# VISCOSITY OF LIQUIDS

The absolute viscosity of some common liquids at temperatures between  $-25$  and  $100^{\circ}\text{C}$  is given in this table. Values were derived by fitting experimental data to suitable expressions for the temperature dependence. The substances are arranged by molecular formula in the modified Hill order (see Preface). All values are given in units of millipascal seconds (mPa s); this unit is identical to centipoise (cp).

Viscosity values correspond to a nominal pressure of 1 atmosphere. If a value is given at a temperature above the normal boiling point, the applicable pressure is understood to be the vapor pressure of the liquid at that temperature. A few values are given at a temperature slightly below the normal freezing point; these refer to the supercooled liquid.

The accuracy ranges from 1% in the best cases to 5 to 10% in the worst cases. Additional significant figures are included in the table to facilitate interpolation.

## THERMAL CONDUCTIVITY OF GASES

This table gives the thermal conductivity of several gases as a function of temperature. Unless otherwise noted, the values refer to a pressure of 100 kPa (1 bar) or to the saturation vapor pressure if that is less than 100 kPa. The notation  $P = 0$  indicates the low

pressure limiting value is given. In general, the  $P = 0$  and  $P = 100$  kPa values differ by less than 1%. Units are milliwatts per meter kelvin. Substances are listed in the modified Hill order.

MF	Name	Thermal conductivity in mW/m K						Ref.
		100 K	200 K	300 K	400 K	500 K	600 K	
	Air	9.4	18.4	26.2	33.3	39.7	45.7	1

## THERMAL CONDUCTIVITY OF LIQUIDS

This table gives the thermal conductivity of about 275 liquids at temperatures between  $-25$  and  $100$  °C. Values refer to nominal atmospheric pressure; when an entry is given for a temperature above the normal boiling point of the liquid, the pressure is understood to be the saturation vapor pressure at that temperature. Reference 1 contains data on many of these liquids at high pressures. Data on halocarbon refrigerants over a wide range of temperature and pressure may be found in Reference 6.

Values given to three decimal places (i.e., to  $0.001$  W/m K) have an uncertainty of 2% to 5%. Values given to  $0.0001$  W/m K should be accurate to 1% or better.

Substances are arranged by molecular formula in Hill order, except that compounds not containing carbon precede those that do contain carbon.

## DIFFUSION IN GASES

This table gives binary diffusion coefficients  $D_{12}$  for a number of common gases as a function of temperature. Values refer to atmospheric pressure. The diffusion coefficient is inversely proportional to pressure as long as the gas is in a regime where binary collisions dominate. See Reference 1 for a discussion of the dependence of  $D_{12}$  on temperature and composition.

The first part of the table gives data for several gases in the presence of a large excess of air. The remainder applies to equimolar

mixtures of gases. Each gas pair is ordered alphabetically according to the most common way of writing the formula. The listing of pairs then follows alphabetical order by the first constituent.

## DIFFUSION COEFFICIENTS IN LIQUIDS AT INFINITE DILUTION

This table lists diffusion coefficients  $D_{AB}$  at infinite dilution for some binary liquid mixtures. Values are given at 25°C when available; it should be noted that the diffusion coefficient generally increases by 10% to 20% for a 10°C increase above ambient temperature.

Solvents are listed in alphabetical order, as are the solutes within each solvent group.

Solute	Solvent	t/°C	$D_{AB}/10^{-5} \text{ cm}^2 \text{ s}^{-1}$	Ref.
Acetic acid	Acetone	25	3.31	5

## VAPOR PRESSURE OF SATURATED SALT SOLUTIONS

This table gives the vapor pressure of water above saturated solutions of some common salts at ambient temperatures. Data on pure water are given on the last line for comparison.

The references provide additional information on water activity, osmotic coefficient, and enthalpy of vaporization.

## DIFFUSION OF GASES IN WATER

This table gives values of the diffusion coefficient,  $D$ , for diffusion of several common gases in water at various temperatures. For simple one-dimensional transport, the diffusion coefficient describes the time-rate of change of concentration,  $dc/dt$ , through the equation

$$dc/dt = D d^2c/dx^2$$

where  $x$  is, for example, the perpendicular distance from a gas-liquid interface. The values below have been selected from the references indicated; in some cases data have been refitted to permit interpolation in temperature.

Gas-liquid diffusion coefficients are difficult to measure, and large differences are found between values obtained by differ-

ent authors and through different experimental methods. See References 1 and 2 for a discussion of measurement techniques.

## PROPERTIES OF ICE AND SUPERCOOLED WATER

The common form of ice at ambient temperature and pressure is hexagonal ice, designated as ice Ih (see phase diagram in Section 12). The data given here refer to that form. Data have been taken from the references indicated; values have been interpolated and smoothed in some cases. All properties are sensitive to the method of preparation of the sample, since air or other gases are sometimes occluded. For this reason there is often disagreement among values found in the literature.

Density values (except at 0 °C) and the thermal expansion coefficient were calculated from the temperature variation in the crystal lattice constants of ice (see Ref. 1). The thermal expansion coefficient appears to become negative around -200 °C, but there is considerable scatter in the data.

### Density of ice Ih and supercooled water in g cm<sup>-3</sup>

<i>t</i> /°C	$\rho$ (ice)	$\rho$ (supercooled water)
0	0.9167	0.9998
-10	0.9187	0.9982

## PROPERTIES OF LIQUID HELIUM

The following data were obtained by a critical evaluation of all existing experimental measurements on liquid helium, using a fitting procedure described in the reference. All values refer to liquid helium at saturated vapor pressure; temperatures are on the ITS-90 scale. Several properties show a singularity at the lambda point (2.1768 K).

$\epsilon$ : relative permittivity (dielectric constant)

$\sigma$ : surface tension

$\alpha_v$ : cubic expansion coefficient

$\eta$ : viscosity

$\lambda$ : thermal conductivity

$p$ : vapor pressure

$\rho$ : density

$C_s$ : molar heat capacity

$\Delta_{\text{vap}}H$ : molar enthalpy of vaporization

## SURFACE TENSION OF AQUEOUS MIXTURES

The composition dependence of the surface tension of binary mixtures of several compounds with water is given in this table. The data are tabulated as a function of the mass percent of the non-aqueous component. Data for methanol, ethanol, 1-propanol, and 2-propanol are taken from Reference 1, which also gives values at other temperatures.

## VISCOSITY AND DENSITY OF AQUEOUS HYDROXIDE SOLUTIONS

The viscosity and density of aqueous hydroxide solutions at 25°C is tabulated here as a function of concentration. Viscosity is given in millipascal second, which is equal to the c.g.s. unit centipoise (cP). The last entry in each column refers to the saturated solution.

## VAPOR PRESSURE OF MERCURY

The following table gives the vapor pressure of mercury in kilopascals (100 kPa = 1 bar) from the triple point (234.3156 K) to the critical point (1764 K). The data are generated from the formulation of Huber, Laesecke, and Friend in Reference 1, which is based on a critical evaluation of all the published data on mercury vapor pressure and related thermodynamic properties. The estimated uncertainty in the vapor pressure is:

–38 to –10°C	3%
0 to 130°C	1%
140 to 350°C	0.15%
360 to 620°C	0.5%
630 to 1491°C	5%

Most of the entries in this table carry one significant figure beyond the estimated accuracy.

Note that the table refers to mercury vapor in equilibrium with liquid mercury, in the absence of air or other gases.

## VISCOSITY OF LIQUID METALS

This table gives the viscosity of several liquid metals as a function of temperature. Experimental data from some of the references were smoothed to produce the table. Viscosity is given in millipascal second (mPa s), which equals the c.g.s. unit centipoise (cP).

## IONIC LIQUIDS

Ionic liquids are a class of organic salts with relatively low melting points. The term usually implies a melting point of 100 °C or lower, and many are liquid at room temperature. They offer several advantages as solvents, such as very low vapor pressure, good thermal stability, and nonflammable behavior. For these reasons they are attractive as constituents of environmentally friendly chemical processes.

This table lists some of the ionic liquids that have been studied. The following properties are given:

**Mol. Form.** — molecular formula in the Hill convention

**CASRN** — Chemical Abstracts Service Registry Number

**Mol. Wt.** — molecular weight (relative molar mass)

$t_m$  — normal melting point in °C; the notation “gl” indicates a glass–liquid transition, rather than a crystal–liquid transition

$\rho$  — density in g/cm<sup>3</sup>. The superscript indicates the temperature in °C; if there is no superscript, room temperature can be assumed.

$\eta$  — viscosity in mPa s. The superscript indicates the temperature in °C; if there is no superscript, room temperature can be assumed.

The phase behavior of ionic liquids can be complicated. Some are crystalline at low temperatures and show a sharp transition from crystal to liquid state (a true melting point) as the temperature is raised, but others exist as a glass at low temperatures and convert to a liquid at the glass–liquid transition temperature, denoted by a small change in heat capacity. Still others are glasses at very low temperatures, transform to crystals as the temperature is raised, and finally become liquid at a still higher temperature. See Reference 3 for a discussion of the types of phase behavior.

## MELTING CURVE OF MERCURY

The solid–liquid phase boundary of mercury provides a convenient means of calibrating pressures up to 1 GPa in the neighborhood of room temperature. The best representation of this curve is given by:

$$p/\text{GPa} = 1.932845 \cdot 10^{-2}d + 1.8333 \cdot 10^{-6}d^2 + 5.9791 \cdot 10^{-8}d^3$$

where  $d = t/^\circ\text{C} - 38.8344$ . Temperature is on the ITS-90 scale, and the relation is valid for pressures up to about 1.2 GPa. The following table is calculated from this equation.

<i>p vs. t</i>		<i>t vs. p</i>	
<i>t/°C</i>	<i>P/GPa</i>	<i>P/GPa</i>	<i>t/°C</i>
-38.83	0.000	0.010	-38.32

# PROPERTIES OF GAS CLATHRATE HYDRATES

Carolyn A. Koh and E. Dendy Sloan

Gas clathrate hydrates (also known as gas hydrates) are crystalline inclusion compounds composed of hydrogen-bonded water cavities (host) which encage small gas (guest) molecules. Generally, a maximum of one guest molecule occupies each water cavity. Typical guest molecules that form gas hydrates are meth-

ane, ethane, carbon dioxide, and propane (see gas hydrate phase equilibria data in Table II). The structural and physical properties of gas hydrates are given in Tables Ia and Ib. Data have been taken from the references indicated.

**Table Ia. Gas Hydrate Structural Properties (Ref. 1)**

Structure	sI		sII		sH		
Crystal system	Cubic		Cubic		Hexagonal		
Space group	Pm3n (No. 223) <sup>b</sup>		Fd3m (No. 227) <sup>b</sup>		P6/mmm (No. 191) <sup>b</sup>		
Lattice description	Primitive		Face centered		Hexagonal		
Lattice parameters <sup>a</sup>	a = 12 Å α = β = γ = 90°		a = 17.3 Å α = β = γ = 90°		a = 12.2 Å, c = 10.1 Å α = β = 90°, γ = 120°

**Table II: Phase Equilibria Data of Gas Clathrate Hydrates**

This table gives measured phase equilibria data of sI and sII gas clathrate hydrates (see Table I for gas hydrate structure and physical property data). The temperature and pressure conditions at which gas hydrates are stable are listed here for typical guest molecules (Tables IIa–d). For example, data for methane hydrate show that at 277.1 K methane hydrate will dissociate at pressures below 3.81 MPa.

# PROPERTIES OF SATURATED LIQUID D<sub>2</sub>O

Allan H. Harvey

Properties of saturated liquid heavy water, D<sub>2</sub>O, are given in this table as a function of temperature from the melting point to the critical point. The vapor pressure was calculated from the formulation of Harvey and Lemmon (Ref. 2). The other properties were generated from the NIST REFPROP program (Ref. 1) and are consistent with formulations adopted for general and scientific use by The International Association for the Properties of Water and Steam (IAPWS). The background for the equation of state used for density and heat capacity is given by Hill et al. (Ref. 3), and the background for the transport property correlations is given by Matsunaga and Nagashima (Ref. 4). The unpublished surface tension correlation and the other IAPWS formulations may be found on the IAPWS Web site (<http://www.iapws.org>). The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the REFPROP program (<http://www.nist.gov/srd/nist23.htm>). The properties are

$P$ : vapor pressure                       $\eta$ : viscosity  
 $\rho$ : density                                       $\lambda$ : thermal conductivity  
 $C_p$ : isobaric heat capacity               $\sigma$ : surface tension

## PROPERTIES OF AMINO ACIDS

This table gives selected properties of some important amino acids and closely related compounds. The first part of the table lists the 20 "standard" amino acids that are the basic constituents of proteins. The second part includes other amino acids and related compounds of biochemical importance. Within each part of the table the compounds are listed by name in alphabetical order. Structures are given in the following table.

Symbol: Three-letter symbol for the standard amino acids  
 $M_r$ : Molecular weight  
 $t_m$ : Melting point  
 $pK_a$ ,  $pK_b$ ,  $pK_c$ ,  $pK_d$ : Negative of the logarithm of the acid dissociation constants for the COOH and NH<sub>2</sub> groups (and, in some cases, other groups) in the molecule (at 25 °C)  
 pI: pH at the isoelectric point  
 S: Solubility in water in units of grams of compound per kilogram of water; a temperature of 25 °C is understood unless otherwise stated in a superscript. When quantitative data are not available, the notations s.l. (for slightly soluble), s. (for soluble), and v.s. (for very soluble) are used.  
 $V_2^0$ : Partial molar volume in aqueous solution at infinite dilution (at 25 °C)

Data on the enthalpy of formation of many of these compounds are included in the table "Standard Thermodynamic Properties of

Chemical Substances" in Section 5 of this *Handbook*. Absorption spectra and optical rotation data can be found in Reference 3. Partial molar volume is taken from Reference 5; other thermodynamic properties, including solubility as a function of temperature, are given in References 3 and 5. Most of the pK values come from References 1, 6, and 7.

L-Pyroglutamic acid

Sarcosine

Taurine

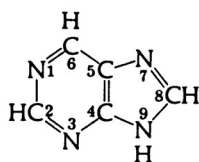

L-Thyroxine

## PROPERTIES OF PURINE AND PYRIMIDINE BASES

This table lists some of the important purine and pyrimidine bases that occur in nucleic acids. The  $pK_a$  values (negative logarithm of the acid dissociation constant) are given for each ioniza-

tion stage. The last column gives the aqueous solubility  $S$  at the indicated temperature in units of grams per 100 grams of solution. The numbering system in the rings is:

Purine

Pyrimidine

Common name	Systematic name	Mol. form.	Mol. wt.	$pK_a$ values			$S$ /mass % (temp.)
<b>Pyrimidines</b>							
Cytosine	4-Amino-2-hydroxypyrimidine	$C_4H_5N_3O$	111.10	4.60	12.16		0.73 (25°C)
5-Methylcytosine	4-Amino-2-hydroxy-5-methylpyrimidine	$C_5H_7N_3O$	125.13	4.6	12.4		0.45 (25°C)
5-Hydroxymethylcytosine	4-Amino-2-hydroxy-5-hydroxymethylpyrimidine	$C_5H_7N_3O_2$	141.13	4.3	13		
Uracil	2,4-Dihydroxypyrimidine	$C_4H_4N_2O_2$	112.09	0.5	9.5	>13	0.27 (25°C)
Thymine	5-Methyluracil	$C_5H_6N_2O_2$	126.11	9.94	>13		0.35 (25°C)
Orotic acid	Uracil-6-carboxylic acid	$C_5H_4N_2O_4$	156.10	2.4	9.5	>13	0.18 (18°C)
<b>Purines</b>							
Adenine	6-Aminopurine	$C_5H_5N_5$	135.14	<1	4.3	9.83	0.104 (25°C)
Guanine	2-Amino-6-hydroxypurine	$C_5H_5N_5O$	151.13	3.3	9.2	12.3	0.0068 (40°C)
7-Methylguanine	7-Methyl-2-amino-6-hydroxypurine	$C_6H_7N_5O$	165.16	3.5	9.9		
Isoguanine	6-Amino-2-hydroxypurine	$C_5H_5N_5O$	151.13	4.5	9.0		0.006 (25°C)
Xanthine	2,6-Dioxypurine	$C_5H_4N_4O_2$	152.11	0.8	7.4	11.1	0.05 (20°C)
Hypoxanthine	6-Hydroxypurine	$C_5H_4N_4O$	136.11	2.0	8.9	12.1	0.07 (19°C)
Uric acid	2,6,8-Trihydroxypurine	$C_5H_4N_4O_3$	168.11	5.4	11.3		0.002 (20°C)

## THE GENETIC CODE

This table gives the correspondence between a messenger RNA codon and the amino acid which it specifies. The symbols for bases in the codon are:

U: uracil  
 C: cytosine  
 A: adenine  
 G: guanine

The amino acid symbols are given in the table entitled "Structures of Common Amino Acids". A chain-initiating codon is indicated by **init** and a chain-terminating codon by **term**.

Example: UCA codes for **Ser**, UAC codes for **Tyr**, etc.

First position	Second position				Third position
	U	C	A	G	
U	Phe	Ser	Tyr	Cys	U
	Phe	Ser	Tyr	Cys	C
	Leu	Ser	<b>term</b>	<b>term</b>	A
	Leu	Ser	<b>term</b>	Trp	G
C	Leu	Pro	His	Arg	U
	Leu	Pro	His	Arg	C
	Leu	Pro	Gln	Arg	A
	Leu	Pro	Gln	Arg	G
A	Ile	Thr	Asn	Ser	U
	Ile	Thr	Asn	Ser	C
	Ile	Thr	Lys	Arg	A
	Met ( <b>init</b> )	Thr	Lys	Arg	G
G	Val	Ala	Asp	Gly	U
	Val	Ala	Asp	Gly	C
	Val	Ala	Glu	Gly	A
	Val ( <b>init</b> )	Ala	Glu	Gly	G

## PROPERTIES OF FATTY ACIDS AND THEIR METHYL ESTERS

This table gives the names and selected properties of some important fatty acids and their methyl esters. It includes most of the acids that are significant constituents of naturally occurring oils and fats. Compounds are listed first by number of carbon atoms and, secondly, by the degree of unsaturation. Both the systematic name and the common or trivial name are given, as well as the Chemical Abstracts Service Registry Number and the shorthand acid code that is frequently used. The first number in this code gives the number of carbon atoms; the number following the colon is the number of unsaturated centers (mainly double bonds). The location and orientation of the unsaturated centers follow. The symbols used are: c = *cis*; t = *trans*; a = acetylenic center; e = ethylenic center at end of chain; ep = *epoxy*. Thus 9c,11t indicates a double bond with *cis* orientation at the No. 9 carbon and another with *trans* orientation at the No. 11 carbon. More details on the codes can be found in Reference 1.

The table gives the molecular weight and melting point of the acid and the melting and boiling points of the methyl ester of the acid when available. A superscript on the boiling point indicates the pressure in mmHg (torr); if there is no superscript, the value refers

to one atmosphere (760 mmHg). The references cover many other fatty acids beyond those listed here and give additional properties.

We are indebted to Frank D. Gunstone for advice on the content of the table.

## CARBOHYDRATE NAMES AND SYMBOLS

The following table lists the systematic names and symbols for selected carbohydrates and some of their derivatives. The symbols for monosaccharide residues and derivatives are recommended by IUPAC for use in describing the structures of oligosaccharide chains. A more complete list can be found in the reference.

### Reference

McNaught, A. D., *Pure Appl. Chem.*, 68, 1919-2008, 1996.

Common name	Symbol	Systematic name
Abequose	Abe	3,6-Dideoxy-D-xylo-hexose
N-Acetyl-2-deoxyneur-2-enaminic acid	Neu2en5Ac	
N-Acetylgalactosamine	GalNAc	
N-Acetylglucosamine	GlcNAc	
N-Acetylneuraminic acid	Neu5Ac	
Allose	All	<i>allo</i> -Hexose
Altrose	Alt	<i>altro</i> -Hexose
Apiose	Api	3-C-(Hydroxymethyl)-glycero-tetrose
Arabinitol	Ara-ol	Arabinitol
Arabinose	Ara	<i>arabino</i> -Pentose
Arcanose		2,6-Dideoxy-3-C-methyl-3-O-methyl-xylo-hexose
Ascarylose		3,6-Dideoxy-L- <i>arabino</i> -hexose
Boivinose		2,6-Dideoxy-D-gulose
Chalcase		4,6-Dideoxy-3-O-methyl-D-xylo-hexose
Cladinose		2,6-Dideoxy-3-C-methyl-3-O-methyl-L- <i>ribo</i> -hexose
Colitose		3,6-Dideoxy-L-xylo-hexose
Cymarose		6-Deoxy-3-O-methyl- <i>ribo</i> -hexose
3-Deoxy-D-manno-oct-2-ulosonic acid	Kdo	
2-Deoxyribose	dRib	2-Deoxy- <i>erythro</i> -pentose
2,3-Diamino-2,3-dideoxy-D-glucose	GlcN3N	
Diginose		2,6-Dideoxy-3-O-methyl- <i>lyxo</i> -hexose
Digitalose		6-Deoxy-3-O-methyl-D-galactose
Digitoxose		2,6-Dideoxy-D- <i>ribo</i> -hexose
3,4-Di-O-methylramnose	Rha3,4Me <sub>2</sub>	
Ethyl glucopyranuronate	Glc <sub>p</sub> A6Et	
Evalose		6-Deoxy-3-C-methyl-D-mannose
Fructose	Fru	<i>arabino</i> -Hex-2-ulose
Fucitol	Fuc-ol	6-Deoxy-D-galactitol
Fucose	Fuc	6-Deoxygalactose
β-D-Galactopyranose 4-sulfate	β-D-Galp4S	
Galactosamine	GalN	2-Amino-2-deoxygalactose
Galactose	Gal	<i>galacto</i> -Hexose
Glucitol	Glc-ol	
Glucosamine	GlcN	2-Amino-2-deoxyglucose
Glucose	Glc	<i>gluco</i> -Hexose
Glucuronic acid	GlcA	
N-Glycoloylneuraminic acid	Neu5Gc	
Gulose	Gul	<i>gulo</i> -Hexose
Hamamelose		2-C-(Hydroxymethyl)-D-ribose
Idose	Ido	<i>ido</i> -Hexose
Iduronic acid	IdoA	
Lactose	Lac	β-D-Galactopyranosyl-(1→4)-D-glucose
Lyxose	Lyx	<i>lyxo</i> -Pentose
Maltose		α-D-Glucopyranosyl-(1→4)-D-glucose
Mannose	Man	<i>manno</i> -Hexose
2-C-Methylxylose	Xyl2CMe	
Muramic acid	Mur	2-Amino-3-O-[(R)-1-carboxyethyl]-2-deoxy-D-glucose
Mycarose		2,6-Dideoxy-3-C-methyl-L- <i>ribo</i> -hexose
Mycinose		6-Deoxy-2,3-di-O-methyl-D-allose

Common name	Symbol	Systematic name
Neuraminic acid	Neu	5-Amino-3,5-dideoxy-D-glycero-D-galacto-non-2-ulosonic acid
Panose		$\alpha$ -D-Glucopyranosyl-(1 $\rightarrow$ 6)- $\alpha$ -D-glucopyranosyl-(1 $\rightarrow$ 4)-D-glucose
Paratose		3,6-Dideoxy-D-ribo-hexose
Primeverose		$\beta$ -D-Xylopyranosyl-(1 $\rightarrow$ 6)-D-glucose
Psicose	Psi	<i>ribo</i> -Hex-2-ulose
Quinovose	Qui	6-Deoxyglucose
Raffinose		$\beta$ -D-Fructofuranosyl- $\alpha$ -D-galactopyranosyl-(1 $\rightarrow$ 6)- $\alpha$ -D-glucopyranoside
Rhamnose	Rha	6-Deoxymannose
Rhodinose		2,3,6-Trideoxy-L- <i>threo</i> -hexose
Ribose	Rib	<i>ribo</i> -Pentose
Ribose 5-phosphate	Rib5P	
Ribulose	Ribulo (Rul)	<i>erythro</i> -Pent-2-ulose
Rutinose		$\alpha$ -L-Rhamnopyranosyl-(1 $\rightarrow$ 6)-D-glucose
Sarmentose		2,6-Dideoxy-3-O-methyl-D- <i>xylo</i> -hexose
Sedoheptulose		D- <i>altro</i> -Hept-2-ulose
Sorbose	Sor	<i>xylo</i> -Hex-2-ulose
Streptose		5-Deoxy-3-C-formyl-L-lyxose
Sucrose		$\beta$ -D-Fructofuranosyl- $\alpha$ -D-glucopyranoside
Tagatose	Tag	<i>lyxo</i> -Hex-2-ulose
Talose	Tal	<i>talo</i> -Hexose
Turanose		$\alpha$ -D-Glucopyranosyl-(1 $\rightarrow$ 3)-D-fructose
Tyvelose	Tyv	3,6-Dideoxy-D- <i>arabino</i> -hexose
Xylose	Xyl	<i>xylo</i> -Pentose
Xylulose	Xylulo (Xul)	<i>threo</i> -Pent-2-ulose

## BIOLOGICAL BUFFERS

This table of frequently used buffers gives the  $pK_a$  value at 25°C and the useful pH range of each buffer. The buffers are listed in order of increasing pH. The table is reprinted with permission of Sigma Chemical Company, St. Louis, Mo.

Acronym	Name	Mol. wt.	$pK_a$	Useful pH range
MES	2-( <i>N</i> -Morpholino)ethanesulfonic acid	195.2	6.1	5.5–6.7
BIS TRIS	Bis(2-hydroxyethyl)iminotris(hydroxymethyl)methane	209.2	6.5	5.8–7.2
ADA	<i>N</i> -(2-Acetamido)-2-iminodiacetic acid	190.2	6.6	6.0–7.2
ACES	2-[(2-Amino-2-oxoethyl)amino]ethanesulfonic acid	182.2	6.8	6.1–7.5
PIPES	Piperazine- <i>N,N'</i> -bis(2-ethanesulfonic acid)	302.4	6.8	6.1–7.5
MOPSO	3-( <i>N</i> -Morpholino)-2-hydroxypropanesulfonic acid	225.3	6.9	6.2–7.6
BIS TRISPROPANE	1,3-Bis[tris(hydroxymethyl)methylamino]propane	282.3	6.8 <sup>a</sup>	6.3–9.5
BES	<i>N,N</i> -Bis(2-hydroxyethyl)-2-aminoethanesulfonic acid	213.2	7.1	6.4–7.8
MOPS	3-( <i>N</i> -Morpholino)propanesulfonic acid	209.3	7.2	6.5–7.9
HEPES	<i>N</i> -(2-Hydroxyethyl)piperazine- <i>N'</i> -(2-ethanesulfonic acid)	238.3	7.5	6.8–8.2
TES	<i>N</i> -Tris(hydroxymethyl)methyl-2-aminoethanesulfonic acid	229.2	7.5	6.8–8.2
DIPSO	3-[ <i>N,N</i> -Bis(2-hydroxyethyl)amino]-2-hydroxypropanesulfonic acid	243.3	7.6	7.0–8.2
TAPSO	3-[ <i>N</i> -Tris(hydroxymethyl)methylamino]-2-hydroxypropanesulfonic acid	259.3	7.6	7.0–8.2
TRIZMA	Tris(hydroxymethyl)aminomethane	121.1	8.1	7.0–9.1
HEPPSO	<i>N</i> -(2-hydroxyethyl)piperazine- <i>N'</i> -(2-hydroxypropanesulfonic acid)	268.3	7.8	7.1–8.5
POPSO	Piperazine- <i>N,N'</i> -bis(2-hydroxypropanesulfonic acid)	362.4	7.8	7.2–8.5
EPPS	<i>N</i> -(2-Hydroxyethyl)piperazine- <i>N'</i> -(3-propanesulfonic acid)	252.3	8.0	7.3–8.7
TEA	Triethanolamine	149.2	7.8	7.3–8.3
TRICINE	<i>N</i> -Tris(hydroxymethyl)methylglycine	179.2	8.1	7.4–8.8
BICINE	<i>N,N</i> -Bis(2-hydroxyethyl)glycine	163.2	8.3	7.6–9.0
TAPS	<i>N</i> -Tris(hydroxymethyl)methyl-3-aminopropanesulfonic acid	243.3	8.4	7.7–9.1
AMPSO	3-[(1,1-Dimethyl-2-hydroxyethyl)amino]-2-hydroxypropanesulfonic acid	227.3	9.0	8.3–9.7
CHES	2-( <i>N</i> -Cyclohexylamino)ethanesulfonic acid	207.3	9.3	8.6–10.0
CAPSO	3-(Cyclohexylamino)-2-hydroxy-1-propanesulfonic acid	237.3	9.6	8.9–10.3
AMP	2-Amino-2-methyl-1-propanol	89.1	9.7	9.0–10.5
CAPS	3-(Cyclohexylamino)-1-propanesulfonic acid	221.3	10.4	9.7–11.1

<sup>a</sup>  $pK_a = 9.0$  for the second dissociation stage.

## TYPICAL pH VALUES OF BIOLOGICAL MATERIALS AND FOODS

This table gives typical pH ranges for various biological fluids and common foods. All values refer to 25°C.

Biological Materials			
Blood, human	7.35–7.45	Hominy (lye)	6.8–8.0
Blood, dog	6.9–7.2	Jams, fruit	3.5–4.0
Spinal fluid, human	7.3–7.5	Jellies, fruit	2.8–3.4
Saliva, human	6.5–7.5	Lemons	2.2–2.4
Gastric contents, human	1.0–3.0	Limes	1.8–2.0
Duodenal contents, human	4.8–8.2	Maple syrup	6.5–7.0
Feces, human	4.6–8.4	Milk, cows	6.3–6.6
Urine, human	4.8–8.4	Olives	3.6–3.8
Milk, human	6.6–7.6	Oranges	3.0–4.0
Bile, human	6.8–7.0	Oysters	6.1–6.6
		Peaches	3.4–3.6
Foods		Pears	3.6–4.0
Apples	2.9–3.3	Peas	5.8–6.4
Apricots	3.6–4.0	Pickles, dill	3.2–3.6
Asparagus	5.4–5.8	Pickles, sour	3.0–3.4
Bananas	4.5–4.7	Pimento	4.6–5.2
Beans	5.0–6.0	Plums	2.8–3.0
Beers	4.0–5.0	Potatoes	5.6–6.0
Beets	4.9–5.5	Pumpkin	4.8–5.2
Blackberries	3.2–3.6	Raspberries	3.2–3.6
Bread, white	5.0–6.0	Rhubarb	3.1–3.2
Butter	6.1–6.4	Salmon	6.1–6.3
Cabbage	5.2–5.4	Sauerkraut	3.4–3.6
Carrots	4.9–5.3	Shrimp	6.8–7.0
Cheese	4.8–6.4	Soft drinks	2.0–4.0
Cherries	3.2–4.0	Spinach	5.1–5.7
Cider	2.9–3.3	Squash	5.0–5.4
Corn	6.0–6.5	Strawberries	3.0–3.5
Crackers	6.5–8.5	Sweet potatoes	5.3–5.6
Dates	6.2–6.4	Tomatoes	4.0–4.4
Eggs, fresh white	7.6–8.0	Tuna	5.9–6.1
Flour, wheat	5.5–6.5	Turnips	5.2–5.6
Gooseberries	2.8–3.0	Vinegar	2.4–3.4
Grapefruit	3.0–3.3	Water, drinking	6.5–8.0
Grapes	3.5–4.5	Wines	2.8–3.8

## CHEMICAL COMPOSITION OF THE HUMAN BODY

The elemental composition of the “standard man” of mass 70 kg is given below.

# STANDARD TRANSFORMED GIBBS ENERGIES OF FORMATION FOR BIOCHEMICAL REACTANTS

Robert N. Goldberg and Robert A. Alberty

This table contains values of the standard transformed Gibbs energies of formation  $\Delta_f G'^{\circ}$  for 130 biochemical reactants. Values of  $\Delta_f G'^{\circ}$  are given at pH 7.0, the temperature 298.15 K, and the pressure 100 kPa for three ionic strengths:  $I = 0$ ,  $I = 0.1$  mol/L and  $I = 0.25$  mol/L. The table can be used for calculating apparent equilibrium constants  $K'$  and standard apparent reduction potentials  $E'^{\circ}$  for biochemical reactions. Such a listing is more compact than tabulating the actual apparent equilibrium constants or standard apparent reduction potentials, which would require a very large number of reactant-product combinations. In the table, all reactants are in aqueous solution unless indicated otherwise.

A biochemical reactant is a sum of species. For example, ATP consists of an equilibrium mixture of the aqueous species  $\text{ATP}^4$ ,  $\text{HATP}^3$ ,  $\text{H}_2\text{ATP}^2$ ,  $\text{MgATP}^2$ , etc. Similarly, phosphate refers to the equilibrium mixture of the aqueous species  $\text{PO}_4^{3-}$ ,  $\text{HPO}_4^{2-}$ ,  $\text{H}_2\text{PO}_4^-$ ,  $\text{H}_3\text{PO}_4$ ,  $\text{MgHPO}_4$ , etc. Biochemical reactions are written using biochemical reactants in terms of an apparent equilibrium constant  $K'$ , which is distinct from the standard equilibrium constant  $K$ . This subject is discussed in an IUPAC report (see Reference 1 below).

The apparent equilibrium constant  $K'$  and the standard transformed Gibbs energy change  $\Delta_r G'^{\circ}$  for a biochemical reaction can be calculated from the  $\Delta_f G'^{\circ}$  values by using the relationship

$$-RT \ln K' = \Delta_r G'^{\circ} = \sum \nu_i' \Delta_f G'^{\circ},$$

where the summation is over all of the biochemical reactants. The quantity  $\nu_i'$  is the stoichiometric number of reactant  $i$  ( $\nu_i'$  is positive for reactants on the right side of the equation and negative for reactants on the left side);  $R$  is the gas constant. As an example, the hydrolysis reaction of ATP is

At pH 7.00 and  $I = 0.25$  M,  $\Delta_r G'^{\circ}$  and  $K'$  are calculated as follows:

$$\Delta_r G'^{\circ} = \{-1424.70 - 1059.49 - (-2292.50 - 155.66)\} \cdot (\text{kJ mol}^{-1}) = -36.03 \text{ kJ mol}^{-1}$$

$$K' = \exp[-(-36030 \text{ J mol}^{-1}) / \{(8.3145 \text{ J mol}^{-1} \text{ K}^{-1}) \cdot (298.15 \text{ K})\}] = 2.05 \cdot 10^6$$

An example involving a biochemical half-cell reaction is

At 298.15 K, pH 7.00, and  $I = 0$ , the standard apparent reduction potential  $E'^{\circ}$  can be calculated as follows

$$E'^{\circ} = -(1/nF) \cdot \{\Delta_f G'^{\circ}(\text{ethanol}) - \Delta_f G'^{\circ}(\text{acetaldehyde})\},$$

where  $n$  is the number of electrons in the half-cell reaction and  $F$  is the Faraday constant. Then,

$$E'^{\circ} = [-1 / (2 \cdot 9.6485 \cdot 10^4 \text{ C mol}^{-1})] \cdot (58.10 \cdot 10^3 \text{ J mol}^{-1} - 20.83 \cdot 10^3 \text{ J mol}^{-1}) = -0.193 \text{ V}$$

# THERMODYNAMIC QUANTITIES FOR THE IONIZATION REACTIONS OF BUFFERS IN WATER

Robert N. Goldberg, Nand Kishore, and Rebecca M. Lennen

This table contains selected values for the  $pK$ , standard molar enthalpy of reaction  $\Delta_r H^\circ$ , and standard molar heat-capacity change  $\Delta_r C_p^\circ$  for the ionization reactions of 64 buffers many of which are relevant to biochemistry and to biology.<sup>1</sup> The values pertain to the temperature  $T = 298.15$  K and the pressure  $p = 0.1$  MPa. The standard state is the hypothetical ideal solution of unit molality. These data permit one to calculate values of the  $pK$  and of  $\Delta_r H^\circ$  at temperatures in the vicinity  $\{T \approx (274 \text{ K to } 350 \text{ K})\}$  of the reference temperature  $\theta = 298.15$  K by using the following equations<sup>2</sup>

$$\Delta_r G_T^\circ = -RT \ln K_T = \ln(10) \cdot RT \cdot pK_T, \quad (1)$$

$$R \ln K_T = -(\Delta_r G_\theta^\circ / \theta) + \Delta_r H_\theta^\circ \{(1/\theta) - (1/T)\} + \Delta_r C_{p\theta}^\circ \{(\theta/T) - 1 + \ln(T/\theta)\}, \quad (2)$$

$$\Delta_r H_T^\circ = \Delta_r H_\theta^\circ + \Delta_r C_{p\theta}^\circ (T - \theta). \quad (3)$$

Here,  $\Delta_r G^\circ$  is the standard molar Gibbs energy change and  $K$  is the equilibrium constant for a reaction;  $R$  is the gas constant (8.314 472 J K<sup>-1</sup> mol<sup>-1</sup>). The subscripts  $T$  and  $\theta$  denote the temperature to which a quantity pertains, the subscript  $p$  denotes constant pres-

sure, and the subscript  $r$  denotes that the quantity refers to a reaction. Combination of equations (1) and (2) yields the following equation that gives  $pK$  as a function of temperature:

$$pK_T = -\{R \ln(10)\}^{-1} [-\{\ln(10) \cdot RT \cdot pK_\theta / \theta\} + \Delta_r H_\theta^\circ \{(1/\theta) - (1/T)\} + \Delta_r C_{p\theta}^\circ \{(\theta/T) - 1 + \ln(T/\theta)\}]. \quad (4)$$

The above equations neglect higher order terms that involve temperature derivatives of  $\Delta_r C_p^\circ$ . Also, it is important to recognize that the values of  $pK$  and  $\Delta_r H^\circ$  effectively pertain to ionic strength  $I = 0$ . However, the values of  $pK$  and  $\Delta_r H^\circ$  are almost always dependent on the ionic strength and the actual composition of the solution. These issues are discussed in Reference 1, which also gives an approximate method for making appropriate corrections.

## NUTRIENT VALUES OF FOODS

The U. S. Department of Agriculture maintains the USDA National Nutrient Database for Standard Reference, which contains over 7000 food items with data on the energy content, minerals, vitamins, and other properties of nutritional interest. The table here includes about 600 common foods extracted from that database. The properties listed are the energy content (in effect, the enthalpy of combustion); the content of carbohydrates, proteins, and lipids (fats); the cholesterol content; and the amount of sodium, potassium, calcium, magnesium, iron, copper, zinc, manganese, phosphorus, and selenium. All values are given for a 100 gram sample of the food.

To conform with common practice in nutritional science, the energy content is given in kilocalories. For conversion to kilojoules, this number should be multiplied by 4.184. For conversion to the avoirdupois units frequently used in the United States, note that:

1 oz = 28.35 g (thus the 100 g basis in this table is approximately 3.5 oz)

1 lb = 453.6 g

The full USDA database covers specific proprietary brands of many processed foods, and it includes vitamin content as well as the minerals given in this table.

## COMPOSITION AND PROPERTIES OF COMMON OILS AND FATS

This table lists some of the most common naturally occurring oils and fats. The list is separated into those of plant origin, fish and other marine life origin, and land animal origin. The oils and fats consist mainly of esters of glycerol (i.e., triglycerides) with fatty acids of 10 to 22 carbon atoms. The four fatty acids with the highest concentration are given for each oil; concentrations are given in weight percent. Because there is often a wide variation in composition depending on the source of the oil sample, a range (or sometimes an average) is generally given. More complete data on composition, including minor fatty acids, sterols, and tocopherols, can be found in the references.

The acids are labeled by the codes described in the previous table, "Properties of Fatty Acids and Their Methyl Esters," which gives the systematic and common names of the acids. Thus 18:2 9c,12c indicates a C<sub>18</sub> acid with two double bonds in the 9 and 12 positions, both with a *cis* configuration (*cis,cis*-9,12-octadecadienoic acid, or linoleic acid).

The density and refractive index of the oils are typical values; superscripts indicate the temperature in °C.

### Notes:

- The composition figure given for oleic acid (18:1 9c) often includes low levels of other 18:1 isomers.

- In some oils where a concentration is given for 18:2 9c,12c (linoleic acid), other isomers of 18:2 may be included.
- Likewise, where a concentration is given for 18:3 9c,12c,15c ( $\alpha$ -linolenic acid), other isomers of 18:3 may be included.
- The acid 20:5 6c,9c,12c,15c,17c, which is prevalent in many fish oils, is often abbreviated as 20:5  $\omega$ -3 or 20:5 n-3.

The assistance of Frank D. Gunstone in preparing this table is gratefully acknowledged.

<sup>a</sup> Jojoba oil consists primarily of wax esters of the acids listed here and long-chain alcohols.

<sup>b</sup> Kapok oil also contains up to 15% cyclopropene acids.

<sup>c</sup> Stillingia oil also contains 5–10% *trans,cis*-2,4-decadienoic acid (stilingic acid, 10:2 2t,4c).

<sup>d</sup> Capelin oil also contains about 10% 16:1.

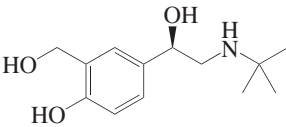

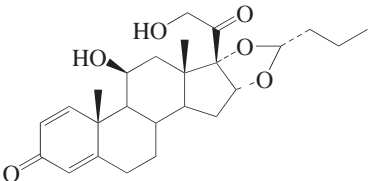

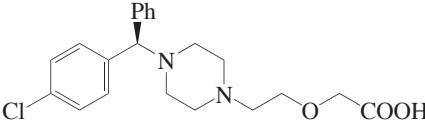

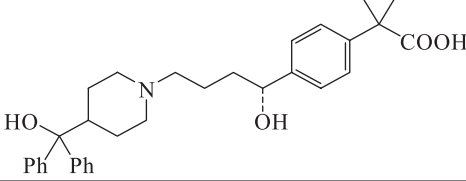

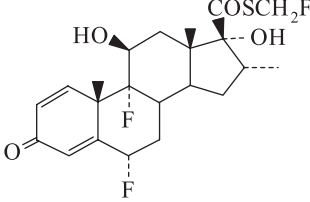

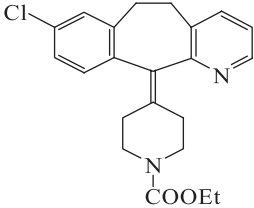

## STRUCTURE AND FUNCTIONS OF SOME COMMON DRUGS

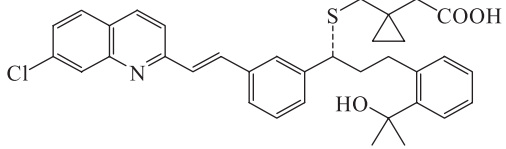

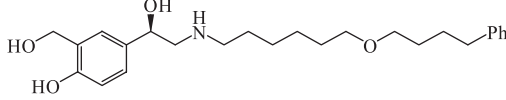

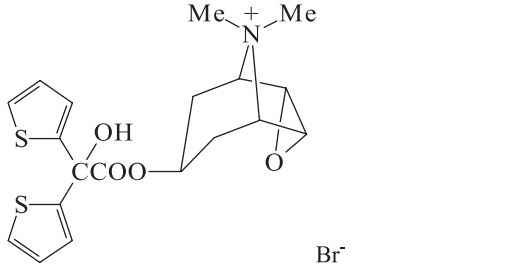

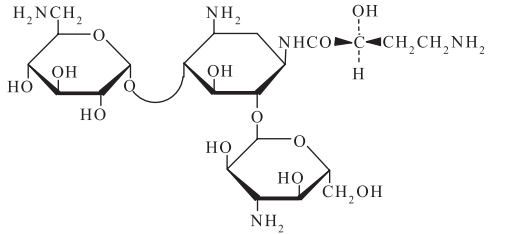

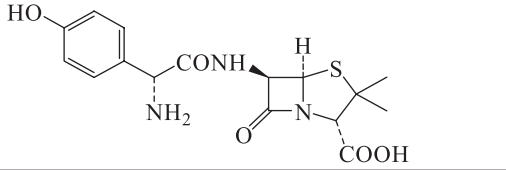

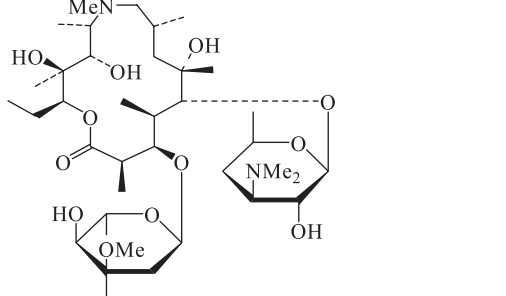

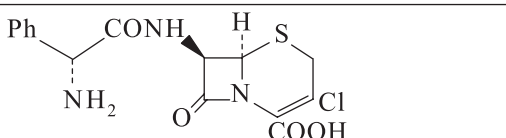

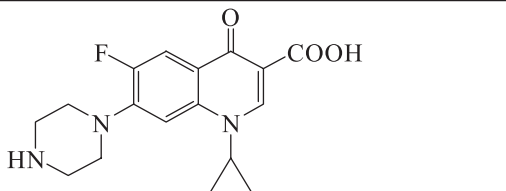

This table lists the names, categories, therapeutic uses, and chemical structures of selected drugs. The generic (chemical) name of each drug is given, along with some of the trade names under which it is sold. When available, physical properties are given in italics in the fourth column. The structure given refers to the active drug, but many of these are packaged as salts or other derivatives. The drugs have been selected to represent a variety of categories; most are widely used throughout the world.

The list is divided into therapeutic categories; within each category the listing is alphabetical by generic name. The index that follows the table can be used to locate a drug by either generic or trade name.

Generic Name	Trade Names	Category and Properties	Applications	Structure
<i>Antiallergic Agents</i>				
1 Albuterol	Proventil; Ventolin; Volmax	$\beta_2$ -Adrenergic receptor agonist	Treatment of troubled breathing caused by asthma, emphysema, and other lung diseases	
2 Budesonide	Budeson; Budamax; Rhinocort; Pulmicort; Inflammide	Glucocorticoid <i>mp</i> 226 °C	Management of asthma and treatment of inflammatory bowel disease	
3 Cetirizine	Zyrtec	Histamine H <sub>1</sub> -receptor antagonist	Treatment of seasonal allergies and hives	
4 Fexofenadine	Carboxyterfenadine; Allegra; Telfast	Histamine H <sub>1</sub> -receptor antagonist	Treatment of allergic rhinitis	
5 Fluticasone	Flovent (as propanoate); Flonase (as propanoate); Advair (with salmeterol)	Anti-inflammatory glucocorticoid	Treatment of asthma & rhinitis	
6 Loratadine	Claritin; Claratyne; Alavert	Long-acting antihistamine <i>mp</i> 132 °C	Relief of allergy symptoms	

Generic Name	Trade Names	Category and Properties	Applications	Structure
7 Montelukast	Singulair	Leukotriene LTD <sub>4</sub> receptor antagonist	Control of asthma and relief of seasonal allergies	
8 Salmeterol	Serevent	β <sub>2</sub> -Adrenergic receptor agonist	Treatment of asthma & chronic obstructive pulmonary disease	
9 Tiotropium bromide	Spiriva	Long-acting antimuscarinic bronchodilator	Treatment of chronic obstructive pulmonary disease	
<b>Antibiotics</b>				
10 Amikacin	Amikin; Biclin; Chemacin; Flexilite; Negasin	Aminoglycoside antibiotic	Treatment of serious infections resistant to other antibiotics	
11 Amoxicillin	Amoxil; Isimoxin; Ospamox	β-Lactam/penicillin	Treatment of a broad spectrum of bacterial infections	
12 Azithromycin	Zithromax; Vinzam; Zmax; Azitrocin	Azalide/macrolide antibiotic <i>mp</i> 155 °C	Treatment of bacterial skin, ear, and respiratory infections	
13 Cefaclor	Ceclor; Kefolar; Panacef; Panoral	β-Lactam/cephalosporin	Treatment of bacterial infections, pneumonia, and urinary tract infections	
14 Ciprofloxacin	Cipro; Ciproxin; Ciprobay; Flociprin; Uniflox	Fluoroquinolone/broad-spectrum antibiotic <i>mp</i> 256 °C	Treatment of urinary & respiratory tract infections, anthrax, and sexually-transmitted diseases	

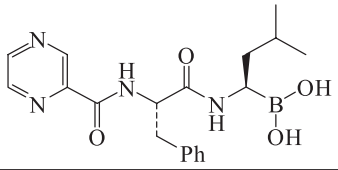

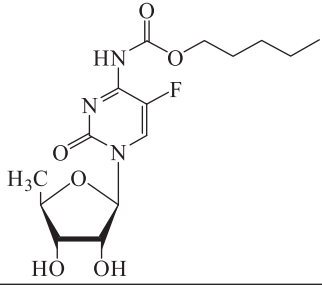

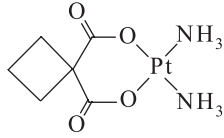

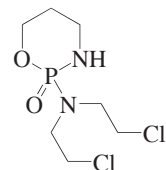

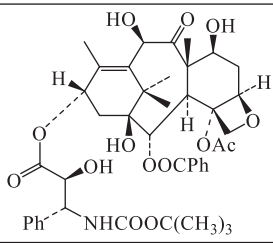

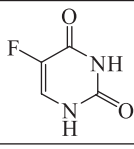

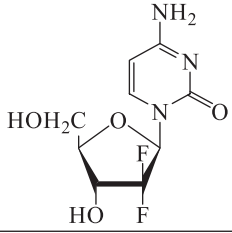

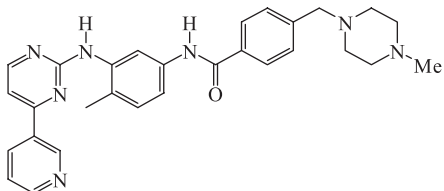

Generic Name	Trade Names	Category and Properties	Applications	Structure
15 Doxycycline	Vibramycin; Adoxa; Doryx; Liviatin; Deoxymykoin	Tetracycline/ broad-spectrum antibiotic	Treatment of urinary tract, respiratory tract, and eye infections; anthrax, syphilis, cholera, etc.	
16 Erythromycin	E-Mycin; Erythrocin; Ilosone	Macrolide antibiotic <i>mp</i> 191 °C	Treatment of bacterial infections, including diphtheria, pertussis, rheumatic fever, venereal disease, etc.	
17 Isoniazid	Laniazid	Antimycobacterial agent <i>mp</i> 171 °C	Treatment of tuberculosis; reduction of tremors from multiple sclerosis	
18 Linezolid	Zyvox	Oxazolidinone <i>mp</i> 182 °C	Treatment of serious Gram-positive infections resistant to other antibiotics	
19 Trimethoprim	Triprim; Proloprim; Monotrim	Dihydrofolate reductase inhibitor <i>mp</i> 199 °C	Treatment of urinary tract infections, diarrhea, and ear infections	
<b>Antidiabetic Drugs</b>				
20 Glipizide	Glucotrol; Glydiazinamide; Glibenese; Minodiab	Potassium channel blocker/sulfonylurea <i>mp</i> 208 °C	Treatment of type 2 diabetes by stimulating insulin secretion in pancreas $\beta$ -cells	
21 Metformin	Glucophage; Diabex; Diaformin; Fortamet	Antidiabetic biguanide	Treatment of type 2 diabetes by enhancing transport of glucose into muscle cells	$\text{Me}_2\text{NCNHCNH}_2$ $\begin{array}{c} \parallel \quad \parallel \\ \text{NH} \quad \text{NH} \end{array}$
22 Pioglitazone	Actos	Peroxisome proliferator-activated receptor <i>mp</i> 174 °C	Treatment of type 2 diabetes by increasing glucose metabolism and insulin sensitivity	

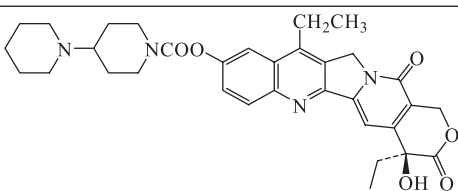

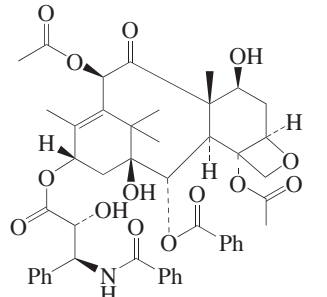

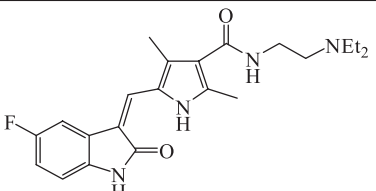

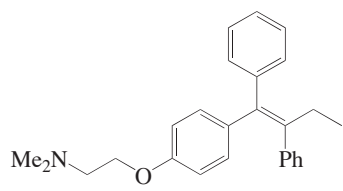

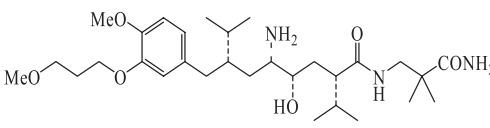

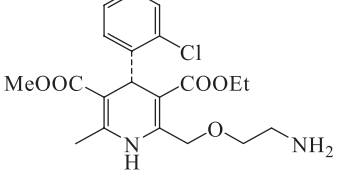

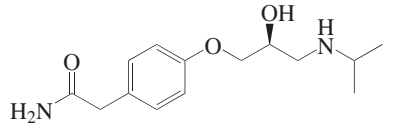

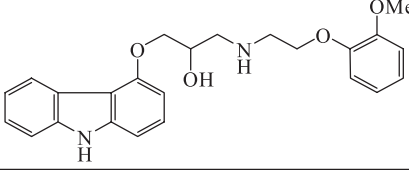

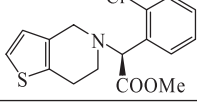

Generic Name	Trade Names	Category and Properties	Applications	Structure
23 Rosiglitazone	Avandia	Thiazolidinedione	Treatment of type 2 diabetes by increasing insulin sensitivity. Possible adverse effects on patients with heart problems.	
24 Sitagliptin	Januvia	Dipeptidyl peptidase IV inhibitor	Treatment of type 2 diabetes by enhancing the body's ability to lower elevated glucose levels	
<b>Anti-Inflammatory Agents</b>				
25 Acetylsalicylic acid	Aspirin	NSAID	Pain and fever relief; anticlotting agent	
26 Celecoxib	Celebrex; Onsenal	NSAID (COX-2 inhibitor) <i>mp</i> 158 °C	Treatment of osteoarthritis and rheumatoid arthritis	
27 Ibuprofen	Advil	NSAID (cyclooxygenase inhibitor) <i>mp</i> 76 °C	Relief of inflammation and pain	
28 Meloxicam	Mobic; Metacam; Metacain	NSAID (cyclooxygenase inhibitor) <i>mp</i> 254 °C	Treatment of osteoarthritis and rheumatoid arthritis	
29 Naproxen	Aleve; Naprelan; Anaprox; Naprogesic	NSAID <i>mp</i> 155 °C	Relief of inflammation and pain	
30 Prednisone	Meticorten; Deltasone	Adrenocortical steroid; anti-inflammatory agent; immunosuppressant	Treatment of asthma and other inflammatory diseases	
<b>Anti-Ulcer Drugs</b>				
31 Cimetidine	Tagamet; Cimetimax; Gastromet; Peptimax	Histamine H <sub>2</sub> -receptor antagonist <i>mp</i> 142 °C	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	
32 Lansoprazole	Prevacid; SoluTab; Prevpac; Zoton; Prezal	Proton pump inhibitor <i>mp</i> 180 °C	Treatment of duodenal ulcers & gastroesophageal reflux disease	

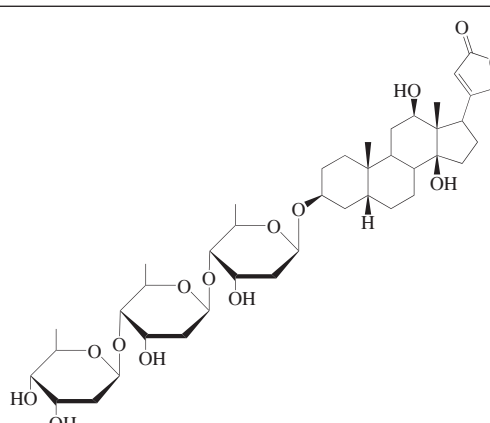

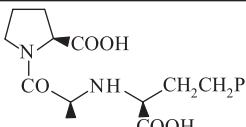

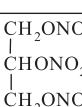

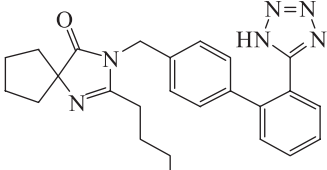

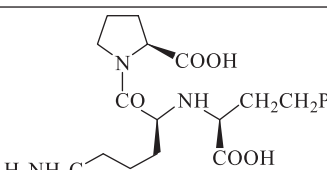

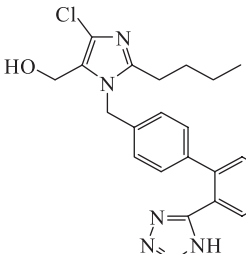

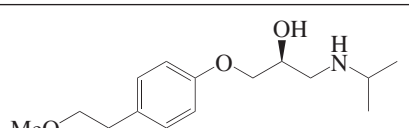

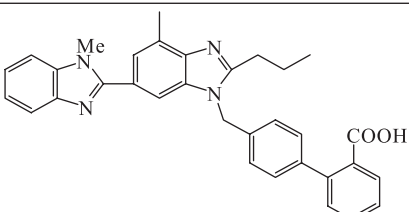

Generic Name	Trade Names	Category and Properties	Applications	Structure
33 Omeprazole	Prilosec; Nexium (Mg salt); Losec; Mepral; Mopral; Zoltum	Proton pump inhibitor <i>mp</i> 156 °C	Treatment of peptic ulcer, dyspepsia, and gastroesophageal reflux disease	
34 Pantoprazole	Protonix; Pantozol; Rifun	Proton pump inhibitor	Treatment of gastric acid-related conditions	
35 Ranitidine	Zantac; Azantac; Melfax; Rantec; Sostril; Taural	Histamine H <sub>2</sub> -receptor antagonist <i>mp</i> 70 °C	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	
<b>Antiviral and Antifungal Agents</b>				
36 Acyclovir	Zovirax; Zovir; Avirax; Mirolex	Viral DNA synthesis inhibitor <i>mp</i> 225 °C	Treatment of cold sores, genital herpes, chicken pox, etc.	
37 Amphotericin	Fungizone; Amfostet; Amphozone	Polyene macrolide antifungal agent <i>mp</i> 170 °C	Intravenous treatment of systemic fungal infections	
38 Efavirenz	Sustiva	Non-nucleoside HIV reverse transcriptase inhibitor <i>mp</i> 131 °C	Treatment of HIV-1 infections (as part of combination therapy)	
39 Fluconazole	Diflucan; Biozolen; Elazor; Triflucan	Cytochrome P450 14α-demethylase inhibitor <i>mp</i> 139 °C	Treatment and prevention of superficial & systemic fungal infections	
40 Lamivudine	Epivir; Heptodin; Zeffix	HIV reverse transcriptase inhibitor	Treatment of hepatitis B and human immunodeficiency virus	

Generic Name	Trade Names	Category and Properties	Applications	Structure
41 Nevirapine	Viramune	Non-nucleoside HIV reverse transcriptase inhibitor <i>mp</i> 250 °C	Treatment of HIV infections (as part of combination therapy)	
42 Oseltamivir	Tamiflu	Neuraminidase inhibitor <i>Foam</i>	Prevention & treatment of influenza A and B	
43 Ribavirin	Virazole; Rebetol; Copegus; Ribasphere; Viratek; Cotronak	Nucleoside antimetabolite <i>mp</i> 175 °C	Treatment of hepatitis C	
44 Terbinafine	Lamisil	Squalene epoxidase inhibitor	Treatment of fungal infections of the skin & nails	
45 Zalcitabine	Hivid	Pyrimidine nucleoside reverse transcriptase inhibitor	Treatment of HIV infection & AIDS	
46 Zidovudine	Retrovir; AZT; Azidothymidine; Zidovir	Pyrimidine nucleoside reverse transcriptase inhibitor <i>mp</i> 121 °C	Treatment of HIV infection & prevention of mother-to-child transmission	
<b>Cancer Chemotherapy Drugs</b>				
47 Anastrozole	Arimidex	Aromatase inhibitor; antineoplastic agent <i>mp</i> 81 °C	Treatment of breast cancer in postmenopausal women	
48 Bicalutamide	Casodex	Antiandrogen <i>mp</i> 180 °C	Treatment of advanced prostate cancer	

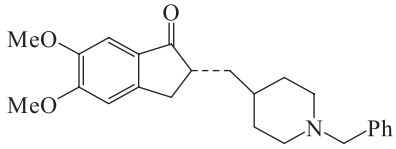

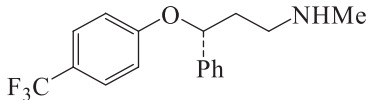

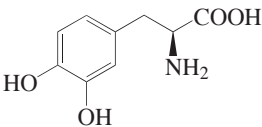

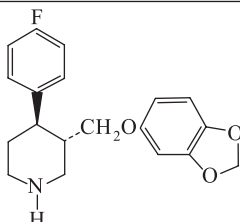

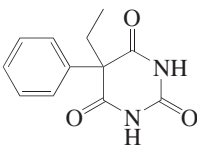

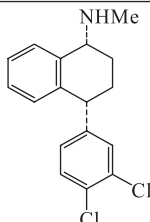

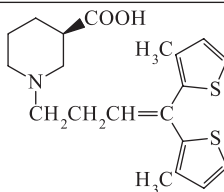

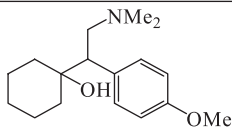

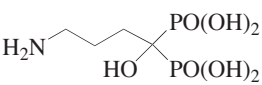

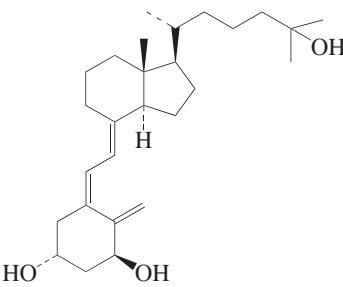

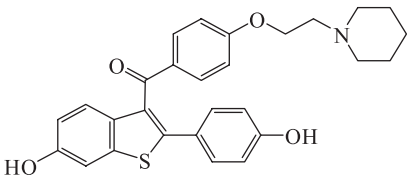

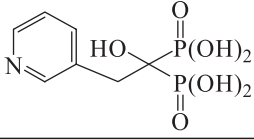

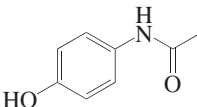

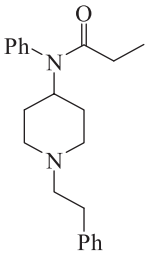

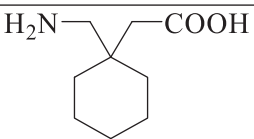

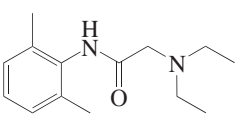

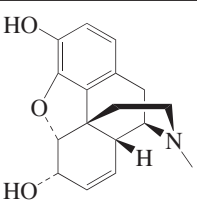

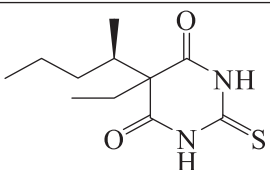

Generic Name	Trade Names	Category and Properties	Applications	Structure
49 Bortezomib	Velcade	Proteasome inhibitor	Treatment of lymphomas and multiple myeloma	
50 Capecitabine	Xeloda	Antimetabolite	Treatment of breast & colon cancer	
51 Carboplatin	Paraplatin; Carboplat; Erbakar; Nonoplat	Platinum-based anticancer agent	Treatment of ovarian cancer	
52 Cyclophosphamide	Cytoxan; Neosar; Cytophosphan; Endoxan; Clafen	Oxazaphosphorine alkylating agent ("Nitrogen mustard") <i>mp 143 °C</i>	Treatment of lymphomas & leukemias, multiple myeloma, and other cancers	
53 Docetaxel	Taxotere	Antineoplastic agent <i>mp 232 °C</i>	Treatment of ovarian, breast and bronchial carcinomas	
54 Fluorouracil	Efudex; Carac; Fluoroplex; Adrucil	Thymidylate synthesis inhibitor <i>mp 243 °C</i>	Constituent of several antineoplastic combinations	
55 Gemcitabine	Gemzar (as hydrochloride)	Antineoplastic and antiviral agent <i>mp 290 °C</i>	Treatment of lung and pancreatic tumors	
56 Imatinib	Gleevec; Glivec	Protein kinase inhibitor <i>mp 212 °C</i>	Treatment of myelogenous leukemia and gastrointestinal tumors	

Generic Name	Trade Names	Category and Properties	Applications	Structure
57 Irinotecan	Camptosar; Camptetin; Topotecin	Topoisomerase I inhibitor	Treatment of colorectal cancer	
58 Paclitaxel	Taxol; Abraxane; Yewtaxan	Microtubule-stabilizing agent <i>mp</i> 214 °C	Treatment of ovarian, breast, and lung cancer	
59 Sunitinib	Sutent	Tyrosine kinases inhibitor	Treatment of gastrointestinal & kidney tumors	
60 Tamoxifen	Nolvadex; Soltamox; Tamaxin; Tamoplex; Valodex	Selective estrogen receptor modulator <i>mp</i> 97 °C	Treatment of breast cancer	
<b>Cardiovascular Agents</b>				
61 Aliskiren	Tekturna; Rasilex	Renin inhibitor	Treatment of hypertension	
62 Amlodipine	Norvasc	Calcium channel blocker	Treatment of hypertension, atrial fibrillation, and angina	
63 Atenolol	Tenormin	$\beta$ -blocker <i>mp</i> 147 °C	Treatment of hypertension and excessive heart rate	
64 Carvedilol	Coreg; Dilatrend; Eucardic	Calcium channel blocker; $\beta$ -adrenoceptor blocker	Treatment of heart failure and hypertension	
65 Clopidogrel	Plavix; Isocover; Meilax; Tipidyl	Antiplatelet agent	Prevention of blood clots after stroke or myocardial infarction	

Generic Name	Trade Names	Category and Properties	Applications	Structure
66 Digoxin	Lanoxin; Davoxin; Digacin; Dilanacin; Rougoxin; Digosin; Cordioxil	Cardiac glycoside <i>mp</i> 249 °C	Treatment of congestive heart failure	
67 Enalaprilat	Vasotec	Angiotensin-converting enzyme inhibitor; antihypertensive agent <i>mp</i> 150 °C	Treatment of hypertension, atherosclerosis, and congestive heart failure	
68 Glycerol trinitrate	Nitroglycerin	Cardiac stimulant and vasodilator	Treatment of angina and congestive heart failure	
69 Irbesartan	Aprovel; Avapro; Avalide (in combination with hydrochlorothiazide)	Angiotensin II AT <sub>1</sub> -receptor antagonist <i>mp</i> 180 °C	Treatment of hypertension and diabetes-related kidney disease	
70 Lisinopril	Acecomb; Alapril; Carace; Novatec; Novazyd; Vivatec; Zestoretic; Zestril	Angiotensin-converting enzyme inhibitor; antihypertensive agent <i>mp</i> 159 °C	Treatment of hypertension	
71 Losartan	Cozaar; Hyzaar (with hydrochlorothiazide)	Angiotensin II AT <sub>1</sub> -receptor antagonist <i>mp</i> 184 °C	Treatment of congestive heart failure and hypertension	
72 Metoprolol	Lopressor; Toprol XL	β-Adrenergic blocker	Treatment of angina and hypertension	
73 Telmisartan	Micardis	Angiotensin II (AT <sub>1</sub> ) receptor antagonist <i>mp</i> 262 °C	Treatment of hypertension	

Generic Name	Trade Names	Category and Properties	Applications	Structure
74 Terazosin	Hytrin; Itrin; Hytrinex; Magnurol; Teraprost; Vasocard; Uroflo; etc.	Antihypertensive agent ( $\alpha_1$ -adrenoceptor antagonist)	Treatment of hypertension and benign prostatic hyperplasia	
75 Warfarin	Coumadin	Anticlotting agent <i>mp</i> 161 °C	Reduction of possibility of stroke or coronary	
<b>Cholesterol-Lowering Drugs</b>				
76 Atorvastatin	Lipitor; Caduet (in combination with amlodipine)	HMG-CoA reductase inhibitor (statin)	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
77 Ezetimibe	Zetia	Selective cholesterol absorption inhibitor <i>mp</i> 165 °C	Reduction of LDL cholesterol levels by inhibiting dietary cholesterol absorption	
78 Nicotinic acid	Niacin	Lipoprotein synthesis inhibitor	Reduction of LDL cholesterol levels	
79 Pravastatin	Pravochol	HMG-CoA reductase inhibitor (statin)	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
80 Simvastatin	Zocor; Vytorin (combination with Ezetimibe)	HMG-CoA reductase inhibitor (statin) <i>mp</i> 136 °C	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
<b>Depression and Anxiety Drugs</b>				
81 Bupropion	Wellbutrin; Amfebutamone; Zyban	Dopamine reuptake inhibitor <i>Pale yellow oil</i>	Antidepressant; smoking cessation aid	
82 Diazepam	Valium; Stesolid; Seduxen; Antenex; Calmpose; Livotensin	Benzodiazepine central nervous system depressant <i>mp</i> 125 °C	Treatment of anxiety, seizures, muscular spasms, and insomnia	

Generic Name	Trade Names	Category and Properties	Applications	Structure
83 Donepezil	Aricept	Acetylcholine esterase inhibitor	Treatment of Alzheimer's disease	
84 Fluoxetine	Prozac; Sarafem; Adofen; Fontex; Lorient	Selective serotonin reuptake inhibitor	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
85 Levodopa	L-Dopa; Larodopa; Bendopa; Veldopa	Precursor to the neurotransmitter dopamine <i>mp</i> 277 °C	Treatment of Parkinson's disease	
86 Paroxetine	Paxil; Seroxat; Tagonis; Aropax; Motivan	Selective serotonin reuptake inhibitor	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
87 Phenobarbital	Luminal; Fenemal; Gardenal; Barbivis	Anticonvulsant <i>mp</i> 174 °C	Epilepsy control; also used as a sedative	
88 Sertraline	Zoloft; Lustral; Serad; Serlain; Tatig	Selective serotonin reuptake inhibitor	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
89 Tiagabine	Gabitril	GABA reuptake inhibitor; anticonvulsant	Treatment of epileptic seizures	
90 Venlafaxine	Effexor; Trewilor; Vandral; Dobupal	Selective serotonin & norepinephrine reuptake inhibitor	Treatment of anxiety and panic disorders	
<b>Osteoporosis Drugs</b>				
91 Alendronic acid	Fosamax; Adronat; Alendros; Dronal	Farnesyl pyrophosphate synthase inhibitor	Prevention and treatment of osteoporosis and Paget's disease	

Generic Name	Trade Names	Category and Properties	Applications	Structure
92 Calcitriol	Rocaltrol; Calcijex	Calcium and phosphate metabolism regulator <i>mp 170 °C</i>	Treatment of rickets and osteoporosis	
93 Raloxifene	Evista (as hydrochloride)	Selective estrogen receptor modulator	Prevention and treatment of osteoporosis	
94 Risedronic acid	Actonel (as Na salt); Optinate	Calcium regulator	Treatment of osteoporosis & Paget's disease	
<b>Pain Relief Drugs</b>				
95 Acetaminophen	Tylenol; APAP; Paracetamol; Hedrex; Tramil	Analgesic/antipyretic <i>mp 170 °C</i>	Relief of musculoskeletal, neuralgic, and other types of pain	
96 Fentanyl	Duragesic; Actiq; Fentora; Sublimaze	Opioid $\mu$ -receptor agonist <i>mp 87.5 °C</i>	Treatment of severe pain; spinal and epidural anesthesia	
97 Gabapentin	Neurotin; Aclonium	Anticonvulsant/analgesic; CNS depressant <i>mp 164 °C</i>	Treatment of neuralgia, pain from shingles, migraine, and epilepsy	
98 Lidocaine	Xylocaine; Xylocard; Lidamantle	Aminoamide anesthetic/antiarrhythmic agent	Local anesthetic for dental procedures	
99 Morphine	Avinza; Contin; Kadian; Roxanol; Meconium; Morfine	Opioid analgesic <i>mp 255 °C</i>	Pain management, especially in malignant diseases	
100 Thiopental	Pentothal; Penthiobarbital; Thiopentone	Short-acting barbiturate/anesthetic	Induction of presurgical anesthesia	

Generic Name	Trade Names	Category and Properties	Applications	Structure
101 Sumatriptan	Imitrex; Imigrane; Megrelan; Permicran; Sumadol	Selective 5-HT <sub>1D</sub> receptor agonist	Treatment of severe migraine headaches	
<i>Reproductive and Urinary System Drugs</i>				
102 Finasteride	Proscar; Propecia; Andozac; Finastid; Procure; Urprosan	5 $\alpha$ Reductase inhibitor <i>mp</i> 252 °C	Treatment of benign prostatic hyperplasia and male hair loss	
103 Mestranol	Devocin; Norinyl; Ovastol; Tranel	Estrogen, used in combination as oral contraceptive <i>mp</i> 151 °C	Prevention of unplanned pregnancy	
104 Mifepristone	Mifeprex; Mifegyne; Corlux; RU 486	Progesterone receptor modulator <i>mp</i> 150 °C	Termination of pregnancy	
105 Sildenafil	Viagra; Revatio	Cyclic GMP phosphodiesterase inhibitor	Treatment of erectile dysfunction and pulmonary hypertension	
106 Tamsulosin	Flomax; Amsulosin; Harnal; Omix	Prostate selective $\alpha_1$ -adrenoceptor antagonist	Treatment of benign prostatic hyperplasia	
107 Testosterone	Androderm; Androgel; Testrim; Striant	Anabolic steroid hormone	Treatment of male hypogonadism	

## Index

The index below lists the trade and generic names for the drugs in this table; the generic names are in bold face. Each entry is referred to by its generic name and the identification number in the

table. An asterisk\* beside the trade name indicates a product that is a combination of two drugs.

Name	Generic Name
Abraxane	Paclitaxel (58)
Acecomb	Lisinopril (70)
<b>Acetaminophen</b>	Acetaminophen (95)
<b>Acetylsalicylic acid</b>	Acetylsalicylic acid (25)
Aclonium	Gabapentin (97)

Name	Generic Name
Actiq	Fentanyl (96)
Actonel	Risedronic acid (94)
Actos	Pioglitazone (22)
Acyclovir	Acyclovir (36)
Adofen	Fluoxetine (84)

Name	Generic Name
Adoxa	Doxycycline (15)
Adronat	Alendronic acid (91)
Adrucil	Fluorouracil (54)
Advair*	Fluticasone (5)
Advil	Ibuprofen (27)
Alapril	Lisinopril (70)
Alavert	Loratadine (6)
<b>Albuterol</b>	Albuterol (1)
<b>Alendronic acid</b>	Alendronic acid (91)
Alendros	Alendronic acid (91)
Aleve	Naproxen (29)
<b>Aliskiren</b>	Aliskiren (61)
Allegra	Fexofenadine (4)
Amfebutamone	Bupropion (81)
Amfostet	Amphotericin (37)
<b>Amikacin</b>	Amikacin (10)
Amikin	Amikacin (10)
<b>Amlodipine</b>	Amlodipine (62)
<b>Amoxicillin</b>	Amoxicillin (11)
Amoxil	Amoxicillin (11)
<b>Amphotericin</b>	Amphotericin (37)
Amphozone	Amphotericin (37)
Amsulosin	Tamsulosin (106)
Anaprox	Naproxen (29)
<b>Anastrozole</b>	Anastrozole (47)
Andozac	Finasteride (102)
Androderm	Testosterone (107)
Androgel	Testosterone (107)
Antenex	Diazepam (82)
APAP	Acetaminophen (95)
Aprovel	Irbesartan (69)
Aricept	Donepezil (83)
Arimidex	Anastrozole (47)
Aropax	Paroxetine (86)
Aspirin	Acetylsalicylic acid (25)
<b>Atenolol</b>	Atenolol (63)
<b>Atorvastatin</b>	Atorvastatin (76)
Avalide*	Irbesartan (69)
Avandia	Rosiglitazone (23)
Avapro	Irbesartan (69)
Avinza	Morphine (99)
Avirax	Acyclovir (36)
Azantac	Ranitidine (35)
Azidothymidine	Zidovudine (46)
<b>Azithromycin</b>	Azithromycin (12)
Azitrocin	Azithromycin (12)
AZT	Zidovudine (46)
Barbivis	Phenobarbital (87)
Bendopa	Levodopa (85)
<b>Bicalutamide</b>	Bicalutamide (48)
Biclin	Amikacin (10)
Biozolene	Fluconazole (39)
<b>Bortezomib</b>	Bortezomib (49)
Budamax	Budesonide (2)
Budeson	Budesonide (2)

Name	Generic Name
<b>Budesonide</b>	Budesonide (2)
<b>Bupropion</b>	Bupropion (81)
Caduet*	Atorvastatin (76)
Calcijex	Calcitriol (92)
<b>Calcitriol</b>	Calcitriol (92)
Calmpose	Diazepam (82)
Camptetin	Irinotecan (57)
Camptosar	Irinotecan (57)
Capecitabine	Capecitabine (50)
Carac	Fluorouracil (54)
Carace	Lisinopril (70)
Carboplat	Carboplatin (51)
<b>Carboplatin</b>	Carboplatin (51)
Carboxyterfenadine	Fexofenadine (4)
<b>Carvedilol</b>	Carvedilol (64)
Casodex	Bicalutamide (48)
Ceclor	Cefaclor (13)
<b>Cefaclor</b>	Cefaclor (13)
Celebrex	Celecoxib (26)
<b>Celecoxib</b>	Celecoxib (26)
<b>Cetirizine</b>	Cetirizine (3)
Chemacin	Amikacin (10)
<b>Cimetidine</b>	Cimetidine (31)
Cimetimax	Cimetidine (31)
Cipro	Ciprofloxacin (14)
Ciprobay	Ciprofloxacin (14)
<b>Ciprofloxacin</b>	Ciprofloxacin (14)
Ciproxin	Ciprofloxacin (14)
Clafen	Cyclophosphamide (52)
Claratyne	Loratadine (6)
Claritin	Loratadine (6)
<b>Clopidogrel</b>	Clopidogrel (65)
Contin	Morphine (99)
Copegus	Ribavirin (43)
Cordioxil	Digoxin (66)
Coreg	Carvedilol (64)
Corlux	Mifepristone (104)
Cotronak	Ribavirin (43)
Coumadin	Warfarin (75)
Cozaar	Losartan (71)
<b>Cyclophosphamide</b>	Cyclophosphamide (52)
Cytophosphan	Cyclophosphamide (52)
Cytoxan	Cyclophosphamide (52)
<b>Davoxin</b>	Digoxin (66)
Deltasone	Prednisone (30)
Deoxyomykoin	Doxycycline (15)
Devocin	Mestranol (103)
Diabex	Metformin (21)
Diaformin	Metformin (21)
<b>Diazepam</b>	Diazepam (82)
Diflucan	Fluconazole (39)
Digacin	Digoxin (66)
Digosin	Digoxin (66)
<b>Digoxin</b>	Digoxin (66)
Dilanacin	Digoxin (66)

Name	Generic Name
Dilatrend	Carvedilol (64)
Dobupal	Venlafaxine (90)
<b>Docetaxel</b>	Docetaxel (53)
<b>Donepezil</b>	Donepezil (83)
Doryx	Doxycycline (15)
Doxycycline	Doxycycline (15)
Dronal	Alendronic acid (91)
Duragesic	Fentanyl (96)
E-Mycin	Erythromycin (16)
<b>Efavirenz</b>	Efavirenz (38)
Effexor	Venlafaxine (90)
Efudex	Fluorouracil (54)
Elazor	Fluconazole (39)
<b>Enalaprilat</b>	Enalaprilat (67)
Endoxan	Cyclophosphamide (52)
Epivir	Lamivudine (40)
Erbakar	Carboplatin (51)
Erythrocin	Erythromycin (16)
<b>Erythromycin</b>	Erythromycin (16)
Eucardic	Carvedilol (64)
Evista	Raloxifene (93)
<b>Ezetimibe</b>	Ezetimibe (77)
Fenemal	Phenobarbital (87)
<b>Fentanyl</b>	Fentanyl (96)
Fentora	Fentanyl (96)
<b>Fexofenadine</b>	Fexofenadine (4)
<b>Finasteride</b>	Finasteride (102)
Finastid	Finasteride (102)
Flexilite	Amikacin (10)
Flociprin	Ciprofloxacin (14)
Flomax	Tamsulosin (106)
Flonase	Fluticasone (5)
Flovent	Fluticasone (5)
<b>Fluconazole</b>	Fluconazole (39)
Fluoroplex	Fluorouracil (54)
<b>Fluorouracil</b>	Fluorouracil (54)
<b>Fluoxetine</b>	Fluoxetine (84)
<b>Fluticasone</b>	Fluticasone (5)
Fontex	Fluoxetine (84)
Fortamet	Metformin (21)
Fosamax	Alendronic acid (91)
Fungizone	Amphotericin (37)
<b>Gabapentin</b>	Gabapentin (97)
Gabitril	Tiagabine (89)
Gardenal	Phenobarbital (87)
Gastromet	Cimetidine (31)
<b>Gemcitabine</b>	Gemcitabine (55)
Gemzar	Gemcitabine (55)
Gleevec	Imatinib (56)
Glibenese	Glipizide (20)
<b>Glipizide</b>	Glipizide (20)
Glivec	Imatinib (56)
Glucophage	Metformin (21)
Glucotrol	Glipizide (20)
<b>Glycerol trinitrate</b>	Glycerol trinitrate (68)

Name	Generic Name
Glydiazinamide	Glipizide (20)
Harnal	Tamsulosin (106)
Hedrex	Acetaminophen (95)
Heptodin	Lamivudine (40)
Hivid	Zalcitabine (45)
Hytrin	Terazosin (74)
Hytrinex	Terazosin (74)
Hyzaar*	Losartan (71)
<b>Ibuprofen</b>	Ibuprofen (27)
Ilosone	Erythromycin (16)
<b>Imatinib</b>	Imatinib (56)
Imigrane	Sumatriptan (101)
Imitrex	Sumatriptan (101)
Inflammid	Budesonide (2)
<b>Irbesartan</b>	Irbesartan (69)
Irinotecan	Irinotecan (57)
Isimoxin	Amoxicillin (11)
Isocover	Clopidogrel (65)
<b>Isoniazid</b>	Isoniazid (17)
Itrin	Terazosin (74)
Januvia	Sitagliptin (24)
Kadian	Morphine (99)
Kefolar	Cefaclor (13)
L-Dopa	Levodopa (85)
Lamisil	Terbinafine (44)
<b>Lamivudine</b>	Lamivudine (40)
Laniazid	Isoniazid (17)
Lanoxin	Digoxin (66)
<b>Lansoprazole</b>	Lansoprazole (32)
Larodopa	Levodopa (85)
<b>Levodopa</b>	Levodopa (85)
Lidamantle	Lidocaine (98)
<b>Lidocaine</b>	Lidocaine (98)
<b>Linezolid</b>	Linezolid (18)
Lipitor	Atorvastatin (76)
<b>Lisinopril</b>	Lisinopril (70)
Liviatin	Doxycycline (15)
Livotensin	Diazepam (82)
Lopressor	Metoprolol (72)
<b>Loratadine</b>	Loratadine (6)
Lorien	Fluoxetine (84)
<b>Losartan</b>	Losartan (71)
Losec	Omeprazole (33)
Luminal	Phenobarbital (87)
Lustral	Sertraline (88)
Magnurol	Terazosin (74)
Meconium	Morphine (99)
Megrelan	Sumatriptan (101)
Meilax	Clopidogrel (65)
Melfax	Ranitidine (35)
<b>Meloxicam</b>	Meloxicam (28)
Mepral	Omeprazole (33)
<b>Mestranol</b>	Mestranol (103)
Metacain	Meloxicam (28)
Metacam	Meloxicam (28)

Name	Generic Name	Name	Generic Name
<b>Metformin</b>	Metformin (21)	Plavix	Clopidogrel (65)
Meticorten	Prednisone (30)	<b>Pravastatin</b>	Pravastatin (79)
<b>Metoprolol</b>	Metoprolol (72)	Pravochol	Pravastatin (79)
Micardis	Telmisartan (73)	<b>Prednisone</b>	Prednisone (30)
Mifegyne	Mifepristone (104)	Prevacid	Lansoprazole (32)
Mifeprex	Mifepristone (104)	Prevpac	Lansoprazole (32)
<b>Mifepristone</b>	Mifepristone (104)	Prezal	Lansoprazole (32)
Minodiab	Glipizide (20)	Prilosec	Omeprazole (33)
Mirolex	Acyclovir (36)	Procure	Finasteride (102)
Mobic	Meloxicam (28)	Proloprim	Trimethoprim (19)
Monotrim	Trimethoprim (19)	Propesia	Finasteride (102)
<b>Montelukast</b>	Montelukast (7)	Proscar	Finasteride (102)
Mopral	Omeprazole (33)	Protonix	Pantoprazole (34)
Morfine	Morphine (99)	Proventil	Albuterol (1)
<b>Morphine</b>	Morphine (99)	Prozac	Fluoxetine (84)
Motivan	Paroxetine (86)	Pulmicort	Budesonide (2)
Naprelan	Naproxen (29)	<b>Raloxifene</b>	Raloxifene (93)
Naprogesic	Naproxen (29)	<b>Ranitidine</b>	Ranitidine (35)
<b>Naproxen</b>	Naproxen (29)	Rantec	Ranitidine (35)
Negasin	Amikacin (10)	Rasilex	Aliskiren (61)
Neosar	Cyclophosphamide (52)	Rebetol	Ribavirin (43)
Neurotin	Gabapentin (97)	Retrovir	Zidovudine (46)
<b>Nevirapine</b>	Nevirapine (41)	Revatio	Sildenafil (105)
Nexium	Omeprazole (33)	Rhinocort	Budesonide (2)
Niacin	Nicotinic acid (78)	Ribasphere	Ribavirin (43)
<b>Nicotinic acid</b>	Nicotinic acid (78)	<b>Ribavirin</b>	Ribavirin (43)
Nitroglycerin	Glycerol trinitrate (68)	Rifun	Pantoprazole (34)

## CHEMICAL CONSTITUENTS OF HUMAN BLOOD

This table lists typical concentrations of some of the chemical constituents of human blood. The table covers elements and compounds of relatively low molecular weight. References 1 and 4 give extensive information on enzymes, hormones, vitamins, and other blood constituents.

The values given for the normal range refer to healthy adults who have not been exposed to unusual environmental agents. In keeping with IUPAC practice, all values refer to a volume of one liter, and thus are stated in units of g/L, mg/L, µg/L or mmol/L. Many clinical test results, especially in the United States, are reported on a deciliter (dL) rather than a liter basis; thus the values in this table should be divided by 10 to place them on a dL basis. The symbols S (for serum), P (plasma), and WB (whole blood) in the second column indicate the nature of the blood sample to which the values apply. In some cases only a single mean value has been reported, rather than a range; these are given in italics.

The total volume of blood in a 100 kg (220 lb) adult is 7.5 L for a male and 6.7 L for a female. The corresponding volume of plasma is 4.4 L and 4.3 L, respectively (Reference 1).

Values from Reference 1 are so-called "reference values" against which clinical tests of blood chemistry are compared. In these cases the "normal range" is understood to include about 95% of the population. The remaining 5% may show values outside the normal range without necessarily implying a medical problem. Note that these reference values may vary slightly from one testing laboratory to another, depending on the detailed test procedure.

Accurate measurements on trace elements are very difficult to make, and wide variations can be found in the literature. Preferred measurement methods are discussed in References 2 and 6. Values

for the trace elements can also vary from one country to another, depending on dietary or environmental factors. Thus cadmium levels tend to be higher in Japan because of the prevalence of sea-food in the diet, and lead levels are higher in regions where lead additives are still used in gasoline. Variations with gender, age, geography, and occurrence of diseases are reviewed in Reference 6.

The Critical Values column gives levels that deviate far enough from the normal range to suggest a probable medical issue. Such values from Reference 3 are the Biological Exposure Indexes (BEI) that are specified by the American Council of Government Industrial Hygienists (ACGIH) as danger signals for the levels of pollutants in the workplace.

\* Measured as the percent of hemoglobin bound to CO. Typical value for heavy smokers is 5%–10%. Major symptoms begin around 30%, and respiratory failure sets in at >60%.

\*\* This is the desirable upper limit. Values between 2000 and 2400 mg/L are considered borderline high.

# APPARENT EQUILIBRIUM CONSTANTS FOR ENZYME-CATALYZED REACTIONS

Robert N. Goldberg

This table contains values of apparent equilibrium constants  $K'$  for selected enzyme-catalyzed reactions at specified temperatures  $T$  and pHs. In those cases where the ionic strength  $I$  and/or the pMg ( $\text{pMg} = -\log_{10}[\text{Mg}^{2+}]$ ) have been reported, the values of these quantities are given. The Enzyme Commission numbers [Webb (1992)] of the enzymes that were used to catalyze the reactions are also given.

There are two fundamentally different types of equilibrium constants. This is illustrated by the following example for the hydrolysis of adenosine 5'-triphosphate (ATP) to adenosine 5'-diphosphate (ADP) and phosphate:

The apparent equilibrium constant for the overall biochemical reaction (1) is

$$K' = [\text{ADP}][\text{phosphate}]/([\text{ATP}]c^\circ) \quad (2)$$

The biochemical reactants ATP, ADP, and phosphate each exist in several different ionized and metal bound forms. For example, ATP is an equilibrium mixture of the species  $\text{ATP}^{4-}$ ,  $\text{HATP}^{3-}$ ,  $\text{H}_2\text{ATP}^{2-}$ ,  $\text{MgATP}^{2-}$ ,  $\text{MgHATP}^-$ ,  $\text{Mg}_2\text{ATP}^0$ . Additional species would also have to be considered if  $\text{Ca}^{2+}$  were present. Thus, ATP has often been denoted in the literature as  $\Sigma\text{ATP}$  or as  $(\text{ATP})_{\text{tot}}$ . When it is clear that one is dealing with total amounts of substances, it is not necessary to use either the  $\Sigma$  or "tot." Thus, these designations are not used in this table. In the above equation,  $c^\circ = 1 \text{ mol dm}^{-3}$ ; it is included to make  $K'$  dimensionless. The standard transformed Gibbs energy of reaction  $\Delta_r G'^\circ$  at specified conditions of temperature  $T$ , pressure  $P$ , ionic strength  $I$ , pH, and pMg can be calculated from  $K'$ :

$$\Delta_r G'^\circ = -RT \ln K' \quad (3)$$

The molar gas constant,  $R$ , is equal to  $8.314\,472 \text{ J K}^{-1} \text{ mol}^{-1}$ .  $\Delta_r G'^\circ$  and the apparent equilibrium constant,  $K'$ , can be used to calculate the position of equilibrium of overall biochemical reactions.

It is also possible to choose a chemical reference reaction that involves selected solute species:

The equilibrium constant for this reference reaction is

$$K = [\text{ADP}^{3-}][\text{HPO}_4^{2-}][\text{H}^+]/\{[\text{ATP}^{4-}](c^\circ)^2\} \quad (5)$$

Equations and algorithms that relate these two different types of equilibrium constants have been published [Alberty (1969), Akers and Goldberg (2001), Alberty (2003)]. To calculate the equilibrium constant  $K$  for the reference reaction from the apparent equilibrium constant  $K'$ , or vice versa, one needs the equilibrium constants for the binding of  $\text{H}^+$  and for the relevant metal ions to  $\text{ATP}^{4-}$ ,  $\text{ADP}^{3-}$ , and  $\text{HPO}_4^{2-}$ .

To avoid confusion between the two different types of equilibrium constants ( $K'$  and  $K$ ) and to avoid ambiguity about whether specific species or sums of species are intended, the word "ammonia," for example, rather than  $\text{NH}_3$  or  $\text{NH}_4^+$ , is used for total ammonia, and chemical formulas are used for specific chemical species. Other substances such as carbon dioxide ( $\text{CO}_2$ ,  $\text{HCO}_3^-$ , and  $\text{CO}_3^{2-}$ ), and phosphate ( $\text{H}_2\text{PO}_4^-$ ,  $\text{HPO}_4^{2-}$ , and  $\text{PO}_4^{3-}$ ) are treated in

the same manner. Exceptions are made for water, which is always written as  $\text{H}_2\text{O}$ , and for gaseous hydrogen and oxygen, which are written as  $\text{H}_2(\text{g})$  and  $\text{O}_2(\text{g})$ , respectively.

For symmetrical reactions, there is no concern about the units used to calculate the value of an equilibrium constant. However, care must be exercised for reactions that are not symmetrical. In such cases, the units " $\text{mol dm}^{-3}$ " have been used for all concentrations. As stated above, a  $c^\circ$  ( $1 \text{ mol dm}^{-3}$ ) is then used to make all equilibrium constants dimensionless.

All substances are assumed to be in aqueous solutions unless specified otherwise.

Values of  $\Delta_r G'^\circ$  and  $K'$  can also be calculated for many biochemical reactions by using the table "Standard Transformed Gibbs Energies of Formation for Biochemical Reactants" in Section 7 of this Handbook.

## Abbreviations

ADP	adenosine 5'-diphosphate
AMP	adenosine 5'-monophosphate
ATP	adenosine 5'-triphosphate
CoA	coenzyme A
GDP	guanosine 5'-diphosphate
GMP	guanosine 5'-monophosphate
GTP	guanosine 5'-triphosphate
IDP	inosine 5'-diphosphate
IMP	inosine 5'-monophosphate
ITP	inosine 5'-triphosphate
NAD <sub>ox</sub>	$\beta$ -nicotinamide-adenine dinucleotide, oxidized form
NAD <sub>red</sub>	$\beta$ -nicotinamide-adenine dinucleotide, reduced form
NADP <sub>ox</sub>	$\beta$ -nicotinamide-adenine dinucleotide phosphate, oxidized form
NADP <sub>red</sub>	$\beta$ -nicotinamide-adenine dinucleotide phosphate, reduced form
UDP	uridine 5'-diphosphate
UTP	uridine 5'-triphosphate

## PREPARATION OF SPECIAL ANALYTICAL REAGENTS

**Aluminon (qualitative test for aluminum).** Aluminon is a trade name for the ammonium salt of aurintricarboxylic acid. Dissolve 1 g of the salt in 1 L of distilled water. Shake the solution well to insure thorough mixing.

**Bang's reagent (for glucose estimation).** Dissolve 100 g of  $K_2CO_3$ , 66 g of KCl and 160 g of  $KHCO_3$  in the order given in about 700 mL of water at 30°C. Add 4.4 g of  $CuSO_4$  and dilute to 1 L after the  $CO_2$  is evolved. This solution should be shaken only in such a manner as not to allow entry of air. After 24 hours 300 mL are diluted to 1 L with saturated KCl solution, shaken gently and used after 24 hours; 50 mL is equivalent to 10 mg glucose.

**Barfoed's reagent (test for glucose).** See Cupric acetate.

**Baudisch's reagent.** See Cupferron.

**Benedict's solution (qualitative reagent for glucose).** With the aid of heat, dissolve 173 g of sodium citrate and 100 g of  $Na_2CO_3$  in 800 mL of water. Filter, if necessary, and dilute to 850 mL. Dissolve 17.3 g of  $CuSO_4 \cdot 5H_2O$  in 100 mL of water. Pour the latter solution, with constant stirring, into the carbonate-citrate solution, and dilute to 1 L.

**Benzidine hydrochloride solution (for sulfite determination).** Make a paste of 8 g of benzidine hydrochloride ( $C_{12}H_8(NH_3)_2 \cdot 2HCl$ ) and 20 mL of water, add 20 mL of HCl (sp. gr. 1.12) and dilute to 1 L with water. Each mL of this solution is equivalent to 0.00357 g of  $H_2SO_4$ .

**Bertrand's reagent (glucose estimation).** Consists of the following solutions:

1. Dissolve 200 g of Rochelle salt and 150 g of NaOH in sufficient water to make 1 L of solution.
2. Dissolve 40 g of  $CuSO_4$  in enough water to make 1 L of solution.
3. Dissolve 50 g of  $Fe_2(SO_4)_3$  and 200 g of  $H_2SO_4$  (sp. gr. 1.84) in sufficient water to make 1 L of solution.
4. Dissolve 5 g of  $KMnO_4$  in sufficient water to make 1 L of solution.

**Bial's reagent (for pentose).** Dissolve 1 g of orcinol (5-methyl-1,3-benzenediol) in 500 mL of 30% HCl to which 30 drops of a 10% solution of  $FeCl_3$  has been added.

**Boutron — Boudet soap solution:**

1. Dissolve 100 g of pure castile soap in about 2.5 L of 56% ethanol.
2. Dissolve 0.59 g of  $Ba(NO_3)_2$  in 1 L of water.

Adjust the castile soap solution so that 2.4 mL of it will give a permanent lather with 40 mL of solution (b). When adjusted, 2.4 mL of soap solution is equivalent to 220 parts per million of hardness (as  $CaCO_3$ ) for a 40 mL sample. See also Soap solution.

**Brucke's reagent (protein precipitation).** See Potassium iodide-mercuric iodide.

**Clarke's soap solution (estimation of hardness in water).**

1. Dissolve 100 g of pure powdered castile soap in 1 L of 80% ethanol and allow to stand over night.
2. Prepare a solution of  $CaCl_2$  by dissolving 0.5 g of  $CaCO_3$  in HCl (sp. gr. 1.19), neutralize with  $NH_4OH$  and make slightly alkaline to litmus, and dilute to 500 mL. One mL is equivalent to 1 mg of  $CaCO_3$ .

Titrate (1) against (2) and dilute (1) with 80% ethanol until 1 mL of the resulting solution is equivalent to 1 mL of (2) after making allowance for the lather factor (the amount of standard soap solution required to produce a permanent lather in 50 mL of distilled water). One mL of the adjusted solution after subtracting the lather factor is equivalent to 1 mg of  $CaCO_3$ . See also Soap solution.

**Cobalticyanide paper (Rinnmann's test for Zn).** Dissolve 4 g of  $K_3Co(CN)_6$  and 1 g of  $KClO_3$  in 100 mL of water. Soak filter paper in solution and dry at 100°C. Apply drop of zinc solution and burn in an evaporating dish. A green disk is obtained if zinc is present.

**Cochineal.** Extract 1 g of cochineal for 4 days with 20 mL of alcohol and 60 mL of distilled water. Filter.

**Congo red.** Dissolve 0.5 g of congo red in 90 mL of distilled water and 10 mL of alcohol.

**Cupferron (Baudisch's reagent for iron analysis).** Dissolve 6 g of the ammonium salt of *N*-hydroxy-*N*-nitrosoaniline (cupferron) in 100 mL of  $H_2O$ . Reagent good for 1 week only and must be kept in the dark.

**Cupric acetate (Barfoed's reagent for reducing monosaccharides).** Dissolve 66 g of cupric acetate and 10 mL of glacial acetic acid in water and dilute to 1 L.

**Cupric oxide, ammoniacal; Schweitzer's reagent (dissolves cotton, linen, and silk, but not wool).**

1. Dissolve 5 g of cupric sulfate in 100 mL of boiling water, and add sodium hydroxide until precipitation is complete. Wash the precipitate well, and dissolve it in a minimum quantity of ammonium hydroxide.
2. Bubble a slow stream of air through 300 mL of strong ammonium hydroxide containing 50 g of fine copper turnings. Continue for 1 hour.

**Cupric sulfate in glycerin-potassium hydroxide (reagent for silk).** Dissolve 10 g of cupric sulfate,  $CuSO_4 \cdot 5H_2O$ , in 100 mL of water and add 5 g of glycerol. Add KOH solution slowly until a deep blue solution is obtained.

**Cupron (precipitates copper).** Dissolve 5 g of benzoinoxime in 100 mL of 95% ethanol.

**Cuprous chloride, acidic (reagent for CO in gas analysis).**

1. Cover the bottom of a 2-L flask with a layer of cupric oxide about 0.5 inch deep, suspend a coil of copper wire so as to reach from the bottom to the top of the solution, and fill the flask with hydrochloric acid (sp. gr. 1.10). Shake occasionally. When the solution becomes nearly colorless, transfer to reagent bottles, which should also contain copper wire. The stock bottle may be refilled with dilute hydrochloric acid until either the cupric oxide or the copper wire is used up. Copper sulfate may be substituted for copper oxide in the above procedure.
2. Dissolve 340 g of  $CuCl_2 \cdot 2H_2O$  in 600 mL of conc. HCl and reduce the cupric chloride by adding 190 mL of a saturated solution of stannous chloride or until the solution is colorless. The stannous chloride is prepared by treating 300 g of metallic tin in a 500 mL flask with conc. HCl until no more tin goes into solution.
3. (Winkler method). Add a mixture of 86 g of CuO and 17 g of finely divided metallic Cu, made by the reduction of CuO with hydrogen, to a solution of HCl, made by dilut-

ing 650 mL of conc. HCl with 325 mL of water. After the mixture has been added slowly and with frequent stirring, a spiral of copper wire is suspended in the bottle, reaching all the way to the bottom. Shake occasionally, and when the solution becomes colorless, it is ready for use.

**Cuprous chloride, ammoniacal (reagent for CO in gas analysis).**

1. The acid solution of cuprous chloride as prepared above is neutralized with ammonium hydroxide until an ammonia odor persists. An excess of metallic copper must be kept in the solution.
2. Pour 800 mL of acidic cuprous chloride, prepared by the Winkler method, into about 4 L of water. Transfer the precipitate to a 250 mL graduate. After several hours, siphon off the liquid above the 50 mL mark and refill with 7.5%  $\text{NH}_4\text{OH}$  solution which may be prepared by diluting 50 mL of conc.  $\text{NH}_4\text{OH}$  with 150 mL of water. The solution is well shaken and allowed to stand for several hours. It should have a faint odor of ammonia.

**Dichlorofluorescein indicator.** Dissolve 1 g in 1 L of 70% alcohol or 1 g of the sodium salt in 1 L of water.

**Dimethylglyoxime, 0.01 N.** Dissolve 0.6 g of dimethylglyoxime (2,3-butanedione oxime) in 500 mL of 95% ethanol. This is an especially sensitive test for nickel, a very definite crimson color being produced.

**Diphenylamine (reagent for rayon).** Dissolve 0.2 g in 100 mL of concentrated sulfuric acid.

**Diphenylamine sulfonate (for titration of iron with  $\text{K}_2\text{Cr}_2\text{O}_7$ ).** Dissolve 0.32 g of the barium salt of diphenylamine sulfonic acid in 100 mL of water, add 0.5 g of sodium sulfate and filter off the precipitate of  $\text{BaSO}_4$ .

**Diphenylcarbazide.** Dissolve 0.2 g of diphenylcarbazide in 10 mL of glacial acetic acid and dilute to 100 mL with 95% ethanol.

**Esbach's reagent (estimation of protein).** To a water solution of 10 g of picric acid and 20 g of citric acid, add sufficient water to make 1 L of solution.

**Eschka's compound.** Two parts of calcined ("light") magnesia are thoroughly mixed with 1 part of anhydrous sodium carbonate.

**Fehling's solution (reagent for reducing sugars.)**

1. Copper sulfate solution. Dissolve 34.66 g of  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  in water and dilute to 500 mL.
2. Alkaline tartrate solution. Dissolve 173 g of potassium sodium tartrate (Rochelle salt,  $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$ ) and 50 g of NaOH in water and dilute when cold to 500 mL.

Mix equal volumes of the two solutions at the time of using.

**Ferric-alum indicator.** Dissolve 140 g of ferric ammonium sulfate crystals in 400 mL of hot water. When cool, filter, and make up to a volume of 500 mL with dilute nitric acid.

**Folin's mixture (for uric acid).** To 650 mL of water add 500 g of  $(\text{NH}_4)_2\text{SO}_4$ , 5 g of uranium acetate, and 6 g of glacial acetic acid. Dilute to 1 L.

**Formaldehyde — sulfuric acid (Marquis' reagent for alkaloids).** Add 10 mL of formaldehyde solution to 50 mL of sulfuric acid.

**Froehde's reagent.** See Sulfomolybdic acid.

**Fuchsin (reagent for linen).** Dissolve 1 g of fuchsin in 100 mL of alcohol.

**Fuchsin — sulfurous acid (Schiff's reagent for aldehydes).**

Dissolve 0.5 g of fuchsin and 9 g of sodium bisulfite in 500 mL of water, and add 10 mL of HCl. Keep in well-stoppered bottles and protect from light.

**Gunzberg's reagent (detection of HCl in gastric juice).** Prepare as needed a solution containing 4 g of phloroglucinol (1,3,5-benzenetriol) and 2 g of vanillin in 100 mL of absolute ethanol.

**Hager's reagent.** See Picric acid.

**Hanus solution (for iodine number).** Dissolve 13.2 g of resublimed iodine in 1 L of glacial acetic acid which will pass the dichromate test for reducible matter. Add sufficient bromine to double the halogen content, determined by titration (3 mL is about the proper amount). The iodine may be dissolved by the aid of heat, but the solution should be cold when the bromine is added.

**Iodine, tincture of.** To 50 mL of water add 70 g of  $\text{I}_2$  and 50 g of KI. Dilute to 1 L with alcohol.

**Iodo-potassium iodide (Wagner's reagent for alkaloids).** Dissolve 2 g of iodine and 6 g of KI in 100 mL of water.

**Litmus (indicator).** Extract litmus powder three times with boiling alcohol, each treatment consuming an hour. Reject the alcoholic extract. Treat residue with an equal weight of cold water and filter; then exhaust with five times its weight of boiling water, cool and filter. Combine the aqueous extracts.

**Magnesia mixture (reagent for phosphates and arsenates).** Dissolve 55 g of magnesium chloride and 105 g of ammonium chloride in water, barely acidify with hydrochloric acid, and dilute to 1 L. The ammonium hydroxide may be omitted until just previous to use. The reagent, if completely mixed and stored for any period of time, becomes turbid.

**Magnesium uranyl acetate.** Dissolve 100 g of  $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$  in 60 mL of glacial acetic acid and dilute to 500 mL. Dissolve 330 g of  $\text{Mg}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4\text{H}_2\text{O}$  in 60 mL of glacial acetic acid and dilute to 200 mL. Heat solutions to the boiling point until clear, pour the magnesium solution into the uranyl solution, cool and dilute to 1 L. Let stand over night and filter if necessary.

**Marme's reagent.** See Potassium-cadmium iodide.

**Marquis' reagent.** See Formaldehyde-sulfuric acid.

**Mayer's reagent (white precipitate with most alkaloids in slightly acid solutions).** Dissolve 1.358 g of  $\text{HgCl}_2$  in 60 mL of water and pour into a solution of 5 g of KI in 10 mL of  $\text{H}_2\text{O}$ . Add sufficient water to make 100 mL.

**Methyl orange indicator.** Dissolve 1 g of methyl orange in 1 L of water. Filter, if necessary.

**Methyl orange, modified.** Dissolve 2 g of methyl orange and 2.8 g of xylene cyanole FF in 1 L of 50% alcohol.

**Methyl red indicator.** Dissolve 1 g of methyl red in 600 mL of alcohol and dilute with 400 mL of water.

**Methyl red, modified.** Dissolve 0.50 g of methyl red and 1.25 g of xylene cyanole FF in 1 L of 90% alcohol. Or, dissolve 1.25 g of methyl red and 0.825 g of methylene blue in 1 L of 90% alcohol.

**Millon's reagent (for albumins and phenols).** Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of water and decant the clear solution after several hours.

**Molisch's reagent.** See 1-Naphthol.

**1-Naphthol (Molisch's reagent for wool).** Dissolve 15 g of 1-naphthol in 100 mL of alcohol or chloroform.

**Nessler's reagent (for ammonia).** Dissolve 50 g of KI in the smallest possible quantity of cold water (50 mL). Add a saturated solution of mercuric chloride (about 22 g in 350 mL of water will be needed) until an excess is indicated by the formation of a precipitate. Then add 200 mL of 5 N NaOH and dilute to 1 L. Let settle, and draw off the clear liquid.

**Nickel oxide, ammoniacal (reagent for silk).** Dissolve 5 g of nickel sulfate in 100 mL of water, and add sodium hydroxide solution until nickel hydroxide is completely precipitated. Wash the precipitate well and dissolve in 25 mL of concentrated ammonium hydroxide and 25 mL of water.

**Nitron (detection of nitrate radical).** Dissolve 10 g of nitron (1,4-diphenyl-3-(phenylamino)-1,2,4-triazolium hydroxide) in 5 mL of glacial acetic acid and 95 mL of water. The solution may be filtered with slight suction through an alundum crucible and kept in a dark bottle.

**1-Nitroso-2-naphthol.** Make a saturated solution in 50% acetic acid (1 part of glacial acetic acid with 1 part of water). Does not keep well.

**Nylander's solution (carbohydrates).** Dissolve 20 g of bismuth subnitrate and 40 g of Rochelle salt in 1 L of 8% NaOH solution. Cool and filter.

**Obermayer's reagent (for indoxyl in urine).** Dissolve 4 g of  $\text{FeCl}_3$  in 1 L of HCl (sp. gr. 1.19).

**Oxine.** Dissolve 14 g of 8-hydroxyquinoline in 30 mL of glacial acetic acid. Warm slightly, if necessary. Dilute to 1 L.

**Oxygen absorbent.** Dissolve 300 g of ammonium chloride in 1 L of water and add 1 L of concentrated ammonium hydroxide solution. Shake the solution thoroughly. For use as an oxygen absorbent, a bottle half full of copper turnings is filled nearly full with the  $\text{NH}_4\text{Cl-NH}_4\text{OH}$  solution and the gas passed through.

**Pasteur's salt solution.** To 1 L of distilled water add 2.5 g of potassium phosphate, 0.25 g of calcium phosphate, 0.25 g of magnesium sulfate, and 12.00 g of ammonium tartrate.

**Pavy's solution (glucose reagent).** To 120 mL of Fehling's solution, add 300 mL of  $\text{NH}_4\text{OH}$  (sp. gr. 0.88) and dilute to 1 L with water.

**Phenanthroline ferrous ion indicator.** Dissolve 1.485 g of 1,10-phenanthroline monohydrate in 100 mL of 0.025 M ferrous sulfate solution.

**Phenolphthalein.** Dissolve 1 g of phenolphthalein in 50 mL of alcohol and add 50 mL of water.

**Phenolsulfonic acid (determination of nitrogen as nitrate).** Dissolve 25 g of phenol in 150 mL of conc.  $\text{H}_2\text{SO}_4$ , add 75 mL of fuming  $\text{H}_2\text{SO}_4$  (15%  $\text{SO}_3$ ), stir well and heat for 2 hours at  $100^\circ\text{C}$ .

**Phloroglucinol solution (pentosans).** Make a 3% phloroglucinol (1,3,5-benzenetriol) solution in alcohol. Keep in a dark bottle.

**Phosphomolybdic acid (Sonnenschein's reagent for alkaloids).**

1. Prepare ammonium phosphomolybdate and after washing with water, boil with nitric acid and expel  $\text{NH}_3$ ; evaporate to dryness and dissolve in 2 M nitric acid.
2. Dissolve ammonium molybdate in  $\text{HNO}_3$  and treat with phosphoric acid. Filter, wash the precipitate, and boil with aqua regia until the ammonium salt is decomposed. Evaporate to dryness. The residue dissolved in 10%  $\text{HNO}_3$  constitutes Sonnenschein's reagent.

**Phosphoric acid — sulfuric acid mixture.** Dilute 150 mL of conc.  $\text{H}_2\text{SO}_4$  and 100 mL of conc.  $\text{H}_3\text{PO}_4$  (85%) with water to a volume of 1 L.

**Phosphotungstic acid (Schcibicr's reagent for alkaloids).**

1. Dissolve 20 g of sodium tungstate and 15 g of sodium phosphate in 100 mL of water containing a little nitric acid.
2. The reagent is a 10% solution of phosphotungstic acid in water. The phosphotungstic acid is prepared by evaporating a mixture of 10 g of sodium tungstate dissolved in 5 g of phosphoric acid (sp. gr. 1.13) and enough boiling water to effect solution. Crystals of phosphotungstic acid separate.

**Picric acid (Hager's reagent for alkaloids, wool and silk).** Dissolve 1 g of picric acid in 100 mL of water.

**Potassium antimonate (reagent for sodium).** Boil 22 g of potassium antimonate with 1 L of water until nearly all of the salt has dissolved, cool quickly, and add 35 mL of 10% potassium hydroxide. Filter after standing overnight.

**Potassium-cadmium iodide (Marme's reagent for alkaloids).** Add 2 g of  $\text{CdI}_2$  to a boiling solution of 4 g of KI in 12 mL of water, and then mix with 12 mL of saturated KI solution.

**Potassium hydroxide (for  $\text{CO}_2$  absorption).** Dissolve 360 g of KOH in water and dilute to 1 L.

**Potassium iodide — mercuric iodide (Brucke's reagent for proteins).** Dissolve 50 g of KI in 500 mL of water, and saturate with mercuric iodide (about 120 g). Dilute to 1 L.

**Potassium pyrogallate (for oxygen absorption).** For mixtures of gases containing less than 28% oxygen, add 100 mL of KOH solution (50 g of KOH to 100 mL of water) to 5 g of pyrogallol. For mixtures containing more than 28% oxygen the KOH solution should contain 120 g of KOH to 100 mL of water.

**Pyrogallol, alkaline.**

1. Dissolve 75 g of pyrogallol in 75 mL of water.
2. Dissolve 500 g of KOH in 250 mL of water. When cool, adjust until sp. gr. is 1.55.

For use, add 270 mL of solution (2) to 30 mL of solution (1).

**Rosolic acid (indicator).** Dissolve 1 g of rosolic acid in 10 mL of alcohol and add 100 mL of water.

**Scheibler's reagent.** See Phosphotungstic acid.

**Schiff's reagent.** See Fuchsin-sulfurous acid.

**Schweitzer's reagent.** See Cupric oxide, ammoniacal.

**Soap solution (reagent for hardness in water).** Dissolve 100 g of dry castile soap in 1 L of 80% alcohol (5 parts alcohol to 1 part water). Allow to stand several days and dilute with 70% to 80% alcohol until 6.4 mL produces a permanent lather with 20 mL of standard calcium solution. The latter solution is made by dissolving 0.2 g of  $\text{CaCO}_3$  in a small amount of dilute HCl, evaporating to dryness and making up to 1 L.

**Sodium bismuthate (oxidation of manganese).** Heat 20 parts of NaOH nearly to redness in an iron or nickel crucible and add slowly 10 parts of basic bismuth nitrate which has been previously dried. Add 2 parts of sodium peroxide, and pour the brownish-yellow fused mass onto an iron plate to cool. When cold, break up in a mortar, extract with water, and collect on an asbestos filter.

**Sodium hydroxide (for  $\text{CO}_2$  absorption).** Dissolve 330 g of NaOH in water and dilute to 1 L.

**Sodium nitroprusside (reagent for hydrogen sulfide and wool).**

Use a freshly prepared solution of 1 g of sodium nitroferricyanide in 10 mL of water.

**Sodium oxalate (primary standard).** Dissolve 30 g of the commercial salt in 1 L of water, make slightly alkaline with sodium hydroxide, and let stand until perfectly clear. Filter and evaporate the filtrate to 100 mL. Cool and filter. Pulverize the residue and wash it several times with small volumes of water. The procedure is repeated until the mother liquor is free from sulfate and is neutral to phenolphthalein.

**Sodium plumbite (reagent for wool).** Dissolve 5 g of sodium hydroxide in 100 mL of water. Add 5 g of litharge (PbO) and boil until dissolved.

**Sodium polysulfide.** Dissolve 480 g of  $\text{Na}_2\text{S}\cdot 9\text{H}_2\text{O}$  in 500 mL of water, add 40 g of NaOH and 18 g of sulfur. Stir thoroughly and dilute to 1 L with water.

**Sonnenschein's reagent.** See Phosphomolybdic acid.

**Starch solution.**

1. Make a paste with 2 g of soluble starch and 0.01 g of  $\text{HgI}_2$  with a small amount of water. Add the mixture slowly to 1 L of boiling water and boil for a few minutes. Keep in a glass stoppered bottle. If other than soluble starch is used, the solution will not clear on boiling; it should be allowed to stand and the clear liquid decanted.
2. A solution of starch which keeps indefinitely is made as follows: Mix 500 mL of saturated NaCl solution (filtered), 80 mL of glacial acetic acid, 20 mL of water and 3 g of starch. Bring slowly to a boil and boil for 2 minutes.
3. Make a paste with 1 g of soluble starch and 5 mg of  $\text{HgI}_2$ , using as little cold water as possible. Then pour about 200 mL of boiling water on the paste and stir immediately. This will give a clear solution if the paste is prepared correctly and the water actually boiling. Cool and add 4 g of KI. Starch solution decomposes on standing due to bacterial action, but this solution will keep well if stored under a layer of toluene.

**Stoke's reagent.** Dissolve 30 g of  $\text{FeSO}_4$  and 20 g of tartaric acid in water and dilute to 1 L. Just before using, add concentrated  $\text{NH}_4\text{OH}$  until the precipitate first formed is redissolved.

**Sulfanilic acid (reagent for nitrites).** Dissolve 0.5 g of sulfanilic acid in a mixture of 15 mL of glacial acetic acid and 135 mL of recently boiled water.

**Sulfomolybdic acid (Froehde's reagent for alkaloids and glucosides).** Dissolve 10 g of molybdic acid or sodium molybdate in 100 mL of conc.  $\text{H}_2\text{SO}_4$ .

**Tannic acid (reagent for albumin, alkaloids, and gelatin).** Dissolve 10 g of tannic acid in 10 mL of alcohol and dilute with water to 100 mL.

**Titration mixture (residual chlorine in water analysis).** Prepare 1 L of dilute HCl (100 mL of HCl (sp. gr. 1.19) in sufficient water to make 1 L). Dissolve 1 g of *o*-tolidine in 100 mL of the dilute HCl and dilute to 1 L with dilute HCl solution.

**Trinitrophenol solution.** See Picric acid.

**Turmeric tincture (reagent for borates).** Digest ground turmeric root with several quantities of water which are discarded. Dry the residue and digest it several days with six times its weight of alcohol. Filter.

**Uffelmann's reagent (turns yellow in presence of lactic acid).** To a 2% solution of pure phenol in water, add a water solution of  $\text{FeCl}_3$  until the phenol solution becomes violet in color.

**Wagner's reagent.** See Iodo-potassium iodide.

**Wagner's solution (used in phosphate rock analysis to prevent precipitation of iron and aluminum).** Dissolve 25 g of citric acid and 1 g of salicylic acid in water and dilute to 1 L. Use 50 mL of the reagent.

**Wij's iodine monochloride solution (for iodine number).** Dissolve 13 g of resublimed iodine in 1 L of glacial acetic acid which will pass the dichromate test for reducible matter. Set aside 25 mL of this solution. Pass into the remainder of the solution dry chlorine gas (dried and washed by passing through  $\text{H}_2\text{SO}_4$  (sp. gr. 1.84)) until the characteristic color of free iodine has been discharged. Now add the iodine solution which was reserved, until all free chlorine has been destroyed. A slight excess of iodine does little or no harm, but an excess of chlorine must be avoided. Preserve in well stoppered, amber colored bottles. Avoid use of solutions which have been prepared for more than 30 days.

**Wij's special solution (for iodine number).** To 200 mL of glacial acetic acid that will pass the dichromate test for reducible matter, add 12 g of dichloramine T (*N,N*-dichloro-4-methylbenzenesulfonamide), and 16.6 g of dry KI (in small quantities with continual shaking until all the KI has dissolved). Make up to 1 L with the same quality of acetic acid used above and preserve in a dark colored bottle.

**Zimmermann-Reinhardt reagent (determination of iron).** Dissolve 70 g of  $\text{MnSO}_4\cdot 4\text{H}_2\text{O}$  in 500 mL of water, add 125 mL of conc.  $\text{H}_2\text{SO}_4$  and 125 mL of 85%  $\text{H}_3\text{PO}_4$ , and dilute to 1 L.

**Zinc chloride solution, basic (reagent for silk).** Dissolve 1000 g of zinc chloride in 850 mL of water, and add 40 g of zinc oxide. Heat until solution is complete.

**Zinc uranyl acetate (reagent for sodium).** Dissolve 10 g of  $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2\cdot 2\text{H}_2\text{O}$  in 6 g of 30% acetic acid with heat, if necessary, and dilute to 50 mL. Dissolve 30 g of  $\text{Zn}(\text{C}_2\text{H}_3\text{O}_2)_2\cdot \text{H}_2\text{O}$  in 3 g of 30% acetic acid and dilute to 50 mL. Mix the two solutions, add 50 mg of NaCl, allow to stand overnight and filter.

## STANDARD SOLUTIONS OF ACIDS, BASES, AND SALTS

For each compound listed, the last column of this table gives the mass in grams which is contained in 1 liter of a solution whose amount-of-substance concentration divided by the equivalence factor of the compound equals 0.1 mol/L. In the older literature such a solution is often referred to as a "decinormal solution" (0.1 N).

Iron oxide (ferrous)	FeO	71.8464	1	7.1846
Iron oxide (ferric)	Fe <sub>2</sub> O <sub>3</sub>	159.6922	1/2	7.9846
Lead peroxide	PbO <sub>2</sub>	239.1888	1/2	11.9594
Manganese dioxide	MnO <sub>2</sub>	86.9368	1/2	4.3468
Nitric acid	HNO <sub>3</sub>	63.0129	1/3	2.1004
Nitrogen trioxide	N <sub>2</sub> O <sub>3</sub>	76.0116	1/4	1.9002
Nitrogen pentoxide	N <sub>2</sub> O <sub>5</sub>	108.0104	1/6	1.8001
Oxalic acid	C <sub>2</sub> H <sub>2</sub> O <sub>4</sub>	90.0358	1/2	4.5018
Oxalic acid hydrate	C <sub>2</sub> H <sub>2</sub> O <sub>4</sub> · 2H <sub>2</sub> O	126.0665	1/2	6.3033
Oxygen	O	15.9994	1/2	0.8000
Potassium dichromate	K <sub>2</sub> Cr <sub>2</sub> O <sub>7</sub>	294.1918	1/6	4.9032
Potassium chlorate	KClO <sub>3</sub>	122.5532	1/6	2.0425
Potassium chromate	K <sub>2</sub> CrO <sub>4</sub>	194.1076	1/3	6.4733
Potassium ferrocyanide	K <sub>4</sub> Fe(CN) <sub>6</sub>	368.3621	1	36.8362
Potassium ferrocyanide hydrate	K <sub>4</sub> Fe(CN) <sub>6</sub> · 3H <sub>2</sub> O	422.4081	1	42.2408
Potassium iodide	KI	166.0064	1	16.6006
Potassium nitrate	KNO <sub>3</sub>	101.1069	1/3	3.3702
Potassium perchlorate	KClO <sub>4</sub>	138.5526	1/8	1.7319
Potassium permanganate	KMnO <sub>4</sub>	158.0376	1/5	3.1608
Sodium chlorate	NaClO <sub>3</sub>	106.4410	1/6	1.7740
Sodium nitrate	NaNO <sub>3</sub>	84.9947	1/3	2.8332
Sodium thiosulfate hydrate	Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> · 5H <sub>2</sub> O	248.1825	1	24.8183
Stannous chloride	SnCl <sub>2</sub>	189.5960	1/2	9.4798
Stannous oxide	SnO	134.6894	1/2	6.7345
Sulfur dioxide	SO <sub>2</sub>	64.0628	1/2	3.2031
Tin	Sn	118.69	1/2	5.935

# ORGANIC ANALYTICAL REAGENTS FOR THE DETERMINATION OF INORGANIC SUBSTANCES

**G. Ackermann, L. Sommer, and D. Thorburn Burns**

Determination	Reagents	Ref.
Aluminium	Alizarin Red S	Onishi, Part II a, p 28. (5), Snell, <i>Metals I</i> , p 587. (7)
	Aluminon	Fries/Getrost, p 16. (2), Onishi, Ila, p 21. (5), Snell, <i>Metals I</i> , p 590. (7)
	Aluminon + Cetyltrimethylammonium bromide	Huaxue Shiji, 8, 85, (1986)
	Chrome Azurol S	Onishi, Part Ila, p 26. (5), Snell, <i>Metals I</i> , p 605. (7)
	Chrome Azurol S + Cetyltrimethylammonium bromide	Marczenko, p 133. (3), Snell, <i>Metals I</i> , p 606. (7)
	Chromazol KS + Cetylpyridinium bromide	<i>Analyst</i> , 107, 428, (1982).
	Eriochrome Cyanine R	Fries/Getrost, p 19. (2), Onishi, Part Ila, p 25. (5), Snell, <i>Metals I</i> , p 611. (7)
	Eriochrome Cyanine R + Cetyltrimethylammonium bromide	Snell, <i>Metals I</i> , p 613. (7), <i>Analyst</i> , 107, 1431, (1982).
8-Hydroxyquinoline		Fries/Getrost, p 22. (2), Marczenko, p 131. (3), Onishi, Part Ila, p 31. (5), Snell, <i>Metals I</i> , p 622. (7)
		Boltz, p 210 (1), Marczenko, p 413. (3), Snell, <i>Nonmetals</i> , p 604. (9)
Ammonia	Phenol + Sodium hypochlorite	Onishi, Part Ila, p 102. (5), Snell, <i>Metals I</i> , p 384. (7)
Antimony	Brilliant Green	<i>Talanta</i> , 13, 507, (1966).
	Bromopyrogallol Red	Fries/Getrost, p 32. (2), Marczenko, p 141. (3), Onishi, Part Ila, p 93. (5), Snell, <i>Metals I</i> , p 404. (7)
Arsenic	Rhodamine B	Fries/Getrost, p 36. (2)
	Silver diethyldithiocarbamate	Fries/Getrost, p 41. (2), Marczenko, p 153. (3), Onishi, Part Ila, p 153. (5), Snell, <i>Metals I</i> , p 370. (7)
Barium	Sulfonazo III	Fries/Getrost, p 46. (2), Snell, <i>Metals II</i> , p 1782. (8), Onishi, Part Ila, p 202. (5)
		Snell, <i>Metals I</i> , p 667. (7)
Beryllium	Beryllon II	Marczenko, p 163. (3), Snell, <i>Metals I</i> , p 672. (7)
	Chrome Azurol S	Marczenko, p 164. (3), Snell, <i>Metals I</i> , p 673. (7)
	Chrome Azurol S + Cetyltrimethylammonium bromide	Snell, <i>Metals I</i> , p 675. (7), <i>Talanta</i> , 31, 249, (1984).
	Eriochrome Cyanine R	Zh. <i>Anal. Khim.</i> , 33, 1298, (1978).
	Eriochrome Cyanine R + Cetyltrimethylammonium bromide	
Bismuth	Dithizone	Onishi, Part Ila, p 262. (5), Snell, <i>Metals I</i> , p 303. (7)
	Pyrocatechol Violet	Fres. <i>Z. Anal. Chem.</i> , 186, 418, (1962).
	Pyrocatechol Violet + Cetyltrimethylammonium bromide	Zh. <i>Anal. Khim.</i> , 38, 216, (1983).
	Thiourea	Onishi, Part Ila, p 260. (5), Snell, <i>Metals I</i> , p 317. (7)
Boron	Xylenol Orange	Fries/Getrost, p 57. (2), Marczenko, p 172. (3), Snell, <i>Metals I</i> , p 320. (7)
	Azomethine H	Snell, <i>Nonmetals</i> , p 165. (9)
	Carminic acid	Boltz, p 14. (1), Fries/Getrost, p 65. (2), Snell, <i>Nonmetals</i> , p 170. (9), Williams, p 35. (11)
	Curcumin	Boltz, p 8. (1), Fries/Getrost, p 68. (2), Marczenko, p 180. (3), Snell, <i>Nonmetals</i> , p 180. (9), Fres. <i>Z. Anal. Chem.</i> , 323, 266, (1986).
	Methylene Blue	Boltz, p 21. (1), Marczenko, p 183. (3), Snell, <i>Nonmetals</i> , p 205. (9), <i>Talanta</i> , 31, 547, (1984).
Bromide	Fluorescein	Boltz, p 48. (1), Snell, <i>Nonmetals</i> , p 276., Fres. <i>Z. Anal. Chem.</i> , 301, 28 (1980).
	Phenol Red	Boltz, p 44. (1), Marczenko, p 190. (3), Snell, <i>Nonmetals</i> , p 28. (9)
Cadmium	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Marczenko, p 197. (3)
	Cadion	Onishi, Part Ila, p 323. (5)
	Dithizone	Fries/Getrost, p 78. (2), Onishi, Part Ila, p 315. (5), Snell, <i>Metals I</i> , p 279. (7), West, p 25. (10).
Calcium	4-(2-Pyridylazo)resorcinol	Fres. <i>Z. Anal. Chem.</i> , 310, 51, (1982).
	Chlorophosphonazo III	Marczenko, p 207. (3), Snell, <i>Metals II</i> , p 1744. (8)
	Glyoxal-bis(2-hydroxyanil)	Fries/Getrost, p 86. (2), Onishi, Part Ila, p 352. (5), Snell, <i>Metals I</i> , p 1762. (8)
	Murexide	Onishi, Part Ila, p 357. (5), Snell, <i>Metals II</i> , p 1769. (8)
Cerium	Phthalein Purple	<i>Anal. Chim. Acta</i> , 34, 71 (1966).
	N-benzoyl-N-phenylhydroxylamine	<i>Anal. Chim. Acta</i> , 48, 155, (1969).

Determination	Reagents	Ref.
	8-Hydroxyquinoline	Fries/Getrost, p 93. (2), Marczenko, p 220. (3), Onishi, Part IIa, p 383. (7)
Chlorine	<i>N,N</i> -Diethyl-1,4-phenylenediamine	Boltz, p 92. (1), Fries/Getrost, p 101. (2), Snell, <i>Nonmetals</i> , p 225. (9), <i>Analyst</i> , 90, 187, (1965).
Chromium	1,5-Diphenylcarbazide	Fries/Getrost, p 105. (2), Onishi, Part IIa, p 412. (5), Snell, <i>Metals I</i> , p 714. (7), West, p 12. (10)
	4-(2-Pyridylazo)resorcinol	Snell, <i>Metals I</i> , p 736. (7), West, p 17. (10)
	4-(2-Pyridylazo)resorcinol + Tetradecyldimethylbenzylammonium chloride	West, p 17. (10), <i>Anal. Chim. Acta</i> , 67, 297, (1973).
	4-(2-Pyridylazo)resorcinol + Hydrogen peroxide	Fres. <i>Z. Anal. Chem.</i> , 304, 382, (1980).
Cobalt	Nitroso-R salt	Fries/Getrost, p 118. (2), Onishi, Part IIa, p 454. (5), Snell, <i>Metals I</i> , p 953. (7)
	1-Nitroso-2-naphthol	Fries/Getrost, p 111. (2), Marczenko, p 246. (3), Snell, <i>Metals I</i> , p 947. (5)
	2-Nitroso-1-naphthol	Fries/Getrost, p 113. (2), Onishi, Part IIa, p 459. (5), Snell, <i>Metals I</i> , p 949. (7), West, p 45. (10)
	4-(2-Pyridylazo)resorcinol	Snell, <i>Metals I</i> , p 969. (7), West, p 44. (10)
	4-(2-Pyridylazo)resorcinol + Diphenylguanidine	<i>Zh. Anal. Khim.</i> , 35, 1306, (1980).
Copper	Bathocuproine	Fries/Getrost, p 135. (2), Snell, <i>Metals I</i> , p 148. (7)
	Bathocuproine disulfonic acid	Fries/Getrost, p 137. (2), West, p 52. (10)
	Dithizone	Marczenko, p 258. (3), Onishi, Part IIa, p 529. (5), Snell, <i>Metals I</i> , p 199. (7)
	Neocuproine	Snell, <i>Metals I</i> , p 217. (5), West, p 51. (10)
	Cuprizone	Onishi, Part IIa, p 534. (5), Snell, <i>Metals I</i> , p 157. (7), West, p 53. (10)
	4-(2-pyridylazo)resorcinol + Tetradecyldimethylbenzylammonium chloride	<i>Anal. Chim. Acta</i> , 138, 321, (1982).
Cyanide	Barbituric Acid + Pyridine	Fries/Getrost, p 153. (2), Snell, <i>Nonmetals</i> , p 653. (9)
	Barbituric Acid + Pyridine-4-carboxylic acid	<i>Anal. Chim. Acta</i> , 99, 197, (1978).
Fluoride	Alizarin Fluorine blue + Lanthanum(III) ion	Boltz, p 129. (1), Fries/Getrost, p 158. (2), Snell, <i>Nonmetals</i> , p 333. (9), Williams, p 354. (11)
	Eriochrome Cyanine R + Zirconium(IV) ion	Boltz, p 119. (1), Snell, <i>Nonmetals</i> , p 359. (2), Williams, p 357. (11)
Gallium	Pyrocatechol violet + Diphenylguanidine	Snell, <i>Metals I</i> , p 500. (7)
	8-Hydroxyquinoline	Onishi Pt IIa, p 582. (5), Snell, <i>Metals I</i> , p 505. (7)
	1-(2-Pyridylazo)-2-naphthol	Snell, <i>Metals I</i> , p 512. (7)
	4-(2-Pyridylazo)resorcinol	Snell, <i>Metals I</i> , p 513. (7)
	Rhodamine B	Marczenko, p 284. (3), Onishi, Part IIa, p 578. (5), Snell, <i>Metals I</i> , p 515. (7)
	Xylenol Orange	Fries/Getrost, p 166. (2), Snell, <i>Metals I</i> , p 523. (7)
	Xylenol Orange + 8-Hydroxyquinoline	<i>Zh. Anal. Khim.</i> , 26, 75, (1971).
Germanium	Brilliant Green + Molybdate	Snell, <i>Metals I</i> , p 562. (7)
	Phenylfluorone	Fries/Getrost, p 168. (2), Marczenko, p 292. (3), Onishi, Part IIa, p 607. (5), Snell, <i>Metals I</i> , p 570. (7)
Gold	5-(4-Diethylaminobenzylidene) rhodanine	Fries/Getrost, p 173. (2), Onishi, Part IIa, p 631. (5), Snell, <i>Metals II</i> , p 1516. (8)
	Rhodamine B	Fries/Getrost, p 175. (2), Marczenko, p 301. (3), Onishi, Part IIa, p 637. (5), Snell, <i>Metals II</i> , p 513. (8)
Hafnium	Arsenazo III	Snell, <i>Metals II</i> , p 1184. (8), <i>Talanta</i> , 19, 807, (1972).
Indium	Bromopyrogallol Red	Snell, <i>Metals I</i> , p 469. (7)
	Chrome Azurol S	Snell, <i>Metals I</i> , p 474. (7)
	Chrome Azurol S + Cetyltrimethylammonium bromide	<i>Anal. Chim. Acta</i> , 67, 107, (1973).
	Dithizone	Fries/Getrost, p 179. (2), Onishi, Part IIa, p 672. (5), Snell, <i>Metals I</i> , p 474. (7)
	8-Hydroxyquinoline	Onishi, Part IIa, p 670. (5), Snell, <i>Metals I</i> , p 475. (7)
	1-(2-Pyridylazo)-2-naphthol	Snell, <i>Metals I</i> , p 480. (7)
	4-(2-Pyridylazo)resorcinol	Marczenko, p 309. (3), Snell, <i>Metals I</i> , p 480. (7)
Iodide	Neocuproine + Copper(II)	<i>Anal. Chim. Acta</i> , 69, 321, (1974).
Iodine	Starch	Boltz, p 162. (1), Marczenko, p 316. (3), Snell, <i>Nonmetals</i> , p 307. (9)
Iridium	Rhodamine 6G + Tin(II)	Marczenko, p 323. (3)
	<i>N,N</i> -Dimethyl-4-nitrosoaniline	<i>Anal. Chem.</i> , 27, 1776, (1955).
Iron	Bathophenanthroline	Fries/Getrost, p 189. (2), Onishi, Part IIa, p 729. (5), Snell, <i>Metals I</i> , p 763. (7)
	Bathophenanthroline disulfonic acid	Fries/Getrost, p 191. (2), Snell, <i>Metals I</i> , p 772. (7)

Determination	Reagents	Ref.
	2,2'-Bipyridyl	Snell, <i>Metals I</i> , p 750. (7)
	Chrome Azurol S + Cetyltrimethylammonium bromide	Snell, <i>Metals I</i> , p 757. (7), <i>Coll. Czech. Chem. Comm.</i> , 45, 2656, (1980).
	1,10-Phenanthroline	Fries/Getrost, p 199. (2), Marczenko, p 331. (3), Onishi, Part IIa, p 725. (5), Snell, <i>Metals I</i> , p 795. (7)
	1,10-Phenanthroline + Bromothymol Blue	<i>Zh. Anal. Khim.</i> , 25, 1348, (1970).
	Ferrozine	Onishi, Part IIa, p 730. (5), Snell, <i>Metals I</i> , p 783. (7)
Lanthanum	Arsenazo III	Marczenko, p 468. (3), Snell, <i>Metals II</i> , p 1910. (8)
Lead	Dithizone	Fries/Getrost, p 207. (2), Onishi, Part IIa, p 824. (5), Snell, <i>Metals I</i> , p 2. (7), West, p 34. (10)
	Sodium diethyldithiocarbamate	Fries/Getrost, p 214. (2), Snell, <i>Metals I</i> , p 27. (7)
	4-(2-Pyridylazo)resorcinol	Fries/Getrost, p 220. (2), Marczenko, p 347. (3), Snell, <i>Metals I</i> , p 34. (7)
Lithium	Thoron	Onishi, Part IIa, p 863. (5), Snell, <i>Metals II</i> , p 1726. (8), <i>Talanta</i> , 30, 587, (1983).
Magnesium	Eriochrome Black T	Fries/Getrost, p 226. (2), Marczenko, p 355. (3), Onishi, Part IIb, p 13. (6), Snell, <i>Metals II</i> , p 1932. (8)
	8-Hydroxyquinoline	Onishi, Part IIb, p 11. (6), Snell, <i>Metals II</i> , p 1938. (8)
	8-Hydroxyquinoline + Butylamine	Fries/Getrost, p 228. (2), Snell, <i>Metals II</i> , p 1938. (8)
	Titan Yellow	Fries/Getrost, p 234. (2), Marczenko, p 352. (3), Snell, <i>Metals II</i> , p 1945. (8)
	Xylidyl Blue	Fries/Getrost, p 231. (2), Onishi, Part IIb, p 14. (6), Snell, <i>Metals II</i> , p 1950. (8)
Manganese	Formaldehyde	Fries/Getrost, p 236. (2), Marczenko, p 364. (3), Onishi Part IIb, p 38. (6), Snell, <i>Metals II</i> , 1010. (8)
Mercury	Dithizone	Fries/Getrost, p 243. (2), Marczenko, p 373. (3), Onishi, Part IIb, p 66. (6), Snell, <i>Metals I</i> , p 107. (7), West, p 29. (10)
	Michler's thioiketone	Marczenko, p 375. (3), Snell, <i>Metals I</i> , p 126. (7)
	Xylenol Orange	<i>Talanta</i> , 16, 1023, (1969)
Molybdenum	Bromopyrogallol Red + Cetylpyridium chloride	West, p 58. (10)
	Phenylfluorone	Snell, <i>Metals II</i> , p 1311. (8), <i>Microchem. J.</i> , 31, 56, (1985).
	Toluene-3,4-dithiol	Fries/Getrost, p 251. (2), Marczenko, p 384. (3), Onishi, Part IIb, p 96. (6), Snell, <i>Metals II</i> , p 1301. (8)
Nickel	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Marczenko, p 397. (3), <i>Talanta</i> 28, 189, (1981).
	Dimethylglyoxime	Fries/Getrost, p 263. (2), Marczenko, p 393. (3), Onishi, Part IIb, p 125. (6), Snell, <i>Metals I</i> , p 887. (7)
	Dimethylglyoxime + Oxidant	Fries/Getrost, p 263. (2), Onishi, Part IIb, p 125. (6), Snell, <i>Metals I</i> , p 887. (7)
	2,2'-Furildioxime	Marczenko, p 396. (3), Snell, <i>Metals I</i> , p 904. (7)
	2-(2-Pyridylazo)-2-naphthol	Snell, <i>Metals I</i> , p 910. (7)
	4-(2-Pyridylazo)resorcinol	Snell, <i>Metals I</i> , p 911. (7), West, p 39. (10), <i>Anal. Chim. Acta</i> , 82, 431, (1976).
Niobium	<i>N</i> -Benzoyl- <i>N</i> -phenylhydroxylamine	Snell, <i>Metals II</i> , p 1425. (8)
	Pyrocatechol + EDTA or 2,2'-Bipyridyl or 1-(2-thenoyl)-3,3,3-trifluoroacetone	Snell, <i>Metals II</i> , p 1427. (8)
	Bromopyrogallol red	Marczenko, p 407. (3), Snell, <i>Metals II</i> , p 1426. (8)
	Bromopyrogallol red + Cetylpyridinium chloride	<i>Talanta</i> , 32, 189, (1985).
	4-(2-Pyridylazo)resorcinol	Fries/Getrost, p 274. (2), Marczenko, p 406. (3), Onishi, Part IIb, p 160. (7), Snell, <i>Metals II</i> , p 1447. (8)
	Sulfochlorophenol S	Onishi, Part IIb, p 161. (7), Snell, <i>Metals II</i> , p 1430. (8)
	Xylenol Orange	Onishi, Part IIb, p 164. (7)
Nitrate	Brucine	Boltz, p 227. (1), Fries/Getrost, p 280. (2), Snell, <i>Nonmetals</i> , p 546. (9)
	Chromotropic acid	Boltz, p 229. (1), Fries/Getrost, p 281. (2), Snell, <i>Nonmetals</i> , p 548. (9), Williams, p 132. (11), <i>Fres. Z. Anal. Chem.</i> , 320, 490, (1985).
	Sulfanilamide + <i>N</i> -(1-Naphthyl)ethylenediamine dihydrochloride	Fries/Getrost, p 279. (2), Snell, <i>Nonmetals</i> , p 559. (9)
Nitrite	Sulfanilamide + <i>N</i> -(1-Naphthyl)ethylenediamine dihydrochlorine	Boltz, p 241. (1), Snell, <i>Nonmetals</i> , p 585. (8), <i>Analyst</i> , 109, 1281, (1984).
	Sulfanilic acid + 1-Naphthylamine	Boltz, p 237. (1), Fries/Getrost, p 285. (2), Marczenko, p 419. (3), Snell, <i>Nonmetals</i> , p 586. (9)
Osmium	1,5-Diphenylcarbazine	Marczenko, p 428. (3)
Palladium	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	<i>Talanta</i> , 33, 939, (1986).

Determination	Reagents	Ref.
	Dithizone	Marczenko, p 440. (3), Onishi, Part IIB, p 227. (6), Snell, <i>Metals II</i> , p 1577. (8)
	2-Nitroso-1-naphthol	Fries/Getrost, p 294. (2), Onishi, Part IIB, p 226. (6), Snell, <i>Metals II</i> , p 1581. (8)
Phosphate	4-(2-Pyridylazo)resorcinol	Snell, <i>Metals II</i> , p 1583. (8) <i>Analyst</i> , 107, 708, (1982).
	Rhodamine B + Molybdate	Snell, <i>Nonmetals</i> , p 103. (9)
	Malachite Green + Molybdate	Snell, <i>Nonmetals</i> , p 12. (9), <i>Analyst</i> , 108, 361, (1983).
Platinum	Sulfochlorophenolazorhodamine	Onishi, Part IIB, p 253. (6), <i>Talanta</i> , 34, 87, (1987).
	Dithizone	Fries/Getrost, p 300. (2), Onishi, Part IIB, p 253. (6), Snell, <i>Metals II</i> , p 1534. (8)
Rare Earths	2-Mercaptobenzothiazole	Fries/Getrost, p 302. (2), <i>Zh. Anal. Khim.</i> , 24, 1172, (1969).
	Arsenazo I	Marczenko, p 470. (3), Onishi, Part IIA, p 785. (5), Snell, <i>Metals II</i> , p 1857. (8)
	Arsenazo III	Fries/Getrost, p 309. (2), Marczenko, p 468. (3), Onishi, Part IIA, p 786. (5), Snell, <i>Metals II</i> , p 1862. (8)
	Xylenol Orange	Onishi, Part IIA, p 787. (5), Snell, <i>Metals II</i> , p 1874. (8)
Rhenium	2,2'-Furildioxime	Fries/Getrost, p 310. (2), Marczenko, p 481. (3), Onishi, Part IIB, p 288. (6), Snell, <i>Metals II</i> , p 1659. (8)
Rhodium	1-(2-Pyridylazo)-2-naphthol	Fries/Getrost, p 311. (2), Snell, <i>Metals II</i> , p 1553. (8)
Ruthenium	1,10-Phenanthroline	Onishi, Part IIB, p 331. (6), Snell, <i>Metals II</i> , p 1623. (8)
	Thiourea	Fries/Getrost, p 318. (2), Onishi, Part IIB, 329. (6), Snell, <i>Metals II</i> , p 1626. (8)
Scandium	1,4-Diphenylthiosemicarbazide	Marczenko, p 493. (3), Onishi, Part IIB, p 330. (8)
	Alizarin red S	Fries/Getrost, p 319. (2), Onishi, Part IIB, p 360. (6), Snell, <i>Metals I</i> , p 536. (7)

# ACID-BASE INDICATORS

A. K. Covington

The first part of this table lists some common acid-base indicators in alphabetical order along with the approximate pH range(s) at which a color change occurs. Following this is a table of the same indicators ordered by pH range, which includes the nature of the color change, instructions on preparation of the indicator solution, and the acid dissociation constant  $pK$ , when available.

The color code is:

C = colorless      A = amber      B/G = blue-green  
 Pk = pink          Y = yellow      V = violet  
 R = red            B = blue        P = purple  
 O = orange

Indicator	pH Range	Indicator	pH Range
Alizarin	5.6-7.2; 11.0-12.4	Ethyl bis(2,4-dimethylphenyl)ethanoate	8.4-9.6
Alizarin Red S	4.6-6.0	Ethyl Orange	3.4-4.8
Alizarin Yellow R	10.1-12.0	Ethyl Red	4.0-5.8
Benzopurpurine 4B	2.2-4.2	Ethyl Violet	0.0-2.4
4,4'-Bis(2-amino-1-naphthylazo)-2,2'-stilbenedisulfonic acid	3.0-4.0	5,5'-Indigodisulfonic acid, disodium salt	11.4-13.0
4,4'-Bis(4-amino-1-naphthylazo)-2,2'-stilbenedisulfonic acid	8.0-9.0	Malachite Green	0.2-1.8
Brilliant Yellow	6.6-7.8	Metacresol Purple	1.2-2.8; 7.4-9.0
Bromocresol Green	3.8-5.4	Metanil Yellow	1.2-2.4
Bromocresol Purple	5.2-6.8	Methyl Green	0.2-1.8
Bromophenol Blue	3.0-4.6	Methyl Orange	3.2-4.4
Bromothymol Blue	6.0-7.6	Methyl Red	4.8-6.0
Chlorophenol Red	5.2-6.8	Methyl Violet	0.0-1.6
Clayton Yellow	12.2-13.2	<i>p</i> -Naphtholbenzein	8.2-10.0
Congo Red	3.0-5.0	Neutral Red	6.8-8.0
<i>o</i> -Cresolphthalein	8.2-9.8	<i>p</i> -Nitrophenol	5.4-6.6
Cresol Red	0.0-1.0; 7.0-8.8	<i>m</i> -Nitrophenol	6.8-8.6
Crystal Violet	0.0-1.8	Orange IV	1.4-2.8
Curcumin (Turmeric)	7.4-8.6	Paramethyl Red	1.0-3.0
<i>p</i> -(2,4-Dihydroxyphenylazo) benzenesulfonic acid, sodium salt	11.4-12.6	Phenolphthalein	8.2-10.0
<i>p</i> -Dimethylaminoazobenzene	2.8-4.4	Phenol Red	6.6-8.0
4-(4-Dimethylamino-1-naphylazo)-3-methoxybenzenesulfonic acid	3.5-4.8	4-Phenylazodiphenylamine	1.2-2.6
2-( <i>p</i> -Dimethylamino-phenylazo)pyridine	0.2-1.8; 4.4-5.6	4-Phenylazo-1-naphthylamine	4.0-5.6
<i>N,N</i> -Dimethyl- <i>p</i> -( <i>m</i> -tolylazo)aniline	2.6-4.8	Propyl Red	4.8-6.6
2,4-Dinitrophenol	2.0-4.7	Quinaldine Red	1.4-3.2
2-(2,4-Dinitrophenylazo)-1-naphthol-3,6-disulfonic acid, disodium salt	6.0-7.0	Resazurin	3.8-6.4
6,8-Dinitro-2,4-(1 <i>H</i> )quinazolinone	6.4-8.0	Resorcin Blue	4.4-6.2
Erythrosin, disodium salt	2.2-3.6	Tetrabromophenolphthalein ethyl ester, potassium salt	3.0-4.2
4-( <i>p</i> -Ethoxyphenylazo)- <i>m</i> -phenylene-diamine monohydrochloride	4.4-5.8	Thymol Blue	1.2-2.8; 8.0-9.6
		Thymolphthalein	9.4-10.6
		4- <i>o</i> -Tolylazo- <i>o</i> -toluidine	1.4-2.8
		1,3,5-Trinitrobenzene	12.0-14.0
		2,4,6-Trinitrotoluene	11.5-13.0
		Turmeric	7.4-8.6

pH range	Color change	Indicator	pK	Preparation
0.0-1.0	R-Y	Cresol Red		0.1 g in 26.2 mL 0.01 M NaOH + 223.8 mL water
0.0-1.6	Y-B	Methyl Violet		0.01-0.05% in water
0.0-1.8	Y-B	Crystal Violet		0.02% in water
0.0-2.4	Y-B	Ethyl Violet		0.1 g in 50 mL 50% v/v methanol-water
0.2-1.8	Y-B/G	Malachite Green	1.3	water
0.2-1.8	Y-B	Methyl Green		0.1% in water
0.2-1.8	Y-R	2-( <i>p</i> -Dimethylaminophenylazo)pyridine		0.1% in ethanol
1.0-3.0	R-Y	Paramethyl Red		ethanol
1.2-2.4	R-Y	Metanil Yellow		0.01% in water
1.2-2.6	R-Y	4-Phenylazodiphenylamine		0.01 g in 1 mL 1 M HCl + 50 mL ethanol + 49 mL water
1.2-2.8	R-Y	Thymol Blue	1.65	0.1 g in 21.5 mL 0.01 M NaOH + 228.5 mL water
1.2-2.8	R-Y	Metacresol Purple	1.51	0.1 g in 26.2 mL 0.01 M NaOH + 223.8 mL water
1.4-2.8	R-Y	Orange IV		0.01% in water
1.4-2.8	O-Y	4- <i>o</i> -Tolylazo- <i>o</i> -toluidine		water
1.4-3.2	C-R	Quinaldine Red	2.63	1% in ethanol
2.0-4.7	C-Y	2,4-Dinitrophenol	3.96	sat. solution in water
2.2-3.6	O-R	Erythrosin, disodium salt		0.1% in water
2.2-4.2	V-R	Benzopurpurine 4B		0.1% in water
2.6-4.8	R-Y	<i>N,N</i> -Dimethyl- <i>p</i> -( <i>m</i> -tolylazo)aniline		0.1% in water
2.8-4.4	R-Y	<i>p</i> -Dimethylaminoazobenzene		0.1 g in 100 mL 90% v/v ethanol-water
3.0-4.0	P-R	4,4'-Bis(2-amino-1-naphthylazo)-2,2'-stilbenedisulfonic acid		0.1 g in 5.9 mL 0.05 M NaOH + 94.1 mL water
3.0-4.2	Y-B	Tetrabromophenolphthalein ethyl ester, potassium salt		0.1% in ethanol
3.0-4.6	Y-B	Bromophenol Blue	4.10	0.1 g in 14.9 mL 0.01 M NaOH + 235.1 mL water
3.0-5.0	B-R	Congo Red		0.1% in water
3.2-4.4	R-Y	Methyl Orange	3.46	0.1% in water
3.4-4.8	R-Y	Ethyl Orange	4.34	0.05-0.2% in water or aqueous ethanol
3.5-4.8	V-Y	4-(4-Dimethylamino-1-naphthylazo)-3-methoxybenzenesulfonic acid		0.1% in 60% ethanol-water
3.8-5.4	Y-B	Bromocresol Green	4.90	0.1 g in 14.3 mL 0.01 M NaOH + 235.7 mL water
3.8-6.4	O-V	Resazurin		water
4.0-5.6	R-Y	4-Phenylazo-1-naphthylamine		0.1% in ethanol
4.0-5.8	C-R	Ethyl Red	5.42	0.1 g in 100 mL 50% v/v methanol-water 0.1% in ethanol
4.4-5.6	R-Y	2-( <i>p</i> -Dimethylaminophenylazo)pyridine		0.1% in ethanol
4.4-5.8	O-Y	4-( <i>p</i> -Ethoxyphenylazo)- <i>m</i> -phenylenediamine monohydrochloride		0.1% in water
4.4-6.2	R-B	Resorcin Blue		0.2% in ethanol
4.6-6.0	Y-R	Alizarin Red S		water
4.8-6.0	R-Y	Methyl Red	5.00	0.02 g in 100 mL 60% v/v ethanol-water
4.8-6.6	R-Y	Propyl Red	5.48	ethanol
5.2-6.8	Y-P	Bromocresol Purple	6.40	0.1 g in 18.5 mL 0.01 M NaOH + 231.5 mL water
5.2-6.8	Y-R	Chlorophenol Red	6.25	0.1 g in 23.6 mL 0.01 M NaOH + 226.4 mL water
5.4-6.6	C-Y	<i>p</i> -Nitrophenol	7.15	0.1% in water
5.6-7.2	Y-R	Alizarin		0.1% in methanol
6.0-7.0	Y-B	2-(2,4-Dinitrophenylazo)-1-naphthol-3,6-disulfonic acid, disodium salt		0.1% in water
6.0-7.6	Y-B	Bromothymol Blue	7.30	0.1 g in 16 mL 0.01 M NaOH + 234 mL water
6.4-8.0	C-Y	6,8-Dinitro-2,4-(1 <i>H</i> )quinazolinone		25 g in 115 mL 1 M NaOH + 50 mL water at 100°C
6.6-7.8	Y-R	Brilliant Yellow		1% in water
6.6-8.0	Y-R	Phenol Red	8.00	0.1 g in 28.2 mL 0.01 M NaOH + 221.8 mL water
6.8-8.0	R-A	Neutral Red		0.01 g in 100 mL 50% v/v ethanol-water
6.8-8.6	C-Y	<i>m</i> -Nitrophenol	8.28	0.3% in water
7.0-8.8	Y-R	Cresol Red	8.46	0.1 g in 26.2 mL 0.01 M NaOH + 223.8 mL water
7.4-8.6	Y-R	Turmaric (Curcumin)		ethanol
7.4-9.0	Y-P	Metacresol Purple	8.3	0.1 g in 26.2 mL 0.01 M NaOH + 223.8 mL water
8.0-9.0	B-R	4,4'-Bis(4-amino-1-naphthylazo)-2,2'-stilbenedisulfonic acid		0.1 g in 5.9 mL 0.05 M NaOH + 94.1 mL water
8.0-9.6	Y-B	Thymol Blue	9.20	0.1 g in 21.5 mL 0.01 M NaOH + 228.5 mL water
8.2-10.0	O-B	<i>p</i> -Naphtholbenzein		1% in dil. alkali

pH range	Color change	Indicator	p <i>K</i>	Preparation
8.2-10.0	C-Pk	Phenolphthalein	9.5	0.5 g in 100 mL 50% v/v ethanol-water
8.2-9.8	C-R	<i>o</i> -Cresolphthalein		0.04% in ethanol
8.4-9.6	C-B	Ethyl bis(2,4-dimethylphenyl)ethanoate		sat. solution in 50% acetone-ethanol
9.4-10.6	C-B	Thymolphthalein		0.04 g in 100 mL 50% v/v ethanol-water
10.1-12.0	Y-R	Alizarin Yellow R		0.01% in water
11.0-12.4	R-P	Alizarin		0.1% in methanol
11.4-12.6	Y-O	<i>p</i> -(2,4-Dihydroxyphenylazo) benzenesulfonic acid, sodium salt		0.1% in water
11.4-13.0	B-Y	5,5'-Indigodisulfonic acid, disodium salt		water
11.5-13.0	C-O	2,4,6-Trinitrotoluene		0.1-0.5% in ethanol
12.0-14.0	C-O	1,3,5-Trinitrobenzene		0.1-0.5% in ethanol
12.2-13.2	Y-A	Clayton Yellow		0.1% in water

# FLUORESCENT INDICATORS

Jack DeMent

Fluorescent indicators are substances that show definite changes in fluorescence with change in pH. Some fluorescent materials are not suitable for indicators since their change in fluorescence is too gradual. Fluorescent indicators find greatest utility in the titration of opaque, highly turbid or deeply colored solutions. A long wavelength ultraviolet ("black light") lamp in a dimly lighted room provides the best environment for titrations involving fluorescent indicators, although bright daylight is sometimes sufficient to evoke a response in the bright green, yellow and orange fluores-

cent indicators. Titrations are carried out in non-fluorescent glassware. One should check the glassware prior to use to make certain that it does not fluoresce due to the wavelengths of light involved in the titration. The meniscus of the liquid in the burette can be followed when a few particles of an insoluble fluorescent solid are dropped onto its surface.

In this table the indicators are arranged by approximate pH range covered. In the case of some of the dyestuffs the end point may vary slightly with the source or manufacturer.

Indicator	C.I.	pH 0 to 2	
		From pH	To pH
Benzoflavine	—	0.3, yellow fl.	1.7, green fl.
3,6-Dioxypthalimide	—	0, blue fl.	2.4, green fl.
Eosine YS	768	0,yellow colored	3.0, yellow fl.
Erythrosine	772	0, yellow colored	3.6, yellow fl.
Esculin	—	1.5, colorless	2, blue fl.
4-Ethoxyacridone	—	1.2, green fl.	3.2, blue fl.
3,6-Tetramethyldiaminooxanthone	—	1.2, green fl.	3.4, blue fl.
<b>pH 2 to 4</b>			
Chromotropic acid	—	3.5, colorless	4.5, blue fl
Fluorescein	766	4, colorless	4.5, green fl.
Magdala Red	—	3.0, purple colored	4.0, fl
$\alpha$ -Naphthylamine	—	3.4, colorless	4.8, blue fl.
$\beta$ -Naphthylamine	—	2.8, colorless	4.4, violet fl.
Phloxine	774	3.4, colorless	5.0, bright yellow fl.
Salicylic acid	—	2.5, colorless	3.5, blue fl.
<b>pH 4 to 6</b>			
Acridine	788	4.9, green fl.	5.1, violet colored
Dichlorofluorescein	—	4.0, colorless	5.0, green fl.
3,6-Dioxyxanthone	—	5.4, colorless	7.6, blue-violet fl.
Erythrosine	772	4.0, colorless	4.5, yellow-green fl.
$\beta$ -Methylesculetin	—	4.0, colorless	6.2, blue fl
Neville-Winther acid	—	6.0, colorless	6.5, blue fl.
Resorufin	—	4.4, yellow fl	6.4, weak orange fl.
Quininic acid	—	4.4, yellow colored	5.0, blue fl.
Quinine [first end point]	—	5.0, blue fl.	6.1, violet fl.
<b>pH 6 to 8</b>			
(claimed for range pH 6.0–7.0)			
Acid R Phosphine	—	6.5, colorless	7.5, violet, fl.
Brilliant Diazol Yellow	—	6.5, colorless	7.5, green fl.
Cleves acid	—	6.5, colorless	9.0, green fl.
Coumaric acid	—	7.2, colorless	8.2, green fl.
3,6-Dioxypthalic dinitrile	—	5.8, blue fl.	7.5, golden fl.
Magnesium 8-hydroxyquinolate	—	6.5, colorless	7.5, blue fl.
$\beta$ -Methylumbelliferone	—	7.0, colorless	6.5, blue fl.
1-Naphthol-4-sulfonic acid	—	6.0, colorless	8.0, green fl.
Orcinaurine	—	6.5, colorless	(for the range pH 6.0–7.0, green-yellow fl.)
Patent Phosphine	789		(for the region pH 6.5–7.0, yellow fl.)
Thioflavine	816		
Umbelliferone	—	6.5, colorless	7.6, blue fl.
<b>pH 8 to 10</b>			
Acridine Orange	788	8.4, orange colored	10.4, green fl.
Ethoxyphenylnaphthostilbazonium chloride	—	9, green fl.	11, non-fl.

G Salt	—	9.0, dull blue fl.	9.5, bright blue fl.
Naphthazol derivatives	—	8.2, colorless	10.0, yellow or green fl.
α-Naphthionic acid	—	9, blue fl.	11, green fl.
2-Naphthol-3,6-disulfonic acid	—	9.5, dark blue fl	Light blue fl. at higher pH
β-Naphthol	—	8.6, colorless	Blue fl. at higher pH
α-Naphtholsulfonic acid	—	8.0, dark blue fl.	9.0, bright violet fl.
1,4-Naphtholsulfonic acid	—	8.2, dark blue fl.	Light blue fl. at higher pH
Orcinsulfonphthalein	—	8.6, yellow colored	10.0 fl.
Quinine [second end point]	—	9.5, violet fl.	10.0, colorless
R-Salt	—	9.0, dull blue fl.	9.5, bright blue fl.
Sodium 1-naphthol-2-sulfonate	—	9.0, dark blue fl.	10.0, bright violet fl.
<b>pH 10 to 12</b>			
Courmarin	—	9.8, deep green fl.	12, light green fl.
Eosine BN	771	10.5, colorless	14.0, yellow fl.
Papaverine (permanganate oxidized)	—	9.5, yellow fl.	11.0, blue fl.
Schaffers Salt	—	5.0, violet fl.	11.0, green-blue fl.
SS-Acid (sodium salt)	—	10.0, violet fl.	12.0, yellow-colored
<b>pH 12 to 14</b>			
Cotarnine	—	12.0, yellow fl.	13.0, white fl.
α-Naphthionic acid	—	12, blue fl.	13, green fl.
β-Naphthionic acid	—	12, blue fl.	13, violet fl.

## CONVERSION FORMULAS FOR CONCENTRATION OF SOLUTIONS

*A* = Weight percent of solute  
*B* = Molecular weight of solvent  
*E* = Molecular weight of solute  
*F* = Grams of solute per liter of solution

*G* = Molality  
*M* = Molarity  
*N* = Mole fraction  
*R* = Density of solution in grams per milliliter

Concentration of solute—SOUGHT	Concentration of solute—GIVEN				
	<i>A</i>	<i>N</i>	<i>G</i>	<i>M</i>	<i>F</i>
<i>A</i>	—	$\frac{100N \times E}{N \times E + (1 - N)B}$	$\frac{100G \times E}{1000 + G \times E}$	$\frac{M \times E}{10R}$	$\frac{F}{10R}$
<i>N</i>	$\frac{\frac{A}{E}}{\frac{A}{E} + \frac{100 - A}{B}}$	—	$\frac{B \times G}{B \times G + 1000}$	$\frac{B \times M}{M(B - E) + 1000R}$	$\frac{B \times F}{F(B - E) + 1000R \times E}$

# ELECTROCHEMICAL SERIES

Petr Vanýsek

There are three tables for this electrochemical series. Each table lists standard reduction potentials,  $E^\circ$  values, at 298.15 K (25 °C), and at a pressure of 101.325 kPa (1 atm). Table 1 is an alphabetical listing of the elements, according to the symbol of the elements. Thus, data for silver (Ag) precede those for aluminum (Al). Table 2 lists only those reduction reactions that have  $E^\circ$  values positive in respect to the standard hydrogen electrode. In Table 2, the reactions are listed in the order of increasing positive potential, and they range from 0.0000 V to + 3.4 V. Table 3 lists only those reduction potentials which have  $E^\circ$  negative with respect to the standard hydrogen electrode. In Table 3, the reactions are listed in the order of decreasing potential and range from 0.0000 V to -4.10 V. The reliability of the potentials is not the same for all the data. Typically, the values with fewer significant figures have lower

reliability. The values of reduction potentials, in particular those of less common reactions, are not definite; they are subject to occasional revisions.

*Abbreviations:* ac = acetate; bipy = 2,2'-dipyridine, or bipyridine; en = ethylenediamine; phen = 1,10-phenanthroline.

# REDUCTION AND OXIDATION POTENTIALS FOR CERTAIN ION RADICALS

Petr Vanýsek

There are two tables for ion radicals. The first table lists reduction potentials for organic compounds which produce anion radicals during reduction, a process described as  $A + e^- \rightleftharpoons A^-$ . The second table lists oxidation potentials for organic compounds which produce cation radicals during oxidation, a process described as  $A \rightleftharpoons A^+ + e^-$ . To obtain reduction potential for a reverse reaction, the sign for the potential is changed.

Unlike the table of the Electrochemical Series, which lists *standard* potentials, values for radicals are experimental values with experimental conditions given in the second column. Since the measurements leading to potentials for ion radicals are very dependent on conditions, an attempt to report standard potentials for radicals would serve no useful purpose. For the same reason, the potentials are also reported as experimental values, usually a half-wave potential ( $E_{1/2}$  in polarography) or a peak potential ( $E_p$  in cyclic voltammetry). Unless otherwise stated, the values are reported vs. SCE (saturated calomel electrode). To obtain a value vs.

normal hydrogen electrode, 0.241 V has to be added to the SCE values. All the ion radicals chosen for inclusion in the tables result from electrochemically reversible reactions. More detailed data on ion radicals can be found in the *Encyclopedia of Electrochemistry of Elements*, (A. J. Bard, Ed.), Vol. XI and XII in particular, Marcel Dekker, New York, 1978.

Abbreviations are: CV — cyclic voltammetry; DMF — *N,N*-Dimethylformamide; *E* swp — potential sweep;  $E^\circ$  — standard potential;  $E_p$  — peak potential;  $E_{p/2}$  — half-peak potential;  $E_{1/2}$  — half wave potential; *M* — mol/L; MeCN — acetonitrile; pol — polarography; rot Pt disk — rotated Pt disk; SCE — saturated calomel electrode; TBABF<sub>4</sub> — tetrabutylammonium tetrafluoroborate; TBAl — tetrabutylammonium iodide; TBAP — tetrabutylammonium perchlorate; TEABr — tetraethylammonium bromide; TEAP — tetraethylammonium perchlorate; THF — tetrahydrofuran; TPACF<sub>3</sub>SO<sub>3</sub> — tetrapropylammonium trifluoromethanesulfite; TPAP — tetrapropylammonium perchlorate; and wr — wire.

## Reduction Potentials (Products are Anion Radicals)

Substance	Conditions/electrode/technique	Potential V (vs. SCE)
Acetone	DMF, 0.1 M TEABr/Hg/pol	$E_{1/2} = -2.84$
1-Naphthylphenylacetylene	DMF, 0.03 M TBAl/Hg/pol	$E_{1/2} = -1.91$
1-Naphthalenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -0.91$
2-Naphthalenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -0.96$
2-Phenanthrenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -1.00$
3-Phenanthrenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -0.94$
9-Phenanthrenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -0.83$
1-Anthracenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -0.75$
1-Pyrenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -0.76$
2-Pyrenecarboxaldehyde	-/Hg/pol	$E_{1/2} = -1.00$
Anthracene	DMF, 0.1 M TBAP/Pt disk/CV	$E_p = -2.00$
	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.93$
	MeCN, 0.1 M TEAP/Hg/CV	$E_{1/2} = -2.07$
	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.92$
9,10-Dimethylantracene	DMF, 0.1 M TBAP/Pt/CV	$E_p = -2.08$
	MeCN, 0.1 M TBAP/Pt/CV	$E_p = -2.10$
1-Phenylantracene	DMF, 0.5 M TBABF <sub>2</sub> /Hg/CV	$E_{1/2} = -1.91$
	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.878$
2-Phenylantracene	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.875$
8-Phenylantracene	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.91$
9-Phenylantracene	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.93$
	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.863$
1,8-Diphenylantracene	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.88$
1,9-Diphenylantracene	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.846$
1,10-Diphenylantracene	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.786$
8,9-Diphenylantracene	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.90$
9,10-Diphenylantracene	MeCN, 0.1 M TBAP/rot Pt/E swp	$E_{1/2} = -1.83$
	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.835$
1,8,9-Triphenylantracene	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.85$
1,8,10-Triphenylantracene	DMF, 0.5 M TBABF <sub>4</sub> /Hg/CV	$E_{1/2} = -1.81$
9,10-Dibiphenylantracene	MeCN, 0.1 M TBAP/rot Pt/E swp	$E_{1/2} = -1.94$
Benz(a)anthracene	MeCN, 0.1 M TEAP/Hg/CV	$E_{1/2} = -2.11$
	MeCN, 0.1 M TEAP/Hg/pol	$E_{1/2} = -2.40^a$
Azulene	DMF, 0.1 M TBAl/Hg/pol	$E_{1/2} = -1.10^c$
Annulene	DMF, 0.5 M TBAP 0°C/Hg/pol	$E_{1/2} = -1.23$
Benzaldehyde	DMF, 0.1 M TBAP/Hg/pol	$E_{1/2} = -1.67$
Benzil	DMSO, 0.1 M TBAP/Hg/pol	$E_{1/2} = -1.04$
Benzophenone	-/Hg/pol	$E_{1/2} = -1.80$
	DMF/Pt disk/CV	$E^\circ = -1.72$
Chrysene	MeCN, 0.1 M TEAP/Hg/pol	$E_{1/2} = -2.73^a$
Fluoranthrene	DMF, 0.1 M TBAP/Pt disk/CV	$E_p = -1.76$
Cyclohexanone	DMF, 0.1 M TEABr/Hg/pol	$E_{1/2} = -2.79$

Substance	Conditions/electrode/technique	Potential V (vs. SCE)
5,5-Dimethyl-3-phenyl-2-cyclohexen-1-one	DMF, 0.5 M/Hg/pol	$E_{1/2} = -1.71$
1,2,3-Indanetrione hydrate (ninhydrin)	DMF, 0.2 M NaNO <sub>3</sub> /Hg/pol	$E_{1/2} = -0.039$

# pH SCALE FOR AQUEOUS SOLUTIONS

A.K. Covington

A Working Party of IUPAC, after extensive considerations over five years, has recently produced a report (1) which sets pH firmly within the International System of Units (SI). A summary of these important developments is given below.

The concept of pH is unique amongst the commonly encountered physicochemical quantities in that, in terms of its definition,

$$\text{pH} = -\lg a_{\text{H}} \quad (1)$$

it involves a single ion quantity, the activity of the hydrogen ion, which is immeasurable by any thermodynamically valid method and requires a convention for its evaluation.

pH was originally defined by Sørensen (2) in terms of the concentration of hydrogen ions (in modern nomenclature) as  $\text{pH} = -\lg(c_{\text{H}}/c^\circ)$  where  $c_{\text{H}}$  is the hydrogen ion concentration in  $\text{mol dm}^{-3}$ , and  $c^\circ = 1 \text{ mol dm}^{-3}$  is the standard amount concentration. Subsequently (3), it was accepted as more satisfactory to define pH in terms of the relative activity of hydrogen ions in solution

$$\text{pH} = -\lg a_{\text{H}} = -\lg(m_{\text{H}}\gamma_{\text{H}}/m^\circ) \quad (2)$$

where  $a_{\text{H}}$  is the relative (molality basis) activity and  $\gamma_{\text{H}}$  is the molal activity coefficient of the hydrogen ion  $\text{H}^+$  at the molality  $m_{\text{H}}$ , and  $m^\circ$  the standard molality. The quantity pH is intended to be a measure of the activity of hydrogen ions in solution. However, since it is defined in terms of a quantity that cannot be measured by a thermodynamically valid method, eqn.(2) can only be considered a *notional definition* of pH.

pH being a single ion quantity, it is not determinable in terms of a fundamental (or base) unit of any measurement system, and there is difficulty providing a proper basis for the traceability of pH measurements. A satisfactory approach is now available in that pH determinations can be incorporated into the International System (SI) if they can be traced to measurements made using a method that fulfils the definition of a 'primary method of measurement' (4).

The essential feature of a primary method is that it must operate according to a well-defined measurement equation in which all of the variables can be determined experimentally in terms of SI units. Any limitation in the determination of the experimental variables, or in the theory, must be included within the estimated uncertainty of the method if traceability to the SI is to be established. If a convention were used without an estimate of its uncertainty, true traceability to SI would not be established. The electrochemical cell without liquid junction, known as the Harned cell (5), fulfils the definition of a primary method for the measurement of the acidity function,  $p(a_{\text{H}}\gamma_{\text{Cl}})$ , and subsequently of the pH of buffer solutions.

The Harned cell is written as

and contains a standard buffer, S, with chloride ions, as potassium or sodium chloride, added in order to use the silver-silver chloride electrode as reference electrode. The application of the Nernst equation to the spontaneous cell reaction of Cell I:

yields the potential difference  $E_1$  of the cell (corrected to 1 atm (101.325 kPa), the partial pressure of hydrogen gas used in electrochemistry in preference to 100 kPa) as

$$E_1 = E^\circ - (RT/F)\ln 10 \lg [(m_{\text{H}}\gamma_{\text{H}}/m^\circ)(m_{\text{Cl}}\gamma_{\text{Cl}}/m^\circ)] \quad (3)$$

which can be rearranged, since  $a_{\text{H}} = m_{\text{H}}\gamma_{\text{H}}/m^\circ$ , to give the acidity function

$$p(a_{\text{H}}\gamma_{\text{Cl}}) = -\lg(a_{\text{H}}\gamma_{\text{Cl}}) = (E_1 - E^\circ)/[(RT/F)\ln 10] + \lg(m_{\text{Cl}}/m^\circ) \quad (4)$$

where  $E^\circ$  is the standard potential difference of the cell, and hence of the silver-silver chloride electrode, and  $\gamma_{\text{Cl}}$  is the activity coefficient of the chloride ion.

The standard potential difference of the silver/silver chloride electrode,  $E^\circ$ , is determined from a Harned cell in which only HCl is present at a fixed molality (e.g.  $m = 0.01 \text{ mol kg}^{-1}$ )

The application of the Nernst equation to the HCl cell (Ia) gives

$$E_{\text{Ia}} = E^\circ - (2RT/F)\ln 10 \lg[(m_{\text{HCl}}/m^\circ)(\gamma_{\pm\text{HCl}})] \quad (5)$$

where  $E_{\text{Ia}}$  has been corrected to 1 atmosphere partial pressure of hydrogen gas (101.325 kPa) and  $\gamma_{\pm\text{HCl}}$  is the mean ionic activity coefficient of HCl.

Values of the activity coefficient ( $\gamma_{\pm\text{HCl}}$ ) at molality 0.01  $\text{mol kg}^{-1}$  and various temperatures were given by Bates and Robinson (6). The standard potential difference depends on the method of preparation of the electrodes, but individual determinations of the activity coefficient of HCl at 0.01  $\text{mol kg}^{-1}$  are more uniform than values of  $E^\circ$ . Hence the practical determination of the potential difference of the cell with HCl at 0.01  $\text{mol kg}^{-1}$  is recommended at 298.15 K at which the mean ionic activity coefficient is 0.904. (It is unnecessary to repeat the measurement of  $E^\circ$  at other temperatures but simply to correct published smoothed values by the observed difference in  $E^\circ$  at 298.15 K)

In national metrology institutes (NMIs), measurements of Cells I and Ia are often done simultaneously in a thermostat bath. Subtracting eqn.(5) from (3) gives

$$\Delta E = E_1 - E_{\text{Ia}} = - (RT/F)\ln 10 \{ \lg[(m_{\text{H}}\gamma_{\text{H}}/m^\circ)(m_{\text{Cl}}\gamma_{\text{Cl}}/m^\circ)] - \lg[(m_{\text{HCl}}/m^\circ)^2\gamma_{\pm\text{HCl}}] \} \quad (6)$$

which is independent of the standard potential difference. Therefore, the subsequently calculated pH does not depend on the standard potential difference and hence does not depend on the assumption that the standard potential of the hydrogen electrode is zero at all temperatures. Therefore, the Harned cell gives an exact comparison between hydrogen ion activities at different temperatures.

The quantity  $p(a_{\text{H}}\gamma_{\text{Cl}}) = -\lg(a_{\text{H}}\gamma_{\text{Cl}})$ , on the left hand side of (4), is called the acidity function (5). To obtain the quantity pH according to eqn. (2) from the acidity function, it is necessary to evaluate  $\lg \gamma_{\text{Cl}}$  independently. This is done in two steps: (i) the

value of  $\lg(a_{\text{H}^+}\gamma_{\text{Cl}^-})$  at zero chloride molality,  $\lg(a_{\text{H}^+}\gamma_{\text{Cl}^-})^0$ , is evaluated and (ii) a value for the activity of the chloride ion  $\gamma_{\text{Cl}^-}^0$ , at zero chloride molality (sometimes referred to as the limiting or 'trace' activity coefficient) is calculated using the Bates-Guggenheim convention (7). The value of  $\lg(a_{\text{H}^+}\gamma_{\text{Cl}^-})^0$  corresponding to zero chloride molality is determined by linear extrapolation of measurements using Harned cells with at least three added molalities of sodium or potassium chloride ( $I < 0.1 \text{ mol kg}^{-1}$ ).

The value of  $\lg(a_{\text{H}^+}\gamma_{\text{Cl}^-})^0$  corresponding to zero chloride molality is determined by linear extrapolation of measurements using Harned cells with at least three added molalities of sodium or potassium chloride ( $I < 0.1 \text{ mol kg}^{-1}$ ) in accord with eqn. (7):

$$-\lg(a_{\text{H}^+}\gamma_{\text{Cl}^-}) = -\lg(a_{\text{H}^+}\gamma_{\text{Cl}^-})^0 + Sm_{\text{Cl}^-} \quad (7)$$

where  $S$  is an empirical, temperature dependent, constant.

The Bates-Guggenheim convention (7) assumes that the trace activity coefficient of the chloride ion  $\gamma_{\text{Cl}^-}^0$  is given by

$$\lg \gamma_{\text{Cl}^-}^0 = -A I^{1/2} / (1 + Ba I^{1/2}) \quad (8)$$

where  $A$  is the Debye-Hückel temperature dependent constant (limiting slope),  $a$  is the mean distance of closest approach of the ions (ion size parameter),  $Ba$  is set equal to  $1.5 (\text{mol kg}^{-1})^{-1/2}$  at all temperatures in the range  $5\text{--}50^\circ\text{C}$ , and  $I$  is the ionic strength of the buffer (which for its evaluation requires knowledge of appropriate acid dissociation constants).

The various stages in the assignment of primary standard pH values are combined in eqn. (9), which is derived from eqns. (4), (5) and (8)

$$\text{pH(PS)} = \lim_{m_{\text{Cl}^-} \rightarrow 0} \{ (E_1 - E_0) / [(RT/F) \ln 10] + \lg(m_{\text{Cl}^-}/m^0) \} - AI^{1/2} / [1 + 1.5 (I/m^0)^{1/2}] \quad (9)$$

In order for a particular buffer solution to be considered a primary buffer solution, it must be of the "highest metrological" quality (4) in accordance with the definition of a primary standard. It is recommended that it have the following attributes (9):

1. High buffer value in the range  $0.016\text{--}0.07 (\text{mol OH}^-)/\text{pH}$ .
2. Small dilution value at half concentration (change in pH with change in buffer concentration) in the range  $0.01\text{--}0.20$ .
3. Small dependence of pH on temperature less than  $\pm 0.01 \text{ K}^{-1}$ .
4. Low residual liquid junction potential  $< 0.01$  in pH.
5. Ionic strength  $\leq 0.1 \text{ mol kg}^{-1}$  to permit applicability of Bates-Guggenheim convention.
6. NMI certificate for specific batch.
7. Reproducible purity of preparation (lot to lot differences of  $|\Delta\text{pH(PS)}| < 0.003$ ).
8. Long term stability of stored solid material.

Values for the above and other important parameters for the primary and secondary buffer materials are given in Table 1.

### Primary Standard Buffers

As there can be significant variations in the purity of samples of a buffer of the same nominal chemical composition, it is essential that the primary buffer material used has been certified with values that have been measured with Cell I. The Harned cell is used

by many national metrological institutes for accurate measurements of pH of buffer solutions.

Typical values of the pH(PS) of the seven solutions from the six accepted primary standard reference buffers, which meet the conditions stated above, are listed in Table 2. Batch-to-batch variations in purity can result in changes in the pH value of samples of at most 0.003. The typical values in Table 2 should not be used in place of the certified value (from a Harned cell measurement) for a specific batch of buffer material.

The required attributes listed above effectively limit the range of primary buffers available to between pH 3 and 10 (at  $25^\circ\text{C}$ ). Calcium hydroxide and potassium tetraoxalate are excluded because the contribution of hydroxide or hydrogen ions to the ionic strength is significant. Also excluded are the nitrogen bases of the type  $\text{BH}^+$  (such as tris(hydroxymethyl)aminomethane and piperazine phosphate) and the zwitterionic buffers (e.g. HEPES and MOPS (10)). These do not comply because either the Bates-Guggenheim convention is not applicable, or the liquid junction potentials are high. This means the choice of primary standards is restricted to buffers derived from oxy-carbon, -phosphorus, -boron and mono, di- and tri-protic carboxylic acids. The uncertainties (11) associated with Harned cell measurements are calculated (1) to be 0.004 in pH at NMIs, with typical variation between batches of primary standard buffers of 0.003.

### Secondary Standards

Substances that do not fulfil all the criteria for primary standards, but to which pH values can be assigned using Cell I are considered to be secondary standards (Table 3). Reasons for their exclusion as primary standards include difficulties in achieving consistent and suitable chemical quality (e.g. acetic acid is a liquid), suspected high liquid junction potential, or inappropriateness of the Bates-Guggenheim convention (e.g. other charge-type buffers). The uncertainty is higher (e.g. 0.01) for biological buffers. Certain other substances, which cannot be used in cells containing hydrogen gas electrodes, are also classed as secondary standards.

### Calibration Procedures

#### (a) One-point calibration

A single point calibration is insufficient to determine both slope and one-point parameters. The theoretical value for the slope can be assumed but the practical slope may be up to 5% lower. Alternatively, a value for the practical slope can be assumed from the manufacturer's prior calibration. The one-point calibration therefore yields only an estimate of pH(X). Since both parameters may change with age of the electrodes, this is not a reliable procedure.

#### (b) Two-point calibration [target uncertainty: $0.02\text{--}0.03$ at $25^\circ\text{C}$ ]

In the majority of practical applications, glass electrodes cells are calibrated by a two-point calibration, or bracketing, procedure using two standard buffer solutions, with pH values,  $\text{pH}(S_1)$  and  $\text{pH}(S_2)$ , bracketing the unknown  $\text{pH}(X)$ . Bracketing is often taken to mean that the  $\text{pH}(S_1)$  and  $\text{pH}(S_2)$  buffers selected from Table 2 should be those that are immediately above and below  $\text{pH}(X)$ . This may not be appropriate in all situations and choice of a wider range may be better.

- (c) Multi-point calibration [target uncertainty: 0.01-0.03 at 25 °C].

Multi-point calibration is carried out using up to five standard buffers. The use of more than five points yields no significant improvement in the statistical information obtainable.

Details of uncertainty computations (11) have been given (1).

### Measurement of pH and choice of pH Standard Solutions

- 1a) If pH is not required to better than  $\pm 0.05$  any pH standard solution may be selected.
- 1b) If pH is required to  $\pm 0.002$  and interpretation in terms of hydrogen ion concentration or activity is desired, choose a standard solution, pH(PS), to match X as closely as possible in terms of pH, composition and ionic strength.
- 2) Alternatively, a bracketing procedure may be adopted whereby two standard solutions are chosen whose pH values, pH(S1), pH(S2) are on either side of pH(X). Then if the corresponding potential difference measurements are  $E(S1)$ ,  $E(S2)$ ,  $E(X)$ , then pH(X) is obtained from

$$\text{pH}(X) = \text{pH}(S1) + [E(X) - E(S1)] / \%k$$

where  $\%k = 100[E(S2) - E(S1)] / [pH(S2) - pH(S1)]$  is the apparent percentage slope. This procedure is very easily done on some pH meters simply by adjusting downwards the slope factor control with the electrodes in S2. The purpose of the bracketing procedure is to compensate for deficiencies in the electrodes and measuring system.

### Information to be given about the measurement of pH(X)

The standard solutions selected for calibration of the pH meter system should be reported with the measurement as follows:

System calibrated with pH(S) = .... at ...K.

System calibrated with two primary standards, pH(PS1) = .... and pH(PS2) = .... at ....K.

System calibrated with  $n$  standards, pH(S1) = ...., pH(S2) = .... etc. at ....K.

### Interpretation of pH(X) in terms of hydrogen ion concentration

The defined pH has no simple interpretation in terms of hydrogen ion concentration but the mean ionic activity coefficient of a typical 1:1 electrolyte can be used to obtain hydrogen ion concentration subject to an uncertainty of 3.9% in concentration, corresponding to 0.02 in pH.

# PRACTICAL pH MEASUREMENTS ON NATURAL WATERS

A. K. Covington and W. Davison

(1) Dilute solutions and freshwater including 'acid-rain' samples ( $I < 0.02 \text{ mol kg}^{-1}$ )

Major problems could be encountered due to errors associated with the liquid junction. It is recommended that either a free diffusion junction is used or it is verified that the junction is working correctly using dilute solutions as follows. For commercial electrodes calibrated with IUPAC aqueous RVS or PS standards, the  $\text{pH}(X)$  of dilute solutions should be within  $\pm 0.02$  of those given in Table 1. The difference in determined  $\text{pH}(X)$  between a stirred and unstirred dilute solution should be  $< 0.02$ . The characteristics of glass electrodes are such that below  $\text{pH } 5$  the readings should be stable within 2 min, but for  $\text{pH } 5$  to 8.8 or so minutes may be necessary to attain stability. Interpretation of  $\text{pH}(X)$  measured in this way in terms of activity of hydrogen ion,  $a_{\text{H}^+}$ , is subject<sup>1</sup> to an uncertainty of  $\pm 0.02$  in  $\text{pH}$ .

(2) Seawater

Measurements made by calibration of electrodes with IUPAC aqueous RVS or PS standards to obtain  $\text{pH}(X)$  are perfectly valid. However, the interpretation of  $\text{pH}(X)$  in terms of the activity of hydrogen ion is complicated by the non zero residual liquid junction potential as well as by systematic differences between electrode pairs, principally attributable to the reference electrode. For 35‰ salinity seawater ( $S = 0.035$ )  $a_{\text{H}^+}$  calculated from  $\text{pH}(X)$  is typically 12% too low. Special seawater  $\text{pH}$  scales have been devised to overcome this problem:

(i) The total hydrogen ion scale,  $\text{pH}_T$ , is defined in terms of the sum of free and complexed (total) hydrogen ion concentrations, where

$${}^T C_{\text{H}} = [\text{H}^+] + [\text{HSO}_4^-] + [\text{HF}].$$

$$\text{So, } \text{pH}_T = -\log {}^T C_{\text{H}}$$

Calibration of the electrodes with a buffer having a composition similar to that of seawater, to which  $\text{pH}_T$  has been assigned, results in values of  $\text{pHT}(X)$  (Tables 2, 3) which are accurately interpretable in terms of  ${}^T C_{\text{H}}$ .

(ii) The free hydrogen ion scale,  $\text{pH}_F$ , is defined, and fully interpretable, in terms of the concentration of free hydrogen ions.

$$\text{pH}_F = -\log [\text{H}^+]$$

Values of  $\text{pH}_F$  as a function of temperature have been assigned to the same set of  $\text{pH}_T$  seawater buffers, and so alternatively can be used for calibration (Tables 2, 3)<sup>2,3</sup>

(3) Estuarine water

Prescriptions for seawater scale buffers are available for a range of salinities. Reliable estuarine  $\text{pH}$  measurements can be made by calibrating with a buffer of the same salinity as the sample. However, these buffers are difficult to prepare and their use presumes prior knowledge of salinity of the sample. Interpretable measurements of estuarine  $\text{pH}$  can be made by calibration with IUPAC aqueous RVS or PS standards if the electrode pair is additionally calibrated using a 20‰ salinity seawater buffer.<sup>4</sup> The difference between the assigned  $\text{pH}_{\text{sws}}$  of the seawater buffer and its measured  $\text{pH}(X)$  value using RVS or PS standards is

$$\Delta\text{pH} = \text{pH}_{\text{sws}} - \text{pH}(X)$$

Values of  $\Delta\text{pH}$  should be in the range of 0.08 to 0.18. It empirically corrects for differences between the two  $\text{pH}$  scales and for measurement errors associated with the electrode pair. The  $\text{pH}(X)$  of samples measured using IUPAC aqueous buffers, can be converted to  $\text{pH}_T$  or  $\text{pH}_F$  using the appropriate measured  $\Delta\text{pH}$ :

$$\text{pH}_T = \text{pH}(X) - \Delta\text{pH}$$

$$\text{or } \text{pH}_F = \text{pH}(X) - \Delta\text{pH}$$

This simple procedure is appropriate to  $\text{pH}$  measurement at salinities from 2‰ to 35‰. For salinities lower than 2‰ the procedures for freshwaters should be adopted.

- A. 25 ml of 0.2 molar KCl + *x* ml of 0.2 molar HCl.  
 B. 50 ml of 0.1 molar potassium hydrogen phthalate + *x* ml of 0.1 molar HCl.  
 C. 50 ml of 0.1 molar potassium hydrogen phthalate + *x* ml of 0.1 molar NaOH.  
 D. 50 ml of 0.1 molar potassium dihydrogen phosphate + *x* ml of 0.1 molar NaOH.  
 E. 50 ml of 0.1 molar tris(hydroxymethyl)aminomethane + *x* ml of 0.1 M HCl.  
 F. 50 ml of 0.025 molar borax + *x* ml of 0.1 molar HCl.  
 G. 50 ml of 0.025 molar borax + *x* ml of 0.1 molar NaOH.  
 H. 50 ml of 0.05 molar sodium bicarbonate + *x* ml of 0.1 molar NaOH.  
 I. 50 ml of 0.05 molar disodium hydrogen phosphate + *x* ml of 0.1 molar NaOH.  
 J. 25 ml of 0.2 molar KCl + *x* ml of 0.2 molar NaOH.

Final volume of mixtures = 100 ml.

## DISSOCIATION CONSTANTS OF INORGANIC ACIDS AND BASES

The data in this table are presented as values of  $pK_a$ , defined as the negative logarithm of the acid dissociation constant  $K_a$  for the reaction

Thus  $pK_a = -\log K_a$ , and the hydrogen ion concentration  $[H^+]$  can be calculated from

$$K_a = \frac{[H^+][B^-]}{[BH]}$$

In the case of bases, the entry in the table is for the conjugate acid; e.g., ammonium ion for ammonia. The  $OH^-$  concentration in the system

can be calculated from the equation

$$K_b = K_{\text{water}}/K_a = \frac{[OH^-][NH_4^+]}{[NH_3]}$$

where  $K_{\text{water}} = 1.01 \times 10^{-14}$  at 25 °C. Note that  $pK_a + pK_b = pK_{\text{water}}$ .

All values refer to dilute aqueous solutions at zero ionic strength at the temperature indicated. The table is arranged alphabetically by compound name.

## DISSOCIATION CONSTANTS OF ORGANIC ACIDS AND BASES

This table lists the dissociation (ionization) constants of over 1070 organic acids, bases, and amphoteric compounds. All data apply to dilute aqueous solutions and are presented as values of  $pK_a$ , which is defined as the negative of the logarithm of the equilibrium constant  $K_a$  for the reaction

i.e.,

$$K_a = [H^+][A^-]/[HA]$$

where  $[H^+]$ , etc. represent the concentrations of the respective species in mol/L. It follows that  $pK_a = pH + \log[HA] - \log[A^-]$ , so that a solution with 50% dissociation has pH equal to the  $pK_a$  of the acid.

Data for bases are presented as  $pK_a$  values for the conjugate acid, i.e., for the reaction

In older literature, an ionization constant  $K_b$  was used for the reaction  $B + H_2O$

$\rightleftharpoons BH^+ + OH^-$ . This is related to  $K_a$  by

$$pK_a + pK_b = pK_{\text{water}} = 14.00 \quad (\text{at } 25^\circ\text{C})$$

Compounds are listed by molecular formula in Hill order.

## CONCENTRATIVE PROPERTIES OF AQUEOUS SOLUTIONS: DENSITY, REFRACTIVE INDEX, FREEZING POINT DEPRESSION, AND VISCOSITY

This table gives properties of aqueous solutions of 66 substances as a function of concentration. All data refer to a temperature of 20°C. The properties are:

Mass %: Mass of solute divided by total mass of solution, expressed as percent.

$m$  Molality (moles of solute per kg of water).

$c$  Molarity (moles of solute per liter of solution).

$\rho$  Density of solution in g/cm<sup>3</sup>.

$n$  Index of refraction, relative to air, at a wavelength of 589 nm (sodium D line); the index of pure water at 20°C is 1.3330.

$\Delta$  Freezing point depression in °C relative to pure water.

$\eta$  Absolute (dynamic) viscosity in mPa s (equal to centipoise, cP); the viscosity of pure water at 20°C is 1.002 mPa s.

Density data for aqueous solutions over a wider range of temperatures and pressures (and for other compounds) may be found in Reference 2. Solutes are listed in the following order:

Acetic acid	Lithium chloride	2-Propanol
Acetone	Magnesium chloride	Silver nitrate
Ammonia	Magnesium sulfate	Sodium acetate
Ammonium chloride	Maltose	Sodium bicarbonate
Ammonium sulfate	Manganese(II) sulfate	Sodium bromide
Barium chloride	<i>D</i> -Mannitol	Sodium carbonate
Calcium chloride	Methanol	Sodium chloride
Cesium chloride	Nitric acid	Sodium citrate
Citric acid	Oxalic acid	Sodium hydroxide
Copper sulfate	Phosphoric acid	Sodium nitrate
Disodium ethylenediamine tetraacetate (EDTA sodium)	Potassium bicarbonate	Sodium phosphate
Ethanol	Potassium bromide	Sodium hydrogen phosphate
Ethylene glycol	Potassium carbonate	Sodium dihydrogen phosphate
Ferric chloride	Potassium chloride	Sodium sulfate
Formic acid	Potassium hydroxide	Sodium thiosulfate
<i>D</i> -Fructose	Potassium iodide	Strontium chloride
<i>D</i> -Glucose	Potassium nitrate	Sucrose
Glycerol	Potassium permanganate	Sulfuric acid
Hydrochloric acid	Potassium hydrogen phosphate	Trichloroacetic acid
Lactic acid	Potassium dihydrogen phosphate	Tris(hydroxymethyl)methylamine
Lactose	Potassium sulfate	Urea
	1-Propanol	Zinc sulfate

Data in this table were calculated from the equation,  $\log_{10} K_w^* = A + B/T + C/T^2 + D/T^3 + (E + F/T + G/T^2) \log_{10} \rho_w^*$ , where  $K_w^* = K_w / (\text{mol kg}^{-1})$ , and  $\rho_w^* = \rho_w / (\text{g cm}^{-3})$ . The parameters are:

$$\begin{aligned}
 A &= -4.098 & E &= +13.957 \\
 B &= -3245.2 \text{ K} & F &= 1262.3 \text{ K} \\
 C &= +2.2362 \times 10^5 \text{ K}^2 & G &= +8.5641 \times 10^5 \text{ K}^2 \\
 D &= -3.984 \times 10^7 \text{ K}^3
 \end{aligned}$$

## IONIZATION CONSTANT OF NORMAL AND HEAVY WATER

This table gives the ionization constant in molality terms for H<sub>2</sub>O and D<sub>2</sub>O at temperatures from 0 to 100°C at the saturated vapor pressure. The quantity tabulated is  $-\log K_w$ , where  $K_w$  is defined by

$$K_w = m_+ \times m_-$$

and  $m_+$  and  $m_-$  are the molalities, in mol/kg of water, for H<sup>+</sup> and OH<sup>-</sup>, respectively.

# SOLUBILITY OF SELECTED GASES IN WATER

L. H. Gevantman

The values in this table are taken almost exclusively from the International Union of Pure and Applied Chemistry "Solubility Data Series". Unless noted, they comprise evaluated data fitted to a smoothing equation. The data at each temperature are then derived from the smoothing equation which expresses the mole fraction solubility  $X_1$  of the gas in solution as:

$$\ln X_1 = A + B/T^* + C \ln T^*$$

where

$$T^* = T/100 \text{ K}$$

All values refer to a partial pressure of the gas of 101.325 kPa (one atmosphere).

The equation constants, the standard deviation for  $\ln X_1$  (except where noted), and the temperature range over which the equation applies are given in the column headed Equation constants. There are two exceptions. The equation for methane has an added term,  $DT^*$ . The equation for  $\text{H}_2\text{Se}$  and  $\text{H}_2\text{S}$  takes the form,

$$\ln X_1 = A + B/T + C \ln T + DT$$

where  $T$  is the temperature in kelvin.

Solubilities given for those gases which react with water, namely ozone, nitrogen oxides, chlorine and its oxides, carbon dioxide, hydrogen sulfide, hydrogen selenide and sulfur dioxide, are recorded as bulk solubilities; i.e., all chemical species of the gas and its reaction products with water are included.

## SOLUBILITY OF CARBON DIOXIDE IN WATER AT VARIOUS TEMPERATURES AND PRESSURES

The solubility of CO<sub>2</sub> in water, expressed as mole fraction of CO<sub>2</sub> in the liquid phase, is given for pressures up to atmospheric and temperatures of 0 to 100 °C. Note that 1 standard atmosphere equals 101.325 kPa. The references give data over a wider range of temperature and pressure. The estimated uncertainty is about 2%.

## AQUEOUS SOLUBILITY AND HENRY'S LAW CONSTANTS OF ORGANIC COMPOUNDS

The solubility in water of about 1300 organic compounds, including many compounds of environmental interest, is tabulated here. When data are available, values are given at several temperatures between 0 °C and 100 °C. Solids, liquids, and gases are included; additional data on gases can be found in the table "Solubility of Selected Gases in Water" in Section 8.

Solubility of solids is defined as the concentration of the compound in a solution that is in equilibrium with the solid phase at the specified temperature and one atmosphere pressure. For liquids whose water mixtures separate into two phases, the solubility given here is the concentration of the specified compound in the water-rich phase at equilibrium. In the case of gases (i.e., compounds whose vapor pressure at the specified temperature exceeds one atmosphere) the solubility is defined here as the concentration in the water phase when the partial pressure of the compound above the solution is 101.325 kPa (1 atm). Values for gases are marked with an asterisk.

The solubility values in this table are expressed as mass percent of solute,  $s = 100w_2$ , where the mass fraction  $w_2$  is defined as

$$w_2 = m_2 / (m_1 + m_2)$$

where  $m_2$  is the mass of solute and  $m_1$  the mass of water. For convenience, the solubility expressed in grams of solute that will dissolve in 1 kilogram of water is tabulated in the adjacent column to mass percent. For compounds with low solubility (e.g.,  $s < 1\%$ ), that column is, to a high approximation, numerically identical to the solubility expressed in grams of solute per liter of solution.

The mass fraction  $w_2$  is related to other common measures of solubility as follows:

Molality:	$m_2 = 1000 w_2 / M_2 (1 - w_2)$
Molarity:	$c_2 = 1000 \rho w_2 / M_2$
Mole fraction:	$x_2 = (w_2 / M_2) / \{ (w_2 / M_2) + (1 - w_2) / M_1 \}$
Mass of solute per 100 g of H <sub>2</sub> O:	$100w_2 / (1 - w_2)$
Mass of solute per liter of solution:	$1000\rho w_2$

Here,  $M_2$  is the molar mass of the solute,  $M_1 = 18.015$  g/mol is the molar mass of water, and  $\rho$  is the density of the solution in g/mL.

Data have been selected from evaluated sources wherever possible, in particular the *IUPAC Solubility Data Series*. Many values come from experimental measurements reported in the *Journal of Chemical and Engineering Data* and the *Journal of Chemical Thermodynamics*, as well as critical review papers in the *Journal of Physical and Chemical Reference Data*. The primary source for each value is listed in the column following the solubility values; additional references of interest are sometimes given. Many of the references contain solubility data at other temperatures and pH values and in the presence of other compounds. The user is cautioned that wide variations of data are found in the literature for the lower solubility compounds. The references should be consulted for more information on these compounds.

The table also contains values of the Henry's Law constant  $k_H$ , which provides a measure of the partition of a substance between the atmosphere and the aqueous phase. Here,  $k_H$  is defined as the limit of  $p_2/c_2$  as the concentration approaches zero, where  $p_2$  is the

partial pressure of the solute above the solution and  $c_2$  is the concentration in the solution at equilibrium (other formulations of Henry's Law are often used; see Reference 5). The values of  $k_H$  listed here are based on direct experimental measurement whenever available, but many of them are simply calculated as the ratio of the pure compound vapor pressure to the solubility. This approximation is reliable only for compounds of very low solubility. In fact, values of  $k_H$  found in the literature frequently differ by a factor of two or three, and variations over an order of magnitude are not unusual (Reference 5). Therefore, the data given here should be taken only as a rough indication of the true Henry's Law constant, which is difficult to measure precisely.

All values of  $k_H$  refer to 25 °C. If the vapor pressure of the compound at 25 °C is greater than one atmosphere, it can be assumed that the  $k_H$  value has been calculated as  $101.325/c_2$ . The source of the Henry's Law data is given in the last column. The air-water partition coefficient (i.e., ratio of air concentration to water concentration when both are expressed in the same units) is equal to  $k_H/RT$  or  $k_H/2.48$  in the units used here.

Compounds are listed by systematic name. To locate a compound by molecular formula or CAS Registry Number, use the indexes to the table "Physical Constants of Organic Compounds" in Section 3, which point to the entry in that table from which the name can be determined.

# AQUEOUS SOLUBILITY OF INORGANIC COMPOUNDS AT VARIOUS TEMPERATURES

The solubility of over 300 common inorganic compounds in water is tabulated here as a function of temperature. Solubility is defined as the concentration of the compound in a solution that is in equilibrium with a solid phase at the specified temperature. In this table the solid phase is generally the most stable crystalline phase at the temperature in question. An asterisk \* on solubility values in adjacent columns indicates that the solid phase changes between those two temperatures (usually from one hydrated phase to another or from a hydrate to the anhydrous solid). In such cases the slope of the solubility vs. temperature curve may show a discontinuity.

All solubility values are expressed as mass percent of solute,  $100w_2$ , where

$$w_2 = m_2 / (m_1 + m_2)$$

and  $m_2$  is the mass of solute and  $m_1$  the mass of water. This quantity is related to other common measures of solubility as follows:

$$\text{Molarity: } c_2 = 1000 \rho w_2 / M_2$$

$$\text{Molality: } m_2 = 1000 w_2 / M_2 (1 - w_2)$$

$$\text{Mole fraction: } x_2 = (w_2 / M_2) / \{ (w_2 / M_2) + (1 - w_2) / M_1 \}$$

$$\text{Mass of solute per 100 g of H}_2\text{O: } r_2 = 100 w_2 / (1 - w_2)$$

Here  $M_2$  is the molar mass of the solute and  $M_1 = 18.015$  g/mol is the molar mass of water.  $\rho$  is the density of the solution in  $\text{g cm}^{-3}$ .

The data in the table have been derived from the references indicated; in many cases the data have been refitted or interpolated in order to present solubility at rounded values of temperature. Where available, values were taken from the IUPAC *Solubility Data Series* (Reference 1) or the related papers in the *Journal of Physical and Chemical Reference Data* (References 2 to 5), which present carefully evaluated data.

The solubility of sparingly soluble compounds that do not appear in this table may be calculated from the data in the table "Solubility Product Constants". Solubility of inorganic gases may be found in the table "Solubility of Selected Gases in Water".

Compounds are listed alphabetically by chemical formula in the most commonly used form (e.g., NaCl,  $\text{NH}_4\text{NO}_3$ , etc.).

## SOLUBILITY PRODUCT CONSTANTS

The solubility product constant  $K_{sp}$  is a useful parameter for calculating the aqueous solubility of sparingly soluble compounds under various conditions. It may be determined by direct measurement or calculated from the standard Gibbs energies of formation  $\Delta_f G^\circ$  of the species involved at their standard states. Thus if  $K_{sp} = [M^+]^m [A^-]^n$  is the equilibrium constant for the reaction

where  $M_m A_n$  is the slightly soluble substance and  $M^+$  and  $A^-$  are the ions produced in solution by the dissociation of  $M_m A_n$ , then the Gibbs energy change is

$$\Delta G^\circ = m \Delta_f G^\circ (M^+, aq) + n \Delta_f G^\circ (A^-, aq) - \Delta_f G^\circ (M_m A_n, s)$$

The solubility product constant is calculated from the equation

$$\ln K_{sp} = -\Delta G^\circ / RT$$

The first table below gives selected values of  $K_{sp}$  at 25°C. Many of these have been calculated from standard state thermodynamic data in References 1 and 2; other values are taken from publications of the IUPAC Solubility Data Project (References 3 to 7).

The above formulation is not convenient for treating sulfides because the  $S^{2-}$  ion is usually not present in significant concentrations (see Reference 8). This is due to the hydrolysis reaction

which is strongly shifted to the right except in very basic solutions. Furthermore, the equilibrium constant for this reaction, which depends on the second ionization constant of  $H_2S$ , is poorly known. Therefore it is more useful in the case of sulfides to define a different solubility product  $K_{spa}$  based on the reaction

Values of  $K_{spa}$ , taken from Reference 8, are given for several sulfides in the auxiliary table following the main table. Additional discussion of sulfide equilibria may be found in References 7 and 9.

*Sulfides*

Compound	Formula	$K_{\text{spa}}$
Cadmium sulfide	CdS	$8 \cdot 10^{-7}$
Copper(II) sulfide	CuS	$6 \cdot 10^{-16}$
Iron(II) sulfide	FeS	$6 \cdot 10^2$
Lead(II) sulfide	PbS	$3 \cdot 10^{-7}$
Manganese(II) sulfide (green)	MnS	$3 \cdot 10^7$
Mercury(II) sulfide (red)	HgS	$4 \cdot 10^{-33}$
Mercury(II) sulfide (black)	HgS	$2 \cdot 10^{-32}$
Silver(I) sulfide	Ag <sub>2</sub> S	$6 \cdot 10^{-30}$
Tin(II) sulfide	SnS	$1 \cdot 10^{-5}$
Zinc sulfide (sphalerite)	ZnS	$2 \cdot 10^{-4}$
Zinc sulfide (wurtzite)	ZnS	$3 \cdot 10^{-2}$

# SOLUBILITY CHART

Abbreviations: **W**, soluble in water; **A**, insoluble in water but soluble in acids; **w**, sparingly soluble in water but soluble in acids; **a**, insoluble in water and only sparingly soluble in acids; **I**, insoluble in water and acids; **d**, decomposes in water. \* Indicates two modifications of the salt.

## REDUCTION OF WEIGHINGS IN AIR TO VACUO

When the mass  $M$  of a body is determined in air, a correction is necessary for the buoyancy of the air. The corrected mass is given by  $M + kM/1000$ , where  $k$  is a function of the material used for the weights, given by

$$k = 1000\rho_{\text{air}}(1/\rho_{\text{body}} - 1/\rho_{\text{weight}})$$

and  $\rho$  is density. The table below is computed for an air density of 0.0012 g/cm<sup>3</sup> and for densities of three common weights:

Density of body (g/cm <sup>3</sup> )	Value of $k$ for weights of:		
	Pt-Ir	Brass	Quartz or Al
0.5	2.34	2.26	1.95
0.6	1.94	1.86	1.55
0.7	1.66	1.57	1.26
0.8	1.44	1.36	1.05
0.9	1.28	1.19	0.88
1.0	1.14	1.06	0.75
1.1	1.04	0.95	0.64
1.2	0.94	0.86	0.55
1.3	0.87	0.78	0.47
1.4	0.80	0.72	0.40
1.5	0.74	0.66	0.35
1.6	0.69	0.61	0.30
1.7	0.65	0.56	0.25

platinum-iridium (21.6 g/cm<sup>3</sup>), brass (8.5 g/cm<sup>3</sup>), and aluminum or quartz (2.65 g/cm<sup>3</sup>).

## PROPERTIES OF CARRIER GASES FOR GAS CHROMATOGRAPHY

The following is a list of carrier gases sometimes used in gas chromatography, with properties relevant to the design of chromatographic systems. All data refer to normal atmospheric pressure (101.325 kPa).

$M_r$ : Molecular weight (relative molar mass)  
 $\rho_{25}$ : Density at 25 °C in g/L  
 $\lambda$ : Thermal conductivity in mW/m °C  
 $\eta$ : Viscosity in  $\mu\text{Pa s}$  (equal to  $10^{-3}$  cP)  
 $c_p$ : Specific heat at 25 °C in J/g °C

## SOLVENTS FOR ULTRAVIOLET SPECTROPHOTOMETRY

This table lists some solvents commonly used for sample preparation for ultraviolet spectrophotometry. The properties given are:

- $\lambda_c$ : cutoff wavelength, below which the solvent absorption becomes excessive.  
 $\epsilon$ : dielectric constant (relative permittivity); the temperature in °C is given as a superscript.  
 $t_b$ : normal boiling point.

## <sup>13</sup>C CHEMICAL SHIFTS OF USEFUL NMR SOLVENTS

The following table gives the expected carbon-13 chemical shifts, relative to tetramethylsilane, for various useful NMR solvents. In some solvents, slight changes can occur with change of concentration.<sup>2,3</sup>

## MASS SPECTRAL PEAKS OF COMMON ORGANIC SOLVENTS

The strongest peaks in the mass spectra of 375 important organic solvents and other liquid reagents are listed in this table. The *m/z* value for each peak is followed by the relative intensity in parentheses, with the strongest peak assigned an intensity of 100. The peaks for each compound are listed in order of decreasing intensity. Compounds are listed by the name used in this *Handbook*, with other common names given in parentheses.

Data on the physical properties of the same compounds may be found in Section 15 in the table *Laboratory Solvents and Other Liquid Reagents*.

## SOLUBILITY OF COMMON SALTS AT AMBIENT TEMPERATURES

This table gives the aqueous solubility of selected salts at temperatures from 10°C to 40°C. Values are given in molality terms.

## FLAME AND BEAD TESTS

### Flame Colorations

#### Violet

Potassium compounds. Purple red through blue glass. Easily obscured by sodium flame. Bluish-green through green glass. Rubidium and cesium compounds impart same flame as potassium compounds.

#### Blues

Azure — Copper chloride. Copper bromide gives azure blue followed by green. Other copper compounds give same coloration when moistened with hydrochloric acid.  
Light blue — Lead, arsenic, selenium.

#### Greens

Emerald — Copper compounds except the halides, and when not moistened with hydrochloric acid.  
Pure green — Compounds of thallium and tellurium.  
Yellowish — Barium compounds. Some molybdenum compounds. Borates, especially when treated with sulfuric acid or when burned with alcohol.

Bluish — Phosphates with sulfuric acid.

Feeble — Antimony compounds. Ammonium compounds.

Whitish — Zinc.

#### Reds

Carmine — Lithium compounds. Violet through blue glass. Invisible through green glass. Masked by barium flame.  
Scarlet — Strontium compounds. Violet through blue glass. Yellowish through green glass. Masked by barium flame.  
Yellowish — Calcium compounds. Greenish through blue glass. Green through green glass. Masked by barium flame.

#### Yellow

Yellow — All sodium compounds. Invisible with blue glass.

### Bead Tests

Abbreviations employed: s = saturated; ss = supersaturated; ns = not saturated; h = hot; c = cold

#### Borax Beads

Substance	Oxidizing flame	Reducing flame
Aluminum	Colorless (h, c, ns); opaque (ss)	Colorless; opaque (s)
Antimony	Colorless; yellow or brownish (h, ss)	Gray and opaque
Barium	Colorless (ns)	
Bismuth	Colorless; yellow or brownish (h, ss)	Gray and opaque
Cadmium	Colorless	Gray and opaque
Calcium	Colorless (ns)	
Cerium	Red (h)	Colorless (h, c)
Chromium	Green (c)	Green
Cobalt	Blue (h, c)	Blue (h, c)
Copper	Green (h); blue (c)	Red (c); opaque (ss); colorless (h)
Iron	Yellow or brownish red (h, ns)	Green (ss)
Lead	Colorless; yellow or brownish (h, ss)	Gray and opaque
Magnesium	Colorless (ns)	
Manganese	Violet (h, c)	Colorless (h, c)
Molybdenum	Colorless	Yellow or brown (h)
Nickel	Brown; red (c)	Gray and opaque
Silicon	Colorless (h, c); opaque (ss)	Colorless; opaque (s)
Silver	Colorless (ns)	Gray and opaque
Strontium	Colorless (ns)	
Tin	Colorless (h, c); opaque (ss)	Colorless; opaque (s)
Titanium	Colorless	Yellow (h); violet (c)
Tungsten	Colorless	Brown
Uranium	Yellow or brownish (h, ns)	Green
Vanadium	Colorless	Green

#### Beads of Microcosmic Salt

Substance	Oxidizing flame	Reducing flame
Aluminum	Colorless; opaque (s)	Colorless; not clear (ss)
Antimony	Colorless (ns)	Gray and opaque
Barium	Colorless; opaque (s)	Colorless; not clear (ss)
Bismuth	Colorless (ns)	Gray and opaque
Cadmium	Colorless (ns)	Gray and opaque
Calcium	Colorless; opaque (s)	Colorless; not clear (ss)

**Beads of Microcosmic Salt**

<b>Substance</b>	<b>Oxidizing flame</b>	<b>Reducing flame</b>
Cerium	Yellow or brownish red (h, s)	Colorless
Chromium	Red (h, s); green (c)	Green (c)
Cobalt	Blue (h, c)	Blue (h, c)
Copper	Blue (c); green (h)	Red and opaque (c)
Iron	Yellow or brown (h, s)	Colorless; yellow or brownish (h)
Lead	Colorless (ns)	Gray and opaque
Magnesium	Colorless; opaque (s)	Colorless; not clear (ss)
Manganese	Violet (h, c)	Colorless
Molybdenum	Colorless; green (h)	Green (h)
Nickel	Yellow (c); red (h, s)	Yellow (c); red (h); gray and opaque
Silver		Gray and opaque
Strontium	Colorless; opaque (s)	Colorless; not clear (ss)
Tin	Colorless; opaque (s)	Colorless
Titanium	Colorless (ns)	Violet (c); yellow or brownish (h)
Uranium	Green; yellow or brownish	Green (h) (h, s)
Vanadium	Yellow	Green
Zinc	Colorless (ns)	Gray and opaque

**Sodium Carbonate Bead**

<b>Substance</b>	<b>Oxidizing flame</b>	<b>Reducing flame</b>
Manganese	Green	Colorless

## SOLUBILITY OF HYDROCARBONS IN SEAWATER

Concern about pollution of the oceans has stimulated measurements of the solubility of organic compounds in seawater. This table gives the solubility of several hydrocarbons in seawater. The data are derived from a review in the IUPAC Solubility Data Series (Reference 1).

Solubility is expressed in this table as parts per million by mass, i.e.,

$$S/\text{ppm}(\text{mass}) = 10^6 \times w_2 = 10^6 \times m_2/(m_1 + m_2)$$

where  $m_1$  and  $m_2$  are the masses of solvent (seawater) and solute, respectively, under saturation conditions, and  $w_2$  is the mass fraction. Since the solubilities in this table are very low, the value of  $S$  is effectively the mass of hydrocarbon in grams per 1000 kg of seawater.

The temperature and salinity of each measurement are given in the table. Salinity is a standardized measure of the concentration of dissolved salts, as explained in the table "Properties of Seawater" in Section 14. Salinity values in the open oceans at mid-latitude typically fall between 34 and 36.

Reference 1 gives details of the method of measurement and an indication of the reliability of the measurements.

# SOLUBILITY OF ORGANIC COMPOUNDS IN PRESSURIZED HOT WATER

Liquid water at elevated temperatures and pressures, but still in the subcritical region, is of interest as a solvent in various laboratory and industrial processes. In effect, this means water at a temperature between about 100°C and 373°C, the critical temperature, and at pressures up to 400 bar or greater. Since the dielectric constant of water decreases with increasing temperature, the solubility of many compounds, especially non-polar compounds, increases dramatically at higher temperature. The fact that solubility can be fine-tuned by controlling temperature and pressure makes pressurized hot water a useful tool in various extraction and reaction processes.

This table gives a sample of the variations of solubility with temperature and pressure for several compounds, mostly hydrocarbons. The solubility is expressed in both mole fraction of solute,  $x_2$ , and mass percent,  $100w_2$ , where  $w_2$  is the mass fraction. More information is available in the references.

## PROTON NMR SHIFTS OF COMMON ORGANIC SOLVENTS

The table below lists the  $^1\text{H}$  chemical shifts for over 300 organic solvents and liquid reagents. The solvent in which the shift was measured is given in the second column. Shifts are given in parts per million relative to tetramethylsilane (TMS) and are listed in order of smallest to largest shift. In many cases the peaks show additional small splittings. Compounds are listed by the name used in this *Handbook*, with other common names given in parentheses.

## BOND LENGTHS IN CRYSTALLINE ORGANIC COMPOUNDS

The following table gives average interatomic distances for bonds between the elements H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, Te, and I as determined from X-ray and neutron diffraction measurements on organic crystals. The table has been derived from an analysis of high-precision structure data on about 10,000 crystals contained in the 1985 version of the Cambridge Structural Database, which is maintained by the Cambridge Crystallographic Data Center. The explanation of the columns is:

Column 4:  $m$  is the median in Å units of all values.  
 Column 5:  $\sigma$  is the standard deviation in the sample.  
 Column 6:  $q_1$  is the lower quartile for the sample (i.e., 25% of values are less than  $q_1$  and 75% exceed it).  
 Column 7:  $q_u$  is the upper quartile for the sample.  
 Column 8:  $n$  is number of observations in the sample.  
 Column 9: Notes refer to the footnotes in Appendix 1.

Column 1: Specification of elements in the bond, with coordination number given in parentheses, and bond type (single, double, etc.). For carbon, the hybridization state is given.  
 Column 2: Substructure in which the bond is found. The target bond is set in boldface. Where X is not specified, it denotes any element type. C# indicates any sp<sup>3</sup> carbon atom, and C\* denotes an sp<sup>3</sup> carbon whose bonds, in addition to those specified in the linear formulation, are to C and H atoms only.  
 Column 3:  $d$  is the unweighted mean in Å units of all the values for that bond length found in the sample.

References to special cases are given in a shorthand form and listed in Appendix 2. Further information on the method of analysis of the data may be found in the reference cited below.

The table is reprinted with permission of the authors, the Royal Society of Chemistry, and the International Union of Crystallography.

## Appendix 1. (Footnotes to Table)

- Sample dominated by B–CH<sub>3</sub>. For longer bonds in B–CH<sub>3</sub> see LITMEB10 [B(4)–CH<sub>3</sub> = 1.621–1.644 Å].
- p(π)–p(π) Bonding with Bsp<sup>2</sup> and Nsp<sup>2</sup> coplanar ( $\tau_{BN} = 0 \pm 15^\circ$ ) predominates. See G. Schmidt, R. Boese, and D. Bläser, *Z. Naturforsch.*, 1982, **37b**, 1230.
- 84 observations range from 1.38 to 1.61 Å and individual values depend on substituents on B and O. For a discussion of borinic acid adducts see S. J. Rettig and J. Trotter, *Can. J. Chem.*, 1982, **60**, 2957.
- See M. Kaftory in 'The Chemistry of Functional Groups. Supplement D: The Chemistry of Halides, Pseudohalides, and Azides', S. Patai and Z. Rappoport, Eds., Wiley: New York, 1983, Part 2, ch. 24.
- Bonds which are endocyclic or exocyclic to any 3- or 4-membered rings have been omitted from all averages in this section.
- The overall average given here is for Csp<sup>3</sup>–Csp<sup>3</sup> bonds which carry only C or H substituents. The value cited reflects the relative abundance of each 'substitution' group. The 'mean of means' for the 9 subgroups is 1.538 ( $\sigma = 0.022$ ) Å.
- See F. H. Allen, (a) *Acta Crystallogr.*, 1980, **B36**, 81; (b) 1981, **B37**, 890.
- See F. H. Allen, *Acta Crystallogr.*, 1984, **B40**, 64.
- See F. H. Allen, *Tetrahedron*, 1982, **38**, 2843.
- See F. H. Allen, *Tetrahedron*, 1982, **38**, 645.
- Cyclopropanones and cyclobutanones excluded.
- See W. B. Schweizer and J. D. Dunitz, *Helv. Chim. Acta*, 1982, **65**, 1547.
- See L. Norskov-Lauritsen, H.-B. Bürgi, P. Hoffmann, and H. R. Schmidt, *Helv. Chim. Acta*, 1985, **68**, 76.
- See P. Chakrabarti and J. D. Dunitz, *Helv. Chim. Acta*, 1982, **65**, 1555.
- See J. L. Hencher in 'The Chemistry of the C≡C Triple Bond', S. Patai, Ed., Wiley, New York, 1978, ch. 2.
- Conjugated: torsion angle about central C–C single bond is  $0 \pm 20^\circ$  (*cis*) or  $180 \pm 20^\circ$  (*trans*).
- Unconjugated: torsion angle about central C–C single bond is 20–160°.
- Other conjugative substituents excluded.
- TCNQ is tetracyanoquinodimethane.
- No difference detected between C2  $\simeq$  C3 and C3  $\simeq$  C4 bonds.
- Derived from neutron diffraction results only.
- Nsp<sup>3</sup>: pyramidal; mean valence angle at N is in range 108–114°.
- Nsp<sup>2</sup>: planar; mean valence angle at N is  $\geq 117.5^\circ$ .
- Cyclic and acyclic peptides.
- See R. H. Blessing, *J. Am. Chem. Soc.*, 1983, **105**, 2776.
- See L. Lebioda, *Acta Crystallogr.*, 1980, **B36**, 271.
- n* = 3 or 4, i.e. tri- or tetra-substituted ureas.
- Overall value also includes structures with mean valence angle at N in the range 115–118°.
- See F. H. Allen and A. J. Kirby, *J. Am. Chem. Soc.*, 1984, **106**, 6197.
- See A. J. Kirby, 'The Anomeric Effect and Related Stereoelectronic Effects at Oxygen', Springer, Berlin, 1983.
- See B. Fuchs, L. Schleifer, and E. Tartakovsky, *Nouv. J. Chim.*, 1984, **8**, 275.
- See S. C. Nyburg and C. H. Faerman, *J. Mol. Struct.*, 1986, **140**, 347.
- Sample dominated by P–CH<sub>3</sub> and P–CH<sub>2</sub>–C.
- Sample dominated by C\* = methyl.
- See A. Kalman, M. Czugler, and G. Argay, *Acta Crystallogr.*, 1981, **B37**, 868.
- Bimodal distribution resolved into 22 'short' bonds and 5 longer outliers.
- All 24 observations come from BUDTEZ.
- 'Long' O–H bonds in centrosymmetric O---H---O H-bonded dimers are excluded.
- N–N bond length also dependent on torsion angle about N–N bond and on nature of substituent C atoms; these effects are ignored here.
- N pyramidal has average angle at N in range 100–113.5°; N planar has average angle of  $\geq 117.5^\circ$ .
- See R. R. Holmes and J. A. Deiters, *J. Amer. Chem. Soc.*, 1977, **99**, 3318.
- No detectable variation in S=O bond length with type of C-substituent.

## STRUCTURE OF FREE MOLECULES IN THE GAS PHASE

This table gives information on the geometric structure of selected molecules in the gas phase, including the overall geometry, interatomic distances, and bond angles. The molecules have been chosen to provide data on a wide variety of chemical bonds and to illustrate the influence of molecular environment on bond distances and angles. The table is restricted to molecules with conventional covalent or ionic bonds, but it should be pointed out that structure data on many loosely bonded complexes of the van der Waals type have recently become available. The references below contain data on many molecules that are not included here and give additional information such as uncertainties and isotopic variations.

The two techniques for gas phase structure determination are spectroscopy and electron diffraction. The following codes are used to indicate the method used for each set of data:

- ED – Gas phase electron diffraction
- MW – Microwave spectroscopy, including both measurements in bulk gases and molecular beams
- IR – Infrared spectroscopy
- R – Raman spectroscopy
- UV – Electronic spectroscopy in the ultraviolet and visible regions, including fluorescence measurements
- ESR – Electron spin resonance.

In some cases data from two sources have been combined to derive the structure; these are labeled by “ED, MW,” for example.

Because of the internal vibrations that are present in all molecules, even in their lowest energy state, the definition of interatomic distance is not a simple matter. The ideal measure is the equilibrium distance in the hypothetical non-vibrating state, designated by  $r_e$ . This is the value of the separation of the atoms at the minimum of the potential function that describes the forces between the two atoms. All other measures represent some form of average, generally complex, over the vibrational motions. Since the potential function is asymmetric and less steep at distances beyond the potential minimum, the average distance is normally greater than  $r_e$ . Distances determined by electron diffraction (ED) represent an average over all vibrational states that are populated at the temperature of the measurement; the most common measure is designated  $r_g$ . Distances determined by spectroscopy (MW, IR, R, or UV) through measurements on the ground vibrational state of the molecule, designated by  $r_0$ , describe some form of average, not easily defined, over the zero-point vibrations. Another measure that is frequently used in microwave spectroscopy is the “substitution” distance  $r_s$ , which is operationally defined through a series of measurements on different isotopic species. In simple cases,  $r_s$  often lies between  $r_0$  and  $r_e$  and is therefore a closer approximation to  $r_e$ . Several other types of averages have been used; good discussions can be found in Volumes II/25 and II/28 of the *Landolt-Börnstein* series (Reference 1) and in References 4 and 5.

Unless otherwise specified, distances and angles given in this table are  $r_0$  values if the method is spectroscopic and  $r_g$  values if the method is electron diffraction. When given, equilibrium and substitution distances are designated by  $r_e$  and  $r_s$ , respectively.

Many interatomic distances and angles calculated by *ab initio* techniques have been reported in the recent literature. However, it should be emphasized that all data in this table are obtained from direct experimental measurements. In a few cases, *ab initio* calculations of vibration-rotation interaction constants have been combined with the primary experimental measurements to derive  $r_e$  values in the table.

The number of significant figures in the values is an indication of the precision of the measurement; thus a distance quoted to three decimal places is probably reliable to about 0.005 Å or better. However, discrepancies between  $r_e$ ,  $r_0$ , and  $r_g$  values for the same bond are often the order of 0.01 Å because of vibrational averaging considerations, so care must be taken in comparing bond distances in different molecules. Some distances in simple molecules are given here to four or five decimal places, but little chemical significance can be attached to differences beyond the third decimal place.

The table is presented in two parts: Part A covers molecules that do not contain carbon while Part B lists carbon-containing molecules. Because many of the entries in Part A are free radicals or other transient species whose systematic chemical names are unfamiliar, the listing in Part A is in order of chemical formula. Part B is ordered by name. In both parts the second column gives information on the overall configuration of the molecule, often indicated by the point group of the equilibrium geometry. Columns 3 through 8 give the values of the bond distances and angles, and the last column indicates the experimental method. Distances are given in Å units, where 1 Å =  $10^{-10}$  m or 0.1 nm. Angles are given in degrees.

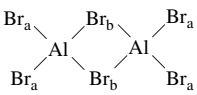

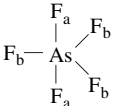

The efforts of Kozo Kuchitsu in preparing an earlier version of this table and in giving advice on the new version are gratefully acknowledged.

## DIPOLE MOMENTS

This table gives selected values of the electric dipole moment for over 800 molecules. When available, values determined by microwave spectroscopy, molecular beam electric resonance, and other high-resolution spectroscopic techniques were selected. Otherwise, the values come from measurements of the dielectric constant in the gas phase or, if these do not exist, in the liquid phase. Entries are listed alphabetically; compounds not containing carbon are listed first, followed by compounds containing carbon.

The dipole moment is given in debye units (D). The conversion factor to SI units is  $1 \text{ D} = 3.33564 \times 10^{-30} \text{ C m}$ .

Dipole moments of individual conformers (rotational isomers) are given when they have been measured. The conformers are designated as *gauche*, *trans*, *axial*, etc. The meaning of these terms can be found in the references. In some cases an average value, obtained from measurements on the bulk gas, is also given. Other information on molecules that have been studied by spectroscopy, such as the components of the dipole moment in the molecular framework and the variation with vibrational state and isotopic species, is given in the references.

When the accuracy of a value is explicitly stated (i.e.,  $1.234 \pm 0.005$ ), the stated uncertainty generally indicates two or three standard deviations. When no uncertainty is given, the value may be assumed to be precise to a few units in the last decimal place. However, if more than three decimal places are given, the exact interpretation of the final digits may require analysis of the vibrational averaging.

Values measured in the gas phase that are questionable because of undetermined error sources are indicated as approximate ( $\approx$ ). Values obtained by liquid phase measurements, which sometimes have large errors because of association effects, are enclosed in brackets, e.g., [1.8].

# BOND DISSOCIATION ENERGIES

Yu-Ran Luo

The bond dissociation energy (enthalpy) is also referred to as bond disruption energy, bond energy, bond strength, or binding energy (abbreviation: BDE, BE, or D). It is defined as the standard enthalpy change of the following fission:  $R-X \rightarrow R + X$ . The BDE, denoted by  $D^\circ(R-X)$ , is usually derived by the thermochemical equation,  $D^\circ(R-X) = \Delta_f H^\circ(R) + \Delta_f H^\circ(X) - \Delta_f H^\circ(RX)$ . The enthalpy of formation  $\Delta_f H^\circ$  of a large number of atoms, free radicals, ions, clusters and compounds is available from the websites of NIST, NASA, CODATA, and IUPAC. Most authors prefer to use the BDE values at 298.15 K.

The following seven tables provide essential information of experimental BDE values of R-X and R<sup>+</sup>-X bonds.

- (1) Table 1: Bond Dissociation Energies in Diatomic Molecules
- (2) Table 2: Enthalpy of Formation of Gaseous Atoms
- (3) Table 3: Bond Dissociation Energies in Polyatomic Molecules
- (4) Table 4: Enthalpies of Formation of Free Radicals and Other Transient Species
- (5) Table 5: Bond Dissociation Energies of Common Organic Molecules
- (6) Table 6: Bond Dissociation Energies in Diatomic Cations
- (7) Table 7: Bond Dissociation Energies in Polyatomic Cations

The data in these tables have been revised through September 2008.

**TABLE 1. Bond Dissociation Energies in Diatomic Molecules**

The BDEs in diatomic species have usually been measured by spectroscopy or mass spectrometry. In the absence of data on the enthalpy function, the values at 0 K,  $D^\circ(A-B)$ , are converted to  $D^\circ_{298}$  by the approximate equation:

$$D^\circ_{298}(A-B) \approx D^\circ(A-B) + (3/2)RT = D^\circ(A-B) + 3.7181 \text{ kJ mol}^{-1}$$

This table has been arranged in an alphabetical order of the atoms A in the diatomics A-B.

### TABLE 3. Bond Dissociation Energies in Polyatomic Molecules

The  $D^\circ_{298}$  values in polyatomic molecules are notoriously difficult to measure accurately since the mechanism of the kinetic systems involved in many of the measurements are seldom straightforward. Thus, much lively controversy has taken place in the literature and is likely to continue for some time to come. We will continue updating and presenting our assessment of the most reliable BDE data every year.

The references relating to each of the  $D^\circ_{298}$  values listed in Table 3 are contained in the *Comprehensive Handbook of Chemical Bond Energies*, by Yu-Ran Luo, CRC Press, 2007. Many  $D^\circ_{298}$  in Table 3 are derived from the equation

$$D^\circ_{298}(\text{R-X}) = \Delta_f H^\circ(\text{R}) + \Delta_f H^\circ(\text{X}) - \Delta_f H^\circ(\text{RX})$$

Here, the enthalpies of formation of the atoms and radicals are taken from Tables 2 and 4, respectively, and the enthalpies of formation of the molecules are from reference sources listed in the above *Comprehensive Handbook of Chemical Bond Energies*.

Table 3 presents H-C, C-C, C-halogen, O-, N-, S-, Si-, Ge-, Sn-, Pb-, P-, As-, Sb-, Bi-, Se-, Te-, and metal-X BDEs. The **boldface** in the species indicates the dissociated fragment. The **metal-X** BDEs are arranged on the basis of the Periodic Table with the new IUPAC notation for Groups 1 to 18, see inside front cover of this *Handbook*.

**TABLE 6. Bond Dissociation Energies in Diatomic Cations**

From thermochemistry, we have

$$D_{298}^{\circ}(\text{A}^+-\text{B}) \equiv \Delta_f H^{\circ}(\text{A}^+) + \Delta_f H^{\circ}(\text{B}) - \Delta_f H^{\circ}(\text{AB}^+) = D_{298}^{\circ}(\text{A}-\text{B}) + IP(\text{A}) - IP(\text{AB})$$

Thus,  $D_{298}^{\circ}(\text{A}^+-\text{B})$  may be derived using the Table 1 and the ionization potentials of species A and AB. The following Table has been arranged in an alphabetical order of the atoms. The **boldface** in the species indicates the dissociated fragment.

TABLE 7. Bond Dissociation Energies in Polyatomic Cations

This Table has been arranged on the basis of the Periodic Table with the IUPAC notation for Groups 1 to 18, see inside front cover of this *Handbook*. The **boldface** in the species indicates the dissociated fragment.

## ELECTRONEGATIVITY

Electronegativity is a parameter originally introduced by Pauling which describes, on a relative basis, the tendency of an atom in a molecule to attract bonding electrons. While electronegativity is not a precisely defined molecular property, the electronegativity difference between two atoms provides a useful measure of the polarity and ionic character of the bond between them. This table gives the electronegativity  $X$ , on the Pauling scale, for the most common oxidation state. Other scales are described in the references.

## FORCE CONSTANTS FOR BOND STRETCHING

Representative force constants ( $f$ ) for stretching of chemical bonds are listed in this table. Except where noted, all force constants are derived from values of the harmonic vibrational frequencies  $\omega_e$ . Values derived from the observed vibrational fundamentals  $\nu$ , which are noted by a, are lower than the harmonic force constants, typically by 2 to 3% in the case of heavy atoms (often by 5 to 10% if one of the atoms is hydrogen). Values are given in the SI unit newton per centimeter (N/cm), which is identical to the commonly used cgs unit mdyn/Å.

<sup>a</sup> Derived from fundamental frequency, without anharmonicity correction.

<sup>b</sup> Average of symmetric and antisymmetric (or degenerate) modes.

<sup>c</sup> Calculated from Local Symmetry Force Field (see Reference 2).

## FUNDAMENTAL VIBRATIONAL FREQUENCIES OF SMALL MOLECULES

This table lists the fundamental vibrational frequencies of selected three-, four-, and five-atom molecules. Both stable molecules and transient free radicals are included. The data have been taken from evaluated sources. In general, the selected values are based on gas-phase infrared, Raman, or ultraviolet spectra; when these were not available, liquid-phase or matrix-isolation spectra were used.

Molecules are grouped by structural type. Within each group, related molecules appear together for convenient comparison.

The vibrational modes are described by their approximate character in terms of stretching, bending, deformation, etc. However, it should be emphasized that most such descriptions are only approximate, and that the true normal mode usually involves a mixture of motions. Abbreviations are:

sym.	symmetric
antisym.	antisymmetric
str.	stretch
deform.	deformation
scis.	scissors
rock.	rocking
deg.	degenerate

In the case of free radicals, strong interactions may exist between the electronic and bending vibrational motions. Details can be found in References 3 and 4. The references should be consulted for information on the accuracy of the data and for data on other molecules not listed here.

All fundamental frequencies (more precisely, wavenumbers) are given in units of  $\text{cm}^{-1}$ .

## SPECTROSCOPIC CONSTANTS OF DIATOMIC MOLECULES

This table lists the leading spectroscopic constants and equilibrium internuclear distance  $r_e$  in the ground electronic state for selected diatomic molecules. The constants are those describing the vibrational and rotational energy through the expressions:

$$E_{\text{vib}}/hc = \omega_e(v + 1/2) - \omega_e x_e(v + 1/2)^2 + \dots$$

$$E_{\text{rot}}/hc = B_v J(J + 1) - D_v [J(J + 1)]^2 + \dots$$

where

$$B_v = B_e - \alpha_e(v + 1/2) + \dots$$

$$D_v = D_e + \dots$$

Here  $v$  and  $J$  are the vibrational and rotational quantum numbers, respectively,  $h$  is Planck's constant, and  $c$  is the speed of light. In this customary formulation the constants  $\omega_e$ ,  $B_e$ , etc. have dimensions of inverse length; in this table they are given in units of  $\text{cm}^{-1}$ .

Users should note that higher order terms in the above energy expressions are required for very precise calculations; constants for many of these terms can be found in the references. Also, if the ground electronic state is not  $^1\Sigma$ , additional terms are needed to account for the interaction between electronic and pure rotational angular momentum. For some molecules in the table the data have been analyzed in terms of the Dunham series expansion:

$$E/hc = \sum_{lm} Y_{lm}(v + 1/2)^l J^m (J + 1)^m$$

In such cases it has been assumed that  $Y_{10} = \omega_e$ ,  $Y_{01} = B_e$ , etc., although in the highest approximations these identities are not precisely correct. Some of the values of  $r_e$  in the table have been corrected for breakdown of the Born-Oppenheimer approximation, which can affect the last decimal place. Because of differences in the method of data analysis and limitations in the model, care should be taken in comparing  $r_e$  values for different molecules to a precision beyond 0.001 Å.

Molecules are listed in alphabetical order by formula as written in the most common form. In most cases this form places the more electropositive element first, but there are exceptions such as OH, NH, CH, etc.

\* Indicates a value for the interval between  $v = 0$  and  $v = 1$  states instead of a value of  $\omega_e$ .

# NUCLEAR SPINS, MOMENTS, AND OTHER DATA RELATED TO NMR SPECTROSCOPY

This table presents the following data relevant to nuclear magnetic resonance spectroscopy:

**Z:** Atomic number

**Isotope:** Element symbol and mass number

**Abundance:** Natural abundance of the isotope in percent. An \* indicates a radioactive nuclide; if no value is given, the nuclide is not present in nature or its abundance is highly variable.

**I:** Nuclear spin

**$\nu$ :** Resonant frequency in megahertz for an applied field  $H_0$  of 1 tesla (in cgs units, 10 kilogauss). The resonant frequency scales with  $H_0$ .

**Relative sensitivity:** Sensitivity relative to  $^1\text{H}$  (=1) assuming an equal number of nuclei and constant temperature. Values were calculated from the expressions:

$$\text{For constant } H_0: 0.0076508(\mu/\mu_N)^3(I+1)/I^2$$

$$\text{For constant } \nu: 0.23871(\mu/\mu_N)(I+1)$$

**$\mu/\mu_N$ :** Nuclear magnetic moment in units of the nuclear magneton  $\mu_N$

**Q:** Nuclear quadrupole moment in units of femtometers squared ( $1 \text{ fm}^2 = 10^{-2} \text{ barn}$ ). Because the determination of quadrupole moments requires knowledge of the electron configuration

near the nucleus, values of Q in the literature tend to scatter considerably. The values quoted here come mainly from the review of Pyykkö (Ref. 3), otherwise from Ref. 1.

The table includes all stable nuclides of non-zero spin for which spin and magnetic moment values have been measured, as well as selected radioactive nuclides of current or potential interest. At least one isotope is included for each element through  $Z = 95$  for which data are available. See Reference 1 for a complete listing of spins and moments.

The assistance of P. Pyykkö in providing data on nuclear quadrupole moments is gratefully acknowledged.

# PROTON NMR CHEMICAL SHIFTS FOR CHARACTERISTIC ORGANIC STRUCTURES

The chart below summarizes the range of chemical shifts for protons in several classes of organic compounds and substituent groups. The chemical shifts  $\delta$  are given in parts per million relative to tetramethylsilane.

## $^{13}\text{C}$ -NMR ABSORPTIONS OF MAJOR FUNCTIONAL GROUPS

The table below lists the range of  $^{13}\text{C}$  chemical shifts  $\delta$  in parts per million relative to tetramethylsilane, in descending order, for various functional groups. Examples of simple compounds for each family are given to illustrate the correlations. The shifts for the carbons of interest, which are italicized, are given in parentheses; when two or more values appear, they refer to the sequence of italicized carbon atoms from left to right in the formula.

$\delta$ (ppm)	Group	Family	Example ( $\delta$ of italicized carbon)		
220-165	$>\text{C}=\text{O}$	Ketones	$(\text{CH}_3)_2\text{CO}$	(206.0)	
			$(\text{CH}_3)_2\text{CHCOCH}_3$	(212.1)	
			$\text{CH}_3\text{CHO}$	(199.7)	
		Aldehydes	$\alpha,\beta$ -Unsaturated	$\text{CH}_3\text{CH}=\text{CHCHO}$	(192.4)
			carbonyls	$\text{CH}_2=\text{CHCOCH}_3$	(169.9)
		Carboxylic acids		$\text{HCO}_2\text{H}$	(166.0)
				$\text{CH}_3\text{CO}_2\text{H}$	(178.1)
			Amides	$\text{HCONH}_2$	(165.0)
		Esters		$\text{CH}_3\text{CONH}_2$	(172.7)
				$\text{CH}_3\text{CO}_2\text{CH}_2\text{CH}_3$	(170.3)
				$\text{CH}_2=\text{CHCO}_2\text{CH}_3$	(165.5)
				$\text{C}_6\text{H}_6$	(128.5)
		140-120	$>\text{C}=\text{C}<$	Aromatic	
Alkenes	$\text{CH}_2=\text{CH}_2$				(123.2)
	$\text{CH}_2=\text{CHCH}_3$			(115.9, 136.2)	
	$\text{CH}_2=\text{CHCH}_2\text{Cl}$			(117.5, 133.7)	
	$\text{CH}_3\text{CH}=\text{CHCH}_2\text{CH}_3$			(132.7)	
	$\text{CH}_3-\text{CN}$			(117.7)	
125-115	$-\text{CN}$	Nitriles			
		Alkynes	$\text{HCCH}$	(71.9)	
80-70	$-\text{CC}-$		$\text{CH}_3\text{CCH}_3$	(73.9)	
			$\text{CH}_3\text{OOCH}_2\text{CH}_3$	(57.6, 67.9)	
70-45	$-\text{C}-\text{O}$	Esters			
		Alcohols	$\text{HOCH}_3$	(49.0)	
			$\text{HOCH}_2\text{CH}_3$	(57.0)	
40-20	$-\text{C}-\text{NH}_2$	Amines	$\text{CH}_3\text{NH}_2$	(26.9)	
			$\text{CH}_3\text{CH}_2\text{NH}_2$	(35.9)	
			$\text{C}_6\text{H}_5-\text{S}-\text{CH}_3$	15.6	
30-15	$-\text{S}-\text{CH}_3$	Sulfides (thioethers)			
		Alkanes, cycloalkanes	$\text{CH}_4$	(-2.3)	
30-(-2.3)	$-\text{C}-\text{H}$		$\text{CH}_3\text{CH}_3$	(5.7)	
			$\text{CH}_3\text{CH}_2\text{CH}_3$	(15.8, 16.3)	
			$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$	(13.4, 25.2)	
			$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$	(13.9, 22.8, 34.7)	
			Cyclohexane	(26.9)

## BOND LENGTHS IN ORGANOMETALLIC COMPOUNDS

This table summarizes the average values of interatomic distances of representative metal–ligand bonds. Sigma bonds between *d*- and *f*-block metals and the elements C, N, O, P, S, and As are included. The values are extracted from a much larger list in Reference 1. The tabulated values are the unweighted means of reported measurements on compounds in each category. If four or more measurements are available, the standard deviation is given in parentheses. All values are in Ångstrom units ( $10^{-10}$  m).

The first part of the table covers metal-carbon bonds in different ligand categories, while the second part covers metal bonds to

other elements. R stands for any alkyl group; Me for a  $\text{CH}_3$  group;  $\text{C}_6\text{R}_5$  indicates an aryl group; and  $\text{C}(=\text{O})\text{R}$  an acyl group. Metals are listed in atomic number order.

## CHARACTERISTIC BOND LENGTHS IN FREE MOLECULES

This is a summary of typical bond lengths in gas-phase molecules. The value given for each bond is near the mid-range of values found in simple molecules. Bond lengths usually vary by 1 or 2%, and often by more, depending on the nature of the other bonds attached to the two atoms in question. References 1 and 2 give bond lengths in individual gas-phase molecules, as determined by spectroscopic and electron diffraction methods.

All bond distances are given in Å ( $1 \text{ \AA} = 10^{-10} \text{ m}$ ).

## ATOMIC RADII OF THE ELEMENTS

The simple model of an atom as a hard sphere that can approach only to a fixed distance from another atom to which it is not bonded has proved useful in interpreting crystal structures and other molecular properties. The term van der Waals radius,  $r_{\text{vdw}}$ , was originally introduced by Pauling as a measure of this atomic size. Thus in a closely packed structure two non-bonded atoms A and B will be separated by the sum of their van der Waals radii  $r_{\text{vdw}}$  (A) and  $r_{\text{vdw}}$  (B). The set of van der Waals radii proposed by Pauling was refined by Bondi (Reference 1) based on crystallographic data, gas kinetic collision cross sections, and liquid state properties. The non-bonded contact distances predicted from the recommended  $r_{\text{vdw}}$  of Bondi have been compared with actual data in the collection of the Cambridge Crystallographic Data Center by Rowland and Taylor (Reference 2) and modified slightly. Their recommended van der Waals radii are given in the third column of this table.

The Cambridge Crystallographic Data Center also makes use of a set of "covalent radii" to determine which atoms in a crystal are bonded to each other. Thus two atoms A and B are judged to be connected by a covalent bond if their separation falls within a tolerance of  $\pm 0.4 \text{ \AA}$  of the sum  $r_{\text{cov}}$  (A) +  $r_{\text{cov}}$  (B). The covalent radii are given in the fourth column of the table.

# HINDERED INTERNAL ROTATION

I. Ozier and N. Moazzen-Ahmadi

In asymmetric tops like methyl alcohol,  $\text{CH}_3\text{OH}$ , and symmetric rotors like  $\text{CH}_3\text{SiH}_3$ , the methyl group can undergo internal rotation relative to the rest of the molecule, traditionally called the frame (LS59, OM07). Although various different tops are considered here, all have three-fold symmetry. In such cases, the potential  $V$  hindering the internal rotation can be written:

$$V(\alpha) = V_3\left(\frac{1}{2}\right)(1 - \cos 3\alpha) + V_6\left(\frac{1}{2}\right)(1 - \cos 6\alpha) + V_9\left(\frac{1}{2}\right)(1 - \cos 9\alpha) + \dots,$$

where  $\alpha$  is the deviation from equilibrium of the angle between the top and frame that measures the torsional motion. If only the first two terms are retained, then  $V_3$  is the height of the hindering potential and  $V_6$  is the shape parameter. For symmetric tops like  $\text{CH}_3\text{CH}_3$  where the top and frame are identical,  $\alpha$  is replaced by  $2\gamma$  and the origin for  $\gamma$  is often taken as the eclipsed configuration. In the expansion,  $-\cos 6n\gamma$  is then replaced by  $(-1)^{n+1}\cos 6n\gamma$ , where  $n = 1, 2, \dots$ . In cases where different forms of the expansion have been used in the original works, the values of the parameters published there have been converted to the conventions defined here.

In Tables 1 and 2, values are given for  $V_3$  for a selection of asymmetric and symmetric tops, respectively. In cases where the higher order parameters have been determined, these are given in the Comments column. Where appropriate, this column also indicates the specific top, isomer, state, and/or isotopomer that has been studied. For ethane, three symmetric top isotopomer are listed to illustrate the isotopic dependence of  $V_3$  and  $V_6$ . In all other cases, only one isotopomer is listed, even if several have been studied. In all but one of these cases, the isotopomer reported is the one with the highest natural abundance. However,  $\text{CH}_3\text{OCDO}$  is listed because the results obtained are more precise than for  $\text{CH}_3\text{OCHO}$ . The molecules are listed alphabetically in Hill order according to the molecular formula.

The determinations listed for the potential parameters are effective values that incorporate to varying degrees effects from other molecular parameters. For example, the apparent value of  $V_3$  can be changed significantly if the reduced rotational constant  $F$  is calculated from the structure, rather than being determined independently (LS59). Other examples include such mechanisms as coupling to excited skeletal vibrations (OM07) and redundancies connecting some of the torsional parameters (LB68, MO87). The experimental uncertainties quoted are taken from the original works; no attempt has been made to standardize the definitions. All the potential parameters are given in  $\text{cm}^{-1}$ . Where the original work has reported these values in other units, the conversion to  $\text{cm}^{-1}$  has been carried out using standard factors (LB02):

$$1 \text{ calorie} = 4.1868 \text{ joules};$$

$$1 \text{ calorie/mole} = 0.34998915 \text{ cm}^{-1}.$$

A variety of different methods have been used to measure  $V_3$ ,  $V_6$ , and  $V_9$  (LS59, OM07); only a few of the more important will be discussed here. For *asymmetric rotors*, both the pure rotational spectrum and its torsion-rotation counterpart are electric dipole allowed and are affected in lowest order by the leading terms in the torsional Hamiltonian. Both types of spectra have been used extensively to determine  $V_3$  (LS59). For *symmetric tops* with a single torsional degree of freedom, either the permanent electric dipole moment vanishes, as in  $\text{CH}_3\text{CH}_3$ , or the normal rotational spectrum is independent of  $V_3$  in lowest order, as in  $\text{CH}_3\text{SiH}_3$ . In

the latter case, the molecular beam avoided crossing method can often be used (OM07). The torsion-rotation spectrum is forbidden in lowest order, but becomes weakly allowed through interactions with the infrared active skeletal vibrations (OM07). By employing long absorption path lengths, this spectrum has been used to determine  $V_3$  in a number of molecules. For both asymmetric and symmetric tops, the most precise determinations of the molecular parameters have been made in cases where both rotational and torsion-rotation spectra have been investigated.

TABLE 1. Asymmetric Top Potential Parameters

Name	Molecular Formula	Line Formula	Ref.	$V_3/\text{cm}^{-1}$	Comments
1 Trifluoromethanethiol	CH <sub>3</sub> S	CF <sub>3</sub> SH	LB02	500.83 ± 0.03	
2 Methylphosphonic difluoride	CH <sub>3</sub> F <sub>2</sub> OP	CH <sub>3</sub> P(=O)F <sub>2</sub>	SL06	676 ± 25	
3 Methanol	CH <sub>4</sub> O	CH <sub>3</sub> OH	LB02	373.594 ± 0.007	$V_6 = -1.597 ± 0.051$ $V_9 = 1.04 ± 0.20$
4 Methanethiol	CH <sub>4</sub> S	CH <sub>3</sub> SH	SH86	443.029 ± 0.070	$V_6 = -1.6451 ± 0.0144$
5 Methylsulfane	CH <sub>4</sub> S <sub>2</sub>	CH <sub>3</sub> SSH	TH86	609.0 ± 14.0	
6 Trifluoromethyl isocyanate	C <sub>2</sub> F <sub>3</sub> NO	CF <sub>3</sub> N=C=O	LB02	47.8769 ± 0.0051	
7 Trifluoroacetaldehyde	C <sub>2</sub> HF <sub>3</sub> O	CF <sub>3</sub> C(H)=O	DG87	298 ± 10	
8 Pentafluoroethane	C <sub>2</sub> HF <sub>5</sub>	CF <sub>3</sub> CHF <sub>2</sub>	EG96	1190 ± 4	
9 Acetyl bromide	C <sub>2</sub> H <sub>3</sub> BrO	CH <sub>3</sub> C(Br)=O	K60	456.7 ± 10.5	
10 1-Chloro-1,1-difluoroethane	C <sub>2</sub> H <sub>3</sub> ClF <sub>2</sub>	CH <sub>3</sub> CClF <sub>2</sub>	ALB97	1311.8 ± 1.4	
11 Acetyl chloride	C <sub>2</sub> H <sub>3</sub> ClO	CH <sub>3</sub> C(Cl)=O	LB02	442.74 ± 1.05	<sup>35</sup> Cl
12 Acetyl fluoride	C <sub>2</sub> H <sub>3</sub> FO	CH <sub>3</sub> C(F)=O	PK59	364.3 ± 2.1	
13 Methyl fluoroformate	C <sub>2</sub> H <sub>3</sub> FO <sub>2</sub>	CH <sub>3</sub> OC(F)=O	LB02	374.1 ± 0.2	
14 Methyl trifluoromethyl ether	C <sub>2</sub> H <sub>3</sub> F <sub>3</sub> O	CH <sub>3</sub> OCF <sub>3</sub>	LB02	382 ± 10	CH <sub>3</sub>
15 Acetyl iodide	C <sub>2</sub> H <sub>3</sub> IO	CH <sub>3</sub> C(=O)I	MK66	455.3 ± 10.5	
16 Methyl cyanate	C <sub>2</sub> H <sub>3</sub> NO	CH <sub>3</sub> OC≡N	LB02	399.0 ± 17.5	
17 1-Chloro-1-fluoroethane	C <sub>2</sub> H <sub>4</sub> ClF	CH <sub>3</sub> CHClF	LB02	1334.9 ± 3.8	
18 1,1-Difluoroethane	C <sub>2</sub> H <sub>4</sub> F <sub>2</sub>	CH <sub>3</sub> CHF <sub>2</sub>	LB02	1163.0 ± 2.5	
19 Acetaldehyde	C <sub>2</sub> H <sub>4</sub> O	CH <sub>3</sub> C(H)=O	KH96	407.716 ± 0.010	$V_6 = -12.068 ± 0.037$
20 Thioacetaldehyde S-oxide	C <sub>2</sub> H <sub>4</sub> OS	CH <sub>3</sub> C(H)=S=O	LB02	285.6 ± 0.3	Z isomer
21 Acetic acid	C <sub>2</sub> H <sub>4</sub> O <sub>2</sub>	CH <sub>3</sub> COOH	IA03	170.1742 ± 0.0002	$V_6 = -6.4725 ± 0.0001$
22 Methyl formate	C <sub>2</sub> H <sub>3</sub> DO <sub>2</sub>	CH <sub>3</sub> OC(D)=O	LB02	400.60 ± 0.03	deuterated
23 Fluoroethane	C <sub>2</sub> H <sub>5</sub> F	CH <sub>3</sub> CH <sub>2</sub> F	FD83	1172.1 ± 1.4	
24 Nitrosoethane	C <sub>2</sub> H <sub>5</sub> NO	CH <sub>3</sub> CH <sub>2</sub> N=O	LB02	903 ± 25	<i>gauche</i> conformer
	C <sub>2</sub> H <sub>5</sub> NO	CH <sub>3</sub> CH <sub>2</sub> N=O	LB02	911 ± 25	<i>cis</i> conformer
25 Acetamide	C <sub>2</sub> H <sub>5</sub> NO	CH <sub>3</sub> C(NH <sub>2</sub> )=O	LB02	24.949 ± 0.008	
26 Difluorodimethylsilane	C <sub>2</sub> H <sub>6</sub> F <sub>2</sub> Si	(CH <sub>3</sub> ) <sub>2</sub> SiF <sub>2</sub>	SG05	439.4 ± 2.5	

Name	Molecular Formula	Line Formula	Ref.	$V_3/\text{cm}^{-1}$	Comments

# LINE SPECTRA OF THE ELEMENTS

Joseph Reader and Charles H. Corliss

The original tables from which this table was derived were prepared under the auspices of the Committee on Line Spectra of the Elements of the National Academy of Sciences-National Research Council. The table contains the outstanding spectral lines of neutral (I) and singly ionized (II) atoms of the elements from hydrogen through plutonium ( $Z = 1-94$ ); selected strong lines from doubly ionized (III), triply ionized (IV), and quadruply ionized (V) atoms are also included. Listed are lines that appear in emission from the vacuum ultraviolet to the far infrared. These lines were selected from much larger lists in such a way as to include the stronger observed lines in each spectral region. A more extensive list may be found in Reference 1.

The data were compiled by the following contributors.

J. G. Conway — Lawrence Berkeley Laboratory  
C. H. Corliss — National Bureau of Standards  
R. D. Cowan — Los Alamos Scientific Laboratory  
C. R. Cowley — University of Michigan  
Henry M. and Hannah Crosswhite — Argonne National Laboratory  
S. P. Davis — University of California, Berkeley  
V. Kaufman — National Bureau of Standards  
R. L. Kelly — Naval Postgraduate School  
J. F. Kielkopf — University of Louisville  
W. C. Martin — National Bureau of Standards  
T. K. McCubbin — Pennsylvania State University  
L. J. Radziemski — Los Alamos Scientific Laboratory  
J. Reader — National Bureau of Standards  
C. J. Sansonetti — National Bureau of Standards  
G. V. Shalimoff — Lawrence Berkeley Laboratory  
R. W. Stanley — Purdue University  
J. O. Stoner, Jr. — University of Arizona  
H. H. Stroke — New York University  
D. R. Wood — Wright State University  
E. F. Worden — Lawrence Livermore Laboratory  
J. J. Wynne — International Business Machines Corporation  
R. Zalubas — National Bureau of Standards

All wavelengths are given in Ångstrom units ( $10^{-10}$  m). Below 2000 Å the wavelengths are in vacuum (except for the Cu II line at 1999.698 Å, which is in air); above 2000 Å the wavelengths are in air. Wavelengths given to three decimal places have an uncertainty of less than 0.001 Å and are therefore suitable for calibration purposes. In the air region, the elements used most commonly for calibration are Ne, Ar, Kr, Fe, Th, and Hg; in the vacuum region, the most common are C, N, O, Si, Cu.

All data refer to natural isotopic abundance of the elements except that Kr I and Kr II lines below 11,000 Å given to three decimal

places are for  $^{86}\text{Kr}$ . A separate table for  $^{198}\text{Hg}$  contains accurately known wavelengths that are frequently used for calibration.

A large number of the lines for neutral and singly ionized atoms were extracted from the National Bureau of Standards (NBS) *Tables of Spectral-Line Intensities* (Reference 2). The intensities of these lines represent quantitative estimates of relative line strengths that take account of varying detection sensitivity at different wavelengths. They are on a linear scale. For nearly all of the other lines the intensities represent qualitative estimates of the relative strengths of lines not greatly separated in wavelength. Because different observers frequently use different scales for their intensity estimates, these intensities are useful only as a rough indication of the appearance of a spectrum. In some cases the intensity scale is not intended to be linear. In the first and second spectra the intensities of the lines of the singly ionized atom (II) relative to those of the neutral atom (I) should be used with caution, inasmuch as the concentration of ions in a light source depends greatly on the excitation conditions.

Descriptive symbols that follow the wavelength have the following meanings:

c — complex  
d — line consists of two unresolved lines  
h — hazy  
l — shaded to longer wavelengths  
s — shaded to shorter wavelengths  
p — perturbed by a close line  
r — easily reversed  
w — wide

The table is arranged alphabetically by element name (not symbol); for each element the lines are listed by wavelength. References to the sources of data for each element are given at the end of the table, starting on page 10-89.

### Sources of Data for Each Element

Numbers following the element name refer to the references on the following pages.

Actinium: 193

Aluminum: 6,8,81,89,127,144,146,227,228,282

Americium: 92

Antimony: 164,167,194,386,406

Argon: 190,203,204,219,367,368,372,373,374,375,414,421

Arsenic: 163,168,197,244,280

Astatine: 188

Barium: 1,78,111,252,259,277,279

Berkelium: 53,339

Beryllium: 15,44,73,102,115,134,135,171,175,198,335

Bismuth: 1,357,358,359,360,361

Boron: 66,69,74,94,104,171,221,222

Bromine: 42,122,124,139,142,240,243,246,248,249,250,316

Cadmium: 44,285,296,353,399

Calcium: 16,25,70,150,270

Californium: 52,331

Carbon: 22,66,211

Cerium: 1,136,166,261,305

Cesium: 78,82,154,155,200,201,259,263,325

Chlorine: 11,28,30,31,85,233,238,239

Chromium: 1,379,380,412

Cobalt: 1,100,125,159,236,276,291

Copper: 199,273,290,295,324

Curium: 51,332

Dysprosium: 1

Einsteinium: 333

Erbium: 1,301

Europium: 1,312

Fluorine: 68,169,224,225,226

Francium: 408

Gadolinium: 1,46,137,151,152

Gallium: 2,19,62,132,140,141,143,195,281

Germanium: 5,119,293,340,341,342

Gold: 38,72,234,393,395

Hafnium: 1,369,404,410,425

Helium: 16,94,173,183,317

Holmium: 1

Hydrogen: 214

Indium: 1,132,348,349,350,351,352,353,435,436

Iodine: 20,21,58,84,124,153,161,176,184

Iridium: 1

Iron: 56,63,71,101,105,138,174,278,381,382

Krypton: 61,121,123,147,208,232,366,390,409,417,421

Lanthanum: 1,78,79,220,309

Lead: 54,64,106,256,274,297,283,329,330

Lithium: 3,15,17,18,37,44,112,284,321,335

Lutetium: 1,148,310,401

Magnesium: 4,7,49,83,103,128,129,177,217,269,315,335

Manganese: 1,126,385,405,433

Mercury (198): 43,50,69,145,229,242

Mercury (Natural): 34,45,90,117,133,189,235,304,327,328,343

Molybdenum: 1,383,420

Neodymium: 1

Neon: 56,58,69,118,150,230,364,365,371,388,389,400,402,413,430

Neptunium: 93

Nickel: 1,294,415,416,422

Niobium: 1,392,407,431

Nitrogen: 66,107,108,212,213,318

Osmium: 1

Oxygen: 23,24,36,66,69,209,210,215

Palladium: 1,287,424

Phosphorus: 179,180,182,336

Platinum: 1,288

Plutonium: 91

Polonium: 47,48

Potassium: 32,59,60,75,76,86,150,160,172,268,314,322

Praseodymium: 1,149,306,308,337,338

Promethium: 196,260

Protactinium: 96

Radium: 253,254

Radon: 251

Rhenium: 1

Rhodium: 1,396

Rubidium: 12,109,130,241,257,258,262,264

Ruthenium: 1,423

Samarium: 1

Scandium: 1,88,150,298,323

Selenium: 9,80,181,216,245,247,275

Silicon: 87,170,237,292,319,320

Silver: 13,99,255,286,289,363,387,398

Sodium: 178,205,206,207,268,299,334

Strontium: 1,109,110,218,231,265,279,313

Sulfur: 29,144,202,209,210,266

Tantalum: 1,411,426

Technetium: 35

Tellurium: 1,344,345,346,347

Terbium: 1,302

Thallium: 1,195,348,354,355,356

Thorium: 1,97,98,156,157,165,434

Thulium: 1,307

Tin: 187,191,399,423

Titanium: 1,378,427,428

Tungsten: 1

Uranium: 1,303

Vanadium: 1,394,397,432

Xenon: 33,116,118,120,232,384,391,429

Ytterbium: 1,40,192,311

Yttrium: 1,77,265,419

Zinc: 39,55,113,131,185,186,370,376,377

Zirconium: 1,362,403,418

# NIST ATOMIC TRANSITION PROBABILITIES

J. R. Fuhr and W. L. Wiese

For the 2005 edition of this *Handbook*, we include new, more accurate data for Fe I and Fe II,<sup>1</sup> and Ba I and Ba II.<sup>2</sup> The new tables contain critically evaluated atomic transition probabilities for over 10500 selected lines of all elements for which reliable data are available on an absolute scale. The material is largely for neutral and singly ionized spectra, but also includes a number of prominent lines of more highly charged ions of important elements.

Many of the data are obtained from comprehensive compilations of the Data Center on Atomic Transition Probabilities at the National Institute of Standards and Technology. Specifically, data have been taken from three recent comprehensive critical compilations on C, N and O,<sup>3</sup> on Sc through Mn<sup>4</sup> and Fe through Ni,<sup>5</sup> and special compilations on neutral and singly ionized iron and barium. Material from earlier compilations for the elements H through Ne<sup>6</sup> and Na through Ca<sup>7</sup> was supplemented by more recent material taken directly from the original literature. For the highly charged ions, some of the data were derived from studies of the systematic behavior of transition probabilities.<sup>8-10</sup> Most of the original literature is cited in the above tables and in recent bibliographies;<sup>11,12</sup> for lack of space, individual literature references are not cited here.

The wavelength range for the neutral species is normally the visible spectrum or shorter wavelengths; only the very prominent near infrared lines are included. For the higher ions, most of the strong lines are located in the far UV. The tabulation is limited to electric dipole — including intercombination — lines and comprises essentially the fairly strong transitions with estimated uncertainties in the 10% to 50% range. With the exception of hydrogen, helium, and the alkali metals, most transitions are between states with low principal quantum numbers.

The transition probability,  $A$ , is given in units of  $10^8 \text{ s}^{-1}$  and is listed to as many digits as is consistent with the indicated accuracy. The power of 10 is indicated by the E notation (i.e., E-02 means  $10^{-2}$ ). Generally, the estimated uncertainties of the  $A$ -values are  $\pm 25$  to 50% for two-digit numbers,  $\pm 10$  to 25% for three-digit numbers and  $\pm 1\%$  or better for four- and five-digit numbers.

Each transition is identified by the wavelength  $\lambda$  in ångströms ( $1 \text{ \AA} = 10^{-10} \text{ m}$ ); and the statistical weights,  $g_i$  and  $g_k$ , of the lower ( $i$ ) and upper ( $k$ ) states [the product  $g_k A$  (or  $g_i f$ ) is needed for many applications]. Whenever the wavelengths of individual lines within a multiplet are extremely close, only an average wavelength for the multiplet as well as the multiplet  $A$ -value are given, and this is indicated by an asterisk (\*) to the left of the wavelength. This also has been done when the transition probability for an entire multiplet has been taken from the literature and values for individual lines cannot be determined because of insufficient knowledge of the coupling of electrons. The wavelength data have been taken either from recent compilations or from the original literature cited in bibliographies published by the Atomic Energy Levels Data Center<sup>13,14</sup> at the National Institute of Standards and Technology. Wavelength values are consistent with those given in the table "Line Spectra of the Elements," which appears elsewhere in this *Handbook*.

In addition to the transition probability  $A$ , the atomic oscillator strength  $f$  and the line strength  $S$  are often used in the literature. The conversion factors between these quantities are (for electric-dipole transitions):

$$g_i f = 1.499 \cdot 10^{-8} \lambda^2 g_k A = 303.8 \lambda^{-1} S$$

where  $\lambda$  is in ångströms,  $A$  is in  $10^8 \text{ s}^{-1}$ , and  $S$  is in atomic units, which are

$$a_0^2 e^2 = 7.188 \cdot 10^{-59} \text{ m}^2 \text{ C}^2.$$

The table for hydrogen is presented first, followed by the tables for other elements in alphabetical sequence by element name (not symbol). Within each element, the tables are ordered by increasing ionization stage (e.g., Al I, Al II, etc.).

The transition probabilities for hydrogen and hydrogen-like ions are known precisely. Because of the hydrogen degeneracy, a "transition" is actually the sum of all fine-structure transitions between the principal quantum numbers; therefore, the hydrogen table gives weighted average  $A$ -values. For hydrogen-like ions of nuclear charge  $Z$ , the following scaling laws hold:

$$A_Z = Z^4 A_{\text{Hydrogen}}$$

$$f_Z = f_{\text{Hydrogen}}$$

$$S_Z = Z^{-2} S_{\text{Hydrogen}}$$

$$\lambda_Z = Z^{-2} \lambda_{\text{Hydrogen}}$$

For very highly charged hydrogen-like ions, starting at about  $Z > 25$ , relativistic corrections<sup>15</sup> must be applied.

# ELECTRON AFFINITIES

Thomas M. Miller

Electron affinity is defined as the energy difference between the lowest (ground) state of the neutral and the lowest state of the corresponding negative ion. The accuracy of electron affinity measurements has been greatly improved since the advent of laser photodetachment experiments with negative ions. Electron affinities can be determined with optical precision, though a detailed understanding of atomic and molecular states and splittings is required to specify the photodetachment threshold corresponding to the electron affinity.

Atomic and molecular electron affinities are discussed in two excellent articles reviewing photodetachment studies which appear in *Gas Phase Ion Chemistry*, Vol. 3, Bowers, M. T., Ed., Academic Press, Orlando, 1984: Chapter 21 by Drzaic, P. S., Marks, J., and Brauman, J. I., "Electron Photodetachment from Gas Phase Negative Ions," p. 167, and Chapter 22 by Mead, R. D., Stevens, A. E., and Lineberger, W. C., "Photodetachment in Negative Ion Beams," p. 213. Persons interested in photodetachment details should consult these articles and the critical reviews of Andersen, T., Haugen, H. K., and Hotop, H., *J. Phys. Chem. Ref. Data*, 28, 1511, 1999; Hotop, H. and Lineberger, W. C., *J. Phys. Chem. Ref. Data*, 14, 731, 1985; and Andersen, T., Haugen, H. K., and Hotop, H., *J. Phys. Chem. Ref. Data* 28, 1511, 1999. For simplicity in the tables below, any electron affinity that was discussed in the articles by Drzaic et al. or Hotop and Lineberger is referenced to these sources, where original references are given. The development of cluster-ion pho-

todetachment apparatuses has brought an explosion of electron affinity estimates for atomic and molecular clusters. The policy in this tabulation is to list the electron affinities for the atoms, diatoms, and triatoms, if adiabatic electron affinities have been determined, but to refer the reader to original sources for higher-order clusters. Additional data on molecular electron affinities may be found in Lias, S. G., Bartmess, J. E., Liebman, J. F., Holmes, J. L., Levin, R. D., and Mallard, W. G., *Gas Phase Ion and Neutral Thermochemistry*, *J. Phys. Chem. Ref. Data*, 17, (Supplement No. 1), 1988 and on the NIST WebBook at the Internet address <http://webbook.nist.gov/>.

For the present tabulation the 2002 CODATA value  $e/hc = 8065.54445 \pm 0.00069 \text{ cm}^{-1} \text{ eV}^{-1}$  (<http://physics.nist.gov>) has been used to convert electron affinities from the units used in spectroscopic work,  $\text{cm}^{-1}$ , into eV for these tables. The 86 ppb uncertainty in  $e/hc$  is insignificant compared to uncertainties in the electron affinity measurements.

Abbreviations used in the tables: calc = calculated value; PT = photodetachment threshold using a lamp as a light source; LPT = laser photodetachment threshold; LPES = laser photoelectron spectroscopy; DA = dissociative attachment; attach = electron attachment/detachment equilibrium; e-scat = electron scattering; kinetic = dissociation kinetics; Knud=Knudsen cell; CT = charge transfer; CD = collisional detachment; and ZEKE = zero electron kinetic energy spectroscopy.
