. The reverse substitution then produces the final answer

$$\int \frac{x^4}{\sqrt{a^2 - x^2}} dx = -\frac{1}{4} x^3 \sqrt{a^2 - x^2} - \frac{3}{8} a^2 x \sqrt{a^2 - x^2} + \frac{3}{8} a^4 \sin^{-1} \frac{x}{|a|} + C.$$

Any rational function of  $x$  may be integrated, if the denominator is factored into linear and irreducible quadratic factors. The function may then be broken into partial fractions, and the individual partial fractions integrated by use of the appropriate formula from the integral table. See the section on partial fractions for further information.

Many integrals may be reduced to rational functions by proper substitutions. For example,

$$z = \tan \frac{x}{2}$$

will reduce any rational function of the six trigonometric functions of  $x$  to a rational function of  $z$ . (Frequently there are other substitutions that are simpler to use, but this one will always work. See integral formula number 484.)

Any rational function of  $x$  and  $\sqrt{ax+b}$  may be reduced to a rational function of  $z$  by making the substitution

$$z = \sqrt{ax+b}.$$

Other likely substitutions will be suggested by looking at the form of the integrand.

The other main method of transforming integrals is integration by parts. This involves applying formula number 5 or 6 in the accompanying integral table. The critical factor in this method is the choice of the functions  $u$  and  $v$ . In order for the method to be successful,  $v = \int dv$  and  $\int v du$  must be easier to integrate than the original integral. Again, this choice is largely a matter of intuition and experience.

**Example:**

$$\int x \sin x dx$$

Two obvious choices are  $u = x$ ,  $dv = \sin x dx$ , or  $u = \sin x$ ,  $dv = x dx$ . Since a preliminary mental calculation indicates that  $\int v du$  in the second choice would be more, rather than less, complicated than the original integral (it would contain  $x^2$ ), we use the first choice.

$$\begin{aligned} u &= x & dv &= \sin x dx & du &= dx & v &= -\cos x \\ \int x \sin x dx &= \int u dv = uv - \int v du = -x \cos x + \int \cos x dx \\ &= \sin x - x \cos x \end{aligned}$$

Of course, this result could have been obtained directly from the integral table, but it provides a simple example of the method. In more complicated examples the choice of  $u$  and  $v$  may not be so obvious, and several different choices may have to be tried. Of course, there is no guarantee that any of them will work.

Integration by parts may be applied more than once, or combined with substitution. A fairly common case is illustrated by the following example.

**Example:**

$$\int e^x \sin x \, dx$$

Let

$$\begin{array}{ll} u = e^x & \text{Then } du = e^x \, dx \\ dv = \sin x \, dx & v = -\cos x \end{array}$$

$$\int e^x \sin x \, dx = \int u \, dv = uv - \int v \, du = -e^x \cos x + \int e^x \cos x \, dx$$

In this latter integral,

$$\begin{array}{ll} \text{Let } u = e^x & \text{Then } du = e^x \, dx \\ dv = \cos x \, dx & v = \sin x \end{array}$$

$$\begin{aligned} \int e^x \sin x \, dx &= -e^x \cos x + \int e^x \cos x \, dx = -e^x \cos x + \int u \, dv \\ &= -e^x \cos x + uv - \int v \, du \\ &= -e^x \cos x + e^x \sin x - \int e^x \sin x \, dx \end{aligned}$$

This looks as if a circular transformation has taken place, since we are back at the same integral we started from. However, the above equation can be solved algebraically for the required integral:

$$\int e^x \sin x \, dx = \frac{1}{2} e^x \sin x - \frac{1}{2} e^x \cos x$$

In the second integration by parts, if the parts had been chosen as  $u = \cos x$ ,  $dv = e^x \, dx$ , we would indeed have made a circular transformation, and returned to the starting place.

In general, when doing repeated integration by parts, one should never choose the function  $u$  at any stage to be the same as the function  $v$  at the previous stage, or a constant times the previous  $v$ .

The following rule is called the extended rule for integration by parts. It is the result of  $n + 1$  successive applications of integration by parts. If

$$\begin{aligned} g_1(x) &= \int g(x) \, dx, & g_2(x) &= \int g_1(x) \, dx, \\ g_3(x) &= \int g_2(x) \, dx, \dots, & g_m(x) &= \int g_{m-1}(x) \, dx, \dots, \end{aligned}$$

then

$$\begin{aligned} \int f(x) \cdot g(x) \, dx &= f(x) \cdot g_1(x) - f'(x) \cdot g_2(x) + f''(x) \cdot g_3(x) - + \dots \\ &+ (-1)^n f^{(n)}(x) g_{n+1}(x) + (-1)^{n+1} \int f^{(n+1)}(x) g_{n+1}(x) \, dx. \end{aligned}$$

A useful special case of the above rule is when  $f(x)$  is a polynomial of degree  $n$ . Then  $f^{(n+1)}(x) = 0$ , and

$$\int f(x) \cdot g(x) \, dx = f(x) \cdot g_1(x) - f'(x) \cdot g_2(x) + f''(x) \cdot g_3(x) - + \dots + (-1)^n f^{(n)}(x) g_{n+1}(x) + C.$$

**Example:** If  $f(x) = x^2$ ,  $g(x) = \sin x$

$$\int x^2 \sin x \, dx = -x^2 \cos x + 2x \sin x + 2 \cos x + C.$$

Another application of this formula occurs if

$$f''(x) = af(x) \quad \text{and} \quad g''(x) = bg(x),$$

where  $a$  and  $b$  are unequal constants. In this case, by a process similar to that used in the above example for  $\int e^x \sin x \, dx$ , we get the formula

$$\int f(x)g(x) \, dx = \frac{f(x) \cdot g'(x) - f'(x) \cdot g(x)}{b - a} + C.$$

This formula could have been used in the example mentioned. Here is another example.

**Example:** If  $f(x) = e^{2x}$ ,  $g(x) = \sin 3x$ , then  $a = 4$ ,  $b = -9$ , and

$$\int e^{2x} \sin 3x \, dx = \frac{3e^{2x} \cos 3x - 2e^{2x} \sin 3x}{-9 - 4} + C = \frac{e^{2x}}{13}(2 \sin 3x - 3 \cos 3x) + C$$

The following additional points should be observed when using this table.

1. A constant of integration is to be supplied with the answers for indefinite integrals.
2. Logarithmic expressions are to base  $e = 2.71828 \dots$ , unless otherwise specified, and are to be evaluated for the absolute value of the arguments involved therein.
3. All angles are measured in radians, and inverse trigonometric and hyperbolic functions represent principal values, unless otherwise indicated.
4. If the application of a formula produces either a zero denominator or the square root of a negative number in the result, there is usually available another form of the answer which avoids this difficulty. In many of the results, the excluded values are specified, but when such are omitted it is presumed that one can tell what these should be, especially when difficulties of the type herein mentioned are obtained.
5. When inverse trigonometric functions occur in the integrals, be sure that any replacements made for them are strictly in accordance with the rules for such functions. This causes little difficulty when the argument of the inverse trigonometric function is positive, since then all angles involved are in the first quadrant. However, if the argument is negative, special care must be used. Thus if  $u > 0$ ,

$$\sin^{-1} u = \cos^{-1} \sqrt{1 - u^2} = \csc^{-1} \frac{1}{u}, \text{ etc.}$$

However, if  $u < 0$ ,

$$\sin^{-1} u = -\cos^{-1} \sqrt{1 - u^2} = -\pi - \csc^{-1} \frac{1}{u}, \text{ etc.}$$

See the section on inverse trigonometric functions for a full treatment of the allowable substitutions.

6. In integrals 340–345 and some others, the right side includes expressions of the form

$$A \tan^{-1}[B + C \tan f(x)].$$

In these formulas, the  $\tan^{-1}$  does not necessarily represent the principal value. Instead of always employing the principal branch of the inverse tangent function, one must instead use that branch of the inverse tangent function upon which  $f(x)$  lies for any particular choice of  $x$ . (This is not an issue when the antiderivative is continuous.)

**Example:**

$$\begin{aligned} \int_0^{4\pi} \frac{dx}{2 + \sin x} &= \frac{2}{\sqrt{3}} \tan^{-1} \frac{2 \tan(x/2 + 1)}{\sqrt{3}} \Big|_0^{4\pi} \\ &= \frac{2}{\sqrt{3}} \left[ \tan^{-1} \left( \frac{2 \tan 2\pi + 1}{\sqrt{3}} \right) - \tan^{-1} \left( \frac{2 \tan 0 + 1}{\sqrt{3}} \right) \right] \\ &= \frac{2}{\sqrt{3}} \left[ \frac{13\pi}{6} - \frac{\pi}{6} \right] = \frac{4\pi}{\sqrt{3}} = \frac{4\sqrt{3}\pi}{3} \end{aligned}$$

Here

$$\tan^{-1} \frac{2 \tan 2\pi + 1}{\sqrt{3}} = \tan^{-1} \frac{1}{\sqrt{3}} = \frac{13\pi}{6},$$

since  $f(x) = 2\pi$ ; and

$$\tan^{-1} \frac{2 \tan 0 + 1}{\sqrt{3}} = \tan^{-1} \frac{1}{\sqrt{3}} = \frac{\pi}{6},$$

since  $f(x) = 0$ .

7.  $B_n$  and  $E_n$  where used in integrals represents the Bernoulli and Euler numbers as defined in tables of Bernoulli and Euler polynomials contained in certain mathematics reference and handbooks.

## ELEMENTARY FORMS

1.  $\int a \, dx = ax$
2.  $\int a \cdot f(x) \, dx = a \int f(x) \, dx$
3.  $\int \phi(y) \, dx = \int \frac{\phi(y)}{y'} \, dy$ , where  $y' = \frac{dy}{dx}$
4.  $\int (u + v) \, dx = \int u \, dx + \int v \, dx$ , where  $u$  and  $v$  are any functions of  $x$
5.  $\int u \, dv = u \int dv - \int v \, du = uv - \int v \, du$
6.  $\int u \frac{dv}{dx} \, dx = uv - \int v \frac{du}{dx} \, dx$
7.  $\int x^n \, dx = \frac{x^{n+1}}{n+1}$ , except  $n = -1$
8.  $\int \frac{f'(x) \, dx}{f(x)} = \log f(x)$ , ( $df(x) = f'(x) \, dx$ )
9.  $\int \frac{dx}{x} = \log x$
10.  $\int \frac{f'(x) \, dx}{2\sqrt{f(x)}} = \sqrt{f(x)}$ , ( $df(x) = f'(x) \, dx$ )
11.  $\int e^x \, dx = e^x$
12.  $\int e^{ax} \, dx = e^{ax}/a$
13.  $\int b^{ax} \, dx = \frac{b^{ax}}{a \log b}$ , ( $b > 0$ )
14.  $\int \log x \, dx = x \log x - x$
15.  $\int a^x \log a \, dx = a^x$ , ( $a > 0$ )
16.  $\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a}$
17.  $\int \frac{dx}{a^2 - x^2} = \begin{cases} \frac{1}{a} \tanh^{-1} \frac{x}{a} \\ \text{or} \\ \frac{1}{2a} \log \frac{a+x}{a-x}, \quad (a^2 > x^2) \end{cases}$
18.  $\int \frac{dx}{x^2 - a^2} = \begin{cases} -\frac{1}{a} \coth^{-1} \frac{x}{a} \\ \text{or} \\ \frac{1}{2a} \log \frac{x-a}{x+a}, \quad (x^2 > a^2) \end{cases}$

$$\begin{aligned}
 19. \quad \int \frac{dx}{\sqrt{a^2 - x^2}} &= \begin{cases} \sin^{-1} \frac{x}{|a|} \\ \text{or} \\ -\cos^{-1} \frac{x}{|a|}, \quad (a^2 > x^2) \end{cases} \\
 20. \quad \int \frac{dx}{\sqrt{x^2 \pm a^2}} &= \log(x + \sqrt{x^2 \pm a^2}) \\
 21. \quad \int \frac{dx}{x\sqrt{x^2 - a^2}} &= \frac{1}{|a|} \sec^{-1} \frac{x}{a} \\
 22. \quad \int \frac{dx}{x\sqrt{a^2 \pm x^2}} &= -\frac{1}{a} \log \left( \frac{a + \sqrt{a^2 \pm x^2}}{x} \right)
 \end{aligned}$$

FORMS CONTAINING  $(a + bx)$ 

For forms containing  $a + bx$ , but not listed in the table, the substitution  $u = \frac{a+bx}{x}$  may prove helpful.

$$\begin{aligned}
 23. \quad \int (a + bx)^n dx &= \frac{(a + bx)^{n+1}}{(n+1)b}, \quad (n \neq -1) \\
 24. \quad \int x(a + bx)^n dx &= \frac{1}{b^2(n+2)}(a + bx)^{n+2} - \frac{a}{b^2(n+1)}(a + bx)^{n+1}, \quad (n \neq -1, -2) \\
 25. \quad \int x^2(a + bx)^n dx &= \frac{1}{b^3} \left[ \frac{(a + bx)^{n+3}}{n+3} - 2a \frac{(a + bx)^{n+2}}{n+2} + a^2 \frac{(a + bx)^{n+1}}{n+1} \right] \\
 26. \quad \int x^m(a + bx)^n dx &= \begin{cases} \frac{x^{m+1}(a+bx)^n}{m+n+1} + \frac{an}{m+n+1} \int x^m(a + bx)^{n-1} dx \\ \text{or} \\ \frac{1}{a(n+1)} \left[ -x^{m+1}(a + bx)^{n+1} + (m+n+2) \int x^m(a + bx)^{n+1} dx \right] \\ \text{or} \\ \frac{1}{b(m+n+1)} \left[ x^m(a + bx)^{n+1} - ma \int x^{m-1}(a + bx)^n dx \right] \end{cases} \\

706.  $\int_0^\pi x \log(\sin x) dx = -\frac{\pi^2}{2} \log 2$
707.  $\int_0^{\pi/2} \sin x \log(\sin x) dx = \log 2 - 1$
708.  $\int_0^{\pi/2} \log \tan x dx = 0$
709.  $\int_0^\pi \log(a \pm b \cos x) dx = \pi \log\left(\frac{a + \sqrt{a^2 - b^2}}{2}\right), \quad (a \geq b)$
710.  $\int_0^\pi \log(a^2 - 2ab \cos x + b^2) dx = \begin{cases} 2\pi \log a & a \geq b > 0 \\ 2\pi \log b & b \geq a > 0 \end{cases}$
711.  $\int_0^\infty \frac{\sin ax}{\sinh bx} dx = \frac{\pi}{2|b|} \tanh \frac{a\pi}{2b}$
712.  $\int_0^\infty \frac{\cos ax}{\cosh bx} dx = \frac{\pi}{2|b|} \operatorname{sech} \frac{a\pi}{2b}$
713.  $\int_0^\infty \frac{dx}{\cosh ax} = \frac{\pi}{2|a|}$

$$714. \int_0^{\infty} \frac{x dx}{\sinh ax} = \frac{\pi^2}{4a^2} \quad (a > 0)$$

$$715. \int_0^{\infty} e^{-ax} \cosh bx dx = \frac{a}{a^2 - b^2}, \quad (0 \leq |b| < a)$$

$$716. \int_0^{\infty} e^{-ax} \sinh bx dx = \frac{b}{a^2 - b^2}, \quad (0 \leq |b| < a)$$

$$717. \int_0^{\infty} \frac{\sinh ax}{e^{bx} + 1} dx = \frac{\pi}{2b} \csc \frac{a\pi}{b} - \frac{1}{2a} \quad (b > 0)$$

$$718. \int_0^{\infty} \frac{\sinh ax}{e^{bx} - 1} dx = \frac{1}{2a} - \frac{\pi}{2b} \cot \frac{a\pi}{b} \quad (b > 0)$$

$$719. \int_0^{\pi/2} \frac{dx}{\sqrt{1 - k^2 \sin^2 x}} = \frac{\pi}{2} \left[ 1 + \left(\frac{1}{2}\right)^2 k^2 + \left(\frac{1 \cdot 3}{2 \cdot 4}\right)^2 k^4 + \left(\frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6}\right)^2 k^6 + \dots \right], \quad \text{if } k^2 < 1$$

$$720. \int_0^{\pi/2} \sqrt{1 - k^2 \sin^2 x} dx = \frac{\pi}{2} \left[ 1 - \left(\frac{1}{2}\right)^2 k^2 - \left(\frac{1 \cdot 3}{2 \cdot 4}\right)^2 \frac{k^4}{3} - \left(\frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6}\right)^2 \frac{k^6}{5} - \dots \right], \quad \text{if } k^2 < 1$$

$$721. \int_0^{\infty} e^{-x} \log x dx = -\gamma = -0.5772157 \dots$$

$$722. \int_0^{\infty} e^{-x^2} \log x dx = -\frac{\sqrt{\pi}}{4} (\gamma + 2 \log 2)$$

$$723. \int_0^{\infty} \left( \frac{1}{1 - e^{-x}} - \frac{1}{x} \right) e^{-x} dx = \gamma = 0.5772157 \dots \quad [\text{Euler's Constant}]$$

$$724. \int_0^{\infty} \frac{1}{x} \left( \frac{1}{1+x} - e^{-x} \right) dx = \gamma = 0.5772157 \dots$$

For  $n$  even :

$$725. \int \cos^n x dx = \frac{1}{2^{n-1}} \sum_{k=0}^{n/2-1} \binom{n}{k} \frac{\sin(n-2k)x}{(n-2k)} + \frac{1}{2^n} \binom{n}{n/2} x$$

$$726. \int \sin^n x dx = \frac{1}{2^{n-1}} \sum_{k=0}^{n/2-1} \binom{n}{k} \frac{\sin[(n-2k)(\frac{\pi}{2}-x)]}{2k-n} + \frac{1}{2^n} \binom{n}{n/2} x$$

For  $n$  odd:

$$727. \int \cos^n x dx = \frac{1}{2^{n-1}} \sum_{k=0}^{(n-1)/2} \binom{n}{k} \frac{\sin(n-2k)x}{n-2k}$$

$$728. \int \sin^n x dx = \frac{1}{2^{n-1}} \sum_{k=0}^{(n-1)/2} \binom{n}{k} \frac{\sin[(n-2k)(\frac{\pi}{2}-x)]}{2k-n}$$

## DIFFERENTIAL EQUATIONS

Certain types of differential equations occur sufficiently often to justify the use of formulas for the corresponding particular solutions. The following set of Tables I to XIV covers all first, second, and  $n$ th order ordinary linear differential equations with constant coefficients for which the right members are of the form  $P(x)e^{rx} \sin sx$  or  $P(x)e^{rx} \cos sx$ , where  $r$  and  $s$  are constants and  $P(x)$  is a polynomial of degree  $n$ .

When the right member of a reducible linear partial differential equation with constant coefficients is not zero, particular solutions for certain types of right members are contained in Tables XV to XXI. In these tables both  $F$  and  $P$  are used to denote polynomials, and it is assumed that no denominator is zero. In any formula the roles of  $x$  and  $y$  may be reversed throughout, changing a formula in which  $x$  dominates to one in which  $y$  dominates. Tables XIX, XX, XXI are applicable whether the equations are reducible or not. The symbol  $\binom{m}{n}$  stands for  $\frac{m!}{(m-n)!n!}$  and is the  $(n+1)$ st coefficient in the expansion of  $(a+b)^m$ . Also  $0! = 1$  by definition.

The tables as herewith given are those contained in the text *Differential Equations* by Ginn and Company (1955) and are published with their kind permission and that of the author, Professor Frederick H. Steen.

### SOLUTION OF LINEAR DIFFERENTIAL EQUATIONS WITH CONSTANT COEFFICIENTS

Any linear differential equation with constant coefficients may be written in the form

$$p(D)y = R(x)$$

where

- $D$  is the differential operation:  $Dy = \frac{dy}{dx}$
- $p(D)$  is a polynomial in  $D$ ,
- $y$  is the dependent variable,
- $x$  is the independent variable,
- $R(x)$  is an arbitrary function of  $x$ .

A power of  $D$  represents repeated differentiation, that is

$$D^n y = \frac{d^n y}{dx^n}$$

For such an equation, the general solution may be written in the form

$$y = y_c + y_p$$

where  $y_p$  is any particular solution, and  $y_c$  is called the *complementary function*. This complementary function is defined as the general solution of the *homogeneous equation*, which is the original differential equation with the right side replaced by zero, i.e.,

$$p(D)y = 0$$

The complementary function  $y_c$  may be determined as follows:

1. Factor the polynomial  $p(D)$  into real and complex linear factors, just as if  $D$  were a variable instead of an operator.
2. For each nonrepeated linear factor of the form  $(D - a)$ , where  $a$  is real, write down a term of the form

$$ce^{ax}$$

where  $c$  is an arbitrary constant.

3. For each repeated real linear factor of the form  $(D - a)^n$ , write down  $n$  terms of the form

$$c_1 e^{ax} + c_2 x e^{ax} + c_3 x^2 e^{ax} + \dots + c_n x^{n-1} e^{ax}$$

where the  $c_i$ 's are arbitrary constants.

4. For each non-repeated conjugate complex pair of factors of the form  $(D - a + ib)(D - a - ib)$ , write down two terms of the form

$$c_1 e^{ax} \cos bx + c_2 e^{ax} \sin bx$$

5. For each repeated conjugate complex pair of factors of the form  $(D - a + ib)^n (D - a - ib)^n$ , write down  $2n$  terms of the form

$$c_1 e^{ax} \cos bx + c_2 e^{ax} \sin bx + c_3 x e^{ax} \cos bx + c_4 x e^{ax} \sin bx \\ + \dots + c_{2n-1} x^{n-1} e^{ax} \cos bx + c_{2n} x^{n-1} e^{ax} \sin bx$$

6. The sum of all the terms thus written down is the complementary function  $y_c$ .

To find the particular solution  $y_p$ , use the following tables, as shown in the examples. For cases not shown in the tables, there are various methods of finding  $y_p$ . The most general method is called *variation of parameters*. The following example illustrates the method:

**Example:** Find  $y_p$  for  $(D^2 - 4)y = e^x$ .

This example can be solved most easily by use of equation 63 in the tables following. However, it is given here as an example of the method of variation of parameters.

The complementary function is

$$y_c = c_1 e^{2x} + c_2 e^{-2x}$$

To find  $y_p$ , replace the constants in the complementary function with unknown functions,

$$y_p = u e^{2x} + v e^{-2x}$$

We now prepare to substitute this assumed solution into the original equation. We begin by taking all the necessary derivatives:

$$\begin{aligned}y_p &= ue^{2x} + ve^{-2x} \\y'_p &= 2ue^{2x} - 2ve^{-2x} + u'e^{2x} + v'e^{-2x}\end{aligned}$$

For each derivative of  $y_p$  except the highest, we set the sum of all the terms containing  $u'$  and  $v'$  to 0. Thus the above equation becomes

$$u'e^{2x} + v'e^{-2x} = 0 \quad \text{and} \quad y'_p = 2ue^{2x} - 2ve^{-2x}$$

Continuing to differentiate, we have

$$y''_p = 4ue^{2x} + 4ve^{-2x} + 2u'e^{2x} - 2v'e^{-2x}$$

When we substitute into the original equation, all the terms not containing  $u'$  or  $v'$  cancel out. This is a consequence of the method by which  $y_p$  was set up.

Thus all that is necessary is to write down the terms containing  $u'$  or  $v'$  in the highest order derivative of  $y_p$ , multiply by the constant coefficient of the highest power of  $D$  in  $p(D)$ , and set it equal to  $R(x)$ . Together with the previous terms in  $u'$  and  $v'$  which were set equal to 0, this gives us as many linear equations in the first derivatives of the unknown functions as there are unknown functions. The first derivatives may then be solved for by algebra, and the unknown functions found by integration. In the present example, this becomes

$$\begin{aligned}u'e^{2x} + v'e^{-2x} &= 0 \\2u'e^{2x} - 2v'e^{-2x} &= e^x\end{aligned}$$

We eliminate  $v'$  and  $u'$  separately, getting

$$\begin{aligned}4u'e^{2x} &= e^x \\4v'e^{-2x} &= -e^x\end{aligned}$$

Thus

$$\begin{aligned}u' &= \frac{1}{4}e^{-x} \\v' &= -\frac{1}{4}e^{3x}\end{aligned}$$

Therefore, by integrating

$$\begin{aligned}u &= -\frac{1}{4}e^{-x} \\v &= -\frac{1}{12}e^{3x}\end{aligned}$$

A constant of integration is not needed, since we need only one particular solution. Thus

$$\begin{aligned}y_p = ue^{2x} + ve^{-2x} &= -\frac{1}{4}e^{-x}e^{2x} - \frac{1}{12}e^{3x}e^{-2x} \\&= -\frac{1}{4}e^x - \frac{1}{12}e^x = -\frac{1}{3}e^x\end{aligned}$$

and the general solution is

$$y = y_c + y_p = c_1e^{2x} + c_2e^{-2x} - \frac{1}{3}e^x$$

The following samples illustrate the use of the tables.

**Example 1:** Solve  $(D^2 - 4)y = \sin 3x$ . Substitution of  $q = -4$ ,  $s = 3$  in formula 24 gives

$$y_p = \frac{\sin 3x}{-9 - 4}$$

wherefore the general solution is

$$y = c_1e^{2x} + c_2e^{-2x} - \frac{\sin 3x}{13}$$

**Example 2:** Obtain a particular solution of  $(D^2 - 4D + 5)y = x^2 e^{3x} \sin x$ .

Applying formula 40 with  $a = 2$ ,  $b = 1$ ,  $r = 3$ ,  $s = 1$ ,  $P(x) = x^2$ ,  $s + b = 2$ ,  $s - b = 0$ ,  $a - r = -1$ ,  $(a - r)^2 + (s + b)^2 = 5$ ,  $(a - r)^2 + (s - b)^2 = 1$ , we have

$$\begin{aligned} y_p &= \frac{e^{3x} \sin x}{2} \left[ \left( \frac{2}{5} - \frac{0}{1} \right) x^2 + \left( \frac{2(-1)2}{25} - \frac{2(-1)0}{1} \right) 2x + \left( \frac{3 \cdot 1 \cdot 2 - 2^3}{125} - \frac{3 \cdot 1 \cdot 0 - 0}{1} \right) 2 \right] \\ &\quad - \frac{e^{3x} \cos x}{2} \left[ \left( \frac{-1}{5} - \frac{-1}{1} \right) x^2 + \left( \frac{1-4}{25} - \frac{1-0}{1} \right) 2x + \left( \frac{-1-3(-1)4}{125} - \frac{-1-3(-1)0}{1} \right) 2 \right] \\ &= \left( \frac{1}{5} x^2 - \frac{4}{25} x - \frac{2}{125} \right) e^{3x} \sin x + \left( -\frac{2}{5} x^2 + \frac{28}{25} - \frac{136}{125} \right) e^{3x} \cos x \end{aligned}$$

The special formulas effect a very considerable saving of time in problems of this type.

**Example 3:** Obtain a particular solution of  $(D^2 - 4D + 5)y = x^2 e^{2x} \cos x$ . (Compare with Example 2.)

Formula 40 is not applicable here since for this equation  $r = a$ ,  $s = b$ , wherefore the denominator  $(a - r)^2 + (s - b)^2 = 0$ . We turn instead to formula 44. Substituting  $a = 2$ ,  $b = 1$ ,  $P(x) = x^2$  and replacing  $\sin$  by  $\cos$ ,  $\cos$  by  $-\sin$ , we obtain

$$\begin{aligned} y_p &= \frac{e^{2x} \cos x}{4} \left( x^2 - \frac{2}{4} \right) + \frac{e^{2x} \sin x}{2} \int \left( x^2 - \frac{1}{2} \right) dx \\ &= \left( \frac{x^2}{4} - \frac{1}{8} \right) e^{2x} \cos x + \left( \frac{x^3}{6} - \frac{x}{4} \right) e^{2x} \sin x \end{aligned}$$

which is the required solution.

**Example 4:** Find  $z_p$  for  $(D_x - 3D_y)z = \ln(y + 3x)$ . Referring to Table XV we note that formula 69 (not 68) is applicable. This gives

$$z_p = x \ln(y + 3x)$$

It is easily seen that  $-y/3 \ln(y + 3x)$  would serve equally well.

**Example 5:** Solve  $(D_x + 2D_y - 4)z = y \cos(y - 2x)$ .

Since  $R$  in formula 76 contains a polynomial in  $x$ , not  $y$ , we rewrite the given equation in the form  $(D_y + \frac{1}{2}D_x - 2)z = \frac{1}{2}y \cos(y - 2x)$ . Then

$$z_c = e^{2y} F \left( x - \frac{1}{2}y \right) = e^{2x} f(2x - y)$$

and by the formula

$$z_p = -\frac{1}{2} \cos(y - 2x) \cdot \left( \frac{y}{2} + \frac{1}{2} \right) = -\frac{1}{8} (2y + 1) \cos(y - 2x)$$

**Example 6:** Find  $z_p$  for  $(D_x + 4D_y)^3 z = (2x - y)^2$ .

Using formula 79, we obtain

$$z_p = \frac{\iiint u^2 du^3}{[2 + 4(-1)]^3} = \frac{u^5}{5 \cdot 4 \cdot 3 \cdot (-8)} = -\frac{(2x - y)^5}{480}$$

**Example 7:** Find  $z_p$  for  $(D_x^3 + 5D_x^2 D_y - 7D_x + 4)z = e^{2x+3y}$ . By formula 87

$$z_p = \frac{e^{2x+3y}}{2^3 + 5 \cdot 2^2 \cdot 3 - 7 \cdot 2 + 4} = \frac{e^{2x+3y}}{58}$$

**Example 8:** Find  $z_p$  for

$$(D_x^4 + 6D_x^3 D_y + D_x D_y + D_y^2 + 9)z = \sin(3x + 4y)$$

Since every term in the left number is of even degree in the two operators  $D_x$  and  $D_y$ , formula 90 is applicable. It gives

$$\begin{aligned} z_p &= \frac{\sin(3x + 4y)}{(-9)^2 + 6(-9)(-12) + (-12) + (-16) + 9} \\ &= \frac{\sin(3x + 4y)}{710} \end{aligned}$$

Differential equation	Method of solution
$yF(xy) dx + xG(xy) dy = 0$	$\ln x = \int \frac{G(v) dv}{v\{G(v) - F(v)\}} + c$ where $v = xy$ . If $G(v) = F(v)$ , then the solution is $xy = c$ .
<p><b>Linear, homogeneous, second order equation</b></p> $\frac{d^2 y}{dx^2} + b \frac{dy}{dx} + cy = 0$ where $b$ and $c$ are real constants	Let $m_1, m_2$ be the roots of $m^2 + bm + c = 0$ . Then there are 3 cases: Case 1. $m_1, m_2$ real and distinct: $y = c_1 e^{m_1 x} + c_2 e^{m_2 x}$ Case 2. $m_1, m_2$ real and equal: $y = c_1 e^{m_1 x} + c_2 x e^{m_1 x}$ Case 3. $m_1 = p + qi, m_2 = p - qi$ : $y = e^{px}(c_1 \cos qx + c_2 \sin qx)$ where $p = -b/2, q = \sqrt{4c - b^2}/2$
<p><b>Linear, nonhomogeneous, second order equation</b></p> $\frac{d^2 y}{dx^2} + b \frac{dy}{dx} + cy = R(x)$ where $b$ and $c$ are real constants	There are 3 cases corresponding to those above: Case 1. $y = c_1 e^{m_1 x} + c_2 e^{m_2 x} + \frac{e^{m_1 x}}{m_1 - m_2} \int e^{-m_1 x} R(x) dx + \frac{e^{m_2 x}}{m_2 - m_1} \int e^{-m_2 x} R(x) dx$ Case 2. $y = c_1 e^{m_1 x} + c_2 x e^{m_1 x} + x e^{m_1 x} \int e^{-m_1 x} R(x) dx - e^{m_1 x} \int x e^{-m_1 x} R(x) dx$ Case 3. $y = e^{px}(c_1 \cos qx + c_2 \sin qx) + \frac{e^{px} \sin qx}{q} \int e^{-px} R(x) \cos qx dx - \frac{e^{px} \cos qx}{q} \int e^{-px} R(x) \sin qx dx$

Differential equation	Method of solution
<b>Euler or Cauchy equation</b> $x^2 \frac{d^2 y}{dx^2} + bx \frac{dy}{dx} + cy = S(x)$	Putting $x = e^t$ , the equation becomes $\frac{d^2 y}{dt^2} + (b-1) \frac{dy}{dt} + cy = S(e^t)$ and can then be solved as a linear second order equation.
<b>Bessel's equation</b> $x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (\lambda^2 x^2 - n^2)y = 0$	$y = c_1 J_n(\lambda x) + c_2 Y_n(\lambda x)$
<b>Transformed Bessel's equation</b> $x^2 \frac{d^2 y}{dx^2} + (2p+1)x \frac{dy}{dx} + (\alpha^2 x^{2r} + \beta^2)y = 0$	$y = x^{-p} \left\{ c_1 J_{q/r} \left( \frac{\alpha}{r} x^r \right) + c_2 Y_{q/r} \left( \frac{\alpha}{r} x^r \right) \right\}$ where $q = \sqrt{p^2 - \beta^2}$ .
<b>Legendre's equation</b> $(1-x^2) \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0$	$y = c_1 P_n(x) + c_2 Q_n(x)$
<b>Separation of variables</b> $f_1(x)g_1(y) dx + f_2(x)g_2(y) dy = 0$	$\int \frac{f_1(x)}{f_2(x)} dx + \int \frac{g_2(y)}{g_1(y)} dy = c$
<b>Exact equation</b> $M(x, y) dx + N(x, y) dy = 0$ where $\partial M/\partial y = \partial N/\partial x$	$\int M \partial x + \int \left( n - \frac{\partial}{\partial y} \int M \partial x \right) dy = c$ where $\partial x$ indicates that the integration is to be performed with respect to $x$ keeping $y$ constant.
<b>Linear first order equation</b> $\frac{dy}{dx} + P(x)y = Q(x)$	$ye^{\int P dx} = \int Qe^{\int P dx} dx + c$
<b>Bernoulli's equation</b> $\frac{dy}{dx} + P(x)y = Q(x)y^n$	$ve^{(1-n) \int P dx} = \int Qe^{(1-n) \int P dx} dx + c$ where $v = y^{1-n}$ . If $n = 1$ , then the solution is $\ln y = \int (Q - P) dx + c$ .
<b>Homogeneous equation</b> $\frac{dy}{dx} = F\left(\frac{y}{x}\right)$	$\ln x = \int \frac{dv}{F(v)-v} + c$ where $v = y/x$ . If $F(v) = v$ , then the solution is $y = cx$ .
<b>Reducible to homogeneous</b> $(a_1 x + b_1 y + c_1) dx + (a_2 x + b_2 y + c_2) dy = 0$ with $\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$	Set $u = a_1 x + b_1 y + c_1$ and $v = a_2 x + b_2 y + c_2$ . Then eliminate $x$ and $y$ and the equation becomes homogeneous.
<b>Reducible to separable</b> $(a_1 x + b_1 y + c_1) dx + (a_2 x + b_2 y + c_2) dy = 0$ with $\frac{a_1}{a_2} = \frac{b_1}{b_2}$	Set $u = a_1 x + b_1 y$ . Then eliminate $x$ or $y$ and the equation becomes separable.

## FOURIER SERIES

1. If  $f(x)$  is a bounded periodic function of period  $2L$  (i.e.,  $f(x + 2L) = f(x)$ ), and satisfies the *Dirichlet conditions*:

- (a) In any period  $f(x)$  is continuous, except possibly for a finite number of jump discontinuities.
- (b) In any period  $f(x)$  has only a finite number of maxima and minima.

Then  $f(x)$  may be represented by the *Fourier series*

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} \left( a_n \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \right)$$

where  $a_n$  and  $b_n$  are as determined below. This series will converge to  $f(x)$  at every point where  $f(x)$  is continuous, and to

$$\frac{f(x^+) + f(x^-)}{2}$$

(i.e., the average of the left-hand and right-hand limits) at every point where  $f(x)$  has a jump discontinuity.

$$\begin{aligned} a_n &= \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, 3, \dots, \\ b_n &= \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots \end{aligned}$$

We may also write

$$a_n = \frac{1}{L} \int_{\alpha}^{\alpha+2L} f(x) \cos \frac{n\pi x}{L} dx \quad \text{and} \quad b_n = \frac{1}{L} \int_{\alpha}^{\alpha+2L} f(x) \sin \frac{n\pi x}{L} dx$$

where  $\alpha$  is any real number. Thus if  $\alpha = 0$ ,

$$\begin{aligned} a_n &= \frac{1}{L} \int_0^{2L} f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, 3, \dots, \\ b_n &= \frac{1}{L} \int_0^{2L} f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots \end{aligned}$$

2. If in addition to the restrictions in (1),  $f(x)$  is an even function (i.e.,  $f(-x) = f(x)$ ), then the Fourier series reduces to

$$\frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L}$$

That is,  $b_n = 0$ . In this case, a simpler formula for  $a_n$  is

$$a_n = \frac{2}{L} \int_0^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, 3, \dots$$

3. If in addition to the restrictions in (1),  $f(x)$  is an odd function (i.e.,  $f(-x) = -f(x)$ ), then the Fourier series reduces to

$$\sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}$$

That is,  $a_n = 0$ . In this case, a simpler formula for the  $b_n$  is

$$b_n = \frac{2}{L} \int_0^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots$$

4. If in addition to the restrictions in (2) above,  $f(x) = -f(L - x)$ , then  $a_n$  will be 0 for all even values of  $n$ , including  $n = 0$ . Thus in this case, the expansion reduces to

$$\sum_{m=1}^{\infty} a_{2m-1} \cos \frac{(2m-1)\pi x}{L}$$

5. If in addition to the restrictions in (3) above,  $f(x) = f(L - x)$ , then  $b_n$  will be 0 for all even values of  $n$ . Thus in this case, the expansion reduces to

$$\sum_{m=1}^{\infty} b_{2m-1} \sin \frac{(2m-1)\pi x}{L}$$

(The series in (4) and (5) are known as *odd-harmonic series*, since only the odd harmonics appear. Similar rules may be stated for even-harmonic series, but when a series appears in the even-harmonic form, it means that  $2L$  has not been taken as the smallest period of  $f(x)$ . Since any integral multiple of a period is also a period, series obtained in this way will also work, but in general computation is simplified if  $2L$  is taken to be the smallest period.)

6. If we write the Euler definitions for  $\cos \theta$  and  $\sin \theta$ , we obtain the complex form of the Fourier series known either as the “Complex Fourier Series” or the “Exponential Fourier Series” of  $f(x)$ . It is represented as

$$f(x) = \frac{1}{2} \sum_{n=-\infty}^{n=+\infty} c_n e^{i\omega_n x}$$

where

$$c_n = \frac{1}{L} \int_{-L}^L f(x) e^{-i\omega_n x} dx, \quad n = 0, \pm 1, \pm 2, \pm 3, \dots$$

with  $\omega_n = \frac{n\pi}{L}$  for  $n = 0, \pm 1, \pm 2, \dots$ . The set of coefficients  $c_n$  is often referred to as the Fourier spectrum.

7. If both sine and cosine terms are present and if  $f(x)$  is of period  $2L$  and expandable by a Fourier series, it can be represented as

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} c_n \sin \left( \frac{n\pi x}{L} + \phi_n \right), \quad \text{where}$$

$$a_n = c_n \sin \phi_n, \quad b_n = c_n \cos \phi_n, \quad c_n = \sqrt{a_n^2 + b_n^2}, \quad \phi_n = \arctan \left( \frac{a_n}{b_n} \right)$$

It can also be represented as

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} c_n \cos \left( \frac{n\pi x}{L} + \phi_n \right), \quad \text{where}$$

$$a_n = c_n \cos \phi_n, \quad b_n = -c_n \sin \phi_n, \quad c_n = \sqrt{a_n^2 + b_n^2}, \quad \phi_n = \arctan \left( -\frac{b_n}{a_n} \right)$$

where  $\phi_n$  is chosen so as to make  $a_n, b_n$ , and  $c_n$  hold.

8. The following table of trigonometric identities should be helpful for developing Fourier series.

	$n$	$n$ even	$n$ odd	$n/2$ odd	$n/2$ even
$\sin n\pi$	0	0	0	0	0
$\cos n\pi$	$(-1)^n$	+1	-1	+1	+1
* $\sin \frac{n\pi}{2}$		0	$(-1)^{(n-1)/2}$	0	0
* $\cos \frac{n\pi}{2}$		$(-1)^{n/2}$	0	-1	+1
$\sin \frac{n\pi}{4}$			$\frac{\sqrt{2}}{2} (-1)^{(n^2+4n+11)/8}$	$(-1)^{(n-2)/4}$	0

\*A useful formula for  $\sin \frac{n\pi}{2}$  and  $\cos \frac{n\pi}{2}$  is given by

$$\sin \frac{n\pi}{2} = \frac{(i)^{n+1}}{2} [(-1)^n - 1] \quad \text{and} \quad \cos \frac{n\pi}{2} = \frac{(i)^n}{2} [(-1)^n + 1], \quad \text{where } i^2 = -1.$$

### Auxiliary Formulas for Fourier Series

$$\begin{aligned}
 1 &= \frac{4}{\pi} \left[ \sin \frac{\pi x}{k} + \frac{1}{3} \sin \frac{3\pi x}{k} + \frac{1}{5} \sin \frac{5\pi x}{k} + \dots \right] & [0 < x < k] \\
 x &= \frac{2k}{\pi} \left[ \sin \frac{\pi x}{k} - \frac{1}{2} \sin \frac{2\pi x}{k} + \frac{1}{3} \sin \frac{3\pi x}{k} - \dots \right] & [-k < x < k] \\
 x &= \frac{k}{2} - \frac{4k}{\pi^2} \left[ \cos \frac{\pi x}{k} + \frac{1}{3^2} \cos \frac{3\pi x}{k} + \frac{1}{5^2} \cos \frac{5\pi x}{k} + \dots \right] & [0 < x < k] \\
 x^2 &= \frac{2k^2}{\pi^3} \left[ \left( \frac{\pi^2}{1} - \frac{4}{1} \right) \sin \frac{\pi x}{k} - \frac{\pi^2}{2} \sin \frac{2\pi x}{k} + \left( \frac{\pi^2}{3} - \frac{4}{3^3} \right) \sin \frac{3\pi x}{k} \right. \\
 &\quad \left. - \frac{\pi^2}{4} \sin \frac{4\pi x}{k} + \left( \frac{\pi^2}{5} - \frac{4}{5^3} \right) \sin \frac{5\pi x}{k} + \dots \right] & [0 < x < k] \\
 x^2 &= \frac{k^2}{3} - \frac{4k^2}{\pi^2} \left[ \cos \frac{\pi x}{k} - \frac{1}{2^2} \cos \frac{2\pi x}{k} + \frac{1}{3^2} \cos \frac{3\pi x}{k} - \frac{1}{4^2} \cos \frac{4\pi x}{k} + \dots \right] \\
 &\hspace{15em} [-k < x < k]
 \end{aligned}$$

$$\begin{aligned}
 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots &= \frac{\pi}{4} \\
 1 - \frac{1}{2^2} + \frac{1}{3^2} + \frac{1}{4^2} + \dots &= \frac{\pi^2}{6} \\
 1 - \frac{1}{2^2} + \frac{1}{3^2} - \frac{1}{4^2} + \dots &= \frac{\pi^2}{12} \\
 1 + \frac{1}{3^2} + \frac{1}{5^2} - \frac{1}{7^2} + \dots &= \frac{\pi^2}{8} \\
 \frac{1}{2^2} + \frac{1}{4^2} + \frac{1}{6^2} + \frac{1}{8^2} + \dots &= \frac{\pi^2}{24}
 \end{aligned}$$

## FOURIER EXPANSIONS FOR BASIC PERIODIC FUNCTIONS

$$f(x) = \frac{4}{\pi} \sum_{n=1,3,5,\dots} \frac{1}{n} \sin \frac{n\pi x}{L}$$

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \left( \cos \frac{n\pi c}{L} - 1 \right) \sin \frac{n\pi x}{L}$$

$$f(x) = \frac{c}{L} + \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \sin \frac{n\pi c}{L} \cos \frac{n\pi x}{L}$$

$$f(x) = \frac{2}{L} \sum_{n=1}^{\infty} \sin \frac{n\pi}{2} \frac{\sin(\frac{1}{2} n\pi c/L)}{\frac{1}{2} n\pi c/L} \sin \frac{n\pi x}{L}$$

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} \sin \frac{n\pi x}{L}$$

$$f(x) = \frac{1}{2} - \frac{4}{\pi^2} \sum_{n=1,3,5,\dots} \frac{1}{n^2} \cos \frac{n\pi x}{L}$$

$$f(x) = \frac{8}{\pi^2} \sum_{n=1,3,5,\dots} \frac{(-1)^{(n-1)/2}}{n^2} \sin \frac{n\pi x}{L}$$

$$f(x) = \frac{1}{2} - \frac{1}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{n\pi x}{L}$$

$$f(x) = \frac{1}{2}(1+a) + \frac{2}{\pi^2(1-a)} \sum_{n=1}^{\infty} \frac{1}{n^2} [(-1)^n \cos n\pi a - 1] \cos \frac{n\pi x}{L};$$

$$(a = \frac{c}{2L})$$

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} \left[ 1 + \frac{\sin n\pi a}{n\pi(1-a)} \right] \sin \frac{n\pi x}{L}; (a = \frac{c}{2L})$$

$$f(x) = \frac{1}{2} - \frac{4}{\pi^2(1-2a)} \sum_{n=1,3,5,\dots} \frac{1}{n^2} \cos n\pi a \cos \frac{n\pi x}{L}; (a = \frac{c}{2L})$$

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \left[ 1 + \frac{1+(-1)^n}{n\pi(1-2a)} \sin n\pi a \right] \sin \frac{n\pi x}{L}; (a = \frac{c}{2L})$$

$$f(x) \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{n\pi x}{4} \sin n\pi a \sin \frac{n\pi x}{L}; (a = \frac{c}{2L})$$

$$f(x) = \frac{9}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\pi}{3} \sin \frac{n\pi x}{L}; \left(a = \frac{c}{2L}\right)$$

$$f(x) = \frac{32}{3\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\pi}{4} \sin \frac{n\pi x}{L}; \left(a = \frac{c}{2L}\right)$$

$$f(x) = \frac{1}{\pi} + \frac{1}{2} \sin \omega t - \frac{2}{\pi} \sum_{n=2,4,6,\dots}^{\infty} \frac{1}{n^2-1} \cos n\omega t$$

## THE FOURIER TRANSFORMS

For a piecewise continuous function  $F(x)$  over a finite interval  $0 \leq x \leq \pi$ ; the *finite Fourier cosine transform* of  $F(x)$  is

$$f_c(n) = \int_0^\pi F(x) \cos nx \, dx \quad (n = 0, 1, 2, \dots)$$

If  $x$  ranges over the interval  $0 \leq x \leq L$ , the substitution  $x' = \pi x/L$  allows the use of this definition, also. The inverse transform is written.

$$\bar{F}(x) = \frac{1}{\pi} f_c(0) - \frac{2}{\pi} \sum_{n=1}^{\infty} f_c(n) \cos nx \quad (0 < x < \pi)$$

where  $F(x) = \frac{F(x+\epsilon) + F(x-\epsilon)}{2}$ . We observe that  $F(x+) = F(x-) = F(x)$  at points of continuity. The formula

$$\begin{aligned} f_c^{(2)}(n) &= \int_0^\pi F''(x) \cos nx \, dx \\ &= -n^2 f_c(n) - F'(0) + (-1)^n F'(\pi) \end{aligned} \quad (1)$$

makes the finite Fourier cosine transform useful in certain boundary value problems. Analogously, the *finite Fourier sine transform* of  $F(x)$  is

$$f_s(n) = \int_0^\pi F(x) \sin nx \, dx \quad (n = 1, 2, 3, \dots)$$

and

$$\bar{F}(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} f_s(n) \sin nx \quad (0 < x < \pi)$$

Corresponding to (1) we have

$$\begin{aligned} f_s^{(2)}(n) &= \int_0^\pi F''(x) \sin nx \, dx \\ &= -n^2 f_s(n) - n F(0) - n(-1)^n F(\pi) \end{aligned} \quad (2)$$

If  $F(x)$  is defined for  $x \leq 0$  and is piecewise continuous over any finite interval, and if  $\int_0^x F(x) \, dx$  is absolutely convergent, then

$$f_c(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^x F(x) \cos(\alpha x) \, dx$$

is the *Fourier cosine transform* of  $F(x)$ . Furthermore,

$$\bar{F}(x) = \sqrt{\frac{2}{\pi}} \int_0^x f_c(\alpha) \cos(\alpha x) d\alpha.$$

If  $\lim_{x \rightarrow \infty} d^n F/dx^n = 0$ , then an important property of the Fourier cosine transform is

$$f_c^{(2r)}(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^x \left( \frac{d^{2r} F}{dx^{2r}} \right) \cos(\alpha x) dx = -\sqrt{\frac{2}{\pi}} \sum_{n=0}^{r-1} (-1)^n a_{2r-2n-1} \alpha^{2n} + (-1)^r \alpha^{2r} f_c(\alpha) \quad (3)$$

where  $\lim_{x \rightarrow \infty} d^r F/dx^r = a_r$ , makes it useful in the solution of many problems.

Under the same conditions,

$$f_s(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^x F(x) \sin(\alpha x) dx$$

defines the *Fourier sine transform* of  $F(x)$ , and

$$\bar{F}(x) = \sqrt{\frac{2}{\pi}} \int_0^x f_s(\alpha) \sin(\alpha x) d\alpha$$

Corresponding to (3) we have

$$f_s^{(2r)}(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^\infty \frac{d^{2r} F}{dx^{2r}} \sin(\alpha x) dx = -\sqrt{\frac{2}{\pi}} \sum_{n=1}^r (-1)^n \alpha^{2n-1} a_{2r-2n} + (-1)^{r-1} \alpha^{2r} f_s(\alpha)$$

Similarly, if  $F(x)$  is defined for  $-\infty < x < \infty$ , and if  $\int_{-\infty}^\infty F(x) dx$  is absolutely convergent, then

$$f(\alpha) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^\infty F(x) e^{i\alpha x} dx$$

is the *Fourier transform* of  $F(x)$ , and

$$\bar{F}(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^\infty f(\alpha) e^{-i\alpha x} d\alpha$$

Also, if

$$\lim_{|x| \rightarrow \infty} \left| \frac{d^n F}{dx^n} \right| = 0 \quad (n = 1, 2, \dots, r-1)$$

then

$$f^{(r)}(\alpha) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^\infty F^{(r)}(x) e^{i\alpha x} dx = (-i\alpha)^r f(\alpha)$$

Finite Sine Transforms

## SERIES EXPANSION

The expression in parentheses following certain of the series indicates the region of convergence. If not otherwise indicated it is to be understood that the series converges for all finite values of  $x$ .

### Binomial Series

$$\begin{aligned}(x + y)^n &= x^n + nx^{n-1}y + \frac{n(n-1)}{2!}x^{n-2}y^2 + \frac{n(n-1)(n-2)}{3!}x^{n-3}y^3 + \dots (y^2 < x^2) \\(1 \pm x)^n &= 1 \pm nx + \frac{n(n-1)x^2}{2!} \pm \frac{n(n-1)(n-2)x^3}{3!} + \dots (x^2 < 1) \\(1 \pm x)^{-n} &= 1 \mp nx + \frac{n(n+1)x^2}{2!} \mp \frac{n(n+1)(n+2)x^3}{3!} + \dots (x^2 < 1) \\(1 \pm x)^{-1} &= 1 \mp x + x^2 \mp x^3 + x^4 \mp x^5 + \dots (x^2 < 1) \\(1 \pm x)^{-2} &= 1 \mp 2x + 3x^2 \mp 4x^3 + 5x^4 \mp 6x^5 + \dots (x^2 < 1)\end{aligned}$$

### Reversion of Series

Let a series be represented by

$$y = a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + \dots$$

with  $a_1 \neq 0$ . The coefficients of the series

$$x = A_1y + A_2y^2 + A_3y^3 + A_4y^4 + \dots$$

are

$$A_1 = \frac{1}{a_1} \quad A_2 = -\frac{a_2}{a_1^3} \quad A_3 = \frac{1}{a_1^5}(2a_2^2 - a_1a_3)$$

$$A_4 = \frac{1}{a_1^7}(5a_1a_2a_3 - a_1^2a_4 - 5a_2^3)$$

$$A_5 = \frac{1}{a_1^9}(6a_1^2a_2a_4 + 3a_1^2a_3^2 + 14a_2^4 - a_1^3a_5 - 21a_1a_2^2a_3)$$

$$A_6 = \frac{1}{a_1^{11}}(7a_1^3a_2a_5 + 7a_1^3a_3a_4 + 84a_1a_2^3a_3 - a_1^4a_6 - 28a_1^2a_2^2a_4 - 28a_1^2a_2a_3^2 - 42a_2^5)$$

$$A_7 = \frac{1}{a_1^{13}}(8a_1^4a_2a_6 + 8a_1^4a_3a_5 + 4a_1^4a_4^2 + 120a_1^2a_2^3a_4 + 180a_1^2a_2^2a_3^2 + 132a_2^6 - a_1^5a_7 - 36a_1^3a_2^2a_5 - 72a_1^3a_2a_3a_4 - 12a_1^3a_3^3 - 330a_1a_2^4a_3)$$

### Taylor Series

$$1. \quad f(x) = f(a) + (x-a)f'(a) + \frac{(x-a)^2}{2!}f''(a) + \frac{(x-a)^3}{3!}f'''(a) + \dots + \frac{(x-a)^n}{n!}f^{(n)}(a) + \dots \quad (\text{Taylor Series})$$

(Increment form)

$$2. \quad f(x+h) = f(x) + hf'(x) + \frac{h^2}{2!}f''(x) + \frac{h^3}{3!}f'''(x) + \dots \\ = f(h) + xf'(h) + \frac{x^2}{2!}f''(h) + \frac{x^3}{3!}f'''(h) + \dots$$

3. If  $f(x)$  is a function possessing derivatives of all orders throughout the interval  $a \leq x \leq b$ , then there is a value  $X$ , with  $a < X < b$ , such that

$$f(b) = f(a) + (b-a)f'(a) + \frac{(b-a)^2}{2!}f''(a) + \dots + \frac{(b-a)^{n-1}}{(n-1)!}f^{(n-1)}(a) + \frac{(b-a)^n}{n!}f^{(n)}(X)$$

$$f(a+h) = f(a) + hf'(a) + \frac{h^2}{2!}f''(a) + \dots + \frac{h^{n-1}}{(n-1)!}f^{(n-1)}(a) + \frac{h^n}{n!}f^{(n)}(a+\theta h)$$

where  $b = a+h$  and  $0 < \theta < 1$ . Or

$$f(x) = f(a) + (x-a)f'(a) + \frac{(x-a)^2}{2!}f''(a) + \dots + (x-a)^{n-1}\frac{f^{(n-1)}(a)}{(n-1)!} + R_n,$$

where

$$R_n = \frac{f^{(n)}[a + \theta \cdot (x-a)]}{n!}(x-a)^n, \quad 0 < \theta < 1.$$

The above forms are known as Taylor series with the remainder term.

4. Taylor series for a function of two variables

$$\text{If } \left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right) f(x, y) = h\frac{\partial f(x, y)}{\partial x} + k\frac{\partial f(x, y)}{\partial y};$$

$$\left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^2 f(x, y) = h^2\frac{\partial^2 f(x, y)}{\partial x^2} + 2hk\frac{\partial^2 f(x, y)}{\partial x\partial y} + k^2\frac{\partial^2 f(x, y)}{\partial y^2}$$

etc., and if  $\left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^n f(x, y)\Big|_{x=a}^{y=b}$  where the bar and subscripts mean that after differentiation we are to replace  $x$  by  $a$  and  $y$  by  $b$ , then

$$f(a+h, b+k) = f(a, b) + \left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right) f(x, y)\Big|_{x=a}^{y=b} + \dots + \frac{1}{n!} \left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^n f(x, y)\Big|_{x=a}^{y=b} + \dots$$

## Maclaurin Series

$$f(x) = f(0) + xf'(0) + \frac{x^2}{2!} f''(0) + \frac{x^3}{3!} f'''(0) + \cdots + x^{n-1} \frac{f^{(n-1)}(0)}{(n-1)!} + R_n,$$

where

$$R_n = \frac{x^n f^{(n)}(\theta x)}{n!}, \quad 0 < \theta < 1.$$

## Exponential Series

$$e = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \cdots$$

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots$$

$$a^x = 1 + x \log_e a + \frac{(x \log_e a)^2}{2!} + \frac{(x \log_e a)^3}{3!} + \cdots$$

$$e^x = e^a \left[ 1 + (x-a) + \frac{(x-a)^2}{2!} + \frac{(x-a)^3}{3!} + \cdots \right]$$

## Logarithmic Series

$$\log_e x = \frac{x-1}{x} + \frac{1}{2} \left( \frac{x-1}{x} \right)^2 + \frac{1}{3} \left( \frac{x-1}{x} \right)^3 + \cdots \quad (x > \frac{1}{2})$$

$$\log_e x = (x-1) - \frac{1}{2}(x-1)^2 + \frac{1}{3}(x-1)^3 - \cdots \quad (2 \geq x > 0)$$

$$\log_e x = 2 \left[ \frac{x-1}{x+1} + \frac{1}{3} \left( \frac{x-1}{x+1} \right)^3 + \frac{1}{5} \left( \frac{x-1}{x+1} \right)^5 + \cdots \right] \quad (x > 0)$$

$$\log_e(1+x) = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \cdots \quad (-1 < x \leq 1)$$

$$\log_e(n+1) - \log_e(n-1) = 2 \left[ \frac{1}{n} + \frac{1}{3n^3} + \frac{1}{5n^5} + \cdots \right]$$

$$\log_e(a+x) = \log_e a + 2 \left[ \frac{x}{2a+x} + \frac{1}{3} \left( \frac{x}{2a+x} \right)^3 + \frac{1}{5} \left( \frac{x}{2a+x} \right)^5 + \cdots \right] \quad (a > 0, -a < x < +\infty)$$

$$\log_e \frac{1+x}{1-x} = 2 \left[ x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots + \frac{x^{2n-1}}{2n-1} + \cdots \right] \quad -1 < x < 1$$

$$\log_e x = \log_e a + \frac{(x-a)}{a} - \frac{(x-a)^2}{2a^2} + \frac{(x-a)^3}{3a^3} - + \cdots \quad 0 < x \leq 2a$$

## Trigonometric Series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots \quad (\text{all real values of } x)$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots \quad (\text{all real values of } x)$$

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \cdots + \frac{(-1)^{n-1} 2^{2n} (2^{2n}-1) B_{2n}}{(2n)!} x^{2n-1} + \cdots,$$

$[x^2 < \frac{\pi^2}{4} \text{ and } B_n \text{ represents the } n^{\text{th}} \text{ Bernoulli number}]$

$$\cot x = \frac{1}{x} - \frac{x}{3} - \frac{x^3}{45} - \frac{2x^5}{945} - \frac{x^7}{4725} - \cdots - \frac{(-1)^{n+1} 2^{2n}}{(2n)!} B_{2n} x^{2n-1} - \cdots,$$

$[x^2 < \pi^2 \text{ and } B_n \text{ represents the } n^{\text{th}} \text{ Bernoulli number}]$

$$\sec x = 1 + \frac{x^2}{2} + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \frac{277}{8064}x^8 + \cdots + \frac{(-1)^n E_{2n}}{(2n)!} x^{2n} + \cdots,$$

$[x^2 < \frac{\pi^2}{4} \text{ and } E_n \text{ represents the } n^{\text{th}} \text{ Euler number}]$

$$\csc x = \frac{1}{x} + \frac{x}{6} + \frac{7}{360}x^3 + \frac{31}{15,120}x^5 + \frac{127}{604,800}x^7 + \cdots + \frac{(-1)^{n+1} 2(2^{2n-1}-1)}{(2n)!} B_{2n} x^{2n-1} + \cdots,$$

$[x^2 < \pi^2 \text{ and } B_n \text{ represents the } n^{\text{th}} \text{ Bernoulli number}]$

$$\sin x = x \left( 1 - \frac{x^2}{\pi^2} \right) \left( 1 - \frac{x^2}{2^2 \pi^2} \right) \left( 1 - \frac{x^2}{3^2 \pi^2} \right) \cdots \quad (x^2 < \infty)$$

$$[2pt] \cos x = \left( 1 - \frac{4x^2}{\pi^2} \right) \left( 1 - \frac{4x^2}{3^2 \pi^2} \right) \left( 1 - \frac{4x^2}{5^2 \pi^2} \right) \cdots \quad (x^2 < \infty)$$

$$[2pt] \sin^{-1} x = x + \frac{x^3}{2 \cdot 3} + \frac{1 \cdot 3}{2 \cdot 4 \cdot 5} x^5 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 7} x^7 + \cdots \quad \left( x^2 < 1, -\frac{\pi}{2} < \sin^{-1} x < \frac{\pi}{2} \right)$$

$$[2pt] \cos^{-1} x = \frac{\pi}{2} - \left( x + \frac{x^3}{2 \cdot 3} + \frac{1 \cdot 3}{2 \cdot 4 \cdot 5} x^5 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 7} x^7 + \cdots \right) \quad (x^2 < 1, 0 < \cos^{-1} x < \pi)$$

\end{aligned}$$

# VECTOR ANALYSIS

## Definitions

Any quantity that is completely determined by its magnitude is called a *scalar*. Examples of such are mass, density, temperature, etc. Any quantity that is completely determined by its magnitude and direction is called a *vector*. Examples of such are velocity, acceleration, force, etc. A vector quantity is represented by a directed line segment, the length of which represents the magnitude of the vector. A vector quantity is usually represented by a boldfaced letter such as  $\mathbf{V}$ . Two vectors  $\mathbf{V}_1$  and  $\mathbf{V}_2$  are equal to one another if they have equal magnitudes and are acting in the same directions. A negative vector, written as  $-\mathbf{V}$ , is one that acts in the opposite direction to  $\mathbf{V}$ , but is of equal magnitude to it. If we represent the magnitude of  $\mathbf{V}$  by  $v$ , we write  $|\mathbf{V}| = v$ . A vector parallel to  $\mathbf{V}$ , but equal to the reciprocal of its magnitude is written as  $\mathbf{V}^{-1}$  or as  $1/\mathbf{V}$ .

The *unit vector*  $\mathbf{V}/v$  (when  $v \neq 0$ ) is that vector which has the same direction as  $\mathbf{V}$ , but has a magnitude of unity (sometimes represented as  $\mathbf{V}_0$  or  $\hat{\mathbf{v}}$ ).

## Vector Algebra

The vector sum of  $\mathbf{V}_1$  and  $\mathbf{V}_2$  is represented by  $\mathbf{V}_1 + \mathbf{V}_2$ . The vector sum of  $\mathbf{V}_1$  and  $-\mathbf{V}_2$ , or the difference of the vector  $\mathbf{V}_2$  from  $\mathbf{V}_1$  is represented by  $\mathbf{V}_1 - \mathbf{V}_2$ .

If  $r$  is a scalar, then  $r\mathbf{V} = \mathbf{V}r$ , and represents a vector  $r$  times the magnitude of  $\mathbf{V}$ , in the same direction as  $\mathbf{V}$  if  $r$  is positive, and in the opposite direction if  $r$  is negative. If  $r$  and  $s$  are scalars,  $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3$ , vectors, then the following rules of scalars and vectors hold:

$$\begin{aligned} \mathbf{V}_1 + \mathbf{V}_2 &= \mathbf{V}_2 + \mathbf{V}_1 \\ (r + s)\mathbf{V}_1 &= r\mathbf{V}_1 + s\mathbf{V}_1; \quad r(\mathbf{V}_1 + \mathbf{V}_2) = r\mathbf{V}_1 + r\mathbf{V}_2 \\ \mathbf{V}_1 + (\mathbf{V}_2 + \mathbf{V}_3) &= (\mathbf{V}_1 + \mathbf{V}_2) + \mathbf{V}_3 = \mathbf{V}_1 + \mathbf{V}_2 + \mathbf{V}_3 \end{aligned}$$

## Vectors in Space

A plane is described by two distinct vectors  $\mathbf{V}_1$  and  $\mathbf{V}_2$ . Should these vectors not intersect each other, then one is displaced parallel to itself until they do (Figure 1). Any other vector  $\mathbf{V}$  lying in this plane is given by

$$\mathbf{V} = r\mathbf{V}_1 + s\mathbf{V}_2$$

A *position vector* specifies the position in space of a point relative to a fixed origin. If therefore  $\mathbf{V}_1$  and  $\mathbf{V}_2$  are the position vectors of the points  $A$  and  $B$ , relative to the origin  $O$ , then any point  $P$  on the line  $AB$  has a position vector  $\mathbf{V}$  given by

$$\mathbf{V} = r\mathbf{V}_1 + (1 - r)\mathbf{V}_2$$

The scalar “ $r$ ” can be taken as the metric representation of  $P$  since  $r = 0$  implies  $P = B$  and  $r = 1$  implies  $P = A$  (Figure 2). If  $P$  divides the line  $AB$  in the ratio  $r:s$  then

$$\mathbf{V} = \left( \frac{r}{r+s} \right) \mathbf{V}_1 + \left( \frac{s}{r+s} \right) \mathbf{V}_2$$

Figure 1.

Figure 2.

The vectors  $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3, \dots, \mathbf{V}_n$  are said to be *linearly dependent* if there exist scalars  $r_1, r_2, r_3, \dots, r_n$ , not all zero, such that

$$r_1\mathbf{V}_1 + r_2\mathbf{V}_2 + \dots + r_n\mathbf{V}_n = 0$$

A vector  $\mathbf{V}$  is linearly dependent upon the set of vectors  $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3, \dots, \mathbf{V}_n$  if

$$\mathbf{V} = r_1\mathbf{V}_1 + r_2\mathbf{V}_2 + r_3\mathbf{V}_3 + \dots + r_n\mathbf{V}_n$$

Three vectors are linearly dependent if and only if they are co-planar.

All points in space can be uniquely determined by linear dependence upon three *base vectors*, i.e., three vectors any one of which is linearly independent of the other two. The simplest set of base vectors is the unit vectors along the coordinate  $Ox$ ,  $Oy$  and  $Oz$  axes. These are usually designated by  $\mathbf{i}$ ,  $\mathbf{j}$  and  $\mathbf{k}$ , respectively.

If  $\mathbf{V}$  is a vector in space, and  $a$ ,  $b$  and  $c$  are the respective magnitudes of the projections of the vector along the axes then

$$\mathbf{V} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$$

and

$$v = \sqrt{a^2 + b^2 + c^2}$$

and the direction cosines of  $\mathbf{V}$  are

$$\cos \alpha = a/v, \quad \cos \beta = b/v, \quad \cos \gamma = c/v.$$

The law of addition yields

$$\mathbf{V}_1 + \mathbf{V}_2 = (a_1 + a_2)\mathbf{i} + (b_1 + b_2)\mathbf{j} + (c_1 + c_2)\mathbf{k}$$

### The Scalar, Dot, or Inner Product of Two Vectors

This product is represented as  $\mathbf{V}_1 \cdot \mathbf{V}_2$  and is defined to be equal to  $v_1v_2 \cos \theta$ , where  $\theta$  is the angle from  $\mathbf{V}_1$  to  $\mathbf{V}_2$ , i.e.,

$$\mathbf{V}_1 \cdot \mathbf{V}_2 = v_1v_2 \cos \theta$$

The following rules apply for this product:

$$\mathbf{V}_1 \cdot \mathbf{V}_2 = a_1a_2 + b_1b_2 + c_1c_2 = \mathbf{V}_2 \cdot \mathbf{V}_1$$

It should be noted that this verifies that scalar multiplication is commutative.

$$\begin{aligned} (\mathbf{V}_1 + \mathbf{V}_2) \cdot \mathbf{V}_3 &= \mathbf{V}_1 \cdot \mathbf{V}_3 + \mathbf{V}_2 \cdot \mathbf{V}_3 \\ \mathbf{V}_1 \cdot (\mathbf{V}_2 + \mathbf{V}_3) &= \mathbf{V}_1 \cdot \mathbf{V}_2 + \mathbf{V}_1 \cdot \mathbf{V}_3 \end{aligned}$$

If  $\mathbf{V}_1$  is perpendicular to  $\mathbf{V}_2$  then  $\mathbf{V}_1 \cdot \mathbf{V}_2 = 0$ , and if  $\mathbf{V}_1$  is parallel to  $\mathbf{V}_2$ , then  $\mathbf{V}_1 \cdot \mathbf{V}_2 = v_1v_2 = rv_1^2$ . In particular

$$\mathbf{i} \cdot \mathbf{i} = \mathbf{j} \cdot \mathbf{j} = \mathbf{k} \cdot \mathbf{k} = 1,$$

and

$$\mathbf{i} \cdot \mathbf{j} = \mathbf{j} \cdot \mathbf{k} = \mathbf{k} \cdot \mathbf{i} = 0$$

### The Vector or Cross Product of Two Vectors

This product is represented as  $\mathbf{V}_1 \times \mathbf{V}_2$  and is defined to be equal to  $v_1v_2(\sin \theta)\mathbf{1}$ , where  $\theta$  is the angle from  $\mathbf{V}_1$  to  $\mathbf{V}_2$  and  $\mathbf{1}$  is a unit vector perpendicular to the plane of  $\mathbf{V}_1$  and  $\mathbf{V}_2$  and so directed that a right-handed screw driven in the direction of  $\mathbf{1}$  would carry  $\mathbf{V}_1$  into  $\mathbf{V}_2$ , i.e.,

$$\mathbf{V}_1 \times \mathbf{V}_2 = v_1v_2(\sin \theta)\mathbf{1}$$

and  $\tan \theta = \frac{|\mathbf{V}_1 \times \mathbf{V}_2|}{\mathbf{V}_1 \cdot \mathbf{V}_2}$

The following rules apply for vector products:

$$\begin{aligned} \mathbf{V}_1 \times \mathbf{V}_2 &= -\mathbf{V}_2 \times \mathbf{V}_1 \\ \mathbf{V}_1 \times (\mathbf{V}_2 + \mathbf{V}_3) &= \mathbf{V}_1 \times \mathbf{V}_2 + \mathbf{V}_1 \times \mathbf{V}_3 \\ (\mathbf{V}_1 + \mathbf{V}_2) \times \mathbf{V}_3 &= \mathbf{V}_1 \times \mathbf{V}_3 + \mathbf{V}_2 \times \mathbf{V}_3 \\ \mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) &= \mathbf{V}_2(\mathbf{V}_3 \cdot \mathbf{V}_1) - \mathbf{V}_3(\mathbf{V}_1 \cdot \mathbf{V}_2) \\ \mathbf{i} \times \mathbf{i} &= \mathbf{j} \times \mathbf{j} = \mathbf{k} \times \mathbf{k} = \mathbf{0} \quad (\text{the zero vector}) \\ \mathbf{i} \times \mathbf{j} &= \mathbf{k}, \quad \mathbf{j} \times \mathbf{k} = \mathbf{i}, \quad \mathbf{k} \times \mathbf{i} = \mathbf{j} \end{aligned}$$

If  $\mathbf{V}_1 = a_1\mathbf{i} + b_1\mathbf{j} + c_1\mathbf{k}$ ,  $\mathbf{V}_2 = a_2\mathbf{i} + b_2\mathbf{j} + c_2\mathbf{k}$ , and  $\mathbf{V}_3 = a_3\mathbf{i} + b_3\mathbf{j} + c_3\mathbf{k}$ , then

$$\mathbf{V}_1 \times \mathbf{V}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = (b_1c_2 - b_2c_1)\mathbf{i} + (c_1a_2 - c_2a_1)\mathbf{j} + (a_1b_2 - a_2b_1)\mathbf{k}$$

It should be noted that, since  $\mathbf{V}_1 \times \mathbf{V}_2 = -\mathbf{V}_2 \times \mathbf{V}_1$ , the vector product is not commutative.

### Scalar Triple Product

There is only one possible interpretation of the expression  $\mathbf{V}_1 \cdot (\mathbf{V}_2 \times \mathbf{V}_3)$  and that is  $\mathbf{V}_1 \cdot (\mathbf{V}_2 \times \mathbf{V}_3)$  which is obviously a scalar. Further

$$\begin{aligned}\mathbf{V}_1 \cdot (\mathbf{V}_2 \times \mathbf{V}_3) &= (\mathbf{V}_1 \times \mathbf{V}_2) \cdot \mathbf{V}_3 = \mathbf{V}_2 \cdot (\mathbf{V}_3 \times \mathbf{V}_1) \\ &= \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \\ &= r_1 r_2 r_3 \cos \phi \sin \theta,\end{aligned}$$

Where  $\theta$  is the angle between  $\mathbf{V}_2$  and  $\mathbf{V}_3$  and  $\phi$  is the angle between  $\mathbf{V}_1$  and the normal to the plane of  $\mathbf{V}_2$  and  $\mathbf{V}_3$ .

This product is called the *scalar triple product* and is written as  $[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3]$ .

The determinant indicates that it can be considered as the volume of the parallelepiped whose three determining edges are  $\mathbf{V}_1$ ,  $\mathbf{V}_2$  and  $\mathbf{V}_3$ .

It also follows that cyclic permutation of the subscripts does not change the value of the scalar triple product so that

$$\begin{aligned}[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] &= [\mathbf{V}_2 \mathbf{V}_3 \mathbf{V}_1] = [\mathbf{V}_3 \mathbf{V}_1 \mathbf{V}_2] \\ \text{but } [\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] &= -[\mathbf{V}_2 \mathbf{V}_1 \mathbf{V}_3] \quad \text{etc.} \quad \text{and} \quad [\mathbf{V}_1 \mathbf{V}_1 \mathbf{V}_2] \equiv 0 \quad \text{etc.}\end{aligned}$$

Given three non-coplanar reference vectors  $\mathbf{V}_1$ ,  $\mathbf{V}_2$  and  $\mathbf{V}_3$ , the *reciprocal system* is given by  $\mathbf{V}_1^*$ ,  $\mathbf{V}_2^*$  and  $\mathbf{V}_3^*$ , where

$$\begin{aligned}1 &= v_1 v_1^* = v_2 v_2^* = v_3 v_3^* \\ 0 &= v_1 v_2^* = v_1 v_3^* = v_2 v_1^* \quad \text{etc.} \\ \mathbf{V}_1^* &= \frac{\mathbf{V}_2 \times \mathbf{V}_3}{[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3]}, \quad \mathbf{V}_2^* = \frac{\mathbf{V}_3 \times \mathbf{V}_1}{[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3]}, \quad \mathbf{V}_3^* = \frac{\mathbf{V}_1 \times \mathbf{V}_2}{[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3]}\end{aligned}$$

The system  $\mathbf{i}, \mathbf{j}, \mathbf{k}$  is its own reciprocal.

### Vector Triple Product

The product  $\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3)$  defines the *vector triple product*. Obviously, in this case, the brackets are vital to the definition.

$$\begin{aligned}\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) &= (\mathbf{V}_1 \cdot \mathbf{V}_3) \mathbf{V}_2 - (\mathbf{V}_1 \cdot \mathbf{V}_2) \mathbf{V}_3 \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & b_1 & c_1 \\ \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} & \begin{vmatrix} c_2 & a_2 \\ c_3 & a_3 \end{vmatrix} & \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix} \end{vmatrix}\end{aligned}$$

i.e., it is a vector, perpendicular to  $\mathbf{V}_1$ , lying in the plane of  $\mathbf{V}_2, \mathbf{V}_3$ . Similarly

$$\begin{aligned}(\mathbf{V}_1 \times \mathbf{V}_2) \times \mathbf{V}_3 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \end{vmatrix} & \begin{vmatrix} c_1 & a_1 \\ c_2 & a_2 \end{vmatrix} & \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix} \\ a_3 & b_3 & c_3 \end{vmatrix} \\ \mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) + \mathbf{V}_2 \times (\mathbf{V}_3 \times \mathbf{V}_1) + \mathbf{V}_3 \times (\mathbf{V}_1 \times \mathbf{V}_2) &\equiv 0\end{aligned}$$

If  $\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) = (\mathbf{V}_1 \times \mathbf{V}_2) \times \mathbf{V}_3$ , then  $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3$  form an *orthogonal set*. Thus  $\mathbf{i}, \mathbf{j}, \mathbf{k}$  form an orthogonal set.

### Geometry of the Plane, Straight Line and Sphere

The position vectors of the fixed points  $A, B, C, D$  relative to  $O$  are  $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3, \mathbf{V}_4$  and the position vector of the variable point  $P$  is  $\mathbf{V}$ .

The vector form of the equation of the straight line through  $A$  parallel to  $\mathbf{V}_2$  is

$$\begin{aligned}\mathbf{V} &= \mathbf{V}_1 + r \mathbf{V}_2 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) &= r \mathbf{V}_2 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) \times \mathbf{V}_2 &= 0\end{aligned}$$

while that of the plane through  $A$  perpendicular to  $\mathbf{V}_2$  is

$$(\mathbf{V} - \mathbf{V}_1) \cdot \mathbf{V}_2 = 0$$

The equation of the line  $AB$  is

$$\mathbf{V} = r \mathbf{V}_1 + (1 - r) \mathbf{V}_2$$

and those of the bisectors of the angles between  $\mathbf{V}_1$  and  $\mathbf{V}_2$  are

$$\begin{aligned}\mathbf{V} &= r \left( \frac{\mathbf{V}_1}{v_1} \pm \frac{\mathbf{V}_2}{v_2} \right) \quad \text{or} \\ \mathbf{V} &= r (\hat{\mathbf{v}}_1 \pm \hat{\mathbf{v}}_2)\end{aligned}$$

The perpendicular from  $C$  to the line through  $A$  parallel to  $\mathbf{V}_2$  has as its equation

$$\mathbf{V} = \mathbf{V}_1 - \mathbf{V}_3 - \hat{\mathbf{v}}_2 \cdot (\mathbf{V}_1 - \mathbf{V}_3) \hat{\mathbf{v}}_2.$$

The condition for the intersection of the two lines,  $\mathbf{V} = \mathbf{V}_1 + r\mathbf{V}_3$  and  $\mathbf{V} = \mathbf{V}_2 + s\mathbf{V}_4$ , is

$$[(\mathbf{V}_1 - \mathbf{V}_2)\mathbf{V}_3\mathbf{V}_4] = 0.$$

The common perpendicular to the above two lines is the line of intersection of the two planes

$$[(\mathbf{V} - \mathbf{V}_1)\mathbf{V}_3(\mathbf{V}_3 \times \mathbf{V}_4)] = 0 \quad \text{and} \quad [(\mathbf{V} - \mathbf{V}_2)\mathbf{V}_4(\mathbf{V}_3 \times \mathbf{V}_4)] = 0$$

and the length of this perpendicular is

$$\frac{[(\mathbf{V}_1 - \mathbf{V}_2)\mathbf{V}_3\mathbf{V}_4]}{|\mathbf{V}_3 \times \mathbf{V}_4|}.$$

The equation of the line perpendicular to the plane  $ABC$  is

$$\mathbf{V} = \mathbf{V}_1 \times \mathbf{V}_2 + \mathbf{V}_2 \times \mathbf{V}_3 + \mathbf{V}_3 \times \mathbf{V}_1$$

and the distance of the plane from the origin is

$$\frac{[\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3]}{|(\mathbf{V}_2 - \mathbf{V}_1) \times (\mathbf{V}_3 - \mathbf{V}_1)|}.$$

In general the vector equation

$$\mathbf{V} \cdot \mathbf{V}_2 = r$$

defines the plane which is perpendicular to  $\mathbf{V}_2$ , and the perpendicular distance from  $A$  to this plane is

$$\frac{r - \mathbf{V}_1 \cdot \mathbf{V}_2}{v_2}$$

The distance from  $A$ , measured along a line parallel to  $\mathbf{V}_3$ , is

$$\frac{r - \mathbf{V}_1 \cdot \mathbf{V}_2}{\mathbf{V}_2 \cdot \hat{\mathbf{v}}_3} \quad \text{or} \quad \frac{r - \mathbf{V}_1 \cdot \mathbf{V}_2}{v_2 \cos \theta}$$

where  $\theta$  is the angle between  $\mathbf{V}_2$  and  $\mathbf{V}_3$ . (If this plane contains the point  $C$  then  $r = \mathbf{V}_3 \cdot \mathbf{V}_2$  and if it passes through the origin, then  $r = 0$ .) Given two planes

$$\begin{aligned} \mathbf{V} \cdot \mathbf{V}_1 &= r \\ \mathbf{V} \cdot \mathbf{V}_2 &= s \end{aligned}$$

then any plane through the line of intersection of these two planes is given by

$$\mathbf{V} \cdot (\mathbf{V}_1 + \lambda\mathbf{V}_2) = r + \lambda s$$

where  $\lambda$  is a scalar parameter. In particular  $\lambda = \pm v_1/v_2$  yields the equation of the two planes bisecting the angle between the given planes.

The plane through  $A$  parallel to the plane of  $\mathbf{V}_2, \mathbf{V}_3$  is

$$\begin{aligned} \mathbf{V} &= \mathbf{V}_1 + r\mathbf{V}_2 + s\mathbf{V}_3 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) \cdot \mathbf{V}_2 \times \mathbf{V}_3 &= 0 \\ \text{or } [\mathbf{V}\mathbf{V}_2\mathbf{V}_3] - [\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3] &= 0 \end{aligned}$$

so that the expansion in rectangular Cartesian coordinates yields (where  $\mathbf{V} \equiv x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ ):

$$\begin{vmatrix} (x - a_1) & (y - b_1) & (z - c_1) \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$$

which is obviously the usual linear equation in  $x, y$ , and  $z$ .

The plane through  $AB$  parallel to  $\mathbf{V}_3$  is given by

$$\begin{aligned} [(\mathbf{V} - \mathbf{V}_1)(\mathbf{V}_1 - \mathbf{V}_2)\mathbf{V}_3] &= 0 \\ \text{or } [\mathbf{V}\mathbf{V}_2\mathbf{V}_3] - [\mathbf{V}\mathbf{V}_1\mathbf{V}_3] - [\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3] &= 0 \end{aligned}$$

The plane through the three points  $A, B$  and  $C$  is

$$\begin{aligned} \mathbf{V} &= \mathbf{V}_1 + s(\mathbf{V}_2 - \mathbf{V}_1) + t(\mathbf{V}_3 - \mathbf{V}_1) \\ \text{or } \mathbf{V} &= r\mathbf{V}_1 + s\mathbf{V}_2 + t\mathbf{V}_3 \quad (r + s + t \equiv 1) \\ \text{or } [(\mathbf{V} - \mathbf{V}_1)(\mathbf{V}_1 - \mathbf{V}_2)(\mathbf{V}_2 - \mathbf{V}_3)] &= 0 \\ \text{or } [\mathbf{V}\mathbf{V}_1\mathbf{V}_2] + [\mathbf{V}\mathbf{V}_2\mathbf{V}_3] + [\mathbf{V}\mathbf{V}_3\mathbf{V}_1] - [\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3] &= 0 \end{aligned}$$

For four points  $A, B, C, D$  to be coplanar, then

$$r\mathbf{V}_1 + s\mathbf{V}_2 + t\mathbf{V}_3 + u\mathbf{V}_4 \equiv 0 \equiv r + s + t + u$$

The following formulas relate to a sphere when the vectors are taken to lie in three-dimensional space and to a circle when the space is two dimensional. For a circle in three dimensions, take the intersection of the sphere with a plane.

The equation of a sphere with center  $O$  and radius  $OA$  is

$$\begin{aligned} \mathbf{V} \cdot \mathbf{V} &= v_1^2 \quad (\text{not } \mathbf{V} = \mathbf{V}_1) \\ \text{or } (\mathbf{V} - \mathbf{V}_1) \cdot (\mathbf{V} + \mathbf{V}_1) &= 0 \end{aligned}$$

while that of a sphere with center  $B$  radius  $v_1$  is

$$\begin{aligned} (\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) &= v_1^2 \\ \text{or } \mathbf{V} \cdot (\mathbf{V} - 2\mathbf{V}_2) &= v_1^2 - v_2^2 \end{aligned}$$

If the above sphere passes through the origin, then

$$\mathbf{V} \cdot (\mathbf{V} - 2\mathbf{V}_2) = 0$$

Note that in two-dimensional polar coordinates this is simply

$$r = 2a \cdot \cos \theta$$

while in three-dimensional Cartesian coordinates it is

$$x^2 + y^2 + z^2 - 2(a_2x + b_2y + c_2z) = 0.$$

The equation of a sphere having the points  $A$  and  $B$  as the extremities of a diameter is

$$(\mathbf{V} - \mathbf{V}_1) \cdot (\mathbf{V} - \mathbf{V}_2) = 0.$$

The square of the length of the tangent from  $C$  to the sphere with center  $B$  and radius  $v_1$  is given by

$$(\mathbf{V}_3 - \mathbf{V}_2) \cdot (\mathbf{V}_3 - \mathbf{V}_2) = v_1^2$$

The condition that the plane  $\mathbf{V} \cdot \mathbf{V}_3 = s$  is tangential to the sphere  $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$  is

$$(s - \mathbf{V}_3 \cdot \mathbf{V}_2) \cdot (s - \mathbf{V}_3 \cdot \mathbf{V}_2) = v_1^2 v_3^2.$$

The equation of the tangent plane at  $D$ , on the surface of sphere  $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$ , is

$$\begin{aligned} (\mathbf{V} - \mathbf{V}_4) \cdot (\mathbf{V}_4 - \mathbf{V}_2) &= 0 \\ \text{or } \mathbf{V} \cdot \mathbf{V}_4 - \mathbf{V}_2 \cdot (\mathbf{V} + \mathbf{V}_4) &= v_1^2 - v_2^2 \end{aligned}$$

The condition that the two circles  $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$  and  $(\mathbf{V} - \mathbf{V}_4) \cdot (\mathbf{V} - \mathbf{V}_4) = v_3^2$  intersect orthogonally is clearly

$$(\mathbf{V}_2 - \mathbf{V}_4) \cdot (\mathbf{V}_2 - \mathbf{V}_4) = v_1^2 + v_3^2$$

The polar plane of  $D$  with respect to the circle

$$\begin{aligned} (\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) &= v_1^2 \quad \text{is} \\ \mathbf{V} \cdot \mathbf{V}_4 - \mathbf{V}_2 \cdot (\mathbf{V} + \mathbf{V}_4) &= v_1^2 - v_2^2 \end{aligned}$$

Any sphere through the intersection of the two spheres  $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$  and  $(\mathbf{V} - \mathbf{V}_4) \cdot (\mathbf{V} - \mathbf{V}_4) = v_3^2$  is given by

$$(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) + \lambda(\mathbf{V} - \mathbf{V}_4) \cdot (\mathbf{V} - \mathbf{V}_4) = v_1^2 + \lambda v_3^2$$

while the radical plane of two such spheres is

$$\mathbf{V} \cdot (\mathbf{V}_2 - \mathbf{V}_4) = -\frac{1}{2}(v_1^2 - v_2^2 - v_3^2 + v_4^2)$$

**Differentiation of Vectors**

If  $\mathbf{V}_1 = a_1\mathbf{i} + b_1\mathbf{j} + c_1\mathbf{k}$ , and  $\mathbf{V}_2 = a_2\mathbf{i} + b_2\mathbf{j} + c_2\mathbf{k}$ , and if  $\mathbf{V}_1$  and  $\mathbf{V}_2$  are functions of the scalar  $t$ , then

$$\begin{aligned} \frac{d}{dt}(\mathbf{V}_1 + \mathbf{V}_2 + \dots) &= \frac{d\mathbf{V}_1}{dt} + \frac{d\mathbf{V}_2}{dt} + \dots \\ \frac{d\mathbf{V}_1}{dt} &= \frac{da_1}{dt}\mathbf{i} + \frac{db_1}{dt}\mathbf{j} + \frac{dc_1}{dt}\mathbf{k}, \quad \text{etc} \\ \frac{d}{dt}(\mathbf{V}_1 \cdot \mathbf{V}_2) &= \frac{d\mathbf{V}_1}{dt} \cdot \mathbf{V}_2 + \mathbf{V}_1 \cdot \frac{d\mathbf{V}_2}{dt} \\ \frac{d}{dt}(\mathbf{V}_1 \times \mathbf{V}_2) &= \frac{d\mathbf{V}_1}{dt} \times \mathbf{V}_2 + \mathbf{V}_1 \times \frac{d\mathbf{V}_2}{dt} \\ \mathbf{V} \cdot \frac{d\mathbf{V}}{dt} &= v \cdot \frac{dv}{dt} \end{aligned}$$

In particular, if  $\mathbf{V}$  is a vector of constant length, then the right-hand side of the last equation is identically zero showing that  $\mathbf{V}$  is perpendicular to its derivative.

The derivatives of the triple products are

$$\begin{aligned} \frac{d}{dt}[\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3] &= \left[ \left( \frac{d\mathbf{V}_1}{dt} \right) \mathbf{V}_2\mathbf{V}_3 \right] + \left[ \mathbf{V}_1 \left( \frac{d\mathbf{V}_2}{dt} \right) \mathbf{V}_3 \right] + \left[ \mathbf{V}_1\mathbf{V}_2 \left( \frac{d\mathbf{V}_3}{dt} \right) \right] \quad \text{and} \\ \frac{d}{dt}\{\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3)\} &= \left( \frac{d\mathbf{V}_1}{dt} \right) \times (\mathbf{V}_2 \times \mathbf{V}_3) + \mathbf{V}_1 \times \left( \left( \frac{d\mathbf{V}_2}{dt} \right) \times \mathbf{V}_3 \right) + \mathbf{V}_1 \times \left( \mathbf{V}_2 \times \left( \frac{d\mathbf{V}_3}{dt} \right) \right) \end{aligned}$$

**Geometry of Curves in Space**

$s$  = the *length of arc*, measured from some fixed point on the curve (Figure 3).

$\mathbf{V}_1$  = the position vector of the point  $A$  on the curve.

$\mathbf{V}_1 + \delta\mathbf{V}_1$  = the position vector of the point  $P$  in the neighborhood of  $A$ .

$\hat{\mathbf{t}}$  = the *unit tangent* to the curve at the point  $A$ , measured in the direction of  $s$  increasing.

The *normal plane* is that plane which is perpendicular to the unit tangent. The principal normal is defined as the intersection of the normal plane with the plane defined by  $\mathbf{V}_1$  and  $\mathbf{V}_1 + \delta\mathbf{V}_1$  in the limit as  $\delta\mathbf{V}_1 \rightarrow 0$ .

$\hat{\mathbf{n}}$  = the *unit normal* (principal) at the point  $A$ . The plane defined by  $\hat{\mathbf{t}}$  and  $\hat{\mathbf{n}}$  is called the *osculating plane* (alternatively plane of curvature or local plane).

$\rho$  = the radius of curvature at  $A$ .

$\delta\theta$  = the angle subtended at the origin by  $\delta\mathbf{V}_1$ .

$$\kappa = \frac{d\theta}{ds} = \frac{1}{\rho}$$

$\hat{\mathbf{b}}$  = the *unit binormal* i.e., the unit vector which is parallel to  $\hat{\mathbf{t}} \times \hat{\mathbf{n}}$  at the point  $A$

$\lambda$  = the *torsion* of the curve at  $A$ .

Figure 3.

*Frenet's Formulas:*

$$\begin{aligned} \frac{d\hat{\mathbf{t}}}{ds} &= \kappa \hat{\mathbf{n}} \\ \frac{d\hat{\mathbf{n}}}{ds} &= -\kappa \hat{\mathbf{t}} + \lambda \hat{\mathbf{b}} \\ \frac{d\hat{\mathbf{b}}}{ds} &= -\lambda \hat{\mathbf{n}} \end{aligned}$$

The following formulas are also applicable:

Unit tangent	$\hat{\mathbf{t}} = \frac{d\mathbf{V}_1}{ds}$
Equation of the tangent	$(\mathbf{V} - \mathbf{V}_1) \times \hat{\mathbf{t}} = 0 \quad \text{or} \quad \mathbf{V} = \mathbf{V}_1 + q\hat{\mathbf{t}}$
Unit normal	$\hat{\mathbf{n}} = \frac{1}{\kappa} \frac{d^2\mathbf{V}_1}{ds^2}$
Equation of the normal plane	$(\mathbf{V} - \mathbf{V}_1) \cdot \hat{\mathbf{t}} = 0$
Equation of the normal	$(\mathbf{V} - \mathbf{V}_1) \times \hat{\mathbf{n}} = 0 \quad \text{or} \quad \mathbf{V} = \mathbf{V}_1 + r\hat{\mathbf{n}}$
Unit binormal	$\hat{\mathbf{b}} = \hat{\mathbf{t}} \times \hat{\mathbf{n}}$
Equation of the binormal	$(\mathbf{V} - \mathbf{V}_1) \times \hat{\mathbf{b}} = 0$ or $\mathbf{V} = \mathbf{V}_1 + u\hat{\mathbf{b}}$
Equation of the osculating plane	$[(\mathbf{V} - \mathbf{V}_1)\hat{\mathbf{t}}\hat{\mathbf{n}}] = 0$ or $\left[ (\mathbf{V} - \mathbf{V}_1) \left( \frac{d\mathbf{V}_1}{ds} \right) \left( \frac{d^2\mathbf{V}_1}{ds^2} \right) \right] = 0$

**Differential Operators—Rectangular Coordinates**

$$dS = \frac{\partial S}{\partial x} \cdot dx + \frac{\partial S}{\partial y} \cdot dy + \frac{\partial S}{\partial z} \cdot dz$$

By definition

$$\nabla \equiv \text{del} \equiv \mathbf{i} \frac{\partial}{\partial x} + \mathbf{j} \frac{\partial}{\partial y} + \mathbf{k} \frac{\partial}{\partial z}$$

$$\nabla^2 \equiv \text{Laplacian} \equiv \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} + \frac{\partial^2}{\partial z^2}$$

If  $S$  is a scalar function, then  $\nabla S \equiv \text{grad } S \equiv \frac{\partial S}{\partial x} \mathbf{i} + \frac{\partial S}{\partial y} \mathbf{j} + \frac{\partial S}{\partial z} \mathbf{k}$ .

Grad  $S$  defines both the direction and magnitude of the maximum rate of increase of  $S$  at any point. Hence the name *gradient* and also its vectorial nature.  $\nabla S$  is independent of the choice of rectangular coordinates.

Figure 4.

$$\nabla S = \frac{\partial S}{\partial n} \hat{\mathbf{n}} \tag{4}$$

where  $\hat{\mathbf{n}}$  is the unit normal to the surface  $S = \text{constant}$ , in the direction of  $S$  increasing. The total derivative of  $S$  at a point having the position vector  $\mathbf{V}$  is given by (Figure 4)

$$dS = \frac{\partial S}{\partial n} \hat{\mathbf{n}} \cdot d\mathbf{V}$$

$$= d\mathbf{V} \cdot \nabla S$$

and the directional derivative of  $S$  in the direction of  $\mathbf{U}$  is

$$\mathbf{U} \cdot \nabla S = \mathbf{U} \cdot (\nabla S) = (\mathbf{U} \cdot \nabla) S$$

Similarly the directional derivative of the vector  $\mathbf{V}$  in the direction of  $\mathbf{U}$  is

$$(\mathbf{U} \cdot \nabla) \mathbf{V}$$

The *distributive* law holds for finding a gradient. Thus if  $S$  and  $T$  are scalar functions

$$\nabla(S + T) = \nabla S + \nabla T$$

The *associative* law becomes the rule for differentiating a product:

$$\nabla(ST) = S\nabla T + T\nabla S$$

If  $\mathbf{V}$  is a vector function with the magnitudes of the components parallel to the three coordinate axes  $V_x, V_y, V_z$ , then

$$\nabla \cdot \mathbf{V} \equiv \text{div } \mathbf{V} \equiv \frac{\partial V_x}{\partial x} + \frac{\partial V_y}{\partial y} + \frac{\partial V_z}{\partial z}$$

The divergence obeys the distributive law. Thus, if  $\mathbf{V}$  and  $\mathbf{U}$  are vector functions, then

$$\begin{aligned}\nabla \cdot (\mathbf{V} + \mathbf{U}) &= \nabla \cdot \mathbf{V} + \nabla \cdot \mathbf{U} \\ \nabla \cdot (S\mathbf{V}) &= (\nabla S) \cdot \mathbf{V} + S(\nabla \cdot \mathbf{V}) \\ \nabla \cdot (\mathbf{U} \times \mathbf{V}) &= \mathbf{V} \cdot (\nabla \times \mathbf{U}) - \mathbf{U} \cdot (\nabla \times \mathbf{V})\end{aligned}$$

As with the gradient of a scalar, the divergence of a vector is invariant under a transformation from one set of rectangular coordinates to another.

$$\begin{aligned}\nabla \times \mathbf{V} &\equiv \text{curl } \mathbf{V} \quad (\text{sometimes } \nabla \wedge \mathbf{V} \text{ or } \text{rot } \mathbf{V}) \\ &\equiv \left( \frac{\partial V_x}{\partial y} - \frac{\partial V_y}{\partial x} \right) \mathbf{i} + \left( \frac{\partial V_x}{\partial z} - \frac{\partial V_z}{\partial x} \right) \mathbf{j} + \left( \frac{\partial V_y}{\partial z} - \frac{\partial V_z}{\partial y} \right) \mathbf{k} \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ V_x & V_y & V_z \end{vmatrix}\end{aligned}$$

The *curl* (or *rotation*) of a vector is a vector that is invariant under a transformation from one set of rectangular coordinates to another.

$$\begin{aligned}\nabla \times (\mathbf{U} + \mathbf{V}) &= \nabla \times \mathbf{U} + \nabla \times \mathbf{V} \\ \nabla \times (S\mathbf{V}) &= (\nabla S) \times \mathbf{V} + S(\nabla \times \mathbf{V}) \\ \nabla \times (\mathbf{U} \times \mathbf{V}) &= (\mathbf{V} \cdot \nabla)\mathbf{U} - (\mathbf{U} \cdot \nabla)\mathbf{V} + \mathbf{U}(\nabla \cdot \mathbf{V}) - \mathbf{V}(\nabla \cdot \mathbf{U})\end{aligned}$$

If  $\mathbf{V} = V_x\mathbf{i} + V_y\mathbf{j} + V_z\mathbf{k}$ , then

$$\begin{aligned}\nabla \cdot \mathbf{V} &= \nabla V_x \cdot \mathbf{i} + \nabla V_y \cdot \mathbf{j} + \nabla V_z \cdot \mathbf{k} \\ \text{and } \nabla \times \mathbf{V} &= \nabla V_x \times \mathbf{i} + \nabla V_y \times \mathbf{j} + \nabla V_z \times \mathbf{k}\end{aligned}$$

The operator  $\nabla$  can be used more than once. The possibilities where  $\nabla$  is used twice are:

$$\begin{aligned}\nabla \cdot (\nabla\theta) &\equiv \text{div grad } \theta \\ \nabla \times (\nabla\theta) &\equiv \text{curl grad } \theta \\ \nabla(\nabla \cdot \mathbf{V}) &\equiv \text{grad div } \mathbf{V} \\ \nabla \cdot (\nabla \times \mathbf{V}) &\equiv \text{div curl } \mathbf{V} \\ \nabla \times (\nabla \times \mathbf{V}) &\equiv \text{curl curl } \mathbf{V}\end{aligned}$$

Thus, if  $S$  is a scalar and  $\mathbf{V}$  is a vector:

$$\begin{aligned}\text{div grad } S &\equiv \nabla \cdot (\nabla S) \equiv \text{Laplacian } S \equiv \nabla^2 S \equiv \frac{\partial^2 S}{\partial x^2} + \frac{\partial^2 S}{\partial y^2} + \frac{\partial^2 S}{\partial z^2} \\ \text{curl grad } S &\equiv 0 \\ \text{curl curl } \mathbf{V} &\equiv \text{grad div } \mathbf{V} - \nabla^2 \mathbf{V}; \\ \text{div curl } \mathbf{V} &\equiv 0\end{aligned}$$

Taylor expansion in three dimensions can be written

$$\begin{aligned}f(\mathbf{V} + \boldsymbol{\varepsilon}) &= e^{\boldsymbol{\varepsilon} \cdot \nabla} f(\mathbf{V}) \quad \text{where } \mathbf{V} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k} \\ \text{and } \boldsymbol{\varepsilon} &= h\mathbf{i} + l\mathbf{j} + m\mathbf{k}\end{aligned}$$

## ORTHOGONAL CURVILINEAR COORDINATES

If at a point  $P$  there exist three uniform point functions  $u$ ,  $v$  and  $w$  so that the surfaces  $u = \text{const.}$ ,  $v = \text{const.}$ , and  $w = \text{const.}$ , intersect in three distinct curves through  $P$ , then the surfaces are called the *coordinate surfaces* through  $P$ . The three lines of intersection are referred to as the *coordinate lines* and their tangents  $a$ ,  $b$ , and  $c$  as the *coordinate axes*. When the coordinate axes form an orthogonal set the system is said to define *orthogonal curvilinear coordinates* at  $P$ .

Consider an infinitesimal volume enclosed by the surfaces  $u, v, w, u + du, v + dv, \text{ and } w + dw$  (Figure 5).

Figure 5.

The surface  $PRS \equiv u = \text{constant}$ , and the face of the curvilinear figure immediately opposite this is  $u + du = \text{constant}$ , etc. In terms of these surface constants

$$\begin{aligned} P &= P(u, v, w) \\ Q &= Q(u + du, v, w) \quad \text{and} \quad PQ = h_1 du \\ R &= R(u, v + dv, w) \quad \text{and} \quad PR = h_2 dv \\ S &= S(u, v, w + dw) \quad \text{and} \quad PS = h_3 dw \end{aligned}$$

where  $h_1, h_2, \text{ and } h_3$  are functions of  $u, v, \text{ and } w$ .

- In rectangular Cartesians  $\hat{i}, \hat{j}, \hat{k}$

$$\begin{aligned} h_1 &= 1, \quad h_2 = 1, \quad h_3 = 1. \\ \frac{\hat{\mathbf{a}}}{h_1} \frac{\partial}{\partial u} &= \hat{\mathbf{i}} \frac{\partial}{\partial x}, \quad \frac{\hat{\mathbf{b}}}{h_2} \frac{\partial}{\partial v} = \hat{\mathbf{j}} \frac{\partial}{\partial y}, \quad \frac{\hat{\mathbf{c}}}{h_3} \frac{\partial}{\partial w} = \hat{\mathbf{k}} \frac{\partial}{\partial z}. \end{aligned}$$

- In cylindrical Cartesians  $\hat{\mathbf{r}}, \hat{\theta}, \hat{\mathbf{z}}$

$$\begin{aligned} h_1 &= 1, \quad h_2 = r, \quad h_3 = 1. \\ \frac{\hat{\mathbf{a}}}{h_1} \frac{\partial}{\partial u} &= \hat{\mathbf{r}} \frac{\partial}{\partial r}, \quad \frac{\hat{\mathbf{b}}}{h_2} \frac{\partial}{\partial v} = \frac{\hat{\theta}}{r} \frac{\partial}{\partial \theta}, \quad \frac{\hat{\mathbf{c}}}{h_3} \frac{\partial}{\partial w} = \hat{\mathbf{z}} \frac{\partial}{\partial z}. \end{aligned}$$

- In spherical coordinates  $\hat{\mathbf{r}}, \hat{\theta}, \hat{\psi}$

$$\begin{aligned} h_1 &= 1, \quad h_2 = r, \quad h_3 = r \sin \theta \\ \frac{\hat{\mathbf{a}}}{h_1} \frac{\partial}{\partial u} &= \hat{\mathbf{r}} \frac{\partial}{\partial r}, \quad \frac{\hat{\mathbf{b}}}{h_2} \frac{\partial}{\partial v} = \frac{\hat{\theta}}{r} \frac{\partial}{\partial \theta}, \quad \frac{\hat{\mathbf{c}}}{h_3} \frac{\partial}{\partial w} = \frac{\hat{\psi}}{r \sin \theta} \frac{\partial}{\partial \psi} \end{aligned}$$

The general expressions for grad, div and curl together with those for  $\nabla^2$  and the directional derivative are, in orthogonal curvilinear coordinates, given by:

$$\begin{aligned} \nabla S &= \frac{\hat{\mathbf{a}}}{h_1} \frac{\partial S}{\partial u} + \frac{\hat{\mathbf{b}}}{h_2} \frac{\partial S}{\partial v} + \frac{\hat{\mathbf{c}}}{h_3} \frac{\partial S}{\partial w} \\ (\mathbf{V} \cdot \nabla) S &= \frac{V_1}{h_1} \frac{\partial S}{\partial u} + \frac{V_2}{h_2} \frac{\partial S}{\partial v} + \frac{V_3}{h_3} \frac{\partial S}{\partial w} \\ \nabla \cdot \mathbf{V} &= \frac{1}{h_1 h_2 h_3} \left\{ \frac{\partial}{\partial u} (h_2 h_3 V_1) + \frac{\partial}{\partial v} (h_3 h_1 V_2) + \frac{\partial}{\partial w} (h_1 h_2 V_3) \right\}. \\ \nabla \times \mathbf{V} &= \frac{\hat{\mathbf{a}}}{h_2 h_3} \left\{ \frac{\partial}{\partial v} (h_3 V_3) - \frac{\partial}{\partial w} (h_2 V_2) \right\} + \frac{\hat{\mathbf{b}}}{h_3 h_1} \left\{ \frac{\partial}{\partial w} (h_1 V_1) - \frac{\partial}{\partial u} (h_3 V_3) \right\} \\ &\quad + \frac{\hat{\mathbf{c}}}{h_1 h_2} \left\{ \frac{\partial}{\partial u} (h_2 V_2) - \frac{\partial}{\partial v} (h_1 V_1) \right\} \\ \nabla^2 S &= \frac{1}{h_1 h_2 h_3} \left\{ \frac{\partial}{\partial u} \left( \frac{h_2 h_3}{h_1} \frac{\partial S}{\partial u} \right) + \frac{\partial}{\partial v} \left( \frac{h_3 h_1}{h_2} \frac{\partial S}{\partial v} \right) + \frac{\partial}{\partial w} \left( \frac{h_1 h_2}{h_3} \frac{\partial S}{\partial w} \right) \right\} \end{aligned}$$

## Formulas of Vector Analysis

	Rectangular coordinates	Cylindrical coordinates	Spherical coordinates
Conversion to rectangular coordinates		$x = r \cos \varphi \quad y = r \sin \varphi \quad z = z$	$x = r \cos \varphi \sin \theta \quad y = r \sin \varphi \sin \theta$ $z = r \cos \theta$
Gradient...	$\nabla \phi = \frac{\partial \phi}{\partial x} \mathbf{i} + \frac{\partial \phi}{\partial y} \mathbf{j} + \frac{\partial \phi}{\partial z} \mathbf{k}$	$\nabla \phi = \frac{\partial \phi}{\partial r} \mathbf{r} + \frac{1}{r} \frac{\partial \phi}{\partial \varphi} \Phi + \frac{\partial \phi}{\partial z} \mathbf{k}$	$\nabla \phi = \frac{\partial \phi}{\partial r} \mathbf{r} + \frac{1}{r} \frac{\partial \phi}{\partial \theta} \theta + \frac{1}{r \sin \theta} \frac{\partial \phi}{\partial \varphi} \Phi$

## TRANSFORMATION OF INTEGRALS

If

1.  $s$  is the distance along a curve "C" in space and is measured from some fixed point.
2.  $S$  is a surface area
3.  $V$  is a volume contained by a specified surface
4.  $\hat{\mathbf{t}}$  = the unit tangent to  $C$  at the point
5.  $\hat{\mathbf{n}}$  = the unit outward pointing normal
6.  $F$  is some vector function
7.  $ds$  is the vector element of curve ( $= \hat{\mathbf{t}} ds$ )
8.  $dS$  is the vector element of surface ( $= \hat{\mathbf{n}} dS$ )

then

$$\int_{(c)} \mathbf{F} \cdot \hat{\mathbf{t}} ds = \int_{(c)} \mathbf{F}$$

and when  $F = \nabla\phi$

$$\int_C (\nabla\phi) \cdot \hat{\mathbf{t}} ds = \int_C d\phi$$

*Gauss' Theorem*

When  $S$  defines a closed region having a volume  $V$ :

$$\iiint_V (\nabla \cdot \mathbf{F}) dV = \iint_S \mathbf{F} \cdot (\hat{\mathbf{n}}) dS = \iint_S \mathbf{F} \cdot dS$$

also

$$\iiint_V (\nabla\phi) dV = \iint_S \phi \hat{\mathbf{n}} dS$$

and

$$\iiint_V (\nabla \times \mathbf{F}) dV = \iint_S (\hat{\mathbf{n}} \times \mathbf{F}) dS$$

*Stokes' Theorem*

When  $C$  is closed and bounds the open surface  $S$ :

$$\iint_S \hat{\mathbf{n}} \cdot (\nabla \times \mathbf{F}) dS = \int_C \mathbf{F} \cdot ds$$

also

$$\iint_S (\hat{\mathbf{n}} \times \nabla\phi) dS = \int_{(c)} \phi ds$$

*Green's Theorem*

$$\begin{aligned} \iint_S (\nabla\phi \cdot \nabla\theta) dS &= \iint_S \phi \hat{\mathbf{n}} \cdot (\nabla\theta) dS = \iiint_V \phi (\nabla^2\theta) dV \\ &= \iint_S \theta \cdot \hat{\mathbf{n}} (\nabla\phi) dS = \iiint_V \phi (\nabla^2\theta) dV \end{aligned}$$

## MOMENT OF INERTIA FOR VARIOUS BODIES OF MASS

The mass of the body is indicated by  $m$

Body	Axis	Moment of inertia
Uniform thin rod of length $l$	Normal to the length, at one end	$m\frac{1}{3}l^2$
Uniform thin rod of length $l$	Normal to the length, at the center	$m\frac{1}{12}l^2$
Thin rectangular sheet, sides $a$ and $b$	Through the center parallel to $b$	$m\frac{1}{12}a^2$
Thin rectangular sheet, sides $a$ and $b$	Through the center perpendicular to the sheet	$m\frac{1}{12}(a^2 + b^2)$
Thin circular sheet of radius $r$	Normal to the plate through the center	$m\frac{1}{2}r^2$
Thin circular sheet of radius $r$	Along any diameter	$m\frac{1}{4}r^2$
Thin circular ring. Radii $r_1$ and $r_2$	Through center normal to plane of ring	$m\frac{1}{2}(r_1^2 + r_2^2)$
Thin circular ring. Radii $r_1$ and $r_2$	Any diameter	$m\frac{1}{4}(r_1^2 + r_2^2)$
Rectangular parallelepiped, edges $a$ , $b$ , and $c$	Through center perpendicular to face $ab$ , (parallel to edge $c$ )	$m\frac{1}{12}(a^2 + b^2)$
Sphere, radius $r$	Any diameter	$m\frac{2}{5}r^2$
Spherical shell, external radius, $r_1$ , internal radius $r_2$	Any diameter	$m\frac{2}{5}\frac{(r_1^5 - r_2^5)}{(r_1^3 - r_2^3)}$
Spherical shell, very thin, mean radius, $r$	Any diameter	$m\frac{2}{3}r^2$
Right circular cylinder of radius $r$ , length $l$	The longitudinal axis of the solid	$m\frac{1}{2}r^2$
Right circular cylinder of radius $r$ , length $l$	Transverse diameter	$m\left(\frac{r^2}{4} + \frac{l^2}{12}\right)$
Hollow circular cylinder, length $l$ , radii $r_1$ and $r_2$	The longitudinal axis of the figure	$m\frac{1}{2}(r_1^2 + r_2^2)$
Thin cylindrical shell, length $l$ , mean radius, $r$	The longitudinal axis of the figure	$mr^2$
Hollow circular cylinder, length $l$ , radii $r_1$ and $r_2$	Transverse diameter	$m\left(\frac{r_1^2 + r_2^2}{4} + \frac{l^2}{12}\right)$
Hollow circular cylinder, length $l$ , very thin, mean radius $r$	Transverse diameter	$m\left(\frac{r^2}{2} + \frac{l^2}{12}\right)$
Elliptic cylinder, length $l$ , transverse semiaxes $a$ and $b$	Longitudinal axis	$m\frac{1}{4}(a^2 + b^2)$
Right cone, altitude $h$ , radius of base $r$	Axis of the figure	$m\frac{3}{10}r^2$
Spheroid of revolution, equatorial radius $r$	Polar axis	$m\frac{2}{5}r^2$
Ellipsoid, axes $2a$ , $2b$ , $2c$	Axis $2a$	$m\frac{1}{5}(b^2 + c^2)$

## BESSEL FUNCTIONS

1. Bessel's differential equation for a real variable  $x$  is

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0$$

2. When  $n$  is not an integer, two independent solutions of the equation are  $J_n(x)$  and  $J_{-n}(x)$  where

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

3. If  $n$  is an integer, then  $J_n(x) = (-1)^n J_{-n}(x)$ , where

$$J_n(x) = \frac{x^n}{2^n n!} \left\{ 1 - \frac{x^2}{2^2 \cdot 1!(n+1)} + \frac{x^4}{2^4 \cdot 2!(n+1)(n+2)} + \frac{x^6}{2^6 \cdot 3!(n+1)(n+2)(n+3)} + \dots \right\}$$

4. For  $n = 0$  and  $n = 1$ , this formula becomes

$$J_0(x) = 1 - \frac{x^2}{2^2(1!)^2} + \frac{x^4}{2^4(2!)^2} - \frac{x^6}{2^6(3!)^2} + \frac{x^8}{2^8(4!)^2} - \dots$$

$$J_1(x) = \frac{x}{2} - \frac{x^3}{2^3 \cdot 1!2!} + \frac{x^5}{2^5 \cdot 2!3!} - \frac{x^7}{2^7 \cdot 3!4!} + \frac{x^9}{2^9 \cdot 4!5!} - \dots$$

5. When  $x$  is large and positive, the following asymptotic series may be used

$$J_0(x) = \left(\frac{2}{\pi x}\right)^{\frac{1}{2}} \left\{ P_0(x) \cos\left(x - \frac{\pi}{4}\right) - Q_0(x) \sin\left(x - \frac{\pi}{4}\right) \right\}$$

$$J_1(x) = \left(\frac{2}{\pi x}\right)^{\frac{1}{2}} \left\{ P_1(x) \cos\left(x - \frac{3\pi}{4}\right) - Q_1(x) \sin\left(x - \frac{3\pi}{4}\right) \right\}$$

where

$$P_0(x) \sim 1 - \frac{1^2 \cdot 3^2}{2!(8x)^2} + \frac{1^2 \cdot 3^2 \cdot 5^2 \cdot 7^2}{4!(8x)^4} - \frac{1^2 \cdot 3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2 \cdot 11^2}{6!(8x)^6} + \dots$$

$$Q_0(x) \sim -\frac{1^2}{1!8x} + \frac{1^2 \cdot 3^2 \cdot 5^2}{3!(8x)^3} - \frac{1^2 \cdot 3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2}{5!(8x)^5} + \dots$$

$$P_1(x) \sim 1 + \frac{1^2 \cdot 3 \cdot 5}{2!(8x)^2} - \frac{1^2 \cdot 3^2 \cdot 5^2 \cdot 7 \cdot 9}{4!(8x)^4} + \frac{1^2 \cdot 3^2 \cdot 5^2 \cdot 7^2 \cdot 9^2 \cdot 11 \cdot 13}{6!(8x)^6} - \dots$$

$$Q_1(x) \sim \frac{1 \cdot 3}{1!8x} - \frac{1^2 \cdot 3^2 \cdot 5 \cdot 7}{3!(8x)^3} + \frac{1^2 \cdot 3^2 \cdot 5^2 \cdot 7^2 \cdot 9 \cdot 11}{5!(8x)^5} - \dots$$

[In  $P_1(x)$  the signs alternate from + to - after the first term]

6. The zeros of  $J_0(x)$  and  $J_1(x)$ .

If  $j_{0s}$  and  $j_{1s}$  are the  $s$ th zeros of  $J_0(x)$  and  $J_1(x)$ , respectively, and if  $a = 4_s - 1$ ,  $b = 4_s + 1$

$$j_{0,s} \sim \frac{1}{4} \pi a \left\{ 1 + \frac{2}{\pi^2 a^2} - \frac{62}{3\pi^4 a^4} + \frac{15,116}{15\pi^6 a^6} - \frac{12,554,474}{105\pi^8 a^8} + \frac{8,368,654,292}{315\pi^{10} a^{10}} - \dots \right\}$$

$$j_{1,s} \sim \frac{1}{4} \pi b \left\{ 1 - \frac{6}{\pi^2 b^2} + \frac{6}{\pi^4 b^4} - \frac{4716}{5\pi^6 b^6} + \frac{3,902,418}{35\pi^8 b^8} - \frac{895,167,324}{35\pi^{10} b^{10}} + \dots \right\}$$

$$J_1(j_{0,s}) \sim \frac{(-1)^{s+1} 2^{\frac{3}{2}}}{\pi a^{\frac{1}{2}}} \left\{ 1 - \frac{56}{3\pi^4 a^4} + \frac{9664}{5\pi^6 a^6} - \frac{7,381,280}{21\pi^8 a^8} + \dots \right\}$$

$$J_0(j_{1,s}) \sim \frac{(-1)^s 2^{\frac{3}{2}}}{\pi b^{\frac{1}{2}}} \left\{ 1 + \frac{24}{\pi^4 b^4} - \frac{19,584}{10\pi^6 b^6} + \frac{2,466,720}{7\pi^8 b^8} - \dots \right\}$$

7. Table of zeros for  $J_0(x)$  and  $J_1(x)$

Define  $\{\alpha_n, \beta_n\}$  by  $J_0(\alpha_n) = 0$  and  $J_1(\beta_n) = 0$ .

Roots $\alpha_n$	$J_1(\alpha_n)$	Roots $\beta_n$	$J_0(\beta_n)$
2.4048	0.5191	0.0000	1.0000
5.5201	-0.3403	3.8317	-0.4028
8.6537	0.2715	7.0156	0.3001
11.7915	-0.2325	10.1735	-0.2497
14.9309	0.2065	13.3237	0.2184
18.0711	-0.1877	16.4706	-0.1965
21.2116	0.1733	19.6159	0.1801

8. Recurrence formulas

$$\begin{aligned} J_{n-1}(x) + J_{n+1}(x) &= \frac{2n}{x} J_n(x) & nJ_n(x) + xJ'_n(x) &= xJ_{n-1}(x) \\ J_{n-1}(x) - J_{n+1}(x) &= 2J'_n(x) & nJ_n(x) - xJ'_n(x) &= xJ_{n+1}(x) \end{aligned}$$

9. If  $J_n$  is written for  $J_n(x)$  and  $J_n^{(k)}$  is written for  $\frac{d^k}{dx^k}\{J_n(x)\}$ , then the following derivative relationships are important

$$\begin{aligned} J_0^{(r)} &= -J_1^{(r-1)} \\ J_0^{(2)} &= -J_0 + \frac{1}{x}J_1 = \frac{1}{2}(J_2 - J_0) \\ J_0^{(3)} &= \frac{1}{x}J_0 + \left(1 - \frac{2}{x^2}\right)J_1 = \frac{1}{4}(-J_3 + 3J_1) \\ J_0^{(4)} &= \left(1 - \frac{3}{x^2}\right)J_0 - \left(\frac{2}{x} - \frac{6}{x^3}\right)J_1 = \frac{1}{8}(J_4 - 4J_2 + 3J_0), \text{ etc.} \end{aligned}$$

10. Half-order Bessel functions

$$\begin{aligned} J_{\frac{1}{2}}(x) &= \sqrt{\frac{2}{\pi x}} \sin x \\ J_{-\frac{1}{2}}(x) &= \sqrt{\frac{2}{\pi x}} \cos x \\ J_{n+\frac{3}{2}}(x) &= -x^{n+\frac{1}{2}} \frac{d}{dx} \{x^{-(n+\frac{1}{2})} J_{n+\frac{1}{2}}(x)\} \\ J_{n-\frac{1}{2}}(x) &= x^{-(n+\frac{1}{2})} \frac{d}{dx} \{x^{n+\frac{1}{2}} J_{n+\frac{1}{2}}(x)\} \end{aligned}$$

n	$\left(\frac{\pi x}{2}\right)^{\frac{1}{2}} J_{n+\frac{1}{2}}(x)$	$\left(\frac{\pi x}{2}\right)^{\frac{1}{2}} J_{-(n+\frac{1}{2})}(x)$
0	$\sin x$	$\cos x$
1	$\frac{\sin x}{x} - \cos x$	$-\frac{\cos x}{x} - \sin x$
2	$\left(\frac{3}{x^2} - 1\right) \sin x - \frac{3}{x} \cos x$	$\left(\frac{3}{x^2} - 1\right) \cos x + \frac{3}{x} \sin x$
3	$\left(\frac{15}{x^3} - \frac{6}{x}\right) \sin x - \left(\frac{15}{x^2} - 1\right) \cos x$ etc.	$-\left(\frac{15}{x^3} - \frac{6}{x}\right) \cos x - \left(\frac{15}{x^2} - 1\right) \sin x$

11. Additional solutions to Bessel's equation are

$$\begin{aligned} Y_n(x) & \text{ (also called Weber's function, and sometimes denoted by } N_n(x)) \\ H_n^{(1)}(x) & \text{ and } H_n^{(2)}(x) \text{ (also called Hankel functions)} \end{aligned}$$

These solutions are defined as follows

$$Y_n(x) = \begin{cases} \frac{J_n(x) \cos(n\pi) - J_{-n}(x)}{\sin(n\pi)} & n \text{ not an integer} & H_n^{(1)}(x) = J_n(x) + iY_n(x) \\ \lim_{\nu \rightarrow n} \frac{J_\nu(x) \cos(\nu\pi) - J_{-\nu}(x)}{\sin(\nu\pi)} & n \text{ an integer} & H_n^{(2)}(x) = J_n(x) - iY_n(x) \end{cases}$$

The additional properties of these functions may all be derived from the above relations and the known properties of  $J_n(x)$ .

12. Complete solutions to Bessel's equation may be written as

$$c_1 J_n(x) + c_2 J_{-n}(x) \quad \text{if } n \text{ is not an integer}$$

or, for any value of  $n$ ,

$$c_1 J_n(x) + c_2 Y_n(x) \quad \text{or} \quad c_1 H_n^{(1)}(x) + c_2 H_n^{(2)}(x)$$

13. The modified (or hyperbolic) Bessel's differential equation is

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} - (x^2 + n^2)y = 0$$

14. When  $n$  is not an integer, two independent solutions of the equation are  $I_n(x)$  and  $I_{-n}(x)$ , where

$$I_n(x) = \sum_{k=0}^{\infty} \frac{1}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

15. If  $n$  is an integer,

$$I_n(x) = I_{-n}(x) = \frac{x^n}{2^n n!} \left\{ 1 + \frac{x^2}{2^2 \cdot 1!(n+1)} + \frac{x^4}{2^4 \cdot 2!(n+1)(n+2)} + \frac{x^6}{2^6 \cdot 3!(n+1)(n+2)(n+3)} + \dots \right\}$$

16. For  $n = 0$  and  $n = 1$ , this formula becomes

$$I_0(x) = 1 + \frac{x^2}{2^2(1!)^2} + \frac{x^4}{2^4(2!)^2} + \frac{x^6}{2^6(3!)^2} + \frac{x^8}{2^8(4!)^2} + \dots$$

$$I_1(x) = \frac{x}{2} + \frac{x^3}{2^3 \cdot 1!2!} + \frac{x^5}{2^5 \cdot 2!3!} + \frac{x^7}{2^7 \cdot 3!4!} + \frac{x^9}{2^9 \cdot 4!5!} + \dots$$

17. Another solution to the modified Bessel's equation is

$$K_n(x) = \begin{cases} \frac{1}{2} \pi \frac{I_{-n}(x) - I_n(x)}{\sin(n\pi)} & n \text{ not an integer} \\ \lim_{\nu \rightarrow n} \frac{1}{2} \pi \frac{I_{-\nu}(x) - I_{\nu}(x)}{\sin(\nu\pi)} & n \text{ an integer} \end{cases}$$

This function is linearly independent of  $I_n(x)$  for all values of  $n$ . Thus the complete solution to the modified Bessel's equation may be written as

$$c_1 I_n(x) + c_2 I_{-n}(x) \quad n \text{ not an integer}$$

or

$$c_1 I_n(x) + c_2 K_n(x) \quad \text{any } n$$

18. The following relations hold among the various Bessel functions:

$$I_n(z) = i^{-n} J_n(iz)$$

$$Y_n(iz) = (i)^{n+1} I_n(z) - \frac{2}{\pi} i^{-n} K_n(z)$$

Most of the properties of the modified Bessel function may be deduced from the known properties of  $J_n(x)$  by use of these relations and those previously given.

19. Recurrence formulas

$$I_{n-1}(x) - I_{n+1}(x) = \frac{2n}{x} I_n(x) \quad I_{n-1}(x) + I_{n+1}(x) = 2I'_n(x)$$

$$I_{n-1}(x) - \frac{n}{x} I_n(x) = I'_n(x) \quad I'_n(x) = I_{n+1}(x) + \frac{n}{x} I_n(x)$$

## THE FACTORIAL FUNCTION

For non-negative integers  $n$ , the factorial of  $n$ , denoted  $n!$ , is the product of all positive integers less than or equal to  $n$ ;  $n! = n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1$ . If  $n$  is a negative integer ( $n = -1, -2, \dots$ ), then  $n! = \pm\infty$ .

Approximations to  $n!$  for large  $n$  include Stirling's formula

$$n! \approx \sqrt{2\pi e} \left(\frac{n}{e}\right)^{n+\frac{1}{2}},$$

and Burnside's formula

$$n! \approx \sqrt{2\pi} \left(\frac{n+\frac{1}{2}}{e}\right)^{n+\frac{1}{2}}.$$

$n$	$n!$	$\log_{10} n!$	$n$	$n!$	$\log_{10} n!$
0	1	0.00000	1	1	0.00000

## THE GAMMA FUNCTION

*Definition:*  $\Gamma(n) = \int_0^{\infty} t^{n-1} e^{-t} dt \quad n > 0$

*Recursion Formula:*  $\Gamma(n+1) = n\Gamma(n)$   
 $\Gamma(n+1) = n!$  if  $n = 0, 1, 2, \dots$  where  $0! = 1$   
 For  $n < 0$  the gamma function can be defined by using  
 $\Gamma(n) = \frac{\Gamma(n+1)}{n}$

*Graph:*

*Special Values:*

$$\Gamma(1/2) = \sqrt{\pi}$$

$$\Gamma(m+1/2) = \frac{1 \cdot 3 \cdot 5 \cdots (2m-1)}{2^m} \sqrt{\pi} \quad m = 1, 2, 3, \dots$$

$$\Gamma(-m+1/2) = \frac{(-1)^m 2^m \sqrt{\pi}}{1 \cdot 3 \cdot 5 \cdots (2m-1)} \quad m = 1, 2, 3, \dots$$

*Definition:*

$$\Gamma(x+1) = \lim_{k \rightarrow \infty} \frac{1 \cdot 2 \cdot 3 \cdots k}{(x+1)(x+2)\cdots(x+k)} k^x$$

$$\frac{1}{\Gamma(x)} = x e^{\gamma x} \prod_{m=1}^{\infty} \left\{ \left(1 + \frac{x}{m}\right) e^{-x/m} \right\}$$

This is an infinite product representation for the gamma function where  $\gamma$  is Euler's constant.

Properties:

$$\Gamma'(1) = \int_0^{\infty} e^{yx} \ln x dx = -\gamma$$

$$\frac{\Gamma'(x)}{\Gamma(x)} = -\gamma + \left(\frac{1}{1} - \frac{1}{x}\right) + \left(\frac{1}{2} - \frac{1}{x+1}\right) + \dots + \left(\frac{1}{n} - \frac{1}{x+n-1}\right) + \dots$$

$$\Gamma(x+1) = \sqrt{2\pi x} x^x e^{-x} \left\{1 + \frac{1}{12x} + \frac{1}{288x^2} - \frac{139}{51,840x^3} + \dots\right\}$$

This is called *Stirling's asymptotic series*.

$$\text{Values of } \Gamma(n) = \int_0^{\infty} e^{-x} x^{n-1} dx; \quad \Gamma(n+1) = n\Gamma(n)$$

## THE BETA FUNCTION

*Definition:*  $B(m, n) = \int_0^1 t^{m-1}(1-t)^{n-1} dt \quad m > 0, n > 0$

*Relationship with Gamma function:*  $B(m, n) = \frac{\Gamma(m)\Gamma(n)}{\Gamma(m+n)}$

*Properties:*

$$B(m, n) = B(n, m)$$

$$B(m, n) = 2 \int_0^{\pi/2} \sin^{2m-1} \theta \cos^{2n-1} \theta d\theta$$

$$B(m, n) = \int_0^{\infty} \frac{t^{m-1}}{(1+t)^{m+n}} dt$$

$$B(m, n) = r^n (r+1)^m \int_0^1 \frac{t^{m-1}(1-t)^{n-1}}{(r+t)^{m+n}} dt$$

## THE ERROR FUNCTION

*Definition:*  $\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$

*Series:*  $\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \left( x - \frac{x^3}{3} + \frac{1}{2!} \frac{x^5}{5} - \frac{1}{3!} \frac{x^7}{7} + \dots \right)$

*Property:*  $\operatorname{erf}(x) = -\operatorname{erf}(-x)$

*Relationship with Normal Probability Function*  $f(t) : \int_0^x f(t) dt = \frac{1}{2} \operatorname{erf} \left( \frac{x}{\sqrt{2}} \right)$  To evaluate  $\operatorname{erf}(2.3)$ , one proceeds as follows:

For  $\frac{x}{\sqrt{2}} = 2.3$ , one finds  $x = (2.3)(\sqrt{2}) = 3.25$ . In the normal probability function table (page A-104), one finds the entry 0.4994 opposite the value 3.25. Thus  $\operatorname{erf}(2.3) = 2(0.4994) = 0.9988$ .

$$\operatorname{erfc}(z) = 1 - \operatorname{erf}(z) = \frac{2}{\sqrt{\pi}} \int_z^{\infty} e^{-t^2} dt$$

is known as the complementary error function.

## ORTHOGONAL POLYNOMIALS

### I: Legendre

Name: Legendre    Symbol:  $P_n(x)$     Interval:  $[-1, 1]$   
Differential Equation:  $(1 - x^2)y'' - 2xy' + n(n + 1)y = 0$

Explicit Expression:  $P_n(x) = \frac{1}{2^n} \sum_{m=0}^{\lfloor n/2 \rfloor} (-1)^m \binom{n}{m} \binom{2n - 2m}{n} x^{n-2m}$

Recurrence Relation:  $(n + 1)P_{n+1}(x) = (2n + 1)xP_n(x) - nP_{n-1}(x)$   
Weight: 1

Standardization:  $P_n(1) = 1$

Norm:  $\int_{-1}^{+1} [P_n(x)]^2 dx = \frac{2}{2n + 1}$

Rodrigues' Formula:  $P_n(x) = \frac{(-1)^n}{2^n n!} \frac{d^n}{dx^n} \{(1 - x^2)^n\}$

Generating Function:  $R^{-1} = \sum_{n=0}^{\infty} P_n(x)z^n; -1 < x < 1, |z| < 1,$   
 $R = \sqrt{1 - 2xz + z^2}$

Inequality:  $|P_n(x)| \leq 1, -1 \leq x \leq 1.$

### II: Tschebysheff, First Kind

Name: Tschebysheff, First Kind    Symbol:  $T_n(x)$     Interval:  $[-1, 1]$   
Differential Equation:  $(1 - x^2)y - xy' + n^2y = 0$

Explicit Expression:  $\frac{n}{2} \sum_{m=0}^{\lfloor n/2 \rfloor} (-1)^m \frac{(n - m - 1)!}{m!(n - 2m)!} (2x)^{n-2m} = \cos(n \arccos x) = T_n(x)$

Recurrence Relation:  $T_{n+1}(x) = 2xT_n(x) - T_{n-1}(x)$

Weight:  $(1 - x^2)^{-1/2}$

Standardization:  $T_n(1) = 1$

$$\text{Norm: } \int_{-1}^{+1} (1-x^2)^{-1/2} [T_n(x)]^2 dx = \begin{cases} \pi/2, & n \neq 0 \\ \pi, & n = 0 \end{cases}$$

$$\text{Rodrigues' Formula: } \frac{(-1)^n (1-x^2)^{1/2} \sqrt{\pi}}{2^{n+1} \Gamma(n + \frac{1}{2})} \frac{d^n}{dx^n} \{(1-x^2)^{n-(1/2)}\} = T_n(x)$$

$$\text{Generating Function: } \frac{1-xz}{1-2xz-z^2} = \sum_{n=0}^{\infty} T_n(x) z^n, \quad -1 < x < 1, \quad |z| < 1$$

$$\text{Inequality: } |T_n(x)| \leq 1, \quad -1 \leq x \leq 1.$$

### III: Tschebysheff, Second Kind

$$\text{Name: Tschebysheff, Second Kind} \quad \text{Symbol } U_n(x) \quad \text{Interval: } [-1, 1]$$

$$\text{Differential Equation: } (1-x^2)y'' - 3xy' + n(n+2)y = 0$$

$$\text{Explicit Expression: } U_n(x) = \sum_{m=0}^{\lfloor n/2 \rfloor} (-1)^m \frac{(m-n)!}{m!(n-2m)!} (2x)^{n-2m}$$

$$U_n(\cos \theta) = \frac{\sin[(n+1)\theta]}{\sin \theta}$$

$$\text{Recurrence Relation: } U_{n+1}(x) = 2xU_n(x) - U_{n-1}(x)$$

$$\text{Weight: } (1-x^2)^{1/2} \quad \text{Standardization: } U_n(1) = n+1$$

$$\text{Norm: } \int_{-1}^{+1} (1-x^2)^{1/2} [U_n(x)]^2 dx = \frac{\pi}{2}$$

$$\text{Rodrigues' Formula: } U_n(x) = \frac{(-1)^n (n+1) \sqrt{\pi}}{(1-x^2)^{1/2} 2^{n+1} \Gamma(n + \frac{3}{2})} \frac{d^n}{dx^n} \{(1-x^2)^{n+(1/2)}\}$$

$$\text{Generating Function: } \frac{1}{1-2xz+z^2} = \sum_{n=0}^{\infty} U_n(x) z^n, \quad -1 < x < 1, \quad |z| < 1$$

$$\text{Inequality: } |U_n(x)| \leq n+1, \quad -1 \leq x \leq 1.$$

### IV: Jacobi

$$\text{Name: Jacobi} \quad \text{Symbol: } P_n^{(\alpha, \beta)}(x) \quad \text{Interval: } [-1, 1]$$

$$\text{Differential Equation: } (1-x^2)y'' + [\beta - \alpha - (\alpha + \beta + 2)x]y' + n(n + \alpha + \beta + 1)y = 0$$

$$\text{Explicit Expression: } P_n^{(\alpha, \beta)}(x) = \frac{1}{2^n} \sum_{m=0}^n \binom{n+\alpha}{m} \binom{n+\beta}{n-m} (x-1)^{n-m} (x+1)^m$$

Recurrence Relation:

$$\begin{aligned} & 2(n+1)(n+\alpha+\beta+1)(2n+\alpha+\beta)P_{n+1}^{(\alpha, \beta)}(x) \\ &= (2n+\alpha+\beta+1)[(\alpha^2-\beta^2) + (2n+\alpha+\beta+2) \\ & \times (2n+\alpha+\beta)x]P_n^{(\alpha, \beta)}(x) \\ & - 2(n+\alpha)(n+\beta)(2n+\alpha+\beta+2)P_{n-1}^{(\alpha, \beta)}(x) \end{aligned}$$

$$\text{Weight: } (1-x)^\alpha (1+x)^\beta; \quad \alpha, \beta > 1$$

$$\text{Standardization: } P_n^{(\alpha, \beta)}(x) = \binom{n+\alpha}{n}$$

$$\text{Norm: } \int_{-1}^{+1} (1-x)^\alpha (1+x)^\beta [P_n^{(\alpha, \beta)}(x)]^2 dx = \frac{2^{\alpha+\beta+1} \Gamma(n+\alpha+1) \Gamma(n+\beta+1)}{(2n+\alpha+\beta+1)n! \Gamma(n+\alpha+\beta+1)}$$

$$\text{Rodrigues' Formula: } P_n^{(\alpha, \beta)}(x) = \frac{(-1)^n}{2^n n! (1-x)^\alpha (1+x)^\beta} \frac{d^n}{dx^n} \{(1-x)^{n+\alpha} (1+x)^{n+\beta}\}$$

$$\text{Generating Function: } R^{-1}(1-z+R)^{-\alpha} (1+z+R)^{-\beta} = \sum_{n=0}^{\infty} 2^{-\alpha-\beta} P_n^{(\alpha, \beta)}(x) z^n,$$

$$R = \sqrt{1-2xz+z^2}, \quad |z| < 1$$

$$\text{Inequality: } \max_{-1 \leq x \leq 1} |P_n^{(\alpha, \beta)}(x)| = \begin{cases} \binom{n+q}{n} \sim n^q \text{ if } q = \max(\alpha, \beta) \geq -\frac{1}{2} \\ |P_n^{(\alpha, \beta)}(x')| \sim n^{-1/2} \text{ if } q < -\frac{1}{2} \\ x' \text{ is one of the two maximum points nearest } \frac{\beta - \alpha}{\alpha + \beta + 1} \end{cases}$$

**V: Generalized Laguerre**

Name: Generalized Laguerre    Symbol:  $L_n^{(\alpha)}(x)$     Interval:  $[0, \infty]$

Differential Equation:  $xy'' + (\alpha + 1 - x)y' + ny = 0$

Explicit Expression:  $L_n^{(\alpha)}(x) = \sum_{m=0}^n (-1)^m \binom{n+\alpha}{n-m} \frac{1}{m!} x^m$

Recurrence Relation:  $(n+1)L_n^{(\alpha)} + 1(x) = [(2n+\alpha+1) - x]L_n^{(\alpha)}(x) - (n+\alpha)L_n^{(\alpha)} - 1(x)$

Weight:  $x^\alpha e^{-x}, \alpha > -1$  Standardization:  $L_n^{(\alpha)}(x) = \frac{(-1)^n}{n!} x^n + \dots$

Norm:  $\int_0^\infty x^\alpha e^{-x} [L_n^{(\alpha)}(x)]^2 dx = \frac{\Gamma(n+\alpha+1)}{n!}$

Rodrigues' Formula:  $L_n^{(\alpha)}(x) = \frac{1}{n! x^\alpha e^{-x}} \frac{d^n}{dx^n} \{x^{n+\alpha} e^{-x}\}$

Generating Function:  $(1-z)^{-\alpha-1} \exp\left(\frac{xz}{z-1}\right) = \sum_{n=0}^\infty L_n^{(\alpha)}(x) z^n$

Inequality:  $|L_n^{(\alpha)}(x)| \leq \frac{\Gamma(n+\alpha+1)}{n! \Gamma(\alpha+1)} e^{x/2}; \quad \begin{matrix} x \geq 0 \\ \alpha > 0 \end{matrix}$

$|L_n^{(\alpha)}(x)| \leq \left[2 - \frac{\Gamma(\alpha+n+1)}{n! \Gamma(\alpha+1)}\right] e^{x/2}; \quad \begin{matrix} x \geq 0 \\ -1 < \alpha < 0 \end{matrix}$

**VI: Hermite**

Name: Hermite    Symbol:  $H_n(x)$     Interval:  $[-\infty, \infty]$

Differential Equation:  $y'' - 2xy' + 2ny = 0$

Explicit Expression:  $H_n(x) = \sum_{m=0}^{\lfloor n/2 \rfloor} \frac{(-1)^m n! (2x)^{n-2m}}{m!(n-2m)!}$

Recurrence Relation:  $H_{n+1}(x) = 2xH_n(x) - 2nH_{n-1}(x)$

Weight:  $e^{-x^2}$  Standardization:  $H_n(1) = 2^n x^n + \dots$

Norm:  $\int_{-\infty}^\infty e^{-x^2} [H_n(x)]^2 dx = 2^n n! \sqrt{\pi}$

Rodrigues' Formula:  $H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} (e^{-x^2})$

Generating Function:  $e^{-x^2+2zx} = \sum_{n=0}^\infty H_n(x) \frac{z^n}{n!}$

Inequality:  $|H_n(x)| e^{x^2/2} k 2^{n/2} \sqrt{n!} k \approx 1.086435$

## CLEBSCH–GORDAN COEFFICIENTS

$$\begin{aligned} \begin{pmatrix} j_1 & j_2 & j \\ m_1 & m_2 & m \end{pmatrix} &= \delta_{m, m_1+m_2} \sqrt{\frac{(j_1+j_2-j)!(j+j_1-j_2)!(j+j_2-j_1)!(2j+1)}{(j+j_1+j_2+1)!}} \\ &\times \sum_k \frac{(-1)^k \sqrt{(j_1+m_1)!(j_1-m_1)!(j_2+m_2)!(j_2-m_2)!(j+m)!(j-m)!}}{k!(j_1+j_2-j-k)!(j_1-m_1-k)!(j_2+m_2-k)!(j-j_2+m_1+k)!(j-j_1-m_2+k)!}. \end{aligned}$$

1. Conditions:

- (a) Each of  $\{j_1, j_2, j, m_1, m_2, m\}$  may be an integer, or half an integer. Additionally:  $j > 0$ ,  $j_1 > 0$ ,  $j_2 > 0$  and  $j + j_1 + j_2$  is an integer.
- (b)  $j_1 + j_2 - j \geq 0$ .
- (c)  $j_1 - j_2 + j \geq 0$ .
- (d)  $-j_1 + j_2 + j \geq 0$ .
- (e)  $|m_1| \leq j_1$ ,  $|m_2| \leq j_2$ ,  $|m| \leq j$ .

2. Special values:

- (a)  $\begin{pmatrix} j_1 & j_2 & j \\ m_1 & m_2 & m \end{pmatrix} = 0$  if  $m_1 + m_2 \neq m$ .
- (b)  $\begin{pmatrix} j_1 & 0 & j \\ m_1 & 0 & m \end{pmatrix} = \delta_{j_1, j} \delta_{m_1, m}$ .
- (c)  $\begin{pmatrix} j_1 & j_2 & j \\ 0 & 0 & 0 \end{pmatrix} = 0$  when  $j_1 + j_2 + j$  is an odd integer.
- (d)  $\begin{pmatrix} j_1 & j_1 & j \\ m_1 & m_1 & m \end{pmatrix} = 0$  when  $2j_1 + j$  is an odd integer.

3. Symmetry relations: all of the following are equal to  $\begin{pmatrix} j_1 & j_2 & j \\ m_1 & m_2 & m \end{pmatrix}$ :

- (a)  $\begin{pmatrix} j_2 & j_1 & j \\ -m_2 & -m_1 & -m \end{pmatrix}$ ,
- (b)  $(-1)^{j_1+j_2-j} \begin{pmatrix} j_2 & j_1 & j \\ m_1 & m_2 & m \end{pmatrix}$ ,
- (c)  $(-1)^{j_1+j_2-j} \begin{pmatrix} j_1 & j_2 & j \\ -m_1 & -m_2 & -m \end{pmatrix}$ ,
- (d)  $\sqrt{\frac{2j+1}{2j_1+1}} (-1)^{j_2+m_2} \begin{pmatrix} j & j_2 & j_1 \\ -m & m_2 & -m_1 \end{pmatrix}$ ,
- (e)  $\sqrt{\frac{2j+1}{2j_1+1}} (-1)^{j_1-m_1+j-m} \begin{pmatrix} j & j_2 & j_1 \\ m & -m_2 & m_1 \end{pmatrix}$ ,
- (f)  $\sqrt{\frac{2j+1}{2j_1+1}} (-1)^{j-m+j_1-m_1} \begin{pmatrix} j_2 & j & j_1 \\ m_2 & -m & -m_1 \end{pmatrix}$ ,
- (g)  $\sqrt{\frac{2j+1}{2j_2+1}} (-1)^{j_1-m_1} \begin{pmatrix} j_1 & j & j_2 \\ m_1 & -m & -m_2 \end{pmatrix}$ ,
- (h)  $\sqrt{\frac{2j+1}{2j_2+1}} (-1)^{j_1-m_1} \begin{pmatrix} j & j_1 & j_2 \\ m & -m_1 & m_2 \end{pmatrix}$ .

By use of the symmetry relations, Clebsch–Gordan coefficients may be put in the standard form  $j_1 \leq j_2 \leq j$  and  $m \geq 0$ .

$m_2$	$m$	$j_1$	$j$	$\left( \begin{array}{c c} j_1 & \frac{1}{2} \\ m_1 & m_2 \end{array} \middle  j \right)$

## NORMAL PROBABILITY FUNCTION

**Table of the Normal Distribution**

For a standard normal random variable ( $\Phi(z)$  is the area under the Standard Normal Curve from  $-\infty$  to  $z$ ).

Limits		Proportion of the total area	Remaining area
$\mu - \lambda\sigma$	$\mu + \lambda\sigma$	(%)	(%)
$\mu - \sigma$	$\mu + \sigma$	68.27	31.73
$\mu - 1.65\sigma$	$\mu + 1.65\sigma$	90	10
$\mu - 1.96\sigma$	$\mu + 1.96\sigma$	95	5
$\mu - 2\sigma$	$\mu + 2\sigma$	95.45	4.55
$\mu - 2.58\sigma$	$\mu + 2.58\sigma$	99.0	0.99
$\mu - 3\sigma$	$\mu + 3\sigma$	99.73	0.27
$\mu - 3.09\sigma$	$\mu + 3.09\sigma$	99.8	0.2
$\mu - 3.29\sigma$	$\mu + 3.29\sigma$	99.9	0.1

$x$	1.282	1.645	1.960	2.326	2.576	3.090
$\Phi(x)$	0.90	0.95	0.975	0.99	0.995	0.999
$2[1 - \Phi(x)]$	0.20	0.10	0.05	0.02	0.01	0.002

$x$	3.09	3.72	4.26	4.75	5.20	5.61	6.00	6.36
$1 - \Phi(x)$	$10^{-3}$	$10^{-4}$	$10^{-5}$	$10^{-6}$	$10^{-7}$	$10^{-8}$	$10^{-9}$	$10^{-10}$

Common sample size calculations

Parameter	Estimate	Sample size
$\mu$	$\bar{x}$	$n = \left(\frac{z_{\alpha/2} \cdot \sigma}{E}\right)^2$
$p$	$\hat{p}$	$n = \frac{(z_{\alpha/2})^2 \cdot pq}{E^2}$
$\mu_1 - \mu_2$	$\bar{x}_1 - \bar{x}_2$	$n_1 = n_2 = \frac{(z_{\alpha/2})^2(\sigma_1^2 + \sigma_2^2)}{E^2}$
$p_1 - p_2$	$\hat{p}_1 - \hat{p}_2$	$n_1 = n_2 = \frac{(z_{\alpha/2})^2(p_1q_1 + p_2q_2)}{E^2}$

Common one-sample confidence intervals

Parameter	Assumptions	100(1 - $\alpha$ )% Confidence interval
$\mu$	$n$ large, $\sigma^2$ known, or normality, $\sigma^2$ known	$\bar{x} \pm z_{\alpha/2} \cdot \frac{\sigma}{\sqrt{n}}$
$\mu$	normality, $\sigma^2$ unknown	$\bar{x} \pm t_{\alpha/2, n-1} \cdot \frac{s}{\sqrt{n}}$
$\sigma^2$	normality	$\left(\frac{(n-1)s^2}{\chi_{\alpha/2, n-1}^2}, \frac{(n-1)s^2}{\chi_{1-\alpha/2, n-1}^2}\right)$
$p$	binomial experiment, $n$ large	$\hat{p} \pm z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$

Common two-sample confidence intervals

Parameter	Assumptions	100(1 - $\alpha$ )% Confidence interval
$\mu_1 - \mu_2$	normality, independence, $\sigma_1^2, \sigma_2^2$ known or $n_1, n_2$ large, independence, $\sigma_1^2, \sigma_2^2$ known	$(\bar{x}_1 - \bar{x}_2) \pm z_{\alpha/2} \cdot \sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}$
$\mu_1 - \mu_2$	normality, independence, $\sigma_1^2 = \sigma_2^2$ unknown	$(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2, n_1+n_2-2} \cdot s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}$ $s_p^2 = \frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1+n_2-2}$
$\mu_1 - \mu_2$	normality, independence, $\sigma_1^2 \neq \sigma_2^2$ unknown	$(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2, v} \cdot \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$ $v \approx \frac{\left(\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}\right)^2}{\frac{(s_1^2/n_1)^2}{n_1-1} + \frac{(s_2^2/n_2)^2}{n_2-1}}$
$\mu_1 - \mu_2$	normality, $n$ pairs, dependence	$\bar{d} \pm t_{\alpha/2, n-1} \cdot \frac{s_d}{\sqrt{n}}$
$p_1 - p_2$	binomial experiments, $n_1, n_2$ large, independence	$(\hat{p}_1 - \hat{p}_2) \pm z_{\alpha/2} \cdot \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$

## PERCENTAGE POINTS, STUDENT'S *T*-DISTRIBUTION

This table gives values of  $t$  such that

$$F(t) = \int_{-\infty}^t \frac{\Gamma\left(\frac{n+1}{2}\right)}{\sqrt{n\pi}\Gamma\left(\frac{n}{2}\right)} \left(1 + \frac{x^2}{n}\right)^{-\frac{n+1}{2}} dx$$

for  $n$ , the number of degrees of freedom, equal to 1, 2, ..., 30, 40, 60, 120,  $\infty$ ; and for  $F(t) = 0.60, 0.75, 0.90, 0.95, 0.975, 0.99, 0.995$ , and  $0.9995$ . The  $t$ -distribution is symmetrical, so that  $F(-t) = 1 - F(t)$

$n/F$	.60	.75	.90	.95	.975	.99	.995	.9995
1	.325	1.000	3.078	6.314	12.706	31.821	63.657	636.619

## PERCENTAGE POINTS, CHI-SQUARE DISTRIBUTION

This table gives values of  $\chi^2$  such that

$$F(\chi)^2 = \int_0^{\chi^2} \frac{1}{2^{n/2} \Gamma(\frac{n}{2})} x^{(n-2)/2} e^{-x/2} dx$$

for  $n$ , the number of degrees of freedom, equal to 1, 2, ..., 30. For  $n > 30$ , a normal approximation is quite accurate. The expression  $\sqrt{2x^2} - \sqrt{2n-1}$  is approximately normally distributed as the standard normal distribution. Thus  $\chi_\alpha^2$ , the  $\alpha$ -point of the distribution, may be computed by the formula

$$\chi_\alpha^2 = \frac{1}{2} [x_\alpha + \sqrt{2n-1}]^2,$$

where  $x_\alpha$  is the  $\alpha$ -point of the cumulative normal distribution. For even values of  $n$ ,  $F(\chi^2)$  can be written as

$$1 - F(\chi^2) = \sum_{x=0}^{x'-1} \frac{e^{-\lambda} \lambda^x}{x!}$$

with  $\lambda = \frac{1}{2}\chi^2$  and  $x' = \frac{1}{2}n$ . Thus the cumulative chi-square distribution is related to the cumulative Poisson distribution.

Another approximate formula for large  $n$

$$\chi_\alpha^2 = n \left( 1 - \frac{2}{9n} + z_\alpha \sqrt{\frac{2}{9n}} \right)^3$$

$n$  = degrees of freedom

$z_\alpha$  = the normal deviate (the value of  $x$  for which  $F(x)$  = the desired percentile).

$x$	1.282	1.645	1.960	2.326	2.576	3.090
$F(x)$	.90	.95	.975	.99	.995	.999

$\chi_{.99}^2 = 60[1 - 0.00370 + 2.326(0.06086)]^3 = 88.4$  is the 99th percentile for 60 degrees of freedom.

$$F(\chi^2) = \int_0^{\chi^2} \frac{1}{2^{n/2} \Gamma(\frac{n}{2})} x^{n-2/2} e^{-x/2} dx$$

$n \backslash F$	.005	.010	.025	.050	.100	.250	.500	.750	.900	.950	.975	.990	.995

## PERCENTAGE POINTS, *F*-DISTRIBUTION

This table gives values of *F* such that

$$F(F) = \int_0^F \frac{\Gamma\left(\frac{m+n}{2}\right)}{\Gamma\left(\frac{m}{2}\right)\Gamma\left(\frac{n}{2}\right)} m^{m/2} n^{n/2} x^{m-2/2} (n+mx)^{-(m+n)/2} dx$$

for selected values of *m*, the number of degrees of freedom of the numerator of *F*; and for selected values of *n*, the number of degrees of freedom of the denominator of *F*. The table also provides values corresponding to  $F(F) = .10, .05, .025, .01, .005, .001$  since  $F_{1-\alpha}$  for *m* and *n* degrees of freedom is the reciprocal of  $F_\alpha$  for *n* and *m* degrees of freedom. Thus

$$F_{.05}(4, 7) = \frac{1}{F_{.95}(7, 4)} = \frac{1}{6.09} = .164$$

$$F(F) = \int_0^F \frac{\Gamma\left(\frac{m+n}{2}\right)}{\Gamma\left(\frac{m}{2}\right)\Gamma\left(\frac{n}{2}\right)} m^{m/2} n^{n/2} x^{(m/2)-1} (n+mx)^{-(m+n)/2} dx = .90$$

$F = \frac{s_1^2}{s_2^2} = \frac{S_1/m}{S_2/n}$ , where  $s_1^2 = S_1/m$  and  $s_2^2 = S_2/n$  are independent mean squares estimating a common variance  $\sigma^2$  and based on  $m$  and  $n$  degrees of freedom, respectively.

## SOURCES OF PHYSICAL AND CHEMICAL DATA

In addition to the primary research journals, there are many useful sources of property data of the type contained in the *CRC Handbook of Chemistry and Physics*. A selected list of these is presented here, with emphasis on print and electronic sources whose contents have been subject to a reasonable level of quality control.

### A. Data Journals

1. **Journal of Physical and Chemical Reference Data** — Published jointly by the National Institute of Standards and Technology and the American Institute of Physics, this quarterly journal contains compilations of evaluated data in chemistry, physics, and materials science. It is available in print and on the Internet. [ojps.aip.org/jpcrd/]
2. **Journal of Chemical and Engineering Data** — This bimonthly journal of the American Chemical Society publishes articles reporting original experimental measurements carried out under carefully controlled conditions. The main emphasis is on thermochemical and thermophysical properties. Review articles with evaluated data from the literature are also published. [pubs.acs.org/journals/jceaax/index.html]
3. **Journal of Chemical Thermodynamics** — This journal publishes original research papers that include highly accurate measurements of thermodynamic and thermophysical properties. [www.sciencedirect.com/science/journal/00219614]
4. **Atomic Data and Nuclear Data Tables** — This is a bimonthly journal containing compilations of data in atomic physics, nuclear physics, and related fields. [www.science.direct.com/science/journal/0092640X]
5. **Journal of Phase Equilibria and Diffusion** — This journal presents critically evaluated phase diagrams and related data on alloy systems. It is published by ASM International and is the successor to the previous ASM periodical *Bulletin of Alloy Phase Diagrams*. [www.asm-intl.org]

### B. Data Centers

This section lists selected organizations that perform a continuing function of compiling and critically evaluating data in specific fields of science.

1. **National Institute of Standards and Technology** — Under its Standard Reference Data program, NIST supports a number of data centers in chemistry, physics, and materials science. Topics covered include thermodynamics, fluid properties, chemical kinetics, mass spectroscopy, atomic spectroscopy, fundamental physical constants, ceramics, and crystallography. Address: Office of Standard Reference Data, National Institute of Standards and Technology, Gaithersburg, MD 20899 [www.nist.gov/srd/].
2. **Thermodynamics Research Center** — Now located at the National Institute of Standards and Technology, TRC maintains an extensive archive of data covering thermodynamic, thermochemical, and transport properties of organic compounds and mixtures. Data are distributed in both print and electronic form. Address: Mail code 838.00, 325 Broadway, Boulder, CO 80305-3328 [www.trc.nist.gov].
3. **Design Institute for Physical Property Data** — Under the auspices of the American Institute of Chemical Engineers [www.aiche.org/dippr/], DIPPR offers evaluated data on industrially important chemical compounds. The largest project deals with physical, thermodynamic, and transport properties of pure compounds. Address: Brigham Young University, Provo, UT 84602 [dippr.byu.edu].
4. **Dortmund Data Bank** — Maintains extensive databases on thermodynamic and transport properties of pure compounds and mixtures of industrial interest. The data are distributed through DECHEMA, FIZ CHEMIE, and other outlets. An abbreviated database system is also available for educational use. Address: DDBST GmbH, Industriestr. 1, 26121 Oldenburg, Germany [www.ddbst.de].
5. **Cambridge Crystallographic Data Centre** — Maintains the Cambridge Structural Database of over 430,000 organic compounds. The data files and manipulation software are distributed in several ways. Address: 12 Union Rd., Cambridge CB2 1EZ, U.K. [www.ccdc.cam.ac.uk].
6. **FIZ Karlsruhe** — In addition to many bibliographic databases, FIZ Karlsruhe maintains the Inorganic Crystal Structure Database in collaboration with the National Institute of Standards and Technology. The ICSD contains the atomic coordinates and related data on over 50,000 inorganic crystals. Address: Fachinformationszentrum (FIZ) Karlsruhe, Hermann-von-Helmholtz-Platz 1, D-76344 Eggenstein-Leopoldshafen, Germany [www.fiz-karlsruhe.de].
7. **International Centre for Diffraction Data** — Maintains and distributes the Powder Diffraction File (PDF), a file of over 500,000 X-ray powder diffraction patterns used for identification of crystalline materials. The ICDD also distributes the NIST Crystal Data file, which contains lattice parameters for over 235,000 inorganic, organic, metal, and mineral crystalline materials. Address: 12 Campus Blvd., Newton Square, PA 19073-3273 [www.icdd.com].
8. **Research Collaboratory for Structural Bioinformatics** — Maintains the Protein Data Bank (PDB), a file of 3-dimensional structures of proteins and other biological macromolecules. Address: Department of Chemistry and Chemical Biology, Rutgers University, 610 Taylor Road, Piscataway, NJ 08854-8087 [www.rcsb.org].
9. **Toth Information Systems** — Maintains the Metals Crystallographic Data File (CRYSTMET). Address: 2045 Quincy Ave., Gloucester, ON, Canada K1J 6B2 [www.tothcanada.com].
10. **Atomic Mass Data Center** — Collects and evaluates high-precision data on masses of individual isotopes and maintains a comprehensive database. Address: C.S.N.S.M (IN2P3-CNRS), Batiment 108, F-91405 Orsay Campus, France [www.nndc.bnl.gov/amdc].
11. **Particle Data Group** — International center for data of high-energy physics; maintains a database of properties of fundamental particles that is published in both print and electronic form. Address: MS 50-308, Lawrence Berkeley National Laboratory, Berkeley, CA 94720 [pdg.lbl.gov].
12. **National Nuclear Data Center** — Maintains databases on nuclear structure and reactions, including neutron cross sections. The NNDC is the U.S. node in an international network of nuclear data centers. Address: Brookhaven National Laboratory, Upton, NY 11973-5000 [www.nndc.bnl.gov].

13. **International Union of Pure and Applied Chemistry** — Address: PO Box 13757, Research Triangle Park, NC 27709-3757 [www.iupac.org]. IUPAC supports a number of long-term data projects, including these examples:
  - a. **Solubility Data Project** — Carries out evaluation of all types of solubility data. The results are published in the Solubility Data Series, whose current outlet is the *Journal of Physical and Chemical Reference Data*. [www.iupac.org/divisions/V/cp5.html]
  - b. **Kinetic Data for Atmospheric Chemistry** — Maintains a comprehensive database on the kinetics of reactions important in the chemistry of the atmosphere. [www.iupac-kinetic.ch.cam.ac.uk/]
  - c. **International Thermodynamic Tables for the Fluid State** — Prepares definitive tables of the thermodynamic properties of industrially important fluids. Thirteen volumes have been published by IUPAC. [www.iupac.org/publications/books/seriestitles/]
  - d. **Stability Constants Database** — Collection of metal-ligand stability constants and associated software. [www.acadsoft.co.uk]

### C. Major Multi-Volume Handbook Series

1. **Chapman & Hall/CRC Chemical Dictionaries** — These originally appeared in print form as the *Dictionary of Organic Compounds*, *Dictionary of Natural Products*, etc. They are now published in electronic form and are available in DVD format [www.crcpress.com] and on the Internet [www.chemnetbase.com]. The consolidated version, called the *Combined Chemical Dictionary*, has data on more than 550,000 compounds spanning all branches of chemistry. The coverage includes physical properties, biological sources, hazard information, uses, and literature references.
2. **Properties of Organic Compounds** — Originally published in three editions as the *Handbook of Data on Organic Compounds*, it is now in electronic form as *Properties of Organic Compounds*. The database includes about 30,000 compounds; physical properties and spectral data (mass, infrared, Raman, ultraviolet, and NMR) are covered. It is offered as CDROM [www.crcpress.com] and by Web access [www.chemnetbase.com].
3. **Beilstein Handbook of Organic Chemistry** — The classic source of data on organic compounds, dating from the 19th century, *Beilstein* was converted to electronic form in the last decade of the 20th century. Over 8 million compounds and 10 million chemical reactions are now covered, with a broad range of physical properties as well as synthetic methods and ecological data. The database is accessed by the CrossFire software [www.beilstein.com].
4. **Gmelin Handbook of Inorganic and Organometallic Chemistry** — A subset of the information in the print series has been converted to electronic form and is now distributed in the same manner as *Beilstein*. In addition to the standard physical properties, the coverage includes a wide range of optical, magnetic, spectroscopic, thermal, and transport properties for about 1.4 million compounds [www.mdli.com].
5. **DECHEMA Chemical Data Series** — DECHEMA distributes the DETHERM database, which emphasizes data used in process design in the chemical industry, including thermodynamic and transport properties of about 20,000 pure compounds and 90,000 mixtures. Access is available

through in-house databases and via the Internet [www.dechema.de].

6. **Landolt-Börnstein Numerical Data and Functional Relationships in Science and Technology** — *Landolt-Börnstein* covers a very broad range of data in physics, chemistry, crystallography, materials science, biophysics, astronomy, and geophysics. Hard-copy volumes in the New Series (started in 1961) are still being published, and the entire New Series is now accessible on the Internet [www.landolt-boernstein.com].

### D. Selected Single-Volume Handbooks

The following handbooks offer broad coverage of high-quality data in a single volume. This list is only representative; an extensive listing of handbooks in all fields of science may be found in *Handbooks and Tables in Science and Technology, Third Edition* (Russell H. Powell, ed., Oryx Press, Westport, CT, 1994).

1. **American Institute of Physics Handbook** — Although an old book, it contains much data that are still useful, especially in acoustics, mechanics, optics, and solid state physics. (Dwight E. Gray, ed., McGraw-Hill, New York, 1972)
2. **Constants of Inorganic Substances** — This book presents physical constants, thermodynamic data, solubility, reactivity, and other information on over 3000 inorganic compounds. Since it draws heavily on Russian literature, it contains a great deal of data that do not make their way into most U.S. handbooks. (R. A. Lidin, L. L. Andreeva, and V. A. Molochko, Begell House, New York, 1995)
3. **Handbook of Chemistry and Physics** — Now in the 90th Edition, the *CRC Handbook* covers data from most branches of chemistry and physics. The annual revisions permit regular updating of the information. Also available on CDROM [www.crcpress.com] and the Web [hbcnetbase.com]. (David R. Lide, ed., CRC Press, Boca Raton, FL, 2009)
4. **Handbook of Inorganic Compounds** — This book covers physical constants and solubility for about 3300 inorganic compounds. Also available on CDROM [www.crcpress.com]. (Dale L. Perry and Sidney L. Phillips, eds., CRC Press, Boca Raton, FL, 1995)
5. **Handbook of Physical Properties of Liquids and Gases** — This is a valuable source of data on all types of fluids, ranging from liquid and gaseous hydrocarbons to molten metals and ionized gases. Detailed tables of physical, thermodynamic, and transport properties are given for temperatures from the cryogenic region to 6000 K. Western and Russian literature is covered. (N. B. Vargaftik, Y. K. Vinogradov, and V. S. Yargin, Begell House, New York, 1996)
6. **Handbook of Physical Quantities** — The range of coverage is somewhat similar to the *CRC Handbook of Chemistry and Physics*, but with a stronger emphasis on physics than on chemistry. Solid state physics, lasers, nuclear physics, geophysics, and astronomy receive considerable attention. (Igor S. Grigoriev and Evgenii Z. Meilikhov, eds., CRC Press, Boca Raton, FL, 1997)
7. **Kaye & Laby Tables of Physical and Chemical Constants** — *Kaye & Laby* dates from 1911, and the 16th Edition was prepared in 1995 by a committee of experts. The coverage extends to almost every field of physics and chemistry; data on a limited number of representative substances or materials are given for each topic. (Longman Group Limited, Harlow, Essex, U.K., 1995)

8. *Lange's Handbook of Chemistry* — Provides broad coverage of chemical data; last updated in 2005. Also available on the Web [www.knovel.com]. (James G. Speight, ed., McGraw-Hill, New York, 2005)
9. *Recommended Reference Materials for the Realization of Physicochemical Properties* — This IUPAC book emphasizes highly accurate data on substances and materials that can be used as calibration standards. It covers physical, thermal, optical, and electrical properties. (K. N. Marsh, ed., Blackwell Scientific Publications, Oxford, 1987)
10. *The Merck Index* — Now in its 14th Edition (published in 2006), *The Merck Index* is a widely used source of data on over 10,000 compounds, chosen particularly for their importance in biology, medicine, and ecology. A short mono-

graph on each compound gives information on the synthesis and uses as well as physical and toxicological properties. A CD-ROM accompanies the book. (Maryadele J. O'Neil, ed., John Wiley & Sons, Indianapolis, IN, 2006)

### E. Summary of Useful Web Sites for Physical and Chemical Properties

Most of the Web sites in the following list provide direct access to factual data on physical and chemical properties. However, the list also includes portals that link to different property databases or describe the procedure for gaining access to electronic sources of property data. There are also a few chemical directory sites that are useful for obtaining formulas, synonyms, and registry numbers for substances of interest.

Web Site	Address	Comments
ACD/Labs Spectral Data	www.acdlabs.com/products/spec_lab/exp_spectra/spec_libraries/	Infrared, Raman and NMR spectra collections from Coblenz Society and other sources
Acronyms and Symbols	www3.interscience.wiley.com/stasa/	Free service; useful for identifying acronyms for chemicals
Advanced Chemistry Development	www.acdlabs.com	Chemical directory, with programs for estimating physical and spectral properties
Alloy Center	products.asminternational.org/alloycenter/	Physical, electrical, thermal, and mechanical properties of alloys
American Mineralogist Crystal Structure Database	www.geo.arizona.edu/AMS/amcsd.php	Lattice constants of minerals
Atomic Mass Data Center	www.nndc.bnl.gov/amdc	See B.10
Beilstein	www.mdl.com/products/knowledge/crossfire_beilstein.com	See C.3
Biocatalysis/Biodegradation Database	umbbd.ahc.umn.edu/	Biocatalytic reactions, biodegradation of chemical compounds
BioCyc	biocyc.org/	Metabolic pathways of microorganisms
BioInfo Bank	gibk26.bse.kyutech.ac.jp/jouhou/jouhoubank.html	Portal to ProTherm (protein thermodynamics), ProNit (protein–nucleic acid interactions), biomolecule structures
Biological Macromolecule Crystallization Database	xpdb.nist.gov:8060/BMCD4/index.faces	Crystal data and crystallization conditions for proteins, nucleic acids, and complexes
BRENDA	www.brenda-enzymes.info/	Enzyme nomenclature and properties
Cambridge Structural Database	www.ccdc.cam.ac.uk	See B.5
Carbon Dioxide Information Center	cdiac.esd.ornl.gov/	Data on atmospheric carbon dioxide
Ceramic Properties Databases	www.ceramics.org/publications_ceramic_properties_databases.aspx	Mechanical, thermal, and other properties of ceramic materials
ChemExper	www.chemexper.com/	Consolidated chemical catalogs from various suppliers; provides physical properties and safety data; links to molfiles and MSDS
Chemfinder	www.chemfinder.com	Chemical directory, with links to several property databases
Chemical Acronyms Database	www.oscar.chem.indiana.edu/cfdocs/libchem/acronyms/acronymsearch.html	Useful for associating chemical names and acronyms
Chemical Entities of Biological Interest (ChEBI)	www.ebi.ac.uk/chebi/	Dictionary of molecules and fragments, with identifiers and structures
Chemical Information Sources–Physical Property Information	cheminfo.informatics.indiana.edu/cicc/cis/index.php/Physical_Property_Information	Extensive listing of print and electronic sources of chemical data
ChemIDplus	chem.sis.nlm.nih.gov/chemidplus/	Chemical directory
ChemIndustry	www.chemindustry.com/chemicals/	Chemical directory
CHEMnetBASE	www.chemnetbase.com	Portal to <i>CRC Chemical Dictionaries, Handbook of Chemistry and Physics, Properties of Organic Compounds</i> , etc.
ChemSynthesis Chemical Database	www.chemsynthesis.com	References to synthesis; limited property data
ChemWeb Databases	www.chemweb.com/content/databases	Portal to databases from John Wiley and others
CODATA Databases	www.codata.org/resources/databases/index.html	Thermodynamic key values and fundamental constants

Web Site	Address	Comments
Comparative Toxicogenomics Database (CTD)	ctd.mdibl.org/	Chemical – gene/protein interactions
CRC Combined Chemical Dictionary	www.chemnetbase.com/scripts/ccdweb.exe	See C.1
Crystallography Open Database (COD)	www.crystallography.net	Crystal data on 52,000 compounds
DECHEMA (DETERM)	www.dechema.de/en/isystems.html	See C.5
DIPPR Pure Compound Database	dippr.byu.edu	See B.3
Dortmund Data Bank	www.ddbst.de	See B.4
Enzyme Nomenclature Database	www.expasy.ch/enzyme/	IUBMB nomenclature for enzymes
Enzyme Structures Database	www.ebi.ac.uk/thornton-srv/databases/enzymes/	Structures of enzymes in Protein Data Bank
European Bioinformatics Institute	www.ebi.ac.uk/Databases/	Nucleotide and protein sequences, protein structures, enzyme nomenclature and reactions
FDM Reference Spectra Databases	www.fdmspectra.com/	Infrared, Raman, and mass spectra
FIZ Chemie Berlin	www.fiz-chemie.de	Portal to DETERM (C.5), Dortmund Data Bank (B.4), Infotherm, Acronyms
FIZ Karlsruhe — ICSD	www.fiz-karlsruhe.de	See B.6
Fundamental Physical Constants	physics.nist.gov/constants	CODATA fundamental constants
Gmelin	www.mdli.com/products/knowledge/crossfire_gmelin/	See C.4
<i>Handbook of Chemistry and Physics</i>	hbcnetbase.com	Web version of <i>CRC Handbook</i>
Hazardous Substances Data Bank	toxnet.nlm.nih.gov/cgi-bin/sis/htmlgen?HSDB	Physical and toxicological properties of chemicals of health or environmental importance
HITRAN Database	cfa-www.harvard.edu/hitran/	High resolution spectroscopic data for constituents of the atmosphere; parameters for calculating atmospheric transmission
Human Metabolome Database	hmdb.ca	Chemical and biological data on small molecule metabolites in humans
Infotherm	www.fiz-chemie.de/infotherm/servlet/infothermsearch	Physical and thermal properties of pure compounds and mixtures
International Centre for Diffraction Data	www.icdd.com	See B.7
International Spectroscopic Data Bank	www.is-db.org	All types of spectra, deposited by users. Access is free
Ionic Liquids Database (ILThermo)	ilthermo.boulder.nist.gov/	Thermodynamic and thermophysical properties of ionic liquids and mixtures
Ionic Liquids Catalogue	ildb.merck.de/ionliquids/en/startpage.htm	Miscibility and other properties of organic liquids

NASA Chemical Kinetics Data	jpldataeval.jpl.nasa.gov	Kinetic and photochemical data for stratospheric modeling
National Center for Biotechnology Information	www.ncbi.nlm.nih.gov	Portal to GenBank and other sequence databases
National Nuclear Data Center	www.nndc.bnl.gov	See B.12
National Toxicology Program	ntp-server.niehs.nih.gov	Chemical health and safety data
NIST Atomic Spectra Database	physics.nist.gov/PhysRefData/contents-atomic.html	Energy levels, wavelengths, and transition probabilities of atoms and atomic ions
NIST Ceramics Webbook	www.ceramics.nist.gov/	See B.1
NIST Chemistry Webbook	webbook.nist.gov	Broad range of physical, thermal, and spectral properties

Web Site	Address	Comments
NIST Data Gateway	<a href="http://srdata.nist.gov/gateway/">srdata.nist.gov/gateway/</a>	Portal to all NIST data systems; see B.1
NIST Physical Reference Data	<a href="http://physics.nist.gov/PhysRefData/">physics.nist.gov/PhysRefData/</a>	Atomic and molecular spectra, cross sections, X-ray attenuation, and dosimetry data
NLM Gateway	<a href="http://gateway.nlm.nih.gov/gw/Cmd">gateway.nlm.nih.gov/gw/Cmd</a>	Portal to all National Library of Medicine databases
NMR Shift DB	<a href="http://www.nmrshiftdb.org">www.nmrshiftdb.org</a>	NMR data submitted by users
Nucleic Acid Database	<a href="http://ndbserver.rutgers.edu/">ndbserver.rutgers.edu/</a>	Crystal structures of nucleic acids
Particle Data Group	<a href="http://pdg.lbl.gov">pdg.lbl.gov</a>	See B.11
Physical Property Information	<a href="http://cheminfo.informatics.indiana.edu/cicc/cis/index.php/Physical_Property_Information">cheminfo.informatics.indiana.edu/cicc/cis/index.php/Physical_Property_Information</a>	Useful list of data sources from Indiana University
Polymers — A Property Database	<a href="http://www.polymersdatabase.com/">www.polymersdatabase.com/</a>	Properties of commercial polymers
Powder Diffraction File	<a href="http://www.icdd.com">www.icdd.com</a>	See B.7
Properties of Organic Compounds	<a href="http://www.chemnetbase.com/scripts/pocweb.exe">www.chemnetbase.com/scripts/pocweb.exe</a>	See C.2
Protein Data Bank	<a href="http://www.rcsb.org">www.rcsb.org</a>	See B.8
PubChem	<a href="http://pubchem.ncbi.nlm.nih.gov/">pubchem.ncbi.nlm.nih.gov/</a>	Chemical directory with links to biological information
SABIO-Reaction Kinetics Database	<a href="http://sabio.villa-bosch.de/SABIORK/">sabio.villa-bosch.de/SABIORK/</a>	Data on kinetics of biochemical reactions
Sigma-Aldrich	<a href="http://www.sigmaaldrich.com/">www.sigmaaldrich.com/</a>	Chemical catalogs; includes some physical property data
Spectral Database for Organic Compounds	<a href="http://riodb01.ibase.aist.go.jp/sdbs/cgi-bin/cre_index.cgi?lang=eng">riodb01.ibase.aist.go.jp/sdbs/cgi-bin/cre_index.cgi?lang=eng</a>	MS, NMR, IR, Raman, and ESR spectra; 32,000 compounds measured at AIST, Japan
SpecInfo	<a href="http://www3.interscience.wiley.com/cgi-bin/mrwhome/109609148/HOME">www3.interscience.wiley.com/cgi-bin/mrwhome/109609148/HOME</a>	IR, NMR, and mass spectra
Spectra Online	<a href="http://www.ftirsearch.com/">www.ftirsearch.com/</a>	FTIR and Raman spectra
SPRESI-web	<a href="http://www.spresi.de/">www.spresi.de/</a>	Structures, reactions, and some physical properties
STN Easy	<a href="http://stneasy.cas.org">stneasy.cas.org</a>	Chemical directory (and access to Chemical Abstracts databases)
STN Easy-Europe	<a href="http://stneasy.fiz-karlsruhe.de">stneasy.fiz-karlsruhe.de</a>	European node of STN Easy
STN Easy-Japan	<a href="http://stneasy-japan.cas.org">stneasy-japan.cas.org</a>	Japanese node of STN Easy
Swissprot	<a href="http://bo.expasy.org/enzyme/">bo.expasy.org/enzyme/</a>	Enzyme nomenclature and related information
Syracuse Research Corporation	<a href="http://www.syrres.com/esc/databases.htm">www.syrres.com/esc/databases.htm</a>	Properties of environmental interest
Table of Isotopes	<a href="http://ie.lbl.gov/education/isotopes.htm">ie.lbl.gov/education/isotopes.htm</a>	Nuclear energy levels, moments, and other properties
Thermodynamics of Enzyme-Catalyzed Reactions	<a href="http://xpdb.nist.gov/enzyme_thermodynamics/">xpdb.nist.gov/enzyme_thermodynamics/</a>	Equilibrium constants of biochemical reactions
Thermodynamics Research Center	<a href="http://www.trc.nist.gov">www.trc.nist.gov</a>	See B.2
TOXNET	<a href="http://toxnet.nlm.nih.gov">toxnet.nlm.nih.gov</a>	Portal to HSDB and other databases on hazardous chemicals
Wiley Interscience	<a href="http://www3.interscience.wiley.com/reference.html">www3.interscience.wiley.com/reference.html</a>	Portal to <i>Kirk-Othmer Encyclopedia of Chemical Technology</i> , <i>Ullmann's Encyclopedia of Industrial Chemistry</i> , <i>Encyclopedia of Reagents for Organic Synthesis</i> , SpecInfo Database, etc.

## Tables Relocated or Removed from CRC Handbook of Chemistry and Physics, 71st through 89th Editions

The following tables appeared in previous editions of the *CRC Handbook of Chemistry and Physics* but have been removed, retitled, or rearranged in subsequent editions. In most cases, some or all of the information contained in the original table has been incorporated, in updated form, in a different table (or tables). In such cases the appropriate page references to the 90th Edition (2009-2010) are given in the last column, and the older table should be considered obsolete. The last edition in which the older table appeared is indicated.

Table Title	Last Ed.	Comments
Abbreviations Used in Polymerization Processes	75 Ed.	Removed; general abbreviations in 90 Ed., p. 2-29
Absorption and Velocity of Sound in Still Air	76 Ed.	Updated; see 90 Ed., p. 14-50, 14-51
Allowable Carrying Capacities of Conductors	75 Ed.	Removed
Aluminum Wire Table	75 Ed.	Data included in 90 Ed., p. 15-37
Biochemical Symbols and Abbreviations	77 Ed.	See 90 Ed., p. 2-29
Boiling Point of Water at Various Pressures	89 Ed.	Removed; can be calculated from vapor pressure table in 90 Ed., p. 6-5
Boiling Point Index of Organic Compounds	83 Ed.	Searching available in Internet and CDROM versions
Brazing Filler Metals (Solders)	75 Ed.	Removed
Chemical Composition of Rocks	73 Ed.	Removed
Classification of Comparative Life Hazards of Gases and Vapors	76 Ed.	Removed
Constants for Satellite Geodesy	74 Ed.	Removed
Cross-Section and Mass of Wires	75 Ed.	Data included in 90 Ed., p. 15-37
Density and Composition of Fuming Sulfuric Acid	75 Ed.	Removed
Density of D <sub>2</sub> O	89 Ed.	See 90 Ed., p. 6-10
Diamagnetic Susceptibility Data on Organosilicon Compounds	74 Ed.	Removed
Diffusivities of Metallic Solutes in Molten Metals	76 Ed.	Removed
Diffusivities of Metallic Tracers in Mercury	75 Ed.	Removed
Dissociation Constants of Acids in Water at Various Temperatures	74 Ed.	Removed
Dissociation Constants of Aqueous Ammonia from 0 to 50° C	74 Ed.	Removed
Dissociation Constants of Inorganic Acids in Aqueous Solution	74 Ed.	See 90 Ed., p. 8-40 (acids and bases combined)
Dissociation Constants of Inorganic Bases in Aqueous Solution at 298 K	74 Ed.	See 90 Ed., p. 8-40 (acids and bases combined)
Dissociation Constants of Organic Acids in Aqueous Solution	74 Ed.	See 90 Ed., p. 8-42 (acids and bases combined)
Dissociation Constants of Organic Bases in Aqueous Solution	74 Ed.	See 90 Ed., p. 8-42 (acids and bases combined)
Efficacies and Other Characteristics of Illuminants	76 Ed.	Removed
Efficiency of Drying Agents	76 Ed.	Removed
Emergent Stem Corrections for Liquid-in-Glass Thermometers	75 Ed.	Removed
Emissivity of Total Radiation for Various Materials	77 Ed.	Removed
Emissivity of Tungsten	77 Ed.	Removed
Enthalpy of Vaporization of Water	89 Ed.	See 90 Ed., p. 6-5
Fats and Oils	76 Ed.	See 90 Ed., p. 7-9
Gibbs Energy of Formation of Metal Oxides	77 Ed.	Included in comprehensive table of thermodynamic properties; see 90 Ed., p. 5-4
Heat Capacity of Liquids and Gases at 25° C	76 Ed.	Included in comprehensive table of thermodynamic properties; see 90 Ed., p. 5-4
Heat Capacity of Mercury	73 Ed.	Included with other thermal properties of mercury; see 90 Ed., p. 6-158
Index of Refraction of Fused Quartz	76 Ed.	See 90 Ed., p. 10-250
Index of Refraction of Rock Salt, Sylvine, Calcite, Fluorite, and Quartz	76 Ed.	See 90 Ed., p. 4-149
Introduction to X-Ray Cross Sections	74 Ed.	Removed
Ion Exchange Resins	77 Ed.	Removed
Isothermal Compressibility of Liquids	76 Ed.	Data included in 90 Ed., p. 6-140
Kinetic and Photochemical Data for Atmospheric Chemistry	79 Ed.	See 90 Ed., p. 5-90 (emphasis on stratospheric chemistry)
Kinetic Data for Combustion Modelling	79 Ed.	Removed from book; still present in electronic versions
Lattice Constants for Cubic Crystals	76 Ed.	Removed; some data included in 90 Ed., p. 4-156
Lattice Spacing of Common Analyzing Crystals	76 Ed.	Removed
Lowering of Vapor Pressure by Salts in Aqueous Solution	77 Ed.	Removed; related data in 90 Ed., p. 6-110
Magnetic Rotatory Power	74 Ed.	Removed
Melting Point Index of Organic Compounds	83 Ed.	Searching available in Internet and CDROM versions
Minerals Arranged in Order of Increasing Vickers Hardness Numbers	75 Ed.	See 90 Ed., p. 12-222, for hardness of minerals and ceramics (Mohs and Knoop scales); can be sorted in electronic versions.
Molecular Depression of the Freezing Point	75 Ed.	See 90 Ed., p. 15-28
Molecular Elevation of the Boiling Point	75 Ed.	See 90 Ed., p. 15-27
Nomenclature of Inorganic Chemistry	74 Ed.	See 90 Ed., p. 2-15 (references only), 2-16
Nomenclature of Organic Compounds	74 Ed.	See 90 Ed., p. 2-15 (references only), 2-23
Nomograph and Table for Doppler Linewidths	76 Ed.	Removed
Optical Properties of Metals	73 Ed.	See 90 Ed., p. 12-123
Organic Compounds Listed in Order of Index of Refraction	74 Ed.	Removed; electronic versions permit sorting in this order.
Oxygen Solubility in Aqueous Electrolyte Solutions	76 Ed.	Removed

Permittivity (Dielectric Constant) of Water as a Function of Temperature and Pressure	89 Ed. See 90 Ed., p. 6-1
Physical and Photometric Data for Planets and Satellites	74 Ed. Related data included in 90 Ed., p. 14-2, 14-4
Physical Constants of Clear Fused Quartz	76 Ed. Removed
Physical Constants of Minerals	75 Ed. See 90 Ed., p. 4-149, for physical & optical properties
Platinum Wire	73 Ed. Data included in 90 Ed., p. 15-37
Properties of Carbohydrates	77 Ed. Removed as separate table; data included in 90 Ed., p. 3-1 to 3-523
Properties of Large Production and Priority Organic Pollutants	77 Ed. See 90 Ed., p. 6-72, 8-85, 16-43 for the data in this table
Properties of Sulfuric Acid	75 Ed. Removed; for density, see 90 Ed., p. 15-40
Properties of Tungsten	76 Ed. Removed
Properties of Water in the Range 0-100 °C	89 Ed. See 90 Ed., pp. 6-1, 6-5
Radiative Transition Probabilities for X-Ray Lines	77 Ed. Removed
Radioactive Tracer Diffusion Data for Pure Metals	75 Ed. Removed
Recommended Daily Dietary Allowances	77 Ed. Removed
Reduction of Barometer to Sea Level	75 Ed. Removed
Refractory Materials	76 Ed. Some data included in 90 Ed., p. 12-211
Resistance of Wires	75 Ed. See 90 Ed., p. 15-37
Resistivity of Semiconducting Minerals	73 Ed. Data included in 90 Ed., pp. 12-80
Solvents for Liquid Chromatography	78 Ed. Removed; data included in other tables on solvents
Spark-Gap Voltages	73 Ed. Removed
Specific Heat and Enthalpy of Some Solids at Low Temperature	73 Ed. Removed
Spectral Emissivity	76 Ed. Removed
Spectral Emissivity of Oxides	76 Ed. Removed
Standard Test Sieves and Mesh Size Conversion	75 Ed. Removed
Standard Types of Stainless and Heat Resisting Steels	74 Ed. Removed
Steam Tables	79 Ed. Replaced by 90 Ed., p. 6-1
Steroid Hormones and Other Steroidal Synthetics	76 Ed. Removed as separate table; data included in 90 Ed., p. 3-1 to 3-523
Sublimation Pressure for Organic Compounds	73 Ed. See 90 Ed., p. 6-70
Surface Tension of Liquid Elements	73 Ed. Removed
Temperature Correction for Barometer Readings	75 Ed. See 90 Ed., p. 15-30
Temperature Correction for Glass Volumetric Apparatus	75 Ed. Removed
Temperature Correction for Volumetric Solutions	75 Ed. Removed
Temperature Correction, Glass Scale	73 Ed. Removed
Temperature Dependence of the Permittivity (Dielectric Constant) of Liquids	78 Ed. See 90 Ed., p. 6-166 (Temperature dependence included in general table of permittivity)
The Earth: Its Mass, Dimensions, and Other Related Quantities	74 Ed. Updated table in 90 Ed., p. 14-10
The Limits of Superheat of Pure Liquids	76 Ed. Removed
The pH of Natural Media and its Relation to Precipitation of Hydroxides	73 Ed. See 90 Ed., p. 8-37
Thermal Conductivity of Certain Metals	73 Ed. See 90 Ed., p. 12-203, 12-205, 12-206, 12-208
Thermal Conductivity of Rocks	73 Ed. Removed; certain data included in 90 Ed., p. 12-211
Thermal Conductivity of Saturated H <sub>2</sub> O and D <sub>2</sub> O	89 Ed. See 90 Ed., pp. 6-1, 6-10
Thermal Conductivity of the Elements	73 Ed. See 90 Ed., p. 12-203 & 12-206 for solid elements; 6-218 for gases.
Total Monthly Solar Radiation in a Cloudless Sky	76 Ed. Removed; related data in 90 Ed., p. 14-26
Transmission of Corning Colored Filters	74 Ed. Removed
Transmission of Light by Common Optical Materials	76 Ed. See 90 Ed., p. 10-250
Transmission of Wratten Filters	74 Ed. Removed
Ultraviolet Spectra of Common Liquids	77 Ed. Removed
Units, Symbols, and Equations for Radiometric and Photometric Quantities	77 Ed. Removed (this information is contained in 90 Ed., p. 2-1 and 2-29)
Values for the Langevin Function	77 Ed. Removed
Vapor Pressure at Elevated Temperatures	77 Ed. See 90 Ed., p. 6-72
Vapor Pressure in the Range -25 °C to 150 °C	77 Ed. See 90 Ed., p. 6-72
Velocity of Sound in Dry Air	76 Ed. See 90 Ed., p. 14-51
Velocity of Sound in Various Media	77 Ed. See 90 Ed., p. 14-48
Viscosity of Aqueous Solutions	78 Ed. See 90 Ed., p. 8-52
Weight of One Gallon of Water	75 Ed. See 90 Ed., p. 8-139 for related data
Wire Table:Standard Annealed Copper	75 Ed. See 90 Ed., p. 15-37
Wire Tables:Comparison of Wire Gauges	75 Ed. See 90 Ed., p. 15-37
X-Ray Crystallographic Data on Inorganic Substances and Minerals	76 Ed. See 90 Ed., p. 4-156
X-Ray Wavelengths	76 Ed. Removed

## ALLOWABLE CARRYING CAPACITIES OF CONDUCTORS

(National Electrical Code)

The ratings in the following tabulation are those permitted by the National Electrical Code for flexible cords and for interior wiring of houses, hotels, office buildings, industrial plants, and other buildings.

The values are for copper wire. For aluminum wire the allowable carrying capacities shall be taken as 84% of those given in the table for the respective sizes of copper wire with the same kind of covering.

Size A.W.G.	Area Circular Mils	Diameter of Solid Wires Mils	Rubber Insulation Amperes	Varnished Cambric Insulation Amperes	Other Insulations and Bare Conductors Amperes	Size A.W.G.	Area Circular Mils	Diameter of Solid Wires Mils	Rubber Insulation Amperes	Varnished Cambric Insulation Amperes	Other Insulations and Bare Conductors Amperes
18	1,624.	40.3	3*		6†	4	41,740.	204.3	70	85	90
16	2,583.	50.8	6*		10†	3	52,630.	229.4	80	95	100
14	4,107.	64.1	15	18	20	2	66,370.	257.6	90	110	125
12	6,530.	80.8	20	25	30	1	83,690.	289.3	100	120	150
10	10,380.	101.9	25	30	35	0	105,500.	325.0	125	150	200
8	16,510.	128.5	35	40	50	00	135,100.	364.8	150	180	225
6	26,250.	162.0	50	60	70	000	167,800.	409.6	175	210	275
5	33,100.	181.9	55	65	80	0000	211,600.	460	225	270	325

\* The allowable carrying capacities of No. 18 and 16 are 5 and 7 amperes respectively, when in flexible cords.

† The allowable carrying capacities of No. 18 and 16 are 10 and 15 amperes respectively, when in cords for portable heaters. Types AFS, AFSJ, HC, HPD, and HSJ.

## ALUMINUM WIRE TABLE

Hard-Drawn Aluminum Wire at 20°C (or, 68°F) American Wire Gauge (B. & S.) English Units

Gauge No.	Diameter in mils	Cross section		Ohms per 1000 ft	Pounds per 1000 ft	Pounds per ohm	Feet per ohm	Gauge No.	Diameter in mm	Cross section in mm <sup>2</sup>	Ohms per kilometer	Kilograms per kilometer	Grams per ohm	Meters per ohm

\* Total other elements requirement pertains only to the metallic elements for this filler metal.

<sup>b</sup> These chemical requirements pertain only to the copper oxide and do not include requirements for the organic vehicle in which the copper oxide is suspended.

<sup>c</sup> Total other elements requirement pertains only to metallic elements for this filler metal. The following limitations are placed on the nonmetallic elements:

Constituent	per cent (max)
Chlorides	0.4
Sulfates	0.1
Oxygen	remainder
Nitric acid insoluble	0.3
Acetic acid soluble matter	0.5

<sup>d</sup> Total other elements, including the elements marked with an asterisk (\*), shall not exceed the value specified.

\* This AWS-ASTM classification is intended to be identical with the same classification that appears in the Specification for Copper and Copper-Alloy Welding Rods (AWS Designation A5.7; ASTM Designation B 259).<sup>3</sup>

**UNDERWRITERS' LABORATORIES' CLASSIFICATION OF COMPARATIVE  
LIFEHAZARD OF GASES AND VAPORS  
(Group number definition)**

Group	Definition	Examples
1	Gases or vapors which in concentrations of the order of 1/2 to 1% for durations of exposure of the order of 5 min are lethal or produce serious injury.	Sulfur dioxide
2	Gases or vapors which in concentrations of the order of 1/2 to 1% for duration of exposure of the order of 1/2 h are lethal or produce serious injury	Ammonia, methyl bromide
3	Gases or vapors which in concentrations of the order of 2 to 2 1/2% for durations of exposure of the order of 1 hr are lethal or produce serious injury.	Bromochloromethane carbon tetrachloride, chloroform, methyl formate
4	Gases or vapors which in concentrations of the order of 2 to 2 1/2% for durations of exposure of the order of 2 h are lethal or produce serious injury	Dichloroethylene methyl chloride, ethylbromide
Between 4 and 5	Appear to classify as somewhat less toxic than Group 4.	Methylene chloride, ethyl chloride.
	Much less toxic than group 4 but somewhat more toxic than Group 5.	Refrigerant 112 <sup>a</sup> Refrigerant 113 Refrigerant 21
5a	Gases or vapors much less toxic than Group 4 but more toxic than Group 6.	Refrigerant 11 Refrigerant 22 Refrigerant 114B2 Refrigerant 502 Carbon dioxide
5b	Gases or vapors which available data indicate would classify as either Group 5a or Group 6.	Ethane, propane, butane
6	Gases or vapors which in concentrations up to at least about 20% by volume for duration of exposure of the order of 2 h do not appear to produce injury.	Refrigerant 13B1 Refrigerant 12 Refrigerant 114 Refrigerant 115 Refrigerant 13 <sup>a</sup> Refrigerant 14 <sup>a</sup> Refrigerant 23 <sup>a</sup> Refrigerant 116 <sup>a</sup> Refrigerant C318 <sup>a</sup>

<sup>a</sup> Not tested by U.L. but estimated to belong in group indicated.

## CONSTANTS FOR SATELLITE GEODESY

### Defining Constants

1. Number of ephemeris seconds in 1 tropical year (1900) .....  $s = 31\,556\,925.9747$
2. Gaussian gravitational constant, defining the a. u. ....  $k = 0.017\,202\,09895$

### Primary Constants

3. Velocity of light in meters per second (in vacuum) .....  $c = 2.99792458(1.2) \times 10^8$
4. Dynamical form-factor for Earth .....  $J_2 = 0.001\,082\,7$
5. Sidereal mean motion of Moon in radians per second (1900) .....  $n_{\zeta}^* = 2.661\,699\,489 \times 10^{-6}$
6. General precession in longitude per tropical century (1900) .....  $p = 5025''.64$
7. Constant of nutation (1900) .....  $N = 9''.210$

### Auxiliary Constants and Factors

- $k/86400$ , for use when the unit of time is 1 second .....  $k' = 1.990\,983\,675 \times 10^{-7}$
- Number of seconds of arc in 1 radian ..... = 206 264.806
- Factor for constant of aberration (note 10) .....  $F_1 = 1.000\,142$
- Factor for mean distance of Moon (note 12) .....  $F_2 = 0.999\,093\,142$
- Factor for parallactic inequality (note 15) .....  $F_3 = 49853''.2$

### Derived Constants

8. Solar parallax .....  $\arcsin(\alpha_s/A) = \pi_s = 8''.79405 (8''.794)$
9. Light-time for unit distance .....  $A/c' = \tau_A = 499.012$   
 $= 1^s/0.002\,003\,96$
10. Constant of aberration .....  $F_1 k' \tau_A = \kappa = 20''.4958 (20''.496)$
11. Ratio of masses of Sun to (Earth + Moon) .....  $S/E(1 + \mu) = 328\,912$
12. Perturbed mean distance of Moon, in meters .....  $F_2(GE(1 + \mu)/n_{\zeta}^{*2})^3 = \alpha_{\zeta} = 384\,400 \times 10^3$
13. Constant of sine parallax for Moon .....  $\alpha_{\zeta}/\alpha_{\zeta} = \sin \pi_{\zeta} = 3422''.451$
14. Constant of lunar inequality .....  $\frac{\mu}{1 + \mu} \frac{\alpha_{\zeta}}{A} = L = 6''.43987 (6''.440)$
15. Constant of parallactic inequality .....  $F_3 \frac{1 - \mu}{1 + \mu} \frac{\alpha_{\zeta}}{A} = P_{\zeta} = 124''.986$

## CROSS-SECTION AND MASS OF WIRES

### U. S. Measure

Diameters are given in mils (1 mil = .001 in), and area in square mils (1 sq mil = .00001 sq in). For sections and masses for one-tenth the diameters given, divide by 100 and for sections and masses for ten times the diameter multiply by 100.

### Metric Measure

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter.  $1 \text{ (cm/1000)}^2 = .00001 \text{ sq cm}$ . For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

## DIAMAGNETIC SUSCEPTIBILITY DATA ON ORGANOSILICON COMPOUNDS

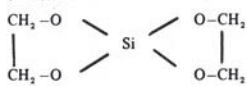

**R. R. Gupta**

The molar susceptibility is represented by  $\chi_M$  and expressed in c.g.s. units. For some of the compounds volume or specific susceptibility is available in the literature and in such cases  $\chi_M$  has been calculated by the relation

$$\chi_M = M\chi = M(\kappa/\rho)$$

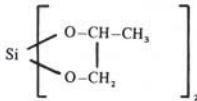

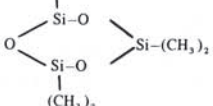

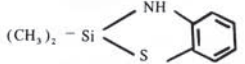

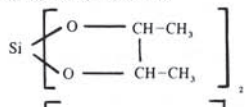

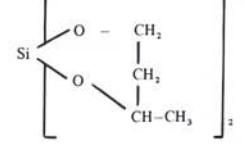

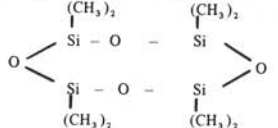

where  $M$  is the molar mass of the substance,  $\chi$  is the specific or mass susceptibility,  $\kappa$  is the volume susceptibility, and  $\rho$  is the density of the substance.

The compounds are arranged in the increasing order of C, H, Si, O, Cl, Br, I, S, and N.

Compound	Molecular formula	Structural formula	$-\chi_M \cdot 10^6$	Ref.
Methyl trichlorosilane	$\text{CH}_3\text{SiCl}_3$	$\text{CH}_3-\text{Si}-\text{Cl}_3$	85.40, 87.45	2, 8
Methyl tribromosilane	$\text{CH}_3\text{SiBr}_3$	$\text{CH}_3-\text{Si}-\text{Br}_3$	126.00, 128.00, 155.50	10, 11, 4
Methyl dichlorosilane	$\text{CH}_3\text{SiCl}_2$	$\text{CH}_3-\text{SiH}-\text{Cl}_2$	66.90	4
Ethyl trichlorosilane	$\text{C}_2\text{H}_5\text{SiCl}_3$	$\text{C}_2\text{H}_5-\text{Si}-\text{Cl}_3$	98.00, 98.84, 96.40	2, 9, 7
Ethyl tribromosilane	$\text{C}_2\text{H}_5\text{SiBr}_3$	$\text{C}_2\text{H}_5-\text{Si}-\text{Br}_3$	147.50	4
Ethyl triiodosilane	$\text{C}_2\text{H}_5\text{SiI}_3$	$\text{C}_2\text{H}_5-\text{Si}-\text{I}_3$	171.50	4
Ethyl dichlorosilane	$\text{C}_2\text{H}_5\text{SiCl}_2$	$\text{C}_2\text{H}_5-\text{SiH}-\text{Cl}_2$	78.90	4
Dimethyl dichlorosilane	$\text{C}_2\text{H}_6\text{SiCl}_2$	$(\text{CH}_3)_2-\text{Si}-\text{Cl}_2$	81.30, 82.45	4, 8
Dimethyl diiodosilane	$\text{C}_2\text{H}_6\text{SiI}_2$	$(\text{CH}_3)_2-\text{Si}-\text{I}_2$	131.80	4
Dimethyl silanediol	$\text{C}_2\text{H}_6\text{SiO}_2$	$(\text{CH}_3)_2-\text{Si}-(\text{OH})_2$	58.40	17, 18
<i>n</i> -Propyl trichlorosilane	$\text{C}_3\text{H}_7\text{SiCl}_3$	$\text{CH}_3-(\text{CH}_2)_2-\text{Si}-\text{Cl}_3$	108.00, 110.20	4, 8
Trimethyl chlorosilane	$\text{C}_3\text{H}_9\text{SiCl}$	$(\text{CH}_3)_3-\text{SiCl}$	79.00, 73.76	4, 8
Trimethyl bromosilane	$\text{C}_3\text{H}_9\text{SiBr}$	$(\text{CH}_3)_3-\text{Si}-\text{Br}$	91.30	4
Trimethyl iodosilane	$\text{C}_3\text{H}_9\text{SiI}$	$(\text{CH}_3)_3-\text{Si}-\text{I}$	104.10	4
1,4,6,9-Tetraoxa-5-silaspiro[4,4]nonane	$\text{C}_4\text{H}_8\text{SiO}_4$		80.94	5
Diethyl dichlorosilane	$\text{C}_4\text{H}_{10}\text{SiCl}_2$	$(\text{C}_2\text{H}_5)_2-\text{SiCl}_2$	105.80	8
Tetramethylsilane	$\text{C}_4\text{H}_{10}\text{Si}$	$\text{Si}-(\text{CH}_3)_4$	74.80	1
Trimethyl methoxysilane	$\text{C}_4\text{H}_{10}\text{SiO}$	$(\text{CH}_3)_3-\text{Si}-\text{OCH}_3$	78.80	1
Dimethyl dimethoxysilane	$\text{C}_4\text{H}_{12}\text{SiO}_2$	$(\text{CH}_3)_2-\text{Si}-(\text{OCH}_3)_2$	81.70, 81.60, 81.95	1, 17, 5
Diethyl silanediol	$\text{C}_4\text{H}_{12}\text{SiO}_2$	$(\text{C}_2\text{H}_5)_2-\text{Si}-(\text{OH})_2$	81.00	17, 18

## DIFFUSIVITIES OF METALLIC TRACERS IN MERCURY

R. P. Chhabra

There are several sources for these data in the literature. Different investigators have obtained different results. That is the reason there are different diffusivity values listed for the same temperature.

Tracer	Temp. (K)	Diffusivity $\times 10^5$ cm <sup>2</sup> /s	Tracer	Temp. (K)	Diffusivity $\times 10^5$ cm <sup>2</sup> /s

Phosphoric	$K_a \cdot 10^3$	8.968	—	—	—	—	7.516	—	—	—	—	5.495
Phosphoric	$K_{2a} \cdot 10^8$	4.85	5.24	5.57	5.89	6.12	6.34	6.46	6.53	6.58	6.59	6.55
Boric	$K_a \cdot 10^{10}$	—	3.63	4.17	4.72	5.26	5.79	6.34	6.86	7.38	—	8.32
Carbonic	$K_{1a} \cdot 10^7$	2.64	3.04	3.44	3.81	4.16	4.45	4.71	4.90	5.04	5.13	5.19
Phenol-sulfonic	$K_{2a} \cdot 10^{10}$	4.45	5.20	6.03	6.92	7.85	8.85	9.89	10.94	12.00	13.09	14.16
Glycine	$K_{1a} \cdot 10^7$	—	3.82	3.99	4.17	4.32	4.46	4.57	4.66	4.73	4.77	4.79
Citric	$K_{1a} \cdot 10^4$	6.03	6.31	6.69	6.92	7.21	7.45	7.66	7.78	7.96	7.99	8.04
	$K_{2a} \cdot 10^5$	1.45	1.54	1.60	1.65	1.70	1.73	1.76	1.77	1.78	1.76	1.75
	$K_{3a} \cdot 10^7$	4.05	4.11	4.14	4.13	4.09	4.02	3.99	3.78	3.69	3.45	3.28

Reproducibility between various workers is about  $\pm (0.01-0.02) \cdot 10^5$ .

### DISSOCIATION CONSTANTS ( $K_b$ ) OF AQUEOUS AMMONIA FROM 0 TO 50°C

Temperature (°C)	$pK_b$	$K_b$
0	4.862	$1.374 \times 10^{-5}$
5	4.830	$1.479 \times 10^{-5}$
10	4.804	$1.570 \times 10^{-5}$
15	4.782	$1.652 \times 10^{-5}$
20	4.767	$1.710 \times 10^{-5}$
25	4.751	$1.774 \times 10^{-5}$
30	4.740	$1.820 \times 10^{-5}$
35	4.733	$1.849 \times 10^{-5}$
40	4.730	$1.862 \times 10^{-5}$
45	4.726	$1.879 \times 10^{-5}$
50	4.723	$1.892 \times 10^{-5}$

Values of  $K_b$  accurate to  $\pm 0.005$ ; determined by e.m.f. method by: Bates, R. G. and Pinching, G. D., *J. Am. Chem. Soc.*, 72, 1393, 1950.

## EFFICACIES AND OTHER CHARACTERISTICS OF ILLUMINANTS

Gordon D. Rowe

### A. Incandescent Lamps (120 volt; Inside Frost)

Nominal lamp watts	Bulb	Base	Approximate rated life (hr)	Approximate initial lumens	Approximate initial efficacy	Chromaticity (°K)
25	A-19	Medium	2500	235	9.4	Note: The chromaticity of incandescent lamps is generally in the order of 2900—3000 K; the color rendering index, 99+. These factors will vary with changes in the voltage.
40	A-19	Medium	1000	480	12.0	
60	A-19	Medium	1000	870	14.5

<sup>a</sup> Life rating at 3 or more hours per start on rapid-start circuits, 15,000 hr.

<sup>b</sup> Life with rapid-start circuits; on preheat circuits, 12,000 hr.

<sup>c</sup> Rated average life at 3 hr/start; at 12 hr/start, 18,000 hr.

<sup>d</sup> Initial lumen rating as measured when lamp is operated in vertical position.

### APPROXIMATE LUMINANCE OF VARIOUS LIGHT SOURCES

Compiled by C.J. Allen and G.D. Rowe

Luminance of source is given in candelas per square centimeter

Source		Approx. avg. luminance* (cd cm <sup>-2</sup> )	Source		Approx. avg. luminance* (cd cm <sup>-2</sup> )
Natural sources			High-output (96T12)	800 mA	1.13
Clear sky	Average luminance	0.8	Grooved bulb (96T17)	1500 mA	1.50
Sun (as observed from earth's surface)	At meridian	160000	Fluorescent lamps (other than cool white)		
Sun (as observed from earth's surface)	Near horizon	600	Daylight (40wT12)	430 mA	0.62
Moon (as observed from earth's surface)	Bright spot	0.25	Blue (40wT12)	430 mA	0.30
Combustion sources			Green (40wT12)	430 mA	1.17
Candle flame (sperm)	Bright spot	1.0	Red (40wT12)	430 mA	0.05
Welsbach mantle	Bright spot	6.2	High-intensity discharge (HID)		
Acetylene flame	Mees burner	10.5	Mercury-vapor (E-37)		
Photoflash lamps		16000-40000 peak	Clear	400 watt	970
Incandescent electric lamps			Color-improved	400 watt	11.0
Carbon filament	3 Lumens per watt	52	Deluxe-white	400 watt	12.1
Tungsten filament	Vacuum lamp--10 lumens per watt	200	Mercury-vapor (BT-56)		
Tungsten filament	Gas-filled lamp--20 lumens per watt	1200	Clear	1000 watt	980
Tungsten filament	750-watt projection lamp--26 lumens per watt	7500	Color-improved	1000 watt	15.0
Fluorescent lamps (cool white)			Deluxe white	1000 watt	17.2
Rapid start (40wT12)	430 mA	0.82	Metal halide (E-37)		
			Clear	400 watt	810
			Color-improved	1000 watt	930
			Deluxe white	1500 watt	1620
			High pressure sodium (Lucalox <sup>®</sup> )	250 watt	520
				400 watt	780
				1000 watt	810

\*Luminance values perpendicular to lamp axis

## EFFICIENCY OF DRYING AGENTS

Compiled by John H. Yoe

### A. Drying agents depending upon chemical action (absorption) for their efficiency:\*

Substance	Residual water, mg per liter of dry air**	Reference
P <sub>2</sub> O <sub>5</sub>	<1 mg in 40,000 liters	Morley, Am. J. Sci., 34, 199 (1887); J.A.C.S., 26, 1171 (1904).
Mg(ClO <sub>4</sub> ) <sub>2</sub> anhyd.	"Unweighable" in 210 liters	Willard and Smith, J.A.C.S., 44, 2255 (1922).
BaO	0.00065	Bower, Bur. Std. J. Res., 12, 241 (1934).
KOH fused	0.002	Baxter and Starkweather, J.A.C.S., 38, 2038 (1916).
CaO	0.003	Bower, loc. cit.
H <sub>2</sub> SO <sub>4</sub>	0.003	Baxter and Starkweather, loc. cit.
CaSO <sub>4</sub> anhyd.	0.005	Bower loc. cit.
Al <sub>2</sub> O <sub>3</sub>	0.005	Ibid.
KOH sticks	0.014	Ibid.
NaOH fused	0.16	Baxter and Starkweather, loc. cit.
CaBr <sub>2</sub>	0.18	Baxter and Warren, J.A.C.S., 33, 340 (1911).
CaCl <sub>2</sub> fused	0.34	Baxter and Starkweather, loc. cit.
NaOH sticks	0.80	Bower loc. cit.
Ba(ClO <sub>4</sub> ) <sub>2</sub>	0.82	Ibid.
ZnCl <sub>2</sub>	0.85	Baxter and Warren, loc. cit.
ZnBr <sub>2</sub>	1.16	Ibid.
CaCl <sub>2</sub> granular	1.5	Bower, loc. cit.
CuSO <sub>4</sub> anhyd.	2.8	Ibid.

### B. Drying agents depending upon physical action (adsorption) for their efficiency:\* Alumina (low temperature fired), asbestos, charcoal, clay and porcelain (low temperature fired), glass wool, kieselguhr, silica gel, refrigeration.

\* It should be noted that the efficiency of some drying agents (e.g. Al<sub>2</sub>O<sub>3</sub> and anhydrous CaCl<sub>2</sub>, and probably also BaO, anhydrous Mg(ClO<sub>4</sub>)<sub>2</sub>, Mg(ClO<sub>4</sub>)<sub>2</sub>·3H<sub>2</sub>O, anhydrous Ba(ClO<sub>4</sub>)<sub>2</sub>, and CaSO<sub>4</sub>) depends upon both adsorption and absorption.

\*\* 30°C. for Bower's values; others 25°C. or room temp.

## EMERGENT STEM CORRECTION FOR LIQUID-IN-GLASS THERMOMETERS

Accurate thermometers are calibrated with the entire stem immersed in the bath which determines the temperature of the thermometer bulb. However, for reasons of convenience it is common practice when using a thermometer to permit its stem to extend out of the apparatus. Under these conditions both the stem and the mercury in the exposed stem are at a temperature different from that of the bulb. This introduces an error into the observed temperature. Since the coefficient of thermal expansion of glass is less than that of mercury, the observed temperature will be less than the true temperature if the bulb is hotter than the stem and greater than the true temperature, providing the thermal gradient is reversed. For exact work the magnitude of this error can only be determined by experiment. However, for most purposes it is sufficiently accurate to apply the following equation which takes into account the difference of the thermal expansion of glass and mercury:

$$T_c = T_o + F \times L(T_o - T_m)$$

Where

$T_c$  = corrected temperature

$T_o$  = observed temperature

$T_m$  = mean temperature of exposed stem. The mean temperature of the exposed stem may be determined by fastening the bulb of a second thermometer against the midpoint of the exposed liquid column.

$L$  = the length of the exposed column in degrees above the surface of the substance whose temperature is being determined.

$F$  = correction factor. For approximate work and when the liquid in the thermometer is mercury a value for  $F$  of 0.00016 is generally used. For more accurate work with mercury filled thermometers values as given in the following table are used. For thermometers filled with organic liquids it is customary to use 0.001 for the value of  $F$ .

Values of  $F$  for various glasses

$T_m$ °C.	Corning 0041	Corning 8800	Corning 8810	Jena 16 III	Jena 59 III

INTRODUCTION TO X-RAY CROSS SECTIONS

Alex F. Burr

These tables are part of an extensive report published by W. H. McMaster, et al. as UCRL 50174 and available from the National Technical Information Service, Springfield, Va. 22151. Section I of UCRL 50174 describes the data base and the treatment given it. Section II contains the total cross sections between 1 and 1000 keV for all the elements. Section III contains results used in producing Section II, and Section IV contains total cross sections for selected energies and is reproduced in part here. To obtain these values existing experimental x-ray total cross section data and theoretical cross section calculations were surveyed. The coherent (Rayleigh) scattering cross sections and the incoherent (Compton) scattering cross sections were computed. The photo-electric cross sections were obtained by least squares fitting of experimental data, theory, and interpolation of experiment and theory. The following table contains cross sections interpolated from the basic compilation at those wavelengths of most use to x-ray crystallographers. The wavelengths chosen were selected to correspond to those given in the International Tables for X-Ray Crystallography. The energy-to-wavelength conversion is given below.

Table I. Energy-to-wavelength conversion

Target radiation	$\lambda$	keV	Target radiation	$\lambda$	keV
Ag K $\alpha$	0.5608	22.105	Ni K $\alpha$	1.6591	7.472
K $\beta_1$	0.4970	24.942	K $\beta_1$	1.5001	8.265
Pd K $\alpha$	0.5869	21.125	Co K $\alpha$	1.7902	6.925
K $\beta_1$	0.5205	23.819	K $\beta_1$	1.6208	7.649
Rh K $\alpha$	0.6147	20.169	Fe K $\alpha$	1.9373	6.400

## ION EXCHANGE RESINS

### ANION EXCHANGE RESINS

The following table is divided into two parts; the first lists properties of some anionic resins and the second, properties of some cationic resins.

Character S=strong W=weak	Trade name	Manu- facturer*	Active group	Matrix	Effective pH	Selectivity	Order of selectivity	Total exchange capacity: meq/ml	Total exchange capacity: meq/gm	Maximum thermal stability: °C	Physical form: s = sphere b = beads	Standard mesh range	Ionic form as shipped	Shipping density: lb./cu. ft.
S	Dowex 1	1	Trimethyl benzyl ammonium	Polystyrene	0-14	Cl/H approx. 25	I, NO <sub>3</sub> , Br, Cl, Acetate, OH, F	1.33	3.5	OH <sup>-</sup> 50 Cl <sup>-</sup> 150	s	20-50 (wet)	Cl <sup>-</sup>	44
S	Dowex 21 K	1	Trimethyl benzyl ammonium	Polystyrene	0-14	Cl/H approx. 15	I, NO <sub>3</sub> , Br, Cl, Acetate, OH, F	1.25	4.5	OH <sup>-</sup> 50 Cl <sup>-</sup> 150	s	20-50 (wet)	Cl <sup>-</sup>	43
S	Duolite A-101 D	2	Quaternary ammonium	Polystyrene	0-14	--	--	1.4	4.2	OH <sup>-</sup> 60 Cl <sup>-</sup> 100	b	16-50	Cl <sup>-</sup>	--
S	Ionac A-540	3	Quaternary ammonium	Polystyrene	0-14	--	--	1.0	3.6	salt 100 OH <sup>-</sup> 60	b	16-50	salt	43-66
S	Dowex 2	1	Dimethyl ethanol benzyl ammonium	Polystyrene	0-14	Cl/H approx. 1.5	I, NO <sub>3</sub> , Br, Cl, Acetate, OH, F	1.33	3.5	OH <sup>-</sup> 30 Cl <sup>-</sup> 150	s	20-50 (wet)	Cl <sup>-</sup>	44
S	Duolite A-102 D	2	Quaternary ammonium	Polystyrene	0-14	--	--	1.4	4.2	OH <sup>-</sup> 40 Cl <sup>-</sup> 100	b	16-50	Cl <sup>-</sup>	--
S	Ionac A-550	3	Dimethyl ethanol benzyl ammonium	Polystyrene	0-14	--	--	1.3	3.5	salt 100 OH <sup>-</sup> 40	b	16-50	salt	43-46
W	Duolite A-30 B	2	Tertiary amine; Quaternary ammonium	Epoxy polyamines	0-9	--	--	2.6	8.7	80	b	16-50	salt	--
W	Ionac A-300	3	Tertiary amine; Quaternary ammonium	Epoxy amine	0-12	--	--	1.8	5.5	40	g	16-50	salt	19-21
W	Duolite A-6	2	Tertiary amine	Phenolic	0-5	--	--	2.4	7.6	60	g	16-50	salt	--
W	Duolite A-7	2	Secondary amine	Phenolic	0-4	--	--	2.4	9.1	40	g	16-50	salt	--

### CATION EXCHANGE RESINS

Character S=strong W=weak	Trade name	Manu- facturer*	Active group	Matrix	Effective pH	Selectivity	Order of selectivity	Total exchange capacity: meq/ml	Total exchange capacity: meq/mg	Maximum thermal stability: °C	Physical form: s = sphere b = beads	Standard mesh range	Ionic form as shipped	Shipping density: lb./cu. ft.
S	Dowex 50	1	Nuclear sulfonic acid	Polystyrene	0-14	Na/H approx. 1.2	Ag, Cs, Rb, K, NH <sub>4</sub> , Na, H, Li, Ba, Sr, Ca, Mg, Be	Na <sup>+</sup> 1.9 H <sup>+</sup> 1.7	Na <sup>+</sup> 4.8 H <sup>+</sup> 5.0	150	s	20-50 (wet)	H <sup>+</sup> or Na <sup>+</sup>	H <sup>+</sup> 50 Na <sup>+</sup> 53

### LATTICE SPACING OF COMMON ANALYZING CRYSTALS

Crystal	Reflection plane	<i>d</i> Spacing (Å)	Crystal	Reflection plane	<i>d</i> Spacing (Å)
ADP <sup>a</sup>	101	5.31	Lead stearate		51
ADP <sup>a</sup>	110	5.325	LiF	200	2.014
ADP <sup>a</sup>	200	3.75	LiF	220	1.424
Beryl	10 $\bar{1}$ 0	7.98	Mica	002	9.96
Calcite	100	3.036	NaCl	200	2.820
EDDT <sup>b</sup>	020	4.404	Oxalic acid	001	5.85
Germanium	111	3.265	PET <sup>d</sup>	002	4.371
Graphite	001	6.69	Quartz	10 $\bar{1}$ 0	4.225
Gypsum	010	7.600	Quartz	10 $\bar{1}$ 1	3.343
KAP <sup>c</sup>	001	13.32	Quartz	11 $\bar{2}$ 0	2.456
KBr	200	3.29	Silicon	111	3.13
KCl	200	3.14	Topaz	303	1.356

While several of the above spacings have been measured to more than four significant figures, no more than four figures are given here because complications introduced by the index of refraction, anomalous dispersion, temperature coefficient of expansion, and crystal impurities must be considered before the additional figures are useful.

<sup>a</sup> Ammonium dihydrogen phosphate.

<sup>b</sup> Ethylenediamine *d*-tartrate.

<sup>c</sup> Potassium acid phthalate.

<sup>d</sup> Pentaerythritol.

## MAGNETIC ROTATORY POWER

The rotation of the plane of polarization of light by transparent substances subjected to a magnetic field may be applied to problems of molecular structure. This rotary effect is known as the Faraday effect. Investigations of this effect by E. Verdet showed the angle of rotation ( $\alpha$ ) to depend on the nature of the substance and to be proportional to the length ( $l$ ) of the column of the substance which the light traverses and to the strength ( $H$ ) of the magnetic field. Thus

$$\alpha = \Lambda/H$$

where  $\Lambda$  is the Verdet constant for the experimental material.

Other symbols in the table have the following significance:

$\lambda$  = Wavelength in  $\mu\text{m}$

$t$  = Temperature in  $^{\circ}\text{C}$

$\rho_m$  = Molecular magnetic rotation of the substance under consideration compared to that of water determined in the same apparatus in the same magnetic field.

Thus

$$\rho_m = M \alpha \rho / M' \alpha' \rho'$$

where  $M$  is the molecular weight,  $\alpha$  the angle of rotation and  $\rho$  the density of the given substance, and  $M'$ ,  $\alpha'$ , and  $\rho'$  are the same quantities of water.

$[\Lambda]_M^{\lambda, t}$  = Molecular rotatory value of the substance at the given temperature and at the wavelength  $\lambda$ . Values are in (radians)(gauss $^{-1}$ )(cm $^{-1}$ ).

Values in this table are reproduced by permission from Volume 3, Tables de Constantes et Donnees Numeriques, "Pouvoir Rotatoire Magnetique, Effet Magneto-Optique de Kerr."

A much greater listing of values for both organic and inorganic compounds is in the above publication.

Formula	Name	$\lambda$	$t$	$Q_m$	$10^4[\Lambda]_M^{\lambda, t}$	$10^4\Lambda^{\lambda, t}$ Verdet

## NOMOGRAPH AND TABLE FOR DOPPLER LINEWIDTHS

Sidney O. Kastner

The Doppler width of a spectral line is given by the well-known relation  $\Delta\lambda = (7.162 \times 10^{-7}) \lambda T^{1/2} M^{-1/2}$ , where wavelength units are in Angstroms, temperature is in degrees Kelvin and M is the atomic mass. This relation between four variables is amenable to representation by a nomograph, which does not appear to have been constructed but which would seem to be of practical value. Therefore such a nomograph is presented here. Its construction is briefly described so that the reader who has not made a plot of this type may follow the steps.

The Doppler relation is first rewritten as

$$\ln \Delta\lambda = \ln k\lambda + \frac{1}{2} \ln T - \frac{1}{2} \ln M$$

or equivalently  $u_4 = u_1 + u_2 + u_3$ , with  $k = 7.162 \times 10^{-7}$ . Putting  $\xi = u_1 + u_2$ , first, one has a linear relation  $\xi - u_1 - u_2 = 0$  between three variables which can be represented (Menzel\*) by the determinantal equation

$$\begin{vmatrix} \xi/2 & 1/2 & 1 \\ u_1 & 1 & 1 \\ u_2 & 0 & 1 \end{vmatrix} = 0$$

so that in the Cartesian (x,y) plane the function  $u_2$  lies along the x axis, the function  $u_1$  along the line  $y = 1$  and the function  $\xi/2$  along the line  $y = 1/2$ . These lines form three parallel scales with which to obtain a value of  $\xi$ , given the pair  $(u_1, u_2)$ .

The original equation  $u_4 = \xi + u_3$  provides a second linear relation  $u_4 - \xi - u_3 = 0$ , so that a second set of scales similarly results with  $u_3$  along the x axis,  $\xi$  along the line  $y = 1$  and  $u_4/2$  along the line  $y = 1/2$ . The function  $u_4 \equiv \log \Delta\lambda$  can then be obtained from the known pair  $(\xi, u_3)$ .

In practice, for the nomograph scales to represent useful ranges of the physical variables, some shifting and magnification of the individual scales will be found to be necessary, after completion of the first diagram. The nomograph arrived at here is shown in Figure 1. The x axis runs horizontally through the values  $x = 0$ ,  $T = 10^5$ , and the ordinates of the six scales from left to right are given by:

$$\begin{aligned} y_1 &= 5 \ln(10^{5/2} k\lambda) & y_2 &= 10 \ln(k\lambda T^{1/2}) \\ y_3 &= \frac{5}{2} \ln(k\lambda T^{1/2}) & y_4 &= 5 \ln \Delta\lambda + \frac{5}{2} \ln 10 \\ y_5 &= 5 \ln(T^{1/2}/10^{5/2}) & y_6 &= 5 \ln(10/M) \end{aligned}$$

The approximate range of temperatures covered by the figure is a slowly varying function of wavelength, being  $1000^\circ\text{K} - 10^6 \text{ K}$  for  $\lambda = 10,000\text{\AA}$ ;  $4000 \text{ K} - 5 \times 10^6 \text{ K}$  for  $\lambda = 5000\text{\AA}$ ;  $80,000 \text{ K} - 10^7 \text{ K}$  for  $\lambda = 1000\text{\AA}$ ; and  $300,000 \text{ K} - 10^7 \text{ K}$  for  $\lambda = 500\text{\AA}$ .

In use, the left-hand sides of the three lines are used to find the value of the intermediate variable  $x$  corresponding to given  $\lambda$  and  $T$ . The right-hand sides then give the Doppler width  $\Delta\lambda$  in  $\text{\AA}$ , for this value of  $x$  and the given  $M$ .

For example, suppose one wishes to find the Doppler width of the solar coronal forbidden line of Fe XIV (atomic mass  $M = 56$ ) at  $5303\text{\AA}$ , emitted at a temperature of about  $T = 2 \times 10^6 \text{ K}$ . A straight line drawn between  $\lambda = 5300\text{\AA}$  and  $T = 2 \times 10^6$  intersects the x scale at about 4.2. A second line then drawn between  $x = 4.2$  and  $M = 56$  intersects the middle line at  $\Delta\lambda \approx 0.73\text{\AA}$ .

To use the nomograph, one must know the appropriate atomic weight  $M$  for a given element of interest. An alternative and more accurate procedure, if a calculator is available, for obtaining any required Doppler width is to use Table I, which gives the value of the constant  $k_z \equiv 7.162 M_z^{-1/2}$  for any given atomic number  $Z$ , in the equivalent Doppler relation  $\Delta\lambda = k_z(\lambda T^{1/2}) \times 10^{-7}$ . This table thereby avoids the necessity of looking up the atomic weight  $M$ . For the forbidden line example above, where  $Z = 26$ , the Doppler width obtained from the table is  $\Delta\lambda = (0.9584)(5303)(2,000,000)^{1/2}(10^{-7}) = 0.719\text{\AA}$ .

## OXYGEN SOLUBILITY IN AQUEOUS ELECTROLYTE SOLUTIONS

The Bunsen coefficients,  $\alpha$ , and the standard deviation among a number of tests performed under identical conditions are presented. The Bunsen coefficient is defined as the gas volume at STP (0.101 325 MPa and 273.15 K) absorbed per unit volume of pure liquid at the temperature of the measurement. All data refer to a temperature of 310.2 K and a pressure of 0.101 325 MPa.

These data are from *Industrial & Engineering Chemistry Fundamentals*, 25, 778—779, 1986, Werner Lang and Rolf Zander. They are reproduced with permission of the copyright owner, the American Chemical Society.

**PHYSICAL CONSTANTS OF CLEAR FUSED QUARTZ**  
**Based on information contained in Fused Quartz Catalogue Q-7A**  
**General Electric Company**

Property	Clear fused quartz
Density	2.2 g cm <sup>-3</sup>
Hardness	4.9 (Mohs')
Tensile strength	7000 psi
Compressive strength	>160,000 psi
Bulk modulus	(approx.) 5.3 × 10 <sup>6</sup> psi
Rigidity modulus	4.5 × 10 <sup>6</sup> psi
Young's modulus	10.4 × 10 <sup>6</sup> psi
Poisson's ratio	0.16
Coefficient of thermal expansion	(av.) 5.5 × 10 <sup>-7</sup> cm cm <sup>-1</sup> °C <sup>-1</sup> { 20°C 320°C
Thermal conductivity	0.0033 cal cm <sup>-1</sup> s <sup>-1</sup> °C <sup>-1</sup> cm <sup>-1</sup>
Specific heat	0.18 cal g <sup>-1</sup>
Softening point	(approx.) 1665°C
Annealing point	(approx.) 1140°C
Strain point	1070°C
Electrical resistance	9.5 log <sub>10</sub> R for cm <sup>3</sup> at 350°C
Dielectric constant	3.75 at 20°C. 1 MHz
Dielectric loss factor	less than 0.0004 at 20°C. 1 MHz
Dissipation factor	less than 0.0001 at 20°C. 1 MHz
Index of refraction	1.4585
Velocity of sound — shear wave	3.75 × 10 <sup>5</sup> cm s <sup>-1</sup>
Velocity of sound — compressional wave	5.90 × 10 <sup>5</sup> cm s <sup>-1</sup>
Sonic attenuation	less than 0.033 dB ft <sup>-1</sup> MHz <sup>-1</sup>

## PROPERTIES OF CARBOHYDRATES

These data for carbohydrates were compiled originally for the Biology Data Book by M. L. Wolfram, G. G. Maher and R. G. Pagnucco (1964). Data are reproduced here by permission of the copyright owners of the above publication, the Federation of American Societies for Experimental Biology, Washington, D.C. pp. 351-359.

All data are for crystalline substances, unless otherwise specified. Selection of substances was restricted to natural carbohydrates found free (or in chemical combination and released on hydrolysis) and to biological oxidation products of the natural carbohydrates. The nomenclature conforms with that of the British-American report as published in the *Journal of Organic Chemistry*, 28:281 (1963). Substances have been arranged alphabetically under the name of the parent sugar within groups formulated according to increasing carbon content (excluding carbon in substituents), with synonymous common names in parentheses. **Melting Point:** b.p. = boiling point; d. = decomposes; s. = sinters. **Specific Rotation** was determined in water at concentrations of 1-5 g per 100 ml. of solution and at 20°-25°C, unless otherwise specified; other temperatures or wavelengths are shown in brackets; c = grams solute per 100 ml of solution.

### Part I. NATURAL MONOSACCHARIDES: ALDOSES AND KETOSES

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$
(A)	(B)	(C)	(D)
Aldoses			
1 D-Glyceraldehyde	C <sub>3</sub> H <sub>6</sub> O <sub>3</sub>	.....	+13.5 ± 0.5 (syrup)
2 D-Glyceraldehyde, 3-deoxy-3,3-C-bis-(hydroxymethyl)- (Cordycepose)	C <sub>5</sub> H <sub>10</sub> O <sub>4</sub>	.....	-26 (c 0.6, C <sub>7</sub> H <sub>14</sub> OH)
3 D-Glyceraldehyde, 3,3-bis(C'-hydroxymethyl)- (Apiose)	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	.....	+5.6 (c 10) [15°] syrup
4 β-D-Arabinose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	155	-175 → -103
5 D-Arabinose, 2-O-methyl-	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	Syrup	-102
6 α-L-Arabinose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	158 amorphous	+55.4 → +105
7 β-L-Arabinose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	160	+190.6 → +104.5
8 DL-Arabinose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	163.5-164.5	None
9 α-L-Lyxose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	105	+5.8 → +13.5
10 L-Lyxose, 5-deoxy-3-C'-formyl- (Streptose)	C <sub>6</sub> H <sub>10</sub> O <sub>5</sub>	.....	.....
11 L-Lyxose, 3-C'-formyl- (Hydroxystreptose)	C <sub>6</sub> H <sub>10</sub> O <sub>6</sub>	.....	.....
12 Pentose, 4,5-anhydro-5-deoxy-D-erythro-	C <sub>5</sub> H <sub>8</sub> O <sub>2</sub>	.....	.....
13 Pentose, 2-deoxy-D-erythro-	C <sub>5</sub> H <sub>10</sub> O <sub>4</sub>	96-98	-91 → -58
14 D-Ribose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	87	-23.1 → -23.7
15 D-Ribose, 2-C'-hydroxymethyl- (Hamamelose)	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	.....	-7.1 [λ578]
16 α-D-Xylose	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	145	+93.6 → +18.8
17 D-Xylose, 5-deoxy-	C <sub>5</sub> H <sub>10</sub> O <sub>4</sub>	.....	+16
18 β-D-Xylose, 2-O-methyl-	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	137-138	-21 → +34
19 α-D-Xylose, 3-O-methyl-	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	95	+45 → +19
20 D-Allose, 6-deoxy-	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	140-143	+1.6 [18°] (c 0.6)
		146-148	-4.7 → 0
		102-106	-46 → -29
21 D-Allose, 6-deoxy-2,3-di-O-methyl- (Mycinose)	C <sub>6</sub> H <sub>14</sub> O <sub>5</sub>	.....	.....
22 Amicitose (a trideoxy hexose)	C <sub>6</sub> H <sub>12</sub> O <sub>3</sub>	Oil, b.p. 65-70	+28.6 (CHCl <sub>3</sub> )
23 Antiarose	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	.....	Levo
24 α-D-Galactose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	167	+150.7 → +80.2
25 β-D-Galactose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	143-145	+52.8 → +80.2
26 D-Galactose, 3,6-anhydro-	C <sub>6</sub> H <sub>10</sub> O <sub>3</sub>	.....	+21.3 [10°]
27 α-D-Galactose, 6-deoxy- (D-Fucose; Rhodeose)	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	140-145	+127 → +76.3 (c 10)
28 D-Galactose, 6-deoxy-3-O-methyl- (Digitalose)	C <sub>7</sub> H <sub>14</sub> O <sub>5</sub>	106 <sup>1</sup> , 119 <sup>2</sup>	+106
29 D-Galactose, 6-deoxy-4-O-methyl-	C <sub>7</sub> H <sub>14</sub> O <sub>5</sub>	131-132	+82
30 D-Galactose, 6-deoxy-2,3-di-O-methyl-	C <sub>8</sub> H <sub>16</sub> O <sub>5</sub>	.....	+73
31 α-D-Galactose, 3-O-methyl-	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	144-147	+150.6 → +108.6
32 α-D-Galactose, 6-O-methyl-	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	122-123	+117 → +77.3
33 L-Galactose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	.....	See D-Galactose
34 α-L-Galactose, 3,6-anhydro-	C <sub>6</sub> H <sub>10</sub> O <sub>3</sub>	.....	-39.4 → -25.2
35 α-L-Galactose, 6-deoxy- (L-Fucose)	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	145	-124.1 → -76.4
36 L-Galactose, 6-deoxy-2-O-methyl-	C <sub>7</sub> H <sub>14</sub> O <sub>5</sub>	149-150	-75 ± 4 (c 0.5)
37 L-Galactose, 6-sulfate	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub> S	.....	-47 (c 0.2) (Na salt)
38 DL-Galactose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	143-144, 163	None (racemic)
39 α-D-Glucose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	146, 83 (H <sub>2</sub> O)	+112 → +52.7
40 β-D-Glucose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	148-150	+18.7 → +52.7
41 D-Glucose, 6-acetate	C <sub>7</sub> H <sub>14</sub> O <sub>7</sub>	135	+48
42 D-Glucose, 2,3-di-O-methyl-	C <sub>8</sub> H <sub>16</sub> O <sub>6</sub>	85-86, 121	+50
43 D-Glucose, 6-O-benzoyl- (Vaccinin)	C <sub>12</sub> H <sub>16</sub> O <sub>7</sub>	Amorphous	+48 (C <sub>2</sub> H <sub>5</sub> OH)
44 α-D-Glucose, 6-deoxy- (Chinovose; Epirhamnose; Glucomethyllose; Isorhamnose; Isorhodeose; Quinovose)	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	139-140	+73.3 → +29.7 (c 8)
45 α-D-Glucose, 6-deoxy-3-O-methyl- (D-Thevetose)	C <sub>7</sub> H <sub>14</sub> O <sub>5</sub>	116	+84 → +33

**PROPERTIES OF CARBOHYDRATES (continued)**

**Part I. NATURAL MONOSACCHARIDES: ALDOSES AND KETOSES (Continued)**

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$
(A)	(B)	(C)	(D)
Aldoses (Con't)			
46 D-Glucose, 6-sulfonic acid, 6-deoxy- (6-Sulfoquinovose)	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub> S	173-174	+87 <sup>a</sup>
47 D-Glucose, 3-O-methyl-	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	162-167	+98 → +59.5
48 α-L-Glucose	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	141-143	-95.5 → -51.4
49 L-Glucose, 6-deoxy-3-O-methyl- (L-Thevetose)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	126-129	-36.9 ± 2
50 D-Gulose, 6-deoxy-	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	.....	.....
51 Hexose, 2-deoxy-D-arabino- <sup>4</sup>	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	148	+46.6 [18°]
52 Hexose, 2,6-dideoxy-3-O-methyl-D-arabino- (D-Oleandrose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	.....	-11
53 Hexose, 3,6-dideoxy-D-arabino- (Tyvelose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	.....	+24 ± 2
54 Hexose, 2,6-dideoxy-3-O-methyl-L-arabino- (L-Oleandrose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	62-63	+11.9 ± 2.5
55 Hexose, 3,6-dideoxy-L-arabino- (Ascarylose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	.....	-24 ± 2
56 Hexose, 2,6-dideoxy-3-O-methyl-D-lyxo- (Diginose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	90-92	+56 ± 4
57 Hexose, 2,6-dideoxy-L-lyxo- (L-Fucose, 2-deoxy-)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	103-106	-61.6
58 Hexose, 2,6-dideoxy-3-O-methyl-L-lyxo-	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	78-85	-65
59 Hexose, 2,6-dideoxy-D-ribo- (Digi- toxose; D-Altrose, 2,6-dideoxy-)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	110	+46.4
60 Hexose, 2,6-dideoxy-3-O-methyl-D-ribo- (Cymarose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	93	+52
61 Hexose, 3,6-dideoxy-D-ribo- (Paratose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	.....	+10 ± 2 (c 0.9)
62 Hexose, 4,6-dideoxy-3-O-methyl-D-ribo- (D-Gulose, 4,6-dideoxy-3-O-methyl-; Chalcose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	96-99	+120 → +76
63 Hexose, 2,6-dideoxy-D-xylo- (Boivinose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	96-98	-3.9 → +3.9
64 Hexose, 2,6-dideoxy-3-O-methyl-D-xylo- (Sarmetose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	78-79	+12 → +15.8
65 Hexose, 3,6-dideoxy-D-xylo- (Abe- quose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	.....	-3.2 ± 0.6
66 Hexose, 2,6-dideoxy-3-C-methyl-L-xylo- (Mycarose)	C <sub>7</sub> H <sub>14</sub> O <sub>4</sub>	129-129	-31.1
67 Hexose, 2,6-dideoxy-3-C-methyl-3-O-methyl-L-xylo- (Cladinose)	C <sub>8</sub> H <sub>16</sub> O <sub>4</sub>	oil, b.p. 120-132 (0.25 mm)	-23.1
68 Hexose, 3,6-dideoxy-L-xylo- (Colitose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	.....	+4 (H <sub>2</sub> O); -51 ± 2 (CH <sub>3</sub> OH)
69 D-Idose <sup>5</sup>	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	.....	.....
70 L-Idose, 1,6-anhydro-	C <sub>6</sub> H <sub>10</sub> O <sub>3</sub>	.....	.....
71 α-D-Mannose	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	133	+29.3 → +14.5
72 β-D-Mannose	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	132	-16.3 → +14.5
73 D-Mannose, 6-deoxy- (D-Rhamnose)	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	86-90	-7.0
74 α-L-Mannose, 6-deoxy-monohydrate (L-Rhamnose)	C <sub>6</sub> H <sub>14</sub> O <sub>4</sub>	93-94	-8.6 → +8.2
75 β-L-Mannose, 6-deoxy-	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	123-125	+38.4 → +8.9
76 L-Mannose, 6-deoxy-2-O-methyl-	C <sub>7</sub> H <sub>14</sub> O <sub>5</sub>	.....	.....
77 L-Mannose, 6-deoxy-3-O-methyl- (L-Acofriose)	C <sub>7</sub> H <sub>14</sub> O <sub>5</sub>	114-115	+30 [18°]
78 L-Mannose, 6-deoxy-2,4-di-O-methyl-	C <sub>8</sub> H <sub>16</sub> O <sub>5</sub>	82	-19 [16°]
79 L-Mannose, 6-deoxy-5-C-methyl-4-O-methyl- (Noviose)	C <sub>8</sub> H <sub>16</sub> O <sub>5</sub>	128-130	+19.9 (50% C <sub>2</sub> H <sub>5</sub> OH)
80 Rhodinose (a 2,3,6-trideoxyhexose)	C <sub>6</sub> H <sub>12</sub> O <sub>3</sub>	.....	-11 ± 1.6
81 D-Talose	C <sub>6</sub> H <sub>12</sub> O <sub>4</sub>	128-132	+16.9
82 D-Talose, 6-deoxy- (D-Talomethylose)	C <sub>6</sub> H <sub>12</sub> O <sub>3</sub>	129-131	+20.6
83 L-Talose, 6-deoxy- (L-Talomethylose)	C <sub>6</sub> H <sub>12</sub> O <sub>3</sub>	116-118	-19.5 ± 2 [18°]
84 L-Talose, 6-deoxy-2-O-methyl- (L-Acovenose)	C <sub>7</sub> H <sub>14</sub> O <sub>3</sub>	.....	-19.4
85 Heptose, D-glycero-D-galacto-	C <sub>7</sub> H <sub>14</sub> O <sub>7</sub>	139-140	+47 → +64 (c 0.5)
86 Heptose, D-glycero-D-manno-	C <sub>7</sub> H <sub>14</sub> O <sub>7</sub>	.....	.....
87 Heptose, D-glycero-L-manno-	C <sub>7</sub> H <sub>14</sub> O <sub>7</sub>	.....	.....
Ketoses			
88 Dihydroxyacetone	C <sub>3</sub> H <sub>6</sub> O <sub>3</sub>	80 (dimer)	None
89 Tetrulose, L-glycero- <sup>8</sup> (L-Erythrulose; Ketoerythritol; L-Threulose)	C <sub>4</sub> H <sub>8</sub> O <sub>4</sub>	Syrup	+12
90 Pentulose, D-erythro- (Adonose; D-Ribulose)	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	Syrup	+16.6 [27°]
91 Pentulose, L-erythro- (L-Ribulose)	C <sub>5</sub> H <sub>10</sub> O <sub>5</sub>	.....	-16.6

110 Octulose, <i>D-glycero-D-manno</i> -	C <sub>8</sub> H <sub>16</sub> O <sub>8</sub>	.....	+20 (CH <sub>2</sub> OH)

<sup>1</sup> Original melting point. <sup>2</sup> Melting point after four-months' storage. <sup>3</sup> As a methyl glycoside cyclohexylamine salt. <sup>4</sup> Included because of speculations concerning it in biological processes. <sup>5</sup> Either *D*-idose or *L*-altrose is in the polysaccharide varianose. <sup>6</sup> Early literature refers to this as *D*-erythrose. <sup>7</sup> The  $\frac{1}{2}$ H<sub>2</sub>O and  $\cdot 2$ H<sub>2</sub>O forms also exist.

**Part II. NATURAL MONOSACCHARIDES: AMINO SUGARS**

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$
(A)	(B)	(C)	(D)
Aldosamines			
1 <i>D</i> -Ribose, 3-amino-3-deoxy-	C <sub>5</sub> H <sub>11</sub> NO <sub>4</sub>	158-158.5 d.	-24.6 (hydrochloride)
2 <i>D</i> -Galactose, 2-amino-2-deoxy- (Galactosamine; Chondrosamine)	C <sub>6</sub> H <sub>13</sub> NO <sub>5</sub>	185	+121 → +80 (hydrochloride)
3 $\alpha$ - <i>L</i> -Galactose, 2-amino-2,6-dideoxy- ( <i>L</i> -Fucosamine)	C <sub>6</sub> H <sub>13</sub> NO <sub>4</sub>	192-193 d.	-119 → -92 [27°] (hydrochloride)
4 $\alpha$ - <i>D</i> -Glucose, 2-amino-2-deoxy- (Glucosamine; Chitosamine)	C <sub>6</sub> H <sub>13</sub> NO <sub>5</sub>	88	+100 → +47.5
5 $\beta$ - <i>D</i> -Glucose, 2-amino-2-deoxy-	C <sub>6</sub> H <sub>13</sub> NO <sub>5</sub>	110-111	+28 → +47.5
6 <i>D</i> -Glucose, 3-amino-3-deoxy- (Kanosamine)	C <sub>6</sub> H <sub>13</sub> NO <sub>5</sub>	128 d.	+19 [14°]
7 <i>D</i> -Glucose, 6-amino-6-deoxy-	C <sub>6</sub> H <sub>13</sub> NO <sub>5</sub>	161-162 d.	+23 → +50.1 (hydrochloride)
8 <i>D</i> -Glucose, 2,6-diamino-2,6-dideoxy- (Neosamine C)	C <sub>6</sub> H <sub>14</sub> N <sub>2</sub> O <sub>4</sub>	>230	+61.5 (dihydrochloride)
9 <i>D</i> -Glucose, 3,6-dideoxy-3-dimethylamino- (Mycaminose)	C <sub>8</sub> H <sub>17</sub> NO <sub>4</sub>	115-116	+31 (hydrochloride)
10 <i>D</i> -Glucose, 4,6-dideoxy-4-dimethylamino-	C <sub>8</sub> H <sub>17</sub> NO <sub>4</sub>	192-193	+45.5 (hydrochloride)
11 <i>L</i> -Glucose, 2-deoxy-2-methylamino-	C <sub>7</sub> H <sub>15</sub> NO <sub>5</sub>	130-132	-64
12 <i>D</i> -Gulose, 2-amino-1,6-anhydro-2-deoxy-	C <sub>6</sub> H <sub>11</sub> NO <sub>4</sub>	250-260 d.	+41 ± 2 (hydrochloride)
13 <i>D</i> -Gulose, 2-amino-2-deoxy-	C <sub>6</sub> H <sub>13</sub> NO <sub>5</sub>	152-162 d.	+5.6 → -18.7 (hydrochloride)
14 Hexose, 3,4,6-trideoxy-3-dimethylamino- <i>D-xyllo</i> - (Desosamine; Pirocine)	C <sub>6</sub> H <sub>17</sub> NO <sub>3</sub>	189-191 d.	+49.5 ( <i>c</i> 10) (hydrochloride)
15 Hexose, a 4-acetamido-2-amino-2,4,6-trideoxy-	C <sub>8</sub> H <sub>16</sub> N <sub>2</sub> O <sub>4</sub>	216-219	+115 → +94 [26°] ( <i>c</i> 0.05)
16 Hexose, an amino-deoxy-3- <i>O</i> -carboxyethyl-	C <sub>6</sub> H <sub>17</sub> NO <sub>7</sub>	.....	.....
17 Hexose, a 2,6-diamino-2,6-dideoxy- (Neosamine B; Paramose)	C <sub>6</sub> H <sub>14</sub> N <sub>2</sub> O <sub>4</sub>	135-150 d.	+17.5 ( <i>c</i> 0.9) (hydrochloride)

**PROPERTIES OF CARBOHYDRATES (continued)**

**Part II. NATURAL MONOSACCHARIDES: AMINO SUGARS (Continued)**

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$
(A)	(B)	(C)	(D)
Aldosamines (Con't)			
18 Hexose, a 3-dimethylamino-2,3,6-trideoxy- (Rhodosamine)	$C_6H_{17}NO_3$	.....	.....
19 D-Mannose, 2-amino-2-deoxy- (Mannosamine)	$C_6H_{13}NO_5$	142 d.	-4.3 (c 9) (hydrochloride)
20 D-Mannose, 3-amino-3,6-dideoxy- (Mycosamine)	$C_6H_{13}NO_4$	162	-11.5 (hydrochloride)
21 D-Talose, 2-amino-2-deoxy- (Talosamine)	$C_6H_{13}NO_5$	151-153	+3.4 → -5.7 (c 0.9) (hydrochloride)
22 L-Talose, 2-amino-2,6-dideoxy- (Pneumosamine)	$C_6H_{13}NO_4$	162-163	+6.9 → +10.4 (hydrochloride)
Ketosamines			
23 Pentulose, 1-( <i>o</i> -carboxyanilino)-1-deoxy-D-erythro-	$C_{12}H_{14}NO_6$	.....	.....
24 Hexulose, 1-( <i>o</i> -carboxyanilino)-1-deoxy-D-arabino-	$C_{13}H_{16}NO_7$	.....	.....
25 Hexulose, 5-amino-5-deoxy-L-xylo-	$C_6H_{13}NO_5$	174-176	-62
26 Hexulose, 6-deoxy-6-( <i>N</i> -methylacetamido)-L-xylo-	$C_6H_{17}NO_6$	.....	.....

**Part III. NATURAL ALDITOLS AND INOSITOLS (with Inososes and Inosamines)**

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$
(A)	(B)	(C)	(D)
Alditols			
1 Glycerol	$C_3H_8O_3$	20	None
2 Glycerol, 1-deoxy- (1,2-Propane-diol) <sup>1</sup>	$C_3H_6O_2$	Oil, b.p. 188-189	None (racemic)
3 Erythritol	$C_4H_{10}O_4$	118-120	None (meso)
4 Erythritol, 1,4-dideoxy- (2,3-Butylene-glycol)	$C_4H_{10}O_2$	25, 34	None (meso)
5 D-Threitol, 1,4-dideoxy-	$C_4H_{10}O_2$	19	-13.0
6 L-Threitol, 1,4-dideoxy-	$C_4H_{10}O_2$	.....	+10.2
7 DL-Threitol, 1,4-dideoxy-	$C_4H_{10}O_2$	7.6	None (racemic)
8 D-Arabinitol	$C_5H_{12}O_5$	103	+7.82 (c 8, borax solution)
9 L-Arabinitol	$C_5H_{12}O_5$	101-102	-32 (c 0.4, 5% molybdate)
10 Ribitol (Adomitol)	$C_5H_{12}O_5$	102	None (meso)
11 Galactitol (Dulcitol)	$C_6H_{14}O_6$	186-188	None (meso)
12 D-Glucitol (Sorbitol)	$C_6H_{14}O_6$	112	-1.8 [15°]
13 D-Glucitol, 1,5-anhydro- (Polygalitol)	$C_6H_{12}O_5$	140-141	+42.4
14 L-Iditol	$C_6H_{14}O_6$	73.5	-3.5 (c 10)
15 D-Mannitol	$C_6H_{14}O_6$	166	-0.21
16 D-Mannitol, 1,5-anhydro- (Styracitol)	$C_6H_{12}O_5$	157	-49.9
17 Heptitol, D-glycero-D-galacto- (Heptitol, L-glycero-D-manno-; Perseitil)	$C_7H_{16}O_7$	183-185, 188	-1.1
18 Heptitol, D-glycero-D-gluco- (Heptitol, L-glycero-D-talo-; β-Sedoheptitol)	$C_7H_{16}O_7$	131-132	+46 (5% NH <sub>4</sub> molybdate)
19 Heptitol, D-glycero-D-manno- (Heptitol, D-glycero-D-talo-; Volemitil)	$C_7H_{16}O_7$	153	+2.65
20 Octitol, D-erythro-D-galacto-	$C_8H_{18}O_8$ , H <sub>2</sub> O	169-170	-11 (5% NH <sub>4</sub> molybdate)
Inositols			
21 Betitol (a dideoxy inositol)	$C_6H_{12}O_4$	224	.....
22 Bioinosose ( <i>scylla</i> -Inosose; <i>myo</i> -Inosose-2; a deoxy keto inositol)	$C_6H_{10}O_4$	198-200	None (meso)
23 <i>h</i> -Bornesitol (a <i>myo</i> -inositol monomethyl ether)	$C_7H_{14}O_4$	200	+31.6
24 <i>l</i> -Bornesitol (a <i>myo</i> -inositol monomethyl ether)	$C_7H_{14}O_4$	205-206	-32.1
25 Conduritol (a 2,3-dehydro-2,3-dideoxyinositol)	$C_6H_{10}O_4$	142-143	None (meso)
26 Cordycepic acid (a tetrahydroxycyclohexanecarboxylic acid) <sup>2</sup>	$C_7H_{12}O_6$	.....	.....
27 Dambonitol (a <i>myo</i> -inositol dimethyl ether)	$C_8H_{16}O_6$	206	None (meso)
28 DL-Inositol	$C_6H_{12}O_6$	253	None (racemic)

PROPERTIES OF CARBOHYDRATES (continued)

Part III. NATURAL ALDITOLS AND INOSITOLS  
(with Inososes and Inosamines) (Continued)

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation [α] <sub>D</sub>
(A)	(B)	(C)	(D)
Inositols (Con't)			
29 <i>d</i> -Inositol	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	.....	+60
30 <i>l</i> -Inositol	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	240	-65
31 Laminitol (a <i>C</i> -methyl <i>myo</i> -inositol)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	266-269	-3
32 Liriodendritol (a <i>myo</i> -inositol dimethyl ether)	C <sub>8</sub> H <sub>16</sub> O <sub>6</sub>	224	-25
33 <i>muco</i> -Inositol monomethyl ether	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	322-325	.....
34 <i>myo</i> -Inositol ( <i>meso</i> -Inositol)	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	217-218	None ( <i>meso</i> )
35 <i>d</i> - <i>myo</i> -Inosose-1 (a deoxy keto inositol)	C <sub>6</sub> H <sub>10</sub> O <sub>6</sub>	138-139	+19.6
36 Mytilitol (a <i>C</i> -methyl <i>scyllo</i> -inositol)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	259	None ( <i>meso</i> )
37 <i>neo</i> -Inosamine-2 (a deoxy amino inositol)	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub> N	239-241 d.	None ( <i>meso</i> )
38 <i>d</i> -Ononitol (a <i>myo</i> -inositol monomethyl ether)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	172	+6.6
39 <i>h</i> -Pinitol (a <i>dextro</i> -inositol monomethyl ether)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	186	+65.5
40 <i>l</i> -Pinitol (a <i>levo</i> -inositol monomethyl ether)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	186	-65
41 <i>L</i> -Quebrachitol (a <i>levo</i> -inositol monomethyl ether)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	190-191	-80.2 [28°]
42 <i>d</i> -Quercitol (a deoxy <i>dextro</i> -inositol)	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	235	+24.2
43 <i>d</i> -Quinic acid (a trideoxy carboxy <i>dextro</i> -inositol)	C <sub>7</sub> H <sub>12</sub> O <sub>6</sub>	164	+44 (c 10)
44 <i>L</i> -Quinic acid (a trideoxy carboxy <i>levo</i> -inositol)	C <sub>7</sub> H <sub>12</sub> O <sub>6</sub>	162	-42.1
45 Quinic acid, 5-dehydro-	C <sub>7</sub> H <sub>10</sub> O <sub>6</sub>	140-142 (138 s.)	-82.4 [28°]
46 Scyllitol ( <i>scyllo</i> -Inositol; Cocositol)	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	352-353	None ( <i>meso</i> )
47 Sequoyitol (a <i>myo</i> -inositol monomethyl ether)	C <sub>7</sub> H <sub>14</sub> O <sub>6</sub>	234-235	None ( <i>meso</i> )
48 Shikimic acid (a 3,4-anhydro-quinic acid)	C <sub>7</sub> H <sub>10</sub> O <sub>5</sub>	183-184	-200 [16°]
49 Shikimic acid, 5-dehydro-	C <sub>7</sub> H <sub>8</sub> O <sub>5</sub>	150-152	-57.5 [28°] (EtOH)
50 Streptamine (2,4-diaminodideoxy-scyllitol)	C <sub>6</sub> H <sub>14</sub> O <sub>4</sub> N <sub>2</sub>	88, 210-250 d.	None ( <i>meso</i> )
51 Streptamine, 2-deoxy-	C <sub>6</sub> H <sub>14</sub> O <sub>3</sub> N <sub>2</sub>	.....	None ( <i>meso</i> )
52 Streptadine (1,3-Dideoxy-1,3-diguandino-scyllitol)	C <sub>6</sub> H <sub>12</sub> N <sub>4</sub> O <sub>4</sub>	.....	None ( <i>meso</i> )
53 Viburnitol (a deoxy <i>levo</i> -inositol) <sup>3</sup>	C <sub>6</sub> H <sub>12</sub> O <sub>5</sub>	174	-73.9

<sup>1</sup> The 1-phosphate ester of this diol is said to occur in brain tissue and sea-urchin eggs. <sup>2</sup> Strong evidence that cordycepic acid is really *D*-mannitol. <sup>3</sup> Not an enantiomorph of *d*-quercitol; other isomeric relationship is involved.

Part IV. NATURAL ALDONIC, URONIC, AND ALDARIC ACIDS

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation [α] <sub>D</sub>
(A)	(B)	(C)	(D)
Aldonic Acids			
1 <i>D</i> -Glyceric acid	C <sub>3</sub> H <sub>6</sub> O <sub>4</sub>	Gum	Dextro
2 <i>L</i> -Glyceric acid	C <sub>3</sub> H <sub>6</sub> O <sub>4</sub>	Gum	Levo
3 <i>D</i> -Arabinonic acid	C <sub>5</sub> H <sub>10</sub> O <sub>6</sub>	114-116	+10.5 (c 6)
4 <i>L</i> -Arabinonic acid	C <sub>5</sub> H <sub>10</sub> O <sub>6</sub>	118-119	-9.6 → -41.7 <sup>1</sup>
5 <i>L</i> -Arabinonic-1,4-lactone	C <sub>5</sub> H <sub>8</sub> O <sub>5</sub>	97-99	-72
6 <i>D</i> -Ribonic acid	C <sub>5</sub> H <sub>10</sub> O <sub>6</sub>	112-113	-17.0
7 <i>D</i> -Xylonic acid	C <sub>5</sub> H <sub>10</sub> O <sub>6</sub>	.....	-2.9 → +20.1 <sup>1</sup>
8 <i>L</i> -Xylonic acid	C <sub>5</sub> H <sub>10</sub> O <sub>6</sub>	.....	-91.8 <sup>1</sup>
9 <i>D</i> -Altronic acid	C <sub>6</sub> H <sub>12</sub> O <sub>7</sub>	.....	+11.5 → +24.8 <sup>1</sup> (Ca salt, <i>N</i> HCl)
0 <i>D</i> -Galactonic acid	C <sub>6</sub> H <sub>12</sub> O <sub>7</sub>	122	-11.2 → +57.6 <sup>1</sup>
1 <i>D</i> -Gluconic acid	C <sub>6</sub> H <sub>12</sub> O <sub>7</sub>	130-132 (110-112 s.)	-6.7 → +11.9 <sup>1</sup>
2 <i>L</i> -Gulonic acid	C <sub>6</sub> H <sub>12</sub> O <sub>7</sub>	Exists only in soln.	[ca. 0°]
3 Hexosonic acid, 2-deoxy- <i>D</i> -arabino-	C <sub>6</sub> H <sub>12</sub> O <sub>6</sub>	93-95	+68 (lactone)
4 2-Hexulosonic acid, <i>D</i> -arabino-	C <sub>6</sub> H <sub>10</sub> O <sub>7</sub>	.....	-81.7 (Na salt)
5 2-Hexulosonic acid, 3-deoxy- <i>D</i> -erythro-	C <sub>6</sub> H <sub>10</sub> O <sub>6</sub>	.....	-29.2 (c 6, Ca salt)
6 2-Hexulosonic acid, <i>D</i> -lyxo-	C <sub>6</sub> H <sub>10</sub> O <sub>7</sub>	169	-5
7 5-Hexulosonic acid, <i>D</i> -arabino-	C <sub>6</sub> H <sub>10</sub> O <sub>7</sub>	108-109	.....
8 5-Hexulosonic acid, <i>D</i> -xylo-	C <sub>6</sub> H <sub>10</sub> O <sub>7</sub>	.....	-14.5
9 <i>D</i> -Mannonic acid	C <sub>6</sub> H <sub>12</sub> O <sub>7</sub>	.....	-15.6
0 <i>D</i> -Gluconic acid, <i>O</i> -β- <i>D</i> -galactopyranosyl- (1 → 4)- (Lactobionic acid)	C <sub>12</sub> H <sub>22</sub> O <sub>12</sub>	.....	+25.1 (Ca salt)

## PROPERTIES OF CARBOHYDRATES (continued)

### Part IV. NATURAL ALDONIC, URONIC, AND ALDARIC ACIDS (Continued)

Substance (Synonym)	Chemical Formula	Melting Point °C	Specific Rotation $[\alpha]_D$
(A)	(B)	(C)	(D)
Uronic Acids			
21 <i>l</i> -Lyxuronic acid	$C_5H_8O_6$	.....	.....
22 $\beta$ -D-Galacturonic acid	$C_6H_{10}O_7$	160	+27 → +55.6
23 $\alpha$ -D-Galacturonic acid-monohydrate	$C_6H_{12}O_8$	159–160 (110–115 s.)	+97.9 → +50.9
24 D-Galacturonic acid, 2-amino-2-deoxy-	$C_6H_{11}O_6N$	160 d.	+84.5 (pH 2 HCl)
25 $\beta$ -D-Glucuronic acid	$C_6H_{10}O_7$	156	+11.7 → +36.3
26 D-Glucuronic acid, 2-amino-2-deoxy-	$C_6H_{11}O_6N$	120–172 d.	+55
27 D-Glucuronic acid, 3-O-methyl-	$C_7H_{12}O_7$	Syrup	+6
28 <i>l</i> -Guluronic acid	$C_6H_{10}O_7$	.....	.....
29 <i>l</i> -Iduronic acid	$C_6H_{10}O_7$	.....	+30
30 $\beta$ -D-Mannuronic acid	$C_6H_{10}O_7$	165–167	–47.9 → –23.9
31 $\alpha$ -D-Mannuronic acid-monohydrate	$C_6H_{12}O_8$	110 s., 120–130 d.	+16 → –6.1 (c 6.8)
Aldaric Acids			
32 D-Tartaric acid	$C_4H_6O_6$	170	–15
33 <i>l</i> -Tartaric acid	$C_4H_6O_6$	170	+15 [15°]
34 <i>l</i> -Malic acid	$C_4H_6O_5$	100	–2.3 (c 8.4)

<sup>1</sup> Equilibrates with the lactone.

**PROPERTIES OF SULFURIC ACID**

## RADIOACTIVE TRACER DIFFUSION DATA FOR PURE METALS

John Askill

The data in these tables are the most reliable set of radioactive tracer diffusion data for pure metals published in the literature from 1938 through December, 1970. For a complete listing of all published data on this subject up to December 1968 see "Tracer Diffusion Data for Metals, Alloys and Simple Oxides" by John Askill, published by Plenum Press, New York, 1970.

The diffusion coefficient  $D_T$  at a temperature  $T$ (°K) is given by the following relation:

$$D_T = D_0 e^{-Q/RT}$$

Abbreviations used in the tables are:

A.R.G. = Autoradiography	S. = Single Crystal
R.A. = Residual Activity	⊥c. = Perpendicular to c Direction
S.D. = Surface Decrease	∥c. = Parallel to c Direction
S.S. = Serial Sectioning	99.95 = 99.95%
P. = Polycrystalline	

Solute (tracer)	Material (metal, crystalline form and purity)	Temperature range, °C	Form of analysis	Activation energy, $Q$ , Kcal/mole	Frequency factor, $D_0$ , cm <sup>2</sup> /sec	Reference

<sup>a</sup> The allowances, expressed as average daily intakes over time, are intended to provide for individual variations among most normal persons as they live in the United States under usual environmental stresses. Diets should be based on a variety of common foods in order to provide other nutrients for which human requirements have been less well defined.

<sup>b</sup> Weights and heights of Reference Adults are actual medians for the U.S. population of the designated age. The use of these figures does not imply that the height-to-weight ratios are ideal.

<sup>c</sup> Retinol equivalents. 1 retinol equivalent = 1  $\mu$ g retinol or 6  $\mu$ g  $\beta$ -carotene.

<sup>d</sup> As cholecalciferol. 10  $\mu$ g cholecalciferol = 400 IU of vitamin D.

<sup>e</sup>  $\alpha$ -Tocopherol equivalents. 1 mg d- $\alpha$ -tocopherol = 1  $\alpha$ -TE.

<sup>f</sup> 1 NE (niacin equivalent) is equal to 1 mg of niacin or 60 mg of dietary tryptophan.

**RECOMMENDED DAILY DIETARY ALLOWANCES (continued)**

**Estimated Safe and Adequate Daily Dietary Intakes of Selected Vitamins and Minerals<sup>a</sup>**

Category	Age (years)	Vitamins	
		Biotin (µg)	Pantothenic Acid (mg)
Infants	0-0.5	10	2
	0.5-1	15	3
Children and adolescents	1-3	20	3
	4-6	25	3-4
	7-10	30	4-5
	11+	30-100	4-7
Adults		30-100	4-7

Category	Age (years)	Trace Elements <sup>b</sup>				
		Copper (mg)	Manganese (mg)	Fluoride (mg)	Chromium (µg)	Molybdenum (µg)
Infants	0-0.5	0.4-0.6	0.3-0.6	0.1-0.5	10-40	15-30
	0.5-1	0.6-0.7	0.6-1.0	0.2-1.0	20-60	20-40
Children and adolescents	1-3	0.7-1.0	1.0-1.5	0.5-1.5	20-80	25-50
	4-6	1.0-1.5	1.5-2.0	1.0-2.5	30-120	30-75
	7-10	1.0-2.0	2.0-3.0	1.5-2.5	50-200	50-150
	11+	1.5-2.5	2.0-5.0	1.5-2.5	50-200	75-250
Adults		1.5-3.0	2.0-5.0	1.5-4.0	50-200	75-250

<sup>a</sup> Because there is less information on which to base allowances, these figures are not given in the main table of RDA and are provided here in the form of ranges of recommended intakes.

<sup>b</sup> Since the toxic levels for many trace elements may be only several times usual intakes, the upper levels for the trace elements given in this table should not be habitually exceeded.

## REDUCTION OF BAROMETER TO SEA LEVEL

The correction to be added to reduce barometric readings to "sea level" values depends principally on three factors: The temperature of the air column (assumed) from the station to sea level, the altitude of the station, and the value of the reading itself. Two tables are provided. Table I is entered with the altitude and assumed temperature and is a factor "2000 m" taken out. Table II is entered with the above factor and the approximate barometer reading and the final correction taken out.

The correction is to be added. If  $B_0$  is the corrected or sea level value; B the barometer reading at the station; C the correction,—

$$C = B_0 - B = B(10^m - 1)$$

The actual barometer reading at the station should be corrected for temperature of the mercury column by the usual methods before entering the tables or applying the sea level correction.

A complete explanation of the theory of the corrections and a more extended set of tables will be found in the Smithsonian Meteorological Tables.

### Latitude Factor

The influence of the latitude on the value of the correction is usually negligible, being overshadowed by uncertainties in the assumed temperature of the air column. For cases where this correction is desirable the table below is provided. The value of the temperature-altitude factor "2000 m" obtained in Table I is corrected for latitude by subtracting for latitudes 0-45° and adding for latitudes from 45-90° the values found. With this corrected value of "2000 m" Table II is entered for the value of the correction.

## LATITUDE FACTOR

To be used in connection with Tables I and II, either English or metric units, to obtain latitude corrections to temperature-altitude factor. For latitudes 0-45° subtract the correction. For latitudes 45-90° add the correction.

Temp.-Alt. from Table I	Latitude			
	0°	15°	30°	45°
100	0.3	0.2	0.1	0.0
200	0.5	0.5	0.3	0.0
300	0.8	0.7	0.4	0.0
	90°	75°	60°	45°

## METRIC UNITS—TABLE I

Values of the temperature-altitude factor (2000 m ) for entering table II.

Altitude in meters	Assumed temperature of air column °C										Altitude in meters	Assumed temperature of air column °C									
	-16°	-8°	0°	+4°	+8°	+12°	+16°	+20°	+24°	+28°		-16°	-8°	0°	+4°	+8°	+12°	+16°	+20°	+24°	+28°

Nitrides

Name	Formula	Molecular weight	Melting point, °C	Crystalline form	Lattice parameter, Å	X-ray density, g/cm <sup>3</sup>
Boron nitride	BN	24.83	2,730 <sup>(6)</sup>	Hexagonal (B 12)	a = 2.51 ± .02 c = 6.70 ± .04 <sup>(52)</sup>	2.25
Chromium nitride	CrN	66.02	1,500 (decomposes)	Cubic NaCl type (B1)	a = 4.140 <sup>(6)</sup>	6.14
Hafnium nitride	HfN	192.60	3,310 <sup>(6)</sup>			
Niobium nitride	NbN	106.92	2,050 <sup>(46)</sup>	Cubic NaCl type (B1)	a = 4.41–4.375 <sup>(6)</sup>	7.28
Tantalum nitride	Ta <sub>2</sub> N	375.77	3,090 <sup>(46)</sup>	Hexagonal	a = 3.05 <sup>(48)</sup> c = 4.95 <sup>(53)</sup>	14.1
Thorium nitride	ThN	246.13	2,630 <sup>(48)</sup>	Cubic NaCl type (B1)	a = 5.2 <sup>(48)</sup>	
Titanium nitride	TiN	61.91	2,930 N <sub>2</sub> liberated on melting <sup>(46)</sup>	Cubic NaCl type (B1)	a = 4.23 <sup>(53)</sup>	5.43
Uranium nitride	UN		2,650	Cubic NaCl type (B1)	a = 4.880 <sup>(58)</sup>	14.32
Vanadium nitride	VN	64.96	2,050 <sup>(46)</sup>	Cubic NaCl type (B1)	a = 4.129 <sup>(6)</sup>	6.102
Zirconium nitride	ZrN	105.22	2,980 <sup>(47)</sup>	Cubic NaCl type (B1)	a = 4.567 <sup>(53)</sup>	7.349

Tungsten silicide		33.4 <sup>(68)</sup>	3 <sup>(3)</sup>	4 <sup>(3)</sup>	986 kg/mm <sup>2</sup> (49)
				1-2 <sup>(3)</sup>	1,310 kg/mm <sup>2</sup> (68) 1,090 kg/mm <sup>2</sup> (68)
Uranium silicide					
Vanadium silicide		9.5 <sup>(68)</sup>			1,090 kg/mm <sup>2</sup> (50)

<sup>a</sup>Numbers in parentheses refer to references at end of table.

<sup>b</sup>Ductility - 1: capable of being severely drawn, rolled, or otherwise worked without failure; 2: capable of withstanding slight deformation, or consisting of individually ductile crystals fragily bound together; 3: incapable of being worked, of glasslike brittleness.

<sup>c</sup>Resistance to oxidation - classed according to the temperature range in which the rate of attack by air would cause severe erosion or failure of the coated specimen within a few hours. 1: above 1,700°C; 2: 1,400 to 1,700°C; 1,100 to 1,400°C; 4: 800 to 1,000°C; 5: 500 to 800°C.

<sup>d</sup>Microhardness values taken with 100-g load.

# SOLVENTS FOR LIQUID CHROMATOGRAPHY

Solvent	Viscosity (mPa·s; 20 °C)	UV cutoff (nm)	Refractive index (20 °C)	Normal boiling point (°C)	Dielectric constant (20 °C)
Acetic acid	1.31(15)		1.372	117.9	6.15
Acetone	0.30(25)	330	1.359	56.1	20.7(25)
Acetonitrile	0.34(25)	190	1.344	81.6	37.5
Benzene	0.65	278	1.501	80.1	2.284
1-Butanol	2.95	215	1.399	117.7	17.8
2-Butanol	4.21	260	1.397	99.5	15.8(25)
<i>n</i> -Butyl acetate	0.73	254	1.394	126.1	
<i>n</i> -Butyl chloride	0.47(15)	220	1.402	78.4	
Carbon tetrachloride	0.97	263	1.460	76.8	2.238
Chlorobenzene	0.80	287	1.525	131.7	2.708
Chloroform	0.58	245	1.446	61.2	4.806
Cyclohexane	0.98	200	1.426	80.7	2.023
Cyclopentane	0.44	200	1.406	49.3	1.965
<i>o</i> -Dichlorobenzene	1.32(25)	295	1.551	180.0	9.93(25)
<i>N,N</i> -Dimethylacetamide	2.14	268	1.438	166.0	37.8
Dimethylformamide	0.92	268	1.430	153.0	36.7
Dimethyl sulfoxide	2.20	286	1.478	189.0	4.7
Dioxane	1.44(15)	215	1.422	101.4	2.209(25)
2-Ethoxyethanol	2.05	210	1.408	135.0	
Ethyl acetate	0.46	256	1.372	77.1	6.02(25)
Ethyl ether	0.24	218	1.352	34.4	4.335
Glyme (ethylene glycol dimethyl ether)	0.46(25)	220	1.380	93.0	
Heptane	0.42	200	1.388	98.4	1.92
Hexadecane	3.34	200	1.434	286.9	
Hexane	0.31	200	1.375	68.7	1.890

- <sup>l</sup> Superconducting.
- <sup>m</sup> In germanium the electronic specific heat is markedly dependent on impurities. The values given are for pure germanium (negligible electronic specific heat).
- <sup>n</sup>  $\alpha$ -Iron is the form that is thermodynamically stable at low temperatures. It has the body-centered cubic lattice which is the basis of the ferritic steels.
- <sup>o</sup>  $\gamma$ -Iron is stable between 910 and 1400°C. It has the face-centered cubic structure which is the basis of the austenitic steels. Since pure  $\gamma$ -iron is not stable at low temperatures the above values were calculated by application of the Kopp-Neumann rule to experimental data on two austenitic Fe-Mn alloys and of uncertain accuracy.
- <sup>p</sup> Superconducting transition temperature.
- <sup>q</sup> Superconducting transition temperature of mercury.
- <sup>r</sup> Melting temperature of mercury.
- <sup>s</sup> In silicon the electronic specific heat,  $\gamma T$ , is markedly dependent on impurities. Values of the coefficient,  $\gamma$ , from zero to  $2.4 \times 10^{-6}$  J/g K<sup>2</sup> have been reported. The values in the above table are for pure silicon ( $\gamma = 0$ ).
- <sup>t</sup> It has been shown (Barrett 1956, Hull & Rosenberg 1959) that sodium partially transforms at low temperatures from the normal body-centered cubic structure to close-packed hexagonal. The transformation is of the martensitic type and is promoted by cold-working at the low temperatures. Inasmuch as none of the calorimetric measurements on sodium were accompanied by crystallographic analysis, the tabulated data below 100 K are to some degree ambiguous.
- <sup>u</sup> Superconducting transition temperature of tin.
- <sup>v</sup> Superconducting transition temperature of tantalum.

## SPECTRAL EMISSIVITY

Prepared by Roeser and Wensel, National Bureau of Standards  
Spectral Emissivity of Materials, Surface Unoxidized for 0.65 $\mu$ m

## SPECTRAL EMISSIVITY OF OXIDES

The emissivity of oxides and oxidized metals depends to a large extent upon the roughness of the surface. In general, higher values of emissivity are obtained on the rougher surfaces.

Material	Range of observed values	Probable value for oxide formed on smooth metal
<b>Oxide</b>		
Aluminum	0.22—0.40	0.30
Beryllium	0.07—0.37	0.35
Cerium	0.58—0.80	—
Chromium	0.60—0.80	0.70
Cobalt	—	0.75
Columbium	0.55—0.71	0.70
Copper	0.60—0.80	0.70
Iron	0.63—0.98	0.70
Magnesium	0.10—0.43	0.20

## STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS

Erwin DiCyan

The field of steroids has expanded considerably and rapidly in degree and in kind, because synthetic steroids have been synthesized which though resembling the hormones in the body have no natural counterpart, but exert an effect comparable to those of the natural hormones.

In fact, the term *steroid hormone* thus becomes a misnomer when applied to the newer synthetically prepared steroids which do not have a counterpart in the body of man or other animals—as prednisone. (A hormone, by definition, is a material with certain functions and characteristics, *secreted by the ductless glands*. That part of the definition cannot be met by prednisone or by similar steroids as these are not secreted by the ductless, or endocrine glands.)

All the hormones as well as the synthetic analogues have in common the cyclopentanophenanthrene nucleus. Although chemically very similar, a comparatively slight structural change is in many instances productive of substances which have physiologically dissimilar effects, often acting upon different physiologic systems. But in many cases a small change in structure will result merely in an accentuation of certain effects.

The Cyclopentanophenanthrene Nucleus

**Classification.** Classification becomes a bizarre problem by reason of the (a) overlapping uses to which these substances are put, and (b) the multiple purposes for which the hormones or synthetic substances are used. Indeed, the steroids may be classified by structure; that however would be uninformative to the student as to their use. Classification by origin, as adrenal, would also be unsuitable because, for example, a number of the adrenal corticosteroids are not found in the adrenal cortex at all, but merely resemble the natural hormones found in the adrenal cortex.

For those reasons the hormonal or hormonelike entries in the tables are classified by-and-large, by their predominant pharmacologic effects. Even that classification has its disparities as for example, the use of male sex hormones, i.e. the androgens, is neither limited to men, nor to uses which entail their effect upon male sex characteristics.

**Uses.** Originally, the use of steroid hormones was largely based upon one or more of the following predicates:

- To supplement the progressively declining secretion of a specific hormone due to natural biologic aging of the organism; in the menopause as an example of such declining secretion, a female sex hormone is used for such supplementation;
- To make available to the body a specific hormone, the natural secretion of which is inhibited because of a congenital or developmental anomaly; the underdevelopment of male secondary sex characteristics is an example of such an inhibited secretion, in which a male sex hormone is used—and correspondingly, female sex hormones in underdevelopment in females;
- To cause a reversal of hormonal balance in the treatment of diseases peculiar to a sex; for example, in the case of cancer of the female breast, a male sex hormone is administered, and in cancer of the prostate, a female sex hormone is used;
- To mimic a natural function, as menstruation, by the administration of estrogens—on withdrawal of which bleeding occurs; or by the alternate use of estrogenic and progestational—both female sex hormones.
- To delay a function, as ovulation, as in oral contraceptives, or *birth control pills*.

Since the finding that cortisone ameliorates the symptoms of rheumatoid arthritis (1949) the adrenal corticosteroid hormones and especially the synthetically prepared steroid analogues which have no natural counterpart in the body, have been successfully employed in the treatment of diseases not related to sex or sex function.

**Androgens and Anabolic Agents.** The agents listed in the tables under this classification have the effect of male sex hormones (androgens) i.e., to stimulate sexual maturation, in the "male climacteric," etc. But all androgens have in greater or lesser degree the ability to stimulate muscle development, i.e., an anabolic effect. Among the synthetically prepared agents which have no counterpart in the body (Methandrostenolone or Oxymetholone) are those which have a lessened androgenic, but a heightened anabolic effect. These qualities are determined by biological tests on animals but principally confirmed by clinical use in man. The anabolic effect includes remineralization of bone, which may be partially demineralized (osteoporosis) by age, or by certain drugs, as the adrenal corticosteroids (q.v.).

Anabolic agents are used for muscle and bone nutrition in men as well as women. The reason for the high interest in synthetic steroidal substances for anabolic use, is based on the need for materials, which within a given effective dose have a greater anabolic-to-androgenic ratio than such androgens as methyl testosterone. Otherwise, the administration of androgens to women produces manifestations of virilism, such as growth of hair on the face, a deepening of the voice, etc. Androgens are also used in the female in the suppression of excessive bleeding and in the treatment of cancer of the breast and cervix. (For other androgen-like agents, see also Progestogens and Progestins.)

**Estrogens.** Estrogenic agents hasten sexual maturation in the female. Therefore, they are used in underdevelopment in the female. The widest use of estrogens is in the treatment of the menopause, in which they supplement from without, the secretion of natural estrogens by the ovary, which begins to decline at about the 40th year. The menopause is usually a slow process, and the declining secretion gives rise to various symptoms during the time that the secretion declines, until adjustment to the new status takes place. The menopause, a period of physical and psychological stress, is made less precipitous by estrogens.

Frequently, a menopause must be quickly induced, as in cancer of the ovary or in uterine hemorrhage. This is done by radiation or by the removal of the uterus. Severe vasomotor symptoms occur when the menopause is thus suddenly induced. Estrogens—among other drugs—are used in the amelioration of these symptoms.

Estrogens (especially diethylstilbestrol which though not a hormone has an estrogenic effect) are also used in the control of cancer of the prostate in the male. Note the inverse correspondence to the use of male sex hormones in cancer of the breast in the female.

**Progestogens and Progestins (Including 19-Norsteroid Compounds).** The agents under that listing include progesterone, a female sex hormone, as well as progestins, i.e., synthetic progesterone-like compounds which have no natural counterpart in the body. Their use includes a variety of conditions: functional uterine bleeding, absence of menstruation (amenorrhea) used at times with estrogens, painful menstruation (dysmenorrhea), infertility, habitual abortion in order to maintain pregnancy, and in fact, to suppress ovulation hence their use as antifertility drugs. Certain progestins—as norethindrone combined with

## STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)

an estrogen, are the principal components of birth control pills—suppressing ovulation, there is no egg to fertilize, hence conception does not take place.

**Adrenal Corticosteroids, Including Antiinflammatory, Antiallergic and Antirheumatic Agents.** The adrenal cortex secretes a large number of hormones. They usually differ from each other in the accentuation of some phases of their properties. Virtually all of the cortical hormones are catabolic, thus having an effect in this respect, diametrically opposed to the androgens which are anabolic. Nearly all the cortical hormones—differing in degree from each other—cause retention of sodium and water by the body and hasten the excretion of potassium. These effects are utilized in the treatment of adrenal insufficiency or Addison's disease, in which conversely, there is an undue excretion of sodium and a strong retention of potassium. Desoxycorticosterone is used in Addison's disease because it has a particularly strong sodium retaining and potassium excreting effect.

Since the finding in 1949 of the usefulness of cortisone in profoundly reducing the symptoms of rheumatoid arthritis, the adrenal corticosteroids, including hydrocortisone, a natural hormone secreted by the adrenal cortex, and particularly the synthetic analogues not found in the body, as prednisone, have been used in the treatment of a wide variety of inflammatory diseases—especially diseases of collagen tissue. The same antiinflammatory effect is also brought into use in the reduction of inflammations associated with diseases of the skin, allergy, asthma, and in such systematic diseases as disseminated lupus erythematosus, also a collagen disease.

The drawbacks of cortisone, also shared in lesser measure by hydrocortisone, gave the impetus to the synthesis of steroidal substances not native to the body but differing somewhat from cortisone and hydrocortisone, in order to reduce the drawbacks attendant to the use of the latter. The sideeffects—especially those of cortisone—are retention of water and sodium, excretion of potassium, loss of mineral from bone leading to osteoporosis and fractures, hypertension, at times diabetes, personality changes or gastric ulcer. Prednisone and prednisolone among others (see tables) are two such steroidal synthetics which have the effects of cortisone, but fewer or less severe sideeffects. Whereas the synthetic steroidal substances are superior to cortisone with respect to lessened sideeffects, it cannot be said that the sideeffects are absent—they vary in degree from substance to substance.

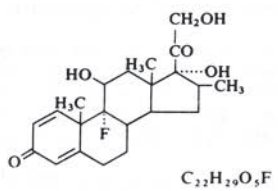

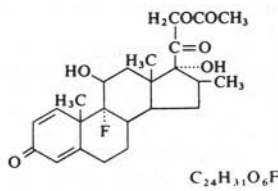

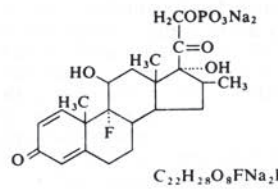

**Diuretic, Antidiuretic and Local Anesthetic Agents.** Aldosterone, a natural hormone of the adrenal cortex promotes retention in the body of sodium and water, and facilitates excretion of potassium. Hence its effect is almost diametrically opposed to diuretics—especially the thiazide diuretics. Aldosterone is much more active in this respect than desoxycorticosterone, and is used in the treatment of Addison's disease, a hypofunction of the adrenal glands.

Spironolactone is an antagonist to aldosterone—the latter when elaborated in the body in excessive amounts gives rise to a syndrome called aldosteronism. Spironolactone, a synthetically produced steroid does not have a natural counterpart in the body, is diuretic when mercurial or thiazide diuretics are ineffective; it prevents sodium retention and potassium excretion—effects opposite to aldosterone. Hence spironolactone is used in aldosteronism, against edema, in the treatment of congestive heart failure and in other conditions in which an accumulation of water, and water-retaining salt, is to be corrected.

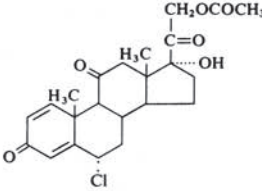

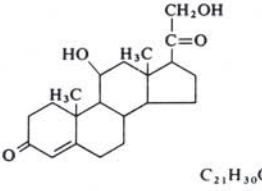

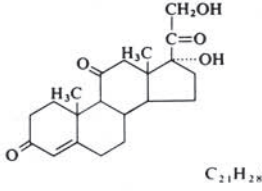

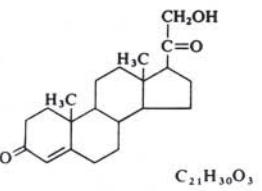

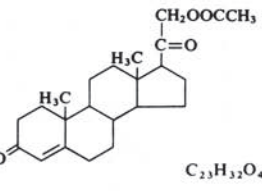

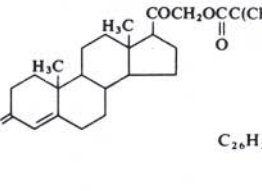

**Doses.** The amount of substance which comprises a dose of steroid hormones, or of the steroidal synthetics varies from substance to substance—from 0.1 mg for an estradiol ester, to 50 mg for a 19-norsteroid compound. The dose is conditioned upon the order of activity of the substance, the purpose for which it is administered, as well as the patient's response. However, as additional steroids for hormonal use are synthesized—especially those with adrenocortical activity, their average dose is usually smaller than the previously available steroid. The smaller effective dose of the more recent steroid is cited as an advantage over the previously available steroid.

However, a smaller dose cannot be claimed as an inherent advantage of a new steroid in comparison with an existing one, unless the lower dosage exhibits either greater or more prolonged activity or lesser sideeffects. One cannot meaningfully compare a dose, milligram for milligram, without taking into consideration if a heightened effect of the smaller dose produces fewer sideeffects. For example, it does not make any difference if a given effect and the same accompanying sideeffects are produced by a 50 mg or a 5 mg dose.

### ADRENAL CORTICOSTEROIDS, INCLUDING ANTIINFLAMMATORY, ANTIALLERGIC AND ANTIRHEUMATIC AGENTS

Melting point (°C)	166–167	205–207	161–166
Specific rotation	( $\alpha$ ) $\frac{20}{D} + 9 - + 17$ (100 mg. in 10 ml. alcohol)	( $\alpha$ ) $\frac{20}{D} - 73$ (100 mg. in 10 ml. alcohol)	( $\alpha$ ) $\frac{25}{D} + 69 - + 75$ (100 mg. in 10 ml. dioxane)
Absorption max.			

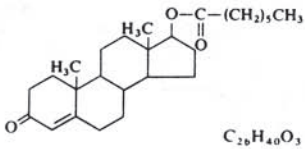

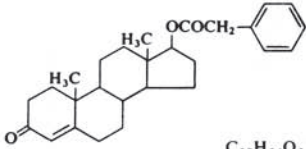

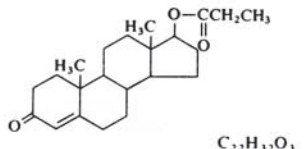

Names & synonyms:	<b>NORETHANDROLONE:</b> 17 $\alpha$ -ethyl-19-nortestosterone; 17 $\alpha$ -ethyl-17-hydroxy-4-norandrosten-3-one; 17 $\alpha$ -ethyl-17-hydroxy-19-norandrost-4-en-3-one.	<b>OXANDROLONE:</b> 17 $\beta$ -hydroxy-17 $\alpha$ -methyl-2-oxa-5 $\alpha$ -androstan-3-one.
Formulae:	 C <sub>20</sub> H <sub>30</sub> O <sub>2</sub>	 C <sub>18</sub> H <sub>30</sub> O <sub>3</sub>
Molecular weight	302.4	306.4
Melting point (°C)	130–136	230–233
Specific rotation	( $\alpha$ ) $\frac{25}{D} + 21$ (dioxane)	( $\alpha$ ) $\frac{25}{D} - 21$ (1% in chloroform)
Absorption max.	240 m $\mu$ ( $\epsilon = 16,500$ )	None

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

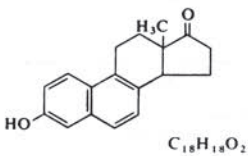

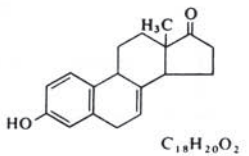

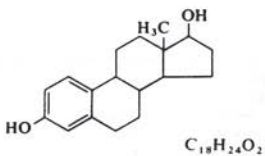

Names & synonyms:	<b>OXYMETHOLONE:</b> 17 $\beta$ -hydroxy-2-hydroxymethylene-17 $\alpha$ -methyl-3-androstanone; 2-hydroxymethylene-17- $\alpha$ -methyl dihydrotestosterone.	<b>PROMETHOLONE:</b> 2 $\alpha$ -methyl-dihydro-testosterone propionate; 2 $\alpha$ -methyl-5 $\alpha$ -androstan-17 $\beta$ -ol-3-one-propionate.
Formulae:	 $C_{21}H_{32}O_3$	 $C_{27}H_{40}O_3$
Molecular weight	332.4	360.5
Melting point (°C)	182	124–130
Specific rotation	$(\alpha)_{25}^D = +36$ (200 mg. in 10 ml. dioxane)	$(\alpha)_{25}^D +22 - +29$ (200 mg. in 10 ml. chloroform)
Absorption max.	$E_{1\%}^1 = 547$ at 315 m $\mu$ (in alkaline methanol made 0.01 N with NaOH)	without significant absorption from 220–300 m $\mu$ (methanol)
Names & synonyms:	<b>TESTOSTERONE:</b> trans-testosterone; $\Delta^4$ -androst-17- $\beta$ -ol-3-one; 17 $\beta$ -hydroxy-4-androsten-3-one.	<b>TESTOSTERONE CYPIONATE:</b> testosterone cyclopentylpropionate; 17 $\beta$ -hydroxy-4-androsten-3-one, cyclopentanepropionate.
Formulae:	 $C_{19}H_{28}O_2$	 $C_{27}H_{40}O_3$
Molecular weight	288.4	412.6
Melting point (°C)	151–156	100–102
Specific rotation	$(\alpha)_{24}^D +109$ (400 mg. in 10 ml. alcohol)	$(\alpha)_{20} +88.5 \pm 3.5$ (CHCl <sub>3</sub> )
Absorption max.	238 m $\mu$	$\lambda_{max} 241$ m $\mu$ ( $\epsilon$ 16,125)

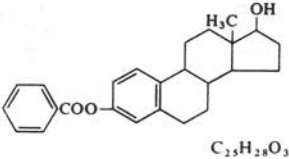

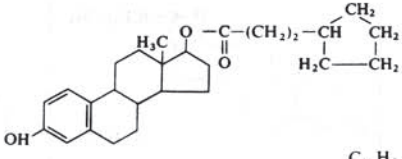

### STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)

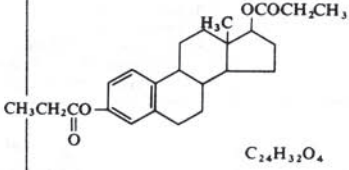

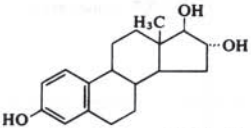

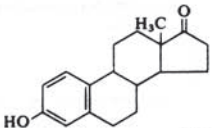

Names & synonyms:	TESTOSTERONE ENANTHATE; testosterone heptanoate; 17 $\beta$ -hydroxyandrost-4-en-3-one-17- enanthate.	TESTOSTERONE PHENYLACETATE; 17 $\beta$ -hydroxy-4-androsten-3-one phenyl- acetate; testosterone $\alpha$ -toluate.	TESTOSTERONE PROPIONATE; $\Delta^4$ -androstene-17- $\beta$ -propionate-3-one.
Formulae:	 $C_{28}H_{40}O_3$	 $C_{27}H_{34}O_3$	 $C_{22}H_{32}O_3$
Molecular weight	400.6	406.5	344.4
Melting point (°C)	34–39	129–131	118–122
Specific rotation	$(\alpha) \frac{25}{D} + 77 - + 82$ (2% in dioxane)	$(\alpha) \frac{25}{D} + 101 \pm 3$ (1% in chloroform)	$(\alpha) \frac{25}{D} + 83 - + 90$ (100 mg. in 10 ml. dioxane)
Absorption max.	241 m $\mu$ (in ethanol)	241 m $\mu$ (in ethanol)	

### ESTROGENS

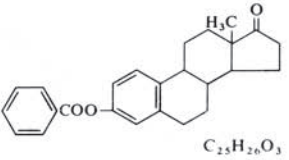

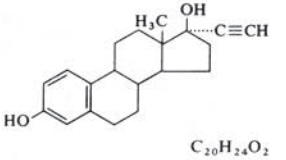

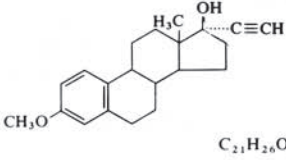

Names & synonyms:	EQUILENIN; 3-hydroxy-17-keto- $\Delta^{1,3,5-10,6,8}$ estrapentaene; 1,3,5-10,6,8-estrapentaen-3- ol-17-one.	EQUILIN; 3-hydroxy-17-keto- $\Delta^{1,3,5-10,7}$ estratetraene; 1,3,5,7-estratetraen-3-ol-17-one.	ESTRADIOL (formerly called $\alpha$ -estradiol); $\beta$ -estradiol; dihydrofolliculin; dihydroxyestrin; 1,3,5-estratriene-3,17 $\beta$ -diol; 3,17-dihydroxy- $\Delta^{1,3,5-10}$ -estratriene; 3,17-epidihydroxyestratriene.
Formulae:	 $C_{18}H_{16}O_2$	 $C_{18}H_{20}O_2$	 $C_{18}H_{24}O_2$
Molecular weight	266.3	268.3	272.3
Melting point (°C)	258–259	236–240	173–179
Specific rotation	$(\alpha) \frac{25}{D} + 89$ (dioxane)	$(\alpha) \frac{25}{D} + 308$ (200 mg. in 10 ml. dioxane); $+ 325$ (200 mg. in 10 ml. alcohol).	$(\alpha) \frac{25}{D} + 76 - + 83$ (100 mg. in 10 ml. dioxane)
Absorption max.	231, 270, 282, 292, 325, 340 m $\mu$	283–285 m $\mu$	225, 280 m $\mu$

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

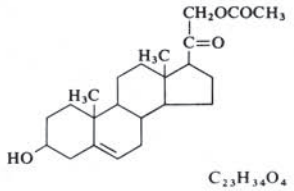

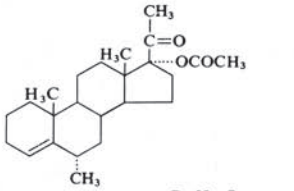

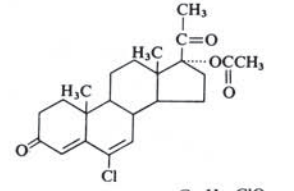

Names & synonyms:	<b>ESTRADIOL BENZOATE;</b> β-estradiol-3-benzoate; estradiol monobenzoate.	<b>ESTRADIOL CYPIONATE;</b> estradiol cyclopentylpropionate; β-estradiol 17-cyclopentanepronate; 1,3,5(10)-estratriene-3,17β-diol,17-cyclopentanepronate.
Formulae:	 C <sub>25</sub> H <sub>28</sub> O <sub>3</sub>	 C <sub>26</sub> H <sub>34</sub> O <sub>3</sub>
Molecular weight	376.4	396.6
Melting point (°C)	191–196	151–154
Specific rotation	(α) <sub>D</sub> <sup>25</sup> + 58 – + 63 (200 mg. in 10 ml. dioxane)	(α) <sub>D</sub> + 41.5 ± 3.5 (dioxane)
Absorption max.		223 mμ

Names & synonyms:	<b>ESTRADIOL DIPROPIONATE;</b> α-estradiol dipropionate; 17β-estradiol dipropionate.	<b>ESTRIOL;</b> trihydroxyestrin; Δ <sup>1,3,5-10</sup> -estratriene-3-16-cis-17-trans-diol; 1,3,5-estratriene-3,16α,17β-triol.	<b>ESTRONE;</b> folliculin; ketohydroxyestrin; 1,3,5-estratrien-3-ol-17-one.
Formulae:	 C <sub>24</sub> H <sub>32</sub> O <sub>4</sub>	 C <sub>18</sub> H <sub>24</sub> O <sub>3</sub>	 C <sub>18</sub> H <sub>22</sub> O <sub>2</sub>
Molecular weight	384.5	288.3	270.3
Melting point (°C)	104–109	282	258–262
Specific rotation	(α) <sub>D</sub> <sup>25</sup> + 39 ± 2 (1% in dioxane)	(α) <sub>D</sub> <sup>25</sup> + 53 – + 63 (40 mg. in 1 ml. dioxane)	(α) <sub>D</sub> <sup>25</sup> + 158 – + 168 (100 mg. in 10 ml. dioxane)
Absorption max.	268 mμ	280 mμ	283–285 mμ

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

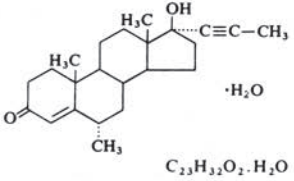

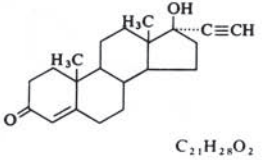

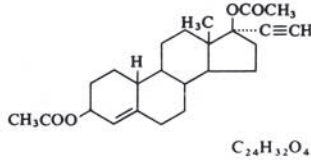

Names & synonyms:	ESTRONE BENZOATE	ETHYNYL ESTRADIOL; 17-ethynyl estradiol; 17 $\alpha$ -ethynyl-1,3,5-estratriene-3,17 $\beta$ -diol.	MESTRANOL; ethynylestradiol 3-methyl ether; 3-methoxy-17 $\alpha$ -ethynyl-1,3,5(10)- estratriene-17 $\beta$ -ol; 17 $\alpha$ -ethynyl-estradiol-3-methyl ether; 3-methoxy-19-nor-17 $\alpha$ -pregna-1,3,5,10- trien-20-yn-17-ol.
Formulae:	 C <sub>25</sub> H <sub>26</sub> O <sub>3</sub>	 C <sub>20</sub> H <sub>24</sub> O <sub>2</sub>	 C <sub>21</sub> H <sub>26</sub> O <sub>2</sub>
Molecular weight	374.4	296.4	310.4
Melting point (°C)	220	141–146	148–154
Specific rotation	( $\alpha$ ) $\frac{25}{D}$ + 120 (dioxane)	( $\alpha$ ) $\frac{25}{D}$ + 1 – + 10 (100 mg. in 10 ml. dioxane)	( $\alpha$ ) $\frac{25}{D}$ + 2 to + 8 (200 mg. in 10 ml. dioxane)
Absorption max.		248 m $\mu$	278 to 287 m $\mu$ (methanol)

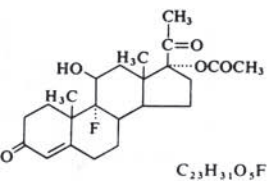

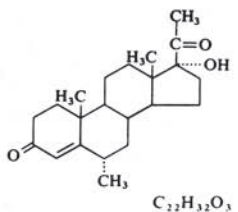

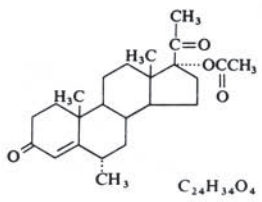

**PROGESTOGENS AND PROGESTINS (INCLUDING 19-NORSTEROID COMPOUNDS)**

Names & synonyms:	ACETOXPREGNENOLONE; 21-acetoxypregnenolone; prebediolone acetate; $\Delta^5$ -pregnene-3 $\beta$ ,21-diol-20-one-21- monoacetate; 21-acetoxy-5-pregnene-3-ol-20-one; 3-hydroxy-21-acetoxy-5-pregnen-20-one.	ANAGESTONE ACETATE; 6 $\alpha$ -methyl-4-pregnen-17 $\alpha$ -ol-20-one acetate; 17 $\alpha$ -acetoxy-6 $\alpha$ -methylpregn-4-en-20-one; 17 $\alpha$ -acetoxy-6 $\alpha$ -methyl-4-pregnen-20-one.	CHLORMADINONE ACETATE; 6-chloro- $\Delta^6$ -dehydro-17 $\alpha$ - acetoxyprogesterone; 6-chloro- $\Delta^4,6$ -pregnadiene-17 $\alpha$ -ol- 3,20-dioneacetate.
Formulae:	 C <sub>23</sub> H <sub>34</sub> O <sub>4</sub>	 C <sub>24</sub> H <sub>36</sub> O <sub>3</sub>	 C <sub>23</sub> H <sub>29</sub> ClO <sub>4</sub>
Molecular weight	374.5	372.6	404.9
Melting point (°C)	184–185	172–178	204–212
Specific rotation	( $\alpha$ ) $\frac{20}{D}$ + 37 – + 43 (dioxane)	( $\alpha$ ) $\frac{25}{D}$ + 40 to + 45 (10 mg. in 10 ml. chloroform)	( $\alpha$ ) $\frac{25}{D}$ 0 to – 6 (200 mg. in 10 ml. chloroform)
Absorption max.			284 m $\mu$ (methanol) Log $\epsilon$ = 4.34 $\pm$ 0.02

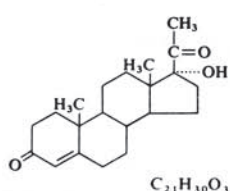

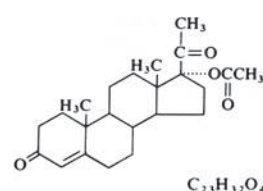

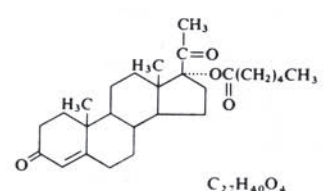

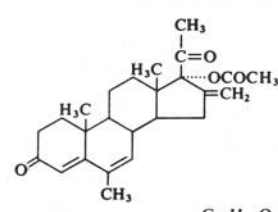

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

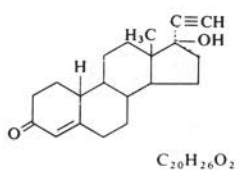

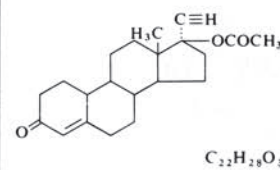

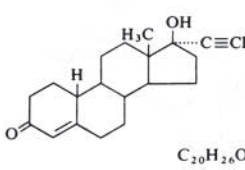

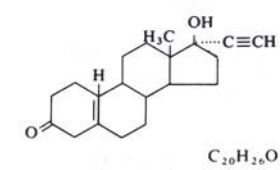

Names & synonyms:	<b>DIMETHISTERONE;</b> 6 $\alpha$ ,21-dimethylethisterone; 6 $\alpha$ ,21-dimethyl-17 $\beta$ -hydroxy-17 $\alpha$ -pregn-4-en-20-yn-3-one; 6 $\alpha$ -methyl-17 $\alpha$ -propynylandrost-4-en-17 $\beta$ -ol-3-one; 17 $\beta$ -hydroxy-6 $\alpha$ -methyl-17 $\alpha$ -(prop-1-ynyl)-androst-4-ene-3-one.	<b>ETHISTERONE;</b> anhydrohydroxyprogesterone; ethinyl testosterone; pregneninolone; 17 $\alpha$ ethynyl testosterone; 17 $\alpha$ -ethynyl-17 $\beta$ -hydroxy-4-androsten-3-one.	<b>ETHYNODIOL DIACETATE;</b> 17 $\alpha$ -ethynyl-4-estrene-3 $\beta$ ,17 $\beta$ -diol-17-diacetate; 19-nor-17 $\alpha$ -pregn-4-en-20-yne-3 $\beta$ ,17-diol diacetate.
Formulae:	 $C_{23}H_{32}O_2 \cdot H_2O$	 $C_{21}H_{28}O_2$	 $C_{24}H_{32}O_4$
Molecular weight	358.5	312.4	384.5
Melting point (°C)	App. 100 (dec.)	266–273	126–132
Specific rotation	( $\alpha$ ) $\frac{20}{D} + 16.5$ to $+ 18.5$ (2% solution in chloroform) (calculated to the anhydrous basis)	( $\alpha$ ) $\frac{25}{D} - 32^\circ$ (100 mg. in 10 ml. pyridine)	( $\alpha$ ) $\frac{25}{D} - 74$ (1% in chloroform)
Absorption max.	App. 240 m $\mu$ (anhydrous ethanol) $E_{1\%}^{1\text{cm}} = 443$	241 m $\mu$ (methanol)	None

Names & synonyms:	<b>FLUROGESTONE ACETATE;</b> 17 $\alpha$ -acetoxy-9 $\alpha$ -fluoro-11 $\beta$ -hydroxy-4-pregnene-3,20-dione.	<b>HYDROXYMETHYLPROGESTERONE;</b> medroxyprogesterone; 17 $\alpha$ -hydroxy-6 $\alpha$ -methylprogesterone; 17 $\alpha$ -hydroxy-6 $\alpha$ -methyl-4-pregnene-3,20-dione.	<b>HYDROXYMETHYLPROGESTERONE ACETATE;</b> medroxyprogesterone acetate; 17 $\alpha$ -hydroxy-6 $\alpha$ -methylprogesterone acetate; 17 $\alpha$ -hydroxy-6 $\alpha$ -methyl-4-pregnene-3,20-dione acetate.
Formulae:	 $C_{23}H_{31}O_5F$	 $C_{22}H_{32}O_3$	 $C_{24}H_{34}O_4$
Molecular weight	406.5	344.5	386.5
Melting point (°C)	250–251	220–223.5	202–207
Specific rotation	( $\alpha$ ) $\frac{25}{D} + 78$	( $\alpha$ ) $\frac{25}{D} + 75$	( $\alpha$ ) $\frac{25}{D} + 51$ (dioxane)
Absorption max.	238 m $\mu$ ( $\epsilon = 17,100$ )	241 m $\mu$ ( $\epsilon = 16,150$ )	241 m $\mu$ ( $\alpha_M = 16,500$ ) ethanol

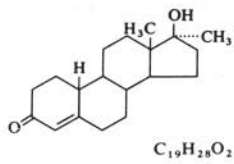

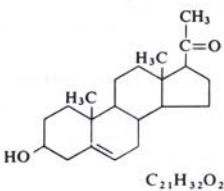

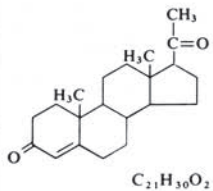

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

Names & synonyms:	<b>HYDROXYPROGESTERONE:</b> 17 $\alpha$ -hydroxyprogesterone; 17 $\alpha$ -hydroxy-4-pregene-3,20 dione; 4-pregnen-17 $\alpha$ -ol-3,20-dione.	<b>HYDROXYPROGESTERONE ACETATE:</b> 17 $\alpha$ -acetoxyprogesterone; 17 $\alpha$ -hydroxyprogesterone acetate; 17 $\alpha$ -hydroxy-4-pregene-3,20 dione acetate.
Formulae:	 $C_{21}H_{30}O_3$	 $C_{23}H_{32}O_4$
Molecular weight	330.4	372.5
Melting point (°C)	276	249–250
Specific rotation	( $\alpha$ ) $\frac{17}{D}$ + 105 (104 mg. in 10 ml. chloroform)	( $\alpha$ ) $\frac{25}{D}$ + 72 (chloroform)
Absorption max.		240 m $\mu$ ( $a_M = 16,875$ ) ethanol
Names & synonyms:	<b>HYDROXYPROGESTERONE CAPROATE:</b> 17 $\alpha$ -hydroxyprogesterone caproate; 17 $\alpha$ -hydroxy-4-pregene-3,20-dione caproate.	<b>MELENGESTROL ACETATE: MGA:</b> 17 $\alpha$ -hydroxy-6-methyl-16-methylene-4,6-pregnadiene-3,20-dione acetate; 6-dehydro-17-hydroxy-6-methyl-16-methylene-progesterone acetate.
Formulae:	 $C_{27}H_{40}O_4$	 $C_{25}H_{32}O_4$
Molecular weight	428.6	396.51
Melting point (°C)	121–123	215–227
Specific rotation	( $\alpha$ ) $\frac{25}{D}$ + 57 (chloroform)	( $\alpha$ ) <sub>D</sub> – 127 to – 135 (in CHCl <sub>3</sub> )
Absorption max.		288 m $\mu$ ( $\epsilon_1^1 = 24,000$ ) (ethanol)

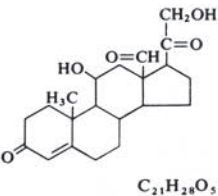

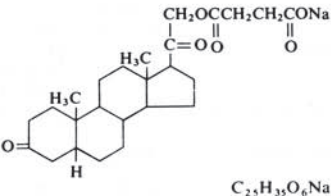

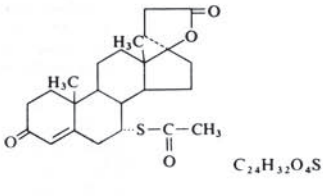

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

Names & synonyms:	<b>NORETHINDRONE:</b> Norethisterone; 17 $\alpha$ -ethynyl-19-nortestosterone; 17 $\alpha$ -ethynyl-17-hydroxy-19-nor-17 $\alpha$ -4-en-20-yn-3-one.	<b>NORETHINDRONE ACETATE:</b> 17 $\alpha$ -ethynyl-19-nortestosterone acetate.
Formulae:	 <chem>C20H26O2</chem>	 <chem>C22H28O3</chem>
Molecular weight	298.4	340.4
Melting point (°C)	202 and 208	157-163
Specific rotation	( $\alpha$ ) $\frac{25}{D}$ - 30 - - 35 (200 mg. in 10 ml. dioxane)	( $\alpha$ ) $\frac{25}{D}$ - 32 - - 35 (200 mg. in 10 ml. dioxane)
Absorption max.	$\alpha$ (1 %, 1 cm.) $\lambda$ 240 = 535 $\pm$ 15	$\alpha$ (1 %, 1 cm.) $\lambda$ 240 = 490 to 520 (505 $\pm$ 15) (ethanol)
Names & synonyms:	<b>NORETHISTERONE:</b> norethindrone; 19-norethisterone; 17 $\alpha$ -ethynyl-19-nor- $\Delta^4$ -androstan-17 $\beta$ -ol-3-one; 17 $\alpha$ -ethynyl-19-nor-testosterone; 17-hydroxy-3-oxo-19-nor-17 $\alpha$ -pregn-4-ene-20-yne; 17-hydroxy-19-nor-17 $\alpha$ -pregn-4-en-20-yn-3-one.	<b>NORETHYNODREL:</b> 17 $\alpha$ -ethynyl-17 $\beta$ -hydroxy-5(10)-estren-3-one.
Formulae:	 <chem>C20H26O2</chem>	 <chem>C20H26O2</chem>
Molecular weight	298.4	298.4
Melting point (°C)	200-207	174-184
Specific rotation	( $\alpha$ ) $\frac{25}{D}$ - 30 - - 38 (200 mg. in 10 ml. dioxane)	( $\alpha$ ) $\frac{25}{D}$ + 125 (dioxane)
Absorption max.	240 m $\mu$ ( $\epsilon_1^1$ = 576)	

**STEROID HORMONES AND OTHER STEROIDAL SYNTHETICS (Continued)**

Names & synonyms:	<b>NORMETHISTERONE:</b> 19-normethisterone; normethandrolone; metalutin; normetandrone; 17 $\alpha$ -methyl-19-nor- $\Delta^4$ -androstene-17 $\beta$ -ol-3-one; 17 $\alpha$ -methyl-19-nor-testosterone; 17 $\beta$ -hydroxy-3-oxo-17 $\alpha$ -methyl-estra-4-ene; 17 $\beta$ -hydroxy-17-methyl-estr-4-en-3-one.	<b>PREGNENOLONE:</b> $\Delta^5$ -pregnenolone; $\Delta^5$ -pregnen-3 $\beta$ -ol-20-one; 17 $\beta$ (1-ketoethyl)- $\Delta^5$ -androstene-3 $\beta$ -ol.	<b>PROGESTERONE:</b> progestin; progestone; pregnendione; $\Delta^4$ -pregnene-3,20-dione.
Formulae:	 C <sub>19</sub> H <sub>28</sub> O <sub>2</sub>	 C <sub>21</sub> H <sub>32</sub> O <sub>2</sub>	 C <sub>21</sub> H <sub>30</sub> O <sub>2</sub>
Molecular weight	288.4	308.4	314.4
Melting point (°C)	153–158	193	( $\beta$ ) isomer 121; ( $\alpha$ ) isomer 127–131
Specific rotation	( $\alpha$ ) $\frac{25}{D} + 25$ to $+29$ (200 mg. in 10 ml. chloroform)	( $\alpha$ ) $\frac{20}{D} + 28 - +30$ (alcohol)	( $\alpha$ ) $\frac{20}{D} + 172 - +182$ (200 mg. in 10 ml. dioxane)
Absorption max.	241 m $\mu$ – 565 $\pm$ 15		240 m $\mu$

**DIURETIC, ANTIDIURETIC AND LOCAL ANESTHETIC AGENTS**

Names & synonyms:	<b>ALDOSTERONE:</b> electrocortin; 18-oxocorticosterone; 18-formyl-11 $\beta$ ,21-dihydroxy-4-pregnene-3,20-dione.	<b>HYDROXYDIONE SODIUM:</b> 21-hydroxypregnane-3,20-dione-21-sodium hemisuccinate.	<b>SPIRONOLACTONE:</b> 3-(3-oxo-7 $\alpha$ -acetylthio-17 $\beta$ -hydroxy-4-androsten-17 $\alpha$ -yl)-propionic acid $\gamma$ lactone.
Formulae:	 C <sub>21</sub> H <sub>28</sub> O <sub>5</sub>	 C <sub>25</sub> H <sub>35</sub> O <sub>6</sub> Na	 C <sub>24</sub> H <sub>32</sub> O <sub>4</sub> S
Molecular weight	360.4	454.5	416.5
Melting point (°C)	108–112 (hydrate); 164 (anhydrous)	193–203 (dec.)	135; 202 (dec.)
Specific rotation	( $\alpha$ ) $\frac{25}{D} + 161$ (10 mg. in 10 ml. chloroform)	( $\alpha$ ) $\frac{25}{D} + 95$ (chloroform) for free acid.	( $\alpha$ ) $\frac{25}{D} - 34$ (chloroform)
Absorption max.	240 m $\mu$ (log $\epsilon = 4.20$ monohydr.; $\epsilon$ mol. 15,000 anhydr.)	280 m $\mu$ ( $\epsilon = 93.2$ )	$\epsilon^{238} = 20,200$

# SURFACE TENSION OF LIQUID ELEMENTS

## Gernot Lang

The following data were collected from many sources. As a result their accuracy varies. Users of data in this table are advised that:

1. As a rule, results from the "sessile drop" and "maximum bubble pressure" as well as from the "pendant drop" methods are preferable to results obtained from other methods for metals with very high melting points.
2. Values of single measurements are usually not as well supported by experiments as those of serial measurements at various temperatures.
3. Values in parentheses can be considered improbable.

The units of  $\sigma$  are mN/m.

Values of $\sigma$ at various temperatures													
Element	Purity (wt. %)	$\sigma_{mp}$ (mN/m)	Atm.	$t/^\circ\text{C}$	$\sigma$	$t/^\circ\text{C}$	$\sigma$	$t/^\circ\text{C}$	$\sigma$	Method	Year	Ref.

## TEMPERATURE CORRECTION FOR GLASS VOLUMETRIC APPARATUS

This table gives the correction to be added to actual capacity (determined at certain temperatures) to give the capacity at the standard temperature, 20°C. Conversely, by subtracting the corrections from the indicated capacity of an instrument standard at 20°C, the corresponding capacity at other temperatures is obtained. The table assumes for the cubical coefficient of expansion of glass 0.00025 per degree centigrade. The coefficients of expansion of glasses used for volumetric instruments vary from 0.00023 to 0.00028.

Temperature in degrees C.	2,000 ml	1,000 ml	500 ml	400 ml	300 ml	250 ml	Temperature in degrees C.	2,000 ml	1,000 ml	500 ml	400 ml	300 ml	250 ml

### TEMPERATURE CORRECTION FOR VOLUMETRIC SOLUTIONS

This table gives the correction to various observed volumes of water, measured at the designated temperatures to give the volume at the standard temperature, 20°C. Conversely, by subtracting the corrections from the volume desired at 20°C., the volume that must be measured out at the designated temperatures in order to give the desired volume at 20°C., will be obtained. It is assumed that the volumes are measured in glass apparatus having a coefficient of cubical expansion of 0.000025 per degree centigrade. The table is applicable to dilute aqueous solutions having the same coefficient of expansion as water.

Temperature of measurement, °C.	Capacity of apparatus in milliliters at 20°C.							Temperature of measurement, °C.	Capacity of apparatus in milliliters at 20°C.						
	2,000	1,000	500	400	300	250	150		2,000	1,000	500	400	300	250	150
	Correction in milliliters to give volume of water at 20°C.								Correction in milliliters to give volume of water at 20°C.						
15	+1.54	+0.77	+0.38	+0.31	+0.23	+0.19	+0.12	24	-1.61	-.81	-.40	-.32	-.24	-.20	-.12
16	+1.28	+.64	+.32	+.26	+.19	+.16	+.10	25	-2.07	-1.03	-.52	-.41	-.31	-.26	-.15
17	+.99	+.50	+.25	+.20	+.15	+.12	+.07	26	-2.54	-1.27	-.64	-.51	-.38	-.32	-.19
18	+.68	+.34	+.17	+.14	+.10	+.08	+.05	27	-3.03	-1.52	-.76	-.61	-.46	-.38	-.23
19	+.35	+.18	+.09	+.07	+.05	+.04	+.03	28	-3.55	-1.77	-.89	-.71	-.53	-.44	-.27
21	-.37	-.18	-.09	-.07	-.06	-.05	-.03	29	-4.08	-2.04	-1.02	-.82	-.61	-.51	-.31
22	-.77	-.38	-.19	-.15	-.12	-.10	-.06	30	-4.62	-2.31	-1.16	-.92	-.69	-.58	-.35
23	-1.18	-.59	-.30	-.24	-.18	-.15	-.09								

In using the above table to correct the volume of certain standard solutions to 20°C. more accurate results will be obtained if the numerical values of the corrections are increased by the percentages given below:

Solution	Normality		
	N	N/2	N/10
HNO <sub>3</sub>	50	25	6
H <sub>2</sub> SO <sub>4</sub>	45	25	5
NaOH	40	25	5
KOH	40	20	4

## TEMPERATURE CORRECTION, GLASS SCALE

Metric

To reduce readings of a mercurial barometer with a glass scale to 0°C. subtract the appropriate quantity as found in table.

# THE LIMITS OF SUPERHEAT OF PURE LIQUIDS

C. T. Avedisian

The limit of superheat of a liquid, also known as the homogenous nucleation limit, represents the deepest possible penetration of a liquid into the domain of metastable states. At constant pressure ( $P$ ) it is the highest temperature ( $T$ ) below the critical point that a liquid can sustain without undergoing a phase transition; at constant temperature, it is the lowest pressure. The importance of this limit resides in the consequences of the phase transition that eventually occurs when the limit is reached. The phase transition may be explosive or nonexplosive as it relates to such processes as contact vapor explosions in postulated nuclear reactor accidents, spills of liquid natural gas during transport, and burning of fuel droplets.

The perspective upon which the concept of a superheat limit emerges is based on random molecular density fluctuations within the bulk of a liquid producing hole-like regions of molecular dimensions that act as bubbles. A phase transition occurs when a bubble, formed by these molecular processes, grows to a size such that it is in unstable equilibrium (i.e., a "critical size nucleus") with the surrounding liquid. The "nucleation rate",  $J$ , refers to the mean rate of forming such vapor nuclei in units of nuclei/(volume\*time).

According to classical homogeneous nucleation theory, the nucleation rate depends exponentially on the energy ( $\Phi$ ) of forming a critical size nucleus as follows:

$$J = \Gamma k_n N_o \exp[-\Phi/(kT)] \quad (1)$$

where

$$\Phi = 16 \pi \sigma^3 / [3(P_b - P)^2] \quad (2)$$

and  $k$  is the Boltzmann constant,  $k_n$  is the molecular evaporation rate for a nucleus containing  $n$  molecules,  $N_o$  is the number density of liquid molecules,  $P$  is the ambient pressure,  $P_b$  is the gas pressure within the critical size nucleus,  $\sigma$  is surface tension, and  $\Gamma$  is a kinetic pre-factor which accounts for the possibility that nuclei larger than the critical size may decay; if every critical size nucleus continues to grow, then  $\Gamma = 1$ . From Equations (1) and (2), it is evident that 1) a unique superheat limit does not exist because to each nucleation rate corresponds its own superheat limit at a given ambient pressure, 2) if  $J$  increases so should  $T$  at constant pressure, and 3)  $J$  depends very strongly on  $T$  because of the variation of physical properties (surface tension, vapor pressure, and density) with temperature. This strong dependence implies the existence of a threshold temperature above which  $J$  will be large and below which it will be negligibly small. The limit of superheat is defined as the mean temperature in this range of large change of  $J$ .

The limits of superheat given below are organized as follows. All substances are listed in alphabetical order by chemical formula. Inorganic substances are listed first, followed by organic compounds in the order of increasing carbon number. The second and third columns list the nucleation pressures and temperatures at the corresponding nucleation rate. The nucleation rates listed are characteristic of the various experimental methods used to perform the measurements.

### TOTAL MONTHLY SOLAR RADIATION IN A CLOUDLESS SKY

Total radiation is the sum of the direct and scattered radiation that strikes the earth's surface. It is influenced by the degree of cloudiness, atmospheric transparency, duration of sunshine, and height of elevation at which the measurements are taken. Deviations from values in this table are bound to occur; however, it is believed that the deviations do not exceed  $\pm 10\%$  for the summer months and  $\pm 15\%$  for the winter months. The radiation units in this table are kcal/cm<sup>2</sup>.

## TRANSMISSION OF CORNING COLORED FILTERS

Supplied by R. G. Saxton

If  $I_0$  is the intensity of radiation entering a layer of some medium and  $I$  the intensity reaching the opposite surface, the ratio  $I/I_0$  is called the transmittance. In practice the ratio of intensity of radiation passing through a glass sample to that incident on its surface is often measured and plotted as transmission. The transmission is the result of two factors, the transmittance of the glass and the losses by reflection. These losses amount to about 4% for each glass-air surface; the transmission of a sample is about 92% of its transmittance. Since the reflection losses differ slightly with different samples, the correction is often determined and applied when the transmission is measured. Values in this table have been corrected for reflection losses.

The identifying glass number, CS number, color and properties, and nominal thickness for the Corning glasses in this table are:

Glass No.	CS	Color and properties	Nominal thickness
0160	0-54	Clear; Ultraviolet transmitting	2.0
2030	2-64	Red; Sharp cut	3.0
2403	2-58	Red; Sharp cut	3.0
2404	2-59	Red; Sharp cut	3.0
2408	2-60	Red; Sharp cut	3.0
2412	2-61	Red; Sharp cut	3.0
2418	2-62	Red; Sharp cut	3.0
2424	2-63	Red; Sharp cut	3.0
2434	2-73	Red; Sharp cut	3.0
2540	7-56	Black; IR transmitting; Visible absorbing	2.5
2550	7-57	Black; IR transmitting; Visible absorbing	2.0
2600	7-69	Black; IR transmitting; Visible absorbing	3.0
3060	3-75	Straw	2.0
3304	3-76	Dark amber	3.0
3307	3-77	Dark amber	3.0
3384	3-70	Yellow	3.0
3385	3-71	Yellow	3.0
3387	3-72	Straw	3.0
3389	3-73	Straw	3.0
3391	3-74	Straw	3.0
3480	3-66	Yellow; Sharp cut	3.0
3482	3-67	Yellow; Sharp cut	3.0
3484	3-68	Yellow; Sharp cut	3.0
3486	3-69	Yellow; Sharp cut	3.0
3718	3-94	Yellow	3.0
3750	3-79	Yellow; Yellow green fluorescing	5.0
3780	3-80	Yellow	2.0
3850	0-51	Clear; UV transmitting	4.0
3961	1-56	Bluish; IR absorbing; Visible transmitting	2.5
3962	1-57	Bluish; IR absorbing; Visible transmitting	2.5
3965	1-58	Bluish; IR absorbing; Visible transmitting	2.5
3966	1-59	Bluish; IR absorbing; Visible transmitting	2.5
4010	4-64	Green	4.0
4015	4-65	Yellow green	3.0
4060	4-67	Green	2.0
4084	4-68	Green	4.5

4305	4-71	Blue green	4.0
4308	4-70	Blue green	4.0
4309	4-69	Blue green	4.0
4445	4-74	Green	2.5
4602	1-75	Bluish; IR absorbing; Visible transmitting	3.0
4784	4-94	Blue green	5.0
5030	5-57	Blue	5.0
5031	5-56	Blue	4.5
5070	7-62	Amethyst	3.9
5071	7-63	Amethyst	3.9
5073	7-64	Amethyst	3.9
5113	5-58	Blue	4.0
5120	1-60	Smoky violet; Absorbs yellow	5.2
5300	4-106	Green	3.9
5330	1-64	Blue	4.5
5433	5-59	Blue	5.0
5543	5-60	Blue	5.0
5562	5-61	Blue	5.0
5572	1-61	Blue	5.0
5840	7-60	Black; UV transmitting; Visible absorbing	4.5
5850	7-59	Purple; UV transmitting; Visible absorbing	4.0
5860	7-37	Black; UV transmitting; Visible absorbing	5.0
5874	7-39	Black; UV transmitting; Visible absorbing	5.0
5900	1-62	Blue	5.5
5970	7-51	Black; UV transmitting; Visible absorbing	5.0
7380	0-52	Clear; UV transmitting	2.0
7740	0-53	Clear; UV transmitting	2.0
7905	9-30	Clear; UV transmitting; Long Range IR transmitting	2.0
7910	9-54	Clear; UV transmitting	2.0
8364	7-98	Gray	2.0
9780	4-76	Blue green	5.0
9782	4-96	Blue green	5.0
9788	4-97	Blue green	5.0
9830	4-77	Green	3.4
9863	7-54	Black; UV transmitting; Visible absorbing	3.0

# TRANSMISSION OF WRATTEN FILTERS

Compiled by Allie C. Peed, Jr. for The Eastman Kodak Company

Data condensed from Kodak Wratten Filters for Scientific and Technical Use published by the Eastman Kodak Company, manufacturers of the filters.

The following pages give (1) percentage luminous transmittance at wave lengths from 400 to 700 $\mu$  at intervals of 10 $\mu$  for the standard illuminant "C" adopted by the International Commission of Illumination, (2) dominant wavelength in millimicrons, and (3) percentage of excitation purity. Values of wave length followed by "c" indicate the complementary wave lengths of purple filters which do not have a dominant wave length.

All colorimetric specifications are based on the 1931 standard ICI colorimetric and luminosity data.

The transmittance data are given as representing standard samples of the filters. They are intended only for the information of users in choosing filters which will meet their requirements. Values taken from the tables of data should not be used by research workers as representing precisely the absorption characteristics of a particular filter. If such precise data are needed, they should be determined for the particular filter being used.

Where the spectra extend into the ultraviolet this fact is indicated by an asterisk (\*) in the transmission tables immediately beneath the filter number, and quantitative data are not given. The manufacturer should be consulted for this information. Transmission in the ultraviolet of wave lengths less than 330 $\mu$  will be eliminated in the case of cemented filters, as glass absorbs ultraviolet radiation of wave lengths shorter than about 330 $\mu$ .

Stability ratings are given as three letter combinations following the filter description in the table below. In establishing the stability classifications each filter is exposed to a selected light source for a specific time interval. The following grading system is used to describe the result:

Class A — stable  
 Class B — relatively stable  
 Class C — somewhat unstable  
 Class D — unstable

The classification letters, for example, AAA, describe the stability to the following three exposure tests in this order:

1. Two weeks' exposure to daylight in a south window
2. Twenty-four hours' exposure to a "Fade-Ometer"
3. Two weeks' exposure at two feet from a 1000-watt tungsten lamp.

Filters are supplied in two forms: as lacquered gelatin film, or as a gelatin film cemented between pieces of optical glass. Filters in glass are cemented between sheets of plane-parallel glass, which is surfaced in quantities and is of sufficient accuracy for general photographic work, and for most scientific purposes.

Most Wratten Gelatin Filters are stocked in 2- or 3-inch squares. Stocks of 2- or 3-inch square filters cemented in glass are maintained only in filters usually used for general photographic work.

The booklet "Kodak Filters and Lens Attachments" gives more valuable information on this subject.

## FILTER DATA

No.	Description, use, and stability	No.	Description, use, and stability
	<b>Colorless</b>	25	A — Tricolor red for direct color separation. Contrast effects in commercial photography and in outdoor scenes. Two-color general viewing. Aerial infrared photography and haze cutting, AAA.
0	For compensating thickness of other gelatin filters in optical systems, AAA.		
1	Absorbs ultraviolet below 360 m $\mu$ , DDD.	26	Stereo red, AAA.
1A	Kodak Skylight Filter — Reduces excess bluishness in outdoor color photographs in open shade under a clear, blue sky, ACA.	29	Red color separation from transparencies and for the Kodak Fluorescence Process. Strong contrast effects. Copying blueprints. Tungsten tricolor projection, AAA.
	<b>Yellow</b>		
2B	Absorbs ultraviolet below 410 m $\mu$ , ACA.		
3	Light yellow, CCD.		
3N5	No. 3 plus 0.5 neutral density, AAA.	30	<b>Magentas and Violets</b>
4	Light yellow — Approximate correction on panchromatic materials for outdoor scenes, including sky, CCC.	31	Green absorption, BBC.
6	K1 — Light yellow — Partial correction outdoors, BBA.	32	Green absorption, CCA.
8	K2 — Yellow — Full correction outdoors on Type B panchromatic materials. Widely used for proper sky, cloud, and foliage rendering. Green separation for Fluorescence Process, AAA.	33	Minus green, CCD.
		34	Strong green absorption, CCB.
8N5	No. 8 plus 0.5 neutral density, AAA.	34A	Violet, CDD.
9	K3 — Deep yellow. Moderate contrast in outdoor photography (with black-and-white films), AAA.	35	Blue separation — Kodak Fluorescence Process, DCC.
11	X1 — Greenish yellow. Correction for tungsten light on Type B panchromatic materials; also for daylight correction with Type C panchromatic materials in making outdoor portraits, darkening skies, or lightening foliage, AAA.	36	Contrast in microscopy, CDD.
12	Minus blue. Haze cutting in aerial photography, AAA.	38	Dark violet, CCC.
13	X2 — Yellow green. Correction for Type C panchromatic materials in tungsten light, ABA.		<b>Blues and Blue-greens</b>
15	G — Deep yellow. Overcorrection in landscape photography. Contrast control in copying and in aerial infrared photography, AAA.	38A	Red absorption, BCA.
16	Blue absorption, AAB.	39	Red absorption. Increasing contrast in visual microscopy, BBB.
18A	Transmits ultraviolet and infrared only (glass), AAA.	40	Contrast control in printing motion-picture duplicates (glass) AAA.
	<b>Oranges and Reds</b>	44	Green for two-color photography (tungsten), CBC.
21	Blue and blue-green absorption, CBB.	44A	Minus red — Two-color general viewing, DDD.
22	Yellow-orange. For increasing contrast in blue preparations in microscopy. Mercury yellow, BAC.	45	Minus red, DDD.
23A	Light red. Two-color projection — contrast effects, BAB.	45A	Contrast in microscopy, DDD.
24	Red for two-color photography (daylight or tungsten). White-flame-arc tricolor projection, AAB.	46	Highest resolving power in visual microscopy, CDC.
		47	Blue projection (experimental), DDD.
		47B	Tricolor blue for direct color separation and from Kodak Ektacolor Film for Dye Transfer. Contrast effects in commercial photography. Tungsten and white-flame-arc tricolor projection, BBC.
		48	Tricolor blue for color separation from transparencies and from Kodak Ektacolor Film for Graphic Arts, BBB.
		48A	Green and red absorption, CBC.
		49	Green and red absorption, AAB.
		49B	Dark blue, BCB.
		50	Very dark blue, BBB.
		52	Very dark blue. Mercury violet, CCC.
			<b>Greens</b>
			Light green, AAB.

## TRANSMISSION OF WRATTEN FILTERS (Continued)

### FILTER DATA

No.	Description, use, and stability	No.	Description, use, and stability
53	Medium green, CCB	†86B	Yellowish. Photometric filter (visual), BCA.
	Very dark green, AAA.	†86C	Yellowish. Photometric filter (visual), AAA.
55	Stereo green, BBC.		<b>Light Balancing</b>
56	Very light green, CBC.	80A	For Kodachrome Film, Daylight Type, and photographic flood lamps, ABA.
57	Green for two-color photography (daylight), CBC.	81	Yellowish. For warmer color rendering.
57A	Light green, BBC.	81A	Yellowish. For Kodak Ektachrome Film, Type B, with photographic flood lamps.
58	Tricolor green for direct color separation. Contrast effects in commercial photography and microscopy, BBC.	81B	Yellowish. For warmer color rendering.
59	Green for tricolor projection (white-flame-arc), BBB.	81C	Yellowish. For Kodachrome Film, Type A, with flash lamps.
59A	Very light green, BBB.	81D	Yellowish. For Kodachrome Film, Type A, with flash lamps.
60	Green for two-color photography (tungsten), BDC.	81EF	Yellowish. For Kodak Ektachrome Film, Type B, with flash lamps.
61	Green color separation from transparencies and Kodak Ektacolor Film. Tricolor projection (tungsten), ABC.	82	Bluish. For cooler color rendering.
64	Red absorption (light), CDB.	82A	Bluish. For Kodachrome Film, Type A, with 3200 K lamps.
65	Red absorption, ADB.	82B	Bluish. For cooler color rendering.
65A	Red absorption, CCD.	82C	Bluish. For cooler color rendering.
66	Contrast effects in microscopy and medical photography, DDC.	83	Yellowish. For 16 mm Commercial Kodachrome Film and daylight exposure, BBB.
67A	Red absorption (light). Two-color projection, CDC.	85	Orange. For Type A Kodak color films and daylight exposure, BAA.
	<b>Narrow-band</b>	85B	Orange. For Kodak Ektachrome Film, Type B, and daylight exposure, BAB.
70	Dark red. Infrared photography. Color separation for Kodak Ektacolor Film (with tungsten), ABC.		<b>Miscellaneous</b>
72B	Dark orange-yellow, CCC.	79	Photographic sensitometry. Corrects 2360 K to 5500 K, AAA.
73	Dark yellow-green, ABB.	87	For infrared photography. Absorbs visual.
74	Dark green. Mercury green, BBC.	87C	Absorbs visual, transmits infrared.
75	Dark blue-green, ACC.	88A	For infrared photography. Absorbs visual.
76	Dark violet (compound filter), DDD.	89B	For infrared photography, AAA.
77	Transmits 546 m $\mu$ mercury line (glass plus gelatin), AAA.	90	Narrow-band viewing filter for judging brightness scale of scenes, CCD.
77A	Transmits 546 m $\mu$ mercury line (glass plus gelatin), AAA.	96	Neutral filters for controlling luminance, AAB.
	<b>Photometrics</b>	97	Dichroic absorption, AAA.
78	Bluish. Photometric filter (visual), BAB.	102	Correction filter for Barrier-layer photocell, ABA.
78AA	Bluish. Photometric filter (visual), BAA.	106	Correction filter for S-4 type photocell, AAA.
78A	Bluish. Photometric filter (visual), AAA.		
78B	Bluish. Photometric filter (visual), AAA.		
78C	Bluish. Photometric filter (visual), BAA.		
86	Yellowish. Photometric filter (visual), BBA.		
86A	Yellowish. Photometric filter (visual), AAA.

## ULTRAVIOLET SPECTRA OF COMMON LIQUIDS

The following tables present the UV spectra of some common solvents and other liquids. The data were obtained, using a 1.00-cm path-length cell, against a water reference.

## UNITS, SYMBOLS, AND EQUATIONS FOR RADIOMETRIC AND PHOTOMETRIC QUANTITIES

Submitted by Abraham Abramowitz  
from Z-7.1-1967

### Radiometric Quantities (See Note at bottom of page)

Quantity*	Symbol*	Defining Equation**	Commonly Used Units	Symbol
Radiant energy	$Q, (Q_e)$		erg ‡ joule kilowatt-hour	J kWh
Radiant density	$w, (w_e)$	$w = dQ/dV$	‡ joule per cubic meter erg per cubic centimeter	$J/m^3$ $erg/cm^3$
Radiant flux	$\Phi, (\Phi_e)$	$\Phi = dQ/dt$	erg per second ‡ watt	$erg/s$ W
Radiant flux density at a surface				
Radiant exitance	$M, (M_e)$	$M = d\Phi/dA$	watt per square centimeter	$W/cm^2$
(Radiant emittance)†				
Irradiance	$E, (E_e)$	$E = d\Phi/dA$	‡ watt per square meter, etc.	$W/m^2$
Radiant intensity	$I, (I_e)$	$I = d\Phi/d\omega$ ( $\omega$ = solid angle through which flux from point source is radiated)	‡ watt per steradian	W/sr
Radiance	$L, (L_e)$	$L = d^2\Phi/d\omega^2(dA \cos\theta)$ $= dI/(dA \cos\theta)$ ( $\theta$ = angle between line of sight and normal to sur- face considered)	watt per steradian and square centimeter ‡ watt per steradian and square meter	$W \cdot sr^{-1} cm^{-2}$ $W \cdot sr^{-1} m^{-2}$
Emissivity	$\epsilon$	$\epsilon = M/M_{blackbody}$ ( $M$ and $M_{blackbody}$ are re- spectively the radiant exi- tance of the measured specimen and that of a blackbody at the same temperature as the speci- men)	one (numeric)	—

Note: The symbols for photometric quantities (see following table) are the same as those for the corresponding radiometric quantities (see above). When it is necessary to differentiate them the subscripts  $v$  and  $e$  respectively should be used, e.g.,  $Q_v$  and  $Q_e$ .

\*Quantities may be restricted to a narrow wavelength band by adding the word spectral and indicating the wavelength. The corresponding symbols are changed by adding a subscript  $\lambda$ , e.g.,  $Q_\lambda$  for a spectral concentration or a  $\lambda$  in parentheses, e.g.,  $K(\lambda)$ , for a function of wavelength.

\*\*The equations in this column are given merely for identification.

\*\*\* $\Phi_i$  = incident flux  
 $\Phi_a$  = absorbed flux  
 $\Phi_r$  = reflected flux  
 $\Phi_t$  = transmitted flux

†to be deprecated.

‡International System (SI) unit.

**UNITS, SYMBOLS, AND EQUATIONS FOR RADIOMETRIC AND PHOTOMETRIC QUANTITIES**  
(continued)

Quantity*	Symbol*	Photometric Quantities		
		Defining Equation**	Commonly Used Units	Symbol
Absorptance	$\alpha, (\alpha_v, \alpha_e)$	$\alpha = \Phi_d/\Phi_i^{***}$	one (numeric)	—
Reflectance	$\rho, (\rho_v, \rho_e)$	$\rho = \Phi_r/\Phi_i^{***}$	one (numeric)	—
Transmittance	$\tau, (\tau_v, \tau_e)$	$\tau = \Phi_t/\Phi_i^{***}$	one (numeric)	—
Luminous energy (quantity of light)	$Q, (Q_v)$	$Q_v = \int_{380}^{760} K(\lambda) Q_e \lambda d\lambda$	lumen-hour ‡lumen-second (talbot)	lm · h lm · s
Luminous density	$w, (w_v)$	$w = dQ/dV$	‡lumen-second per cubic meter	lm · s · m <sup>-3</sup>
Luminous flux	$\Phi, (\Phi_v)$	$\Phi = dQ/dt$	‡lumen	lm
Luminous flux density at a surface Luminous exitance (Luminous emittance)†	$M, (M_v)$	$M = d\Phi/dA$	lumen per square foot	lm/ft <sup>2</sup>
Illumination (illuminance)	$E, (E_v)$	$E = d\Phi/dA$	footcandle (lumen per square foot) ‡lux (lm/m <sup>2</sup> ) phot (lm/cm <sup>2</sup> )	fc lx ph
Luminous intensity (candlepower)	$I, (I_v)$	$I = d\Phi/d\omega$ ( $\omega$ = solid angle through which flux from point source is radiated)	‡candela (lumen per steradian)	cd
Luminance (photometric brightness)	$L, (L_v)$	$L = d^2\Phi/d\omega (dA \cos\theta)$ $= dI/(dA \cos\theta)$ ( $\theta$ = angle between line of sight and normal to surface considered)	candela per unit area stilb (cd/cm <sup>2</sup> ) nit (‡cd/m <sup>2</sup> ) footlambert (cd/πft <sup>2</sup> ) lambert (cd/πcm <sup>2</sup> ) apostilb (cd/πm <sup>2</sup> )	cd/in <sup>2</sup> , etc. sb nt fL L asb
Luminous efficacy	$K$	$K = \Phi_v/\Phi_e$	‡lumen per watt	lm/W
Luminous efficiency	$V$	$V = K/K_{\text{maximum}}$ ( $K_{\text{maximum}}$ = maximum value of $K(\lambda)$ function)	one (numeric)	—

**ILLUMINATION CONVERSION FACTORS**

1 lumen = 1/680 lightwatt	1 watt-second = 1 joule = 10 <sup>7</sup> ergs
1 lumen-hour = 60 lumen-minutes	1 phot = 1 lumen/cm <sup>2</sup>
1 footcandle = 1 lumen/ft <sup>2</sup>	1 lux = 1 lumen/m <sup>2</sup>

Number of → Multiplied by ↘	Footcandles	*Lux	Phots	Milliphots

*Lux	10.76	1	10,000	10
Phot	0.00108	0.0001	1	0.001
Milliphot	1.076	0.1	1,000	1

\*The International System (SI) unit.

**VALUES FOR THE LANGEVIN FUNCTION  $\mathcal{L}(u)$**   
**Compiled by Allen L. King**

Because of random thermal rotations a dipole or dipole-like element ordinarily has an average dipole moment of zero. If it is placed in an orienting field  $F$  however it tends to align itself with the field so that the average component of the dipole moment parallel to the field equals  $p$ . Classically, if the system is in thermal equilibrium,

$$\bar{p} = p_0(\coth u - 1/u) = p_0\mathcal{L}(u)$$

Here  $p_0$  is the permanent moment (electric or magnetic) of the dipole, and  $\mathcal{L}(u)$  is the Langevin function of the argument  $u$  which equals  $Fp_0/kT$ . The following table gives values of  $\mathcal{L}(u)$ . Note that for  $u \ll 1$ ,  $\mathcal{L}(u) \approx u/3$ ; for  $u \gg 1$ ,  $\mathcal{L}(u) \approx (u - 1)/u$ .

## X-RAY WAVELENGTHS

J. A. Bearden

These tables were originally published as the final report to the U.S. Atomic Energy Commission as Report NYO-10586 in partial fulfillment of Contract AT(30-1)-2543. The tables were later reproduced in *Review of Modern Physics*. The data may also be obtained from the Superintendent of Documents, U.S. Government Printing Office, Washington, D. C. 20402 in the publication NSRDS-NBS 14. Persons seeking discussion of the experimental work, conventions, secondary standards, etc. will find these in *Review of Modern Physics*, Vol. 39, No. 1, 78-124, January 1967.

### THE W $K\alpha_1$ WAVELENGTH STANDARD

A wavelength standard should possess characteristics which permit its ready redetermination in other laboratories by different techniques. Considering all of the factors involved in the selection of a wavelength standard, the W  $K\alpha_1$  line is superior to any other x-ray or  $\gamma$ -ray wavelength. Its advantages as the x-ray wavelength standard are discussed in *Review of Modern Physics* Vol. 39, page 82 (1967).

$$\lambda W K\alpha_1 = 0.2090100 \text{ \AA} \pm 5 \text{ ppm.}$$

This numerical value of the wavelength of the W  $K\alpha_1$  line is used to define the *x-ray wavelength standard* by the relation

$$\lambda(W K\alpha_1) = 0.2090100 \text{ \AA}^*.$$

This is a new unit of length which may differ from the angstrom by  $\pm 5$  ppm (probable error), *but as a wavelength standard it has no error*. In order to clearly indicate that this unit is not exactly an angstrom, it has been designated  $\text{\AA}^*$ .

Wavelengths tabulated normally refer to the pure element in its solid form. However, there are many instances in which such data are not available. For example, rare gases are of necessity almost always used in the gaseous form, while the rare-earth elements were customarily used in the form of salts.

In high precision work there is some ambiguity as to exactly what feature of a line profile should be taken to be the "true wavelength." In double-crystal work the line peak is usually employed. In crystallography the centroid is widely used; in photographic work with visual observation of the plates, there is involved some subjective criterion of the observer which it is difficult to define precisely. In this survey the peak of the line profile has been adopted as the standard criterion.

In the study of the X-ray literature, the wavelengths of a number of lines were noted which appeared inconsistent with the remaining data. A Moseley-type diagram was constructed, and if the value was clearly outside estimated probable error, it was assumed that an experimental or typographical error had occurred, and the interpolated value was listed in the table. Such cases are marked with a dagger ( $\dagger$ ) as a superscript to the wavelength. For elements of atomic number 85 through 89 and 91, there are no measured lines of the  $K$  series and very few of other series except for 88 radium and 91 protactinium. Likewise there are very few measurements for 43 technetium and 54 xenon. In these cases, interpolated values are listed for the more prominent lines and marked with a dagger ( $\dagger$ ).

X-RAY WAVELENGTHS

X-ray wavelengths in Å\* units and in keV. The probable error (p.e.) is the error in the last digit of wavelength. Designation indicates both conventional Siegbahn notation (if applicable) and transition, e.g.,  $\beta_1 L_{II}M_{IV}$  denotes a transition between the  $L_{II}$  and  $M_{IV}$  levels, which is the  $L\beta_1$  line in Siegbahn notation.

# Index

---

The most efficient way to use this index is to look for the pertinent *property* (e.g., vapor pressure, entropy), *process* (e.g., disposal of chemicals, calibration), or *general concept* (e.g., units, radiation). Most primary entries are subdivided into several secondary entries, e.g., under heat capacity there are 17 secondary entries such as air, metals, water, etc. Primary entries will be found for certain *classes of substances*, such as alloys, elements, organic compounds, refrigerants, semiconductors, etc. Primary entries are also given for the individual chemical elements and for a few compounds such as water and carbon dioxide. However, only the most important tables are listed under these substances. Therefore, the user will find in most cases that it is best to look first for the property of interest, then examine the table or tables that are referenced.

Entries in boldface type are the titles of tables as they appear in the Table of Contents.

The reference given for each index term is the inclusive pages of the pertinent table (e.g., **8-45** to 55). The introduction to each table describes the method of ordering the substances within that table.

The editor would be grateful for comments and suggestions on this index.

# INDEX

## A

AAS, definition, 12-1 to 4

Abbreviations

- amino acids, 7-3 to 4
- physical quantities, 2-1 to 12
- scientific terms, 2-29 to 41
- units, 1-23 to 26

Absorption

- infrared, by earth's atmosphere, 14-33
- light, by elemental solids, 12-123 to 147
- light, by other solids, 12-148 to 166
- microwave power, by water, 6-14
- sound, by air, 14-50

**Abundance of Elements in the Earth's Crust and in the Sea, 14-18**

Abundance, isotopic, 1-14 to 17, 11-56 to 253

**Acceleration Due to Gravity, 14-13**

Acceleration due to gravity

- at poles and equator, 14-10 to 11
- at various latitudes, 14-13
- on the sun, moon, and planets, 14-2 to 3
- standard value, 1-1 to 11

**Acid-Base Indicators, 8-15 to 17**

Acid dissociation constant

- amino acids, 7-1 to 2
- biological buffers, 7-26
- indicators, 8-15 to 17
- inorganic acids and bases, 8-40 to 41
- organic acids and bases, 8-42 to 51
- purine and pyrimidine bases, 7-5

Acid rain, pH measurement, 8-37 to 38

Acids

- activity coefficients, 5-78 to 79, 5-80 to 83
- decinormal solutions, 8-5 to 6
- electrical conductivity, 5-71
- enthalpy of dilution, 5-84
- fatty, 7-7 to 8
- indicators, 8-15 to 17
- inorganic, dissociation constant, 8-40 to 41
- organic, dissociation constant, 8-42 to 51

Acoustics

- human hearing, 14-53 to 54
- musical scales, 14-52
- noise levels, 14-53 to 54
- sound velocity, 14-48 to 49, 14-50, 14-51
- sound velocity in air, 6-15 to 20
- sound velocity in fluids, 6-21 to 37
- sound velocity in water and steam, 6-1 to 4

Acronyms, definitions, 2-29 to 41

Actinium: *see also* Elements

- electron configuration, 1-18 to 19
- heat capacity, 4-135
- history, occurrence, uses, 4-1 to 42
- ionization energy, 10-203 to 205
- isotopes and their properties, 11-56 to 253
- physical properties, 4-133 to 134
- thermal properties, 12-203 to 204

Activation energy

- atmospheric reactions, 5-90 to 101
- diffusion in semiconductors, 12-99 to 106

Activity coefficients, 5-78 to 79, 5-80 to 83

**Activity Coefficients of Acids, Bases, and Salts, 5-78 to 79**

AES, definition, 12-1 to 4

AFM, definition, 12-1 to 4

Air

- absorption of sound, 14-50
- cryogenic properties, 6-143
- density, 6-15 to 20
- diffusion of gases in, 6-225 to 226
- enthalpy, 6-15 to 20
- entropy, 6-15 to 20
- heat capacity, 6-15 to 20
- index of refraction, 10-253
- mean free path, 6-48
- permittivity (dielectric constant), 6-188
- speed of sound, as function of humidity and frequency, 14-50
- speed of sound, as function of temperature, 6-15 to 20, 14-51
- thermal conductivity, 6-15 to 20, 6-218 to 219
- thermodynamic properties, 6-15 to 20
- U.S. Standard Atmosphere, 14-20 to 25
- vapor pressure, 6-15 to 20
- viscosity, 6-15 to 20, 6-208

Airborne contaminants, threshold limits, 16-29 to 42

Albedo

- planets, 14-2 to 3
- satellites of the planets, 14-4 to 6

ALI for radionuclides, 16-49 to 52

Alkali halides, secondary electron emission, 12-122

Alkali hydroxide solutions, viscosity and density, 6-215

Alkali metals: *see* entries for Lithium, Sodium, etc.

**Allocation of Frequencies in the Radio Spectrum, 15-50 to 51**

Alloys

- composition, 12-107 to 115
- electrical resistivity, 12-43 to 45
- eutectic temperatures, 15-36
- magnetic properties, 12-107 to 115
- phase diagrams, 12-184 to 201
- superconducting properties, 12-59 to 74
- thermal conductivity, 12-208

Alloys, commercial

- electrical resistivity, 12-221
- mechanical and thermal properties, 12-221
- stainless steel, 12-205
- thermal conductivity, 12-208

Alphabets: Greek, Russian, Hebrew, 2-42

Aluminum: *see also* Elements

- electrical resistivity, 12-41 to 42
- electron configuration, 1-18 to 19
- heat capacity, 4-135, 12-202
- history, occurrence, uses, 4-1 to 42

   radio spectrum allocations, 15-50 to 51  
   standards, infrared, 10-261 to 267, 10-268 to 272
- Friction, coefficient of, 15-47 to 48
- FTIR, definition, 12-1 to 4
- Fundamental constants, 1-1 to 11
- Fundamental particles, 11-1 to 55

**Fundamental Physical Constants**, 1-1 to 11

**Fundamental Physical Constants -**

**Frequently Used Constants**,  
Inside back cover

**Fundamental Vibrational Frequencies of  
Small Molecules**, 9-100 to 102

Fusion: *see* Enthalpy of fusion

## G

g-Factor of the electron, 1-1 to 11

Gadolinium: *see also* Elements

electrical resistivity, 12-41 to 42

electron configuration, 1-18 to 19

heat capacity, 4-135

history, occurrence, uses, 4-1 to 42

ionization energy, 10-203 to 205

isotopes and their properties, 11-56 to 253

magnetic susceptibility, 4-142 to 147

molten, density, 4-139 to 141

physical properties, 4-133 to 134

thermal properties, 12-203 to 204

vapor pressure, 6-72 to 101

vapor pressure, high temperature, 4-136 to  
137

Gallium: *see also* Elements

electrical resistivity, 12-41 to 42

electron configuration, 1-18 to 19

heat capacity, 4-135

history, occurrence, uses, 4-1 to 42

ionization energy, 10-203 to 205

isotopes and their properties, 11-56 to 253

magnetic susceptibility, 4-142 to 147

molten, density, 4-139 to 141

physical properties, 4-133 to 134

thermal properties, 12-203 to 204

vapor pressure, 6-72 to 101

vapor pressure, high temperature, 4-136 to  
137

Gamma function, A-81 to 82

Gamma rays

in cosmic ray showers, 11-267 to 270

cross sections, for the elements, 10-235 to  
239

energy, of nuclides, 11-56 to 253

photon attenuation coefficients, 10-235 to  
239

protection against, 16-48

Gas chromatography, carrier gas properties,  
8-140

Gas clathrate hydrates, 6-148 to 152

Gas constant, 1-1 to 11, 1-46

Gas phase basicity, 10-174 to 192

Gases

average velocity, 6-48

breakdown voltage, 15-42 to 46

collision diameter, 6-48

dielectric constant, 6-188

diffusion, 6-225 to 226

diffusion in water, 6-227

dipole moment, 9-50 to 58

enthalpy of solvation, 5-86 to 89

mean free path, 6-48

permittivity, 6-188

refractive index, 10-254

solubility in water, 8-80 to 83

speed of sound in, 14-48 to 49

thermal conductivity, 6-218 to 219

threshold limits, 16-29 to 42

van der Waals constants, 6-47

Verdet constants, 12-167 to 180

virial coefficients, 6-38 to 46

viscosity, 6-208

Gauges, of wires, 15-37

Gauss' Theorem, A-77

Gaussian gravitational constant, 14-1

GDMS, definition, 12-1 to 4

Genetic code, 7-6

**Geographical and Seasonal Variation in  
Solar Radiation**, 14-26

**Geological Time Scale**, 14-12

Geophysical constants, 14-10 to 11

Germanium: *see also* Elements

dielectric constant, 12-47 to 55

electron configuration, 1-18 to 19

heat capacity, 4-135, 12-202

history, occurrence, uses, 4-1 to 42

ionization energy, 10-203 to 205

isotopes and their properties, 11-56 to 253

magnetic susceptibility, 4-142 to 147

molten, density, 4-139 to 141

optical properties, 12-123 to 147

physical properties, 4-133 to 134

semiconducting properties, 12-80 to 92

thermal conductivity, 12-206 to 207

thermodynamic properties, 5-1 to 3

vapor pressure, 6-72 to 101

Gibbs energy of formation

aqueous ions, 5-66 to 67

biochemical species, 7-16 to 18

high temperature, 5-43 to 65

standard state values, 5-4 to 42

**Glass Transition Temperature for Selected  
Polymers**, 13-6 to 12

Glasses

composition, 12-213 to 216

density, 15-39

dielectric constant, 12-58

index of refraction, 10-250

loss factor, 12-58

resistivity, 12-58

speed of sound in, 14-48 to 49

thermal conductivity, 12-209 to 210, 12-213  
to 216

transmittance, 10-250

Verdet constants, 12-167 to 180

**Global Temperature Trend, 1856-2004**, 14-38

Global warming

atmospheric carbon dioxide concentration,  
14-34 to 35

mean temperatures, global, 14-38

mean temperatures, U. S., 14-36 to 37

**Global Warming Potential of Greenhouse  
Gases**, 14-39 to 40

Gloves, resistance to chemicals, 16-1 to 12

Glucose, aqueous solution properties, 8-52  
to 77

Gold: *see also* Elements

electrical resistivity, 12-41 to 42

electron configuration, 1-18 to 19

heat capacity, 4-135, 12-202

history, occurrence, uses, 4-1 to 42

ionization energy, 10-203 to 205

isotopes and their properties, 11-56 to 253

magnetic susceptibility, 4-142 to 147

molten, density, 4-139 to 141

physical properties, 4-133 to 134

thermal conductivity, 12-206 to 207

thermal properties, 12-203 to 204

vapor pressure, 6-72 to 101

vapor pressure, high temperature, 4-136 to  
137

Golden ratio, A-1

Googol, googolplex, 1-38

Gradient, definition, A-68 to 75

Graphite

electrical resistivity, 12-46

heat capacity, 12-202

heat of combustion, 5-68

phase diagram, 12-184 to 201

sublimation pressure, 6-72 to 101

thermal conductivity, 12-206 to 207

Gravitational constant, 1-1 to 11, 14-1

Gravitational potential, 14-2 to 3

Gravity, acceleration of

in interior of earth, 14-14

at poles and equator, 14-10 to 11

standard value, 1-1 to 11

at various latitudes, 14-13

Gray, definition, 1-23 to 26, 16-48

**Greek, Russian, and Hebrew Alphabets**, 2-42

Green's Theorem, A-77

Greenhouse gases

carbon dioxide concentration, 14-34 to 35

carbon dioxide, from fuel combustion, 5-69

global warming potential, 14-39 to 40

infrared absorption, 14-33

radiative efficiency and lifetime, 14-39 to 40

## H

Hafnium: *see also* Elements

electrical resistivity, 12-41 to 42

electron configuration, 1-18 to 19

heat capacity, 4-135

history, occurrence, uses, 4-1 to 42

ionization energy, 10-203 to 205

isotopes and their properties, 11-56 to 253

magnetic susceptibility, 4-142 to 147

molten, density, 4-139 to 141

physical properties, 4-133 to 134

thermal properties, 12-203 to 204

vapor pressure, 6-72 to 101

vapor pressure, high temperature, 4-136 to  
137

Hall coefficient, rare earth elements, 4-127 to  
132

Hall density, superconductors, 12-75 to 76

Hall resistance, quantized, 1-1 to 11

Halocarbon refrigerants, 6-145 to 147

**Handling and Disposal of Chemicals in  
Laboratories**, 16-1 to 12

Hardness

ceramics, 12-222

minerals, 4-149 to 155, 12-222

scales, comparison, 12-222

semiconductors, 12-80 to 92

various materials, 12-222

**Hardness of Minerals and Ceramics**, 12-222

Hartree energy, 1-1 to 11

Hassium (element 108), 4-1 to 42, 11-56 to 253

Hazardous chemicals, handling and disposal,  
16-1 to 12

Hearing, characteristics, 14-53 to 54

Heat capacity

air, 6-15 to 20

aqueous ions, 5-66 to 67

carrier gases for chromatography, 8-140

common fluids, as function of temperature  
and pressure, 6-21 to 37

cryogenic fluids, 6-143

elements, 4-135

high temperature, 5-43 to 65

 thermal properties, 12-203 to 204  
 thermodynamic properties, 5-1 to 3  
 vapor pressure, 6-72 to 101  
 vapor pressure, high temperature, 4-136 to 137
- LEED, definition, 12-1 to 4
- Legendre polynomials, A-83 to 85
- Legendre's equation, A-46 to 56
- Leptons, summary of properties, 11-1 to 55
- Lifetime  
 fundamental particles, 11-1 to 55  
 in laser systems, 10-255 to 260  
 nuclides, 11-56 to 253
- Light, speed of, 1-1 to 11
- Lightning, 14-41 to 47
- LIMS, definition, 12-1 to 4
- Line Spectra of the Elements**, 10-1 to 92
- Line strengths in atomic spectra, 10-93 to 155
- Line width, x-ray lines, 10-234
- Liquid air, thermodynamic properties, 6-15 to 20
- Liquid helium properties, 6-144
- Liquid metals  
 density, 4-139 to 141  
 viscosity, 6-216 to 217
- Liquids  
 breakdown voltage, 15-42 to 46  
 dielectric constant, 6-166 to 187  
 diffusion, 6-228 to 229  
 flammability, 15-13 to 22  
 index of refraction, 4-148, 10-252  
 Kerr constants, 12-167 to 180  
 permittivity, 6-166 to 187  
 speed of sound in, 14-48 to 49  
 surface tension, 6-161 to 164  
 thermal conductivity, 6-220 to 224  
 Verdet constants, 12-167 to 180  
 viscosity, 6-209 to 213
- Liter, definition, 1-23 to 26
- Lithium: *see also* Elements  
 electrical resistivity, 12-41 to 42  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253  
 magnetic susceptibility, 4-142 to 147  
 molten, density, 4-139 to 141  
 physical properties, 4-133 to 134  
 thermal properties, 12-203 to 204  
 thermodynamic properties, 5-1 to 3  
 vapor pressure, 6-72 to 101  
 vapor pressure, high temperature, 4-136 to 137
- Lithosphere, mass of, 14-10 to 11
- Logarithmic series, A-65 to 68
- Log *P*, 16-43 to 47
- Loss factor, glasses, 12-58
- Loss tangent, 6-14
- Loudness level, definition, 14-53 to 54
- Low Temperature Baths for Maintaining Constant Temperature**, 15-35
- Lumen, definition, 1-23 to 26
- Lutetium: *see also* Elements  
 electrical resistivity, 12-41 to 42  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253  
 magnetic susceptibility, 4-142 to 147  
 molten, density, 4-139 to 141  
 physical properties, 4-133 to 134  
 thermal properties, 12-203 to 204  
 vapor pressure, 6-72 to 101  
 vapor pressure, high temperature, 4-136 to 137
- Lux, definition, 1-23 to 26
- ## M
- Maclaurin series, A-65 to 68
- Madelung constant, 12-34
- Magnesium: *see also* Elements  
 electrical resistivity, 12-41 to 42  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253  
 magnetic susceptibility, 4-142 to 147  
 molten, density, 4-139 to 141  
 thermal conductivity, 12-206 to 207  
 thermal properties, 12-203 to 204  
 thermodynamic properties, 5-1 to 3  
 vapor pressure, 6-72 to 101  
 vapor pressure, high temperature, 4-136 to 137
- Magnetic materials, composition and properties, 12-107 to 115
- Magnetic moment  
 electron, 1-1 to 11, 11-1 to 55  
 fundamental particles, 11-1 to 55  
 NMR, for important nuclei, 9-113 to 115  
 nuclides, 11-56 to 253  
 proton, 1-1 to 11  
 rare earth elements, 4-127 to 132
- Magnetic phase transitions, 12-19 to 20
- Magnetic properties  
 alloys, 12-107 to 115  
 organic magnets, 12-116 to 118  
 rare earth elements, 4-127 to 132  
 superconductors, 12-59 to 74, 12-75 to 76
- Magnetic susceptibility  
 elements, 4-142 to 147  
 inorganic compounds, 4-142 to 147  
 organic compounds, 3-672 to 676  
 rare earth elements, 4-127 to 132  
 semiconductors, 12-80 to 92  
 various materials, 12-107 to 115
- Magnetic Susceptibility of the Elements and Inorganic Compounds**, 4-142 to 147
- Magnetism, symbols and units, 1-27, 12-107 to 115
- Magneton (nuclear, Bohr), 1-1 to 11
- Magneto-optic constants, 12-167 to 180
- Magnetostriction, 12-107 to 115
- Major World Earthquakes**, 14-27 to 30
- Makemake, orbital data and dimensions, 14-2 to 3
- Manganese: *see also* Elements  
 electrical resistivity, 12-41 to 42  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253

- Properties of Carrier Gases for Gas Chromatography**, 8-140
- Properties of Commercial Metals and Alloys**, 12-221
- Properties of Cryogenic Fluids**, 6-143
- Properties of Fatty Acids and their Methyl Esters**, 7-7 to 8
- Properties of Gas Clathrate Hydrates**, 6-148 to 152
- Properties of Ice and Supercooled Water**, 6-12
- Properties of Liquid Helium**, 6-144
- Properties of Magnetic Materials**, 12-107 to 115
- Properties of Organic Semiconductors**, 12-95 to 98
- Properties of Purine and Pyrimidine Bases**, 7-5
- Properties of Refrigerants**, 6-145 to 147
- Properties of Saturated Liquid D<sub>2</sub>O**, 6-10 to 11
- Properties of Seawater**, 14-16 to 17
- Properties of Semiconductors**, 12-80 to 92
- Properties of Superconductors**, 12-59 to 74
- Properties of the Solar System**, 14-2 to 3
- Protactinium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205
- isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
vapor pressure, high temperature, 4-136 to 137
- Protection Against Ionizing Radiation**, 16-48
- Proton  
in cosmic ray showers, 11-267 to 270  
magnetic moment, 1-1 to 11  
mass, 1-1 to 11  
summary of properties, 11-1 to 55
- Proton Affinities**, 10-174 to 192
- Proton NMR Chemical Shifts for Characteristic Organic Structures**, 9-116
- Proton NMR Shifts of Common Organic Solvents**, 8-150 to 156
- PSD, definition, 12-1 to 4
- psia and psig, definition, 1-40
- Purine bases, properties of, 7-5
- Pyrimidine bases, properties of, 7-5
- Pyrophoric chemicals, safe handling, 16-1 to 12

## Q

- Quadratic equation formula, A-2
- Quadrupole moments  
all nuclides, 11-56 to 253  
important nuclei for NMR, 9-113 to 115
- Quartz  
crystallographic data, 4-156 to 163  
dielectric constant, 12-58  
loss factor, 12-58  
optical properties, 4-149 to 155  
phase diagram, 12-184 to 201  
thermal conductivity, 12-209 to 210

## R

- Rad, definition, 16-48
- Radiation  
black body, 10-243 to 244  
electromagnetic, classification, 10-240 to 241  
microwave, classification of bands, 10-240 to 241
- Radiation, ionizing  
conversion factors, 1-44 to 45  
from nuclear decay, 11-56 to 253  
permissible intake of radionuclides, 16-49 to 52  
protection against, 16-48
- Radiation, solar  
by month and latitude, 14-26  
by wavelength, 14-19  
flux, solar constant, 14-2 to 3
- Radiative transition probability, 10-93 to 155
- Radicals, free: *see* Free radicals
- Radicals, nomenclature, 2-16 to 22, 2-23 to 26
- Radio spectrum, 15-50 to 51
- Radioastronomy, 14-7 to 9
- Radionuclides, permissible intake, 16-49 to 52
- Radium: *see also* Elements  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
physical properties, 4-133 to 134

- thermal properties, 12-203 to 204  
vapor pressure, 6-72 to 101
- Radius of ions in crystals, 12-11 to 12
- Radon: *see also* Elements  
critical constants, 6-50 to 69  
electron configuration, 1-18 to 19  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
physical properties, 4-133 to 134  
solubility in water, 8-80 to 83  
vapor pressure, 6-72 to 101, 6-102 to 109
- Rankine temperature, conversion to other scales, 1-38
- Rare earth crystals, Verdet constants, 12-167 to 180
- Rare earth metals, general properties, 4-127 to 132
- Rate constants  
atmospheric reactions, 5-90 to 101  
conversion factors, 1-43
- RBS, definition, 12-1 to 4
- Reagents  
decinormal solutions, 8-5 to 6, 8-7  
disposal of, 16-1 to 12  
formulas for concentration, 8-19  
organic, for analysis, 8-8 to 12  
preparation, 8-1 to 4
- Reduction and Oxidation Potentials for Certain Ion Radicals**, 8-30 to 31
- Reduction of Weighings in Air to Vacuo**, 8-138
- Reduction potentials  
biochemical species, 7-16 to 18  
general table, 8-20 to 29  
ion radicals, 8-30 to 31
- Reference states of elements, 5-4 to 42
- Reflection coefficient of solids, 12-123 to 147, 12-148 to 166
- Refractive Index and Transmittance of Representative Glasses**, 10-250
- Refractive index: *see* Index of refraction
- Refractory materials  
hardness, 12-222  
thermal conductivity, 12-211 to 212
- Refrigerants, various properties, 6-145 to 147
- Relation of angular functions in terms of one another, A-8
- Relative humidity  
from wet and dry bulb temperatures, 15-32  
relation to dew point, 15-31  
solutions for calibration, 15-34  
solutions for constant humidity, 15-33
- Relative Sensitivity of Bayard-Alpert Ionization Gauges to Various Gases**, 15-12
- Relaxation time, in water, 6-14
- Rem, definition, 16-48
- Remanence, magnetic materials, 12-107 to 115
- Representation of Chemical Structures with the IUPAC International Chemical Identifier (InChI)**, 2-27 to 28
- Resistance of wires, 15-37
- Resistivity, electrical  
alloys, 12-43 to 45  
commercial metals and alloys, 12-221  
conversion factors, 1-42  
elements, 12-41 to 42  
glasses, 12-58  
graphite and related materials, 12-46  
pure metals, 12-41 to 42  
quartz, 12-58  
rare earth elements, 4-127 to 132  
semiconducting minerals, 12-80 to 92  
semiconductors, 12-80 to 92, 12-95 to 98  
superconductors, 12-75 to 76
- Respirators, for laboratory use, 16-1 to 12
- RHEED, definition, 12-1 to 4
- Rhenium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
molten, density, 4-139 to 141  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
vapor pressure, 6-72 to 101  
vapor pressure, high temperature, 4-136 to 137
- Rhodium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
molten, density, 4-139 to 141  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
vapor pressure, 6-72 to 101  
vapor pressure, high temperature, 4-136 to 137
- Ring systems, nomenclature, 2-23 to 26
- Rochelle salts, 12-56
- Rocks  
age, 14-10 to 11  
density, 15-39  
thermal conductivity, 12-211 to 212
- Roentgen, definition, 16-48
- Roentgenium (element 111), 4-1 to 42, 11-56 to 253
- Rotational constants, diatomic molecules, 9-102 to 107
- Rounding of numbers, 1-28 to 37
- Rubbers  
breakdown voltage, 15-42 to 46  
density, 15-39  
dielectric constant, 13-13  
speed of sound in, 14-48 to 49  
thermal conductivity, 12-211 to 212
- Rubidium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
molten, density, 4-139 to 141  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
thermodynamic properties, 5-1 to 3  
vapor pressure, 6-72 to 101  
vapor pressure, high temperature, 4-136 to 137
- Russian alphabet, 2-42
- Ruthenium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
molten, density, 4-139 to 141  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
vapor pressure, 6-72 to 101  
vapor pressure, high temperature, 4-136 to 137
- Rutherfordium (element 104)  
electron configuration, 1-18 to 19  
history, occurrence, uses, 4-1 to 42  
isotopes and their properties, 11-56 to 253
- Rydberg constant, 1-1 to 11

## S

- Sackur-Tetrode constant, 1-1 to 11
- Safety  
chemical carcinogens, 16-53 to 58  
flammability of chemicals, 16-13 to 28  
laboratory practices, 16-1 to 12  
radiation, 16-48, 16-49 to 52
- SALI, definition, 12-1 to 4
- Salinity scale for seawater, 14-16 to 17
- Salts  
activity coefficients, 5-78 to 79, 5-80 to 83  
decinormal solutions, 8-5 to 6  
electrical conductivity, 5-71, 5-74  
enthalpy of solution, 5-85  
molten, density of, 4-139 to 141  
solubility as a function of temperature, 8-121 to 126, 8-130  
vapor pressure of aqueous solutions, 6-110
- Samarium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
molten, density, 4-139 to 141  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
vapor pressure, 6-72 to 101  
vapor pressure, high temperature, 4-136 to 137
- Sample size calculations, A-88 to 90
- SANS, definition, 12-1 to 4
- Saponification value, oils and fats, 7-9 to 13
- Satellites of the Planets**, 14-4 to 6
- Saturn, orbital data and dimensions, 14-2 to 3
- Scalar product, A-68 to 75
- Scandium: *see also* Elements  
electrical resistivity, 12-41 to 42  
electron configuration, 1-18 to 19  
heat capacity, 4-135  
history, occurrence, uses, 4-1 to 42  
ionization energy, 10-203 to 205  
isotopes and their properties, 11-56 to 253  
magnetic susceptibility, 4-142 to 147  
molten, density, 4-139 to 141  
physical properties, 4-133 to 134  
thermal properties, 12-203 to 204  
vapor pressure, 6-72 to 101

- vapor pressure, high temperature, 4-136 to 137
- Scientific Abbreviations and Symbols**, 2-29 to 41
- Seaborgium (element 106), 4-1 to 42, 11-56 to 253
- Seawater  
 composition (elemental), 14-18  
 composition (ions), 14-16 to 17  
 density, 14-16 to 17  
 electrical conductivity, 14-16 to 17  
 freezing point, 14-16 to 17  
 pH measurement, 8-37 to 38  
 pressure as a function of depth, 14-15  
 salinity scale, 14-16 to 17  
 solubility of hydrocarbons in, 8-131 to 132  
 specific heat, 14-16 to 17  
 speed of sound in, 14-48 to 49  
 viscosity, 14-16 to 17
- Secant function, A-6 to 7
- Second, definition, 1-23 to 26
- Second radiation constant, 1-1 to 11
- Secondary Electron Emission**, 12-122
- Secondary Reference Points on the ITS-90 Temperature Scale**, 15-10 to 11
- Seebeck effect, 12-217 to 218
- Selected Properties of Semiconductor Solid Solutions**, 12-93 to 94
- Selenium: *see also* Elements  
 critical constants, 6-50 to 69  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253  
 magnetic susceptibility, 4-142 to 147  
 molten, density, 4-139 to 141  
 physical properties, 4-133 to 134  
 vapor pressure, 6-72 to 101
- SEM, definition, 12-1 to 4
- Semiconductors  
 crystal structure, 12-15 to 18, 12-80 to 92  
 diffusion in, 12-99 to 106  
 effective mass, 12-80 to 92  
 elastic constants, 12-35 to 40  
 electrical properties, 12-80 to 92, 12-95 to 98  
 extinction coefficient, 12-123 to 147, 12-148 to 166  
 index of refraction, 12-123 to 147, 12-148 to 166  
 minerals, resistivity of, 12-80 to 92  
 optical properties, 12-123 to 147, 12-148 to 166, 12-167 to 180  
 organic, 12-95 to 98  
 physical properties, 12-80 to 92  
 reflection coefficient, 12-123 to 147, 12-148 to 166  
 solid solutions, 12-93 to 94  
 thermal conductivity, 12-80 to 92, 12-206 to 207  
 thermoelectric properties, 12-217 to 218
- Sensitivity of the Human Eye to Light of Different Wavelengths**, 10-242
- Series expansions, A-65 to 68
- Shielding, from radiation, 10-235 to 239, 16-48
- SI units  
 conversion factors to, 1-28 to 37  
 definitions and symbols, 1-23 to 26  
 prefixes, 1-23 to 26
- Siemens, definition, 1-23 to 26
- Sievert, definition, 1-23 to 26, 16-48
- Silicon: *see also* Elements  
 dielectric constant, 12-47 to 55  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135, 12-202  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253  
 magnetic susceptibility, 4-142 to 147  
 molten, density, 4-139 to 141  
 optical properties, 12-123 to 147  
 physical properties, 4-133 to 134  
 semiconducting properties, 12-80 to 92  
 thermal conductivity, 12-206 to 207  
 thermodynamic properties, 5-1 to 3  
 thermodynamic properties at high temperature, 5-43 to 65  
 vapor pressure, 6-72 to 101
- Silver: *see also* Elements  
 electrical resistivity, 12-41 to 42  
 electron configuration, 1-18 to 19  
 heat capacity, 4-135, 12-202  
 history, occurrence, uses, 4-1 to 42  
 ionization energy, 10-203 to 205  
 isotopes and their properties, 11-56 to 253  
 magnetic susceptibility, 4-142 to 147  
 molten, density, 4-139 to 141  
 physical properties, 4-133 to 134  
 resistance of wires, 15-37  
 thermal conductivity, 12-206 to 207  
 thermal properties, 12-203 to 204

## W

Water  
 azeotropic mixtures, 6-189 to 207  
 compressibility, 6-140 to 141  
 critical constants, 6-9  
 density, as function of pressure and temperature, 6-1 to 4  
 density, 6-7 to 8  
 density (supercooled), 6-12  
 dielectric constant, as function of frequency, 6-14  
 dielectric constant, as function of temperature and pressure, 6-1 to 4  
 dielectric constant, vapor, 6-188  
 diffusion of gases, 6-227  
 dissociation constant, 8-78, 8-79  
 electrical conductivity, 5-70  
 enthalpy of fusion, 6-130 to 139  
 enthalpy of vaporization, 6-5 to 6  
 fixed point properties, 6-9  
 freezing point, pressure dependence, 6-49  
 index of refraction, 10-251  
 ion product, 8-78, 8-79  
 octanol-water partition coefficients, 16-43 to 47  
 permittivity, as function of frequency, 6-14  
 permittivity, as function of temperature and pressure, 6-1 to 4  
 pH measurement, 8-37 to 38  
 speed of sound, 6-1 to 4, 14-48 to 49  
 surface tension, 6-5 to 6  
 thermal conductivity, 6-218 to 219  
 thermal expansion coefficient, 6-140 to 141  
 thermodynamic properties at high temperature, 5-43 to 65  
 thermophysical properties, 6-1 to 4  
 triple point constants, 6-9  
 van der Waals constants, 6-47  
 vapor pressure, 6-5 to 6  
 vapor pressure over salt solutions, 15-33  
 viscosity, 6-208  
 volume of one gram, 8-139

Water(D<sub>2</sub>O)  
 boiling point, 6-9  
 critical constants, 6-9  
 density, 6-10 to 11  
 dissociation constant, 8-79  
 fixed point properties, 6-9  
 heat capacity, 6-10 to 11  
 ion product, 8-79  
 surface tension, 6-10 to 11  
 thermal conductivity, liquid, 6-10 to 11  
 thermal conductivity, vapor, 6-218 to 219  
 triple point constants, 6-9  
 vapor pressure, 6-10 to 11  
 viscosity, liquid, 6-10 to 11  
 viscosity, vapor, 6-208

Watt, definition, 1-23 to 26

Wavelengths  
 atomic spectra, 10-1 to 92  
 correction to vacuum, 10-253

electromagnetic radiation bands, 10-240 to 241  
 laser sources, 10-255 to 260  
 sensitivity of eye, 10-242

**Weather-Related Scales, 14-31 to 32**

Weber, definition, 1-23 to 26

Weighings, reduction from air to vacuum, 8-138

Width, x-ray lines, 10-234

Wien displacement law constant, 1-1 to 11

Wind chill factors, 14-31 to 32

Wind scales, 14-31 to 32

**Wire Tables, 15-37**

Wood  
 density, 15-39  
 speed of sound in, 14-48 to 49  
 thermal conductivity, 12-211 to 212

Work function, of the elements, 12-121

## X

Xenon: *see also* Elements  
 critical constants, 6-50 to 69
