sing from the domains, protection-money paid by the Jews, tolls, land-tax, mines, forests, duties on stamp-paper, salt, and variety of other imposts and excises, is computed at about 2,500,000 crowns; but the money is said to be much inferior in goodness to that of Saxony and the dominions of Hanover. During the late war it was extremely debased. Some estimate the whole number of the inhabitants of the royal and electoral dominions at 5,000,000, and the revenues at about 2,000,000 sterling. The present king and elector keeps upwards of 100,000 men on foot in time of peace, which are said to cost him more than half of his whole revenue. These troops are under strict discipline, very expert at their exercise, always in readiness to march, and always complete. Each regiment has a particular canton or district allotted it for its quarters and raising recruits. The infantry are clothed in blue, and the horse and dragoons in white; and both are required to hear sermons twice a-day when in quarters or garrisons. In time of peace they are allowed, for several months in the year, to hire themselves out, or to follow their business either as burghers or peasants, in the canton where they are quartered; but they are not allowed to marry. A considerable part of these troops are stationed in the Mark, particularly at Berlin and Potsdam. The corps of hussars alone amounts to about 10,000 men. The Mark of Brandenburg is divided, in general, into the electoral and new Marks. The former is again subdivided into the old Mark, the Pregnitz, the middle Mark, and the Ucker Mark. The old Mark, which lies on the west side of the Elbe, between that river and Lunenburg, is about 50 miles in length, and 30 in breadth.

BRANDENBURG, a city of Germany, and capital of the marquisate of that name, situated on the river Havel, in E. Long. 13°. N. Lat. 52. 25. It is divided into the old and new town, and was anciently the see of a bishop. The mountain in the neighbourhood called *Marienbergr*, is planted with vines. Here is a small colony of French Calvinists, with a manufacture of cloth, fustain, and canvas; and a pretty good trade is carried on by the Havel. The fort here looks like a suburb, and contains a riding-school, with the cathedral church. The greatest part also of the members of the chapter which still subsists, and is composed of a Lutheran provost, dean, senior, subdeacon, and three other canons, reside in it. They are distinguished by a cross of gold enamelled with violet, terminating in eight points; and have a considerable citate. Near the town is a large lake.

BRANDON, a town of Suffolk in England, seated on the little river Ouse, over which it has a bridge, and a ferry at a mile's distance: whence it is divided into Brandon, and Brandon-ferry; which last has the most business, because commodities are brought thither from the isle of Ely. E. Long. o. 55. N. Lat. 52. 30.

BRANDRITH, a trevet, or other iron utensil, to fet a vessel on over the fire.

BRANDT (Gerard), a learned divine of the reformed religion, was born at Amsterdam in 1626, and was successively minister in several places of the Netherlands. He wrote some works which are esteemed, particularly The history of the reformation of the Netherlands, 4 vols 4to; and The life of admiral Ruyter; both written in the Flemish tongue. He died at Rot-

terdam in 1685;

BRANDY, a spirituous and inflammable liquor, extracted from wine and other liquors by distillation †.

Wine-brandy, made in France, is esteemed the best in Europe. They make it wherever they make wine, and for that purpose use wine that is pricked rather than good wine. The chief brandies for foreign trade, and those accounted best, are the brandies of Bourdeaux, Rochelle, Cogniac, Charenton, the isle of Rhe, Orleans, the county of Blaisois, Poictou, Touraine, Anjou, Nantz, Burgundy, and Champaign.

BRANK, an instrument used in some parts of Scotland, and in Staffordshire, for correcting scolding women. It is a sort of head-piece, which opens, and incloses the head of the impatient, while an iron, sharp as a chisel, enters the mouth, and subdues the more dreadful weapon within. Thus harnessed, the offender is led in triumph through the streets. Dr Plot, in his History of Staffordshire, has favoured the world with a minute description and figure of the instrument †, which is there called a *scolding-bridle*; and tells us, he looks upon it "as much to be preferred to the ducking-stool, which not only endangers the health of the party, but also gives the tongue liberty betwixt every dip; to neither of which this is at all liable."

BRANLIN, in ichthyology, a species of salmon, with several transverse black streaks, resembling the impression of so many fingers.

BRANSKA, a town of Transylvania, situated on the river Maris. E. Long. 23. 15. N. Lat. 46. 0.

BRASIDAS, a celebrated general of the Lacedaemonians, about 424 years before the birth of Christ. He defeated the Athenians by land and sea, took many places, and rendered his country formidable to all the neighbouring states. He conquered the Athenians on their attempting to surprize Amphipolis, but died of the wounds he received in that battle *.

BRASIDA, an anniversary solemnity at Sparta, in memory of Brasidas, a Lacedaemonian captain, famous for his achievements at Methone, Pylos, and Amphipolis. It was celebrated with sacrifices and games, wherein none were permitted to contend but free-born Spartans. Whoever neglected to be present at the solemnity was fined.

BRASIL, a large country of South America, being the easternmost part of that continent, lying between the equinoctial line and the tropic of Capricorn. It is about 1560 miles in length, and 1000 in breadth; but, measuring along the coast, it is 2000 miles long, and is bordered with mountains that open from time to time, and form good harbours where vessels may lie in safety. It was accidentally discovered by the Portuguese in 1500. Emanuel king of Portugal had equipped a squadron of 13 sail, carrying 1200 soldiers and sailors destined for the East Indies, under the conduct of Peter Alvarez Cabral. This admiral, quitting Lisbon on the 9th of March 1500, struck out to sea to avoid the coast of Guinea, and steered his course southward, that he might the more easily turn the Cape of Good Hope, which projects a good way into the ocean. On the 24th of April, he got sight of the continent of South America, which he judged to be a large island at some distance from the coast of Africa. Coasting along for some time, he ventured to send a boat on shore; and was astonished to observe the in-

Brandy
Bragil.

habitants

Brasil.

bitants entirely different from the Africans in features, hair, and complexion. It was found, however, impracticable to seize upon any of the Indians, who retired with great celerity to the mountains on the approach of the Portuguese; yet, as the sailors had discovered a good harbour, the admiral thought proper to come to an anchor, and called the bay *Puerto Seguro*. Next day he sent another boat on shore, and had the good fortune to lay hold on two of the natives, whom he clothed and treated kindly, and then dismissed, to make a proper report to their countrymen. The stratagem had the desired effect. The Indians, having heard the relation of the prisoners, immediately crowded to the shore, singing, dancing, and sounding horns of different kinds; which induced Cabral to land, and take solemn possession in the name of his Portuguese majesty.

As soon as the court of Lisbon had ordered a survey to be taken of the harbours, bays, rivers, and coasts of Brasil, and was convinced that the country afforded neither gold nor silver, they held it in such contempt, that they sent thither none but condemned criminals and abandoned women. Two ships were sent every year from Portugal, to carry the refuse of the kingdom to this new world, and to bring home parrots and woods for the dyers and cabinet-makers. Ginger was afterwards added; but soon after prohibited, lest it should interfere with the sale of the same article from India.

In 1548, the Jews, many of whom had taken refuge in Portugal, beginning to be persecuted by the inquisition, were stripped of their possessions, and banished to Brasil. Here, however, they were not entirely forsaken. Many of them found kind relations and faithful friends; others, who were known to be men of probity and understanding, obtained money in advance from merchants of different nations with whom they had formerly had transactions. By the assistance of some enterprising men, they were enabled to cultivate sugar-canes, which they first procured from the island of Madeira. Sugar, which till then had been used only in medicine, became an article of luxury. Princes and great men were all eager to procure themselves this new species of indulgence. This circumstance proved favourable to Brasil, and enabled it to extend its sugar plantations. The court of Lisbon, notwithstanding its prejudices, began to be sensible, that a colony might be beneficial to the mother-country, without producing gold or silver; and this settlement, which had been wholly left to the capricious management of the colonists, was now thought to deserve some kind of attention; and accordingly Thomas de Souza was sent thither, in 1549, to regulate and superintend it.

This able governor began by reducing these men, who had always lived in a state of anarchy, into proper subordination, and bringing their scattered plantations closer together; after which he applied himself to acquire some information respecting the natives, with whom he knew he must be incessantly engaged either in traffic or war. This it was no easy matter to accomplish. Brasil was full of small nations, some of which inhabited the forests, and others lived in the plains and along the rivers. Some had settled habitations; but the greater number of them led a roving life, and most of them had no intercourse with each other. It is not to be supposed that such a people

Brasil.

would be at all disposed to submit to the yoke which the Portuguese wanted to put upon them on their arrival. At first they only declined all intercourse with these strangers: but finding themselves pursued in order to be made slaves, and to be employed in the labours of the field, they took the resolution to murder and devour all the Europeans they could seize upon. The friends and relations of the savages that were taken prisoners, also ventured to make frequent attempts to rescue them, and were sometimes successful; so that the Portuguese were forced to attend to the double employments of labour and war.

Souza did not bring a sufficient number of forces to change the situation of affairs. Indeed, by building San Salvador, he gave a centre to the colony; but the honour of settling, extending, and making it really useful to the mother-country, was reserved for the Jesuits who attended him. These men, who for their arts of insinuation and address have been equalled by none, dispersed themselves among the Indians. When any of the missionaries were murdered, they were immediately replaced by others; and seeming to be inspired only with sentiments of peace and charity, the Indians, in process of time, grew not only familiar but passionately fond of them. As the missionaries were too few in number to transact all the business themselves, they frequently deputed some of the most intelligent Indians in their stead. These men having distributed hatchets, knives, and looking glasses, among the savages they met with, represented the Portuguese as a harmless, humane, and good sort of people.

The prosperity of the colony of Brasil, which was visible to all Europe, excited the envy of the French, Spaniards, and Dutch successively. The latter, indeed, bid fairest for the conquest of the whole. Their admiral Henry Louk arrived, in the beginning of the year 1630, with 46 men of war, on the coast of Fernambucca, one of the largest and best fortified captainships of these parts. He reduced it after several obstinate engagements, in which he was always victorious. The troops he left behind subdued the captainships of Temara, Pareiba, and Rio Grande, in the years 1633, 1634, and 1635. These, as well as Fernambucca, furnished annually a large quantity of sugar, a great deal of wood for dyeing, and other commodities. The Hollanders were so elated with the acquisition of this wealth, which flowed to Amsterdam instead of Lisbon, that they determined to conquer all the Brasils, and entrusted Maurice of Nassau with the conduct of this enterprise. That general reached the place of his destination in the beginning of the year 1637. He found the soldiers so well disciplined, the commanders such experienced men, and so much readiness in all to engage, that he directly took the field. He was successively opposed by Albuquerque, Banjola, Lewis Rocca de Borgia, and the Brazilian Cameron, the idol of his people, passionately fond of the Portuguese, brave, active, cunning, and who wanted no qualification necessary for a general, but to have learned the art of war under able commanders. These several chiefs exerted their utmost efforts to defend the possessions that were under their protection; but their endeavours proved ineffectual. The Dutch seized upon the captainships of Siara, Serregippe, and the greater part of that of Bahia. Seven of the 15 provinces which composed the colony had already

ready

ready submitted to them, and they flattered themselves that one or two campaigns would make them masters of the rest of their enemies' possessions in that part of America; when they were suddenly checked by the revolution happening on the banishment of Philip IV. and placing the duke of Braganza on the throne. After this, the Portuguese recovering their spirits, soon drove the Dutch out of Brasil, and have continued masters of it ever since.

The country of Brasil is divided into the following provinces, viz. Paria, Maragnano, Siara, Rio Grande, Pareiba, Tamarica, Fernambuco, Serengeppe, Bahia, Porto Seguro, Esperito Santo, Rio de Janeiro, Angra, St Vincent, and Del Rey. See these articles.

The first aspect of the country from the sea is rather unfavourable, as it appears high, rough, and unequal; but, on a more narrow inspection, nothing can be more delightful, the eminences being covered with woods, and the valleys and savannahs with the most refreshing verdure. In so vast a tract of land, it cannot be imagined that the climate will be found at all equal, or the seasons uniform. The northern provinces are subject to heavy rains and variable winds, like other countries under the same parallels. Tornados, storms, and the utmost fury of the elements, wreak their vengeance here; while the southerly regions are blessed with all the comforts which a fine fertile soil and temperate climate can afford. In some of the provinces, the heat of the climate is thought to prove favourable to the generation of a great variety of poisonous reptiles; some of which, as the *liboya*, or *roebuck* snake, are said to extend to the length of 30 feet, and to be two or three yards in circumference. The rattlesnake, and other reptiles of the same kind, grow likewise to an enormous size; and the serpent called *ibibakoka* is affirmed to be seven yards long, and half a yard in circumference, possessed too of a poison instantaneously fatal to the human race. Here also are scorpions, ant-bears, tygers or madilloes, porcupines, jaoonveras, and an animal called *tapirafon*, which is the production of a bull and an ass, having a great resemblance to both. No country on earth affords a greater number of beautiful birds, nor variety of the most exquisite fruits; but the chief commodities are Brasil wood, ebony, dyng woods, ambergris, rosin, balsams, indigo, sweetmeats, sugar, tobacco, gold, diamonds, beautiful pebbles, crystal, emeralds, jasper, and other precious stones; in all which the Portuguese carry on such an amazing trade, as may justly be reputed the support, and indeed the vital fountain, of the mother-country. The gold and diamond mines are but a recent discovery: they were first opened in the year 1681; and have since yielded above five millions Sterling annually, of which sum a fifth belongs to the crown. So plentiful are diamonds in this country, that the court of Portugal hath found it necessary to restrain their importation, to prevent too great a diminution of their value. They are neither so hard, nor so clear, as those of the East Indies, nor do they sparkle so much, but they are whiter. The Brazilian diamonds are sold ten per cent. cheaper than the Oriental ones, supposing the weights to be equal. The largest diamond in the world was sent from Brasil to the king of Portugal. It weighs 1680 carats, or 12½ ounces; and has been valued at 56,787,500l. Some skilful lapidaries, however, are of opinion that this supposed diamond is only a to-

paz; in which case a very great abatement must be made in its value. The crown-revenue arising from this colony amounts to two millions sterling in gold, if we may credit some late writers, besides the duties and customs on merchandize imported from that quarter. This indeed is more than a fifth of the precious metal produced by the mines; but, every other consequent advantage considered, it probably does not much exceed the truth. The excessive confluence of people to the Brasil colonies, as well from other countries as from Portugal, not only enlarges the imports of gold, but, what is of infinitely more importance to Europe in general, the exportation of the manufactures of this hemisphere; of which the principal are the following. Great Britain sends woollen manufactures; such as fine broad medley cloths, fine Spanish cloths, scarlet and black cloths; ferges, duroys, druggets, sagathies, shalloons, camblets, and Norwich stuffs; black Colchester bays; says, and perpetuanas called *long ells*; hats, stockings, and gloves. Holland, Germany, and France, chiefly export fine hollands, bone-lace, and fine thread: silk manufactures, pepper, lead, block tin, and other articles, are also sent from different countries. Besides the particulars already specified, England likewise trades with Portugal, for the use of the Brasils, in copper and brass, wrought and unwrought pewter, and all kinds of hardware: all which articles have so enlarged the Portuguese trade, that, instead of 12 ships usually employed in the Brasil commerce, there are now never fewer than 100 sail of large vessels constantly going and returning to those colonies. To all this may be added the vast slave-trade carried on with the coast of Africa for the use of the Brasil colonies; which, we may believe, employs a great number of shipping, from the multitude of slaves that are annually transported. Indeed the commerce of Brasil alone is sufficient to raise Portugal to a considerable height of naval power, as it maintains a constant nursery of seamen: yet a certain insatiation in the policy of the country has prevented that effect even amidst all these extraordinary advantages. All the ships in this trade, being under the direction of the government, have their appointed seasons of going and returning, under convoy of a certain number of men of war: nor can a single ship clear out or go, except with the fleet, but by a special licence from the king, which is seldom granted; though it is easily determined, that such restrictions can prove no way beneficial to the general commerce, though possibly the crown-revenue may be better guarded thereby. The fleets sail in the following order, and at the following stated periods: That to Rio de Janeiro sets sail in January; the fleet to Balria, or the bay of All Saints, in February; and the third fleet, to Fernambuco, in the month of March.

BRASIL-WOOD, or *Brasil-wood*, an American wood of a red colour, and very heavy. It is denominated variously, according to the places from whence it is brought: Thus we have brasil of Fernambuco, Japan, Lamou, &c. For its description, &c. see *CÆSALPINA*.

BRASILETTO, the same with Brasil-wood.

BRASLAW, a considerable town of Poland, in Lithuania, and palatinate of Wilna, with a castle. It is situated on a small lake, in E. Long. 17. 5. N. Lat. 55. 45.

BRASS, or, as the French call it, *yellow copper*, is

Brass.

Brass.

a factitious metal, made of copper and zinc, or lapis calaminaris. See CHEMISTRY, n^o 377.

† Gen. iv. The first formation of brass, as we are assured by scripture, was prior to the flood, and discovered even in the seventh generation from Adam †. But the use of it was not, as is generally believed, and the Arundelian marbles assert, previous to the knowledge of iron. They were both first known in the same generation, and first wrought by the same discoverer. And the knowledge of them must have been equally carried over the world afterwards, with the spreading of the colonies of the Noachides. An acquaintance with the one or the other was absolutely necessary to the existence of the colonists; the clearing away of the woods about their settlements, and the erection of houses for their habitation.

The ancient Britons, though acquainted from the remotest periods with the use of both these metals, remained long ignorant that they were to be obtained in the island. Before this discovery they imported all their iron and brass from the continent. And when they had at length detected the former in their own hills, and had ceased to introduce it, they continued to receive the latter. Their want of the metal remained, and no mines of it were opened in the island. In the earliest ages, whose manners have been delineated by history, we find the weapons of their warriors invariably framed of this factitious metal; and the most authentic of all the profane records of antiquity, the Arundelian marbles, for that reason, mistakenly date the first discovery of iron a couple of centuries below the Trojan war. Every military nation, as such, is naturally studious of brightness in its arms; and the Britons, particularly, gloried in the neatness of theirs. For this reason the nations of the world still fabricated their arms of brass, even long after the Arundelian æra for the discovery of iron; and the Britons continued to import it from the continent, though they had found iron to be a native of the country, and could have supplied themselves with a sufficient quantity of it.

† Hist. of Manchester.

Mr Whittaker † supposes, that when the Britons derived their iron and brass from the continent, they purchased the latter at an easier expence than the former. The Gauls had many large brass works carried on in the kingdom, but seem to have had few iron forges within it. And this would naturally induce the Belgæ to be less diligent in their inquiry after the veins of copper and calamine at home, than for the courses of iron ore; though the one was equally discoverable in the island as the other, and lay equally within the Belgic regions of it. Brass being thus cheaper than iron, they necessarily formed with it some domestic as well as military implements. Such were common among the Gauls; and such were familiar to the Britons, either imported into the island, as some actually were, or manufactured within it, as others also assuredly were. The Britons had certainly brass founderies erected among them, and minted money, and fabricated weapons of brass.

In this condition of the works, the Romans entered the island. And, seeing so great a demand among the natives for this article, they would speedily instruct them to discover the materials of it among themselves. This must unavoidably have resulted from the conquest of the Romans. The power of surprising their new

subjects with so unexpected a discovery would naturally stimulate the pride of the Roman intellect; and the desire of obliging themselves with so cheap a supply of that useful metal, stationary as they were in that kingdom, would also equally actuate the selfishness of the Roman heart. The veins of copper and calamine would be easily found out by an experienced inquirer after them; and the former metal is therefore distinguished among the Welsh, only by the Roman appellation of *cyprium, koppr*, or copper. And many founderies of brass appear to have been established in the island. Some had been erected before, one perhaps within the confines of every kingdom, and probably in the vicinity of every capital. One at least would be necessary, in order to supply the armory of the principality; and one perhaps was sufficient for most of the British states. But several appear now to have been settled in every kingdom, and one perhaps near every stationary town. Two have been discovered in the single county of Essex, and within a narrow portion of it at Fifeild and Danbury. And a third was placed upon Easterly Moor in Yorkshire, 12 miles to the north-west of York, and in the neighbourhood of Ifurium or Aldborough.

Corinthian Brass, famous in antiquity, is a mixture of gold, silver, and copper. L. Mummius having sacked and burnt the city of Corinth, 146 years before Christ, it is said this metal was formed from the immense quantities of gold, silver, and copper, wherewith that city abounded, thus melted and run together by the violence of the conflagration.

BRASS, in the glass trade.—Thrice-calcined brass is a preparation which serves the glassmen to give many very beautiful colours to their metal. The manner of preparing it is this: Place thin plates of brass on tiles on the leet of the furnace near the ochsis; let it stand to be calcined there for four days and it will become a black powder sticking together in lumps. Powder this, sift it fine, and recalcine it four or five days more; it will not then stick together, but remain a loose powder, of a russet colour. This is to be calcined a third time in the same manner; but great care must be taken in the third calcination, that it be not overdone nor underdone; the way to be certain when it is right, is, to try it several times in glass while melting. If it makes it, when well purified, to swell, boil, and rise, it is properly calcined; if not, it requires longer time. This makes, according to the different proportions in which it is used, a sea-green, an emerald green, or a turcoise colour.

Brass, by long calcination alone, and without any mixture, affords a fine blue or green colour for glass; but they have a method of calcining it also with powdered brimstone, so as to make it afford a red, a yellow, or a chalcedony colour, according to the quantity and other variations in the using it. The method of making the calcination is this: Cut thin plates of brass into small pieces with sheers, and lay them stratum super stratum, with alternate beds of powdered sulphur, in a crucible; calcine this for 24 hours in a strong fire; then powder and sift the whole; and finally, expose this powder upon tiles for 12 days to a reverberating furnace; at the end of this time, powder it fine, and keep it for use. The glass-makers have also a method of procuring a red powder from brass, by a more simple calci-

calcination, which serves them for many colours. The method of preparing it is this: They put small and thin plates of brass into the arches of the glass furnaces, and leave them there till they are sufficiently calcined, which the heat in that place, not being enough to melt them, does in great perfection. The calcined matter powdered, is of a dusky red, and requires no farther preparation.

BRASS-COLOUR, one prepared by the braziers and colour-men to imitate brass. There are two sorts of it; the red brass, or bronze, and the yellow or gilt brass: the latter is made only of copper-silings, the smallest and brightest that can be found; with the former they mix some red ochre, finely pulverized; they are both used with varnish.—In order to make a fine brass that will not take any rust or verdigraese, it must be dried with a chafing-dish of coals as soon as it is applied.—The finest brass colour is made with powder-brass imported from Germany, diluted into a varnish, made and used after the following manner. The varnish is composed of one pound four ounces of spirit of wine, two ounces of gum-lac, and two ounces of sandarac; these two last drugs are pulverized separately, and afterwards put to dissolve in spirit of wine, taking care to fill the bottle but half full. The varnish being made, you mix such quantity as you please of it with the pulverized brass, and apply it with a small brush to what you would brass over. But you must not mix too much at once, because the varnish being very apt to dry, you would not have time to employ it all soon enough; it is therefore better to make the mixture at several times. After this manner they brass over figures of plaster, which look as well as if they were of cast brass.

BRASS-LUMPS, a common name given by miners to the globular pyrites. See PYRITES.

BRASSAW, or **CRONSTADT**, a strong town of Transylvania in Burezland; seated on the river Buxel, in E. Long. 22. 35. N. Lat. 46. 30.

BRASSE, in ichthyology, a species of PERCA.

BRASSICA, **CABBAGE**; a genus of the siliquosa order, belonging to the tetradynamia class of plants.

Species. I. The oleracea, or common white cabbage. Of this there are commonly reckoned the following varieties. 1. The sabauda, or Savoy cabbage. 2. The rubra, or red cabbage. 3. The pyramidalis, or sugar-loaf cabbage. 4. The præcox, or early cabbage. 5. The peregrina, or foreign milk-cabbage. 6. The muscovitica, or small Russian cabbage. 7. The capitata, or large-sided cabbage. 8. The viridis, or green Savoy. 9. The laciniata, or borcole. 10. The selenisia, or green borcole. 11. The fimbriata, or Siberian borcole, by some called *Scotch kale*. Of these Mr. Miller thinks the second sort is undoubtedly a distinct species; as he always found the seeds produce the same, with this difference only, that in good ground the stalks are much larger than in poor land. The other species are, 11. The napo brassica, or turnip-rooted cabbage. 12. The botrytis, or cauliflower, which hath two varieties, viz. Purple and white broccoli. 13. The sylvestris, or taller shrubby sea-cabbage. 14. The violacea, with entire, oval, spear-shaped, smooth, leaves, which are indented. 15. The purpurea, with oblong, heart-shaped leaves, embracing the stalks, which are entire. 16. The orientalis, or colewort with heart-shaped smooth leaves, which embrace the stalk. 17. The gongyloides, wild navew, or cole-feed. To

VOL. II.

these species Linnæus joins the turnip, navew, and rocket; but as it would be apt to breed confusion to class these plants along with cabbages, when speaking of their culture and uses, however proper it may be in a system of botany, we shall speak of them under their proper names.

Culture, &c. The second sort never varies. It grows naturally on the sea-shore near Dover. It hath a perennial branching stalk, in which it differs from all the other species. In very severe winters, when the other sorts are destroyed, this is a necessary plant, for the most severe frosts do not injure it. The flower-stalks grow from the end of the branches, and spread out horizontally; but those which arise from the centre of the plants grow erect, and seldom put out branches. The cauliflower has been much more improved in Britain than in any other part of Europe. In France they rarely have cauliflowers till Michaelmas, and Holland is generally supplied with them from Britain. In many parts of Germany there were none of them cultivated till within a few years past, and most parts of Europe are supplied with seeds from Britain. The eighth sort, which is generally known by the title of *rape* or *cole seed*, is much cultivated in the isle of Ely, and some other parts of England, for its seed, from which rape-oil is drawn; and it hath also been cultivated of late years, in other places, for feeding of cattle, to great advantage. The cole seed, when cultivated for feeding of cattle, should be sown about the middle of June. The ground for this should be prepared for it in the same manner as for turnips. The quantity of seeds for an acre of land is from six to eight pounds; and as the price of the seed is not great, so it is better to allow eight pounds; for if the plants are too close in any part, they may be easily thinned when the ground is hoed, which must be performed in the same manner as is practised for turnips, with this difference only, of leaving these much nearer together; for as they have fibrous roots and slender stalks, so they do not require near so much room. These plants should have a second hoeing, about five or six weeks after the first, which, if well performed in dry weather, will entirely destroy the weeds, so they will require no farther culture. Where there is not an immediate want of food, these plants had better be kept as a reserve for hard weather, or spring feed, when there may be a scarcity of other green food. If the heads are cut off, and the stalks left in ground, they will shoot again early in the spring, and produce a good second crop in April; which may be either fed off, or permitted to run to seeds, as is the practice where this is cultivated for the feeds: but if the first is fed down, there should be care taken that the cattle do not destroy their stems, or pull them out of the ground. As this plant is so hardy as not to be destroyed by frost, so it is of great service in hard winters for feeding of ewes; for when the ground is so hard frozen as that turnips cannot be taken up, these plants may be cut off for a constant supply. This will afford late food after the turnips are run to feed; and if it is afterwards permitted to stand for feed, one acre will produce as much as, at a moderate computation, will sell for five pounds, clear of charges. Patridges, pheasants, turkeys, and most other fowl, are very fond of this plant; so that wherever it is cultivated, if there are any birds in the neighbourhood, they will constantly

lie among these plants. The seeds of this plant are sown in gardens for winter and spring fallads, this being one of the small fallad herbs.

The common white, red, flat, and long-sided cabbages are chiefly cultivated for autumn and winter use; the seeds of these sorts must be sown the beginning or middle of April, in beds of good fresh earth; and when the young plants have about eight leaves, they should be pricked out into shady borders, about three or four inches square, that they may acquire strength, and to prevent their growing long shanked. About the middle of June you must transplant them out, where they are to remain. If they are planted for a full crop in a clear spot of ground, the distance from row to row should be three feet and a half, and in the rows two feet and a half asunder: if the season should prove dry when they are transplanted out, you must water them every other evening until they have taken fresh root; and afterwards, as the plants advance in height, you should draw the earth about their stems with a hoe, which will keep the earth moist about their roots, and greatly strengthen the plants. These cabbages will come of them be fit for use soon after Michaelmas, and will continue until the end of February, if they are not destroyed by bad weather; to prevent which, the gardeners near London pull up their cabbages in November, and trench their ground up in ridges, laying their cabbages against their ridges as close as possible on one side, burying their stems in the ground: in this manner they let them remain till after Christmas, when they cut them for the market; and although the outer part of the cabbage be decayed (as is often the case in very wet or hard winters), yet, if the cabbages were large and hard when laid, the inside will remain sound.

The Russian cabbage was formerly in much greater esteem than at present, it being now only to be found in particular gentlemen's gardens, who cultivate it for their own use. This must be sown late in the spring of the year, and managed as those before directed, with this difference only, that these must be sooner planted out, and must have an open clear spot of ground, and require much less distance every way, for it is but a very small hard cabbage. This sort will not continue long before they will break and run up to seed.

The early and sugar-loaf cabbages are commonly sown for summer use, and are what the gardeners about London commonly call *Michaelmas cabbages*. The season for sowing of these is about the end of July, or beginning of August, in an open spot of ground; and when the plants have got eight leaves, you must prick them into beds at about three or four inches distance every way, that the plants may grow strong and short shanked, and toward the end of October you should plant them out: the distance that these require is, three feet row from row, and two feet and a half asunder in the rows. The ground must be kept clean from weeds, and the earth drawn up about your cabbage plants. In May, if your plants were of the early kind, they will turn in their leaves for cabbaging; at which time, the gardeners near London, in order to obtain them a little sooner, tie in their leaves close with a slender osier-twig to blanch their middle; by which means, they have them at least a fortnight sooner than they could have if they were left untied.

The early cabbage being the first, we should chuse

to plant the fewer of them, and a greater quantity of the sugar-loaf kind, which comes after them; for the early kind will not supply the kitchen long, generally cabbaging apace when they begin, and as soon grow hard and burst open; but the sugar-loaf kind is longer before it comes, and is as slow in its cabbaging; and being of an hollow kind, will continue for a good long time. The sugar-loaf kind may be planted out in February, and will succeed as well as if planted earlier; with this difference only, that they will be later before they cabbage. You should also reserve some plants of the early kind in some well-sheltered spot of ground, to supply your plantation, in case of a defect; for in mild winters many of the plants are apt to run to seed, especially when their seeds are sown too early, and in severe winters they are often destroyed.

The Savoy cabbages are propagated for winter use, as being generally esteemed the better when pinched by the frost: these must be sown about the end of April, and treated after the manner as was directed for the common white cabbage; with this difference, that these may be planted at a closer distance than those; two feet and a half square will be sufficient. These are always much better when planted in an open situation, which is clear from trees and hedges; for in close places they are very subject to be eaten almost up by caterpillars and other vermin, especially if the autumn prove dry. The borecole may also be treated in the same manner, but need not be planted above one foot asunder in the rows, and the rows two feet distance; these are never eaten till the frost hath rendered them tender, for otherwise they are tough and bitter.

The seeds of the broccoli (of which there are several kinds, *viz.* the Roman or purple, the Neapolitan or white, and the black broccoli, with some others, but the Roman is preferred to them all), should be sown about the latter end of May, or beginning of June, and when the plants are grown to have eight leaves, transplant them into beds (as was directed for the common cabbage); and toward the latter end of July they will be fit to plant out, which should be done into some well-sheltered spot of ground, but not under the drip of trees: the distance these require is about a foot and a half in the rows, and two feet row from row. The soil in which they should be planted ought to be rather light than heavy: if your plants succeed well (as there will be little reason to doubt, unless the winter prove extreme hard), they will begin to show their small heads, which are somewhat like a cauliflower, but of a purple colour, about the end of December, and will continue eatable till the middle of April. The brown or black broccoli is by many persons greatly esteemed, though it doth not deserve a place in the kitchen-garden where the Roman broccoli can be obtained, which is much sweeter, and will continue longer in season: indeed, the brown sort is much hardier, so that it will thrive in the coldest situations, where the Roman broccoli is sometimes destroyed in very hard winters. The brown sort should be sown in the middle of May, and managed as hath been directed for the common cabbage, and should be planted at the same distance, which is about two feet and a half asunder. This will grow very tall, so should have the earth drawn up to their stems as they advance in height. This doth not form heads so perfect as the Roman broccoli; the stems and hearts of the plants

Brassica.

plants are the parts which are eaten. The Roman broccoli (if well managed) will have large heads, which appear in the centre of the plants like clusters of buds. These heads should be cut before they run up to seed, with about four or five inches of the stem; and the skin of these stems should be stripped off before they are boiled. After the first heads are cut off, there will be a great number of side shoots produced from the stems, which will have small heads to them, but are full as well flavoured as the large. The Naples broccoli hath white heads very like those of the cauliflower, and eats so like it as not to be distinguished from it.—Besides this first crop of broccoli (which is usually sown in the end of May), it will be proper to sow another crop the beginning of July, which will come in to supply the table the latter end of March and the beginning of April; and being very young, will be extremely tender and sweet.

In order to save good seeds of this kind of broccoli, you should reserve a few of the largest heads of the first crop, which should be let remain to run up to seed, and all the under shoots should be constantly stripped off, leaving only the main stem to flower and seed. If this be duly observed, and no other sort of cabbage permitted to seed near them, the seeds will be as good as those procured from abroad, and the sort may be preserved in perfection many years.

The turnip-rooted cabbage was formerly more cultivated in Britain than at present, for since other sorts have been introduced which are much better flavoured, this sort has been neglected. There are some persons who esteem this kind for soups, but it is too strong for most palates; and is seldom good but in hard winters, which will render it tender and less strong. At the end of June the plants should be transplanted out where they are to remain, allowing them two feet distance every way, observing to water them until they have taken root; and as their stems advance, the earth should be drawn up to them with a hoe, which will preserve a moisture about their roots, and prevent their stems from drying and growing woody, so that the plants will grow more freely; but it should not be drawn very high, for as it is the globular part of the stalk which is eaten, so that should not be covered. In winter they will be fit for use, when they should be cut off, and the stalks pulled out of the ground and thrown away, being good for nothing after the stems are cut off.

The curled colewort or Siberian borecole is now more generally esteemed than the former, being extreme hardy, so is never injured by cold, but is always sweeter in severe winters than in mild seasons. This may be propagated by sowing of the seeds the beginning of July; and when the plants are strong enough for transplanting, they should be planted in rows about a foot and a half asunder, and ten inches distance in the rows. These will be fit for use after Christmas, and continue good until April, so that they are very useful in a family.

The musk cabbage. This may be propagated in the same manner as the common cabbage, and should be allowed the same distance: it will be fit for use in October, November, and December; but, if the winter proves hard, these will be destroyed much sooner than the common sort.

The common colewort or Dorsetshire kale, is now

Brassica.

almost lost near London, where their markets are usually supplied with cabbage plants instead of them. The best method to cultivate this plant in the fields is, to sow the seeds about the beginning of July, choosing a moist season, which will bring up the plants in about ten days or a fortnight; the quantity of seed for an acre of land is nine pounds: when the plants have got five or six leaves they should be hoed, as is practised for turnips, cutting down all the weeds from amongst the plants, and also thinning the plants where they are too thick; but they should be kept thicker than turnips, because they are more in danger of being destroyed by the fly: this work should be performed in dry weather, that the weeds may be killed. About six weeks after the plants should have a second hoeing, which, if carefully performed in dry weather, will entirely destroy the weeds, and make the ground clean, so that they will require no farther culture: in the spring they may be either drawn up and carried out to feed the cattle, or they may be turned in to feed upon them as they stand; but the former method is to be preferred, because there will be little waste; whereas, when the cattle are turned in amongst the plants, they will tread down and destroy more than they eat, especially if they are not fenced off by hurdles.

The two last sorts of cabbages are varieties fit for a botanic garden, but are plants of no use. They are annual plants, and perish when they have perfected their seeds.

The best method to save the seeds of all the sorts of cabbages is, about the end of November you should make choice of some of your best cabbages, which you should pull up, and carry to some shed or other covered place, where you should hang them up for three or four days by their stalks, that the water may drain from between their leaves; then plant them in some border near a hedge or pale, quite down to the middle of the cabbage, leaving only the upper part of the cabbage above ground, observing to raise the earth above it, so that it may stand a little above the level of the ground; especially if the ground is wet, they will require to be raised pretty much above the surface. If the winter should prove very hard, you must lay a little straw or pease-haulm lightly upon them, to secure them from the frost, taking it off as often as the weather proves mild, lest by keeping them too close they should rot. In the spring of the year these cabbages will shoot out strongly, and divide into a great number of small branches: you must therefore support their stems, to prevent their being broken off by the wind; and if the weather should be very hot and dry when they are in flower, you should refresh them with water once a week all over the branches, which will greatly promote their feeding, and preserve them from mildew. When the pods begin to change brown, you will do well to cut off the extreme part of every shoot with the pods, which will strengthen your seeds; for it is generally observed, that those seeds which grow near the top of the shoots, are very subject to run to seed before they cabbage; so that by this there will be no loss, but a great advantage. When your seeds begin to ripen, you must be particularly careful that the birds do not destroy it, for they are very fond of these seeds. The best method to prevent this, is to get a quantity of birdlime, and dawb over a parcel of slender twigs, which should be fast-

ened at each end to stronger sticks, and placed near the upper part of the feed in different places, so that the birds may alight upon them, by which means they will be fastened thereto; where you must let them remain, if they cannot get off themselves: and although there should not above two or three birds be caught, yet it will sufficiently terrify the rest, that they will not come to that place again for a considerable time after.

When your feed is fully ripe, you must cut it off; and after drying, thresh it out, and preserve it in bags for use.

But in planting of cabbages for feed, it will be proper never to plant more than one sort in a place, or near one another: for example, never plant red and white cabbages near each other, nor Savoy with white or red cabbages; for they will, by the commixture of their effluvia, produce a mixture of kinds: and it is said to be owing to this neglect, that the gardeners rarely save any good red cabbage seed in Britain, but are obliged to procure fresh seeds from abroad; as supposing the soil or climate of Britain alters them from red to white, and of a mixed kind betwixt both; whereas, if they should plant red cabbages by themselves for seeds, and not suffer any other to be near them, they might continue the kind as good in Britain as in any other part of the world.

Cauliflowers have of late years been so far improved in Britain, as to exceed in goodness and magnitude what are produced in most parts of Europe, and by the skill of the gardener are continued for several months together; but the most common season for the great crop is in May, June, and July. Having procured a parcel of good feed, you must sow it about the 21st of August, upon an old cucumber or melon-bed, sifting a little earth over the seeds, about a quarter of an inch thick; and if the weather should prove extreme hot and dry, you should shade the beds with mats, to prevent the earth from drying too fast, and give it gentle waterings as you may see occasion. In about a month's time after sowing, your plants will be fit to prick out: you should therefore put some fresh earth upon your cucumber or melon beds; or where these are not to be had, some beds should be made with a little new dung, which should be trodden down close, to prevent the worms from getting through it; but it should not be hot dung, which would be hurtful to the plants at this season, especially if it proves hot; into this bed you should prick your young plants at about two inches square, observing to shade and water them at first planting; but do not water them too much after they are growing, nor suffer them to receive too much rain if the season should prove wet, which would be apt to make them black shanked (as the gardeners term it, which is no less than a rotteness in their stems), and is the destruction of the plants so affected. In this bed they should continue till about the 30th of October, when they must be removed into the place where they are to remain during the winter season; which, for the first sowing, is commonly under bell or hand glasses, to have early cauliflowers, and these should be of an early kind: but in order to have a succession during the season, you should be provided with another more late kind, which should be sown four or five days after the other, and managed as was directed for them. In order to have very early cauliflowers, you should make

choice of a good rich spot of ground that is well defended from the north, east, and west winds, with ledges, pales, or walls; but the first are to be preferred, if made with reeds, because the winds will fall dead in these, and not reverberate as by pales or walls. This ground should be well trenched, burying therein a good quantity of rotten dung; then level your ground, and if it be naturally a wet soil, you should raise it up in beds about two feet and a half, or three feet broad, and four inches above the level of the ground; but if your ground is moderately dry, you need not raise it at all: then plant your plants, allowing about two feet six inches distance from glass to glass in the rows, always putting two good plants under each glass, which may be at about four inches from each other; and if you design them for a full crop, they may be three feet and a half row from row: but if you intend to make ridges for cucumbers between the rows of cauliflower plants, (as is generally practised by the gardeners near London) you must then make your rows about eight feet asunder; and the ground between the rows of cauliflowers may be planted with cabbage plants, to be drawn off for coleworts in the spring. When you have planted your plants, if the ground is very dry you should give them a little water, and then set your glasses over them, which may remain quite close down over them till they have taken root, which will be in about a week or ten days time, unless there should be a kindly shower of rain; in which case you may set off the glasses, that the plants may receive the benefit of it; and in about ten days after planting, you should be provided with a parcel of forked sticks or bricks, with which you should raise your glasses about three or four inches on the side toward the south, that your plants may have free air: in this manner your glasses should remain over the plants night and day, unless in frosty weather, when you should set them down as close as possible; or if the weather should prove very warm, which many times happens in November, and sometimes in December, in this case you should keep your glasses off in the day-time, and put them on only in the night, left, by keeping the glasses over them too much, you should draw them into flower at that season; which is many times the case in mild winters, especially if unskillfully managed. Toward the latter end of February, if the weather proves mild, you should prepare another good spot of ground to remove some of the plants into from under the glasses, which should be well dunged and trenched (as before); then set off your glasses; and, after making choice of one of the most promising plants under each glass, which should remain, take away the other plant, by raising it up with a trowel, &c. so as to preserve as much earth to the root as possible; but take care not to disturb or prejudice the roots of the plants which remain. Then plant the plants which you have taken out at the distance before directed, viz. if for a full crop, three feet and a half, row from row; but if for ridges of cucumbers between them eight feet, and two feet four inches distance in the rows: then, with a small hoe, draw the earth up to the stems of the plants which were left under the glasses, taking great care not to let the earth fall into their hearts; and set your glasses over them again, raising your props an inch or two higher than before, to give them more air, observing to take them off whenever there may be some gentle showers, which

which

which will greatly refresh the plants.

In a little time after, if you find your plants grow so fast as to fill the glasses with their leaves, you should then slightly dig about the plants, and raise the ground about them in a bed broad enough for the glasses to stand, about four inches high, which will give your plants a great deal of room, by raising the glasses so much higher when they are set over them; and by this means they might be kept covered until April, which otherwise they could not, without prejudice to the leaves of the plants; and this is a great advantage to them, for many times we have returns of severe frosts at the latter end of March, which prove very hurtful to these plants, if exposed thereto, especially after having been nursed up under glasses.

After you have finished your beds, you may set your glasses over your plants again, observing to raise your props pretty high, especially if the weather be mild, that they may have free air to strengthen them; and in mild soft weather let off your glasses, as also in gentle showers of rain; and now you must begin to harden them by degrees to endure the open air; however, it is advisable to let your glasses remain over them as long as possible, if the nights should be frosty, which will greatly forward your plants; but you must not let your glasses remain upon them in very hot sun-shine, especially if their leaves press against the sides of the glasses; for it hath often been observed in such cases, that the moisture which hath risen from the ground, together with the perspiration of the plants, which, by the glasses remaining over them, hath been detained upon the leaves of the plants, and when the sun hath shone hot upon the sides of the glasses, hath acquired such a powerful heat from the beams thereof, as to scald all their larger leaves, to the no small prejudice of the plants: nay, sometimes large quantities of plants have been so affected therewith, as never to be worth any thing after.

If your plants have succeeded well, toward the end of April some of them will begin to fruit: you must therefore look over them carefully every other day, and when you see the flower plainly appear, you must break down some of the inner leaves over it to guard it from the sun, which would make the flower yellow and unsightly if exposed thereto; and when you find your flower at its full bigness (which you may know by its outside parting as if it would run), you must then draw it out of the ground, and not cut them off, leaving the stalk in the ground, as is by some practised; and if they are designed for present use, you may cut them out of their leaves; but if designed to keep, you should preserve their leaves about them, and put them into a cool place; the best time for pulling them is in a morning, before the sun hath exhales the moisture; for cauliflowers pulled in the heat of the day, lose that firmness which they naturally have, and become tough.

But to return to our second crop (the plants being raised and managed as was directed for the early crop, until the end of October), you must then prepare some beds, either to be covered with glass-frames, or arched over with hoops, to be covered with mats, &c. These beds should have some dung laid at the bottom, about six inches or a foot thick, according to the size of your plants; for if they are small, the bed should be thicker of dung to bring them forward, and so *vice versa*; this dung should be beat down close with a fork, in order

to prevent the worms from finding their way through it; then lay some good fresh earth about four or five inches thick thereon, in which you should plant your plants about two inches and a half square, observing to shade and water them until they have taken new root; but you must not keep your coverings close, for the warmth of the dung will occasion a large damp in the bed, which, if pent in, will greatly injure the plants. When your plants have taken root, you must give them as much free open air as possible, by keeping the glasses off in the day-time as much as the weather will permit; and in the night, or at such times as the glasses require to be kept on, raise them up with props to let in fresh air, unless in frosty weather; at which time the glasses should be covered with mats, straw, pease-haulm, &c. but this is not to be done but in very hard frosts; you must also observe to guard them against great rain, which in winter time is very hurtful to them, but in mild weather, if the glasses are kept on, they should be propped to admit fresh air; and if the under leaves grow yellow and decay, be sure to pick them off: for if the weather should prove very bad in winter, so that you should be obliged to keep them close covered for two or three days together, as it sometimes happens, these decayed leaves will render the inclosed air very noxious; and the plants perspiring pretty much at that time, are often destroyed in vast quantities.

In the beginning of February, if the weather be mild, you must begin to harden your plants by degrees, that they may be prepared for transplantation: the ground where you intend to plant your cauliflowers out (which should be quite open from trees, &c. and rather moist than dry), having been well dunged and dug, should be sown with radishes a week or fortnight before you intend to plant out your cauliflowers: the sowing of radishes is particularly mentioned, because if there are not some radishes amongst them, and the month of May should prove hot and dry, as it sometimes happens, the fly will seize your cauliflowers, and eat their leaves full of holes, to their prejudice, and sometimes their destruction; whereas, if there are radishes upon the spot, the flies will take to them, and never meddle with the cauliflowers so long as they last: indeed, the gardeners near London mix spinach with their radish-seed, and so have a double crop; which is an advantage where ground is dear, or where persons are straitened for room; otherwise it is very well to have only one crop amongst the cauliflowers, that the ground may be cleared in time.

Your ground being ready and the season good, about the middle of February you may begin to plant out your cauliflowers: the distance which is generally allowed by the gardeners near London (who plant other crops between their cauliflowers to succeed them, as cucumbers for pickling, and winter cabbages) is every other row four feet and a half apart, and the intermediate rows two feet and a half, and two feet two inches distance in the rows; so that in the latter end of May or beginning of June (when the radishes and spinach are cleared off), they put in seeds of cucumbers for pickling, in the middle of the wide rows, at three feet and a half apart; and in the narrow rows plant cabbages for winter use, at two feet two inches distance, so that these stand each of them exactly in the middle of the square between four cauliflower plants; and these after the cauliflowers are gone off, will have full room

Brassica,
Brassicaviv.

Brauls
Brawn.

to grow, and the crop be hereby continued in a succession through the whole season.

There are many people who are very fond of watering cauliflower plants in summer, but the gardeners near London have almost wholly laid aside this practice, as finding a deal of trouble and charge to little purpose; for if the ground be so very dry as not to produce tolerable good cauliflowers without water, it seldom happens that watering of them makes them much better; and when once they have been watered, if it is not constantly continued, it had been much better for them if they never had any; as also, if it be given them in the middle of the day, it rather helps to scald them: so that, upon the whole, if care be taken to keep the earth drawn up to their stems, and clear them from every thing that grows near them, that they may have free open air, you will find that they will succeed better without than with water, where any of these cautions are not strictly observed.

But in order to have a third crop of cauliflowers, you should make a slender hot-bed in February, in which you should sow the seeds, covering them a quarter of an inch thick with light mould, and covering the bed with glass-frames. When the plants are come up, and have gotten four or five leaves, you should prepare another hot-bed to prick them into, which may be about two inches square; and in the beginning of April harden them by degrees, to fit them for transplanting, which should be done the middle of that month, at the distance directed for the second crop, and must be managed accordingly: these (if the soil is moist where they are planted, or the season cool and moist) will produce good cauliflowers about a month after the second crop is gone, whereby their season will be greatly prolonged.

There is also a fourth crop of cauliflowers, which is raised by sowing the seed about the 23^d of May; and being transplanted, as hath been before directed, will produce good cauliflowers in a kindly season and good soil after Michaelmas, and continue through October and November, and, if the season permit, often a great part of December.

All the species of cabbage are supposed to be hard of digestion, to afford little nourishment, and to produce flatulencies, though probably on no very good foundation. They tend strongly to putrefaction, and run into this state sooner than almost any other vegetable; when putrefied, their smell is likewise the most offensive, greatly resembling that of putrefied animal substances. A decoction of them is said to loosen the belly. Of all these plants cauliflower is reckoned the easiest of digestion. The white is the most fetid, and the red most emollient or laxative; a decoction of this last is recommended for softening acrimonious humours in some disorders of the breast, and in hoarseness. The red cabbage is chiefly used for pickling. In some countries they bury the white cabbage when full grown in the autumn, and thus preserve it all winter. The Germans cut them to pieces, and, along with some aromatic herbs and salt, press them close down in a tub where they soon ferment, and are eaten under the name of *Sour-croût*. See that article.

BRASSICAVIT, or BRACHICAVIT, in the menage, is a horse whose fore-legs are naturally bended archwise: being so called by way of distinction from an

arched horse, whose legs are bowed by hard labour.

BRAULS, Indian cloths with blue and white stripes. They are otherwise called *turbants*, because they serve to cover those ornaments of the head, particularly on the coast of Africa.

BRAUN (George), in Latin *Braunius*, archdeacon of Dortmund, and dean of Notre Dame in Grædibus, at Cologne. He published a Latin oration against the priests guilty of fornication; he also wrote the Life of Jesus Christ, that of the Holy Virgin, and a controversial treatise against the Protestants; but his chief work is the *Theatrum Urbium*, in several volumes folio.

BRAUNA, a town of Germany, in Bavaria, seated on the river Inn. It has a strong fortress: notwithstanding, it was taken by the Austrians in 1743. E. Long. 13. 3. N. Lat. 48. 10.

BRAUNSBURG, a town of Poland, in Regal Prussia, with a very commodious harbour, and belonging to the king of Prussia. It is seated near the Baltic sea, in E. Long. 20. 0. N. Lat. 54. 15.

BRAUNSFELD, a town of Germany, in the circle of the Upper Rhine, and country of Solmes, with a handsome palace or castle. E. Long. 8. 32. N. Lat. 50. 22.

BRAVO, one of the Cape de Verd islands on the coast of Africa, remarkable for its excellent wines, and inhabited by Portuguese. The land is very high, and consists of mountains which look like pyramids. It abounds in Indian corn, gourds, water-melons, potatoes, horses, asses, and hogs. There is also plenty of fish on the coast, and the island produces salt-petre. W. Long. 25. 35. N. Lat. 14. 0.

BRAVO, a town of Africa, on the coast of Ajan, with a pretty good harbour. It is an independent place, and is about 80 miles distant from Magadoxo. E. Long. 41. 35. N. Lat. 1. 0.

BRAURONIA, in Grecian antiquity, a festival in honour of Diana, surnamed *Brauronia*, from its having been observed at Brauron, an Athenian borough. This festival was celebrated once in five years, being managed by ten men, called in Greek [*ιεροποι*]. The victim offered in sacrifice was a goat, and it was customary for certain men to sing one of Homer's Iliads. The most remarkable persons at this solemnity were young virgins, habited in yellow gowns, and consecrated to Diana. It was unlawful for any of them to be above ten or under five years of age.

BRAWN, the flesh of a boar fowced or pickled: for which end the boar should be old; because the older he is, the more horny will the brawn be.—The method of preparing brawn is as follows: The boar being killed, it is the sitches only, without the legs, that are made brawn; the bones of which are to be taken out, and then the flesh sprinkled with salt, and laid in a tray, that the blood may drain off: Then it is to be fattened a little, and rolled up as hard as possible. The length of the collar of brawn, should be as much as one side of the boar will bear, so that when rolled up it will be nine or ten inches diameter.

The collar being thus rolled up, is to be boiled in a copper, or large kettle, till it is so tender, that you can run a straw through it; then fet it by, till it is thoroughly cold, and put it into the following pickle. To every gallon of water, put a handful or two of salt, and as much wheat-bran: Boil them together,

then

Qualities,
&c.

then drain the bran as clear as you can from the liquor; and when the liquor is quite cold, put the brawn into it.

BRAY (Sir Reginald), a celebrated architect and politician, was the second son of Sir Richard Bray, one of the privy-council to king Henry VI. Sir Reginald was instrumental in the advancement of king Henry VII. to the throne of England; and was greatly in the favours of that prince, who bestowed honours and wealth upon him. His skill in architecture appears from Henry VII.'s chapel at Westminster, and the chapel of St George at Windsor, as he had a principal concern and direction in the building of the former, and the finishing and bringing to perfection the latter, to which he was also a liberal benefactor. In the middle of the fourth aisle of the above chapel, is a spacious chapel built by him, and still called by his name. He died in 1501; and was interred in the above chapel, probably under the stone where lies Dr Waterland; for, on opening the vault for that gentleman, who died in 1740, a leaden coffin of ancient form was found, which, by other appearances, was judged to be that of Sir Reginald, and was, by order of the dean, immediately arched over.

BRAY (Dr Thomas), an eminent, learned, and pious divine, was born at Marton, in Shropshire, in the year 1656, and educated at Oxford. He was at length presented to the vicarage of Over-Whitacre, in Warwickshire; and, in 1690, to the rectory of Sheldon, where he composed his *Catechetical Lectures*; which procured him such reputation, that Dr Compton, bishop of London, pitched upon him as a proper person to model the infant church of Maryland, and establish it upon a solid foundation, and for that purpose he was invested with the office of commissary. He now engaged in several noble undertakings. He procured sums to be raised for purchasing small libraries for the use of the poor ministers in the several parts of our plantations; and the better to promote this design, he published two books; one entitled *Bibliotheca parochialis*, or a scheme of such theological and other heads as seem requisite to be perused or occasionally consulted by the clergy, together with a catalogue of books which may be profitably read on each of those points; the other, Apostolical charity, its nature and excellency considered. He endeavoured to get a fund established for the propagation of the gospel, especially among the uncultivated Indians; and by his means a patent was obtained for erecting the corporation called *The Society for the propagation of the gospel*. He, by his industry, procured relief for prisoners; and formed the plan for the society for the reformation of manners, charity-schools, &c. He wrote, 1. his *Martyrology*, or *Papal usurpation*, in one volume folio; 2. *Directorium missionarium*; and other works. This excellent man died in 1730, aged 73.

BRAY, a port-town of Ireland, in the county of Wicklow, and province of Leinster, seated on St George's channel, eight miles south of Dublin. W. Long. 6. 16. N. Lat. 53. 8.

BRAY sur Seine, a town of France, in Champagne, and in Sennois, on the confines of Brie. E. Long. 2. 15. N. Lat. 48. 35.

BRAYLE, among sportsmen, a piece of leather slit to put upon the hawk's wing, to tie it up.

BRAZED, in heraldry, a term serving to describe three chevrons, one clapping another.

BRAZEN, something consisting of brass, or formed out of it. See BRASS.

BRAZEN Age. See AGE.

BRAZEN *Dijb*, among miners, is the standard by which the other dishes are gauged, and is kept in the king's hall.

BRAZEN *Sea*, in Jewish antiquity, one of the sacred utensils in the temple of Solomon. It was cast in the plain of Jordan, and removed from thence into the inner court of the temple: where it was placed upon 12 oxen, three of which looked towards each quarter of the world. It was ten cubits from the one brim to the other, five cubits in height, and 30 cubits in circumference, and contained 3000 baths. The brim of it was perfectly round, and so it continued in the two upper cubits; but, below the brim, in the three lower cubits, it was square. It was a hand-breadth thick, and the brim was wrought like the brim of a cup, with flowers of lilies. About the body of this huge vessel there were two borders of engravings, being the heads of oxen in demi-relief; out of which some suppose the water issued, and that they were made as cocks and conveyances for that purpose.—This brazen or molten sea, was designed for the priests to wash themselves in, before they performed the service of the temple. The supply of water was through a pipe out of the well Etam; though some are of opinion, that it was constantly supplied with water by the Gibeonites.

BRAZIER, an artificer who makes and deals in all kinds of brass ware. This trade, as exercised in Britain, may be reckoned a branch of the smithery, though they seldom keep forges, except for brazing or soldering, and tinning the insides of their vessels, which they work up chiefly out of copper and brass prepared rough to their hands. They consist of a working part, and a shop-keeping part, which latter many carry on to a great extent, dealing as well in all sorts of iron and steel, as copper and brass goods for household furniture; and lately have fallen much into selling what is called *French plate*, made of a sort of white metal, silvered and polished to such a degree that the eye cannot soon distinguish it from real silver.

BRAZIL. See BRASIL.

BRAZING, the soldering or joining two pieces of iron together by means of thin plates of brass, melted between the pieces that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, they cover it with pulverized borax, melted with water, that it may incorporate with the brass powder, which is added to it: The piece is then exposed to the fire without touching the coals, and heated till the brass is seen to run.

BRAZING is also the joining two pieces of iron together by beating them hot, the one upon the other, which is used for large pieces by farriers, &c.

BRAZZA, a town and island on the coast of Dalmatia, in the gulph of Venice, opposite to Spalatto, and subject to Venice. E. Long. 28. 0. N. Lat. 43. 0.

BREACH, in a general sense, denotes a break or rupture in some part of a fence or inclosure, whether owing to time or violence.—Inundations, or overflowings of lands, are frequently owing to breaches in the dikes or sea-banks. Dagenham breach is famous; it was

was made in 1707, by a failure of the Thames wall in a very high tide. The force wherewith it burst in upon the neighbouring level tore up a large channel or passage for water 100 yards wide, and in some places 20 feet deep, by which a multitude of subterraneous trees that had been buried many ages before were laid bare.

BREACH, in fortification, a gape made in any part of the works of a town by the cannon or mines of the besiegers, in order to make an attack upon the place. To make the attack more difficult, the besieged flow the breach with crow-feet, or stop it with chevaux de frize.—A practicable breach, is that where the men may mount and make a lodgment, and ought to be 15 or 20 fathoms wide. The besiegers make their way to it, by covering themselves with gabions, earth-bags, &c.

BREACH, in a legal sense, is where a person breaks through the condition of a bond or covenant; on an action upon which, the breach must be assigned: And this assignment must not be general, but particular, as, in an action of covenant for not repairing houses, it ought to be assigned particularly what is the want of reparation; and in such certain manner, that the defendant may take an issue.

BREAD, a mass of dough kneaded and baked in an oven. See **BAKER**, **BAKING**, and **BARM**.

Macquer's Chem. Dict. The grains of all vegetables are almost entirely composed of substances very proper for the nourishment of animals; and amongst grains those which contain a farinaceous matter are the most agreeable and most nutritive.

Man, who appears to be designed by nature to eat of all substances which are capable of nourishing him, and still more of vegetables than animals, has, from time immemorial, and in all parts of the earth, used farinaceous grains as the principal basis of his food: but as these grains cannot be without difficulty eaten by men in their natural state, this active and intelligent animal has gradually found means not only to extract the farinaceous part, that is, the only nutritive part of these grains, but also to prepare it so that it becomes a very agreeable and wholesome aliment, such as the bread we now generally eat.

Nothing appears so easy at first sight as to grind corn, to make a paste with the flour and water, and to bake this paste in an oven. They who are accustomed to enjoy the advantages of the finest human inventions, without reflecting on the labour it has cost to complete them, think all these operations common and trivial. However, it appears very certain, that for a long time men no otherwise prepared their corn than by boiling and forming compact viscous cakes, not very agreeable to the taste, and of difficult digestion, before they were able to make bread of good taste and quality, as we have now. It was necessary to invent and complete ingenious machines for grinding corn, and separating the pure flour with little trouble and labour; and that inquiries, or rather some happy chance, which some observing person availed himself of, should discover, that flour mixed with a certain quantity of water is susceptible of a fermentation, which almost entirely destroys its viscidty, heightens its taste, and renders it proper to make a light bread, very agreeable to the taste, and of easy digestion.

This essential operation, on which the good quality

of bread depends, is entirely of the province of chemistry. It would add to the honour of the ancient cultivators of chemistry, to attribute to them so useful and important a discovery; but, unhappily, it is too probable that they had no share in it. The ancient chemists were engaged in other pursuits than that of bread and other common objects. They hoped to make gold; and what is bread in comparison with gold?

However that be, to the fortunate invention of raising the paste before baking we owe the perfection of the art of making bread. This operation consists in keeping some paste or dough, till by a peculiar spirituous fermentation it swells, rarefies, and acquires a smell and taste quick, pungent, spirituous, somewhat sour, and rather disagreeable. This fermented dough is well worked with some fresh dough, which is by that mixture, and moderate heat, disposed to a similar but less advanced fermentation than that above-mentioned. By this fermentation the dough is attenuated, and divided; air is introduced into it, which, being incapable of disengaging itself from the tenacious and solid paste, forms in it small cavities, raises and swells it: hence the small quantity of fermented paste which disposes the rest to ferment, is called *leaven*, from the French word *lever*, signifying to raise.

When the dough is thus raised, it is in a proper state to be put into the oven; where, while it is baked, it dilates itself still more by the rarefaction of the air, and of the spirituous substance it contains, and it forms a bread full of eyes or cavities, consequently light, and entirely different from the heavy, compact, viscous, and indigested masses made by baking unfermented dough.

The invention of beer, or wine of grains, furnishes a new matter useful in the making of bread. This matter is the froth which forms upon the surface of these liquors during fermentation. When it is mixed with dough, it raises it better and more quickly than ordinary leaven. It is called *yeast* or *barm*. By means of this, the finest, lightest bread is made. It often happens, that bread made with leaven dough has a fourth and not agreeable taste; which may proceed from too great a quantity of leaven, or from leaven in which the fermentation has advanced too far. This inconvenience does not happen to bread made with yeast; because the fermentation of this substance is not too far advanced, or because more attention is given to that finer bread.

It may be asked, Why, since dough is capable of fermenting spontaneously and singly, as we see from the leaven, a substance is added to dispose it to ferment? The true reason is, That all the parts of a fermenting substance do not ferment at the same time, nor to the same degree; so that some parts of this substance have finished their fermentation, while others have not yet begun. The fermentable liquors which contain much sugar, as hydromel, and must of wines, give proofs of this truth; for, after these liquors have become very vinous, they have still very distinctly a saccharine taste: but all saccharine matter is still susceptible of fermentation; and, in fact, if vinous hydromel, or must, or even new beer, be distilled, so that all their ardent spirit shall be separated, and the residuums diluted with water, we shall see a second fermentation take place, and a new quantity of ardent spirit formed.

Bread.

The same thing precisely happens to dough, and still more sensibly, from its viscosity and want of fluidity; so that if it be left to ferment alone, and without the help of leaven, as the fermentation proceeds very slowly and successively, the parts which ferment first will have become sour and rapid before all the rest be sufficiently attenuated and changed, by which the bread will acquire a disagreeable taste.

A mixture of a small quantity of leaven with dough effectually prevents this inconvenience; because the effect of this leaven, and of all fermenting substances, is to dispose to a similar fermentation all matters capable of it, with which it is mixed; or rather, by means of leaven, the fermentation of all the parts of such substances is effected more nearly at the same time.

Bread well raised and baked differs from unfermented bread, not only in being less compact, lighter, and of a more agreeable taste, but also in being more easily miscible with water, with which it does not form a viscous mass, which circumstance is of great importance in digestion.

It is observable, that without bread, or somewhat of this form, no nation seems to live. Thus the Laplanders, having no corn of their own, make a sort of bread of their dried fishes, and of the inner rind of the pine, which seems to be used, not so much for their nourishment, as for supplying a dry food. For this mankind seem to have an universal appetite, rejecting bland, slippery, and mucilaginous foods. This is not commonly accounted for, but seems to depend on very simple principles. The preparation of our food depends on the mixture of the animal fluids in every stage. Among others the saliva is necessary, which requires dry food as a necessary stimulus to draw it forth, as bland, slippery, fluid aliments are too inert, and make too short stay in the mouth, to produce this effect, or to cause a sufficient degree of mastication to emulge that liquor. For this reason we commonly use dry bread along with animal food, which otherwise would be too quickly swallowed. For blending the oil and water of our food nothing is so fit as bread, assisted by a previous mastication. For which purpose, bread is of like necessity in the stomach, as it is proper that a substance of solid consistence should be long retained there. Now the animal fluids must be mixed with our aliments, in order to change the acceffency it undergoes. But liquid foods would not attain this end, whereas the solid stimulates and emulges the glands of the stomach. The bread then appears to be exceedingly proper, being bulky without too much solidity, and firm without difficulty of solution.

Among the ancients we meet with various denominations of bread; as, 1. *Panis siliagineus*, called also *mundus*, *athleticus*, *isungius*, *coliphisus*, and *robys*, answering to our white bread; being made of the purest flour of the best wheat, and only used by the richer sort. 2. *Panis secundarius*, called also *smilacis* or *smilagineus*, the next in purity; being made of fine flour, only all the bran not sifted out. 3. *Austopyrus*, called also *syncoctus* and *confusaneus*, made of the whole substance of the wheat, without either retrenching the finer flour or coarser bran; answering to our household bread. 4. *Cacabaceus*, apparently the same with what was otherwise denominated *fordidus*, as being given to dogs; *surfuraceus*, *surfurcus*, or *sur-*

furatus, because made in great part of bran; and, in the middle age, *bifus*, on account of its brownness; sometimes also *leibo*. There were other sorts of bread, denominated from the manner in which they were made, or the uses they were applied to; as, 1. *The militaris*, which was prepared by the soldiers and officers in camp with their own hands; for which purpose some had hand-mills, others pounded the corn in a mortar, and baked it on the coals. 2. *Glibanites*, that baked in an oven, by way of contradiction from that baked on the hearth or under the embers. 3. That called *subcineritius*, or *sub cinere coctus*; sometimes also *reverfatus*, because it was to be turned in the baking. 4. *Nasticus*, answering to our sea-biscuit, and denominated accordingly *bis coctus*, because baked several times over to make it keep the longer. Other kinds of bread were denominated from their qualities and accidents; as, 1. *The panis ficus*, that which had been long baked; such as were the *bis coctus*, naval and buccellated bread. 2. *Madidus*, a sort made of rye or bear, sometimes also made of fine flour, wherewith they smeared their faces, by way of a cosmetic, to render them smooth. 3. *Acidus*, or sour bread, which was acidulated with vinegar. 4. *Azymus*, that unleavened or unfermented.

The French have also a great variety of breads; as queen's bread, almode bread, bread de Segovic, de Gentilly, quality-bread, &c. all prepared in peculiar manners by the bakers of Paris. The bread de Gonnefle excels all others, on account of the waters at Gonnefle, a town three leagues from Paris. It is light, and full of eyes, which are the marks of its goodness. *Pain de menage*, is that which each family bakes for itself. Spice-bread, *pain d'epice*, denotes bread baked and iced over with the scum taken off sugar in refining houses; it is sometimes made with honey and other sorts of seasoning, and answers to what the ancients call *panis mellitus*.

Among us, bread is chiefly divided into white, wheaten, and household; differing only in degrees of purity. In the first, all the bran is separated; in the second, only the coarser; in the third, none at all: so that fine bread is made only of flour; wheaten bread, of flour and a mixture of the finer bran; and household, of the whole substance of the grain, without taking out either the coarse bran or fine flour. We also meet with fymnel bread, manchet or roll bread, and French bread: which are only so many denominations of the finest and whitest bread, made of the purest flour; except that in roll-bread there is an addition of milk; and in French bread, of eggs and butter also. In Lancashire, and several of the northern counties of England, they have several sorts of oaten bread; as, 1. The bannock, which is an oat-cake, kneaded only with water, and baked on the embers. 2. Clap-bread, which is made into thin hard cakes. 3. Bitchinels bread, which is made of thin batter, and made into thin soft oaten-cakes. 4. Riddle-cakes, which are thick and four, have but little leaven, and are kneaded stiff. And, 5. Jannock, which is oaten bread made up into loaves. Add to these, *pease-bread*, much used in many parts of Scotland; being bread consisting either wholly of the flour of pease, or of this and oat-meal mixed: the dough, sometimes leavened, sometimes made only with water, is formed either into bannocks or cakes, and baked over the embers; or into what they call *baps*, i. e. a kind

Bread.

Calices on the Mat. Med.

Suppl. to Chambers's Dict.

Bread.

of flattish rolls, and baked in the oven. In the statute of assize of bread and ale, 51 Hen. III. mention is made of wafel-bread, cocket-bread, and bread of treet; which answer to the three kinds of bread now in use, called *white*, *wheatens*, and *household* bread. In religious houses, they heretofore distinguished bread by the names *Élquires* bread, *panis armigerorum*; monks bread, *panis conventualis*; boys bread, *panis puerorum*; and servants bread, *panis famulorum*, called also *panis servientalis*. A like distribution obtained in the households of nobles and princes; where, however, we find some other denominations; as, messengers bread, *panis nunciatus*, that given to messengers as a reward of their labour; court bread, *panis curialis*, that allowed by the lord for the maintenance of his household; eleemosynary bread, that distributed to the poor by way of alms.

It is for the interest of the community that the food of the poor should be as various as possible, that, in times of dearth and scarcity of the ordinary kinds, they may not be without ready and cheap resources. To the discovery of such resources several benevolent philosophers having successfully turned their inquiries, we shall lay before the reader the result of their experiments.

1. BREAD of Potatoes*. Potatoes, previously deprived of their skin, cut into thin slices, and put between paper, will dry in a heat somewhat less than 35° of Reaumur's thermometer; and, when thus dried, they will preserve their white colour. By this process they lose about two thirds of their weight, and they may then be reduced to a fine powder. A little of this powder thrown upon the fire sends out a smoke, accompanied with a smell resembling burnt bread. As this smell is perceived from all farinaceous vegetables when treated in the same manner, Mr Parmentier thinks it may be considered as the characteristic of the presence of an amyaceous* matter. This smell does not, however, he observes, arise from the amyaceous or fibrous part separately, but from both taken together. The powder of potatoes, obtained in the manner described above, has the smell and taste of wheat; and, like it, is devoured by rats and mice; but, even when most finely powdered, it has not the feel or brightness of the flour of wheat; although, on a chemical analysis, it yields the same products. It is also nutritious, and keeps well for a long time.

Finding so great a similarity between the meal of wheat and what may be called the meal of potatoes, Mr Parmentier next endeavoured to make bread of them when mixed in different proportions. His trials were made with one fourth, one third, one half, and two thirds, of the potato-meal, the remainder being flour from wheat. These proportions, with the addition of a little salt and yeast, yielded bread which was well tasted, but which had fermented little, was brown, and covered with hard brown crusts. Bread made from the meal of potatoes alone, with the addition of salt and yeast, was eatable, but very heavy, unfermented, and exceedingly brown. This bread, from the meal of potatoes alone, was apt to crumble into powder. To give it more adhesion, he mixed with the meal a decoction of bran, or a mixture of honey and water; either of which made it lighter and more fermented; it obtained also a crust of a golden colour, became well tasted, and sufficiently adhesive. Mr Parmentier obtained bread

also, well fermented, and of a good colour and taste, from a mixture of raw potato-pulp with meal of wheat, or potato-meal, with the addition of yeast and salt.

Potatoes, when used for making bread, are not readily disposed to ferment; without which, bread is very insipid, and not easily digested. But Mr Parmentier found, from a variety of experiments, that good bread might be made from equal quantities of flour and potato-meal. He concludes, therefore, with recommending the mixture of potatoes, in times of scarcity, with the flour of wheat, instead of employing rye, barley, or oats, as has frequently been done.

When grain is altogether wanting, he recommends the use of bread made from a mixture of the amyaceous powder of potatoes and of their pulp, this mixture being fermented with leaven, or with honey. The meal of this root, when diluted with hot water, acquires a tenacious and gluey consistence. However fair the meal of potatoes may be, it always gives a grey colour to the bread made by mixing it with the flour of wheat: but a mixture of the pulp of potatoes with the flour of wheat does not produce brown-coloured bread.

Mr Parmentier made bread, very much like that of wheat, by a mixture of the following four substances, viz. four ounces of amyaceous powder of potatoes, one dram of mucilage extracted from barley, one dram of the bran of rye, and a dram and a half of glutinous matter dried and powdered.

2. BREAD from different Vegetables not commonly in Use*. Although horse-chestnut has not hitherto been employed, yet it is certain that wholesome bread, without any bitterness, may be obtained from it. Mr Parmentier advises, that the fruit, after the skin is taken off, and the juice pressed from it, be made into a paste. This mass must be diluted in water, and then strained through a sieve. A milky-coloured liquor is thus separated, which, on standing, deposits a fine powder. This, being dried, is without either smell or taste, and very fit for aliment; the mass from which it is procured retaining the bitterness of the fruit.

The roots of the bryona, when treated in the same manner, yielded a similar white powder. By the same treatment also, fine, white, insipid, inodorous powders may be procured from the roots of the iris, gladiolus, ranunculus, fumarica, arum, dracunculus, mandragora, colchicum, filipendula, and helleborus; plants which grow spontaneously, and in great abundance.

Of acorns bread has frequently been made; and to this day, in some countries, they are in common use. The method of preparation which Mr Parmentier recommends, is, that they be deprived of their cover by boiling, then dried and powdered, and afterwards baked in the same manner as the flour of wheat. When fully ripe, and made into a paste, they were deprived of their atringency by merely pressing their juice from them. The mass remaining after the pressure, when dried, was easily reduced to a fine powder by no means disagreeable.

The græmen caninum arvense, in its appearance, approaches to corn; and some naturalists have considered it as the original species from which all our grain is produced. Its roots are sweet-tasted, and have long been employed in making ptisans. In the preparation of them for bread, it is only necessary that the roots should be cleansed, cut small, dried, and pounded. This

powder,

Bread.

* From *Examen Chimique des Pommes de Terre*, &c. par M. Parmentier, apoth. major del hotel des invalides, Paris.

* See the note infra.

* From *Mémoire sur les végétaux qui pourroient suppléer en temps de disette de ceux que l'on employe communément à la nourriture des hommes*, &c. par M. Parmentier.

Bread.

powder, Mr Parmentier observes, does not dissolve in cold water or spirits; but it does in boiling water, which it renders thick and cloudy, and, upon cooling, the whole mass obtains a gelatinous consistence. Upon a chemical analysis, it yields an acid empyreumatic oil, which possesses a singular odour, resembling that which is perceived on burning the plant. The spongy residuum, calcined in the air, gives a fixed alkali. These properties incontestably prove, that it contains an *amylaceous* (A) matter similar to that of grain, which appears to be the nutritive part of vegetables. This amylaceous matter, formed into a jelly, and diffused in water, keeps for a long time without suffering any change; it then turns acid, and at length putrefies.

The amylaceous matter of acrid and poisonous plants, although innocent and nutritive, cannot be converted into bread without the addition of some mucilaginous substance. In times of great scarcity, common bran will answer the purpose: but when potatoes are to be had, the addition of a proper proportion of these is to be preferred.

Mr Parmentier gives an account of the bread which he obtained from the amylaceous powders of the different vegetables mentioned above, with the addition of potatoes and a small quantity of common leaven of grain. This bread appeared in general to be well fermented; it was of a good white colour, and free from any disagreeable odour: but to the taste it was somewhat insipid; which, however, he imagines, might have been corrected by the addition of a proper quantity of salt.

As the resources against scarcity here pointed out can be procured only at particular seasons, the author proposes a method for preserving the matter thus obtained. For this purpose, he advises, that bread prepared in the manner mentioned above should be carefully dried, reduced to powder, and then kept in a close cask. By this means, he is of opinion that it may be preserved for a very long time, and will always be ready to make an agreeable and wholesome panada by the addition of a little butter and salt.

Mr Parmentier, in order to discover the degree of power wherewith this alimentary powder nourished, made himself the subject of experiment; and found, that three ounces of it for dinner, and as much for supper, made into panada with water, was a sufficient

quantity of aliment for a day. From his discharge by stool while he used it, he had reason to believe that it is almost totally alimentary. He concludes with recommending it not only as useful in times of scarcity, but as a proper substitute for sea-biscuit, and as a species of food well adapted for armies and hospitals.

3. *Cheap method of making wholesome BREAD,* when wheat-flour is dear, by mixing turnip with it*.

“ At the time I tried this method, bread was very dear, inasmuch that the poor people, in the country where I live, could hardly afford themselves half a meal a day. This put me upon considering whether some cheaper method might not be found, than making it of wheat-meal. Turnips were at that time very plentiful. I had a number of them pulled, washed clean, pared, and boiled; when they were become soft enough to mash, I had the greatest part of the water pressed out of them, and afterwards had them mixed with an equal quantity in weight of coarse wheat-meal; the dough was then made in the usual manner, with yeast or barm, salt, water, &c. It rose very well in the trough; and after being well kneaded, was formed into loaves, and put into the oven to be baked. I had at the same time some other bread made with common meal in the ordinary way. I baked my turnip-bread rather longer than the other. When they were drawn from the oven, I caused a loaf of each sort to be cut; and found, on examination, the turnip bread was sweeter than the other, to the full as light and as white, but had a little taste (though nowise disagreeable) of the turnip. Twelve hours afterwards I tasted my turnip-bread again, when I found the taste of the turnip in it scarce perceivable, and the smell quite gone off. On examining it when it had been baked 24 hours, had I not known that there were turnips in its composition, I should not have imagined it: it had, it is true, a peculiar sweetish taste, but by no means disagreeable; on the contrary, I rather preferred it to the bread made of wheat-meal alone. After it had been baked 48 hours, it underwent another examination, when it appeared to me to be rather superior to the other; it eat fresher and moister, and had not at all abated in its good qualities: to be short, it was still very good after a week; and, as far as I could see, kept as well as the bread made of common wheat-meal.

“ In my trials of this bread by the taste, I was

8 K 2

not

(A) M. Beccari of the Bolognian academy has discovered in the flour of wheat two distinct substances. The one he terms an *animal or glutinous* matter; the other, an *amylaceous* matter, or *vegetable paste*.

The *gluten* has been supposed to be the nutritive part of corn, from its not dissolving unles in vegetable acids; from its assuming a spongy form in boiling water; from its supposed analogy to the animal lymph; and, lastly, from the similitude which the products it affords, on a chemical analysis, bear to those obtained from animal substances. M. Parmentier, however, from various experiments, was led to conclude, with the celebrated Model of Peterburg, that the gluten or animal matter of Beccari exists in the bran, and is not the nutritive part of the wheat. Having made experiments with four different kinds of flour, it appeared that the quantity of animal matter was always proportioned to the coarseness of the flour. Hence, were this gluten the nutritive part, the coarsest bread, or that which contained most bran, would afford the greatest quantity of nourishment. The contrary of this, however, is now known to be fact.

The *amylaceous* part, or, as some have termed it, the *fecula*, of wheat and other vegetables, is a peculiar gum, not soluble in spirit of wine, vinegar, or cold water. It contains more acid, and less water, than the ordinary gums. It is found in many of those plants that make the nourishment of men and other animals. Hence Mr Parmentier concludes it to be the nutritive matter.

Though we are not to consider the glutinous matter as the nutritious part of vegetables, yet it is a very necessary ingredient. It is that which preserves the cohesion of the paste in fermenting bread: it is that which forms the viscid pellicle, and stops the air in fermentation; gives the savoury taste to bread; occasions it to be light, to ferment, and which forms the small cells seen in it. It is found especially near the cortical part of grain; and this accounts for its being found in the greatest quantity in coarse brown meal. It is this gluten which renders wheat a superior aliment to the other grains and roots.

Bread.

* From a letter in the *Musæum Rosticum et Commerciale*

Bread.

not satisfied with eating it by itself; I had some of it spread with butter; I tasted it with cheese; I eat of it toasted and buttered, and finally in boiled milk and in soup: in all these forms it was very palatable and good."

BREAD in Medicine. Besides the alimentary, bread has also medical qualities.—Decoctions, creams, and jellies of bread are directed in some dispensaries. Bread carefully toasted, and infused or lightly boiled in water, imparts a deep colour, and a sufficiently agreeable refracting taste. This liquor, taken as common drink, has done good service in a weak lax state of the stomach and intestines; and in bilious vomiting and purging, or the cholera morbus: examples are related in the Edinburgh essays of several cases of this kind cured by it, without any thing spirituous, is made out of the juice of craw-fish, may-dew, rose-water, nutmegs, and saffron, distilled from a large quantity of this bread. This is esteemed a great restorative, and given in hectic habits. The other is distilled from this bread and Rhenish wine, with nutmegs and cinnamon. This is given in all the disorders of the stomach, vomiting, loss of appetite, and other complaints of the same kind: and besides these, there is a spirit distilled from it by the rectory in the dry way, which, when separated from its fetid oil, is esteemed a powerful sudorific, and very valuable medicine in removing impurities of the blood.

Bread is also medicinal, applied externally, as is vulgarly known*. Mr Boyle assures us he drew a menstruum from bread stronger than aquafortis, and which would act even upon glass itself †.

BREAD-Tree, the English name of the arctocarpus (B); the fruit of which not only serves as a substitute for bread among the inhabitants of O-Taheiti ‡ and the neighbouring islands, but also, variously dressed, composes the principal part of their food. It grows on a tree that is about the size of a middling oak; its leaves are frequently a foot and an half long, of an oblong shape, deeply sinuated like those of the fig-tree, which they resemble in colour and consistence, and in the exuding of a milky juice upon being broken. The fruit is about the size and shape of a new-born child's head; and the surface is reticulated*, not much unlike a truffle; it is covered with a thin skin, and has a core about as big as the handle of a small knife. The eatable part lies between the skin and the core; it is as white as snow, and somewhat of the consistence of new bread; it must be roasted before it is eaten, being first divided into three or four parts; its taste is insipid, with a slight sweetness somewhat resembling that of the crumb of wheaten bread

mixed with a Jerusalem artichoke. This fruit is also cooked in a kind of oven, which renders it soft, and something like a boiled potatoe; not quite so farinaeous as a good one, but more so than those of the middling sort. Of the bread-fruit they also make three dishes, by putting either water or the milk of the cocoa nut to it, then beating it to a paste with a stone pestle, and afterwards mixing it with ripe plantains, bananas, or the four paste which they call *carve*.

The mahie, which is likewise made to *carve* as a succedaneum for ripe bread-fruit before the season comes on, is thus made: The fruit of the bread-tree is gathered just before it is perfectly ripe; and being laid in heaps, is closely covered with leaves: in this state it undergoes a fermentation, and becomes disagreeably sweet; the core is then taken out entire, which is done by gently pulling out the stalk, and the rest of the fruit is thrown into a hole which is dug for that purpose generally in the houses, and neatly lined in the bottom and sides with grass; the whole is then covered with leaves and heavy stones laid upon them; in this state it undergoes a second fermentation, and becomes sour, after which it will suffer no change for many months. It is taken out of the hole as it is wanted for use; and being made into balls, it is wrapped up in leaves and baked: after it is dressed, it will keep five or six weeks. It is eaten both cold and hot; and the natives seldom make a meal without it, though to Europeans the taste is as disagreeable as that of a pickled olive generally is the first time it is eaten.

To procure this principal article of their food, (the bread-fruit), costs these happy people no trouble or labour except climbing up a tree: the tree which produces it does not indeed grow spontaneously; but if a man plants ten of them in his life-time, which he may do in about an hour, he will as completely fulfil his duty to his own and future generations, as the native of our less temperate climate can do by ploughing in the cold of winter, and reaping in the summer's heat, as often as these seasons return; even if, after he has procured bread for his present household, he should convert a surplus into money, and lay it up for his children.

Bees-BREAD. See APIS, n° 12, par. ult.

Cassada-BREAD. See JATROPHA.

Earth BREAD*. "In the lordship of Mofcow in the Upper Lusatia, a sort of white earth is found, of which the poor, urged by the calamities of the wars which raged in those parts, make bread. It is taken out of a hill where they formerly worked at salt-petre. When the sun has somewhat warmed this earth it cracks, and small white globules proceed from it as meal; it does not ferment alone, but only when mixed with meal. Mr Sarlitz, a Saxon gentleman, was pleased to inform us, that he has seen persons who in a great measure lived upon it for some time. He assures us that he procured bread to be made of this earth alone, and of different mixtures of earth and meal; and that he even kept some of this bread by him upwards of six years: he further says, a Spaniard told him, that this earth is also found near Geronne in Catalonia."

Eucharist or Sacramental BREAD, in the Protestant churches, is common leavened bread, in conformity to the ancient practice. In the Romish mass, azymous or unleavened

(B) A new genus of plants; so named from *αρτος* (*panis*) "bread," and *καρπος* (*fructus*) "fruit," and referred to the monoccia monogynia of Linnæus. [*Forsteri Characteres*, 51].

Bread.

Bread.

unleavened bread is used, particularly in the Gallican church, where a sort is provided for this purpose called *pain a chanter*, made of the purest wheat flour pressed between two iron plates graven like wafer-moulds, being first rubbed with white wax to prevent the paste from sticking. The Greeks observe divers ceremonies in their making the eucharist bread. It is necessary the person who bakes it have not lain with his wife the day before; or, if it be a woman, that she have not conversed with her husband. The Abyssinians have an apartment in their churches for this service, being a kind of sacristy. F. Sirmond, in his dissertation on azymous bread, shews from the council of Toledo, that anciently there were as many ceremonies used in the Latin church in the preparation of their unleavened bread as are still retained in the eastern churches. He cites the example of *Queena Radeconda*, who distributed with her own hands, in the church, the bread which she herself had made. It appears also from the dispute of cardinal Humbert against the Greeks, that in the Latin church no bread was used for the eucharist, but what was taken out of the sacristy, and had been made by the deacons, subdeacons, and even priests, who rehearsed several psalms during the process.

Ecclesiastical writers enumerate other species of bread allotted for purposes of religion; as, 1. *Calendarius*, that anciently offered to the priest at the calends. 2. *Prebendarius*, the same with *capitularis*, that distributed daily to each prebendary or canon. 3. *Benedictus*, that usually given to catechumens before baptism, in lieu of the eucharistic bread, which they were incapable of partaking of. The *panis benedictus* was called also *panagium* and *eulogium*, being a sort of bread blessed and consecrated by the priest, whereby to prepare the catechumens for the reception of the body of Christ. The same was used afterwards, not only by catechumens, but by believers themselves, as a token of their mutual communion and friendship. Its origin is dated from the 7th century, at the council of Nantz. In the Gallican church we still find *panis benedictus*, *pain benit*, used for that offered for benediction, and afterwards distributed to pious persons who attend divine service in chapels. 4. Consecrated bread is a piece of wax, paste, or even earth, over which several ceremonies have been performed with benedictions, &c. to be set in an *Agnus Dei*, or relic-box, and presented for veneration. 5. Unleavened bread, *panis azymus* †. The Jews eat no other bread during their passover; and exact search was made in every house, to see that no leavened bread was left. The usage was introduced in memory of their hasty departure from Egypt, when they had not leisure to bake leavened. 6. Shew-bread was that offered to God every sabbath-day, being placed on the golden table in the holy of holies.

Horſe Bread is made of wheat, oats, and beans; to which sometimes are added aniseed, gentian, liquorice, fenugreek, eggs, and ale; and sometimes rye and white wine are used.

For race-horses three sorts of bread are usually given with success, for the second, third, and fourth nights feeding: they are all made of beans and wheat worked with barm; the difference consisting chiefly in the proportion of the two former. In the first kind, three times the quantity of beans is used to one of wheat; in the second, equal quantities of both; in the third, three

times the quantity of wheat to one of beans.

Sago Bread. See *SAGO*.

Mise † of *BREAD*. The price and weight of bread is regulated by the magistrates according to the price of wheat. We have divers tables of the weights of the loaves both of white, wheaten, and household bread, at every price of wheat. If bread want one ounce in 36, the baker formerly was to suffer the pillory: now, to forfeit 5 s. for every ounce wanting; and for every defect less than an ounce, 2 s. 6 d.; such bread being complained of and weighed before a magistrate within 24 hours after it is baked or exposed to sale within the bills of mortality, or within three days in any other place. It is to be observed, bread loses weight by keeping: in some experiments recited by Bartholine, the diminution was near one fourth in six months. The same author assures us, that in Norway they make bread which keeps 30 or 40 years; and that they are there fonder of their old hard bread, than elsewhere of new or soft; since the older it is, the more agreeable it grows. For their great feasts, particular care is taken to have the oldest bread; so that, at the christening of a child, they have usually bread which had been baked perhaps at the christening of his grandfather. It is made of barley and oat-meal baked between two hollow itones.

BREAD-ROOM, in a ship, that destined to hold the bread or biscuit.

The boards of the bread-room should be jointed and caulked, and even lined with tin plates, or mats. It is also proper to warm it well with charcoal for several days before the biscuit is put into it; since nothing is more injurious to the bread than moisture.

BREADTH, in geometry, one of the three dimensions of bodies, which multiplied into their length constitutes a surface.

BREAK, in a general sense, signifies to divide a thing into several parts with violence.

In the art of war, to *break ground*, is to open the trenches before a place.

Among sportsmen, to *break a horse* in trotting, is to make him light upon the hand in trotting, in order to make him fit for a gallop. To *break a horse* for hunting, is to supple him, to make him take the habit of running.

BREAKERS, a name given by sailors to those billows that break violently over rocks lying under the surface of the sea. They are distinguished both by their appearance and sound, as they cover that part of the sea with a perpetual foam, and produce a hoarse and terrible roaring, very different from what the waves usually have in a deeper bottom. When a ship is unhappily driven among breakers, it is hardly possible to save her, as every billow that heaves her upwards serves to dash her down with additional force when it breaks over the rocks or sands beneath it.

BREAKING, in a mercantile style, denotes the becoming bankrupt. See *BANKRUPT*.

BREAKING Bulk, in the sea-language, is the same with unloading part of the cargo.

BREAKSPEAR (Nicholas). See *ADRIAN IV*.

BREAM, in ichthyology. See *CYPRINUS*.

BREAST, in anatomy, denotes the fore-parts of the thorax. See *ANATOMY*, n^o 35, 373.

Smiting the breast is one of the expressions of penitence.

Bread

||

Bread.

† See *Affice*, par. ult.† See *Azymus*.

Breast.

tence. In the Romish church, the priest beats his breast in rehearsing the general confession at the beginning of the mass.

BREASTS, or *Mammae*, in anatomy. See ANATOMY, n° 376.

The breasts are usually two; though we also meet with instances of *trimaemie* or women with three breasts*, and even some with four, all yielding milk alike †.

BREAST-Hooks, in ship-building, are thick pieces of timber incurvated into the form of knees, and used to strengthen the fore-part of the ship, where they are placed at different heights directly across the stem, so as to unite it with the bows on each side. The breast-hooks are strongly connected to the stem and hawse-pieces by tree-nails, and by bolts driven from without through the planks and hawse-pieces, and the whole thickness of the breast-hooks, upon whose inside those bolts are forelocked or clinched upon rings. They are usually about one-third thicker, and twice as long, as the knees of the decks they support.

BREAST-Plate, in antiquity, a piece of armour worn to defend the breast, originally believed to be made of hides, or hemp twisted into small cords, but afterwards made of brass, iron, or other metals, which were sometimes to exquisitely hardened, as to be proof against the greatest force.

BREAST-Plate, in Jewish antiquity, one part of the priestly vestments anciently worn by the high-priests. It was a folded piece of the same rich embroidered stuff of which the *ephod* was made: and it was set with twelve precious stones, on each of which was engraven the name of the tribes. They were set in four rows, three in each row; and were divided from each other by the little golden squares or partitions in which they were set. The names of these stones, and that of the tribes engraven on them, as also their disposition on the breast-plate, are as follows.

Sardine RUBI	Emerald JUDAH.	Lizard GAD.	Beryl ZEBULUN.
Topaz SIMEON	Onyx DAN.	Agate ASHER	Onyx JOSEPH.
Caruncle LEVI	Diamond NAPHTHALI	Amethyst ISSACHAR	Jasper BENJAMIN.

This breast-plate was fastened at the four corners; those on the top to each shoulder by a golden hook or ring at the end of a wreath chain; and those below, to the girdle of the *ephod*, by two strings or ribbons, which had likewise two rings and hooks.

This ornament was never to be fevered from the priestly garment; and it was called the *memorial*, to put the high-priest in mind how dear those tribes ought to be to him, whose names he wore on his breast. It is also called the *breast-plate of judgment*, because it had the divine oracle of *Urim and Thummim* annexed to it. See URIM AND THUMMIM.

BREAST-Plate, in the menage, the strap of leather that runs from one side of the saddle to the other, over the horse's breast, in order to keep the saddle tight, and hinder it from sliding backwards.

BREAST-Work, in fortification, the same with PARAPET.

BREATH, the air inspired and expelled again in the action of respiration.

The ancients were very watchful over the last breath of dying persons, which the nearest relations, as the mother, father, brother, or the like, received in their mouths.

BREATHING, the same with RESPIRATION.

BRECHIN, a town of Scotland, in the county of Angus, situated in E. Long. 2. 18. N. Lat. 56. 40. It consists of one large handsome street, and two smaller; and is seated on the side of a small hill, washed by the river Southesk, over which there is a stone-bridge of two large arches. At the foot of the town is a long row of houses independent of it, built on ground held in feu from the family of Northesk. It is a royal borough, and, with four others, sends a member to parliament. In respect to trade, it has only a small share of the linen manufacture. It lies at no great distance from the harbour of Montrose: and the tide flows within two miles of the town; to which a canal might be made, which perhaps might create a trade, but would be of certain service in conveying down the corn of the country for exportation.

Brechin was a rich and ancient bishopric founded by David I. about the year 1150. At the Reformation, its revenues, in money and in kind, amounted to 700l. a-year; but, after that event, were reduced to 150l. chiefly by the alienation of lands and tythes by Alexander Campbell, the first Protestant bishop, to his chieftain the earl of Argyll.—The Culdees had a convent here. Their abbot Leod was witness to the grant made by king David to his new abbey of Dunfermline. In after times, they gave way to the Mathurines or Red Friars. The ruins of their house, according to Maitland, are still to be seen in the College Wynd.—Here was likewise an hospital called *Maison de Dieu*, founded in 1256, by William de Brechin, for the repose of the souls of the kings William and Alexander; of John earl of Chester, and of Huntingdon his brother; of Henry his father, and Juliana his mother. Albino bishop of Brechin, in the reign of Alexander II. was witness to the grant. By the walls which are yet standing, behind the west end of the chief street, it appears to have been an elegant little building.

The cathedral is a Gothic pile, supported by 12 pillars; is in length 166 feet, in breadth 61: part is ruinous, and part serves as the parish-church. The west end of one of the aisles is entire: its door is Gothic, and the arch consists of many mouldings; the window of it neat tracery. The steeple is a handsome tower, 120 feet high; the four lower windows in form of long narrow openings; the belfry windows adorned with that species of opening called the *quatrefoil*: the top battlemented, out of which rises a handsome spire.—At a small distance from the aisle stands one of those singular round towers whose use has so long baffled the conjectures of antiquaries. These towers appear to have been peculiar to North-Britain and Ireland: in the last they are frequent; in the former, only two at this time exist. That at Brechin stood originally detached from other buildings. It is at present joined near the bottom by a low additional aisle to the church, which takes in about a sixth of its circumference. From this aisle there is an entrance into it of modern date, approachable by a few steps, for the use of the ringers: two handsome bells

Breath
Brechin.Pennant's
Tour in Scot-
land.

bells are placed in it, which are got at by means of six ladders placed on wooden femicircular floors, each resting on the circular abutments within side of the tower. The height from the ground to the roof is 80 feet; the inner diameter, within a few feet of the bottom, is 8 feet; the thickness of the wall at that part, 7 feet 2 inches; so that the whole diameter is 15 feet 2 inches; the circumference very near 48 feet; the inner diameter at top is 7 feet 8 inches; the thickness of the walls, 4 feet 6 inches; the circumference, 38 feet 8 inches; which proportion gives the building an inexpressible elegance: the top is roofed with an octagonal spire 23 feet high, which makes the whole 103. In this spire are four windows placed alternate on the sides, resting on the top of the tower; near the top of the tower are four others facing the four cardinal points: near the bottom are two arches, one within another, in relief; on the top of the outmoft is a crucifixion: between the mouldings of the outmoft and inner are two figures; one of the Virgin Mary; the other of St John, the cup, and lamb. On each corner of the bottom of this arch is a figure of certain beasts; one possibly the Caledonian bear; and the other, with a long snout, the boar. The stone-work within the inner arch has a small slit or peep-hole, but without the appearance of there having been a door within any modern period: yet there might have been one originally; for the filling up consists of larger stones than the rest of this curious rotund. The whole is built with most elegant masonry, which Mr Gough observed to be composed of 60 courses.—This tower hath often been observed to vibrate with a high wind.

The learned among the antiquaries are greatly divided concerning the use, as well as the founders, of these buildings. Some think them Pictish, probably because there is one at Abernethy the ancient seat of that nation; and others call them Danish, because it was a custom of the Danes to give an alarm in time of danger from high places. But the manner and simplicity of building, in early times, of both these nations, was such as to supersede that notion: besides, there are so many specimens left of their architecture, as tend at once to disprove any conjecture of that kind: the Hebrides, Caithness, and Ross-shire, exhibit relics of their buildings totally different. They could not be designed as bell-towers, as they are placed near the steeples of churches, infinitely more commodious for that end; nor places of alarm, as they are often erected in situations unfit for that purpose. The most probable opinion therefore seems to be that of the late Mr Peter Collinson, viz. that they were *Inclusoria; et arci inclusorii ergastula*, the prisons of narrow inclosures: that they were used for the confinement of penitents; some perhaps constrained, others voluntary. *Dunbad o Braoin* being said to have retired to such a prison, where he died A. D. 987. The penitents were placed in the upper story: after undergoing their term of probation, they were suffered to descend to the next; after that, they took a second step, till at length, the time of purification being fulfilled, they were released and received again into the bosom of the church. Mr Collinson says that they were built in the 10th and 11th centuries. The religious were in these days the best architects, and religious architecture the best of any. Ireland being the land of sanctity, *Patria Sanctorum*, the people

of that country might be the original inventors of these towers of mortification. They abound there; and, in all probability, might be brought into Scotland by some of those holy men who dispersed themselves to all parts of Christendom to reform mankind.

The castle of Brechin was built on an eminence, a little fourth of the town; but no vestige of it is now left. It underwent a long siege in the year 1303; was gallantly defended against the English under Edward III.; and, notwithstanding all the efforts of that potent prince, the brave governor Sir Thomas Maule, ancestor of the present earl of Panmure, held out this small fortress for 20 days, till he was slain by a stone cast from an engine on the 20th of August, when the place was instantly surrendered.—Brechin is also remarkable for a battle fought near it, in consequence of the rebellion raised in 1452, on account of the murder of the earl of Douglas in Stirling castle. The victory fell to the royalists under the earl of Huntly. The malecontents were headed by the earl of Crawford, who, retiring to his castle of Finhaven, in the frenzy of disgrace declared, that he would willingly pass seven years in hell, to obtain the glory which fell to the share of his antagonist.

BRECKNOCK, or BRECON, a town of Brecknockshire in Wales, and capital of the county. It is called by the Welch *Aber-Honday*, and is seated at the confluence of the rivers Honday and Usk, over which there is a handsome stone bridge. It is an ancient place, containing three churches, one of which is collegiate, and is seated at the west end of the town. The houses are well built. Here was formerly a stately castle, and a strong wall, through which there were three gates, that are all demolished. It sends one member to parliament. It is well inhabited, which is in some measure owing to its being the town where the affizes are kept; and there is here a considerable woollen-manufactory. The markets are well supplied with cattle, corn, and provisions. W. Long. 3. 15. N. Lat. 52. 0.

BRECKNOCKSHIRE, a county of Wales, bounded by Radnorshire, on the north; Cardiganshire and Caermarthenshire, on the west; Herefordshire and Monmouthshire, on the east; and by Glamorganshire and Monmouthshire, on the south. It is 35 miles in length, 30 in breadth, and about 100 in circumference. It is surrounded with hills, which render the air in the valleys pretty temperate. The soil on the hills is very stony, but the streams descending from thence into the valleys render them fruitful both in corn and grass. The chief commodities here are corn, cattle, fish, and otter's fur, besides manufactures of cloth and stockings. The principal rivers are the Uik, the Wye, and the Yvon. The chief towns are Brecknock, Bealt, and Hay.

Two miles to the east of Brecknock is a large lake, called *Brecknock Meer*, and by the Welch *Llyn Savaddan*; it is two miles in length, and nearly the same in breadth. It contains plenty of otters, tench, perch, and eels. The county sends one member to parliament. It is in the diocese of Landaff, and contains 61 parishes, and is divided into six hundreds.

BREDA, a town in Holland, the capital of Dutch Brabant. It is a large, populous, well-built city, regularly fortified after the modern way, and is one of the strongest places on the Dutch frontiers. It is seated on the river Meck, in a marshy country, which may be overflowed

overflowed and rendered inaccessible to an army. It is 4000 paces in circumference, and contains upwards of 2000 houses. It is not very well-built, but has one handsome street. The town is of a triangular figure, and the ramparts are all planted round with elms. At every angle there is a gate built with brick. The curtains are flanked with 15 bastions, planted with cannon, and by 15 ravelins. The great church is a noble structure, remarkable for its fine spire, which is 362 feet high. The mausoleum of Angelbert II. count of Nassau, is a curious piece adorned with several statues and inscriptions suitable to the occasion. In 1577, the garrison delivered this city to the States-general; but it was retaken in 1581, by Cloude de Bailaimot, assisted by the baron de Frefin, who was prisoner therein. In 1590, prince Maurice took it again from the Spaniards; but Spinola became master of it in 1625, after a siege of six months. It was retaken by the prince of Orange, for the United Provinces, in 1637. There was a congress held here, and peace concluded, in 1667, between the Dutch and the English. E. Long. 4. 45. N. Lat. 51. 35.

BRECH of a great gun, or cannon, the end next the touch-hole.

BRECHES, a garment worn by males, reaching from the girdle to the knees, and serving to cover the hips, thighs, &c.

The ancient Romans had nothing in their dress answering to our breeches and stockings; instead of which, under their lower tunics and waistcoats, they sometimes bound their thighs and legs round with silken scarves or fasciæ, called *tibialia* and *femoralia*. Breeches appear to be a habit peculiar to the barbarous nations, especially those inhabiting the colder countries of the north; whence Tacitus calls them *barbarum tegmen*. We find mention made of them among the ancient Getæ, Sarmatæ, Gauls, Germans, and Britons; they also obtained among the Medes and Persians, as being a people of Scythian origin: they also afterwards got footing in Italy, some pretend as early as the time of Augustus; but without much foundation, that emperor's breeches, mentioned by Suetonius, being apparently only swaths tied over his thighs. However this be, breeches were at last received into Italy, and grew so highly into fashion, that it was thought necessary under Honorius and Arcadius, to restrain them by law, and expel the *bracarii* or breeches-makers out of the city; it being thought unworthy of a nation that commanded the world, to wear the apparel of barbarians.

BRECHINGS, in the sea-language, the ropes with which the great guns are lashed or fastened to the ship's side. They are thus called, because made to pass round the breech of the gun.

BREEDING, in a general sense, the producing, nourishing, and educating all manner of young animals.

BREEDING, in a moral sense, denotes a person's deportment or behaviour in the external offices and decourments of social life. In this sense we say *well-bred, ill-bred, a man of breeding, &c.* Good-breeding is hard to define; none can understand the speculation but those who have the practice. Good-breeding amounts to much the same with what is otherwise called *politeness*, among the ancient Romans *urbanity*. Good-breeding is near to virtue, and will of itself lead a man a great part of the way towards the same. It teaches him to

rejoice in acts of civility, to seek out objects of compassion, and to be pleased with every occasion of doing them good offices. Lord Shaftesbury compares the well-bred man with the real philosopher: both characters aim at what is excellent, aspire to a just taste, and carry in view the model of what is beautiful and becoming. The conduct and manners of the one is formed according to the most perfect ease, and good entertainment of company; of the other, according to the strictest interest of mankind; the one according to his rank and quality in his private station, the other according to his rank and dignity in nature. Horace seems to have united both characters,

Quid verum atque decens curæ et rogo, et omnis in hoc sum.

See the article **Good-MANNERS**.

BREEDING of Horses: See **EQUUS**.

BREEDING of Fish. The necessary qualities of a pond, to make it serve well for breeding fish, are very different from those which are to make it serve for the feeding of them, inasmuch that some particular ponds serve only for one of these purposes, and others for the other; and scarce ever the same pond is found to answer for them both. In general, it is much more rare to find a good breeding pond than a good feeding one. The best indications for a good breeding pond are these; that there be a good quantity of rushes and grafs about its sides, with gravelly shoals, such as horse-ponds usually have: when a pond has this property, and takes to the breeding of fish, it is amazing what a progress will be made in a little time. The spawn of fish is prodigious in quantity; and where it succeeds, one is able to produce many millions: thus, in one of these breeding ponds, two or three melters, and as many spawners, will, in a very little time, stock the whole country. When these ponds are not meant entirely for breeding, but the owner would have the fish to grow to some size in them, the method is to thin the numbers, because they would otherwise starve one another, and to put in other fish that will prey upon the young, and thin them in the quickest manner. Eels and perch are the most useful on this account; because they prey not only upon the spawn itself, but upon the young fry from the first hatching to the time they are of a considerable size. Some fish are observed to breed indifferently in all kinds of waters, and that in considerable plenty; of this nature are the roach, pike, and perch.

BREEZE, a shifting wind that blows from sea or land for some certain hours in the day or night; common in Africa and some parts of the East and West Indies.

Breezes differ from *estive* or trade-winds, as the former are diurnal, or have their periods each day; and the latter are anniversary, and blow at a distance from land. The sea-breezes blow by day, and the land-breezes by night; so that, dividing their empire, they remain constant as the seasons of the year, or course of the sun, on which they seem to depend: not but that they appear sooner or later, stronger or weaker, in some places than in others; and vary the alternative according to the several latitudes, situations, and soils, &c. of the countries where they are found. See the article **WIND**.

BREEZE-Fly. See **TABANUS**.

BREGENTZ, or **BERGENTZ**, a town of Tyrol in Germany, situated at the east end of the lake of Constance, in E. Long. 9. 40. N. Lat. 47. 36.

BREGMA,

BREGMA, in anatomy, the fame with finciput †.

BREHONS, the provincial judges among the ancient Irish, by whom justice was administered, and controversies decided. These judges were a distinct tribe or family, to whom competent lands were allowed in inheritance. In criminal cases the brehon had the eleventh part of all the fines; which could not but be considerable at a time when murders, rapes, robberies, and the like offences, were only subject to pecuniary commutations.

BREHON-LAWS, or *Leges Brehonicae*, denote the general maxims or rules of law observed by the brehons, and having the force of laws throughout all the provinces of Ireland. Several fragments of the *leges brehonicae* are still extant in public and private libraries. The most complete collection is that belonging to the duke of Chandos; containing 22½ sheets close written, full of abbreviated words, and not very legible. By the statute of Kilkenny, made under Edward III. it is enacted that no English subject shall submit to a trial by the brehon law, on the penalty of high treason. Notwithstanding which, many were still under a necessity of being concluded by the Irish laws and customs, till the whole kingdom was settled on an English bottom by king James I.

BREHAR, one of the Scilly islands, lying almost directly west of the land's end in Cornwall, about the distance of 30 miles. It lies between the isles of Micalcaro, Guel, Trefcaw, and Samfon. It is the roughest and most mountainous of them all, and not many years since there were only two families in it, but now there are 13. There are a few poor houses, called the *town of Brebar*; and there are several BARROWS edged with stone, in which they buried considerable persons in ancient times; besides many monuments of the DRUIDS. Some are of opinion, that this with the rest made but one island, which is the reason why so many antiquities are now found in most of them.

BREMEGARTON, a handsome and pretty considerable town of Swisserland, in the territory of Fyen-Aempter, between the cantons of Zurich and Bern. The inhabitants deal chiefly in paper; and their religion is the Roman-catholic. It is divided into the upper and lower towns, and is very advantageously seated on the river Rufs. E. Long. 8. 25. N. Lat. 47. 20.

BREMEN, a large, populous, and very strong town of Germany, capital of a duchy of the same name, with an archbishop's see, secularized in favour of the Swedes, but now belongs to the elector of Hanover. The river Wefer runs through the middle, and divides it into the old and new town. In September 1739, while the inhabitants were asleep, the magazine of powder was set on fire by lightning; and all the houses were shook, as if there had been a violent earthquake, which threw them into a terrible conflagration. This town is divided into four quarters, each of which has a burgomaster; and in the middle there is a large market-place, with the statue of Rolando. E. Long. 8. 45. N. Lat. 53. 40.

BREMEN, a duchy of Germany, in the province of lower Saxony, lying between the rivers Wefer and the Elbe; of which the former separates it from the duchy of Oldenburg, and the other from that of Holstein. The air is cold; but the country is fertile, and well peopled. It formerly belonged to the Swedes, but was

afterwards sold to the king of Great Britain, as elector of Hanover, in 1716. In the winter it is subject to inundations. In 1617, on Christmas-day, several thousand cattle were drowned, besides several hundred of men; and the country was so covered with water, that it has cost immense sums to repair the dykes. Bremen is the capital town.

BREMEN-VEERD, a town of Germany, in the circle of lower Saxony, and duchy of Bremen. It is an open town, seated on the river Oost, and was formerly the place of residence of the archbishop. E. Long. 8. 35. N. Lat. 53. 58.

BRENNUS, a celebrated captain among the Gauls, who, about 388 years before the Christian era, entered Italy with a powerful army; made great conquests there; defeated the Romans; and sacked Rome. The capitol alone was defended; and Camillus coming to its relief, drove the Gauls not only out of Rome, but out of all Italy. See (*History of*) ROME.

BRENT, a town of Devonshire, with a market on Saturdays, and two fairs, on May 13th and October 10th, for horned cattle. It is but a small place, and lies on the road from Exeter to Plymouth, being 26 miles south-west from the former, and 198 west-by-south of London. W. Long. 5. 7. N. Lat. 50. 30.

BRENT GOOSE, a species of goose with a black neck, and a white collar round; usually confounded with the barnacle, tho' in reality a distinct species. See ANAS.

BRENTFORD, a town of Middlesex, in the great London road to the west. It is divided into old and new Brentford, in which last are the church and market-house. It is a long place, well stocked with public houses, and is seated on the river Thames, in W. Long. 0. 10. N. Lat. 51. 26.

BRENTWOOD, or BURNTWOOD, a town of Essex in England; it stands on a rising ground in the road from London to Colchester, and has several good inns. E. Long. 0. 25. N. Lat. 51. 38.

BREREWOOD (Edward), a very learned English mathematician and antiquary, was the son of Robert Brerewood a tradesman, who was three mayor of Chester; and born in that city in the year 1565. He was educated in grammar learning at the free school in Chester; and afterwards admitted, in 1581, of Brazen-nose-college in Oxford. In the year 1596, he became the first professor of astronomy in Gresham-college in London; where he led the same private and retired course of life that he had before done in Oxford. He died there of a fever, upon the 4th of November 1613, much lamented. He was a great searcher into antiquity and curious knowledge; but is remarkable for having never published any thing during his lifetime. After his death came out the following works. 1. *De ponderibus et pretiis veterum nummorum.* 2. Inquiries touching the diversities of languages and religion through the chief parts of the world. 3. *Elementa logicae in gratiam studiose juventutis in Acad. Oxon.* 4. *Tractatus quidam logici.* 5. 6. Two treatises on the Sabbath. 7. *Tractatus duo, quorum primus est de meteoris, secundus de oculo.* 8. *Commentarii in ethica Aristotelis.* Mr. Wood tells us, that the original manuscript of this, written with his own hand, is in the smallest and neatest characters that his eyes ever beheld; and that it was finished by him on the 27th of October 1586. 9. Patriarchal government of the ancient church.

Brerewood.

BRESCIA, a strong and handsome town of Italy, with a bishop's see and a good citadel. It is the capital of Bresciano in the territory of Venice, and is seated in an agreeable plain on the river Garza, in E. Long. 10. 5. N. Lat. 45. 31.

BRESCIANO, a province of Italy in the territory of Venice; bounded on the north, by the Grisons and the bishopric of Trent; on the east, by the lake Garda, the Veronese, and the duchy of Mantua; on the south, by the duchy of Mantua and the Cremonese; and on the west, by the Cremasco, the Burgomasco, and the Valtelina. It is watered by several small rivers, which render it very fertile; and is full of towns and villages, of which Brescia is the capital.

BRESELLO, a small town of Italy, in the duchy of Modena, seated on the river Po, in E. Long. 10. 25. N. Lat. 44. 55.

BRESCICATE, in commerce, a kind of bays, of which there is some trade carried on with the negroes, between the river Gambia and Sierra Leona. The best sorts for that purpose are the blue and the red.

BRESLAU, a small duchy of lower Silesia in Germany, lying between those of Wolow, Olse, Brigg, Schwednitz, and Lignitz. It is every where level and flat; is an excellent corn country, yielding also good pasture; abounding also with herds of cattle and flocks of sheep; but destitute of wood, except in one district or circle; and the roads in general are very bad. It is an immediate principality, that is, one of which both the property and jurisdiction belong to the king, forming a part of one of the three bailiwicks into which all the immediate principalities are divided.

BRESLAU, the chief town of the duchy of that name, and of all Silesia, is situated at the conflux of the Oder and Ohlau, in E. Long. 17. 5. N. Lat. 51. 4. Including the suburbs, it is of great extent; having many large regular squares, broad streets, stately public and private edifices; but the fortifications are of no great importance. Here are in particular a great many churches and convents belonging to the catholics; of the former are several also belonging to the Lutherans, one to the Calvinists, and another to the Greeks. The Jews have likewise two synagogues, the bishop a stately palace, and the Lutherans two gymnasia. The Polish university is a noble structure, nor is the exchange destitute of magnificence. This city is the seat of all the high colleges; and the third in rank, next to Berlin and Konigsberg, in all the Prussian dominions. The magistracy of it is Lutheran, and its trade and manufactures are very considerable. Several of the monasteries and nunneries are very magnificent; and there are also some good public libraries in it, with two armouries, a college of physicians, and a mint. Breslau is very populous, and much frequented by Hungarian, Bohemian, Polish, and other merchants, having several yearly fairs. The city was taken by the king of Prussia in 1741, and retaken by the Austrians in 1757; but the king of Prussia took it back again the same year, and gained a signal victory over the Austrians at Leuthen, a village not far from the capital.

BRESSE, a province of France, bounded on the north, by Burgundy and the Franche Comte; on the east, by Savoy; on the south, by Viennois; on the west, by the principality of Dombes and the Somme. It is 40 miles from north to south, and 23 from east to west.

It is fertile in corn and hemp, has fine pastures, and several lakes with plenty of fish. It is divided into the higher and lower; the first is on the side of Bourges, and the second towards St Trivier and the river Sonne. The French got possession of it in 1601. The principal places are Bourgen, Bresse, Montluel, Pont de Vaux, and Coligny.

BRESSICI, in geography. See **BRESSE**.

BREST, a maritime town of France, in lower Brittany, seated on the declivity of a hill on the side of its port, which is the largest in the kingdom, and will hold 500 ships at a time. There is an arsenal with masts, which was placed there on account of its nearness to the woods, mines of iron, and other things proper for the building of ships. It was entirely consumed by fire in 1744, which was an irreparable loss to France. The entrance into the port is guarded by a strong castle seated on a rock, which cannot be attempted on the sea side, because it is craggy, and is defended on the land side by a large ditch and other fortifications. The streets of Brest are very narrow, ill contrived, few in number, and have all a descent. A great quay surrounds this side of the port, which is above a mile in length, and 200 paces broad; and there are magazines on the quay full of all foreign merchandises. On the other side of the port the fine church of Notre Dame is situated; and in a suburb, which is as big as half the city, there is a strong tower opposite to the castle, at the entrance of the port; there is also a great quay on this side, bordered with large magazines, partly within the rock, which has been cut away to enlarge the place. These are extended almost as far as the bottom of the harbour, where there are two docks very commodious for the building of large ships; the shops and houses of the workmen are all around them: the ropewalks are separated from the city by one of these docks. The entrance into the harbour is called the *gullet*, and is a passage extremely difficult on account of the sunk rocks on both sides of the shore; but there are experienced pilots who carry ships in very safely. The English attempted to take possession of this harbour in 1694, but were disappointed. W Long. 4. 26. N. Lat. 48. 23.

BREST, or *Bressil*, in architecture, a term sometimes used for the member of a column, more usually called *torus*. See **Torus**.

BREST-Summers, in timber buildings, are pieces in the outward thereof, into which the girders are framed: this, in the ground-floor, is called a *cell*; and, in the garret-floor, a *beam*.—As to their size, it is the same with that of girders. See **GIRDERS**.

BRESTE, the palatinate of, is one of the provinces of Cujava, in Poland. It lies between the palatinates of Pioesko, Rava, and Lencici Wladislaw. It is divided into four chateaux, and Breste is the capital of the whole.

BRESTE, or *Bressici*, the capital of the palatinate of Bressici, and of Polesia, in Poland, seated on the river Bog, 80 miles east of Warsaw, and subject to Poland. It is a fortified town, and has a castle built upon a rock. Here is a famous synagogue, resorted to by the Jews from all the countries in Europe. E. Long. 24. 0. N. Lat. 41. 35.

BRET, a name the people on the coasts of Lincolnshire give to the common turbot, a fish extremely plentiful with them, and taken in vast abundance. The way

Breteffe,
Breton.

Breton.

of catching them is in a net trailed on the ground by two horses; the one going up to the middle of his body in water, the other on shore.

BRETESSE, in heraldry, denotes a line embattled on both sides.

BRETON, or CAPE-BRETON, an island near the eastern continent of North America, lying between 45 and 47 degrees of north latitude. It is separated from Nova Scotia by a narrow strait called *Canso*, and is about 100 miles in length and 50 in breadth. It is surrounded with little sharp-pointed rocks, separated from each other by the waves, above which some of their tops are visible. All its harbours are open to the east, turning towards the south. On the other parts of the coast there are but a few anchoring places for small vessels, in creeks, or between islets. Except in the hilly parts, the surface of the country has but little solidity, being every where covered with a light moss, and with water. The dampness of the soil is exhaled in fogs, without rendering the air unwholesome. In other respects, the climate is very cold; owing either to the prodigious quantity of lakes, which cover above half the island, and remain frozen a long time; or to the number of forests, that totally intercept the rays of the sun; the effect of which is besides decreased by perpetual clouds.

Tho' some fishermen had long resorted to this island every summer, not more than 20 or 30 had ever fixed there. The French, who took possession of it in August 1713, were properly the first inhabitants. They changed its name into that of *Ile Royale*, and fixed upon Fort Dauphin for their principal settlement. This harbour was two leagues in circumference. The ships came to the very shore, and were sheltered from winds. Forests affording oak sufficient to fortify and build a large city, were near at hand; the ground appeared less barren than in other parts, and the fishery was more plentiful. This harbour might have been rendered impregnable at a trifling expence; but the difficulty of approaching it (a circumstance that had at first made a stronger impression than the advantages resulting from it) occasioned it to be abandoned, after great labour had been bestowed upon the undertaking. They then turned their views to Louisbourg, the access to which was easier; and convenience was thus preferred to security: the fortification of Louisbourg, however, was not begun till 1720.

In the year 1714, some fishermen, who till then had lived in Newfoundland, settled in this island. It was expected that their number would soon have been increased by the Acadians, who were at liberty, from the treaties that had been granted them, to remove with all their effects, and even to dispose of their estates; but these hopes were disappointed. The Acadians chose rather to retain their possessions under the dominion of Britain, than to give them up for any precarious advantage they might derive from their attachment to France. Their place was supplied by some distressed adventurers from Europe, who came over from time to time to Cape Breton, and the number of inhabitants gradually increased to 4000. They were settled at Louisbourg, Fort Dauphin, Port Toulouse, Nerucka, and on all the coasts where they found a proper beach for drying the cod. The inhabitants never applied themselves to agriculture, the soil being unfit for it. They often sowed corn, but it seldom came to matu-

ry; and when it did thrive so much as to be worth reaping, it had degenerated so considerably, that it was not fit for feed for the next harvest. They have only continued to plant a few pot-herbs that are tolerably well tasted, but must be renewed every year from abroad. The poorness and scarcity of pastures has likewise prevented the increase of cattle. In a word, the soil of Cape Breton seemed calculated to invite none but fishermen and soldiers.

Though the island was entirely covered with forests before it was inhabited, its wood has scarce ever been an object of trade. A great quantity, however, of soft wood was found there fit for firing, and some that might be used for timber; but the oak has always been scarce, and the fir never yielded much resin. The peltry trade was a very inconsiderable object. It consisted only in the skins of a few lynxes, elks, musk-rats, wild cats, bears, otters, and foxes both of a red and silver-grey colour. Some of these were procured from a colony of Mickmac Indians who had settled on the island with the French, and never could raise more than 60 men able to bear arms. The rest came from St John's, or the neighbouring continent. Greater advantages might possibly have been derived from the coal-mines which abound in the island. They lie in a horizontal direction; and being no more than six or eight feet below the surface, may be worked without digging deep, or draining off the waters. Notwithstanding the prodigious demand for this coal from New England, from the year 1745 to 1749, these mines would probably have been forsaken, had not the ships which were sent out to the French islands wanted ballast. In one of these mines a fire has been kindled, which could never yet be extinguished.

The people of Cape Breton did not send all their fish to Europe. They sent part of it to the French southern islands, on board 20 or 25 ships from 70 to 140 tons burthen. Besides the cod, which made at least half their cargo, they exported to the other colonies timber, planks, thin oak-boards, salted salmon and mackerel, train-oil, and sea-coal. All these were paid for in sugar and coffee, but chiefly in rum and molasses. The island could not consume all these commodities. Canada took off but a small part of the overplus; it was chiefly bought by the people of New England, who gave in exchange fruits, vegetables, wood, brick, and cattle. This trade of exchange was allowed; but a smuggling trade was added to it, carried on in flour, and salt fish.

This island, the key of Canada, was attacked by the English in 1745; and the event is of so singular a nature, that it deserves a particular detail. The plan of this first invasion was laid at Boston, and New England bore the expence of it. A merchant named *Pepperel*, who had excited, encouraged, and directed the enterprise, was intrusted with the command of an army of 6000 men, which had been levied for this expedition.

Though these forces, conveyed by a squadron from Jamaica, brought the first news to Cape Breton from the danger that threatened it; though the advantage of a surprize would have secured the landing without opposition; though they had but 600 regular troops to encounter, and 800 inhabitants hastily armed; the success of the undertaking was still precarious. What great exploits, indeed, could be expected from a militia

suddenly assembled, who had never seen a siege or faced an enemy, and were to act under the direction of sea-officers only. These unexperienced troops stood in need of the assistance of some fortunate incident, which they were indeed favoured with in a singular manner.

The construction and repairs of the fortifications had always been left to the care of the garrison of Louisbourg. The soldiers were eager of being employed in these works, which they considered as conducive to their safety, and as the means of procuring them a comfortable subsistence. When they found that those who were to have paid them, appropriated to themselves the profit of their labours, they demanded justice. It was denied them, and they determined to assert their right. As these depredations had been shared between the chief persons of the colony and the subaltern officers, the soldiers could obtain no redress. Their indignation against these rapacious extortioners rose to such a height, that they defied all authority. They had lived in open rebellion for six months, when the British appeared before the place.

This was the time to conciliate the minds of both parties, and to unite in the common cause. The soldiers made the first advances; but their commanders mistrusted a generosity of which they themselves were incapable. It was firmly believed that the soldiers were only desirous of falling out, that they might have an opportunity of deserting; and their own officers kept them in a manner prisoners, till a defence so ill-managed had reduced them to the necessity of capitulating. The whole island shared the fate of Louisbourg, its only bulwark.

This valuable possession, restored to France by the treaty of Aix la Chapelle, was again attacked by the British in 1758. On the 2^d of June, a fleet of 23 ships of the line and 18 frigates, carrying 16,000 well disciplined troops, anchored in Gabarus bay, within half a league of Louisbourg. As it was evident it would be to no purpose to land at a great distance, because it would be impossible to bring up the artillery and other necessaries for a considerable siege, it had been attempted to render the landing impracticable near the town. In the prudent precautions that had been taken, the besiegers saw the dangers and difficulties they had to expect; but, far from being deterred by them, they had recourse to stratagem, and while by extending their line they threatened and commanded the whole coast, they landed by force of arms at the creek of Cormorant.

This place was naturally weak. The French had fortified it with a good parapet planted with cannon. Behind this rampart they had posted 2000 excellent soldiers and some Indians. In front they had made such a close hedge with branches of trees, that would have been very difficult to penetrate, even if it had not been defended. This kind of palliade, which concealed all the preparations for defence, appeared at a distance to be nothing more than a verdant plain.

This would have preserved the colony, had the assailants been suffered to complete their landing, and to advance with the confidence that they had but few obstacles to surmount. Had this been the case, overpowered at once by the fire of the artillery and the small arms, they would infallibly have perished on the shore, or in the hurry of embarking; especially as the sea was just then very rough. This unexpected loss might have

interrupted the whole project.

But all the prudent precautions that had been taken, were rendered abortive by the impetuosity of the French. The English had scarce begun to move towards the shore, when their enemies hastened to discover the snare they had laid for them. By the brisk and hasty fire that was aimed at their boats, and still more by the premature removal of the boughs that masked the forces, which it was so much the interest of the French to conceal, they guessed at the danger they were going to rush into. They immediately turned back, and saw no other place to effect their landing but a rock, which had been always deemed inaccessible. General Wolf, though much taken up in reembarking his troops, and sending off the boats, gave the signal to major Scot to repair thither. That officer immediately removed to the spot with his men. His own boat coming up first, and sinking at the very instant he was stepping out, he climbed up the rock alone. He was in hopes of meeting with 100 of his men who had been sent thither some hours before. He found only ten. With these few, however, he gained the summit of the rock. Ten Indians and 60 Frenchmen killed two of his men, and mortally wounded three. In spite of his weakness, he flood his ground under cover of a thicket, till his brave countrymen, regardless of the boisterous waves and the fire of the cannon, came up to him, and put him in full possession of that important post, the only one that could secure their landing. The French, as soon as they saw that the enemy had got a firm footing on land, betook themselves to the only remaining refuge, and shut themselves up in Louisbourg. The fortifications were in a bad condition, because the sea fad, which they had been obliged to use, is by no means fit for works of masonry. The revetments of the several curtains were entirely crumbled away. There was only one casemate and a small magazine that were bomb proof. The garrison which was to defend the place consisted only of 2,900 men.

Notwithstanding all these disadvantages, the besieged were determined to make an obstinate resistance. It is scarce credible that the French were confirmed in their resolution by the courage of a woman. Madame de Druicourt was continually upon the ramparts, with her purse in her hand; and firing herself three guns every day, seemed to dispute with the governor her husband the glory of his office. The besieged were not dismayed at the ill success of their several sallies, or the masterly operations concerted by admiral Boscawen and general Amherst. It was but at the eve of an assault, which it was impossible to sustain, that they talked of surrendering. They made an honourable capitulation; and the conqueror shewed more respect for his enemy and for himself, than to fully his glory by any act of barbarity or avarice.

BRETTIGAW, a territory or valley of the Grisons, lying between the Rhine and the county of Tyrol, and along the river Lanquet. The fortress of Castels is the principal town.

BREVE, in law, is any writ directed to the chancellor, judges, sheriffs, or other officers, whereby a person is summoned, or attached, to answer in the king's court, &c.

BREVE *Perquirere*, the purchasing of a writ or licence for trial in the king's courts; whence comes the present

Breve
|
Breugel.Breugel,
Breviary.

present use of paying 6s. 8d. fine to the king in fuit, for money due on bond, where the debt is 40l. and of 10s. where it is 100l. &c.

BREVE de Retto, is a writ of right or licence, for a person ejected, to sue for the possession of the estate detained from him.

BREVE, in music, a note or character of time, in the form of a diamond or square, without any tail, and equivalent to two measures or minims.

BREVET, in the French customs, denotes the grant of some favour or donation from the king; in which sense it partly answers to our warrant, and partly to letters-patent.

BREVET, more particularly denotes the commission of a subaltern officer, being only written on parchment, and without seal.

BREUGEL (Peter), an eminent painter, commonly called *Old Breugel*, was born at a village of the same name near Breda, in the year 1565; and was the first pupil of Peter Cock, whose daughter he married. It was customary with him to dress like a country-man, in order to be more easily admitted into the company of country-people, and be allowed to join in their frolics, by which means he became perfectly acquainted with their manners and gestures, of which he made excellent use in his pictures. He travelled to France and Italy, and for a long time studied landscapes on the mountains of Tyrol. His humourous turn of mind displayed itself in all his pictures, which generally consisted of country-dances, marriages, sports, and diversions; tho' he sometimes performed pieces from the historical parts of the holy Scriptures. At his return from Italy, he settled at Antwerp, and in his last illness caused his wife to gather together all his immodest pieces and burn them before his face. He died at Antwerp; but in what year cannot be ascertained.—He had a son named *Peter*, who also distinguished himself by his paintings; and *Johr*, the subject of the following article.

Of the works of old Breugel, the great duke of Tuscany has, Christ carrying his cross, with a great number of figures; and a country feast. The emperor has the tower of Babel, the massacre of the Innocents, and the conversion of St Paul, of his painting; the elector Palatine, a landscape, with St Philip baptizing queen Candace's eunuch; and St John preaching in the wilderness, with a great many figures.

BREUGEL (John), commonly called *Velvet Breugel*, from his generally wearing velvet clothes, was the son of Peter Breugel, and born about the year 1575. He first applied himself to painting flowers and fruit, in which he excelled; and afterwards had great success in drawing landscapes, and views of the sea, set off with small figures. He lived long at Cologne, where he acquired great reputation. He travelled to Italy, where his fame had got before him; and where his fine landscapes, adorned with small figures superior to those of his father, gave very great satisfaction. If a good judgment may be formed from the great number of pictures he left behind him, all highly finished, he must have been exceedingly industrious. Nor did he satisfy himself with embellishing his own works only, but was very useful in this respect to his friends. Even Rubens made use of Breugel's hand in the landscape part of several of his small pictures, such as his Vertumnus and Pomona; the satyr viewing the sleeping nymph; and the

terrestrial paradise, which is looked upon as his masterpiece; and, together with the two former, was done for king William III. of Great Britain. He died in 1642, in the 67th year of his age.

Several of his works are to be seen in the archbishop's gallery at Milan; particularly a hunting-piece with a vast many figures; a landscape representing a desert, with the picture of St Hierom painted by Cerrano, alias Gro Baptista Crespi. In the Ambrosian library are 20 pieces of this masterly hand; particularly, Daniel in the lion's den, the inside of the great church at Antwerp, the four seasons on copper, and the burning of Gomorrah. In the possession of the elector Palatine at Dusseldorp, Christ preaching on the sea-shore; a country-dance; a sea-port, with a great many figures; a coach and two chariots, with a multitude of figures and animals; a landscape, wherein Flora is crowned by a nymph; St John preaching in the wilderness; a small sea-landscape, and several other pieces. In the possession of the king of France, a woman playing with a dog, the battle between Alexander and Darius, both in wood; Orpheus in hell, &c.

BREVIARY, a daily office, or book of divine service, in the Romish church. It is composed of matins, lauds, first, third, sixth, and ninth vespers, and the compline, or post communion.

The breviary of Rome is general, and may be used in all places; but on the model of this various others have been built, appropriated to each diocese, and each order of religious.

The breviary of the Greeks is the same in almost all churches and monasteries that follow the Greek rites: the Greeks divide the psalter into 20 parts. In general, the Greek breviary consists of two parts; the one containing the office for the evening, the other that of the morning, divided into matins, lauds, first, third, sixth, and ninth vespers, and the compline; that is, of seven different hours, on account of that saying of David, *Septies in die laudem dixi tibi*.

The institution of the breviary is not very ancient: there have been inserted in it the lives of the saints, full of ridiculous and ill-attested stories, which gave occasion to several reformations of it, by several councils, particularly those of Trent and Cologne; by several popes, particularly Pius V. Clement VIII. and Urban VIII.; and also by several cardinals and bishops, each lopping off some extravagances, and bringing it nearer to the simplicity of the primitive offices. Originally, every body was obliged to recite the breviary every day; but by degrees the obligation was reduced to the clergy only, who are enjoined, under penalty of mortal sin and ecclesiastical censures, to recite it at home, when they cannot attend in public. In the 14th century, there was particular reserve granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without rehearsing the breviary.

This office was originally called *curfus*; and afterwards, the *breviarium*: which latter name imports that the old office was abridged; or rather, that this collection is a kind of abridgment of all the prayers.

The breviaries now in use are innumerable; the difference between them consists principally in the number and order of the psalms, hymns, pater-nosters, ave-Maries, creeds, magnificates, cantemus's, benedictus's, canticamus's, nunc dimittis's, miserere's, hallelujah's, gloria

gloria patriæ, &c.

BREVIARY, in Roman antiquity, a book first introduced by Augustus, containing an account of the application of the public money.

BREVIATOR, an officer under the eastern empire, whose business it was to write and translate briefs.—At Rome those are styled *breviators*, or *abbreviators*, who dictate and draw up the pope's briefs.

BREVIBUS A ROTULIS LIBERANDIS, a writ or command to a sheriff to deliver to his successor the county, with the appurtenances, and the rolls, writs, and other things to his office belonging.

BREVIÉR, among printers, a small kind of type or letter between bourgeois and minion.

BREVIUM CUSTOS. See *Custos*.

BREVORDT, a town of Guelderland, in the United Netherlands, situated in E. Long. 6. 35. N. Lat. 52°.

BREWER (Anthony), a dramatic poet who flourished in the reign of king Charles I. and appears to have been held in high estimation by the wits of that time, as may be more particularly gathered from an elegant compliment paid to him in a poem called *Steps to Parnassus*, wherein he is supposed to have a magic power to call the muses to his assistance, and is even set on an equality with the immortal Shakespeare himself. There are, however, great disputes among the several writers as to the number of his works. Those which have been ascribed to him with any certainty are, 1. The country girl, a comedy. 2. The love-sick king, a comedy. And, 3. *Lingua*: a piece in regard to which Winstanley records a remarkable anecdote, which points it out to have been in some measure the innocent cause of those troubles that disturbed the peace of these realms in the middle of the 17th century. He tells us, that, when this play was acted at Cambridge, Oliver Cromwell (then a youth) acted a part in it. The

substance of the piece is a contention among the Senecas for a crown which *Lingua* had laid for them to find. The part allotted to young Cromwell was that of *Taduis*, or *Touch*; who, having obtained the contested coronet, makes this spirited declamation:

Roses and bays, pack hence! this crown and robe
My brows and body circles and jewels:
How gallantly it fits me! fure the flame
Mensur'd my head who wrought this coronet.—
They lie that say complexions cannot change!
My blood's ennobled, and I am transform'd
Unto the fiercer temper of a king.
Methinks I hear my noble parasites
Styling me *Cæsar*, or *Great Alexander*,
I, taking my tea, &c.

It is said that he felt the whole part so warmly, and more especially the above-quoted speech, that it was what first fired his soul with ambition, and excited him, from the possession of an imaginary crown, to stretch his views to that of a real one; for the accomplishment of which he was content to wade through seas of blood.

BREWER, a person who professes the art of brewing.

There are companies of brewers in most capital cities; that of London was incorporated in 1427 by Henry VI. and that of Paris is still older.

The apparatus and utensils of a brewer, or a brew-house, are, A furnace made close and hollow for saving fuel, and with a vent for the smoke lest it taint the liquor; a copper, which is preferable to lead; a mask-vat near the head; a cooler near the mask-vat; and a guile-vat under the cooler: adjoining to all are several clean tubs, to receive the worts and liquors.

BREWERS-HAVEN, a good harbour at the north end of the island of Chiloe on the coast of Chili, in South America, and in the South sea. The Dutch landed forces here in 1643, desirous to get possession of some part of Chili; but they were driven from thence by the Spaniards and the natives. W. Long. 82°. S. Lat. 42°.

B R E W I N G,

THE operation of preparing ale or beer from MALT.

³
No settled
theory of
brewing.

Though the art of brewing is undoubtedly a part of chemistry, and certainly depends upon fixed and invariable principles as well as every other branch of that science, these principles have never yet been thoroughly investigated. For want of a settled theory, therefore, the practice of this art is found to be precarious; and to succeed unaccountably with some, and misgive as unaccountably with others. Some few hints, however, have been thrown out, in order to establish a regular theory of brewing; the principal of which we shall lay before our readers.

³
Common
processes de-
scribed.

The usual process of brewing is as follows. A quantity of water, being boiled, is left to cool till the height of the steam be over; when so much is poured to a quantity of malt in the mashing tub, as makes it of a consistence stiff enough to be just well rowed up: after standing thus a quarter of an hour, a second quantity of the water is added, and rowed up as before: lastly, the full quantity of water is added; and that in proportion as the liquor is intended to be strong or weak.—This part of the operation is called *mashing*.—The whole now stands two or three hours, more or less, ac-

ording to the strength of the wort or the difference of weather, and is then drawn off into a receiver; and the mashing repeated for a second wort, in the same manner as for the first, only the water must be cooler than before, and must not stand above half the time. The two worts are then to be mixed, the intended quantity of hops added, and the liquor close covered up, gently boiled in a copper for the space of an hour or two; then let into the receiver, and the hops strained from it into the coolers. When cool, the barm or yeast is applied; and it is left to work or ferment till it be fit to tun up. For small beer there is a third mashing with the water near cold, and not left to stand above three quarters of an hour; to be hopped and boiled at discretion. For double beer or ale, the liquors resulting from the two first mashings must be used as liquor for a third mashing of fresh malt.

From considering this process, and the multiplicity of circumstances to be attended to in it, we may easily see that it must be a very precarious one. The success of the operation, *i. e.* the goodness of the beer, must depend upon the quality of the malt from which it is made; on that of the water with which it is infused; on the degree of heat applied in the infusion; on the length

³
Difficulties
attending

length of time the infusion is continued; on the proper degree of boiling, the quantity and quality of the hops employed; on the proper degree of fermentation, &c.: all which, as already observed, have never yet been thoroughly investigated and ascertained.

The manner of making malt Sir Robert Murray describes as follows.—Take good barley newly threshed, &c.; put about six English quarters in a stone trough full of water, where let it steep till the water be of a bright reddish colour; which will be in about three days, more or less, according to the moisture or dryness, smallness or bigness, of the grain, the season of the year, or the temperature of the weather. In summer, malt never makes well; in winter it requires longer steeping than in spring or autumn. It may be known when it is steeped enough by other marks besides the colour of the water; as by the excessive swelling of the grain if it be over-steeped, and by too much softness; being, when it is in a right temper, like the barley prepared to make broth of. When it is sufficiently steeped, take it out of the trough, and lay it in heaps to let the water drain from it; then, after two or three hours, turn it over with a scoop, and lay it in a new heap, 20 or 24 inches deep. This is called the *coming heap*, in the right management whereof lies the principal skill. In this heap it may lie 40 hours, more or less, according to the forementioned qualities of the grain, &c. before it come to the right temper of malt; which that it may do equally, is mainly desired. While it lies in this heap, it must be carefully looked to after the first 15 or 16 hours: for about that time the grains begin to put forth roots; which when they have equally and fully done, the malt must, within an hour after, be turned over with a scoop; otherwise the grains will begin to put forth the blade and spire also, which must by all means be prevented. If all the malt do not come equally, but that which lies in the middle, being warmest, come the soonest; the whole must be turned, so that what was outmost may be inmost; and thus it is managed till it be all alike. As soon as the malt is sufficiently come, turn it over, and spread it to a depth not exceeding five or six inches; and by that time it is all spread out, begin and turn it over again three or four times. Afterwards turn it over in like manner once in four or five hours, making the heap deeper by degrees; and continue to do so for the space of 48 hours at least. This frequent turning it over, cools, dries, and deadens the grain; whereby it becomes mellow, melts easily in brewing, and separates entirely from the husk. Then throw up the malt into a heap as high as you can; where let it lie till it grow as hot as your hand can endure it, which usually happens in about the space of 30 hours. This perfects the sweetness and mellowness of the malt. After it is sufficiently heated, throw it abroad to cool, and turn it over again about six or eight hours after; and then lay it on a kiln with a hair-cloth or wire spread under it; where, after one fire which must last 24 hours, give it another more slow, and afterwards, if need be, a third: for if the malt be not thoroughly dried, it cannot be well ground, neither will it dissolve well in the brewing; but the ale it makes will be red, bitter, and unfit for keeping.

From this account of the process of malting, it appears, that, besides the proper management in wetting, turning, &c. the drying is an article of the utmost con-

sequence; and concerning the proper degrees of heat to be employed for this purpose, M. Combrune has related the following experiments. “In an earthen pan, of about two feet diameter, and three inches deep, I put as much of the palest malts, very unequally grown, as filled it on a level to the brim. This I placed over a little charcoal lighted in a small stove, and kept continually stirring it from bottom to top; at first it did not feel so damp as it did about half an hour after.

“In about an hour more, it began to look of a bright orange colour on the outside, and appeared more swelled than before. Every one is sensible how long continued custom alone makes us sufficient judges of colours. Then I macerated some of the grains, and found they were nearly such as are termed *brown malts*. On stirring and making a heap of them towards the middle, I placed therein at about half depth the bulb of my thermometer, and found it rose to 140 degrees: here the malt felt very damp, and had but little smell.

“At 165 degrees I examined it in the same manner as before, and could perceive no damp: the malt was very brown; and, on being macerated, some few black specks appeared.

“Now many corns, nearest the bottom, were become black and burnt: with all the diligence I could use, I placed my thermometer nearly there, and it rose to 175 degrees. But the particles of fire, arising from the stove, act on the thermometer in proportion to the distance of the situation it is placed in; for which, through the whole experiment, an abatement of 5 degrees should be allowed, as near as I could estimate; so, a little after, putting my thermometer in the same position, where nearly half the corns were black, it shewed 180 degrees. I now judged that the water was nearly all evaporated, and the heap grew black again.

“Again, in the centre of the heap raised in the middle of the pan, I found the thermometer at 180 degrees; the corn tasted burnt; and the whole, at top, appeared about one half part a full brown, the rest black: on being macerated, still some white specks appeared; which I observed to proceed from these barley-corns which had not been thoroughly germinated, and whose parts coloring more together, the fire, at this degree of heat, had not penetrated them: their taste was insipid, the malts brittle, and readily parting from the skin: but the thermometer was now more various, as it was nearer to or farther from the bottom; and here I judged all the true malt to be charred.

“However, I continued the experiment; and, at 190 degrees, still found some white specks on macerating the grain; the acropire always appearing of a deeper brick or brown than the outward skin: the corn now fried at the bottom of the pan.

“I next increased the fire; the thermometer, placed in the mean between the bottom of the pan and the upper edge of the corn, shewed 210 degrees. The malt hilled, fried, and smoked abundantly; though, during the whole process, the grain had been kept stirring, yet, on examination, the whole had not been equally affected with the fire. I found a great part thereof reduced to perfect cinders, easily crumbling to dust between the fingers, some of a very black hue without gloss, some very black with oil shining on the outside. Upon the whole, two third parts of the

Mr Combrune's experiments on the drying of malt; Essay on Brewing.

corn were perfectly black; the rest were of a deep brown, more or less so, as they were hard, stecy, or imperfectly germinated; which was easily discovered by the length of the shoot. Most of them seemed to have lost their cohesion, and had a taste resembling that of high roasted coffee.

"In the last stage of charring the malt, I set thereon a wine-glass inverted, into which arose a pinguis oily matter, which tasted very salt. Perhaps it may not be unnecessary to say, that the length of time this experiment took up was four hours, and that the effect it had both on myself and the person who attended me was such as greatly resembled the case of inebriation.

"Though, from hence, it is not possible to fix the exact degree of heat in which malts charr, yet we see some black appeared when the thermometer was at 165 degrees, that some were entirely black at 175 and at 180 degrees, that the grains thus affected were such as had been perfectly germinated, and that those which bore a greater heat were defective in that point; whence we may conclude with an exactness that will be sufficient for the purposes of brewing, that true germinated malts are charred in heats between 175 and 180 degrees; and that as these correspond to the degrees in which pure alcohol, or the finest spirit of the grain itself boils, or disengages itself therefrom, they may point out to us the reason of barley being the fittest grain for the purposes of brewing."

From these experiments, our author has constructed the following table of the different degrees of the dryness of malt, with the colour occasioned by each degree.

Deg.	White.
119	White.
124	Cream colour.
129	Light yellow.
134	Amber colour.
138	High amber.
143	Pale brown.
148	Brown.
152	High brown.
157	Brown inclining to black.
162	High brown speckled with black.
167	Blackish brown with black specks.
171	Colour of burnt coffee.
176	Black.

"The above table (says he) not only shews us how to judge of the dryness of malt from its colour, but also, when a grist is composed of several sorts of malt, what effect the whole will have when blended together by extraction; and though possibly some small errors may arise in judgments thus formed by our senses, yet as malts occupy different volumes in proportion to their dryness in the practice of brewing, if the result of the water coming in contact with the malt shew the degree expected, such parcel of malt may be said to have been judged of rightly in the degree of dryness it was estimated to; so that the first trial either confirms, or sets us numerically right as to our opinion thereof."

It is found by experience, that the less heat employed in drying the malt, the shorter time will be required before the beer is fit to be used; and of this our author has given the following table.

Deg.	2 weeks.	Deg.	6 months.
119	2 weeks.	143	6 months.
124	a month.	148	10 months.
129	3 months.	152	15 months.
134	4 months.	157	20 months.
138	6 months.	162	two years.

Lastly, Mr Combrune hath given the following table shewing the tendency beers have to become fine, when properly brewed from malts of different degrees of dryness.

Deg.	Colour of malt.	
119	White.	These, when properly brewed, become spontaneously fine, even as far as 138°; when brewed for amber by repeated fermentations, they become pellucid.
124	Cream colour.	
129	Light yellow.	
134	Amber colour.	
138	High amber.	By precipitation these grow bright in a short time.
143	Pale brown.	
148	Brown.	With precipitation these require 8 or 10 months to be bright.
152	High brown.	
157	Brown inclining to black.	With precipitation these may be fined, but will never become bright.
162	Brown speckled with black.	
167	Blackish brown speckled with black.	These with difficulty can be brewed without setting the galls, and will by no means become bright, not even with the strongest acid menstruum
171	Colour of burnt coffee.	
176	Black.	

In a pamphlet intitled "Theoretic hints on an improved practice of brewing malt-liquors, &c. by John Richardson," we have the following observations on the nature and properties of malt.

"The process of making malt is an artificial or forced vegetation, in which the nearer we approach the footsteps of nature in her ordinary progress, the more certainly shall we arrive at that perfection of which the subject is capable. The farmer prefers a dry season to sow his corn in, that the common moisture of the earth may but gently insinuate itself into the pores of the grain, and thence gradually dispose it for the reception of the future shower, and the action of vegetation. The maltster cannot proceed by such slow degrees, but makes an immersion in water a substitute for the moisture of the earth, where a few hours infusion is equal to many days employed in the ordinary course of vegetation; and the corn is accordingly removed as soon as it appears fully saturated, lest a solution, and consequently a destruction, of some of its parts, should be the effect of a longer continuance in water, instead of that separation which is begun by this introduction of aqueous particles into the body of the grain.

"Were it to be spread thin after this removal, it would become dry, and no vegetation would ensue; but being thrown into the couch, a kind of vegetative fermentation commences, which generates heat, and produces the first appearance of germination. This state of the barley is nearly the same with that of many days continuance in the earth after sowing: but being in so large a body, it requires occasionally to be turned over, and spread thinner; the former to give the outward parts of the heap their share of the required warmth and moisture, both of which are lessened by exposure

6
Mr Richardson's observations.

to the air, the latter to prevent the progress of the vegetative to the putrefactive fermentation, which would be the consequence of suffering it to proceed beyond a certain degree.

“ To supply the moisture thus continually decreasing by evaporation and consumption, an occasional but sparing sprinkling of water should be given to the floor, to recruit the languishing powers of vegetation, and imitate the shower upon the corn field. But this should not be too often repeated; for, as in the field, too much rain, and too little sun, produce rank stems and thin ears, so here would too much water, and of course too little dry warmth, accelerate the growth of the malt, so as to occasion the extraction and loss of such of its valuable parts, as by a slower process would have been duly separated and left behind.

“ By the slow mode of conducting vegetation here recommended, an actual and minute separation of the parts takes place. The germination of the radicles and acrospire carries off the cohesive properties of the barley, thereby contributing to the preparation of the saccharine matter, which it has no tendency to extract or otherwise injure, but to increase and meliorate, so long as the acrospire is confined within the husk; and by how much it is wanting of the end of the grain, by so much does the malt fall short of perfection, and in proportion as it has advanced beyond, is that purpose defeated.

“ This is very evident to the most common observation, on examining a kernel of malt in the different stages of its progress. When the acrospire has shot but half the length of the grain, the lower part only is converted into that yellow saccharine flour we are solicitous about, whilst the other half affords no other signs of it than the whole kernel did at its first germination. Let it advance to two thirds of the length, and the lower end will not only have increased its saccharine flavour, but will have proportionally extended its bulk, so as to have left only a third part unmalted. This, or even less than this, is contended for by many maltsters, as a sufficient advance of the acrospire, which they say has done its business as soon as it has passed the middle of the kernel. But we need seek no further for their conviction of error, than the examination here alluded to.

“ Let the kernel be slit down the middle, and tasted at either end, whilst green; or let the effects of mastication be tried when it is dried off; when the former will be found to exhibit the appearances just mentioned, the latter to discover the unwrought parts of the grain, in a body of stony hardness, which has no other effect in the mash-tun than that of imbuing a large portion of the liquor, and contributing to the retention of those saccharine parts of the malt which are in contact with it; whence it is a rational inference, that three bushels of malt, imperfect in this proportion, are but equal to two of that which is carried to its utmost perfection. By this is meant the farthest advance of the acrospire, when it is just curling from its confinement, before it has effected its enlargement. The kernel is then uniform in its internal appearance, and of a rich sweetness in flavour, equal to any thing we can conceive obtainable from imperfect vegetation. If the acrospire be suffered to proceed, the mealy substance melts into a liquid sweet, which soon passes into the blade,

and leaves the husk entirely exhausted.

“ The sweet thus produced by the infant efforts of vegetation, and lost by its more powerful action, revives and makes a second appearance in the stem, but is then too much dispersed and altered in its form to answer any of the known purposes of art.

“ Were we to inquire, by what means the same barley, with the same treatment produces unequal portions of the saccharine matter in different situations, we should perhaps find it principally owing to the different qualities of the water used in malting. Hard water is very unfit for every purpose of vegetation, and soft will vary its effects according to the predominating quality of its impregnations. Pure elementary water is in itself supposed to be only the vehicle of the nutriment of plants, entering at the capillary tubes of the roots, rising into the body, and there dispersing its acquired virtues, perspiring by innumerable fine pores at the surface, and thence evaporating by the purest distillation into the open atmosphere, where it begins anew its round of collecting fresh properties, in order to its preparation for fresh service.

“ This theory leads us to the consideration of an attempt to increase the natural quantity of the saccharum of malt by adventitious means; but it must be observed on this occasion, that no addition to water will rise into the vessels of plants, but such as will pass the filter; the pores of which appearing somewhat similar to the fine strainers or absorbing vessels employed by nature in her nicer operations, we by analogy conclude, that properties so intimately blended with water as to pass the one, will enter and unite with the economy of the other, and *vice versa*.

“ Supposing the malt to have obtained its utmost perfection, according to the criterion here inculcated, to prevent its further progress and secure it in that state, we are to call in the assistance of a heat sufficient to destroy the action of vegetation by evaporating every particle of water, and thence leaving it in a state of preservation, fit for the present or future purpose of the brewer.

“ Thus having all its moisture extracted, and being by the previous process deprived of its cohesive property, the body of the grain is left a mere lump of flour, so easily divisible, that, the husk being taken off, a mark may be made with the kernel, as with a piece of soft chalk. The extractable qualities of this flour are, a saccharum closely united with a large quantity of the farinaceous mucilage peculiar to bread corn, and a small portion of oil enveloped by a fine earthy substance, the whole readily yielding to the impression of water applied at different times and different degrees of heat, and each part predominating in proportion to the time and manner of its application.

“ In the curing of malt, as nothing more is requisite than a total extrication of every aqueous particle, if we had in the season proper for malting, a solar heat sufficient to produce perfect dryness, it were practicable to reduce beers nearly colourless; but that being wanting, and the force of custom having made it necessary to give our beers various tinctures and qualities resulting from fire, for the accommodation of various tastes, we are necessitated to apply such heats in the drying as shall not only answer the purpose of preservation, but give the complexion and property required.

“ To effect this with certainty and precision, the introduction of the thermometer is necessary ; but the real advantages of its application are only to be known by experiment, on account of the different construction of different kilns, the irregularity of the heat in different parts of the same kiln, the depth of the malt, the distance of the bulb of the thermometer from the floor, &c. &c. for though similar heats will produce similar effects in the same situation, yet is the dispersion of heat in every kiln so irregular, that the medium spot must be found for the local situation of the thermometer ere a standard can be fixed for ascertaining effects upon the whole. That done, the several degrees necessary for the purposes of porter, amber, pale beers, &c. are easily discovered to the utmost exactness, and become the certain rule of future practice.

“ Though custom has laid this arbitrary injunction of variety in our malt-liquors, it may not be amiss to imitate the losses we often sustain, and the inconveniences we combat, in obedience to her mandate.

“ The further we pursue the deeper tints of colour by an increase of heat beyond that which simple preservation requires, the more we injure the valuable qualities of the malt. It is well known that scorched oils turn black, and that calcined sugar assumes the same complexion. Similar effects are producible in malts, in proportion to the increase of heat, or the time of their continuing exposed to it. The parts of the whole being so united by nature, an injury cannot be done to the one, without affecting the other ; accordingly we find, that such parts of the subject, as might have been severally extracted for the purposes of a more intimate union by fermentation, and by great heat in curing, burnt and blended so effectually together, that all discrimination is lost, the unfermentable are extracted with the fermentable, the integrant with the constituent, to the very great loss both of spirituousity and transparency. In paler malts, the extracting liquor produces a separation which cannot be effected in brown, where the parts are so incorporated, that unless the brewer is very well acquainted with their several qualities and attachments, he will bring over, with the burnt mixture of saccharine and mucilaginous principles, such an abundance of the scorched oils, as no fermentation can attenuate, no precipitants remove ; for, being in themselves impediments to the action of fermentation, they lessen its efficacy, and being of the same specific gravity with the beer, they remain suspended in, and incorporated with the body of it, an offence to the eye, and a nausea to the palate to the latest period.”

7
Quality of
the water to
be employed
in brewing.

The next consideration is the quality of the water to be employed in brewing ; and here soft water is universally allowed to be preferable to hard, both for the purposes of mashing and fermentation. Transparency is, however, more easily obtained by the use of hard than soft water ; first, from its inaptitude to extract such an abundance of that light mucilaginous matter, which, floating in the beer for a long time, occasions its turbidity ; secondly, from its greater tendency to a state of quietude after the vinous fermentation is finished by which those floating particles are more at liberty to subside ; and, lastly, from the mutual aggregation of the earthy particles of the water with those of the materials, which by their greater spe-

cific gravity thus aggregated, not only precipitate themselves, but carry down also that lighter mucilage just mentioned. For these reasons, hard water is not well adapted to the brewing of porter, and such beers as require a fulness of palate, when drawn to the great lengths of the London brewery, and of some country situations.

The purity of water is determined by its lightness ; and in this, distilled water only can claim any material degree of perfection. Rain water is the purest of all naturally produced : but by the perpetual exhalations of vegetables, and other fine substances floating in the atmosphere, it does not come down to us entirely free from those qualities which pond and river waters possess in a greater degree. These, especially of rivers running through fens and morasses, from the quantity of grass and weeds growing therein, imbibe an abundance of vegetable solutions which occasions them to contain more fermentable matter, and consequently to yield a greater portion of spirit ; but at the same time induces such a tendency to acidity as will not easily be conquered. This is more to be apprehended towards the latter end of the summer than at any other time ; because these vegetable substances are then in a state of decay, and thence more readily impart their pernicious qualities to the water which passes over them.

At such an unfavourable time, should the brewer be necessitated to pursue his practice, it will behove him to pay the utmost attention to the cause of this disposition in his liquor, and thence endeavour to prevent the ill consequences, by conducting his process to the extraction and combination of such parts of the materials as his judgment informs him will best counteract its effects.

Where there is the liberty of choice, we would recommend the use of that water which, from natural purity, equally free of the austerities of imbibed earths, and the rankness of vegetable saturation, has a soft fulness upon the palate, is totally flavourless, inodorous, and colourless ; whence it is the better prepared for the reception and retention of such qualities as the processes of brewing is to communicate and preserve.

The next thing to be considered is the proper degree of heat to be employed in making the infusion ; and here it is evident, that though this must be an object of the utmost importance to the success of the operation, it is extremely difficult, perhaps impossible, to fix upon a precise standard that shall at all times fully answer the purpose. On this subject Mr Richardson presents us with the following observations.

“ The quality of the saccharine part of malt resembles that of common sugar, to which it is practicable to reduce it ; and its characteristical properties are entirely owing to its intimate connection with the other parts of the malt, from which such distinguishing flavours of beers are derived as are not the immediate result of the hop. Were it not for these properties, the brewer might adopt the use of sugar, molasses, honey, or the sweet of any vegetable, to equal advantage ; which cannot now be done, unless an eligible succedaneum be found to answer that purpose. As we are at present circumstanced, a search on the other side would turn more to the brewer's account. We have in malt a superabundance of the grosser principles ; and would government permit the introduction of a foreign addition to the saccharine,

8
MrRichard-
son's obser-
vations on
the degree
of heat.

faccharine, which is too deficient, many valuable improvements might be made from it; as we could, by a judicious application of such adventitious principle, produce a second and third wort, of quality very little inferior to the first.

“But in these experiments a very particular attention would be necessary to the solvent powers of the water at different degrees of heat, and to the inquiry how far a menstrum saturated with one principle may be capable of dissolving another. Such a consideration is the more necessary on this occasion to direct us clear of two extremes equally disagreeable: the first is, that of applying the menstrum pure, and at such a heat as to bring off an over proportion of the oleaginous and earthy principles, which would occasion in the beer, thus wanting its natural share of saccharum, a harshness and austerly which scarce any time the brewer could allow would be able to dissipate; the other is, that of previously loading the menstrum with the adopted sweet in such an abundance as to destroy its solvent force upon the characteristical qualities we wish to unite with it, and thereby leave it a mere solution of sugar. The requisite mean is that of considering what portion of the saccharine quality has been extracted in the first wort, according to the quantity of water and degree of heat applied; and then to make such a previous addition of artificial sweet as will just serve to counterbalance the deficiency, and assimilate with that portion of the remaining principles we are taught to expect will be extracted with the succeeding wort.

“From the nature of the constituent principles of malt, it is easy to conceive, that the former, or saccharine or mucilaginous parts, yield most readily to the impression of water, and that at so low a degree of heat as would have no visible effect upon the latter. If, therefore, we are to have a certain proportion of every part, it is a rational inference, that the means of obtaining it rests in a judicious variation of the extracting heat according to the several proportions required.

“A low degree of heat, acting principally upon the saccharum, produces a wort replete with a rich soft sweet, fully impregnated with its attendant mucilage, and in quantity much exceeding that obtainable from increased heat; which, by its more powerful insinuation into the body of the malt acting upon all the parts together, extracts a considerable portion of the oleaginous and earthy principles, but falls short in softness, fulness, sweetness, and quantity. This is occasioned by the coagulating property of the mucilage, which, partaking of the nature of flour, has a tendency to run into paste in proportion to the increase of heat applied; by which means it not only locks up a considerable part of the saccharum contained therein, but retains with it a proportionate quantity of the extracting liquor, which would otherwise have drawn out the imprisoned sweet, thence lessening both the quantity and quality of the worts. And this has sometimes been known to have had so powerful an effect, as to have occasioned the *setting of the goods*, or the uniting the whole into a pally mass; for though heat increases the solvent powers of water in most instances, there are some in which it totally destroys them. Such is the presence of flour, which it converts into paste; besides those of blood, eggs, and some other animal substances, which it invariably tends to harden.

“From a knowledge of these effects, we form our ideas of the variations necessary in the heat of the extracting liquor; which are of more extensive utility than has been yet intimated, though exceedingly limited in their extent from one extreme to the other.

“The most common effects of too low a heat, besides sometimes producing immediate acidity, are an insipidity of the flavour of the beer, and a want of early transparency, from the superabundance of mucilaginous matter extracted by such heats, which, after the utmost efforts of fermentation, will leave the beer turbid with such a cloud of its lighter feculencies as will require the separation and precipitation of many months to disperse.

“The contrary application, of too much heat, at the same time that it lessens the mucilage, has, as we have seen before, the effect of diminishing the saccharum also; whence that lean thin quality observable in some beers; and, by extracting an over proportion of oleaginous and earthy particles, renders the business of fermentation difficult and precarious, and impresses an austerly on the flavour of the liquor which will not easily be effaced.

“Yet the true medium heat for each extract cannot be universally ascertained. An attention not only to the quality of the malt, but to the quantity wetted, is absolutely necessary to the obtaining every due advantage; nor must the period at which the beer is intended for use be omitted in the account. The quality of the water also claims a share in the consideration, in order to supply that deficient thinness and want of solvent force in hard, and to allow for the natural fulness and fermentative quality of soft; a particular to which London in a great measure owes the peculiar mucilaginous and nutritious quality of its malt liquors.

“Although the variations above alluded to are indispensable, it is easy to conceive, from the small extent of the utmost variety, that they cannot be far distant. If, therefore, we know that a certain degree extracts the first principles in a certain proportion, we need not much consideration to fix upon another degree that shall produce the required proportion of the remaining qualities, and effect that equal distribution of parts in the extract which it is the business of fermentation to form into a consistent whole.”

The principal use of boiling, as it respects the worts Of ⁹boiling particularly, is to separate the grosser or more palpable worts. parts of the extract, preparatory to that more minute separation which is to be effected in the gyle tun. The eye is a very competent judge of this effect; for the concretions into which the continued action of boiling forms those parts are obvious to the slightest inspection, whilst the perfect transparency of the interstices of the worts points out its utility in promoting that desirable quality in the beer. These coagulable parts are formed from the superabundant mucilage already mentioned; and hence they are found in greater proportion in the first worts than in those that come after; at the same time, they are in these last so mingled with a quantity of oleaginous matter, that they become much more difficultly coagulable in the weak worts than in such as are stronger, and hence these require to be much longer boiled than the others.

During this operation the hops are generally added, which are found to be absolutely necessary for prevent-

ing the too great tendency of beer to acidity. The fine essential oil of hops being most volatile and soonest extracted, we are thence taught the advantage of boiling the first wort no longer than is sufficient to form the extract, without exposing it to the action of the fire so long as to dissipate the finer parts of this most valuable principle, and defeat the purpose of obtaining it. To the subsequent worts we can afford a larger allowance, and pursue the means of preservation so long as we can keep in view those of flavour; to which no rules can positively direct, the process varying with every variety of beer, and differing as essentially in the production of porter and pale ale as the modes of producing wine and vinegar.

The consequence of not allowing a sufficient time for the due separation of the parts of the wort and extraction of the requisite qualities of the hop must be obvious. If we proceed to the other extreme, we have every thing to apprehend from the introduction of too large a quantity of the grosser principles of the hop, which are very inimical to fermentation; and from impairing the fermentative quality of the worts themselves, by suffering their too long exposure to the action of the fire passing through them, whereby they are reduced to a more dense consistence, and their parts too intimately blended to yield to the separating force of fermentation with that ease the perfection of the product requires.

The last step in the process of brewing is to ferment the liquor properly; for if this is not done, whatever care and pains have been taken in the other parts, they will be found altogether insufficient to produce the liquor desired. The first thing to be done here is to procure a proper ferment; for though all fermentable liquors would in time begin to ferment of themselves, yet, being also susceptible of putrefaction, the vinous and putrefactive ferments would both take place at the same time in such a manner that the product would be entirely spoiled. There are only two kinds of artificial ferments procurable in large quantity, and at a low price, *viz.* beer-yeast and wine-lees. A prudent management of these might render the business of the brewery for distillation, as in the business of the malt-distiller, &c. much more easy and advantageous*. Brewers have always found it a considerable difficulty to procure these ferments in sufficient quantities, and preserve them constantly ready for use; and this has been so great a discouragement to the business, that some have endeavoured to produce other ferments, or to form mixtures or compounds of particular fermentable ingredients: but this has been attempted without any great success, all these mixtures falling short even of common baker's leaven in their use. Whoever has a turn for making experiments and attempting improvements of this kind, will find it much easier and more advantageous to preserve and raise nurseries of the common ones, than to devise mixtures of others. Yeast may be preserved by freeing it from its moister parts. This may be done by the sun's heat, but slowly and imperfectly. The best method is by gently pressing it in canvas bags: thus the liquid part, in which there is scarce any virtue, will be thrown off, and the solid will remain behind in form of a cake, which may be packed in a barrel or box, and will keep for a long time sweet and fragrant, and fit for the finest uses; and the same me-

thod may be taken either with wine-lees, or the flowers of wine. The former may be brought from abroad with great ease in this manner: the latter may be made with us from the lees, by only dissolving them in water, and stirring them about with a stick; by this means, the lighter, more moveable, and more active part of the lees will be thrown up to the top, and may be taken off and preserved, in the manner above mentioned, in any quantity desired. By this means, an easy method is found of raising an inexhaustible fund; or a perpetual supply of the most proper ferments may be readily formed in the way of successive generation, so as to cut off all future occasion of complaint for want of them in the business of distillation. It must be observed, that all ferments abound in essential oil much more than the liquors which produce them; whence they very strongly retain the particular flavour and scent of the subject from whence they were made. It is requisite, therefore, before the ferment is applied, to consider what flavour ought to be introduced, and accordingly what species of ferment is most suited to the liquor. The alteration thus caused by ferments is so considerable, as to determine or bring over any naturally fermentable liquor of a neutral kind to be of the same kind with that which yielded the ferment. The benefit of this, however, does not extend to malt, or to any other matter that does not naturally yield a tolerably pure and tasteless spirit, as it otherwise makes not a simple, pure, and uniform flavour, but a compound and mixed one.

The greatest circumspection and care are necessary in regard to the quality of the ferment. It must be chosen perfectly sweet and fresh: for all ferments are liable to grow musty and corrupt; and if in this case they are mixed with the fermentable liquor, they will communicate their nauseous and stinky flavour to it in such a manner as never to be got off. If the ferment is sour, it must by no means be used for any liquor; for it will communicate its flavour to the whole, and even prevent its rising to a head, and give it an acetous, instead of a vinous, tendency. When the proper quantity is got ready, it must be put to the liquor in a state barely tepid, or scarce luke-warm. The best method of putting them together, so as to make the fermentation strong and quick, is as follows. When the ferment is solid, it must be broken to pieces, and gently thinned with some of the warm liquor; but a complete or uniform solution of it is not to be expected or desired, as this would weaken its efficacy for the future business. The whole intended quantity being thus loosely mixed in some of the lukewarm liquor, and kept near the fire or elsewhere in a tepid state, free from too rude commerce with the external air, more of the insensibly warm liquor ought at proper intervals to be brought in, till thus by degrees the whole quantity is set at work together. When the whole is thus set at work, secured in a proper degree of warmth, and kept from a too free intercourse with the external air, it becomes as it were the business of nature to finish the operation.

In the operation of fermentation, however, the degree of heat employed is of the utmost consequence. In forming the extracts of the malt, the variation of a few degrees of heat produces an important difference in the effect. In the heat of fermentation, similar consequences result from similar variety. Under a certain regulation of the process, we can retain in the beer, as far as art

¹⁰
Of Fermentation.

* See Distillation.

is capable, the finer mucilage, and thereby preserve that fulness upon the palate which is by many so much admired : on the other hand, by a slight alteration we can throw it off, and produce that evenness and uniformity of flavour which has scarce any characteristical property, and is preferred by some only for want of that heaviness which they complain of in full beers. If a more vinous racy ale be required, we can, by collecting and confining the operation within the body of the wort, cause the separation and absorption of such an abundant portion of the oleaginous and earthy principles, as to produce a liquor in a perfect state at the

earliest period, and so highly flavoured as to create a suspicion of an adventitious quality. But though all this may be done, and often hath been done, the proper management of fermenting liquors depends so much upon a multiplicity of slight and seemingly unimportant circumstances, that it hath never yet been laid down in an intelligible manner; and no rules, drawn from any thing hitherto published on the subject of brewing, can be at all sufficient to direct any person in this matter, unless he hath had considerable opportunities of observing the practice of a brewhouse.

B R I

BREY, a town of Germany, on the frontiers of Brabant, seated on a rivulet, in E. Long. 5. 35. N. Lat. 51. 6.

BREYNIA, in botany, a synonyme of the capparid. See CAPPARIS.

BRIANCON, a town of France, in upper Dauphiny, capital of the Brianconnois. E. Long. 6. 45. N. Lat. 44. 46.

BRIANCONNOIS, a territory of France, in Dauphiny, bounded by Grenoblois, Gapennois, Ambrunois, Piedmont, and Savoy. It comprehends several valleys, which lie among the mountains of the Alps; and though it is extremely cold, yet it is fertile in corn and pastures. The inhabitants have a great deal of wood; yet they choose to be in the stables with their cattle six months in the year, to keep themselves warm. Briancon is the capital town.

BRIAR, in botany, the English name of a species of rosa. See ROSA.

BRIARE, a town of France, in the Gatinois, seated on the river Loire. It is remarkable for nothing but a long street full of inns and farriers, it being on the great road to Lyons; and the canal of Briare, which is 33 miles in length, and maintains a communication between the Loire and the Seine, by means of the Loing. E. Long. 2. 45. N. Lat. 47. 40.

BRIAREUS, in fabulous history, a giant; the son of Æther, Titan, or Cælus, and Terra. This was his name in heaven; on earth he was called *Ægeon*. He was of signal service to Jupiter, when Juno, Pallas, Neptune, and the rest of the gods, endeavoured to bind him in chains and dethrone him. Afterwards, however, he conspired with the rest of his gigantic brethren to dethrone Jupiter. Virgil, on this occasion, describes him as having 100 hands, 50 heads, and breathing out fire †. The fable says that Jupiter, to punish him, threw him under mount Ætna, which, as often as he moves, belches out fire. See ÆTNA.

BRIBE, a reward given to pervert the judgment. See the next article.

BRIBERY, (from the French *briber*, to devour or eat greedily), is a high offence, where a person in a judicial place takes any fee, gift, reward, or brokerage, for doing his office, but of the king only. But, taken largely, it signifies the receiving or offering any undue reward to or by any person concerned in the administration of public justice, whether judge, officer, &c. to act contrary to his duty; and sometimes it signifies the taking or giving a reward for a public office.

In the East it is the custom never to petition any su-

perior for justice, not excepting their kings, without a present. This is calculated for the genius of despotic countries; where the true principles of government are never understood, and it is imagined that there is no obligation due from the superior to the inferior, no relative duty owing from the governor to the governed. The Roman law, though it contained many severe injunctions against bribery, as well for selling a man's vote in the senate or other public assembly, as for the bartering of common justice; yet, by a strange indulgence in one instance, it tacitly encouraged this practice; allowing the magistrate to receive small presents, provided they did not on the whole exceed 100 crowns a-year: not considering the insinuating nature and gigantic progress of this vice, when once admitted. Plato, therefore, in his ideal republic, orders those who take presents for doing their duty to be punished in the severest manner: and by the laws of Athens, he that offered a bribe was also prosecuted, as well as he that received a bribe. In England this offence of taking bribes is punished, in inferior officers, with fine and imprisonment; and in those that offer a bribe, though not taken, the same. But in judges, especially the superior ones, it has been always looked upon as so heinous an offence, that the chief justice Thorpe was hanged for it in the reign of Edward III. By a statute 11 Henry IV. all judges and officers of the king convicted of bribery, shall forfeit treble the bribe, be punished at the king's will, and be discharged from his service for ever.

Blackst.
Comment.

And some notable examples have been made in parliament, of persons in the highest stations, and otherwise very eminent and able, but contaminated with this forbidden vice. Thus in the reign of king James I. the earl of M. lord treasurer of England, being impeached by the commons, for refusing to hear petitions referred to him by the king, till he had received bribes, &c. was, by sentence of the lords, deprived of all his offices, and disabled to hold any for the future, or to sit in parliament; he was also fined 50,000*l.* and imprisoned during the king's pleasure. In the 11th year of king George I. the lord chancellor M—— had a somewhat milder punishment: he was impeached by the commons, with great zeal, for bribery, in selling the places of masters in chancery for exorbitant sums, and other corrupt practices, tending to the great loss and ruin of the suitors of that court; and the charge being made good against him, being before divested of his office, he was sentenced to pay a fine of 30,000*l.* and imprisoned till it was paid. It is said, that one of the *peers*, if not two, who voted against him, had been possessed of

Deliber
Brick.

of the office of chancellor, and sold the places of ma-
sters in chancery whenever vacant.

BRIBERY in Elections. See ELECTIONS.

BRICIANI, those of the order of that name. This
was a military order, instituted by St Bridget, queen
of Sweden, who gave them the rules and constitutions
of those of Malta and St Augustin. This order was
approved by pope Urban V. They were to fight for
the burying of the dead, to relieve and assist widows,
orphans, the lame, sick, &c.

BRICK, a fat reddish earth, formed into long
squares, four inches broad, and eight or nine long, by
means of a wooden mould, and then baked or burnt in
a kiln, to serve the purposes of building.

Bricks are of great antiquity, as appears by the sa-
cred writings, the tower and walls of Babylon being
built with them.

The Greeks chiefly used three kinds of bricks; the
first whereof was called [*didorón*], i. e. of two palms;
the second [*tetradorón*], of four palms; the third [*pen-
tadorón*], of five palms. They had also other bricks,
just half each of those, to render their works more so-
lid, and also more agreeable to the sight, by the diver-
sities of the figures and sizes of the bricks.

The dimensions of the brick chiefly used by the Ro-
mans, according to Pliny, were a foot and a half long,
and a foot broad; which measures agree with those of
several Roman bricks in England, which are about 17
inches long, and 11 broad, of our measure. Sir Henry
Wotton speaks of a sort of bricks at Venice, of which
stately columns were built; they were first formed in a
circular mould, and cut, before they were burnt, into
four or more quarters or sides; afterwards, in laying,
they were jointed so close, and the points concentrated
so exactly, that the pillars appeared one entire piece*.
The ordinary Paris brick is eight inches long, four
broad, and two thick, French measure, which makes
something more than ours. But this smallness is an ad-
vantage to a building, the strength of which consists
much in the multitude of angles and joints, at least if
well laid, and having a good bond.

Supplement
to Chambers.

Bricks among us are various according to their
various forms, dimensions, uses, method of making,
&c. The principal are, compass-bricks, of a circular
form, used in keying of walls: concave, or hollow
bricks, on one side flat like a common brick, on the
other hollowed, and used for conveyance of water: fea-
ther-edged bricks, which are like common statute-
bricks, only thinner on one edge than the other, and
used for penning up the brick panels in timber build-
ings: cogging bricks are used for making the indented
works under the capping of walls built with great bricks:
capping bricks, formed on purpose for capping of walls:
Dutch or Flemish bricks, used to pave yards, stables,
and for soap-boilers vaults and cisterns: clinkers, such
bricks as are glazed by the heat of the fire in making:
fandel or famel-bricks, are such as lie utmost in a kiln
or clamp, and consequently are soft and useless as not
being thoroughly burnt: great bricks are those twelve
inches long, six broad, and three thick, used to build
fence-walls: plaster or buttress bricks, have a notch at
one end, half the breadth of the brick; their use is to
bind the work which is built of great bricks: statute-
bricks, or small common bricks, ought, when burnt, to
be nine inches long, four and a quarter broad, and two

and a half thick; they are commonly used in paving
cellars, sinks, hearths, &c.

Worlidge, and others after him, have endeavoured to
excite brickmakers to try their skill in making a new
kind of brick, or a composition of clay and sand, where-
of to form window-frames, chimney-pieces, door-frames,
and the like. It is to be made in pieces fashioned in
moulds, which, when burnt, may be set together with
a fine red cement, and seem as one entire piece, by
which may be imitated all manner of stone-work. The
thing should seem feasible, by the earthen pipes made
fine, thin, and durable, to carry water under-ground at
Portsmouth; and by the earthen backs and grates for
chimneys, formerly made by Sir John Winter, of a
great bigness and thicknes. If chimney-pieces thus
made in moulds, and dried and burnt, were not found
smooth enough, they might be polished with sand and
water; or were care taken, when they were half dry in
the air, to have them polished with an instrument of
copper or iron, then leave them till they were dry enough
to burn, it is evident they would not want much po-
lishing afterwards. The work might even be glazed,
as potters do their fine earthen ware, either white, or
of any other colour; or it might be veined in imitation
of marble, or be painted with figures of various colours,
which would be much cheaper, perhaps equally durable,
and as beautiful, as marble itself.

Bricks are commonly red; though there are some also
of a white colour, for which fort Walpit in Suffolk is
famous. Bricks may be made of any earth that is clear
of stones, even sea-ouze; but all will not burn red, a
property peculiar to earths which contain ferruginous
particles. In England, bricks are chiefly made of a
hazely, yellowish-coloured, fatty earth, somewhat red-
dish, vulgarly called *lam*. The earth, according to
Leibourn, ought to be dug before winter, but not made
into bricks before spring. For the making of such
bricks as will stand the fiercest fires, Sturbridge clay or
Windford loam are esteemed the best. In general, the
earth whereof bricks are made ought not to be too
sandy, which would render them heavy and brittle; nor
too fat, which would make them crack in drying.

The first step in the process of brickmaking is cast-
ing the clay, or earth. The next step is to tread or
temper it, which ought to be performed doubly of what
is usually done; since the goodness of the bricks de-
pends chiefly upon this first preparation. The earth it-
self, before it is wrought, is generally brittle and dully;
but adding small quantities of water gradually to it, and
working and incorporating it together, it opens its
body, and tinges the whole with a tough, gluey band
or substance. If, in the tempering, you overwater
them, as the usual method is, they become dry and
brittle, almost as the earth they are made of; whereas,
if duly tempered, they become smooth and solid, hard
and durable. A brick of this last sort takes up near as
much earth as a brick and a half made the contrary
way; in which the bricks are spongy, light, and full
of cracks, partly through want of due working, and
partly by mixing of ashes and light sandy earth to make
it work easy and with greater dispatch; as also to save
culm or coals in the burning. We may add, that for
bricks made of good earth, and well tempered, as they
become solid and ponderous, so they take up a longer
time in drying and burning than the common ones;
and

and that the white efflorescence which is frequently observable on the surface of new bricks, is of an aluminous nature. The long exposure of clay to the air before it is moulded into bricks, the sulphurous exhalations of the pit-coal used for burning it, together with the suffocating and bituminous vapour which arises from the ignited clay itself, sufficiently account for the combination of a vitriolic acid with the earth of alum.

Bricks are burnt either in a kiln or clamp. Those that are burnt in a *kiln*, are first set or placed in it; and then the kiln being covered with pieces of bricks, they put in some wood to dry them with a gentle fire; and this they continue till the bricks are pretty dry, which is known by the smoke's turning from a darkish colour to transparent smoke: they then leave off putting in wood, and proceed to make ready for burning; which is performed by putting in brush, furze, spray, heath, brake, or fern-faggots: but before they put in any faggots, they dam up the mouth or mouths of the kiln with pieces of bricks (which they call *shinlog*) piled up one upon another, and close it up with wet brick-earth instead of mortar. The shing they make so high, that there is but just room above it to thrust in a faggot: then they proceed to put in more faggots, till the kiln and its arches look white, and the fire appears at the top of the kiln; upon which they slacken the fire for an hour, and let all cool by degrees. This they continue to do, alternately heating and slacking, till the ware be thoroughly burnt, which is usually effected in 48 hours.

About London they chiefly burn in *clamps*, built of the bricks themselves, after the manner of arches in kilns, with a vacancy between each brick, for the fire to play through; but with this difference, that instead of arching, they span it over by making the bricks project one over another on both sides of the place, for the wood and coals to lie in till they meet, and are bounded by the bricks at the top, which close all up. The place for the fuel is carried up straight on both sides, till about three feet high; then they almost fill it with wood, and over that lay a covering of sea-coal, and then overspan the arch; but they strew fea-coal also over the clamp, betwixt all the rows of bricks; lastly, they kindle the wood, which gives fire to the coal; and when all is consumed, then they conclude the bricks are sufficiently burnt.

In Dr Percival's essays*, we have the following experiment of the effects of bricks on water. "Two or three pieces of common brick were steeped four days in a basin full of distilled water. The water was then decanted off, and examined by various chemical tests. It was immiscible with soap, struck a lively green with syrup of violets, was rendered slightly lactescent by the volatile alkali, and quite milky by the fixed alkali and by a solution of saccharum tarturi. The infusion of tormentil root produced no change in it." This experiment, he observes, affords a striking proof of the impropriety of lining wells with brick, a practice very common in many places, and which cannot fail of rendering the water hard and unwholesome. Clay generally contains a variety of heterogeneous matters. The coloured loams often participate of bitumen, and the ochre of iron. Sand and calcareous earth are still more common ingredients in their composition; and the experiments of Mr Geoffry and Mr Pott prove, that the earth of alum also may in large quantity be extracted from clay. Now as clay is exposed to the open air for a long space of time, is then moulded into bricks, and burnt, this process resembles in many respects that by which the alum-stone is prepared. And it is probable

that the white efflorescence which is frequently observable on the surface of new bricks, is of an aluminous nature. The long exposure of clay to the air before it is moulded into bricks, the sulphurous exhalations of the pit-coal used for burning it, together with the suffocating and bituminous vapour which arises from the ignited clay itself, sufficiently account for the combination of a vitriolic acid with the earth of alum.

Oil of Bricks, olive oil imbibed by the substance of bricks, and afterwards distilled from it. This oil was once in great repute for curing many diseases, but is now justly laid aside.

Brick-Layer, an artificer whose business is to build with bricks, or make brick work.

Bricklayers work, or business, in London, includes tiling, walling, chimney work, and paving with bricks and tiles. In the country it also includes the mason's and plasterer's business.

The materials used by brick-layers are bricks, tiles, mortar, laths, nails, and tile-pins. Their tools are a brick trowel, wherewith to take up mortar; a brick-ax, to cut bricks to the determined shape; a saw, for sawing bricks; a rub-stone, on which to rub them; also a square, wherewith to lay the bed or bottom, and face or surface of the brick, to see whether they are at right angles; a bevel, by which to cut the under sides of bricks to the angles required; a small trammel of iron, wherewith to mark the bricks; a float-stone, with which to rub a moulding of brick to the pattern described; a banker, to cut the bricks on; line-pins, to lay their rows or courses by; plumb-rule, whereby to carry their work upright; level, to conduct it horizontal; square, to set off right angles; ten-foot rod, wherewith to take dimensions; jointer, wherewith to run the long joints; rammer, wherewith to beat the foundation; crow and pick-ax, wherewith to dig through walls.

The London brick-layers make a regular company, which was incorporated in 1568; and consists of a master, two wardens, 20 assistants, and 78 on the livery.

Brick-Laying, the art of framing edifices of bricks. Moxon hath an express treatise on the art of brick-laying; in which he describes the materials, tools, and method of working, used by brick-layers.

Great care is to be taken, that bricks be laid joint on joint in the middle of the walls as seldom as may be; and that there be good bond made there, as well as on the out-sides. Some brick-layers, in working a brick and half wall, lay the header on one side of the wall perpendicular on the header on the other side, and so fall along the whole course; whereas, if the header on one side of the wall were toothed as much as the stretcher on the other side, it would be a stronger toothing, and the joints of the headers of one side would be in the middle of the headers of the course they lie upon of the other side. If bricks be laid in winter, let them be kept as dry as possible; if in summer, it will quit cost to employ boys to wet them, for that they will then unite with the mortar better than if dry, and will make the work stronger. In large buildings, or where it is thought too much trouble to dip all the bricks separately, water may be thrown on each course after they are laid, as was done at the building the physician's college, by order of Dr Hooke. If bricks are laid in summer, they are to be covered; for if the mortar dries too hastily, it will not bind so firmly to the bricks as when left.

* Vol. I. p. 392.

Brick
Bridgroom

left to dry more gradually. If the bricks be laid in winter, they should also be covered well, to protect them from rain, snow, and frost; which last is a mortal enemy to mortar, especially to all such as have been wetted just before the frost assaults it.

BRICK-MAKER, is he who undertakes the making of BRICKS. This is mostly performed at some small distance from cities and towns; and though some, thro' ignorance, look upon it as a very mean employ, because laborious, yet the matters about London, and other capital cities, are generally men of substance.

BRICKING, among builders, the counterfeiting of a brick-wall on plaster: which is done by smearing it over with red ochre, and making the joints with an edged tool; these last are afterwards filled with a fine platter.

BRIDE, a woman newly married. Among the Greeks, it was customary for the bride to be conducted from her father's house to her husband's in a chariot, the evening being chosen for that purpose, to conceal her blushes; she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other; torches were carried before her, and she was entertained in the passage with a song suitable to the occasion. When they arrived at their journey's end, the axle-tree of the coach they rode in was burnt, to signify that the bride was never to return to her father's house.—Among the Romans, the bride was to seem to be ravished by force from her mother, in memory of the rape of the Sabines under Romulus; she was to be carried home in the night-time to the bridegroom's house, accompanied by three boys, one whereof carried a torch, and the other two led the bride; a spindle and distaff being carried with her: she brought three pieces of money called asses, in her hand to the bridegroom, whose doors on this occasion were adorned with flowers and branches of trees: being here interrogated who she was, she was to answer *Caia*, in memory of *Caia Cecilia*, wife of *Tarquin the Elder*, who was an excellent *lanifica* or spinstress; for the like reason, before her entrance, she lined the door-posts with wool, and smeared them with grease. Fire and water being set on the threshold, she touched both; but starting back from the door, refused to enter, till at length she passed the threshold, being careful to step over, without touching it: here the keys were given her, a nuptial supper was prepared for her, and minstrels to divert her; she was seated on the figure of a priapus, and here the attendant boys resigned her to the *pronuba*, who brought her into the nuptial chamber and put her to bed. This office was to be performed by matrons who had only been once married, to denote that the marriage was to be for perpetuity.

BRIDEGROOM, a man newly married, the spouse of the bride.

The Spartan bridegrooms committed a kind of rape upon their brides. For matters being agreed on between them two, the woman that contrived and managed the match, having shaved the bride's hair close to her skin, dressed her up in man's clothes, and left her upon a mattress: this done, in came the bridegroom, in his usual dress, having supped as ordinary, and stealing as privately as he could to the room where the bride lay, and untying her virgin girdle, took her to his embraces; and having staid a short time with her, returned to

Bridewell,
Bridge.

his companions, with whom he continued to spend his life, remaining with them by night as well as by day, unless he stole a short visit to his bride, which could not be done without a great deal of circumspection, and fear of being discovered. Among the Romans, the bridegroom was decked to receive his bride; his hair was combed and cut in a particular form; he had a coronet or chaplet on his head, and was dressed in a white garment.

By the ancient canons, the bridegroom was to forbear the enjoyment of his bride the first night, in honour of the nuptial benediction given by the priest on that day*. In Scotland, and perhaps also some parts of England, a custom called *marchet*, obtained; by which the lord of the manor was entitled to the first night's habitation with his tenants' brides †.

BRIDEWELL, a work-house, or place of correction for vagrants, trumpets, and other disorderly persons.

These are made to work, being maintained with clothing and diet; and when it seems good to their governors, they are sent by passes into their native countries: however, while they remain here, they are not only made to work, but, according to their crimes, receive, once a fortnight, such a number of stripes as the governor commands. Yet to this hospital several hopeful and ingenious lads are put apprentices, and prove afterwards honest and substantial citizens.

BRIDGE, a work of masonry or timber, consisting of one or more arches built over a river, canal, or the like, for the convenience of passing the same.

The first inventor of bridges, as well as of ships and crowns, is by some learned men supposed to be *Janus*; their reason is, that on several ancient Greek, Sicilian, and Italian coins, there are represented on one side a *Janus*, with two faces; and on the other a bridge, or a crown, or a ship.

Bridges are a sort of edifices very difficult to execute, on account of the inconvenience of laying foundations and walling under water. The earliest rules and instructions relating to the building of bridges are given by *Leon Baptista Alberti*, *Archit.* l. viii. Others were afterwards laid down by *Palladio*, l. iii. *Serlio*, l. iii. c. 4. and *Scamozzi*, l. v. all of which are collected by *M. Blondel*, *Cours d'Archit.* p. 629, seq. The best of them are also given by *Goldman*, *Baukunst*, l. iv. c. 4. p. 134, and *Hawkesmoor's History of London* bridge, p. 26, seq. *M. Gautier* has a piece expressive on bridges, ancient and modern; *Traité des Ponts*, Paris 1716, 12mo.

The parts of a bridge are, The piers; the arches; the pavement, or way over for cattle and carriages; the foot-way on each side, for foot-passengers; the rail or parapet, which incloses the whole; and the buttments or ends of the bridge on the bank.

The conditions required in a bridge are, That it be well-designed, commodious, durable, and suitably decorated. The piers of stone-bridges should be equal in number, that there may be one arch in the middle, where commonly the current is strongest; their thickness is not to be less than a sixth part of the span of the arch, nor more than a fourth; they are commonly guarded in the front with angular sterlings, to break the force of the current: the strongest arches are those whose sweep is a whole femicircle; as the piers of bridges al-

* *Johnf. Eccl. Law.*
an. 740.
§. 88.
† *Sec Mar- chet.*

ways diminish the bed of a river, in case of inundations, the bed must be sunk or hollowed in proportion to the space taken up by the piers (as the waters gain in depth what they lose in breadth) which otherwise conduce to wash away the foundation and endanger the piers: to prevent this, they sometimes diminish the current, either by lengthening its course, or by making it more winding; or by stopping the bottom with rows of planks, stakes, or piles, which break the current.

Among the Romans, the building and repairing of bridges was first committed to the pontifices or priests; then to the censors, or curators of the roads; lastly, the emperors took the care of bridges into their own hands. Thus Antoninus Pius built the Pons Janiculis of marble; Gordian restored the Pons Cestius; and Adrian built a new one denominated from him. In the middle age, bridge-building was reckoned among the acts of religion; and a regular order of Hospitaliers was founded by St Benezet, towards the end of the 12th century, under the denomination of *pontifices*, or bridge-builders, whose office it was to be assiduous to travellers, by making bridges, settling ferries, and receiving strangers in hospitals, or houses built on the banks of rivers. We read of one hospital of this kind at Avignon, where the hospitaliers dwelt under the direction of their first superior St Benezet. The Jesuit Raynaldus has a treatise expressly on St John the bridge-builder.

Among the bridges of antiquity, that built by Trajan over the Danube is allowed to be the most magnificent. See ARCHITECTURE, n^o 138.

Among modern bridges, that of Westminster, built over the river Thames, may be accounted one of the finest in the world: it is 44 feet wide, a commodious foot-way being allowed for passengers, on each side, of about seven feet broad, raised above the road allowed for carriages, and paved with broad moor-stones, while the space left between them is sufficient to admit three carriages and two horses to go a-breast, without any danger. Its extent from wharf to wharf is 1220 or 1223 feet, being full 300 feet longer than London-bridge. The free water-way under the arches of this bridge is 870 feet, being four times as much as the free water-way left between the sterlings of London-bridge: this disposition, together with the gentleness of the stream, are the chief reasons why no sensible fall of water can ever stop, or in the least endanger, the smallest boats in their passage through the arches.

It consists of 13 large and 2 small arches, together with 14 intermediate piers.

Each pier terminates with a salient right angle against either stream: the two middle piers are each 17 feet in thickness at the springing of the arches, and contain 3000 cubic feet, or near 200 tons, of solid stone; and the others decrease in width equally on each side by one foot.

All the arches of this bridge are femicircular; they all spring from about two feet above low-water mark; the middle arch is 76 feet wide, and the others decrease in breadth equally on each side by 4 feet.

This bridge is built of the best materials; and the size and disposition of these materials are such, that there is no false bearing, or so much as a false joint in the whole structure; besides that, it is built in a neat and elegant taste, and with such simplicity and gran-

deur, that, whether viewed from the water, or by the passengers who walk over it, it fills the mind with an agreeable surprize. The semioctangular towers which form the recesses of the foot-way, the manner of placing the lamps, and the height of the balustrade, are at once the most beautiful, and, in every other respect, the best contrived.

London bridge consists of 20 locks or arches, 19 of which are open, and one filled up or obscured. It is 900 feet long, 60 high, and 74 broad, having a draw-bridge in the middle, and almost 20 feet aperture in each arch. It is supported by 18 piers, from 25 to 34 feet thick; so that the greatest water-way when the tide is above the sterlings is 450 feet, scarce half the width of the river; and below the sterlings, the water-way is reduced to 194 feet. Thus a river 900 feet wide is here forced thro' a channel of 194 feet. London bridge was first built of timber, some time before the year 994, by a college of priests, to whom the profits of the ferry of St Mary Overy's had descended; it was repaired, or rather new built of timber, in 1163. The stone-bridge was begun by king Henry in 1176, and finished by king John in 1209. The architect was Peter of Colechurch, a priest*. For the keeping it in repair, a large house is allotted, with a great number of offices, and a vast revenue in land, &c. The chief officers are two bridge-masters, chosen yearly out of the body of the livery. The defects of this bridge are the narrowness and irregularity of the arches, and the largeness of the piers, which, together with the sterlings, turn the current of the Thames into many frightful cataracts, which must obstruct and endanger the navigation through the bridge; to which may be added, the narrowness of the bridge above, occasioned by the houses built on it: but it is pretty certain that there were no houses on the bridge for upwards of 200 years; since we read of a tilt and tournament held on it in 1395. The sterlings have been added, to hinder the piers from being undermined by the rotting of the piles on which they are built: for by means of these sterlings the piles are kept constantly wet; and thus the timber is kept from decaying, which always happens when it is suffered to be alternately wet and dry.

Blackfriars bridge, situated near the centre of the city, and built according to a plan drawn by Mr Robert Mylne, is an exceeding light and elegant structure. The arches are only 9 in number; but very large, and of an elliptical form. The centre-arch is 100 feet wide; and those on the sides decrease in a regular gradation; and the width of that near the abutment at each end is 70 feet. It has an open balustrade at the top, and a foot-way on each side, with room for three carriages abreast in the middle. It has also recesses on the sides for the foot passengers, each supported by two lofty Ionic columns.

The longest bridge in England is that over the Trent at Burton, built by Bernard abbot of Overton, in the 12th century; it is all of squared free stone, strong and lofty, 1545 feet in length, and consisting of 34 arches. Yet this comes far short of the wooden bridge over the Drave, which according to Dr Brown is at least five miles long.

But the most singular bridge in Europe is that built over the river Tave in Glamorganshire. It consists of one stupendous arch, the diameter of which is 175 feet,

* Hawkins.
Hist. of Lan-
don bridge,
p. 6.

the chord 140, the altitude 35, and the abutments 32. This magnificent arch was built by William Edward, a poor country mason, in the year 1756.

The famous bridge of Venice, called the *Rialto*, consists of but a single arch, and that a flat or low one, and passed for a masterpiece of art. It was built in 1591, on the design of Michael Angelo; the span of the arch is 98½ feet, and its height above the water only 23.—Poulet mentions a bridge of a single arch in the city of Munster in Bothuia, much bolder than that of the Rialto at Venice. But these are nothing to a bridge in China, built from one mountain to another, consisting of a single arch 400 cubits long, and 500 in height, whence it is called the *flying-bridge*: a figure of it is given in the *Philosophical Transactions*. Kircher also speaks of a bridge in the same country 360 perches long, supported by 300 pillars.

Bridges are either built of stone or timber, as is judged most convenient. See ARCHITECTURE, n° 121, &c.

Rushen BRIDGE, *Pont de jonc*, is made of large sheaves of rushes growing in marshy grounds, which they cover with boards or planks; they serve for crossing ground that is boggy, miry, or rotten. The Romans had also a sort of subitaneous bridges made by the soldiers, of boats, or sometimes of casks, leathern bottles, or bags, or even of bullocks bladders blown up and fastened together, called *ascogasti*. M. Couplet gives the figure of a portable bridge 200 feet long, easily taken asunder and put together again, and which 40 men may carry. Frezier speaks of a wonderful kind of bridge at Apurima in Lima, made of ropes, formed of the bark of a tree.

Pendent or *Hanging* BRIDGES, called also *Philosophical Bridges*, are those not supported either by posts or pillars, but hung at large in the air, only supported at the two ends or butments. Instances of such bridges are given by Palladio and others. Dr Wallis gives the design of a timber-bridge 70 feet long, without any pillars, which may be useful in some places where pillars cannot be conveniently erected. Dr Plot assures us, that there was formerly a large bridge over the cafile-ditch at Tutbury in Staffordshire, made of pieces of timber, none much above a yard long, and yet not supported underneath either with pillars or archwork, or any sort of prop whatever.

Draw-BRIDGE, one that is fastened with hinges at one end only, so that the other may be drawn up; in which case, the bridge stands upright, to hinder the passage of a ditch or moat.

Flying-BRIDGE, or *Pont d'aerorius*, an appellation given to a bridge made of pontoons, leather boats, hollow beams, casks, or the like, laid on a river, and covered with planks, for the passage of an army.

Flying-BRIDGE (*pont volant*) more particularly denotes a bridge composed of one or two boats joined together by a sort of flooring, and surrounded with a rail or balfustrade; having also one or more masts, to which is fastened a cable, supported, at proper distances, by boats, and extended to an anchor, to which the other end is fastened, in the middle of the water: by which contrivance, the bridge becomes moveable, like a pendulum from one side of the river to the other, without any other help than the rudder.—Such bridges sometimes also consist of two stories, for the quicker passage of a great number of men, or that both infantry and

cavalry may pass at the same time.

In Plate LXV. is represented a flying-bridge of this kind. Fig. 2. is a perspective view of the course of a river and its two banks. *a, b, c, d*, Two long boats or bateaux, which support the flying-bridge. *G, H, K, L*, two masts joined at their tops by two transverse pieces, or beams, and a central arch, and supported in a vertical position by two pair of shrouds and two chains *LN, HR*. *M*, a horse, or cross-piece, over which the rope or cable *M, F, e, f*, that rides or holds the bridge against the current, passes. *E*, a roll or windlafs round which the rope *M, F, e, f*, is wound. *a, b*, The rudders. *AB*, and *CD*, two portions of bridges of boats fastened to the bank on each side, and between which the flying-bridge moves in passing from one side of the river to the other. *e, f*, Chains supported by two punts, or small flat-bottomed boats: there are five or six of these punts at about 40 fathoms from one another. The first, or farthest from the bridge, is moored with anchors in the middle of the bed of the river.

Fig. 3. Is a plan of the same bridge. *a, b, c, d*, The two boats that support it. *K* and *G*, the two masts. *K, F, G*, the transverse piece or beam over which the cable passes. *E*, The roll, or windlafs, round which the rope or cable is wound. *a, b*, The rudders. *O*, a boat. *e*, One of the punts, or small flat-bottomed boats that support the chain. *N, N*, pumps for extracting the water out of the boats. *P, P*, captans.

Fig. 4. Lateral elevation of the bridge. *a, c*, One of the boats. *b*, The rudder. *E*, The roll, or windlafs. *M*, The horse, or cross-piece. *G, H*, One of the masts. *E, M, H, F*, The cable. In this view the balfustrade running along the side of the bridge is plainly exhibited.

Fig. 5. Elevation of the hinder or stern part of the bridge. *a, b*, The two boats. *G, H, K, L*, The two masts. *H, L*, The upper transverse beam. *p, q*, The lower transverse beam, or that over which the cable passes, and on which it slides from one mast to the other; this beam is therefore always kept well greased. *p, k, q, g*, Shrouds extending from the sides of the bridge to the tops of the masts. *M*, The horse or cross-piece over which the cable passes to the roll or windlafs *E*.

Bridges of boats are either made of copper or wooden boats, fastened with flukes, or anchors, and laid over with planks. One of the most notable exploits of Julius Cæsar was the expeditious making a bridge of boats over the Rhine. Modern armies carry copper or tin boats, called *pontoons*, to be in readines for making bridges; several of these being joined side by side till they reach across the river, and planks laid over them, make a plane for the men to march on. There are fine bridges of boats at Beaucaire and Rouen, which rise and fall with the water; and that at Seville is said to exceed them both. The bridge of boats at Rouen, built in lieu of the stately stone-bridge erected there by the Romans, is represented by a modern writer as the wonder of the present age. It always floats, and rises and falls with the tide, or as the land-waters fill the river. It is near 300 yards long, and is paved with stone, just as the streets are; carriages with the greatest burdens go over it with ease, and men and horses with safety, though there are no rails on either hand. The boats are very firm, and well moored with strong chains, and the whole well looked after, and constantly repaired, though

Bridge. though now very old.

BRIDGE of Communication, is that made over a river, by which two armies, or forts, which are separated by that river, have a free communication with one another.

Floating-BRIDGE, is ordinarily made of two small bridges, laid one over the other, in such manner, as that the uppermost stretches and runs out, by the help of certain cords running through pulleys placed along the sides of the under-bridge, which push it forwards till the end of it joins the place it is designed to be fixed on. When these two bridges are stretched out to their full length, so that the two middle ends meet, they are not to be above four or five fathoms long; because, if longer, they will break. Their chief use is for surmounting out-works, or posts that have but narrow moats. In the memoirs of the royal academy of sciences we find an ingenious contrivance of a floating bridge, which lays itself on the other side of the river.

BRIDGE, in gunnery, the two pieces of timber which go between the two transoms of a gun-carriage, on which the bed rests.

BRIDGE, in music, a term for that part of a stringed instrument over which the strings are stretched. The bridge of a violin is about one inch and a quarter high, and near an inch and a half long.

BRIDGE-Town, the capital of the island of Barbadoes, situated in W. Long. 61°. N. Lat. 13°. It stands in the inmost part of Carlisle bay. This originally was a most unwholesome situation, and was chosen entirely for its convenience for trade; but is now deemed to be as healthy as any place in the island. The town itself would make a figure in any European kingdom. It is said to contain 1500 houses, and some contend that it is the finest the British possess in America. The houses in general are well-built and finished, and their rents as high as such houses would let for in London. The wharfs and quays are well defended from the sea, and very convenient. The harbour is secure from the north-east wind, which is the constant trade-wind there; and Carlisle-bay is capable of containing 500 ships, and is formed by Needham and Pelican points. But what renders Bridge-town the finest and most desirable town in the West Indies is its security against any attacks from foreign enemies. It is defended on the west ward by James-fort, which mounts 18 guns. Near this is Willoughby's fort, which is built upon a tongue of land running into the sea, and mounts 12 guns. Needham's fort has three batteries, and is mounted with 20 guns; and St Anne's fort, which is the strongest in the island, stands more within land. In short, according to Mr Douglas, there is all along the lee-shore a breast-work and trench, in which, at proper places, were 29 forts and batteries, having 308 cannon mounted, while the windward shore is secured by high rocks, steep cliffs, and foul ground. Such was the state of the fortifications in 1717; but since that time they have been much strengthened. Bridge-town is destitute of few elegancies or conveniences of life that any city of Europe can afford. The church of St Michael exceeds many English cathedrals in beauty, largeness, and convenience; and has a fine organ, bells, and clock. Here also is a free-school for the instruction of poor boys, an hospital, and a college. The latter was erected by the society for propagating the Christian religion, in pursuance of

the will of colonel Christopher Codrington, who left about 2000*l.* a-year for its endowment, for maintaining professors and scholars to study and practise divinity, surgery, and physic. See CODRINGTON.

BRIDGENORTH, a town of Shropshire in England, seated on the river Severn, which divides it into two parts; but they are united by a handsome stone bridge, and these are called the *upper* and the *lower town*. It is said to have been built by Ethelfleda, widow of Ethelred king of the Mercians, about the year 675. Robert de Belizma, son of Robert de Montgomery, built the castle, and maintained it against king Henry I. by which means it was forfeited to the crown, and remained so till the reign of Richard III. who gave it to John Sutton lord Dudley. This town has undergone several sieges; and in the civil war it suffered very much, many fine buildings, and the whole town, being almost destroyed by fire, when Sir Lewis Kirke defended the citadel for king Charles. There are now no other remains of the castle than a small part of one of the towers, and a place yet called the *castle*, within the walls of the old one; within which stands one of the churches, dedicated to St Mary Magdalen, which was made a free chapel, and exempted from episcopal jurisdiction. The other church is at the north end of the town, on the highest part of the hill, near to whose church-yard stood a college, which was destroyed by fire in the civil wars, together with the church just mentioned; which has been since rebuilt by the inhabitants. On the west bank of the river are the remains of an ancient and magnificent convent, under which are several remarkable vaults and caverns running to a great length. Part of the cow-gate street is a rock, rising perpendicularly, in which are several houses and tenements that make a very agreeable though grotesque appearance. In many other places there are also caves and dwellings for families, in the rocks; and indeed the whole town has an appearance surprisingly singular. W. Long. 2. 30. N. Lat. 52. 40.

BRIDGEWATER, a town of Somersetshire in England, seated on the river Parret, over which there is a stone bridge, near which ships of 100 tons burden may ride with ease. It is a large, well frequented place, with the title of a duchy, and sends two members to parliament. There are in it several large inns, and the market is well supplied with provisions. W. Long. 3. 0. N. Lat. 51. 15.

BRIDLE, in the menage, a contrivance made of straps or thongs of leather and pieces of iron, in order to keep a horse in subjection and obedience.

The several parts of a bridle are the bit, or snaffle; the head-stall, or leathers from the top of the head to the rings of the bit; the fillet, over the fore-head and under the fore-top; the throat-band, which buttons from the head-band under the throat; the reins, or long thongs of leather that come from the rings of the bit, and being cast over the horse's head, the rider holds them in his hand; the nose-band, going through loops at the back of the head-stall, and buckled under the cheeks; the trench; the cavesson; the martingal; and the chaff halter.

Pliny assures us that one Pelethronius first invented the bridle and saddle; though Virgil ascribes the invention to the Lapithæ, to whom he gives the epithet *Pelethronii*, from a mountain in Thessaly named *Pelethronium*.

Bridon *thrionium*, where horses were first begun to be broken. The first horsemen, not being acquainted with the art of governing horses with bridles, managed them only with a rope or a switch, and the accent of the voice. This was the practice of the Numidians, Getulians, Libyans, and Massilians. The Roman youth also learned the art of fighting without bridles, which was an exercise or lesson in the menage; and hence it is, that on the Trajan column, soldiers are represented riding at full speed without any bridles on.

Scolding-BRIDLE. See BRANK.
BRIDON, or SNAFFLE, after the English fashion, is a very slender bit-mouth, without any branches. The English make much use of them, and scarcely use any true bridles except in the service of war. The French call them *bridons*, by way of distinction from bridles.

BRIDLINGTON, a sea-port town in the east riding of Yorkshire in England. It is seated on a creek of the sea near Flamborough-head, having a commodious quay for ships to take in their lading. It has a safe harbour, and is a place of good trade. It is more generally known by the name of *Burlington*, as it gives title to an earl of that name. E. Long. o. 10. N. Lat. 54. 15.

BRIDPORT, a town of Dorsetshire in England. It has a low dirty situation between two rivers, which, at a little distance, joining a small stream, formerly made a convenient harbour; but is now quite choked up with sand. It sends two members to parliament, who are chosen by the inhabitants who are housekeepers. It is noted for making of ropes and cables for shipping; whence arises a proverb of a man that is hanged, that he is *hanged with a Bridport dagger*. W. Long. 3. o. N. Lat. 50. 40.

BRIEF, in law, an abridgement of the client's case, made out for the instruction of council on a trial at law; wherein the case of the plaintiff, &c. is to be briefly but fully stated: the proofs must be placed in due order, and proper answers made to whatever may be objected to the client's cause by the opposite side; and herein great care is requisite, that nothing be omitted, to endanger the cause.

BRIEF, in Scots law, a writ issued from the chancery, directed to any judge-ordinary, commanding and authorizing that judge to call a jury to inquire into the case mentioned in the brief, and upon their verdict to pronounce sentence.

Apollitical BRIEFS, letters which the pope dispatches to princes, or other magistrates, relating to any public affair.—These briefs are distinguished from bulls, in regard the latter are more ample, and always written on parchment, and sealed with lead or green wax; whereas briefs are very concise, written on paper, sealed with red wax, and with the seal of the fisherman, or St Peter in a boat.

BRIEG, a town of Silesia in Germany, situated in E. Long. 17. 35. N. Lat. 50. 40. It might have passed for a handsome place before the last siege; the castle, the college, and the arsenal, being very great ornaments, and most of the houses very well built. But the Prussians, who besieged it in 1741, threw 2172 bombs into it, and 4714 cannon bullets, which reduced a great part of the town to ashes, and quite ruined a wing of the castle. It was obliged to surrender, after sustaining seven days continual fire. The Prussians, to

whom this place was ceded by the peace, have augmented the fortifications, and built a new suburb.—The town stands upon the Oder; on the other side of which there are plenty of fallow-deer, and large forests of beech and oak trees. They have a yearly fair, at which they sell above 12,000 horned cattle. Since 1728, they have begun to manufacture fine cloth.

BRIEL, a maritime town of the United Provinces, and capital of the island of Vuorn. It was one of the cautionary towns which was delivered into the hands of queen Elizabeth, and garrisoned by the English during her reign and part of the next. The Dutch took it from the Spaniards in 1572, which was the foundation of their republic. It is seated at the mouth of the river Meuse, in E. Long. 3. 56. N. Lat. 51. 53.

BRIESCIA, a palatinate in the duchy of Lithuania, in Poland. The name given to it by some is *Polesia*. It is bounded on the north, by Novogrode and Troki; on the west, by those of Bielko and Lublin; on the south, by that of Chelm and upper Volhinia; and on the east, by the territory of Rziecica. This province is of considerable extent from east to west, and is watered by the rivers Bug and Pripepe: it is full of woods and marshes; and there are lakes that yield large quantities of fish, that are salted by the inhabitants, and sent into the neighbouring provinces.

BRIEUX (St), a town of France, in upper Brittany, with a bishop's see. It is seated in a bottom, surrounded with mountains, which deprive it of a prospect of the sea, though it is not above a mile and a quarter from it, and there forms a small port. The churches, streets, and squares, are tolerably handsome; but the town is without walls and ditches. The church of St Michael is in the suburb of the same name, and is the largest in the place. The convent of the Cordeliers is well built, and the garden is spacious. The college, which is very near, is maintained by the town for the instruction of youth. W. Long. 2. 58. N. Lat. 48. 33.

BRIG, or BRIGANTINE, a merchant-ship with two masts. This term is not universally confined to vessels of a particular construction, or which are masted and rigged in a manner different from all others. It is variously applied, by the mariners of different European nations, to a peculiar sort of vessel of their own marine. Amongst British seamen, this vessel is distinguished by having her mainfall set nearly in the plane of her keel; whereas the mainfalls of larger ships are hung athwart, or at right angles with the ship's length, and fastened to a yard which hangs parallel to the deck: but in a brig, the foremost edge of the mainfall is fastened in different places to hoops which encircle the main-mast, and slide up and down it as the sail is hoisted or lowered: it is extended by a gaff above, and a boom below.

BRIGADE, in the military art, a party or division of a body of soldiers, whether horse or foot, under the command of a brigadier.—An army is divided into brigades of horse and brigades of foot: a brigade of horse is a body of eight or ten squadrons; a brigade of foot consists of four, five, or six battalions. The eldest brigade has the right of the first line, and the second the right of the second; the two next take the left of the two lines, and the youngest stand in the centre.

BRIGADE-Major, is an officer appointed by the brigadier, to assist him in the management and ordering of his brigade.

Brigadier
Briggs.

BRIGADIER, is the general officer who has the command of a brigade. The eldest colonels are generally advanced to this post. He that is upon duty is brigadier of the day. They march at the head of their own brigades, and are allowed a serjeant and ten men of their own brigade for their guard.

BRIGADIERS, or *Sub-brigadiers*, are posts in the horse-guards.

BRIGANDINE, a coat of mail, a kind of ancient defensive armour, consisting of thin jointed scales of plate, pliant and easy to the body.

BRIGANTIA, or **BRIGANTIUM**, (anc. geog.), a town of Vindelicis; now *Bregenz*, in Tyrol, at the east end of the lake of Constance*.—Another *Brigantium* in the Alps Cottica; which last is probably Briannon, a town on the borders of Dauphiny †.

BRIGANTINE. See **BRIG.**

BRIGANTINUS LACUS, (anc. geog.), a lake of Rhetia, or Vindelicis which Tacitus includes in Rhetia. Ammian calls the lake *Brigantia*. It took its name either from the Brigantii, the people inhabiting on it, or from the adjoining town. Now the lake of *Constance*, or *Bodensee*.

BRIGANTINUS Portus, (anc. geog.), a port of the hither Spain; so called from Flavius Brigantium. Now *El Puerto de la Corunna*, commonly the *Groyne**.

BRIGG, by some called *Glanford Bridges*, a town of England, in Lincolnshire, seated on the river Ankam. W. Long. o. 20. N. Lat. 53. 40.

BRIGGS (Henry), one of the greatest mathematicians in the 16th century, was born at Warley Wood in the parish of Halifax in Yorkshire, in 1556. In 1592, he was made examiner and lecturer in mathematics, and soon after, reader of the physic lecture founded by Dr Linaacer. When Gresham college in London was established, he was chosen the first professor of geometry there, about the beginning of March 1596. In 1609, Mr Briggs contracted an intimacy with the learned Mr James Uther afterwards archbishop of Armagh, which continued many years by letters, two of which, written by our author, are yet extant. In one of these letters, dated in August 1610, he tells his friend he was engaged in the subject of eclipses; and in the other, dated March 10th 1615, he acquaints him with his being wholly employed about the noble invention of logarithms, then lately discovered, in the improvement of which he had afterwards a large share. In 1619, he was made Savilian professor of geometry at Oxford; and resigned his professorship of Gresham college on the 25th of July 1620. Soon after his going to Oxford, he was incorporated master of arts in that university; where he continued till his death, which happened on the 26th of January 1630. Dr Smith gives him the character of a man of great probity; a contemner of riches, and contented with his own station; preferring a studious retirement to all the splendid circumstances of life. He wrote, 1. *Logarithmorum arithmetica prima*. 2. *Arithmetica logarithmica*. 3. *Trigonometria Britannica*. 4. A small tract on the north-west passage; and some other works.

BRIGGS (William), an eminent physician in the latter end of the 17th century, was the son of Augustin Briggs, Esq; four times member for the city of Norwich, where our author was born. He studied at the university of Cambridge; and his genius leading him

to the study of physic, he travelled into France, where he attended the lectures of the famous anatomist M. Vieuffens, at Montpellier. After his return, he published his *Ophthalmographia* in 1676. The year following he was created doctor of medicine at Cambridge, and soon after was made fellow of the college of physicians at London. In 1682, he quitted his fellowship to his brother; and the same year, his *Theory of vision* was published by Hooke. The ensuing year he sent to the royal society a continuation of that discourse, which was published in their Transactions; and the same year, he was by king Charles II. appointed physician to St Thomas's hospital. In 1684, he communicated to the royal society two remarkable cases relating to vision, which were likewise printed in their Transactions; and in 1685 he published a Latin version of his *Theory of vision*, at the desire of Mr Newton, afterwards Sir Isaac, professor of mathematics at Cambridge, with a recommendatory epistle from him prefixed to it. He was afterwards made physician in ordinary to king William, and continued in great esteem for his skill in his profession till he died Sept. 4th, 1704.

BRIGHTHELMSTONE, a sea-port town of Suffex in England. It is a pretty large and populous town; but ill built, inhabited chiefly by fishermen, and has a pretty good harbour. W. Long. o. 10. N. Lat. 50. 50. It was at this place king Charles II. embarked for France, 1651, after the battle of Worcester.

BRIGITTINS, or **BRIDGETINS**, more properly *Brigittins*, a religious order, denominated from their founder St Bridget or *Birgit*, a Swedish lady in the 14th century: whom some represent as a queen; but Fabricius, on better grounds, as a princess, the daughter of king Birgenes, legislator of Upland, and famous for her revelations. The Brigittins are sometimes also called the *Order of our Saviour*; it being pretended, that Christ himself dictated the rules and constitutions observed by them to St Bridget. In the main, the rule is that of St Augustin; only with certain additions supposed to have been revealed by Christ, whence they also denominate it the *Rule of our Saviour*.—The first monastery of the Bridgetin order was erected by the foundress about the year 1344, in the diocese of Lincopen; on the model of which all the rest were formed. The constitution of these houses was very singular: though the order was principally intended for nuns, who were to pay a special homage to the holy Virgin, there are also many friars of it, to minister to them spiritual assistance. The number of nuns is fixed at 60 in each monastery, and that of friars to 13, answerable to the number of apostles, of whom St Paul made the 13th; besides which there are to be four deacons, to represent the four doctors of the church, St Ambrose, St Augustin, St Gregory, and St Jerome; and eight lay-brothers; making together, says our author, the number of Christ's 72 disciples.—The order being instituted in honour of the Virgin, the direction is committed to an abbess, who is superior not only of the nuns, but also of the friars, who are obliged to obey her. Each house consists of two convents or monasteries, separately inclosed, but having one church in common; the nuns being placed above, and the friars on the ground. The Bridgetins profess great mortification, poverty, and self-denial, as well as devotion; and they are not to possess any thing they can call their

Brightelm-
stone,
Brigittins.

Brignoles
Brimstone.

own, not so much as an halfpenny; nor even to touch money on any account. This order spread much thro' Sweden, Germany, the Netherlands, &c. In England we read but of one monastery of Briggittins, and this built by Henry V. in 1413, opposite to Richmond, now called *Sion house*; the ancient inhabitants of which, since the dissolution, are settled at Lisbon. The revenues were reckoned at 1495 l. per annum.

BRIGNOLES, a town of France, in Provence, famous for its prunes. It is seated among mountains, in a pleafant country, 275 miles S. S. E. of Paris. E. Long. 6. 15. N. Lat. 43. 24.

BRIHUEGA, a town of Spain, in New Castile, where general Stanhope with the English army were taken prisoners, after they had separated themselves from that commanded by count Staremberg. It is seated at the foot of the mountain Tajuna, 43 miles north-east of Madrid. W. Long. 3. 20. N. Lat. 41. 0.

BRIL (Matthew and Paul), natives of Antwerp, and good painters.—Matthew was born in the year 1550, and studied for the most part at Rome. He was eminent for his performances in history and landscape, in the galleries of the Vatican; where he was employed by Pope Gregory XIII. He died in 1584, being no more than 34 years of age.—Paul was born in 1554; followed his brother Matthew to Rome; painted several things in conjunction with him; and, after his decease, brought himself into credit by his landscapes, but especially by those which he composed in his latter time. The invention in them was more pleafant, the disposition more noble, all the parts more agreeable, and painted with a better gusto, than his earlier productions in this way; which was owing to his having studied the manner of Hanibal Carrache, and copied some of Titian's works in the same kind. He was much in favour with Pope Sixtus V.; and for his successor Clement VIII. painted the famous piece, about 68 feet long, wherein the faint of that name is represented cast into the sea with an anchor about his neck. He died at Rome in the year 1626, aged 72.

BRILLIANT, in a general sense, something that has a bright and lucid appearance.

BRILLIANT, in the menage. A brisk, high mettled, stately horse is called *brilliant*, as having a raised neck; a fine motion; and excellent haunches, upon which he rises, though ever so little put on.

BRILLIANTS, a name given to diamonds of the finest cut. See **DIAMOND**.

BRIM, denotes the outmost verge or edge, especially of round things. The brims of vessels are made to project a little over, to hinder liquors, in pouring out, from running down the side of the vessel. The brimming of vessels was contrived by the ancient potters, in imitation of the supercilium or drip of the cornices of columns: it is done by turning over some of the double matter when the work is on the wheel.

BRIM, in country affairs. A fow is said to *brim* or *to go to brim*, when she is ready to take the boar.

BRIMSTONE. See **SULPHUR**.

BRIMSTONE Medals, Figures, &c. may be cast in the following manner. Melt half a pound of brimstone over a gentle fire: with this mix half a pound of fine vermilion; and when you have cleared the top, take it off the fire, stir it well together, and it will dissolve like oil; then cast it into the mould, which should be

first anointed with oil. When cool, the figure may be taken out; and in case it should change to a yellowish colour, you need only wipe it over with aqua fortis, and it will look like the finest coral*.

BRIN, a strong town of Bohemia, in Moravia. It is pretty large, and well built; the assembly of the states is held alternately there and at Olmutz. The castle of Spilberg is on an eminence, out of the town, and is its principal defence. It was invaded by the king of Prussia in 1742, but he was obliged to raise the siege. It is near the river Swart, in E. Long. 7. 8. N. Lat. 49. 8.

BRINDISI, an ancient celebrated town of Italy, in the Terra d'Otranto, and kingdom of Naples, with an archbishop's see. It has a castle built in the sea, at the entrance of the port, which is extremely strong, and is also defended by two forts. Its territory has whole forests of olive trees. E. Long. 18. 5. N. Lat. 40. 52.

BRINE, or **PICKLE**; water replete with saline particles.

BRINE-Water, a salt water, which, being boiled, turns into falt. See **SALT**.

Brine taken out of brine-pits, or brine-pans, used by some for curing or pickling of fish, without boiling the same into falt; and rock-salt, without refining it into white falt; are prohibited by 1 Ann. cap. xxi.

BRINE-Springs, are fountains which flow with falt-water instead of fresh. Of these there are a good number in South Britain, but though not peculiar to this island, are far from being common in the countries on the continent. There are some of them in several different countries; and perhaps, on a due search, others might be discovered*. The most remarkable of these already known are, one at East-Chenock in Somersetshire, about 20 miles from the sea. Another at Leamington in Warwickshire, very near the river Leam; which, however, is but weak. Such a spring likewise runs into the river Cherwell in Oxfordshire, and several more in Westmoreland and Yorkshire; but as they are but poor, and the fuel in most of those countries scarce and dear, no falt is prepared from them. At Barrowdale near Grange, three miles from Kefwick in Cumberland, a pretty strong spring rises in a level near a moss, 16 gallons of the water of which yield one of pure falt; which is the more remarkable, when it is considered that the same quantity of falt cannot be obtained from less than 22 gallons of the waters of the German ocean. At a place called *Salt-water Haugh* near Butterby in the bishopric of Durham there are a multitude of falt springs which rise in the middle of the river Weare, for the space of about 40 yards in length, and 10 in breadth; but particularly one out of a rock, which is so strong that in a hot summer's day the surface will be covered with a pure white falt. At Weston, in Staffordshire, there are brine pits which afford about a ninth part of very fine white falt. There are others at Enson, St Thomas, and in the parish of Ingestre, but so weak that they are not wrought; though it is believed, that by boring, stronger springs might be found in the neighbourhood. In Lancashire there are several falt springs, but (if we except that at Barton, which is as rich as the spring at Norwich) by no means so famous as those of Cheshire, called in general by the name of the *wiches*. Brine
Brioude.

wich on the river Weever, has a noble spring not far from the river, which is so rich as to yield one sixth part of pure white falt. At fix miles diftance ftands Northwich, at the confluence of the Weever and the Dan; where the brine is ftill richer, fince they obtain fix ounces of falt from 16 of water. There are, even at this day, fome vifible remains of a Roman canefway between thefe two towns. The inhabitants of Wales, who, before that country was incorporated into England, were fupplied chiefly, if not folety, with that neceffary commodity from thefe two towns, called the former *Hellath Wen*, and the latter *Hellath Du*; i. e. the white and black falt pit. In 1670, a rock of falt was difcovered at a fmall diftance from Northwich, which has been wrought to a great depth, and to a vail extent, fo as to be juftly eiteemed one of the greateft curiofities in England; and it is highly probable, that there is an immense body of foftile falt in the bowels of the earth, under this whole county; fince, upon boring, brine-pits have been found in many places on both fides the river Weever. This is the more likely, fince, at Middlewich, which ftands at the confluence of the Croke and the Dan, there are falt-fprings with a freth brook running between them. The brines from thefe pits are of unequal ftrength; but, when mixed, they commonly obtain four ounces of falt from a pound of brine. Experience fhews, that in thefe fprings the water is ftrongeft neareft the bottom, richer in dry weather than in wet, and when long drawn than when firft wrought. But there are no rules in refpect to other falt-fprings, fince in thofe of Franche Comte the brine is ftrongeft in wet weather. There are feveral other bodies diffolved in thefe brines befides falt; in fome a fuphureous fubftance, which fublimes as the brine heats; a fort of dirty ochre which difcolours the brine, but, if fuffered to ftand, fpeedily fubfides; and in moft brines a calcareous, or rather felenitic earth, which fettles to the bottom of the pans *.

* See Salt,
and Spring.

To BRING-TO, in navigation, to check the courfe of a fhip when the is advancing, by arranging the fails in fuch a manner, that they ftall counteract each other, and prevent her either from retreating or moving forward. In this fituation the fhip is faid to lie by, or lie to; having, according to the fea-phrafe, fome of her fails *aback*, to oppofe the force of thofe which are full; or having them otherwife thortened by being *farled*, or *hauled up in the brails*.

BRINGING-TO, is generally ufed to detain a fhip in any particular ftation, in order to wait the approach of fome other that may be advancing towards her; or to retard her courfe occasionally near any port in the courfe of a voyage.

BRINGING-in a Horfe, in the manage, the fame as to fay, keep down the nofe of a horfe that boars and toffes his nofe in the wind: this is done by means of a branch.

BRIONNE, a town of France, in Normandy, feated on the river Rille. E. Long. o. 51. N. Lat. 49. 51.

BRIOUDE, a town of France, in lower Auvergne. There are two Brioudes, three quarters of a mile from each other; the one is called *Church Brioude*, the other *Old Brioude*. The houfes are built after the antique manner, and are badly difpofed. The canons are all temporal lords and counts. It is in no diocefe, but depends immediately on the Pope. There are feveral con-

Briqueras
Briſſot.

vents; and, among the reft, the church of St Ferrol, which is highly celebrated. Near the Old Town is a ftone-bridge on the river Allier, which confifts of one arch: this is eiteemed a ftupendous ftructure, and is thought to be a work of the Romans. The inhabitants have no manufactures. It is fituated in E. Long. 3. 25. N. Lat. 45. 14.

BRIQUERAS, a town in Piedmont, feated in the valley of Lucern, three miles from the town of that name, and four fourth of Pignerol. It had a very ftiong caſtle towards the latter end of the 16th century; but when the French got footing in it, it was ruined, that is, before they delivered it up to the duke of Savoy in 1696. E. Long. 7. 24. N. Lat. 44. 41.

BRISACH, a town of Germany, and capital of Briſgaw. It was twice in poffeffion of the French; but reftored to the houfe of Aultria, in confequence of treaties of peace. It was a very ftiong place, but the fortifications have been demolifhed. It is feated on the Rhine, where there is a bridge of boats. E. Long. 7. 49. N. Lat. 48. 5.

BRISACH (New), a town of France, in Alface, built by order of Lewis XIV. over againft Old Briſach, and fortified by Vauban. It is 32 miles fouth of Straſburg. E. Long. 7. 46. N. Lat. 48. 5.

BRISEIS, or HIPPODAMIA, in fabulous hiftory, the wife of Mynes king of Lyrneſſa. After Achilles had taken that city, and killed her husband, ſhe became his captive. That hero loved her tenderly; but Agamemnon taking her from him, ſhe became the accidental caufe of numberlefs diforders in the Grecian army. Achilles, enraged, retired to his tent; and, till the death of Patroclus, refuſed to fight againft the Trojans. The reſentment of this prince is finely painted in the *Iliad*.

BRISGAW, a territory of Germany, in the circle of Suabia, on the eaſtern banks of the Rhine, about 50 miles in length, and 30 in breadth. The principal places are Old Briſach, New Briſach, Freyburgh, Rhinmarck, and an iſland in the Rhine.

BRISSOT (Peter), one of the ableſt phyſicians of the 16th century, was born at Fontenai le Comte in Poitou. He ſtudied at Paris; and, having taken his doctor's degree, bent his thoughts to the reforming of phyſic, by reſtoring the precepts of Hippocrates and Galen, and exploding the maxims of the Arabians: to this purpoſe he publicly explained Galen's works, inſtead of thoſe of Avicenna, Rhaſis, and Meſſue. He afterwards reſolved to travel to acquire the knowledge of plants; and going to Portugal, praſticed phyſic in the city of Eboræ. His new method of bleeding in pleuriſies, on the ſide where the pleuriſy was, raiſed a kind of civil war among the Portugueſe phyſicians; it was brought before the univerſity of Salamanca, who at laſt gave judgment, that the opinion aſcribed to Briſſot was the pure doctrine of Galen. The partizans of Denys, his opponent, appealed in 1529 to the emperor, to prevent the practice, as being attended with deſtructive conſequences; but Charles III. duke of Savoy happening to die at this time of a pleuriſy, after having been bled on the oppoſite ſide, the proſecution dropped. He wrote an Apology for his practice; but died before it was publiſhed, in 1552; but Anthony Luceus, his friend, printed it at Paris three years after. Renatus Moreau procured a new edition of it at Paris

in.

Bristol.
Bristol.

in 1622; and annexed to it a treatise entitled *De missione sanguinis in pleuritide*, together with the Life of Bristot.

BRISTLE, a rigid glossy kind of hair found on swine, and much used by brush-makers, &c.

BRISTOL, a city of England, and inferior to none, except London, for wealth, trade, and number of inhabitants. Bristol is a corruption of *Brightflow*, as it was called by the Saxons. It is thought to have stood anciently altogether on the west or Somersetshire side of the Avon, before the bridge was built; but after that, it came to be partly in Somersetshire, and partly in Gloucestershire, until it was made a county of itself, though even before that, in the parliament rolls, it was always placed in Somersetshire. At present, the east side is by much the largest and most populous. It had anciently a castle, built by Robert earl of Gloucester, natural son to Henry I. which was demolished by Cromwell; and the ground is now laid out into streets. The corporation consists of a mayor; recorder; twelve aldermen, of whom the recorder is one; two sheriffs; and twenty-eight common-council men. The recorder is generally a serjeant at law, and sits as judge in capital and all other criminal causes. The mayor, to support his dignity, and defray his extraordinary expence, is entitled to certain fees from ships, which long ago amounted to 500 or 600*l*. Besides the cathedral, which was anciently the church of the Augustine monastery, there are 18 parish churches. Here are dissenters of all denominations, of whom the quakers are very respectable both for their wealth and numbers. When Henry VIII. dissolved the monastery, he applied its revenues to the maintenance of a bishop, dean, six prebendaries, and other officers. Of the parish churches, St Mary Ratcliff is reckoned one of the finest, not only here, but in the whole kingdom. In this church, besides two monuments of the founder William Cannings, who had been five times mayor of this city, one in the habit of a magistrate, and another in that of a priest (for in his latter days he took orders), there is one of Sir William Penn, father to the famous quaker. The old bridge over the Avon consisted of four broad arches, with houses on both sides like those formerly on London bridge; but this has been lately pulled down, and another erected in its place. No carts or waggons are admitted into Bristol, for fear of damaging the vaults and gutters made under ground for carrying the filth of the city into the river. Queen's-square, in this city, is larger than any in London, except Lincoln's-inn-fields, and has in the centre an equestrian statue of king William III. All the gates of the city remain entire, and a part of the walls; the rest were razed in the reign of William Rufus. It is almost as broad as long, about seven miles in circumference, and contains about 95,000 inhabitants. Of the hospitals, the chief are, 1. That called Queen Elizabeth's, in which 100 boys are taught reading, writing, arithmetic, and navigation; six of whom, when they go out, have 10*l*. and the rest 8*l*. 8*s*. to bind them apprentices: the matter is allowed 450*l*. a-year for the maintenance of the boys. 2. Colston's hospital; in which 100 boys are maintained for seven years, and taught and apprenticed, as in queen Elizabeth's. 3. Another founded by the same gentleman in 1691, for 12 men and 12 women, with an allowance of 3*s*. per week, and 24 sacks of coals

Bristol.

in the year. This charity cost the founder 25,000*l*.

4. Another founded partly by Mr Colston, and partly by the merchants, in which 18 men on account of the merchants, and 12 men and women on account of Mr Colston, are maintained. 5. An infirmary, which was opened in 1736 for the sick, lame, and distressed poor of the city, which is maintained by subscription, besides 5000*l*. bequeathed to it by John Eldridge, Esq; formerly comptroller of the customs at this port. There are, besides these, a bridewell, several alms-houses, and charity-schools. There is also a guildhall for the sessions and assizes; the mayor's and sheriffs courts; a council-house, where the mayor and aldermen meet every day, except Sundays, to administer justice; a handsome new exchange, with three entrances, about two thirds as large as that in London; and a key half a mile in length, the most commodious in England for shipping and landing goods, for which purpose it is provided with several cranes. In College-green is a stately high cross, with the effigies of several kings round it. In Winch-street is a guard-house, with barracks for soldiers. As to the trade of this city, it was computed many years ago to be much greater in proportion, especially to America and the West Indies, than that of London. Fifty sail, some of them ships of considerable burden, have arrived here at one time, or very near one another, from the West Indies. For this trade, and that to Ireland, it is much better situated than London, besides the great advantages it possesses of an inland navigation by the Wye and Severn. Their trade extends to the Baltic, Norway, Holland, Hamburgh, Guinea, and the Streights. The largest ships are discharged at Hungrood, four miles below the city, and the goods are brought to the key by lighters. For building, equipping, and repairing ships, there are docks, yards, rope-walks, and ship-wrights. Here are some considerable woollen manufactures; and no less than 15 glass-houses, for which Kingswood and Mendip furnish the coals. The city companies are 13: 1. The merchant adventurers. 2. The merchant tailors. 3. The mercers. 4. The soap-boilers. 5. The tobaccoconists. 6. The butchers. 7. The barbers. 8. The tylers. 9. The holliers, who are the sled-men. 10. Shoemakers. 11. Coopers. 12. Bakers. 13. Smiths. For supplying the city with water there are six public conduits; and handsome hackney-coaches may be hired at very reasonable rates, but they do not ply in the streets. There are also stage-coaches, which set out every day for Bath, London, and other places. A mile below the city, close by the river, is the hot well, whose waters are specific for the diabetes, and good in phthical, scorbutic, and inflammatory disorders. Hither is a great resort in the summer of invalids, as well as other company; for whose accommodation and entertainment there is a pump-room, ball-room, coffee-house, with taverns, and a great number of elegant lodging-houses, both below on a level with the well, and above in the delightful village of Clifton, which is situated on the brow of a hill, from whence there are downs extending several miles, where the company ride out for exercise. Nothing can be more pure and salutary than the air of these downs, which afford a variety of the most romantic and agreeable prospects, comprehending Kingroad, with the ships at anchor, the mouth of the Severn, and the mountains of Wales. In the rocks above the well are

found

Bristol,
Britain.

found those six-cornered stones called *Bristol stones*; but they are not so plentiful now as in Camden's days, when, he says, whole bushels might have been easily gathered. In this city is a theatre, where plays are acted almost every night during the recesses of the comedians from the metropolis. There are two annual fairs, to which the concourse is so great, that the neighbouring inns have filled 100 beds a-piece with their guests. In the winter season there is an assembly every Thursday for the gayer part of the citizens of both sexes. About half way betwixt Bristol and Bath, at a place called *Warmly*, a company of Bristol merchants have erected a noble manufacture of pins and other brass utensils, which employs a great number of hands, including above 200 children of both sexes from seven to twelve or thirteen years of age. All the different operations of melting, splitting, drawing, hammering, turning, &c. are performed by wheels worked with water, which is raised by two fire-engines of a very curious mechanism. The city of Bristol gives the title of earl to the family of Hervey. It is worth observing, that whoever marries a citizen's daughter becomes free of the city.

New BRISTOL, the capital of the county of Bucks in Pennsylvania, situated on the river Delawar, about 20 miles north of Philadelphia, in W. Long. 75°. N. Lat. 40. 45.

BRISTOL Water. Of the four principal warm waters naturally produced in England this is the least fo. As the Bath waters are proper where the secretions are defective, so the Bristol water is of service where they exceed the requirements of health. The Bath water warms; the Bristol cools. Bath water helps the stomach, intestines, and nerves; the Bristol favours the lungs, kidneys, and bladder. Except a jaundice attend, the Bristol water may be of use in dropies by its drying and diuretic qualities. Dr Wynter asserts, that there is no iron in the Bristol water; and that its mineral contents are chalk, lapis calcarius, and calaminaris. Five gallons of this water, after evaporation, afforded only 3 iii. and gr. ii. of a mineral-like substance. The diseases in which this water is useful are internal hemorrhages, immoderate menses, internal inflammations, spitting blood, dysentery, purulent ulcers of the viscera, consumption, dropsy, scurvy with heat, stone, gravel, strangury, habitual gout, atrophy, a slow fever, scrophula, glects, and a diabetes, in which last it is a specific, and may be drank as freely as the thirst requires it. The hotter months are the best for using it. The Bristol and Matlock waters are of exactly the same qualities.

Doctors Mead and Lane first established the reputation of Bristol waters in diseases of the kidneys and bladder.

BRITAIN, or *GREAT BRITAIN*, the most considerable of all the European islands, extends from the Lizard Point, in the latitude of about 50°. to Dunefbay-head in latitude 58. 30. N. or, taking it in a straight line from north to south, about eight degrees or 550 miles; and from Dover-head on the east to Land's-end on the west comprehends about seven degrees of longitude, which may be computed at about 290 miles: but the form being very irregular, and lessening continually towards the north, proper allowances must be made in computing its dimensions.

The ancient name of this island was *Albion*, the name Vol. II.

Britain.

Britain being then common to all the islands round it. Hence Agathemercus, speaking of the British islands, "They are many in number (says he); but the most considerable among them are Hibernia and Albion." And Ptolemy, to the chapter wherein he describes the island now called *Great Britain*, prefixes the following title: "The situation of *Albion* a British island." But as this far excelled the other British islands, the name of *Albion* in process of time was laid quite aside, and that of *Britain* used in its stead. By this name it was known in Pliny's time, and even in Cæsar's. The origin of both these names is very uncertain. Some derive that of *Albion* from the Greek word *alphon*, which, according to Felsus, signifies *white*, the chalky cliffs that in several places rise on the southern coasts having that colour; while others pretend this name to have been borrowed from a giant feigned to have been the son of Neptune, and mentioned by several ancient authors. Some etymologists have recourse to the Hebrew, and others to the Phœnician; *alben* in the former signifying *white*, and *alp* in the latter signifying *high*. The origin of the name *Britain* is no less uncertain than that of *Albion*. Nennius and some other British writers derive it from Brutus, whom they likewise call *Brifo*, the fifth in descent from the celebrated Æneas. Others derive it from the British words *pryd cain*, that is, a *white form*, softened by degrees into *Britannia*. Camden derives it from the word *brith*, which, in the ancient language of the island, signifies *painted*; and *tania*, importing, in Greek, a region or country; so that the word *Brithania*, changed in process of time into *Britannia*, expresses what the Britons really were, that is, *painted*. Somner, disliking Camden's etymology, proposes another, viz. that the name *Britain* comes from *brydio*; signifying, in the British tongue, *rage*, and pointing out the violent motion of the sea that surrounds the island. Mr Whittaker, in his History of Manchester, derives it from the word *brith*, *briet*, *brit*, *bris*, or *brig*, which, he says, signifies *divided* or *striped*. Against the first of these etymologies it may be objected, that it is founded on a fable: and against the other four lies one common and unanswerable objection; which is, that the name of *Britain* was given to the island by foreigners, who could not borrow it from the British tongue, with which they were in all likelihood unacquainted. That the island received the name of *Britain* from foreigners is evident, since the natives never styled themselves *Britons*, nor their country *Britain*; their true name being *Canri*, or *Cambri*; whence *Cambria* the name of Wales to this day among the Welsh.

The learned Bochart, speaking of the colonies and language of the Phœnicians, offers a conjecture which most of our modern writers have adopted as the most natural. The Phœnicians, according to that writer, called this island, and some others near it, *Barat Anac*, that is, *the land or country of tin or lead*, and more contractedly *Bratanae*; which name, passing from the Phœnicians to the Greeks, and from these to the Romans, might have been softened into that of *Britannica* and *Britannia*. That the Phœnicians first discovered these islands, which were afterwards by the Greeks called *Cassiterides*, and are proved by Camden to be our Scilly islands, appears both from Strabo and Pliny; of whom the former tells us, that the Phœnicians first brought tin from the Cassiterides, which they sold to the Greeks; but

but kept the trade to themselves, and the place private: and the latter writes, that Medicoritus was the first who brought lead from the Cassiterides; where Bochart shews that we ought to read *Melichartus*, who is the Phœnician Hercules of Sanchoniatho, to whom that nation ascribe their first western discoveries. But, notwithstanding the care of the Phœnicians to conceal these islands, the Greeks at last discovered them; and gave them the name of *Cassiterides*, which, in the Greek tongue, signifies the same with *Barat Anac* in the Phœnician. This name was at first given to the islands of Scilly already mentioned, but by degrees communicated to all the others lying in the same sea. Thus Bochart. But after all, his opinion, however plausible in appearance, may be as foreign to the purpose as any of the rest; many instances of names given to new-discovered countries shewing that the origin of such names is not always owing to reason, but often to chance or caprice.

The general division of Britain is into SCOTLAND, ENGLAND, and WALES; for a particular description and history of which, see these articles.

^a James VI. of Scotland succeeds to the crown of England.

In the year 1603, the kingdoms of Scotland and England fell under the dominion of one sovereign, by the accession of James VI. of Scotland to the throne of England also. He derived his title to the latter from being the grandson of Margaret eldest daughter to Henry VII. of that kingdom; and, on the failure of all the male line, his hereditary right remained incontestable. Queen Elizabeth, with her latest breath, had recognized him for her successor; so that few sovereigns ever ascended a throne with more approbation of their subjects, or greater hopes of a peaceable and happy reign.

Those hopes, however, were soon blasted; and the history of this monarch's reign consists of little else than a detail of disputes and contentions between him and his parliament. A particular and minute account of such transactions could afford very little entertainment; but it is of importance to know their origin, as they are to be reckoned the ultimate causes of those succeeding events which make so conspicuous a figure in the annals of Britain.

⁵ General state of the nation at that time.

In those barbarous ages which preceded the period we are now entering upon, the human mind, enervated by superstition, and obscured by ignorance of every art and science, seemed to have given up all pretensions to liberty either religious or civil. Unlimited and uncontrolled despotism prevailed every where; and though England suffered less in this respect than almost any other nation, the many examples of arbitrary power exerted by her sovereigns, queen Elizabeth herself, James's immediate predecessor, not excepted, shew that they were very far from being then a free people. An incontestable proof of this, and an evidence how little restraint at that time the people could lay upon the authority of the sovereign, is, that the proceedings of parliament were accounted, even by themselves, of so little consequence, that they were not at the trouble to keep journals of them. It was not till the year 1607, four years after the accession of James, that parliamentary journals were kept, at the motion of Sir Edwin Sandys, a member of great authority in the house.

⁶ Parliaments of little consideration.

The proceedings of the parliament being at that time of so little consequence, it is no wonder that the sessions

Britain.

were not regular, or that little attention was paid to the choice or continuance of the members. In the reign of Elizabeth, and her predecessors, the sessions of parliament did not continue above the twelfth part so long as the vacations. It was then usual, after parliaments had been prolonged beyond one session, for the chancellor to exert a discretionary authority of issuing new writs to supply the place of any members whom he judged incapable of attending, either on account of their employment, sickness, or other impediment. No practice could be more dangerous to liberty than this, as it gave the chancellor, and consequently the sovereign, an opportunity of garbling at pleasure the representatives of the nation: yet so little was liberty at that time understood, that the commons, of their own accord, without the least court influence or intrigue, and contrary to some former votes of their own, confirmed the chancellor's power in this respect in the 23^d of Elizabeth. Nor did they proceed any farther in the assertion of their privileges, than to vote, that "during the sitting of parliament there do not, at any time, any writ go out for the choosing or returning any member without the warrant of the house."

Towards the end of the 16th or beginning of the 17th century, a great revolution took place, though insensibly, throughout all Europe. Arts and sciences began to flourish, commerce and navigation were greatly extended, and learning of all kinds began to diffuse itself. By more enlarged views, the love of freedom began, in England especially, to take place in the breasts of most people of birth and education; and this was greatly promoted by an acquaintance with the ancient Greek and Latin historians. From the example of the republics of Greece and Rome, whose members had so often sacrificed their lives for the sake of liberty, a patriotic spirit began to arise; and a desire of circumfcribing the excessive prerogative and arbitrary proceedings of the crown began secretly to take place throughout the nation.

Nor was this desire unreasonable, or without a solid foundation. During the last years of queen Elizabeth's reign, the commerce, navigation, and number of seamen in England, had sensibly decayed. A remonstrance from the Trinity-house in 1602 says, that, since 1588, the number of seamen and shipping had decayed about a third part. Every species of domestic industry was fettered by monopolies; and by exclusive companies, which are only another species of monopoly, almost all foreign trade, except that to France, was brought into the hands of a few rapacious engrossers, and all prospect of future improvement in commerce was for ever sacrificed to a little temporary advantage of the sovereign. These companies, though arbitrarily erected, had carried their privileges so far, that almost all the commerce of England centered in London; the customs of that port alone amounted to 110,000*l.* a-year; while those of all the kingdom beside amounted only to 17,000*l.*; nay, the whole trade of London was confined to about 200 citizens, who were easily enabled, by combining among themselves, to fix whatever price they pleased both on the exports and imports of the nation. Besides this, the subjects were burdened by wardships and purveyances. The latter was an old prerogative of the crown, by which the officers of the household were empowered to take, without consent of the owners, pro-

⁷ Origin of the patriotic party.

⁸ Grievances of the nation at that time laboured under.

Britain.

provisions for the king's family, and carts and horses for the removal of his baggage, upon paying a stated price for them. The king had also a power of fending any person, without his consent, on whatever message he pleased; and thus he could easily force any individual to pay him whatever money he chose, rather than be sent out of the country on a disagreeable errand. Money extorted from individuals, by this or any other method, was called a *benevolence*.

These were some of the grievances under which the nation at this time laboured, and these the rising spirit of patriotism tended to redress. This disposition, however, the severe government of Elizabeth had confined within very narrow bounds: but when James succeeded to the throne; a foreign prince, less dreaded and less beloved; symptoms of a more free and independent genius immediately appeared. Happily James neither perceived the alteration, nor had sufficient capacity to check its early advances. He had established in his own mind a speculative system of absolute government, which few of his subjects, and none but traitors and rebels, he thought, would make any scruple to admit. He considered himself as intitled to equal prerogatives with other European sovereigns, not considering the military force with which their despotism was supported. The almost unlimited power which, for upwards of a century, had been exercised by the English sovereigns, he considered as due to royal birth and title, not to the prudence and spirit of those monarchs, or the conjunctures of the times. In his person, therefore, he imagined all legal power to be centered by an hereditary and a divine right; nay, so fully was he persuaded that he was the absolute proprietor of his subjects, that in his speech to the parliament in 1621, he told them, that he "wished them to have said that their privileges were derived from the grace and permission of him and his ancestors." And when the same parliament protested that "the liberties, franchises, privileges, and jurisdictions of parliament, are the ancient and undoubted birthright and inheritance of the subjects of England," he was so enraged, that sending for the journals of the commons, he with his own hand, before the council, tore out this protestation; and ordered his reasons to be inserted in the council-book.

Such were the opposite dispositions of the prince and parliament, at the commencement of the Scottish line; dispositions just beginning to exist and to appear in parliament, but thoroughly established, and openly avowed on the part of the king, throughout his whole reign.

The consequence of such opposite dispositions prevailing in the king and parliament was, that during this reign the prerogatives of the crown were violently and openly attacked; but the chief grounds of discontent were money, and religion. The king's high notions of the royal prerogative made him imagine he had a right to whatever sums he pleased to demand; and his profusion caused him to dissipate in a short time the scanty supplies he could extort from the parliament, who seem to have behaved as unreasonably on the one hand, as James himself did on the other. With regard to religious matters, the nation was at that time greatly infected with puritanism. Though the severities of Elizabeth had almost totally suppressed the Papists, it had been otherwise with the Puritans. So much had they increased by the very means which had diminished

the number of catholics, that no less than 750 clergymen of that persuasion signed a petition to James on his accession. They hoped that the king, having received his education in Scotland, and having always professed an attachment to the church established there, would at least abate the rigour of the laws enacted against the Puritans, if he did not shew them particular favour and encouragement. But in this they were mistaken. He had observed in their Scots brethren a violent turn towards republicanism, and a zealous attachment to civil liberty. In the capacities both of monarch and theologian, he had experienced the little compliance they were disposed to shew him. They controverted his commands; disputed his tenets; and to his face, before the whole people, censured his conduct and behaviour. This superiority assumed by the presbyterian clergy, the monarchic pride of James could never digest. Tho' he had been obliged while in Scotland to court their favour, he treasured up, on that account, the stronger resentment against them; and was determined to make them feel, in their turn, the weight of his authority. He therefore not only rejected the petition of the 750 clergymen abovementioned, but throughout his whole reign refused to relax in the least the severity of the laws against Protestant nonconformists, though very often petitioned in their favour by his parliaments.

The same principles which occasioned in James such an aversion to the Puritans, prompted him greatly to favour the episcopals, and even the Papists, as being greater friends to despotism. In his youth he had been suspected of a bias towards the religion of the latter; and when he ascended the throne of England, it is certain he often endeavoured to procure some mitigation of the laws against them, if not an absolute toleration. But in this he was as constantly opposed by the parliament; and indeed the strong inclination shewn by James to establish episcopacy throughout every corner of his dominions, tended very much to alienate the minds of the generality of his subjects, especially in Scotland, entirely from him.

In May 1617, the king set out for Scotland, expressly with the design of establishing episcopacy in that kingdom. He did not, however, propose to abolish presbytery entirely, and set up absolute episcopacy in its room. He designed to content himself with establishing the royal authority above the ecclesiastical, and introducing some ceremonies into the public worship, such as kneeling at the sacrament, private communion, private baptism, confirmation of children, and the observance of Christmas, &c. But as his design was fully seen from the beginning, every advance towards episcopacy gave the greatest discontent, and those trivial ceremonies were rejected as so many mortal sins.

At this time the power of the Scots clergy was exceedingly great; and the gloomy enthusiastic spirit with which they were actuated, prompted them to exercise it in such a manner as to make their tyranny insupportable to those who were of a different way of thinking from themselves. Every ecclesiastical court possessed the power of excommunication; which was then attended with some very serious temporal consequences, besides the spiritual ones which were supposed to flow from it. The person excommunicated was shunned by every one as profane and impious; his whole estate during his life-time, and all his moveables for-ever, were

forfeited to the crown. A sentence of excommunication was sometimes pronounced in a summary manner, by any ecclesiastical court however inferior, against any person, whether he lived within the bounds of their jurisdiction or not. And by this means, the whole tyranny of the inquisition, though without its orders, was introduced into Scotland. But the clergymen were not satisfied with this unbounded authority in ecclesiastical matters: they assumed a censorial power over every part of administration; and, in all their sermons, and even prayers, mingling politics with religion, they inculcated the most seditious and turbulent principles. One Black, a minister of St Andrews, went so far as to pronounce, in one of his sermons, that all kings were the devil's children; and in his prayer for the queen he used these words, "We must pray for her for the fashion's sake, but we have no cause: she will never do us any good." Another minister preaching in the principal church of that capital, said, that the king was possessed with a devil; and, that one devil being expelled, seven worse had entered in his place. To which he added, that the subjects might lawfully rise, and take the sword out of the hands of their sovereign.

15
Anecdotes
of some of
them.

16
The king's
design mis-
gives in
Scotland.

We can scarce wonder that James should be desirous of subjugating such rebellious and turbulent spirits as these; and, on the other hand, considering the extreme weakness of this monarch's understanding, and that he imagined himself able to manage not only furious religionists, but even the most powerful foreign nations, with no other weapon than mere argumentation, we can as little wonder at his want of success.—In short, so far was James from being able to establish his royal authority above the ecclesiastical, that he found himself unable to introduce a single ceremony. He returned therefore with the mortification not only of seeing his schemes entirely baffled with regard to Scotland, but of having disgusted even the few of that nation over whom religious prejudices did not prevail: for they, considering the ceremonies so much insisted on by the king as trivial and insignificant, could not help thinking the national honour sacrificed by a servile imitation of the modes of worship practised in England, and that their sovereign betrayed equal narrowness of mind, though in an opposite manner, with those he so much commended.

17
His bad suc-
cess against
the puritans
in England.

The like bad success attended James when he attempted more opposition to the puritanical innovations in England. He had observed in his progress through that kingdom, that a Judaical observance of the Sunday gained ground every day: and that by this means, under colour of religion, the people were debarred from such sports and recreations as contributed to their health as well as amusement. Imagining, therefore, that it would be easy to infuse cheerfulness into the dark spirit of devotion which then prevailed, he issued a proclamation to allow and encourage, after divine service, all kinds of lawful games and exercises; and this proclamation his subjects regarded as the utmost instance of profaneness and impiety. In 1620 a bill was brought in by the commons for the more strict observance of the Sunday, which they affected to call the *sabbath*. One Shepherd opposed this bill, objected to the appellation of *sabbath* as puritanical, and seems even to have justified sports on that day. For this he was expelled the house by the suggestion of Mr

Pym; and in the sentence pronounced against Shepherd, his offence is said to be *great, exorbitant, and unparalleled*.

This sketch, we hope, will be sufficient to give the reader a tolerable idea of the situation of affairs during the reign of James I. We now proceed to give an account of the few remarkable transactions which occurred in this period.

The first thing of any consequence was a conspiracy formed, the very year of the king's accession to the throne, to displace him, and bestow the kingdom on Arabella Stuart, a near relation of James's, and equally descended from Henry VII. With regard to this conspiracy every thing remains still mysterious, as it was at the time when the conspiracy itself was discovered. What renders it remarkable is the concern Sir Walter Raleigh was said to have in it; for which he was tried, condemned without sufficient proof, suffered 13 years imprisonment in the tower, and was afterwards executed out of complaisance to the Spaniards.

18
Sir Walter
Raleigh's
conspiracy.

* See Ra-
leigh.

In 1605 was discovered the famous *gunpowder treason*, the anniversary of which discovery hath ever afterwards been celebrated with rejoicings. Its origin was as follows. On the accession of James, great expectations had been formed by the catholics that he would prove favourable to them, both as that was the religion of his mother, and that he himself had been suspected of a bias towards it in his youth. It is even pretended that he had entered into positive engagements to grant them a toleration as soon as he should mount the throne of England. Here, however, they found their hopes built on a false foundation. James, on all occasions, expressed his intention of executing strictly the laws enacted against them, and of persevering in all the rigorous measures of Queen Elizabeth. A plan of revenge was first thought of by one Cateby, a gentleman of good parts, and of an ancient family. He communicated his mind to Percy, a descendant of the house of Northumberland. The latter proposed to assassinate the king; but this seemed to Cateby very far from being adequate to their purpose. He told Percy, that the king would be succeeded by his children, who would also inherit his maxims of government. He told him, that, even though the whole royal family were destroyed, the parliament, nobility, and gentry, who were all infected with the same heresy, would raise another Protestant prince to the throne. "To serve any good purpose (says he), we must destroy, at one blow, the king, the royal family, the lords and commons; and bury all our enemies in one common ruin. Happily they are all assembled on the first meeting of parliament; and afford us the opportunity of glorious and useful vengeance. Great preparations will not be requisite. A few of us may run a mine below the hall, in which they meet; and chusing the very moment when the king harangues both the houses, consign over to destruction those determined foes to all piety and religion. Mean while, we ourselves standing aloof, safe and unsuspected, shall triumph in being the instruments of divine wrath, and shall behold with pleasure those sacrilegious walls, in which were passed the edicts for proscribing our church and butchering her children, tossed into a thousand fragments; while their impious inhabitants, meditating perhaps still new persecutions against us, pass from flames

the plot.

flames above to flames below, there for ever to endure the torments due to their offences."

This terrible scheme being approved of, it was resolved to communicate it to a few more. One Thomas Winter was sent over to Flanders in quest of Fawkes, an officer in the Spanish service of approved zeal and courage. All the conspirators were bound by the most solemn oaths, accompanied with the sacrament; and to such a degree had superstition effaced every principle of humanity from their minds, that not one of them ever entertained the smallest compunction for the cruel massacre they were going to commit. Some indeed were startled at the thoughts of destroying a number of catholics who must necessarily be present as spectators, or attendants on the king, or as having seats in the house of peers. But Tesmond a jesuit, and Garnet superior of that order in England, removed those scruples, by shewing that the interest of religion required in this case the sacrifice of the innocent with the guilty.

This happened in the spring and summer of 1604; when the conspirators also hired a house in Percy's name, adjoining to that in which the parliament was to assemble. Towards the end of that year they began to pierce through the wall of the house, in order to get in below that where the parliament was to sit. The wall was three yards thick, and consequently occasioned a great deal of labour. At length, however, they approached the other side, but were then startled by a noise for which they could not well account. Upon inquiry, they found that it came from a vault below the house of lords; that a magazine of coals had been kept there; and that the coals were then selling off, after which the vault would be let to the highest bidder. Upon this the vault was immediately hired by Percy; 36 barrels of powder lodged in it; the whole covered up with faggots and billets; the doors of the cellar boldly flung open; and every body admitted, as if it contained nothing dangerous.

Being now, as they thought, assured of success, the conspirators began to plan the remaining part of their enterprise. The king, the queen, and prince Henry, were expected to be present at the opening of the parliament. The duke, by reason of his tender age, would be absent, and it was resolved that Percy should seize or murder him. The princess Elizabeth, likewise a child, was kept at Lord Harrington's house in Warwickshire; and some others of the conspirators engaged to assemble their friends on pretence of a hunting match, when they were to seize that princess, and immediately proclaim her queen. The day so long wished for at last approached; the dreadful secret, tho' communicated to more than 20 persons, had been religiously kept for near a year and an half; and nothing could be foreseen which could possibly prevent the success of their design. Ten days before the meeting of parliament, however, lord Montague, a catholic son to lord Morley, received the following letter, which had been delivered to his servant by an unknown hand. "My lord, out of the love I bear to some of your friends, I have a care of your preservation. Therefore I would advise you, as you tender your life, to devise some excuse to shift off your attendance on this parliament. For God and man have determined to punish the wickedness of this time. And think not slightly of this advertisement; but retire yourself into the country,

where you may expect the event in safety. For, tho' there be no appearance of any stir, yet, I say, they shall receive a terrible blow this parliament; and yet they shall not see who hurts them. This counsel is not to be condemned, because it may do you good, and can do you no harm: for the danger is over as soon as you have burned this letter. And I hope God will give you the grace to make good use of it, to whose holy protection I commend you."—Though Montague imagined this letter to be only a ridiculous artifice to frighten him, he immediately carried it to lord Salisbury, secretary of state; who laid it before the king on his arrival in town a few days after.

The king looked upon the letter in a more serious light. From the manner in which it was wrote he concluded that some design was forming to blow up the parliament-house with gunpowder, and it was thought advisable to search the vaults below. The lord chamberlain, to whom this charge belonged, purposely delayed the search till the day before the meeting of parliament. He remarked those great piles of wood and faggots which lay in the vault under the upper house; and casting his eye upon Fawkes, who stood in a corner and passed himself for Percy's servant, he took notice of that daring and determined courage which was conspicuous in his face, and so much distinguished this conspirator even amongst the other heroes in villany that were concerned in the scheme. Such a quantity of fuel, also, for one who lived so little in the town as Percy, appeared somewhat extraordinary; and, upon comparing all circumstances, it was resolved to make a further search. About midnight, Sir Thomas Knevet, a justice of peace, was sent with proper attendants; and before the door of the vault, finding Fawkes, who had just finished all his preparations, he immediately seized him, and, turning over the faggots, discovered the powder. The matches and every thing proper for setting fire to the train were taken in Fawkes's pocket; who seeing now no refuge but in boldness and despair, expressed the utmost regret that he had lost the opportunity of firing the powder at once, and of sweetening his own death by that of his enemies. For two or three days he displayed the same obdurate intrepidity; but, being confined in the tower, and the rack just shewn to him, his courage at last failed, and he made a full discovery of all the conspirators.

Catesby, Percy, and the other criminals, on hearing that Fawkes was arrested, hurried away to Warwickshire; where Sir Edward Digby, imagining that his confederates had succeeded, was already in arms, to seize the princess Elizabeth. She had escaped into Coventry; and they were obliged to put themselves in a posture of defence against the country-people, who were raised from all quarters and armed by the sheriffs. The conspirators, with all their attendants, never exceeded the number of 80 persons; and being surrounded on every side, could no longer have any hope either of prevailing or escaping. Having therefore confessed themselves, and received absolution, they boldly prepared for death, and resolved to sell their lives as dear as possible. But even this miserable consolation was denied them. Some of their powder took fire, and disabled them from defending themselves. The people then rushed in upon them. Percy and Catesby

tesby were killed with one shot. Digby, Rookwood, Winter, and others, being taken prisoners, were tried, confessed their guilt, and died, as well as Garnet, by the hands of the common executioner. The lords Stourton and Mordaunt, two catholics, were fined, the former of 4000*l.* the latter of 10,000*l.* by the star-chamber; because their absence from parliament had occasioned a suspicion of their being made acquainted with the conspiracy. The earl of Northumberland was fined 30,000*l.* and detained several years a prisoner in the tower; because, not to mention other grounds of suspicion, he had admitted Percy into the number of gentlemen pensioners, without his taking the requisite oaths.

25
James's wife
conduct in
the legisla-
tion of Ire-
land.

In 1612, James appears in his most advantageous point of view, namely, as legislator of Ireland, and the person who undertook to civilize the barbarous inhabitants of that kingdom, and to render their subjection durable and useful to the crown of England. In this work, James proceeded by a steady, regular, and well-concerted plan. He began with abolishing the ancient Irish customs which supplied the place of laws, and which were exceedingly barbarous and absurd. By the Brehon law, every crime however enormous was punished not with death, but by a fine. Murder itself was compensated in this way. Every one had a value affixed to him, called his *eric*; and whoever was able to pay this, might kill him when he pleased. As for such slight offences as oppression, extortion, or other things of that nature, no penalty was affixed to them, nor could any redress for them ever be obtained. By the custom of *gavelkind*, upon the death of any person, his land was divided among all the males of the sept or family, both bastard and legitimate: and after partition made, if any of the sept died, his portion was not shared out among his sons; but the chieftain at his discretion made a new partition of all the lands belonging to that sept, and gave every one his share: as no man, by reason of this custom, enjoyed the fixed property of any land; to build, cultivate, or improve, must have been too much lost labour. These chieftains were established by election, or, more properly speaking, by force and violence. Their authority was absolute; and, notwithstanding certain lands were assigned to the office, its chief profit resulted from exactions, dues, assessments, for which there was no fixed law, and which were levied at pleasure.

After abolishing these customs, and substituting English law in their place; James having taken all the natives under his protection, and declared them free citizens, proceeded to govern them by a regular administration, military as well as civil. A sufficient army was maintained, its discipline inspected, and its pay transmitted from England, in order to prevent the soldiery from preying upon the country, as had been usual in former reigns. When Odoghartie raised an insurrection, a reinforcement was sent over, and the rebellion immediately extinguished. All minds being first quieted by an universal indemnity, circuits were established, justice administered, and crimes of every kind severely punished. As the Irish had been universally engaged in a rebellion against Elizabeth, a resignation of all the rights formerly granted them to separate jurisdictions was rigorously exacted; a resignation of private estates was even required; and when

they were restored, the proprietors received them under such conditions as might prevent all future tyranny and oppression over the common people. The whole province of Ulster having fallen to the crown by the attainer of rebels, a company was established in London for planting new colonies in that fertile country. The property was divided into moderate shares, the largest not exceeding 2000 acres: Tenants were brought over from England and Scotland: The Irish were removed from the hills and fastnesses, and settled in the open country: Husbandry and the arts were taught them; and by these means Ulster, from being the most wild and disorderly province in Ireland, soon became the best cultivated and most civilized.

This year was also remarkable for the death of Henry prince of Wales, who died suddenly on the 6th of November, not without strong suspicions of poison, for which the king himself was blamed. On opening his body, however, no symptoms of poison appeared; but his death diffused an universal grief throughout the nation, he being reckoned a prince of extraordinary accomplishments.

26
Death of
Henry
prince of
Wales.

The marriage of the princess Elizabeth with Frederic elector palatine, which was celebrated February 14th 1613, served to dissipate the grief which had arisen on account of prince Henry's death. But this marriage, in the event, proved unhappy to the king as well as his son-in-law. The elector, trusting to so great an alliance, engaged in enterprizes beyond his strength; and James, not being able, and indeed perhaps not willing, to assist him in his distress, lost entirely what remained of the affections of his people.

27
Marriage of the princess
Elizabeth
with the e-
lector pala-
tine.

These had consequences did not begin to appear till the year 1619. At that time the states of Bohemia having taken arms against the emperor Matthias, in defence of the Protestant religion, and continued their revolt against his successor Ferdinand II. and being alarmed at his mighty preparations against them, made an offer of their crown to the elector palatine. To this they were induced by the greatness of his connections, as being son-in-law to the king of England, and nephew to prince Maurice, whose authority in the United Provinces was almost absolute; and the young palatine stimulated by ambition, without consulting either James or Maurice, whose opposition he foresaw, immediately accepted the offer, and marched all his forces into Bohemia, in support of his new subjects.

28
The elector
chosen king
of Bohemia.

The affairs of the new king were not long of coming to an unfortunate crisis. It was known almost at one time in England, that Frederic being defeated in the great and decisive battle of Prague, had fled with his family into Holland; and that Spinola the Spanish general had invaded the palatinate, where meeting with little resistance, except from one body of 2400 Englishmen commanded by the brave Sir Horace Vere, had in a little time reduced almost the whole principality. In 1621, the ban of the empire was published against the unfortunate elector, and the execution of it was committed to the duke of Bavaria. The upper palatinate was in a little time conquered by that prince; and measures were taking in the empire for bestowing on him the electoral dignity which the palatine was deposed. Frederic was now obliged to live with his numerous family, in poverty and distress, either in Holland, or at Sedan, with his uncle

Britain. the duke of Bouillon; and the new conquests of the catholics throughout all Germany were attended with persecutions against the Protestants.

30 English in-
fist for a war
with the
Austria.
31 His ridicu-
lous motives
for not af-
flicting his
son-in-law.
At this news the religious zeal of the English was inflamed to the highest degree; and they would have plunged headlong into a war with the house of Austria, without reflecting in the least on the consequences that might ensue. The sufferings of their Protestant brethren in Germany were the only objects of consideration, and the neutrality and inactive spirit shewn by James were loudly exclaimed against. But though James might have defended his pacific measures by very plausible arguments, it is certain that some of his motives were the most ridiculous that can be imagined.

Such was the opinion that he himself entertained of his own wisdom, that he imagined himself capable of disarming hostile nations by dint of argument; and that the whole power of Austria, though not awed by the power of England, would submit to his arbitration, merely out of respect to his virtue and moderation.— So much also he was wedded to his opinion concerning the prerogative of kings, that he imagined, wherever there was a contention between any sovereign and his subjects, the latter behoved always to be in the wrong; and for this reason, from the very first he had denied his son-in-law the title of *king of Bohemia*, and forbade him to be prayed for in the churches under that appellation. Besides these reasons, James was on another account extremely averse to come to a rupture with Spain. He had entertained an opinion peculiar to himself, which was, that any alliance below that of a king was unworthy a prince of Wales; and he never would allow any prince's but a daughter of France or Spain to be mentioned as a match for his son. This piece of pride, which really implied meanness, as if he could have received honour from any alliance, gave Spain an opportunity of managing this monarch in his most important concerns. With a view to engage him to a neutrality with regard to the succession of Cleves, the eldest daughter of the king of Spain had been indirectly offered during the life of prince Henry. The bait, however, did not then take; James, in consequence of his alliance with the Dutch, marched 4000 men to the assistance of the Protestants, by which means the succession was secured to the Protestant line. In 1618, Gondomar the Spanish ambassador made offer of the king's second daughter to prince Charles; and, that he might render the temptation irresistible to the necessitous James, gave hopes of an immense fortune that should attend the prince's. Upon this match James had built great hopes, not only of relieving his own necessities, but of recovering the palatinate for his son-in-law; which last, he imagined, might be procured from the mere motive of friendship and personal attachment.

32 He is defi-
rous of a
Spanish
match for
his son.
33 Commons
averse to
this mea-
sure.
34 They frame
a remon-
strance a-
gainst it.
This last step was equally disagreeable to the commons with the rest; and, joined to the other pieces of James's conduct, at last blew into a flame the contention which had so long subsisted between their sovereign and them. On the 14th of November 1621, the commons framed a remonstrance which they intended to carry to the king. They represented, that the enormous growth of the Austrian power threatened the liberties of Europe; that the progress of the Catholic religion in England bred the most melancholy appre-

hensions lest it should again acquire an ascendancy in the kingdom; that the indulgence of his majesty towards the professors of that religion had encouraged their insolence and temerity; that the unconquered conquests made by the Austrian family in Germany raised mighty expectations in the English Papists; but above all, that the Spanish match elevated them so far as to hope for an entire toleration, if not a final re-establishment, of their religion. They therefore intreated his majesty, that he would immediately undertake the defence of the palatine, and maintain it by force of arms; that he would turn his sword against Spain, whose armies and treasures were the chief support of the Catholic interest in Europe; that he would enter into no negotiation for the marriage of his son but with a Protestant prince; that the children of Popish recusants should be taken from their parents, and committed to the care of Protestant teachers and school-masters; and that the fines and confiscations to which the Catholics by law were liable, should be levied with the utmost severity.

35 Contention
between the
king and
commons.
The king, who was then at Newmarket, hearing of the intended remonstrance, wrote a letter to the speaker, in which he sharply rebuked the house for debating on matters far above their reach and capacity; and he strictly forbade them to meddle with any thing that regarded his government, or deep matters of state, and especially not to touch on his son's marriage with the Spanish prince. Upon this the commons framed a new remonstrance, in which they asserted their right of debating on all matters of government, and that they possessed entire freedom of speech in their debates. The king replied, that their remonstrance was more like a denunciation of war, than an address of dutiful subjects; that their pretension to inquire into all state affairs without exception, was such a plenipotency as none of their ancestors, even during the reign of the weakest princes, had ever pretended to; that public transactions depended on a complication of views and intelligence, with which they were entirely unacquainted; that they could not better shew their wisdom, as well as duty, than by keeping within their proper sphere; and that in any business which depended on his prerogative, they had no title to interpose with their advice, unless when he pleased to ask it, &c. The commons in return framed the protestation already mentioned, which the king tore out of their journals, and soon after dissolved the parliament. The leading members of the house, Sir Edward Coke and Sir Robert Phillips, were committed to the tower; three others, Selden, Pym, and Mallory, to other prisons; and, as a lighter punishment, some others were sent into Ireland to execute the king's business. Sir John Savile, however, a powerful man in the house of commons, and a zealous opposer of the court, was made controller of the household, a privy councillor, and soon after a baron. This event is memorable; as being the first instance in the English history, of any king's advancing a man on account of parliamentary interest, and of opposition to his measures.

36 Origin of
the factions
of whig and
tory.
This breach between the king and parliament soon made politics become a general subject of discourse, and every man began to indulge himself in reasonings and inquiries concerning matters of state; and the factions which commenced in parliament were propagated through-

Britain.

throughout the nation. In vain did James by reiterated proclamations forbid discourses of this kind. Such proclamations, if they had any effect, served rather to inflame the curiosity of the public. In every company or society the late transactions became the subject of argument and debate; some taking the side of monarchy, others of liberty; and this was the origin of the two parties since known by the names of *Whigs* and *Tories*.

37
James gains
the favour
of the court
of Spain.

For five years, James continued the dupe of the court of Spain. Though firmly resolved to contract no alliance with a heretic, the king of Spain had continued to procrastinate, and invent one excuse after another, while he pretended to be very willing to conclude the match. At last the king of England, finding out what was really the matter, resolved to remove that obstacle if possible. He issued public orders for discharging all Popish recusants who were imprisoned; and it was daily apprehended that he would forbid, for the future, the execution of the penal laws against them. For this conduct he was obliged to apologize, and even pretend that it was done in order to procure from foreign princes a toleration for the Protestants; the severity of the English laws against catholics, he said, having been urged as a reason against shewing any favour to Protestants residing in catholic kingdoms.

These concessions in favour of the catholics, however ill relished by his subjects, at last obtained James's end with regard to the marriage. The earl of Bristol, ambassador at the court of Spain, a minister of vigilance and penetration, and who had formerly opposed the alliance with catholics, being now fully convinced of the Spanish sincerity, was ready to congratulate the king on the completion of his projects. The Spanish princess is represented as very accomplished; she was to bring with her a fortune of 600,000*l.*; and, what was more, not only Bristol considered this match as an infallible prognostic of the palatine's restoration, but the Spaniards themselves did the same. All things being therefore agreed upon between the parties, nothing was wanting but the dispensation from Rome, which might be considered as a matter of mere formality. The king exulted in his pacific counsels, and boasted of his superior sagacity and penetration; when all his flattering prospects were blasted by the temerity of the duke of Buckingham, who governed both court and nation with almost unlimited sway.

This nobleman had suddenly been raised to the highest honours. Though possessed of some accomplishments of a courtier, he was utterly devoid of every talent of a minister; but at once partook of the insolence which attends a fortune newly acquired, and the impetuosity which belongs to persons born in high situations, and unacquainted with opposition. Among those who had experienced the arrogance of this overgrown favourite, the prince of Wales himself had not been entirely spared; and a great coldness, if not enmity, had for that reason taken place between them. Buckingham, being desirous of putting an end to this coldness, and at the same time envious of the great reputation of the earl of Bristol, persuaded the prince to undertake a journey to Madrid; which, he said, would be an unexpected gallantry; would equal all the fictions of Spanish romance; and, suiting the amorous and enterprising character of that nation, must immediately introduce him to the princess under the agreeable character of a devoted lo-

ver and daring adventurer. Little persuasion was necessary to prevail with prince Charles to undertake this journey; and the impetuosity of Buckingham having extorted a consent from James, our two adventurers set out, prince Charles as the knight-errant, and Buckingham as the squire. They travelled through France in disguise, assuming the names of Jack and Tom Smith. They went to a ball at Paris, where the prince first saw the princess Henrietta whom he afterwards married, who was then in the bloom of youth and beauty, and with whom the novellists of that time say he then fell in love. On their arrival at Madrid, every body was surprised by a step so little usual among great princes. The Spanish monarch made Charles a visit, expressed the utmost gratitude for the confidence he reposed in him, and made warm protestations of a correspondent confidence and friendship. He gave him a golden key which opened all his apartments, that the prince might, without any introduction, have access to him at all hours: he took the left hand of him on every occasion, except in the apartments assigned to Charles; for there, he said, the prince was at home: Charles was introduced into the palace with the same pomp and ceremony which attend the kings of Spain on their coronation: the council received public orders to obey him as the king himself: Olivarez too, the prime minister, though a grandee of Spain, who has the right of being covered before his own king, would not put on his hat in the prince's presence: all the prisons of Spain were thrown open, and all the prisoners received their freedom, as if an event the most honourable and most fortunate had happened to the monarchy; and every sumptuary law with regard to apparel was suspended during prince Charles's residence in Spain. The infanta, however, was only shown to her lover in public; the Spanish ideas of decency being so strict, as not to allow any farther intercourse till the arrival of the dispensation. The point of honour was carried so far by these generous people, that no attempt was made, on account of the advantage they had acquired by having the prince of Wales in their power, to impose any harder conditions of treaty: their pious zeal only prompted them on one occasion to desire more concessions in the religious articles; but, on the opposition of Bristol, they immediately desisted. The Pope, however, hearing of Charles's arrival in Madrid, tacked some new clauses to the dispensation; and it became necessary to transmit the articles to London, that the king might ratify them. This treaty, which was made public, consisted of several articles, chiefly regarding the exercise of the catholic religion by the infanta; and, among these, nothing could reasonably be found fault with, except one article, in which the king promised that the children should be educated by the princess till they were ten years of age; which undoubtedly was insisted upon with a view of seasoning their minds with catholic principles. But, besides this public treaty, there were some private articles sworn to by James, which could not have been made public without grievous murmurs. A suspension of the penal laws against the English catholics was promised, as likewise a repeal of them in parliament, and a toleration for the exercise of that religion in private houses. Meanwhile Gregory XV. who granted the dispensation, died; and Urban VIII. was chosen in his place. Upon this event, the nuncio refused to deliver the dispensation

fation till it should be renewed by Urban. This the crafty pontiff delayed, in hopes that, during the prince's residence in Spain, some expedient might be fallen upon to effect his conversion. The king of England, as well as the prince, became impatient: but, on the first hint, Charles obtained leave to return; and Philip graced his departure with all the circumstances of civility and respect which had attended his arrival. He even erected a pillar on the spot where they took leave of each other, as a monument of mutual friendship; and the prince, having sworn to the observance of all the articles, embarked on board the English fleet at St Andro.

The modest, reserved, and decent behaviour of Charles, together with his unparalleled confidence in them, and the romantic gallantry he had practised with regard to their princesses, had endeared him to the whole court of Madrid. But in the same proportion that Charles was beloved and esteemed, was Buckingham despised and hated. His fallies of passion; his indecent freedoms with the prince; his dissolute pleasures; his arrogant impetuous temper, which he neither could nor would disguise; were to the Spaniards the objects of peculiar aversion. They lamented the infant's fate, who must be approached by a man whose temerity seemed to respect no laws divine or human. Buckingham, on the other hand, sensible how odious he was become to the Spaniards, and dreading the influence which that nation would naturally acquire after the arrival of the infant, resolved to employ all his credit in order to prevent the marriage. By what arguments he could prevail on the prince to offer such an insult to the Spanish nation, from whom he had received such generous treatment; by what colours he could disguise the ingratitude and imprudence of such a measure; these are totally unknown to us: certain it is, however, that when the prince left Madrid, he was firmly determined, in opposition to his most solemn promises, to break off the treaty with Spain. On their arrival at London, therefore, the prince and Buckingham assumed the entire direction of the negotiation; and it was their business to seek for pretences by which they could give a colour to their intended breach of treaty. At last, after many fruitless artifices were employed to delay or prevent the espousals, Bristol received positive orders not to deliver the proxy which had been left in his hands, or to finish the marriage, till security was given for the full restitution of the palatinate. Philip undertook this language: but being determined to throw the whole blame of the rupture on the English, he delivered into Bristol's hand a written promise, by which he bound himself to procure the restoration of the palatinate either by persuasion or by every other possible means; and when he found that this concession gave no satisfaction, he ordered the infant to lay aside the title of *princess of Wales*, which she bore after the arrival of the dispensation from Rome, and to drop the study of the English language; and as he knew that such rash counsels as now governed the court of England would not stop at the breach of the marriage-treaty, he immediately ordered preparations for war to be made throughout all his dominions.

former. However, the king had not the same allurances in prosecuting this match as the former, the portion promised him being much smaller; but, willing that his son should not be altogether disappointed of a bride, as the king of France demanded only the same terms that had been offered to the court of Spain, James thought proper to comply. In an article of this treaty of marriage, it was stipulated, that the education of the children till the age of 13 should belong to the mother; and this probably gave that turn towards popery which has since proved the ruin of the unfortunate family of Stewart.

James now, being deprived of every other hope of relieving his son-in-law but by force of arms, declared war against Spain and the emperor, for the recovery of the palatinate; 6000 men were sent over into Holland to assist prince Maurice in his schemes against those powers; the people were every where elated at the courage of their king, and were satisfied with any war which was to exterminate the Papists. This army was followed by another consisting of 12,000 men, commanded by count Mansfeldt; and the court of France promised its assistance. But the English were disappointed in all their views: the troops being embarked at Dover, upon sailing to Calais, found no orders for their admission. After waiting for some time, they were obliged to sail towards Zealand, where no proper measures were yet consulted for their disembarkation. Mean while, a pestilential distemper crept in among them, so long cooped up in narrow vessels: half the army died while on board; and the other half, weakened by sickness, appeared too small a body to march into the palatinate; and thus ended this ill-concerted and fruitless expedition. Whether this misfortune had any effect on the king's constitution or not, is uncertain; but he was soon after seized with a tertian ague, which put an end to his life on the 27th of March 1625, after having lived 59 years, and reigned over England 22, and over Scotland almost as long as he had lived.

James was succeeded by his son Charles I. who ascended the throne amidst the highest praises and caresses of his subjects for what was perhaps the most blame-worthy action of his life, namely, his breaking off the match with the Spanish princesses, and procuring the rupture with the house of Austria. Being young and unexperienced, he regarded these praises as sincere; and therefore was so impatient to assemble the great council of the nation, that he would gladly, for the sake of dispatch, have called together the same parliament which sat under his father, and which lay at that time under prorogation. But being told that such a measure would appear unusual, he issued writs for summoning a new parliament on the 7th of May; and it was not without regret that the arrival of the princess Henrietta, whom he had espoused by proxy, obliged him to delay, by repeated prorogations, their meeting till the 18th of June, when they assembled at Westminster for the dispatch of business.

Charles inherited from his father, great distrests for money, very high notions of the royal prerogative, and a violent attachment to episcopacy. As to his character, he seems to have been obstinate, though not resolute; and therefore, though it was scarce ever possible to make him give up his point, he never could carry on his designs with that spirit which was necessary for

their success. In other respects, he appears to have possessed every virtue requisite to constitute the character of a good man. At present believing his subjects to be in perfect friendship with him as he was with them, he resolved that their bounty to him should be entirely unasked, and the genuine effect of mutual confidence and regard. Accordingly, his discourse to the parliament was full of simplicity and cordiality; he lightly mentioned the occasion he had for supply. He employed no intrigue to influence the suffrages of the members. He would not even allow the officers of the crown, who had seats in the house, to mention any particular sum which he had occasion for; but trusted entirely to the wisdom and affection of his parliament, who perfectly well knew his circumstances.

It is almost impossible to read without indignation an account of the return made by the commons to this generous behaviour of their sovereign. They knew, that all the money granted by the last parliament had been expended on military and naval preparations; and that great anticipations were likewise made on the revenues of the crown. They were not ignorant that Charles was loaded with a debt contracted by his father, who had borrowed money both from foreign princes, and from his own subjects. They had learned by experience, that the public revenues could with difficulty maintain the dignity of the crown, even under the ordinary charges of government. They were sensible that the present war was, very lately, the result of their own importunate applications and intreaties, and that they had solemnly engaged to support their sovereign in the management of it. They were acquainted with the difficulty of military enterprizes directed against the whole house of Austria; against the king of Spain, possessed of the greatest riches and most extensive dominions of any prince in Europe; against the emperor Ferdinand, hitherto the most fortunate monarch of the age, who had subdued and astonished Germany by the rapidity of his victories. Deep impressions they saw must be made by the British sword, and a vigorous offensive war be waged against these mighty potentates, ere they would resign the palatinate which they had now fully subdued, and which they held in secure possession by its being surrounded with all their other territories. To answer, therefore, all these great and important ends; to satisfy their young king in the first request he made them; to prove their sense of the many royal virtues, particularly economy, with which Charles was endued; the commons thought proper to confer on the king a supply of 112,000 *l.* To search for the reasons of such an extravagant piece of conduct would be needless; it is impossible they could be good.

It is not to be supposed that Charles, or any person of common sense, could be insensible of such treatment as this; he behaved, however, with great moderation. He represented in the most explicit manner the necessity there was for a large supply: he even defended to use intreaties: he said that this request was the first he had ever made them; that he was young, and in the commencement of his reign; and if he now met with kind and dutiful usage, it would endear him to the use of parliaments, and would for-ever preserve an entire harmony between him and his people.—To these reasons and intreaties, the commons remained inexorable; they

even refused the addition of two fifteenths to the former supply. Instead of this, they renewed their ridiculous complaints against the growth of popery, which was now their only grievance. They shewed their intolerant spirit by demanding a strict execution of the penal laws against the catholics; and remonstrated against some late pardons granted to priests. They attacked Montague, one of the king's chaplains, on account of a moderate book which he had lately composed, and which, to their great disgust, saved virtuous catholics as well as other Christians from eternal torments. Charles gave them a gracious and compliant answer; but firmly resolved to abate somewhat of the rigorous laws against that unfortunate party, which his engagements with France absolutely required. No measure, however, throughout the whole reign of this prince, was more disgusting to his bigoted subjects, or by its consequences more fatal to himself, than this resolution. The Puritans had continued to gain ground during the whole reign of James, and now formed the majority of the house of commons; in consequence of which, petitions were presented to the king for replacing such *able* clergymen as had been silenced for want of conformity to the ceremonies. They also enacted laws for the strict observance of Sunday, which they affected to call the *sabbath*, and which they sanctified with the most melancholy indolence; and it is worthy of notice, that the different appellations of *Sunday* and *sabbath* were at that time known symbols of the different parties.—In consequence of this behaviour in Charles's first parliament, it was dissolved on the 12th of August 1625, and a new one called on Feb. 6th 1626.

During this interval Charles had been obliged to borrow from his subjects on privy-seals; the advantage of which was but a small compensation for the disgust it occasioned. By means, however, of that supply, and some other expedients, he was enabled to equip his fleet, tho' with difficulty. It was designed against Spain, but performed nothing worth notice, and its bad success increased the clamours against the court.

Charles's second parliament immediately adopted the same views with the former; however, they voted him a supply of three subsidies (168,000 *l.*) and three fifteenths; but the passing this vote into a law was reserved until the end of the session, that in the mean time they might have an opportunity of forcing the king to make what concessions they pleased. This harsh and undutiful conduct was greatly resented by Charles; but he found himself obliged to submit, and wait the event with patience. In the mean time they attacked the duke of Buckingham, who was become generally obnoxious; and he was also impeached by the earl of Britton, on account of his conduct with regard to the Spanish negotiation. The earl's impeachment, however, was entirely overlooked, and the commons were able to prove nothing otherwise of any consequence against him. The king imagining that Buckingham's greatest crime was the having been so much in favour with his sovereign, commanded the house expressly not to meddle with his minister and servant, but to finish in a few days the bill they had begun for the subsidies; otherwise they must expect to sit no longer.

Suggestions of this kind had a bad effect; and when the king proceeded further to throw into prison two members

Britain.

members of the house who had managed the impeachment against Buckingham, the commons declared that they would proceed no further in business till they had satisfaction in their privileges. Charles alleged as the reason of this measure, certain seditious expressions, which, he said, had, in their accusation of the duke, dropped from these members. Upon inquiry it appeared that no such expressions had been used, and the members were accordingly released. Soon after, the house of lords, moved by the example of the commons, claimed liberty for the earl of Arundel, who had been lately confined in the tower; and after many fruitless evasions the king was obliged, though somewhat ungracefully, to comply.

The next attack made by the commons would have proved decisive, had it succeeded, and would have reduced the king to an absolute dependence on his parliament. They were preparing a remonstrance against the levying of tonnage and poundage without consent of parliament. This article, together with the new impositions laid on merchandize by James, constituted near one half of the crown revenues; and after having gained this point, they were to petition the king, which then would have been the same thing with commanding him, to remove Buckingham from his presence and councils. The king, however, being alarmed at the yoke they were preparing for him, dissolved his parliament a second time, June 15th 1626.

Charles having thus made such a breach with his parliament as there was no hopes of repairing, was obliged to have recourse to the exercise of every branch of his prerogative in order to supply himself with money. A commission was openly granted to compound with the catholics, and agree for dispensing with the penal laws enacted against them; and by this expedient the king, indeed, filled his coffers, but gave universal disgust to his subjects. From the nobility he desired assistance: from the city he required a loan of 100,000 l. The former contributed slowly: but the latter, covering themselves under many pretences and excuses, gave at last a flat denial. In order to equip a fleet, a distribution by order of the council was made to all the maritime towns; and each of them was required, with the assistance of the adjacent counties, to arm as many vessels as were appointed them. The city of London was rated at 20 ships: and this is the first appearance, in Charles's reign, of ship-money; a taxation which had once been imposed by Elizabeth, but which, when carried some steps farther by Charles, produced the most violent discontents.—These methods of supply were carried on with some moderation, till news arrived of the king of Denmark being totally defeated by count Tilly the Imperial general; but money then becoming more than ever necessary, it was suggested in council, that the most speedy, equal, and convenient method of supply was by a general loan from the subject, according as every man was assessed in the rolls of the last subsidy. That precise sum was required which each would have paid, had the vote of four subsidies been passed into a law: care, however, was taken, that the sums thus exacted were not to be called subsidies, but loans; but it was impossible to avoid observing, that thus the liberty of the subject was entirely destroyed, and all parliaments rendered at once superfluous.

Many people throughout England refused these

loans, and some were even active in encouraging their neighbours to insist upon their common rights and privileges. By warrant of the council, these were thrown into prison. Most of them patiently submitted to confinement, or applied by petition to the king, who commonly released them. Five gentlemen, however, Sir Thomas Darnel, Sir John Corbet, Sir Walter Earl, Sir John Heweningham, and Sir Edmund Hamden, demanded release, not as a favour from the court, but as their due by the laws of their country. No particular cause was assigned for their commitment. The special command of the king and council alone was pleaded. And it was alleged, that by law this was not sufficient reason for refusing bail or release to the prisoners. The question was brought to a solemn trial before the court of king's bench; and the whole kingdom was attentive to the issue of the cause. By the debates on this subject it appeared, that personal liberty had been secured by no less than six different statutes, and by an article in magna charta itself. It appeared, that, in times of turbulence and sedition, the princes infringed upon these laws; and of this also many examples were produced. The difficulty then lay to determine when such violent measures were necessary; but of that the court pretended to be the supreme judge. As it was legal, therefore, that these five gentlemen should plead the statute, by which they might demand bail, so it was expedient in the court to remand them to prison, without determining on the necessity of taking bail for the present. This was a cruel evasion of justice; and, in fact, satisfied neither party. The court insisted that no bail could be taken; the country exclaimed that the prisoners ought to be set free.

While the king was thus embroiled with his parliament at home, and with powerful nations abroad, he rashly engaged in a war with France, a kingdom with which he had but lately formed the most natural alliance. All historians agree that this war proceeded from the rivalry of the duke of Buckingham and cardinal Richlieu; both of whom were in love with the queen of France: and an inveterate enmity being thus produced between these favourites, they resolved to involve their respective nations in the dispute. However this be, war was declared against France; and Charles was taught to hope, that hostilities with that kingdom would be the surest means of procuring tranquillity at home.—The success of this war was proportionable to the wisdom with which it was commenced. Buckingham was appointed commander; and he being entirely unacquainted both with sea and land service, managed matters so ill, that he lost two thirds of his army, and returned in total discredit both as an admiral and general.

The discontents in England now rose to such a height, that there was reason to apprehend an insurrection or rebellion. Charles was also reduced to the greatest distress for want of money. That which he had levied by virtue of his prerogative came in very slowly, and it was dangerous to renew the experiment on account of the ill humour of the nation in general. A third parliament therefore was called March 17th 1628; whom Charles plainly told at the beginning of the session, that “if they should not do their duties, in contributing to the necessities of the state, he must, in discharge of his conscience, use those other means which

God had put into his hands, in order to save that which the follies of some particular men may otherwise put in danger." This parliament behaved in a much more reasonable manner than either of the two former ones. The nation was now really aggrieved by the late arbitrary proceedings. They began with voting against arbitrary imprisonments and forced loans; after which, five subsidies (280,000*l.*) were voted to the king. With this sum, though much inferior to his wants, Charles declared himself well satisfied; and even tears of affection started in his eye when informed of this concession: the commons, however, resolved not to pass this vote into a law, before they had obtained from the king a sufficient security that their liberties should be no longer violated as they had formerly been. They resolved to frame a law, which they were to call a *petition of right*, in which they should collect all the arbitrary exertions of the prerogative which Charles had exposed to their view, and these they were to assault at once by their petition. The grievances now complained of were, forced loans, benevolences, taxes without consent of parliament, arbitrary imprisonments, billeting soldiers, and martial law. They pretended not, as they affirmed, to any unusual powers or privileges; nor did they intend to infringe the royal prerogative in any respect: they aimed only at securing those rights and privileges derived from their ancestors.

66

Duplicité of
the king.

The king, on his part, now began plainly to show that he aimed at nothing less than absolute power. This reasonable petition he did his utmost to evade, by repeated messages to the house, in which he always offered his royal word that there should be no more infringements on the liberty of the subject. These messages, however, had no effect on the commons: they knew how insufficient such promises were, without further security; and therefore the petition at last passed both houses, and nothing was wanting but the royal assent to give it the force of a law. The king accordingly came to the house of peers, sent for the commons, and being seated in the chair of state, the petition was read to him. In answer to it, he said, "The king willeth, that right be done according to the laws and customs of the realm, and that the statutes be put into execution; that his subjects may have no cause to complain of any wrong or oppression contrary to their just rights and liberties, to the preservation whereof he holds himself in conscience as much obliged as of his own prerogative."

This equivocal answer was highly resented. The commons returned in very ill humour. Their indignation would undoubtedly have fallen on the unfortunate catholics, had not their petition against them already received a satisfactory answer. To give vent to their present wrath, therefore, they fell on Dr Manwaring, who had preached a sermon, and, at the special command of the king, printed it; which was now found to contain doctrines subversive of all civil liberty. It taught, that tho' property was commonly lodged in the subject, yet, whenever any exigency required supply, all property was transferred to the sovereign; that the consent of parliament was not necessary for the imposition of taxes; and that the divine laws required compliance with every demand, however irregular, which the prince should make upon his subjects. For these doctrines Manwaring was sentenced to be imprisoned during the plea-

Britain.

sure of the house; to be fined 1000*l.* to the king; make submission and acknowledgment for his offence; be suspended three years; be incapable of holding any ecclesiastical dignity or secular office; and that his book be called in and burnt. No sooner, however, was the session ended, than Manwaring received a pardon, and was promoted to a living of considerable value. Some years afterwards he was promoted to the see of St Asaph. At last, the king, seeing it was impossible to carry his point, yielded to the importunities of parliament. He came to the house of peers, and pronouncing the usual form of words, "Let it be law as is desired," gave full sanction and authority to the petition. The house resounded with acclamations, and the bill for five subsidies immediately passed.

68
He at last
gives his as-
sent to the pe-
tition.

The commons, however, were not yet satisfied; they began again to attack Buckingham, against whom they were implacable: they also asserted, that the levying of tonnage and poundage without consent of parliament was a palpable violation of the ancient liberties of the people, and an open infringement of the petition of right so lately granted. The king, in order to prevent a remonstrance on that subject, suddenly prorogued the parliament, on June 26th, 1628.

69
Parliament
prorogued.

The commons soon got rid of their enemy Buckingham; who was murdered, on the 23^d of August this same year, by one Felton who had formerly served under him as a lieutenant. The king did not appear much concerned at his death, but retained an affection for his family throughout his whole lifetime. He desired also that Felton might be tortured, in order to extort from him a discovery of his accomplices; but the judges declared, that though that practice had been formerly very common, it was altogether illegal.

70
Buckingham mur-
dered.

In 1629, the usual contentions between the king and his parliament continued. The great article on which the commons broke with their sovereign, and which finally created in him a disgust at all parliaments, was their claims with regard to tonnage and poundage. The dispute was, whether this tax could be levied without consent of parliament or not. Charles, supported by multitudes of precedents, maintained that it might; and the parliament, in consequence of their petition of right, asserted that it could not. The commons were resolved to support their rights: and the disputes concerning tonnage and poundage went hand in hand with some theological controversies; particularly concerning Arminianism, which the Puritans, which now formed the majority of the nation, opposed with the greatest violence; and which consequently crept in among those who professed episcopacy, where it hath still maintained its ground more than in any other party.

71
Contentions
about ton-
nage and
poundage.

The commons began with summoning before them the officers of the custom-house, to give an account by what authority they had seized the goods of those merchants who had refused to pay the duties of tonnage and poundage. The barons of exchequer were questioned with regard to their decrees on that head. The sheriff of London was committed to the Tower for his activity in supporting the officers of the custom-house. The goods of Rolles, a merchant, and member of the house, being seized for his refusal to pay the duties, complaints were made of this violence, as if it were a breach of privilege. Charles, on the other hand, supported his officers in all these measures, and the quar-

rel

Britain.

Britain.

rel between him and the commons became every day higher. Sir John Elliot framed a remonstrance against tonnage and poundage, which he offered to the clerk to read; but it was refused, and he then read it himself. The question being called for, Sir John Finch the speaker said, that he had a command from the king to adjourn, and to put no question; upon which he rose and left the chair. The whole house was in an uproar; the speaker was pushed back into the chair, and forcibly held in it, till a short remonstrance was formed, which was instantaneously passed by almost universal acclamation. Papists and Arminians were now declared capital enemies to the commonwealth. Those who levied tonnage and poundage were branded with the same epithet. And even the merchants, who should voluntarily pay these duties, were declared betrayers of English liberty, and public enemies. The doors being locked, the gentleman-usher of the house of lords, who was sent by the king, could get no admittance till this remonstrance was finished. By the king's order he took the mace from the table, which put an end to their proceedings, and on the 10th of March the parliament was dissolved. Some of the members were imprisoned and fined; but this severity served only to increase the general discontent, and point out the sufferers as proper leaders for the popular party.

72
Parliament dissolved.

Charles being now disgusted with parliaments, resolved to call no more; but finding himself destitute of resources, was obliged to make peace with the two powers with which he was at war. A treaty was signed with France on the 14th of April, and another with Spain on the 5th of November 1630, by which Charles bound himself to observe a neutrality with regard to the affairs on the continent. His conduct to his subjects cannot now appear entirely blameless, nor the general discontent altogether without foundation. As if, however, he had resolved to ruin himself, and to lose the small degree of affection which remained among his subjects, Charles now began to set about making innovations in religion. Archbishop Laud had obtained a prodigious ascendancy over the king; and, by his superstitious attachment to foolish ceremonies, led him into a conduct that proved fatal to himself and to the kingdom in general. The humour of the nation ran at that time in a channel perfectly the reverse of superstition. The ancient ceremonies which had been sanctified by the permission and practice of the first reformers, could scarce be retained in divine service. Laud chose this time, of all others the most improper, for renewing the ceremonies of the fourth and fifth century, when the Christian church, as is well known, was sunk into those superstitions, which were afterwards continued and augmented by the policy of the church of Rome. So openly were these tenets espoused, that not only the discontented Puritans believed the church of England to be relapsing fast into the Romish superstition, but the court of Rome itself entertained hopes of regaining its authority in this island. To forward Laud's good intentions, an offer was twice made him, in private, of a cardinal's hat; which he declined accepting. His answer was, (as he says himself), that "something dwelt within him, which would not suffer his compliance, till Rome was other than it is." It must be confessed, however, that though Laud deserved not the appellation of a *Papist*, the genius of his religion was, though

73
Peace with France and Spain.

74
The king attempts to introduce new religious ceremonies.

in a less degree, the same with that of the Romish. The same profound respect was exacted to the sacerdotal character; the same submission to the creeds and decrees of synods and councils required; the same pomp and ceremony was affected in worship; and the same superstitious regard to days, postures, meats, and vestments. Orders were given, and rigorously insisted on, that the communion-table should be removed from the middle of the area where it had hitherto stood in all churches except cathedrals. It was placed at the east end, railed in, and denominated an *altar*; as the clergyman, who officiated, commonly received the appellation of *priest*. All kinds of ornaments, especially pictures, were introduced. Some of these, upon inquiry, were found to be the very same that were to be met with in the mafs-book. The crucifix too, that perpetual consolation of all pious Catholics, and terror to all found Protestants, was not forgot on this occasion.

In return for Charles's indulgence towards the church, Laud and his followers took care to magnify on every occasion the regal authority, and to treat with the utmost disdain or detestation all puritanical pretensions to a free and independent constitution. From this subjection, however, they took care to exclude themselves, and insisted upon a divine and apostolical charter in preference to a legal and parliamentary one. The sacerdotal character was magnified as sacred and undefeasible; all right to spiritual authority, or even to private judgment in spiritual subjects, was refused to profane laymen: ecclesiastical courts were held by bishops in their own name, without any notice taken of the king's authority; and Charles, tho' extremely jealous of every claim in popular assemblies, seemed rather to encourage than repress those encroachments of his clergy.

The principles which exalted prerogative were put in practice during the whole time that Charles ruled without parliaments. He wanted money for the support of government; and he levied it, either by the revival of obsolete laws, or by violations of the privileges. Though humane and gentle in his nature, he gave way to feverities in the star-chamber and high commission, which seemed necessary in order to support the present mode of administration, and suppress the rising spirit of liberty throughout the kingdom. Tonnage and poundage were continued to be levied by royal authority alone. The former arbitrary impositions were still exacted; and even new impositions laid upon different kinds of merchandize. The custom-house officers received orders from the council to enter into any house, warehouse, or cellar; to search any trunk or chest; and to break any bulk whatever, in default of the payment of customs. In order to exercise the militia, each county by an edict of the council was assessed in a certain fund for maintaining a multer-master appointed for that service. Compulsions were openly made with recusants, and the Popish religion became a regular part of the revenue. A commission was granted for compounding with such as were possessed of crown-lands on defective titles; and on this pretence some money was exacted of the people, &c.

While the English were in the utmost discontent, and almost ready to break out in open rebellion by these arbitrary proceedings, Charles thought proper to attempt setting up episcopacy in Scotland. The canons for establishing ecclesiastical jurisdiction were pro-

promulgated in 1635, and were received without much appearance of opposition; yet, with great inward apprehension and discontent. The first reading of the liturgy was attempted in the cathedral church of St Giles in Edinburgh, in 1637; but this produced such a tumult, that it was not thought safe to repeat the experiment. An universal combination against the religious innovations began immediately to take place; but Charles, as if obliquely bent on his own destruction, continued inflexible in his purpose, though he had nothing to oppose to the united force of the kingdom but a proclamation, in which he pardoned all past offences, and exhorted the people to be more obedient for the future, and to submit peaceably to the use of the liturgy. This proclamation hastened forward the insurrection which had been slowly advancing before. Four tables, as they were called, were formed in Edinburgh. One consisted of nobility, another of gentry, a third of ministers, and the fourth of burgesses. The table of gentry was divided into many subordinate ones, according to their different counties. In the hands of the four tables, the authority of the whole kingdom was placed. Orders were issued by them, and every where obeyed with the utmost regularity; and among the first acts of their government was the production of the COVENANT.

77
Which occasions an insurrection

78
Account of the covenant.

This famous covenant consisted of a renunciation of Popery, formerly signed by James in his youth, and filled with many virulent invectives against that party. A bond of union followed, by which the subscribers obliged themselves to resist all religious innovations, and to defend each other against all opposition whatsoever: And all this for the greater glory of God, and the greater honour and advantage of their king and country. The covenant was subscribed by people of all ranks and conditions. Few disapproved of it in their hearts, and still fewer dared openly to condemn it. The king's ministers and counsellors themselves were mostly of the same way of thinking; and none but rebels to God, and traitors to their country, it was thought, would withdraw themselves from so salutary and pious a combination.

79
Charles attempts to appease the covenanters

The king now began to be alarmed. He sent the marquis of Hamilton, as commissioner, with authority to treat with the covenanters. He required the covenant to be renounced and recalled; and he thought that on his part he made very satisfactory concessions, when he offered to suspend the canons and liturgy till in a fair and legal way they could be received, and so to model the high commission that it should no longer give offence to his subjects. In answer to this demand the covenanters told him, they would sooner renounce their baptism; and invited the commissioner himself to sign it. Hamilton returned to London; made another fruitless journey with new concessions to Edinburgh; returned again to London, and was immediately sent back with still more satisfactory concessions. The king was now willing to abolish entirely the canons, the liturgy, and the high-commission court; he even resolved to limit extremely the power of the bishops, and was content if on any terms he could retain that order in the church of Scotland. And to ensure all these gracious offers, he gave Hamilton authority to summon first an assembly, and then a parliament, where every national grievance should be redressed.—

These successive concessions only shewed the weakness of the king, and encouraged the malcontents to rise in their demands. The offer, however, of an assembly and a parliament, in which they expected to be entirely masters, was very willingly embraced by the covenanters.

Charles, perceiving what advantage his enemies had reaped from their covenant, resolved to have a covenant also on his side; and he ordered one to be drawn up for that purpose. It consisted of the same violent renunciation of Popery with the other; which, though the king did not approve of it, he thought proper to adopt, in order to remove all the suspicions entertained against him. As the covenanters, in their bond of mutual defence against all opposition, had been careful not to except the king; Charles had formed a bond which was annexed to this renunciation, and which expressed the subscribers loyalty and duty to his majesty. But the covenanters perceiving that this new covenant was only meant to weaken and divide them, received it with the utmost scorn and detestation. And, without delay, they proceeded to model the assembly from which such great achievements were expected.

The assembly met at Glasgow in 1638. A firm determination had been entered into of utterly abolishing episcopacy; and, as a preparative to it, there was laid before the presbytery of Edinburgh, and solemnly read in all the churches of the kingdom, an accusation against the bishops, as guilty, all of them, of heresy, simony, bribery, perjury, cheating, incest, adultery, fornication, common-swearing, drunkenness, gaming, breach of the sabbath, and every other crime which had occurred to the accusers. The bishops sent a protest, declining the authority of the assembly; the commissioner too protested against that court, as illegally constituted and elected; and, in his majesty's name, dissolved it. This measure was foreseen, and little regarded. The court still continued to sit and do business. All the acts of assembly, since the accession of James to the crown of England, were, upon pretty reasonable grounds, declared null and invalid. The acts of parliament which affected ecclesiastical affairs, were on that very account supposed to have no authority. And thus the whole fabric, which James and Charles, in a long course of years, had been rearing with much care and policy, fell at once to the ground. The covenant likewise was ordered to be signed by every one, under pain of excommunication.

In 1639, the covenanters prepared in earnest for war. The earl of Argyle, though he long seemed to temporize, at last embraced the covenant; and he became the chief leader of that party. The earls of Rothes, Cassils, Montrose, Lothian, the lords Lindsey, Loudon, Yester, and Balmerino, also distinguished themselves. Many of their officers had acquired reputation in the German wars, particularly under Gustavus; and these were invited over to assist their country in her present necessity. The command was entrusted to Lesly, a soldier of experience and ability. Forces were regularly enlisted and disciplined. Arms were commissioned and imported from foreign countries. A few castles which belonged to the king, being unprovided of victuals, ammunition, and garrisons, were soon seized. And the whole country, except a small part, where the marquis of Huntly still adhered to the king,

Violent proceedings of the assembly

82
Preparations for war by the covenanters

Britain. king, being in the covenants hands, was soon put into a tolerable posture of defence.

By the king. Charles, on the other hand, was not deficient in his endeavours to oppose this formidable combination. By regular oeconomy he had not only paid all the debts contracted in the French and Spanish wars, but had amassed a sum of 200,000 l.; which he had reserved for any sudden exigency. The queen had great interest with the catholics, both from the sympathy of religion, and from the favours and indulgences which she had been able to procure them. She now employed her credit, and persuaded them, that it was reasonable to give large contributions, as a mark of their duty to the king, during this urgent necessity: And thus, to the great scandal of the Puritans, a considerable supply was gained. The king's fleet was formidable and well supplied. Having put 5000 land-forces on board, he intrusted it to the marquis of Hamilton, who had orders to sail to the frith of Forth, and cause a diversion in the forces of the malcontents. An army was levied of near 20,000 foot, and 3000 horse; and was put under the command of the earl of Arundel, a nobleman of great family, but celebrated neither for military nor political abilities. The earl of Essex, a man of strict honour, and extremely popular, especially among the soldiery, was appointed lieutenant-general: The earl of Holland was general of the horse. The king himself joined the army, and he summoned all the peers of England to attend him. The whole had the appearance of a splendid court rather than a military armament, and in this situation the camp arrived at Berwick.

The Scottish army was equally numerous with that of the king, but inferior in cavalry. The officers had more experience; and the soldiers, though ill disciplined and armed, were animated, as well by the national aversion to England, and the dread of becoming a province to their old enemy, as by that religious enthusiasm which was the occasion of the war. Yet so prudent were their leaders, that they immediately sent very submissive messages to the king, and craved leave to be admitted to a treaty.—Charles, as usual, took the worst course. He concluded a sudden pacification, in which it was stipulated, that he should withdraw his fleet and army; that within 48 hours the Scots should dismiss their forces; that the king's forts should be restored to him; his authority be acknowledged; and a general assembly and parliament be immediately summoned, in order to compose all differences.

This peace was of no long duration. Charles could not prevail on himself to abandon the cause of episcopacy, and secretly intended to seize every favourable opportunity to recover the ground he had lost. The assembly, on the other hand, proceeded with the utmost fury and violence. They voted episcopacy to be unlawful in the church of Scotland: they stigmatized the canons and liturgy as Popish: they denominated the high commission tyranny. The parliament which sat after the assembly, advanced pretensions which tended to diminish the civil power of the monarch; and what probably affected Charles still more, they were proceeding to ratify the acts of assembly, when by the king's instructions Traquair the commissioner prorogued them. And on account of these claims, which might have been easily foreseen, war was recommenced the same year.

No sooner had Charles concluded the peace, than he found himself obliged to disband his army, on account of his want of money; and as the soldiers had been held together merely by mercenary views, it was not possible, without great trouble, expence, and loss of time, to reassemble them. On the contrary, the covenanters, in dismissing their troops, had been careful to preserve nothing but the appearance of a pacification. The officers had orders to be ready on the first summons: The soldiers were warned not to think the nation secure from an English invasion: And the religious zeal which animated all ranks of men made them immediately fly to their standards, as soon as their trumpet was sounded by their spiritual and temporal leaders.

In 1640, however, the king made shift to draw an army together; but finding himself unable to support them, was obliged to call a parliament after an intermission of above 11 years. As the sole design of the king's calling this parliament was to obtain a supply, and the only reason they had for attending was to procure a redress of grievances, it is not to be supposed there could be any good agreement between them. The king accordingly insisted for money, and the parliament on their grievances, till a dissolution ensued.—To add to the unpopularity of this measure, the king, notwithstanding his dissolving the parliament, allowed the convocation to sit; a practice of which, since the reformation, there had been very few examples, and which was now by many deemed very irregular. Besides granting to the king a supply from the spirituality, the convocation, jealous of innovations similar to those which had taken place in Scotland, imposed an oath on the clergy and the graduates in the universities, by which every one swore to maintain the established government of the church, by archbishops, bishops, deans, chapters, &c. These steps were deemed illegal, because not ratified by consent of parliament; and the oath, containing an &c. in the middle of it, became a subject of general ridicule.

The king, disappointed of parliamentary subsidies, was obliged to have recourse to other expedients. The ecclesiastical subsidies served him in some stead; and it seemed but just that the clergy should contribute to the expence of a war which had been in a great measure of their own raising. He borrowed money from his ministers and courtiers; and so much was he beloved among them, that above 300,000 l. were subscribed in a few days. Some attempts were made towards forcing a loan from the citizens; but still repelled by the spirit of liberty, which was now become unconquerable. A loan of 40,000 l. was extorted from the Spanish merchants who had bullion in the tower. Coat and conduct money for the soldiery was levied on the counties; an ancient practice, but which was supposed to be abolished by the petition of right. All the pepper was bought from the East India Company upon trust; and sold, at a great discount, for ready money. A scheme was proposed for coining two or three hundred thousand pounds of base money. Such were the extremities to which Charles was reduced. The fresh difficulties, which amidst the present distresses were every day raised, with regard to the payment of ship-money, obliged him to exert continual acts of authority, augmented extremely the discontent of the people,

ple, and increased his indigence and necessities.

The present expedients, however, enabled the king, though with great difficulty, to march his army, consisting of 19,000 foot and 2000 horse. The earl of Northumberland was appointed general; the earl of Strafford, who was called over from Ireland, lieutenant-general; lord Conway, general of the horse. A small fleet was thought sufficient to serve the purposes of this expedition. The Scots, though somewhat superior, were sooner ready than the king's army, and marched to the borders of England. Notwithstanding their warlike preparations and hostile attempts, the covenanters still preserved the most submissive language to the king; and entered England with no other design, they said, than to obtain access to the king's presence, and lay their humble petition at his royal feet. At Newburn upon Tyne they were opposed by a detachment of 4500 men under Conway, who seemed resolute to dispute with them the passage of the river. The Scots first intreated them, with great civility, not to stop them in their march to their gracious sovereign; and then attacked them with great bravery, killed several, and chased the rest from their ground. Such a panic seized the whole English army, that the forces at Newcastle fled immediately to Durham; and not yet thinking themselves safe, they deserted that town, and retreated into Yorkshire.

The Scots continued to advance; they dispatched messengers to the king, who was now arrived at York. They took care, after the advantage they had gained, to redouble their expressions of loyalty, duty, and submission to his person; and they even made apologies full of sorrow and contrition for their late victory. Charles was in a very distressed condition; and, in order to prevent the further advance of the Scots, agreed to a treaty, and named 16 English noblemen to meet with 11 Scots commissioners at Rippon. Strafford, upon whom, by reason of Northumberland's sickness, the command of the army had devolved, advised Charles rather to put all to hazard, than submit to such unworthy terms as he saw would be imposed upon him. He advised him to push forward and attack the Scots, and bring the affair to a quick decision; and if he was ever so unsuccessful, nothing worse could befall him than what from his inactivity he would certainly be exposed to; and, to shew how easily this project might be executed, he ordered an assault to be made on some quarters of the Scots, and gained an advantage over them. This salutary advice Charles had not resolution to follow. He therefore resolved to call a council of the peers; and as he foresaw that they would advise him to call a parliament, he told them in his first speech, that he had already taken that resolution. In order to subvert both armies (for the king was obliged to pay his enemies, in order to save the northern counties), Charles wrote to the city, desiring a loan of 200,000 l. And the peers at York, whose authority was now much greater than that of their sovereign, joined in the same request.

The parliament met November 3^d 1640: the house of commons had never been observed so numerous; and, that they might strike a decisive blow at once against the court they began with the impeachment of the earl of Strafford. That nobleman, who was considered as prime minister, both on account of the credit he possessed with his master, and his own uncommon vigour and

capacity, had now the misfortune of having incurred the hatred of all the three kingdoms. The Scots looked upon him as the capital enemy of their country. He had engaged the parliament of Ireland to advance large subsidies to be employed in a war against them: he had levied an army of 9000 men, with which he had menaced all their western coast: he had obliged the Scots who lived under his government to renounce the covenant, &c.: he had governed Ireland, first as deputy, and then as lord-lieutenant, during eight years, with great vigilance, activity, and prudence, but with very little popularity. In a nation so averse to the English government and religion, these very virtues were sufficient to draw on him the public hatred. His manners, besides, were at bottom haughty, rigid, and severe; and no sooner did adversity begin to seize him, than the concealed aversion blazed up at once, and the Irish parliament used every expedient to aggravate the charge against him.

The universal discontent which prevailed throughout the English nation was all pointed against the earl of Strafford; though for no other reason but because he was the minister of state whom the king most favoured and trusted. His extraction was honourable, his paternal fortune considerable; yet even attended his sudden and great elevation; and his former associates in popular councils, finding that he owed his advancement to the desertion of their cause, represented him as the great apostate of the commonwealth, whom it behoved them to sacrifice as a victim to public justice.

From so terrible a combination against a single person, nothing else could be expected than what really happened. Strafford was impeached, most unjustly condemned, and at last executed, in the year 1641. It was not without extreme difficulty that the king could be brought to consent to his execution. He came to the house of lords, where he expressed his resolution never to employ Strafford again in any public business; but with regard to the treason for which he was condemned, he professed himself totally dissatisfied. The commons voted it a breach of privilege for the king to take notice of any bill depending before the house. Charles did not perceive, that his attachment to Strafford was the chief motive for the bill; and the greater proof he gave of this attachment to his favourite minister, the more inevitable did he render his destruction. The house of lords were intimidated, by popular violence, into passing the bill of attainder against the unfortunate earl. The same battery was next employed to force the king's assent. The populace flocked about Whitehall, and accompanied their demand of justice with the loudest clamours and most open menaces. A thousand idle reports of conspiracies, insurrections, and invasions, were spread abroad. On whatever side the king cast his eyes, he saw no resource nor security. All his servants, consulting their own safety rather than their master's honour, declined interposing with their advice between him and his parliament. The queen, terrified at the appearance of so great danger, pressed Charles, with tears, to satisfy his people in this demand, which it was hoped would finally content them. Archbishop Juxon alone had the courage to advise him, if he did not approve of the bill, by no means to consent to it.

xiety, wrote to him a letter, in which he desired his own execution, in order to give peace to the nation: and at last, after the most violent anxiety and doubt, Charles granted a commission to four noblemen, in his name, to give the royal assent to the bill; flattering himself, perhaps, that as neither his will consented to the deed, nor was his hand immediately engaged in it, he was the more free from all the guilt which attended it. These commissioners he empowered at the same time to give his assent to a bill yet more fatal to himself, viz. That the present parliament should not be dissolved, prorogued, or adjourned, without their own consent.

94
Charles ren-
ders the par-
liament per-
petual.

95
His reasons
for this step.

By this last bill Charles rendered the power of his enemies perpetual as it was already uncontrollable. The reason of this extraordinary step was, that the commons, from policy, more than necessity, had embraced the expedient of paying the two armies by borrowing money from the city. These loans they repaid afterwards by taxes levied on the people. At last the citizens, either of themselves, or by suggestion, began to start difficulties with regard to a farther loan which was demanded. "We make no scruple of trusting the parliament, (said they), were we certain that the parliament was to continue till our repayment. But, in the present precarious situation of affairs, what security can be given us for our money?" In order to obviate this objection, the abovementioned bill was suddenly brought in, and having passed both houses with great rapidity, was at last brought to the king; who, being oppressed with grief on account of the unhappy fate of Strafford, did not perceive the pernicious consequence of the bill.

All this time the commons had ruled in other respects with an uncontrollable sway. Soon after the impeachment of Strafford, Laud was accused of high treason, and committed to custody. To avoid the like fate, lord keeper Finch and secretary Windebank fled, the one into Holland, the other into France. The house instituted a new species of guilt, termed *delinquency*: those who had exercised the powers necessary for the defence of the nation during the late military operations, were now called *delinquents*. In consequence of this determination, many of the nobility and prime gentry of the nation, while only exerting, as they justly thought, the legal powers of magistracy, found themselves unexpectedly involved in this new crime of delinquency. The commons, however, by their institution, reaped this multiplied advantage; they disarmed the crown, they established the maxims of rigid law and liberty, and they spread the terror of their own authority. All the sheriffs who had formerly exacted ship-money, though by the king's express command, were now declared delinquents. The farmers and officers of the customs who had been employed during so many years in levying tonnage, poundage, &c. were likewise denominated criminals of the same kind, and were afterwards glad to compound for a pardon by paying 150,000*l*. Every discretionary or arbitrary sentence of the star-chamber and high commission courts, which from their very nature were arbitrary, underwent a severe scrutiny; and all those who had concurred in such sentences, were voted to be liable to the penalties of law. No minister of the king, no member of the council, but what found himself exposed by this deter-

VOL. II.

Britain.

mination. The judges who had formerly given judgment against Hamden for refusing to pay ship-money, were accused before the peers, and obliged to find security for their appearance. Berkeley, a judge of the king's bench, was seized by order of the house, even when sitting in his tribunal. The faction of the lords and commons, as well as that of the king, was declared necessary for the confirmation of ecclesiastical canons. Monopolists and projectors, if of the king's party, were now expelled the house; but one Mildmay, a notorious monopolist, was allowed to keep his feat, because he was of the popular party. In short, the constitution was completely new-modelled; and during the first period of the transactions of this remarkable parliament, if we except Strafford's attainder, their merits in other respects so much overbalance their mistakes, as to intitle them to very ample praises from all lovers of liberty. Not only were former abuses remedied, and grievances redressed: great provision for the future was made by excellent laws against the return of the like complaints. And if the means by which they obtained such mighty advantages favoured often of artifice, sometimes of violence; it is to be considered, that revolutions of government cannot be effected by mere force of argument and reasoning; and that, factions being once excited, men can neither so firmly regulate the tempers of others, nor their own, as to ensure themselves against all exorbitancies.

Had the parliament stopped here, it had been happy for the nation; but they were now resolved to be satisfied with nothing less than the total abolition of monarchy. The king had promised to pay a visit, this summer, to his subjects in Scotland, in order to settle their government; and though the English parliament was very importunate with him to lay aside that journey, they could not prevail with him so much as to delay it. Having failed in this, they appointed a small committee of both houses to attend him, in order, as was pretended, to see the articles of pacification executed, but really to be spies upon the king, to extend still farther the ideas of parliamentary authority, as well as eclipse his majesty. Endeavours were even used, before Charles's departure, to have a protector of the kingdom appointed, with a power to pass laws without having recourse to the king. About this time, the king concluded the marriage of the princess Mary, with William prince of Orange. He did not conclude this alliance without communicating his intentions to parliament, who were very well satisfied with the proposal. They adjourned from September 9th, to October 20th, 1641.

99
Marriage of
the princess
Mary with
the prince of
Orange.

Charles arrived in Scotland August 14th 1641, with a design to give full satisfaction if possible to this restless kingdom. Some good regulations were made; the bench of bishops, and lords of articles, were abolished; it was ordained that no man should be created a Scottish peer, who possessed not 10,000 marks (above 500*l*.) of annual rent in the kingdom; a law for triennial parliaments was likewise enacted; and it was ordained, that the last act of every parliament should be to appoint the time and place for holding the parliament next ensuing; the king was also deprived of that power formerly exercised, of issuing proclamations which enjoined obedience under the penalty of treason. But the most fatal blow given to royal authority, and what

100
Charles ar-
rives in Scot-
land.

101
His great
concessions.

Britain.

in a manner dethroned the prince, was an article, that no member of the privy-council, in whose hands, during the king's absence, the whole administration lay, no officer of state, none of the judges, should be appointed but by advice and approbation of parliament. Charles even agreed to deprive of their seats four judges who had adhered to his interests; and their place was supplied by others more agreeable to the ruling party. Several of the covenants were also sworn of the privy-council; and all the ministers of state, counsellors and judges, were, by law, to hold their places during life or good behaviour. The king, while in Scotland, conformed himself to the established church; he bestowed pensions and preferments on Henderson, Gillespy, and other popular preachers; he pacified every art to soften, if not to gain, his greatest enemies; the earl of Argyll was created a marquis, Lord London an earl, and Lesly was dignified with the title of *Lord Leven*. But though Charles was thus obliged to heap favours on his enemies and overlook his friends, the former were not satisfied, as believing all he did proceeded from artifice and necessity; while some of the latter were disgusted, and thought themselves ill rewarded for their past services.

Argyle and Hamilton, being seized with an apprehension, real or pretended, that the earl of Crawford and others meant to assassinate them, left the parliament suddenly, and retired into the country: but, upon invitation and assurances, returned in a few days. This event, which in Scotland had no visible consequence, was commonly denominated the *incident*; but though the incident had no effect in Scotland, it was attended with very serious consequences in England. The English parliament immediately took the alarm; or rather probably were glad of the hint: they insinuated to the people, that the *malignants*, so they called the king's party, had laid a plot at once to murder them and all the godly in both kingdoms. They applied therefore to Essex, whom the king had left general of the south of England; and he ordered a guard to attend them.

102
English parliament desires a guard.

In the mean time a most dangerous rebellion broke out in Ireland, with circumstances of unparalleled horror, bloodshed, and devastation. The old Irish, by the wife conduct of James, had been fully subdued, and proper means taken for securing their dependence and subjection for the future; but their old animosity still remained, and only wanted an occasion to exert itself. This they obtained from the weak condition to which Charles was reduced, and this was made use of in the following manner.

One Roger More, a gentleman descended from an ancient Irish family, but of narrow fortune, first formed the project of expelling the English, and asserting the independency of his native country. He secretly went from chieftain to chieftain, and roused up every latent principle of discontent. He maintained a close correspondence with lord Macguire, and Sir Phelim O Neale, the most powerful of the old Irish; and by his persuasions soon engaged not only them, but the most considerable persons of the nation, into a conspiracy; and it was hoped, the English *of the pale*, as they were called, or the old English planters, being all catholics, would afterwards join the party which restored their religion to its ancient splendor and authority. The

103
Rebellion breaks out in Ireland.

Britain.

plan was, that Sir Phelim O Neale, and the other conspirators, should begin an insurrection on one day throughout the provinces, and should attack all the English settlements; and that on the very same day, lord Macguire and Roger More should surprize the castle of Dublin. They fixed on the beginning of winter for the commencement of this revolt; that there might be more difficulty in transporting forces from England. Succours to themselves, and supplies of arms, they expected from France, in consequence of a promise made them by cardinal Richelieu; and many Irish officers who had served in the Spanish troops, had given assurances of their concurrence, as soon as they saw an insurrection entered upon by their catholic brethren. News, which every day arrived from England, of the fury expressed by the commons against all Papists, struck fresh terror into the Irish nation, stimulated the conspirators to execute their fatal purpose, and assured them of the concurrence of their countrymen.

Such a propensity was discovered in all the Irish to revolt, that it was deemed unnecessary as well as dangerous to trust the secret in many hands; and though the day appointed drew nigh, no discovery had yet been made to government. The king, indeed, had received information from his ambassadors, that something was in agitation among the Irish in foreign parts; but though he gave warning to the administration in Ireland, his intelligence was entirely neglected. They were awakened from their security only that very day before the commencement of hostilities. The castle of Dublin, by which the capital was commanded, contained arms for 10,000 men, with 35 pieces of cannon, and a proportionable quantity of ammunition. Yet was this important place guarded, and that too without any care, by no greater force than 50 men. Macguire and More were already in town with a numerous band of their retainers; others were expected that night; and next morning they were to enter upon what they esteemed the easiest of all enterprises, the surprisal of the castle. O Conolly, however, an Irishman, but a Protestant, discovered the conspiracy. The justices and council fled immediately to the castle, and reinforced the guards. The city was immediately alarmed, and all the Protestants prepared for defence. More escaped, but Macguire was taken; and Mahone, one of the conspirators, being likewise seized, first discovered to the justices the project of a general insurrection.

But though O Conolly's discovery saved the castle from a surprize, Mahon's confession came too late to prevent the intended insurrection. O Neale and his confederates had already taken arms in Ulster. The houses, cattle, and goods of the English were first seized. Those who heard of the commotions in their neighbourhood, instead of deserting their habitations, and assembling together for mutual protection, remained at home in hopes of defending their property; and fell thus separately into the hands of their enemies. An universal massacre now commenced, accompanied with circumstances of unequalled barbarity. No age, sex, or condition, was spared. All connections were dissolved, and death was dealt by that hand from which protection was implored and expected. All the tortures which warlike cruelty could devise, all the linger-

104
Horrid cruelties of the rebels.

ing

ing pains of body, the anguish of mind, the agonies of despair, could not satiate revenge excited without injury, and cruelty derived from no cause. Such enormities, in short, were committed, that though attested by undoubted evidence, they appear almost incredible. The stately buildings or commodious habitations of the planters, as if upbraiding the sloth and ignorance of the natives, were consumed with fire, or laid level with the ground; and where the miserable owners, shut up in their houses, and preparing for defence, perished in the flames, together with their wives and children, a double triumph was afforded to their insulting foes. If any where a number assembled together, and resolved to oppose the assassins; they were disarmed by capitulations, and promises of safety, confirmed by the most solemn oaths. But no sooner had they surrendered, than the rebels, with perfidy equal to their cruelty, made them share the fate of their unhappy countrymen. Others tempted their prisoners, by the fond love of life, to embroil their hands in the blood of friends, brothers, or parents; and having thus rendered them accomplices in their own guilt, gave them that death which they sought to shun by deserting it.

Such were the barbarities by which Sir Phelim O Neale and the Irish in Ulster signalized their rebellion. More, shocked at the recital of these enormities, flew to O Neale's camp; but found that his authority, which was sufficient to excite the Irish to a rebellion, was too feeble to restrain their inhumanity. Soon after, he abandoned the cause, and retired to Flanders. From Ulster, the flames of rebellion diffused themselves in an instant over the other three provinces of Ireland. In all places, death and slaughter were not uncommon; though the Irish in these other provinces pretended to act with moderation and humanity. But cruel and barbarous was their humanity! Not content with expelling the English from their houses, they stripped them of their very clothes, and turned them out naked and defenceless to all the severities of the season. The heavens themselves, as if conspiring against that unhappy people, were armed with cold and tempest unusual to the climate, and executed what the sword had left unfinished. By some computations, those who perished by all these cruelties are supposed to amount to 150 or 200,000. But by the most reasonable and moderate, they are made to amount only to 40,000; though probably even this account is not free of exaggeration.

The English of the pale, who probably were not at first in the secret, pretended to blame the insurrection, and to detest the barbarity with which it was accompanied. By their protestations and declarations they engaged the justices to supply them with arms, which they promised to employ in defence of government. But in a little time, the interests of religion were found to be more prevalent over them than regard and duty to their native country. They chose lord Gormonstone their leader; and, joining the old Irish, rivalled them in every act of cruelty towards the English Protestants. Besides many smaller bodies, dispersed over the kingdom, the main army of the rebels amounted to 20,000 men, and threatened Dublin with an immediate siege. Both the English and Irish rebels conspired in one impotence, by which they seduced many of their countrymen. They pretended authority from the king

and queen, but especially the latter, for their insurrection; and they affirmed that the cause of their taking arms was to vindicate the royal prerogative, now invaded by the puritanical parliament. Sir Phelim O Neale, having found a royal patent in the house of lord Caulfield, whom he had murdered, tore off the seal, and affixed it to a commission which he had forged for himself.

The king received intelligence of this insurrection while in Scotland, and immediately acquainted the Scots parliament with it. He hoped, as there had all along been such an outcry against Popery, that now, when that religion was appearing in its blackest colours, the whole nation would vigorously support him in the suppression of it. But here he found himself mistaken. The Scots considering themselves now as a republic, and conceiving hopes from the present distresses of Ireland, they resolved to make an advantageous bargain for the succours with which they should supply the neighbouring nation. Except dispatching a small body of forces, to support the Scots colonies in Ulster, they would, therefore, go no farther than to send commissioners to London, in order to treat with the parliament, to whom the sovereign power was in reality transferred. The king too, sensible of his utter inability to subdue the Irish rebels, found himself obliged, in this exigency, to have recourse to the English parliament, and depend on their assistance for supply. He told them that the insurrection was not, in his opinion, the result of any rash enterprise, but of a formed conspiracy against the crown of England. To their care and wisdom, therefore, he said, he committed the conduct and prosecution of the war, which, in a cause so important to national and religious interests, must of necessity be immediately entered upon, and vigorously pursued.

The English parliament, now re-assembled, discovered in each vote the same dispositions in which they had separated. Nothing less than a total abolition of monarchy would serve their turn. But this project it had not been in the power of the popular leaders to have executed, had it not been for the passion which seized the nation for the presbyterian discipline, and the wild enthusiasm which at that time attended it. By the difficulties and distresses of the crown, the commons, who possessed alone the power of supply, had aggrandized themselves; and it seemed a peculiar happiness, that the Irish rebellion had succeeded, at such a critical juncture, to the pacification in Scotland. That expression of the king's, by which he committed to them the care of Ireland, they immediately laid hold of, and interpreted in the most unlimited sense. They had on other occasions been gradually encroaching on the executive power of the crown, which forms its principal and most natural branch of authority; but with regard to Ireland, they at once assumed it, fully and entirely, as if delivered over to them by a regular gift or assignment. And to this usurpation the king was obliged passively to submit, both because of his inability to resist, and lest he should expose himself still more to the charge of favouring the rebels; a reproach eagerly thrown upon him by the popular party as soon as they heard that the Irish pretended to act by his commission. Nay, to complete their character, while they pretended the utmost zeal against the insurgents, they took no

Britain.

steps for its suppression, but such as likewise gave them the superiority in those commotions which they foresaw must be so soon excited in England. They levied money under pretence of the Irish expedition, but reserved it for purposes which concerned them more nearly: they took arms from the king's magazines, but still kept them with a secret intention of making use of them against himself: whatever law they deemed necessary for aggrandizing themselves, they voted, under colour of enabling them to recover Ireland; and if Charles withheld his royal assent, the refusal was imputed to those pernicious counsels which had at first excited the Popish rebellion, and which still threatened total ruin to the Protestant interest throughout his dominions. And though no forces were for a long time sent over into Ireland, and very little money remitted during the extreme distress of that kingdom; so strong was the people's attachment to the commons, that the fault was never imputed to those pious zealots, whose votes breathed nothing but death and destruction to the Irish rebels.

107
King returns from Scotland.

The conduct of the parliament towards the king now became exceedingly unreasonable, unjust, and cruel. It was thought proper to frame a general remonstrance of the state of the kingdom; and accordingly the committee, which at the first meeting of the parliament had been chosen for that purpose, were commanded to finish their undertaking. The king returned from Scotland November 25th 1641. He was received in London with the shouts and acclamations of the populace, and with every demonstration of regard and affection. Sir Richard Gournay, lord mayor, a man of great merit and authority, had promoted these favourable dispositions; and had engaged the populace, who so lately insulted the king, and who so soon after made furious war upon him, to give him these marks of their dutiful attachment. But all the pleasure which Charles reaped from this joyful reception was soon damped by the remonstrance of the commons, which was presented to him together with a petition of the like nature. The bad counsels which he followed were there complained of; his concurrence in the Irish rebellion plainly insinuated; the scheme laid for the introduction of popery and superstition inveighed against; and for a remedy to all these evils, the king was desired to entrust every office and command to persons in whom his parliament should have cause to confide. By this phrase, which was very often repeated in all the memorials and addresses of that time, the commons meant themselves and their adherents. To this remonstrance Charles was obliged to make a civil reply, notwithstanding his subjects had transgressed all bounds of respect and even good manners in their treatment of their sovereign.

108
Commons assume the sovereignty.

It would be tedious to point out every invasion of the prerogative now attempted by the commons: but finding themselves at last likely to be opposed by the nobility, who saw their own depression closely connected with that of the crown, they openly told the upper house, that "they themselves were the representatives of the whole body of the kingdom, and that the peers were nothing but individuals, who held their seats in a particular capacity; and therefore, if their lordships will not consent to acts necessary for the preservation of the people, the commons, together with such of the lords as are more sensible of the danger, must join to-

Britain.

gether and represent the matter to his majesty." Every method proper for alarming the populace was now put in practice. The commons affected continual fears of destruction to themselves and to the whole nation. They excited the people by never ceasing inquiries after conspiracies, by reports of insurrections, by feigned intelligence of invasions from abroad, and by discoveries of dangerous combinations at home amongst Papists and their adherents. When Charles dismissed the guard which they had ordered during his absence, they complained; and, upon his promising them a new guard under the command of the earl of Lindsey, they absolutely refused the offer: they ordered halberets to be brought into the hall where they assembled, and thus armed themselves against those conspiracies with which they pretended they were hourly threatened. Several reduced officers, and young gentlemen of the inns of court, during this time of distress and danger, offered their service to the king. Between them and the populace there passed frequent skirmishes, which ended not without bloodshed. By way of reproach, these gentlemen gave the rabble the name of *round-heads*, on account of their short cropt hair; while they distinguished the others by the name of *cavaliers*. And thus the nation, which was before sufficiently provided with religious as well as civil causes of quarrel, was also supplied with party-names, under which the factions might rendezvous and signalize their mutual hatred.

109
Round-heads and *Cavaliers*.

These tumults continued to increase about Westminster and Whitehall. The cry continually resounded against bishops and rotten-hearted lords. The former especially, being easily distinguishable by their habit, and being the object of violent hatred to all the sectaries, were exposed to the most dangerous insults. The archbishop of York, having been abused by the populace, hastily called a meeting of his brethren. By his advice a protestation was drawn and addressed to the king and the house of lords. The bishops there set forth, that though they had an undoubted right to sit and vote in parliament, yet in coming thither they had been menaced, assaulted, affronted, by the unruly multitude, and could no longer with safety attend their duty in the house. For this reason they protested against all laws, votes, and resolutions, as null and invalid, which should pass during the time of their forced absence. This protestation, which, though just and legal, was certainly ill-timed, was signed by twelve bishops, and communicated to the king, who hastily approved of it. As soon as it was presented to the lords, that house desired a conference with the commons, whom they informed of this unexpected protestation. The opportunity was seized with joy and triumph. An impeachment of high treason was immediately sent up against the bishops, as endeavouring to subvert the fundamental laws, and to invalidate the authority of the legislature. They were, on the first demand, sequestered from parliament, and committed to custody. No man in either house ventured to speak a word in their vindication; so much was every one displeas'd at the egregious imprudence of which they had been guilty. One person alone said, that he did not believe them guilty of high treason; but that they were stark mad, and therefore desired they might be sent to bedlam.

110
Bishops retire from the house of lords.

This was a fatal blow to the royal interest; but it soon felt a much greater from the imprudence of the king

Britain.

111

bers of par-
liament im-
peached by
the king's
order.

king himself. Charles had long suppressed his resentment, and only strove to gratify the commons by the greatness of his concessions; but finding that all his compliance had but increased their demands, he could no longer contain. He gave orders to Herbert his attorney-general to enter an accusation of high treason, in the house of peers, against lord Kimbolton, one of the most popular men of his party, together with five commons, Sir Arthur Haslerig, Hollis, Hambden, Pym, and Strode. The articles were, That they had traitorously endeavoured to subvert the fundamental laws and government of the kingdom, to deprive the king of his regal power, and to impose on his subjects an arbitrary and tyrannical authority; that they had invited a foreign army to invade the kingdom; that they had aimed at subverting the very rights and being of parliaments; and had actually raised and countenanced tumults against the king. Men had scarce leisure to wonder at the precipitancy and imprudence of this impeachment, when they were astonished by another measure still more rash and unsupported. A serjeant at arms, in the king's name, demanded of the house the five members, and was sent back without any positive answer. This was followed by a conduct still more extraordinary. The next day, the king himself was seen to enter the house of commons alone, advancing through the hall, while all the members stood up to receive him. The speaker withdrew from his chair, and the king took possession of it. Having seated himself, and looked round him for some time, he told the house, that he was sorry for the occasion that forced him thither; that he was come in person to seize the members whom he had accused of high treason, seeing they would not deliver them up to his serjeant at arms. Then addressing himself to the speaker, he desired to know whether any of them were in the house: but the speaker, falling on his knees, replied, that he had neither eyes to see, nor tongue to speak, in that place, but as the house was pleased to direct him; and he asked pardon for being able to give no other answer. The king sat for some time, to see if the accused were present; but they had escaped a few minutes before his entry. Thus disappointed, perplexed, and not knowing on whom to rely, he next proceeded, amidst the invectives of the populace, who continued to cry out, *Privilege! Privilege!* to common council of the city, and made his complaint to them. The common council answered his complaints by a contemptuous silence; and on his return, one of the populace, more insolent than the rest, cried out, "To your tents, O Israel!" a watch-word among the Jews, when they intended to abandon their princes.

112
had conse-
quences of
this attempt

When the commons assembled the next day, they pretended the greatest terror; and passed an unanimous vote that the king had violated their privileges, and that they could not assemble again in the same place, till they should obtain satisfaction, and have a guard for their security. The king had retired to Windsor, and from thence he wrote to his parliament, making every concession, and promising every satisfaction in his power. But they were resolved to accept of nothing unless he would discover his advisers in that illegal measure; a condition to which, they knew, that without rendering himself for ever vile and contemptible, he could not possibly submit.

The commons had already stripped the king of almost

all his privileges; the bishops were fled, the judges were intimidated; it now only remained, after securing the church and the law, that they should get possession of the sword also. The power of appointing governors and generals, and of levying armies, was still a remaining prerogative of the crown. Having therefore first magnified their terrors of Popery, which perhaps they actually dreaded, they proceeded to petition that the Tower might be put into their hands; and that Hull, Portsmouth, and the fleet, should be intrusted to persons of their chusing. These were requests, the complying with which subverted what remained of the constitution; however, such was the necessity of the times, that they were first contended, and then granted. At last, every compliance only increasing the avidity of making fresh demands, the commons desired to have a militia, raised and governed by such officers and commanders as they should nominate, under pretence of securing them from the Irish Papists, of whom they were under the greatest apprehension.

Britain.

114
Commons demand pos-
session of the
executive
power of
the state.

It was here that Charles first ventured to put a stop to his concessions; and that not by a refusal, but a delay. He was at that time at Dover attending the queen and the prince of Orange, who had thought it prudent to leave the kingdom. He replied to the petition, that he had not now leisure to consider a matter of such great importance; and therefore would defer an answer till his return. But the commons were well aware, that though this was depriving him even of the shadow of power, yet they had now gone too far to recede; and they were therefore desirous of leaving him no authority whatever, being conscious that themselves would be the first victims to its fury. They alleged, that the dangers and distempers of the nation were such as could endure no longer delay; and unless the king should speedily comply with their demands, they should be obliged, both for his safety and that of the kingdom, to embody and direct the militia by the authority of both houses. In their remonstrances to the king, they desired even to be permitted to command the army for an appointed time; which so exasperated him, that he exclaimed, "No, not for an hour." This peremptory refusal broke off all further treaty; and both sides were now resolved to have recourse to arms.

115
Refused by
the king.

Charles, taking the prince of Wales with him, retired to York, where he found the people more loyal, and less infected with the frenzy of the times. He found his cause there backed by a more numerous party among the people than he had expected. The queen, who was in Holland, was making successful levies of men and ammunition by selling the crown-jewels. But before war was openly declared, the shadow of a negotiation was carried on, rather with a design to please the people than with any view of reconciliation. Nay, that the king might despair of all composition, the parliament sent him the conditions on which they were willing to come to an agreement. Their demands were contained in 19 propositions, and amounted to a total abolition of monarchical authority. They required that no man should remain in the council who was not agreeable to parliament; that no deed of the king's should have validity unless it passed the council, and was attested under their hand; and that all the officers of state should be chosen with consent of parliament; that none of the royal family should marry without consent of parliament

parliament or council; that the laws should be executed against Catholics; that the votes of Popish lords should be excluded; that the reformation of the liturgy and church-government should take place according to the advice of parliament; that the ordinance with regard to the militia be submitted to; that the justice of parliament may pass upon all delinquents; that a general pardon be granted with such exceptions as should be advised by parliament; that the forts and castles be disposed of by consent of parliament; and that no peers be made but with consent of both houses. War on any terms was esteemed, by the king and all his counsellors, preferable to so ignominious a peace. Charles accordingly resolved to support his authority by force of arms. "His towns (he said) were taken from him; his ships, his army, and his money; but there still remained to him a good cause, and the hearts of his loyal subjects; which, with God's blessing, he doubted not would recover all the rest." Collecting therefore some forces, he advanced southwards, and erected his royal standard at Nottingham.

The king found himself supported in the civil war by the nobility and more considerable gentry. They, dreading a total confusion of rank from the fury of the populace, enlisted themselves under the banner of their monarch; from whom they received, and to whom they communicated, their lustre. The concurrence of the bishops and church of England also increased the adherents of the king; but it may be safely affirmed, that the high monarchical doctrines so much inculcated by the clergy, had never done him any good. The bulk of the nobility and gentry who now attended the king in his distresses, breathed the spirit of liberty as well as of loyalty; and in the hopes alone of his submitting to a limited and legal government they were willing to sacrifice their lives and fortunes.

On the other hand, the city of London, and most of the great corporations, took part with the parliament; and adopted with zeal those democratical principles on which these assemblies were founded. The example of the Dutch commonwealth too, where liberty had so happily supported industry, made the commercial part of the nation desire to see a like form of government established in England. Many families also, who had enriched themselves by commerce, saw with indignation, that, notwithstanding their opulence, they could not raise themselves to a level with the ancient gentry: they therefore adhered to a power by whose success they hoped to acquire rank and consideration.

119
Distressed
condition of
the royalists.

At first every advantage seemed to lie against the royal cause. The king was totally destitute of money. London and all the sea-ports, except Newcastle, being in the hands of parliament, they were secure of a considerable revenue; and the seamen naturally following the disposition of the ports to which they belonged, the parliament had the entire dominion of the sea. All the magazines of arms and ammunition they seized at first; and their fleet intercepted the greatest part of those sent by the queen from Holland. The king, in order to arm his followers, was obliged to borrow the weapons of the train bands, under promise of restoring them as soon as peace should be settled. The nature and qualities of his adherents alone, gave the king some compensation for all the advantages possessed by his adversaries. More bravery and activity were hoped for from

British.

the generous spirit of the nobles and gentry, than from the base disposition of the multitude. And as the landed gentlemen, at their own expence, levied and armed their tenants, besides an attachment to their masters, greater force and courage were to be expected from these rustic troops, than from the vicious and enervated populace of cities. Had the parliamentary forces, however, exerted themselves at first, they might have easily dissipated the small number the king had been able to collect, and which amounted to no more than 800 horse, and 3000 foot; while his enemies were within a few days march of him with 6000 men. In a short time the parliamentary army were ordered to march to Northampton; and the earl of Essex who had joined them found the whole to amount to 15,000. The king's army too was soon reinforced from all quarters; but still, having no force capable of coping with the parliamentary army, he thought it prudent to retire to Derby, and from thence to Shrewsbury, in order to countenance the levies which his friends were making in those parts. At Wellington, a day's march from Shrewsbury, he made a rendezvous of all his forces, and caused his military orders to be read at the head of every regiment. That he might bind himself by reciprocal obligations, he here protested solemnly before his whole army, that he would maintain the Protestant religion according to the church of England; that he would govern according to the known statutes and customs of the kingdom; and particularly, that he would observe inviolable the laws to which he had given his consent during this parliament, &c.

While Charles lay at Shrewsbury, he received the news of an action, the first which had happened in these parts, and wherein his party was victorious. On the appearance of commotions in England, the princes Rupert and Maurice, sons of the unfortunate elector palatine, had offered their service to the king; and the former at that time commanded a body of horse which had been sent to Worcester in order to watch the motions of Essex, who was marching towards that city. No sooner had the prince arrived, than he saw some cavalry of the enemy approaching the gates. Without delay he briskly attacked them, as they were desfilng from a lane, and forming themselves. Colonel Sandys their commander was killed, the whole party routed, and pursued above a mile.

120
They gain
an advantage
over their
enemies.

In 1642, October 23^d, happened a general engagement at Edgehill, in which, though the royalists were at first victorious, their impetuosity lost the advantage they had gained, and nothing decisive happened. Five thousand men, it is said, were found dead on the field of battle. Soon after, the king took Banbury and Reading; and defeated two regiments of his enemies at Brentford, taking 500 prisoners. Thus ended the campaign in 1642; in which, though the king had the advantage, yet the parliamentary army amounted to 24,000 men, and was much superior to his; notwithstanding which, his enemies had been so far humbled as to offer terms of peace.

121
Battle of
Edgehill.

In 1643, the treaty was carried on, but without any cessation of hostilities: and indeed the negotiation went no farther than the first demand on each side; for the parliament, finding no likelihood of coming to an accommodation, suddenly recalled their commissioners. On the 27th of April, Reading surrendered to the par-

liamentary forces under the earl of Essex, who commanded a body of 18,000 men. The earl of Northumberland united in a league for the king the counties of Northumberland, Cumberland, Westmorland, and the bishopric; and engaged, some time after, other counties in the same association. The same nobleman also took possession of York, and dislodged the forces of the parliament at Tadcaster, but his victory was not decisive. Other advantages were also gained by the royalists; the most important of which was the battle of Stratton, where the poet Waller, who commanded the parliament's army, was entirely defeated, and forced to fly with only a few horse to Bristol. This happened on the 13th of July; and was followed by the siege of that city, which surrendered to prince Rupert on the 25th of the same month.

Though the taking of Bristol had cost the royalists dear, yet such a continued run of successes had greatly dispirited the opposite party; and such confusion now prevailed at London, that some proposed to the king to march directly to that city, which it was hoped might be reduced either by an insurrection of the citizens, by victory, or by treaty, and thus an end put to the civil disorders at once. This advice, however, was rejected, on account of the great number of the London militia; and it was resolved first to reduce Gloucester, in consequence of which the king would have the whole course of the Severn under his command. The rich and malcontent counties of the west, having then lost all protection from their friends, might be enforced to pay large contributions as an atonement for their disaffection; an open communication could be preserved between Wales and these new conquests; and half the kingdom being entirely freed from the enemy, and thus united into one firm body, might be employed in re-establishing the king's authority throughout the remainder.

The siege of this city commenced August 10th; but being defended by Massey a resolute governor, and well garrisoned, made a vigorous defence. The consternation at London, however, was as great as if the enemy had been already at their gates; and in the midst of the general confusion, a design was formed by Waller of forcing the parliament to accept of some reasonable conditions of peace. He imparted his design to some others; but a discovery being made of their proceedings, he and two others were condemned to death. Waller, however, escaped with a fine of 10,000*l*. The city of Gloucester in the mean time was reduced to the utmost extremity; and the parliament, as their last resource, dispatched Essex with an army of 14,000 men, in order to force the king to raise the siege of that city. This he accomplished; and when he entered, found only one barrel of gunpowder left, and other provisions in the same proportion. On his return to London, he was intercepted by the king's army, with whom a most desperate battle ensued at Newbury which lasted till night. Though the victory was left undecided, Essex next morning proceeded on his march, and reached London in safety, where he received the applause for his conduct he deserved. The king followed him on his march; and having taken possession of Reading after the earl left it, he there established a garrison, and straitened by that means London and the quarters of the enemy.

127
Advantages gained by Fairfax and Cromwell.

128
Lord Fairfax defeated at Atherton.

129
English parliament ask assistance from the Scots.

130
Solemn league and covenant framed.

In the north, during this summer, the earl, now created marquis of Newcastle, had raised a considerable force for the king; and great hopes of success were entertained from that quarter. There appeared, however, in opposition to him, two men on whom the event of the war finally depended, and who began about this time to be remarked for their valour and military conduct. These were, Sir Thomas Fairfax, son to the lord of that name; and Oliver Cromwell. The former gained a considerable advantage over the royalists at Wakefield, and took general Goring prisoner: the latter obtained a victory at Gainsborough over a party commanded by the gallant Cavendish, who perished in the action. But both these defeats were more than compensated by the total rout of lord Fairfax at Atherton moor, and the dispersion of his army, which happened on the 31st of July. After this victory, the marquis of Newcastle sat down before Hull with an army of 15,000 men; but being beat off by a fall of the garrison, he suffered so much that he thought proper to raise the siege. About the same time, Manchester, who advanced from the eastern associated counties, having joined Cromwell and young Fairfax, obtained a considerable victory over the royalists at Horn castle; where the two last mentioned officers gained renown by their conduct and gallantry. And though fortune had thus balanced her favours, the king's party still remained much superior in those parts of England; and had it not been for the garrison of Hull, which kept Yorkshire in awe, a conjunction of the northern forces with the army in the south might have been made, and had probably enabled the king, instead of entering on the unfortunate, perhaps imprudent enterprise of Gloucester, to march directly to London, and put an end to the war. The battle of Newbury was attended with such loss on both sides, that it put an end to the campaign of 1643, by obliging both parties to retire into winter quarters.

The event of the war being now very doubtful, the king and parliament began both of them to look for assistance from other nations. The former cast his eyes on Ireland, the latter on Scotland. The parliament of England had ever invited the Scots, from the commencement of the civil dissensions, to interpose their mediation, which they knew would be very little favourable to the king, and which for that reason he had declined. Early in the spring 1643, this offer of mediation had been renewed, with no better success than before. The commissioners were also empowered to press the king to a compliance with the Presbyterian worship and discipline. But this he absolutely refused, as well as to call a parliament in Scotland; so that the commissioners, finding themselves unable to prevail in any one of their demands, returned home highly dissatisfied. The English parliament being now in great distress, gladly sent commissioners to Edinburgh, to treat of a more close confederacy with the Scottish nation. The person they principally trusted to on this occasion was Sir Henry Vane, who in eloquence, address, capacity, as well as in art and dissimulation, was not surpassed even by any one in that age so famous for active talents. By his persuasions was framed at Edinburgh the SOLEMN LEAGUE AND COVENANT; which effaced all former protestations and vows taken in both kingdoms, and long maintained its credit and authority.

Britain.

city. In this covenant, the subscribers, besides engaging mutually to defend each other against all opponents, bound themselves to endeavour, without respect of persons, the extirpation of popery and prelacy, superstition, heresy, and profaneness; to maintain the rights and privileges of parliaments, together with the king's authority; and to discover and bring to justice all incendiaries and malignants. They vowed also to preserve the reformed religion established in the church of Scotland; but by the artifice of Vane, no declaration more explicit was made with regard to England and Ireland, than that these kingdoms should be reformed according to the word of God, and the example of the purest churches.

Great were the rejoicings among the Scots, that they should be the happy instruments of extending their mode of religion, and dissipating the profound darknesses in which the neighbouring nations were involved. And being determined that the sword should carry conviction to all refractory minds, they prepared themselves with great vigilance and activity for their military enterprises; so that, having added to their other forces the troops which they had recalled from Ireland, they were ready about the end of the year to enter England under their old general the earl of Leven, with an army of above 20,000 men. The king, in order to secure himself, concluded a cessation of arms with the Irish rebels, and recalled a considerable part of his army from Ireland. Some Irish catholics came over with these troops, and joined the royal army, where they continued the same cruelties and disorders to which they had been accustomed. The parliament voted, that no quarter in any action should ever be given them. But prince Rupert, by making some reprisals, soon expressed this inhumanity.

The campaign of 1644 proved very unfortunate to the royal cause. The forces brought from Ireland were landed at Moyne in North Wales, and put under the command of lord Byron. They besieged and took the castles of Hawarden, Beeston, Acton, and Deddington-house. No place in Cheshire or the neighbourhood now adhered to the parliament, except Nantwich; and to this place Byron laid siege in the depth of winter. Sir Thomas Fairfax, alarmed at so great a progress, assembled an army of 4000 men in Yorkshires; and having joined Sir William Brereton, was approaching to the camp of the royalists. Byron and his soldiers, elated with successes in Ireland, entertained a most profound contempt for their enemies. Fairfax suddenly attacked their camp. The swelling of the river by a thaw, divided one part of the army from another. That part exposed to Fairfax, being beat from their post, retired into the church at Acton, where being surrounded, they were all taken prisoners. The other retreated with precipitation; and thus was dissipated or rendered useless that body of forces which had come from Ireland. This happened on the 25th of January; and on the 11th of April, Colonel Bellaſis was totally defeated at Selby in Yorkshires by Sir Thomas Fairfax, who had returned from Cheshire with his victorious forces. Being afterwards joined by lord Leven, the two generals sat down before the city of York; but being unable to invest that city completely, they were obliged to content themselves with incommoding it by a loose blockade. Hopeton, having as-

sembled a body of 14,000 men, endeavoured to break into Suffex, Kent, and the southern affociation, which seemed well disposed to receive him; but was defeated by Waller at Cherington. At Newark, however, prince Rupert totally defeated the parliamentary army which besieged that place; and thus preserved the communication open between the king's northern and southern quarters.

The great advantages the parliament had gained in the north, seemed now to second their unwarrantable enterprizes, and finally to promise them success. Manchester having taken Lincoln, had united his army to that of Leven and Fairfax; and York was now closely besieged by their numerous forces. That town, tho' vigorously defended by the marquis of Newcastle, was reduced to the last extremity, when prince Rupert, having joined Sir Charles Lucas who commanded Newcastle's horse, hastened to its relief with an army of 20,000 men. The Scots and parliamentary generals raised the siege, and drawing up on Marston moor, proposed to give battle to the royalists. Prince Rupert approached the town by another quarter, and interposing the river Ouse between him and the enemy, safely joined his forces to those of Newcastle. The marquis endeavoured to persuade him, that having so successfully effected his purpose, he ought to be contented with the present advantages, and leave the enemy now much diminished by their losses, and discouraged by their ill success, to dissolve by those mutual diffensions which had begun to take place among them. The prince, however, hurried on by his natural impetuosity, gave immediate orders for fighting. The battle was lost, the royal army entirely pushed off the field, and the train of artillery taken. Immediately after this unfortunate action the marquis of Newcastle left the kingdom, and prince Rupert retired into Lancashire. The city of York was surrendered in a few days, and Newcastle soon after taken by storm.

This was a fatal blow to the royal cause, and far from being balanced by an advantage gained at Croprey bridge by the king over Waller, or even by the disarming of Essex's forces, which happened on the 1st of September. On the 27th of October, another battle was fought at Newbury, in which the royalists were worsted, but soon after retrieved their honour at Dennington castle, which finished the campaign in 1644.

In 1645, a negotiation was again set on foot, and the commissioners met at Uxbridge on the 30th of January; but it was soon found impossible to come to any agreement. The demands of the parliament were exorbitant; and what was worse, their commissioners owned them to be nothing but preliminaries. The king was required to attain, and except from a general pardon, 40 of the most considerable of his English subjects, and 19 of his Scots, together with all the Popish recusants who had born arms for him. It was insisted that 48 more, with all the members of either house who had sat in the parliament called by the king at Oxford, all lawyers and divines who had embraced the king's party, should be rendered incapable of any office, be forbid the exercise of their profession, be prohibited from coming within the verge of the court, and forfeit the third of their estates to the parliament. It was required, that whoever had born arms for the king should forfeit the tenth of their estates; or if that

did not suffice, the sixth, for the payment of public debts. As if royal authority were not sufficiently annihilated by these terms, it was demanded that the court of wards should be abolished; that all the considerable officers of the crown, and all the judges, should be appointed by parliament; and that the right of peace and war should not be exercised without consent of parliament. A little before the commencement of this fruitless treaty, the parliament, to shew their determined resolution to proceed in the same haughty imperious method in which they had begun, brought to the block archbishop Laud, who had long been a prisoner in the Tower, and was incapable of giving offence to any.

Exploits of
the earl of
Montrose in
Scotland.

While the king's affairs thus went to decay in England, they seemed to revive a little in Scotland, thro' the conduct and valour of the earl of Montrose, a young nobleman newly returned from his travels. He had been introduced to the king; but, not meeting with an agreeable reception, had gone over to the covenanters, and been active in forwarding all their violence. Being commissioned, however, by the *tables*, to wait upon the king while the army lay at Berwick, he was fo gained by the civilities and caresses of that monarch, that he thenceforth devoted himself entirely, though secretly, to his service. For attempting to form an association in favour of the royal cause, Montrose was quickly thrown into prison; but being again released, he found the king ready to give ear to his counsels, which were of the boldest and most daring kind. Though the whole nation of Scotland was occupied by the covenanters, though great armies were kept on foot by them, and every place guarded by a vigilant administration, he undertook by his own credit, and that of the few friends who remained to the king, to raise such commotions, as would soon oblige those malcontents to recal the forces which had so sensibly thrown the balance in the favours of parliament. The defeat at Marston-moor had left him no hopes of any succours from England; he was therefore obliged to stipulate with the earl of Antrim, a nobleman of Ireland, for some supply of men from that country. And he himself having used various disguises, and passed through many dangers, arrived in Scotland, where he lay for some time concealed in the borders of the Highlands.

The Irish did not exceed 1100 foot, very ill armed. Montrose immediately put himself at their head; and, being joined by 1300 Highlanders, attacked lord Elcho, who lay at Perth with 6000 men, utterly defeated him, and killed 2000 of the covenanters. He next marched northwards, in order to rouse again the marquis of Huntly and the Gordons, who had taken arms before, but been suppressed by the covenanters. At Aberdeen he attacked and entirely defeated lord Burley, who commanded 2500 men. Montrose, however, by this victory, did not obtain the end he proposed; the marquis of Huntly shewed no inclination to join an army where he was so much eclipsed by the general.

Montrose was now in a very dangerous situation. Argyle, reinforced by the earl of Lothian, was behind him with a great army. The militia of the northern counties, Murray, Ross, and Caithness, to the number of 5000, opposed him in front, and guarded the banks of the Spey, a deep and rapid river. In order

Vol. II.

to save his troops, he turned aside into the hills; and after some marches and countermarches, Argyle came up with him at Faigy cattle; and here after some skirmishes, in which he was always victorious, Montrose got clear of a superior army, and by a quick march through these almost inaccessible mountains put himself absolutely beyond their power.

It was the misfortune of this general, that very good or very ill fortune were equally destructive of his army. After every victory his Scots soldiers went home to enjoy the spoil they had acquired; and had his army been composed of these only, he must have soon been abandoned altogether; but his Irishmen having no place to which they could retire, adhered to him in every fortune. With these, therefore, and some reinforcements of the Atholmen and Macdonalds, Montrose fell suddenly upon Argyle's country, letting loose upon it all the horrors of war. Argyle, collecting 3000 men, marched in quest of the enemy, who had retired with their plunder; and he lay at Innerloch, supposing himself to be still at a good distance from them. The earl of Seaforth, at the head of the garrison of Inverness, and a body of 5000 new-levied troops, pressed the royalists on the other side, and threatened them with total destruction. By a quick and unexpected march, Montrose hastened to Innerloch, and presented himself in order of battle before the covenanters. Argyle alone, seized with a panic, deserted his army. They made a vigorous resistance, however; but were at last defeated and pursued with great slaughter: after which, Montrose was joined by great numbers of Highlanders; Seaforth's army dispersed of itself; and the lord Gordon, eldest son to the marquis of Huntly, having escaped from his uncle Argyle, who had hitherto detained him, now joined Montrose with a considerable number of his followers, attended by the earl of Aboyne.

The council at Edinburgh, alarmed at these victories, sent for Baillie, an officer of reputation, from England; and, joining him in command with Urrey, sent them with a considerable army against the royalists. Montrose, with a detachment of 800 men, had attacked Dundee, a town extremely attached to the covenant; and having carried it by assault, had given it up to be plundered by his soldiers; when Baillie and Urrey with their whole force came upon him. He instantly called off his soldiers from the plunder; put them in order; secured his retreat by the most skilful measures; and having marched 60 miles in the face of an enemy much superior, without stopping, or allowing his soldiers the least sleep or refreshment, at last secured himself in the mountains. His antagonists now divided their forces, in order to carry on the war against an enemy who surprised them as much by the rapidity of his marches as by the boldness of his enterprises. Urrey met him with 4000 men, at Alderac near Inverness; and trusting to his superiority in numbers (for Montrose had only 2000 men), attacked him in the post which he had chosen. Montrose, having placed his right wing in strong ground, drew the best of his forces to the other, and left no main body between them; a defect which he artfully concealed by shewing a few men through trees and bushes with which that ground was covered. That Urrey might have no leisure to perceive the stratagem, he instantly led his wing to the charge, made a furious attack on the covenanters, drove

them off the field, and obtained a complete victory over their defeat. Baillie now advanced, in order to revenge Urrey's defeat; but he himself met with a like fate at Alford. Montrose, weak in cavalry, lined his troops of horse with infantry; and, after putting the enemy's horse to rout, fell with united force upon their foot, which were entirely cut in pieces, though with the loss of the gallant lord Gordon on the part of the royalists.—Having thus prevailed in so many battles, which his vigour always rendered as decisive as they were successful, he prepared for marching into the southern provinces, in order to put a total period to the power of the covenanters, and dissipate the parliament, which with great pomp and solemnity they had ordered to meet at St Johnstone's.

139
Parliamentary
new model
led.

While Montrose was thus signaling his valour in the north, Fairfax, or rather Oliver Cromwell under his name, employed himself in bringing in a *new model* into the parliamentary army, and throwing the whole troops into a different shape; and never surely was a more singular army established, than that which was now set on foot by the parliament. To the greatest number of the regiments chaplains were not appointed. The officers assumed the spiritual duty, and united it with their military functions. During the intervals of action they occupied themselves in sermons, prayers, and exhortations. Rapturous ecstasies supplied the place of study and reflection; and while the zealous devotees poured out their thoughts in unpremeditated harangues, they mistook that eloquence, which to their own surprise, as well as that of others, flowed in upon them, for divine illuminations, and insapies of the Holy Spirit. Wherever they were quartered, they excluded the minister from his pulpit; and, usurping his place, conveyed their sentiments to the audience with all the authority that followed their power, their valour, and their military exploits, united to their apparent zeal and fervour. The private soldiers were seized with the same spirit; and in short, such an enthusiasm seized the whole army as was perhaps scarce ever equalled.

The royalists ridiculed this fanaticism of the parliamentary armies, without being sensible how much reason they had to dread it. They were at this time equal, if not superior, in numbers to their enemies; but so licentious, that they were become more formidable to their friends than their enemies. The commanders were most of them men of dissolute characters; in the west especially, where Goring commanded, universal spoil and havoc were committed; and the whole country was laid waste by the rapine of the army; so that the most devoted friends both to the church and state wished there for such success to the parliamentary forces as might put an end to these disorders.

140
Royalists
defeated at
Naseby.

The natural consequence of such enthusiasm in the parliamentary army, and licentiousness in that of the king, was, that equal numbers of the latter would no longer maintain their ground against the former. This appeared in the decisive battle of Naseby, where the forces were nearly equal; but after an obstinate engagement, Charles was entirely defeated, 500 of his officers and 4000 private men made prisoners, all his artillery and ammunition taken, and his infantry totally dispersed; so that scarce any victory could be more complete.

After this fatal battle, the king retired first to Here-

ford, then to Abergavenny; and remained some time in Wales, from the vain hope of raising a body of infantry in these quarters already harried and exhausted. His affairs now, however, went to ruin in all quarters. Fairfax retook Leicester on the 17th of June. On the 10th of July, he raised the siege of Taunton; and the royalists retired to Lampport, an open town in the county of Somerset. Here they were attacked by Fairfax, and beat from their post, with the loss of 300 killed and 1400 taken prisoners. This was followed by the loss of Bridgewater, which Fairfax took three days after; making the garrison, to the number of 2600 men, prisoners of war. He then reduced Bath and Sharburn; and on the 11th of September Bristol was ¹⁴¹ surrendered to him by prince Rupert, though a few ^{ken.} days before he had boasted in a letter to Charles, that he would defend the place for four months. This so enraged the king, that he immediately recalled all the prince's commissions, and sent him a pass to go beyond sea.

The Scots in the mean time, having made themselves masters of Carlisle after an obstinate siege, marched southwards and invested Hereford; but were obliged to raise the siege on the king's approach. And this was the last glimpse of success that attended his arms. Having marched to the relief of Chester, which was anew besieged by the parliamentary forces under colonel Jones, his rear was attacked by Pointz, and an engagement immediately ensued. While the fight was continued with great obstinacy, and victory seemed to incline to the royalists, Jones fell upon them from the other side, and defeated them with the loss of 600 killed and 1000 taken prisoners. The king with the remains of his army fled to Newark; and from thence escaped to Oxford, where he shut himself up during the winter season.

142
Charles re-
tires to Ox-
ford.

After the surrender of Bristol, Fairfax and Cromwell, having divided their forces, the former marched westwards in order to complete the conquest of Devonshire and Cornwall; the latter attacked the king's garrisons which lay the east of Bristol. Nothing was able to stand before these victorious generals; every town was obliged to submit, and every body of troops that pretended to resist were utterly defeated. At last, news arrived, that Montrose himself, after some more successes, was defeated; and thus the only hope of the royal party was destroyed.

When that brave general descended into the southern counties, the covenanters, assembling their whole force, met him with a numerous army, and gave him battle at Kilsyth. Here he obtained his most memorable victory: 6000 of the covenanters were killed on the spot, and no remains of an army left them in Scotland. Many noblemen, who secretly favoured the royal cause, now declared openly for it, when they saw a force able to support them. The marquis of Douglas, the earls of Annandale and Hartfield, the lords Fleming, Seton, Maderty, Carnegie, with many others, flocked to the royal standard. Edinburgh opened its gates, and gave liberty to all the prisoners there detained by the covenanters. Among the rest was lord Ogilvy, son to Airly, whose family had contributed very much to the victory gained at Kilsyth.—David Lesly was detached from the army in England, and marched to the relief of his distressed party in Scotland. Montrose advan-

Britain. ced still further to the south, allured by the vain hopes, both of rousing to arms the earls of Hume, Traquaire, and Roxborough, who had promised to join him; and of obtaining from England some supply of cavalry, in which he was very deficient. By the negligence of his scouts, Lesly, at Philip-haugh in the forest, surprized his army, much diminished in numbers from the desertion of the Highlanders, who had retired to the hills, according to custom, to secure their plunder. After a sharp conflict, in which Montrose exerted great valour, his forces were routed by Lesly's cavalry, and he himself forced to fly to the mountains.

144 Charles fur-
renders
himself to
the Scots.

Nothing could be more affecting than the situation in which the king now was. He now resolved to grant the parliament their own terms, and sent them repeated messages to this purpose, but they never deigned to make him the least reply. At last, after reproaching him with the blood spilt during the war, they told him that they were preparing some bills, to which, if he would consent, they would then be able to judge of his pacific inclinations. Fairfax, in the mean time, was advancing with a victorious army in order to lay siege to Oxford; and Charles, rather than submit to be taken captive and led in triumph by his insolent subjects, resolved to give himself up to the Scots, who had never testified such implacable animosity against him, and to trust to their loyalty for the rest. After passing through many bye-ways and cross-roads, he arrived in company with only two persons, Dr Hudson and Mr Alburnham, at the Scots camp before Newark, and discovered himself to lord Leven their general.

145 Who fell
him to the
English.

The reception he met with was such as might be expected from these infatuated bigots, delitute of every principle of reason, honour, or humanity. Instead of endeavouring to alleviate the distresses of their sovereign, they suffered him to be insulted by the clergyman. They immediately sent an account of his arrival to the English parliament, and they as quickly entered into a treaty with the Scots about delivering up their prisoner. The Scots thought this a proper time for the recovery of their arrears due to them by the English. A great deal was really due them, and they claimed much more than actually belonged to them. At last, after various debates between them and the parliament, in which they pretended to great honour, and insisted upon many punctilios, it was agreed, that, upon payment of 400,000*l.* the Scots should deliver up the king to his enemies; and this was cheerfully complied with. Thus the Scots justly fell under the censure of having sold their king who had thrown himself upon their mercy; a stain peculiar to the nation, and unparalleled in history either ancient or modern. It must, however, be acknowledged, that the infamy of this bargain had such an influence on the Scots parliament, that they once voted that the king should be protected, and his liberty insisted on. But the general assembly interposed; and pronounced, that as he had refused to take the covenant which was pressed on him, it became not the godly to concern themselves about his fortunes. In consequence of this, the parliament were obliged to retract their vote. The king, being delivered over to the English commissioners, was conducted under a guard to Holdenby in the county of Northampton, where he was very rigorously confined; his ancient servants being dismissed, himself debarred from visits, and all communication cut off with his

friends or family.

The civil war being now over, the king absolved his followers from their allegiance, and the parliament had now no enemy to fear but their own troops. From this quarter their danger only arose; and it was not long before they found themselves in the same unfortunate situation to which they had reduced the king. The majority of the house were presbyterians, but the majority of the army were independents. The former, soon after the retreat of the Scots, seeing every thing reduced to obedience, proposed to disband a considerable part of the army, and send the rest over to Ireland. This was by no means relished, and Cromwell took care to heighten the disaffection. Instead of preparing to disband, therefore, the soldiers resolved to petition; and they began by desiring an indemnity, ratified by the king, for any illegal actions which they might have committed during the war. The commons voted that this petition tended to introduce mutiny, &c. and threatened to proceed against the promoters of it as enemies to the state and disturbers of the public peace. The army now began to set up for themselves. In opposition to the parliament at Westminster, a military parliament was formed. The principal officers formed a council to represent the body of peers; the soldiers collected two men out of each company to represent the commons, and these were called the *agitators of the army*; and of this assembly Cromwell took care to be a member. The new parliament soon found many grievances to be redressed; and specified some of the most considerable. The commons were obliged to yield to every request, and the demands of the agitators rose in proportion. The commons accused the army of mutiny and sedition; the army retorted the charge, and alleged that the king had been deposed only to make way for their usurpations. Cromwell, in the mean time, who secretly conducted all the measures of the army, while he exclaimed against their violence, resolved to seize the king's person. Accordingly a party of 500 horse appeared at Holmby castle, under the command of one Joyce, originally a taylor, but now a cornet; and by this man was the king conducted to the army, who were hastening to their rendezvous at Triplo-heath near Cambridge. Next day Cromwell arrived among them, where he was received with acclamations of joy, and immediately invested with the supreme command.

The commons now saw the designs of the army; but it was too late, all resistance was become vain: Cromwell advanced with precipitation, and was in a few days at St Albans. Even submission was now to no purpose; the army still rose in their demands, in proportion as these demands were gratified, till at last they claimed a right of modelling the whole government, and settling the nation.

Cromwell began with accusing eleven members of the house, the very leaders of the presbyterian party, as guilty of high treason, and being enemies of the army. The commons were willing to protect them; but the army insisting on their dismissal, they voluntarily left the house. At last the citizens of London, finding the constitution totally overturned, and a military despotism beginning to take place, instead of the kingly one they were formerly afraid of, began to think seriously of repressing the insolence of the troops. The common council assembled the militia of the city; the works were

Britain.

manned; and a manifesto published, aggravating the hostile intentions of the army. Finding that the commons, in compliance with the request of the army, had voted that the city-militia should be disbanded, the multitude rose, besieged the door of the house, and obliged them to reverse that vote they had so lately passed. The assembly was, of consequence, divided into two parties; the greater part siding with the citizens; but the minority, with the two speakers at their head, were for encouraging the army. Accordingly the two speakers, with 62 of the members, secretly retired from the house, and threw themselves under the protection of the army who were then at Hounslow-heath. They were received with shouts and acclamations; their integrity was extolled; and the whole force of the soldiery, to the number of 20,000 men, now moved forward to reinstate them in their places.

In the mean time, the part of the house which was left, resolved to resist the encroachments of the army. They chose new speakers, gave orders for enlisting troops, ordered the train-bands to man the lines; and the whole city boldly resolved to resist the invasion. But this resolution only held while the enemy was at a distance; for when Cromwell appeared, all was obedience and submission: the gates were opened to the general, who attended the two speakers and the rest of the members peaceably to their habitations. The eleven impeached members being accused as causes of the tumult, were expelled; and most of them retired to the continent. The mayor, sheriff, and three aldermen, were sent to the tower; several citizens, and officers of the militia, were committed to prison; and the lines about the city levelled with the ground. The command of the Tower was given to Fairfax, the general; and the parliament ordered him their hearty thanks for disobeying their commands.

It now only remained to dispose of the king, who remained a prisoner at Hampton-court. The independent army, at the head of whom was Cromwell, on one hand; and the presbyterians, in name of both houses, on the other; treated with him separately in private. He had sometimes even hopes, that, in these struggles for power, he might have been chosen mediator in the dispute; and he expected that the kingdom at last, being sensible of the miseries of anarchy, would of its own accord be hushed into its former tranquil condition. At this time he was treated with some flattering marks of distinction; he was permitted to converse with his old servants; his chaplains were admitted to attend him, and celebrate divine service their own way. But the most exquisite pleasure he enjoyed was in the company of his children, with whom he had several interviews. The meeting on these occasions was so pathetic, that Cromwell himself, who was once present, could not help being moved, and was heard to declare, that he never beheld such an affecting scene before. But these instances of respect were of no long continuance. As soon as the army had gained a complete victory over the house of commons, the king was treated not only with the greatest disrespect, but even kept in continual alarms for his own personal safety. The consequence of this was, that Charles at last resolved to withdraw himself from the kingdom. Accordingly, on the 11th of November 1647, attended only by Sir John Berkeley, Ashburnham, and Leg, he privately left Hamp-

ton court; and his escape was not discovered till near an hour after; when those who entered his chamber, found on the table some letters directed to the parliament, to the general, and to the officer who had attended him. All night he travelled thro' the forest, and arrived next day at Titchfield, a seat of the earl of Southampton, where resided the countess dowager, a woman of honour, to whom the king knew he might safely entrust his person. Before he arrived at this place, he had gone to the sea coast: and expressed great anxiety that a ship which he seemed to look for, had not arrived. He could not hope to remain long concealed at Titchfield: the question was, what measure should next be embraced? In the neighbourhood lay the Isle of Wight, of which Hammond was governor. This man was entirely dependent on Cromwell, which was a very unfavourable circumstance: yet because the governor was nephew to Dr Hammond the king's favourite chaplain, and had acquired a good reputation in the army, it was thought proper to have recourse to him in the present exigence, when no other rational expedient could be thought of. Ashburnham and Berkeley were dispatched to the island. They had orders not to inform Hammond of the place where the king lay concealed, till they had first obtained a promise of him not to deliver up his majesty, even though the parliament and army should require him; but restore him to his liberty, if he could not protect him. The promise would have been but a very slender security: yet even without exacting it, Ashburnham imprudently, if not treacherously, brought Hammond to Titchfield; and the king was obliged to put himself into his hands, and to attend him to Carisbrooke castle in the isle of Wight, where, though he was received with great demonstrations of respect and kindness, he was in reality a prisoner.

While the king continued in this forlorn situation, Cromwell found himself upon the point of losing all the fruits of his former schemes, by having his own principles turned against himself. Among the Independents, who in general were for no ecclesiastical subordination, a set of men grew up called *levellers*, who disallowed all subordination whatsoever, and declared that they would have no other chaplain, king, or general, but Jesus Christ. Though this would have gone down very well with Cromwell as long as it was only directed against his enemies, he did not so well relish it when applied to himself. Having intimation that the levellers were to meet at a certain place, he unexpectedly appeared before them at the head of his red regiment, which had hitherto been deemed invincible. He demanded, in the name of God, what these meetings and murmurings meant; he expostulated with them upon the danger and consequence of their precipitant schemes, and desired them immediately to depart. Instead of obeying, however, they returned an insolent answer; wherefore, rushing on them in a fury, he laid two of them dead at his feet. His guards dispersing the rest, he caused several of them to be hanged upon the spot, and sent others to London; and thus dissipated a faction no otherwise criminal than in having followed his own example.

Cromwell's authority was greatly increased by the last mentioned action; but it became irresistible in consequence of a new and unexpected addition to his success. The Scots, perhaps ashamed of the reproach

of having fold their king, and stimulated farther by the Independents, who took all occasions to mortify them, raised an army in his favour, and the chief command was given to the earl of Hamilton; while Langdale, who professed himself at the head of the more bigotted party who had taken the covenant, marched at the head of his separate body, and both invaded the north of England. Though these two armies amounted to above 20,000 men, yet Cromwell, at the head of 8000 of his hardy veterans, feared not to give them battle. He attacked them one after another; routed and dispersed them; took Hamilton prisoner; and, following his blow, entered Scotland, the government of which he settled entirely to his satisfaction. An insurrection in Kent was quelled by Fairfax with the same ease; and nothing but success attended all this usurper's attempts.

155
Negotiation
between the
king and
parliament.

During these contentions, the king, who was kept a prisoner at Carisbrook castle, continued to negotiate with the parliament for settling the unspeakable calamities of the kingdom. The parliament now saw no other method of destroying the military power, but to depress it by the kingly. Frequent proposals for an accommodation passed between the captive king and the commons; but the great obstacle which had all along stood in the way, still kept them from agreeing. This was the king's refusing to abolish episcopacy, tho' he consented to alter the liturgy. However, the treaty was still carried on with vigour, and the parliament for the first time seemed in earnest to conclude their negotiations. But all was now too late. The victorious army, with Cromwell at their head, advanced to Windsor, and with furious remonstrances began to demand vengeance on the king. The unhappy monarch had been lately sent under confinement to that place; and from thence he was now conveyed to Hurst-castle in Hampshire, opposite to the isle of Wight. The parliament in the mean time began to issue ordinances for a more effectual opposition to these military encroachments, when they were astonished by a message from Cromwell, that he intended paying them a visit next day with his whole army; and in the mean time ordering them to raise him 40,000*l.* on the city of London.

The commons, though destitute of all hopes of prevailing, had still the courage to resist, and to attempt in the face of the whole army to finish the treaty they had begun with the king. They had taken into consideration the whole of his concessions; and though they had formerly voted them unsatisfactory, they now renewed the consultation with great vigour. After a violent debate which lasted three days, it was carried in the king's favour by a majority of 129 against 83, that his concessions were a foundation for the houses to proceed upon in settling the affairs of the nation. This was the last attempt in his favour; for the next day colonel Pride, at the head of two regiments, blockaded the house; and seizing in the passage 41 members of the presbyterian party, sent them to a low room belonging to the house, that passed by the denomination of *Hell*. Above 160 members more were excluded; and none were allowed to enter but the most furious and determined of the Independents, in all not exceeding 60. This atrocious invasion of parliamentary rights commonly passed by the name of *Pride's purge*, and the remaining members were called the *Rump*. These

156
Colonel
Pride's
purge.

foen voted, that the transactions of the house a few days before were entirely illegal, and that their general conduct was just and necessary.

Nothing now remained, to complete the wickedness of this parliament, but to murder the king. In this assembly, therefore, composed of the most obscure citizens, and officers of the army, a committee was appointed to bring in a charge against the king; and on their report, a vote passed declaring it treason in a king to levy war against his parliament. It was therefore resolved, that an high court of justice should be appointed, to try his majesty for this new invented treason. For form's sake, they desired the concurrence of the few remaining lords in the upper house; but there was virtue enough left in that body unanimously to reject the proposal. The commons, however, were not to be stopped by so small an obstacle. They voted that the concurrence of the house of lords was unnecessary, and that the people were the origin of all just power. To add to their zeal, a woman of Herefordshire, illuminated by prophetic visions, desired admittance, and communicated a revelation she pretended to have received from heaven. She assured them that their measures were consecrated from above, and ratified by the sanction of the Holy Ghost. This intelligence gave them great comfort, and much confirmed them in their present resolutions.

Colonel Harrison, the son of a butcher, was commanded to conduct the king from Hurst-castle to Windsor, and from thence to London. His afflicted subjects, who ran to have a sight of their sovereign, were greatly affected at the change that appeared in his face and person. He had permitted his beard to grow; his hair was become venerably grey, rather by the pressure of anxiety than the hand of time; while the rest of his apparel bore the marks of misfortune and decay. He had long been attended by an old decrepid servant whose name was *Sir Philip Warwick*, who could only deplore his master's fate without being able to revenge his cause. All the exterior symbols of sovereignty were now withdrawn, and his attendants had orders to serve him without ceremony. He could not, however, be persuaded that his adversaries would bring him to a formal trial; but he every moment expected to be dispatched by private assassination.

From the 6th to the 20th of January was spent in making preparations for this extraordinary trial. The court of justice consisted of 133 persons named by the commons; but of these never above 70 met upon the trial. The members were chiefly composed of the principal officers of the army, most of them of very mean birth, together with some of the lower house, and a few citizens of London. Bradshaw a lawyer was chosen president; Coke was appointed solicitor for the people of England; Dorislaus, Steele, and Alke, were named assistants. The court sat in Westminster-hall. When the king was brought forward before the court, he was conducted by the mace-bearer to a chair placed within the bar. Though long detained a prisoner, and now produced as a criminal, he still maintained the dignity of a king. His charge was then read by the solicitor, accusing him of having been the cause of all the bloodshed which followed since the commencement of the war; after which Bradshaw directed his discourse to him, and told him that the court expected his answer.

157
Charge against
the
king
brought in.

B R I [1426] B R I

The king began his defence with declining the authority of the court. He represented, that having been engaged in treaty with his two houses of parliament, and having finished almost every article, he expected a different treatment from what he had now received. He perceived, he said, no appearance of an upper house, which was necessary to constitute a just tribunal. He alleged that he was himself the king and fountain of law, and consequently could not be tried by laws to which he had never given his assent; that having been intrusted with the liberties of the people, he would not now betray them by recognizing a power founded in usurpation; that he was willing, before a proper tribunal, to enter into the particulars of his defence; but that before them he must decline any apology for his innocence, lest he should be considered as the betrayer of, and not a martyr for, the constitution. Bradshaw, in order to support the authority of the court, insisted, that they had received their authority from the people, the source of all right. He pressed the king not to decline the authority of the court that was delegated by the commons of England, and interrupted and over-ruled him in his attempts to reply. In this manner the king was three times produced before the court, and as often persisted in declining its jurisdiction. The fourth and last time he was brought before this self-created tribunal, as he was proceeding thither, he was insulted by the soldiers and the mob, who cried out, "Justice! justice! Execution! execution!" but he continued undaunted. His judges having now examined some witnesses, by whom it was proved that the king had appeared in arms against the forces commissioned by parliament, they pronounced sentence against him. He seemed very anxious at this time to be admitted to a conference with the two houses, and it was supposed that he intended to resign the crown to his son; but the court refused compliance, and considered his request as an artifice to delay justice.

159
He is insulted by the soldiers.

The behaviour of Charles under all these instances of low-bred malice was great, firm, and equal. In going through the hall from this execrable tribunal, the soldiers and rabble were again incited to cry out, justice and execution! They reviled him with the most bitter reproaches. Among other insults, one miscreant presumed to spit in the face of his sovereign. He patiently bore their insolence: "Poor souls (cried he), they would treat their generals in the same manner for sixpence." Those of the populace who still retained the feelings of humanity expressed their sorrow in sighs and tears. A soldier more compassionate than the rest could not help imploring a blessing on his royal head. An officer overhearing him, struck the honest sentinel to the ground before the king; who could not help saying, that the punishment exceeded the offence.

At his return to Whitehall, Charles desired permission of the house to see his children, and to be attended in his private devotions by Dr Juxon late bishop of London. These requests were granted, and also three days to prepare for execution. Every night between his sentence and execution, the king slept sound as usual, though the noise of the workmen employed in framing the scaffold continually resounded in his ears. The fatal morning being at last arrived, he rose early; and calling one of his attendants, he had him employ more

160
His execution.

than usual care in dressing him, and preparing him for so great a solemnity. The street before Whitehall was the place defined for his execution; for it was intended that this should increase the severity of his punishment. He was led through the banquetting-house to the scaffold adjoining to that edifice, attended by his friend and servant bishop Juxon, a man of the same mild and steady virtues with his master. The scaffold, which was covered with black, was guarded by a regiment of soldiers under the command of colonel Tomlinson; and on it were to be seen the block, the ax, and two executioners in masques. The people, in crowds, stood at a greater distance. The king surveyed all these solemn preparations with calm composure; and, as he could not expect to be heard by the people at a distance, he addressed himself to the few persons who stood round him. He there justified his own innocence in the late fatal wars: he observed, that he had not taken arms till after the parliament had sworn him the example; and that he had no other object in his warlike preparations, than to preserve that authority entire which had been transmitted to him by his ancestors. But, though innocent towards his people, he acknowledged the equity of his execution in the eyes of his Maker: he owned that he was justly punished for having consented to the execution of an unjust sentence against the earl of Strafford. He forgave all his enemies; exhorted the people to return to their obedience, and acknowledge his son as his successor; and signified his attachment to the Protestant religion as professed by the church of England. So strong was the impression made by his dying words on those who could hear him, that colonel Tomlinson himself, to whose care he had been committed, acknowledged himself a convert. At one blow his head was severed from his body. The other executioner then, holding up the head, exclaimed, "This is the head of a traitor."

It is impossible to describe the grief, indignation, and astonishment, which took place, not only among the spectators, who were overwhelmed with a flood of sorrow, but throughout the whole nation, as soon as the report of this fatal execution was conveyed to them. Each blamed himself either with active disloyalty to the king, or a passive compliance with his destroyers. The very pulpits that used to resound with insolence and sedition were now bedewed with tears of unfeigned repentance; and all united in their detestation of those dark hypocrites who, to satisfy their own enmity, involved a whole nation in the guilt of treason.—Charles was executed on the 30th of January 1649, in the 49th year of his age, and 24th of his reign. He was of a middling stature, robust, and well-proportioned. His visage was pleasant, but melancholy; and it is probable that the continual troubles in which he was involved might have made that impression on his countenance.

It being remarked, that the king, the moment before he stretched out his neck to the executioner, had said to Juxon, with a very earnest accent, the single word REMEMBER; great mysteries were supposed to be concealed under that word; and the generals vehemently insisted with the prelate that he should inform them of the king's meaning. Juxon told them, that the king, having frequently charged him to inculcate on his son the forgiveness of his murderers, had taken this opportunity in the last moment of his life, when his commands,

Britain.

commands, he supposed, would be regarded as sacred and inviolable, to reiterate that desire; and that his mild spirit thus terminated its present course by an act of benevolence to his greatest enemies.

The dissolution of the monarchy in England soon followed the death of the monarch. When the peers met on the day appointed in their adjournment, they entered upon business; and sent down some votes to the commons, of which the latter deigned not to take the least notice. In a few days after, the commons voted, that the house of lords was useless and dangerous; for which reason it was abolished. They voted it high treason to acknowledge Charles Stuart, son of the late king, as successor to the throne. A great seal was made: on one side of which were engraven the arms of England and Ireland, with this inscription, "The great seal of England." On the reverse was represented the house of commons sitting, with this motto: "On the first year of freedom, by God's blessing restored, 1648." The forms of all public business were changed from being transacted in the king's name, to that of the *keepers of the liberties of England*. The court of king's bench was called the court of *public bench*. Nay, so cautious on this head, it is said, were some of the republicans, that, in reciting the Lord's prayer, they would not say, "thy kingdom," but "thy *commonwealth*, come." The king's statue in the exchange was thrown down; and on the pedestal these words were inscribed: *Exit tyrannus, regnum ultimus*; "The tyrant is gone, the last of the kings." The commons, it is said, intended to bind the princess Elizabeth apprentice to a button-maker; the duke of Gloucester was to be taught some other mechanical employment: but the former soon died, of grief, as is supposed, for her father's tragical end; the latter was sent beyond sea by Cromwell.

The commons next proceeded to punish those who had been most remarkable for their attachment to their late sovereign. The duke of Hamilton, lord Capel, and the earl of Holland, were condemned and executed; the earl of Norwich and Sir John Owen were also condemned, and afterwards pardoned. These executions irritated the Scots: their loyalty began to return; and the insolence of the independents, with their victories, inflamed them still more. They determined, therefore, to acknowledge prince Charles for their king, but at the same time to abridge his power by every limitation which they had attempted to impose on his father.

Charles, after the death of his father, having passed some time at Paris, and finding no likelihood of assistance from that quarter, was glad to accept of any conditions. The Scots, however, while they were thus professing loyalty to their king, were nevertheless cruelly punishing his adherents. Among others, the brave marquis of Montrose was taken prisoner, as he endeavoured to raise the Highlanders in the royal cause; and, being brought to Edinburgh, was hanged on a gibbet 30 feet high, then quartered, and his limbs stuck up in the principal towns of the kingdom. Yet, notwithstanding all this severity, Charles ventured into Scotland, and had the mortification to enter the gate of Edinburgh where the limbs of that faithful adherent were still exposed.

The young king soon found that he had only exchanged his exile for imprisonment. He was surrounded

and incessantly importuned by the fanatical clergymen, who, having brought royalty under their feet, were resolved to keep it still subservient, and to trample upon it with all the contumely of upstarts. Charles pretended to give ear to their discourses; but, however, made an attempt to escape. He was overtaken and brought back; when he owned the greatness of his fault, and testified his repentance for what he had done. Cromwell, in the mean time, who had been appointed by the parliament to command the army in Ireland, prosecuted the war in that kingdom with his usual success. He had to encounter the royalists commanded by the duke of Ormond, and the native Irish led on by O'Neal. These troops he quickly overcame; and most of the towns, intimidated by his cruelty, opened their gates at his approach. He was on the point of reducing the whole kingdom, when he was recalled by the parliament to defend his country against the Scots, who had raised a considerable army in support of the royal cause.

On the return of Cromwell to England, he was chosen commander in chief of the parliamentary forces, in the room of Fairfax, who declined opposing the presbyterians. The new general immediately set forward for Scotland with an army of 16,000 men, where he was opposed by general Leslie, who formed an excellent plan for his own defence. This prudent commander, knowing his men to be inferior in valour and discipline, however superior in numbers, to those of Cromwell, kept himself carefully in his intrenchments. At last Cromwell was drawn into a very disadvantageous post near Dunbar, where his antagonist waited deliberately to take advantage of him. From this imminent danger, however, he was delivered by the madness of the Scots clergy. They, it seems, had been wrestling in prayer with the Lord night and day, and at last fancied that they had obtained the superiority. Revelations were made them, that the heretical army, together with Agag their general, would be delivered into their hand. Upon the assurances of these visions, they obliged their general to descend into the plain, and give the English battle. When Cromwell saw this mad action, he assured his followers, that the Lord had delivered them into his hands, and ordered his army to sing psalms, as if already certain of victory. The Scots, though double the number of the English, were soon put to flight, and pursued with great slaughter, while Cromwell did not lose in all above 40 men.

After this defeat, Charles put himself at the head of the remains of his army; and these he further strengthened by the royalists, who had been for some time excluded from his service by the covenants. He was so closely pursued by Cromwell, however, that he soon found it impossible to maintain his army. Observing, therefore, that the way was open to England, he immediately directed his march towards that country, where he expected to be reinforced by all the royalists in that part of the kingdom. In this, however, he was deceived: the English, terrified at the name of his opponent, dreaded to join him. But his mortification was greatly increased, when at Worcester he was informed, that Cromwell was marching with hasty strides from Scotland with an army of 40,000 men. This news was scarcely arrived, when Cromwell himself was there. He fell upon the town on all sides: the whole Scots army

was either killed or taken prisoners; and the king himself, having given many proofs of personal valour, was obliged to fly.

The young king now entered upon a scene of adventures the most romantic that can be imagined. After his hair was cut off, the better to disguise his person, he worked for some days in the habit of a peasant, cutting faggots in a wood. He next made an attempt to retire into Wales, under the conduct of one Pendrel, a poor farmer, who was sincerely attached to his cause. In this attempt, however, he was disappointed; every pass being guarded to prevent their escape. Being obliged to return, he met one colonel Careless, who had escaped the carnage at Worcester. In his company the king was obliged to climb a spreading oak; among the thick branches of which they spent the day together, while they heard the soldiers of the enemy in pursuit of them below. From thence he passed with imminent danger, feeling all the varieties of famine, fatigue, and pain, till he arrived at the house of colonel Lane, a zealous royalist in Staffordshire. There he deliberated about the means of escaping into France; and Bristol being supposed the properest port, it was resolved that he should ride thither before this gentleman's sister, on a visit to one Mrs Norton, who lived in the neighbourhood of that city. During this journey, he every day met with persons whose faces he knew, and at one time passed through a whole regiment of the enemy's army.

When they arrived at Mrs Norton's, the first person they saw was one of his own chaplains sitting at the door, and amusing himself with seeing people play at bowls. The king, after having taken proper care of his horse in the stable, was shewn to an apartment which Mrs Lane had provided for him, as it was said he had the ague. The butler, however, being sent to him with some refreshment, no sooner beheld his face, which was very pale with anxiety and fatigue, than he recollected his king and master; and, falling on his knees, while the tears streamed down his cheeks, cried out, "I am rejoiced to see your majesty." The king was alarmed; but made the butler promise that he would keep the secret from every mortal, even from his master; and the honest servant punctually obeyed him.

No ship being found that would for a month set sail from Bristol either for France or Spain, the king was obliged to go elsewhere for a passage. He therefore repaired to the house of colonel Wyndham in Dorsetshire, where he was cordially received. His mother, a venerable matron, seemed to think the end of her life nobly rewarded in having it in her power to give protection to her king. She expressed no dissatisfaction at having lost three sons and one grandchild in the defence of his cause, since she was honoured in being instrumental in his own preservation.

Pursuing from thence his journey to the sea-side, he once more had a very narrow escape at a little inn, where he set up for the night. The day had been appointed for a solemn fast; and a fanatical weaver, who had been a soldier in the parliamentary army, was preaching against the king in a little chapel fronting the house. Charles, to avoid suspicion, was himself among the audience. It happened that a smith, of the same principles with the weaver, had been examining the horses belonging to the passengers, and came to as-

sure the preacher, that he knew by the fashion of the shoes, that one of the strangers' horses came from the north. The preacher immediately affirmed, that this horse could belong to no other than Charles Stuart, and instantly went with a constable to search the inn. But Charles had taken timely precautions, and left the inn before the constable's arrival.

At Shoreham, in Suffex, a vessel was at last found, in which he embarked. He was known to so many, that, if he had not set sail at that critical moment, it had been impossible for him to escape. After 41 days concealment, he arrived safely at Feschamp in Normandy. No less than 40 men and women had, at different times, been privy to his escape.

Cromwell in the mean time returned in triumph; and his first care was to depress the Scots, on account of their having *witstood* the work of the gospel as he called it. An act was passed for abolishing royalty in Scotland, and annexing that kingdom as a conquered province to the English commonwealth. It was empowered, however, to send some members to the English parliament. Judges were appointed to distribute justice; and the people of that country, now freed from the tyranny of the ecclesiastics, were not much dissatisfied with the government.

All parts of the British dominions being now reduced to perfect subjection to the parliament, they next resolved to chastise the Dutch, who had given but very slight causes of complaint. It happened that one Dr Dorilaus, who was of the number of the late king's judges, being sent by the parliament as their envoy to Holland, was assassinated by one of the royal party who had taken refuge there. Some time after, also, Mr St John, appointed their ambassador to that court, was insulted by the friends of the prince of Orange. These were thought sufficient reasons for a declaration of war against the Hollanders by the commonwealth of England. The parliament's chief dependence lay in the activity and courage of Blake their admiral; who, though he had not embarked in naval command till late in life, yet surpassed all that went before him in courage and dexterity. On the other side, the Dutch opposed to him their famous admiral Van Tromp, to whom their country never since produced an equal. Many were the engagements between these celebrated admirals, and various was their success. Several dreadful encounters served rather to shew the excellency of the admirals, than to determine their superiority. At last the Dutch, who felt many great disadvantages by the loss of their trade, and by the total suspension of their fisheries, were willing to treat of a peace. The parliament, however, gave but a very unfavourable answer. They studied to keep their navy on foot as long as they could; rightly judging, that, while the force of the nation was exerted by sea, it would diminish the formidable power of Cromwell by land.

This great aspirer, however, quickly perceived their designs; and therefore, secure in the attachment of the army, resolved to seize the sovereign power. He persuaded the officers to present a petition for payment of arrears, and redress of grievances. His orders were obeyed: a petition was drawn up and presented, in which the officers, after demanding their arrears, desired the parliament to consider how many years they had sat, and what pretensions they had formerly made

of their designs to new-model the house, and establish freedom on its broadest basis. They alleged, that it was now full time to give place to others; and however meritorious their actions might have been, yet the rest of the nation had some right, in their turn, to manifest their patriotism in defence of their country. The house was highly offended: they appointed a committee to prepare an act, ordaining that all persons who presented such petitions for the future should be deemed guilty of high treason. To this the officers made a very warm remonstrance, and the parliament as angry a reply. Cromwell, being informed of this altercation, rested up in the utmost seeming fury, and turning to major Vernon, cried out, that "he was compelled to do a thing that made the very hair of his head stand on end." Then, hastening to the house with 300 soldiers, and with the marks of violent indignation on his countenance, he entered, took his place, and attended to the debates for some time. When the question was ready to be put, he suddenly started up, and began to lead the parliament with the vilest reproaches for their tyranny, ambition, oppression, and robbery of the public. Upon which, stamping with his foot, which was the signal for the soldiers to enter, the place was immediately filled with armed men. Then, addressing himself to the members, "For shame, (said he), get you gone. Give place to honest men; to those who will more faithfully discharge their trust. You are no longer a parliament; I tell you, you are no longer a parliament; the Lord has done with you." Sir Harry Vane exclaiming against this conduct, "Sir Harry! (cries Cromwell with a loud voice), O Sir Harry Vane! The Lord deliver me from Sir Harry Vane!" Taking hold then of one of the members by his cloak, "Thou art a whoremaster," cries he; to another, "Thou art an adulterer;" to a third, "Thou art a drunkard;" to a fourth, "Thou art a glutton, &c." "It is you, (continued he to the members), that have forced me upon this. I have fought the Lord night and day, that he would rather slay me than put me upon this work." Then, pointing to the mace, "Take away that bauble," cried he: after which, turning out all the members, and clearing the hall, he ordered the doors to be locked; and putting the keys in his pocket, returned to Whitehall.

176
He turns
out the par-
liament.

Thus, the whole civil and military power centered in Cromwell, who by this bold transaction became, in effect, king of Great Britain, with uncontrollable authority. Being willing, however, to amuse the people with the form of a commonwealth, he proposed to give his subjects a parliament; but such an one as should be altogether obedient to his commands. For this purpose it was decreed, that the sovereign power should be vested in 144 persons, under the denomination of a parliament; and he undertook to make the choice himself. The persons pitched upon were the lowest, meanest, and most ignorant among the citizens, and the very dregs of the fanatics. To go further than others in the absurdities of fanaticism was the chief qualification upon which each of these valued himself. Their very names, borrowed from scripture, and rendered ridiculous by their misapplication, served to shew their excess of folly. One of them particularly, who was called *Praise-God Barebone*, a canting leather-feller, gave his name to this odd assembly, and it was

VOL. II.

called *Barebone's parliament*. They were chiefly composed of Antinomians; a sect that, after receiving the spirit, supposed themselves incapable of error; and the fifth-monarchy-men, who every hour expected Christ's second coming on earth. They began by chusing eight of their tribe to seek the Lord in prayer, while the rest calmly sat down to deliberate upon the suppression of the clergy, the universities, and courts of justice; and instead of all this, it was their intent to substitute the law of Moses.

It was impossible such a legislature as this could stand; even the vulgar began to exclaim against it, and Cromwell himself to be ashamed of their absurdities. He had carefully chosen many persons among them who were entirely devoted to his interests, and these he commanded to dismiss the assembly. These accordingly met by concert earlier than the rest of their fraternity; and observing to each other that this parliament had sat long enough, they hastened to Cromwell, with Rouse their speaker at their head, and into his hands resigned the authority which he had invested them. Cromwell accepted their resignation with pleasure; but being told that some of their number were refractory, he sent colonel White to clear the house of such as ventured to remain there. They had placed one Moyer in the chair by the time that the colonel had arrived; and he being asked by the colonel what they did there, Moyer replied very gravely, That they were seeking the Lord. "Then you may go elsewhere, (cried White); for, to my certain knowledge, the Lord hath not been here these many years."

175
Who are a-
gain turned
out.

The shadow of a parliament being thus dissolved, the officers, by their own authority, declared Cromwell protector of the commonwealth of England. The mayor and aldermen were sent for to give solemnity to his appointment, and he was instituted into his new office at Whitehall, in the palace of the kings of England. He was to be addressed by the title of *Highness*; and his power was proclaimed in London, and other parts of the kingdom. It was now, indeed, in a great measure necessary that some person should take the supreme command; for affairs were brought into such a situation, by the furious animosities of the contending parties, that nothing but absolute power could prevent a renewal of former bloodshed and confusion.

179
Cromwell
declared
protector.

The government of the kingdom was adjusted in the following manner. A council was appointed, which was not to exceed 21, nor to be under 13 persons. These were to enjoy their offices for life, or during good behaviour; and, in case of a vacancy, the remaining members named three, of whom the protector chose one. The protector was appointed the supreme magistrate of the commonwealth, with such powers as the king was possessed of. The power of the sword was vested in him jointly with the parliament when sitting, or with the council at others. He was obliged to summon a parliament once every three years, and to allow them to sit five months without adjournment. A standing army was established of 20,000 foot, and 10,000 horse; and funds were assigned for their support. The protector enjoyed his office for life; and on his death, his place was to be supplied by the council. Of all these clauses the standing army was sufficient for Cromwell's purpose; for, while possessed of that instrument, he could mould the rest of the constitution to his pleasure

180
He settles
the govern-
ment.

Britain.

at any time. He chose his council from among his officers, who had been the companions of his dangers and victories, to each of whom he assigned a pension of 1000 *l.* a-year. He took care to have his troops, upon whose fidelity he depended for support, paid a month in advance; the magazines were also well provided; and the public treasure managed with frugality and care; while his activity, vigilance, and resolution, were so well exerted, that he discovered every conspiracy against his person, and every plot for an insurrection, before they took effect.

Thus Cromwell continued to govern, though without assuming the title of *king*, in as absolute a manner as the most despotic prince in Europe. As he was feared at home, so he made himself respected abroad. The Dutch, having been humbled by repeated defeats, were obliged to sue for peace. Cromwell obliged them to pay deference to the British flag. He compelled them to abandon the interests of the king, to pay 85,000 *l.* as an indemnification for former expences, and to restore to the English East India company a part of those dominions which they had been dispossessed of by the Dutch during the former reign. The ministry of France thought proper to pay deference to the imperious character of the protector; and he having lent that court a body of 6000 men to attack the Spanish dominions in the Netherlands, who obtained a signal victory, the French put Dunkirk into his hands as a reward for his attachment. By means of the celebrated admiral Blake † he humbled Spain prodigiously, as also the Algerines and Tunisines. Penn and Venables, two other admirals, made an attempt on the island of Hispaniola; but failing of this, they steered to Jamaica, which was surrendered to them without a blow. Yet so little was thought of the importance of this conquest, that, on their return, the two admirals were committed to the tower, on account of the failure of the principal object of their equipment.

It is not to be supposed that a numerous standing army could be maintained, and so many foreign wars carried on, without incurring extraordinary expences. The protector's revenues were so much exhausted, that he was obliged to have recourse to methods which he probably would not have chosen, had he not been driven to them by necessity. One or two conspiracies entered into by the royalists, which were detected and punished, served him as a pretence to lay a heavy tax upon all that party, of the tenth penny on all their possessions. In order to raise this oppressive imposition, ten major-generals were instituted, who divided the whole kingdom into so many military jurisdictions. These men had power to subject whom they pleased to this tax, and to imprison such as denied their jurisdiction. Under colour of these powers they exercised the most arbitrary authority; the people had no protection against their exactions; the very mask of liberty was thrown off, and all property was at the disposal of a military tribunal. It was in vain that the nation cried out for a free parliament. Cromwell assembled one in consequence of their clamours; but as speedily dissolved it when he found it refractory to his commands. At last, as parliaments were always held in such estimation by the people, he resolved to give them one, but such as should be entirely of his own choosing, and chiefly composed of his creatures. Left any of a different com-

plexion should enter the house, guards were placed at the door, and none admitted but such as produced a warrant from his council.

The principal design of convening this assembly was, that they should offer him the crown, with the title of *king*, and all the other ensigns of royalty. His creatures, therefore, took care to insinuate the confusion there was in legal proceedings without the name of a king; that no man was acquainted with the extent or limits of the present magistrates authority, but those of a king had been well ascertained by the experience of ages. The motion was at last formally made in the house, easily carried through, and nothing was now wanting but Cromwell's own consent to have his name enrolled among the kings of England. This consent, however, he never had resolution enough to give. His doubts continued for some days; and the conference carried on with the members who made him the offer, so far as it is on his part intelligible, seems to argue that he was desirous of being compelled to accept the offer: however, the conference ended in his total refusal.

With all these proffered honours, and with all his despotic power, the situation of Cromwell was far from being enviable. Perhaps no situation, however mean, or loaded with contempt, could be more truly distressful than his, at the time the nation was loading him with congratulations and addresses. He had at last rendered himself hateful to every party, and he owed his safety to their mutual hatred and diffidence of one another. His arts of dissimulation were exhausted; none could be deceived by them; even those of his own party and principles disdaining the use to which he had converted his zeal and professions. Though the whole nation silently detested his administration, he had not been completely wretched if he could have found domestic consolation. But even his own family had embraced republican principles with so much vehemence, that they could not without indignation behold him invested with uncontrollable power; and Mrs Claypole, his favourite daughter, upbraided him, on her death-bed, with all the crimes which led him to trample on the throne. To add to all this, not only were conspiracies formed against him, but he was at last taught upon reasoning principles, that his death was not only desirable, but his assassination would be meritorious. A book was published by colonel Titus, a man who had formerly been attached to his cause, entitled *Killing no murder*. Of all the pamphlets that appeared at that time, or perhaps of those that have since appeared, this was the most eloquent and masterly. Cromwell read it, and it is said never to have smiled afterwards.

The usurper now found, that the grandeur to which he had sacrificed his former tranquillity was only an inlet to fresh inquietudes. He was haunted with perpetual fears of assassination. He wore armour under his clothes, and always kept pistols in his pockets. His aspect was clouded by a settled gloom, and he regarded every stranger with suspicion. He was always attended by a numerous guard, and travelled in a hurry. He never returned from any place by the road he went; and never slept above three nights together in the same chamber. At last he was delivered from this life of horror and anxiety by a tertian ague, of which he died September 3^d, 1658, after having usurped the go-

vernment nine years.

Oliver Cromwell was succeeded in his office of protector by his son Richard, who immediately called a parliament. To this assembly the army presented a remonstrance, desiring some person for their general in whom they could confide. The house voted such meetings and remonstrances unlawful: upon which the officers, surrounding Richard's house, forced him to dissolve the parliament; and soon after he signed an abdication of the government. His younger brother Henry, who had been appointed to the command in Ireland, followed Richard's example, and resigned his commission without striking a blow.

The officers, thus left at liberty, resolved to restore the *rump parliament* as it was called, consisting of that remnant of a parliament which had condemned Charles. They were no sooner reinstated in their authority, however, than they began to humble the army by cashiering some of the officers, and appointing others on whom they could have more dependence. The officers immediately resolved to dissolve the assembly. Lambert, one of the general officers, drew up a chosen body of troops; and placing them in the streets which led to Westminster-hall, when the speaker Lenthall proceeded in his carriage to the house, he ordered the horses to be turned, and very civilly conducted him home. The other members were likewise intercepted; and the army returned to their quarters to observe a solemn fast, which generally either preceded or attended their outrages. A committee was then elected, of 23 persons; of whom seven were officers. These they pretended to invest with sovereign authority; and a military government was established, which gave the nation a prospect of endless servitude and tyranny without redress.

Upon hearing that the officers had by their own authority dissolved the parliament, general Monk, who was then in Scotland with 8000 veteran troops, protested against the measure, and resolved to defend the national privileges. As soon as he put his army in motion, he found himself eagerly fought after by all parties; but so cautious was he of declaring his mind, that, till the very last, it was impossible to know which side he designed to take. A remarkable instance of this cautious behaviour was, that, when his own brother came to him with a message from lord Granville in the name of the king, he refused all conversation with him upon hearing that he had told his errand to Mr Price, the general's own chaplain, and a man of known probity and honour.

Hearing that the officers were preparing an army to oppose him, Monk amused them with negotiations; and the people, finding themselves not entirely defenceless, began to declare for a free parliament. The *Rump*, finding themselves invited also by the navy and part of the army, again ventured to resume their seats, and to thunder votes in their turn against the officers and that part of the army by which they had been ejected. Without taking any notice of Lambert, they sent orders to the troops to repair immediately to the garrisons appointed for them. The soldiers obeyed; and Lambert at last found himself deserted by his whole army. Monk in the mean time proceeded with his army to London. The gentry, on his march, flocked round him with addresses expressing their desire of a new parliament; but that general, still continuing his

inflexible taciturnity, at last came to St Alban's, within a few miles of the capital, leaving all the world in doubt as to his motives and designs. Here he sent the parliament a message, desiring them to remove such forces as remained in London to country quarters. Some of the regiments willingly obeyed this order; and such as did not, Monk turned out by force: after which he took up his quarters with his army in Westminster. The house voted him thanks for his services: he desired them to call a free parliament; and this soon inspired the citizens to refuse submission to the present government. They resolved to pay no taxes until the members formerly excluded by colonel Pride should be replaced. For this they were punished by Monk, at the desire of the parliament. He arrested 11 of the most obnoxious of the common-council; broke the gates and portcullises; and, having exposed it to the scorn and contempt of all who hated it, he returned in triumph to his quarters at Westminster. The next day, however, he made an apology for this conduct, and promised for the future to co-operate with the mayor and common-council in such schemes as they should approve.

The commons were now greatly alarmed. They tried every method to gain off the general from his new alliance. Some of them even promised to invest him with the dignity of supreme magistrate, and to support his usurpation. But Monk was too just, or too wise, to hearken to such wild proposals; he resolved to restore the secluded members, and by their means to bring about a new election.

The restoration of the expelled members was easily effected; and their number was so much superior to that of the *Rump*, that the chiefs of this last party now thought proper to withdraw in their turn. The restored members began with repealing all those orders by which they had been expelled. They renewed and enlarged the general's commission; fixed a proper stipend for the support of the fleet and army; and, having passed these votes, they dissolved themselves, and gave orders for the immediate assembling of a new parliament. Mean while, Monk new-modelled his army to the purposes he had in view. Some officers, by his direction, presented him with an address, in which they promised to obey implicitly the orders of the ensuing parliament. He approved of this engagement, which he ordered to be signed by all the different regiments; and this furnished him with a pretence for dismissing all the officers by whom it was rejected.

In the midst of these transactions, Lambert, who had been confined in the Tower, escaped from his prison, and began to raise forces; and as his activity and principles were sufficiently known, Monk took the earliest precautions to oppose his measures. He dispatched against him colonel Ingoldby, with his own regiment, before Lambert had time to assemble his dependents. That officer had taken possession of Daventry with four troops of horse: but the greater part of them joined Ingoldby; to whom he himself surrendered, not without exhibiting strong marks of pusillanimity.

All this time, Monk still persisted in his reserve; nor would he intrust his secret intentions with any person, except one Morrice, a gentleman of Devonshire. He was of a sedentary and studious disposition; and with him alone did the general deliberate on the great and dangerous enterprize of the restoration. Sir John Gran-

vile, who had a commission from the king, applied for access to the general; but he was desirous to communicate his business to Morrice. Granville refused, though twice urged, to deliver his message to any but the general himself: so that Monk now, finding he could depend on this minister's secrecy, opened to him his whole intentions; but, with his usual caution, refused to commit any thing to paper. In consequence of these, the king left the Spanish territories, where he very narrowly escaped being detained at Breda by the governor, under pretence of treating him with proper respect and formality. From thence he retired to Holland, where he resolved to wait further advice.

The new parliament being assembled, Sir Harbottle Grimston was chosen speaker, a man known to be a royalist in his heart. The affections of all were turned towards the king; yet such were their fears, and such dangers attended a freedom of speech, that no one dared for some days to make any mention of his name. At length Monk gave directions to Anselmy, president of the council, to inform them that one Sir John Granville, a servant of the king's, had been sent over by his majesty, and was now at the door with a letter to the house of commons. This message was received with the utmost joy. Granville was called in, the letter read, and the king's proposals immediately accepted of. He offered a general amnesty to all persons whatsoever, and that without any exceptions but what should be made by parliament. He promised to indulge scrupulous consciences with liberty in matters of religion; to leave to the examination of parliament the claims of all such as possessed lands with contested titles; to confirm all these concessions by act of parliament; to satisfy the army under general Monk with respect to their arrears, and to give the same rank to his officers when they should be enlisted in the king's army.

In consequence of this good agreement between king and parliament, Montague the English admiral waited on his majesty to inform him that the fleet expected his orders at Scheveling. The duke of York immediately went on board, and took the command as lord high admiral. The king embarked, and landing at Dover, was received by the general, whom he tenderly embraced. He entered London in 1660, on the 29th of May, which was his birth-day; and was attended by an innumerable multitude of people, who testified their joy by the loudest acclamations.

Charles II. was 30 years of age at the time of his restoration. Being naturally of an engaging countenance, and possessed of an open and amiable disposition, he was the favourite of all ranks of his subjects. They had now felt the miseries of anarchy, and in proportion to these miseries was the satisfaction they felt on the accession of their young monarch. His first measures were calculated to give universal satisfaction. He seemed desirous of losing the memory of past animosities, and of uniting every party in affection for their prince and country. He admitted into his council the most eminent men of the nation, without regard to former distinctions. The presbyterians shared this honour equally with the royalists. Calamy and Baxter, presbyterian clergymen, were even made chaplains to the king. Admiral Montague was created earl of Sandwich, and general Monk duke of Albemarle. Morrice, the general's friend, was created secretary of state. But

what gave the greatest contentment to the nation was the judicious choice which the king at first made of his principal ministers and favourites. Sir Edward Hyde, created earl of Clarendon, was prime minister and chancellor. The marquis, created duke of Ormond, was steward of the household; the earl of Southampton high-treasurer; Sir Edward Nicholas secretary of state. These men, united together in the strictest friendship, and combining in the same laudable inclinations, supported each others credit, and pursued the interests of the public.

The parliament having been summoned without the king's consent, received at first only the title of a *convention*; and it was not till after an act passed for that purpose, that they were acknowledged by the name of *parliament*. Both houses owned the guilt of the former rebellion, and gratefully received in their own name, and in that of all the subjects, his majesty's gracious pardon and indemnity. The king had before promised an indemnity to all criminals, but such as should be excepted by parliament: he now issued a proclamation, declaring, that such of the late king's judges as did not surrender themselves within 14 days should receive no pardon. Nineteen surrendered themselves; some were taken in their flight; others escaped beyond sea. The peers seemed inclined to great severity on this occasion; but were restrained by the king, who in the most earnest terms pressed the act of general indemnification.

After repeated solicitations, the act of indemnity passed both houses, with the exception of those who had an immediate hand in the king's death. Even Cromwell, Ireton, and Bradshaw, though dead, were considered as proper objects of resentment: their bodies were dug from their graves; dragged to the place of execution; and, after hanging some time, buried under the gallows. Of the rest who sat in judgment on the late monarch's trial, some were dead, and some thought worthy of pardon. Ten only, out of 80, were doomed to immediate destruction; and these were enthusiasts who had all along acted from principle, and who, in the general spirit of rage excited against them, shewed a fortitude that would have done honour to a better cause.

This was all the blood that was shed at the restoration. The rest of the king's judges were reprimed, and afterwards dispersed into several prisons. The army was disbanded, that had for so many years governed the nation; prelacy, and all the ceremonies of the church of England, were restored; at the same time that the king pretended to preserve the air of moderation and neutrality. In fact, with regard to religion, Charles, in his gayer hours, was a professed deist; but in the latter part of his life he shewed an inclination to the Catholic persuasion, which he had strongly imbibed in his infancy and exile.

On the 13th of September this year, died the young duke of Gloucester, a prince of great hopes. The king was never so deeply affected by any incident in his life. The prince of Orange, having come to England, in order to partake of the joy attending the restoration of her family, with whom she lived in great friendship, soon after sickened and died. The queen-mother paid a visit to her son, and obtained his consent to the marriage of the prince of Orange with the duke of Orleans,

leans, brother to the French king. The parliament having met on the 6th of November, and carried on business with the greatest unanimity and dispatch, were dissolved by the king on the 29th of December 1660.

During the reign of Charles II. the spirit of the people seemed to take a turn quite opposite to that in the time of Charles I. The latter found his subjects animated with a ferocious though ignorant zeal for liberty. They knew not what it was to be free, and therefore imagined that liberty consisted in throwing off entirely the royal authority. They gained their point: the unhappy monarch was dethroned and murdered; but instead of liberty, they found themselves involved in much worse tyranny than before. Being happily freed from this tyranny by the restoration, they ran into the contrary extreme; and instead of an unbounded spirit of opposition, there was nothing now to be found but as unbounded a spirit of submission; and through the slavish submissions and concessions of the people in this reign, Charles found means to render himself at last almost quite absolute, and to govern without requiring, or indeed without having any occasion for parliaments.

A like revolution took place with regard to religious matters. During the former reigns, a spirit of the most gloomy enthusiasm had overspread the whole island, and men imagined that the Deity was only to be pleased by their denying themselves every social pleasure, and refusing every thing that tended to make life agreeable. The extreme hypocrisy of Cromwell and his associates, and the absurd conduct of others, showed that this was not religion: but, in avoiding this error, they ran into one equally dangerous; and every thing religious or serious was discountenanced. Nothing but riot and dissipation took place every where. The court set them the example: nothing but scenes of gallantry and festivity were to be seen; the horrors of the late war became the subject of ridicule; the formality of the sectaries was displayed on the stage, and even laughed at from the pulpit. In short, the best mode of religion now was to have as little as possible; and to avoid not only the hypocrisy of the sectaries, but even the common duties of morality.

208
Ingratitude
of Charles.

In the midst of this riot and dissipation, the old and faithful followers of the royal family were left unrewarded. Numbers who had fought both for the king and his father, and who had lost their whole fortunes in his service, still continued to pine in want and oblivion; while in the mean time their persecutors, who had acquired fortunes during the civil war, were permitted to enjoy them without molestation. The wretched royalists petitioned and murmured in vain; the monarch fled from their expostulations to scenes of mirth and festivity; and the act of indemnity was generally said to have been an act of *forgiveness* to the king's enemies, and of *oblivion* to his friends.

209
Submissive
disposition
of both par-
liaments.

In 1661, the Scots and English parliaments seemed to vie with each other in their prostrations to the king. In England, monarchy and episcopacy were raised to the greatest splendour. The bishops were permitted to resume their seats in the house of peers; all military authority was acknowledged to be vested in the king. He was empowered to appoint commissioners for regulating corporations, and expelling such members as had intruded themselves by violence, or professed pri-

Britain.

ciples dangerous to the constitution. An act of uniformity was passed, by which it was required that every clergyman should be re-ordained, if he had not before received episcopal ordination; that he should declare his assent to every thing contained in the book of Common prayer, and should take the oath of canonical obedience. In consequence of this law, above 2000 of the presbyterian clergy resigned their cures at once. In Scotland the right of the king was asserted in the fullest and most positive terms to be hereditary, divine, and indefeasible. His power was extended to the lives and possessions of his subjects, and from his original grant was said to come all that they enjoyed. They voted him an additional revenue of 40,000 *l.*; and all their former violences were treated with a degree of the utmost detestation.

210
The nation
disgusted
with the
king's ex-
travagance.

This intoxication of loyalty, however, began soon to wear off. The king's profusion and extravagance in his pleasures, together with his indolence in administration, furnished opportunities of making very disadvantageous comparisons between him and Oliver Cromwell. These animosities were heightened by the ejected clergy, especially when they saw Dunkirk, which had been acquired during the usurper's vigorous administration, sold to the French for 40,000 *l.* and that merely to supply the king's extravagance. From this time (August 17th 1662), Charles found himself perpetually opposed, and his parliaments granted supplies much more reluctantly than before.

211
Marriage
with the in-
fanta of
Portugal.

A few months before, the continual exigencies of the king had forced him to conclude a marriage with the Infanta of Portugal for the sake of her portion, which was 500,000 *l.* in money, together with the forests of Tangier in Africa, and of Bombay in the East Indies. The chancellor Clarendon, the dukes of Ormond and Southampton, urged many reasons against this match, particularly the likelihood of her never having any children; but all their objections could not prevail, and therefore Clarendon set himself to promote it as far as lay in his power. Still, however, the king's necessities were greater than his supplies. He therefore resolved to sacrifice his minister the great Clarendon to the resentment of the parliament, to whom he became obnoxious, in order to procure some more supplies for himself. In 1663, an extraordinary supply was demanded: the king sent for the commons, on the 12th of June, to Whitehall. He complained of their inattention; and by acquainting them of a conspiracy to seize the castle of Dublin, he hoped to furnish a reason for demanding a present supply. Four subsidies were immediately granted, and the clergy in convocation followed the example of the commons. On this occasion the earl of Bristol ventured to impeach the chancellor in the house of peers; but as he did not support his charge, the affair was dropped for the present.

212
War with
the Dutch.

With a view probably of having the money to be employed for that purpose in his hands, Charles was induced to declare war against the Dutch in 1664. In this war the English, under the command of Sir Robert Holmes, expelled the Dutch from Cape-Orse castle on the coast of Africa, and likewise seized on their settlements of Cape Verd and the isle of Goree. Sailing from thence to America, the admiral possessed himself of Nova Belgia, since called *New York*; and which

has

has ever since continued subject to Britain. On the other hand, De Ruyter, the Dutch admiral, dispossessed the English of all their settlements in Guinea except Cape Corfe. He afterwards failed to America, where he attacked Barbadoes and Long Island, but was repulsed. Soon after, the two most considerable fleets of each nation met; the one under the duke of York, to the number of 114 sail; the other commanded by Opdam admiral of the Dutch navy, of nearly equal force. The engagement began at four in the morning, and both sides fought with equal intrepidity. The duke of York was in the hottest part of the engagement, and behaved with great spirit and composure, while many of his lords and attendants were killed beside him. In the heat of the action the Dutch admiral's ship blew up; which so discouraged and disheartened them, that they fled towards their own coast, having 30 ships sunk and taken, while the victors lost only one. This success of the English so much excited the jealousy of the neighbouring states, that France and Denmark immediately resolved to protect the republic from such formidable enemies. De Ruyter the great Dutch admiral on his return from Guinea was appointed, at the head of 76 sail, to join the duke of Beaufort the French admiral, who it was supposed was then entering the British channel from Toulon. The duke of Albemarle and prince Rupert now commanded the British fleet, which did not exceed 74 sail. Albemarle detached prince Rupert with 20 ships to oppose the duke of Beaufort; against which piece of rashness Sir George Ayscue protested in vain. The fleets thus engaging upon unequal terms, a most memorable battle ensued. The first day, the Dutch admiral Evertzen was killed by a cannon-ball, one of their ships was blown up, and three of the English ships taken; the combatants were parted by darkness. The second day they renewed the battle with incredible fury. Sixteen fresh ships joined the Dutch; and the English were so shattered, that their fighting ships were reduced to 28. Upon retreating towards their own coast, the Dutch followed them; where another dreadful conflict was beginning, but parted by the darkness of the night as before. The morning of the third day the English continued their retreat, and the Dutch their pursuit. Albemarle came to the desperate resolution of blowing up his own ship rather than submit to the enemy, when he found himself happily reinforced by prince Rupert with 16 ships of the line. By this time it was night; and the next day the fleets came again to a close combat, which was continued with great violence, till they were parted by a mist. Sir George Ayscue having the misfortune to strike on the Galoper sands, was taken, with a ship of 100 guns.

Both sides claimed the victory, but the Dutch certainly had the advantage in this engagement. A second, however, equally bloody, happened soon after, with larger fleets on both sides, commanded by the same admirals. In this the Dutch were vanquished; but they were soon in a condition to face their enemies, by the junction of Beaufort the French admiral. The Dutch fleet appeared in the Thames, conducted by their great admiral. The English were thrown into the utmost consternation: a chain had been drawn across the river Medway; and some fortifications had been added to the forts along the bank. But all these were

unequal to the present force: Sheerness was soon taken; the Dutch passed forward and broke the chain, though fortified by some ships sunk by Albemarle's orders. Destroying the shipping in their passage, they still advanced, with six men of war and five fire-ships, as far as Upnore castle, where they burned three men of war. The whole city of London was in consternation; it was expected that the Dutch might fail up next tide to London-bridge, and destroy not only the shipping, but even the buildings of the metropolis. The Dutch, however, were unable to prosecute that project from the failure of the French who had promised them assistance. Spreading therefore an alarm along the coast, and having insulted Norwich, they returned to their own coasts.

During these transactions abroad, happened a great plague at London, which destroyed 100,000 of the inhabitants. This calamity was soon followed by another, still more dreadful if possible. A fire broke out in a baker's house in Pudding-lane near the bridge, and spread with such rapidity, that no efforts could extinguish it, till it laid in ashes the most considerable part of the city. This calamity, though it reduced thousands to beggary, proved in the end both beneficial and ornamental to the city. It rose from its ruins in greater beauty than ever; the streets being widened, and the houses built of brick instead of wood, became thus more wholesome and secure. In so great a calamity it is remarkable that not a single life was lost.

These complicated misfortunes did not fail to excite many murmurs among the people: The blame of the fire was laid on the Papists: the Dutch war was exclaimed against as unsuccessful and unnecessary, as being an attempt to humble that nation who were equal enemies to Popery with themselves. Charles himself also began to be sensible, that all the ends for which he had undertaken the Dutch war were likely to be entirely frustrated. Instead of being able to lay up money for himself, the supplies of parliament had hitherto been so scanty, that he found himself considerably in debt. A treaty was therefore set on foot, which was concluded at Breda on the 2^d of July 1667. By this treaty the only advantage gained by Britain was, the cessation of the colony of New York. It was therefore judged disgraceful, and the blame of it thrown upon the unhappy earl of Clarendon. Along with this, he was charged with the sale of Dunkirk; the bad payment of the seamen; the disgrace by the Dutch fleet; and his own ambition. His daughter, while yet in Paris, had commenced an amour with the duke of York; and under a solemn promise of marriage had admitted him to her bed. Her lover, however, either of his own accord, or through the persuasions of his brother Charles, afterwards married her; and this too was imputed as a crime to Clarendon. On these accusations, the king, who on account of his rigid virtue had never much loved this nobleman, ordered the seals to be taken from him, and given to Sir Orlando Bridgeman. Clarendon was again impeached; and though the charges were manifestly frivolous, yet so strong was the popular torrent against him, that he thought proper to withdraw into France. Soon after, the king formed an alliance with Holland and Sweden, in order to prevent the French king from completing his conquest of the Netherlands. The greatest part of his country he had already

219
Arbitrary
proceedings
Charles.

The king now began to act in a very arbitrary manner. He had long wished to extend his prerogative, and to be able to furnish himself with whatever sums he might want for his pleasures, and therefore was most likely to be pleased with those ministers who could flatter both his wishes at once. These he found in Clifford, Ashley, Buckingham, Arlington, and Lauderdale, a junto distinguished by the name of the *cabal*; a word formed by the initials of their names. The first effects of their advice was a secret alliance with France, and a rupture with Holland. Soon after this, the duke of York declared himself a Papist; and liberty of conscience was proclaimed to all sectaries, whether dissenters or Papists: a proclamation was issued containing very rigorous clauses in favour of pressing; another full of menaces against those who should speak undutifully of his majesty's measures; and even against those who heard such discourses, unless they informed in due time against the offenders. All these things gave very great and just offence to the people; but they were especially alarmed at the alliance with France, and justly afraid of the treachery of that nation.

220
New war
th' Hol-
nd.

On the 28th of May 1672, the English fleet under the duke of York was surpris'd by the Dutch in South-west bay. About eight in the morning began a most furious engagement. The gallant Sandwich, who commanded the English van, drove his ship into the midst of the enemy, beat off the admiral that ventured to attack him, sunk another ship that attempted to board him, and three fire-ships that offered to grapple with him. Though his vessel was torn with shot, and out of 1000 men there only remained 400, he still continued to fight. At last, a fire-ship, more fortunate than the rest, having laid hold of his vessel, her destruction became inevitable, and the earl himself was drowned in attempting to swim to some other ship. Night parted the combatants; the Dutch retired, and were not followed by the English. The loss sustained by the two maritime powers was nearly equal; but the French suffered very little, not having entered into the heat of the engagement. It was even supposed that they had orders for this conduct, and to spare their own ships, while the Dutch and English should weaken each other by their mutual animosities.

222
Success of
Lewis XIV.
gainst the
Dutch.

The combined powers were much more successful against the Dutch by land. Lewis conquered all before him, crossed the Rhine, took all the frontier towns of the enemy, and threatened the new republic with a final dissolution. Terms were proposed to them by the two conquerors. Lewis offered them such as would have deprived them of all power of resisting an invasion from France by land. Those of Charles exposed them equally to every invasion by sea. At last the murmurs of the English at seeing this brave and industrious people, the supporters of the Protestant cause, totally sunk and on the brink of destruction, were too loud not to reach the king. He was obliged to call a parliament, to take the sense of the nation upon his conduct; and he soon saw how his subjects stood affected.

223
A parlia-
ment called.

The parliament met on the 4th of February 1673.

They began with repressing some of the king's extraordinary stretches of prerogative, and taking means for uniformity in religious matters. A law was passed entitled the *test act*, imposing an oath on all who should enjoy any public benefice. Besides the taking the oaths of allegiance and the king's supremacy, they were obliged to receive the sacrament once a year in the established church, and to abjure all belief in the doctrine of transubstantiation. As the dissenters also had seconded the efforts of the commons against the king's declaration of indulgence to Roman Catholics, a bill was passed for their ease and relief, which, however, went with some difficulty through the house of peers. The Dutch in the mean time continued to defend themselves with such valour, that the commons began to despair of success. They therefore resolved that the standing army was a grievance; they next declared, that they would grant no more supplies to carry on the Dutch war, unless it appeared that the enemy were so obstinate as to refuse all reasonable conditions. To cut short these disagreeable altercations, the king resolved to prorogue the parliament; and, with that intention, went unexpectedly to the house of peers, from whence he sent the usher of the black-rod to summon the house of commons to attend. It happened that the usher and the speaker met nearly at the door of the house; but the speaker being within, some of the members suddenly shut the door, and cried "To the chair." Upon which the following motions were instantly made in a tumultuous manner: That the alliance with France was a grievance; that the evil counsellors of the king were a grievance; that the earl of Lauderdale was a grievance; and then the house rose in great confusion. The king soon saw that he could expect no supply from the commons for carrying on the war which was so disagreeable to them; he resolved, therefore, to make a separate peace with the Dutch, on terms which they had proposed by the Spanish ambassador. For form's sake, he asked the advice of his parliament; who concurring heartily in his intentions, a peace was concluded accordingly.

224
Tumult in
the house of
commons.

226
National
dissentions.

The prepossession which Charles had all along shewn for France, and his manifest inclination upon all occasions to attach himself to that kingdom, had given great offence to his people. Along with this, other circumstances conspired to raise a general discontent. The toleration of Catholics, so much wished for by the king; the bigotry of the duke of York, the heir apparent to the crown, and his zeal for the propagation of the Catholic religion; excited a conflagration not altogether without foundation, as if the Protestant religion was in danger. This fear and discontent was carefully kept up and fomented by wicked and designing men, who to promote their own interests would not scruple to advance the grossest falsehoods. In 1678, an account of a plot formed by the Papists for destroying the king and the Protestant religion, was given in by one Kirby a chemist, Dr Tong, a weak credulous clergyman, and Titus Oates, who had likewise been a clergyman, but one of the most abandoned miscreants that can be imagined. The circumstances attending this pretended discovery were so perfectly incredible, that it appears amazing how any person of common sense could give ear to them. Nevertheless, so much were the minds of the nation in general inflamed against the Catholics at the

this time, that it not only produced the destruction of individuals of the Romish persuasion, but an universal massacre of that unhappy sect was apprehended. The parliament, who ought to have repressed these delusions, and brought back the people to calm deliberate inquiry, were found more credulous than even the vulgar themselves. The cry of plot was immediately echoed from one house to the other; and the country party could not let slip so favourable an opportunity of managing the passions of the people; the courtiers were afraid of being thought disloyal if they should doubt the guilt of those who were accused of designs against the king's person. Danby, the prime minister, himself entered into it very furiously, and persisted in his inquiries notwithstanding all the king's advices to the contrary. Charles himself, who was the person that ought to have been most concerned, was the only one who treated it with contempt. Nothing, however, could stop the popular fury; and for a time the king was obliged to give way to it.

227
Lord Dan-
by impeach-
ed.

During the time of this general uproar and persecution, the lord treasurer Danby was impeached in the house of commons by Seymour the speaker. The principal charge against him was, his having written a letter to Montague the king's ambassador at Paris, directing him to sell the king's good offices at the treaty of Nimeguen, to the king of France, for a certain sum of money; contrary to the general interests of the confederates, and even of those of his own kingdoms. Tho' the charge was just, yet Danby had the happiness to find the king resolved to defend him. Charles assured the parliament, that, as he had acted in every thing by his orders, he held him entirely blameless; and though he would deprive him of all his employments, yet he would positively insist on his personal safety. The lords were obliged to submit; however, they went on to impeach him, and Danby was sent to the Tower, but no worse consequences followed.

These furious proceedings had been carried on by an house of commons that had continued undissolved for above 17 years. They were now dissolved, and another parliament was called; which, however, proved as unmanageable as the preceding. The members resolved to check the growth of Popery by striking at the root of the evil; and therefore brought in a bill for the total exclusion of the duke of York from the crown of England and Ireland, which passed the lower house by a majority of 79. They next voted the king's standing army and guards to be illegal. They proceeded to establish limits to the king's power of imprisoning delinquents at will. It was now also that the celebrated statute called the *habeas corpus act* was passed, which confirms the subject in an absolute security from oppressive power.

228
Exclusion
bill brought
in.

During these troubles the duke of York had retired to Brussels; but an indisposition of the king led him back to England, to be ready, in case of any sinister accident, to assert his right to the throne. After prevailing upon his brother to disgrace his natural son the duke of Monmouth, who was now become very popular, he himself retired to Scotland, under pretence of quieting the apprehensions of the English nation, but in reality to strengthen his interests in that part of the empire. This secession served still more to inflame the country party, who were strongly attached to the duke of Monmouth, and were resolved to support him against

the duke of York. Mobs, petitions, pope-burnings, were artifices employed to keep up the terrors of Popery, and alarm the court. The parliament had shown favour to the various tribes of informers, and that served to increase the number of these infernals; but plots themselves also became more numerous. Plot was set up against plot; and the people were kept suspended in the most dreadful apprehension.

But it was not by plots alone that the adverse parties endeavoured to supplant each other. Tumultuous petitions on the one hand, and flattering addresses on the other, were sent up from all quarters. Wherever the country party prevailed, petitions were sent to the king filled with grievances and apprehensions. Wherever the church or court-party prevailed, addresses were framed, containing expressions of the highest regard to his majesty, and the deepest abhorrence of those who endeavoured to disturb the public tranquillity. Thus the nation came to be distinguished into *petitioners* and *abhorrrers*. *Whig* and *Tory*, also, were now first used as terms of reproach. The whigs were so denominated from a cant name given to the four presbyterian conventicles, (*whig* being *milk turned sour*). The tories were denominated from the Irish banditti so called, whose usual manner of bidding people deliver was by the Irish word *Tories*, or "Give me."

229
Peitioners
and abhor-
rrs, who.

All this time the king had tyrannized over the Scots in a very cruel manner. Being apprized of the tendency of presbyterian principles to a republican form of government, Charles, like his predecessors, had endeavoured to introduce episcopacy there, but in a much more violent manner than had been formerly attempted. The rights of patrons had for some years been abolished; and the power of electing ministers had been vested in the kirk-session and lay elders: but it was now enacted, that all incumbents who had been admitted upon this title should receive a presentation, and be instituted anew by the bishop, under the penalty of deprivation. In consequence of this, 350 parishes were at once declared vacant. New ministers were sought for all over the kingdom, and none was so vicious or ignorant as to be rejected. The people, as might have been expected, were displeased to the highest degree; they resolved, however, to give no sign of mutiny or sedition, notwithstanding their discontent. This submission made their case still worse; it being foolishly imagined, that, as they did not complain for a little ill usage, they would submit altogether if they were worse treated.

230
Attempt to
establish e-
piscopacy in
Scotland.

Affairs remained in a peaceable situation, till, in 1664, a very severe act was passed in England against conventicles; and this severity was imitated by the Scots parliament, who passed an act of the same kind. Military force was next let loose. Wherever the people had generally forsaken their churches, the guards were quartered throughout the country. They were commanded by Sir James Turner, a man of a very furious temper and dissolute life. He went about and received lists from the clergy of those who absented themselves from the churches, or were supposed to frequent conventicles. Without any proof, or legal conviction, he demanded a fine from them; and quartered soldiers on the supposed criminals till he received payment. An insurrection being dreaded during the Dutch war, new forces were levied, and entrusted to the command of Dalziel

Presbyteri-
ans persecuted.

Dalziel and Drummond, two men of a very cruel disposition, and the Scots parliament gave full scope to all their enormities.

Representations were now made to the king, who promised some redress. But his lenity came too late. The people, in 1668, rose in arms. They surprised Turner in Dumfries, and resolved to have put him to death; but finding his orders to have been more violent than his execution of them, they spared his life. At Lanerick they renewed the covenant, and published their manifesto; where they professed their submission to the king, and only desired the re-establishment of presbytery, and of their former ministers. Their force never exceeded 2000 men; and though the country in general bore them great favour, men's spirits were so subdued, that the insurgents could expect no farther increase of numbers. Dalziel took the field to oppose them. The number of the covenanters was now reduced to 800, and these no way capable of contending with regular forces. Having advanced near Edinburgh, they attempted to find their way back into the west by Pentland-hills. Here they were attacked by the king's troops, and received the first charge very resolutely; but that was all the action. Immediately they fell into confusion, and fled. About 40 were killed on the spot, and 130 taken prisoners.

So long ago as the year 1661, the presbyterians had deputed one Sharpe to lay their grievances before the king. Instead of this, their deputy abandoned the cause altogether, became their violent enemy, and as a reward of his treachery was made archbishop of St Andrews. After the battle of Pentland-hills, this man was the foremost to take vengeance on the unhappy insurgents, whose oppressed state and inoffensive behaviour had made them objects of universal compassion. Ten were hanged on one gibbet in Edinburgh; 35 before their own doors in different places. They might all have saved their lives, if they would have renounced the covenant; but this they resolutely refused. The executions were going on, when the king wrote a letter to the privy council, in which he ordered that such of the prisoners as should simply promise to obey the laws for the future should be set at liberty, and that the incorrigible should be sent to the plantations. This letter was brought to the council by Burnet, but was not immediately delivered by Sharpe. What his motives were for this delay, we pretend not to say; but certain it is, that no action of his life will bear a worse construction than this. It had been customary to put these poor creatures to very severe tortures, in order to make them confess that to be falsehood which they believed to be true. By Sharpe's delay, one Hugh Maccaill had been tortured, who would otherwise have escaped; and so violent were the torments he endured, that he expired under them. He seemed to die in an ecstasy of joy. His last words were uttered with an accent which struck all the bystanders with astonishment. "Farewell, (said he), sun, moon, and stars; farewell world and time; farewell weak, frail body; welcome eternity; welcome angels and saints; welcome Saviour of the world; and welcome God the judge of all."

In 1670, an act against conventicles was passed, seemingly with a design of mitigating the former persecuting laws; though even this was severe enough. By this act, the hearer in a conventicle, (that is, in a dis-

senting assembly where more than five beside the family were present), was fined 5s. for the first offence, and 10s. for the second; the preacher 20l. for the first offence, and 40l. for the second. The person in whose house the conventicle met was fined a like sum with the preacher. One remarkable clause was, that if any dispute should arise with regard to the interpretation of any part of the act, the judges should always explain the doubt in the sense least favourable to conventicles, it being the intention of parliament entirely to suppress them.

As the violent methods used by the king were found ineffectual to obtain his purpose in Scotland, in 1678 a scheme of comprehension was tried, by which it was proposed to diminish greatly the authority of the bishops, to abolish their negative voice in the ecclesiastical courts, and to leave them little more than the right of precedence among the presbyters: but this too was rejected by the people, who well knew its tendency. The next scheme was an indulgence. By this, the most popular of the expelled preachers, without requiring any terms of submission to the established religion, were settled in vacant churches; and small salaries of about 20l. a-year were offered to the rest, till they should be otherwise established. This bounty was rejected as the wages of criminal silence, and the replaced ministers soon repented of their compliance; conventicles multiplied, and the covenanters daily met in arms at their places of worship, though they usually dispersed themselves after divine service.

These mild methods being rejected, a renewal of the persecution commenced under the administration of the duke of Lauderdale, and in which archbishop Sharpe had a principal hand. It was an old law, and but seldom put in execution, that a man who was accused of any crime, and did not appear to take his trial, might be *intercommuned*; that is, he might be publicly outlawed; and whoever afterwards, either on account of business, relation, or charity, had the least intercourse with him, was subjected to the same penalties which the law could inflict on the criminal himself. A great many writs of intercommuning were now issued against the covenanters; by which absurd method of proceeding, crimes and punishments were multiplied to an extreme degree.

Application was made to Charles for some redress of these grievances: but he was too much taken up with his pleasures to take any effectual means of putting a stop to them; nay, even while he retracted them, he was persuaded to avow and praise them in a letter to the privy council. The consequence of all this was, that the covenanters were at last so much enraged against Sharpe, whom they considered as an apostate, and experienced to be an unrelenting persecutor, that, on the 3^d of May 1679, he was way-laid and murdered with all the circumstances of unrelenting cruelty. The murder of Sharpe produced a persecution still more violent, which at last brought on another insurrection.

The covenanters finding themselves obliged to meet in large bodies, and bring arms along with them for their own security, set forth a declaration against pre-lacy, which they published at Rutherglen, a small borough near Glasgow; and in the market-place there they burned several acts of parliament which had established that mode of ecclesiastical government, and had prohibited all conventicles. For this purpose they chose

the 29th of May, the anniversary of the reformation; and previously extinguished the bonfires that had been kindled on that occasion. Count Graham, afterwards viscount Dundee, an active and enterprising officer, attacked a great conventicle upon Loudon-hill, but was repulsed with the loss of 30 men. The covenanters then finding themselves unwarily engaged in rebellion, were obliged to persevere; and therefore pushed on to Glasgow, which, though repulsed at first, they afterwards made themselves masters of. Here they dispossessed the established clergy, and issued proclamations in which they declared that they fought against the king's supremacy, against Popery and prelacy, and against a Popish successor.

Charles, being now alarmed, dispatched against the covenanters a small body of English cavalry under the duke of Monmouth. He joined the Scots guards, and some regiments of militia levied from the well-affected counties; and with great celerity marched in quest of the insurgents. They had taken post at Bothwell-bridge between Hamilton and Glasgow; where there was no access but by the bridge, and where a small body was able to defend it against the king's army. The whole army of the covenanters never exceeded 8000 men, and they had in reality no other generals than their clergymen. Monmouth attacked the bridge, and the covenanters maintained their post as long as their ammunition lasted. When they felt for more, they received orders to quit their post and retire; and this imprudent measure occasioned an immediate defeat. Monmouth passed the bridge without opposition, and drew up his forces opposite to the enemy. His cannon alone put them to the rout. About 700 were killed in the pursuit; for, properly speaking, there was no action. Twelve hundred were taken prisoners, and treated with humanity by Monmouth. Such as promised to live peaceably under the present government were dismissed; and about 300 who refused this condition were shipped for Barbadoes, but unfortunately perished by the way. Two of their clergymen were hanged. Soon after, an act of indemnity was passed: but Lauderdale took care that it should afford little protection to the unhappy covenanters; for though orders were given to connive thenceforward at all conventicles, he found means under a variety of pretences to elude the execution of them.

It is now certainly known, that king Charles II. had formed a scheme of overturning the established religion, and substituting Popery in its place; as also of rendering himself absolute. In this, however, he met with violent opposition from his parliaments; and as this one of 1679 seemed even to surpass their predecessors in violence, the king was induced to dissolve them and call another in 1689. By this step, however, he was no gainer. They voted the legality of petitioning the king; and fell with extreme violence on the abhorbers, who in their addresses to the crown had expressed their disapprobation of those petitions. Great numbers of these were seized by their order in all parts of England, and committed to close custody: the liberty of the subject, which had been so carefully guarded by their own recent law, was every day violated by their arbitrary and capricious imprisonments. One Stowel of Exeter put a stop to their proceedings: he refused to obey the serjeant at arms who was sent to apprehend

him; he stood upon his defence, and said he knew no law by which the house of commons pretended to commit him. The house, finding it equally dangerous to proceed or recede, got off by an evasion. They voted that Stowel was indisposed; and a month's time was allowed him for his recovery. It is happy for the nation, that should the commons at any time overleap the bounds of their authority, and capriciously order men to be put in prison, there is no power, in case of resistance, that can compel the prisoner to submit to their decrees.

The chief point, however, laboured by the present parliament was, to obtain the exclusion bill, which, though the former house had voted, was never yet passed into a law. It passed by a great majority in the house of commons, but was thrown out by the house of peers. All the bishops, except three, voted against it; for they were of opinion that the church of England was in much greater danger from the prevalence of presbyterianism than Popery. The commons were extremely mortified at the rejection of their favourite bill: in revenge, they passed several other disagreeable acts, among which one was, That, till the exclusion bill was passed, they could not, consistent with the trust reposed in them, grant the king any manner of supply; and that whoever should hereafter lend, by way of advance, any money upon any branches of the king's revenue, should be responsible to parliament for his conduct. Charles, therefore, finding that there were no hopes of extorting either money or obedience from the commons, came to a resolution of once more dissolving the parliament. His usher of the black-rod accordingly came to dissolve them while they were voting that the dissenters should be encouraged, and that the Papists had burned the city of London.

It was for some time a doubt whether the king would ever call another parliament: his necessities, however, surmounted all his fears of their violence; and, in 1681, he summoned his parliament to meet him at Oxford, that he might thus have an opportunity of punishing the city of London by shewing his suspicions of their loyalty. In this, as in all former parliaments, the country party predominated; and they trode exactly in the same paths with their predecessors. The same speaker was chosen, and the exclusion bill urged more fiercely than before. Ernelly, one of the king's ministers, proposed that the duke should be banished 500 miles from England; and that, on the king's decease, the next heir should be constituted regent with regal power. Yet even this expedient, which left the duke the bare title of king, could not obtain the attention of the house. Nothing but a total exclusion could satisfy them.

Each party had now for some time reviled and ridiculed each other in pamphlets and libels; and this practice at last was attended with an incident that deserves notice. One Fitzharris, an Irish Papist, employed a Scotman named *Everhard* to write a libel against the king and the duke of York. The Scot was actually a spy for the contrary party; and supposing this a trick to entrap him, he discovered the whole to Sir William Waller, an eminent justice of the peace; and, to convince him of the truth of his information, posted the magistrate and two other persons privately, where they heard the whole conference between Fitzharris and himself. The libel composed between them was replete with

with the utmost rancour and scurrility. Waller carried the intelligence to the king, and obtained a warrant for committing Fitzharris, who happened at that very time to have a copy of the libel in his pocket. Seeing himself in the hands of a party from whom he expected no mercy, he resolved to fide with them, and throw the odium of the libel upon the court, who, he said, were willing to draw up a libel which should be imputed to the excludions, and thus render them hateful to the people. He enhanced his services to the country-party by a new Popish plot more tremendous than any of the foregoing, and in which he brought in the duke of York as a principal accomplice.

The king imprisoned Fitzharris; the commons avowed his cause. They voted that he should be impeached by themselves, to seren him from the ordinary forms of justice: the lords rejected the impeachment; the commons asserted their right: a commotion was likely to ensue; and the king, to break off the contest, went to the house and dissolved the parliament, with a fixed resolution never to call another.

From this moment the king ruled with despotic power. His temper, which had always been easy and merciful, now became arbitrary and cruel; he entertained spies and informers round the throne, and imprisoned all such as he thought most daring in their designs. He resolved to humble the presbyterians: they were divested of their employments and their places; and their offices given to such as held with the court, and approved the doctrine of non-resistance. The clergy began to testify their zeal and their principles by their writings and sermons; but though among these the partizans of the king were the most numerous, those of the opposite faction were the most enterprising. The king openly espoused the cause of the former; and thus placing himself at the head of a faction, he deprived the city of London, which had long headed the popular party, of their charter. It was not till after an abject submission that he restored it to them, having previously subjected the election of their magistrates to his immediate authority.

Terrors also were not wanting to confirm this new species of monarchy. Fitzharris was brought to a trial before a jury, and condemned and executed. The whole gang of spies, witnesses, informers, sorners, which had long been encouraged and supported by the leading patriots, finding now that the king was entirely master, turned short upon their ancient drivers, and offered their evidence against those who first put them in motion. The king's ministers gave them encouragement; and in a short time the same injustice and the same cruelties were practised against presbyterian schemes, that had formerly been practised against Catholic treasons. The king's chief resentment was levelled against the earl of Shaftesbury; and, indeed, not without reason, as he had had a very active hand in the late disturbances. No sums were spared to seek for evidence, or even to suborn witnesses, against this intriguing and formidable man. A bill of indictment being presented to the grand jury, witnesses were examined, who swore to such incredible circumstances as must have invalidated their testimony, even if they had not been branded as perjured villains. Among his papers, indeed, a draught of an association was found, which might have been construed into treason; but it was not in the earl's hand-writing, nor

Britain.

could it be proved that he had ever communicated this scheme to any body, or signified his approbation of any such project. The sheriffs had summoned a jury, whose principles coincided with those of the earl; and that probably, more than any want of proof, procured his safety.

In 1683, the city of London was deprived of its charter; which was restored only upon terms of the utmost submission, and giving up the nomination of their own magistrates. This was so mortifying a circumstance, that all the other corporations in England soon began to fear the same treatment, and were successively induced to surrender their charters into the hands of the king. Considerable sums were exacted for restoring these charters; and all the offices of power and profit were left at the disposal of the crown. Resistance now, however justifiable, could not be safe; and all prudent men saw no other expedient but submitting patiently to the present grievances.

There was a party, however, in England, that still cherished their former ideas of freedom, and resolved to restore liberty to their country by dethroning the king who acted in such a despotic manner. The principal conspirators were Monmouth, Shaftesbury, Ruffel, Essex, Howard, Algernon Sidney, and John Hamden grandson to the great man of that name. Monmouth engaged the earl of Macclesfield, Lord Brandon, Sir Gilbert Gerard, and other gentlemen in Cheshire. Lord Ruffel fixed a correspondence with Sir William Courtney, Sir Francis Knowles, and Sir Francis Drake, who promised to raise the west. Shaftesbury, with one Ferguson, an independent clergymen, and a restless plotter, managed the city, upon which the confederates chiefly relied. These schemes had been laid in 1681; but the caution of lord Ruffel, who induced the duke of Monmouth to put off the enterprize, saved the kingdom from the horrors of a civil war; while Shaftesbury was so struck with a sense of his impending danger, that he left his house, and, lurking about the city, attempted, but in vain, to drive the Londoners to an open insurrection. At last, enraged at the numberless cautions and delays which clogged and defeated his projects, he threatened to begin with his own friends singly. However, after a long struggle between fear and rage, he abandoned all hopes of success, and fled to Amsterdam, where he soon after died.

The loss of Shaftesbury, though it retarded, did not suppress, the designs of the conspirators. The remaining six formed a council; they corresponded with Argyle and the malecontents in Scotland; and resolved to prosecute the scheme of the insurrection, tho' they widely differed in principles from one another. Monmouth aspired at the crown; Ruffel and Hamden proposed to exclude the duke of York from the succession, and redress the grievances of the nation; Sidney was for restoring the republic, and Essex joined in the same wish. Lord Howard was an abandoned man, who, having no principles, sought to embroil the nation, to gratify his private interest in the confusion.

Besides these, there was a set of subordinate conspirators, who frequently met together, and carried on projects quite unknown to Monmouth and his council. Among these was colonel Rumley, an old republican officer; lieutenant-colonel Walcot, of the same stamp; Goodenough, under-sheriff of London, a zealous

and noted party-man; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London. But Rumley and Ferguson were the only persons that had access to the great leaders of the conspiracy. These men undertook the desperate resolution of assassinating the king in his way to New-market; Rumbold, one of the party, possessed a farm upon that road, called the *Rye-house*, and from thence the conspiracy was called the *Rye-house plot*. They deliberated on a scheme of stopping the king's coach by overturning a cart on the high way at this place, and shooting him through the hedges. The house in which the king lived at New-market accidentally took fire, and he was obliged to leave New-market eight days sooner than was expected; to which circumstance he owed his safety. Soon after this, the conspiracy was discovered; Ruffel, Sidney, and Walcot, were executed; Essex cut his own throat; Hambden was fined 40,000*l*.; and scarce one escaped who had been in any manner concerned, except the duke of Monmouth, who was the most culpable of all.

This was the last blood that was shed on account of plots or conspiracies, which continued during the greatest part of this reign. Severe punishments, however, were inflicted on many who treated the duke of York unworthily. The famous Titus Oates was fined 100,000*l*. for calling him a Popish traitor; and he was imprisoned till he should pay it, which he was absolutely incapable of. A similar sentence was passed upon Dutton Colt. Sir Samuel Barnadiston was fined 10,000*l*. for having, in some private letters, reflected on the government. The government of Charles was now as absolute as that of any prince in Europe; but, to please his subjects by an act of popularity, he judged it proper to marry the lady Anne, his niece, to prince George brother to the king of Denmark. This was the last remarkable transaction of this extraordinary reign. On February 24 1685, about eight in the morning, the king was seized with a fit of the apoplexy; being dressed, and just come out of his closet, where he had been for some time after he rose from bed. By being blooded, he was restored perfectly to his senses; and there were great hopes of his recovery the next day. On the fourth day the physicians despaired of his life, and therefore sent for the queen. He was in his perfect senses when she arrived. She threw herself on her knees, and asked his pardon for all her offences. He replied, that she had offended in nothing; but that he had been guilty of offences against her, and asked her pardon. He spoke with great affection to the duke of York, and gave him excellent counsel for his future conduct. He advised him to adhere to the laws with strictness, and invariably to support the church of England. The duke seemed anxious to convince him before he died how little he intended to follow his advice. Having removed the bishops, and several of the lords who attended the bed of the king, he sent for Huddleston, a Romish priest. In the presence of the duke, the earl of Bath, and Trevannion a captain in the guards, Huddleston gave the extreme unction to the king, and administered to him the sacrament according to the rites of the church of Rome. All this was done in the space of half an hour. The doors were then thrown open. Six prelates, who had before attended the king, were sent for to give him the

sacrament. Kenn, bishop of Bath and Wells, read the visitation of the sick; and, after he said that he repented of his sins, the absolution. The king assidued with seeming devotion at the service; but his mouth being distorted with fits, and his throat contracted, he could not swallow the elements. He professed, however, his satisfaction in the church of England; and expired on the 6th of February, between 11 and 12 o'clock; having reigned 25 years, and lived 55.

The first act of James II.'s reign was to assemble the privy council: where, after some praises bestowed on the memory of his predecessor, he made professions of his resolution to maintain the established government both in church and state; and as he had heretofore ventured his life in defence of the nation, he would still go as far as any man in maintaining all its just rights and privileges.

This discourse was received with great applause, not only by the council, but by the whole nation. Addresses came from all quarters, full of duty, nay of the most servile adulation. From this charge, however, we must except those of the Quakers, which is remarkable for its good sense and simplicity. "We are come (said they) to testify our sorrow for the death of our good friend Charles, and our joy for thy being made our governor. We are told that thou art not of the persuasion of the church of England no more than we: wherefore we hope that thou wilt grant us the same liberty which thou allowest thyself. Which doing, we wish thee all manner of happiness."

The king, however, soon showed, that he either was not sincere in his promises, or that he entertained so lofty an idea of his own legal power, that even his utmost sincerity could tend very little to the security of the liberties of the people. All the customs, and the greater part of the excise, which had been voted to the late king for his life only, were levied by James without a new act for that purpose. He went openly to mals with all the ensigns of his dignity; and even sent one Caryl as his agent to Rome to make submissions to the Pope, and to pave the way for the re-admission of England into the bosom of the Catholic church. From the suggestions of these men all his measures were undertaken. One day when the Spanish ambassador ventured to advise his majesty against putting too much confidence in such kind of people, "Is it not the custom in Spain (said James), for the king to consult with his confessor?" "Yes, (answered the ambassador), and that is the reason why our affairs succeed so very ill."

James's first parliament, which was composed mostly of zealous Tories, was strongly inclined to comply with the measures of the crown. They voted unanimously, that they should settle on the present king, during life, all the revenue enjoyed by the late king till the time of his decease. For this favour, James assured them, that he would secure them in the full enjoyment of their laws; but with regard to religion, no answer could be extorted, for that he was resolved to alter. In every thing, however, religion excepted, James merited every praise. He applied himself to business with unremitting attention. He managed his revenue with the strictest economy. He retrenched superfluous expences, and shewed himself zealous for the glory of the nation. He endeavoured to expel from court the vice which had prevailed so much during the former reign, and to restore

decency and morality. He presided daily at the council, at the boards of admiralty and treasury. He even entered into the whole detail of the concerns of the great departments of the state. But his bigotry for the Romish religion sullied all his good qualities, and rendered him feared for his violence, where he was not despised for his weakness.

But whilst every thing was submitted in tranquillity to James at home, a storm was gathering abroad to disturb his repose. For a long time the prince of Orange had entertained hopes of ascending the British throne, and had even used all his endeavours to exclude James from it. Monmouth who, since his last conspiracy, had been pardoned, but ordered to depart the kingdom, had retired to Holland. He was received by the prince of Orange with the highest marks of distinction, and even became his chief favourite through whom all his favours were to be obtained. When the news of Charles's death arrived, indeed, the prince made a shew of altering his note, and dismissed Monmouth, though he still kept a close correspondence with him. The duke retired to Brussels, where, under the auspices of the prince of Orange, he resolved to invade England, with a design of seizing the crown for himself. He was seconded by the duke of Argyle, who formed the scheme of an insurrection in Scotland; and while Monmouth attempted to make a rising in the west of England, it was resolved that Argyle should also try his endeavours in the north. The generosity of the prince of Orange, however, did not correspond with the warmth of his professions. The unfortunate duke derived from his own plate and jewels his whole supply for the war; and the enthusiasm of a rich widow supplied Argyle with 10,000*l.* wherewith he purchased three vessels, which he loaded with arms and ammunition.

Argyle was the first who landed in Scotland, where he published his manifestoes, put himself at the head of 2500 men, and strove to influence the people in his favour. But a formidable body of the king's forces coming against him, his army fell away; and he himself, after being wounded in attempting to escape, was taken prisoner by a peasant who found him standing up to the neck in water. He was from thence carried to Edinburgh, where after suffering many indignities he was publicly executed.

By this time Monmouth had landed in Dorsetshire with scarce 100 followers. His name, however, was so popular, and so great was the hatred of the people to James on account of his religion, that in four days he had assembled a body of above 2000 men. They were indeed all of them the lowest of the people, and his declarations were suited entirely to their prejudices. He called the king the duke of York; and denominated him a traitor, a tyrant, a murderer, and a Popish usurper. He imputed to him the fire of London, and even affirmed that he had poisoned the late king.

Monmouth continued to make a rapid progress, and in a short time found himself at the head of 6000 men; but was daily obliged to dismiss great numbers for want of arms. The king was not a little alarmed at his invasion. Six regiments of British troops were called over from Holland; and a body of regulars, to the number of 3000, were sent, under the command of the earl of Feversham and Churchill, to check the pro-

gress of the rebels. They took post at Sedgemoor, a village in the neighbourhood of Bridgewater, and were joined by considerable numbers of the country militia. Here Monmouth resolved, by a desperate effort, to lose his life, or gain the kingdom. He drove the royal infantry from their ground, and was on the point of gaining a complete victory, when the cowardice of Gray, who commanded the horse, brought all to ruin. This nobleman fled at the first onset; and the rebels, being charged in flank, gave way after a three-hours contest. About 300 were killed in the engagement, and 1000 in the pursuit. Monmouth fled above 20 miles from the field of battle, till his horse sunk under him. He then alighted; and, exchanging clothes with a shepherd, fled on foot, attended by a German court who had accompanied him from Holland. Being quite exhausted with hunger and fatigue, they both lay down in a field, and covered themselves with fern. The shepherd, being found in Monmouth's clothes by the pursuers, increased the diligence of the search; and by the means of blood-hounds he was detected in his miserable situation, with raw pease in his pocket, on which he had lived for some days. He burst into tears when seized by his enemies; and petitioned, with the most abject submissions, for his life. On his way to London, he wrote a submissive letter to the king, promising discoveries, should he be admitted into his presence. The curiosity of James being excited by the letter, he sent Sheldon a gentleman of the bed-chamber to meet Monmouth. In his conversation with Sheldon, he asked who was in chief confidence with the king; and being answered that it was Sunderland, Monmouth knocked his breast in a surprise, and said, "Why then, as I hope for salvation, he promised to meet me." He desired Sheldon to inform the king, that several of his accomplices in rebellion were in the confidence of his majesty; and he gave him a particular account of the part which the prince of Orange had acted in his whole affair.

Sheldon, on his return from the duke of Monmouth, began to give an account to the king of what he had learned from the unhappy prisoner. Sunderland, pretending business, came into the room. Sheldon stopped, and signified his desire to speak in private with the king. James told him he might say any thing before that lord. Sheldon was in great perplexity; but being urged, he told all that Monmouth had asserted. Sunderland appeared, for some time, confused; at length he said, with a laugh, "If that is all he can discover to save his life, he will derive little good from his information." Monmouth himself was soon after brought before the king. Sunderland by an artifice ensured the death of the unfortunate duke, to save himself and the other adherents of the prince of Orange. When he saw Monmouth's letter to James, and heard the discoveries made by Sheldon, he is said to have advised him, that, as he could assure him of the certainty of a pardon, he ought to deny what he had said in prejudice of his friends, who could serve him on some other more favourable occasion. The credulous duke, swayed by the advice of Sunderland, suppressed what he had said to Sheldon, when he was examined by the king. He mentioned nothing of the concern which the prince of Orange had taken in the invasion; tho' a point on which James was already sufficiently informed. D'Avaux, the French minister to the States, had

given a circumstantial account of the whole conduct of the prince to Lewis XIV. who had ordered it to be privately communicated to the king of England. The minister who had been sent from Holland to congratulate James on the suppression of Argyle's rebellion, was in a grievous agony when he heard that the king was resolved to see Monmouth. "Though he found that he said nothing of his master, (said James), he was never quiet till Monmouth was dead."

The unfortunate duke made various attempts to obtain mercy. He wrote to the queen dowager; he sent a letter to the reigning queen, as well as to the king himself. He begged his life, when admitted into his presence, with a meanness unsuitable to his pretensions and high rank. But all his entreaties and submissions were of no avail. James told him, that he was much affected with his misfortunes, but that his crime was too dangerous in its example to be left unpunished. In his last moments he behaved with a magnanimity worthy of his former courage. When he came to the scaffold, he behaved with decency and even with dignity. He spoke little; he made no confession; nor did he accuse any of his friends. Circumstances are said to have attended his death that created a horror among the spectators. The executioner missed his blow, and struck him slightly on the shoulder. Monmouth raised his head from the block, and looked him full in the face, as if reproaching him for his mistake. He struck him twice again, but with feeble strokes; and then threw the ax from his hands. The sheriff forced him to renew his attempt; and the head of the duke, who seemed already dead, was at last severed from his body.

265
Terribly

the executioner.

266
Rebels cru-
elly treated.

Those concerned in the duke of Monmouth's conspiracy were punished with the utmost severity. Immediately after the battle of Sedgemoor, Feverham hanged up above 20 prisoners; and was proceeding in his executions, when the bishop of Bath and Wells informed him that these unhappy men were now by law intitled to a trial, and that their execution would be deemed a real murder. Nineteen were put to death in the same manner at Bridgewater, by colonel Kirke, a man of a savage and bloody disposition. This vile fellow, practised in the arts of slaughter at Tangier, where he served in garrison, took pleasure in committing instances of wanton barbarity. He ravaged the whole country, without making any distinction between friend and foe. His own regiment, for their peculiar barbarity, went under the ironical title of *Kirke's lambs*. It doth not, however, appear that these cruelties were committed by the direction, or even with the approbation, of James; any more than the legal slaughters that were committed by judge Jefferies, who was sent down to try the delinquents. The natural brutality of this man's temper was inflamed by continual intoxication. No fewer than 80 were executed by his orders at Dorchester; and on the whole, at Exeter, Taunton, and Wells, 250 are computed to have fallen by the hand of justice as it was called; nor were women exempted from the general severity, but suffered for harbouring their nearest kindred. Jefferies on his return was immediately created a peer, and soon after vested with the dignity of chancellor. In justice to the king, however, it must be owned, that in his memoirs he complains, with apparent indignation, of "the strange havoc made by Jefferies and Kirke in the

Britain.

west;" and that he attributed the unpopularity, which afterwards deprived him of the crown, to the violence and barbarity of those pretended friends of his authority. He even ascribes their severities, in some degree, to a formed design of rendering his government odious to his subjects; and from hence it is probable, that no exact or impartial accounts of these cruelties had reached his ears, at least till long after they were committed.

267
James en-
deavours to
establish
Popery.

James now began to throw off the mask, and to endeavour openly to establish Popery and arbitrary power. He told the house of commons, that the militia were found by experience to be of no use; that it was necessary to augment the standing army; and that he had employed a great many Catholic officers, in whose favour he had thought proper to dispense with the test required to be taken by all who were employed by the crown. He found them useful, he said, and he was determined to keep them employed. These stretches of power naturally led the lords and commons into some degree of opposition; but they soon acquiesced in the king's measures, and then the parliament was dissolved for their tardy compliance. This was happy for the nation; for it was perhaps impossible to pick out another house of commons that could be more ready to acquiesce in the measures of the crown; but the dissolution of this parliament was generally looked upon as a sign that James never intended to call another.

268
Parliament
dissolved.

The parliament being dismissed, James's next step was to secure a Catholic interest in the privy council. Accordingly four Catholic lords were admitted, *viz.* Powis, Arundel, Belasis, and Dover. Sunderland, who saw that the only way to gain preferment was by Popery, became a convert. Rocheiter, the treasurer, was turned out of his office, because he refused to conform. Even in Ireland, where the duke of Ormond had long supported the royal cause, this nobleman was displaced as being a Protestant; and the lord Tyrconnel, a furious Roman-catholic, was placed in his stead. In his zeal for Popery, it is said, that James stooped so low as even to attempt the conversion of colonel Kirke: but the daring soldier told him, that he was pre-engaged; for he had promised the king of Morocco, when he was quartered at Tangiers, that, if ever he changed his religion, he would turn Mahometan.

269
Catholics
promoted.

At last the clergy of the church of England began to take the alarm, and commenced an opposition to court measures. The pulpits now thundered out against Popery; and it was urged, that it was more formidable from the support granted it by the king. It was in vain that James attempted to impose silence on these topics; instead of avoiding the controversy, the Protestant preachers pursued it with greater warmth.

270
English
clergy op-
pose the
court mea-
sures.

To effect his designs, the king determined to revive the highcommission court, which had formerly given the nation so much disgust, and which had been abolished for ever by act of parliament. An ecclesiastical commission was issued out anew, by which seven commissioners were invested with a full and unlimited authority over the whole church of England.—The next step was to allow a liberty of conscience to all sectaries; and he was taught to believe that the truth of the Catholic religion would then, upon a fair trial, gain the victory. In such a case, the same power that granted liberty of conscience

Britain.

conscience might refrain it; and the Catholic religion alone be allowed to predominate. He therefore issued a declaration of general indulgence, and asserted that non-conformity to the established religion was no longer penal. In Scotland, he ordered his parliament to grant a toleration only to the Catholics, without interceding in the least for the other dissenters who were much more numerous. In Ireland, the Protestants were totally expelled from all offices of trust and profit, and Catholics put in their places. These measures sufficiently disgusted every part of the British empire; but, to complete the work, James publicly sent the earl of Castlemaine ambassador extraordinary to Rome, in order to express his obedience to the Pope, and reconcile his kingdoms to the Catholic communion. This proceeding was too precipitate to be relished even by the Pope himself; and therefore the only return he made to this embassy was the sending a nuncio into England. The nuncio made a public and solemn entry into Windsor; which did not fail to add to the general discontent; and because the duke of Somerset refused to attend the ceremony, he was dismissed from his employment of one of the lords of the bed-chamber.

Soon after this, the Jesuits were permitted to erect colleges in different parts of the kingdom, and to exercise the Catholic worship in the most public manner. Father Francis, a benedictine monk, was recommended by the king to the university of Cambridge, for the degree of master of arts. The university rejected him on account of his religion; and presented a petition to the king, beseeching him to recall his mandate. James disregarded their petition, and denied their deputies a hearing; the vice-chancellor himself was summoned to appear before the high commission court, and deprived of his office: yet the university persisted, and father Francis was refused. The place of president of Magdalen college being vacant, the king sent a mandate in favour of one Farmer, a new convert, and a man of bad character in other respects. The fellows of the college made very submissive applications for recalling his mandate; but the election-day coming on before they received an answer, they chose Dr Hough, a man of learning, integrity, and resolution. The king was incensed at their presumption; an inferior ecclesiastical court was sent down, who finding Farmer a man of scandalous character, issued a mandate for a new election. The man now recommended by the king was doctor Parker; a man of an abandoned character, but very willing to embrace the Catholic religion. The fellows refused to comply with this injunction; which so irritated the king, that he came down to Oxford in person, and ordered the fellows to be brought before him. He reproached them with their insolence and disobedience; and commanded them to choose Parker without delay. Another refusal on their side served still more to exasperate him; and finding them resolute in the defence of their privileges, he ejected them all except two from their benefices, and Parker was put in possession of the place. Upon this, the college was filled with Catholics; and Charnock, one of the two that remained, was made vice-president.

In 1688, a second declaration for liberty of conscience was published almost in the same terms with the former; but with this peculiar injunction, that all divines should read it after service in their churches. The

clergy resolved to disobey this order. Loyde bishop of St Asaph, Ken of Bath and Wells, Turner of Ely, Lake of Chichester, White of Peterborough, and Trelawney of Bristol, together with Sancroft the primate, concerted an address in form of a petition to the king, which, with the warmest expressions of zeal and submission, remonstrated, that they could not read his declaration consistent with their consciences, or the respect they owed the Protestant religion. The king received their petition with marks of surprise and displeasure. He said he did not expect such an address from the church of England, particularly from some amongst them; and persisted in his orders for their obeying his mandate.

As the petition was delivered in private, the king summoned the bishops before the council, and there questioned them whether they would acknowledge it. They for some time declined giving an answer; but being urged by the chancellor, they at last owned the petition. On their refusal to give bail, an order was immediately drawn for their commitment to the Tower, and the crown lawyers received directions to prosecute them for a seditious libel. The king gave orders that they should be conveyed to the Tower by water, as the whole city was in commotion in their favour. The people were no sooner informed of their danger, than they ran to the river-side in prodigious multitudes, craving their blessing; calling upon heaven to protect them, &c. The very soldiers by whom they were guarded, knelt down before them, and implored their forgiveness.

The 29th of June 1688 was fixed for the trial of the bishops; and their return was still more splendidly attended than their imprisonment. Twenty-nine peers, a great number of gentlemen, and an immense crowd of people, waited upon them to Westminster-hall. The dispute was learnedly managed by the lawyers on both sides. The jury withdrew into a chamber where they passed the whole night; but next morning they returned into court, and pronounced the bishops not guilty. Westminster-hall instantly rang with loud acclamations, which were communicated to the whole extent of the city. They even reached the camp at Hounslow, where the king was at dinner in lord Feverham's tent. His majesty demanding the cause of those rejoicings, and being informed that it was nothing but the soldiers shouting for the delivery of the bishops; "Call you that nothing! (cried he); but so much the worse for them." Immediately after this, the king struck out two of the judges, Powel and Holloway, who had appeared to favour the bishops. He issued orders to prosecute all those clergymen who had not read his declaration, and all had refused it except 200. He sent also a mandate to the new fellows, whom he had obtruded on Magdalen college, to elect for president, in the room of Parker lately deceased, one Gifford, a doctor of the Sorbonne, and titular bishop of Madura.

As the king found the clergymen every where averse to his measures, he was willing next to try what he could do with the army. He thought, if one regiment should promise implicit obedience, their example would induce others to comply. He therefore ordered one of the regiments to be drawn up in his presence, and desired that such as were against his late declaration of liberty of conscience should lay down their arms.

He was surpris'd to see the whole battalion ground their arms, except two officers and a few Roman-catholic soldiers.—A fortunate circumstance happened about this time in his family. A few days before the acquittal of the bishops, the queen was brought to bed of a son, who was baptized by the name of *James*. This would, if any thing could at that time, have serv'd to establish him on the throne: but so great was the animosity against him; that a story was propagated that the child was supposititious; and so great was the monarch's pride, that he scorn'd to take any precautions to refute the calumny.

Though the enthusiasm of James himself bordered upon madness, the most wild of his religious projects seem to have been suggested by his enemies to accomplish his ruin. The earl of Sunderland, whom he chiefly trusted, was a man of abandoned principles, insatiable avarice, and sited by nature for stratagem, deception, and intrigue. The love of money was his ruling passion, and he sold his influence to the highest bidder. To such a degree was he mercenary, that he became at once the pensioner of the prince of Orange and of the king of France. The former, who had long fix'd his eye on the English throne, watch'd James's motions, and took every advantage of his errors. He had laid his schemes so extensively, that nothing but the birth of a male heir to the crown of England could possibly prevent him from an almost immediate possession of the kingdom. He had the address to render two thirds of the powers of Europe interested in his success. The treaty of *Augsburg*, form'd to break the power of France, could not accomplish its object without the accession of England. The house of Austria, in both its branches, preferred their political views to their zeal for the Roman faith, and promoted the dethronement of James as the only means to humble *Lewis XIV.* *Odescalchi*, who under the name of *Innocent XI.* fill'd then the papal chair, was gain'd to the measures of the prince of Orange by other considerations, as well as through his fixed aversion to France. The prince of Orange sent his intimate friend the prince of *Vaudemont* to Rome, to procure the aid of the Pope. He explain'd to his Holiness, that the Catholic princes were in the wrong to expect any advantage to their faith from James, as his being a declared Papist rendered his people averse to all his measures. As for himself, should he have the good fortune to mount the throne of England, he might take any step in favour of the Roman-catholics without jealousy; and he promis'd to procure a toleration for the Papists, should the Pope, the emperor, and the king of Spain, favour his attempt. This negotiation procur'd the desired effect. *Innocent* contributed, with the money of the church, to expel a Roman-catholic prince from his throne.

Though the contest with the bishops had completed the king's unpopularity, he deriv'd the fuddeness of his ruin from the birth of a prince of Wales. That circumstance increased the fears of his subjects in proportion as it rais'd his security and hopes. In the reign of a prince to be educated under the prejudices of such a father nothing but a continuance of the same unconstitutional measures could be expected. So low indeed was his credit sunk among his people at this time, and such presence they all seem'd to have of his fate, that the child had like to have died before a wet nurse could

be procur'd to suckle him.

The prince of Orange, seeing the national discontent now rais'd to the highest pitch, resolv'd to take advantage of it. He began by giving one *Dykevelt*, his envoy, instructions to apply in his name to every religious sect in the kingdom. To the church-party he sent assurances of favour and regard; and protest'd, that his education in Holland had noway prejudic'd him against episcopacy. To the non-conformists he sent exhortations, not to be deceiv'd by the insidious careffs of their known enemy, but to wait for a real and sincere protector, &c. In consequence of these insinuations, the prince soon received invitations from the most considerable persons in the kingdom. Admirals *Herbert* and *Ruffel* assur'd him in person of their own and the national attachment. *Henry Sidney*, brother to *Algernon*, and uncle to the earl of *Sunderland*, came over to him with assurances of an universal combination against the king. Lord *Dumblaine*, son to the earl of *Danby*, being master of a frigate, made several voyages to Holland, and carried from many of the nobility tenders of duty and even considerable sums of money to the prince of Orange. Soon after, the bishop of *London*, the earls of *Danby*, *Nottingham*, *Devonshire*, *Dorset*, and several other lords, gentlemen, and principal citizens, united in their addresses to him, and intreated his speedy descent. The people, though long divid'd between whig and tory, now join'd against their unhappy sovereign as a common enemy. *William* therefore determin'd to accept of their invitations; and this the more readily, as he perceiv'd the malecontents had conducted themselves with prudence and secrecy. Having the principal servants of James in pay, he was minutely inform'd of the most secret actions and even designs of that prince. His intelligence came, through *Sidney*, from *Sunderland*, who betray'd the very measures which he himself had advis'd. The prince had a fleet ready to sail, and troops provided for action, before the beginning of June 1688.

The king of France was the first who gave James warning of his danger, and offer'd to assist him in repelling it. But he declin'd this friendly offer, lest it should be said that he had enter'd into a private treaty with that monarch to the prejudice of the Protestant religion. Being also deceiv'd and betray'd by *Sunderland*, he had the weakness to believe, that the reports of an invasion were invent'd in order to frighten him into a strict connexion with France. He gave credit to the repeated assurances of the states, that the armament prepar'd in their ports was not design'd against England. Nay, he even believ'd the assertions of the prince himself, whose interest it was to deceive. *Sunderland* deserv'd against the possibility of an invasion, and turn'd to ridicule all who believ'd the report. Having by the prior consent of James taken possession of all the foreign correspondence, he suppress'd every intelligence that might alarm; and even all others whom James trust'd, except *Dartmouth*, affect'd long to give no faith to the reports of an invasion.

Lewis, finding his first offers reject'd, next propos'd to march down his army to the frontiers of the Dutch provinces, and thus detain their forces at home for their own defence. But this proposal met with no better reception than the former. Still *Lewis* was unwilling to abandon a friend and ally whose interest he re-

gard'd

Britain.

Britain.

garded as closely connected with his own. He ventured to remonstrate with the Dutch against the preparations they were making to invade England. The Dutch treated his remonstrance as an officious impertinence, and James himself declined his mediation.

The king of England, having thus rejected the assistance of his friends, and being left to face the danger alone, was afflicted with an advice from his minister in Holland, that an invasion was not only projected, but avowed. When he first read the letter containing this information, he grew pale, and the letter dropt from his hand. He saw himself on the brink of destruction, and knew not to whom to apply for protection. In this emergency, Lewis wrote to James in his own hand, that, to divert the Dutch from their intended invasion of England, he would lay siege to Maestricht with 30,000 men. James communicated this intelligence to Sunderland, and he to the prince of Orange. Six thousand men were thrown into Maestricht; and the design of Lewis, as being impracticable, was laid aside. On this, Lewis, being disgusted with James, turned his arms towards Germany. The dauphin laid siege to Philipsburgh on the 5th of October; and prince Clement of Bavaria, by throwing a strong garrison into Cologne, effectually secured the states of Holland from any sudden danger from the arms of France.

James had now no resource but in retreating from those precipitate measures which had plunged him into inextricable distresses. He paid court to the Dutch, and offered to enter into any alliance with them for their common security. He replaced in all the counties of England all the deputy lieutenants and justices who had been deprived of their commissions for their adherence to the test and penal laws. He reitored the charters of such corporations as he had possessed himself of; he annulled the high commission court; he reinstated the expelled president and fellows of Magdalen college; and was even reduced to carefs those bishops whom he had so lately persecuted and insulted.

All these concessions, however, were now too late; they were regarded as the effects of fear, and not of repentance. Indeed, it is said, he very soon gave proofs of his insincerity: for, hearing that the Dutch fleet was dispersed, he recalled those concessions he had made in favour of Magdalen college; and, to show his attachment to the Romish church, at the baptism of the prince of Wales he appointed the Pope one of the sponsors.

In the mean time, William set sail from Helvoetsluys with a fleet of near 500 vessels, and an army of above 14,000 men. Fortune, however, seemed at first every way unfavourable to his enterprise. He was driven back by a dreadful storm; but he soon reftitted his fleet, and again set sail for England. It was given out that this invasion was designed for the coasts of France; and many of the English, who saw the fleet pass along their coasts, little suspected the place of its destination. It happened that the same wind which sent the Dutch to their place of destination, detained the English fleets in the river: so that the Dutch passed the straits of Dover without molestation; and, after a voyage of two days, landed at Broxholme in Torbay, on the 5th of November, the anniversary of the gunpowder treason.

But though the invitation from the English was very general, the prince for some time had the mortification

to find himself joined by very few. He continued for ten days in expectation of being joined by the malcontents, and at last was going to despair of success. But just when he began to deliberate about reembarking his forces, he was joined by several persons of consequence, and the whole country soon after flocked to his standard. The first person that joined the prince was major Durrington, and he was quickly followed by the gentry of the counties of Devon and Somerset. Sir Edward Seymour made proposals for an association, which was signed by great numbers; and every day there appeared some effect of that universal combination into which the nation had entered against the measures of the king.

This was followed by the defection of the army. Lord Colchester, son to the earl of Rivers, first deserted to the prince. Lord Cornbury, son to the earl of Clarendon, carried off the greatest part of three regiments of cavalry at once; and several officers of distinction informed Feverham their general, that they could not in honour fight against the prince of Orange. Soon after this, the unhappy monarch found himself deserted by his own servants and creatures. Lord Churchill had been raised from the rank of a page, and had been invested with an high command in the army; he had been created a peer, and owed his whole fortune to the king's bounty: yet even he deserted among the rest; and carried with him the duke of Grafton natural son to the late king, colonel Berkley, and some others.

In this universal defection, James, not knowing where to turn, began to think of requesting assistance from France when it was now too late. He wrote to Leopold emperor of Germany: but in vain; that monarch only returning for answer, that what he had foreseen had happened. James had some dependence on his fleet; but they were entirely disaffected. In a word, his interests were deserted by all, for he had long deserted them himself. He still found his army, however, to amount to 20,000 men; and had he led them immediately to battle, it is possible they might then have fought in his favour. But James's misfortunes had deprived him of his natural firmness and resolution; and, seeing himself deserted by those in whom he thought he could have placed most confidence, he became suspicious of all, and was in a manner deprived even of the power of deliberation. In this extremity of distresses, the prince of Denmark, and Anne James's favourite daughter, perceiving the desperation of his circumstances, cruelly resolved to take part with the prince of Orange. When the king was informed of this, he was stung with the most bitter anguish. "God help me (cried he), my own children have forsaken me." To add to his distresses as a parent, he was accused of being accessory to the death of his own child. Her nurse, and her uncle the earl of Clarendon, went up and down like distracted persons, affirming that the Papists had murdered the princefs. They publicly asked the queen's servants whither they had conveyed her? and they contributed to inflame the populace, whose zeal had already inflamed them to tumult and disorder. It was, however, soon known that she fled, under the conduct of the bishop of London, to Northampton.

On the 30th of November 1688, James sent three of his noblemen to treat with the prince of Orange. But though the latter knew very well that the king's com-

missioners were in his interests, his behaviour showed plainly that he now thought the time of treating was past. For some time he would not admit them to an audience; and, when he did, would give no satisfactory answer. James now began to be afraid of his personal safety. But what most affected him was the terrors of the queen for herself and her infant son. He therefore resolved to send them abroad. They crossed the river in a boat, at Whitehall, in a stormy and rainy day. They were carried to Graveend in a coach, under the conduct of the count de Lauzun. A yacht, commanded by captain Gray, which lay there ready for the purpose, soon transported them in safety to Calais.

293
James at-
tempts to
leave the
kingdom.

The king was now so dispirited and distracted, that he resolved to leave the kingdom at once, and thus throw every thing into confusion. He threw the great seal into the Thames; he left none with any authority to conduct affairs in his absence; and he vainly hoped to derive advantage to his affairs from anarchy and disorder. About twelve at night, on the 10th of December, he disguised himself, took boat at Whitehall, and crossed the river. Sir Edward Hales, with another friend, met him at Vauxhall with horses. He mounted; and being conducted through by-ways by a guide, he passed in the night-time to the Medway, which he crossed by Aylesford-bridge. At Woolpeck he took fresh horses, sent thither before by Sheldon one of his equerries who was in the secret of his flight. He arrived at ten o'clock at Embury near Feverham, where a customhouse hoy, hired by Sir Edward Hales, lay ready to receive them on board. But the wind blew fresh, and the vessel had no ballast. The master, therefore, easily persuaded the king to permit him to take in ballast at Shilness. It being half ebb when they ran ashore, they designed to fail as soon as the vessel should be afloat. But when the vessel was almost afloat, she was boarded by three sloop-boats belonging to Feverham, containing 50 men. They seized the king and his two companions, under pretence of their being Papists that wanted to escape from the kingdom. They turned up Feverham water with the tide; but still the king remained unknown. Sir Edward Hales placed privately 50 guineas in the hands of the captain, as an earnest of more should he permit them to escape. He promised: but was so far from keeping his word, that he took what money they had, under pretence of securing it from the seamen; and, having possessed himself of their all, he left them to their fate. The unfortunate fugitives were at length carried in a coach to Feverham, amid the insults, clamours, and shouts, of the sailors. When the king was brought to the inn, a seaman, who had served under him, knew him, and melted into tears; and James himself was so much moved at this instance of his affection, that he wept. The other fishermen, who had treated him with such indignity before, when they saw his tears, fell upon their knees. The lower inhabitants of the whole village gathered round him; but the better sort fled from his presence. The seamen, however, formed themselves into a guard round him, and declared that "a hair of his head should not be touched." In the mean time, Sir James Oxendon, under the pretence of guarding him from the rabble, came with the militia to prevent his escape. The king found a change in his condition when he was taken out of the hands of the sailors. The commanders of the militia

showed him no respect. He was even insulted by the common soldiers. A letter which he intended to send to London for clothes, a change of linen, and some money, was stopped by those who pretended to protect his person.

All things in the mean time ran into confusion at London, and the prince of Orange exercised in his own person all the functions of royalty. He issued a declaration to the disbanded army to reassemble themselves. He ordered the secretary at war to bring him a list of the king's troops. He commanded the lord Churchill to collect his troop of horse-guards. He sent the duke of Grafton to take possession in his name of Tilbury fort. The assembly of peers adjourned to the council-chamber at Whitehall; and, to give the appearance of legality to their meeting, chose the marquis of Halifax for their president. While this assembly was sitting, on the 13th of December, a poor countryman, who had been engaged by James, brought an open letter from that unfortunate prince to London. It had no superscription; and it was addressed to none. It contained, in one sentence only, his deplorable condition when in the hands of a desperate rabble. This poor messenger of their fallen sovereign had long waited at the council door, without being able to attract the notice of any who passed. The earl of Mulgrave at length, apprised of his business, had the courage to introduce him to the council. He delivered his open letter, and told the state of the king with tears. The assembly were so much moved, that they sent the earl of Feverham with 200 of the guards towards Feverham. His instructions were to rescue him first from danger, and afterwards to attend him to the sea-coast, should he chuse to retire. He chose, however, to return to London; but the prince of Orange sent a message to him desiring him to advance no nearer the capital than Rochester. The messenger missed James by the way. The king sent Feverham with a letter to the prince of Orange, requesting his presence in London to settle the nation. He himself proceeded to that place, and arrived on the 16th of December. Doubting the fidelity of the troops who were quartered at Westminster, he chose to pass through the city to Whitehall. Never prince returning with victory to his capital was received with louder acclamations of joy. All the streets were covered with bonfires. The bells were rung, and the air was rent with repeated shouts of gladness. All orders of men crowded to his coach; and, when he arrived at Whitehall, his apartments were crowded with people who came to express their joy at his return.

The prince of Orange received the news of his return with an haughty air. His aim from the beginning was to force him by threats and severities to relinquish the throne. The Dutch guards were ordered to take possession of Whitehall, and to displace the English. The king was soon after commanded by a message, which he received in bed at midnight, to leave his palace next morning, and to depart for Ham, a seat of the dukes of Lauderdale's. He desired, however, permission to retire to Rochester, a town not far from the sea-coast, and opposite to France. This was readily granted; and it was now perceived that the harsh measures of the prince had taken effect, and that the king meditated an escape to France.

The king, surrounded by the Dutch guards, arrived

at Rochester, on the 19th of December. The restraint put upon his person, and the manner in which he had been forced from London, raised the indignation of many, and the compassion of all. The English army, both officers and soldiers, began to murmur; and had it not been for the timidity and precipitation of James himself, the nation had certainly returned to their allegiance. He remained three nights at Rochester, in the midst of a few faithful friends. The earls of Arrian, Dumbarton, Ailsbury, Litchfield, and Middleton, were there; and, with other officers of merit, the gallant lord Dundee. They argued against his flight with united efforts. Several bishops, some peers, and many officers, intreated his stay in some part of England. Message followed message from London. They represented that the opinions of men began to change, and that events would daily rise in favour of his authority. Dundee added his native ardour to his advice. "The question, Sir, (said he), is, Whether you shall stay in England, or fly to France? Whether you shall trust the returning zeal of your native subjects, or rely on a foreign power? Here you ought to stand. Keep possession of a part, and the whole will submit by degrees. Refuse the spirit of a king. Summon your subjects to their allegiance. Your army, though disbanded, is not dispersed. Give me your commission. I will gather 10,000 of your troops. I will carry your standard at their head through England, and drive before you the Dutch and their prince." The king replied, "that he believed it might be done; but that it would raise a civil war, and he would not do so much mischief to a nation that would so soon come to their senses again." Middleton urged his stay, though in the remotest part of the kingdom. "Your majesty, (said he), may throw things into confusion by your departure; but it will be but the anarchy of a month: a new government will soon be settled, and you and your family will be ruined." These spirited remonstrances had no effect upon James. He resolved to quit the kingdom; and having communicated his design to a few of his friends, he passed at midnight through the back-door of the house where he lodged, and with his son the duke of Berwick, and Biddulph one of his servants, went in a boat to a smack, which lay waiting for him without the fort of Sheerness. By reason of a hard gale they were forced to bear up toward Leigh, and to anchor on the Essex-side, under the lee of the land. When the gale slackened, they reached the Buoy of the Narrows without tacking; but not being able to weather the Goodwin, they were forced to sail through the downs. Seven ships lay there at anchor; but the smack passed unquestioned along. Unable to fetch Calais, she bore away for Boulogne, and anchored before Ambleteuse. The king landed at three o'clock in the morning of Tuesday, December 25th; and taking post, soon joined his queen at St Germain's.

James having thus abandoned his dominions, the prince of Orange remained master of them of course. By the advice of the house of lords, the only member of the legislature remaining, he was desired to summon a parliament by circular letters; but the prince, unwilling to act upon so imperfect an authority, convened all the members who had sat in the house of commons during any parliament of Charles II. and to these were added the mayor, aldermen, and fifty of the common

council of London; and the prince, being thus supported by an assembly deriving its authority from himself, wrote circular letters to the counties and corporations of England to call a new parliament.

The house being met, which was mostly composed of the Whig party, thanks were given to the prince of Orange for the deliverance he had brought them; after which they proceeded to settle the kingdom. A vote passed both houses, that king James II. having endeavoured to subvert the constitution of the kingdom, by breaking the original contract between the king and his people; and having by the advice of Jesuits and other wicked persons violated the fundamental laws, and withdrawn himself out of the kingdom; had abdicated the government, and that the throne was thereby vacant.

The king being thus deposed, it was easy for William to get himself appointed as his successor. Proposals were made for electing a regent. Others were for investing the prince of Orange with regal power, and declaring the young prince supposititious. To these proposals, however, William opposed the following decisive argument, *viz.* that "he had been called over to defend the liberties of the British nation, and that he had happily effected his purpose; that he had heard of several schemes proposed for the establishing of the government; that if they chose a regent, he thought it incumbent upon him to inform them that he would not be that regent; that he would not accept of the crown under the prince's wife, though he was convinced of her merits: that therefore, if either of these schemes was adopted, he could give them no assistance in the settlement of the nation; but would return home to his own country, satisfied with his aims to secure the freedom of theirs." Upon this, after a long debate in both houses, a new sovereign was preferred to a regent by a majority of two voices. It was agreed that the prince and prince of Orange should reign jointly as king and queen of Britain; while the administration of government should be placed in the hands of the prince only. The marquis of Halifax, as speaker of the house of lords, made a solemn tender of the crown to their Highnesses, in the name of the peers and commons of Britain. The prince accepted the offer; and that very day, February 13th 1689, William and Mary were proclaimed king and queen of Great Britain.

Though Mary was comprehended in the royal title, she never possessed either the authority of a queen, or the influence of a wife. Her easy temper had long been subdued by the stern severity of a husband who had very few amiable qualities. Being brought up in a manner under the tuition of her spouse, and in some degree confined by his orders, she was accustomed to adopt implicitly his political maxims and even his thoughts; and in consequence of her want of importance with him, she ceased to be an object of consequence in the eyes of the nation.

William began his reign with issuing a proclamation for continuing in office all Protestants that had been in place on the first of the preceding December. On the 17th of the month he formed his privy council, which consisted chiefly of such persons as had been most active in raising him to the throne. To gratify as many as possible of his friends, the several boards, and

even the chancery, were put into commission. The benches of the exchequer and common law were filled with persons who had distinguished themselves against the measures of the late king. The earl of Nottingham who had violently opposed the elevation of William, and the earl of Shrewsbury who had adhered to his views, were made secretaries of state. The marquis of Halifax, and the earl of Danby, though rivals in policy, were admitted into the cabinet; the first as lord privy seal, the second as president of the council. His Dutch friends in the mean time were not forgotten by the king. Bentinck, his favourite, was made a privy counsellor, groom of the stole, and privy purse. Auverquerque was appointed master of the horse. Zuylstein received the office of master of the robes. Schomberg was placed at the head of the ordnance.

303
National
dissenters.

Though these instances of gratitude were no doubt necessary to William, the generality of the nation were displeas'd. The Tories were offend'd at being excluded from his favour, especially as they had departed from their principles in order to serve him. The nation in general were much prejudic'd against foreigners, and universal discontent ensu'd upon seeing them prefer'd. The king, who had been bred a Calvinist, was also very strongly inclin'd to favour that sect; and his prejudices in favour of Calvinism were almost equal to those of James in favour of Popery. Finding, therefore, the clergy of the church of England little inclin'd to take the oaths to the new government, he began openly to indulge his own prejudices in favour of dissenters. Having come to the house of lords to pass some bills, on the 16th of March, he made a speech, urging the necessity of admitting all Protestants indiscriminately into the public service. He told his parliament, that he had something to communicate, which would conduce as much to their settlement as to the disappointment of their enemies. He inform'd them, that he was employ'd in filling up the vacancies in offices of trust; and he hop'd that they were sensible of the necessity of a law to settle the oaths to be taken by such persons as should be admitted into place. As he doubted not, he said, that they would sufficiently provide against Papists, so he hop'd that they would leave room for the admission of all Protestants that were able and willing to serve.

304
His scheme
in favour of
dissenters
reject'd.

This proposition was reject'd with vehemence. The adherents of the church complain'd that the ruin which they fear'd from the Papists in the preceding reign was now to be dread'd from the Protestant dissenters. They affirm'd, that if the establish'd religion was to be destroy'd, it matter'd little by whose hands it must fall. A bill brought in by the ministry for abrogating the former oaths of supremacy and allegiance was reject'd.

An attempt to dispense with the sacramental test was made without success in another form. The court party propos'd that any man should be sufficiently qualified for an office by producing a certificate of his having received the sacrament in any Protestant congregation. But this motion was also reject'd in the house of lords by a great majority. William repeated his attempts of a comprehension; but he was ultimately unsuccessful, and in the coronation-oath the church-party insert'd a clause highly favourable to themselves, viz. that the king should maintain the Protestant reli-

gion "as establish'd by law." To this clause William is said to have discover'd an apparent unwillingness to swear.

For these and other reasons the government of William was for some time but in a very tottering condition. The king, either through want of health or inclination, interfer'd but little in the affairs of the nation. Ireland was strangely neglect'd. Halifax and Danby, who had in a manner rais'd the king to the throne, cabal'd with his enemies. They perceiv'd that the people, with the same levity that induc'd them to desert their former sovereign, were beginning to be discontented with their new prince. Every thing seem'd to tend to a change. Halifax himself declar'd, that were James to conform with the Protestants, he could not be kept four months from reascending his throne. Danby averr'd, that, were the late king to give satisfaction for the security of religion, it would be difficult to oppose his restoration. From these apparent dissenters of the nation, the friends and emissaries of James assum'd more boldness. They tamper'd with the servants of the crown, and inflam'd the army. The former they alarm'd with the prospect of a sudden change; the latter they rous'd into indignation by the manifest preference given by William to his countrymen the Dutch.

305
Tottering
condition of
William's
government

Though the kingdom of Scotland did not at first recognize the authority of William, yet the party of James never attain'd sufficient strength to be of any effectual service to him in that kingdom. Thirty Scots peers, and near 80 gentlemen, then in London, had wait'd in the beginning of January on the prince of Orange. Without any authority from the regency still subsisting in Edinburgh, they form'd themselves into a kind of convention. The prince of Orange in a formal manner ask'd their advice. He withdrew, and they adjourn'd to the council-chamber at Whitehall. The duke of Hamilton being chosen president, explain'd the distract'd state of Scotland. He represent'd, that disorders, anarchy, and confusion, prevail'd; and he urg'd the necessity of placing the power somewhere till a convention of states should be call'd to form a lasting and solid settlement. When the heads of their address to the prince of Orange were settl'd, and order'd to be engross'd, the earl of Arran unexpectedly arose, and propos'd to invite back the king. The meeting, however, adher'd to the prince of Orange; and wait'd on him in a body, requesting him to take the administration into his hands. He thank'd them for the trust they had repos'd in him; and a convention was order'd to meet at Edinburgh on the 14th of March, and it was provid'd that no exception or limitation whatever should be made, except that the members should be Protestants.

306
He is ac-
knowledg'd
king in
Scotland.

A secession, however, was made from this convention, in favour of James. The archbishop of Glasgow, the earl of Balcarras, and the viscount Dundee, were authorized by an instrument sign'd by the late king, at that time in Ireland, to call a convention of the states at Stirling. But this measure was disappoint'd, first by the wavering disposition of the marquiss of Athol, and afterwards by the delay and folly of the party. At last, the viscount Dundee, being alarm'd by an information of a design form'd by the covenanters to assassinate him, left Edinburgh at the head of

50 horse. When he passed under the walls of the castle, the duke of Gordon who held that place, and favoured the cause of James, called him to a conference. He scrambled up the precipice, and informed the duke of his designs in favour of the late king. He conjured him to hold out the cattle, under a certainty of being relieved. The novelty of the sight collected multitudes of spectators. The convention were alarmed. The president ordered the doors to be locked, and the keys to be laid upon the table. The drums were beat to alarm in the town. A parcel of ill-armed retainers were gathered together in the street by the earl of Leven. Dundee in the mean time rode off with his party. But when they found themselves secure, the duke of Hamilton adjourned the convention, which relieved the adherents of James from dreadful apprehensions for their own safety. Fifty members retired from Edinburgh; and that circumstance procured an unanimity in all the succeeding resolutions of the convention. Soon after this it was determined in a committee, that James had *forfeaulted* his right to the crown, by which was meant that he had perpetually excluded himself and his whole race from the crown, which was thereby become vacant. This resolution was approved by the convention, and another was drawn up for raising William and Mary to the vacant throne; in consequence of which they were proclaimed at Edinburgh on the 11th of April 1689.

vour of
James.

The castle of Edinburgh was still kept, in the name of James, by the duke of Gordon; but despairing of any relief, and pressed by a siege, he surrendered it on the 13th of June, upon honourable terms. The adherents of James, terrified with this unexpected misfortune, now turned their eyes to the viscount Dundee. That nobleman having been in vain urged by the convention to return, they had declared him a fugitive, an outlaw, and a rebel. General Mackay had been sent to Scotland by William with four regiments of foot, and one of dragons; and Dundee being apprised of his design to surprize him, retired to the Grampian mountains with a few horse. He marched from thence to Gordon castle, where he was joined by the earl of Dunfermline with 50 gentlemen. He then passed through the county of Murray to Inverness. Macdonald of Keppoch lay with 700 men before that town; after having ravaged in his way from his own country the lands of the clan of Macintosh. Dundee, having promised to the magistrates of Inverness to repay, at the king's return, the money extorted from them by Macdonald, induced the latter to join him with all his men. He could not prevent them, however, from first returning home with their spoil. He accompanied them to Lochaber, and on the 8th of May arrived in Badenoch. From thence he wrote letters to the chiefs of all the clans, appointing them to meet at a general rendezvous in Lochaber, on the 18th of the same month. In the mean time, passing suddenly through Athol, he surprized the town of Perth. In hopes of gaining to his party the two troops of Scots dragoons, who lay at Dundee, he marched suddenly to that place; but the fidelity of captain Balfour, who commanded them, disappointed his views. Having raised the land-tax as he passed, Dundee returned through Athol and Rannoch to hold the diet of rendezvous at Lochaber. Here he was reinforced by several Highland chieftains,

so that his army amounted to 1500 men. He pursued Mackay for four days, who had advanced to Inverness, but afterwards retreated to Strathbogie, leaving the whole Highlands exposed to the enemy.

Soon after, however, Dundee found himself surrounded with many difficulties. The officers of the Scots dragoons, who held a secret correspondence with him, wrote him false intelligence, as an excuse for their own fears. They informed him that a party of Irish, who had endeavoured to land in Scotland, under the duke of Berwick, were driven back, and the duke himself taken prisoner; and that Mackay had been reinforced with a regiment of English horse, and another of foot. On this intelligence, Dundee retreated to Badenoch. The natives of the low country who served in his army quitted him without leave; and the Highlanders plundered the country wherever they came; at last he himself fell sick, while Mackay hovered on his rear. A slight skirmish happened, in which the Highlanders prevailed; but they lost their baggage during the action. Dundee at length arrived at Ruthven; but Mackay being reinforced with a body of 1200 men advanced against him, and other regiments had arrived at Perth and Dumblain. The Highlanders now deserted every night by hundreds; their gallant leader himself was forced to retire to Lochaber, where only 200 of his whole force remained with him; and, to complete his misfortunes, he received at the same time news of the surrender of the castle of Edinburgh.

On the 23^d of June, letters arrived from king James, with a promise of immediate succours from Ireland; upon which Dundee ordered the neighbouring clans to assemble round his standard. But still he had scarce anything but the mere bodies of his men with which he could prosecute the war. The Highlanders were armed only with their own proper weapons, and he had no more than 40 pounds of powder in his whole army. All difficulties, however, were surmounted by the active spirit of the general, for whom the army entertained an enthusiastic zeal. On the 17th of July, he met the king's forces under general Mackay, near the pass of Killcranky. An engagement ensued, in which the Highlanders were victorious. Two thousand of Mackay's men were lost either in the field or in the pursuit; but the victory cost the Highlanders very dear, for their brave general was mortally wounded. He survived the battle, however; and wrote an account of the victory to king James: he even imagined his wound was not mortal; but he died the next morning at Blair. With him ended all the hopes of James in Scotland. Colonel Cannon, who succeeded Dundee in the command, possessed neither his popularity nor his abilities. After some insignificant actions, in which the valour of the soldiers was more conspicuous than the conduct of their leader, the Highlanders dispersed themselves in disgust; and the war soon after ended favourably for William, without any repulse given to his enemies.

308
He is slain at
Killcranky.

During the troubles in England, which had terminated in placing William on the throne, the two parties in Ireland were kept in a kind of tranquillity by their mutual fears. The Protestants were terrified at the prospect of another massacre; and the Papists expected every day to be invaded by the joint force of the English and Dutch. Their terrors, however, were ill founded; for though Tyrconnel sent several messages

309
Ireland never
splected by
William.

Britain.

to the prince, that he was ready to deliver up the kingdom to any force that might make a surrender decent, his offers were always rejected. William was persuaded by the marquis of Halifax, that, should Ireland yield, no pretence could remain for keeping an army in pay; that then, having no army to protect his authority, he might as easily be turned out as he had been brought in; that the English nation could never remain long in a state of good humour; and that he might perceive they already began to be discontented. These insidious arguments induced William to neglect Ireland in such a manner as is justly looked upon to be one of the greatest blemishes in his whole reign. His enemies, indeed, though perhaps without any good foundation, assign a worse cause; viz. that should England be confirmed under his government, Ireland could not long hold out; and that the obstinacy of his Irish enemies would give a pretence for forfeitures to gratify his English, but especially his foreign, friends.

310
An insurrection in favour of James.

Tyrconnel, disappointed in his views of surrendering Ireland to the prince of Orange, affected to adhere to James. The whole military force of the kingdom at that time amounted only to 4000 men, and of these only 600 were in Dublin; and what was still worse, all of them were so much disposed to quit the service, that the lord deputy was obliged to issue commissions for levying new forces. Upon this, an half-armed rabble, rather than army, rose suddenly in various parts of the kingdom. Having no pay from the king, they subsisted by depredation, and regarded no discipline. The Protestants in the north armed themselves in their own defence; and the city of Londonderry, relying on its situation, and a slight wall, shut its gates against the new-raised army. Protestant parties in the mean time rose every where, declaring their resolution to unite in self-defence, to preserve the Protestant religion, to continue their dependence on England, and to promote the meeting of a free parliament.

311
Protestants take arms in their own defence.

To preserve appearances, William now sent general Hamilton, an Irishman and a Roman-catholic, to treat with Tyrconnel; but instead of persuading that lord to yield to William, this messenger advised him to adhere to James. In the mean time James himself assured the lord deputy, that he was ready to sail from Brest with a powerful armament. Hamilton, assuming spirit from the hopes of this aid, marched against the northern insurgents. They were routed with considerable slaughter at Drumore; and Hillsborough, where they had fixed their head-quarters, was taken without resistance: the city of Londonderry, however, resolved to hold out to the last extremity.

312
They are defeated at Drumore.

On the 7th of March 1689, James embarked at Brest. The whole force of his expedition consisted of 14 ships of war, 6 frigates, and three fire-ships. Twelve hundred of his native subjects in the pay of France, and 700 French officers, composed the whole army of James. He landed at Kinsale without opposition on the 12th of the month, where he was received with the utmost demonstrations of joy. His first care was to secure in the fort of Kinsale, the money, arms, and ammunition, which he brought from France; and put the town in some posture of defence: which having done, he advanced to Corke. Tyrconnel arrived at this place soon after, and brought intelligence of the route at Drumore. The king was so much pleased with his attach-

313
James lands in Ireland.

Britain.

ment and services, that he created him a duke; after which, he himself advanced towards Dublin. The condition of the rabble, who poured round him under the name of an *army*, was not calculated to raise his hopes of success. The most of them were only provided with clubs; some had sticks tipped with iron; and even of those who were best armed, scarce two in a hundred had muskets fit for service. Their very numbers distressed their sovereign, and ruined the country; inasmuch that James resolved to disband the greatest part of them. More than 100,000 were already on foot in the different parts of the island. Of these he reserved 14 regiments of horse and dragoons, and 35 regiments of foot; the rest he ordered to their respective homes, and armed those that were retained in the best manner he could.

Being received at Dublin with an appearance of universal joy, James proceeded immediately to business. He ordered by proclamation all Protestants who had abandoned the kingdom to return. He commanded in a second proclamation, all Papists, except those in his army, to lay up their arms, and put an end to the robberies and depredations which they had committed in the violence of their zeal. He raised the value of the currency by a proclamation; and he summoned a parliament to meet on the 7th of May, to settle the affairs of the kingdom. The Protestant clergy represented their grievances in an address; and the university of Dublin appeared with complaints and congratulations. He assured the first of his absolute protection, and a full redress; and he promised the latter not only to defend, but even to enlarge, their privileges.

On the 8th of April, James left Dublin, resolving to lead his army against the insurgents in person. They retired before him, and the king laid siege to Londonderry. The besieged made such a vigorous resistance as has made the place remarkable ever since †: but being reduced to the last extremity, they were have been obliged to surrender, had not they been relieved on the 28th of July, by seven ships laden with provisions; upon which, the siege was immediately raised.

314
Is forced to raise the siege of Londonderry.
† See Londonderry.

In the mean time, the distressed situation of James, and his absolute dependence upon France, drove him into measures which otherwise he would never have thought of. His soldiers for some time had been supported by their officers, or subsisted by depredation. The funds of the officers were at last exhausted, and the country itself could no longer bear the riot and injustice of the soldiers. Pressed by these difficulties, James, by the advice of his council, resolved to coin pieces of copper, which should be received for silver. He saw well enough the inconveniences of this measure; but all Ireland possessed not the means of paying the army, in current coin, to the middle of June. Of the French remittances only 200,000 livres remained; and the king found it absolutely necessary to reserve that sum, to forward his measures with regard to Britain, and to procure intelligence of the motions of his enemies. The army was satisfied even with this appearance of money, and the people received the fictitious coin in hopes of being repaid in a more favourable state of affairs. A tax of 20,000*l.* a month, granted for 13 months by the parliament, furnished government with an appearance of resources; and in the mean time the king endeavoured to support the former revenue. He opened

315
Is driven into disagreeable measures.

opened a trade with France to supply the want of commerce with England. But the French, knowing their own importance, and the necessity of the unfortunate monarch's affairs, claimed and obtained advantages in traffic, which offended his own subjects.

To add to the distress of James, Ireland was now invaded by 10,000 men under the command of the duke of Schomberg. They appeared on the 12th of August 1689, in 90 transports, on the coast of Donaghadee, in the county of Down. Next day Schomberg landed without opposition his army, horses, and train of artillery. Having marched to Belfast on the 15th, he continued in that place four days to refresh his troops. He invested Carrickfergus, and threw into it 1000 bombs, which laid the houses in ashes. The garrison having expended their powder to the last barrel, marched out with all the honours of war. But Schomberg's soldiers broke the capitulation. They disarmed and stripped the inhabitants, without any regard to sex or quality; even women, stark naked, were publicly whipped between the lines; and all this under pretence of cruelties of the same kind having been committed by the Papists.

Though Schomberg was an experienced general, who had passed a life of 80 years almost continually in the field, he found himself at a loss how to carry on the war in Ireland. He did not consider the dangers that threatened the health of his troops by confining them too long in one place; and he kept them in a low moist camp near Dundalk, almost without firing of any kind; so that the men fell into fevers and fluxes, and died in great numbers. The enemy were not less afflicted with similar disorders. Both camps remained for some time in sight of each other; and at last, the rainy season approaching, both armies quitted their camps at the same time, and retired into winter quarters.

The bad success of the campaign, and the miserable situation of the Protestants in Ireland, at length induced William to attempt their relief in person. Accordingly he left London on the 4th of June 1690, and arrived at Carrickfergus on the 14th of that month. From thence he passed to Lisburn, the head quarters of the duke of Schomberg. He reviewed at Lough-Britland his army, which consisted of 36,000 men, and was composed of English, Dutch, Germans, Danes, and French. Being supplied with every necessary, and in high health and spirits, they seemed absolutely certain of victory. The Irish army, having abandoned Ardee at their approach, fell back to the south of the Boyne. On the banks of that river they were joined by James, who had marched from Dublin at the head of his French auxiliaries. The banks of the Boyne were steep; the south side hilly, and fortified with ditches. The river itself was deep, and it rose very high with the tide. These advantages induced James, contrary to the opinion of his officers, to keep possession of this post. His army was inferior in numbers, discipline, and every thing, to his enemies: but flight, he thought, would dispirit his troops, and tarnish his own reputation; he therefore resolved to put the fate of Ireland on the issue of a battle. Urged by his friends in England, and encouraged by a projected invasion of that kingdom by France, he had resolved to quit Ireland; and to this he was farther encouraged by the assurance of aid from a powerful fleet that had already entered the narrow seas. But the

strength of his situation, and the sudden appearance of the enemy, which made even a retreat dangerous, induced him to defer his purpose.

William was no sooner arrived, than he rode along the river's side, in sight of both armies, to make proper observations on the plan of battle; but in the mean time, being perceived by the enemy, a cannon was privately brought out and planted against him where he was sitting. The shot killed several of his followers, and he himself was wounded in the shoulder. The news of his being slain was instantly propagated thro' the Irish camp, and even sent off to Paris; but William, as soon as his wound was dressed, rode through the camp, and quickly undeceived his army.

The next morning, (June 30th), the battle began at six in the morning. James's forces behaved with great resolution, but were at last defeated with the loss of 1500 men. The Protestants lost but about one third of that number; but among these was their brave general the duke of Schomberg. He was killed by a discharge from his own troops, who, not knowing that he had been accidentally hurried into the midst of the enemy, fired upon the body of men who surrounded him. During the action, James stood on the hill of Dunmore, surrounded with some squadrons of horse; and at intervals was heard to exclaim, when he saw his own troops repulsing those of the enemy, "O spare my English subjects!" While his troops were yet fighting, he quitted his station; and leaving orders to guard the pass at Duleek, made the best of his way to Dublin. He advised the magistrates of that city to make the best terms they could with the victors; and he himself set out for Waterford, where he immediately embarked for France. When he first deserted his troops at the Boyne, O'Regan, an old Irish captain, was heard to say, "That if the English would exchange generals, the conquered army would fight them over again."

The victory at the Boyne was by no means decisive, and the friends of James resolved to continue their opposition to William. Sarsfield, a popular and experienced general, put himself at the head of the army that had been routed at the Boyne, and went farther into the country to defend the banks of the river Shannon. James appointed one St Ruth to command over Sarsfield, which gave the Irish universal discontent. On the other hand, general Ginokle, who had been appointed to command the English army in the absence of William, who was gone over to England, advanced towards the Shannon to meet the enemy. The only place where it was fordable was at Athlone, a strong walled town built on both sides of the river, and in the hands of king James's party. The English soon made themselves masters of that part which was on the hither side of the river; but the part on the opposite bank being defended with great vigour, was for a long while thought impregnable. At length it was resolved in a council of war, that a body of forlorn hope should ford the stream in the face of the enemy; and this desperate enterprize was performed with great resolution; the enemy were driven from their works, and the town surrendered at discretion. St Ruth marched his army to its relief, but he came too late; for he no sooner approached, than his own guns were turned against him: upon which he instantly marched off and took post at Aughrim, at ten miles distance, where he determined

to wait the English army. Ginckle did not decline the combat, though he had only 18,000 men, while the Irish were above 25,000 strong. A desperate engagement ensued; but at last St Ruth being killed, his troops gave way on all sides, and retreated to Limeric, where they determined to make a final stand, after having lost near 5000 of their best men.

³³⁴
Limeric be-
sieged.

Ginckle, wishing to put an end to the war at once, suffered as many of the Irish as chose, to retire to Limeric. In this last retreat the Irish forces made a brave defence. The siege commenced August 25th 1691. Six weeks were spent before the place without any decisive effect. The garrison was well supplied with provisions, and provided with all means of defence. The winter was approaching, and Ginckle had orders to finish the war upon any terms. He therefore offered such conditions as the Irish, had they been victors, could scarce have refused with prudence. He agreed, that all in arms should receive their pardon: that their estates should be restored, their attainders annulled, and their outlawries reversed: that none should be liable for debts incurred through deeds done in the course of hostilities; that all Roman-catholics should enjoy the same toleration with regard to their religion, as in the reign of Charles II.: that the gentry should be permitted to make use of arms: that the inferior fort should be allowed to exercise their callings and professions: that no oaths but that of allegiance should be required of high or low: that should the troops, or any number of them, chuse to retire into any foreign service, they should be conveyed to the continent, at the expence of the king: Sarsfield, who had obtained the title of *earl of Lucan* from James after his abdication, was permitted to retain a dignity which the laws could not recognise. The lords justices had arrived from Dublin on the first of October. They signed the articles together with Ginckle; and thus the Irish Papists put a happy period to a war which threatened their party with absolute ruin. In consequence of this treaty, about 14,000 of those who had fought for king James went over to France, having transports provided by government for conveying them thither. When they arrived, James thanked them for their loyalty, and told them that they should still fight for their old master; and that he had obtained an order from the king of France, for their being new clothed, and put into quarters of refreshment. In this manner all James's expectations from Ireland were entirely frustrated, and the kingdom submitted quietly to the English government.

³³⁶
Massacre at
Glenco.

In the beginning of the year 1692, an action of unexampled barbarity disgraced the government of William in Scotland. In the preceding August, in consequence of a pacification with the Highlanders, a proclamation of indemnity had been issued to such insurgents as should take the oaths to the king and queen, on or before the last day of December. The chiefs of the few tribes who had been in arms for James complied soon after with the proclamation: but Macdonald of Glenco failed in submitting within the limited time; more, however, from accident than design. In the end of December, he came to colonel Hill, who commanded the garrison in fort William, to take the oaths of allegiance to the government. Hill, having furnished Macdonald with a letter to Sir Colin Campbell, sheriff of the county of Argyle, directed him to repair immediately to

Britain.

Inverary, to make his submission in a legal manner before that magistrat. The way to Inverary lay through almost impassable mountains; the season was extremely rigorous, and the whole country covered with a deep snow. So eager, however, was Macdonald to take the oaths, before the limited time should expire, that, tho' the road lay within half a mile of his own house, he would not stop to visit his family. After various obstructions, he arrived at Inverary. The time was elapsed, and the sheriff hesitated to receive his submission; but Macdonald prevailed on him by his importunities, and even tears. Sir John Dalrymple, afterwards earl of Stair, attended king William as secretary of state for Scotland. He took advantage of Macdonald's neglecting to take the oaths within the time prescribed, and procured from the king a warrant of military execution against him and his whole tribe. As a mark of his own eagerness, or to save Dalrymple, William signed the warrant, both above and below, with his own hand. The secretary, in letters expressive of a brutal ferocity of mind, urged the officers who commanded in the Highlands to execute their orders with the utmost rigour. Campbell of Glenlyon, a captain in Argyle's regiment, and two subalterns, were ordered, with 120 men, to repair to Glenco on the first of February. Campbell, being uncle to young Macdonald's wife, was received by the father with all manner of friendship and hospitality. The men were treated in the houses of his tenants with free quarters and kind entertainment. Till the 13th of the month, the troops lived in good humour and familiarity with the people. The officers, on the very night of the massacre, passed the evening and played at cards in Macdonald's house. In the night, lieutenant Lindsay, with a party of soldiers, called in a friendly manner at his door. He was instantly admitted. Macdonald, as he was rising to receive his guest, was shot dead behind his back, with two bullets. His wife had already put on her clothes; but she was stripped naked by the soldiers, who tore the rings off her fingers with their teeth. The slaughter was become general. To prevent the pity of the soldiers to their hosts, their quarters had been changed the night before. Neither age nor infirmity was spared. Some women, in defending their children, were killed. Boys, imploring mercy, were shot by officers, on whose knees they hung. In one place, nine persons, as they sat enjoying themselves at table, were shot dead by the soldiers. At Inveriggen, in Campbell's own quarters, nine men were first bound by the soldiers, and then shot at intervals, one by one. Near 40 persons were massacred by the troops. Several, who fled to the mountains, perished by famine and the inclemency of the season. Those who escaped owed their lives to a tempestuous night. Lieutenant colonel Hamilton, who had the charge of the execution from Dalrymple, was on his march with 400 men, to guard all the passes from the valley of Glenco; but was obliged to stop by the severity of the weather, which proved the safety of the unfortunate tribe. He entered the valley next day; laid all the houses in ashes; and carried away all the cattle and spoil, which were divided among the officers and soldiers.

The entire reduction of Ireland, and the dispersion and extermination of the Highland chieftains who favoured his cause, did not entirely put an end to the hopes

Britain. hopes of James. His chief expectations next
 327

 James. A plot was first formed in Scotland by Sir James Mont-
 gomery; a person who, from being an adherent to
 William, now turned against him: but as the project
 was ill contrived, so it was as lightly discovered by the
 instigator. To this another succeeded, which seemed
 to threaten more serious consequences, as it was ma-
 naged by the whig party, who were the most formi-
 dable in the state. A number of these joined them-
 selves to the Tories, and both made advances to the ad-
 herents of the late king. They assembled together;
 and the result of their deliberations was, that the res-
 toration of James was to be effected entirely by foreign
 forces: that he should sail for Scotland, and be there
 joined by 5000 Swedes; who, because they were of
 the Protestant religion, would, it was thought, remove
 a part of the odium which attended an invasion by so-
 reigners: it was concerted that assistance should at the
 same time be sent from France, and that full liberty of
 conscience should be proclaimed throughout the king-
 dom. In order to lose no time, it was resolved to send
 over to France two trusty persons to consult with the
 banished monarch; and lord Preston and Mr Ashton
 were the two persons appointed for this embassy. Both
 of them, however, were seized when they least expected
 it, by order of lord Carmarthen. Both were con-
 demned, and Ashton was executed without making
 any confession; but lord Preston had not the same res-
 olution. Upon an offer of pardon, he discovered a
 great number of associates; among whom the duke of
 Ormond, lord Dartmouth, and lord Clarendon, were
 foremoil.

329
 He is sup-
 ported by
 the French.

The French at last became sensible of their bad po-
 licy in not having better supported the cause of James,
 and therefore resolved to make a descent upon England
 in his favour. In pursuance of this scheme, the French
 king supplied James with an army consisting of a body
 of French troops, some English and Scots refugees,
 and the Irish regiments, which had been transported
 into France from Limerick, and were now become ex-
 cellent soldiers by long discipline and severe duty. This
 army was assembled between Cherbourg and La Hogue,
 and commanded by king James in person. More than
 300 transports were provided for landing it on the op-
 posite coast; and Tourville, the French admiral, at
 the head of 63 ships of the line, was appointed to favour
 the descent. His orders were, at all events, to attack
 the enemy, in case they should oppose him; so that
 every thing promised the banished king a change of
 fortune.

These preparations on the side of France were soon
 known at the English court, and every precaution ta-
 ken for a vigorous opposition. All the secret machi-
 nations of the banished king's adherents were discovered
 to the English ministry by spies; and by these they
 found that the Tories were more faithful than even the
 Whigs who had placed king William on the throne.
 The duke of Marlborough, lord Godolphin, and even
 the princess Anne herself, were violently suspected of
 disaffection. Preparations, however, were made, with
 great tranquillity and resolution, to resist the growing
 storm. Admiral Russel was ordered to put to sea with
 all possible expedition; and he soon appeared with 99

ships of the line, besides frigates and fire-ships. At the
 Britain. head of this formidable fleet he set sail for the coast of
 France; and, near La Hogue, he discovered the ene-
 my under Tourville, who prepared to give him battle.
 The engagement began between the two admirals with
 330
 William de- great fury, and the rest of the fleet soon followed their
 feated. example. The battle lasted for ten hours; but at last
 victory declared on the side of numbers: the French
 fled for Conquet road, having lost four ships in the first
 day's action. The pursuit continued for two days fol-
 lowing: three French ships of the line were destroyed
 the next day; and 18 more, which had taken refuge in
 the bay of La Hogue, were burned by Sir George
 Rooke. In this manner were all the French prepara-
 tions frustrated; and so decisive was the blow, that
 from this time France seemed to relinquish all claims to
 the ocean.

This engagement, which happened on the 21st of
 May 1692, put a final period to the hopes of James.
 No further attempts were made in his favour, except
 some plots to assassinate king William, which ended
 only in the destruction of those who formed them. But
 it was never thoroughly proved that James countenanced
 these plots in the least; it rather appears, that in all
 cases he expressed the utmost abhorrence of such at-
 tempts. In 1697, the abbe de Polignac, ambassador
 330
 James of from France in Poland, wrote to his master, that several the
 crown of thoughts were entertained of the late king of Britain,
 Poland. in the new election which happened on the death of
 John Sobieski king of Poland; and that James had
 been already named by some of the diets as his suc-
 cessor. Lewis was eager to seize an opportunity of
 ridding himself with honour of a prince whose preten-
 sions he could no longer support. The friends of which he
 331
 refuses. James were also sanguine for the project; but he himself
 refused it. He told them, that "he would ever retain a
 grateful remembrance of his friends in Poland. That,
 however, he would not accept of the crown, had it ac-
 tually been offered; much less would he endeavour to
 obtain by solicitation any crown which was not ac-
 tually his due. That his acceptance of any other sceptre
 would amount to an abdication indeed of that which he
 deemed his right. That therefore he was resolved to
 remain in his present forlorn condition, possessing less
 hopes than ever of being restored, rather than to do
 the least act of prejudice to his family." The same
 year, at an interview between king William and
 Lewis XIV. it was proposed that the prince of Wales
 (James's son) should succeed to the throne of England
 after the death of William. The king with little hesi-
 tation agreed to this request. He even solemnly en-
 gaged to procure the repeal of the act of settlement;
 and to declare by another, the prince of Wales his suc-
 cessor to the throne. Even this proposal was rejected
 by James. He told the king of France, that though he
 could suffer with patience the usurpation of his nephew
 upon his right, he would never permit his own son to
 be guilty of the same injustice. He urged, that should
 the son reign in his father's lifetime, that circumstance
 would amount to a formal renunciation. That the
 prince of Wales by succeeding to the prince of Orange,
 would yield his sole right, which was that of his fa-
 ther, &c.

332
 William en-

Britain.

the austerities of religious enthusiasm. His constitution, though vigorous and athletic, had for some time begun to yield to the infirmities of age, and to that melancholy which superfluous as well as his uncommon misfortunes had impressed on his mind. In the beginning of September 1701, when he was, according to his daily custom, at public prayers, he fell suddenly into a lethargy; and though he recovered his senses soon after, he languished for some days, and expired on the 6th of September. The French king, with great humanity, paid him several visits during his sickness; and exhibited every symptom of compassion, affection, and even respect.

Lewis, being under a difficulty how to proceed upon the expected death of James, called a council to take their advice, whether he should own the prince of Wales as king of Great Britain and Ireland. The king himself had hesitated long on this delicate point. But the dauphin, the duke of Burgundy, and all the princes of the blood, declared, that it was unbecoming the dignity of the crown of France not to own that the titles of the father devolved immediately upon the son. Lewis approved of this resolution, and determined to acquit the dying king with it in person. When he arrived at St Germain's, he acquainted first the queen, and then her son, of his design. He then approached the bed in which James lay almost insensible with his disorder. The king, rousing himself, began to thank his most Christian majesty for all his favours; but Lewis interrupted him. "Sir (said he), what I have done is but a small matter; but what I have to say is of the utmost importance." The people then began to retire. "Let no person withdraw (said Lewis). I come to acquaint you, Sir, that when God shall please to call your majesty from this world, I shall take your family into my protection, and acknowledge your son, as he then will certainly be, king of Great Britain and Ireland."

Though the defeat of the French fleet at La Hogue had put king William out of all danger from any further attempts from that quarter, he by no means possessed his throne with any kind of tranquillity. The want of a common enemy produced dissensions among the people, and William began to find as much uneasiness from his parliament at home as from an enemy in the field. The uneasiness he felt from the refractory disposition of his subjects was not a little heightened by the death of his queen, who was taken off by the small-pox on the 28th of December 1694. For some time he was under a sincere concern for her loss; but as politics had taken entire possession of his mind, he lost all other concerns in the greatness of his apprehensions for the balance of power and the fluctuating interests of Europe.

His chief motive for accepting the crown was to engage England more deeply in the concerns of Europe. His great object had been to humble the French, and all his politics consisted in forming alliances against them. On the other hand, many of the English had no such animosity against the French; and these, therefore, considered the interest of the nation as sacrificed to foreign connexions; and complained that the continental war fell most heavily on them, though they had the least interest in its success. These complaints were heard by William with the most phlegmatic indifference; he employed all his attention only on the balance of power,

and the interests of Europe. He became unmindful of the cultivation of internal polity; and, as he formed alliances abroad, increased the influence of party at home. Patriotism began to be ridiculed as an ideal virtue; and the practice of bribing a majority in parliament became universal. The example of the great was caught up by the vulgar; principle, and even decency, was gradually banished; talents lay uncultivated, and the ignorant and profligate were received into favour.

The king, upon accepting the crown, was resolved to preserve as much of the prerogative as possible; and he sometimes exerted a branch of it which his predecessors had never chosen to make use of, viz. the power of refusing his assent to some bills that had passed both houses. From this and other causes there were perpetual bickerings between him and his parliaments. At last William became fatigued with opposition. He admitted every restraint upon the prerogative in England, upon condition of being properly supplied with the means of humbling France. Provided the parliament supplied him with the means of executing this, he permitted them to rule the internal polity as they pleased. For the prosecution of the French war, the sums granted were indeed incredible. The nation, not contented with furnishing him such sums of money as they were capable of raising by the taxes of the year, mortgaged those taxes, and involved themselves in debts which they have never since been able to discharge.

The war with France continued during the greatest part of this king's reign; but at length the treaty of Ryfwick, in 1697, put an end to those contentions in which England had engaged without policy, and came off at last without advantage. In the general pacification, her interests seemed entirely deserted; and for all the treasures she had sent to the continent, and all the blood which had been shed there, the only equivalent received was an acknowledgement of William's title from the king of France.

The king, being now freed from a foreign war, set himself to strengthen his authority at home. As he could not bear the thoughts of being a king without military command, he conceived hopes of keeping up, in the time of a profound peace, those forces which had been granted during the time of danger. The commons, however, to his great mortification, passed a vote, that all the forces in the English pay, exceeding 7000 men, should be forthwith disbanded; and that those retained should be natural-born subjects of England. With this vote the king was exceedingly displeased. His indignation, indeed, was kindled to such a degree, that he actually conceived a design of abandoning the government. From this, however, his ministers diverted him, and persuaded him to consent to the passing of the bill.

These altercations continued during the remainder of this reign. William considered the commons as a body of men desirous of power for themselves, and consequently bent upon obstructing all his projects to secure the liberties of Europe. He seemed but little attached to any particular party in the house, all of whom he found at times deserted or opposed him. He therefore veered to whigs and Tories indiscriminately, as interest or the immediate exigence demanded. He considered England as a place of labour, anxiety, and alteration. If he had any time for amusement or relaxation,

laxation, he retired to Loo in Holland, where, among a few friends, he gave a loose to those coarse festivities which he alone was capable of relishing. Here he planned the different success of the princes of Europe, and laboured to undermine the schemes and the power of Lewis his rival in politics and fame.

But however feeble William's desire of other amusements might be, he could scarce live without being at variance with France. Peace had scarce been made with that nation, when he began to think of resources for carrying on a new war, and for inciting his English subjects in the confederacy against that nation. Several arts were used for inducing the people to second his aims; and the whole nation seemed at last to join in desiring a French war. He had been in Holland concerting with his allies operations for a new campaign. He had engaged in a negotiation with the prince of Hesse; who assured him, that, if he would besiege and take Cadiz, the admiral of Castile and several other grandees of Spain would declare for the house of Austria. The elector of Hanover had resolved to concur in the same measures; the king of the Romans, and prince Lewis of Baden, undertook to invest Lauda, while the emperor promised to send a powerful reinforcement into Italy; but death put a period to his projects and his ambition.

340
His death.

William was naturally of a very feeble constitution; and it was by this time almost quite exhausted by a series of continual disquietude and action. He had endeavoured to repair his constitution, or at least to conceal its decays, by exercise and riding. On the 21st of February 1702, in riding to Hampton-court from Kensington, his horse fell under him; and he was thrown with such violence, that his collar-bone was fractured. His attendants conveyed him to the palace at Hampton-court, where the fracture was reduced; and in the evening he returned to Kensington in his coach. The jolting of the carriage disunited the fracture; and the bones were again replaced by Bidloo his physician. This, in a robust constitution, would have been a trifling misfortune; but to him it was fatal. For some time he appeared in a fair way of recovery; but falling asleep on his couch, he was seized with a shivering, which terminated in a fever and diarrhæa, that soon became dangerous and desperate. Perceiving his end approaching, the objects of his former care lay next his heart; and the fate of Europe seemed to remove the sensations he might be supposed to feel for his own. The earl of Albemarle arriving from Holland, he conferred with him in private on the posture of affairs abroad. Two days after, having received the sacrament from archbishop Tennison, he expired, on Sunday March 8th; having lived 52 years, and reigned 13.—He was in his person of a middle stature, a thin body, and a delicate constitution. He had an aquiline nose, sparkling eyes, a large forehead, and a grave solemn aspect. He left behind him the character of a great politician, though he had never been popular; and of a formidable general, tho' he had been seldom victorious. His deportment was grave, phlegmatic, and fullen; nor did he ever show any fire but in the day of battle.

342
Accession
of queen
Anne.

William was succeeded by the princess Anne, who had married George prince of Denmark. She ascended the throne in the 38th year of her age, to the general satisfaction of all parties. William had died at

the eve of a war with France; and the present queen, who generally took the advice of her ministry on every important occasion, was now urged by opposite councils; a part of her ministry being inclined to war, and another to peace. At the head of those who opposed a war with France was the earl of Rochelle, lord lieutenant of Ireland, first cousin to the queen, and the chief of the tory faction. At the head of the opposite party was the earl afterwards duke of Marlborough, and since so much renowned for his victories over the French. After giving the reasons for both their opinions, that of Marlborough preponderated: the queen resolved to declare war; and communicating her intentions to the house of commons, by whom it was approved, war was proclaimed accordingly. In this declaration of war, Lewis was taxed with having taken possession of a great part of the Spanish dominions; with designing to invade the liberties of Europe, to obstruct the freedom of navigation and commerce; and with having offered an unpardonable insult to the queen and her throne by acknowledging the title of the pretender: he was accused of attempting to unite the crown of Spain to his own dominions by placing his grandson upon the throne of that kingdom, and thus of endeavouring to destroy the equality of power that subsisted among the states of Europe. This declaration of war on the part of England was seconded by similar declarations by the Dutch and Germans, all on the same day.

344
War declar-
ed against
France.

Lewis XIV. whose power had been greatly circumscribed by William, expected, on the death of the latter, to enter on a field open for new conquests and fame. At the news of the English monarch's death, therefore, he could not suppress his rapture; the people of Paris, and indeed through the whole kingdom, testified their joy in the most public manner. At seeing, therefore, such a combination against him, the French monarch was filled with indignation; but his resentment fell chiefly on the Dutch. He declared with great emotion, that as for those gentlemen pedlars the Dutch, they should one day repent their insolence and presumption in declaring war against him whose power they had formerly felt and dreaded. By these threats, however, the affairs of the allies were no way influenced. Marlborough was appointed general of the British forces, and by the Dutch he was chosen generalissimo of the allied army; and indeed his after conduct showed, that no person could possibly have been chosen with greater propriety. He had learned the first rudiments of war under the famous marshal Turenne, having been a volunteer in his army; and by that general his future greatness was prognosticated.

343
Duke of
Marlbor-
ough ap-
pointed ge-
neral.

The first attempt that Marlborough made to deviate from the general practices of the army was to advance the subaltern officers, whose merits had been hitherto neglected. Regardless of seniority, wherever he found abilities, he was sure to promote them; and thus he had all the upper ranks of commanders rather remarkable for their skill and talents, than for their age and experience. In his first campaign, in the beginning of July 1702, he repaired to the camp at Nimwegen, where he found himself at the head of 60,000 men well provided with all necessaries, and long disciplined by the best officers of the age. He was opposed on the part of France by the duke of Burgundy, a youth of

344

Britain. very little experience in the art of war; but the real acting general was the marshal Boufflers, an officer of courage and activity. But wherever Marlborough advanced, the French were obliged to retire before him, leaving all Spanish Guelderland at his discretion. The duke of Burgundy finding himself obliged to retreat before the allied army, rather than expose himself longer to such a mortifying indignity, returned to Versailles, leaving Boufflers to command alone. Boufflers retired to Brabant; and Marlborough ended the campaign by taking the city of Liege; in which was found an immense sum of money, and a vast number of prisoners.

345
L. of sea at sea. This good fortune seemed to console the nation for some unsuccessful expeditions at sea. Sir John Munden had permitted a French squadron of 14 ships to escape him by taking shelter in the harbour of Corunna; for which he was dismissed the service by prince George. An attempt was made upon Cadiz by sea and land, Sir George Rooke commanding the navy, and the duke of Ormond the land forces; but this also miscarried. At Vigo, however, the British arms were attended with better success. The duke of Ormond landed with 2500 men at the distance of six miles from the city, while the fleet forcing their way into the harbour, the French fleet that had taken refuge there were burned by the enemy to prevent their falling into the hands of the English. Eight ships were thus burned and run ashore; but ten ships of war were taken, together with eleven galleons, and above a million of money in silver. In the West Indies, admiral Bembow had been stationed with ten ships to distress the enemy's trade. Being informed that Du Cassé the French admiral was in those seas with a force equal to his own, he resolved to attack him; and soon after discovered the enemy's squadron near St Martha, steering along the shore. He quickly gave orders to his captains, formed the line of battle, and the engagement began. He found, however, that the rest of the fleet had taken some disgust at his conduct; and they permitted him to sustain, almost alone, the whole fire of the enemy. Nevertheless, the engagement continued till night, and he determined to renew it next morning. But he had the mortification to perceive that all the rest of his ships had fallen back, except one, who joined him in urging the pursuit of the enemy. Four days this intrepid seaman, assisted by only one ship, pursued and engaged the enemy, while his cowardly officers remained at a distance behind. His last day's battle was more furious than any of the former: alone, and unsupported by any of the rest, he engaged the whole French squadron; when his leg was shattered by a cannon-ball, and he himself died soon after of his wounds. Two of his cowardly associates were shot on their arrival in England; one died on his passage thither; the rest were disgraced.

346
Bravery and death of admiral Bembow.

347
Continental army increased.

The next parliament, which was convened by the queen, were highly pleased with the success of the British arms on the continent. The house of commons was composed chiefly of Tories, who voted 40,000 seamen, and the like number of land-forces, to act in conjunction with those of the allies. Soon after, the queen informed her parliament, that she was pressed by the allies to augment her forces; and upon this it was resolved that 10,000 more men should be added to the continental-army, but on condition that the Dutch should immediately break off all commerce with France and

Spain; and this condition was very readily complied with.

In the beginning of April 1703, the duke of Marlborough crossed the sea, and, assembling the allied army, opened the campaign with the siege of Bonn, the residence of the elector of Cologne. This held out but a short time. He next retook Huy; the garrison of which, after a vigorous defence, surrendered prisoners of war. Limburg was next besieged, and surrendered in two days; and thus the campaign concluded, the allies having secured the country of Liege, and the electorate of Cologne, from the designs of the enemy.

In the campaign of 1704, the duke of Marlborough informed the Dutch that it was his intention to march to the relief of the empire, which had been for some time oppressed by the French forces; and the states gave him full powers to march as he thought proper, with assurances of their assistance in all his endeavours. The French king, finding Boufflers no longer capable of opposing Marlborough, appointed the marshal de Villeroy to command in his place. But Marlborough, who, like Hannibal of old, was remarkable for studying the disposition of his antagonists, having no great fears from Villeroy, immediately flew to the assistance of the emperor. Taking with him about 13,000 British troops, he advanced by hasty marches to the banks of the Danube; he defeated a body of French and Bavarians stationed at Donavert to oppose him; then passed the river, and laid under contribution the dukedom of Bavaria that had sided with the enemy. Villeroy, who at first attempted to follow his motions, seemed all at once to have lost sight of his enemy; nor was he apprised of his route, till informed of his success. But, in the mean time, marshal Tallard prepared by another route to obstruct Marlborough's retreat, with an army of 30,000 men. He was soon after joined by the duke of Bavaria's forces; so that the French army in that part of the continent amounted to 60,000 veterans, commanded by the two best reputed generals then in France.

To oppose these powerful generals, the duke of Marlborough was joined by a body of 30,000 men under the celebrated prince Eugene. The allied army, with this reinforcement, amounted to about 52,000. After various marches and countermarches, the two armies met at Blenheim †. A terrible engagement ensued, in which the French were entirely defeated, and a country of 100 leagues extent fell into the hands of the conquerors. Soon after finishing the campaign, the duke repaired to Berlin, where he procured a reinforcement of 8000 Prussians to serve under prince Eugene in Italy. Thence he proceeded to negotiate for succours at the court of Hanover; and soon after returned to England, where he was received with every possible demonstration of joy.

The arms of Britain, in the mean time, were not less fortunate by sea than by land. The town of Gibraltar was taken by the prince of Hesse and Sir George Rooke: but so little was the value of the conquest at that time understood, that it was for some time in debate whether it was a capture worth thanking the admiral for; and at last it was considered as unworthy of public gratitude. Soon after, the British fleet, to the number of 53 ships of the line, came up with that of France, consisting of 52 men of war, commanded by the

Britain. the count de Thouloufe, off the coast of Malaga. This was the last great naval engagement in which the French ventured to face the British on equal terms. The battle began at ten in the forenoon, and continued with great fury for six hours; when the van of the French began to give way. The British admiral, for two days, attempted to renew the engagement; but this was as cautiously declined by the French, who at last disappeared totally. Both sides claimed the victory, but the consequences decided it in favour of the British.

352
Ineffectual attempt of the Spaniards on Gibraltar.

In the mean time, the Spaniards, alarmed at the taking of Gibraltar, sent the marquis of Villadurias with a large army to retake it. France also sent a fleet of 13 ships of the line: but part of them were dispersed by a tempest, and part taken by the British. Nor was the land army more successful. The siege continued for four months; during which time the prince of Hesse, who commanded the town for the English, gave many proofs of valour. At length, the Spaniards having attempted to scale the rock in vain, finding no hopes of taking the place, were contented to draw off their men, and abandon the enterprise.

353
Charles appointed king of Spain.

While the British were thus victorious by land and sea, a new scene of contention was opened on the side of Spain. Philip IV. grandson of Lewis XIV. had been placed on the throne of that kingdom, and received with the joyful concurrence of the greatest part of his subjects. He had also been nominated successor to the crown by the late king of Spain's will. But in a former treaty among the powers of Europe, Charles, son of the emperor of Germany, was appointed heir to that crown; and this treaty had been guarantee'd by France herself, though she now resolved to revert that consent in favour of a descendant of the house of Bourbon. Charles was still farther led on to put in for the crown of Spain, by the invitation of the Catalonians, who declared in his favour; and, with the assistance of the British and Portuguese, promised to arm in his cause. Upon his way to his newly assumed dominion, he landed in England; where he was received on shore by the dukes of Somerset and Marlborough, who conducted him to Windsor. He was kindly received by the queen; and furnished with 200 transports, 30 ships of war, and 9000 men, for the conquest of that extensive empire. The earl of Peterborough, a man of romantic bravery, offered to conduct them; and his single service was reckoned equivalent to armies.

354
He is supported by queen Anne

355
Barcelona taken.

The first attempt of this general was on the city of Barcelona, at that time defended by a garrison of 5000 men. The fort Monjuc, situated on a hill that commanded the city, was attacked; the outworks were taken by storm, and the powder-magazine was blown up by a shell; upon which the fort immediately surrendered, and the city capitulated in a short time after. The conquest of all Valencia succeeded the taking of Barcelona. Charles became master of Arragon, Carthagen, Grenada, and Madrid. The British general entered the capital in triumph, and there proclaimed Charles king of Spain without opposition.

356
French defeated at Ramillies.

To these successes, however, very little regard was paid in Britain. The victories of the duke of Marlborough alone engrossed their attention. In 1706, he opened the campaign with an army of 80,000 men. He was met by the French under Villeroi near the village of Ramillies †. An engagement ensued, in which

† See Ramillies.

the duke gained a victory almost as complete as that of Blenheim had been; and the whole country of Brabant was the reward of the victors. The French troops were now dispirited; the city of Paris was in confusion; Lewis, who had long been flattered with conquest, was now humbled to such a degree as almost to excite the compassion of his enemies. He entreated for peace, but in vain; the allies carried all before them; and his very capital began to dread the approach of the conquerors. But what neither his armies nor his politics could effect, was brought about by a party in England. The dissension between the whigs and tories saved France that now seemed tottering on the brink of ruin.

Britain.
357
Lewis flies in vain for peace.

The councils of the queen had hitherto been governed by a whig ministry; for though the duke of Marlborough started in the interest of the opposite party, he soon joined the whigs, as he found them most sincere in the design of humbling France. The people, however, were now, in fact, beginning to change, and a general spirit of toriyism to take place. The queen's personal virtues, her successes, her deference for the clergy, and their great veneration for her, began to have a prevailing influence over the whole nation. People of every rank were not ashamed to defend the most servile tenets, when they tended to flatter or increase the power of the sovereign. They argued in favour of strict hereditary succession, divine right, and non-resistance to the regal power. The tories, though joining in vigorous measures against France, were never ardently their enemies: they rather secretly hated the Dutch, as of principles very opposite to their own; and longed for an opportunity of withdrawing from their friendship. They began to meditate schemes of opposition to the duke of Marlborough. Him they considered as a self-interested man, who sacrificed the real advantages of the nation, in protracting a ruinous war for his own private emolument and glory. They saw their country oppressed with an increasing load of taxes, which by a continuance of the war must inevitably become an intolerable burden. Their dissentions began to spread, and the tories wanted only a few determined leaders to assist them in removing the present ministry.

358
Revolution in the councils of queen Anne.

In the mean time a succession of losses began to dissipate the conquering frenzy that had seized the nation in general, and to incline them to wish for peace. The earl of Galway, who commanded the army in Spain, was utterly defeated at Almanza † by the duke of Berwick; and in consequence of this victory, all Spain, except the province of Catalonia, returned to their duty, to Philip their lawful sovereign. An attempt was made upon Toulon, by the duke of Savoy and prince Eugene by land, and an English fleet by sea; but to no purpose. The fleet under Sir Cloudesly Shovel, having set sail for England, was driven by a violent storm on the rocks of Scilly. His own ship was lost, and every soul on board perished. Three more ships met with the same fate; while three or four others were saved with the utmost difficulty. In Germany, marshal Villars the French general carried all before him, and was upon the point of restoring the elector of Bavaria. The only hopes of the people lay in the activity and conduct of the duke of Marlborough, who opened the campaign of 1707, about the middle of May; but even here they were disappointed. The duke declined an engagement; and after several marchings and countermarchings, both

359
English defeated at Almanza.

armies

Britain.

armies retired into winter-quarters about the end of October. The French made vigorous preparations for the next campaign; and the duke returned to England to meet with a reception he did not at all expect, and which, as far as appears, he did not deserve.

The most remarkable transaction, however, of this year, and indeed of this whole reign, was the union between the two kingdoms of Scotland and England. Though governed by one sovereign since the time of James I. of England, yet each nation continued to be ruled by its respective parliament; and often professed to pursue opposite interests to those of its neighbour. The union had often been unsuccessfully attempted before. A new attempt commenced with the beginning of Anne's reign: but some disputes arising relative to the trade of the east, the conference was broke up, and it was thought that an agreement would be impossible. It was revived by an act in either parliament, granting power to commissioners named on the part of both nations to treat on the preliminary articles of an union, which should afterwards undergo a more thorough discussion by the legislative body of both kingdoms. The choice of these commissioners was left to the queen; and she took care that none should be employed but such as heartily concurred in the measure.

The commissioners met in the council-chamber of the cock-pit near Whitehall; which was the place appointed for their conferences. Their commissions being opened, and introductory speeches pronounced by the lord keeper of England and by the lord chancellor of Scotland, the conference began. The Scots commissioners were inclined to a federal union like that of the United Provinces; but the English were bent upon an incorporation, so that no Scottish parliament should ever have power to repeal the articles of this treaty. The lord keeper Cowper proposed, that the two kingdoms of Scotland and England should be for ever united into one, under the name of *Great Britain*; that it should be represented by one and the same parliament, and governed by the same hereditary monarch. The Scots commissioners, on their part, insisted that the subjects of Scotland should forever enjoy the same rights and privileges with those of England; and that all statutes, contrary to the tenor of these privileges in either kingdom, should be repealed. As the queen frequently exhorted them to dispatch, the articles of this famous union were soon agreed to by the commissioners; and it only remained to lay them before the parliaments of both nations.

By these articles it was stipulated, That the succession to the united kingdoms should be veiled in the house of Hanover; that the united kingdoms should be represented by one and the same parliament; that all the subjects of Great Britain should enjoy a communication of privileges and advantages; that they should have the same allowances and privileges with respect to commerce and customs; that the laws concerning public right, civil government, and policy, should be the same throughout the two united kingdoms; but that no alteration should be made in laws which concerned private right, except for the evident benefit of the subjects of Scotland; that the courts of session, and all other courts of judicature in Scotland, should remain as then constituted by the laws of that kingdom, with the same authority and privileges as before the union; that

Britain.

Scotland should be represented in the parliament of Great Britain by 16 peers, and 45 commoners, to be elected in such a manner as should be settled by the present parliament of Scotland; that all peers of Scotland should be considered as peers of Great Britain, and rank immediately after the English peers of the like degrees at the time of the union, and before such as should be created after it; that they should enjoy all the privileges of English peers, except sitting in the house of lords and voting on the trial of a peer; that all the insignia of royalty and government should remain as they were; that all laws and statutes in either kingdom, as far as they might be inconsistent with the terms of these articles, should cease, and be declared void by both parliaments.

The obtaining the sanction of the English and Scots parliaments to these articles, was found to be a matter of much more difficulty than had been at first imagined. To induce the Scots parliament to come into the measure, it was alleged by the ministry and their supporters, that an entire and perfect union would be the foundation of a solid and lasting peace. It would secure their religion, liberty, and property; remove the animosities that prevailed among themselves, and the jealousies that subsisted between the two nations. It would increase their strength, riches, and commerce. The whole island would be joined in affection, and freed from all apprehensions of different interests, so as to be enabled to resist all its enemies, to support the Protestant interest, and maintain the liberties of Europe. It was observed, that the less the wheels of government were clogged by a multiplicity of councils, the more vigorous would be their exertions. They were shown, that the taxes, which in consequence of this union they were to pay, were by no means proportionable to their share in the legislature: that their taxes did not amount to a 70th part of those supplied by the English, and yet their share in the legislature was not a tenth part less. In the English houses it was observed, that a powerful and dangerous nation would thus for ever be prevented from giving them any disturbance: that in case of any future rupture, England had every thing to lose, and nothing to gain, against a nation that was courageous and poor.

On the other hand, the Scots were fired with indignation at the thoughts of losing their ancient and independent government. The nobility found themselves degraded in point of dignity and influence, by being excluded from their seats in parliament. The trading part of the nation beheld their commerce loaded with heavy duties, and considered their new privilege of trading to the English plantations in the West Indies as a very uncertain advantage. In the English houses also it was observed, that the union of a rich with a poor nation would be always beneficial to the latter, and that the former could only hope for a participation of their necessities.—It was said, that the Scots reluctantly yielded to this coalition, and that it might be likened to a marriage with a woman against her consent. It was supposed to be an union made up of so many unmatched pieces, and such incongruous ingredients, that it could never take effect. It was complained, that the proportion of the land-tax paid by the Scots was small, and unequal to their share of the legislature.

Britain.

To these arguments in both nations, besides the shew of a particular answer to each, one great argument was added, which preponderated against all the lesser ones. It was observed, that all inconveniences were to be overlooked in the attainment of one great fold advantage; viz. that of acting with an uniformity of councils for the benefit of a community naturally united. The party therefore for the union prevailed; and this measure was carried in both nations, through all the obstacles of pretended patriotism and private interest.

Notwithstanding all the opposition of the English Tories, every article of the union was approved in the house of lords; and being sent to be ratified by the house of commons, Sir Simon Harcourt prepared the bill in such an artful manner as to prevent all debates. All the articles as they passed in Scotland were recited by way of preamble; and in the conclusion there was one clause by which the whole was ratified and enacted into a law. By this contrivance, those who were desirous of starting new difficulties found themselves disabled from pursuing their aim: they could not object to the recital which was merely a matter of fact; and they had not strength sufficient to oppose all the articles at once, which had before passed with the majority. It passed in the house of commons by a majority of 114; it made its way through the house of lords a second time with equal ease; and when it received the royal sanction, the queen expressed the utmost satisfaction.

³⁶¹
French defeated at Oudenarde.

The duke of Marlborough in the mean time returned to Flanders, where he seemed resolved to push his good fortune. Peace had been offered more than once; treaties entered upon, and as often frustrated. After the battle of Ramillies, the king of France had employed the elector of Bavaria to write letters in his name to the duke of Marlborough, containing proposals for opening a congress. He offered to give up either Spain and its dominions, or the kingdoms of Naples and Sicily, to Charles of Austria, and to give a barrier to the Dutch in the Netherlands. But these terms were rejected. The two armies once more met in numbers nearly equal at Oudenarde*. An engagement ensued, in which the French were defeated, and Lille the strongest town in Flanders, Ghent, Bruges, and all the other towns in that country, soon after fell into the hands of the victors. The campaign ended with fixing a barrier to the Dutch provinces, and it now only remained to force a way into the provinces of the enemy.

* See Oudenarde.

The French king, being now in a manner reduced to despair, again sued for peace; but the demands of the allies were so high, that he was obliged to reject them, and prepare for another campaign. This was in the year 1709. The first attempt of the allies was on the city of Tournay, garrisoned by 12,000 men, and exceedingly strong both by nature and art. After a terrible siege of 21 days, the town capitulated; and a month afterwards the citadel, which was still stronger than the town. Next followed the bloody battle of Malplaquet*; where the allied army, consisting of 110,000 men, attacked the French consisting of 120,000, strongly posted and fortified in such a manner that they seemed quite inaccessible. Nothing, however, was able to stand before the allied army; they drove the French

* See Malplaquet.

³⁶³
Andat Malplaquet.

from their fortifications: but their victory cost them dear; 20,000 of their best troops lay dead on the field of battle. The consequence of this victory was the surrender of the city of Mons, which ended the campaign.

Britain.

The last campaign of the duke of Marlborough, which happened in the year 1711, is said to have excelled all his former exploits. He was opposed by the marshal Villars, the fame who had commanded the French in the battle of Malplaquet. He contrived his measures so, that, by marching and countermarching, he induced the enemy to quit a strong line of entrenchments without striking a blow, which he came afterwards and took possession of. This enterprise was followed by the taking of Bouchain, which was the last military achievement of this great general. By a continuance of conduct and success almost unparalleled, he had gained to the allies a prodigious tract of country. From the beginning of the war, which had now continued nine years, he had perpetually advanced, and never retreated before his enemies, nor lost an advantage he had obtained over them. He most frequently gained the enemy's posts without fighting; but where he was obliged to attack, no fortifications were able to resist him. He had never besieged a city which he did not take, nor engaged in a battle in which he did not come off victorious. Thus the allies had reduced under their command Spanish Guelderland, Limbourg, Brabant, Flanders, and Hainault; they were masters of the Scarpe, the capture of Bouchain had opened for them a way into the heart of France, and another campaign might have made them masters of Paris: but on the duke's return from this campaign, he was accused of having taken a bribe of 6000 l. a-year from a Jew who had contracted to supply the army with bread; and the queen thought proper to dismiss him from all his employments.

³⁶⁴
Last campaign of the duke of Marlborough.

³⁶⁵
His excellent conduct

³⁶⁶
He is dismissed from all his employments.

The disgrace of the duke of Marlborough had been owing to the prevalence of the tory party, who had now got the whig ministry turned out: the consequence of this was, that in spite of all the remonstrances, memorials, &c. of the allies, the British army in Flanders was ordered not to act offensively; and in 1713, a peace was concluded between France and Britain. In this treaty it was stipulated, that Philip, now acknowledged king of Spain, should renounce all right to the crown of France, the union of two such powerful kingdoms being thought dangerous to the liberties of Europe. It was agreed, that the duke of Berry, Philip's brother, and after him in succession, should also renounce his right to the crown of Spain, in case he became king of France. It was stipulated, that the duke of Savoy should possess the island of Sicily, with the title of king; together with Fenestrelles, and other places on the continent; which increase of dominion was in some measure made out of the spoils of the French monarchy. The Dutch had the barrier granted them which they so much desired; and if the crown of France was deprived of some dominions to enrich the duke of Savoy, on the other hand the house of Austria was taxed to supply the wants of the Hollanders, who were put in possession of the strongest towns in Flanders. The fortifications of Dunkirk were demolished. Spain gave up Gibraltar and the island of Minorca. France resigned her pretensions to Hudson's bay, Nova Scotia,

³⁶⁷
Peace with France.

and

Britain.

and Newfoundland; but was left in possession of Cape Breton, and the liberty of drying fish upon the shore. Among the articles glorious to the British nation, their setting free the French Protestants confined in the prisons and gallees for their religion, was not the least meritorious. For the emperor it was stipulated, that he should possess the kingdom of Naples, the duchy of Milan, and the Spanish Netherlands. The king of Prussia was to have Upper Guelder; and a time was fixed for the emperor's acceding to these articles, as he had for some time obstinately refused to assist at the negotiation.

This famous treaty, which was signed at Utrecht on the last day of March 1713, was the last remarkable transaction of this reign. The rest of its history consists entirely of the intrigues of the whigs and tories against one another; which, as they are now of no importance, it is needless to take up time in relating, further than that the tory influence continued to prevail. Whether the ministry at this time wished to alter the succession from the Hanoverian line, cannot now be clearly made out; but certain it is, that the whigs firmly believed it, and the tories but faintly denied the charge. The suspicions of the former became every day stronger, particularly when they saw a total removal of the whigs from all places of trust and confidence throughout the kingdom, and their employments bestowed on professed tories, supposed to be maintainers of an unbroken hereditary succession.

368
Death of the
queen.

The violent dissensions between these two parties, their unbounded licentiousness, cabals, and tumults, made the queen's situation very disagreeable; her health declined; and on the 28th of July 1714, she fell into a lethargic insensibility. Notwithstanding all the medicines the physicians could prescribe, the distemper gained ground so fast, that next day they despaired of her life. All the members of the privy council, without distinction, were now summoned from the different parts of the kingdom; they began to provide for the security of the constitution. A letter was sent to the elector of Hanover, informing him of the queen's desperate situation, and desiring him to repair to Holland, where he would be attended by a British Squadron to convey him to England. At the same time they dispatched instructions to the earl of Strafford at the Hague, to desire the States-general to be ready to perform the guaranty of the Protestant succession. Precautions were taken to secure the sea-ports; and the command of the fleet was bestowed upon the earl of Berkeley, a professed whig. These measures, which were all dictated by that party, answered a double end. They argued the alacrity of the whigs in the cause of their new sovereign, and seemed to imply that the state was in danger from the disaffection of the opposite party.

On the 30th of July the queen seemed to be somewhat relieved by the medicines which had been given her. She rose from her bed about eight in the morning, and walked a little. After some time, casting her eyes on a clock that stood in her chamber, she continued to gaze at it for some minutes. One of the ladies in waiting asked her what she saw there more than usual; to which the queen only answered by turning her eyes upon her with a dying look. She was soon after seized with an apoplectic fit; from which, however, she was somewhat recovered by the assistance of

Britain.

Dr Mead. She continued all night in a state of stupor. She gave some signs of life betwixt twelve and one the next day; but expired the following morning, a little after seven o'clock, having lived 49 years, and reigned upwards of twelve. This princess was remarkable neither for her learning nor her capacity. Like all the rest of her family, she seemed rather fitted for the duties of private life than a public station; being a pattern of conjugal fidelity, a good mother, a warm friend, and an indulgent mistress; and to her honour it certainly must be recorded, that during her reign none suffered on the scaffold for treason. In her ended the line of the Stuarts; a family who never rewarded their friends, nor ever avenged them of their adversaries; a family whose misfortunes and misconducts are not to be paralleled in history.

369
She is suc-
ceeded by
George I.

The queen had no sooner reigned her breath, than the privy-council met, and three instruments were produced, by which the elector of Hanover appointed several of his known adherents to be added as lords justices to the seven great officers of the kingdom. Orders also were immediately issued out for proclaiming George king of England, Scotland, and Ireland. The regency appointed the earl of Dorset to carry him the intimation of his accession to the crown, and to attend him in his journey to England. They sent the general officers, in whom they could confide, to their posts; they reinforced the garrison of Portsmouth, and appointed the celebrated Mr Addison secretary of state. No tumult, no commotion, arose against the accession of the new king; and this gives a strong proof that the tories, had they really intended to exclude him, never took any rational measures to accomplish their purpose.

370
He arrives
in England.

The king first landed at Greenwich; where he was received by the duke of Northumberland, captain of the life-guard, and the lords of the regency. From the landing-place he walked to his house in the park, accompanied by a great number of the nobility and other persons of distinction, who expected to make their court in this reign in consequence of their turbulence and opposition to the reigning party in the last. George I. was 54 years old when he ascended the British throne. His mature age, his sagacity and experience, his numerous alliances, and the general tranquillity of Europe, all contributed to establish his interests, and promise him a peaceable and happy reign. His virtues, though not shining, were solid; and he was of a very different disposition from the Stuart family whom he succeeded. These were known to a proverb for leaving their friends in extremity; George, on the contrary, soon after his arrival in England, was heard to say, "My maxim is, never to abandon my friends, to do justice to all the world, and to fear no man." To these qualities of resolution and perseverance, he joined great application to business. One fault, however, with regard to England, remained behind: he studied the interests of the kingdom he had left, more than of those he came to govern.

The new king soon discovered his inclination to support those who had raised him to the throne, that is, the whig party. When he retired to his bed-chamber, after his first landing, he sent for such of the nobility as had distinguished themselves by their zeal for his succession. He expressed the greatest regard for the
duke

371

the whigs.

Britain.

duke of Marlborough just then arrived from the continent, whither he had been driven by the violence of the Tories. The same friendship he professed for the other leaders of the whigs; but the Tories found themselves excluded from the royal favour. The king did not seem sensible that the monarch of a faction rules but one half of his subjects. It was his misfortune, and consequently that of the nation, that he was hemmed round by men who foured him with all their own interests and prejudices. The whigs, while they pretended to secure the crown for the king, were using all their art to confirm their own interests, extend their connections, and give laws to their sovereign. An instantaneous change was made in all the offices of trust, honour, or advantage. The names of the contending parties were changed into those of *Hanoverians* and *Jacobites*. The former governed the senate and court, oppressed whom they would, bound the lower orders of people by severe laws, and kept them at a distance by vile distinctions; and then taught them to call this *liberty*.

In consequence of these partialities, the highest discontent was raised through the whole kingdom. The Tories or Jacobites raised the most terrible outcries; and had the pretender been a man of any judgment or abilities, a fair opportunity was now offered him of striking a decisive blow. Instead of this, he continued a calm spectator on the continent, and only sent over his emissaries to disperse ineffectual manifestoes and delude the unwary. In these papers he observed, that the late queen had intentions of calling him to the crown. He expatiated with his people upon the injustice they had done themselves in proclaiming a foreign prince for their sovereign, contrary to the laws of the country, that gave him alone the real claim. Copies of a printed address were sent to the dukes of Shrewsbury, Marlborough, Argyle, and other noblemen of the first distinction; vindicating his right to the crown, and complaining of the injustice of his people. Yet, though he still complained of their conduct, he never took any step to correct his own, or remove that obstacle by which his father had lost his throne. He still continued to profess the truest regard to the Catholic religion; and, instead of concealing his sentiments on that head, gloried in his principles.

But, however much the Popish religion was at that time hated in England, the principles of the dissenters were not in the least more agreeable to the generality. The Tories affirmed, that, under a whig administration, heresy and impiety were daily gaining ground. The lower orders of the clergy joined in these complaints, and pointed out several tracts published in favour of Arianism and Socinianism. The ministry not only refused to punish the delinquents, but silenced the clergy themselves, and forbade their future disputations on these topics.—The parliament was now dissolved, and another called by a very extraordinary proclamation. In this the king complained of the evil designs of men disaffected to his succession; and of their having misrepresented his conduct and principles. He expressed his hopes, that his subjects would send up to parliament the fittest persons to redress the present disorders. He intreated that they would elect such in particular as had expressed a firm attachment to the Protestant succession when it was in a danger. In the election of this

important parliament, uncommon vigour was exerted on both sides; but by dint of the monied interest that prevailed in corporations, and the activity of the ministry, a great majority of whigs was returned both in England and Scotland.

Upon the first meeting of this new parliament, the most violent measures were resolved upon against the late ministry. Part of them kept away from business. A committee was appointed to inspect all the papers relative to the late treaty, and to pick out such of them as might serve for grounds of accusation against the late ministry. The earl of Oxford was impeached of high treason, and sent to the Tower. The violence of the commons was answered with equal violence without doors. Tumults became every day more frequent, and every tumult served only to increase the severity of the legislature. They now passed an act, declaring, that if any persons to the number of 12, unlawfully assembled, should continue together one hour after being required to disperse by a justice of peace or other officer, and after hearing the act against riots read in public, they should be deemed guilty of felony without benefit of clergy. This is a very severe act, and one of the greatest restrictions on the liberty of the subject that has passed during this century; as by it, all meetings of the people, either for the purposes of amusement or redress, are rendered criminal, if it shall please any magistrate to consider them as such.

These vindictive proceedings excited the indignation of the people, who perceived that the avenues of royal favour were closed to all but a faction. A rebellion commenced in Scotland, where to their other grievances they joined that of the union, which they were taught to consider as an oppression. The malcontents of this country had all along maintained a correspondence with their friends in England, who were now driven by resentment and apprehension into a system of policies they would not otherwise have dreamed of. Some of the Tory party, who were men attached to the Protestant religion, and of moderate principles in government, began to associate with the Jacobites, and to wish in earnest for a revolution. Scotland first shewed them the example. The earl of Mar, assembling 300 of his vassals in the Highlands, proclaimed the pretender at Castleton; and setting up his standard at Braemar, assumed the title of *lieutenant-general of his majesty's forces*. To second these attempts, two vessels arrived from France, with arms, ammunition, and a number of officers, together with assurances to the earl, that the pretender himself would shortly come over to head his own forces. In consequence of this promise, the earl soon found himself at the head of 10,000 men well armed and provided. He secured the pass of Tay at Perth, where his head-quarters were established; and made himself master of the whole province of Fife, and all the sea-coast on that side of the frith of Forth. He marched from thence to Dumblain, as if he had intended to cross the Forth at Stirling bridge; but there he was informed that the duke of Argyle, who on this occasion was appointed commander in chief of all the forces in North Britain, was advancing against him from Stirling with all his own clans, assisted by some troops from Ireland. Upon this, he thought proper at first to retreat; but being soon after joined by some of the clans under the earl of Seaforth, and others under general

Gordon, an experienced officer, who had signalized himself in the Russian service, he resolved to face the enemy, and directed his march towards the south.

376
Battle near
Dumblain.

The duke of Argyle, apprized of his intentions, and at any rate willing to prove his attachment to the present government, resolved to give him battle in the neighbourhood of Dumblain, though his forces did not amount to half the number of the enemy. In the morning, therefore, he drew up his army, which did not exceed 3500 men, in order of battle; but he soon found himself greatly outflanked by the insurgents. The duke, therefore, perceiving the earl make attempts to surround him, was obliged to alter his disposition, which, on account of the scarcity of general officers, was not done so expeditiously as to be finished before the rebels began the attack. The left wing of the duke's army received the centre of the enemy, and supported the first charge without shrinking. It seemed even for a while victorious, and the earl of Clauronland was killed. But Glengary, who was second in command, undertook to inspire his intimidated forces with courage; and, waving his bonnet, cried out several times, *Revenge!* This animated the rebel troops to such a degree, that they followed him close to the points of the enemies bayonets, and got within their guard. A total rout began to ensue of that wing of the royal army; and general Wetham, their commander, flying full speed to Stirling, gave out that the rebels were completely victorious. In the mean time, the duke of Argyle, who commanded in person on the right, attacked the left of the enemy; and, drove them before him two miles, though they often faced about and attempted to rally. Having thus entirely broken that wing, and driven them over the river Allen, he returned back to the field of battle; where, to his great mortification, he found the enemy victorious, and patiently waiting for the assault. However, instead of renewing the engagement, both armies continued to gaze at each other, neither caring to begin the attack. In the evening, both parties drew off, and both claimed the victory. All the advantages of a victory, however, belonged to Argyle. He had interrupted the progress of the enemy; and, in their circumstances, delay was defeat. In fact, the earl of Mar soon found his losses and disappointments increase. The castle of Inverness, of which he was in possession, was delivered up by lord Lovat, who had hitherto professed to act in the interest of the pretender. The marquis of Tullibardine forsook the earl, in order to defend his own part of the country; and many of the clans seeing no likelihood of coming to a second engagement, returned quietly home.

377
Bad conduct
of James's
party.

In the mean time, the rebellion was still more unsuccessfully prosecuted in England. From the time the pretender had undertaken this wild project at Paris, in which the duke of Ormond and lord Bolingbroke were engaged, lord Stair the English ambassador there had penetrated all his designs, and sent faithful accounts of all his measures and of all his adherents to the ministry at home. Upon the first rumour, therefore, of an insurrection, they imprisoned several lords and gentlemen, of whom they had a suspicion. But these precautions were not able to stop the insurrection in the western counties, where it was already begun. All their preparations, however, were weak and ill con-

Britain.

ducted; every measure was betrayed to government as soon as projected, and many revolts were repressed in the very outset. The university of Oxford was treated with great severity on this occasion. Major-general Pepper, with a strong detachment of dragoons, took possession of the city at day-break, declaring that he would instantly shoot any of the students who should presume to appear without the limits of their respective colleges.

The insurrection in the northern counties came to greater maturity. In the month of October 1715, the earl of Derwentwater, and Mr Forster, took the field with a body of horse, and, being joined by some gentlemen from the borders of Scotland, proclaimed the pretender. Their first attempt was to seize upon Newcastle, in which they had many friends; but finding the gates shut against them, they retired to Hexham. To oppose these, general Carpenter was detached by government with a body of 900 men, and an engagement was hourly expected. The rebels had two methods by which they might have conducted themselves with prudence and safety. The one was to march directly into the western parts of Scotland, and there join general Gordon, who commanded a strong body of Highlanders. The other was to cross the Tweed, and boldly attack general Carpenter, whose forces did not exceed their own. From the insatiation attendant on the measures of that party, neither of these counsels was pursued. They took the rout to Jedburgh, where they hoped to leave Carpenter on one side, and penetrate into England by the western border. This was the effectual means to cut themselves off either from retreat or assistance. A party of Highlanders, who had joined them by this time, at first refused to accompany them in such a desperate incursion, and one half of them actually returned to their own country. At Brampton, Mr Forster opened his commission of general, which had been sent him by the earl of Mar, and there he proclaimed the pretender. They continued their march to Penrith, where the body of the militia that was assembled to oppose them fled at their appearance. From Penrith they proceeded by the way of Kendal and Lancaster to Preston, of which place they took possession without any resistance. But this was the last stage of their ill-advised excursion: for general Wills, at the head of 7000 men, came up to attack them; and from his activity there was no escaping. They now, therefore, began to raise barricades about the town, and to put the place in a posture of defence, repulsing the first attacks of the royal army with success. Next day, however, Wills was reinforced by Carpenter, and the town was invested on all sides. In this deplorable situation, in which they were reduced by their own rashness, Forster hoped to capitulate with the general; and accordingly sent colonel Oxburgh, who had been taken prisoner, with a trumpeter to propose a capitulation. This, however, Wills refused; alleging that he would not treat with rebels, and that the only favour they had to expect was to be spared from immediate slaughter. These were hard terms, but no better could be obtained. They accordingly laid down their arms, and were put under a strong guard. All the noblemen and leaders were secured, and a few of their officers tried for deserting from the royal army, and shot by order of a court-martial. The common men were imprisoned at

380
Abfurd
conduct of
James's
party in
France.

Though the schemes of the pretender appear to have been foolishly enough conducted in Britain, yet they were much more so in France. Bolingbroke had been made his secretary at Paris, and Ormond his prime minister. But these statesmen quickly found that nothing could be done in favour of his cause. The king of France, who had ever espoused the interest of the abdicated family, was just dead; and the duke of Orleans, who succeeded in the government of the kingdom, was averse to lending the pretender any assistance. His party, however, which was composed of the lowest and the most ignorant exiles from the British dominions, affected the utmost confidence, and boasted of a certainty of success. The deepest secrets of his cabinet, and all his intended measures, were bandied about in coffee-houses by persons of the lowest rank both in fortune and abilities. Subaltern officers resolved to be his generals; and even prostitutes were entrusted to manage his negotiations. Little, therefore, could be expected from such assistants and such counsils.

381
Pretender
lands in
Scotland.

Though, by this time, the pretender might easily have seen that his affairs were desperate; yet, with his usual insatiation, he resolved to hazard his person among his friends in Scotland at a time when such a measure was too late for success. Passing, therefore, through France, in disguise, and embarking in a small vessel at Dunkirk, he arrived, after a voyage of a few days, on the coasts of Scotland, with only six gentlemen in his train. He passed unknown through Aberdeen to Feteroffe, where he was met by the earl of Mar, and about 30 noblemen and gentlemen of the first quality. There he was solemnly proclaimed; and his declaration, dated at Commerce, was printed and dispersed. He went from thence to Dundee, where he made a public entry; and in two days more he arrived at Scoon, where he intended to have the ceremony of his coronation performed. He ordered thanksgivings to be made for his safe arrival; he enjoined the ministers to pray for him in their churches; and without the smallest share of power, went through the ceremonies of royalty, which threw an air of ridicule on all his conduct. Having thus spent some time in unimportant parade, he resolved to abandon the enterprise with the same levity with which it was undertaken. Having made a speech to his grand council, he informed them of his want of money, arms, and ammunition, for undertaking a campaign, and therefore deplored that he was obliged to leave them. He once more embarked on board a small French ship that lay in the harbour of Montrose, accompanied with several lords, his adherents; and in five days arrived at Graveline.

382
And again
leaves it.

General Gordon, who was left commander in chief of the forces, with the assistance of earl Marfchal, proceeded at their head to Aberdeen, where he secured three vessels to sail northward, which took on board such persons as intended to make their escape to the continent. He then continued his march through the Highlands, and quietly dismissed his forces as he went forward. This retreat was made with such expedition, that the duke of Argyle, with all his activity, could

never overtake his rear, which consisted of 1000 horse.

Britain.
383
Cruel treat-
ment of the
rebels.

The rebellion being ended, the law was put in force with all its terrors; and the prisons of London were crowded with those deluded persons, whom the ministry seemed resolved not to pardon. The commons, in their address to the crown, declared they would prosecute, in the most rigorous manner, the authors of the late rebellion; and their measures were as vindictive as their resolutions were speedy. The earls of Derwentwater, Nithsdale, Carnwath, and Wintown, the lords Widdington, Kenmuir, and Nairne, were impeached; and, upon pleading guilty, all but lord Wintown, received sentence of death. No intertices could prevail upon the ministry to spare these unhappy men. The house of lords even presented an address to the throne for mercy, but without effect; the king only answered, that on this, as on all other occasions, he would act as he thought most consistent with the dignity of the crown and the safety of the people. Orders were accordingly dispatched for executing the lords Derwentwater, Nithsdale, and Kenmuir, immediately; the rest were respited to a farther time. Nithsdale, however, had the good fortune to escape in woman's clothes that were brought him by his mother the night before his execution. Derwentwater and Kenmuir were brought to the scaffold on Tower-hill at the time appointed. Both underwent their sentence with calm intrepidity, and seemingly less moved than those who beheld them.

An act of parliament was next made for trying the private prisoners in London, and not in Lancashire where they were taken in arms. This was considered, by some of the best lawyers, as an alteration of the ancient constitution of the kingdom, by which it was supposed, that every prisoner should be tried in the place where the offence was committed, as a jury of neighbours would be best qualified to enter into the nature of the offence. In the beginning of April, commissioners for trying the rebels met in the court of common pleas, when the bills were found against Mr Forster, Mr Macintosh, and 20 of their confederates. Forster escaped from Newgate, and reached the continent in safety; the rest pleaded not guilty. Pitts the keeper of Newgate, being suspected of having connived at Forster's escape, was tried for his life, but acquitted. After this, Macintosh, and several other prisoners, broke from Newgate, after having mastered the keeper and turnkey, and disarmed the sentinel. The court proceeded to the trial of those that remained; four or five were hanged, drawn, and quartered, at Tyburn. The judges appointed to try the rebels at Liverpool found a considerable number of them guilty of high treason. Two-and-twenty were executed at Manchester and Preston; about 1000 experienced the king's mercy, if such it may be called, to be transported to North America.

The rebellion being thus extinguished, the danger of the state was made a pretence for continuing the parliament beyond the term fixed for its dissolution. An act, therefore, was made by their own authority, repealing that by which they were to be dissolved every third year, and the term of their duration was extended to seven years. This attempt in any delegated body of people to increase their own power by extending it, is contrary to the first principles of justice. If it was

384
Duration
of the par-
liament
lengthened.

Britain.

right to extend their duration to seven years, they might also perpetuate their authority; and thus cut off even the shadow of a nomination. The bill, however, passed both houses, and all objections to it were considered as disaffection. The people might murmur at this encroachment, but it was too late for redress.

395
Britain
threatened
with an in-
vasion by
Charles XII.

Domestic concerns being thus adjusted, the king resolved upon a voyage to the continent. He foresaw a storm gathering from Sweden. Charles XII. was highly provoked against him for having entered into a confederacy with the Russians and Danes during his absence at Bender, and for having purchased from the king of Denmark the towns of Bremen and Verden, which constituted a part of his dominions. In consequence of this, Charles maintained a close correspondence with the dissatisfied subjects of Great Britain; and a scheme was formed for landing a considerable body of Swedish forces, with the king at their head, in some part of the island, where it was expected they would be joined by all the malcontents in the kingdom. Count Gyllenburg, the Swedish minister in London, was peculiarly active in the conspiracy; but being seized, with all his papers, by order of the king, the confederacy was broke for that time. A bill, however, was passed by the commons, forbidding all commerce with Sweden; the trade with which country was at that time of the utmost consequence to the English merchants. George having passed through Holland to Hanover, in order to secure his German dominions, entered into a new treaty with the Dutch and the regent of France, by which they agreed mutually to assist each other in case of an invasion; and for his further security the commons granted him 250,000 *l*. But the death of the Swedish monarch, who was soon after killed at the siege of Fredericshall in Norway, put an end to all disquietude from that quarter.

Among the many treaties for which this reign was remarkable, one had been concluded, which was called the *quadruple alliance*. It was agreed between the emperor, France, Holland, and Britain, that the emperor should renounce all pretensions to the crown of Spain, and exchange Sardinia for Sicily with the duke of Savoy; that the succession to the duchies of Tuscany, Parma, and Placentia, should be settled on the queen of Spain's eldest son, in case the present possessors should die without male issue. This treaty, however, was by no means agreeable to the king of Spain; and consequently it became prejudicial to the English, as it interrupted the commerce with that kingdom. A war soon after commenced between Spain and the emperor, who was considered as the principal contriver of the treaty; and a numerous body of Spanish forces were sent into Italy to support Philip's pretensions in that quarter. The regent of France attempted in vain to dissuade him, and the king of Britain offered his mediation with the like bad success; their interposition was considered as partial and unjust. A Spanish war was then resolved on. A squadron of 22 ships was equipped on all expedition, the command of which was given to Sir George Byng, and ordered to sail for Naples, at that time threatened with a Spanish army. He was received with the greatest joy by the Neapolitans; who informed him that the Spaniards, to the amount of 30,000, were then actually landed in Sicily. In this exigence, as no assistance could be given by

396
War with
Spain.

Britain.

land, he resolved to sail thither, fully determined to pursue the Spanish fleet on which the army was embarked. Upon coming round Cape Faro, he perceived two small Spanish vessels; and pursuing them closely, they led him to their main fleet, which, before noon, he discovered in line of battle, amounting in all to 27 sail. The Spaniards, however, notwithstanding their superiority in number, attempted to sail away: but finding it impossible to make their escape, they kept up a running fight, and the commanders behaved with great courage and activity; in spite of which they were all taken, except three, which were preserved by the conduct of one Camoc, their vice-admiral, a native of Ireland. Sir George Byng behaved on this occasion with great prudence and resolution; and the king wrote him a letter with his own hand, approving his conduct.

The rupture with Spain was thought to be favourable to the interests of the pretender; and it was hoped that, by the assistance of cardinal Albroni the Spanish minister, a new insurrection might be excited in England. The duke of Ormond was the person fixed upon to conduct this expedition; and he obtained from the Spanish court, a fleet of ten ships of war and transports, having on board 6000 regular troops, with arms for 12,000 more. But fortune was still as unfavourable as ever. Having set sail, and proceeded as far as Cape Finisterre, he was encountered by a violent storm, which disabled his fleet, and frustrated the expedition. This misfortune, together with the bad success of the Spanish arms in Sicily and other parts of Europe, induced Philip to wish for a cessation of arms; and he at last consented to sign the quadruple alliance, by which means peace was again restored to Europe.

Tranquillity being thus established, the ministry proceeded to secure the dependency of the Irish parliament on that of England. One Maurice Annesley had appealed to the house of peers of England from a decree made by the Irish peers, and their decree was reversed. The British peers ordered the barons of exchequer in Ireland to put Mr Annesley in possession of the lands he had lost by the decree of the lords in that kingdom. The barons obeyed this order; and the Irish peers passed a vote against them, as having attempted to diminish the just privileges of the parliament of Ireland; and at the same time ordered the barons to be taken under the custody of the black rod. On the other hand, the house of lords in England resolved, that the barons of the exchequer in Ireland had acted with courage and fidelity; and addressed the king to signify his approbation of their conduct, by some marks of his favour. To complete their intention, a bill was prepared, by which the Irish house of lords was deprived of all right of final jurisdiction. This bill was opposed in both houses, but particularly by the commons. It was there asserted by Mr Pitt, that it would only increase the power of the English peers, who were already but too formidable. Mr Hungerford demonstrated, that the Irish lords had always exerted their power of finally deciding causes. Notwithstanding all opposition, the bill was carried by a great majority, and soon after received the royal assent.

This blow was severely felt by the Irish; but was by no means so great as that which the English about this time felt from the *South-sea scheme*, which com-

South-sea
scheme.

Britain. menced in the year 1721. To explain this as concisely as possible, it must be observed, that ever since the revolution under king William, the government not having sufficient supplies granted by parliament, or what was granted requiring time to be collected, they were obliged to borrow money from several different companies of merchants; and, among the rest, from that company which traded to the South-sea. In the year 1716, the government was indebted to this company about nine millions and an half of money; for which they granted at the rate of 6 per cent. interest. As this company was not the only one to which government was indebted, Sir Robert Walpole formed a design of lessening the national debts, giving the several companies an alternative either of accepting a lower interest, namely 5 per cent. or of being paid the principal. The different companies chose rather to accept of the diminished interest, than to be paid the principal. The South-sea company, in particular, having augmented their loan to ten millions, were contented to receive 500,000 l. annually as interest, instead of 600,000 l. which they usually received. In the same manner, the governors and company of the bank, and other companies, were contented to receive a diminished annual interest for their respective loans; all which greatly lessened the debts of the nation.

In this situation of things, one *Blount* a scrivener proposed to the ministry, in the name of the South-sea company, to buy up all the debts of the different companies, and thus for the South-sea company to become the sole creditors of the state. The terms he offered to government were extremely advantageous. The South-sea company was to redeem the debts of the nation out of the hands of the private proprietors who were creditors to the government, upon whatever terms they could agree on; and for the interest of this money which they had thus redeemed and taken into their own hands, they would be contented to be allowed by government 5 per cent for six years; after which the interest should be reduced to 4 per cent. and should at any time be redeemable by parliament. For these purposes a bill passed both houses. But now came the part of the scheme big with fraud and ruin. As the directors of the South-sea company could not of themselves be supposed to possess so much money as was sufficient to buy up the debts of the nation, they were empowered to raise it by opening a subscription to an imaginary scheme for trading in the South seas; from which commerce immense advantages were promised, and still greater expected by the rapacious credulity of the people. All the creditors of government, therefore, were invited to come in, and exchange their securities, viz. the security of government, for that of the South-sea company. The directors books were no sooner opened for the first subscription, but crowds came to make the exchange of government stock for South-sea stock. The delusion was artfully continued and spread. Subscriptions in a few days sold for double the price they had been bought at. The scheme succeeded beyond even the projector's hopes, and the whole nation was infected with a spirit of avaricious enterprize. The insatiation prevailed; the stock increased to a surprizing degree, even to near ten times the value of what it was first bought for.

After a few months, however, the people waked

from their dream of riches; and found that all the advantages they expected were merely imaginary, while thousands of families were involved in one common ruin. Many of the directors, by whose arts the people were taught to expect such great benefits from a traffic to the South seas, had amassed considerable fortunes by the credulity of the public. It was some consolation, however, to the people to find the parliament flaring in the general indignation, and resolving to strip those unjust plunderers of their possessions. Orders were first given to remove all the directors of the South-sea company from their seats in parliament, and the places they possessed under government. The principal delinquents were punished by a forfeiture of all such possessions and estates as they had acquired during the continuance of this popular frenzy. The next care was to redress the sufferers. Several just and useful resolutions were taken by parliament, and a bill was speedily prepared for repairing the late sufferings as far as the inspection of the legislature could extend. Of the profits arising from the South-sea scheme, the sum of seven millions were given back to the original proprietors; several additions were also made to their dividends out of what was possessed by the company in their own right; and the remaining capital stock was also divided among the old proprietors at the rate of 33 per cent.—In the mean time, petitions from all parts of the kingdom were presented to the house, demanding justice; and the whole nation seemed exasperated to the highest degree. Public credit sustained a terrible shock. Some principal members of the ministry were deeply concerned in these fraudulent transactions. The bank was drawn upon faster than it could supply; and nothing was heard but the ravings of disappointment, and the cries of despair.

By degrees, however, the effects of this terrible calamity wore off, and matters returned to their former tranquillity. A new war with Spain commenced. Admiral Hofer was sent to South America to intercept the Spanish galleons; but the Spaniards, being apprized of his design, relanded their treasure. The greatest part of the British fleet sent on that expedition was rendered entirely unfit for service. The seamen were cut off in great numbers by the malignity of the climate and the length of the voyage, while the admiral himself is said to have died of a broken heart. In order to retaliate these hostilities, the Spaniards undertook the siege of Gibraltar; but with as little success on their side. In this dispute France offered her mediation; and such a reconciliation as treaties could procure was the consequence: a temporary peace ensued; both sides only watching an opportunity to renew hostilities with advantage.

Soon after the breaking up of the parliament in the year 1727, the king resolved to visit his electoral dominions of Hanover. Having appointed a regency in his absence, he embarked for Holland, and lay, upon his landing, at a little town called *Vorst*. Next day he proceeded on his journey; and in two days more, between ten and eleven at night, arrived at Delden, to all appearance in perfect health. He supped there very heartily, and continued his journey early the next morning; but between eight and nine ordered his coach to stop. It being perceived that one of his hands lay motionless, monieur Fabricé, who had formerly been servant to the king of Sweden, and who now attended king

king George, attempted to quicken the circulation, by chafing it between his own. As this had no effect, the furgeon who followed on horseback was called, and he rubbed it with spirits. Soon after, the king's tongue began to swell, and he had just strength enough to bid them hasten to Osnaburgh. Then, falling insensible into Francis's arms, he never recovered; but expired about 11 o'clock the next morning, in the 68th year of his age, and 13th of his reign. His body was conveyed to Hanover, and interred among his ancestors.

394
Contests be-
tween the
court and
country
parties.

On the accession of George II. the two great parties into which the nation had so long been divided, again changed their names, and were now called the *court* and *country* parties. Throughout the greatest part of this reign, there seem to have been two objects of controversy, which rose up in debate at every session, and tried the strength of the opposites; these were the national debt, and the number of forces to be kept in pay. The government on the present king's accession owed more than 30,000,000 of money; and tho' there was a long continuance of profound peace, yet this sum was found constantly increasing. It was much wondered at by the country party how this could happen, and it was as constantly the business of the court to give plausible reasons for the increase. Thus, demands for new supplies were made every session of parliament, either for the purposes of securing friends upon the continent, of guarding the kingdom from internal conspiracies, or of enabling the ministry to act vigorously in conjunction with the powers in alliance abroad. It was vainly alleged that those expenses were incurred without preference or necessity; and that the increase of the national debt, by multiplying and increasing taxes, would at last become an intolerable burden to the poor. These arguments were offered, canvassed, and rejected; the court party was constantly victorious, and every demand was granted with cheerfulness and profusion.

395
Account of
the charita-
ble corpora-
tion.

The next thing worthy of notice in the reign of George II. is the *charitable corporation*. A society of men had united themselves into a company by this name; and their professed intention was to lend money at legal interest to the poor upon small pledges, and to persons of higher rank upon proper security. Their capital was at first limited to 30,000*l.* but they afterwards increased it to 600,000*l.* This money was supplied by subscription, and the care of conducting the capital was intrusted to a proper number of directors. This company having continued for more than 20 years, the cashier, George Robinson, member for Marlow, and the warehouse-keeper, John Thompson, disappeared in one day. Five hundred thousand pounds of capital were found to be sunk or embezzled by means which the proprietors could not discover. They, therefore, in a petition, represented to the house the manner in which they had been defrauded, and the distress to which many of the petitioners were reduced. A secret committee being appointed to examine into this grievance, a most iniquitous scene of fraud was soon discovered, which had been carried on by Thompson and Robinson, in concert with some of the directors, for embezzling the capital and cheating the proprietors. Many persons of rank and quality were concerned in this infamous conspiracy; and even some of the first characters in the nation did not escape censure. No less than six members of parliament were expelled for the most fordid acts

of knavery. Sir Robert Sutton, Sir Archibald Grant, and George Robinson, for their frauds in the management of the charitable corporation scheme; Dennis Bond, and Jerfant Burch, for a fraudulent sale of the late unfortunate earl of Derwentwater's estate; and lastly, John Ward, of Hackney, for forgery. It was at this time asserted in the house of lords, that not one shilling of the forfeited estates was ever applied to the service of the public, but became the reward of fraudulence and venality.

British.

This happened in the year 1731; and in 1732, an Excise scheme was formed by Sir Robert Walpole of fixing a general excise. He introduced it by recounting the frauds practised by the factors in London that were employed in selling the American tobacco. To prevent these frauds, he proposed, that instead of having the customs levied in the usual manner upon tobacco, all hereafter to be imported should be lodged in warehouses appointed for that purpose by the officers of the crown; and should from thence be sold, upon paying the duty of 4*d.* per pound, when the proprietor found a purchaser. This proposal raised a violent ferment, both within doors and without. At last, the fury of the people was worked up to such a pitch, that the parliament-house was surrounded by multitudes, who intimidated the ministry, and compelled them to drop the design. The miscarriage of the bill was celebrated with public rejoicings in London and Westminster, and the minister was burned in effigy by the populace at London.

396

An Excise
scheme re-
jected.

On this occasion an attempt was made to repeal the septennial bill, and bring back triennial parliaments, as settled at the Revolution. But notwithstanding the warmth of the opposition, the ministry, exerting all their strength, were victorious, and the motion was suppressed by the majority. However, as on this occasion the country party seemed to have gained strength, it was thought proper to dissolve the parliament; and another was called by the same proclamation.

397

Parliament
dissolved.

The same disputes were carried on in this parliament as in the former. New subjects of controversy offered every day, and both sides were eager to seize them. A convention agreed on by the ministry, at the Prado, with Spain, became an object of warm altercation. By this the court of Spain agreed to pay 95,000*l.* to the English, as a satisfaction for all demands; and to discharge the whole in four months from the day of ratification. This, however, was considered as no equivalent to the damages that had been sustained, which were said to amount to 340,000*l.* On this occasion the minister was provoked into unusual vehemence, and branded the opposite party with the appellation of traitors. The ministry, as usual, were victorious; and the country party finding themselves out-numbered and out-voted in every debate, resolved to withdraw for ever: Walpole, being thus left without opposition, took the opportunity of passing several useful laws in their absence, in order to render the opposite party odious or contemptible.

In 1739, a new war commenced with Spain. Ever since the treaty of Utrecht, the Spaniards in America had insulted and distressed the commerce of Great Britain; and the British merchants had endeavoured to carry on an illicit trade in their dominions. As a right of cutting logwood in the bay of Campeachy, claimed by the British, gave them frequent opportuni-
ties

398

War with
Spain.

Britain. ties of pulling in contraband commodities upon the continent, the Spaniards resolved to put a stop to the evil by refusing liberty to cut logwood in that place. The Spanish guarda-costas continued their severities upon the British, and many British subjects were sent to dig in the mines of Potosi. One remonstrance followed another to the court of Madrid; but the only answers given were promises of inquiry, which produced no reformation. In 1739, war was declared with all proper solemnity; and soon after, admiral Vernon, with six ships only, destroyed all the fortifications of Porto Bello, and came away victorious, with scarce the loss of a man.

As the war was thus successfully begun, supplies were cheerfully granted to prosecute it with all imaginable vigour. Commodore Anson was sent with a squadron of ships to distress the enemy in the South Seas, and to co-operate occasionally with admiral Vernon across the isthmus of Darien. This squadron was designed to act a subordinate part to a formidable armament that was to be sent against New Spain; but through the mismanagement of the ministry both these schemes were frustrated. Anson was detained till too late in the season; he then set out with five ships of the line, a frigate, and two store-ships, with about 1400 men. Coming into the stormy South Seas at a very wrong season of the year, he encountered the most terrible storms; his fleet was dispersed, and his crew deplorably afflicted with the scurvy; so that with much difficulty he gained the delightful island of Juan Fernandez. Here he was joined by one ship and a frigate of seven guns. From thence sailing along the coast of Chili, he plundered and burnt the town of Païta. He next traversed the great Pacific ocean, in hopes of meeting with one of the immensely rich galleons that trade from the Philippine Islands to Mexico. Having refreshed his men at the island of Tinian, he set forward for China; and returning the same way he came, at last discovered the galleon. Her he engaged, and took; and with this prize, valued at 313,000*l.* together with other captures to the value of about as much more, he returned home after a voyage of three years. By this expedition the public sustained the loss of a fine squadron of ships, but a few individuals became possessed of immense fortunes.

The other expedition ended still more unfortunately. The armament consisted of 29 ships of the line, and almost an equal number of frigates, furnished with all kinds of warlike stores, near 15,000 faemen, and as many land forces. The most sanguine hopes of success were entertained; but the ministry detained the fleet without any visible reason, till the season for action in America was almost over. At last, however, they arrived before the wealthy city of Carthage. They soon became masters of the strong forts which defended the harbour. But though by this means they advanced a good deal nearer the town, they found great difficulties still before them. It was asserted, that the fleet could not lie near enough to batter the town, and therefore the remaining forts must be attempted by scale. This dangerous experiment was tried; the guides were slain by the enemies fire, and then the forces mistook their way. Instead of attempting the weakest place of the fort, they attacked the strongest, and where they were exposed to the fire of the whole town. Their scaling ladders were too short; and, at last, after bearing

a dreadful fire with great resolution for some hours, they retreated, leaving 600 men dead on the spot. The terrors of the climate now began to be more dreadful than those of war. The rainy season commenced with such violence, that it was impossible for the troops to continue their encampment. To these calamities was added the dissension between the sea and land commanders, who blamed each other, and at last could be only brought to agree in one mortifying measure, *viz.* to re-embark the troops, and withdraw them as quick as possible.

The miscarriage of this enterprize produced the greatest discontents; especially as other causes of complaint were now joined with it. Sir John Norris had twice failed to the coasts of Spain at the head of a very powerful squadron, without doing any thing to the purpose. The commerce of Britain was greatly annoyed by the Spanish privateers, who had taken 407 ships since the commencement of the war; while the British fleets seemed to be quite inactive, and to suffer one loss after another, without endeavouring in the least to make proper reprisals. These discontents burst all at once upon Sir Robert Walpole; a majority in the house of commons was formed against him; he was created earl of Orford, the parliament being adjourned for a few days for that purpose; and he resigned all his employments.

The removal of this minister gave universal satisfaction. His antagonists entertained great hopes of seeing him punished; but he had laid his schemes too well to be under any apprehensions on that account; and what was worse, the new ministry were no sooner got in, than they trod in the footsteps of those they had so much exclaimed against. The nation had now become disgusted with naval operations. The people wished for a renewal of their victories in Flanders, and the king ardently joined in the same wish. An army of 16,000 men was therefore shipped over into Flanders, to take part in the quarrels that were then beginning on the continent. Immense triumphs were expected from this undertaking; but they forgot that the army was not now commanded by the duke of Marlborough.

In order to give some notion of the origin of these continental quarrels, it is necessary to go back for some years. After the duke of Orleans, who had been regent of France, died, cardinal Fleury undertook to settle the confusion in which the kingdom was then involved. Under him France repaired her losses, and enriched herself by commerce. During the long interval of peace which this minister's councils had procured for Europe, two powers, till now unregarded, began to attract the notice and jealousy of the neighbouring nations. These were Russia and Prussia. The other states were but little prepared to renew war. The empire remained under the government of Charles VI. who had been placed on the throne by the treaty of Utrecht. Sweden continued to languish from the destructive projects of Charles XII. Denmark was powerful enough, but inclined to peace; and part of Italy still remained subject to those princes who had been imposed upon it by foreign treaties.

All these states, however, continued to enjoy a profound peace, until the death of Augustus king of Poland, by which a general flame was once more kindled in Europe. The emperor, assisted by the arms of Rus-

fia, declared for the elector of Saxony, son to the deceased king. On the other hand, France declared for Stanislaus, who had long since been nominated king of the Poles by Charles of Sweden, and whose daughter the king of France had since married. Stanislaus was gladly received at Dantzic, and acknowledged king of Poland; but here he was besieged by 10,000 Russians, the city taken, and he himself with difficulty made his escape. France, however, still resolved to assist him, as this, it was thought, would be the most effectual method of distressing the house of Austria. These views of France were seconded by Spain and Sardinia, both of which hoped to grow rich by the spoils of Austria. A French army, therefore, over-ran the empire, under the conduct of the old marshal Villars; while the duke of Montemar, the Spanish general, was equally victorious in the kingdom of Naples. The emperor was soon obliged to sue for peace; which was granted, but Stanislaus was neglected in the treaty. It was stipulated that he should renounce all claim to the kingdom of Poland; for which the emperor gratified France with the duchy of Lorraine, and some other valuable territories.

405
Desperate
situation of
the queen of
Hungary.

The emperor dying in the year 1740, the French began to think this a favourable opportunity for exerting their ambition. Regardless of treaties, therefore, particularly that called the *Pragmatic Sanction*, by which the late emperor's dominions was settled upon his daughter, they caused the elector of Bavaria to be crowned emperor. Thus the queen of Hungary, daughter of Charles VI. was at once stripped of her inheritance, and was left for a whole year deserted by all Europe, and without any hopes of succour. At the same time she lost the province of Silesia by an irruption of the young king of Prussia, who took the opportunity of her defenceless state to renew his pretensions to that province, of which his ancestors had been unjustly deprived. France, Saxony, and Bavaria, attacked the rest of her dominions: Britain was the only ally that seemed willing to assist her; in which, however, Sardinia, Holland, and Russia, soon after concurred.

It must be owned that Britain had no other reason for interfering in these disputes, than that the security of the electorate depended upon nicely balancing the different interests of the empire; and the ministry were willing to gratify the king. His majesty informed the parliament, that he had sent a body of British forces into the Netherlands, which he had augmented by 16,000 Hanoverians, to make a diversion upon the dominions of France, in favour of the queen of Hungary. When the supplies came to be considered by which this additional number of Hanoverian troops was to receive pay from Britain for defending their own cause, most violent parliamentary debates ensued; but the ministry carried their point by the strength of numbers.

406
Relieved by
the British
forces.

But, however prejudicial these continental measures might be to the true interests of Great Britain, they effectually relieved the queen of Hungary's desperate affairs, and soon began to turn the scale of victory on her side. The French were driven out of Bohemia. Her general, prince Charles, at the head of a large army, invaded the dominions of Bavaria. Her rival, the nominal emperor, was obliged to fly before her; and being abandoned by his allies, and stripped even of his hereditary dominions, retired to Frankfort, where he lived in obscurity.

Britain.

407
Battle of
Dettingen.

In the mean time, the British and Hanoverian army advanced, in order to effect a junction with that of prince Charles of Lorraine, in which case they would have outnumbered their enemies. To prevent this, the French opposed an army of 60,000 men, under the command of the marshal de Noailles, who posted his troops on the east side of that river. The British army was commanded by the earl of Stair, who had learned the art of war under the great prince Eugene; nevertheless, he suffered himself to be inclosed by the enemy on every side, near a village called *Dettingen*. In this situation, the whole army, with the king himself, who had by this time arrived in the camp, must have been taken, had the French behaved with prudence. Their impetuosity, however, saved the whole army. They passed a defile, which they ought to have contented themselves with guarding; and, under the conduct of the duke of Gramont, their horse charged the British foot with great fury. They were received with great resolution; and at last obliged to repass the Mayne with precipitation, and the loss of about 5000 men.

409
Intended in-
vasion of
Britain by
the French.

Though the British were victorious in this engagement, the French were very little disconcerted by it. They opposed prince Charles, and interrupted his attempts to pass the Rhine. In Italy they also gained some advantages; but their chief hopes were placed on an intended invasion of England. From the violence of parliamentary disputes in England, France had been persuaded that the country was ripe for a revolution, and only wanted the presence of the pretender to bring about a change. An invasion was therefore actually projected. The troops destined for the expedition amounted to 15,000; and preparations were made for embarking them at Duukirk, and some of the ports nearest to England, under the eye of the young pretender. The duke de Roquefeuille, with 20 ships of the line, was to see them safely landed on the opposite shore, and the famous count Saxe was to command them when landed. But the whole project was disconcerted by the appearance of Sir John Norris, who with a superior fleet made up to attack them. The French fleet was obliged to put back; a very hard gale of wind damaged their transports beyond redress; and the French, now frustrated in their scheme of a sudden descent, thought fit openly to declare war.

The national joy for Sir John Norris's success, however, was soon damped by the miscarriage of admirals Matthews and Lestock; who, thro' a misunderstanding between themselves, suffered a French fleet of 34 sail to escape them near Toulon. In the Netherlands the British arms were attended with still worse success. The French had there assembled an army of 120,000 men, commanded by count Saxe, natural son to the late king of Poland, an officer of great experience. The English were headed by the duke of Cumberland, who had an inferior army, and was much inferior in the knowledge of war to the French general. Count Saxe, therefore, carried all before him. In 1743, he besieged Fribourg; and in the beginning of the campaign 1744, invested the strong city of Tournay. To save this place, if possible, the allies resolved to hazard an engagement; and on this ensued the bloody battle of Fontenoy, in which the allies left on the field of battle near 12,000 men, and the French almost an equal number. In consequence of this victory, Tournay was soon after taken by the

409
Battle of
Fontenoy.

Britain.

the French. To balance this bad success, however, admirals Rowley and Warren had retrieved the honour of the British flag, and made several rich captures at sea. The fortrefs of Louifburg, a place of great consequence to the British commerce, furrendered to general Pepperell; while, a fhort time after, two French East-India fhips, and a Spanifh fhip from Peru laden with treafure, put into the harbour, fupposing it ftill their own, and were taken.

During this gleam of returning fuccefs, Charles Edward, the fon of the old pretender to the British crown, refolved to make an attempt to recover what he called his right. Being furnifhed with fome money from France, he embarked by the marquis of Tullibardine, Sir Thomas Sheridan, and fome others; and for the conquest of the whole British empire only brought with him feven officers, and arms for 2000 men.

Fortune, however, feemed no way more favourable to this attempt, than to others fimilar to it. His convoy, a fhip of 60 guns, was fo difabled in an engagement with an Englifh man of war, that it was obliged to return to Breff, while he continued his courfe to the weftern parts of Scotland. On the 27th of July 1745, he landed on the coaft of Lochaber, and was in a little time joined by the Highlanders, to the number of 1500: the minority at firft could fcarcely be induced to credit his arrival; but when they could no longer doubt of it, they fent Sir John Cope with a fmall body of forces to oppofe his progress.

By this time the young adventurer was arrived at Perth, where he performed the ceremony of proclaiming his father king of Great Britain. From thence, defcending towards Edinburgh, and his forces continually increafing, he entered the capital without oppofition; but was unable, for want of cannon, to reduce the caftle. Here he again proclaimed his father; and promifed to difolve the union, which was confidered as one of the national grievances. In the mean time, Sir John Cope being reinforced by two regiments of dragoons, refolved to give the enemy battle. The rebels attacked him near Preftopans, and in a few minutes put him and his troops to flight, with the lofs of 500 men.

This victory gave the rebels great influence; and had the pretender marched direftly to England, the confequence might have been fatal to freedom. But he was amufed by the promife of fuccours which never came; and thus induced to remain in Edinburgh till the feafon for action was loft. He was joined, however, by the earl of Kilmarnock, lord Balmerino, lords Cromarty, Elcho, Ogilvy, Pitligo, and the eldeft fon of lord Lovat, who with their vaffals confiderably increafed his army. Lord Lovat himfelf, fo remarkable for his treachery, was an enthuft in favour of the pretender, but was unwilling to act openly for fear of the minority. But while Charles was thus trifling away his time at Edinburgh, the British minority were taking effectual methods to oppofe him. Six thoufand Dutch troops, that had come over to the affiftance of the crown, were difpatched northward under the command of general Wade; but, as it was then faid, thefe could lend no affiftance, being prifoners of France upon their parole, and under engagements not to oppofe that power for a year. But however this be, the duke of

Vol. II.

Cumberland foon after arrived from Flanders, and was followed by another detachment of dragoons and infantry, well difciplined and inured to action; and befides thefe, volunteers offered themfelves in every part of the kingdom.

At laft, Charles refolved upon an irruption into England. He entered that country by the weftern border, and took the town of Carlifle; after which he continued his march fouthwards, having received affurances that a confiderable body of forces would be landed on the fouthern coafts to make a diversion in his favour. He eftablifhed his head-quarters at Manchester, where he was joined by about 200 Englifh formed into a regiment, under the command of colonel Townley. From thence he purfued his march to Derby, intending to go by the way of Chefter into Wales, where he hoped to be joined by a great number of malecontents; but in this he was prevented by the factions among his followers.

Being now advanced within 100 miles of London, that capital was in the utmoft confternation; and had he proceeded with the fame expedition he had hitherto ufed, perhaps he might have made himfelf matter of it. But he was rendered incapable of purfuing this, or any other rational plan, by the difcontents which began to prevail in his army. In fact, the young pretender was but the nominal leader of his forces; his generals, and the Highland chiefs, being averfe to fubordination, and ignorant of command. They were now unanimous in their refolution to return to their own country, and Charles was forced to comply. They retreated to Carlifle without any lofs; and from thence croffing the rivers Eden and Solway, entered Scotland. They next marched to Glasgow, which was laid under fevere contributions. From thence advancing to Stirling, they were joined by lord Lewis Gordon at the head of fome forces which had been afsembled in his abfence. Other clans likewife came in; and from fome fupplies of money received from Spain, and fome skirmifhes with the royalifts, in which he was victorious, the pretender's affairs began to wear a more promifing afpect. Being joined by lord Drummond, he invited the caftle of Stirling, in the fiege of which much time was confumed to no purpofe. General Hawley, who commanded a confiderable body of forces near Edinburgh, undertook to raife this fiege, and advanced towards the rebel army as far as Falkirk. After two days fpent in mutually examining each others ftrength, an engagement enfued, in which the king's forces were entirely defeated, with the lofs of their tents and artillery.

This was the end of all the triumphs of the rebel army. The duke of Cumberland having arrived, was put at the head of the troops at Edinburgh, which amounted to about 14,000 men. With thefe he advanced to Aberdeen, where he was joined by feveral of the nobility attached to the houfe of Hanover; the enemy in the mean time retreating before him. He next advanced to the banks of the Spey, a deep and rapid river, where the rebels might have difputed his paffage; but their contentions with one another were now rifen to fuch a height, that they could fcarce agree in any thing. At laft they refolved to wait their purfuers. An engagement enfued at Culloden*, near Invernefs; in which the rebels were defeated with great slaughter, and a final end was put to all the hopes

of the young adventurer. The conquerors behaved with the greatest cruelty; refusing quarter to the wounded, the unarmed, and the defenceless; some were slain who had only been spectators of the combat, and soldiers were seen to anticipate the safe employment of the executioner. The duke, immediately after the action, ordered 36 deserters to be executed: the conquerors spread terror wherever they came; and after a short space, the whole country round was one dreadful scene of plunder, slaughter, and desolation.

419
Adventures
of the young
pretender.

Immediately after the engagement, the young pretender fled away with a captain of Fitzjames's cavalry; and when their horses were fatigued, they both alighted, and separately fought for safety. There is a striking resemblance between the adventures of Charles II. after the battle of Worcester, and those of the young pretender after the battle of Culloden. For some days he wandered in the country. Sometimes he found refuge in caves and cottages, without any attendants at all. Sometimes he lay in forests with one or two companions of his distress, continually pursued by the troops of the conqueror, there being a reward of 30,000 l. offered for taking him either dead or alive. In the course of his adventures, he had occasion to trust his life to the fidelity of above 50 individuals; not one of whom could be prevailed upon by so great a reward as was offered, to betray him whom they looked upon to be their king's son.

For six months the unfortunate Charles continued to wander in the frightful wilds of Glengary, often hemmed round by his pursuers, but still rescued by some providential accident from the impending danger. At length, a privateer of St Maloes, hired by his adherents, arrived in Lochnanach, in which he embarked in the most wretched attire. He was clad in a short coat of black frize, thread-bare; over which was a common Highland plaid, girt round him by a belt, from which hung a pistol and dagger. He had not been shifted for many weeks; his eyes were hollow, his visage wan, and his constitution greatly impaired by famine and fatigue. He was accompanied by Sullivan and Sheridan, two Irish adherents who had shared all his calamities; together with Cameron of Lochiel, his brother, and a few other exiles. They set sail for France; and, after having been chased by two English men of war, arrived in safety at a place called *Rosseau* near Morlaix in Bretagne.

419
He escapes
to France.

420
Rebels ex-
ecuted.

While the pretender was pursued, the scaffolds and gibbets were preparing for his adherents. Seventeen officers were hanged, drawn, and quartered, at Kennington-common in the neighbourhood of London; nine were executed in the same manner at Carlisle, and eleven at York. A few obtained pardons, and a considerable number of the common men were transported to America. The earls of Kilmarnock and Cromarty, and lord Balmerino, were tried and found guilty of high treason. Cromarty was pardoned: but Kilmarnock and Balmerino were executed; as was also Mr Radcliffe brother to the late earl of Derwentwater, who was sentenced upon a former conviction. Lord Lovat was tried, and suffered some time after.

421
New regu-
lations in
Scotland.

Immediately after the suppression of the rebellion, the legislature undertook to establish several regulations in Scotland, which were equally conducive to the happiness of the people, and the tranquillity of the united

kingdoms. The Highlanders had till that time continued to wear the military dress of their ancestors, and never went without arms. In consequence of this, they considered themselves as a body of people distinct from the rest of the nation, and were ready, upon the shortest notice, to second the insurrections of their chiefs. Their habits were now reformed by an act of legislature, and they were compelled to wear clothes of the common fashion. But what contributed still more to their real felicity was the abolition of that hereditary jurisdiction which their chieftains exerted over them. The power of their chieftains was totally destroyed, and every subject in that part of the kingdom was granted a participation in the common liberty.

Soon after the battle of Culloden, the duke of Cumberland returned to Flanders, where he resumed the command of an army to which he was by no means equal. The French carried every thing before them; and they reduced under their dominion all those strong towns which had been taken by the duke of Marlborough, and formed a barrier to the United Provinces. They gained a considerable victory at *Boucroux*; which, however, cost them as many men as they destroyed of the enemy; but these they could more easily spare, as they were much more numerous. Another victory which they obtained at *La Feldt*, served to depress the allied army still lower. But the taking of *Bergen-op-zoom*, the strongest fortification of *Brabant*, reduced the Dutch to a state of desperation.

422
Allies de-
feated in
Flanders.

These victories and successes in Flanders were, however, counterbalanced by almost equal disappointments. In Italy, the marshal *Belleisle's* brother, attempting to penetrate, at the head of 34,000 men, into *Piedmont*, was defeated and killed. A fleet was fitted out for the recovery of *Cape Breton*, but without success. Two others were fitted out, the one to make a descent upon the British colonies in America, and the other to carry on the operations in the East Indies; but these were attacked by *Anson* and *Warren*, and nine of their ships taken. Soon after this, commodore *Fox*, with six ships of war, took above 40 French ships richly laden, from *St Domingo*; and soon after this the French fleet was defeated by admiral *Hawke*, who took seven ships of the line, and several frigates.

423
Loss of
the French
in other
parts.

For a long time *Lewis* had been desirous of a general tranquillity; and this desire he had even expressed to *Sir John Ligonier*, who was taken prisoner at the battle of *La Feldt*. But now the bad success of his admirals at sea, his armies in Italy, the frequent bankruptcies of his merchants at home, and the election of a stadtholder in *Holland* who gave spirit to the opposition; all these contributed to make him weary of the war, and to propose terms of accommodation. This was what the allies had long wished for, but had been ashamed to demand. A congress, therefore, was held at *Aix-la-Chapelle*, where a treaty was concluded on the following terms. 1. That all prisoners on each side should be mutually given up, and all conquests restored. 2. That the duchies of *Parma*, *Placentia*, and *Guastalla*, should be ceded to *Don Philip*, heir apparent to the Spanish crown; after whom these dominions should return to the house of *Austria*. 3. That the fortifications of *Dunkirk* towards the sea should be demolished; and that the British ship annually sent with slaves to the coast of *New Spain*, should have this privilege continued

pelle*.

for

Britain.

for four years. 4. That the king of Prussia should be confirmed in the possession of Silesia, and that the queen of Hungary should be secured in the possession of her patrimonial dominions. But the most mortifying clause was, that the king of Great Britain should immediately, after the ratification of this treaty, send two persons of rank to France as hostages, until restitution should be made of Cape Breton and all other British conquests made during the war. No mention was made of the searching British vessels in the American seas, tho' this was the original cause of the quarrel. The limits of their respective possessions in North America were not ascertained; nor did they receive any equivalent for those forts which they restored to the enemy.

435
Death of
the prince of
Wales.

In the year 1751, died Frederic prince of Wales, of a pleurisy thought at first to be no way dangerous. He was greatly regretted; for his good-nature had rendered him popular, and those who opposed the present administration had grounded all their hopes of redress upon his accession to the throne.

Some time before this, viz. in the year 1749, a scheme was entered upon, which the nation in general imagined would be very advantageous. This was the encouraging those who had been discharged the army or navy to become settlers in Nova Scotia. This country is cold, barren, and almost incapable of cultivation. Nevertheless, on account of this barren spot, the English and French renewed the war, which soon after spread with such terrible devastation over every part of the globe. The possession of this country was reckoned necessary to defend the English colonies to the north, and to preserve their superiority in the fisheries in that part of the world. The French, however, who had been long settled in the back parts, resolved to use every method to dispossess the new comers, and spirited up the Indians to begin hostilities. Another source of dispute also sprung up soon after in the same part of the world. The French, pretending to have first discovered the mouth of the river Mississippi, claimed the whole adjacent country towards New Mexico on the east, quite to the Apalachian mountains on the west. In order to assert their claims, as they found several English who had settled beyond these mountains, they dispossessed them of their new settlements, and built such forts as would command the whole country round about.

Negotiations, mutual accusations, and hostilities, first took place between the two powers; at length, in 1756, four operations were undertaken by the British in America at once. Colonel Monkton had orders to drive the French from their encroachments upon the province of Nova Scotia. General Johnson was sent against Crown Point; General Shirley against Niagara, to secure the forts on the river; and General Braddock against Fort du Quesne. In these expeditions, Monkton was successful; Johnson also was victorious, though he failed in taking the fort against which he was sent; Shirley was thought to have lost the season of operation by delay; and Braddock was defeated and killed.

In return for this bad success, the British made reprisals at sea; and in this they were so successful, that the French navy was unable to recover itself during the continuance of the war that was shortly after declared on both sides. The first step of the French was to threaten an invasion. Several bodies of their troops

Britain.

were sent down to the coasts that lay opposite to the British shores; these were instructed in the manner of embarking and relanding from flat-bottomed boats, which were made in great numbers for that expedition. The number of men amounted to 50,000; but all discovered the utmost reluctance to the undertaking. The ministry were greatly alarmed. They applied to the Dutch for 6000 men, which they were by treaty obliged to furnish in case of an invasion. This supply was refused; the Dutch alleging, that their treaty was to send the troops in case of an actual, and not a threatened, invasion. The king, therefore, finding he could not have the Dutch forces till their assistance would be too late, desisted entirely from his demand; and the Dutch with great amity returned him thanks for withdrawing his request. Upon this, 10,000 Hessians and Hanoverians were brought over. But this occasioned great discontent. The ministry were reviled for such disgraceful condescension, as if the nation was unable to defend itself. The people only demanded a vigorous exertion of their own internal strength, and then feared no force that could be led to invade them.

The British invasion, however, never took place: but ⁴¹⁷Minorea invaded.

A French army landed in Minorca, and invested the citadel of St Philip's, which was reckoned the strongest in Europe; but the garrison was weak, and no way fitted to stand a vigorous siege. To raise this siege, admiral Byng was dispatched with a squadron of ten men of war, with orders to relieve Minorca, or at any rate to throw a body of troops into the garrison. This last he reckoned too hazardous an undertaking; nor did he even attempt it. Soon after, a French fleet appeared nearly equal in force to his own; but the admiral resolved to act only upon the defensive. The French advanced; a slight engagement ensued with part of the English fleet; after which, the French slowly sailed away, and another opportunity never occurred of coming to a closer engagement. After this, it was resolved in a council of war to return to Gibraltar to rest, and that the relief of Minorca was impracticable. For this conduct Byng was brought home under arrest, tried, and sentenced to death. His sentence was to be ⁴¹⁸shot; and he suffered with the greatest resolution, after delivering a paper filled with protestations of his innocence as to any treacherous intention.

418
Admiral
Byng executed.

After the conquest of Minorca, the French declared that they would revenge all injuries they should sustain in their colonies on the king of Britain's dominions in Germany. Upon this, the court of London, eager to ⁴¹⁹preserve Hanover, entered into a treaty with the court of Russia, by which it was stipulated, that a body of 50,000 Russians should be ready to act in the British service, in case Hanover should be invaded by the French. For this the czarina was to receive 100,000l. annually, to be paid in advance. This treaty was opposed by the king of Prussia. He had long considered himself as guardian of the interests of Germany, and was therefore alarmed at a treaty which threatened to deluge the empire with an army of barbarians. Besides, he was already apprized of an agreement between the Austrians and Russians, by which the latter were to enter the empire and strip him of his late conquest of Silesia. He ⁴³⁰therefore declared, that he would not suffer any foreign king of Prussia. forces to enter the empire, either as auxiliaries or principals. The king of Britain now found himself obliged

Britain.

to drop his Russian connection, and conclude a treaty with the king of Prussia. As both monarchs wished only to prevent the invasion of Germany, they soon came to an agreement to assist each other mutually. From this alliance a new combination took place among the European powers, quite opposite to the former; and their forces were drawn out in the following manner. Britain opposed France in America, Asia, and on the ocean. France attacked Hanover; which the king of Prussia undertook to protect, while Britain promised him troops and money to assist his operations. Austria had their aims on the dominions of Prussia, and drew the elector of Saxony into the same designs. In these views the Austrians were seconded by France, Sweden, and Russia, who had hopes of acquiring a settlement in the west of Europe.

Thus the king of Prussia launched into the tumult of war, having only the king of Britain for his ally, while the most potent states of Europe were his antagonists. He now performed exploits perhaps unequalled in the annals of modern ages; for a particular account of which, see the article PRUSSIA. The British ministry, in order to procure a diversion in his favour, planned an enterprize against the coast of France. The destination of the fleet equipped for this purpose was kept a profound secret. At last it appeared before Rochford; where the commanders, having trifled away their time in deliberating how to proceed, secured the little island of Aix, an easy and an useless conquest: soon after which, they returned home, without attempting any thing else. By this miscarriage the ministry were so discouraged, that they had thoughts of abandoning the king of Prussia to his fate; and the king was actually meditating a negotiation of this nature, when he was prevented by the expostulations of his distressed ally. From motives of generosity, therefore, more than of interest, it was resolved to continue to assist him; and success, which had long fled from the British arms, once more began to return with double splendour.

It was in the East Indies where this returning success first began to appear. The war in Asia had never been totally suspended. It was carried on at first by both nations under pretence of lending assistance to the contending chiefs of the country; but the allies soon became the principals in the contention. This war at first, and for a long time after the treaty of Aix-la-Chapelle, was protracted with doubtful success; but at length the affairs of the English seemed to gain the ascendancy by the courage and conduct of Mr Clive. By his activity the province of Arcot was first cleared. Soon after, the French general was taken prisoner; and the nabob whom the English supported was re-instated in the government of which he had been formerly deprived. Upon this, the French sent over a commissary to Europe to restore peace. A convention between the two companies was accordingly concluded, importing, that the territories taken on either side since the conclusion of the last peace should be mutually restored; that the nabobs advanced by the influence of either party should be acknowledged by both; and that, for the future, neither should interfere in the differences that should arise between the princes of the country. This tranquillity, however, was of short duration. In a few months both sides renewed their opera-

tions, no longer under the name of auxiliaries, but as rivals in arms, government, and commerce. The most powerful prince in that country declared war against the British; and, levying a numerous army, laid siege to Calcutta, one of the principal British forts in that part of the world, but which was not in a condition to defend itself even from these barbarians. But, for a particular account of the miserable fate of this place, and the subsequent transactions there, see BENGAL, n^o 10, & seq.; and CALCUTTA.

Clive, having fully revenged the loss sustained at Calcutta, and made the power of the British irresistible over all the peninsula of India, the French ministry were greatly alarmed. To make some sort of opposition, a considerable body of forces was sent out under the command of general Lally; and for some time the affairs of France seemed to wear a better aspect from his conduct. He took Fort St David's; plundered the country of the king of Tanjour in alliance with the British; and then, entering the province of Arcot, prepared for laying siege to Madras; but in this enterprize he miscarried through the cowardice of his soldiers. These successes, however, were of short duration. The British troops, headed by colonel Coote a native of Ireland, marched against Lally, with a design to come to a decisive engagement. On his march, Coote took the city of Wandewash, and afterwards reduced the fortrefs of Carangoly. At length he came up with the French general, who had no thoughts of declining an engagement. In the morning early, the French advanced within three quarters of a mile of the British line; and the cannonading began with great fury on both sides. The engagement continued till two in the afternoon; when the French gave way and fled towards their camp; which they quickly after abandoned, leaving all their cannon and baggage to the victors.

The retaking the city of Arcot was the consequence of this victory; so that nothing now remained to the French, of all their Indian dominions, but the strong town of Pondicherry and some adjacent fortresses. Coote began with reducing the forts in its neighbourhood; after which, he sat down before the city. Lally held out to the last extremity, but was at length obliged to capitulate; and thus a final period was put to the power of France in the East Indies.

The British conquests in the western part of the world were about this time still more splendid than those in the east. But these successes must, partly at least, be ascribed to the vigorous administration of Mr William Pitt, who about this time came into power. An expedition was set on foot against Cape Breton, under general Amherst and admiral Boscawen; another, under general Abercrombie, against Crown Point and Ticonderago; and a third, under brigadier-general Forbes, against Fort du Quebec. The fortrefs of Louisburg, which defended the island of Cape Breton, was very strong both by nature and art; the garrison was numerous, the commander vigilant, and every precaution had been taken to prevent a landing. But the activity of the British surmounted every obstacle; the place was surrendered by capitulation, and its fortifications were demolished. The expedition against Fort du Quebec was equally successful; but that against Crown Point once more miscarried. General Abercrombie attacked the French in their entrenchments, was repulsed with

Britain. great slaughter, and obliged to retire to his camp at Lake George. But though in this respect the British arms were unsuccessful, yet, upon the whole, the campaign of 1758 was greatly in their favour. The taking of Fort du Quebec served to remove from their colonies the terror of the incursions of the Indians, while it interrupted the correspondence along a chain of forts with which the French had environed the British settlements in America, so that the succeeding campaign promised great success.

In 1759, it was resolved to attack the French in several parts of their empire at once. General Amherst with a body of 12,000 men was commanded to attack Crown Point; General Wolfe was to undertake the siege of Quebec; while general Prideaux and Sir William Johnson were to attempt a French fort near the cataracts of Niagara. This last expedition was the first that succeeded. The siege was begun with vigour, and promised an easy conquest; but general Prideaux was killed in the trenches by the bursting of a mortar, so that the whole command devolved on general Johnson. A body of French troops, sensible of the importance of the place, attempted to relieve it; but were utterly defeated and dispersed: soon after which, the garrison surrendered prisoners of war. On his arrival at the forts at Crown Point and Ticonderago, general Amherst found them deserted and destroyed. There now remained, therefore, but one decisive blow to reduce all North America under the British dominion; and this was by the taking of Quebec * the capital of Canada. This expedition was commanded by admiral Saunders and general Wolfe. The enterprise was attended with difficulties which appeared insurmountable; but all these difficulties were got over by the conduct of general Wolfe, and the bravery of his men. He engaged and put to flight the French under Montcalm; and to the great regret of the British, their general was killed in the action. The surrender of Quebec was the consequence of this victory, which was soon followed by the cession of all Canada. The following season, indeed, the French made a vigorous effort to recover the city; but by the resolution of governor Murray, and the appearance of a British fleet under the command of lord Colville, they were obliged to abandon the enterprise. The whole province was soon after reduced by the prudence and activity of general Amherst, who obliged the French army to capitulate, and it has since remained annexed to the British empire. About the same time also the island of Guadalupe was reduced by commodore More and general Hopson.

The British affairs in Germany had at the beginning of the war worn a very unfavourable aspect. The Hanoverians were commanded by the duke of Cumberland, who was greatly outnumbered by the enemy. He was driven beyond the Weser, the passage of which might have been disputed with some appearance of success; but the French were suffered to pass it unmolested. The Hanoverians were driven from one part of the country to another, till at length it made a stand near a village called *Hasenback*, where it was hoped the numbers of the enemy would have the least opportunity of coming to a general engagement. The Hanoverians, however, left the field of battle to the French, after a faint resistance. Their enemies pursued, and the duke retired towards Stade; by which means he

marched into a country from whence he could neither procure provisions, nor attack the enemy with any hopes of success. Here, being unable either to escape or advance, he was compelled to sign a capitulation by which the whole army laid down their arms, and were dispersed into different quarters of cantonment. By this remarkable capitulation, which was called the *capitulation of Closter Seven*, Hanover was obliged to submit quietly to the French, who were now determined to turn their arms against the king of Prussia.

Soon after this capitulation, both sides began to complain that the treaty was not strictly observed. The Hanoverians exclaimed against the rapacity of the French general, and the brutality of his soldiers. The French retorted the charge against them; accused them of insolence and infurrection; and, being sensible of their own superiority, resolved to bind them strictly to their terms of agreement. The Hanoverians only wanted a pretence to take arms, and a general to head them. Neither were long wanting. The oppressions of the tax-gatherers whom the French had appointed, were considered as so severe, that the army rose to vindicate the freedom of their country, while Ferdinand, prince of Brunfwick, put himself at their head. As soon as this was known in Britain, large supplies were granted both for the service of the king of Prussia, and to enable the Hanoverian army to act vigorously in conjunction with him. A small body of British forces was sent over to join prince Ferdinand under the duke of Marlborough. After some inconceivable successes at Crevelt, the duke of Marlborough dying, the command of the British forces devolved on lord George Sackville. A misunderstanding arose between him and prince Ferdinand, which appeared at the battle of Minden that was fought shortly after. Lord George pretended that he did not understand the orders sent him by the prince, and of consequence did not obey them. The allies gained the victory, which would have been more decisive had the British commander obeyed his orders. He was soon after recalled, tried by a court-martial, found guilty of disobedience, and declared incapable of serving in any military command for the future.

After this victory it was imagined, that one reinforcement more of British troops would terminate the war in favour of the allies; and that reinforcement was quickly sent. The British army in Germany was augmented to upwards of 30,000 men, and sanguine hopes of conquest were generally entertained. These hopes, however, were soon found to be ill founded. The allies were defeated at Corbach; but retrieved their honour at Exdorf. A victory at Warbourg followed shortly after, and another at Zierenberg: but then they suffered a defeat at Compen; after which, both sides retired into winter-quarters.

On the 25th of October 1760, happened the death of king George II. He had risen at his usual hour, and observed to his attendants, that as the weather was fine, he would take a walk into the gardens of Kensington, where he then resided. In a few minutes after his return, being left alone, he was heard to fall down upon the floor. The noise of this bringing his attendants into the room, they lifted him into bed; where he expired with a faint voice, that the princess Amelia might be sent for: but before she could reach

the apartment, he expired, in the 77th year of his age, and 33^d of his reign. An attempt was made to bleed him, but without effect; and afterwards the surgeons, upon opening him, discovered that the right ventricle of the heart was ruptured, and a great quantity of blood discharged through the aperture.

King George III. ascended the throne amidst the greatest successes both by sea and land. At this time, indeed, the efforts of Britain in every quarter of the globe were truly astonishing. The king of Prussia received a subsidy; a large body of English forces commanded the extensive peninsula of India; another army of 20,000 men confirmed their conquests in North America; 30,000 men were employed in Germany; and a great many more were dispersed in the different garrisons in different parts of the world: but all this was surpassed by the astonishing naval force, which carried command wherever it came, and had totally annihilated the French maritime power. The courage and conduct of the English admirals excelled every thing that had been heard of before; neither superior force nor number, nor even the terrors of the tempest, could intimidate them. Admiral Hawke gained a complete victory over an equal number of French ships, in Quiberon bay on the coast of Bretagne, in the middle of a tempest, during the darkness of night, and, what a seaman fears still more, in the neighbourhood of a rocky shore.

As soon as his present majesty had met with his parliament, which was on November 18th 1760, he confirmed the hopes of his allies, and gave assurances of his intentions to prosecute the war with vigour. By this time, however, the people were in some measure weary with conquests; especially with those in Germany, from which they could never hope for any solid advantage, and which were gained at an immense expence to the nation. Disputes concerning the propriety of the German war were carried on, and the general run of popular opinion seemed to be rather against than for it. For some time, however, no change took place in the method of carrying on the war. In 1761, proposals of peace were made between the belligerent powers of Europe; and for this purpose Mr Stanley was sent to Paris, and Mr Bussy to London: but the French, desirous to draw Spain into a confederacy with them, seem not to have been sincere in their intentions; and thus the treaty came to nothing. An enterprize was projected against the island of Belleisle, near the coast of France, which was conducted by commodore Keppel and general Hodgson †. The place was conquered, with the loss of 1800 men killed and wounded on the part of the British; and however unimportant this conquest might be, the rejoicings on account of it were great. In Germany the campaign was unsuccessful on the part of the allies. At first, indeed, they drove the French quite out of the territory of Hesse, and laid siege to the city of Cassel; but being defeated at Stangerode, they were forced to raise the siege, retire behind the Dymel, and again abandon Hesse to their enemies. Here they were followed and attacked by the French; who, though defeated in that attempt, were with difficulty prevented from making themselves masters of Munster and Brunswick.

All this time an appearance of negotiation had been carried on; but at last the French having brought their designs with the court of Spain to a bearing, Mr

Bussy delivered to Mr Pitt a private memorial, signifying, that, in order to establish the peace on a lasting foundation, the king of Spain might be induced to guaranty the treaty; and to prevent the differences which then subsisted between Britain and Spain from producing a fresh war in Europe, he proposed, that in this negotiation, the three points which had been disputed between the crowns of England and Spain might be finally settled. First, the restitution of some captures made upon the Spanish flag. Secondly, the privilege of the Spanish nation to fish upon the banks of Newfoundland. Thirdly, the demolition of the English settlements made in the bay of Honduras. This memorial was returned as wholly inadmissible. Mr Pitt declared, that it would be looked upon as an affront to the dignity of his master, and incompatible with the sincerity of the negotiation, to make any further mention of such a circumstance.

Mr Pitt, being now thoroughly convinced of the sinister designs of Spain, proposed immediately to declare war against that kingdom. But this proposal being rejected, he immediately resigned his employment of secretary of state; after which, he was created earl of Chatham, and had a pension of 3000*l.* per annum settled upon him for three lives.

Soon after this, however, the new administration found that Mr Pitt was in the right, and war was declared between Great Britain and Spain. As Portugal was an useful ally of Britain, it was resolved by the French and Spaniards to attack that kingdom, which was then in no capacity of defending itself. The Portuguese monarch was by the most haughty memorials commanded to accede to the confederacy against Britain, and threatened with the vengeance of France and Spain in case of a refusal. It was in vain that he promised to observe a strict neutrality, and urged the obligations he was under to the king of Britain; this moderate and reasonable reply only drew on more haughty and insulting answers. His Portuguese majesty, however, continued to reject their proposals in the most resolute manner; and concluded his last declaration with these words, that "it would affect him less, though reduced to the last extremity of which the great Judge is the sole arbiter, to let the last tile of his palace fall, and to see his faithful subjects spill the last drop of their blood, than to sacrifice, together with the honour of his crown, all that Portugal holds most dear, and to submit, by such extraordinary means, to become an unheard of example to all pacific powers, who will no longer be able to enjoy the benefit of neutrality, whenever a war shall be kindled between other powers with which the former are connected by defensive treaties." This declaration was made on the 27th of April 1762; and soon after, France and Spain jointly declared war against Portugal.

As the design of the courts of France and Spain in making war with Portugal, was professedly to prevent Great Britain from the military and commercial use of the ports of that kingdom, their principal endeavours were aimed at the two great ports where the British used to reside, *viz.* Oporto and Lisbon. With this view, three inroads were to be made; one to the north; another more to the south; while the third was made in the middle provinces, in order to sustain these two bodies, and preserve a communication between them.

Britain.

The first body of troops was commanded by the marquis of Savria; and entered the north-east angle of Portugal, marching towards Miranda. This town might possibly have retarded their progress, had not a powder-magazine been blown up by accident; and the Spaniards entered on the ninth of May by the breaches made by this explosion. From thence they marched to Braganza, which surrendered six days after Miranda. Moncorvo was taken in like manner; every thing was clear before them to the banks of the Douro; and they became masters of almost the whole extensive province of Traloz Montes. Oporto was given up for lost, and the British admiralty prepared transports to carry off the effects of the British merchants. On the banks of the Douro, however, the career of this body was stopped. The peasants, animated, and guided by some British officers, seized a difficult pass, and drove the enemy back to Moncorvo.

The second body of Spaniards entered the province of Beira, at the villages called *Val de Mula* and *Val de Coelha*. They were joined by strong detachments amounting to almost the whole army in Traloz Montes; and immediately laid siege to Almeida, the strongest and best provided place on the frontiers of Portugal. This place was defended with sufficient resolution; but, like the rest, was obliged to surrender on the 25th of August. The Spaniards then over-ran the whole territory of Castel Branco, a principal district of the province of Beira, making their way southward until they approached the banks of the Tagus. During the whole of their progress, and indeed during the whole of the campaign, the allied troops of Great Britain and Portugal had nothing that could be called an army in the field, and they could not think of opposing the enemy in a pitched battle. All that could be done was by the defence of passes, skirmish, and surprise.

By this time the count of la Lippe Buckeburg had arrived in Portugal, to the inexpressible joy of the whole nation. The third Spanish army had assembled on the frontiers of Estremadura, with a design to invade the province of Alentejo; and had this body of troops been joined to the others, they would probably, in spite of all opposition, have forced their way to Lisbon itself; had it acted separately, it might have greatly distracted the defendants, so as to enable some other body of forces to penetrate to that city. The count, therefore, resolved to prevent their entrance into the kingdom; and with this view dispatched brigadier-general Burgoyne to attack an advanced body of Spaniards which lay on their frontiers, in a town called *Valentia de Alcantara*. On the 27th of August, the town was surprised; the general was taken who intended to have commanded in the invasion, together with one colonel, two captains, and 17 subaltern officers. One of the best regiments in the Spanish service was also entirely destroyed; and thus the enemy were in all probability prevented from entering Alentejo.

That part of the Spanish army which acted in the territory of Castel Branco had made themselves masters of several important passes, which they obliged some bodies of Portuguese to abandon. The combined army of British and Portuguese pretended to retire before them, in order to draw them into the mountainous tracts. They attacked the rear of the allies, but were

repulsed with loss. Still, however, they continued masters of the country, and nothing remained but the passage of the Tagus to enable them to take up their quarters in the province of Alentejo. This the count designed to prevent; and in this service general Burgoyne was employed, who formed a design of surprising them. The execution was committed to colonel Lee, who, in the night of October 6th, fell upon their rear, dispersed the whole body with considerable slaughter, destroyed their magazines, and returned with scarce any loss. The season was now far advanced; immense quantities of raiment fell; the roads were destroyed; and the Spaniards, having seized no advanced posts where they could maintain themselves, and being unprovided with magazines for the support of their horse, every where fell back to the frontiers of Spain.

No less successful were the British arms in America, and the East Indies. From the French were taken the islands of Martinico, St Lucia, St Vincent, and Granada; from the Spaniards, the strong fortresses called *Havannah*, in the island of Cuba. By the acquisition of the first mentioned islands, the British became the sole and undisturbed possessors of all the Carribees, and held that chain of innumerable islands which forms an immense bow, extending from the eastern point of Hispaniola almost to the continent of South America. The conquest of the Havannah cost a number of brave men; more of whom were destroyed by the climate than the enemy*. It was in this place that the fleets from the several parts of the Spanish West Indies, called the *galleons* and *flota*, assembled, before they finally set out on their voyage for Europe. The acquisition of this place, therefore, united in itself all the advantages which can be acquired in war. It was a military advantage of the highest class; it was equal to the greatest naval victory, by its effect on the enemy's marine; and in the plunder it equalled the produce of a national subsidy. Nine of the enemy's men of war, with four frigates, were taken; three of their capital ships had been sunk in the harbour at the beginning of the siege; two more were on the stocks in great forwardness, and these were destroyed. In money and valuable merchandizes, the plunder did not fall short of 3,000,000 l. sterling. To this success in the western part of the world may be added the capture of the Spanish register-ship called the *Hermione*, by the Antigua privateer. This happened on the 21st of May 1762, just as she was entering one of the ports of Old Spain, and the prize was little short of 1,000,000 l. sterling.

In the East Indies an expedition was undertaken against the Philippine islands, which was committed to colonel Draper, who arrived for this purpose at Madras, in the latter end of June 1762. The 79th regiment was the only regular corps that could be spared for this service. Every thing was conducted with the greatest celerity and judgment. The British forces landed on Manila on the 24th of September; on the 6th of October the governor was obliged to surrender at discretion; and soon after, the galleon bound from Manila to Acapulco, laden with rich merchandise, to the value of more than half a million, was taken by two frigates called the *Argo* and *Panther*. By the conquest of Manila, 14 considerable islands fell into the hands of the British; which from their extent, fertility, and

Britain.

convenience of commerce, furnished the materials of a great kingdom. By this acquisition, joined to our former successes, we secured all the avenues of the Spanish trade, and interrupted all communications between the parts of their vast but unconnected empire. The conquest of the Havannah had cut off, in a great measure, the intercourse of their wealthy continental colonies with Europe: the reduction of the Philippines excluded them from Asia: and the plunder taken was far more than sufficient to indemnify the charges of the expedition; a circumstance not very common in modern wars. It amounted to upwards of a million and a half; of which the East India company, on whom the charge of the enterprise in a great measure lay, were by contract to have a third part.

All this time the war in Germany had continued with the utmost violence; the allies under prince Ferdinand had continued to give the highest proofs of their valour, but no decisive advantage could be obtained against the French. It was, however, no longer the interest of Britain to continue a destructive war. There never had been a period so fortunate or glorious to this island. In the course of this war she had conquered a tract of continent of immense extent. Her American territory approached to the borders of Asia, and came near to the frontiers of the Russian and Chinese dominions. She had conquered 25 islands, all of them distinguishable for their magnitude, their riches, or the importance of their situation. By sea or land she had gained 12 battles, had reduced 9 fortified cities, and near 40 castles and forts. She had taken or destroyed above 100 ships of war from her enemies, and acquired at least 10,000,000 l. in plunder.

By such unexampled and wide extended conquests, it is no wonder that the French and Spaniards were desirous of a peace; which was at length concluded at Paris on the 10th of February 1763. The terms granted them were by many thought too favourable. The principal of them were, That the French king should relinquish all claims to Nova Scotia: that he should likewise give up all the country of Canada; and that for the future the boundary betwixt the British and French dominions in America should be fixed by a line drawn along the middle of the river Mississippi from its source to the river Iberville, and from thence drawn by a line along the middle of this river, and the lakes Maurepas and Pontchartrain, to the sea. The islands of St Pierre, Miquelon, Martinico, Guadaloupe, Marigalante, Desfrade, St Lucia, and Belleisle, were restored to France: Minorca, Granada, and the Grenadines, St Vincent, Dominica, and Tobago, were ceded to Britain. In Africa, the island of Goree was restored to France; and the river Senegal, with all its forts and dependencies, ceded to Great Britain. In the East Indies, all the forts and factories taken from the French were restored. In Europe, the fortifications of Dunkirk were to be destroyed; and all the countries, fortresses, &c. belonging to the electorate of Hanover, the duke of Brunswic, and the count of La Lippe Buckeburg, restored. With regard to Spain, the British fortifications on the bay of Honduras were to be demolished; and the Spaniards were to desist from their claim of a right to fish on the Newfoundland bank. The Havannah was restored; in consequence of which, Florida, St Augustine, and the bay of Pensacola, were ceded to Britain,

and the Spaniards were to make peace with Portugal: all other countries not particularly mentioned were to be restored to their respective owners at the beginning of the war.

NEW BRITAIN, a large country of North America, called also *Terra Labrador*, has Hudson's bay and strait, on the north and west; Canada and the river St Lawrence, on the south; and the Atlantic ocean, on the east. It is subject to Great Britain, but yields only skins and furs. The following is the best description of this country that hath yet appeared. It was drawn up by the commander of the Otter sloop, and communicated to the royal society by the honourable Daines Barrington in 1774.

"There is no part of the British dominions so little known as the immense country of Labrador. So few have visited the northern parts of this vast country, that almost from the straits of Belleisle until you come to the entrance of Hudson's bay, for more than ten degrees of latitude, no chart which can give any tolerable idea of the coast hath been hitherto formed. The barrenness of the country explains why it has been so seldom frequented. Here avarice has but little to feed on.

"Perhaps without an immoderate share of vanity, I may venture to presume, that as far as I have been, which is to the latitude of 59. 10. the draught which I have been able to form is by much the best of any that has hitherto been made.

"Others have gone before me blest with abilities superior to mine, and to whom I hope to be thought equal only in assiduity. But I had advantages of which they were destitute: with a small vessel, and having an Indian with me, who knew every rock and shoal upon the coast, I was enabled to be accurate in my observations; and these are the reasons why I deem my own sketch preferable to all others.

"As this country is one of the most barren in the whole world, so its sea-coast is the most remarkable. Bordered by innumerable islands, and many of them being a considerable distance from the main land, a ship of burden would sail a great way along the coast without being able to form any notion of its true situation.

"Hence it is that all charts of it have been so extremely erroneous; and hence arose those opinions that some of the inlets extended a vast distance into the country, if not quite into the sea of Hudson's bay.

"Davis's inlet, which has been so much talked of, is not 20 leagues from the entrance of it to its extremity.

"The navigation here is extremely hazardous. Towards the land, the sea is covered with large bodies and broken pieces of ice; and the farther you go northward, the greater is the quantity you meet with.

"Some of those masses, which the seamen call *islands of ice*, are of a prodigious magnitude; and they are generally supposed to swim two thirds under water. You will frequently see them more than 100 feet above the surface; and to ships in a storm, or in thick weather, nothing can be more terrible.

"Those prodigious pieces of ice come from the north, and are supposed to be formed by the freezing of cataracts upon the lands about East Greenland and the pole. As soon as the severity of the winter begins to abate, their immense weight breaks them from the shore, and they are driven to the southward. To the
miserable

miserable inhabitants of Labradore their appearance upon the coast serves as a token of the approach of summer.

" This vast tract of land is extremely barren, and altogether incapable of cultivation. The surface is every where uneven and covered with large stones, some of which are of amazing dimensions. There are few springs; yet throughout the country there are prodigious chains of lakes or ponds, which are produced by the rains and the melting of the snow. These ponds abound in trout, but they are very small.

" There is no such thing as level land. It is a country formed of frightful mountains, and unfruitful valleys. The mountains are almost devoid of every sort of herbage. A blighted shrub and a little moss is sometimes to be seen upon them, but in general the bare rock is all you behold. The valleys are full of crooked low trees, such as the different pines, spruce, birch, and a species of cedar. Up some of the deep bays, and not far from the water, it is said, however, there are a few flocks of no inconsiderable size. In a word, the whole country is nothing more than a prodigious heap of barren rocks.

" The climate is extremely rigorous. There is but little appearance of summer before the middle of July; and in September the approach of winter is very evident. It has been remarked, that the winters within these few years have been less severe than they have been known heretofore. The cause of such an alteration it would be difficult to discover.

" All along the coast there are many rivers that empty themselves into the sea, yet there are but few of any consideration; and you must not imagine that the largest are any thing like what is generally understood by a river. Custom has taught us to give them this appellation; but the greatest part of them are nothing more than broad brooks or rivulets. As they are only drains from the ponds, in dry weather they are every where fordable; for, running upon a solid rock, they become broad without having a bed of any depth below the surface of the banks.

" The superficial appearance of this country is extremely unfavourable. What may be hidden in its bowels, we cannot pretend to suggest: probably it may produce some copper; the rocks in many places are impregnated with an ore of that resemblance. Something of a horny substance which is extremely transparent, and which will scale out into a multitude of small sheets, is often found amidst the stones; there are both black and white of this sort, but the black is the most rare. It has been tried in fire, but seems to be noways affected by heat.

" The species of wood here are not very various: excepting a few shrubs which have as yet received no name from the Europeans, the principal produce of the country is the different sorts of spruce and pine. Of these, even in the more southern parts, there is not abundance; as you advance northwards they gradually diminish; and by the time you arrive at the 60th degree of latitude, the eye is not delighted with any sort of herbage. Here the wretched residents build their miserable habitations with the bones of whales. If ever they cheer their aching limbs with a fire, they gather a few sticks from the sea shore, which have probably been washed from Norway or Lapland. Here a vast quan-

ty of snow remains upon the land throughout the year.

" Although the winter here is so excessively rigid, in summer the heat is sometimes disagreeable; and in that season the weather is very moderate, and remarkably serene. It is but seldom foggy, speaking comparatively, between this and Newfoundland; nor are you so frequently liable to those destructive gales of wind which visit many other parts of the globe.

" It is in general high land, and sometimes you meet with mountains of an astonishing height; you are also frequently presented with prospects that are really awful, and extremely romantic.

" The inhabitants of New Britain are called *Eskimaux*; for a particular account of whom, see the article *ESKIMAUX*.

BRITANNICA, in botany, the trivial name of the rumex aquaticus. See *RUMEX*.

BRITANNICUS, son to the emperor Claudius by Messalina, was excluded from the empire after his father had married Agrippina; who put her son Nero on the throne, and caused Britannicus to be poisoned, A. D. 55.

BRITANNICUS, an Italian, one of the best humanists of the 15th century, was born at Brescia. He published notes on Persius, Juvenal, Terence, Statius, and Ovid. He died in 1510.

BRITE, or **BRIGHT**, in husbandry. Wheat, barley, or any other grain, is said to *brize*, when it grows over ripe and shatters.

BRITTANY, or **BRETAGNE**, a considerable province of France, which is 150 miles in length, and 112 in breadth. It is a peninsula, surrounded on all sides by the ocean, except on the east where it joins to Anjou, Maine, Normandy, and Poitou. It is divided into the upper and lower; and therein are large forests. It carries on a great trade, by reason of the many harbours on its coasts. It was united to the crown of France in 1532. Rennes is the capital town.

BRITTLENESS, that quality of bodies on account of which they are denominated *brittle*, or which subjects them to be easily broken by pressure or percussion.

Brittle bodies are extremely hard; a very small percussion exerts a force on them equivalent to the greatest pressure, and thus may easily break them. This effect is particularly remarkable in glass suddenly cooled, the brittleness of which is thereby much increased. Tin, though in itself tough, gives a brittleness to all the other metals when mixed therewith. The brittleness of glass has been said to arise from the heterogeneity of the parts whereof it is composed, as salt and sand can never bind sufficiently together: but this cannot be the case; for the pure calces of metals, or any other simple substances when vitrified, become brittle also. In timbers, brittleness seems to be connected with durability; the more brittle any sort of wood is, the more durable it is found. Thus oak is of very long duration; while beech and birch, as being tough, presently rot, and are of little service in building.

BRITTON (Thomas), the famous musical small-coal-man, was born at Higham Ferrers in Northamptonshire. He served his time in London, where he set up in a stable, next door to the little gate of St John of Jerusalem, on Clerkenwell-green, which he converted into a house. Here, getting acquainted with Dr Ga-

Britton.

renciers his near neighbour, he became an excellent chemist, constructing a moveable laboratory which was much admired by all who saw it. His skill in music was noways inferior to that in chemistry, either in the theory or practice: he had for many years a well frequented musical club, meeting at his own little cell; and was as well respected as known by persons of the first quality; being, above all, a valuable man in his moral character. In Ward's account of clubs, we are told, that "Britton's was first begun, or at least confirmed, by Sir Roger L'Estrange, a very musical gentleman; and that the attachment of Sir Roger and other ingenious gentlemen, lovers of the muses, to Britton, arose from the profound regard he had in general to all manner of literature." It is observable, that this meeting was the first of the kind, and the undoubted parent of some of the most celebrated concerts in London. Ward, who was his cotemporary, says, that at the first institution of it, his concert was performed in his own house, which is thus described. "On the ground floor was a repository for small-coal: over that was the concert room, which was very long and narrow; and had a ceiling so low, that a tall man could but just stand upright in it. The stairs to this room were on the outside of the house, and could scarce be ascended without crawling. The house itself was very old and low built, and in every respect so mean as to be a fit habitation only for a very poor man." Notwithstanding all, this mansion, despicable as it may seem, attracted to it as polite an audience as ever the opera did.

At these concerts Dr Pepusch, Mr Handel, Mr Bannister, Mr Henry Neweller, and other capital masters, were performers. At the first institution of this club, it is certain, Britton would receive no gratuity whatever from his guests, and was offended whenever any was offered him. According to some, however, he departed from this; and the rules were, Britton found the instruments, the subscription was 10*s.* a year, and they had coffee at a penny a dish.

The singularity of his character, the course of his studies, and the collections he made, induced suspicions that Britton was not the man he seemed to be. Among other groundless conjectures, his musical assembly was thought by some to be only a cover for seditious meetings; by others, for magical purposes; and Britton himself was taken for an atheist, a presbyterian, a Jesuit, &c.

The circumstances of this man's death are not less remarkable than those of his life. There lived at that time one Samuel Honeyman, a blacksmith by trade, who became very famous for a faculty which he possessed of speaking as if his voice proceeded from some distant part of the house where he stood; in short, he was one of those men called *Ventriloqui**, i. e. those that speak from their bellies. One Robe, an acquaintance of Britton's, was foolish enough to introduce this man, unknown, to Britton, for the sole purpose of terrifying him; and he succeeded in it. Honeyman, without moving his lips, or seeming to speak, announced, as from afar off, the death of Britton within a few hours, with an intimation that the only way to avert his doom was for him to fall on his knees immediately and say the Lord's prayer: the poor man did as he was bid, went home and took to his bed, and in a few days died, leaving his friend Mr Robe to enjoy the fruits of his mirth. This happened in September 1714. Brit-

ton left behind him a large collection of books, music, and musical instruments. Of the former Sir Hans Sloane was a considerable purchaser. His collection of music, mostly picked by himself, and very neatly, fold for near 100*l.*

In the British Museum there is a painting of him taken from the life. A mezzotint print was taken from this picture, for which Mr Hughes (author of the siege of Damascus, and a frequent performer at Britton's concerts) wrote the following lines.

Tho' mean thy rank, yet in thy humble cell
Did gentle peace and arts unpurchas'd dwell;
Well pleas'd, Apollo thither led his train,
And music warbled in her sweetest strain.
Cyllenius so, as fables tell, and Iove,
Came willing guests to poor Philemon's grove.
Let useless pomp behold, and blush to find
So low a station, such a liberal mind.

BRIVA ISARÆ, (anc. geog.), a town of Gallia Belgica on the river Isara or Oyle; now *Pontoyfe*.

BRIVATES, (anc. geog.), a port of Gallia Celtica; now *Brest*, in Brittany.

BRIVES-IA-GALLARD, a town of France, in lower Limosin. It stands in a fruitful plain, opposite to an island formed by the river Coreze, over which there are two handsome bridges. E. Long. 1. 45. N. Lat. 45. 15.

BRIXELLUM, (anc. geog.), a town of Gallia Cispadana; remarkable for being the place where Otho killed himself after the battle of Bedriacum: now *Bersello*, or *Bresello*, in the territory of Rhegio.

BRIXEN (the bishopric of), is seated in Tirol, in Germany, near the frontiers of Friuli and Carinthia, towards the east. The bishop has a vote and seat in the diet of the empire, and furnishes his contingent when any tax is laid on Tirol. The principal places are Brixen, Sertzingen, Breunack, and Lientz.

BRIXEN, the capital of the bishopric of the same name, and where the bishop commonly resides, is seated on the river Eisache, at some distance from the mountain Brenner. It is surrounded with mountains, where there are plenty of vineyards, which yield good red wine. It is a populous town; and the houses are well built with piazzas, and are painted on the outside. The public buildings are very handsome, and there are several spacious squares. It is much frequented, on account of the mineral waters that are near it. E. Long. 11. 50. N. Lat. 46. 35.

BRIXIA (anc. geog.), a town of the Cenomani in the Regio Transpadana: now *Brescia*, capital of the Bresciano.

BRIZA, **QUAKING-GRASS**; a genus of the digynia order, belonging to the triandria class of plants. There are five species of briza; two of which are natives of Britain, viz. the media or middle quaking-grass, and the minor or small quaking-grass. They grow in pasture grounds.

BRIZE, in husbandry, denotes ground that has lain long untilled.

BRIZE-Vents, shelters used by gardeners who have not walls on the north-side, to keep cold winds from damaging their beds of melons. They are inclosures about six or seven feet high, and an inch or more thick; and made of straw, supported by stakes fixed into the ground, and props across on both inside and outside; and fastened together with willow-twigs, or iron-wire.

BROÄCH, **BROCHA** (from the French *broche*), de-

notes

* See *Ventriloquism*.

Broadalbin
Brocade.

Brocade.

notes an awl or bodkin; also a large packing-needle. A spit, in some parts of England, is called a *broach*; and from this word comes to pierce or broach a barrel. In Scotland, *broach, broche, or broche*, is the name of an utensil which the Highlanders use, like the *fibula* of the Romans, to fasten their vest. They are usually made of silver; of a round figure; with a tongue crossing its diameter, to fasten the folds of the garment; sometimes with two tongues, one on each side of a cross-bar in the middle. There are preserved in several families, ancient broches of very elegant workmanship, and richly ornamented. Some of them are inscribed with names, to which particular virtues used to be attributed; others are furnished with receptacles for relics, supposed to preserve from harm. So that these broches seem to have been wore not only for use, but as amulets. One or two of this sort are figured and described by Mr Pennant, *Tour in Scotl.* i. go. iii. 14. edit. 3^d.

BROADALBIN. See **BRADALBIN.**

BROADSIDE, in the sea-language, denotes a volley of cannon, or a general discharge of all the guns on one side of a ship at once.

BROCADE, or **BROCANO,** a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the merchants or manufacturers.

Formerly the word signified only a stuff, wove all of gold, both in the warp and in the woof, or all of silver, or of both mixed together; thence it passed to those of stuffs in which there was silk mixed, to raise and terminate the gold or silver flowers: but at present all stuffs, even those of silk alone, whether they be programs of Tours or of Naples, satins, and even taffeties or lustrings, if they be but adorned and worked with some flowers or other figures, are called *brocades*.

In manufacturing brocades, the flattened gilt wire is spun on threads of yellow silk approaching as near as may be to the colour of gold itself. The wire, winding off from a hobbin, twists about the thread as it spins round; and, by means of curious machinery, too complex to be described here, a number of threads are thus twisted at once by the turning of one wheel. The principal art consists in so regulating the motion, that the several circumvolutions of the flattened wire on each side may just touch one another, and form, as it were, one continued covering. It is said, that at Milan there is made a sort of flattened wire gilt only on one side, which is wound upon the thread so that only the gilt side appears; and that the preparation of this wire is kept a secret, and has been attempted in other places with little success. There is also a gilt copper wire, made in the same manner as the gilt silver: Savary observes, that this kind of wire, called *saufe gold*, is prepared chiefly at Nuremberg; and that the ordinances of France require it to be spun, for its distinction from the gilt silver, on flaxen or hempen threads. One of our writers takes notice, that the Chinese, instead of flattened gilt wire, use slips of gilt paper, which they both interweave in their stuffs, and twist upon silk threads: this practice he inconsiderately proposes as a hint to the British weaver. But, whatever be the pretended beauty of stuffs of this kind of manufacture, it is obvious that they must want durability. The Chinese themselves, according to Du Halde's account, sensible of this im-

perfection, scarcely use them any otherwise than in tapestries, and such other ornaments as are not intended to be much worn, or exposed to moisture.

The Venetians have carried on a large trade to the Levant, in a kind of brocade called *damaquette*, which, though it has only about half the quantity of gold or silver as that made among us, looks far more beautiful. The flattened wire is neither wound close together on the silk threads, nor the threads struck close in the weaving; yet, by passing the stuff betwixt rolls, the disposition and management of which is kept a secret, the tissue or flower is made to appear one entire brilliant plate of gold or silver. The French ministry, ever vigilant for the advancement of arts and commerce, judged this manufacture important enough to deserve their attention; and accordingly, for contivuing the machinery, they engaged the ingenious M. Vaucanson, known throughout Europe for his curious pieces of mechanism, who, in the memoirs of the academy for the year 1757, lately printed, gives an account of his success, and of the establishment of such a manufacture at Lyons.

The lower roll is made of wood, 32 inches in length and 14 in diameter; the upper one of copper, 36 inches long and 8 in diameter: this last is hollow, and open at one end, for introducing iron heaters. For making the rolls cylindrical, he has a particular kind of lathe, wherein the cutting tool, which the most dextrous hand could not guide in a straight line through such a length as 36 inches, is made to slide, by means of a screw, on two large steel rulers, perfectly straight, and capable of being moved at pleasure, nearer, and always exactly parallel, to the axis of the roll.

He first disposed the rolls nearly as in the common flattening mill. In this disposition, ten men were scarcely sufficient for turning them with force enough to duly extend the gilding; and the collars, in which the axes of the rolls turned at each end, wore or galled so fast, that the pressure continually diminished, insofmuch that a piece of stuff of ten ells had the gilding sensibly less extended on the last part than on the first. He endeavoured to obviate this inconvenience by screwing the rolls closer and closer in proportion as the stuff passed thro', or as the wearing of the collars occasioned more play between them; but this method produced an imperfection in the stuff, every turn of the screw making a sensible bar across it. To lessen the attrition, each end of the axis, instead of a collar, was made to turn between three iron cylinders called *friction-wheels*: but even this did not answer fully, for now another source of unequal pressure was discovered. The wooden roll, being compressible, had its diameter sensibly diminished: it likewise lost its roundness, so that the pressure varied in different points of its revolution. On trying different kinds both of European and Indian woods, all the hard ones split, the soft ones warped without splitting, and, of more than 20 rolls, there was not one which continued round for 24 hours even without being worked in the machine.

These failures put him upon contriving another method of pressing the rolls together, so that the force should always accommodate itself to whatever inequalities might happen. The axis of the copper roll being made to turn between friction-wheels as before, that of the wooden one is pressed upwards by a lever at each

Lewis's
Commerce of
Asia.

end furnished with a half collar for receiving the end of the axis. Each lever has the end of its short arm supported on the frame of the machine, and the long arm is drawn upwards by an iron rod communicating with the end of the short arm of another lever placed horizontally: to the long arm of this lever is hung a weight, and the levers are so proportioned, that a weight of 30 pounds presses the rolls together with a force equivalent to 17,536 pounds, which was found to be the proper force for the sufficient extension of the gilding. By this contrivance four men can turn the rolls with more ease than ten can turn those which are kept together by screws; and the same weight acting uniformly in every part, the pressure continues always equal, though the wooden roll should even become oval, and though the stuff be of unequal thickness.

A piece of cloth, of about two ells, is sewed to the beginning and end of the stuff, to keep it out to its width when it enters and parts from the rolls, which could not be done by the hands for fear of burning or bruising them: as it would take too much time to sew these cloths to every small piece of an ell or two, a number of these is sewed together. The stuff is rolled upon a cylinder, which is placed behind the machine, and its axis pressed down by springs to keep the stuff tight as it comes off. Four iron bars, made red hot, are introduced into the copper roll, which in half an hour acquires the proper degree of heat, or nearly such a one as is used for the ironing of linen: the wooden roll is then laid in its place, and the machine set to work. If more than 30 ells are to be passed at once, the wooden roll must be changed for another, for it will not bear a long continuance of the heat without danger of splitting; and therefore the manufacturer should be provided with several of these rolls, that when one is removed, another may be ready to supply its room: as soon as taken off from the machine, it should be wrapt in a cloth and laid in a moist place.

The principal inconvenience attending the use of this machine, is, that the heat necessary for extending the gilding, though it improves the brightness of white and yellow silks, is injurious to some colours, as crimson and green. A double pressure will not supply the place of heat; and the only method of preventing this injury, or rendering it as slight as possible, appeared to be, to pass the stuff through with great celerity.

Method of Cleaning BROCADE when sullied. For this purpose neither alkalies nor soap must be used; because the former, while they clean the gold, corrode the silk, and change or discharge its colour; and the latter also alters the shade, and even the species, of certain colours. But spirit of wine may be used without any danger of its injuring either the colour or quality of the subject; and in many cases proves as effectual for restoring the lustre of the gold, as the most corrosive detergents. A rich brocade, flowered with a variety of colours, after being disagreeably tarnished, had the lustre of the gold perfectly restored by washing it with a soft brush dipped in warm spirit of wine, and some of the colours of the silk which were likewise soiled became at the same time remarkably bright and lively. Spirit of wine seems to be the only material adapted to this intention, and probably the boasted secret of certain artificers is no other than this spirit disguised. Dr Lewis says he does not know

of any other that is of sufficient activity to discharge

the foul matter, without being hurtful to the silk. As to powders, however fine, and however cautiously used, they scratch and wear the gold, which here is only superficial, and of extreme tenacity.

BROCADE-Shell, the English name of a species of LIMAX.

BROCATEL, or **BROCADEL**, a kind of coarse brocade; chiefly used for tapetery.

BROCCOLI, a kind of cabbage cultivated for the use of the table. See BRASSICA.

BROCHE, or **BROACH**. See BROACH.

BROCK, among sportsmen, a term used to denote a badger.—A hart, too, of the third year, is called a *brock*, or *brocket*; and a hind of the same year is called a *brocket's sister*.

BROD, a town of Hungary, in the county of Poffega in Slavonia, seated on the river Save. It was once more considerable than at present; and is memorable for a victory obtained over the Turks in 1668. E. Long. 18. 36. N. Lat. 45. 20.

BRODEAU (John), in Latin *Brodeus*, a great critic, on whom Lyppius, Scaliger, Grotius, and all the learned, have bestowed great encomiums, was descended from a noble family in France, and born at Tours in 1500. He was liberally educated, and placed under Alciat to study the civil law; but soon forsaking that, he gave himself up wholly to languages and the belles lettres. He travelled into Italy, where he became acquainted with Sadoleto, Bembo, and other famous wits; and here (says Thuanus) he applied himself to the study of mathematics, philosophy, and the sacred languages, in which he made no small proficiency. Then, returning to his own country, he led a retired, but not an idle, life, as his many learned lucubrations abundantly testify. He was a man free from all ambition and vain glory, and suffered his works to be published rather under the sanction and authority of others than under his own. His chief works are, 1. A commentary on the *Anthologia*. 2. Ten books of miscellanies. 3. Notes on Oppian, Euripides, &c. He died in 1563, aged 63.

BRODERA, or **BRODRA**, a town of Asia, in the empire of the Great Mogul. It stands in a large sandy plain, on the little river Wastet; and is fortified, after the old way, with pretty good walls and towers. It is inhabited by Banians and callico-weavers. The country about it produces plenty of gum-lac and indigo. E. Long. 72. 30. N. Lat. 22. 10.

BROGLING FOR BELLS, the same with SNIGGLING.

BROGLIO, a town of Piedmont in Italy, and capital of a county of the same name, situated near the frontiers of Provence, in E. Long. 6. 42. N. Lat. 44. 12.

BROKE (Sir Robert), lord chief justice of the common pleas, was the son of Thomas Broke, Esq; of Claverley in Shropshire, and educated at Oxford; from whence he removed to the Middle Temple, and soon became a very eminent lawyer. In the year 1542, he was chosen sumner reader, and double reader in 1550. In 1552, he was made serjeant at law; and the year following (first of queen Mary), lord chief justice of the common pleas; about which time he received the honour of knighthood. Stow says he was recorder of London and speaker of the house of commons; which is confirmed by a manuscript in the Ashmolean library. He died and was buried at Claverley in Shropshire, the place

Broken,
Broker.

place of his nativity, in 1558. Wood gives him the character of a great lawyer and an upright judge. His works are, 1. An abridgement containing an abstract of the year-books till the time of queen Mary. 2. Certain cases adjudged in the reign of Henry VIII. Edward VI. and queen Mary. 3. Reading on the statute of limitations, 32 Hen. VIII. c. 2.

BROKEN WIND, among farriers. See FARRIERY, § 7.

BROKER, a name given to persons of several and very different professions; the chief of which are exchange-brokers, stock-brokers, pawn-brokers, and brokers simply so called who sell household-furniture and second-hand apparel.

Exchange-BROKERS, are a kind of agents, or negotiators, who contrive, propose, and conclude bargains between merchants, and between merchants and tradesmen, in matters of bills of exchange, or merchandise, for which they have so much commission. These, by the statute of 8 and 9 William III. are to be licenced in London by the lord mayor, who gives them an oath, and takes bond for the faithful execution of their offices.

If any person shall act as broker without being thus licenced and admitted, he shall forfeit the sum of 500l.; and persons employing him, 5l.; and brokers are to register contracts, &c. under the like penalty: also brokers shall not deal for themselves, on pain of forfeiting 200l. They are to carry about with them a silver medal, having the king's arms and the arms of the city, and pay 40s. a-year to the chamber of the city.—The exchange-brokers make it their business to know the alteration of the course of exchange, to inform merchants how it goes, and to give notice to those who have money to receive or pay beyond sea: they are the proper persons for negotiating the exchange; and when the matter is accomplished, that is, when the money for the bill is paid, and the bill delivered, they have for brokerage 2s. for 100l. sterling.

They reckon at Paris, among the city-officers, who are employed under the jurisdiction of the provost of the merchants, and *echevins* or aldermen, three sorts of brokers. 1. The brokers of horses for the carriage of merchandise by water: they are established for the navigation; and take care to examine the horses used to draw the boats up the river, to fet the horses together, to oblige the carriers to repair their boats, or to break such as are no longer fit to serve. 2. Sworn wine-brokers on the keys, to examine and taste all the wine that arrives there. 3. Brokers of bacon and lard. These are established to examine those sorts of merchandises as they are landed or unloaded, and to answer for their goodness to the buyer, and to the seller for the price of his wares.

Stock-BROKERS, are those who are employed to buy and sell shares in the joint stock of a company or corporation. As the practice of stock-jobbing has been carried to such an excess as became not only ruinous to a great number of private families, but even affected, or at least might soon affect, the public credit of the nation, the legislature thought fit to put a stop to it, or at least to bring it within certain bounds, and under some regulation, by statute 7 George II. c. viii. sect. 1.

Pawn-BROKERS, persons who keep shops, and lend money upon pledges to necessitous persons, and most commonly at an exorbitant interest. They are more properly styled *pawn-takers*, or *tally-men*, sometimes

friseurs, or *friserers*. These are meant in 1 Jac. I. cap. xxi. sect. 5. where it is declared, that the sale of goods wrongfully taken to any broker, or pawn-broker, in London, Westminster, Southwark, or within two miles of London, does not alter the property. And (sect. 7.) if a broker, having received such goods, shall not, upon request of the owner, discover them, how and when he came by them, and to whom they are conveyed, he shall forfeit the double value thereof, to be recovered by action of debt, &c.

In the cities of Italy, there are companies established by authority for the letting out money on pawns, called *mounts of piety*; a title little becoming such institutions. In some parts of Italy, they have also mounts of piety of another kind, wherein they only receive ready money, and return it again with interest, at a certain sum *per annum*. At Bologna, they have several such mounts, which are distinguished into *frank* and *perpetual*: the interest of the former is only four *per cent.*; that of the latter, seven.

BROKERS are also those who sell old household furniture, and wearing apparel, &c.

BROME (Alexander), a poet and attorney in the lord mayor's court in the reign of Charles II. was the author of the greatest part of those songs and epigrams which were published in favour of the royalists, and against the *rump*, as well in Oliver Cromwell's time as during the rebellion. These, together with his Epistles and Epigrams translated from different authors, were all printed in one volume 8^{vo} after the Restoration. He also published a version of Horace, by himself and others, which is very far from being a bad one. He left behind him a comedy entitled *The Cunning Lovers*: and the world is indebted to him for two volumes of Richard Brome's plays in octavo; many of which, but for his care in preserving and publishing them, would in all probability have been entirely lost. He died in 1666.

BROME (Richard), a dramatic writer who lived in the reign of king Charles I. and was cotemporary with Decker, Ford, Shirley, &c. His extraction was mean, he having been originally no better than a menial servant to the celebrated Ben Johnson. He wrote himself, however, into high reputation, as is testified not only by various commendatory verses written by his cotemporaries and prefixed to many of his plays, but also by some lines which his quondam master addressed to him on account of his comedy called *The Northern Lads*. Brome, in imitation of his master, laid it down as his first great point, to apply closely to the study of men and manners. His genius was entirely turned to comedy; and therefore his proper province was observation more than reading. His plots are all his own, and are far from being ill conducted; and his characters, which for the most part are strongly marked, were the offspring of his own judgment and experience, and his close attention to the foibles of the human heart. In a word, his plays in general are good ones; met with great applause when first acted; and, as Langbain informs us, were thought by the players worthy to be revived, to their own profit and the author's honour, in that critical age which he himself lived in. Nay, we have had a proof, even in our own time, of the merit of one of his comedies, which with a very little alteration has lately been revived, and with great success, viz. *The Jovial*

Broker,
Brome.

Bromelia vial Grew, which for no less than three seasons running brought crowded audiences to the theatre-royal in Covent Garden at all the frequent repetitions of its performance. The comedies which the author left behind him are 15 in number; ten of which are collected together, as above mentioned, in two volumes octavo. He joined also with Thomas Heywood in a play called *The Lancashire Witches*.

BROMELIA, the PINE-APPLE; a genus of the monogynia order, belonging to the hexandria class of plants.

Species. Of this genus Linnæus enumerates seven species; but the following are the most remarkable. I. The ananas; of which there are six varieties, viz. 1. The ovatus, or oval-shaped pine-apple. 2. The pyramidalis, pyramidal, or sugar-loaf pine. 3. The glaber, with smooth leaves. 4. The lucidus, with shining green leaves. 5. The ferrotinus, with a yellowish-coloured flesh. 6. The viridis, or green pine-apple. The other species are, II. The nudicaulis, with the lower leaves indented and prickly. III. The lingulata, with obtuse, sawed, and prickly leaves.—The first sort hath leaves very like some sorts of aloes, but not so thick and succulent, which are strongly armed with black spines. From the centre of the plant arises the flower-stalk, which is near three feet high, the lower part of which is garnished with entire leaves placed alternately at every joint. The upper part of the stalk is garnished with flowers set in a loose spike or thyrse quite round: these are succeeded by oval seed-vessels, having a longitudinal partition, in the centre of which are fastened smooth cylindrical seeds.—The second hath shorter leaves than the first, which are sharply sawed on their edges, and of a deep green colour. The flower-stem arises from the centre of the plant, which divides upward into several branches: the upper part of these are garnished with spikes of flowers, which come out alternately from the sides of the branches, each having a narrow entire leaf just below it, which are longer than the spike. The flowers are placed very close on the spikes; and when they decay, the empaleme turns to an oval pointed seed-vessel, inclosing seeds of the same shape with the other.

Culture, &c. The first sort of ananas is the most common in Europe; but the second sort is much preferable to it, the fruit of this being larger and much better flavoured: the juice of this sort is not so astringent as that of the first; so that this fruit may be eaten in greater quantity, with less danger. This sort frequently produces suckers immediately under the fruit, whereby it may be increased much faster than the common sort; so that in a few years it may be the best common sort in Britain.

The third sort is preserved by some curious persons for the sake of variety; but the fruit is not worth any thing.

The sort with very smooth grass-green leaves was raised from seeds taken out of a rotten fruit which came from the West Indies to the late Henry Heathcote, Esq; from whom Mr Miller received one plant, which produced large fruit: this is what the people of America call the *king pine*.

The plants are propagated by planting the crowns which grow on the fruit, or the suckers which are produced either from the sides of the plants or under the

fruit: both which are found to be equally good; although by some persons the crown is thought preferable to the suckers, as supposing it will produce fruit sooner than the suckers, which is certainly a mistake. The suckers and crowns must be laid to dry in a warm place for four or five days, or more (according to the moisture of the part which adhered to the old plant or fruit); for if they are immediately planted, they will rot. The certain rule of judging when they are fit to plant, is by observing if the bottom is healed over and become hard; for if the suckers are drawn off carefully from the old plants, they will have a hard skin over the lower part, so need not lie so long as the crowns or those whose bottoms are moist. But whenever a crown is taken from the fruit, or the suckers from old plants, they should be immediately divested of their bottom-leaves, so high as to allow depth for their planting; so that they may be thoroughly dry and healed in every part, left when they receive heat and moisture they should perish, which often happens when this method is not observed. If these suckers or crowns are taken off late in the autumn, or during the winter, or early in the spring, they should be laid in a dry place in the stove for a fortnight or three weeks before they are planted; but in the summer season, they will be fit for planting in a week at farthest.

These should be planted in a rich good kitchen-garden mould, not too heavy so as to detain the moisture too long, nor over light and sandy; but where this is wanting, you should procure some fresh earth from a good pasture, which should be mixed with about a third part of rotten neat's dung, or the dung of an old melon or cucumber bed which is well consumed. These should be mixed six or eight months at least before they are used, but if it be a year it will be the better; and should be often turned, that their parts may be the better united, as also the clods well broken. This earth should not be screened very fine; for if you only clear it of the great stones, it will be better for the plants than when it is made too fine. You should always avoid mixing any sand with the earth, unless it be extremely stiff, and then it will be necessary to have it mixed at least six months or a year before it is used; and it must be frequently turned, that the sand may be incorporated in the earth so as to divide its parts: but you should not put more than a sixth part of sand; for too much sand is very injurious to these plants. In the summer season, these plants must be frequently watered; but you should not give them large quantities at a time: you must also be very careful that the moisture is not detained in the pots by the holes being stopped, for that will soon destroy the plants. If the season is warm, they should be watered twice a-week; but in a cool season, once a-week will be often enough; and, during the summer season, you should once a-week water them gently all over their leaves; which will wash the filth from off them, and thereby greatly promote the growth of the plants.

There are some persons who frequently shift these plants from pot to pot. But this is by no means to be practised by those who propose to have large well-flavoured fruit: for, unless the pots be filled with the roots, by the time the plants begin to show their fruit, they commonly produce small fruit, which have generally large crowns on them; therefore the plants will

not

Bromelia.

not require to be new-potted oftener than twice in a season. The first time should be about the end of April, when the suckers and crowns of the former year's fruit (which remained all the winter in those pots in which they were first planted) should be shifted into larger pots; *i. e.* those which were in halfpenny or three-farthling pots should be put into penny or at most three-halfpenny pots, according to the size of the plants; for you must be very careful not to overpot them, nothing being more prejudicial to these plants. The second time for shifting of them is in the beginning of August; when you should shift those which are of a proper size for fruiting the following spring into two-penny pots, which are full large enough for any of these plants. At each of these times of shifting the plants, the bark-bed should be stirred up, and some new bark added, to raise the bed up to the height it was at first made; and when the pots are plunged again into the bark-bed, the plants should be watered gently all over their leaves, to wash off the filth, and to settle the earth to the roots of the plants. If the bark-bed be well stirred, and a quantity of good fresh bark added to the bed, at this latter shifting it will be of great service to the plants; for they may remain in the same tan until the beginning of November, or sometimes later, according to the mildness of the season, and will ripen but little before that time. During the winter, they will not require to be watered oftener than once a-week, according as you find the earth in the pots to dry; nor should you give them too much at each time; for it is much better to give them a little water often, than to over-water them.

You must observe never to shift those plants which show their fruit into other pots; for if they are removed after the fruit appears, it will stop the growth, and thereby cause the fruit to be smaller, and retard its ripening, so that many times it will be October or November before the fruit is ripe: therefore you should be very careful to keep the plants in a vigorous growing state from the first appearance of the fruit, because upon this depends the goodness and the size of the fruit; for if they receive a check after this, the fruit is generally small and ill-tasted.

When you have cut off the fruit from the plant whose kind you are desirous to propagate, you should trim the leaves, and plunge the pots again into a moderate hot-bed, observing to refresh them frequently with water, which will cause them to put out suckers in plenty; so that a person may be soon supplied with plants enough of any of the kinds, who will but observe to keep the plants in health.

The most dangerous thing that can happen to these plants is their being attacked by small white insects, which appear at first like a white mildew, but soon after have the appearance of lice: these attack both root and leaves at the same time; and, if they are not soon destroyed, will spread over a whole stove in a short time, and in a few weeks entirely stop the growth of the plants by sucking out the nutritious juice, so that the leaves will appear yellow and sickly, and have generally a great number of yellow transparent spots all over them. These insects, after they are fully grown, appear like bugs, adhering so closely to the leaves as not to be easily washed off, and seem to have no local motion. They were originally brought from America

upon the plants which were imported from thence; and are probably the same insects which have destroyed the sugar-canes of late in some of the Leeward Islands, for upon some sugar-canes which were sent Mr Miller from Barbadoes he observed great numbers of these insects. Since they have been in England, they have spread greatly in such stoves where there has not been more than ordinary care taken to destroy them. They have also attacked the orange-trees in many gardens near London, and have done them incredible damage; but they do not endure the cold of our climate in winter, so that they are never found on such plants as live in the open air. The only method yet discovered for destroying these insects, is by frequently washing the leaves, branches, and stems, of such plants as they attack, with water in which there has been a strong infusion of tobacco stalks. But this method cannot be practised on the ananas plants, because the insects will fasten themselves so low between the leaves, that it is impossible to come at them with a sponge to wash them off; so that if all those which appear to fight are cleared off, they will soon be succeeded by a fresh supply from below, and the roots will be also equally infested at the same time. Therefore, wherever these insects appear on the plants, the safest method will be to take the plants out of the pots, and clear the earth from the roots; then prepare a large tub, which should be filled with water in which there has been a strong infusion of tobacco stalks; into this tub you should put the plants, placing some sticks cross the tub to keep them immersed in water. In this water they should remain 24 hours; then take them out, and with a sponge wash off all the insects from the leaves and roots, and dip the plants into a tub of fair water, washing them therein, which is the most effectual way to clear them from the insects. After which, you should pot them in fresh earth; and, having stirred up the bark-bed, and added some new tan to give a fresh heat to the bed, the pots should be plunged again, observing to water them all over the leaves, and this should be repeated once a-week during the summer season; for these insects always multiply much faster where the plants are kept dry, than where they are sometimes sprinkled over with water, and kept in a growing state.

As these insects are frequently brought over from America on the ananas plants which come from thence, those persons who procure their plants from thence, should look carefully over them when they receive them, to see they have none of these insects on them; for if they have, they will soon be propagated over all the plants in the stove where they are placed; therefore, whenever they are observed, the plants should be soaked (as before directed) before they are planted into pots.

The other species of bromelia are likewise natives of warm countries, but require no particular directions for their culture farther than what is common to other exotics.

BROMLEY, a town of Kent in England, situated on the river Ravenburn, in E. Long. 0. 5. N. Lat. 51. 23.

BROMSGROVE, a town of Worcesterhire in England, seated on the river Salwarp. It is a pretty good town, well inhabited by clothiers; and the market is large for corn, cattle, and all sorts of provisions. W. Long.

Long. 2. 5. N. Lat. 52. 26.

BROMOIDES, in botany. See *FESTUCA*.

BROMUS, BROOM-GRASS; a genus of the digynia order, belonging to the triandria class of plants. There are 17 species, eight of which are natives of Britain, viz. the fecalinus or field broom-grass; the arvensis, or common broom-grass; the ciliatus, or wall broom-grass; the sterilis, or barren broom-grass; the giganteus, or tall broom-grass; the ramulosus, or wood broom-grass; and the pinnatus, or spiked broom-grass.

BROMYARD, a town of Herfordshire in England, seated on a rising ground, and containing about 200 houses. W. Long. 2. 46. N. Lat. 52. 20.

BRON, a town of Italy, in the duchy of Milan, where the Imperialists gained an advantage over the French in 1703. E. Long. 10. 0. N. Lat. 44. 50.

BRONCHIA, in anatomy, the ramifications of the trachea. See *ANATOMY*, n^o 380.

BRONCHOCELE, a tumour rising in the anterior part of the neck *.

BRONCHOTOMY, in surgery, an incision made in the aspera arteria, or wind-pipe, which is necessary in many cases, and especially in a violent quinsey, to prevent suffocation from the great inflammation or tumor of the parts. It is also called *laryngotomy* and *tracheotomy*. See *SURGERY*, n^o 33.

BRONTIÆ, or THUNDER-STONES, in natural history. See *BELEMNITES*.

BRONTIUM, in Grecian antiquity, a place underneath the floor of the theatres, in which were kept brazen vessels full of stones and other materials, with which they imitated the noise of thunder.

BRONTOLOGY, denotes the doctrine of thunder, or an explanation of its causes, phenomena, &c. together with the prelates drawn from it †.

BRONZE, a compound of copper and tin, to which sometimes other metallic substances, particularly zinc, are added.—This metal is brittle, hard, and sonorous. It is employed for various uses, as for making of bells, cannons, and statues; and the proportions of the component metals are varied to suit the several purposes to which it is applied. This compound, like some others, is specifically heavier than either of the metals taken se-

parately *. A metallic mass, composed of four fifths of copper and one fifth part of tin, weighs in water $7\frac{7}{10}$ grains more than the same quantities of these two metals would together weigh in water if not alloyed. This proves, that in the union of copper and tin there is a penetration of parts, the one metal entering into the pores of the other; and this is further confirmed by an observation of Mr Tillet, member of the royal academy of Sciences. In his memoir concerning the ductility of metals, he takes notice, that when the mixture of copper and tin is made in the proportions above-mentioned, the colour of the copper is entirely annulled and covered by that of the tin, although the quantity of the first be four times greater; and this singular effect cannot be understood without admitting a total change in the size and disposition of the pores of the compound metal.

Tin being less subject to rust than copper, bronze is also found to be less liable to be covered with verdigrise than pure copper is; and this is one reason why it is used for cannons, statues, and works exposed to the air and weather. The greater fusibility of bronze

than copper is also an advantageous property, and much facilitates the casting of large works. The operation for casting bronze is sufficiently simple. For this purpose a brick furnace is used, nearly of the shape of an oven for baking bread. The floor of this furnace is concave, and consists of a composition of sand and clay. In this hollow floor the metals to be fused are put.—The furnace has three openings. The first is a lateral mouth, at which enters the flame of the wood placed in a second furnace, on one side of the first: the second opening is a chimney placed on a side opposite to the mouth, by means of which the flame is drawn over the metal. The third is a hole which is opened and shut at pleasure; through which the inner part of the furnace may be occasionally inspected, that the state of the metal may be observed. When the metal is in the state required, a fourth opening is then unclosed, communicating with the hollow floor, and thro' which the melted metal flows by channels into the moulds prepared to receive it.

BRONZE, also denotes a colour prepared by the colourmen of Paris, wherewith to imitate bronze.—There are two sorts, the red bronze, and the yellow or golden. The latter is made solely of copper-dust, the finest and brightest that can be got: the former is made of the same, with the addition of a little quantity of red oker well pulverized. They are both applied with varnish. To prevent their turning greenish, the work must be dried over a chafing-dish as soon as bronzed.

BRONZES, a name given by antiquarians to figures either of men or beasts, to urns, and, in general, to every piece of sculpture which the ancients made of that metal. We likewise give the name of *bronzes* to statues or busts cast of bronze, whether these pieces be copies of antiques, or original subjects.—Among medallists, all copper medals bear the name of *bronzes*.

BRONZING, the art or act of imitating bronze, which is done by means of copper dust or leaf, fastened on the outside, as gold leaves are in gilding.

BROOD, the young of fish, fowls, &c.

BROODING, the act of a hen in hatching her eggs. See *HATCHING*.

BROOK, a little river or small current of water.—A brook is distinguished from a river, inasmuch as a river flows at all times, whereas a brook flows at some particular seasons only.

BROOK-Lime. See *VERONICA*.

BROOM, in botany. See *GENISTA*.

Butcher's-BROOM, in botany. See *RUSCUS*.

Spanish BROOM, in botany. See *SPARTIUM*.

Broom-Flower, (*ordre de la geniste*), an order instituted by St Louis, king of France, to shew the esteem which he had for the queen his wife, he himself receiving this order the evening before his queen's coronation.

Broom-Gall, in natural history; a name given by authors to a remarkable species of galls found on the *genista vulgaris*, or common broom. This is occasioned, like all other galls, by the puncture and eating of an insect: and, when opened, is found to contain a small oblong worm of a red colour, but whose size requires the use of a glass to see it distinctly. This gall is of a very singular kind: it is round and prickly; the stalk of the broom always grows directly through it, as if thrust through its middle; and, when nicely examined, the

Brouwer.

the whole gall appears to be formed of a congeries of leaves much larger than those of the broom naturally are, and twisted into a sort of horns or cornets, ending in a point: these leaves are all hollowed in the middle; and are so thick set and nicely fixed to one another, that they make up the substance of the gall, which is nevertheless a considerably hard one, and their points make the appearance of spines or prickles on the outside. Sometimes there is a sort of fleshy or pulpy substance within it, which supports the leaves; and the worms are sometimes found in this, sometimes in the hollows of the leaves, and sometimes between them: they are so numerous, that there are often some hundreds of them in one gall. The origin of this gall is not from the eggs of the parent animal lodged in the tree; but they are deposited on the surface of the branches, and the young worms, while very small, almost as soon as hatched from them, go in company to some bud on the side of the branch: they get into the folds of this bud, and wounding it in several parts, cause a wrong derivation of the juices into it; the consequence of which is, that instead of forming a branch shooting out from the other, it only yields a congeries of leaves which every where surround it. These galls are of various sizes, the largest seldom exceeding that of a nut; and there are often three or four of them seen on one branch, placed at an inch, or a little more, distance from one another.

BROOM-Rape, in botany. See **OROBANCHE**.

BROOMING, or **BREAMING**, of a Ship, the washing and burning off all the filth she has contracted on her sides with weeds, straw, broom, or the like, when she is on the careen, or on the ground. See **CAREENING**.

BROSSARD (Sebastian de), an eminent French musician. In the former part of his life he had been prebendary and chapel-master of the cathedral church of Strasburg; but afterwards became grand-chaplain, and also maître de chapelle in the cathedral of Meaux. There is extant of his a work intitled *Prodromus musicalis*. He was author also of a very useful book entitled *Dictionnaire de musique*, printed at Amsterdam, in folio, 1703, and afterwards at the same place in octavo, without a date. At the end of this book is a catalogue of authors ancient and modern, to the amount of 900, who have written on music; divided into classes, wherein are interpersed many curious observations of the author relating to the history of music. By Mr Boivin's *Catalogue general des livres de musique* for the year 1729, it appears that Brossard was the author of two sets of motets, as also of nine *Lecons de Tenebres* therein mentioned. It seems that these several publications were at a time when the author was far advanced in years; for Walther takes notice, that in the *Mercure Galante*, he is mentioned as an abbé and composer, so early as the year 1678.

BROTHEL-HOUSES, lewd places, being the common habitations of prostitutes. King Henry VIII. by proclamation, in the 37th year of his reign, suppressed all the lews or brothel-houses which had long continued on the bank-side in Southwark, contrary to the law of God and of the land*. A brothelman was a loose idle fellow; and a *seme bordelier*, or *brothelier*, a common whore. And *brothelman* is a contraction for *brothelman*†.

BROTHER, a term of relation between male children, sprung from the same parents, or from the same

father, or the same mother.

The ancients used the term *brother*, indifferently, to almost all who stood related in the collateral line; as uncles and nephews, cousins-german, &c.

According to the law of Moses, the brother of a man, who died without children, was obliged to marry the widow of the deceased, in order to raise up children to him, that his name and memory might not be extinct. See **WIDOW**.

Among us, it is customary for kings to give the title *brother* to each other.

In the civil law, brothers, *fratres*, in the plural number, sometimes comprehends sisters.

BROTHER is also a customary term for priests of the same persuasion to address one another by: but it is more particularly used to denote the relation between monks of the same convent; as, brother Zachary: in English, we more usually say, Friar Zachary, from the French word *frere*, brother.—Preachers also call their hearers, *my brethren*, or *my dear brethren*. This appellation is borrowed from the primitive Christians, who all called each other *brothers*. But it is now principally used for such of the religious as are not priests; those in orders are generally honoured with the title of *father*, whereas the rest are only simply brothers.

BROUAGE, a maritime town of Saintonge in France. It consists of five or six streets which terminate in a great square. It is famous for its salt-works, which are the finest in the kingdom. W. Long. 1. 0. N. Lat. 45. 50.

BROURSHAVEN, a port-town of the United Provinces, in the island of Schonen in Zealand, seated on the north side of the island, in a bay of the sea, in E. Long. 3. 35. N. Lat. 51. 50.

BROUGH, a town of Westmoreland in England, seated under Stanmore-hill, in E. Long. 17. 50. N. Lat. 54. 40. It was formerly a place of great note, being a Roman fortress; but is now so much decayed, that it is little better than a village.

BROUNCKER, or **BROUNKER**, (William), lord viscount of Castle-Lyons, in Ireland, and the first president of the Royal Society, was the son of Sir William Brounker, knt. and born about the year 1620. He was distinguished by his knowledge of the mathematics, and by the considerable posts of honour and profit he enjoyed after the restoration; for he had at the same time the office of chancellor to the queen, and the keeping of her great seal, that of one of the commissioners of the navy, and master of St Catherine's hospital near the Tower of London. He wrote, 1. Experiments of the recoiling of guns. 2. An algebraical paper upon the squaring of the hyperbola; and several letters to Dr Usher, archbishop of Armagh. He died in 1684.

BROUWER (Adrian), a famous Dutch painter, born either at Oudenard or Haerlem, in 1608, of poor parentage. He became the disciple of Francis Hals, under whom he proved an imitatable artist. His subjects were taken from low life, always copied from nature; as droll conversations, drunken brawls, boors at cards, or surgeons dressing the wounded. Brouwer was apprehended at Antwerp as a spy; where being discovered by Rubens, he procured his liberty, took him home, clothed him, and endeavoured to acquaint the public with his merit: but the levity of his temper made him quit his benefactor; and he died not

long after, in 1640, destroyed by a dissolute course of life.

BROW, or EYE-BROW, an hairy arch extended over the orbit of each eye. See ANATOMY, n° 398, d.

BROW-POST, among builders, denotes a beam which goes across a building.

BROW-ANTLER, among sportsmen, that branch of a deer's horn next the tail.

BROWALLIA, in botany, a genus of the angiospermia order, belonging to the didymia class of plants, for which there is no English name.—Of this there are two species. The demissa, with a single flower upon each footstalk; and the elata, with one or many flowers on each footstalk. The seeds of the first were sent to Mr Miller from Panama. It usually grows about two feet high, and spreads out into lateral branches on every side of the stalk, garnished with oval leaves which are entire, and have short footstalks. Towards the end of the branches, the flowers are produced singly upon pretty long footstalks arising from the wing of the leaf. These are of a light blue colour, sometimes inclining to a purple or red; and there are often three colours of flowers on the same plant. The plant flowers in July, August, and September; and the seeds are ripe in five or six weeks after. The second sort is a native of Peru: the stalk of this plant is twice the size of that of the first, and appears somewhat shrubby; the leaves upon the flower-branches are smooth: the footstalks have some with one flower, others with three, and others with five; which are of a deep violet colour. As both species of browallia are annual plants, they must be raised from seeds, which are to be sown on a hot-bed: but they may be transplanted in June, into the borders of the flower-garden; where, if the weather proves warm, they will flower and perfect seeds; but lest these should fail, there should be a plant or two kept in the stove to secure seeds.

BROWN (Robert), a schismatic divine, the founder of the Brownists, a numerous sect of dissenters in the reign of queen Elizabeth. He was the son of Mr Anthony Brown of Tolthorp in Rutlandshire; whose father obtained the singular privilege of wearing his cap in the king's presence, by a charter of Henry VIII. Robert was educated at Cambridge, in Corpus Christi, or, according to Collier, in Bennet college, and was afterwards a schoolmaster in Southwark. About the year 1580, he began to promulgate his principles of dissent from the established church; and the following year preached at Norwich, where he soon accumulated a numerous congregation. He was violent in his abuse of the church of England; pretended to divine inspiration; and, like all other fains, pretended that he alone was the sure guide to heaven. This new sect daily increasing, Dr Freaque bishop of Norwich, with other ecclesiastical commissioners, called our apostle before them. He was insolent to the court, and they committed him to the custody of the sheriff's officer: but he was released at the intercession of lord treasurer Burleigh, to whom it seems he was related. Brown now left the kingdom; and, with permission of the States, settled at Middleburg in Zealand; where he formed a church after his own plan, and preached without molestation; but here persecution, the *sine qua non* of fanaticism, was wanting. In 1585

Brown.

we find him again in England: for in that year he was cited to appear before archbishop Whitgift; and seeming to comply with the established church, was, by lord Burleigh, sent home to his father: but, relapsing into his former obstinacy, his aged parent was obliged to turn him out of his house. He now wandered about for some time, and in the course of his mission endured great hardships. At last he fixed at Northampton; where, labouring with too much indifferetion to increase his sect, he was cited by the bishop of Peterborough, and, refusing to appear, was finally excommunicated for contempt. The solemnity of this censure, we are told, immediately effected his reformation. He moved for absolution, which he obtained, and from that time became a dutiful member of the church of England. This happened about the year 1590; and, in a short time after, Brown was preferred to a rectory in Northamptonshire, where he kept a curate to do his duty, and where he might probably have died in peace: but having some dispute with the constable of his parish, he proceeded to blows; and was afterwards so insolent to the justice, that he committed him to Northampton jail, where he died in 1630, aged 80. Thus ended the life of the famous Richard Brown; the greatest part of which was a series of opposition and persecution. He boasted on his death-bed, that he had been confined in no less than 32 different prisons. He wrote "A treatise of reformation without tarrying for any, and of the wickedness of those teachers which will not reform themselves and their charge, because they will tarry till the magistrate command and compel them, by me Robert Brown;" and two others, making together a thin quarto; published at Middleburg, 1582.

BROWN (Ulysses Maximilian), a celebrated general of the 18th century, was son of Ulysses, baron Brown and Camus, colonel of a regiment of cuirassiers in the emperor's service, and descended from one of the most ancient and noble families in Ireland. He was born at Basil in 1705; and having finished his first studies at Limeric in Ireland, was, in 1715, sent for into Hungary, by count George Brown, his uncle, member of the aulic council of war, and colonel of a regiment of infantry. He was present at the famous battle of Belgrade, in 1717. Next year he followed his uncle into Italy, who made him continue his studies, in the Clementine college, at Rome, till the year 1721, when he was sent to Prague in order to learn the civil law. At the end of the year 1723, he became captain in his uncle's regiment; and in 1725, lieutenant-colonel: in 1730, he went into Corfica with a battalion of his regiment; and contributed greatly to the taking of Callanfera, where he received a considerable wound in his thigh. In 1732, the emperor made him chamberlain: He was raised to the rank of colonel in 1734; and distinguished himself so much in the war of Italy, especially at the battles of Parma and Guastalla, and in burning in the presence of the French army the bridge which the marshal de Noailles had caused to be thrown over the Adige, that he was made general in 1736. The following year he favoured the retreat of the army, after the unhappy battle of Banalucia in Bosnia, by an excellent manœuvre, and saved all the baggage. His admirable conduct upon this occasion was rewarded by his obtaining a second regiment

ment

Brown. ment of infantry, vacant by the death of count Francis de Wallis.

At his return to Vienna, in 1739, the emperor Charles VI. raised him to the rank of general-field-marshal-lieutenant, and made him counsellor in the aulic council of war. After the death of that prince, the king of Prussia entering Silesia, count Brown, with a small body of troops, disputed the country with him inch by inch. He signalized himself on several other occasions; and, in 1743, the queen of Hungary made him a privy-counsellor, at her coronation in Bohemia. He at length passed into Bavaria, where he commanded the van-guard of the Austrian army; seized Deckendorf, with a great quantity of baggage; and obliged the French to abandon the banks of the Danube, which the Austrian army passed in full security. The same year, viz. in 1743, the queen of Hungary sent him to Worms, in quality of her plenipotentiary to the king of Britain; where he put the last hand to the treaty of alliance between the courts of Vienna, London, and Turin. In 1744, he followed prince Lobkowitz into Italy; took the city of Veltro, on the 4th of August, in spite of the superior numbers of the enemy; entered their camp, overthrew several regiments, and took many prisoners. The following year he was recalled into Bavaria, where he took the town of Wilhofen by assault, and received a dangerous shot in the thigh. The same year he was made general of the artillery; and in January 1746, marched for Italy, at the head of a body of 18,000 men. He then drove the Spaniards out of the Milanese; and having joined the forces under prince de Lichtenstein, commanded the left wing of the Austrian army at the battle of Placentia on the 15th of June 1746, and defeated the right wing of the enemy's forces commanded by marshal de Maillebois. After this victory, he commanded in chief the army against the Genoese; seized the pass of Bofetta or Bochetta, though defended by above 4000 men; and took the city of Genoa. Count Brown at length joined the king of Sardinia's troops; and took, in conjunction with him, Mont-Alban, and the county of Nice. On the 30th of November he passed the Var, in spite of the French troops; entered Provence; took the isles of St Margaret and St Honorat; and thought to have rendered himself master of a much greater part of Provence, when the revolution which happened in Genoa, and marshal de Belleisle's advancing with his army, obliged him to make that fine retreat which procured him the admiration and esteem of all persons skilled in war. He employed the rest of the year 1747 in defending the states of the house of Austria in Italy; and after the peace in 1748, he was sent to Nice to regulate there, in conjunction with the duke of Belleisle and the marquis de las Minas, the differences that had arisen with respect to the execution of some of the articles of the definitive treaty of Aix la Chapelle.

The empress queen, to reward these signal services, especially his glorious campaigns in Italy in 1749, made him governor of Transylvania, where he rendered himself generally admired for his probity and disinterestedness. In 1752, he obtained the government of the city of Prague, with the chief command of the troops in that kingdom; in 1753, the king of Poland, elector of Saxony, honoured him with the

collar of the order of the white eagle; and the next year he was declared field-marshal.

The king of Prussia entering Saxony in 1756, and attacking Bohemia, count Brown marched against him; and repulsed that prince at the battle of Lobowitz, on the 1st of October, though he had only 27,000 men, and the king of Prussia had at least 40,000. Seven days after this battle, he undertook the famous march into Saxony, to deliver the Saxon troops shut up between Pirna and Konigstein; an action worthy of the greatest captains, ancient or modern. He at length obliged the Prussians to retire from Bohemia; for which he was rewarded, by being made a knight of the golden fleece. Soon after, count Brown hastily assembled an army in Bohemia, to oppose the king of Prussia, who had again penetrated into that kingdom at the head of all his forces; and on the 6th of May fought the famous battle of Prague; in which, while he was employed in giving his orders for maintaining the advantages he had gained over the Prussians, he was dangerously wounded, that he was obliged to be carried to Prague, where he died of his wounds, on the 26th of June 1757, at 52 years of age. There is reason to believe, that, had he not been wounded, he would have gained the victory, as he had broken the Prussians, and the brave count Schwerin one of their greatest generals was slain.

BROWN (Sir Thomas), an eminent physician and celebrated writer, was born at London, October 19th 1605. Having studied at Winchester college, and afterwards at Oxford, he travelled through France and Italy; and returning by the way of Holland, took his degree of doctor of physic at Leyden. In 1636, he settled at Norwich; and the year following, was incorporated as doctor of physic at Oxford. His *Religio Medici* made a great noise; and being translated into Latin, instantly spread throughout Europe, and gained him a prodigious reputation: it was then translated into almost every language in Europe. This book has been heavily censured by some, as tending to infidelity, and even atheism; while others, with much more reason, have applauded the piety, as well as the parts and learning, of the author. The reverend Mr Granger observes, that among other peculiarities in this book, he speaks of the ultimate act of love as a folly beneath a philosopher; and says, that he could be content that we might procreate, like trees, without conjunction; but, after the writing of it, he defended from his philosophic dignity, and married an agreeable woman. It was said, that his reason for marrying was, because he could discover no better method of procreation. His treatise on *Vulgar Errors* was read with equal avidity; he also published *Hydrotopia*, or a Discourse of Sepulchral Urns lately found in Norfolk. His reputation in his profession was equal to his fame for learning in other respects; and therefore the college of physicians were pleased to take him into their number as an honorary member; and king Charles II. coming to Norwich in his progress, in 1671, was pleased to knight him, with singular marks of favour and respect. He died on his birth-day, in 1682, leaving several manuscripts behind him, which were published under the title of *The posthumous works of the learned Sir Thomas Brown, Knt. M. D.*

BROWN (Edward), the son of the former, physician

Brown.

Brown
||
Brown.

to king Charles II. and president of the royal college at London. He was born in the year 1642; and studied at Cambridge, and afterwards at Merton college, Oxford. He then travelled; and at his return published a brief account of some travels in Hungary, Servia, Bulgaria, Macedonia, Thessaly, Austria, Styria, Carinthia, Carniola, Friuli, &c.: he also published an account of several travels through great part of Germany; and joined his name to those of many other eminent men, in a translation of Plutarch's lives. He was acquainted with Hebrew, was a critic in Greek, and no man of his age wrote better Latin. High-Dutch, Italian, French, &c. he spoke and wrote with as much ease as his mother-tongue. King Charles said of him, that "he was as learned as any of the college, and as well bred as any at court." He died August 27th 1708.

Browns (William), an English poet of the 17th century, was descended from a good family, and born at Tavistock in Devonshire in the year 1590. After he had passed through the grammar school, he was sent to Exeter college in the university of Oxford, in the beginning of the reign of James I. and became tutor to Robert Dormer, who was afterwards earl of Carnarvon, and killed at Newbury battle, September 20th 1643. He is styled in the public register of the university, "a man well skilled in all kinds of polite literature and useful arts;" *vir omni humana literatura et bonarum artium cognitione instructus*. After he had left the college with his pupil, he was taken into the family of William earl of Pembroke, who had a great respect for him; and he made his fortune so well, that he purchased an estate. His poetical works procured him a very great reputation. They are as follow. 1. Britannia's Pastorals. The first part was published at London, 1613, in folio; and ushered into the world with several copies of verses made by his ingenious and learned friends John Selden, Michael Drayton, Christopher Cook, &c. The second part was printed at London in 1616, and recommended by various copies of verses written by John Glanville who afterwards became eminent in the profession of the law, and others. These two parts were reprinted in two vols 8^{vo}, 1625. 2. The shepherd's pipe, in seven eclogues; London, 1614, in 8vo. 3. An elegy on the never-enough bewailed death of prince Henry, eldest son of king James I. Mr Wood tells us, that it is probable, our author wrote several other poems which he had not seen. It is uncertain when he died.

BROWN (Thomas), "of facetious memory," as he is styled by Addison, was the son of a farmer in Shropshire; and entered in Christ-church college, Oxford, where he soon distinguished himself by his uncommon attainments in literature. But the irregularities of his life not suffering him to continue long there, he, instead of returning to his father, went to London to seek his fortune: his companions, however, being more delighted with his humour, than ready to relieve his necessities, he had recourse to the usual refuge of half-starved wits, scribbling for bread; and published a great variety of poems, letters, dialogues, &c. full of humour and erudition, but often indelicate. Though a good-natured man, he had one pernicious quality, which was, rather to lose his friend than his joke.

Towards the latter end of Tom Brown's life, we

are informed by Mr Jacob, that he was in favour with the earl of Dorset, who invited him to dinner on a Christmas day, with Mr Dryden and some other gentlemen celebrated for their ingenuity, (as his lordship's custom was); when Mr Brown to his agreeable surprize found a bank note of 50*l*. under his plate, and Mr Dryden at the same time was presented with a another of 100*l*. Mr Brown died in the year 1704; and was interred in the cloyster of Westminster abbey, near the remains of Mrs Behn, with whom he was intimate in his lifetime. His works have been printed both in 8vo and 12mo, making 4 vols.

Browns, among dyers, painters, &c. a dusky colour, inclining towards reds. Of this colour there are various shades or degrees, distinguished by different appellations; for instance, Spanish-brown, a fad-brown, a tanney-brown, the London brown, a clove-brown, &c.

Spanish-brown is a dark dull red, of a horse-flesh colour. It is an earth; and is of great use among painters, being generally used as the first and priming colour that they lay upon any kind of timber-work in house-painting. That which is of the deepest colour, and free from stones, is the best. Though this is of a dirty brown colour, yet it is much used, not to colour any garment, unless it be an old man's gown; but to shadow vermilion, or to lay upon any dark ground behind a picture, or to shadow yellow berries in the darkest places, when you want lake, &c. It is best and brightest when burnt in the fire till it be red hot; although, if you would colour any hare, horie, dog, or the like, it should not be burnt: but, for other uses, it is best when it is burnt: as for colouring wood, posts, bodies of trees, or any thing else of wood, or any dark ground of a picture.

BROWNISTS, in church-history, a religious sect, which sprung up in England towards the end of the 16th century. Their leader was one Robert Brown, born at Northampton. They separated from the established church, on account of its discipline and form of government. They equally disliked episcopacy and presbyterianism. They condemned the solemn celebration of marriages in churches; maintaining, that matrimony being a political contract, the confirmation of it ought to proceed from the civil magistrate. They rejected all forms of prayer; and held, that the Lord's prayer was not to be recited as a prayer, being given only as a model upon which to form our prayers.

BROWNIE, the name of a servicable kind of sprite, who, according to a superstitious notion formerly prevalent in the Hebrides and Highlands of Scotland, (as well as among the country people in England, where he had the name of *Robin Goodfellow*), was wont to clean the houses, helped to churn, thrashed the corn, and would labour all that pretended to make a jest of him. He was represented as stout and blooming, had fine long flowing hair, and went about with a wand in his hand. He was the very counter part of Milton's *Lubber Fiend*, who

Tells how the drudging goblin sweats,
To earn his cream-bowl duly set,
When in one night, ere glimpse of morn,
His shadowy flail hath thrush'd the corn,
That ten day-lab'ers could not end;
Then lies him down the Lubber Fiend,
And stretch'd along the chimney's length,
Basks at the fire his hairy strength.

BROWSE,

Browfe
||
Bruges.

BROWSE, the tops of the branches of trees, whereon beasts feed. This is sometimes also called *brouce* and *bruttle*; probably from the French *broust*, which signifies the same thing.

Browse more properly denotes the food which deer find in young copes, continually sprouting anew.

BRUCE (Robert), son of the earl of Carrick, being competitor with Baliol for the crown of Scotland, lost it by the arbitration of Edward I. of England, for generously refusing to hold the crown of Scotland, as depending on him, which his ancestors had left him independent. But Baliol having afterward broke his agreement with Edward, Bruce was easily persuaded by that king to side with him against Baliol, upon promise that he would settle him on the throne. Having contributed much to the breaking of Baliol's party, he demanded the accomplishment of king Edward's promise, who is said to have given him this answer: "What! have I nothing else to do, but to conquer kingdoms for you." However, he recovered his crown, defeated the English in several battles, raised the glory of the Scots, and extended their dominions to

BRUCHSAL, a town of Germany, in the palatinate of the Rhine, and bishopric of Spire, situated on the river Satz, in E. Long. 8. 30. N. Lat. 49. 15.

BRUCHUS, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are filiform, and gradually increase in thickness. There are seven species, viz. the pill, has grey elytra interperfed with white spots, and a white fundament with two black spots. It is a native of North America, and destroys whole fields of peafe: It is now found in several of the southern parts of Europe; where it does great injury to the corn. 2. The theobroma, with whitish elytra interperfed with black points. It frequents the theobrome or chocolate-trees in the East Indies. 3. The glediſtie, with striated elytra of the same length with the belly, a pitch-coloured body, and green feelers. It is a native of America. 4. The bactris, with smooth elytra, a hoary body, and the hind part of the thighs oval. It frequents the palm-trees of Jamaica. 5. The granarius, has black elytra; the fore-feet are red, and the hind-feet are dentated. It frequents the seeds of plants in different parts of Europe. 6. The feminarius is black, with the base of the feelers and fore-feet testaceous. It is about the size of a louse, and a native of Europe. 7. The peticornis, with comb-shaped feelers longer than the body. It is a native of Barbary and China.

BRUGES, a city of the Austrian Netherlands, capital of the territory of Bruges, with a bishop's see. It is seated in a plain, eight miles from the sea; and has a great number of canals, made for the benefit of trade, one of which leads to Ghent, another to Ostend, another to Sluys, to Newport, to Furnes, to Ypres, and to Dunkirk, which you may reach in a day in the summer-time. All the waters about Bruges are without any current; but they may be changed in half an hour's time, by opening the sluices, and letting the water run into the sea. There are several bridges about the city, and that which was built in 1739 of free stone is very stately.

Bruges was in a very flourishing condition upwards of 200 years ago, and every nation had a consul here, for the maintenance of their rights and privileges;

Bruges.
Bruin.

but since the enlargement of Amsterdam and Antwerp, the trade is diminished, and its inhabitants are not numerous enough for so large a place. However, there are many rich merchants, and a chamber for trade. There are several fine churches; in the first rank of which is the cathedral, whose rich ornaments and treasure deserve notice. The finest square in the city is the great market, in which stand the halls, with public galleries, and a large court in the middle, and on one of its sides a high steeple supported only with four pillars. It is full of bells, with the most harmonious chimes in all the country. On the side of the great square there is a structure which serves for a public magazine to lay cloth in. It is built on a canal, and supported by pillars in such a manner, that small vessels can pass under it, to cross the city from the canal of Ostend to that of Ghent.

The square where the Wednesday's market is kept is very fine; for it contains several walks between two rows of trees, and a new guard-house in the middle. The Burg is a large square, in which is the town-house, built in the Gothic manner, and adorned with a variety of figures of the ancient counts and countesses of Flanders. In the same square there are several other public buildings. The church dedicated to the Virgin Mary is very fine, with a high steeple, which serves as a sea-mark for the ships that come to Ostend; on the inside are two tombs of copper gilt, of an extraordinary magnificence. Besides the cathedral and two collegiate churches, there are five parish churches, fourteen chapels, and twelve convents for men and women. There are a great many alms-houses and hospitals, one of which is called the *school of Begards*, where there are about one hundred and eighty boys, some of which are brought up to learning, others to trades, according to their genius. Their habit is cloth, and half of them wear blue and half red, with a black bonnet. There is also a school for poor girls, to the number of one hundred and twenty, clothed with red or blue. In short, there is no place in the Low Countries where they take more care of widows and orphans.

It is remarkable that the knights of the golden fleece were instituted in this city in 1430, when the marriage of Philip the Good was celebrated with Elizabeth princess of Portugal. The parts about the city, which belong to it, are called *Franc of Bruges*, and contain thirty-seven villages, and enjoy perfect liberty, according to the tenour of their freedom. The fortifications of Bruges are but trifling, inasmuch that in the time of war they always yield to the strongest party. It is eight miles east of Ostend, twenty-four north-east of Ghent, and forty-six west of Antwerp. E. Long. 3. 5. N. Lat. 51. 11.

BRUGES (John of), (real name, John van Eick), a celebrated Flemish painter, and the first who discovered the method of painting in oil, flourished in the 15th century. He found in the course of his chemical experiments, (to which science he also applied himself), that, by grinding colours with linseed or nut-oil, he could form them into a solid body which would resist the water, and not need the varnish used in painting in water-colours or in fresco. He presented the first picture painted in this manner to Alphonfus I. king of Naples, who was much pleased with it.

BRUIN (John de), professor of natural philosophy and

See (His-
tory of)
Scotland.

and mathematics at Utrecht, was born at Gorcum in 1620. He had uncommon skill in dissecting animals, and was a great lover of experiments. He made also observations in astronomy. He published dissertations *De vi altrice; De corporum gravitate et levitate; De cognitione Dei naturali; De lucis causa et origine*, &c. He had a dispute with Isaac Vossius, to whom he wrote a letter printed at Amsterdam in 1663; wherein he criticises Vossius's book *De natura et proprietate lucis*, and strenuously maintains the hypothesis of Descartes. He died in 1675, after he had been professor 23 years: and his funeral oration was pronounced four days after by M. Grævius.

BRUISE, in surgery, the same with *CONTUSION*.

BRUMALES PLANTÆ, in botany, (from *bruma* winter); plants which flower in our winter: common about the Cape.

BRUMALIA, in Roman antiquity, festivals of Bacchus celebrated twice a-year; the first on the 12th of the kalends of March, and the other on the 18th of the kalends of November. They were instituted by Romulus, who during these feasts used to entertain the senate. Among other heathen festivals which the primitive Christians were much inclined to observe, Tertullian mentions the *brumæ* or *brumalia*.

BRUMOY (Peter), a learned jesuit born at Rouen in 1668, distinguished himself in his youth by his talents for the belles lettres; and during his whole life was beloved for his probity, his virtue, and the goodness of his heart. He wrote many works, the most considerable of which is his *Theatre of the Greeks*. He died at Paris in 1742.

BRUN (Anthony le), an ambassador of Spain, famous for his skill in negotiating, was of an ancient and noble family, and born at Dole in the year 1600. He was attorney-general in the parliament of Dole; during which time he had a hand in all the state negotiations which concerned the provinces. He was sent afterwards by Philip IV. to the diet of Ratibon, and from thence to the court of the emperor Ferdinand III. He was one of the plenipotentiaries of his Catholic majesty, at the conferences of Munster held in 1643; where, though all the other plenipotentiaries took place of him, yet it is said that he far exceeded them all in capacity. The king of Spain was particularly beholden to him for the peace which the Dutch made at Munster, exclusively of France; and the intriguing turn which he shewed upon this occasion made him dreaded ever after by French ambassadors. He was a man of letters, as well as of politics; and therefore employed his pen, as well as his tongue, in the service of his master. He died at the Hague, during his embassy, in the year 1654.

BRUN (Charles le), was descended of a family of distinction in Scotland, and born in the year 1619. His father was a statutory by profession. He discovered, it is said, such an early inclination for painting, that at three years of age he used to take coats, and design on the hearth and sides of the chimney, only by the light of the fire; and at 12 he drew the picture of his uncle so well, that it still passes for a fine piece. His father being employed in the gardens at Sequier, and having brought his son along with him, the chancellor of that name took a liking to him, and placed him with Simon Vouet, an eminent painter. He was afterwards

sent to Fountainbleau, to take off some of Raphael's pieces. He went him next to Italy, and supported him there for six years. Le Brun, in his return, met with the celebrated Poussin, by whose conversation he greatly improved himself in his art, and contracted a friendship with him which lasted as long as their lives. A painting of St Stephen, which he finished in 1651, raised his reputation to the highest pitch. Soon after this, the king, upon the representation of Mr Colbert, made him his first painter, and conferred on him the order of St Michael. His majesty employed two hours every day to see him work, while he was painting the family of Darius at Fountainbleau. About the year 1662, he began his five large pieces of the history of Alexander the Great, in which he is said to have set the actions of that famous conqueror in a more glorious light than Quintus Curtius hath done in his history. He procured several advantages for the royal academy of painting and sculpture at Paris, and formed the plan of another for the students of his own nation at Rome. There was scarce any thing done for the advancement of the fine arts in which he was not consulted. It was thro' the interest of M. Colbert that the king gave him the direction of all his works, particularly of his royal manufactory at the Gobelins, where he had a handsome house with a genteel salary assigned to him. He was also made director and chancellor of the royal academy, and shewed the greatest zeal to encourage the fine arts in France. He was endowed with a vast inventive genius, which extended itself to arts of every kind. He was well acquainted with the manners and history of all nations. Besides his extraordinary talents, his behaviour was so genteel, and his address so pleasing, that he attracted the regard and affection of the whole court of France, where, by the places and pensions conferred on him by the king's liberality, he made a very considerable figure. Le Brun was the author of two treatises; one on physiognomy, and the other on the different characters of the passions. He died at Paris in 1690.

The talent of this painter, except for landscapes, was universal. He was not indeed admired for his colouring, nor for his skill in the distribution of his lights and shadows; but for a good gusto of design, an excellent choice of attitudes, an agreeable management of his draperies, a beautiful and just expression, and a strict observance of decorum. In fine, his compositions demand the attention and admiration of the nicest judges. The pieces that gained him his greatest reputation were, besides what we have already mentioned, those which he finished at Fountainbleau, the great stair-case at Versailles, but especially the grand gallery there, which was the last of his works, and is said to have taken him up 14 years.

BRUNDISIUM, or BRUNDISIUM, (anc. *geog.*), a town of Calabria, with the best harbour in Italy. It was a very ancient town, and belonged originally to the Salentines; but was taken by the Romans about 256 years before Christ. Now *Brindisi*; which see.

BRUNO (Jordano), an atheistical writer, was born at Nolo in the kingdom of Naples; and about the year 1582, began to call in question some of the tenets of the Romish church, which occasioned his retiring to Geneva: but after two years stay there, he expressed his aversion to Calvinism in such a manner that he was expelled

Bruno
Brunswick.

pelled the city. After having staid some time at Lyons, Tholouse, and Paris, he came to London, and continued two years in the house of Mr Cailleau the French ambassador. He was very well received by queen Elizabeth and the politer part of the court. His principal friends were Sir Philip Sidney and Sir Fulk Greville. With these and some others of their club, Bruno held assemblies; but as they treated of subjects of a very delicate nature, which could not suit the taste or capacity of every body, they kept the door always shut, and none but select persons were admitted into their company. At Sir Philip's request, he composed his *Spaccio della Bestia Trionfante*, which was printed in 8vo, 1584, and dedicated to that gentleman. This work, which is remarkable for nothing but its impiety, we are told in one of the Spectators, (n^o 389), fold at an auction in London for 30*l*. From England he went to Wittemberg, and from thence to Prague, where he printed some tracts, in which he openly discovered his atheistical principles. After visiting some other towns in Germany, he made a tour to Venice. Here he was apprehended by order of the inquisition; tried; condemned; and refusing to retract, was burnt at the stake, February 9th 1600.

BRUNSBUTTLE, a sea-port town of Germany, in the circle of lower Saxony, and duchy of Holstein, seated at the mouth of the river Elbe, in E. Long. 8. 42. N. Lat. 44. 30. It is subject to Denmark.

BRUNSFELSIA, a genus of the monogynia order, belonging to the pentandria class of plants; of which there is only one species, viz. the americana. It rises with a woody, branching, rough stem, six or eight feet high; garnished with oblong entire leaves on footstalks, and large whitish flowers by threes or fours at the ends of the branches, succeeded by round saffron-coloured soft fruit. This plant may be raised from seeds sown in pots in the spring, and plunged in a bark-bed. It may also be propagated by cuttings planted in pots in the same season, plunging them also in a bark-bed or other hot-bed under glasses. The plants must always remain in the stove.

BRUNSWICK, a city of Germany, in the circle of Lower Saxony, and capital of the duchy of the same name. It is composed of five towns, viz. the Old Town, the New Town, the Hagen or Burg, the Old Wick, and the Sac, which makes it a large place, but the houses are almost all built of wood. There are several churches, one of which is an ancient Gothic building, but the appearance of its antiquity is almost absorbed by the repairs it has undergone. Brunswick is a fortified place, and would require a numerous army to besiege, and not a few men to defend it. It is of a square form, divided in the middle by the river Ocker. It is about two miles in circumference, and is strongly fortified. On the ramparts is a mortar-piece of brass, ten feet six inches long, and nine feet two inches in circumference, weighing 1800 quintals, and has 93 quintals of iron in its carriages. It will carry a ball of 730 pounds weight to the distance of 33,000 paces, and throw a bomb of a thousand weight; but it requires 52 pounds of powder for a charge. This city is the residence of the prince whom we style the duke of Brunswick Wolfenbuttle. The inhabitants of the city and parts adjacent carry on a considerable trade with Bohemia. Brunswick mum is well known in England; a

small fort of which is the common drink of the inhabitants of the city. The religion here is the Lutheran, and they observe it very strictly. The peasants are sober and laborious, but clownish and heavy; however, as they are robust and strong, they make good soldiers. The elector of Hanover is styled duke of Brunswick, though he has no property in, nor dominion over, this city, which belongs to the duke of Brunswick Wolfenbuttle. E. Long. 10. 28. N. Lat. 52. 15.

BRUNSWICK (the duchy of), is a country of Germany, bounded on the north by the duchy of Lunenburg; on the west, by the circle of Westphalia, from which it is separated by the river Weser; on the south, by Hesse, and the little territory of Peichfeld; and on the east, by Thuringia, with the principalities of Anhalt and Halberstadt, and the duchy of Magdeburg. The rivers are the Weser, the Ocker, and the Lyne; and it is fertile both in corn and pastures. It is divided into three principalities, Wolfenbuttle, Grubenhagen, and Calenberg, which also comprehends the duchy of Gottingen. The principality of Wolfenbuttle has its own dukes; but the other two belong to the elector of Hanover. The territories of the house of Brunswick are more extensive; the principal of which are the duchies of Brunswick and Lunenburg, with the county of Danneburg, which is annexed thereto. The rest are Blankenburg, Dieport, and Hoyer, besides two or three smaller districts.

BRUNTSISLAND, a parliament-town of Fifeshire in Scotland, situated on the frith of Forth, eight miles north of Edinburgh, in W. Long. 3. 5. N. Lat. 56. 12. Here is the best harbour on the coast, formed by a rocky isle eked out with piers, for there are none on this side the county entirely natural. This is dry at low water. The church is square, with a steeple rising in the centre. The old castle, built by the *Durics*, commanded both town and harbour. The place has a natural strength, which, with the conveniency of a port opposite to the capital, made it, during the troubles of 1560, a most desirable post. The French, allies of the queen regent, fortified it strongly. In 1715, it was surprized and possessed by the rebels, who here formed the bold design of passing over a body of troops to the opposite shore; which was in part executed, under the command of brigadier Macintosh, notwithstanding all the efforts of the men of war.

BRUSCHIUS (Gaspar), a Latin historian and poet, was born at Egra in Bohemia, in 1518. He was devoted to books from his childhood, and especially to poetry, in which he gained so much reputation, that he attained to the poetical crown, to the dignity of poet laureat, and of count palatine. He wrote with prodigious facility; and his verses are extremely flowing, easy, and natural. He published Latin poems on a great variety of subjects; the history of the bishops and bishoprics of Germany; history of German monasteries; and a great number of other works, of which a catalogue is given in Gesner's *Bibliothecae*. Bruschius was far from being rich, or rather he was very poor; subsisting almost entirely by the benefactions of his poetical patrons, and by presents from the abbots and abbesses whose monasteries he described. The liberalities of some abbots, while he was with Oporin at Basil, enabled him to buy a new suit of clothes; but when he found, that appearing well dressed in the streets procured

Brunswick
Bruschius.

red him many marks of respect from the vulgar, he tore his new finery to pieces, "as slaves that had usurped their master's honours." Bruchius seems to have been too great a philosopher for the age he lived in, or indeed for any age. He was murdered in the forest of Scalingenbach, between Rottemberg on the Tauber, and Winsheim: and it was believed that this assassination was concerted and carried into execution by some gentlemen against whom Bruchius was about to write something.

BRUSH, an assemblage of hairs, or hogs bristles, fastened in the holes of a wooden handle or board, pierced for that purpose, serving to cleanse divers bodies by rubbing therewith. The manner of making brushes is by folding the hair or bristle in two; and bringing it by means of a packthread, which is engaged in the fold, through the holes with which the wood is pierced all over, being afterwards fastened therein with glue. When the holes are thus filled, the ends of the hair are cut to make the surface even.

Shearers' BRUSH, is made of wild boars bristles; and serves to lay the wool or nap of cloth, after shearing it for the last time.

BRUSH, among painters, a larger and coarser kind of a pencil made of hogs bristles, wherewith to lay the colours on their large pieces. The Chinese painters brush consists of the stalk of a plant; whose fibres being fretted at both ends, and tied again, serve for a brush.

Wire-BRUSHES, are used by silver smiths and gilders, for scrubbing silver, copper, or brass pieces, in order to the gilding of them.

BRUSSELS, the capital of Brabant, in the Austrian Netherlands, and generally the seat of the Austrian governor, is situated on the small river Senne, which runs through it. It is a rich and handsome city; and among the public structures, the ducal palace where the governor resides, the town-house, and the arsenal, are most superb. No city in Europe, except Naples and Genoa, makes a finer appearance at a distance: but, like them, when in the town, it is all up and down hill. It is encompassed with a double brick wall, and has seven gates; but being seven miles in compass, is too large to hold out a long siege. In Brussels are seven fine squares, or market-places; that of the great market is one of the most beautiful in the world. The town-house takes up one quarter of it; and has a very high steeple, on the top of which is a brazen statue of St Michael, fifteen feet high. In one of the apartments, which is handsomely adorned, the states of Brabant meet. In three other rooms there is the history of the reign of Charles V. wrought in tapestry; which is so well done, that it may be mistaken for painting. In the other parts of this square, are the halls of the different trades. There are here several palaces of the nobility: that of Orange now belongs to the king of Prussia. The opera-house is built after the Italian manner, with rows of boxes, in which are chimneys. One is covered over with looking glass, so that they can sit by the fire, drink a bottle, and see what is doing. There are 20 public fountains, adorned with statues, at the corners of the most public streets; and in the middle of the town-house is one with Neptune, the tritons, and the horses spouting out water from their nostrils. The hospitals are well endowed, some of which are for

the maintenance of strangers for three days. There is also a foundling-hospital, and one for penitent court-tezans. Among the churches, that of St Gudula is very magnificent. It stands on the top of a hill, near the gate of Lovain, and is surrounded with iron balustrades. It is an old Gothic structure, with two large steeples at the east end, and is finely adorned within. The Jesuits have a fine church as well as a library. There are several monasteries and nunneries, two of which last are English. The nunnery called the Beuginage is like a little town, being surrounded by a wall and ditch, and has little streets, where each nun has an apartment. Six or seven hundred girls are educated here.

In 1695, Brussels was bombarded by marshal Villeroy, who demolished four thousand houses, the stathouse, and several churches. In 1708, it was besieged again, by the elector of Bavaria; but the duke of Marlborough soon came to its assistance, and obliged him to raise the siege with precipitation. Marshal Saxe, the French general, took it in 1746; but it was restored by the treaty of Aix la Chapelle. It is much fallen from its former splendor; and all the trade which is carried on there is in lace, camblets, and tapestry, which they make in great perfection. E. Long. 4. 8. N. Lat. 50. 51.

BRUSSELS (the quarter or district of), is one of the four parts of the duchy of Brabant. This quarter is bounded on the east, by that of Louvain; on the north, by that of Antwerp; on the west, by Flanders; and on the south, by Hainhalt. Brussels is the capital city of this quarter and all Brabant.

BRUTE, a general name for all animals, except mankind.

Among brutes, the monkey kind bear the nearest resemblance to man; both in the external shape and internal structure, but more in the former than in the latter. In the monkey kind, the highest, and the nearest approach to the likeness of man is the *Oran Outang*, or *Homo Silvestris* †.—The structure and economy of brutes make the objects of what is called *Comparative ANATOMY*. See that article.

Philosophers have been much puzzled about the essential characteristics of brutes, by which they may be distinguished from man. Some define a brute to be an *animal not risible, or a living creature incapable of laughter*; others call them *mute animals*. The peripatetics allowed them a sensitive power, but denied them a rational one. The Platonists allowed them reason and understanding, though in a degree less pure and refined than that of men. Laërtius allows every thing to brutes which men have, except a sense of religion; and even this has been ascribed to them by some sceptics. Descartes maintained that brutes are mere inanimate machines, absolutely destitute not only of reason, but of all thought and perception, and that all their actions were only consequences of the exquisite mechanism of their bodies. This system, however, is much older than Descartes; it was borrowed by him from Gomez Pereira, a Spanish physician, who employed 30 years in composing a treatise which he entitled *Antoniana Margarita*, from the Christian names of his father and mother. It was published in 1554: but his opinion had not the honour of gaining partizans, or even of being refuted; so that it died with him. Even
Pereira

† See *Sinnia*.

Brute.

Pereira seems not to have been the inventor of this notion; something like it having been held by some of the ancients, as we find from Plutarch and St Augustin. Others, who rejected the Cartesian hypotheses, have maintained that brutes are endowed with a soul essentially inferior to that of men; and to this soul some have allowed immortality, others not. And, lastly, in a treatise published by one Bougaut a Jesuit, entitled *A Philosophical amusement on the language of beasts*, he affirms that they are animated by evil spirits or devils.

The opinion of Descartes was probably invented, or at least adopted, by him to defeat two great objections: one against the immortality of the souls of brutes, if they were allowed to have any; the other against the goodness of God, in suffering creatures who had never sinned, to be subjected to so many miseries. The arguments in favour of it may be stated as follow. 1. It is certain, that a number of human actions are merely mechanical; because they are done imperceptibly to the agent, and without any direction from the will; which are to be ascribed to the impression of objects and the primordial disposition of the machine, wherein the influence of the soul has no share; of which number are all habits of the body acquired from the reiteration of certain actions. In all such circumstances, human beings are no better than automata. 2. There are some natural movements so involuntary, that we cannot restrain them; for example, that admirable mechanism ever on the watch to preserve an equilibrium, when we stoop, bend, or incline our bodies in any way, and when we walk upon a narrow plank. 3. The natural liking for, and antipathy against, certain objects, which in children precede the power of knowing and discriminating them, and which sometimes in grown persons triumph over all the efforts of reason; are all phenomena to be accounted for from the wonderful mechanism of the body, and are so many cogent proofs of that irresistible influence which objects have on the human frame. 4. Every one knows how much our passions depend on the degree of motion into which the blood is put, and the reciprocal impressions caused by the animal-spirits between the heart and brain, that are so closely connected by their nerves; and if such effects may be produced by such simple mechanical means as the mere increase of motion in the blood, without any direction of the will, we are not to wonder at the actions of brutes being the effects only of a refined mechanism, without thought, or perception. 5. A farther proof will arise from a consideration of the many wonderful effects which even the ingenuity of men has contrived to bring about by mechanical means; the androide, for instance, of Mr Kempell, which plays at chess. Now it is not to be questioned, but that the mechanism of the body of the meanest animal infinitely surpasses that of Mr Kempell's machine; and what can be the consequence of this, but that the actions of that animal must be proportionably more surprising than those of the wooden chess-player?

The above is a short abstract of all the arguments that are brought in favour of the Cartesian system; but they are evidently very far from being conclusive. They are deficient, in the first place, because, though we allow them in the utmost extent the Cartesians themselves can desire, they prove only the possibility of brutes being inanimate, and that the power of God actually

could produce such and such actions from inanimate machines; but that he actually hath done so, they have not the least tendency to prove. In the second place, the Cartesian argument is insufficient, because it hath no limits, and knows not where to stop; for, by the same method of arguing, every man might prove his neighbour to be an inanimate machine: for though every individual is conscious of his own thoughts, he is not so of those of his neighbours, and it no more exceeds the power of God to cause an inanimate machine perform the actions of a man, than those of a beast. Neither are the two objections which the hypothesis is calculated to answer, to be at all admitted as arguments in its favour. They are, 1. That if we allow brutes to have souls, they must be immaterial, and consequently immortal; and, 2. It seems a contradiction to the goodness of God to think that he should subject innocent creatures to such a multitude of evils as we see the brute creation endure in this world. The first of these is productive of no bad consequences to us, though it should be granted: and if it is supposed that the brute creatures are really immortal, the second objection vanishes; because, in the enjoyment of endless felicity, all temporary afflictions, how severe soever, must be swallowed up as though they had never been.

As to a positive proof on the other side, viz. that brutes are really endowed with sensation and consciousness, there is undoubtedly the same evidence for the sensibility of brutes, that there is for that of mankind. We see brutes avoid pain as much as we do; and we likewise see them seek for pleasure and express their happiness in the enjoyment of certain things by signs not at all equivocal. Therefore, though we grant the possibility of all this being the effect of mere mechanism; yet as we are conscious that in ourselves similar effects are produced by a sentient principle, we have all the reason in the world to conclude that in brutes they are likewise derived from a principle of sensation: especially seeing we know of no kind of mechanism in any other part of nature that produces any thing like the effects just mentioned; and until we see that a mechanism of this kind does take place in some part of nature, we have no right to suppose it in any. As to those actions of the human body in which it seems to move spontaneously, like an automaton, without the direction of the mind or will, it is almost superfluous to observe, that they were not performed in this manner originally, but required very great exertions of the will and intellectual faculty before the body could be brought to perform them easily; so that from this nothing can be inferred. Add to that, that divine revelation sets forth to us in many places, the brute creation as objects of mercy; which could not be done without the highest absurdity, if they were not really capable of feeling pleasure and pain as well as we.

The most rational opposers of the Cartesian scheme maintain, that brutes are endowed with a principle of sensation as well as we; though of an inferior nature to ours. Great disputes, however, have arisen on this subject; some maintaining, that the soul of brutes is merely sensitive, and that they are altogether destitute of reflection and understanding; others, that they not only reason, but make a better use of it than men do. That the brutes are endowed only with sensation, and totally destitute of all power of reflection, or even rea-

Brute.

Brute.

soning, is what can by no means be maintained on good grounds: neither can it be asserted that they act entirely from instinct, or a blind propensity to certain things without knowing why or wherefore. In numberless instances, needless to be mentioned here, but which will readily occur to every reader, it is evident, that education will get the better of many of the natural instincts of brutes; which could never be the case were they absolutely incapable of reasoning. On the other hand, it is equally certain, that they are by no means capable of education in the same degree that men are; neither are the rational exertions of brutes at all to be compared even with those of the meanest savages. One remarkable instance of this is in the use of the element of fire. The most savage nations have known how to make this element subservient to their purposes; or if some have been found who have been entirely ignorant of its existence, they have quickly learned its uses on seeing it made use of by others: but though many of the brute creatures are delighted with warmth, and have opportunities every day of seeing how fire is supplied with fuel, and by that means preserved, it never was known that one of them attempted to preserve a fire by this means. This shews a strange defect of rationality, unaccountable upon any other supposition than that the soul or sentient principle of brutes is some how or other inferior in its nature to that of man; but still, it is a sentient principle, capable of perceptions as quick, and in many instances much more so than our own.

Father Bougeant supports his opinion of the spirits of brute creatures being devils, in the following manner. Having proved at large that brutes naturally have understanding, "Reason (says he) naturally inclines us to believe that brutes have a spiritual soul; and the only thing that opposes this sentiment is, the consequences that might be inferred from it. If brutes have a soul, that soul must be either matter or spirit; it must be one of the two, and yet you dare affirm neither. You dare not say it is matter, because you must then necessarily suppose matter to be capable of thinking; nor will you say that it is spirit, this opinion bringing with it consequences contrary to the principles of religion; and this, among others, that man would differ from brutes only by the degrees of plus and minus; which would demolish the very foundation of all religion. Therefore, if I can elude all these consequences; if I can assign to brutes a spiritual soul, without striking at the doctrines of religion; it is evident, that my system, being moreover the most agreeable to reason, is the only warrantable hypothesis. Now I shall, and can do it, with the greatest ease imaginable. I even have means, by the same method, to explain many very obscure passages in the Holy Scripture, and to resolve some very great difficulties which are not well confuted. This we shall unfold in a more particular manner.

"Religion teaches us, that the devils, from the very moment they had sinned, were reprobate, and that they were doomed to burn for ever in hell; but the church has not yet determined whether they do actually endure the torments to which they are condemned. It may then be thought that they do not yet suffer them, and that the execution of the verdict brought against them is referred for the day of the final judgement.— Now what I pretend to infer from hence is, that, till

Brute.

doomsday comes, God, in order not to suffer so many legions of reprobate spirits to be of no use, has distributed them through the several spaces of the world, to serve the designs of his Providence, and make his omnipotence to appear. Some, continuing in their natural state, busy themselves in tempting men, in seducing and tormenting them; either immediately, as Job's devil, and those that lay hold of human bodies; or by the ministry of forcerers or phantoms. These wicked spirits are those whom the scripture calls the *powers of darkness*, or the *powers of the air*. God, with the others, makes millions of beasts of all kinds, which serve for the uses of men, which fill the universe, and cause the wisdom and omnipotence of the Creator to be admired. By that means I can easily conceive, on the one hand, how the devils can tempt us; and on the other, how beasts can think, know, have sentiments, and a spiritual soul, without any way striking at the doctrines of religion. I am no longer surpris'd to see them have forecast, memory, and judgment. I should rather have occasion to wonder at their having no more, since their soul very likely is more perfect than ours. But I discover the reason of this: it is because, in beasts as well as in ourselves, the operations of the mind are dependent on the material organs of the machine to which it is united; and those organs being grosser and less perfect than in us, it follows, that the knowledge, the thoughts, and the other spiritual operations of the beasts must of course be less perfect than ours: And if these proud spirits know their own dismal state, what an humiliation must it be to them thus to see themselves reduced to the condition of beasts! But, whether they know it or no, so shameful a degradation is still, with regard to them, the primary effect of the divine vengeance I just mentioned; it is an anticipated Hell.—

Having mentioned the prejudices against this hypothesis, such as particularly the pleasure which people of sense and religion take in beasts and birds, especially all sorts of domestic animals; he proceeds, "Do we love beasts for their own sakes? No. As they are altogether strangers to human society, they can have no other appointment but that of being useful and amusing. And what care we whether it be a devil or any other creature that amuses us? The thought of it, far from shocking, pleases me mightily. I with gratitude admire the goodness of the Creator, who gave me so many little devils to serve and amuse me. If I am told that these poor devils are doomed to suffer eternal torments, I admire God's decrees, but I have no manner of share in that dreadful sentence; I leave the execution of it to the sovereign Judge; and, notwithstanding this, I live with my little devils as I do with a multitude of people, of whom religion informs me that a great number shall be damned. But the cure of a prejudice is not to be effected in a moment; it is done by time and reflection; give me leave then lightly to touch upon this difficulty, in order to observe a very important thing to you.

"Persuaded as we are that brutes have intelligence, have we not all of us a thousand times pitied them for the excessive evils which the majority of them are exposed to, and in reality suffer? How unhappy is the condition of horses! we are apt to say upon seeing a horse whom an unmerciful carman is murdering with blows.

How

Brute.

How miserable is a dog whom they are breaking for hunting! How dismal is the fate of beasts living in woods! they are perpetually exposed to the injuries of the weather; always seized with apprehensions of becoming the prey of hunters, or of some wilder animal; forever obliged, after long fatigue, to look out for some poor insipid food; often suffering cruel hunger; and subject, moreover, to illness and death! If men are subject to a multitude of miseries that overwhelm them, religion acquaints us with the reason of it; viz. the being born sinners. But what crimes can beasts have committed by birth to be subject to evils so very cruel? What are we, then, to think of the horrible excesses of miseries undergone by beasts? miseries, indeed, far greater than those endured by men. This is, in any other system, an incomprehensible mystery; whereas nothing is more easy to be conceived from the system I propose. The rebellious spirits deserve a punishment still more rigorous, and happy it is for them that their punishment is deferred. In a word, God's goodness is vindicated, man himself is justified: for what right can we have, without necessity, and often in the way of mere diversion, to take away the life of millions of beasts, if God had not authorized us so to do? And beasts being as sensible as ourselves of pain and death, how could a just and merciful God have given man that privilege, if they were not so many guilty victims of the divine vengeance?

“ But hear still something more convincing, and of greater consequence: Beasts, by nature, are extremely vicious. We know well that they never sin, because they are not free; but this is the only condition wanting to make them sinners. The voracious birds and beasts of prey are cruel. Many insects of one and the same species devour one another. Cats are perfidious and ungrateful; monkeys are mischievous; and dogs envious. All beasts in general are jealous and revengeful to excess; not to mention many other vices we observe in them: and at the same time that they are by nature so very vicious, they have, say we, neither the liberty nor any helps to resist the bias that hurries them into so many bad actions. They are, according to the schools, necessitated to do evil, to disconcert the general order, to commit whatever is in nature most contrary to the notion we have of natural justice and to the principles of virtue. What monsters are these in a world originally created for order and justice to reign in? This is, in good part, what formerly persuaded the Manicheans that there were of necessity two orders of things, one good, and the other bad; and that the beasts were not the work of the good principle: a monstrous error! But how then shall we believe that beasts came out of the hands of their Creator with qualities so very strange? If man is so very wicked and corrupt, it is because he has himself through sin perverted the happy nature God had given him at his creation. Of two things, then, we must say one: either that God has taken delight in making beasts so vicious as they are, and of giving us in them models of what is most shameful in the world; or that they have, like man, original sin, which has perverted their primitive nature.

“ The first of these propositions finds very difficult access to the mind, and is an express contradiction to the holy scriptures; which say, that whatever came out

Brute.

of God's hands, at the time of the creation of the world, was good, yea very good. What good can there be in a monkey's being so very mischievous, a dog so full of envy, a cat so malicious? But then many authors have pretended, that beasts, before man's fall, were different from what they are now; and that it was in order to punish man that they became so wicked. But this opinion is a mere supposition of which there is not the least footing in Holy Scripture. It is a pitiful subterfuge to elude a real difficulty: this at most might be said of the beasts with whom man has a sort of correspondence; but not at all of the birds, fishes, and insects, which have no manner of relation to him. We must then have recourse to the second proposition, That the nature of beasts has, like that of man, been corrupted by some original sin: Another hypothesis, void of foundation, and equally inconsistent with reason and religion, in all the systems which have been hitherto proposed concerning the soul of beasts. What party are we to take? Why, admit of my system, and all is explained. The souls of beasts are refractory spirits which have made themselves guilty towards God. The sin in beasts is no original sin; it is a personal crime, which has corrupted and perverted their nature in its whole substance; hence all the vices and corruption we observe in them, though they can be no longer criminal, because God, by irrevocably reprobating them, has at the same time divested them of their liberty.”

These quotations contain the strength of father Bougeant's hypothesis, which also hath had its followers; but the reply to it is obvious. Beasts, though remarkably mischievous, are not completely so; they are in many instances capable of gratitude and love, which devils cannot possibly be. The very same passions that are in the brutes, exist in the human nature; and if we chose to argue from the existence of those passions, and the ascendancy they have over mankind at some times, we may say with as great justice, that the souls of men are devils, as that the souls of brutes are. All that can be reasonably inferred from the greater prevalence of the wicked passions among the brutes than among men, is, that the former have less rationality than men; and accordingly it is found, that among savages, who exercise their reason less than other men, every species of barbarity is practised, without being thought a crime.

It has been much disputed whether the brutes have any language whereby they can express their minds to each other; or whether all the noise they make consists only of cries inarticulate, and unintelligible even to themselves. We are, however, too little acquainted with the intellectual faculties of these creatures to be able to determine this point. Certain it is, that their passions, when excited, are generally productive of some peculiar cry; but whether this is designed as an expression of the passion to others, or only a mechanical motion of the muscles of the larynx occasioned by the passion, is what we have no means of knowing. We may indeed, from analogy, conclude, with great reason, that some of the cries of beasts are really expressions of their sentiments; but whether one beast is capable of forming a design, and communicating that design by any kind of language to others, is what we submit to the judgment of the reader, after giving the

Brutii
||
Brutus.

following instance which among others is brought as a proof of it by father Bougeant. "A sparrow finding a nest that a martin had just built, standing very conveniently for him, possessed himself of it. The martin, seeing the usurper in her house, called for help to expel him. A thousand martins came full speed, and attacked the sparrow; but the latter being covered on every side, and presenting only his large beak at the entrance of the nest, was invulnerable, and made the boldest of them who durst approach him repent of their temerity. After a quarter of an hour's combat, all the martins disappeared. The sparrow thought he had got the better, and the spectators judged that the martins had abandoned their undertaking. Not in the least. Immediately they returned to the charge; and each of them having procured a little of that tempered earth with which they make their nests, they all at once fell upon the sparrow, and inclosed him in the nest to perish there, though they could not drive him thence. Can it be imagined that the martins could have been able to hatch and concert this design all of them together, without speaking to each other?"

BRÜTTII, an ancient people of Italy, inhabiting the country now called *Calabria Ultra*; different from the ancient Calabria, or Messapia, to the east on the Adriatic or Ionian sea.

BRUTTON, a town of Somersethire, in England. It is situated on the river Brew; and is a good place, and well inhabited. It is adorned with a very beautiful church; has a free school, founded by Edward I; and the alms-house or hospital is so good, that it has the appearance of a college. They have a woollen manufactory of cloth and ferges, and they are likewise noted for their malt. W. Long. 2. 30. N. Lat. 51. 15.

BRUTUS, or BRUTE, according to the old exploded history of this country by Geoffroy of Monmouth, was the first king of Britain. He is said to have been the son of Sylvius, and he of Ascanius the son of Æneas, and born in Italy; killing his father by chance, he fled into Greece, where he took king Pandrusus prisoner, who kept the Trojans in slavery, whom he released on condition of providing ships, &c. for the Trojans to forsake the land. Being advised by the oracle to sail west beyond Gaul, he, after some adventures, landed at Totness in Devonshire. Albion was then inhabited by a remnant of giants, whom Brutus destroyed; and called the island, after his own name, *Britain*. He built a city called *New Troy*, since London; and having reigned here 24 years, at his death parcelled the island among his three sons: Loocrine had the middle, called *Loegria*; Camber had Wales, and Albanact Scotland.

BRUTUS (Lucius Junius), the avenger of the rape of Lucretia, and founder of the Roman republic, flourished 509 years before Christ. See (*History of*) ROME.

BRUTUS (Marcus), the passionate lover of his country, and chief conspirator against Cæsar, slew himself on losing the battle of Philippi, 42 years before Christ*.

BRUTUS (John Michael), a man of learning, and a polite writer, in the 16th century. He was a native of Venice; and, having studied at Padua, spent great part of his life in travelling, and became historiographer to his imperial majesty. He wrote, 1. A history of Hungary. 2. A history of Florence. 3. Notes on Horace, Cæsar, Cicero, &c.; and other works. He was living

in the year 1590.

BRUTUS (Stephen Junius), the disguised author of a political work intitled *Vindicia contra tyrannos**.

BRUYERE (John de la), a celebrated French author, was born at Dourdan in the year 1664. He wrote *Characters*, describing the manners of his age, in imitation of Theophrastus; which characters were not always imaginary or general, but descriptive, as was well known, of persons of considerable rank. In the year 1693, he was by an order of the king chosen a member of the French academy; and died in the year 1696.—“The *Characters* of Bruyere (says the celebrated Voltaire) may justly be ranked among the extraordinary productions of this age. Antiquity furnishes no examples of such a work. A style rapid, concise, and nervous; expressions animated and picturesque; an use of language altogether new, without offending against its established rules, struck the public at first; and the allusions, which are crowded in almost every page, completed its success. When La Bruyere showed his work in manuscript to Malefieux, this last told him, that the book would have many readers, and its author many enemies. It somewhat sunk in the opinion of men, when that whole generation whose follies it attacked were passed away; yet, as it contains many things applicable to all times and places, it is more than probable that it will never be forgotten.” *Age of Lewis* XIV. chap. 29.

BRUYIERS, a town of Lorrain, in Vosque, with a provostship. E. Long. 6. 45. N. Lat. 48. 15.

BRYANS-BRIDGE, a town of Ireland, in the county of Clare and province of Connaught, seated on the river Shannon, eight miles north of Limerick. W. Long. 8. 30. N. Lat. 52. 31.

BRYANT (Sir Francis), a soldier, statesman, and a poet of no inconsiderable fame in his time, was born of a genteel family, educated at Oxford, and afterwards spent some time in travelling abroad. In the year 1522, the 14th of Henry VIII. he attended, in a military capacity, the earl of Surrey on his expedition to the coast of Brittany; and commanded the troops in the attack of the town of Morlaix, which he took and burnt. For this service he was knighted on the spot by the earl. In 1528, he was in Spain; but on what service, is doubtful. In 1529, he was sent ambassador to France; and, the year following, to Rome on account of the king's divorce. He had also been there in 1522, in the same capacity, when cardinal Woolsey's election to the holy see was in agitation. He was gentleman of the privy chamber to king Henry VIII. and to his successor Edward VI. in the beginning of whose reign he marched with the protector against the Scots; and after the battle of Musselburgh, in which he commanded the light horse, was made banneret. In 1548, he was appointed chief governor of Ireland, where he married the countess of Ormond. He died soon after, and was buried at Waterford. He wrote, 1. Songs and sonnets; some of which were printed with those of the earl of Surrey and Sir Thomas Wyatt. Lond. 1565. 2. Letters written from Rome concerning the king's divorce; manuscript. 3. Various letters of state; which Ant. Wood says he had seen. 4. A dispraise of the life of a courtier, &c. Lond. 1548, 8vo. from the French of A-laygri, who translated it from the Castilian language, in which it was originally written by Guevara.

* See (*History of*) Rome.

BRYENNIUS (Manuel), a Greek writer on music, is supposed to have flourished under the elder Paleologus, viz. about the year of Christ 1120. He wrote three books on Harmonics; the first whereof is a kind of commentary on Euclid, as the second and third are on Ptolemy. He professes to have studied peripatry for the sake of young men. Meibomius had given the public expectations of a translation of this work: but not living to complete it, Dr Wallis undertook it; and it now makes a part of the third volume of his works, published at Oxford in three volumes folio, 1699.

BRYENNIUS (Nicephorus), a prince distinguished by his courage, probity, and learning, was born at Orestia in Macedonia; where his father by rebellion provoked the emperor to send his general Alexis Comnenus against him, who ordered his eyes to be pulled out; but being charmed with his son Bryennius, he married him to Anne Comnenus his daughter, so famous by her writings. When Alexis came to the throne, he gave Bryennius the title of *Cæsar*; but would not declare him his successor, though solicited to it by the empress Irene; and was therefore succeeded by his son John Comnenus, to whom Bryennius behaved with the utmost fidelity. Being sent, about the year 1137, to besiege Antioch, he fell sick; and, returning, died at Constantinople. This prince wrote the *History of Alexis Comnenus*, which he composed at the request of his mother-in-law the empress Irene.

BRYGMUS, among physicians, a grating noise made by the gnashing of the teeth.

BRYONIA, **BRYONY**; a genus of the syngenesia order, belonging to the monœcia class of plants.

Species. 1. The alba, rough or white bryony with red flowers, is a native of dry banks under hedges in many parts of Britain. The roots of this plant have by impostors been brought into a human shape, and shewn for mandrakes. The method practised by these people was to find a young thriving plant of bryony; then they opened the earth all round, being careful not to disturb the lower fibres; and being provided with such a mould as is used for making plaster figures, they fixed the mould close to the root, fastening it with wire to keep it in its proper situation: then they filled the earth about the root, leaving it to grow to the shape of the mould; which in one summer it will do; so that if this is done in March, by September it will have the shape. The leaves of this plant are also imposed on people for mandrake-leaves; although there is no resemblance between them, nor any agreement in quality. 2. The africana, or African tuberous rooted bryony. 3. The racemosa, or bryony with a red olive-shaped fruit. These are natives of warm climates; and are perennial; but their branches decay every winter. They flower in July, and in warm summers will perfect their seeds in Britain. 4. The cretica, or spotted bryony of Crete. 5. The variegata, or American bryony with a variegated fruit. 6. The bonariensis, or bryony with hairy palmated leaves, divided into five parts, and obtuse segments. These are likewise natives of warm countries; but merit cultivation on account of the pretty appearance they make when the plants are full of fruit.

Culture. The second and third sorts are to be planted in pots filled with fresh light earth; and in winter must be placed in the green-house to protect them from frosts and great rains, which would destroy them if they were

exposed thereto. In summer, they may be exposed to the open air, and must be frequently refreshed with water in dry weather. The three last sorts are annual plants: they must be raised on a hot-bed early in the spring; and when the plants are about three inches high, they should be each transplanted into a small pot, and plunged into a hot-bed of tanner's bark. When the plants are grown so large as to ramble about on the surface of the bed, and begin to entangle with other plants, they should be shifted into larger pots, and placed in the bark-stove; where their branches may be trained to the wall, or against an espalier, that they may have fun and air, which is absolutely necessary for their producing fruit.

Medicinal Uses, &c. The roots of the first species are used in medicine. These are very large, sometimes as thick as a man's thigh: they smell, when fresh, is strong and disagreeable; the taste nauseously bitter, acrid, and biting; the juice is so sharp, as in a little time to excoriate the skin; in drying, they lose great part of their acrimony, and almost their whole scent.—Bryony-root is a strong irritating cathartic; and as such has sometimes been successfully exhibited in maniacal cases, in some kinds of dropsies, and in several chronic disorders, where a quick solution of viscid juices, and a sudden stimulus on the solids, were required. An extract prepared by water acts more mildly, and with greater safety, than the root in substance: given from half a dram to a dram, it is said to prove a gentle purgative, and likewise to operate powerfully by urine.—Bryony-root, applied externally, is said to be a powerful discutient: it enters a cataplasm for that purpose in the Edinburgh Pharmacopœia. See PHARMACY, n°931.

Black Bryony. See TAMUS.

BRYUM, in botany, a genus of the cryptogamia musci class. The anthera is covered with an operculum; the calyptra is smooth. There are 41 species, most of them natives of Britain.

BUA, an island of the gulph of Venice, on the coast of Dalmatia, near the town of Trau; called likewise the *Partridge-island*, because frequented by those birds.

BUANES, a town of France, in Gascony, and in the diocese of Aire, seated on the river Bahus, in E. Long. o. 5. N. Lat. 43. 47.

BUARCOS, a town of Portugal, in the province of Beira. W. Long. 8. 5. N. Lat. 40. 3.

BUBALIS, in zoology, the trivial name of the buffalo, a species of the bos. See Bos.

BUBBLE, in philosophy, small drops or vesicles of any fluid filled with air; and formed either on its surface by an addition of more of the fluid, as in raining, &c.; or in its substance, by an intestine motion of its component particles. Bubbles are dilatible or compressible, *i. e.* they take up more or less room as the included air is more or less heated, or more or less pressed from without; and are round, because the included air acts equally from within all around.

BUBBLE, in commerce, a cant term given to a kind of project for raising money on imaginary grounds, much practised in France and England in the years 1719, 1720, and 1721.

The pretence of those schemes was the raising a capital for retrieving, setting on foot, or carrying on, some promising and useful branch of trade, manufacture, machinery, or the like. To this end proposals were

Bubo,
Bubon.

were made out, shewing the advantages to be derived from the undertaking, and inviting persons to be engaged in it. The sum necessary to manage the affair, together with the profits expected from it, were divided into shares or subscriptions, to be purchased by any disposed to adventure therein.

Bubbles, by which the public have been tricked, are of two kinds, viz. 1. Those which we may properly enough term *trading-bubbles*; and, 2. Stock or fund bubbles. The former have been of various kinds; and the latter at different times, as in 1719 and 1720.

BUBO, in ornithology, the trivial name of a species of flix. See STRIX.

BUBO, or *Buboe*, in surgery, a tumour which arises, with inflammation, only in certain or particular parts to which they are proper, as in the arm-pits and in the groins. See (the *Index* subjoined to) MEDICINE.

BUBON, MACEDONIAN PARSLEY; a genus of the dignia order, belonging to the pentandria class of plants.

Species. 1. The macedonicum sends out many leaves from the root; the lowest of which grow almost horizontally, spreading near the surface of the ground: the foot-stalk of each leaf divides into several smaller; which are garnished with smooth rhomb-shaped leaves, which are of a bright pale-green colour, and sawed on their edges. In the centre of the plant arises the flower-stem, which is little more than a foot high, dividing into many branches, each being terminated by an umbel of white flowers, which are succeeded by oblong hairy seeds. This plant, in warm countries, is biennial; the plants, which rise from seeds, one year produce flowers, and seeds the next, and then perish: but in Britain they seldom flower till the third or fourth year from the seed; but whenever the plant flowers, it always dies. 2. The rigidus, hard or rigid ferula, is a native of Sicily. It is a low perennial plant, having short, stiff, and very narrow leaves: the flower-stalk rises a foot high, which is terminated by an umbel of small white flowers; which are succeeded by small, oblong, channelled seeds. It is a plant of little beauty or use, so is only cultivated for the sake of variety. 3. The galbanum, or African ferula, rises with an upright stalk to the height of eight or ten feet, which at bottom is woody, having a purplish bark covered with a whitish powder that comes off when handled. The upper part of the stalk is garnished with leaves at every joint, the foot-stalks half-embracing them at their base, and are set with leaves like those of the lovage, but smaller, and of a grey colour: the top of the stalk is terminated by an umbel of yellow flowers; which are succeeded by oblong channelled seeds, which have a thin membrane or wing on their border. When any part of the plant is broken, there issues out a little thin milk of a cream colour, which hath a strong scent of galbanum. 4. The gummiferum, with a mock chervil leaf, rises with a lignous stalk about the same height; and is garnished with leaves at each joint, which branch out like the former; but the small leaves or lobes are narrow and indented like those of balfard hemlock. The stalk is terminated by an umbel of small yellow flowers, which are succeeded by seeds like those of the former sort.—These plants are all propagated by seeds, and require the common culture of other exotic vegetables. The galbanum of the shops is supposed to be procured from

the third and fourth forts.

BUBONOCELE, or HERNIA INGUINALIS, in surgery, a tumour in the inguen, formed by a prolapsus of the intestines, omentum, or both, through the processes of the peritonæum and rings of the abdominal muscles. See SURGERY, n^o 13.

BUBONIUM, in botany, a synonyme of the INULA.

BUC (George), a learned English antiquarian, flourished in the beginning of the 17th century. In the reign of king James I. he was made one of the gentlemen of his majesty's privy-chamber, and knighted: he was also constituted master of the revels. What he mostly distinguished himself by, was his writing, 1. The history of the reign of Richard III.; in which he takes great pains to wipe off the bloody stains that have blotched his character, and represents the person and actions of that prince in a much less odious light than other historians have done. He also wrote, 2. A treatise of the art of revels; and, 3. a work intitled *The third universitie of England*.

BUCANEER, one who dries and smokes flesh, or fish, after the manner of the Indians. The name was particularly given to the first French settlers on the island of St Domingo, whose sole employment consisted in hunting bulls or wild boars, in order to sell their hides and flesh. The name has also been applied to those famous piratical adventurers, chiefly English and French, who joined together to make depredations on the Spaniards of America. Of both these we shall give an account.

I. *The Bucaneers of St Domingo*. The Spaniards had not been long in the possession of the West-Indies and the continent of America, when other nations, especially the English and French, began to follow them there. But though the Spaniards were unable to people such extensive countries themselves, they were resolved that no others should do it for them; and therefore made a most cruel war on all those of any other nation, who attempted to settle in any of the Antilles or Caribbee Islands. The French, however, were at last lucky enough to acquire some footing in the island of St Christopher's; but by the time they began to subsist into a regular form of government, the Spaniards found means to dislodge them. Upon this the wretched fugitives, considering at how great a distance they were from their mother-country, and how near to the island of Hispaniola or St Domingo, the northern parts of which were then uninhabited and full of swine and black cattle, they immediately resolved to take possession of that country, in conjunction with several other adventurers of their own and the English nation; especially as the Dutch, who now began to appear in these seas, promised to supply them plentifully with all kinds of necessaries they might procure, in exchange for the hides and tallow by hunting.

These new settlers obtained the name of *bucaneers*, from their custom of buccanning their beef and pork in order to keep it for sale, or for their own consumption, the method of which will be presently described. But some of them soon grew tired of this new way of life, and took to planting; while many more chose to turn pirates, trusting to find, among those who remained on shore, a quick sale for all the plunder they could make at sea. This new body of adventurers were called *freebooters*, from their making free prey or booty of what
ever

Bubonocèle
||
Bucaneer.

Bucanier. ever came in their way.

The colony now began to thrive at a great rate, by the cheap and easy manner in which the free-booters acquired the greatest riches, and the profusion with which they distributed them among their old companions the bucaniers and planters for the meereft trifles. This brought numbers of settlers from Old France in quality of indented servants, though they toiled rather like slaves during the three years for which they generally bound themselves. One of these men presuming to referent to his master, who always fixed upon a Sunday for sending him with skins to the port, that God had forbidden such a practice, when he had declared, "Six days shalt thou labour, and on the seventh day shalt thou rest:" "And I (replied the brutal bucanier) say to thee, Six days shalt thou kill bulls, and strip them of their skins, and on the seventh day shalt thou carry their hides to the sea-shore." This command was followed by blows, which sometimes enforce obedience, sometimes disobedience to the laws of God.

Thus the colony consisted of four classes: bucaniers; freebooters; planters; and indented servants, who generally remained with the bucaniers, or planters. And these four orders composed what they now began to call the *body of adventurers*. These people lived together in a perfect harmony under a kind of democracy: every freeman had a despotic authority over his own family; and every captain was a sovereign in his own ship, tho' liable to be discarded at the discretion of the crew.

The planters settled chiefly in the little island of Tortuga on the northern coast of Hispaniola: but it was not long before some of them going to the great island to hunt with the bucaniers, the rest were surpris'd by the Spaniards; and all, even those who had surrendered at discretion in hopes of mercy, were put to the sword, or hanged.

The next care of the Spaniards was to rid the great island of the bucaniers; and for this reason they assembled a body of 500 lance-men, who, by their seldom going fewer than 50 in a company, obtained the name of the *Fifties* from their enemies, whose manners and customs we shall now enter upon.

The bucaniers lived in little huts built on some spots of cleared ground, just large enough to dry their skins on, and contain their buccaning houses. These spots they called *Boucan*, and the huts they dwelt in *Ajoupas*, a word which they borrowed from the Spaniards, and the Spaniards from the natives. Though these ajoupas lay open on all sides, they were very agreeable to the hardy inhabitants, in a climate where wind and air are so very desirable things. As the bucaniers had neither wife nor child, they associated by pairs, and mutually rendered each other all the services a master could reasonably expect from a servant, living together in so perfect a community, that the survivor always succeeded his deceased partner. This kind of union or fellowship they called *semaletoter* [infailoring], and each other *matelot*, [failor], whence is derived the custom of giving, at least in some parts of the French Antilles, the name *matelotage* [failorage], to any kind of society formed by private persons for their mutual advantage. They behaved to each other with the greatest justice and openness of heart: it would have been a crime to keep any thing under lock and key; but, on the other hand, the least pilfering was unpardonable, and pu-

nished with expulsion from the community. And indeed there could be no great temptation to steal, when it was reckoned a point of honour, never to refuse a neighbour what he wanted; and where there was so little property, it was impossible there should be many disputes. If any happened, the common friends of the parties at variance interposed, and soon put an end to the difference.

As to laws, the bucaniers acknowledged none but an odd jumble of conventions made between themselves, which, however, they regarded as the sovereign rule. They silenced all objections by coolly answering, that it was not the custom of the coast; and grounded their right of acting in this manner, on their baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marine ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had very little authority over them; they contented themselves with rendering him from time to time some slight homage. They had in a manner entirely shaken off the yoke of religion, and thought they did a great deal in not wholly forgetting the God of their fathers. We are surpris'd to meet with nations, among whom it is a difficult matter to discover any trace of a religious worship: and yet it is certain, that had the bucaniers of St Domingo been perpetuated on the same footing they subsisted at the time we are speaking of, the third or fourth generation of them would have as little religion as the Caffres and Hottentots of Africa, or the Topinambous and Cannibals of America.

They even laid aside their surnames, and assumed nick-names, or martial names, most of which have continued in their families to this day. Many, however, on their marrying, which seldom happened till they turned planters, took care to have their real surnames inserted in the marriage-contract; and this practice gave occasion to a proverb, still current in the French Antilles, *A man is not to be known till he takes a wife*.

Their dress consisted of a filthy greasy shirt, dyed with the blood of the animals they killed; a pair of trousers still more nasty; a thong of leather by way of belt, to which they hung a case containing some Dutch knives, and a kind of very short fabre called *Manchette*; a hat without any brim, except a little flap on the front to take hold of it by; and shoes of hogskin all of a piece. Their guns were four feet and a half in the barrel, and of a bore to carry balls of an ounce. Every man had his contract servants, more or fewer according to his abilities; besides a pack of 20 or 30 dogs, among which there was always a couple of beagles. Their chief employment at first was ox-hunting; and, if at any time they chafed a wild hog, it was rather for pasture, or to make provision for a feast, than for any other advantage. But, in process of time, some of them betook themselves entirely to hunting of hogs, whose flesh they buccaned in the following manner: First, they cut the flesh into long pieces, an inch and an half thick, and sprinkled them with salt, which they rubbed off after 24 hours. Then they dried these pieces in stoves over the fire made of the skin and bones of the beast, till they grew as hard as a board, and assumed a deep brown colour. Pork prepared in this manner will keep in casks a twelvemonth and longer; and when steeped but a little while in lukewarm water, become plump

and rosy, and yield moreover a most grateful smell, either broiled or boiled, or otherwise dressed, enough to tempt the most languid appetite and please the most delicate palate. Those who hunt the wild boar, have of late been called simply *hunters*.

In hunting, they set out at day-break, preceded by the beagles, and followed by their servants with the rest of the dogs; and as they made it a point never to balk their beagles, they were often led by them over the most frightful precipices, and through places which any other mortal would have deemed absolutely impassable. As soon as the beagles had scented the game, the rest of the dogs struck up and surrounded the beast, stopping it, and keeping a constant barking till the bucaneer could get near enough to shoot it; in doing this, he commonly aimed at the pit of the breast; when the beast fell, he hamstringed it, to prevent its rising again. But it has sometimes happened that the creature, not wounded enough to tumble to the ground, has run furiously at his pursuer, and ripped him open. But, in general, the bucaneer seldom missed his aim; and when he did, was nimble enough to get up the tree behind which he had the precaution to place himself. What is more; some of them have been seen to overtake the beast in chace, and hamstring it without any further ceremony.

As soon as the prey was half skinned, the master cut out a large bone, and sucked the marrow for breakfast. The rest he left to his servants, one of whom always remained behind to finish the skinning, and bring the skin with a choice piece of meat for the huntsmen's dinner. They then continued the chace till they had killed as many beasts as there were heads in the company. The master was the last to return to the boucan, loaded like the rest with a skin and a piece of meat. Here the bucaneeers found their tables ready; for every one had his separate table; which was the first thing, any way fit for the purpose, that came in their way, a stone, the trunk of a tree, and the like. No table-cloth, no napkin, no bread or wine, graced their board; not even potatoes or bananas, unless they found them ready to their hands. When this did not happen, the fat and lean of the game, taken alternately, served to supply the place. A little pimento, and the squeeze of an orange, their only sauce; contentment, peace of mind, a good appetite, and abundance of mirth, made every thing agreeable. Thus they lived and spent their time, till they had completed the number of hides for which they had agreed with the merchants; which done, they carried them to Tortuga, or some port of the great island.

As the bucaneeers used much exercise, and fed only on flesh meat, they generally enjoyed a good state of health. They were indeed subject to fevers, but either such as lasted only a day, and left no sensible impression the day following; or little slow fevers, which did not hinder them from action, and were of course so little regarded, that it was usual with the patient, when asked how he did, to answer, "Very well, nothing ails me but the fever." It was impossible, however, they should not suffer considerably by such fatigues under a climate, to the heat of which few of them had been early enough inured. Hence the most considerate among them, after they had got money enough for that purpose, turned planters. The rest soon spent the

Bucaneer.

fruits of their labour in taverns and tipping-houses; and many had so habituated themselves to this kind of life, as to become incapable of any other. Nay, there have been instances of young men, who having early embarked through necessity in this painful and dangerous profession, persisted in it afterwards, merely thro' a principle of libertinism, rather than return to France and take possession of the most plentiful fortunes.

Such were the bucaneeers of St Domingo, and such their situation, when the Spaniards undertook to extirpate them. And at first they met with great success; for as the bucaneeers hunted separately, every one attended by his servants, they were easily surpris'd. Hence the Spaniards killed numbers, and took many more, whom they condemned to a most cruel slavery. But whenever the bucaneeers had time to put themselves into a state of defence, they fought like lions, to avoid falling into the hands of a nation from whom they were sure to receive no quarter; and by this means they often escap'd; nay, there are many instances of single men fighting their way through numbers. These dangers, however, and the success of the Spaniards in discovering their boucans, where they used to surpris'e and cut the throats of them and their servants in their sleep, engag'd them to cohabit in greater numbers, and even to act offensively, in hopes that by so doing they might at last induce the Spaniards to let them live in peace. But the fury with which they behaved whenever they met any Spaniards, serv'd only to make their enemies more intent on their destruction; and assistance coming to both parties, the whole island was turn'd into a slaughter-house, and so much blood spilt on both sides, that many places, on account of the carnage of which they had been the theatres, were intitled, *of the massacre*: such as *the hill of the massacre*; *the plain of the massacre*; *the valley of the massacre*; which names they retain to this day.

At length the Spaniards grew tired of this way of proceeding, and had recourse to their old method of surpris'e, which against enemies of more courage than vigilance was like to succeed better. This put the bucaneeers under a necessity of never hunting but in large parties, and fixing their boucans in the little islands on the coast, where they retired every evening. This expedient succeed'd; and the boucans, by being more fixed, soon acquired the air and consistency of little towns.

When the bucaneeers had once fix'd themselves, as related, each boucan ordered scouts every morning to the highest part of the island, in order to reconnoitre the coast, and see if any Spanish parties were abroad. If no enemy appear'd, they appointed a place and hour of rendezvous in the evening, and were never absent if not killed or prisoners. When therefore any one of the company was missing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or avenged his death if killed.

Things continued in this situation for a long time, till the Spaniards made a general hunt over the whole island; and by destroying their game, put the bucaneeers under a necessity of betaking themselves to another course of life. Some of them turn'd planters; and thereby increased some of the French settlements on the coast, and formed others. The rest, not relishing to be confin'd and regular a life, enter'd among the freebooters, who thereby became a very powerful body.

France,

Bucaneers.

France, who had hitherto disclaimed for her subjects these ruffians whose successs were only temporary, acknowledged them, however, as soon as they formed themselves into settlements; and took proper measures for their government and defence *.

* See the article St Domingo.

Savary's Dict. of Com.

The hunting both of the bull and boar is at this day carried on, and proves of considerable importance. That of the former furnishes France with the finest hides brought from America. The bucaneeers put the hides in packs which they call loads, mixing together hides of full grown bulls, of young bullocks, and of cows. Each of these loads is composed of two bull-hides, or of an equivalent; that is to say, either of two real bull-hides, or of one bull-hide and two cow-hides, or of four cow-hides, or of three young bullocks hides; three bullocks hides being reckoned equivalent to two full-grown bulls hides, and two cows hides equivalent to one bull's hide. These bulls they commonly call *oxen* in France, though they are not gelt. Each load is commonly sold for six pieces of eight rials, which is a Spanish coin, the French coin being but little current, or not at all, in the island of St Domingo.

The boar meat bucanned in the manner abovementioned is sold by the bundle or pack, weighing commonly 60 pounds, at the rate of six pieces of eight per pack. The palmetto leaves serve to pack it up in; but their weight is deducted, so that there must be in each pack 60 pounds of net flesh. These bucaneeers have also a great trade of the lard of boars, which they melt, and gather in large pots called *potiches*. This lard, which is called *mantegua*, is also sold for about eight pieces of eight per pot. There is a great trade, and a great consumption of each of these merchandizes in the French settlements of the island of St Domingo, and in those of Tortuga: besides which, they used to send great quantities of them to the Antilles, and even into the continent of French America. There is also a great deal of it sold for the support of the crews of the ships that come from France for trading, or which the privateers of Tortuga fit out for cruising against the Spaniards.

The Spaniards, who have large settlements in the island of St Domingo, have also their bucaneeers there, whom they call *mataidores* or *moneros*. Their chase has something noble, which favours of the Spanish pride: the huntsman being on horseback, uses the lance to strike the bull, thinking it beneath his courage to shoot him at a distance. When the servants, who are on foot, have discovered the beast, and with their dogs have driven it into some savannah or meadow, in which the maister waits for them on horseback, armed with two lances, that matadore goes and hamstringing it with the first lance, the head of which is made like a crescent or half-moon, and extremely sharp, and kills it afterwards with the other lance, which is a common one. This chase is very agreeable; the huntsman making commonly, in order to attack the bull, the same turns and the same ceremonies which are practised in those festivals so famous in Spain, wherein the greatest lords expose themselves sometimes to the view of the people, to make them admire their dexterity and intrepidity, in attacking those furious animals: but then it is a very dangerous chase; those bulls, in their fury, often running directly against the huntsman, who may think

Vol. II.

himself very happy if he comes off only with the loss of his horse, and if he himself is not mortally wounded.

The Spaniards dress their hides like the French, who have learned it from them; and these hides being carried to the Havannah, a famous harbour in the island of Cuba, are part of the trade of that celebrated town. The flota and the galleons scarce ever fail touching there, on their return from Vera Cruz and Porto Bello, and load there those hides which they carry into Spain, where they are sold for Havannah hides, the most esteemed of any that are brought from America into Europe.

II. BUCANEERS, the *Pirates*. Before the English had made any settlement at Jamaica, and the French at St Domingo, some pirates of both nations, who have since been so much distinguished by the name of *Bucaneers*, had driven the Spaniards out of the small island of Tortuga; and, fortifying themselves there, had with an amazing intrepidity made excursions against the common enemy. They formed themselves into small companies, consisting of 50, 100, or 150 men each. A boat, of a greater or smaller size, was their only armament. Here they were exposed, night and day to all the inclemencies of the weather, having scarce room enough to lie down. A love of absolute independence, the greatest blessing to those who are not proprietors of land, rendered them averse from those mutual restraints which the members of society impose upon themselves for the common good; some of them chose to sing, while others were desirous of going to sleep. As the authority they had conferred on their captain was confined to his giving orders in battle, they lived in the greatest confusion. Like the savages, having no apprehension of want, nor any care to preserve the necessaries of life, they were constantly exposed to the severest extremities of hunger and thirst. But deriving, even from their very distresses, a courage superior to every danger, the sight of a ship transported them to a degree of frenzy. They never deliberated on the attack, but it was their custom to board the ship as soon as possible. The smallness of their vessels, and the skill they shewed in the management of them, screened them from the fire of the greater ships; and they presented only the fore part of their little vessels filled with fusileers; who fired at the port-holes with so much exactness, that it entirely confounded the most experienced gunners. As soon as they threw out the grappling, the largest vessel seldom escaped them.

In cases of extreme necessity, they attacked the people of every nation, but fell upon the Spaniards at all times. They thought that the cruelties the latter had exercised on the inhabitants of the new world justified the implacable aversion they had sworn against them. But this was heightened by a personal pique, from the mortification they felt in seeing themselves debarred from the privilege of hunting and fishing, which they considered as natural rights. Such were their principles of justice and religion, that, whenever they embarked on any expedition, they used to pray to heaven for the success of it; and they never came back from the plunder, but they constantly returned thanks to God for their victory.

The ships that sailed from Europe into America seldom tempted their avidity. The merchandise they contained would not easily have been sold, nor been very profitable to these barbarians in those early times. They al-

Bucaneers.

Raynal's Hist. of the Indies.

ways waited for them on their return, when they were certain that they were laden with gold, silver, jewels, and all the valuable productions of the new world. If they met with a single ship, they never failed to attack her. As to the fleets, they followed them, till they failed out of the gulph of Bahama; and as soon as any one of the vessels was separated by accident from the rest, it was taken. The Spaniards, who trembled at the approach of the bucaners, whom they called *devils*, immediately surrendered. Quarter was granted, if the cargo proved to be a rich one; if not, all the prisoners were thrown into the sea.

The bucaners, when they had got a considerable booty, at first held their rendezvous on the island of Tortuga, in order to divide the spoil; but afterwards the French went to St Domingo, and the English to Jamaica. Each person, holding up his hand, solemnly protested that he had deserted nothing of what he had taken. If any one among them was convicted of perjury, a case that seldom happened, he was left, as soon as an opportunity offered, upon some desert island, as a traitor unworthy to live in society. Such brave men among them as had been maimed in any of their expeditions, were first provided for. If they had lost a hand, an arm, a leg, or a foot, they received 26l. An eye, a finger, or a toe, lost in fight, was valued only at half the above sum. The wounded were allowed 2s. 6d. a-day for two months, to enable them to have their wounds taken care of. If they had not money enough to answer these several demands, the whole company were obliged to engage in some fresh expedition, and to continue it till they had acquired a sufficient stock to enable them to satisfy such honourable contracts.

After this act of justice and humanity, the remainder of the booty was divided into as many shares as there were bucaners. The commander could only lay claim to a single share as the rest; but they complimented him with two or three, in proportion as he had acquitted himself to their satisfaction. Favour never had any influence in the division of the booty; for every share was determined by lot. Instances of such rigid justice as this are not easily met with; and they extended even to the dead. Their share was given to the man who was known to be their companion when alive, and therefore their heir. If the person who had been killed had no intimate, his part was sent to his relations when they were known. If there were no friends or relations, it was distributed in charity to the poor and to churches, which were to pray for the person in whose name these benefactions were given.

When these duties had been complied with, they then indulged themselves in all kinds of profusion. Unbounded licentiousness in gaming, wine, women, every kind of debauchery, was carried to the utmost pitch of excess, and was stopt only by the want which such profusions brought on. Those men who were enriched with several millions, were in an instant totally ruined, and destitute of clothes and provisions. They returned to sea; and the new supplies they acquired were soon lavished in the same manner.

The Spanish colonies, flattering themselves with the hopes of seeing an end to their miseries, and reduced almost to despair in finding themselves a perpetual prey to these ruffians, grew weary of navigation. They gave up all the power, conveniences, and fortune, which

their connections procured them, and formed themselves almost into so many distinct and separate states. They were sensible of the inconveniences arising from such a conduct, and avowed them; but the dread of falling into the hands of rapacious and savage men, had greater influence over them, than the dictates of honour, interest, and policy. This was the rise of that spirit of inactivity which continues to this time.

This dependency served only to increase the boldness of the bucaners. As yet they had only appeared in the Spanish settlements, in order to carry off some provisions when they were in want of them. They no sooner found their captures begin to diminish, than they determined to recover by land what they had lost at sea. The richest and most populous countries of the continent were plundered and laid waste. The culture of lands was equally neglected with navigation; and the Spaniards dared no more appear in their public roads, than sail in the latitudes which belonged to them.

Among the bucaners who signalized themselves in this new species of excursions, Montbar, a gentleman of Languedoc, particularly distinguished himself. Having by chance, in his infancy, met with a circumstantial account of the cruelties practised in the conquest of the new world, he conceived an aversion which he carried to a degree of frenzy against that nation which had committed such enormities. The enthusiasm this spirit of humanity worked him up to, was turned into a rage more cruel than that of religious fanaticism, to which so many victims had been sacrificed. The names of these unhappy sufferers seemed to rouse him and call upon him for vengeance. He had heard some account of the bucaners, who were said to be the most inveterate enemies to the Spanish name: he therefore embarked on board a ship, in order to join them.

In the passage, they met with a Spanish vessel; attacked it; and, as it was usual in those times, immediately boarded it. Montbar, with a sabre in his hand, fell upon the enemy; broke through them; and, hurrying twice from one end of the ship to the other, levelled every thing that opposed him. When he had compelled the enemy to surrender, leaving to his companions the happiness of dividing so rich a booty, he contented himself with the savage pleasure of contemplating the dead bodies of the Spaniards, lying in heaps together, against whom he had sworn a constant and deadly hatred.

Fresh opportunities soon occurred, that enabled him to exert this spirit of revenge, without extinguishing it. The ship he was in arrived at the coast of St Domingo; where the bucaners on land immediately applied to barter some provisions for brandy. As the articles they offered were of little value, they alleged in excuse, that their enemies had over-run the country, laid waste their settlements, and carried off all they could. "Why (replied Montbar) do you tamely suffer such insults?" "Neither do we (answered they in the same tone); the Spaniards have experienced what kind of men we are, and have therefore taken advantage of the time when we were engaged in hunting. But we are going to join some of our companions, who have been still more ill-treated than we; and then we shall have warm work." "If you approve of it (answered Montbar), I will head you, not as your commander, but as the fore-

foremost to expose myself to danger." The bucaners, perceiving from his appearance that he was such a man as they wanted, cheerfully accepted his offer. The same day they overtook the enemy, and Montbar attacked them with an impetuosity that astonished the bravest. Scarcely one Spaniard escaped the effects of his fury. The remaining part of his life was equally distinguished as on this day. The Spaniards suffered so much from him, both by land and at sea, that he acquired the name of the *Exterminator*.

His savage disposition, as well as that of the other bucaners who attended him, having obliged the Spaniards to confine themselves within their settlements, these free-booters resolved to attack them there. This new method of carrying on the war required superior forces, and their associations in consequence became more numerous. The first that was considerable, was formed byOLONois, who derived his name from the sands of Olonos the place of his birth. From the abject state of a bondman, he had gradually raised himself to the command of two canoes, with 22 men. With these he was so successful, as to take a Spanish frigate on the coast of Cuba. He then repaired to the Port-au-Prince, in which were four ships, fitted out purposely to sail in pursuit of him. He took them, and threw all the crew into the sea, except one man, whom he saved, in order to send him with a letter to the governor of the Havannah, acquainting him with what he had done, and assuring him that he would treat in the same manner all the Spaniards that should fall into his hands, not excepting the governor himself, if he should be so fortunate as to take him. After this expedition, he ran his canoes and prize-ships aground, and sailed with his frigate only to the island of Tortuga.

Here he met with Michael de Basco, who had distinguished himself by having taken, even under the cannon of Porto-Bello, a Spanish ship estimated at 218,500*l.* and by other actions equally brave and daring. These two gave out, that they were going to embark together on an expedition equally glorious and profitable; in consequence of which they soon collected together 440 men. This body of men, the most numerous the bucaners had yet been able to muster, sailed to the bay of Venezuela, which runs up into the country for the space of 50 leagues. The fort that was built at the entrance of it for its defence, was taken; the cannon were nailed up; and the whole garrison, consisting of 250 men, put to death. They then reembarked; and came to Maracaybo, built on the western coast of the lake of the same name, at the distance of ten leagues from its mouth. This city, which had become flourishing and rich by its trade in skins, tobacco, and cocoa, was deserted. The inhabitants had retired with their effects to the other side of the bay. If the bucaners had not loit a fortnight in riot and debauch, they would have found at Gibraltar, near the extremity of the lake, every thing that the inhabitants had secreted to secure it from being plundered. On the contrary, they met with fortifications lately erected, which they had the useless satisfaction of making themselves masters of, at the expence of a great deal of blood; for the inhabitants had already removed at a distance the most valuable part of their property. Exasperated at this disappointment, they set fire to Gibraltar. Maracaybo would have shared the same fate, had it not been ran-

fomed. Besides the sum they received for its ransom, they also carried off with them all the crosses, pictures, and bells of the churches; intending, as they said, to build a chapel in the island of Tortuga, and to consecrate this part of their spoils to sacred purposes. Such was the religion of these barbarous people, who could make no other offering to heaven than that which arose from their robberies and plunder.

While they were idly dissipating the spoils they had made on the coast of Venezuela, Morgan, the most renowned of the English bucaners, sailed from Jamaica to attack Porto-Bello. His plan of operations was so well contrived, that he surpris'd the city, and took it without opposition.

The conquest of Panama was an object of much greater importance. To secure this, Morgan thought it necessary to sail in the latitudes of Costa-Ricca, to procure some guides in the island of St Catherine's, where the Spaniards confined their malefactors. This place was so strongly fortified, that it ought to have held out for ten years against a considerable army. Notwithstanding this, the governor, on the first appearance of the pirates, sent privately to concert measures how he might surrender himself without incurring the imputation of cowardice. The result of this consultation was, that Morgan, in the night-time, should attack a fort at some distance, and the governor should fall out of the citadel to defend a post of so much consequence; that the assailants should then attack him in the rear, and take him prisoner, which would consequently occasion a surrender of the place. It was agreed that a smart firing should be kept on both sides, without doing mischief to either. This farce was admirably carried on. The Spaniards, without being exposed to any danger, appeared to have done their duty; and the bucaners, after having totally demolished the fortifications, and put on board their vessels a prodigious quantity of warlike ammunitions which they found at St Catherine's, steered their course towards the river Chagre, the only channel that was open to them to arrive at the place which was the object of their utmost wishes.

At the entrance of this considerable river, a fort was built upon a steep rock, which the waves of the sea constantly beat against. This bulwark, very difficult of access, was defended by an officer whose extraordinary abilities were equal to his courage, and by a garrison that deserved such a commander. The bucaners, for the first time, here met with a resistance that could only be equalled by their perseverance: it was a doubtful point, whether they would succeed, or be obliged to raise the siege, when a lucky accident happened that proved favourable to their glory and their fortune. The commander was killed, and the fort accidentally took fire: the besiegers then taking advantage of this double calamity, made themselves masters of the place.

Morgan left his vessels at anchor, with a sufficient number of men to guard them; and sailed up the river in his sloops for 33 miles, till he came to Cruces, where it ceases to be navigable. He then proceeded by land to Panama, which was only five leagues distant. Upon a large and extensive plain that was before the city, he met with a considerable body of troops, whom he put to flight with the greatest ease, and entered into the city, which was now abandoned. Here were found prodigious treasures concealed in the wells and caves.

Bucaners. Some valuable commodities were also taken upon the boats that were left aground at low water; and in the neighbouring forests were also found several rich deposits.

Having burnt the city, they set sail with a great number of prisoners, who were ransomed a few days after; and came to the mouth of the Chagre with a prodigious booty.

In 1603, an expedition of the greatest consequence was formed by Van Horn, a native of Orlend, but who had served all his life among the French. His intrepidity would never let him suffer the least signs of cowardice among those who associated with him. In the heat of an engagement, he went about his ship; successfully observed his men; and immediately killed those who shrunk at the sudden report of a pistol, gun, or cannon. This extraordinary discipline had made him become the terror of the coward, and the idol of the brave. In other respects, he readily shared with the men of spirit and bravery the immense riches that were acquired by so truly warlike a disposition. When he went upon these expeditions, he generally failed in his frigate, which was his own property. But these new designs requiring greater numbers to carry them into execution, he took to his assistance Grammont, Godfrey, and Jonqué, three Frenchmen distinguished by their exploits; and Lawrence de Graff, a Dutchman, who had signalized himself still more than they. Twelve hundred bucaners joined themselves to these famous commanders, and failed in six vessels for Vera Cruz.

The darkness of the night favoured their landing, which was effected at three leagues from the place, where they arrived without being discovered. The governor, the fort, the barracks, and the posts of the great city consequence; every thing, in short, that could occasion any resistance, was taken by the break of day. All the citizens, men, women, and children, were shut up in the churches, whither they had fled for shelter. At the door of each church were placed barrels of gunpowder to blow up the building. A bucaner, with a lighted match, was to set fire to it upon the least appearance of an insurrection.

While the city was kept in such terror, it was easily pillaged; and after the bucaners had carried off what was most valuable, they made a proposal to the citizens who were kept prisoners in the churches, to ransom their lives and liberties by a contribution of 437,500*l*. These unfortunate people, who had neither ate nor drank for three days, cheerfully accepted the terms that were offered them. Half of the money was paid the same day: the other part was expected from the internal parts of the country; when there appeared on an eminence a considerable body of troops advancing, and near the port a fleet of 17 ships from Europe. At the sight of this armament, the bucaners, without any marks of surprize, retreated quietly, with 1500 slaves they had carried off with them as a trifling indemnification for the rest of the money they expected, the settling of which they referred to a more favourable opportunity.

Their retreat was equally daring. They boldly sailed through the midst of the Spanish fleet; which let them pass without firing a single gun, and were in fact rather afraid of being attacked and beaten. The Spaniards would not probably have escaped so easily, and with no other inconvenience but what arose from their fears,

if the vessels of the pirates had not been laden with silver, or if the Spanish fleet had been freighted with any other effects but such merchandise as were little valued by these pirates.

A year had scarce elapsed since their return from Mexico, when on a sudden they were all seized with the rage of going to plunder the country of Peru. It is probable, that the hope of finding greater treasures upon a sea little frequented, than on one long exposed to piracies of this kind, was the cause of this expedition. But it is somewhat remarkable, that both the English and French, and the particular associations of these two nations, had projected this plan at the same time, without any communication, intercourse, or design of acting in concert, with each other. About 4000 men were employed in this expedition. Some of them came by Terra-Firma, others by the freights of Magellan, to the place that was the object of their wishes. If the intrepidity of these barbarians had been directed, under the influence of a skilful and respectable commander, to one single uniform end, it is certain that they would have deprived the Spaniards of this important colony. But their natural character was an invincible obstacle to so rare an union; for they always formed themselves into several distinct bodies, sometimes even so few in number as ten or twelve, who acted together, or separated, as the most trifling caprice directed. Grogner, Lécuyer, Picard, and Le Sage, were the most distinguished officers among the French: David, Samms, Peter, Wilsner, and Towley, among the English.

Such of those adventurers as had got into the South Sea by the freights of Darien, seized upon the first vessels they found upon the coast. Their associates, who had failed in their own vessels, were not much better provided. Weak however as they were, they beat several times the Squadrons that were fitted out against them. But these victories were prejudicial to them, as they interrupted their navigation. When there were no more ships to be taken, they were continually obliged to make descents upon the coasts to get provisions, or to go by land in order to plunder those cities where the booty was secured. They successively attacked Seppa, Puebla-Nuevo, Leon, Realajo, Puebla-Viejo, Chiriquita, Leparso, Granada, Villia, Nicoya, Tecomanca, Mucmeluna, Chiloteca, New-Segovia, and Guayaquil, the most considerable of all these places.

Many of them were taken by surprize; and most of them deserted by their inhabitants, who fled at the sight of the enemy. As soon as they took a town, it was directly set on fire, unless a sum proportioned to its value was given to save it. The prisoners taken in battle were massacred without mercy, if they were not ransomed by the governor or some of the inhabitants: gold, pearls, or precious stones, were the only things accepted of for the payment of their ransom. Silver being too common, and too weighty for its current value, would have been troublesome to them. The chances of fortune, that seldom leave guilt unpunished, nor adversity without a compensation for its suffering, atoned for the crimes committed in the conquest of the new world, and the Indians were amply revenged of the Spaniards.

While such piracies were committed on the southern ocean, the northern was threatened with the same by Gram-

Grammont. He was a native of Paris, by birth a gentleman, and had distinguished himself in a military capacity in Europe; but his passion for wine, gaming, and women, had obliged him to join the pirates. He was, however, affable, polite, generous, and eloquent: he was endued with a sound judgment, and was a person of approved valour; which soon made him be considered as the chief of the French bucanears. As soon as it was known that he had taken up arms, he was immediately joined by a number of brave men. The governor of St Domingo, who had at length prevailed upon his matter to approve of the project, equally wise and just, of fixing the pirates to some place, and inducing them to become cultivators, was desirous of preventing the concerted expedition, and forbade it in the king's name. Grammont, who had a greater share of sense than his associates, was not on that account more inclined to comply, and sternly replied: "How can Lewis disapprove of a design he is unacquainted with, and which has been planned only a few days ago?" This answer highly pleased all the bucanears; who directly embarked, in 1685, to attack Campeachy.

They landed without opposition. But at some distance from the coast, they were attacked by 800 Spaniards, who were beaten and pursued to the town; where both parties entered at the same time. The cannon they found there was immediately levelled against the citadel. As it had very little effect, they were contriving some stratagem to enable them to become masters of the place; when intelligence was brought that it was abandoned. There remained in it only a gunner; an Englishman; and an officer of such signal courage, that he chose rather to expose himself to the greatest extremities, than basely to fly from the place with the rest. The commander of the bucanears received him with marks of distinction, generously released him, gave him up all his effects, and besides complimented him with some valuable presents: such influence have courage and fidelity even on the minds of those who seem to violate all the rights of society.

The conquerors of Campeachy spent two months in searching all the environs of the city, for 12 or 15 leagues, carrying off every thing that the inhabitants, in their flight, thought they had preserved. When all the treasure they had collected from every quarter was deposited in the ships, a proposal was made to the governor of the province, who still kept the field with 900 men, to ransom his capital city. His refusal determined them to burn it, and demolish the citadel. The French, on the festival of St Louis, were celebrating the anniversary of their king; and in the transports of their patriotism, intoxication, and national love of their prince, they burnt to the value of a million of logwood; a part, and a very considerable one too, of the spoil they had made. After this singular and extravagant instance of folly, of which Frenchmen only could boast, they returned to St Domingo.

In 1697, 1200 bucanears were induced to join a squadron of seven ships that sailed from Europe under the command of Pointis, to attack the famous city of Carthagena. This was the most difficult enterprise that could be attempted in the new world. The situation of the port, the strength of the place, the badness of the climate, were so many obstacles that seemed insurmountable to any but such men as the bucanears were.

But every obstacle yielded to their valour and good fortune: the city was taken, and booty gained to the amount of 1,750,000*l*. Their rapacious commander, however, deprived them of the advantages resulting from their success. He scrupled not, as soon as they set sail, to offer 5250*l*. for the share of those who had been the chief instruments in procuring him so considerable a spoil.

The bucanears, exasperated at this treatment, resolved immediately to board the vessel called the *Sceptre*, where Pointis himself was, and which at that time was too far distant from the rest of the ships to expect to be assisted by them. This avaricious commander was upon the point of being massacred, when one of the malecontents cried out: "Brethren, why should we attack this rascal? he has carried off nothing that belongs to us. He has left our share at Carthagena, and there we must go to recover it." This proposal was received with general applause. A savage joy at once succeeded that gloomy melancholy which had seized them; and without further deliberation, all their ships sailed towards the city.

As soon as they had entered the city without meeting with any resistance, they shut up all the men in the great church; and exacted payment of 218,750*l*. the amount of their share of booty which they had been defrauded of; promising to retreat immediately upon their compliance, but threatening the most dreadful vengeance if they refused. Upon this, the most venerable priest in the city mounted the pulpit, and made use of the influence his character, his authority, and his eloquence gave him, to persuade his hearers to yield up without reserve all the gold, silver, and jewels they had. The collection, which was made after the sermon, not furnishing the sum required, the city was ordered to be plundered.

At length, after amassing all they could, these adventurers set sail; when unfortunately they met with a fleet of Dutch and English ships, both which nations were then in alliance with Spain. Several of the pirates were either taken or sunk, with all the cargo they had on board their ships; the rest escaped to St Domingo.

Such was the last memorable event in the history of the bucanears. The separation of the English and French, when the war, on account of the prince of Orange, divided the two nations: the successful means they both made use of to promote the cultivation of land among their colonies, by the assistance of these enterprising men; and the prudence they shewed in fixing the most distinguished among them, and entrusting them with civil and military employments: the protection they were both under a necessity of affording to the Spanish settlements, which till then had been a general object of plunder: all these circumstances, and various others, besides the impossibility there was of supplying the place of these remarkable men, who were continually dropping off, concurred to put an end to a society, as extraordinary as ever existed. Without any regular system, without laws, without any degree of subordination, and even without any fixed revenue, they became the astonishment of that age in which they lived, as they will be also of posterity.

BUCCELLARI, an order of soldiery under the Greek emperors, appointed to guard and distribute the

Buccellatum ammunition bread; tho' authors are somewhat divided as to their office and quality. Among the Visigoths, buccellarius was a general name for a client or vassal who lived at the expence of his lord. Some give the denomination to parasites in the courts of princes, some make them the body-guards of emperors, and some fancy they were only such as emperors employed in putting persons to death privately.

BUCELLATUM, among ancient military writers, denotes camp-bread, or biscuit baked hard and dry, both for lightness and keeping. Soldiers always carried with them enough for a fortnight, and sometimes much longer, during the time that military discipline was kept up.

BUCCINA, an ancient musical and military instrument. It is usually taken for a kind of trumpet; which opinion is confirmed by Festus, by his defining it a crooked horn, played on like a trumpet. Vegetius observes, that the buccina bent in a semicircle, in which respect it differed from the tuba or trumpet. It is very hard to distinguish it from the cornu or horn, unless it was something less, and not quite so crooked; yet it certainly was of a different species, because we never read of the cornu in use with the watch, but only the buccina. Besides, the sound of the buccina was sharper, and to be heard much farther, than either the cornu or the tuba. In scripture, the like instrument, used both in war and in the temple, was called *rans-horns*, *kiren-jobel*, and *spheroth hagijobelim*.

This instrument was in use among the Jews to proclaim their feast-days, new-moons, jubilees, sabbatic years, and the like. At Lacedaemon, notice was given by the buccina, when it was supper-time; and the like was done at Rome, where the grandees had a buccina blown both before and after they sat down to table. The sound of the buccina was called *buccinus*, or *bucinus*; and the musician who played on it was called *buccinator*.

BUCCINUM, or **WHELK**, a genus of shell-fish belonging to the order of vermes testaceae. This animal is one of the snail kind. The shell is univalve, spiral, and gibbous. The aperture is oval, ending in a small strait canal. Linnæus enumerates about 60 species, most of which are found in the southern seas. The six following are found in the British seas.

1. The pullus, or brown whelk, with five spires striated, waved, and tuberculated. Aperture wrinkled; upper part replicated. Length five eighths of an inch.
2. The undatum, or waved whelk, with seven spires, is spirally striated, and deeply and transversely undulated. Length three inches. Inhabits deep water.
3. The striatum has eight spires, with elevated striæ, undulated near the apex. Length near four inches.
4. The reticulatum, with spires scarcely raised, and strongly reticulated, is of a deep brown colour, and of an oblong form. The aperture white, glossy, and denticulated. Size of a hazel nut.
5. The minutum, or small whelk, with five spires, striated spirally, ribbed transversely. Size less than a pea. Found also in Norway.

* PL. LXVI. fig. 1. 6. The lapillus *, or massy whelk, with about five spires; side of the mouth slightly toothed: a very strong thick shell, of a whitish colour. A variety yellow, or fasciated with yellow, on a white ground; or sulcated spirally, and sometimes reticulated. Length

near an inch and an half. Inhabits, in vast abundance, rocks near low-water mark. This is one of the British shells that produce the purple dye analogous to the *purpura* of the ancients. See *MUREX*.

The process of obtaining the English *purpura* is well described by Mr William Cole of Bristol, in 1684, in the following words. "The shells, being harder than most other kinds, are to be broken with a smart stroke of a hammer, on a plate of iron or firm piece of timber (with their mouths downwards) so as not to crush the body of the fish within; the broken pieces being picked off, there will appear a white vein lying transversely in a little furrow or cleft next to the head of the fish, which must be digged out with the stiff point of a horse-hair pencil, being made short and tapering. The letters, figures, or what else shall be made on the linen, (and perhaps silk too), will presently appear of a pleasant light green colour; and if placed in the sun, will change into the following colours; (*i. e.* if in winter, about noon, if in the summer, an hour or two after sunrise, and so much before setting; for in the heat of the day in summer, the colours will come on so fast, that the succession of each colour will scarcely be distinguished.) Next to the light green, it will appear of a deep green; and in a few minutes, change into a sea-green; after which, in a few minutes more, it will alter to a wotchet-blue; from that, in a little time more, it will be of a purple-red; after which, (supposing the sun still shining), it will be of a very deep purple-red, beyond which the sun can do no more. But then, the last and most beautiful colour, after washing in scalding water and soap, will (the matter being again put into the wind or sun to dry) be of a fair bright crimson, or near to the prince's colour; which afterwards, notwithstanding there is no use of any styptic to bind the colour, will continue the same if well ordered; as I have found in handkerchiefs, that have been washed more than 40 times; only it will be somewhat allayed from what it was after the first washing. While the cloth so writ upon lies in the sun, it will yield a very strong and fetid smell, as if garlic and asafetida were mixed together."

BUCCO, in ornithology, a genus belonging to the order of picæ. The beak is cultrated, turned inwards, compressed on the sides, and emarginated on each side at the apex; and there is a long slit below the eyes. The nostrils are covered with feathers. The feet have four toes, two before and two behind. There is but one species, *viz.* the capensis, which is of a reddish colour, with a yellow belt round the shoulders, and a black one round the breast. It is found at the Cape of Good Hope.

BUCCENTAUR, a galeas, or large galley of the doge of Venice, adorned with fine pillars on both sides, and gilt over from the prow to the stern. This vessel is covered over head with a kind of tent, made of purple silk. In it the doge receives the great lords and persons of quality that go to Venice, accompanied with the ambassadors and counsellors of state, and all the senators seated on benches by him. The same vessel serves also in the magnificent ceremony of ascension-day, on which the duke of Venice throws a ring into the sea to espouse it, and to denote his dominion over the gulph of Venice.

BUCCENTAUR is also the name of a ship, as great and

Buccinum
||
Barentaur.

Phil. Transf.
abr. ii. 526.

as magnificent as that of the Venetians, built by order of the elector of Bavaria, and lanchod on a lake which is six leagues in length.

BUCER (Martin), one of the first authors of the reformation at Straburgh, was born in 1491, in Alface; and took the religious habit of St Dominic, at seven years of age: but meeting afterward with the writings of Martin Luther, and comparing them with the Scriptures, he began to entertain doubts concerning several things in the Romish religion. After some conferences with Luther at Heidelberg in 1521, he adopted most of his sentiments; but in 1532 he gave the preference to those of Zuinglius. He assisted in many conferences concerning religion; and in 1548 was sent for to Augsburg to sign the agreement between the Papists and Protestants, called the *interim*. His warm opposition to this project exposed him to many difficulties and hardships; the news of which reaching England, where his fame had already arrived, Cranmer archbishop of Canterbury gave him an invitation to come over, which he readily accepted. In 1549, an handsome apartment was assigned him in the university of Cambridge, and a salary to teach theology. King Edward VI. had the greatest regard for him. Being told that he was very sensible of the cold of the climate, and suffered much for want of a German stove, he sent him 100 crowns to purchase one. He died of a complication of disorders in 1551; and was buried at Cambridge with great funeral pomp. Five years after, in the reign of queen Mary, his body was dug up, and publicly burnt, and his tomb demolished; but it was afterwards set up by order of queen Elizabeth. He composed many works, among which are commentaries on the evangelists and gospels.

BUCEROS, in ornithology, a genus belonging to the order of pica. The beak is convex, cultrated, very large, and serrated outwards: the fore-head is naked, with a bony gibbosity. The nostrils are behind the base of the beak. The tongue is sharp and short. The feet are of the *gressarii* kind, i. e. the toes are distinct from each other. There are four species of the buceros, viz. 1. The *bicornis*, with a flat bony forehead, and two horns before. The body is black, and about the size of a hen; but the breast, belly, and thighs are white. There is a white spot on the wing; the tail is long, with ten black prime feathers, and the four outermost on each are white. The feet are greenish, with three toes before and one behind. It is a native of China, and called *calao* by Willoughby and other authors. 2. The *hydrocorax*, or Indian crow of Ray, has a plain bony forehead without any horns. The body is yellowish, and blackish below. It inhabits the Molucca isles. 3. The *rhinoceros*, has a crooked horn in the forehead joined to the upper mandible. It is a native of India, and feeds upon carrion. 4. The *nafutus*, has a smooth forehead. It is about the size of a magpie, and is a native of Senegal.

BUCHAN, a county or district of Scotland, lying partly in the shire of Aberdeen, and partly in that of Banff: it gives the title of earl to the noble and ancient family of Erskine.

BUCHANAN (George), the best Latin poet of his time, perhaps inferior to none since the Augustan age, was born in February 1506.

This accomplished scholar and distinguished wit was

not defended of a family remarkable for its rank. He had no occasion for the splendor of ancestry. He wanted not a reflected greatness, the equivocal, and too often the only, ornament of the rich and noble. The village of Killearn, in Dumbarton-shire, Scotland, was the place of his nativity; and the abject poverty in which his father died might have confined him to toil at the lowest employments of life, if the generosity of an uncle had not assisted him in his education, and enabled him to pursue, for two years, his studies at Paris. But that short space was scarcely elapsed, when the death of his benefactor made it necessary that he should return to his own country, and forsake, for a time, the paths of science.

He was yet under his 20th year, and surrounded with the horrors of indigence. In this extremity, he enlisted as a common soldier under John duke of Albany, who commanded the troops which France had sent to assist Scotland in the war it waged, at this period, against England. But nature had not destined him to be a hero. He was disgusted with the fatigues of one campaign; and, fortunately, John Major, then professor of philosophy at St Andrew's, hearing of his necessity and his merit, afforded him a temporary relief. He now became the pupil of John Maiz, a celebrated teacher in the same university, under whom he studied the subtilties of logic; and, contracting an attachment to his master, he followed him to Paris.

There, after having encountered many difficulties, he was invited to teach grammar in the college of St Barbe. In this slavish occupation he was found by the earl of Castels; with whom, having remained five years at Paris, he returned into Scotland. He next acted as preceptor to the famous earl of Murray, the natural son of James V. But, while he was forming this nobleman for public affairs, he found that his life was in danger; and from enemies, whose vindictive rage could suffer no abatement, and who would not scruple the most dishonourable means of gratifying it.

The scandalous lives of the clergy had, it seems, excited his indignation; and, more than reasoning or argument, had estranged him from the errors of Popery. The Franciscan monks, in return to the beautiful but poignant satires he had written against them, branded him with the appellation of *atheist*; a term which the religious of all denominations are too apt indiscriminately to lavish where they have conceived a prejudice; and, not satisfied with the outrage of abuse and calumny, they conspired his destruction. Cardinal Beaton gave orders to apprehend him, and bribed king James with a very considerable sum to permit his execution. He was seized upon accordingly; and the first genius of his age was about to perish by the halter, or by fire, to satisfy a malignant resentment, when, escaping the vigilance of his guards, he fled into England. Henry VIII. at all times the slave of caprice and passion, was then burning, on the same day, and at the same stake, the Lutheran and the Papist. His court did not buy a philosopher, or a satyrilist. After a short stay, Buchanan crossed the sea to France; and, to his extreme disappointment, found, at Paris, cardinal Beaton, as ambassador from Scotland. He retired privately to Bourdeaux, dreading, perhaps, new misfortunes, and concerned that he could not prosecute his studies in obscurity and in silence. Here he met Andrew Govea,

Govea, a Portuguese of great learning and worth, with whom he had formerly been acquainted during his travels, and who was now employed in teaching a public school. He dissuaded not to act as the assistant of his friend; and, during the three years he resided at this place, he composed the tragedies which do him so much honour. It was here, also, that he wrote some of the most pleasant of those poems, in which he has rallied the muses, and threatened to forsake them, as not being able to maintain their votary. About this time, too, he presented a copy of verses to the emperor Charles V. who happened to pass through Bourdeaux.

His enemies, mean while, were not inactive. Cardinal Beaton wrote about him to the archbishop of Bourdeaux; and, by every motive which a cunning and a wicked heart can invent, he invited him to punish the most pestiferial of all heretics. The archbishop, however, was not so violent as the cardinal. On inquiring into the matter, he was convinced that the poet had committed a very small impropriety; and allowed him to be pacified.

But fortune was not long to continue her smiles. Andrew Govea being called by the king of Portugal, his master, to establish an academy at Coimbra, he treated Buchanan to accompany him. He obtained his request; and had not been a year in his own country, when he died, and left his associate exposed to the malice of his inveterate enemies the monks. They loudly objected to him, that he was a Lutheran; that he had written poems against the Franciscans; and that he had been guilty of the abominable crime of eating flesh in lent. He was confined to a monastery till he should learn what these men fancied to be religion: and they enjoined him to translate the Psalms of David into Latin verse; a task which every man of taste knows with what admirable skill and genius he performed.

On obtaining his liberty, he had the offer of a speedy promotion from the king of Portugal; the issue of which, his aversion to the clergy did not allow him to wait. He hastened to England; but the perturbed state of affairs during the minority of Edward VI. not giving him the promise of any lasting security, he set out for France. There he had not been long, when he published his *Jephtha*, which his necessities made him dedicate to the marshal de Brissac. This patron did not want generosity, and could judge of merit. He sent him to Piedmont, as preceptor to his son Timoleon de Cossi.

In this employ he continued several years; and, during the leisure it afforded him, he fully examined the controversies which now agitated Europe; and he put the last hand to many of the most admired of his smaller poems.

When his pupil had no longer any use for him, he passed into Scotland, and made an open profession of the reformed faith. But he soon quitted his native country for France; which appears to have been more agreeable to his taste. Queen Mary, however, having determined that he should have the charge of educating her son, recalled him; and, till the prince should arrive at a proper age, he was nominated to the principality of St Andrew's. His success as James's preceptor is well known. When it was reproached to him, that he had made his majesty a pedant; "It is

a wonder (he replied) that I have made so much of him." Mackenzie relates a story concerning his tutelage of his pedantic majesty, which is strongly expressive of Buchanan's character as a man of humour, and, at the same time, shews the degree of his veneration for royalty. The young king being one day at play with his fellow-pupil the master of Erskine, Buchanan, who was then reading, desired them to make less noise. Finding that they disregarded his admonition, he told his majesty, if he did not hold his tongue, he would certainly whip his breech. The king replied, he would be glad to see who would *bell the cat*, alluding to the fable. Buchanan, in a passion, threw the book from him, and gave his majesty a sound flogging. The old countess of Mar, who was in the next apartment, rushed into the room, and, taking the king in her arms, asked how he dared to lay his hand on *the Lord's anointed*. "Madam, (says Buchanan), I have whipped his a—; you may kiss it, if you please."

On the misfortunes which befel the amiable but imprudent Mary, he went over to the party of the earl of Murray; and at his earnest desire he was prevailed upon to write his "Detection," a work which his greatest admirers have read with regret. Having been sent with other commissioners to England, against his mistress, he was, on his return, rewarded with the abbacy of Cross Raguel; made director to the chancery; and, some time after, lord of the privy council, and privy seal. He was likewise rewarded by queen Elizabeth with a pension of 100*l.* a-year. The twelve last years of his life he employed in composing his history of Scotland. After having vied with almost all the more eminent of the Latin poets, he contended with Livy and Sallust the palm of eloquence and political sagacity. But it is to be remembered with pain, that like the former of these historians, he was not always careful to preserve himself from the charge of partiality. In the year 1582, he expired at Edinburgh, in the 76th year of his age.

Various writers who have mentioned this author, speak of him in very different language, according to their religious and political principles. From his works, however, it is evident, that, both as a Latin poet and prose writer, he hath rarely been equalled since the reign of Augustus; nor is he less deserving of remembrance as a friend to the natural liberties of mankind, in opposition to usurpation and tyranny. "The happy genius of Buchanan (says Dr Robertson), equally formed to excel in prose and in verse, more various, more original, and more elegant, than that of almost any other modern who writes in Latin, reflects, with regard to this particular, the greatest lustre on his country."

The following is a list of his works. 1. *Rerum Scotticarum*, &c. 2. *Psalmorum Davidis paraphrasis poetica*. 3. *De jure regni apud Scotos dialogus*. 4. *Psalmus civ. cum judicio Barclaii*, &c. 5. *Psalmus cxx. cum analysi organica Beuzeri*. 6. *Baptistes, sive calumniam*. 7. *Alexis, tragedia*. 8. *Tragedia sacra, et extera*. 9. *De caeleo recepto carmen, apud Stephanum*. 10. *Franciscanus et fratres*, &c. 11. *Elegie, Sylois*, &c. 12. *De sphaera Herborne*. 13. *Poemata*. 14. *Satyra in cardinale Lotharingium*. 15. *Rudimenta grammaticae, Tho. Linacri ex Anglico sermone in Latinum versa*. 16. An admonition to the true lords.

Buchanness
||
Buckling.

17. *De profodia*. 18. *Chameleon*, 1572. 19. *Ad viros sui seculi epistola*. 20. *Litæra regina Scotica ad com. Bothwellie*. 21. A detection of the doings of Mary queen of Scots, and of James earl of Bothwell, against Henry lord Darnly. 22. *Vita ab ipso scripta, bixinio ante mortem, cum commentario D. Rob. Sibbaldi*, M. D. 23. Life of Mary queen of Scots. These have been severally printed often, and in various countries. An edition of them all collected together was printed at Edinburgh in 1704, in 2 vols folio.

* BUCHANNESS, a cape or promontory of Scotland, which is the farthest point of Buchan, not far from Peterhead, and the most eastern of all Scotland. E. Long. o. 30. N. Lat. 57. 28.

BUCHAW, a free and imperial town of Germany, in Suabia, seated on the river Tederice, 22 miles south-west of Ulm. Here is a monastery, whose abbess has a voice in the diets of the empire. E. Long. 9. 37. N. Lat. 48. 5.

BUCHAW, a small territory of Germany, in the circle of the Upper Rhine, which comprehends the district of the abbot of Flad.

BUCHOREST, a pretty large town of Turkey, in Europe, seated in the middle of Walachia, and the ordinary residence of a hospodar. The houses are mean and very ill built, except a few that belong to the principal persons. In 1716, a party of Germans sent from Transylvania entered this town, and took the prince prisoner with all his court, and carried them off. This expedition was the more easily performed, as several lords of the country had a secret intelligence with the governor of Transylvania. This prince had no other way to regain his liberty, but by giving up that part of Walachia which lies between the river Aluth and Transylvania, to the emperor of Germany, by the peace concluded at Passarowitz in 1718. The Germans entered again into the capital of his dominions, and levied excessive contributions. But affairs took another turn after the fatal battle of Crotzka, in 1737; for the emperor was obliged to restore this part of Walachia to the hospodar, in virtue of the treaty of Belgrade. E. Long. 26. 30. N. Lat. 44. 30.

BUCHOM, a small, free, and imperial town of Swabia in Germany, seated on the lake of Constance, in E. Long. 9. 20. N. Lat. 47. 41.

BUCIOCHE, in commerce, a sort of woollen cloth manufactured in Provence in France, which the French ships carry to Alexandria and Cairo.

BUCK, in zoology, a male horned beast of venery or chase, whose female is denominated a doe *.

BUCK, is also applied to the males of the hare and rabbit kind. See LEFUS, and HARE-HUNTING.

BUCK-Bean, in botany. See MENYANTHES.

BUCK-Thorn, the English name of the RHAMNUS.

BUCK-Wheat. See POLYGONUM.

BUCKENHAM (New), a town of Norfolk in England, which formerly had a strong castle, but now demolished. It is seated in a flat, in E. Long. 1. 10. N. Lat. 52. 30.

BUCKET, a small portable vessel to hold water, often made of leather for its lightness and easy use in cases of fire.—It is also the vessel let down into a well, or the sides of ships, to fetch up water.

BUCKING, the first operation in the whitening of linen yarn or cloth. See BLEACHING.

VOL. II.

Buckingham
||
Buckle.

BUCKINGHAM, the chief town of Buckinghamshire in England, stands in a low ground, on the river Ouse, by which it is almost surrounded, and over which there are three handsome stone-bridges. The town is large and populous, sends two members to parliament, and had the title of a duchy. It seems, however, to have been but an inconsiderable place at the conquest; for, according to Doomsday-book, it paid only for one hide, and had but 26 burgeses. Edward the elder fortified it in the year 918 against the incursions of the Danes, with a rampart and turrets. It also had formerly a castle in the middle of the town, of which no vestiges now remain. The shrine of St Rumbald, the patron of fishermen, preserved in the church, was held in great veneration. The county-goal stands in this town, and here the alizars are sometimes kept. It was formerly a staple for wool, but that advantage it hath now lost. It is governed by a bailiff and 12 burgeses, who are the sole electors of the members. In its neighbourhood are many paper-mills upon the Ouse. W. Long. o. 58. N. Lat. 51. 30.

BUCKINGHAM-SHIRE, (supposed to derive its name from the Saxon word *Buc*, denoting a hart or buck), a county of England, bounded on the south by Berkshire, from which it is parted by the Thames; on the west by Oxfordshire; on the north by Northamptonshire; and on the east by Bedfordshire, Hertfordshire, and Middlesex. Its length is 39 miles, its breadth 18, and circumference 138; in which space it contains 441,000 acres; eight hundreds, three to the south, and five to the north of the Cheltem; 11 market-towns, six parliamentary boroughs, 185 parishes, and about 111,000 souls. The boroughs are, Buckingham, Chipping-Wycomb, Aylebury, Agmondesham, Wendover, and great Marlow, each of which sends two members to parliament, and the county two; in all 14. It lies in the diocese of Lincoln, and Norfolk circuit; and gives the title of earl to the family of Hobart.—The air is good, especially upon the Chiltern; and though in the vale it may not be altogether so pure and serene as upon the hills, the soil is more fruitful; yet that of the Chiltern is far from being barren; for, besides feeding large flocks of sheep, it produces very good wheat and barley. The meadows of the vale are among the richest pastures in England, as the sheep are among the largest; though the mutton is not so good as that of the downs, nor the beef equal to that of Somersetshire. The Chiltern was formerly over-run with wood, and infamous for being a harbour of thieves; but it hath long been cleared of both. The graziers of the vale are as considerable as any in England; and their herds of cattle as numerous, and of as large a size. The country is also well furnished with wood and water, so that it is inferior to few in England. The chief manufactures are paper and boneclay; the last of which is almost equal to that of Flanders. The chief rivers are the Thames, the Ouse, and the Caln.

BUCKINGHAM (George Villiers duke of). See VILLIERS.

BUCKINGHAM (John Sheffield duke of). See SHEFFIELD.

BUCKLE, a well known utensil, made of divers sorts of metals, as gold, silver, steel, brass, &c.

The fashion or form of buckles is various; but their use, in general, is to make fast certain parts of dress,

* See Cervus, and Buck Hunting.

Buckle
||
Buckram.

as the shoes, garters, &c.

BUCKLE, in heraldry. The buckle was so much esteemed in former times, that few persons of repute and honour wore their girdle without it; and it may be considered, in coats of arms, as a token of the surety, the faith, and service of the bearer.

BUCKLER, a piece of defensive armour used by the ancients. It was worn on the left arm; and composed of wickers woven together, or wood of the lightest sort, covered with hides, and fortified with plates of brass or other metal. The figure was sometimes round, sometimes oval, and sometimes almost square. Most of the bucklers were curiously adorned with all sorts of figures of birds and beasts, as eagles, lions; nor of these only, but of the gods, of the celestial bodies, and all the works of nature; which custom was derived from the heroic times, and from them communicated to the Grecians, Romans, and Barbarians.

The scutum, or Roman buckler, was of wood, the parts being joined together with little plates of iron, and the whole covered with a bull's hide. An iron plate went about it without, to keep off blows; and another within, to hinder it from taking any damage by lying on the ground. In the middle was an iron boss or *umbo* jutting out, very serviceable to glance off stones and darts; and sometimes to press violently upon the enemy, and drive all before them. They are to be distinguished from the *clypei*, which were less, and quite round, belonging more properly to other nations, though for some little time used by the Romans. The scuta themselves were of two kinds; the *ovata*, and the *imbricata*: the former is a plain oval figure; the other oblong, and bending inward like half a cylinder. Polybius makes the scuta four feet long, and Plutarch calls them *ovatae*, reaching down to the feet. And it is very probable that they covered almost the whole body, since in Livy we meet with soldiers who stood on the guard, sometimes sleeping with their head on their shield, having fixed the other part of it in the earth.

Votive **BUCKLERS**: Those consecrated to the gods, and hung up in their temples, either in commemoration of some hero, or as a thanksgiving for a victory obtained over an enemy; whose bucklers, taken in war, were offered as a trophy.

BUCKOR, a province of Asia, subject to the great mogul. It is seated on the river Indus, on the banks of which there are corn and cattle; but the west part, which is bounded by Sagestan in Persia, is a desert. The inhabitants are strong, robust, and apt to mutiny; for which reason the mogul has a garrison at the chief town, called *Buckor*, which is seated in an island made by the river Indus. They are all Mahometans, and drive a great trade in cotton cloth, and other Indian commodities. E. Long. 70. 5. N. Lat. 28. 10.

BUCKRAM, in commerce, a sort of coarse cloth made of hemp, gummed, calendered, and dyed several colours. It is put into those places of the lining of a garment, which one would have stiff, and to keep their form. It is also used in the bodies of womens gowns; and it often serves to make wrappers to cover cloths, serges, and such other merchandises, in order to preserve them and keep them from the dust, and their colours from fading. Buckrams are sold wholesale by the dozen of small pieces or remnants, each

about four ells long, and broad according to the piece from which they are cut. Sometimes they use new pieces of linen cloth to make buckrams, but most commonly old sheets and old pieces of falls.

BUCKSTALL, a toil to take deer, which must not be kept by any body that has not a park of his own, under penalties.

BUCOLIC, in ancient poetry, a kind of poem relating to shepherds and country affairs, which, according to the most generally received opinion, took its rise in Sicily. Bucolics, says Vossius, have some conformity with comedy. Like it, they are pictures and imitations of ordinary life; with this difference, however, that comedy represents the manners of the inhabitants of cities, and bucolics the occupations of country people. Sometimes, continues he, this last poem is in form of a monologue, and sometimes of a dialogue. Sometimes there is action in it, and sometimes only narration; and sometimes it is composed both of action and narration. The hexameter verse is the most proper for bucolics in the Greek and Latin tongues. Moschus, Bion, Theocritus, and Virgil, are the most renowned of the ancient bucolic poets.

BUD, in botany. See the article *GEMMA*.

BUDA, the capital city of Hungary, called *Ofen* by the inhabitants, and *Baden* by the Turks. It is large, well fortified, and has a castle that is almost impregnable. The houses are tolerably handsome, being most of them built with square stone. It was a much finer place before the Turks had it in their possession; but they being masters of it 135 years, have suffered the finest buildings to fall to decay. The lower city, or Jews town, extends like suburbs from the upper city to the Danube. The upper town takes up all the declivity of a mountain; and is fortified with good walls, which have towers at certain distances. The castle, which is at the extremity of the hill, on the east side, and commands the greatest part of it, is surrounded with a very deep ditch, and defended by an old-fashioned tower, with the addition of new fortifications. There is also a suburb, inclosed with hedges, after the Hungarian manner. The most sumptuous structures now are the caravanseras, the mosques, bridges, and baths. These last are the finest in Europe, for the magnificence of the building, and plenty of water. Some of the springs are used for bathing and drinking; and others are so hot, that they cannot be used without a mixture of cold water. The Danube is about three quarters of a mile in breadth; and there is a bridge of boats between this city and Pest, consisting of 63 large pontoons. The Jews have a synagogue near the castle-gardens. The adjacent country is fruitful and pleasant, producing rich wines; though in some places they have a sulphureous flavour.

This city was the residence of the Hungarian monarchs till the Turks took it in 1526. Ferdinand archduke of Austria recovered it the next year; but in 1529 the Turks became masters of it again. In 1684 the Christians laid siege to it; but they were obliged to raise it soon after, though they had an army of 80,000 men. Two years after, the Turks lost it again, it being taken by assault in the fight of a very numerous army. The booty that the Christians found there was almost incredible, because the rich inhabitants had lodged their treasury in this city as a place of safety.

However,

Buckball
||
Buda.

Buda
||
Buddzus.

However, part of these riches were lost in the fire occasioned by the assault. This last siege cost the Christians a great deal of blood, because there were many in the camp who carried on a secret correspondence with the Turks. When the seraskier saw the city on fire, and found he could not relieve it, he beat his head against the ground for anger. In 1687, this city had like to have fallen into the hands of the Turks again, by treachery. After this, the Christians augmented the fortifications of this place, to which the Pope contributed 100,000 crowns, for this is looked upon as the key of Christendom. It is seated on the Danube, 105 miles south-east of Vienna, 163 north by west of Belgrade, and 563 north-west of Constantinople. E. Long. 19. 22. N. Lat. 47. 20.

BUDA (the beglerbeglic of), was one of the chief governments of the Turks in Europe. It included all the countries of Upper Hungary between the rivers Teiffe and Danube, and between Agria and Novigrad all Lower Hungary, from Gran and Canifca, the eastern part of Slavonia, and almost all Servia: but a good part of this government now belongs to the queen of Hungary.

BUDÆUS (William), the most learned man in France in the 15th century, was descended of an ancient and illustrious family, and born at Paris in 1467. He was placed young under masters; but barbarism prevailed so much in the schools of Paris, that Budæus took a dislike to them, and spent his whole time in idleness, till his parents sent him to the university of Orleans to study law. Here he passed three years without adding to his knowledge; for his parents sending for him back to Paris, found his ignorance no less than before, and his reluctance to study, and love to gaming and other youthful pleasures, much greater. They talked no more to him of learning of any kind; and as he was heir to a large fortune, left him to follow his own inclinations. He was passionately fond of hunting, and took great pleasure in horses, dogs, and hawks. The fire of youth beginning to cool, and his usual pleasures to pall upon his senses, he was seized with an irresistible passion for study. He immediately disposed of all his hunting equipage, and even abstracted himself from all business to apply himself wholly to study, in which he made, without any assistance, a very rapid and amazing progress, particularly in the Latin and Greek languages. The work which gained him greatest reputation was his treatise *de Affe*. His erudition and high birth were not his only advantages; he had an uncommon share of piety, modesty, gentleness, and good-breeding. The French king Francis I. often sent for him; and at his persuasion, and that of Du Bellay, founded the royal college of France, for teaching the languages and sciences. The king sent him to Rome with the character of his ambassador to Leo X. and in 1522 made him master of requests. The same year, he was chosen provost of the merchants. He died at Paris in 1540. His works, making four volumes in folio, were printed at Basil in 1557.

BUDDÆUS (John Francis), a celebrated Lutheran divine, and one of the most learned men Germany has produced, was born in 1667, at Anclam a town of Pomerania, where his father was minister. He was at first Greek and Latin professor at Colburg; af-

terwards professor of morality and politics in the university of Hall; and at length, in 1705, professor of divinity at Jena, where he fixed, and where he died, after having acquired a very great reputation. His principal works are, 1. A large historical German dictionary. 2. *Historia ecclesiastica Veteris Testamenti*, 2 vols 4^{to}. 3. *Elementa philosophiæ practicæ, instrumentalis et theoreticæ*, 3 vols 8vo. which has had a great number of editions, because, in most of the universities of Germany, the professors take this work for the text of their lessons. 4. *Selecta juris natura et gentium*. 5. *Miscellanea sacra*, 3 vols 4to. 6. *Isagoge historico-theologica ad theologiam universam, singulasque ejus partes*, 2 vols 4to; which is much valued by the Lutherans. 7. A treatise on atheism and superstition.

BUDDSDALE, or BETTSDALE, a town of Suffolk in England, seated in a dale or valley, and its street takes in a good part of Ricking, all which together make up the town, for of itself it is but a hamlet, having a small chapel, and an endowed grammar-school, to which belong certain scholarships, assigned to Bennet or Corpus Christi-college in Cambridge, being the gift of Sir Nicholas Bacon, lord keeper of the great seal. E. Long. 1. 8. N. Lat. 52. 25.

BUDDLE, in mineralogy, a large square frame of boards, used in washing the tin ore.

BUDDLEIA, in botany, a genus of the monogynia order, belonging to the tetrandria class of plants; of which there are two species, viz. the americana, and occidentalis. The first is a native of Jamaica and most of the other American islands; where it rises to the height of ten or twelve feet, with a thick woody stem covered with a grey bark; and sends out many branches towards the top, which come out opposite: at the ends of the branches the flowers are produced in long close spikes branching out in clusters, which are yellow, consisting of one leaf cut into four segments; these are succeeded by oblong capsules filled with small seeds. The second grows naturally at Carthagea; and rises much higher than the other, dividing into a great number of slender branches covered with a russet hairy bark, garnished with long spear-shaped leaves ending in sharp points: at the end of the branches are produced branching spikes of white flowers growing in whorls round the stalks, with small spaces between each.—These plants grow in gullies, or other low sheltered spots; their branches being too tender to resist the force of strong winds. They may be propagated by seeds procured from those places where they are natives; and are to be managed like other exotics: only their seeds must be sown in pots as soon as they arrive, and very lightly covered; for if they are buried deep in the earth, they will all perish.

BUDELICH, a town of Germany, in the electoral circle of the Rhine and archbishopric of Treves, seated on the little river Traen, in E. Long. 6. 55. N. Lat. 49. 52.

BUDGE-BARRELS, among engineers, small barrels well hooped, with only one head; on the other end is nailed a piece of leather, to draw together upon strings like a purse. Their use is for carrying powder along with a gun or mortar; being less dangerous, and easier carried, than whole barrels. They are likewise used upon a battery of mortars, for holding meal-powder.

BUDGELL (Eustace), Esq; an ingenious and po-

Buddfeldæ
||
Buddgell.

Budgett.

lite writer, was the son of Gilbert Budgett, doctor of divinity; and was born at St Thomas, near Exeter, about the year 1685. He was educated at Christ-church college, Oxford; from which he removed to the Inner Temple, London: but instead of studying the law, for which his father intended him, he applied to polite literature; kept company with the genteelst persons in town; and particularly contracted a strict intimacy with the ingenious Mr Addison, who was first cousin to his mother, and who, on his being made secretary to lord Wharton lord lieutenant of Ireland, took him with him as one of the clerks of his office. Mr Budgett, who was about 20 years of age, and had read the classics, and the works of the best English, French, and Italian authors, now became concerned with Sir Richard Steele and Mr Addison in writing the Tatler, as he had, soon after, a share in writing the Spectators, where all the papers written by him are marked with an X; and when that work was completed, he had likewise a hand in the Guardian, where his performances are marked with an asterisk. He was afterwards made under-secretary to Mr Addison, chief secretary to the lords justices of Ireland, and deputy-clerk of the council. Soon after, he was chosen member of the Irish parliament; and in 1717, Mr Addison, having become principal secretary of state in England, procured him the place of accountant and comptroller general of the revenue in Ireland. But the next year, the duke of Bolton being appointed lord-lieutenant, Mr Budgett wrote a lampoon against Mr Webster his secretary, in which his Grace himself was not spared; and upon all occasions treated that gentleman with the utmost contempt. This imprudent step was the primary cause of his ruin: for the duke of Bolton, in support of his secretary, got him removed from the post of accountant-general; upon which, returning to England, he, contrary to the advice of Mr Addison, published his case in a pamphlet, intitled "A letter to the lord * * *, from Eustace Budgett, Esq; accountant-general," &c. Mr Addison had now resigned the seals, and was retired into the country for the sake of his health: Mr Budgett had also lost several other powerful friends, who had been taken off by death; particularly the lord Halifax, and the earl of Sunderland; he, however, made several attempts to succeed at court, but was constantly kept down by the duke of Bolton. In the year 1720 he lost 20,000*l.* by the South-sea scheme, and afterwards spent 5000*l.* more in unsuccessful attempts to get into parliament. This completed his ruin. He at length employed himself in writing pamphlets against the ministry, and wrote many papers in the Craftsman. In 1733, he began a weekly pamphlet, called *The Bee*; which he continued for above 100 numbers, printed in eight volumes 8vo. During the progress of this work, Dr Tindal's death happened, by whose will Mr Budgett had 2000*l.* left him; and the world being surpris'd at such a gift from a man entirely unrelated to him, to the exclusion of the next heir, a nephew and the continuator of Rapin's history of England, immediately imputed it to his making the will himself. Thus the satyrist:

Let Budgett charge low Grub-Street on my quill,
And write whatever he please, except my will.

It was thought he had some hand in publishing Dr Tindal's *Christianity as old as the creation*; for he often

talked of another additional volume on the same subject, but never published it. After the cessation of the Bee, Mr Budgett became so involved in law-suits, that he was reduced to a very unhappy situation. He got himself called to the bar, and attended for some time in the courts of law; but finding himself unable to make any progress, and being distressed to the utmost, he determined at length to make away with himself. Accordingly, in the year 1736, he took a boat at Somerset-lairs, after filling his pockets with stones; ordered the waterman to float the bridge; and, while the boat was going under, threw himself into the river. He had several days before been visibly distracted in his mind. Upon his bureau was found a slip of paper, on which were these words:

What Cato did, and Addison approv'd,
C^{annot} be wrong.

Besides the above works, he wrote a Translation of Theophrastus's Characters. He was never married; but left one natural daughter, who afterwards assumed his name, and became an actress in Drury-lane.

BUDOVA, a maritime town of Dalmatia, with a bishop's see, subject to the Venetians. It is seated between the gulf of Cattaro and the city of Dulingno, on the coast of Albany; and is an important fortress, where the Venetians always keep a strong garrison. In 1667, it suffered greatly by an earthquake: and in 1686 was besieged by Soliman basha of Scutari; but general Cornaro obliged him to raise the siege. E. Long. 19. 22. N. Lat. 42. 12.

BUDRIO, a town of Italy, in the Bolognese. The adjacent fields produce large quantities of fine hemp, which renders the town of more consequence than larger places. E. Long. 11. 35. N. Lat. 44. 27.

BUDWEIS, a royal city of Bohemia, in Germany. It is pretty large and well built, surrounded with strong walls, fortified with a good rampart, and might be made an important place. It was taken by the king of Prussia in 1744, but he did not keep it very long. E. Long. 14. 19. N. Lat. 42. 15.

BUDZIAC TARTARY, lies on the rivers Neister, Bog, and Nieper; having Poland and Russia on the north, Little Tartary on the east, the Black sea on the south, and Bessarabia on the west. The chief town is Oczskow. It is subject to Turkey.

BUENA VISTA, one of the Cape de Verd islands, lying in N. Lat. 15. 56. It is also called *Bonvifia*, and *Bonnevue*: but the first is the true appellation, the others being only abbreviations and corruptions of the original name, which signifies a *good prospect*, intimating the beautiful appearance it makes to ships at sea. This island is reckoned near 20 leagues in circumference, and is distinguished on the north side by a ridge of white rocks that bound it. The coast that stretches east and north-west is terminated with sundry banks to the sea; but the interior part is chiefly mountainous. From the northern point there is a large ridge of rocks projecting near a whole league into the sea, against which the waves break with incredible fury. Another point of rocks stretches into the sea on the southern point of the island eastward, a league and a half beyond that point; and in that bay is the best road for shipping.

BUENOS AYRES, a country of South America, belonging to the Spaniards. This name, given from the pleasantness of the climate, is extended to all that country

Budos

Buenos.

try lying between Tucuman on the east, Paraguay on the west, and Terra Magellanica on the south, or to the vertex of that triangular point of land which composes South America. The country is watered by the great river La Plata; first discovered in 1515 by Juan Diaz de Solis, who with two of his attendants was massacred by the natives; and partly subdued by Sebastian Gaboto, who gave the great river the appellation of *La Plata*, from the abundance of the precious metals he procured from the inhabitants, imagining them to be the produce of the country, though in fact they were brought from Peru.—No country in the world abounds more in horned cattle and horses than Buenos Ayres, where the greatest expence of a horse or cow is in the catching it, and they are frequently to be had at the small price of two or three rials. In such abundance are these useful animals, that the hide alone is deemed of any value, as this constitutes a main article in the trade of the country. All rove wild in the fields; but they are now become more difficult of access, the terrible havoc made among them having taught the cautious brutes to keep at a greater distance. All kinds of fish are in the same abundance; the fruits produced by every quarter of the globe grow up here in the utmost perfection; and for the enjoyment of life, and the salubrity of the air, a finer country cannot be imagined. The principal cities are Buenos Ayres the capital, Monte Video, Corriento, and Santa Fe.

Buenos-Ayres (Nuestra Señora de), the capital of the country called *Buenos Ayres*, in South America, was founded in the year 1535, under the direction of Don Pedro de Mendoza, at that time governor. It stands on a point called *Cape Blanco*, on the south side of the Plata, fronting a small river, in S. Lat. 34°. 34'. 38". according to the observations of Father Ferville. The situation is in a fine plain, rising by a gentle ascent from the river; and truly paradisaical, whether we regard the temperature of the climate, the fertility of the soil, or that beautiful verdure which overpreads the whole face of the country, of which the inhabitants have a prospect as far as the eye can reach. The city is very considerable in extent, containing 3000 houses, inhabited by Spaniards and others of different complexions. The streets are straight, broad, and pretty equal in the heights and dimensions of the buildings; one very handsome square adorns it, the front being a castle in which the governor holds his court, and presides over a garrison of 3000 soldiers. Most of the buildings are of chalk or brick, except the cathedral, a magnificent structure, composed chiefly of stone.

BUFALMACO (Boramico), an Italian painter; the first who put labels to the mouths of his figures, with sentences; since followed by bad masters, but more frequently in caricatura engravings. He died in 1340.

BUFF, in commerce, a sort of leather prepared from the skin of the buffalo; which dressed with oil, after the manner of shammy, makes what we call *buff-skin*. This makes a very considerable article in the French, English, and Dutch commerce at Constantinople, Smyrna, and all along the coast of Africa. The skins of elks, oxen, and other like animals, when prepared after the same manner as that of the buffalo, are likewise called *buffs*.

Of *buff-skin*, or *buff-leather*, are made a sort of coats for the horse or *gens d'armes* of France, bandaliers, belts,

pouches, and gloves.

In France, there are several manufactories designed for the dressing of those sorts of hides, particularly at Corbeil, near Paris; at Niort, at Lyons, at Rone, at Etanepus, at Cone.

BUFFALO, in zoology. See **Bos**.

BUFFET was anciently a little apartment, separated from the rest of the room by slender wooden columns, for the disposing of china, glass-ware, &c.

It is now properly a large table in a dining-room, called also a *side-board*, for the plate, glasses, bottles, basons, &c. to be placed on, as well for the service of the table, as for magnificence. In houses of persons of distinction in France, the buffet is a detached room, decorated with pictures relative to the subject, with fountains, cisterns, and vases. It is commonly faced with marble or bronze.

BUFFOON, a droll or mimic, who diverts the public by his pleasantries and follies.

BUFONIA, **TOAD-GRASS**; a genus of the monogynia order, belonging to the diandria class of plants, of which there is but one species, *viz.* the *tenuifolia*, a native of Britain.

BUG, or **BUGG**, in zoology, the English name of a species of cimex. See **CIMEX**.

Cheap, easy, and clean mixture for effectually destroying BUGGS. Take of the highest rectified spirit of wine, (*viz.* lamp-spirits) that will burn all away dry, and leave not the least moisture behind it, half a pint; new distilled oil, or spirit of turpentine, half a pint: mix them together; and break into it, in small bits, half an ounce of camphire, which will dissolve in it in a few minutes: shake them well together; and with a piece of sponge, or a brush dipt in some of it, wet very well the bed or furniture wherein those vermin harbour and breed, and it will infallibly kill and destroy both them and their nits, although they swarm ever so much. But then the bed and furniture must be well and thoroughly wet with it (the dust upon them being first brushed and shook off), by which means it will neither soil, stain, nor in the least hurt, the finest silk or damask bed that is. The quantity here ordered of this mixture (that costs but about a shilling) will rid any one bed whatever, tho' it swarms with bugs. If any bugs should happen to appear after once using it, it will only be for want of well wetting the lacing, &c. of the bed, or the folding of the lincens or curtains near the rings, or the joints or holes in and about the bed or head-board, wherein the bugs and nits nestle and breed; and then their being wetted all again with more of the same mixture, which dries in as fast as you use it, pouring some of it into the joints and holes where the brush or sponge cannot reach, will never fail absolutely to destroy them all. Some beds that have much wood work can hardly be thoroughly cleared without being first taken down; but others that can be drawn out, or that you can get well behind, to be done as it should be, may. The smell this mixture occasions will be all gone in two or three days; which yet is very wholesome, and to many people agreeable. Remember always to shake the mixture together very well, whenever you use it, which must be in the daytime, not by candle-light, lest the subtlety of the mixture should catch the flame as you are using it, and occasion damage.

BUGEY, a province of France, bounded on the east

by

Buggers
Bugia.
Bugie.
Buckharit.

by Savoy, on the west by Bresse, on the south by Dauphiny, and on the north by the territory of Gex and the Franche Compté. It is about 40 miles long, and 25 broad. Though it is a country full of hills and rivers, yet it is fertile in some places, the rivers abound with trouts, and there are plenty of all sorts of game. The chief places are Belley the capital, Scifel, St Lambert, Fort l'Ecluse, and Chateau-Neuf.

BUGGERS, in church-history, the same with Bulgarians, a sect of heretics, which, among other errors, held, that men ought to believe no Scripture but the New Testament; that baptism was not necessary to infants; that husbands who conversed with their wives could not be saved; and that an oath was absolutely unlawful. The Buggers are mentioned by Matthew Paris, in the reign of Henry III. under the name of *Bugares*. They were strenuously refuted by Fr. Robert, a Dominican, furnished the *Bugger*, as having formerly made profession of this heresy.

BUGGERER, a person who is guilty of the crime of buggery. See the next article.

BUGGERY, or **SODOMY**, is defined by Sir Edward Coke to be a carnal copulation against nature, either by a confusion of species, that is to say, either a man or a woman with a brute beast; or sexes, as a man with a man, or a man unnaturally with a woman. It is said this sin against God and nature was first brought into England by the Lombards. As to its punishment, the voice of nature and of reason, and the express law of God †, determine it to be capital. Of this we have a signal instance, long before the Jewish dispensation, by the destruction of two cities by fire from heaven; so that this is an universal, not merely a provincial, precept. Our ancient law, in some measure, imitated this punishment, by commanding such miscreants to be burnt to death; though Fleta says, they should be buried alive; either of which punishments was indifferently used for this crime among the ancient Goths. But now the general punishment of all felonies is the same, namely, by hanging; and this offence (being in the times of Popery only subject to ecclesiastical censures) was made felony without benefit of clergy by statute 25 Hen. VIII. c. 6. revived and confirmed by 5 Eliz. c. 17. And the rule of law herein is, that, if both parties are arrived at the years of discretion, *agentes et consentientes pari pena plectantur*, "both are liable to the same punishment."

BUGIA, a province of the kingdom of Algiers in Africa. It is almost surrounded with mountains; and is divided into three parts, Benijubar, Auraz, and Labez. These mountains are peopled with the most ancient Arabs, Moors, or Saracens. The province is very fertile in corn.

BUGIA, by the Africans called *Bugeiab*, a maritime town of Africa, in the kingdom of Algiers, and once the capital of the province of that name. It is supposed to be the *Saldæ* of Strabo, built by the Romans. It hath a handsome port formed by a narrow neck of land running into the sea; a great part of whose promontory was formerly faced with a wall of hewn stone; where was likewise an aqueduct, which supplied the port with water, discharging it into a capacious basin; all which now lie in ruins. The city itself is built on the ruins of a large one, at the foot of a high mountain that looks towards the north-east; a great part of whose

walls run up quite to the top of it; where there is also a castle that commands the whole town, besides two others at the bottom, built for a security to the port. The inhabitants drive a considerable trade in ploughshares, mattocks, and other iron tools, which they manufacture from the neighbouring mines. The town is watered by a large river, supposed to be the *Nafava* of Ptolemy. The place is populous, and hath a considerable market for iron work, oil, and wax, which is carried on with great tranquillity; but is no sooner over than the whole place is in an uproar, so that the day seldom concludes without some flagrant instance of barbarity. E. Long. 4. N. Lat. 35. 30.

BUGIE, a town of Egypt, situated on the western shore of the Red Sea almost opposite to Ziden, the port-town to Mecca, and about 100 miles west of it. E. Long. 36. N. Lat. 22. 15.

BUGLE, in botany. See *AJUGA*.

BUGLOSS, in botany. See *ANCHUSA*.

Vipers **BUGLOSS**, in botany. See *ECHINUM*.

BUILDING, a fabric erected by art, either for devotion, magnificence, or convenience.

BUILDING is also used for the art of constructing and raising an edifice; in which sense it comprehends as well the expences as the invention and execution of the design.

As for the materials of buildings, they are either stone, as marble, free-stone, brick for the walls, mortar, &c. or of wood, as fir, cypress, cedars for pillars of upright uses, oak for summers, beams, and crop-work, or for joining and connection. See *ARCHITECTURE*.

BUILDING OF SHIPS. See *SHIP-BUILDING*.

BUILT-H, or BEALT, a town of South-Wales in Brecknockshire, pleasantly seated on the river Wye, over which there is a wooden bridge that leads into Radnorshire. W. Long. 3. 10. N. Lat. 52. 8.

BUIS, a territory of France, in Dauphiny. It is a small mountainous country, but pretty fertile; and Buis and Nions are the principal places.

BUKARI, a small well-built town of Hungarian Dalmatia, situated on the Golfo di Bikeriza, in E. Long. 20. 53. N. Lat. 45. 20.

BUKHARIA, a general name for all that vast tract of land lying between Karazm and the *great Kobi*, or sandy desert bordering on China. It derives its name of *Bukharia* from the mogul word *Bukbar*, which signifies a learned man; it being formerly the custom for those who wanted instruction in the languages and sciences to go into Bukharia. Hence, this name appears to have been given to it by the Moguls who under Jenghiz Khan conquered the country. It is nearly the same with that called by the Arabs *Mawaralnahar*, which is little other than a translation of the word *Transoxana*, the name formerly given to these provinces.

This region is divided into Great and Little Bukharia.

Great Bukharia, (which seems to comprehend the *Sogdiana* and *Bactriana* of the ancient Greeks and Romans with their dependencies), is situated between the 34th and 46th degrees of north latitude, and between the 76th and 92^d degrees of east longitude. It is bounded on the north by the river *Sir*, which separates it from the dominions of the *Eluths* or Kalmucks; the kingdom of *Kasgar* in Little Bukharia, on the east;

by

† Levit. xx.
13, 15.

Bukharia. by the dominions of the Great Mogul and Persia on the south; and by the country of Karazm on the west: being about 770 miles long from west to east, and 730 miles broad from south to north. It is an exceeding rich and fertile country; the mountains abound with the richest mines; the valleys are of an astonishing fertility in all sorts of fruit and pulse; the fields are covered with grass the height of a man; the rivers abound with excellent fish; and wood, which is scarce over all Grand Tartary, is here in great plenty. But all these benefits are of little use to the Tartar inhabitants, who are naturally so lazy, that they would rather go rob and kill their neighbours, than apply themselves to improve the benefits which nature so liberally offers them. This country is divided into three large provinces, *viz.* Bukharia proper, Samarqand, and Balk; each of which generally has its proper khan. The province of Bukharia proper is the most western of the three; having on the west Karazm, on the north a desert called by the Arabs *Gazznah*, on the east the province of Samarqand, and on the south the river Amu. It may be about 390 miles long, and 320 broad. The towns are Bokhara, Zam, Wardan, Karakul, Siunjabad, Karshi, Zarjui, Nersem, Karmina, &c.

Little Bukharia is so called, not because it is less in dimensions than the other, for in reality it is larger; but because it is inferior to it as to the number and beauty of its cities, goodness of the soil, &c. It is surrounded by deserts: it has on the west, Great Bukharia; on the north, the country of the Kalmucks; on the east, that of the Moguls subject to China; on the south, Tibet, and the north-west corner of China. It is situated between the 93^d and 118th degrees of east longitude, and between 35^o. 30'. and 45^o of north latitude; being in length from east to west about 850 miles, and in breadth from north to south 580: but if its dimensions be taken according to its semicircular course from the south to the north-east, its length will be 1200 miles. It is sufficiently populous and fertile; but the great elevation of its land, joined to the height of the mountains which bound it in several parts, particularly towards the south, renders it much colder than from its situation might naturally be expected. It is very rich in mines of gold and silver; but the inhabitants reap little benefit by them, because neither the Eluths nor Kalmucks, who are masters of the country, nor the Bukhars, care to work in them. Nevertheless, they gather abundance of gold from the beds of the torrents formed by the melting of the snow in the spring; and from hence comes all that gold dust which the Bukhars carry into India, China, and Siberia. Much musk is likewise found in this country; and all sorts of precious stones, even diamonds; but the inhabitants have not the art of either cutting or polishing them.

The inhabitants both of Great and Little Bukharia, are generally those people called *Bukhars*. They are commonly sun-burned and black-haired; although some of them are very fair, handsome, and well made. They do not want politeness, and are addicted to commerce; which they carry on with China, the Indies, Persia, and Russia: but those who deal with them will be sure of being over-reached, if they do not take great care. The habits of the men differ very little from those of the Tartars. Their girdles are like those of the Poles. The garments of the women differ in nothing from

those of the men, and are commonly quilted with cotton. They wear bobs in their ears, 12 inches long; part and twist their hair in tresses, which they lengthen with black ribbands embroidered with gold or silver, and with great tassels of silk and silver, which hang down to their heels; three other tufts of a smaller size cover their breasts. Both sexes carry about with them prayers written by their priests, which they keep in a small leather purse by way of relics. The girls, and some of the women, tinge their nails red with the juice of an herb called by them *kena*; they dry and pulverize it; then mixing it with powder-alum, expose it in the air for 24 hours before they use it, and the colour lasts a long time. Both sexes wear close breeches, and boots of Russia leather, very light, and without heels, or leather soles; putting on galloches, or high-heeled slippers like the Turks, when they go abroad. They wear also the same sort of bonnets and covering for the head; only the women set off theirs with trinkets, small pieces of money, and Chinese pearls. Wives are distinguished from maids by a long piece of linen worn under their bonnets; which, folding round the neck, they tie in a knot behind, so that one end of it hangs down to the waist.

The Bukhar houses are of stone, and pretty good; but their moveables consist mostly of some China trunks plated with iron. Upon these, in the day-time, they spread the quilts they have made use of at night, and cover them with a cotton carpet of various colours. They have likewise a curtain sprigged with flowers and various figures; also a sort of bedstead half a yard high, and four yards long, which is hidden in the day-time with a carpet. They are very neat about their victuals; which are dressed in the master's chamber by his slaves, whom the Bukhars either take or buy from the Russians, Kalmucks, or other neighbours. For this purpose there are in the chamber, according to the largeness of the family, several iron pots, set in a kind of range near a chimney. Some have little ovens, made like the rest of their walls, with a stiff clay or bricks. Their utensils consist of some plates and porringers made of Capua wood or of china, and some copper vessels. A piece of coloured calico serves them instead of a table-cloth and napkins. They use neither chairs nor tables, knives nor forks; but sit cross-legged on the ground; and the meat being served up, they pull it to pieces with their fingers. Their spoons resemble our wooden ladles. Their usual food is minced meats, of which they make pies of the form of a half-moon: these serve for provision when the Bukhars go long journeys, especially in winter. They carry them in a bag, having first exposed them to the frost; and when boiled in water, they make very good broth. Tea is their common drink, of which they have a black sort prepared with milk, salt, and butter; eating bread with it, when they have any.

As the Bukhars buy their wives, paying for them more or less according to their handsomeness; so the surest way to be rich is to have many daughters. The persons to be married must not see or speak to each other from the time of their contract to the day of marriage. This is celebrated with three days feasting, as they do great annual festivals. The evening before the wedding, a company of young girls meet at the bride's house, and divert themselves till midnight, playing,

ing, dancing, and singing. Next morning the guests assemble, and help her to prepare for the ceremony. Then, notice being given to the bridegroom, he arrives soon after, accompanied by ten or twelve of his relations and friends. These are followed by some playing on flutes, and by an *Abur* (a kind of priest), who sings, while he beats two little timbrels. The bridegroom then makes a horse-race; which being ended, he distributes the prizes, six, eight, or twelve, in number, according to his ability. They consist of damasks, sables, fox-skins, calico, or the like. The parties do not see each other while the marriage ceremony is performing, but answer at a distance to the questions asked by the priest. As soon as it is over, the bridegroom returns home with his company; and after dinner carries them to the bride's house, and obtains leave to speak to her. This done, he goes back, and returns again in the evening, when he finds her in bed; and, in presence of all the women, lays himself down by her in his cloaths, but only for a moment. The same farce is acted for three days successively; but the third night he passes with her entirely, and the next day carries her home.

Although the prevailing religion throughout all Little Bukharia is the Mahometan, yet all others enjoy a perfect toleration. The Bukhars say that God first communicated the koran to mankind by Moses and the prophets; that afterwards Mahomet explained, and drew a moral from it, which they are obliged to receive and practise. They hold Christ to be a prophet, but have no notion of his sufferings. Yet they believe in the resurrection, but cannot be persuaded that any mortal shall be eternally damned: on the contrary, they believe, that as the dæmons led them into sin, so the punishment will fall on them. They believe moreover, that at the last day every thing but God will be annihilated; and, consequently, that all creatures, the devils, angels, and Christ himself, will die. Likewise, that, after the resurrection, all men, excepting a few of the elect, will be purified or chastised by fire, every one according to his sins, which will be weighed in the balance. They say there will be eight different paradises for the good; and seven hells, where sinners are to be purified by fire: that those who will suffer most, are liars, cheats, and others of that kind: that the elect who do not feel the fire will be chosen from the good; viz. one out of 100 men, and one out of 1000 women; which little troop will be carried into one of the paradises, where they shall enjoy all manner of felicity, till it shall please God to create a new world. It is a sin, according to them, to say, that God is in heaven. God, say they, is every where; and therefore it derogates from his omnipresence to say that he is confined to any particular place. They keep an annual fast of 30 days, from the middle of July to the middle of August, during which time they taste nothing all day; but eat twice in the night, at sun-set, and midnight: nor do they drink any thing but tea, all strong liquors being forbidden. Whoever transgresses these ordinances is obliged to emancipate his most valuable slave, or to give an entertainment to 60 people: he is likewise to receive 85 strokes on the back with a leathern strap called *dura*. The common people, however, do not observe this fast exactly, and workmen are allowed to eat in the day-time. The Bukhars say prayers five

times a-day; before morning, towards noon, afternoon, at sun-set, and in the third hour of the night.

Jenghis Khan, who conquered both the Bukharias from the Arabs, left the empire of them to his son Jagatay Khan. He died in the year 1240, and left the government to his son Kara Kulaku, and of Little Bukharia to another called *Amul Khoja Khan*. A long succession of khans is enumerated in each of these families, but their history contains no interesting particulars. They are long since extinct, and the Kalmuck Tartars are masters of the country.

BUL, in the ancient Hebrew chronology, the eighth month of the ecclesiastical, and the second of the civil year; it has since been called *Marshewan*, and answers to our October.

BULIAC, a town of Egypt, situated on the eastern shore of the river Nile, about two miles west of Grand Cairo, of which it is the port-town, and contains about 4000 families. It is a place of great trade, as all the vessels going up and down the Nile make some stay here. It is also at this place that they cut the banks of the river every year, in order to fill their canals, and overflow the neighbouring grounds, without which the soil would produce neither grain nor herbage. E. Long. 32°. N. Lat. 30°.

BULAFU, a musical instrument, consisting of several pipes of wood tied together with thongs of leather, so as to form a small interstice between each pipe. It is used by the negroes of Guinea.

BULARCHUS, a Greek painter; the first who introduced (among the Greeks at least) different colours in the same picture. He flourished 740 B. C.

BULB, in the anatomy of plants, a kind of large bud, generally produced under the ground, upon or near the root of certain herbaceous plants, hence denominated *bulbosus*.

A bulb is defined by Linnæus to be a species of hybernaculum, produced upon the descending caudex, or root; consisting of stipulæ, petioli, the rudiments of the former leaves, and scales of bark †.

To elucidate this definition, it is proper to remark, that every bud contains, in miniature or embryo, a plant, in every respect similar to the parent plant upon which it is seated*. Plants therefore are perpetuated in the buds, as well as in the seeds; and the species may be renewed with equal efficacy in either way.

The tender rudiments of the future vegetable of which the bud is composed, are enclosed, and during the severities of winter defended from cold and other external injuries, by a hard bark or rind, which generally consists of a number of scales placed over each other like tiles, and fastened together by means of a tenacious, resinous, and frequently odoriferous, substance. Thus defended, the buds remain upon different parts of the mother plant, till the ensuing spring; and are, therefore, with great propriety, denominated by Linnæus the *hybernaculum* or winter-quarters of the future vegetable.

With respect to their place, buds are situated either upon the stem and branches, or upon the roots: the former are styled *gemmæ*, or buds properly so called; but as they subsist several years by their roots, may be furnished with the other species of *hybernaculum*, called *bulbs*, which, according to the definition, are seated upon the descending *caudex* of the root.

Again,

Bul
Bulb.

† See *Hybernaculum*, and *Caudex*.

* See the article *Plants*.

Again, trees which are perennial, with a woody and durable stem or trunk, have generally proper buds or gemme, but no bulbs.

In bulbous plants, as the tulip, onion, or lily, what we generally call the *root*, is in fact a bulb or hybernaculum, which incloses and secures the embryo or future shoot.

At the lower part of this bulb may be observed a fleshy knob or tubercle, from whence proceed a number of fibres or threads. This knob, with the fibres attached to and hanging from it, is, properly speaking, the true root; the upper part being only the cradle, or nursery of the future stem, which after the bulb has repaired a certain number of times, it perishes; but not till it has produced, at its sides, a number of smaller bulbs, or suckers, for perpetuating the species.

One part of Linnæus's definition still remains obscure. The bulb, says he, is composed of the remains or rudiments of the former leaves of the plant; *e rudimento foliorum præteritorum*.

It is easy to comprehend that buds contain the rudiments of the future leaves; but how can bulbs be said to contain the rudiments of leaves that, to all appearance, are already perished? To explain this, let it be observed, that, in the opinion of very eminent botanists, the root, in a very great number of perennial herbs, is annually renewed, or repaired out of the trunk or stalk itself; in which sense, only roots are properly said to descend.

In the perennials alluded to, the basis of the stalk continually, and by insensible degrees, descends below the surface of the earth, and is thus changed into a true root; which root, by the continuance of the said motion of the stalk, also descends; and thus, according to the durability of its substance, becomes a longer or shorter root; the elder, or lower part, rotting off in proportion as the upper is generated out of the stalk. Thus, in brownwort, the basis of the stalk sinking down by degrees till it is hid under the ground, becomes the upper part of the root; and continuing still to sink, the next year becomes the lower part, and the following year rots away.

This is exactly what obtains in bulbous roots, as well as in the far greater number of other herbaceous perennials, as arum, valerian, tansey, samphire, primrose, woodforrel, iris, and others.

The immediate visible cause of this descent is the string-roots which this kind of trunks frequently puts forth; which descending themselves directly into the ground, serve, like so many ropes, for pulling the trunk after them. Hence the tuberous roots of iris are sometimes observed to reascend a little upon the rotting or fading away of the string-roots which hang at them.

In bulbous roots, where the stalk and former leaves of the plant are sunk below, and formed into what is called the *bulb*, or wintering of the future vegetable, the radicles, or small fibres that hang from the bulb, are to be considered as the root; that is, the part which furnishes nourishment to the plant: the several rinds and shells whereof chiefly the bulb consists, successively perish, and shrink up into so many dry skins; betwixt which, and in their centre, are formed other leaves and shells, and thus the bulb is perpetuated.

What has been said of the descent of roots by the sinking of the stalk, is further confirmed by the ap-

pearance of certain roots; as of valerian, plantago major, and devil's-bit, in which the lower part appears bitten or chopped off. In these the lower part rotting off as the upper descends, the living remainder becomes stumped, or seems bitten.

All bulbous roots, says the learned Dr Grew in his anatomy of plants, may be considered as hermaphrodite roots, or root and trunk both together: for the radicles or strings only, are absolute roots; the bulb actually containing those parts which, springing up, make the body or leaves of the plant; so that it may be regarded as a large bud under ground.

Bulbous roots are said to be solid, when composed of one uniform lump of matter; tunicated, when formed of multitudes of coats surrounding one another; squamose, when composed of, or covered with, lesser flakes; duplicate, when there are only two to each plant; and aggregate, when there is such a congeries of such roots to each plant.

BULBOCASTANUM, in botany. See **BUNYON**.

BULBOCODIUM, MOUNTAIN-SAFFRON; a genus of the monogynia order, belonging to the hexandria class of plants; of which there are two species, the alpinum and vernum. The first sort grows naturally on the Alps, and also on Snowdon in Wales. It hath a small bulbous root, which sends forth a few long narrow leaves somewhat like those of saffron, but narrower. In the middle of these the flower comes out, which stands on the top of the footstalk, growing erect, and is shaped like those of the crocus, but smaller; the footstalk rises about three inches high, and hath four or five short narrow leaves placed alternately upon it below the flower. This flowers in March, and the seeds are ripe in May. The second is a native of Spain. It hath a bulbous root shaped like those of the snow-drop, which sends out three or four spear-shaped concave leaves, between which comes out the flower, standing on a very short footstalk. The flowers appear about the same time with the last; at first they are of a pale colour, but afterwards change to a whitish purple. These plants may be propagated by off-sets at the decay of the flower and leaf every second or third year; also, by sowing the seed in pots in autumn, sheltering them in a frame from frost; and the plants will appear in the spring, which, at the decay of the leaves, may be taken up for planting in the borders in October, where they will flower the year following.

BULBOSE, or **BULBOUS**. See **BULB**.

BULEUTÆ, in Grecian antiquity, were magistrates answering to the decurions among the Romans. See **DECURIO**.

BULGARIA, a small province of Turkey in Europe, bounded on the north by Wallachia, on the east by the Black Sea, on the south by Romania and Macedonia, and on the west by Servia. It is very narrow, but 325 miles long on the side of the Danube, from Servia till it falls into the Black sea. The inhabitants are Christians; but extremely ignorant, inasmuch that they seem to know nothing of Christianity but baptism and fasting. It is divided into four sangiacates; Byden, Sardice, Nicopolis, and Silitria. The chief towns are of the same names, except Sardice, which is now called *Sophia*.

BULGARIAN Language, the same with the **SCLAVONIC**.

Bulimy

joined to)
Medicine.

BULIMY, a disease in which the patient is affected with an insatiable and perpetual desire of eating; and, unless he is indulged, he often falls into fainting fits. It is also called *James canina*, canine appetite †.

BULITHUS, a stone found either in the gall-bladder, or in the kidneys and bladder, of an ox. See Bos. **BULK** of a SHIP, the whole content in the hold for the stowage of goods.

BULK-HEADS are partitions made athwart the ship with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-room, and several other divisions. The *bulk-head afore* is the partition between the fore-castle and gratings in the head.

BULL (Dr John), a celebrated musician and composer, was born in Somersetshire about the year 1563, and, as it is said, was of the Somerset family. He was educated under Blitheman. In 1586, he was admitted at Oxford to the degree of bachelor of music, having practised in that faculty 14 years; and in 1592, was created doctor in the university of Cambridge. In 1591, he was appointed organist of the queen's chapel, in the room of his master, Blitheman.

Bull was the first Gresham professor of music, and was appointed to that station upon the special recommendation of queen Elizabeth. However skilful he might be in his profession, it seems he was not able to read his lectures in Latin; and therefore, by a special provision in the ordinances respecting the Gresham professors, made anno 1597, it is declared, that because Dr Bull is recommended to the place of music-professor by the queen's most excellent majesty, being not able to speak Latin, his lectures are permitted to be altogether English, so long as he shall continue music-professor there.

In the year 1601, he went abroad for the recovery of his health, which at that time was declining; and during his absence was permitted to substitute as his deputy, a son of William Bird, named *Thomas*. He travelled incognito into France and Germany; and Wood takes occasion to relate a story of him while abroad, which the reader shall have in his own words.

"Dr Bull hearing of a famous musician belonging to a cathedral in St Omer's, he applied himself, as a novice, to him, to learn something of his faculty, and to see and admire his works. This musician, after some discourse had passed between them, conducted Bull to a vestry or music-school joining to the cathedral, and shewed him a lesson or song of 40 parts; and then made a vaunting challenge to any person in the world to add one part more to them, supposing it to be so complete and full, that it was impossible for any mortal man to correct or add to it. Bull thereupon, desiring the use of pen, ink, and ruled paper, such as we call *musical paper*, prayed the musician to lock him up in the said school for two or three hours; which being done, not without great disdain by the musician, Bull, in that time or less, added 40 more parts to the said lesson or song. The musician thereupon being called in, he viewed it, tried it, and retried it; at length he burst out into a great ecstasy, and swore by the great God, that he that added these 40 parts must either be the devil or Dr Bull. Whereupon Bull making himself known, the musician fell down and adored him. Afterwards continuing there and in those parts for a time,

he became so much admired, that he was courted to accept of any place of preferment suitable to his profession, either within the dominions of the emperor, the king of France, or Spain; but the tidings of these transactions coming to the English court, queen Elizabeth commanded him home." *Fassi*, anno 1586.

Dr Ward, who has given the life of Dr Bull, in his lives of the Gresham professors, relates, that upon the decease of queen Elizabeth he became chief organist to king James, and had the honour of entertaining his majesty and prince Henry at Merchant Taylor's hall with his performance on the organ. The same author proceeds to relate, that in 1613, Bull quitted England, and went to reside in the Netherlands, where he was admitted into the service of the archduke. He suggests, as the reason for Bull's retirement, that the science began to sink in the reign of king James; which he infers from that want of court-patronage, which, it seems, induced the musicians of that day to dedicate their works to one another. But surely Bull had none of these reasons to complain of being slighted that others had. He was in the service of the chapel, and at the head of the prince's musicians; and in the year 1604 his salary for the chapel-duty had been augmented. The circumstances of his departure from England may be collected from the following entry now to be seen in the cheque book: "1613, John Bull doctor of music went beyond seas without licence, and was admitted into the archduke's service, and entered into paie there about Mich. and Peter Hopkins a bafe from Paul's was sworn into his place the 27th of December following. His wages from Mich. unto the day of the swearing of the said Peter Hopkins was disposed of by the deane of his majesty's chapel." Wood says, that Dr Bull died at Hamburg; others have said at Lubeck.

The only works of Bull in print are lessons in the "Parthenia, or the maiden-head of the first music that ever was printed for the virginals." An anthem of his, "Deliver me, O God," is to be found in Bernard's collection of church-music. Dr Ward has given a long list of compositions of Dr Bull in manuscript in the collection of the late Dr Pepusch, by which it appears that he was equally excellent in vocal and instrumental harmony. By some of the lessons in the Parthenia it seems that he was possessed of a power of execution on the harpsichord far beyond what is generally conceived of the masters of that time. As to his lessons, they were, in the estimation of Dr Pepusch, not only for the harmony and contrivance, but for air and modulation, so excellent, that he scrupled not to prefer them to those of Couperin, Scarlatti, and others of the modern composers for the harpsichord.

BULL (George), bishop of St David's, was born at Wells, in 1634; and educated at Exeter college, in Oxford. The first benefice he enjoyed was that of St George's, near Bristol, whence he rose successively to be rector of Suddington in Gloucestershire, prebendary of Gloucester, archdeacon of Llandaff, and in 1705 bishop of St David's. This dignity he enjoyed about four years, and died in 1709. During the usurpation of Cromwell, he adhered steadily, though still with great prudence, to the forms of the church of England; and in the reign of James II. preached very strenuously against the errors of Popery. He wrote, 1. A defence of the Nicene faith. 2. Apostolical harmony.

3. Primitive apostolical tradition; and other works.

BULL, in zoology. See BOS.

Wild Bulls. The wild bulls now so numerous on the continent of America, are said to have sprung from one bull and seven cows, which were carried thither by some of the first conquerors. For the manner of hunting these, see BUCANEERS.

BULL, in astronomy. See ASTRONOMY, n° 206.

BULL's-EYE, among seamen, a small, obscure, sub-line cloud, ruddy in the middle, that sometimes appear to mariners, and is the immediate forerunner of a great storm at sea.

BULL-Fighting, a sport or exercise much in vogue among the Spaniards and Portuguese, consisting in a kind of combat of a cavalier or torador against a wild bull, either on foot or on horseback, by riding at him with a lance. The Spaniards have bull-fights, i. e. feasts attended with shews, in honour of St John, the Virgin Mary, &c. This sport the Spaniards received from the Moors, among whom it was celebrated with great éclat. Some think that the Moors might have received the custom from the Romans, and they from the Greeks. Dr Plot is of opinion, that the Ταυροκαθίστρον ήμιστρα among the Thesalians, who first instituted this game, and of whom Julius Cæsar learned and brought it to Rome, were the origin both of the Spanish and Portuguese bull-fighting, and of the English bull-running. This practice was prohibited by Pope Pius V. under pain of excommunication incurred *ipso facto*. But succeeding popes have granted several mitigations in behalf of the toradors.

BULL-Running, denotes a feudal custom obtaining in the honour of Tutbury in Staffordshire; where, anciently, on the day of the assumption of our Lady, a bull is turned loose by the lord to the minstrels; who, if they can catch him before he passes the river Dove, are to have him for their own, or, in lieu thereof, to receive each 40 pence; in consideration of which custom they pay 20 pence yearly to the said lord.

BULL-Finch, in ornithology. See LOXIA.

BULL-Frog, in zoology. See RANA.

BULL-Head, or Miller's-Thumb, in ichthyology. See COTTUS.

BULL, among ecclesiastics, a written letter, dispatched, by order of the Pope, from the Roman chancery, and sealed with lead, being written on parchment, by which it is partly distinguished from a brief: see the article BRIEF.—It is a kind of apostolical receipt, or edict; and is chiefly in use in matters of justice or grace. If the former be the intention of the bull, the lead is hung by a hempen chord; if the latter, by a silken thread. It is this pendent lead, or seal, which is, properly speaking, the bull, and which is impressed on one side with the heads of St Peter and St Paul, and on the other with the name of the Pope and the year of his pontificate. The bull is written in an old, round, Gothic letter, and is divided into five parts, the narrative of the fact, the conception, the clause, the date, and the salutation, in which the Pope styles himself *servus servorum*, i. e. the servant of servants. These instruments, besides the lead hanging to them, have a cross, with some text of scripture, or religious motto, about it. Bulls are granted for the consecration of bishops, the promotion to benefices, and the celebration of jubilees, &c.

BULL in *cana Domini*, a particular bull read every year, on the day of the Lord's supper, or Maundy Thursday, in the Pope's presence, containing excommunications and anathemas against heretics, and all who disturb or oppose the jurisdiction of the holy see. After the reading of the bull, the Pope throws a burning torch in the public place, to denote the thunder of this anathema.

Golden BULL, an edict, or imperial constitution, made by the emperor Charles IV. reputed to be the magna charta, or the fundamental law of the German empire.

It is called *golden*, because it has a golden seal, in the form of a pope's bull, tied with yellow and red cords of silk: upon one side is the emperor represented sitting on his throne, and on the other the capitol of Rome. It is also called *Caroline*, on Charles IV.'s account. Till the publication of the golden bull, the form and ceremony of the election of an emperor were dubious and undetermined, and the number of the electors not fixed. This solemn edict regulated the functions, rights, privileges, and pre-eminences, of the electors. The original, which is in Latin, on vellum, is preserved at Frankfurt: this ordonnance, containing 30 articles or chapters, was approved of by all the princes of the empire, and remain still in force.

Silver BULLS were not in so frequent use; tho' we do not want instances of them.

LeadEN BULLS were sent by the emperors of Constantinople to despots, patriarchs, and princes; and the like were also used by the grandes of the Imperial court, as well as by the kings of France, Sicily, &c. and by bishops, patriarchs, and popes. It is to be observed, that the leaden bulls of these last had, on one side, the name of the pope or bishop inscribed. Polydore Virgil makes Pope Stephen III. the first who used leaden bulls, about the year 772. But others find instances of them as early as Silvester, Leo I. and Gregory the Great. The latter popes, beside their own names, strike the figures of St Peter and St Paul on their bulls; a practice first introduced by Pope Paschal II. But why, in these bulls, the figure of St Paul is on the right, and that of St Peter on the left side, is a question which has occasioned many conjectures and disputes.

WaxEN BULLS are said to have been first brought into England by the Normans. They were in frequent use among the Greek emperors, who thus sealed letters to their wives, mothers, and sons. Of these there were two sorts, one red, and the other green.

BULLA, or DIPPER, in zoology, a genus belonging to the order of vermes testaceæ. It is an animal of the snail-kind: the shell consists of one valve, convoluted, and without any prickles; the aperture is narrowish, oblong, longitudinal, and entire at the base; the columella is smooth and oblique. There are 23 species; four of them found in the British seas; the rest chiefly natives of the Asiatic and Atlantic oceans †.

BULLÆ, in antiquity, a kind of ornaments much in use among the ancient Romans. Mr Whittaker is of opinion that they were originally formed of leather among all ranks of people; and it is certain, that they continued so to the last among the commonalty. He also imagines, that at first the bulla was intended as an amulet rather than an ornament; as a proof of which he tells us that the bulla were frequently impressed with

† See Plate LXVI. fig. 2.

Bullæ,
Bulleyæ.

the figure of the sexual parts. It is universally asserted by the critics, that the bullæ were made hollow for the reception of an amulet; but this Mr Whittaker contradicts from the figure of a golden one lately found at Manchester, which had no aperture whereby an amulet could have been introduced.—Pliny refers the original of the bulla to the elder Tarquin, who gave one with the pretexta to his son, because at the age of 14 he had with his own hand killed an enemy; and in imitation of him it was afterwards assumed by other patricians. Others affirm that the bulla was given by that king to the sons of all the patricians who had born civil offices. Lastly, others allege that Romulus first introduced the bulla, and gave it to Tullus Hostilius, the first child born of the rape of the Sabines.—As to the form of the bullæ, Mr Whittaker informs us that they were originally made in the shape of hearts; but they did not always retain the form of an heart, any more than they were always made of leather. As the wealth of the state and the riches of individuals increased, the young patrician distinguished himself by a bulla of gold, while the common people wore the amulet of their ancestors. The figure of an heart then became so generally round, some even having the impression of an heart upon them, that there are not many of the original form to be found in the cabinets of the curious. The form is naturally varied from a complete circle, to that of a segment; and this was the shape of the abovementioned bulla found at Manchester. When the youth arrived at 15 years of age, they hung up their bullæ about the necks of their gods lars. We are further informed, that the bullæ were not only hung about the necks of young men, but of horses also. We may add, that bullæ were sometimes allowed to statues; whence the phrase *statue bullatæ*.

BULLÆ was also the denomination given to divers other metalline ornaments made after the same form; and in this sense bullæ seem to include all gold and silver ornaments of a roundish form, whether worn on the habits of men, the trappings of horses, or the like. Such were those decorations used by the ancients on their doors and belts. The bullæ of doors were a kind of large-headed nails fastened on the doors of the rich, and kept bright with great care. The doors of temples were sometimes adorned with golden bullæ. Mr Banelot takes the bullæ worn by soldiers on their belts to be something more than mere ornaments. They seem to have been considered as preservations from dangers and diseases, and even means of acquiring glory, and other advantages. The like may perhaps be extended to the bullæ on doors, which were probably placed there as a security to them from being broken or violated.

BULLÆ also denoted a table hung up in the public courts, to distinguish which days were fasti, and which nefasti; answering in some measure to our calendar.

BULLEYN (William), a learned physician and botanist, was born in the isle of Ely, in the former part of the reign of Henry VIII. and educated at Cambridge. Botany being his favourite study, he travelled through various parts of England, Scotland, and Germany, chiefly with an intention to improve his knowledge in that science. In the reign of Edward VI. or of queen Mary, Mr Bulleyn appears, from his remarks on the natural productions of that country, to have resided at Norwich, or in that neighbourhood, and

also to have spent some time at Bloxhall in Suffolk: but he afterwards removed into the north, and settled at Durham, where he practised physic with considerable reputation and success. His great patron at this time was Sir Thomas Hilton, knight, baron of Hilton, who was governor of Tinmouth castle in the reign of Philip and Mary. In 1560, he came to London; and soon after his arrival, was accused by William Hilton of Bidick, of having murdered his brother Sir Thomas, our author's friend and patron. He was arraigned before the duke of Norfolk, and honourably acquitted. This Hilton afterwards hired some villains to assassinate the doctor; but this attempt proving ineffectual, he had him arrested on an action for debt, and he remained for a long time in prison. During this confinement, Dr Bulleyn composed several of those works which raised his reputation as a medical writer. He died in January 1576, and was buried in St Giles's Cripplegate, in the same grave with his brother the divine, who died 13 years before, and in which John Fox the martyrologist was interred 11 years after. Dr Bulleyn appears from his writings to have been well acquainted with the works of the ancient Greek, Roman, and Arabian physicians. According to the modern practice, his books, were they generally known, would be of little use; but as he was a man of genius and fertile imagination, they are by no means barren of entertainment. He wrote, 1. The government of health, 1559, 8^{vo}. According to Anthony Wood, it was first printed in 1548; but the dedication to his patron, baron Hilton, is dated 1548, 1595, 12^{mo}. 2. A regimen against the pleurisy, 8^{vo}. London, 1562. 3. Bulleyn's bulwark of defence against all sicknesses, forenes, and wounds, that dooe daily assault mankind, London printed by John Kingston, 1562, folio. This includes, The government of health. 4. A dialogue both pleasant and pitefull, wherein is a goodlie regiment against the fever peitilence, with a consolation and comfort against death, London, 1564, 8^{vo}. 1569, 8^{vo}. Very scarce. There is a wooden print of the author prefixed to the first edition of his Government of health; also a small one engraved by Stukeley in 1722.

BULLET, an iron or leaden ball or shot, wherewith fire arms are loaded. Bullets are cast in iron moulds, consisting of two concave hemispheres, with a handle whereby to hold them; and between them is a hole, called *the gate*, at which to pour in the melted metal. The chaps or hemispheres of bullet-moulds are first punched, being blood-red hot, with a round-ended punch, of the shape and nearly of the size of the intended bullets. To cleanse the insides, they make use of a bullet bore, which consists of a steel shank, having a globe at one end, wherewith to bore the inside of a mould clean, and of the intended size.

BULLIALDUS (Ismael), an eminent astronomer, was born at Laon in the isle of France in 1605. He travelled in his youth for the sake of improvement; and afterwards published several works, among which are, 1. *De natura lucis*. 2. *Philolaus*. 3. *Astronomia philolaica, opus novum, in quo motus planetarum per novam et veram hypothesein demonstrantur*. 4. *Astronomie philolaicæ fundamenta clarius explicata et asserta adversus Zothi Wardi impugnationem*. He also wrote a piece or two upon Geometry and Arithmetic. In 1661, he paid Hevelius a visit at Dantzic, for the sake of seeing his optical

Bulleyn
Bullialdus.

optical and astronomical apparatus. Afterwards he became a presbyter at Paris, and died there in 1694.

BULLINGER (Henry), born at Bremgarten in Swisserland in 1504, was an eminent Zuinglian minister, a great supporter of the reformation, and employed in many ecclesiastical negotiations. He composed many books, one against Luther in particular. He died in 1575.

BULLION, uncoined gold or silver in the mass.

Those metals are called so, either when smelted from the native ore, and not perfectly refined; or when they are perfectly refined, but melted down in bars or ingots, or in any unwrought body, of any degree of fineness.

When gold and silver are in their purity, they are so soft and flexible, that they cannot well be brought into any fashion for use, without being first reduced and hardened with an alloy of some other baser metal.

To prevent these abuses which some might be tempted to commit in the making of such alloys, the legislators of civilized countries have ordained, that there shall be no more than a certain proportion of a baser metal to a particular quantity of pure gold or silver, in order to make them of the fineness of what is called the standard gold or silver of such a country.

According to the laws of England, all sorts of wrought plate in general ought to be made to the legal standard; and the price of our standard gold and silver is the common rule whereby to set a value on their bullion, whether the same be ingots, bars, dust, or foreign specie: whence it is easy to conceive that the value of bullion cannot be exactly known, without being first assayed, that the exact quantity of pure metal therein contained may be determined, and consequently whether it be above or below the standard.

Silver and gold, whether coined or uncoined, (though used for a common measure of other things), are no less a commodity, than wine, tobacco, or cloth; and may, in many cases, be exported as much to the national advantage as any other commodity.

BULLOCK, the same with an ox, or gelded bull*.

BULLY-TREE, in botany. See *CHRYSOPHYLLUM*.

BULTER, a term used to denote the refuse of meal after dressing, or the cloth wherein it is dressed, otherwise called *bulter-cloth*.

BULWARK, in the ancient fortification. See *RAMPART*.

BUMICILLI, a religious sect of Mahometans in Egypt and Barbary, who pretend to fight with devils, and commonly appear in a fright and covered with wounds and bruises. About the full moon they counterfeit a combat in the presence of all the people, which lasts for two or three hours, and is performed with assagais, or javelins, till they fall down quite spent; in a little time, however, they recover their spirits, get up, and walk away.

BUNDLE, a collection of things wrapped up together. Of batle-ropes, harness-plates, and gloves knives, ten make a bundle; of Hamburg yarn, twenty skeans; of basket-rods, three feet about the band.

BUNEL (Peter), a native of Toulouse, was one of the most elegant writers of the Latin tongue in the 16th century, but was still more conspicuous for the regularity of his manners. He did not seek either for riches or lucrative employments; but, contented with the bare

necessaries of life, applied himself wholly to the improvement of his mind. He died at Turin in 1547, aged 47; and has left behind him some Latin epistles, which are written with the utmost purity. The magistrates of Toulouse have a bust of him in marble, placed in their town-house. The most correct edition of his Letters is that of Henry Stephens in 1581.

BUNGAY, a market-town of Suffolk, situated on the river Waveney, about 32 miles north-east of Bury. E. Long. 1. 35. N. Lat. 52. 35.

BUNIAS, a genus of the filiquosa order, belonging to the tetradynamia class of plants, for which there is no English name. There are three species; all of them annual plants, but none of them possessed of any remarkable property.

BUNIAM, *PIG-NUT*, or *earth-nut*; a genus of the digynia order, belonging to the pentandria class of plants; of which there are three species. 1. The *bulbocastanum*, with a globular root. This grows naturally in moist pastures in many parts of Britain. It hath a tuberous solid root, which lies deep in the ground. The leaves are finely cut, and lie near the ground. The stalk rises a foot and an half high; is round, channelled, and solid; the lower part being naked; but above, where it branches out, there is one leaf placed below every branch. The flowers are white, and shaped like those of other umbelliferous plants; the seeds are small, oblong, and when ripe are channelled. The roots of this sort are frequently dug up, and by some people eaten raw. They have much resemblance in taste to a chestnut, whence the plant obtains the name of *bulbocastanum*. 2. The creticum, with a turbinated root, was discovered by Dr Tournefort in Crete, whence it took its name; but it grows naturally in many other parts of the Levant. 3. The faxatile, with very narrow tripartite leaves. This Mr Miller received from the Alps; it is a low plant, seldom rising above six inches high.—All the species delight to grow among grafs, so cannot be made to thrive long in a garden.

BUNT of a SAIL, the middle part of it, formed designedly into a bag or cavity, that the sail may gather more wind. It is used mostly in top-sails, because courses are generally cut square, or with but small allowance for bunt or compass. The bunt holds much leeward wind; that is, it hangs much to leeward.

BUNT-Lines are small lines made fast to the bottom of the sails, in the middle part of the bolt-rope, to a cringle, and so are reeved through a small block, seized to the yard. Their use is to trice up the bunt of the sail for the better furling it up.

BUNTING, in ornithology. See *EMBERIZA*.

BUNTINGFORD, a town of Hertfordshire, with a market on Mondays, and two fairs, on June 29th, and November 30th, for pedlars ware. It is a good thoroughfare town, but small, and is accounted only a large hamlet. W. Long. o. 6. N. Lat. 51. 55.

BUNTZEL, or **BUNTZLAU**, a town of Silesia, in the duchy of Jauer. The greatest part of the houses are built with stone, and there were formerly rich mines in the neighbourhood. It is in the common road to Leipsick; and their trade is earthen ware, of which they make great quantities. E. Long. 15. 50. N. Lat. 51. 12.

BUNYAN (John), author of the Pilgrim's Progress, was born at Elstow, near Bedford, in 1628. He was the son of a tinker; and, in the early part of his

Buonocarsi,
Buoy.

life, was a great reprobate, and a soldier in the parliament army: but being at length deeply struck with a sense of his guilt, he laid aside his profligate courses, became remarkable for his sobriety, and applied himself to obtain some degree of learning. About the year 1655, he was admitted a member of a Baptist congregation at Bedford, and was soon after chosen their preacher: but, in 1660, being taken up, and tried for presuming to preach, he was cruelly sentenced to perpetual banishment; and in the mean time committed to jail, where necessity obliged him to learn to make long-tagged thread-laces for his support: to add to his distresses, he had a wife and several children, among whom was a daughter who was blind. In this unjust and cruel confinement he was detained twelve years and a half, and during that time wrote many of his tracts; but he was at length discharged, by the humane interposition of Dr Barlow. When king James's declaration for liberty of conscience was published, he was chosen pastor of a congregation at Bedford. He at length died of the fever at London, on the 31st of August 1688, aged 60. He also wrote an allegory, called *The Holy War*. His *Pilgrim's Progress* has been translated into most European languages; and his works have been collected together, and printed in two volumes folio.

BUNOCARSI, or PIERINO DEL VAGA. See **PIERINO**.

BUOY, in sea affairs, a sort of close cask, or block of wood, fastened by a rope to the anchor, to determine the place where the anchor is situated, that the ship may not come too near it, to entangle her cable about the stock or the flukes of it.

Buoys are of various kinds; as,

Can Buoys: these are in the form of a cone; and of this construction are all the buoys which are floated over dangerous banks and shallows, as a warning to passing ships, that they may avoid them. They are extremely large, that they may be seen at a distance; and are fastened by strong chains to the anchors which are sunk for this purpose at such places. See **PLATE LXV. fig. 6.**

Nun-Buoys are shaped like the middle frustum of two cones, abutting upon one common base, being casks, which are large in the middle, and tapering nearly to a point at each end. **PLATE LXV. fig. 7.**

Wooden Buoys are solid pieces of timber, sometimes in the shape of a cylinder, and sometimes in that of a nun-buoy; they are furnished with one or two holes, in which to fix a short piece of rope, whose two ends, being spliced together, make a sort of circle or ring called the *strop*.

Cable-Buoys, are common casks employed to buoy up the cables in different places from rocky ground. In the harbour of Alexandria, in Egypt, every ship is moored with at least three cables, and has three or four of these buoys on each cable for this purpose.

Slings of the Buoy, the ropes which are fastened about it, and by which it is hung: they are curiously spliced round it, something resembling the braces of a drum.

To stream the Buoy, is to let it fall from the ship's side into the water; which is always done before they let go the anchor, that it may not be retarded by the buoy-ropes as it sinks to the bottom.

Buoy-Rope, the rope which fastens the buoy to the anchor: it should be little more than equal in length

to the depth of the water where the anchor lies, as it is intended to float near, or immediately above, the bed of it, that the pilot may at all times know the situation thereof. See **PLATE XXII. fig. 1. n^o 3;** where *b* is the anchor, *c* the buoy-ropes, and *d* the buoy floating on the surface of the water. The buoy-ropes are often extremely useful otherwise, in drawing up the anchor when the cable is broke. It should always, therefore, be of sufficient strength for this purpose, or else the anchor may be lost through negligence.

BUOYANT, something which, by its aptness to float, bears up other more ponderous and weighty things *.

* See **Buoy.**

Buoy of the Nore, is a buoy placed at the mouth of the river Thames, to direct mariners how to avoid a dangerous sand.

BUPALUS, a celebrated sculptor, and native of the island of Chios, was son, grandson, and great-grandson of sculptors. He had a brother, named *Athenis*, of the same profession. They flourished in the 60th Olympiad; and were cotemporary with Hipponax, a poet of an ugly and despicable figure. Our sculptors diverted themselves in representing him under a ridiculous form. But Hipponax wrote so sharp a satire against them, that they hanged themselves, as some say. Pliny, however, does not allow this; but says, on the contrary, that, after Hipponax had taken his revenge, they made several fine statues in several places; particularly a Diana at Chios, which was placed very high, and appeared with a frowning countenance to those that came in, and with a pleasant one to those that went out. There were several statues at Rome made by them; and they worked only in the white marble of the isle of Paros. Pausanias mentions Bupalus as a good architect as well as sculptor; but says nothing of Athenis.

BUPHAGA, in ornithology, a genus belonging to the order of picae. The beak is straight and quadrangular; the mandibles are gibbous, entire, and the gibbosity is greater on the outside. The feet are of the ambulatory kind. The body is greyish above, and of a dirty yellow below; the tail is shaped like a wedge. There is but one species, viz. the african, a native of Senegal. It frequently perches upon oxen, and picks out the worms from their backs.

BUPHTHALMUM, ox-eye; a genus of the polygamia superflua order, belonging to the syngenesia class of plants. There are ten species; of which the following are the most remarkable.

Species. 1. The helianthoides, a native of North America. This hath a perennial root, and an annual stalk, which rises six or eight feet high, garnished at each joint with two oblong heart-shaped leaves, which have three longitudinal veins, and the base on one side shorter than the other. The flowers come out at the extremities of the branches, and are of a bright yellow colour, resembling a small sun-flower. *2.* The arborescens, rising with several woody stems to the height of eight or ten feet, garnished with leaves very unequal in size; some are narrow and long, others are broad and obtuse; these are intermixed at the same joint, and often at the intermediate one; they are green, and placed opposite. The flowers are produced at the ends of the branches; they are of a pale yellow colour, and have scaly empalements.

Culture. All the species may be propagated by seeds; and those which do not, by parting their roots,

Buoyant
Buphtalmum.

Bupleurum or cuttings of their branches. Some of the species are tender, and require to be raised on a hot-bed.

BUPLEURUM, HARE'S-EAR, or thorough-wax; a genus of the digynia order, belonging to the pentandria class of plants. There are 17 species, of which only the following is remarkable, viz. the fruticosum, or shrubby Ethiopian hartwort. This rises with a shrubby stem, dividing into numerous branches, forming a bushy head five or six feet high, adorned with oblong, oval, entire leaves of a pale green colour, placed alternate, with yellow flowers in umbels at the ends of the branches, which appear in July and August, and are sometimes succeeded by ripe seeds. It may be propagated by cuttings.

BUPRESTIS, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are like bristles, and about the length of the breast; the lead is half retracted into the thorax. There are 27 species of this insect, most of them natives of the Indies.

BUQUOI, a town of Artois, in the French Netherlands, situated on the confines of Picardy. E. Long. 2. 40. N. Lat. 50. 12.

BUR, a broad ring of iron, behind the place made for the hand on the spears used formerly in tilting; which bur was brought to rest, when the tilter charged his spear.

BURBAS, in commerce, a small coin at Algiers, with the arms of the dey struck on both sides: it is worth half an asper.

BURCHAUSEN, a town of Germany, in the Lower Bavaria, situated on the river Saltz. E. Long. 13. 25. N. Lat. 48. 5.

BURDEN, or BURDON, in music, the drone or bass, and the pipe or string which plays it: hence that part of a song, that is repeated at the end of every stanza, is called the *burden* of it.—A chord which is to be divided, to perform the intervals of music, when open and undivided, is also called the *burden*.

BURDEN of a Ship is its contents, or number of tons it will carry. The burden of a ship may be determined thus: Multiply the length of the keel, taken within board, by the breadth of the ship, within board, taken from the midship-beam, from plank to plank; and multiply the product by the depth of the hold, taken from the plank below the keelson, to the under part of the upper deck plank; and divide the last product by 94: the quotient is the content of the tonnage required. See **FREIGHT**.

BURDOCK, in botany. See **XANTHIUM**.

BURELL, or CIVITA BURELLA, a town of Italy in the kingdom of Naples, and in the Abruzzo Citra, near the river Sangro. E. Long. 15. 5. N. Lat. 41. 56.

BUREN, a town of the United Provinces, in Guelderland. It gives the title of count de Buren to the prince of Orange. E. Long. 5. 22. N. Lat. 52. 0.

BUREN, a town of Germany, in the circle of Westphalia, and bishopric of Paderborn. It is seated on the river Alme, five miles south of Paderborn. E. Long. 8. 25. N. Lat. 51. 35.

BURFORD, a town of Oxfordshire, seated on an ascent on the river Windrush, is a handsome place, chiefly noted for the making of saddles. The Downs near it, noted for horse-races, are of great advantage to

the town. It is 23 miles west-north-west of Banbury, and 85 west of London. W. Long. 1. 43. N. Lat. 51. 40.

BURG, a town of Lincolnshire, seated in a marsh, 12 miles south-east of Boston, and 127 north of London. E. Long. 0. 5. N. Lat. 53. 12.

BURG, a town of the Dutch Netherlands, in Zutphen, seated on the old Ifsel, 18 miles east of Nimwegen. E. Long. 6. 12. N. Lat. 52. 0.

BURG-Castle, or Borough-Castle, a fortress on the edge of the county of Suffolk, three miles west of Yarmouth, where the rivers Yare and Waveny meet. It was formerly a delightful place; but now only the ruins of its walls remain, near which Roman coins are often dug up.

BURGAGE, or Tenure in BURGAGE, is where the king, or other person, is lord of an ancient borough, in which the tenements are held by a rent certain. It is indeed only a kind of town socage; as common socage †, by which other lands are holden, is usually of a rural nature. A borough is distinguished from other towns by the right of sending members to parliament; and where the right of election is by burgage-tenure, that alone is a proof of the antiquity of the borough.

Tenure in burgage, therefore, or burgage-tenure, is where houses or lands which were formerly the site of houses in an ancient borough, are held of some lord in common socage, by a certain established rent. And these seem to have withstood the shock of the Norman encroachments principally on account of their insignificance, which made it not worth while to compel them to an alteration of tenure, as 100 of them put together would scarce have amounted to a knight's fee. Besides, the owners of them, being chiefly artificers, and persons engaged in trade, could not with any tolerable propriety be put on such a military establishment, as the tenure in chivalry was. The free socage, therefore, in which these tenements are held, seems to be plainly a remnant of Saxon liberty; which may also account for the great variety of customs, affecting many of these tenements so held in ancient burgage; the principal and most remarkable of which is that called *Borough-Englisch*. See the article *Borough-Englisch*.

BURGDORF, a handsome and pretty large town of Switzerland, in the canton of Bern, seated on an eminence. The river Emma is about a pistol's shot from the town; and as it often changes its bed, it frequently does a great deal of mischief. It runs at the foot of a rock of a prodigious height, and there is a stone-bridge over it. Near the town there is a sulphureous spring which supplies their baths with water, which is good against palsies and diseases of the nerves. E. Long. 7. 35. N. Lat. 47. 6.

BURGESS, an inhabitant of a borough, or one who possesses a tenement therein.

In other countries, burgesses and citizen are confounded together; but with us they are distinguished. The word is also applied to the magistrates of some towns.

Burgess is now ordinarily used for the representative of a borough-town in parliament.

BURGRAVE properly denotes the hereditary governor of a castle or fortified town, chiefly in Germany.

BURGH. See **BOURGH**.

BURGH-Bote signifies a contribution towards the building or repairing of castles, or walls, for the defence

Burgh ||
Burglary. fence of a borough, or city.

By the law of king Athelstan, the castles and walls of towns were to be repaired, and burgh-bote levied every year within a fortnight after rogation days. No person whatever was exempt from this service; the king himself could not exempt a man from burgh-bote: yet, in after times, exemptions appear to have been frequently granted; inasmuch, that, according to Cowel, the word *burgh-bote* came to be chiefly used to denote not the service but the liberty or exemption from it.

BURGH-BREACHE is properly the breaking open a burgh, house, inclosure, &c. and in the laws of Canute, c. 55. signifies a fine imposed upon a community of a town for a breach of the peace. According to Rastallus, burgh-breche is, to be quit of trespasses committed against the peace in city or borough.

BURGHMASTER, among mariners. See *BARMASTER*.

BURGHMOTE, the court of a borough. By the laws of king Edgar, the burghmote was to be held thrice in the year; by those of Henry I. 12 times.

BURGLARY, or *NOCTURNAL HOUSE-BREAKING*, *burgi latrocinium*, which by the ancient English law was called *hamefucken*, as it is in Scotland to this day, has always been looked upon as a very heinous offence: not only because of the abundant terror it carries with it, but also as it is a forcible invasion and disturbance of that right of habitation which every individual might acquire even in a state of nature; an invasion, which, in such a state, would be sure to be punished with death, unless the assailant were stronger. But, in civil society, the laws come into the assistance of the weaker party: and, besides that they leave him this natural right of killing the aggressor if he can, they also protect and avenge him in case the assailant is too powerful. And the law has so particular and tender a regard to the immunity of a man's house, that it styles it his *castle*, and will never suffer it to be violated with impunity; agreeing herein with the sentiments of ancient Rome. For this reason no outward doors can in general be broken open to execute any civil process; tho' in criminal causes the public safety supercedes the private *. Hence also in part arises the animadversion of the law upon eaves-droppers, nufancers, and incendiaries: and to this principle it must be assigned, that a man may assemble people together lawfully, (at least if they do not exceed 11), without danger of raising a riot, rout, or unlawful assembly, in order to protect his house; which he is not permitted to do in any other case.

The definition of a burglar, as given us by Sir Edward Coke, is, "he that by night breaketh and entereth into a mansion house, with intent to commit a felony." In this definition there are four things to be considered; the *time*, the *place*, the *manner*, and the *intent*.

1. The *time* must be by night, and not by day; for in the day-time there is no burglary; *i. e.* if there be day-light or crepusculum enough, begun or left, to discern a man's face withal. But this does not extend to moonlight; for then many midnight burglaries would go unpunished: and besides, the malignity of the offence does not consist so much in its being done in the dark, as at the dead of night; when all the creation, except beasts of prey, are at rest; when sleep has disarmed the

owner, and rendered his castle defenceless.

2. As to the *place*. It must be, according to Sir Edward Coke's definition, in a mansion-house: for no distant barn, warehouse, or the like, are under the same privileges, nor looked upon as a man's castle of defence; nor is a breaking open of houses wherein no man resides, and which for the time being are not mansion-houses, attended with the same circumstances of midnight terror. A house, however, wherein a man sometimes resides, and which the owner hath left only for a short season, *animo revertendi*, is the object of burglary, though no one be in it at the time of the fact committed. And if the barn, stable, or warehouse, be parcel of the mansion-house, though not under the same roof or contiguous, a burglary may be committed therein; for the capital house protects and privileges all its branches and appurtenants, if within the curtilage or homestead. A chamber in a college, or an inn of court, where each inhabitant hath a distinct property, is, to all other purposes as well as this, the mansion-house of the owner. So also is a room or lodging in any private house, the mansion for the time being of the lodger; if the owner doth not himself dwell in the house, or if he and the lodger enter by different outward doors. But if the owner himself lies in the house, and hath but one outward door at which he and his lodgers enter, such lodgers seem only to be inmates, and all their apartments to be parcel of the one dwelling-house of the owner.

3. As to the *manner* of committing burglary: there must be both a breaking and an entry to complete it. But they need not be both done at once; for, if a hole be broken one night, and the same breakers enter the next night through the same, they are burglars. There must be an actual breaking; as, at least, by breaking or taking out the glass of, or otherwise opening, a window; picking a lock, or opening it with a key; nay, by lifting up the latch of a door, or unloosing any other fastening which the owner has provided. But if a person leaves his doors or windows open, it is his own folly and negligence; and if a man enters therein it is no burglary; yet, if he afterwards unlocks an inner or chamber door, it is so. But to come down a chimney is held a burglarious entry; for that is as much closed as the nature of things will permit. So also, to knock at a door, and, upon opening it, to rush in with a felonious intent; or, under pretence of taking lodgings, to fall upon the landlord and rob him; or to procure a constable to gain admittance in order to search for traitors, and then to bind the constable and rob the house; all these entries have been adjudged burglarious, tho' there was no actual breaking: for the law will not suffer itself to be trifled with by such evasions, especially under the cloak of legal process. As for the *entry*, any the least degree of it, with any part of the body, or with an instrument held in the hand, is sufficient; as, to step over the threshold, to put a hand or hook in at a window to draw out goods, or a pistol to demand one's money, are all of them burglarious entries. The entry may be before the breaking, as well as after; for by statute 12 Anne, c. 7. if a person enters into the dwelling house of another, without breaking in either by day or by night, with an intent to commit felony, or, being in such house, shall commit any felony; and shall in the night break out of the same; this is declared

Burglary.

* See the article *Arrest*.

to be burglary.

4. As to the *intent*; it is clear that such breaking and entry must be with a felonious intent, otherwise it is only a trespass. And it is the same, whether such intention be actually carried into execution, or only demonstrated by some attempt or overt act, of which the jury is to judge.

Burglary is a felony at common law, but within the benefit of clergy. Burglary in any house belonging to the plate-glass company, with intent to steal the stock or utensils, is by statute 13 Geo. III. c. 38. declared to be single felony, and punished with transportation seven years.

BURGO MASTER, the chief magistrate of the great towns in Flanders, Holland, and Germany. The power and jurisdiction of the burgo-master is not the same in all places, every town having its particular customs and regulations: at Amsterdam there are four chosen by the voices of all those people in the senate who have either been burgo-masters or echevins. Their authority resembles that of our lord-mayor and aldermen; they dispose of all under offices that fall in their time, keep the key of the bank, and enjoy a salary but of 500 guilders, all feasts, public entertainments, &c. being defrayed out of the common treasury.

BURGOS, a city of Spain, the capital of Old Castile, with an archbishop's see, erected in 1574. It is surrounded with mountains, which render the air very cold nine months in the year, and the other three excessive hot. It is seated on the declivity of a hill, on the top of which there is a strong castle, and the lower part of the town is watered by the river Alagon. The principal avenue to the city is by a handsome bridge over this river, which leads to a beautiful gate, adorned with the statues of several kings of Spain. The town is large and populous; but the houses are ill built, and the streets are narrow and dirty, except some few, especially that which leads to the cathedral. There are several squares, adorned with fountains and statues. The great square in the middle of the city is surrounded with fine houses, with piazzas to each. The cathedral church is a master-piece of Gothic architecture, and one of the finest in all Spain. The church of the Augustines is remarkable for its beautiful and rich chapel of the holy crucifix. There are several fine convents and nunneries; one of which last contains 150 nuns, who must all be of noble extraction. They have likewise a royal hospital, very richly endowed; and at this place they speak the best Castilian, that is, the purest Spanish in the kingdom. W. Long. 4. 7. N. Lat. 42. 20.

BURGUNDY, a province or government of France. It contains, besides the government of Burgundy, La Bresse, La Bugy, and the district of Gex; having Champagne on the north, Lyonnais on the south, Franche Comte on the east, and Nivernois and Bourbonnois on the west. Its length from north to south is about 45 leagues, and its breadth from east to west about 30. It is very fertile in corn, wine, fruit, and tobacco; being watered by the Seine, the Delune which falls into the Soane, the Brebince or Bourbonce, the Armançon, the Ouche, and the Tille. There are some noted mineral springs in it, with subterraneous lakes, and plenty of ochre. For a long time it had dukes of its own, subordinate to the crown of France;

but at last, Lew's XI. upon the failure of the heirs male, seized upon it, and annexed it to his crown. The whole government lies within the jurisdiction of the parliament of Burgundy, except a small part that is subject to that of Paris. The states meet regularly every three years, to raise the money required of them by the court. The principal places are Dijon, Auxerre, Autun, Bourbon, L'Ancey, &c.

BURIAL, the interment of a deceased person.

The rites of burial are looked upon in all countries, and at all times, as a debt so sacred, that such as neglected to discharge it were thought accursed: hence the Romans called them *justi*, and the Greeks *νομομα*, *δικαιο*, *δίκαια*, words implying the inviolable obligations which nature has laid upon the living to take care of the obsequies of the dead. Nor are we to wonder, that the ancient Greeks and Romans were extremely solicitous about the interment of their deceased friends, since they were strongly persuaded, that their souls could not be admitted into the Elysian fields till their bodies were committed to the earth; and if it happened that they never obtained the rites of burial, they were excluded from the happy mansions for the term of 100 years. For this reason it was considered as a duty incumbent upon all travellers who should meet with a dead body in their way, to cast dust or mould upon it three times; and of these three handfuls, one at least was cast upon the head. The ancients likewise considered it as a great misfortune if they were not laid in the sepulchres of their fathers; for which reason, such as died in foreign countries had usually their ashes brought home, and interred with those of their ancestors. But notwithstanding their great care in the burial of the dead, there were some persons whom they thought unworthy of that last office, and to whom therefore, they refused it: such were, 1. Public or private enemies. 2. Such as betrayed, or conspired against their country. 3. Tyrants, who were always looked upon as enemies to their country. 4. Villains guilty of sacrilege. 5. Such as died in debt, whose bodies belonged to their creditors. And, 6. Some particular offenders, who suffered capital punishment.

Of those who were allowed the rites of burial, some were distinguished by particular circumstances of disgrace attending their interment: thus persons killed by lightning were buried apart by themselves, being thought odious to the gods; those who waived their patrimony, forfeited the right of being buried in the sepulchres of their fathers; and those who were guilty of self-murder were privately deposited in the ground, without the accustomed solemnities. Among the Jews, the privilege of burial was denied only to self-murderers, who were thrown out to rot upon the ground. In the Christian church, though good men always desired the privilege of interment, yet they were not, like the heathens, so concerned for their bodies, as to think it any detriment to them, if either the barbarity of an enemy, or some other accident, deprived them of this privilege. The primitive Christian church denied the more solemn rites of burial only to unbaptized persons, self-murderers, and excommunicated persons who continued obstinate and impenitent, in a manifest contempt of the church's censures.

The place of burial among the Jews was never particularly determined. We find they had graves in the

Burick
||
Burkit.

town and country, upon the highways, in gardens, and upon mountains. Among the Greeks, the temples were made repositories for the dead in the primitive ages; yet the general custom in latter ages, with them, as well as with the Romans and other heathen nations, was to bury their dead without their cities, and chiefly by the highways. Among the primitive Christians, burying in cities was not allowed for the first 300 years, nor in churches for many ages after, the dead bodies being first deposited in the atrium or church-yard, and porches and porticos of the church: hereditary burying-places were forbidden till the 12th century. As to the time of burial, with all the ceremonies accompanying it, see the article *FUNERAL-RITES*.

BURICK, a town of Germany, in the circle of Westphalia, and duchy of Cleves, subject to the king of Prussia. It was taken by the French in 1672, who demolished the fortifications. It is agreeably seated on the river Rhine, over against Wesel, in E. Long. 6. 8. N. Lat. 51. 38.

BURIDAN (John), a native of Bethune, in Artois, was one of the most celebrated philosophers of the 14th century. He taught in the university of Paris with great reputation; and wrote commentaries on logic, morality, and Aristotle's metaphysics. Aveninus relates, that he was a disciple of Ockam; and that, being expelled Paris by the power of the Realists, which was superior to that of the Nominalists, he went into Germany, where he founded the university of Vienna. From him came the proverb of the *ass of Buridan*, so famous in the schools. Buridan supposed an hungry ass fixed at an exactly equal distance between two bushels of oats; or an ass, as much pressed by thirst as hunger, between a bushel of oats and a pail of water, each of them acting equally on his senses. Having made this supposition, he desired to know what the ass would do? If he was answered that he would remain immovable, then he concluded he would die of hunger between two bushels of oats, or of both hunger and thirst, with both corn and water within his reach. This appeared absurd, and brought the laughers on his side; but if it was replied, that the ass would not be so stupid as to die of hunger or thirst in such a situation, Then (said he), the ass has free will, or it is possible that of two equal weights one should out-weigh the other? These two consequences appeared equally absurd; and thus Buridan, by this sophism, perplexed the philosophers, and his ass became famous in the schools.

BURKITT (William), a celebrated commentator on the New Testament, was born at Hitcham in Northamptonshire, July 25th 1650, and educated at Pembroke-hall, Cambridge. He entered young upon the ministry, being ordained by bishop Reynolds: and the first employment which he had was at Milden in Suffolk, where he continued 21 years a constant preacher, first as a curate, and afterwards as rector of that church. In the year 1692, he had a call to the vicarage of Dedham in Essex, where he continued to the time of his death, which happened in the latter end of October 1703. He was a pious and charitable man. He made great collections for the French Protestants in the years 1687, &c. and by his great care, pains, and charges, procured a worthy minister to go and settle in Carolina. Among other charities, by his last

Burleigh
||
Burman.

will and testament, he bequeathed the house wherein he lived, with the lands thereunto belonging, to be an habitation for the lecturer that should be chosen from time to time, to read the lecture at Dedham. Besides his Commentary upon the New Testament, written in the same plain, practical, and affectionate manner in which he preached, he wrote a volume entitled *The poor man's help, and rich man's guide*.

BURLEIGH. See **CÆCIL**.

BURLESQUE, a species of composition, which, though a great engine of ridicule, is not confined to that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and burlesque that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain colouring so as to be risible, as in Virgil travestie; the author first laughs at every turn, in order to make his readers laugh. The Lutrin is a burlesque poem of the other sort, laying hold of a low and trifling incident to expose the luxury, indolence, and contentious spirit, of a set of monks. Boileau, the author, turns the subject into ridicule, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. Though ridicule is the poet's aim, he always carries a grave face, and never once betrays a smile. The opposition between the subject and the manner of handling it, is what produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to have quarter, because such images destroy the contrast.

Though the burlesque that aims at ridicule, produces its effects by elevating the style far above the subject; yet the poet ought to confine himself to such images as are lively, and readily apprehended. A strained elevation, soaring above the ordinary reach of fancy, makes not a pleasant impression. The mind is soon disgusted by being kept long on the stretch. Machinery may be employed in a burlesque poem, such as the Lutrin, the Dispensary, or Hudibras, with more success and propriety than in any other species of poetry. For burlesque poems, though they assume the air of history, give entertainment chiefly by their pleasant and ludicrous pictures: it is not the aim of such a poem to raise sympathy; and for that reason, a strict imitation of nature is not necessary. And hence, the more extravagant the machinery in a ludicrous poem, the more entertainment it affords.

BURLINGTON, a sea-port town in the east riding of Yorkshire, situated on the German ocean, about 37 miles north-east of York. E. Long. 10. and N. Lat. 54. 15. It gives the title of *earl* to a branch of the noble family of Boyle.

New BURLINGTON, the capital of New-Jersey, in North America; situated in an island of Delaware river, about 20 miles north of Philadelphia. W. Long. 74. 0. and N. Lat. 40. 40.

BURMAN (Francis), a Protestant minister, and learned professor of divinity at Utrecht, was born at Leyden in 1628; and died on the 10th of November 1679, after having published a course of divinity, and several other works.

He is not to be confounded with *Francis Burman*, his son; or with *Peter Burman*, a laborious commentator on Phædrus, Lucan, Petronius, and other profane authors, who died in 1741.

BURN,

BURN, in medicine and surgery, an injury received in any part of the body by fire. See SURGERY, § ix. 20.

BURNET (Gilbert), bishop of Salisbury in the latter end of the 16th century, was born at Edinburgh, in 1643, of an ancient family in the shire of Aberdeen. His father being bred to the law, was, at the restoration of king Charles II. appointed one of the lords of session, with the title of *lord Grimond*, in reward for his constant attachment to the royal party during the troubles of Great Britain. Our author, the youngest son of his father, was instructed by him in the Latin tongue: at ten years of age he was sent to continue his studies at Aberdeen, and was admitted M. A. before he was 14. His own inclination led him to the study of the civil and feudal law; and he used to say, that it was from this study he had received more just notions concerning the foundations of civil society and government, than those which some divines maintain. About a year after, he changed his mind, and began to apply to divinity, to the great satisfaction of his father. He was admitted preacher before he was 18; and Sir Alexander Burnet, his cousin-german, offered him a benefice; but he refused to accept of it.

In 1663, about two years after the death of his father, he came into England; and after six months stay at Oxford and Cambridge, returned to Scotland; which he soon left again to make a tour for some months in 1664, in Holland and France. At Amsterdam, by the help of a Jewish rabbi, he perfected himself in the Hebrew language; and likewise became acquainted with the leading men of the different persuasions tolerated in that country; as Calvinists, Arminians, Lutherans, Anabaptists, Brownists, Papists, and Unitarians, amongst each of which he used frequently to declare, he met with men of such unfeigned piety and virtue, that he became fixed in a strong principle of universal charity, and an invincible abhorrence of all severities on account of religious dissensions.

Upon his return from his travels, he was admitted minister of Salton; in which station he served five years in the most exemplary manner. He drew up a memorial, in which he took notice of the principal errors in the conduct of the Scots bishops, which he observed not to be conformable to the primitive institution; and sent a copy of it to several of them. This exposed him to their resentments: but, to shew he was not actuated with a spirit of ambition, he led a retired course of life for two years; which so endangered his health, that he was obliged to abate his excessive application to study. In 1669, he published his “*Modest and free conference between a conformist and non-conformist.*” He became acquainted with the duchess of Hamilton, who communicated to him all the papers belonging to her father and her uncle; upon which he drew up the “*Memoirs of the dukes of Hamilton.*” The duke of Lauderdale, hearing he was about this work, invited him to London, and introduced him to king Charles II. He returned to Scotland, and married the lady Margaret Kennedy, daughter of the earl of Caillis; a lady of great piety and knowledge, highly esteemed by the presbyterians, to whose sentiments she was strongly inclined. As there was some disparity in their ages, that it might remain past dispute that this match was wholly owing to inclination, and not to avarice or ambition, the day before their marriage our

author delivered the lady a deed, whereby he renounced all pretensions to her fortune, which was very considerable, and most otherwise have fallen into his hands, the herself having no intention to secure it. The same year he published his “*Vindication of the authority, constitution, and laws of the church and state of Scotland;*” which at that juncture was looked upon as so great a service, that he was again offered a bishopric, and a promise of the next vacant archbishopric; but did not accept of it, because he could not approve of the measures of the court, the grand view of which he saw to be the advancement of popery.

Mr Burnet's intimacy with the duke of Hamilton and Lauderdale occasioned him to be frequently sent for by the king and the duke of York, who had conversations with him in private. But Lauderdale conceiving a resentment against him on account of the freedom with which he spoke to him, represented at last to the king, that Dr Burnet was engaged in an opposition to his measures. Upon his return to London, he perceived that these suggestions had entirely thrown him out of the king's favour, though the duke of York treated him with greater civility than ever, and dissuaded him from going to Scotland. Upon this, he resigned his professorship at Glasgow, and staid at London. About this time the living at Cripple-gate being vacant, the dean and chapter of St Paul's (in whose gift it was), hearing of his circumstances, and the hardships he had undergone, sent him an offer of the benefice; but as he had been informed of their first intention of conferring it on Dr Fowler, he generously declined it. In 1675, at the recommendation of lord Hollis, whom he had known in France, ambassador at that court, he was by Sir Herbottle Grimstone, master of the rolls, appointed preacher of the chapel there, notwithstanding the opposition of the court. He was soon after chosen a lecturer of St Clement's, and became one of the preachers that were most followed in town. In 1697, he published his *History of the reformation*, for which he had the thanks of both houses of parliament. The first part of it was published in 1679, and the second in 1681. Next year he published an abridgement of these two parts.

Mr Burnet about this time happened to be sent for to a woman in sickness, who had been engaged in an amour with the earl of Rochester. The manner in which he treated her during her illness, gave that lord a great curiosity for being acquainted with him. Whereupon, for a whole winter, he spent one evening in a week with Dr Burnet, who discoursed with him upon all those topics upon which sceptics and men of loose morals attack the Christian religion. The happy effect of these conferences occasioned the publication of his account of the life and death of that earl. In 1682, when the administration was changed in favour of the duke of York, being much resorted to by persons of all ranks and parties, in order to avoid returning visits, he built a laboratory, and went for above a year thro' a course of chemical experiments. Not long after, he refused a living of 300 *l.* a-year, offered him by the earl of Essex on the terms of his not residing there but in London. When the inquiry concerning the Popish plot was on foot, he was frequently sent for and consulted by king Charles with relation to the state of the nation. His majesty offered him the bishopric of Chichester,

Burket

then vacant, if he would engage in his interests; but he refused to accept it on these terms. He preached at the Rolls till 1684, when he was dismissed by order of the court. About this time he published several pieces.

On king James's accession to the throne, having obtained leave to go out of the kingdom, he first went to Paris, and lived in great retirement, till contracting an acquaintance with brigadier Stoupe, a Protestant gentleman in the French service, he made a tour with him into Italy. He met with an agreeable reception at Rome. Pope Innocent II. hearing of our author's arrival, sent the captain of the Swiss guards to acquaint him he would give him a private audience in bed, to avoid the ceremony of kissing his holiness's slipper. But Dr Burnet excused himself as well as he could. Some disputes which our author had here concerning religion, beginning to be taken notice of, made it proper for him to quit the city; which, upon an intimation given him by prince Borghese, he accordingly did.

He pursued his travels thro' Switzerland and Germany. In 1688, he came to Utrecht, with an intention to settle in some of the seven provinces. There he received an invitation from the prince and princefs of Orange (to whom their party in England had recommended him) to come to the Hague, which he accepted. He was soon made acquainted with the secret of their counsels, and advised the fitting out of a fleet in Holland sufficient to support their designs and encourage their friends. This, and the *Account of his travels*, in which he endeavoured to blend Popery and tyranny together, and represent them as inseparable, with some papers reflecting on the proceedings of England, that came out in single sheets, and were dispersed in several parts of England, most of which Mr Burnet owned himself the author of, alarmed king James; and were the occasion of his writing twice against him to the princefs of Orange, and insinuating, by his ambassador, on his being forbid the court; which after much importunity was done, tho' he continued to be trusted and employed as before, the Dutch minister consulting him daily. To put an end to these frequent conferences with the ministers, a prosecution for high treason was set on foot against him both in England and Scotland. But Burnet receiving the news thereof before it arrived at the States, he avoided the storm, by petitioning for, and obtaining without any difficulty, a bill of naturalization, in order to his intended marriage with Mary Scot, a Dutch lady of considerable fortune, who, with the advantage of birth, had those of a fine person and understanding.

After his marriage with this lady, being legally under the protection of Holland, when Mr Burnet found king James plainly subverting the constitution, he omitted no method to support and promote the design the Prince of Orange had formed of delivering Great Britain, and came over with him in quality of chaplain. He was soon advanced to the see of Salisbury. He declared for moderate measures with regard to the clergy who scrupled to take the oaths, and many were displeas'd with him for declaring for the toleration of non-conformists. His pastoral letter concerning the oaths of allegiance and supremacy to king William and queen Mary, 1689, happening to touch upon the right of conquest, gave such offence to both houses of parlia-

ment, that it was ordered to be burnt by the hands of the common executioner. In 1698 he lost his wife by the small-pox; and, as he was almost immediately after appointed preceptor to the duke of Gloucester, in whose education he took great care, this employment, and the tender age of his children, induced him the same year to supply her loss by a marriage with Mrs Berkeley, eldest daughter of Sir Richard Blake, knight. In 1699 he published his "Explication of the 39 articles;" which occasioned a representation against him in the lower house of convocation in the year 1701; but he was vindicated by the upper house. His speech in the house of lords in 1704 against the bill to prevent occasional conformity was severely attacked. He died in 1715, and was interred in the church of St James, Clerkenwell, where he has a monument erected to him. He formed a scheme for augmenting the poor livings; which he pressed forward with such success, that it ended in an act of parliament passed in the 2^d year of queen Anne, "for the augmentation of the livings of the poor clergy."

BURNET (Thomas), a polite and learned writer in the end of the 17th century, was born in Scotland, but educated in Cambridge under the tuition of Mr John Tillotson, afterwards archbishop of Canterbury. In the beginning of 1685, he was made master of Sutton's hospital in London, after which he entered into holy orders. During the reign of king James, he made a noble stand in his post as master of the charter-house against the encroachments of that monarch, who would have imposed one Andrew Popham, a Papist, as a pensioner upon the foundation of that house. In 1680 he published his *Telluris theoria sacra*, so universally admired for the purity of the style and beauty of the sentiments, that king Charles gave encouragement to a translation of it into English. This theory was however attacked by several writers. In 1692 he published his *Archæologie philoſophicæ*, dedicated to king William, to whom he was clerk of the closet. He died in 1715. Since his death hath been published, his book *De ſtatu mortuorum et reſurgentium*, and his treatise *De fide et officiis Christianorum*.

BURNET, in botany. See POTERIUM and SANGUISORBA.

BURNHAM, a market town of Norfolk in England, situated in E. Long. o. 50. N. Lat. 53. o.

BURNING, the action of fire on some pabulum or fuel, by which the minute parts thereof are put into a violent motion, and some of them assuming the nature of fire themselves, fly off in *orbem*, while the rest are dissipated in form of vapour, or reduced to ashes *.

Extraordinary Cases of BURNING. We have instances of persons burnt by fire kindled within their own bodies. A woman at Paris, who used to drink brandy to excess, was one night reduced to ashes by a fire from within, all but her head and the ends of her fingers. Signora Corn. Zangari, or, as others call her, *Corn. Bandi*, an aged lady, of an unblemished life, near Cesena in Romagna, underwent the same fate in March 1731. She had retired in the evening into her chamber somewhat indisposed; and in the morning was found in the middle of the room reduced to ashes, all except her face, legs, skull, and three fingers. The stockings and shoes she had on were not burnt in the least. The ashes were light; and, on pressing between the fingers, vanished,

Burnet
Burning.

* See Ignition.

Burning. vanished, leaving behind a gross stinking moisture, with which the floor was smeared; the walls and furniture of the room being covered with a moist cineritious foot, which had not only stained the linen in the chests, but had penetrated into the closet, as well as into the room overhead, the walls of which were moistened with the same viscous humour.—We have various other relations of persons burnt to death in this unaccountable manner.

Sig. Mondini, Bianchini, and Maffei, have written treatises expressly to account for the cause of so extraordinary an event: common fire it could not be, since this would likewise have burnt the bed and the room; besides that it would have required many hours, and a vast quantity of fuel, to reduce a human body to ashes; and, after all, a considerable part of the bones would have remained entire, as they were anciently found after the fiercest funeral fires. Some attribute the effect to a mine of sulphur under the house; others, to a miracle; while others suspect that art or villainy had a hand in it. A philosopher of Verona maintains, that such a conflagration might have arisen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for the conflagration of the lady above mentioned, from her using a bath or lotion of camphorated spirit of wine when she found herself out of order. Maffei supposes it owing to lightning, but to lightning generated in her own body, agreeable to his doctrine, which is, That lightning does not proceed from the clouds, but is always produced in the place where it is seen and its effects perceived. We have had a late attempt to establish the opinion, that these destroying internal fires are caused in the entrails of the body by inflamed effluvia of the blood; by juices and fermentations in the stomach; by the many combustible matters which abound in living bodies for the purposes of life; and, finally, by the fiery evaporations which exhale from the settlings of spirit of wine, brandies, and other hot liquors, in the tunica villosa of the stomach and other adipose or fat membranes; within which those spirits engender a kind of camphor, which in the nighttime, in sleep, by a full respiration, are put in a stronger motion, and are more apt to be set on fire. Others ascribe the cause of such persons being set on fire to lightning; and their burning so entirely, to the greater quantity of phosphorus and other combustible matter they contained.—For our own part, we can by no means pretend to explain the cause of such a phenomenon: but for the interests of humanity we wish it could be derived from something external to the human body; for if, to the calamities of human life already known, we superadd a suspicion that we may unexpectedly and without the least warning be consumed by an internal fire, the thought is too dreadful to be borne.

BURNING, or *Brenning*, in our old customs, denotes an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the *venerical disease*.

In a manuscript of the vocation of John Bale to the bishopric of Ossory, written by himself, he speaks of Dr Hugh Weston, who was dean of Windsor in 1556, but deprived by cardinal Pole for adultery, thus: “At this day is leacherous Weston, who is more practised in the arts of brech-burning, than all the whores of the stews. He not long ago brent a beggar of St Botolph’s

parish.” See STEWS.

BURNING, in antiquity, a way of disposing of the dead much practised by the ancient Greeks and Romans, and still retained by several nations in the East and West Indies. The antiquity of this custom rises as high as the Theban war, where we are told of the great solemnity accompanying this ceremony at the pyre of Menæceus and Archemorus, who were contemporary with Jair the eighth judge of Israel. Homer abounds with funeral obsequies of this nature. In the inward regions of Asia, the practice was of very ancient date, and the continuance long: for we are told, that, in the reign of Julian, the king of Chionia burnt his son’s body, and deposited the ashes in a silver urn. Coeval almost with the first instances of this kind in the east, was the practice in the western parts of the world. The Herulians, the Getes, and the Thracians, had all along observed it; and its antiquity was as great with the Celts, Sarmatians, and other neighbouring nations. The origin of this custom seems to have been out of friendship to the deceased: their ashes were preserved as we preserve a lock of hair, a ring, or a seal, which had been the property of a deceased friend.

Kings were burnt in cloth made of the asbestos stone, that their ashes might be preserved pure from any mixture with the fuel and other matters thrown on the funeral pile. The same method is still observed with the princes of Tartary. Among the Greeks, the body was placed on the top of a pile, on which were thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus we find a number of sheep and oxen thrown in, then four horses, followed by two dogs, and lastly by 12 Trojan prisoners. The like is mentioned by Virgil in the funerals of his Trojans; where, besides oxen, swine, and all manner of cattle, we find eight youths condemned to the flames. The first thing was the fat of the beasts wherewith the body was covered, that it might consume the sooner; it being reckoned great felicity to be quickly reduced to ashes. For the like reason, where numbers were to be burnt at the same time, care was taken to mix with the rest some of humid constitutions, and therefore more easily to be inflamed. Thus we are assured by Plutarch and Macrobius, that for every ten men it was customary to put in one woman. Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile, with other ornaments and presents; a piece of extravagance which the Athenians carried to so great a height, that some of their law-givers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead.—In some cases, burning was expressly forbid among the Romans, and even looked upon as the highest impicity. Thus infants, who died before the breeding of teeth, were intombed unburnt in the ground, in a particular place set apart for this purpose, called *suggrundarium*. The like was practised with regard to those who had been struck dead with lightning, who were never to be burnt again. Some say that burning was denied to suicides.—The manner of burning among the Romans was not unlike that of the Greeks: the corpse, being brought out without the city, was carried directly to the place appointed for burning it; which, if it joined to the sepulchre, was called *burnum*; if separate from it, *ustrina*; and there laid

laid on the *rogus* or *pyra*, a pile of wood prepared on which to burn it, built in shape of an altar, but of different height according to the quality of the deceased. The wood used was commonly from such trees as contained most pitch or resin; and if any other were used, they split it for the more easy catching fire: round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on the couch or bed whereon it lay. This done, the next of blood performed the ceremony of lighting the pile; which they did with a torch, turning their face all the while the other way, as if it were done with reluctance. During the ceremony, deceptions and games were celebrated; after which came the *offitium*, or gathering of the bones and ashes; also washing and anointing them, and repositing them in urns.

BURNING, among surgeons, denotes the application of an actual cautery, that is, a red-hot iron instrument, to the part affected; otherwise denominated *cauterization*.—The whole art of physic among the Japanese lies in the choice of places proper to be burnt; which are varied according to the disease. In the country of the Mogul, the colic is cured by an iron ring applied red-hot about the patient's navel. Certain it is, that some very extraordinary cures have been performed accidentally by burning. The following case is recorded in the Memoirs of the academy of sciences by M. Homberg. A woman of about 35 became subject to a head-ach, which at times was so violent, that it drove her out of her senses, making her sometimes stupid and foolish, at other times raving and furious. The seat of the pain was in the forehead, and over the eyes, which were inflamed, and looked violently red and sparkling; and the most violent fits of it were attended with nausea and vomitings. In the times of the fits, she could take no food; but, out of them, had a very good stomach. Mr Homberg had in vain attempted her cure for three years with all kinds of medicines: only opium succeeded; and that but little, all its effect being only the taking off the pain for a few hours. The redness of her eyes was always the sign of an approaching fit. One night, feeling a fit coming on, she went to lie down upon the bed; but first walked up to the glass with the candle in her hand, to see how her eyes looked: in observing this, the candle set fire to her cap; and as she was alone, her head was terribly burnt before the fire could be extinguished. Mr Homberg was sent for, and ordered bleeding and proper dressings: but it was perceived, that the expected fit this night never came on; the pain of the burning wore off by degrees; and the patient found herself from that hour cured of the head-ach, which had never returned in four years after, which was the time when the account was communicated.—Another case, not less remarkable than the former, was communicated to Mr Homberg by a physician at Bruges. A woman, who for several years had her legs and thighs swelled in an extraordinary manner, found some relief from rubbing them before the fire with brandy every morning and evening. One evening the fire chanced to catch the brandy she had rubbed herself with, and slightly burnt her. She applied some brandy to her burn; and in the night all the water her legs and thighs were swelled with was entirely discharged by urine, and the swelling did not again return.

BURNING-Glass, a convex glass commonly spherical, which being exposed directly to the sun, collects all the rays falling thereon into a very small space called the *focus*; where wood, or any other combustible matter being put, will be set on fire. The term *burning-glass* is also used to denote those concave mirrors, whether composed of glass quick-silvered, or of metalline matters, which burn by reflection, condensing the sun's rays into a focus similar to the former.

The use of burning-glasses appears to have been very ancient. Diodorus Siculus, Lucian, Dion, Zonaras, Galen, Anthemius, Eustathius, Tetzets, and others, attest, that by means of them Archimedes set fire to the Roman fleet at the siege of Syracuse. Tetzets is so particular in his account of this matter, that his description suggested to Kircher the method by which it was probably accomplished. That author says, that "Archimedes set fire to Marcellus's navy, by means of a burning-glass composed of small square mirrors, moving every way upon hinges; which, when placed in the sun's rays, directed them upon the Roman fleet, so as to reduce it to ashes at the distance of a bow-shot." A very particular testimony we have also from Anthemius of Lydia, who takes pains to prove the possibility of setting fire to a fleet, or any other combustible body, at such a distance.

That the ancients were also acquainted with the use of catoptric or refracting burning-glasses, appears from a passage in Aristophanes's comedy of the clouds, which clearly treats of their effects. The author introduces Socrates as examining Strepsiades about the method he had discovered of getting clear of his debts. He replies, that "he thought of making use of a burning-glass which he had hitherto used in kindling his fire;" "for, (says he), should they bring a writ against me, I'll immediately place my glass in the sun at some little distance from it, and set it on fire." Pliny and Lactantius have also spoken of glasses that burned by refraction. The former calls them *balls* or *globes of glass* or *crystal*, which, exposed to the sun, transmit a heat sufficient to set fire to cloth, or corrode away the dead flesh of those patients who stand in need of cauterics; and the latter, after Clemens Alexandrinus, takes notice that fire may be kindled by interposing glasses filled with water between the sun and the object, so as to transmit the rays to it.

It seems difficult to conceive how they should know such glasses would burn without knowing they would magnify, which it is granted they did not, till towards the close of the 13th century, when spectacles were first thought on. For as to those passages in Plautus which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing; and he solves this, by observing, that their burning-glasses being spheres, either solid or full of water, their foci would be one fourth of their diameter distant from them. If then their diameter were supposed half a foot, which is the most we can allow, an object must be at an inch and a half distance to perceive it magnified; those at greater distances do not appear greater, but only more confused through the glass than out of it. It is no wonder, therefore, the magnifying property of convex glasses was unknown, and the burning one known. It is more wonderful there should be 300 years between the invention of spectacles and telescopes.

Burning. scopes.

Among the ancients, the burning mirrors of Archimedes and Proclus are famous: the former we have already taken notice of; by the other, the navy of Vitellius besieging Byzantium, according to Zonaras, was burnt to ashes.

Among the moderns, the most remarkable burning mirrors are those of Settala, of Villette, of Tschirnhausen, and M. Buffon. Settala, canon of Padua, made a parabolic mirror, which, according to Schottus, burnt pieces of wood at the distance of 15 or 16 paces.

M. Tschirnhausen's mirror at least equals the former, both in bigness and effect. The following things are noted of it in the *Acta Eruditorum*. 1. Green wood takes fire instantaneously, so as a strong wind cannot extinguish it. 2. Water boils immediately; and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently; and iron and steel-plate becomes red-hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red-hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass, and shells into a blackish yellow one. 7. A pumice stone, emitted from a volcano, melts in white glass; and, 8. A piece of crucible also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one. The breadth of this mirror is near three Leipzig ells, its focus two ells from it; it is made of copper, and its substance is not above double the thickness of the back of a knife.

Villette, a French artist of Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third presented by the French king to the royal academy; a fourth has been in England, where it was publicly exposed. The effect hereof, as found by Dr Harris and Dr Defaguliers, are, that a silver sixpence is melted in 7" and $\frac{1}{2}$, a king George's halfpenny in 16", and runs with a hole in 34". Tin melts in 3", cast-iron in 16", slate in 3"; a fossil shell calcines in 7"; a piece of Pompey's pillar at Alexandria vitrifies in the black part in 50", in the white in 54"; copper ore in 8"; bone calcines in 4", vitrifies in 33". An emerald melts into a substance like a turquoise stone; a diamond weighing four grains loses $\frac{7}{8}$ of its weight: the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can go no farther with them. This mirror is 47 inches wide, and is ground to a sphere of 76 inches radius; so that its focus is about 38 inches from the vertex. Its substance is a composition of tin, copper, and tin-glass.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a burning-glass. The most considerable of this kind is that made by M. de Tschirnhausen: the diameter of his lens is three and four feet, the focus at the distance of 12 feet, and its diameter an inch and a half. To make the focus the more vivid, it is collected a second time by a second lens parallel to the first, and placed in that point where the diameter of the cone of rays formed by the first lens is equal to the diameter

Burning.

of the second; so that it receives them all; and the focus, from an inch and a half, is contracted into the space of eight lines, and its force increased proportionably.

This glass vitrifies tiles, slates, pumice-stones, &c. in a moment. It melts sulphur, pitch, and all rofins, under water; the ashes of vegetables, woods, and other matters, are transmuted into glass; and every thing applied to its focus, is either melted, turned into a calx, or into smoke. Tschirnhausen observes, that it succeeds best when the matter applied is laid on a hard charcoal well burnt.

Sir Isaac Newton presented a burning-glass to the royal society, consisting of seven concave glasses, so placed, as that all their foci join in one physical point. Each glass is about 11 inches and a half in diameter: six of them are placed round the seventh, to which they are all contiguous; and they form a kind of segment of a sphere, whose subtense is about 34 inches and a half, and the central glass lies about an inch farther in than the rest. The common focus is about 22 inches and a half distant, and about an inch in diameter. This glass vitrifies brick or tile in 1", and melts gold in 30".

It would appear, however, that glass quicksilvered is a more proper material for burning-glasses than metals; for the effects of that speculum wherewith Mr Macquer melted the platinum, seem to have been superior to those above mentioned, though the mirror itself was much smaller. The diameter of this glass was only 22 inches, and its focal distance 28. Black flint, when exposed to the focus, being powdered to prevent its crackling and flying about, and secured in a large piece of charcoal, bubbled up, and ran into transparent glass in less than half a minute. Hessian crucibles, and glass-house pots, vitrified completely in three or four seconds. Forged iron smoked, boiled, and changed into a vitrescent scoria as soon as it was exposed to the focus. The gypsum of Montmartre, when the flat sides of the plates or leaves of which it is composed were presented to the glass, did not show the least disposition to melt; but, on presenting a transverse section of it, or the edges of the plates, it melted in an instant, with a hissing noise, into a brownish yellow matter. Calcareous stones did not completely melt: but there was detached from them, a circle more compact than the rest of the mass, and of the size of the focus; the separation of which seemed to be occasioned by the shrinking of the matter which had begun to enter into fusion. The white calx of antimony commonly called *diaphoretic antimony*, melted better than the calcareous stones, and changed into an opaque pretty glossy substance like white enamel. It was observed, that the whiteness of the calcareous stones and the antimonial calx was of great disadvantage to their fusion, by reason of their reflecting great part of the sun's rays; so that the subject could not undergo the full activity of the heat thrown upon it by the burning-glass. The case was the same with metallic bodies, which melted so much the more difficultly as they were more white and polished; and this difference was so remarkable, that in the focus of this mirror, so fusible a metal as silver, when its surface was polished, did not melt at all.

Plate LXVI. fig. 3. represents Mr Buffon's burning mirror, which he with great reason supposes to be

of

Burning.

of the same nature with that of Archimedes. It consists of a number of small mirrors of glass quicksilvered, all of which are held together by an iron frame. Each of these small mirrors is also moveable by a contrivance on the back part of the frame, that so their reflections may all coincide in one point. By this means they are capable of being accommodated to various heights of the sun, and to different distances. The adjusting them in this manner takes up a considerable time; but after they are so adjusted, the focus will continue unaltered for an hour or more.

Fig. 4. represents a contrivance of Mr. Buffon's for diminishing the thickness of very large reflecting lenses. He observes, that in large lenses of this kind, and which are most convenient for many purposes, the thickness of the glass in the middle is so great, as very much to diminish their force. For this reason he proposes to form a burning-glass of concentric circular pieces of glass, each resting upon the other, as represented in the figure. His method is to divide the convex arch of the lens into three equal parts. Thus, suppose the diameter to be 26 inches, and the thickness in the middle to be three inches: By dividing the lens into three concentric circles, and laying the one over the other, the thickness of the middle piece needs be only one inch; at the same time that the lens will have the same convexity, and almost the same focal distance, as in the other case; while the effects of it must be much greater, on account of the greater thinness of the glass.

BURNING Springs. Of these there are many in different parts of the world; particularly one in Dauphiny near Grenoble; another near Hermanstadt in Transylvania; a third at Chermay, a village near Switzerland; a fourth in the canton of Friburg; and a fifth not far from the city of Cracow in Poland. There also is, or was, a famous spring of the same kind at Wigan in Lancashire, which, upon the approach of a lighted candle, would take fire and burn like spirit of wine for a whole day. But the most remarkable one of this kind, or at least that of which we have the most particular description, was discovered in 1711 at Brofely in Shropshire. The following account of this remarkable spring was given by the reverend Mr. Mason Woodwardian professor at Cambridge, dated February 18th 1746. "The well for four or five feet deep is six or seven feet wide; within that is another less hole of like depth dug in the clay, in the bottom whereof is placed a cylindrical earthen vessel, of about four or five inches diameter at the mouth, having the bottom taken off and the sides well fixed in the clay rammed close about it. Within the pot is a brown water thick as puddle, continually forced up with a violent motion beyond that of boiling water, and a rumbling hollow noise, rising or falling by fits five or six inches; but there was no appearance of any vapour rising, which perhaps might have been visible, had not the sun shone so bright. "Upon putting a candle down at the end of a stick, at about a quarter of a yard distance, it took fire, darting and flashing after a very violent manner for about half a yard high, much in the manner of spirits in a lamp, but with great agitation. It was said, that a tea-kettle had been made to boil in about nine minutes time, and that it had been left burning for 48 hours without any sensible diminution. It

was extinguished by putting a wet mop upon it; which must be kept there for a little time, otherwise it would not go out. Upon the removal of the mop there rises a sulphureous smoke lasting about a minute, and yet the water is very cold to the touch." In 1755, this well totally disappeared by the sinking of a coal-pit in its neighbourhood.

The cause of the inflammable property of such waters, is with great probability supposed to be their mixture with petroleum, which is one of the most inflammable substances in nature, and has the property of burning on the surface of water.

BURNING of Colours, among painters. There are several colours that require burning; as,

First, lamp-black, which is a colour of so greasy a nature, that, except it is burnt, it will require a long time to dry. The method of burning, or rather drying, lamp-black, is as follows: Put it into a crucible over a clear fire, letting it remain till it be red hot, or so near it that there is no manner of smoke arises from it.

Secondly, Umber, which if it be intended for colour for a horse, or to be a shadow for gold, then burning fits it for both these purposes. In order to burn umber, you must put it into the naked fire, in large lumps, and not take it out till it is thoroughly red hot; if you have a mind to be more curious, put it into a crucible, and keep it over the fire till it be red hot.

Ivory also must be burnt to make black, thus: fill two crucibles with shavings of ivory, then clap their two mouths together, and bind them fast with an iron wire, and lute the joints close with clay, salt, and horse-dung, well beaten together; then set it over the fire, covering it all over with coals: let it remain in the fire, till you are sure that the matter inclosed is thoroughly red hot: then take it out of the fire; but do not open the crucibles till they are perfectly cold; for were they opened while hot, the matter would turn to ashes; and so it will be, if the joints are not luted close.

BURNISHER, a round polished piece of steel, serving to smooth and give a lustre to metals.

Of these there are different kinds of different figures, straight, crooked, &c. Half burnishers are used to solder silver, as well as to give a lustre †.

BURNISHING, the art of smoothing or polishing ^{ing.} a metalline body, by a brisk rubbing of it with a burnisher.

Book-binders burnish the edges of their books, by rubbing them with a dog's tooth. Gold and silver are burnished by rubbing them with a wolf's tooth, or by the bloody stone, or by tripoli, a piece of white wood, emery, and the like. Deer are said to burnish their heads, by rubbing off a downy white skin from their horns, against a tree.

BURNLEY, a town of Lancashire in England, situated in W. Long. 2. 5. N. Lat. 53. 40.

BURNTISLAND. See BRUNTSISLAND.

BURNTWOOD, a town of Essex in England, situated on a hill, in E. Long. o. 25. N. Lat. 51. 38.

BURR, the round knob of a horn next a deer's head.

BURRE, BOUREE, or Boree, a kind of dance composed of three steps joined together in two motions, begun with a crotchet rising. The first couplet contains

Burning
||
Burntwood.

tains twice four measures, the second twice eight. It consists of a balance and coupee.

BURR-PUMP, or **BIDGE-Pump**, differs from the common pump, in having a staff 6, 7, or 8 feet long, with a bar of wood, whereto the leather is nailed, and this serves instead of a box. So two men, standing over the pump, thrust down this staff, to the middle wherof is fastened a rope, for 6, 8, or 10 to hale by, thus pulling it up and down.

BURROCK, a small wiar or dam, where wheels are laid in a river, for the taking of fish.

BURROUGHS'S MACHINE, invented by Mr Burroughs of Southwark; and for which the society for the encouragement of arts gave him a premium of 70 l.

Pl. LXVI.

This machine consists of a cog-wheel A (fig. 5.), 12 feet in diameter, carrying 72 cogs; which turn a trundle-head B, one foot four inches in diameter, and furnished with eight rounds; and also an horizontal spur-wheel C, of 12 cogs, and one foot eight inches in diameter. The trundle-head B turns a spur-wheel D of ten cogs, and two feet eight inches in diameter. This spur-wheel has two cranks, *a, b*, in its shaft; one of which *a* gives motion to a wooden frame, *c*, about 34 inches long, and 19 broad. On the under side of this frame are fastened by screws twelve pieces of polished metal, each five inches and a half long, and three broad, covered with leather; and underneath these polishers, a glass plate cemented in another frame is placed on the bench *d*, and polished with tripoli by the motion given to the upper frame by the crank *a*. The nuts of the screws which fasten the polishers to the upper frame are not screwed close to the wood, in order to give the frame room to play; by which contrivance the perpendicular rise of the crank is avoided, and the motion of the polishers always parallel and equal. The under frame may be moved by the hand in any direction without stopping the machine; by which means the plate, when larger than the polishing frame can cover in its motion, will be equally polished in every part.

The other crank *b* gives motion to two other polishers marked *n, o*, which have an alternate motion by the bending of the crank; they move upon the same plate, and have an equal number of polishers, as that already described.

The same crank also gives motion to a contrivance represented at *e* for polishing spectacle-glasses. It consists of two segments of the same sphere; one concave, and the other convex. On the latter the glasses are cemented; and polished by the former, which is moved by the crank *b*. The convex segment may be moved round by the hand without stopping the machine, so that all the glasses on its superficies will be equally polished.

The other spur-wheel C, by means of a crank in its shaft, gives motion to another frame *g*, employed in grinding the glass plates. The rod *h*, extended from the crank *f* to the frame *g*, is fastened to the latter by means of a pivot, in order to admit of a rotatory motion, as well as that given it by the crank in a longitudinal direction. This rotatory motion is effected by means of a rod of iron *i*, called a *trigger*, sharp at the extremity next the frame, where it touches the teeth of an horizontal spur-wheel, or circular piece of wood, fixed on the grinding-plate, while the other end is ex-

tended three feet two inches to the centre of motion.

But this contrivance, in which the merit of the machine principally consists, will be much better conceived from a small delineation of it by itself (fig. 6.), where F is the crank marked *f* in fig. 5. and turned by the spur-wheel C in the same figure. G is the trigger, three feet two inches long. I, a roll fixed on the trigger for the rod to slide on. H, the horizontal spur-wheel, eleven inches in diameter, fixed on the grinding-plate; the teeth of which is touched by the trigger; but with a very unequal force, as it will wholly depend upon the grinding-plate's being farther from, or nearer to, the centre of motion of the trigger. By this simple contrivance, the grinding-plate has a very compound motion, never moving exactly in the same tract, and therefore must grind the plates equally in every part. Several attempts have been made by others for producing the same effect: but without success; the grinding-plate always following the same tract, and consequently the plates were ground unequally.

BURROWS, holes in a warren, serving as a covert for rabbits, &c. A coney's coming out of her burrow is called *bolting*. To catch coney, they sometimes lay purple-nets over the burrows, then put in a terrier clay muzzled, which making the creature bolt, she is caught in the net.

BURSA, or **PRUSA**, in geography, the capital of Bithinia in Asia Minor, situated in a fine fruitful plain, at the foot of mount Olympus, about 100 miles south of Constantinople. E. Long. 29. o. N. Lat. 40. 30.

BURSA-Pasferis, in botany. See **THLASPI**.

BURSA, *Barfe*, originally signifies a purse. In middle-age writers it is more particularly used for a little college or hall in an university, for the residence of students called *burfales* or *burfarii*. In the French universities it still denotes a foundation for the maintenance of poor scholars in their studies. The nomination to burfes is in the hands of the patrons and founders thereof. The burfes of colleges are not benefices, but mere places assigned to certain countries and persons. A burfe becomes vacant by the burfer's being promoted to a cure.

BURSAR, or **BURSER**, (*Burfaricus*), is used in middle-age writers for a treasurer or cash-keeper. In this sense we meet with burfars of colleges. Conventual burfars were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas. The word is formed from the Latin *burfa*, whence also the English word *purse*; hence also the officer, who in a college is called *burfar*, in a ship is called *purser*.

BURSARS, or *Burfors*, (*Burfarii*), also denote those to whom stipends are paid out of a burse or fund appointed for that purpose.

BURSARIA, the burfary, or exchequer of collegiate and conventual bodies; or the place of receiving, paying, and accounting by the burfarii or burfers.

BURSE, in matters of commerce, denotes a public edifice in certain cities, for the meeting of merchants to negotiate bills, and confer on other matters relating to money and trade. In this sense, burse amounts to the same with what we otherwise call an *exchange*.*

The first place of this kind to which the name *Burse* was given, Guiechardin assures us, was at Bruges; and it took its denomination from an hotel adjoining to it,

* See the article *Exchange*.

built by a lord of the family de la Bourfe, whose arms, which are three purfes, are ftill found on the crowning over the portal of the houfe. Catel's account is fomething different, viz. that the merchants of Bruges bought a houfe or apartment to meet in, at which was the fign of the purfe. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amfterdam, Bergen in Norway, and London. This laft, anciently known by the name of the *common burfe of merchants*, had the denomination fince given it by queen Elizabeth, of the *royal exchange*. The moft confiderable burfe is that of Amfterdam, which is a large building, 230 feet long, and 130 broad, round which runs a periftyle 20 feet wide. The columns of the periftyle, which are 46, are numbered, for the conveniency of finding people. It will hold 4500 perfons.

In the times of the Romans there were public places for the meeting of merchants in moft of the trading cities of the empire: that built at Rome, in the 259th year after its foundation, under the confulate of Appius Claudius and Publius Servilius, was denominated the *college of merchants*; fome remains of it are ftill to be feen, and are known by the modern Romans under the name *loggia*. The Hans towns, after the example of the Romans, gave the name of *colleges* to their burfes.

BURSTEN, denotes a perfon who has a rupture †.

BURTHEN of a SHIP. See BURDEN.

BURTON upon TRENT, a town of Staffordshire, in England. It had formerly a large abbey; and over the river Trent it has now a famous bridge of free ftone, about a quarter of a mile in length, fupported by 37 arches. It confifts chiefly of one long ftreet, which runs from the place where the abbey flood to the bridge; and has a good market for corn and provifions. Burton ale is reckoned the beft of any brought to London. E. Long. 1. 36. N. Lat. 52. 48.

BURTON, a town of Lincolnshire in England, feated on a hill near the river Trent. It is but a fmall place, and fituated in W. Long. 0. 30. N. Lat. 53. 40.

BURTON, a town of Weftmorland in England, feated in a valley near a large hill called *Farleton-knot-hill*. It is pretty well built, and lies on the great road from Lancafter to Carlifle. W. Long. 2. 35. N. Lat. 54. 10.

BURTON (Robert), known to the learned by the name of *Democritus junior*, was younger brother to William Burton who wrote "The antiquities of Leiceftershire;" and born of an ancient family at Lindley, in that county, upon the 8th of February 1576. He was educated in grammatical learning in the free fchool of Sutton Colfield in Warwickshire; in the year 1593 was fent to Brazen-nofe college in Oxford; and in 1599 was elefted ftudent of Chrift-church. In 1616, he had the vicarage of St Thomas, in the weft fuburb of Oxford, conferred upon him by the dean and canons of Chrift-church, to the parifhioners of which, it is faid, that he always gave the facrament in wafers; and this, with the reftory of Segrave in Leiceftershire, given him fome time after by George lord Berkeley, he held to the day of his death, which happened in January 1639.

He was a man of general learning; a great philofopher; an exact mathematician; and (what makes the peculiarity of his character) a very curious calculator

of natiivities. He was extremely ftudious, and of a melancholy turn; yet an agreeable companion, and very humorous. *The anatomy of melancholy*, by *Democritus junior*, as he calls himfelf, fhews, that thefe different qualities were mixed together in his compofition. This book was printed firft in 4^o, afterwards in folio, in 1624, 1632, 1638, and 1652, to the great emolument of the bookfeller, who, as Mr Wood tells us, got an eftate by it. Some circumftances attending his death occafioned ftrange fufpicions. He died in his chamber at or very near the time which, it feems, he had fome years before predicted from the calculation of his natiivity; and this exactnefs made it whifpered about, that, for the glory of aftrology, and rather than his calculation fhould fail, he became indeed a *felo de fe*. This, however, was generally difcredited; he was buried with due folemnity in the cathedral of Chrift-church, and had a fair monument erected to his memory. He left behind him a very choice collection of books. He bequeathed many to the Bodleian library; and 100 l. to Chrift-church, the intereft of which was to be laid out yearly in books for their library.

BURTON (John), D. D. a late worthy and learned divine, was born in 1696, at Wembworth, in Devonshire, his father being rector of that parifh; and was educated at Corpus Chrifti college, Oxford. In 1725, being then pro-rector and mafter of the fchools, he fpoke a Latin oration before the determining bachelor, which is intitled "Heli; or, An inflance of a magiftrate's erring through unreafonable lenity;" written and publifhed with a view to encourage the falutary exercife of academical difcipline; and afterwards treated the fame fubject ftill more fully in four Latin fermons before the univerfity, and publifhed them with appendixes. He alfo introduced into the fchools, Locke, and other eminent modern philofophers, as fuitable companions to Aristotle; and printed a double feries of philofophical queftions, for the ufe of the younger ftudents; from which Mr Johnfon of Magdalen college, Cambridge, took the hint of his larger work of the fame kind, which has gone through feveral editions.

When the fettling of Georgia was in agitation, Dr Bray, juftly revered for his institution of parochial libraries, Dr Stephen Hales, Dr Berrinan, and other learned divines, intreated Mr Burton's pious affiftance in that undertaking. This he readily gave, by preaching before the fociety in 1732, and publifhing his fermon, with an appendix on the ftate of that colony; and he afterwards publifhed an account of the defigns of the affociates of the late Dr Bray, with an account of their proceedings.

About the fame time, on the death of Dr Edward Littleton, he was prefented by Eton college to the vicarage of Maple-Derham, in Oxfordshire. Here a melancholy fcene, which too often appears in the manfions of the clergy, prefented itfelf to his view; a widow, with three infant daughters, without a home, without a fortune: from his compaffion arofe love, the confequence of which was marriage; for Mrs Littleton was handfome, elegant, accomplished, ingenious, and had great fweetnefs of temper. In 1760, he exchanged his vicarage of Maple-Derham for the reftory of Worplefton in Surry. In his advanced age, finding his eyes begin to fail him, he collected and publifhed, in one volume, all his fcattered pieces, under the title of *Opuscula*

† See Rupture.

Burton
Burying.

cula miscellanea; and soon after died, February 11th, 1771.

BURTON, in the sea-language, a small tackle consisting of two single blocks, and may be made fast any where at pleasure, for hoisting small things in and out.

BURY, is sometimes used to denote the hole or den of some animal under ground. In this sense we say the *bury* of a mole, a tortoise, or the like. The grillo-talpa, or mole-cricket, digs itself a bury with its fore-feet, which are made broad and strong for that purpose. Naturalists speak of a kind of urchins in the island of Maraguan, which have two entries to their buries, one towards the north, the other to the south, which they open and shut alternately as the wind happens to lie.

BURY, in geography, a market-town of Lancashire, about 30 miles south-east of Lancaster. W. Long. 2. 20. N. Lat. 53. 36.

BURY (St Edmund's), or *St Edmund's Bury*, the county town of Suffolk, about 12 miles east of Newmarket, and 70 north-east of London. E. Long. o. 45. N. Lat. 52. 20.

BURYING, the same with interment or BURIAL.

BURYING *Alive* was the punishment of a vestal who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on. But this was only for show; for the moment the was let down, they began to cast in the earth upon her till the pit was filled up*. Some middle-age writers seem to make burying alive, (*dessejo*), the punishment of a woman thief. Lord Bacon gives instances of the resurrection of persons who have been buried alive. The famous Duns Scotus is of the number; who, having been seized with a catalepsy, was thought dead, and laid to sleep among his fathers, but raised again by his servant in whose absence he had been buried. Bartholin gives an account of a woman, who, on recovering from an apoplexy, could not be convinced but that she was dead, and solicited to long and so earnestly to be buried, that they were forced to comply; and performed the ceremonies, at least in appearance. The famous emperor Charles V. after his abdication, took it into his head to have his burial celebrated in his lifetime, and assisted at it.

BURYING-Place. The ancients buried out of cities and towns; an usage which we find equally among Jews, Greeks, and Romans. Among the last, burying within the walls was expressly prohibited by a law of the 12 tables. The usual places of interment were in the suburbs and fields, but especially by the waysides. We have instances, however, of persons buried in the city; but it was a favour allowed only to a few of singular merit in the commonwealth. Plutarch says, those who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are said to have had tombs in the forum; and Cicero adds Tullius to the number. Lycurgus allowed his Lacedaemonians to bury their dead within the city and around their temples, that the youth, being inured to such spectacles, might be the less terrified with the apprehension of death. Two reasons are alleged why the ancients buried out of cities: the first, an opinion, that the sight, touch, or even neighbourhood, of a corpse defiled a man, especially a priest; whence that rule in

Busec
Bish.

A. Gellius, that the *flamen Dialis*: might not on any account enter a place where there was a grave: the second to prevent the air from being corrupted by the stench of putrefied bodies, and the buildings from being endangered by the frequency of funeral fires.

Burying in churches was not allowed for the first 300 years after Christ; and the same was severely prohibited by the Christian emperors for many ages afterwards. The first step towards it appears to have been the practice of erecting churches over the graves of some martyrs in the country, and translating the relics of others into churches in the city: the next was, allowing kings and emperors to be buried in the atrium or church-porch. In the 6th century, the people began to be admitted into the church-yards; and some princes, founders, and bishops, into the church. From that time the matter seems to have been left to the discretion of the bishop.

BUSBEC (Auger Giflen, lord of), a person illustrious on account of his embassies, was born at Commines, in the year 1522; and educated at the most famous universities, at Louvain, at Paris, at Venice, at Bologna, and at Padua. He was engaged in several important employments and negotiations, and particularly was twice sent ambassador by the king of the Romans to the emperor Soliman. He collected inscriptions; bought manuscripts; searched after rare plants; inquired into the nature of animals; and, in his second journey to Constantinople, carried with him a painter, that he might be able to communicate to the curious, the figures, at least, of the plants and animals that were not well known in the west. He wrote a Discourse of the state of the Ottoman empire, and a Relation of his two journeys to Turkey, which are much esteemed. He died in 1592.

BUSBY (Dr Richard), son of a gentleman in Westminster, was born at Luton in Lincolnshire, in 1606. He passed through the classes in Westminster school, as king's scholar; and completed his studies at Christ-church, Oxford. In 1640, he was appointed master of Westminster school; and by his skill and diligence in the discharge of this important and laborious office, for the space of 55 years, bred up the greatest number of eminent men in church and state that ever at one time adorned any age or nation. He was extremely severe in his school; though he applauded wit in his scholars, even when it reflected on himself. This great man, after a long and healthy life purchased by temperance, died in 1695, aged 89; and was buried in Westminster abbey, where there is a fine monument erected for him, with a Latin inscription. He composed several books for the use of his school.

BUSH (Paul), the first bishop of Bristol, became a student in the university of Oxford about the year 1513, and in 1518 took the degree of bachelor of arts. He afterwards became a brother of the order called *bon-homs*; of which, after studying some time among the friars of St Austin, (now Wadham college), he was elected provincial. In that station he lived many years; till at length king Henry VIII. being informed of his great knowledge in divinity and physic, made him his chaplain, and in 1542 appointed him to the new episcopal see of Bristol: but having in the reign of Edward VI. taken a wife, he was, on the accession of Mary, deprived of his dignity, and spent the remainder

Bush.

of his life in a private flaton at Drifto!, where he died in the year 1558, aged 68, and was buried on the north fide of the choir of the cathedral. Wood fays, that while he was a ftudent at Oxford, he was numbered among the celebrated poets of that univerfity; and Pitts gives him the character of a faithful catholic, his want of chaftity notwithstanding. He wrote, 1. An exhortation to Margaret Burges, wife to John Burges, clothier, of King's-wood, in the county of Wilts. Lond. printed in the reign of Edward VI. 8^{vo}. 2. Notes on the Pfalms. 3. Treatife in praife of the crofs. 4. Answer to certain queries concerning the a-bufes of the mafs. Records, n^o 25. 5. Dialogues between Chrift and the Virgin Mary. 6. Treatife of falves and curing remedies. 7. A little treatife in Englifh, called *The extirpation of ignorancy, &c.* in verfe, Lond. by Pinfon, 4^{to}. 8. *Carmina diverfa*.

BUSH, a term ufed for feveral fhrubs of the kind growing clofe together: thus we fay, a *furze-bush*, *bramble-bush*, &c.

BUSH is fometimes ufed, in a more general fenfe, for any affemblage of thick branches interwoven and mixed together.

Burning-Bush, that bush wherein the Lord appeared to Mofes at the foot of mount Horeb, as he was feeding his father-in-law's flocks.

As to the perfon that appeared in the bush, the text fays, "That the angel of the Lord appeared unto him in a flame of fire, out of the middle of the bush:" but whether it was a created angel, fpeaking in the perfon of God, or God himfelf, or (as the moft received opinion is) Chrift the fon of God, has been matter of fome controversy among the learned. Thofe who fuppofe it no more than an angel feem to imply that it would be a diminution of the majefty of God, to appear upon every occafion, efpecially when he has fuch a number of celeftial minifters, who may do the bufinefs as well. But confidering that God is prefent every where, the notification of his prefence by fome outward fign in one determinate place, (which is all we mean by his appearance), is in our conception lefs laborious (if any thing laborious could be conceived of God) than a delegation of angels upon every turn from heaven, and feems in the main to illuftrate rather than debase the glory of his nature and exiftence. But however this be, it is plain that the angel here fpooken of was no created being, from the whole context, and efpecially from his faying, "I am the Lord God, the Jehovah," &c. fince this is not the language of angels, who are always known to exprefs themfelves in fuch humble terms as thefe, "I am fent from God; I am thy fellow-fer-vant," &c. It is a vain pretext to fay, that an angel, as God's ambaffador, may fpeak in God's name and perfon; for what ambaffador of any prince ever yet faid, "I am the king?" Since therefore no angel, without the guilt of blafphemy, could affume thefe titles; and fince neither God the Father, nor the Holy Ghoft, are ever called by the name of *angel*, i. e. "mef-fenger, or perfon fent," whereas God the Son is called by the prophet Malachi, (chap. iii. 1.), "The angel of the covenant;" it hence feems to follow, that this angel of the Lord was God the Son, who might very properly be called an *angel*, becaufe in the fulnefs of time he was fent into the world in our flefh, as a mef-fenger from God, and might therefore make thefe his

temporary apparitions, prefaces, and forerunners, as it were, of his more folemn miffion.

BUSHEL, a meafure of capacity for dry things, as grain, fruits, dry pulfe, &c. containing four pecks, or eight gallons, or one eighth of a quarter.

A bufhel, by 12 Henry VII. c. 5. is to contain eight gallons of wheat; the gallon eight pounds of Troy-weight; the ounce 20 fterlings, and the fterling 32 grains or corns of wheat growing in the midft of the ear.

At Paris, the bufhel is divided into two half-bufhels; the half bufhel into two quarts; the quart into two half quarts; the half quart into two litrons; and the litron into two half litrons. By a fentence of the provoft of the merchants of Paris, the bufhel is to be eight inches two lines and a half high, and ten inches in diameter; the quart four inches nine lines high, and fix inches nine lines wide; the half quart four inches three lines high, and five inches diameter; the litron three inches and a half high, and three inches ten lines in diameter. Three bufhels make a minot; fix, a mine; 12, a feptier; and 144, a muid. In other parts of France the bufhel varies.

Oats are meafured in a double proportion to other grains; fo that 24 bufhels of oats make a feptier, and 288 a muid. The bufhel of oats is divided into four picotins; the picotiu into two half quarts, or four litrons. For falt, four bufhels make one minot, and fix a feptier; for coals, eight bufhels make one minot, 16 a mine, and 320 a muid; for lime, three bufhels make a minot, and 48 minots a muid.

BUSKIN, a kind of fhoe, fomewhat in manner of a boot, and adapted to either foot, and worn by either fex. This part of drefs, covering both the foot and mid-leg, was tied underneath the knee; it was very rich and fine, and principally ufed on the ftage by actors in tragedy. It was of a quadrangular form; and the fole was fo thick, as that, by means thereof, men of the ordinary ftature might be raifed to the pitch and elevation of the heroes they perfonated. The colour was generally purple on the ftage: herein it was diftinguifhed from the fock, worn in comedy, that being only a low common fhoe. The bufkin feems to have been worn, not only by actors, but by girls, to raife their height; travellers and hunters alfo made ufe of it, to defend themfelves from the mire. In claffic authors, we frequently find the bufkin ufed to fignify tragedy itfelf, in regard it was a mark of tragedy on the ftage. It is alfo to be underftood for a lofty ftair, or high ftyle.

BUSS, in maritime affairs, a fmall fea-veffel, ufed by us and the Dutch in the herring-fifhery, commonly from 48 to 60 tons burden, and fometimes more: a buf is two fmall fheds or cabins, one at the prow, and the other at the ftern; that at the prow ferves for a kitchen. Every buf has a mafter, an affiftant, a mate, and feamen in proportion to the veffel's bignefs; the mafter commands in chief, and without his exprefs orders the nets cannot be caft nor taken up; the affiftant has the command after him; and the mate next, whose bufinefs is to fee the feamen manage their rigging in a proper manner, to mind thofe who draw in their nets, and thofe who kill, gut, and cure the herrings, as they are taken out of the fea: the feamen do generally engage for a whole voyage in the lump. The pro-
vifion

Bufhel

||

Bufs.

Buffy
Butcher.

vision which they take on board the buffes, consist commonly in biscuit, oat-meal, and dried or salt fish; the crew being content for the rest with what fresh fish they catch. See FISHERIES.

BUSSY. See RABUTIN.

BUST, or BUSTO, in sculpture, &c. a term used for the figure or portrait of a person in relieve, shewing only the head, shoulders, and stomach, the arms being lopped off: it is usually placed on a pedestal or console.

BUSTARD, in ornithology. See OTIS.

BUSTUARI, in Roman antiquity, gladiators who fought about the bustum or funeral pile of a person of distinction, that the blood which was spilt might serve as a sacrifice to the infernal gods, and render them more propitious to the manes of the deceased. This custom was introduced in the room of the more inhuman one of sacrificing captives at the bullum, or on the tombs of warriors.

BUSTUARIE MOECHÆ, according to some, women that were hired to accompany the funeral and lament the loss of the deceased: but others are of opinion, that they were rather the more common prostitutes, that stood among the tombs, graves, and other such lonely places.

BUSTUM, in antiquity, a pyramid or pile of wood, upon which were anciently placed the bodies of the deceased, in order to be burnt. Some authors say, that it was properly called *bustum* after the burning, *quasi bene usum*: that before the burning it was called *pyra*; and during the burning, *rogus*.

The bustum in the Campus Martius was encompassed round with white stone and an iron rail.

BUTCHER, a person who slaughters cattle for the use of the table, or who cuts up and retails the same.

Among the ancient Romans, there were three kinds of established butchers, whose office it was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. The *suarii* provided hogs; the *pecuarii* or *boarii*, other cattle, especially oxen; and under these was a subordinate class, whose office was to kill, called *lanii*, and *cornifices*. To exercise the office of butcher among the Jews with dexterity, was of more reputation than to understrand the liberal arts and sciences. They have a book concerning shamble-constitution; and in case of any difficulty, they apply to some learned rabbi for advice: nor was any allowed to practise this art, without a licence in form; which gave the man, upon evidence of his abilities, a power to kill meat, and others to eat what he killed; provided he carefully read every week for one year, and every month the next year, and once a quarter during his life, the constitution above mentioned. We have some very good laws for the better regulation and preventing the abuses committed by butchers. A butcher that sells swine's flesh mangled, or dead of the murrain, for the first offence shall be amerced; for the second, have the pillory; for the third, be imprisoned, and make fine; and for the fourth, abjure the town. Butchers not selling meat at reasonable prices, shall forfeit double the value, leviable by warrant of two justices of the peace. No butcher shall kill any flesh in his scalding-house, or within the walls of London, on pain to forfeit for every ox so killed, 12 *d.* and for every other beast, 8 *d.* to be divided betwixt the king and the

profecutor.

BUTCHER-BIRD, in ornithology. See LANIUS.

BUTCHER-BROOM, in botany. See RUSCUS.

BUTE, an island lying to the west of Scotland, being separated from Cowal, a district of Argyleshire, only by a narrow channel. In length it is about 18 miles; the broadest part from east to west is about five. Part of it is rocky and barren; but from the middle fourthwards, the ground is cultivated, and produces pease, oats, and barley. Here is a quarry of red stone, which the natives have used in building a fort and chapel in the neighbourhood of Rothsay, which is a very ancient royal borough, head town of the shire of Bute and Arran; but very thinly peopled, and maintained chiefly by the herring fishery, with the profits of which all the rents of this island are chiefly paid. On the north side of Rothsay are the ruins of an ancient fort, with its draw-bridges, chapel, and barracks. Here are likewise the remains of some Danish towers. The natives are healthy and industrious, speak the Erse and the dialect of the Lowlands indifferently, and profess the Protestant religion. The island is divided into two parishes, accommodated with four churches; and belongs chiefly to the earl of Bute, who possesses an elegant seat near Rothsay. This island, with that of Arran, the greater and lesser Cumbray, and *Irish-marnoe*, form a county under the name of *Bute*. This shire and that of Caithness send a member to parliament alternately. The earl of Bute is admiral of the country, by commission from his majesty; but no way dependent on the lord high admiral of Scotland: so that if any maritime case occurs within this jurisdiction, (even crimes of as high a nature as murder or piracy), his lordship, by virtue of the powers as admiral, is sufficient judge, or he may delegate his authority to any deputies. The name of this isle has by several authors, and in different periods, been very differently written, as *Bote*, *Bath*, *Botle*, *Boot*, but now generally *Bute*. Our ancient writers suppose that it derived its name from a cell erected therein by St Brendan, an Irish abbot who flourished in the 6th century, because in his language such a cell was called *Bath*. It is, however, probable, that this name was of greater antiquity, since we find it denominated *Botis* by the anonymous geographer of Ravenna. It was from very early times part of the patrimony of the Stewarts: large possessions in it were granted to Sir John Stewart, son of Robert II. by his beloved mistress Elizabeth More; and it has continued in that line to the present time.

BUTEO, in ornithology, the trivial name of a species of FALCO.

BUTLER (Charles), a native of Wycomb in the county of Bucks, and a master of arts in Magdalen college, Oxford, published a book with this title, "The principles of music in singing and setting; with the two-fold use thereof, ecclesiasticall and civil." Quarto, London 1636. The author of this book was a person of singular learning and ingenuity, which he manifested in sundry other works enumerated by Wood in the *Athen. Oxon.* Among the rest is an English grammar, published in 1633, in which he proposes a scheme of regular orthography, and makes use of characters, some borrowed from the Saxon, and others of his own invention, so singular, that we want types to exhibit them: and of this imagined improvement he appears

Butcher
Butler.

Butler.

to have been so fond, that all his tracts are printed in like manner with his grammar; the consequence whereof has been an almost general disgust to all that he has written. His "Principles of music" is, however, a very learned, curious, and entertaining book; and, by the help of the advertisement from the printer to the reader, prefixed to it, explaining the powers of the several characters made use of by him, may be read to great advantage, and may be considered as a judicious supplement to Morley's introduction.

BUTLER (Samuel), a celebrated poet of the last century, was the son of a reputable Worcestershire farmer, and born in 1612. He passed some time at Cambridge, but was never matriculated at that university. Returning to his native country, he lived some years as clerk to a justice of peace; where he found sufficient time to apply himself to history, poetry, and painting. Being recommended to Elizabeth countess of Kent, he enjoyed in her house, not only the use of all kinds of books, but the conversation of the great Mr Selden, who often employed Butler to write letters, and translate for him. He lived also some time with Sir Samuel Luke, a gentleman of an ancient family in Bedfordshire, and a famous commander under Oliver Cromwell; and he is supposed at this time to have wrote, or at least to have planned, his celebrated *Hudibras*; and under that character to have ridiculed the knight. The poem itself furnishes this key; where, in the first canto, *Hudibras* says,

" 'Tis sung, there is a valiant mimaloke

" In foreign land yclep'd ————

" To whom we oft have been compar'd

" For person, parts, address, and beard."

After the restoration, Mr Butler was made secretary to the earl of Carbury, lord-president of Wales, who appointed him steward of Ludlow castle, when the court was revived there. No one was a more generous friend to him than the earl of Dorset and Middlesex, to whom it was owing that the court talked his *Hudibras*. He had promises of a good place from the earl of Clarendon, but they were never accomplished; though the king was so much pleas'd with the poem, as often to quote it pleasantly in conversation. It is indeed said, that Charles order'd him the sum of 3000*l*.: but the sum being express'd in figures, somebody through whose hands the order pass'd, by cutting off a cipher, reduced it to 300*l*. which, though it pass'd the offices without fees, prov'd not sufficient to pay what he then ow'd; so that Butler was not a shilling the better for the king's bounty. He died in 1680: and though he met with many disappointments, was never reduced to any thing like want, nor did he die in debt.—Mr Granger observes, that Butler "stands without rival in burlesque poetry. His *Hudibras* (says he) is, in its kind, almost as great an effort of genius, as the *Paradise Lost* itself. It abounds with uncommon learning, new rhimes, and original thoughts. Its images are truly and naturally ridiculous. There are many strokes of temporary satire, and some characters and allusions which cannot be discover'd at this distance of time."

BUTLER (Joseph), late bishop of Durham, a prelate distinguished by his piety and learning, was the youngest son of Mr Thomas Butler, a reputable shoemaker at Wantage, in Berkshire, where he was born in the year 1692. His father, who was a presbyterian, ob-

serv'ing that he had a strong inclination to learning, after his being at a grammar-school, sent him to an academy in Gloucestershire, in order to qualify him for a dissenting minister; and while there, he wrote some remarks on Dr Clarke's first sermon at Boyle's lecture. Afterwards, resolving to conform to the established church, he studied at Oriel college, where he contracted an intimate friendship with Mr Edward Talbot, son of the bishop of Durham, and brother to the lord chancellor, who laid the foundation of his subsequent advancement. He was first appointed preacher at the Rolls, and rector of Haughton and Stanhope, two rich benefices in the bishopric of Durham. He quitted the Rolls in 1726; and published in 8vo a volume of sermons, preach'd at that chapel. After this he constantly resided at Stanhope, in the regular discharge of all the duties of his office, till the year 1733, when he was call'd to attend the lord chancellor Talbot as his chaplain, who gave him a prebend in the church of Rochester. In the year 1736, he was appointed clerk of the closet to queen Caroline, whom he attended every day, by her majesty's special command, from seven to nine in the evening. In 1738 he was appointed to the bishopric of Bristol; and not long afterwards to the deanry of St Paul's, London. He now resign'd his living of Stanhope. In the year 1746, he was made clerk of the closet to the king; and in 1750, was transferr'd to Durham. This rich preferment he enjoy'd but a short time; for he died at Bath June 16th, 1752. His corpse was interr'd in the cathedral at Bristol; where there is a monument, with an inscription, erected to his memory. He died a bachelor. His deep learning and comprehensive mind appear sufficiently in his writings, particularly in that excellent treatise intitled, *The Analogy of religion, natural and revealed, to the constitution and course of nature*, published in 8vo, 1736.

BUTLER, the name anciently given to an officer in the court of France, being the same as the grand echançon, or great cup-bearer of the present times.

BUTLER, in the common acceptance of the word, is an officer in the houses of princes and great men, whose principal business is to look after the wine, plate, &c.

BUTLERAGE of wine, is a duty of 2*s*. for every ton of wine imported by merchants strangers; being a composition in lieu of the liberties and freedoms granted to them by king John and Edward I. by a charter call'd *charta mercatoria*.

Butlerage was originally the only custom that was payable upon the importation of wines, and was taken and received by virtue of the regal prerogative, for the proper use of the crown. But for many years past, there having been granted by parliament subsidies to the kings of England, and the duty of butlerage not repeal'd, but confirm'd, they have been pleas'd to grant the same away to some nobleman, who, by virtue of such grant, is to enjoy the full benefit and advantage thereof, and may cause the same to be collect'd in the same manner that the kings themselves were formerly wont to do.

BUTMENT. Butments of arches are the same with buttresses. They answer to what the Romans call *sublicas*, the French *culees* and *butees*.

BUTMENTS, or *Abutments*, of a bridge, denote the two

Butler
||
Butment.

Butomus
||
Butter.

two maffives at the end of a bridge, whereby the two extreme arches are fustained and joined with the fhore on either fide.

BUTOMUS, the *FLOWERING-RUSH*, or *Water-gladiole*; a genus of the hexagynia order, belonging to the encaendra clafs of plants. Of this there is but one fpecies, viz. the umbellatus. Of this there are two varieties, the one with a white, the other with a rofe-coloured, flower. Tho' common plants, thefe are very pretty, and are worth propagating in a garden where there is conveniency for an artificial bog, or where there are ponds of ftanding water, as is many times the cafe. Where thef conveniencies are wanting, they may be planted in cifterns, which fhould be kept filled with water, with about a foot thicknefs of earth in the bottom; and into this earth the roots fhould be planted, or the feeds fown as foon as they are ripe.

BUTRINTO, a port-town of Epirus, or Canina, in Turkey in Europe, fituated oppofite to the ifland of Corfu, at the entrance of the gulph of Venice. E. Long. 20. 40. N. Lat. 39. 45.

BUTT, in commerce, a vefel or meafure of wine, containing two hogheads, or 126 gallons. See *PIPE*.

BUTT, or *Butt-ends*, in the fea-language, are the fore-ends of all planks under water, as they rife, and are joined one end to another.—Butt-ends in great fhips are moft carefully bolted; for if any one of them fhould fpring or give way, the leak would be very dangerous and difficult to flop.

BUTTS, the place where archers meet with their bows and arrows to fhoot at a mark, which we call fhooting at the *butts*.—Alfo *butts* are the fhort pieces of land in arable ridges and furrows.

BUTTER, a fat unctuous fubftance, prepared from milk by heating or churning.

It was late ere the Greeks appear to have had any notion of butter; their poets make no mention of it, and yet are frequently fpeaking of milk and cheefe.

The Romans ufed butter no otherwife than as a medicine, never as a food.

The ancient Chriftians of Egypt burnt butter in their lamps inftead of oil; and in the Roman churches, it was anciently allowed, during Christmas time, to burn butter inftead of oil, on account of the great confumption of it otherwife.

For the making of butter, when it has been churned, open the churn, and with both hands gather it well together, take it out of the butter-milk, and lay it into a very clean bowl, or earthen pan; and if the butter be defigned to be ufed fweet, fill the pan with clear water, and work the butter in it to and fro, till it is brought to a firm confiftence of itfelf, without any moiature. When this has been done, it muft be fcothed and fliced over with the point of a knife, every way as thick as poffible, in order to fetch out the fmalleft hair, mote, bit of rag, firfner, or any thing that may have happened to fall into it. Then fpread it thin in a bowl, and work it well together, with fuch a quantity of falt as you think fit, and make it up into difhes, pounds, half pounds, &c.

There are as many forts of butter, as there are different milks of animals whereof to make it: That of the cow is moft in ufe. The northern people, however, make more ufe of it than others. In the Geographical Effays, Vol. V. p. 209. we have the following me-

Butter.

thod of making well-tafted butter from the milk of cows fed on turnips. "Let the bowls, either lead or wood, be kept conflantly clean, and well fcaled with boiling water before ufing. When the milk is brought into the dairy, to every eight quarts mix one quart of boiling water; then put up the milk into the bowls to ftand for cream."

Butter is the fat, oily, and inflammable part of the milk. This kind of oil is naturally diftributed through all the fubftances of the milk in very fmall particles, which are interpoled betwixt the cafeous and ferous parts, amongst which it is fufpended by a flight adhefion but without being diffolved. It is in the fame ftate in which oil is, in emulfions; hence the fame whitenefs of milk and emulfions; and hence, by refl, the oily parts feparate from both thefe liquors to the furface, and form a cream. See *EMULSION*.

When butter is in the ftate of cream, its proper oily parts are not yet fufficiently united together to form an homogeneous mafs. They are ftill half feparated by the interpofition of a pretty large quantity of ferous and cafeous particles. The butter is completely formed by preffing out thefe heterogeneous parts by means of continued percuffion. It then becomes an uniform foft mafs.

Frefh butter which has undergone no change, has fcarcely any fmell; its tafte is mild and agreeable, it melts with a weak heat, and none of its principles are difengaged by the heat of boiling water. Thefe properties prove that the oily part of butter is of the nature of the fat, fixed, and mild oils obtained from many vegetable fubftances by expreffion. See *OILS*.—The half fluid confiftence of butter, as of moft other concrete oily matters, is thought to be owing to a confiderable quantity of acid united with the oily part; but this acid is fo well combined, that it is not fenfible while the butter is frefh, and has undergone no change; but when it grows old, and undergoes fome kind of fermentation, then the acid is difengaged more and more; and this is the caufe that butter, like oils of the fame kind, becomes rancid by age.

Butter is conflantly ufed in food, from its agreeable tafte; but to be wholefome, it muft be very frefh and free from rancidity, and alfo not fried or burnt; otherwife its acid and even cauftic acid, being difengaged, diforders digeftion, renders it difficult and painful, excites acid empyreumatic belchings, and introduces much acrimony into the blood. Some perfons have ftomachs fo delicate, that they are even affected with thefe inconveniences by frefh butter and milk. This obfervation is alfo applicable to oil, fat, chocolate, and in general to all oleaginous matters.

The trade in butter is very confiderable. Some compute 50,000 tons annually confumed in London. It is chiefly made within 40 miles round the city. Fifty thoufand firkins are laid to be fent yearly from Cambridge and Suffolk alone; each firkin containing 56 pounds. Uttoxeter in Staffordfhire is a market famous for good butter, infomuch that the London merchants have an eftablifhed factory there for butter. It is bought by the pot, of a long cylindrical form, weighing 14 lb. Divers abufes are committed in the packing and falt- ing of butter, to increafe its bulk and weight, againft which we have a ftatute exprefs. Pots are frequently laid with good butter for a little depth at the top, and

with

Butter
||
Button.

Button.

with bad at the bottom; sometimes the butter is set in rolls, only touching at top, and standing hollow at bottom. To prevent these cheats, the factors at Utoxeter keep a furveyor, who, in case of suspicion, tries the pots with an iron instrument called a *butter-bore*, made like a cheese-taste, to be struck in obliquely to the bottom.

Shower of BUTTER. Naturalists speak of showers and dews of a butyraceous substance. In 1695, there fell in Ireland, during the winter and ensuing spring, a thick yellow dew, which had the medicinal properties of butter.

BUTTER, among chemists, a name given to several preparations, on account of their consistence resembling that of butter; as butter of antimony*, &c.

Method of Preserving BUTTERFLIES. See INSECTS.

Method of making Pictures of BUTTERFLIES. "Take

butterflies, or field-moths, either those caught abroad, or such as are taken in caterpillars, and nursed in the house till they be flies; clip off their wings very close to their bodies, and lay them on clean paper, in the form of a butterfly when flying; then have ready prepared gum arabic that hath been some time dissolved in water, and is pretty thick; if you put a drop of ox-gall into a spoonful of this, it will be better for the use; temper them well with your finger, and spread a little of it on a piece of thin white paper, big enough to take both sides of your fly; when it begins to be clammy under your finger, the paper is in proper order to take the feathers from the wings of the fly; then lay the gummed side on the wings, and it will take them up; then double your paper so as to have all the wings between the paper; then lay it on a table, pressing it close with your fingers; and you may rub it gently with some smooth hard thing; then open the paper and take out the wings, which will come forth transparent: the down of the upper and under side of the wings, sticking to the gummed paper, form a just likeness of both sides of the wings in their natural shapes and colours. The nicety of taking off flies depends on a just degree of moisture of the gum'd paper: for if it be too wet, all will be blotted and confused; and if too dry, your paper will stick so fast together, that it will be torn in separation. When you have opened your gum'd papers, and they are dry, you must draw the bodies from the natural ones, and paint them in water-colours: you must take paper that will bear ink very well for this use; for sinking paper will separate with the rest, and spoil all."

BUTTERIS, in the menage, an instrument of steel, fitted to a wooden handle, wherewith they pare the foot, or cut off the hoof of a horse.

BUTTOCK *of a SHIP*, is that part of her which is her breadth right astern, from the tack upwards; and a ship is said to have a broad or a narrow buttock, according as she is built broad or narrow at the transom.

BUTTON, an article in dress, whose form and use are too well known to need description. They are

made of various materials, as mohair, silk, horse-hair, metal, &c.

Method of making common BUTTONS. Common buttons are generally made of mohair; some indeed are made of silk, and others of thread; but the latter are of a very inferior sort. In order to make a button, the mohair must be previously wound on a bobbin; and the mould fixed to a board by means of a bodkin thrust through the hole in the middle of it. This being done, the workman wraps the mohair round the mould in three, four, or six columns, according to the button.

Horse-hair BUTTONS. The moulds of these buttons are covered with a kind of stuff composed of silk and hair; the warp being belladine silk, and the shoot horse-hair. This stuff is wove with two selvages, in the same manner and in the same loom as ribbands. It is then cut into square pieces proportional to the size of the button, wrapped round the moulds, and their selvages stitched together, which form the under part of the button.

Cleansing of BUTTONS. A button is not finished when it comes from the maker's hands; the superfluous hairs and hubs of silk must be taken off, and the button rendered glossy and beautiful, before it can be sold. This is done in the following manner. A quantity of buttons are put into a kind of iron sieve, called by workmen a *singeing box*. Then a little spirit of wine being poured into a kind of shallow iron dish, and set on fire, the workman moves and shakes the *singeing box*, containing the buttons, briskly over the flame of the spirit, by which the superfluous hairs, hubs of silk, &c. are burnt off, without damaging the buttons. Great care, however, must be taken that the buttons in the *singeing box* be kept continually in motion; for if they are suffered to rest over the flame, they will immediately burn. When all these loose hairs, &c. are burnt off by the flame of the spirit, the buttons are taken out of the *singeing box*, and put, with a proper quantity of the crumbs of bread, into a leather bag, about three feet long, and of a conical shape; the mouth or smaller end of which being tied up, the workman takes one of the ends in one hand, and the other in the other, and shakes the hand briskly with a particular jerk. This operation cleanses the buttons, renders them very glossy, and fit for sale.

Gold-twist BUTTONS. The mould of these buttons is first covered in the same manner with that of common buttons. This being done, the whole is covered with a thin plate of gold or silver, and then wrought over of different forms, with purple and gimp. The former is a kind of thread composed of silk and gold-wire twisted together; and the latter, capillary tubes of gold or silver, about the tenth of an inch long. These are joined together by means of a fine needle, filled with silk, thrust through their apertures, in the same manner as beads or bugles.

The manner of making Metal-BUTTONS. The metal with which the moulds are intended to be covered is first cast into small ingots, and then flatted into thin plates or leaves, of the thickness intended, at the flattening-mills; after which it is cut into small round pieces proportionable to the size of the mould they are intended to cover, by means of proper punches on a block of wood covered with a thick plate of lead. Each piece

of

Edwards's
History of
Birds,
Vol. II.
p. 122.

Button,
Buttress.

of metal thus cut out of the plate is reduced into the form of a button, by beating it successively in several cavities, or concave moulds, of a spherical form, with a convex puncheon of iron, always beginning with the shallowest cavity or mould, and proceeding to the deeper, till the plate has acquired the intended form: and the better to manage so thin a plate, they form ten, twelve, and sometimes even twenty-four, to the cavities, or concave moulds, at once; often heating the metal during the operation, to make it more ductile. This plate is generally called by workmen, the *cap of the button*.

The form being thus given to the plates, or caps, they strike the intended impression on the convex side, by means of a similar iron puncheon, in a kind of mould engraven *en creux*, either by the hammer, or the press used in coining. The cavity or mould, wherein the impression is to be made, is of a diameter and depth suitable to the sort of button intended to be struck in it; each kind requiring a particular mould. Between the puncheon and the plate is placed a thin piece of lead, called by workmen a *bob*, which greatly contributes to the taking off all the strokes of the engraving; the lead, by reason of its softness, easily giving way to the parts that have relieve, and as easily insinuating itself into the traces or indentures.

The plate thus prepared makes the cap or shell of the button. The lower part is formed of another plate, in the same manner, but much flatter, and without any impression. To the left or under plate is soldered a small eye made of wire, by which the button is to be fastened.

The two plates being thus finished, they are soldered together with soft solder, and then turned in a lathe. Generally indeed they use a wooden mould, instead of the under plate; and in order to fasten it, they pass a thread or gut across, through the middle of the mould, and fill the cavity between the mould and the cap with cement, in order to render the button firm and solid; for the cement entering all the cavities formed by the relieve of the other side, sustains it, prevents its flattening, and preserves its bosse or design.

BUTTON, in the menage. Button of the reins of a bridle, is a ring of leather, with the reins passed thro' it, which runs all along the length of the reins. To put a horse under the button, is when a horse is stopped without a rider upon his back, the reins being laid on his neck, and the button lowered so far down that the reins bring in the horse's head, and fix it to the true posture or carriage. It is not only the horses which are managed in the hand that must be put under the button; for the same method must be taken with such horses as are bred between two pillars, before they are backed.

BUTTON-WOOD. See **CONOCARPUS**.

BUTTON'S BAY, the name of the north part of Hudson's bay, in North America, whereby Sir Thomas Button attempted to find out a north-west passage to the East Indies. It lies between 80° and 100° west longitude, and between 60° and 66° north latitude.

BUTTRESS, a kind of buttment built archwise, or a mass of stone or brick, serving to prop or support the sides of a building, wall, &c. on the outside, where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c.—Buttresses

are used against the angles of steeples and other buildings of stone, &c. on the outside, and along the walls of such buildings as have great and heavy roofs, which would be subject to thrust the walls out, unless very thick, if no buttresses were placed against them. They are also placed for a support and buttment against the feet of great arches, that are turned across great halls in old palaces, abbeyes, &c.

BUTZAW, a town of lower Saxony, in Germany; it stands upon the river Varnow, on the road from Schwerin to Rostock, lying in E. Long. 13. 12. N. Lat. 54. 50.

BUXTON, a place in the peak of Derbyshire, celebrated for medicinal waters, the hottest in England, next to Bath, lying in W. Long. o. 20. N. Lat. 53. 20.

It has been always believed by our antiquaries, that the Romans were acquainted with these wells, and had frequented them much, as there is a military way still visible, called the *Bath-gate*, from Burgh to this place. This was verified about 50 years ago, when Sir Thomas Delves, of Cheshire, in memory of a cure he received here, caused an arch to be erected; in digging the foundations for which, they came to the remains of a solid and magnificent fracture of Roman workmanship; and in other places of the neighbourhood, very capacious leaden vessels, and other utensils, of Roman workmanship, have been discovered. These waters have always been reckoned inferior to those in Somersetshire; but seem never to have been totally disused. They are mentioned by Leland, as well known 200 years ago; but it is certain they were brought into greater credit by Dr Jones in 1572, and by George earl of Shrewsbury, who erected a building over the bath, then composed of nine springs. This building was afterwards pulled down, and a more commodious one erected at the expence of the earl of Devonshire. In doing this, however, the ancient register of cures drawn up by the bath-warden, or physician attending the baths, and subscribed by the hands of the parties, was lost.

The warm waters of Buxton are, the bath, consisting of nine springs, as already mentioned, St Ann's well, and St Peter's or Bingham well. St Ann's well rises at the distance of somewhat more than 32 yards north-east from the bath. It is chiefly supplied from a spring on the north side, out of a rock of black limestone or bastard marble. It formerly rose into a stone basin, shut up within an ancient Roman brick wall, a yard square within, a yard high on three sides, and open on the fourth. But, in 1709, Sir Thomas Delves, as already mentioned, erected an arch over it which still continues. It is 12 feet long, and as many broad, set round with stone steps on the inside. In the middle of this dome the water now springs up into a stone basin two feet square. St Peter's or Bingham well rises about 20 yards south-east of St Ann's. It is also called *Leigh's well*, from a memorable cure received from it by a gentleman of that name. It rises out of a black limestone, in a very dry ground; and is not so warm as St Anne's well.

This water is alterant and not evacuant. The use of it is to be begun by taking a pint in the forenoon; after which, the quantity is to be gradually enlarged. This water increases the vital heat; and is useful in the gout, rheumatism, dry asthma, convulsive disorders, indigestion, loss of appetite, contractions of the tendons,

Butzaw,
Buxton.

Buxton.

† *Exp. Efr.*
Joyl., Vol. 11.
 p. 53.

&c. Mr Percival informs us†, that the water of St Anne's well contains calcareous earth, fossilic alkali, and sea-salt, though in a very small proportion, a gallon of the water yielding only 23 or 24 grains of sediment. It strikes a slight green with syrup of violets, suffers no change from infusion of galls, from the fixed vegetable alkali, or from the mineral acids; it becomes milky with the volatile alkali, and with saccharum saturni; and lets fall a precipitate on the addition of a few drops of a solution of silver in the nitrous acid. The specific gravity of this water is precisely equal to that of rain-water when their temperatures are the same; but it weighs four grains in a pint lighter when first taken from the spring, owing to the superior degree of warmth it has at that time. The temperature of the bath is about 82° of Fahrenheit; that of St Ann's well, as it is a smaller body of water, and exposed to the open air, is somewhat less. The water is transparent, sparkling, and highly grateful to the palate. From some experiments which he made upon himself, the Doctor concludes, that the Buxton waters are of a very heating quality, and suggests the following cautions with regard to the use of them. Small quantities only should be drunk at once, and frequently repeated; the belly should be kept soluble with lenitive electuary, or any other mild purgative; and, at the beginning of the course, the patient may be directed to suffer the water to remain a few seconds in the glass before he swallows it; for this spring abounds with mephitic air, in which its stimulus, and indeed its efficacy, resides, and which is quickly dissipated by exposure to the air. From this property the Doctor supposed that this water might be easily converted into an useful chalybeate*; and, at his desire, Mr Buxton an apothecary near the wells made the following experiment. "A quart bottle containing two drachms of iron filings was filled, by immersion, with the water of St Ann's well, corked and agitated briskly under the surface of the water. It was then suffered to remain in the well till the filings had subsided, when the water was carefully decanted into a half-pint glass. To this were added three drops of the tincture of galls, which immediately occasioned a deep purple colour; and the transparency was quickly restored by a few drops of the acid of vitriol, evident proofs that a solution of the iron was effected in a few minutes. The water also, without the galls, had a chalybeate taste, and left an agreeable astringency upon the palate."

This method of impregnating the Buxton water with iron, must increase its tonic powers, and in many cases improve its virtues. It is a common practice to join the use of a chalybeate spring in the neighbourhood of St Ann's well, with that of the Buxton water. But the superiority of this artificial mineral water must be apparent, if we consider its agreeable warmth, volatility, levity, and gratefulness to the palate. Buxton-bath is frequently employed as a temperate cold bath. For, as the heat of the water is 16 or 18 degrees below that of the human body, a gentle shock is produced on the first immersion, the heart and arteries are made to contract more powerfully, and the whole system is braced and invigorated. But this salutary operation must be greatly diminished, often, indeed, more than counterbalanced, by the relaxing vapours which copiously exhale from the bath to which the patients are exposed during the time of dressing and undressing. June 12th 1772,

the mercury in Fahrenheit's thermometer stood, in the shade, at 65°; but in the vault of the bath, quickly rose to 78°.

BUXTON (Jedediah), a prodigy with respect to skill in numbers. His father, William Buxton, was school-master of the same parish, where he was born in 1704: yet Jedediah's education was so much neglected, that he was never taught to write; and with respect to any other knowledge but that of numbers, seemed always as ignorant as a boy of ten years of age. How he came first to know the relative proportions of numbers, and their progressive denominations, he did not remember; but to this he applied the whole force of his mind, and upon this his attention was constantly fixed, so that he frequently took no cognizance of external objects, and when he did it, it was only with respect to their numbers. If any space of time was mentioned, he would soon after say it was so many minutes; and if any distance of way, he would assign the number of hair-breadths, without any question being asked, or any calculation expected by the company. When he understood a question, he began to work with amazing facility, after his own method, without the use of a pen, pencil, or chalk, or even understanding the common rules of arithmetic as taught in the schools. A gentleman asked him the following question: Suppose a field 423 yards long and 383 wide, what was the area? and in two minutes, by the gentleman's watch, he answered, 162,009 yards. He then asked him how many acres the above field measured? and in 11 minutes he answered, 33 acres, 1 rood, 35 perches, 20 yards and a quarter jult. The gentleman then observed, that allowing the distance between London and York to be 204 miles, he would know how many times a coach-wheel turned round in that distance, allowing the wheel's circumference to be six yards? In thirteen minutes, he answered 59,840 times. The next proposition was, In a bin 346 inches long, 255 inches wide, and 94 inches deep, how many gallons liquid measure, and what corn would it hold? The answer was, 3,454,464 solid inches, or 1,768,568 half quarters of solid inches, making 12,249,872 gallons liquid measure, or 12,249 gallons, 3 quarts, and 34 and a half inches; or it will hold 191 quarters, 3 bushels, 3 quarterns and a half quartern, and 34 inches and a half remainder. Again, suppose a canal was to be dug 426 feet long, 263 wide, and 2 feet and a half deep, how many cubical yards of earth are to be removed? After pausing a quarter of an hour, he answered, 10,373 yards 24 feet. He would stride over a piece of land or a field, and tell you the contents of it almost as exact as if you had measured it by the chain. In this manner he measured the whole lordship of Elmtou, of some thousand acres, belonging to Sir John Rhodes, and brought him the contents, not only in acres, roods, and perches, but even in square inches. After this, for his own amusement, he reduced them into square hair-breadths, computing 48 to each side of the inch. His memory was so great, that while resolving a question, he could leave off, and resume the operation again where he left off the next morning, or at a week, a month, or at several months, and proceed regularly till it was completed. His memory would doubtless have been equally retentive with respect to other objects, if he had attended to other objects with equal diligence; but his perpetual application to figures pre-

* See *Art.*
 n^o 54.

Buxton,
Buxtorf.

prevented the smallest acquisition of any other knowledge. He was sometimes asked, on his return from church, whether he remembered the text, or any part of the sermon, but it never appeared that he brought away one sentence; his mind, upon a closer examination, being found to have been misled, even during divine service, in its favourite operation, either dividing some time, or some space, into the smallest known parts, or resolving some question that had been given him as a test of his abilities.

This extraordinary person living in laborious poverty, his life was uniform and obscure. Time, with respect to him, changed nothing but his age; nor did the seasons vary his employment, except that in winter he used a flail, and in summer a ling-hook. In the year 1754, he came to London, where he was introduced to the royal society, who, in order to prove his abilities, asked him several questions in arithmetic, and he gave them such satisfaction, that they dismissed him with a handsome gratuity. In this visit to the metropolis the only object of his curiosity, except figures, was his desire to see the king and royal family; but they being just removed to Kensington, Jedediah was disappointed. During his residence in London, he was taken to see King Richard III. performed at Drury-lane playhouse; and it was expected, either that the novelty and the splendor of the shew would have fixed him in astonishment, or kept his imagination in a continual hurry, or that his passions would, in some degree, have been touched by the power of action, if he had not perfectly understood the dialogue. But Jedediah's mind was employed in the playhouse, just as it was employed in every other place. During the dance, he fixed his attention upon the number of steps; he declared, after a fine piece of music, that the innumerable sounds produced by the instruments had perplexed him beyond measure; and he attended even to Mr Garrick, only to count the words that he uttered, in which he said he perfectly succeeded. Jedediah returned to the place of his birth, where, if his enjoyments were few, his wishes did not seem to be more. He applied to his labour, by which he subsisted with cheerfulness; he regretted nothing that he left behind him in London; and it continued to be his opinion, that a slice of ruddy bacon afforded the most delicious repast.

BUXTORF (John), a learned professor of Hebrew at Basil, who, in the 17th century, acquired the highest reputation for his knowledge of the Hebrew and Chaldean languages. He died of the plague at Basil, in 1629, aged 65. His principal works are, 1. A small but excellent Hebrew grammar; the best edition of which is that of Leyden in 1701, revised by Leusden. 2. A treasure of the Hebrew grammar. 3. An Hebrew concordance, and several Hebrew lexicons. 4. *Institutio epistolæ Hebraicae*. 5. *De abbreviaturis Hebraeorum, &c.*

BUXTORF (John), the son of the former, and a learned professor of the oriental languages at Basil, distinguished himself, like his father, by his knowledge of the Hebrew language, and his rabbinical learning. He died at Basil in 1664, aged 65 years. His principal works are, 1. His translation of the *Mora Novechim*, and the *Cozzi*. 2. A Chaldean and Syriac lexicon. 3. An anticritic against Cappel. 4. A treatise on the Hebrew points and accents, against the same Cappel.

Buxton,
Buyr.

BUXUS, the BOX-TREE; a genus of the tetrandria order, belonging to the monœcia class of plants.

Species. 1. The arborefcens, with oval leaves. 2. The angulifolia, or narrow-leaved box. These two sorts grow in great plenty upon Boxhill near Dorking in Surry in England. Here were formerly large trees of that kind; but now they are much fewer in number. There are two or three varieties of the first sort which are propagated in gardens; one with yellow, and the other with white striped leaves. Another hath the tips of the leaves only marked with yellow, and is called *tipped box*. 3. The suffruticosa, dwarf or Dutch box, commonly used for bordering of flower-beds.

Culture. The two first sorts may be raised from seeds; and may be also propagated by cuttings, which are to be planted in the autumn in a shady border. The best season for removing these trees is in October; though, if care be used to take them up with a good ball of earth, they may be transplanted almost at any time except the middle of summer. The dwarf box is increased by parting the roots, or planting the slips; but as it makes so great an increase of itself, and so easily parts, it is hardly worth while to plant the slips that have no roots.

Uses. The tree or large box is proper to intermix in clumps of evergreens, &c. where it adds to the variety of such plantations; they are a very great ornament to cold and barren soils where few other things will grow. The dwarf kind of box is used for bordering flower-beds, or other purposes of that nature; and for this it far excels any other plant, being subject to no injuries from cold or heat. It is of long duration; is easily kept handsome; and, by the firmness of its rooting, keeps the mould in the borders from washing into the gravel walks more effectually than any plant whatever.—Boxwood is extremely hard and smooth, and therefore well adapted to the use of the turner. Combs, mathematical instruments, knife-handles, and button-moulds, are made of it. It may properly enough be substituted in default of ebony, the yellow alburnum of which it perfectly resembles. In the Ephemerides of the curious there is the following account of the efficacy of boxwood in making hair grow. "A young woman of Gunberg in Lower Silesia, having had a malignant dysentery which occasioned the falling off of all her hair, was advised by a person, some time after her recovery, (as her hair was not likely to grow again of itself, her head being then as bare as the hand), to wash it all over with a decoction of boxwood; which she readily did, without the addition of any other drug. Hair of a chestnut colour grew on her head, as she was told it would do; but having used no precaution to secure her neck and face from the lotion, they became covered with red hair to such a degree, that she seemed little different from an ape or a monkey." This decoction has been recommended by some as a powerful sudorific, preferable even to guaiacum; but the taste readily discovers that it wants the qualities of that wood. Neither the wood nor the leaves of the box-tree at present are used for any other medicinal purpose than the distillation of an empyreumatic oil; and an oil of nearly the same quality is obtained from almost every other wood.

BY-LAWS, are laws made *obiter*, or by the by; such as orders and constitutions of corporations for the governing of their members, of court-leets, and courts baron; or commoners, or inhabitants in vills, &c. made by common assent, for the good of those that made them, in particular cases whereunto the public law doth not extend; so that they bind farther than the common or statute law: guilds and fraternities of trades by letters patent of incorporation, may likewise make by-laws for the better regulation of trade among themselves or with others. In Scotland these laws are called laws of *birlaw*, or *burlaw*; which are made by neighbours elected by common consent in the *birlaw-courts*, wherein knowledge is taken of complaints betwixt neighbour and neighbour; which men so chosen are judges and arbitrators, and styled *birlaw-men*. And *birlaws*, according to Skene, are *leges rusticorum*, laws made by husbandmen, or townships, concerning neighbourhood among them.—All by-laws are to be reasonable, and for the common benefit, not private advantage of particular persons, and must be agreeable to the public laws in being.

BYNG (George), lord viscount Torrington, was the son of John Byng, Esq; and was born in 1663. At the age of 15, he went volunteer to sea with the king's warrant. His early engagement in this course of life gave him little opportunity of acquiring learning or cultivating the polite arts; but by his abilities and activity as a naval commander he furnished abundant matter for the pens of others. After being several times advanced, he was in 1702 raised to the command of the *Nafau*, a third rate, and was at the taking and burning the French fleet at Vigo; and the next year he was made rear-admiral of the red. In 1704, he served in the grand fleet sent into the Mediterranean under Sir Cloudesly Shovel, as rear-admiral of the red; and it was he who commanded the Squadron that attacked, cannonaded, and reduced Gibraltar. He was in the battle of Malaga, which followed soon after; and for his behaviour in that action queen Anne conferred on him the honour of knighthood. In 1705, in about two months time, he took 12 of the enemies largest privateers, with the *Thetis*, a French man of war of 44 guns; and also several merchant-ships, most of them richly laden. The number of men taken on board was 2070, and of guns 334. In 1718, he was made admiral and commander in chief of the fleet; and was sent with a Squadron into the Mediterranean for the protection of Italy, according to the obligation England was under by treaty against the invasion of the Spaniards; who had the year

Byrom.

before surpris'd Sardinia, and had this year landed an army in Sicily. In this expedition he dispatched captain Walton in the Canterbury, with five more ships, in pursuit of six Spanish men of war, with galleys, fire-ships, bomb-veffels, and store-ships, who separated from the main fleet, and stood in for the Sicilian shore. The captain's laconic epistle on this occasion is worthy of notice; which shewed that fighting was his talent as well as his admirals', and not writing.

“ Sir,

“ We have taken and destroyed all the Spanish ships “ and veffels which were upon the coast, as per margin. Canterbury, off Syracuse, “ I am, &c.

August 16th, 1718.

G. Walton.”

From the account referred to, it appeared that he had taken four Spanish men of war, with a bomb-veffel and a ship laden with arms; and burned four, with a fire-ship and bomb-veffel. The king made the admiral an handsome present, and sent him plenipotentiary powers to negotiate with the princes and states of Italy as there should be occasion. He procured the emperor's troops free access into the fortresses that still held out in Sicily, failed afterwards to Malta, and brought out the Sicilian gallees, and a ship belonging to the Turkey company. Soon after he received a gracious letter from the emperor Charles VI. written with his own hand, accompanied with a picture of his imperial majesty, set round with very large diamonds, as a mark of the grateful sense he had of his services. It was entirely owing to his advice and assistance, that the Germans retook the city of Messina in 1719, and destroyed the ships that lay in the basin; which completed the ruin of the naval power of Spain. The Spaniards being much distressed, offered to quit Sicily; but the admiral declared, that the troops should never be suffered to quit the island till the king of Spain had acceded to the quadruple alliance. And to his conduct it was entirely owing that Sicily was subdued, and his Catholic majesty forced to accept the terms prescribed him by the quadruple alliance. After performing so many signal services, the king received him with the most gracious expressions of favour and satisfaction; made him rear-admiral of England and treasurer of the navy, one of his most honourable privy-council, baron Byng of Southill in the county of Bedford, viscount Torrington in Devonshire, and one of the knights companions of the Bath upon the revival of that order. In 1727, George II. on his accession to the crown, placed him at the head of his naval affairs, as first lord commissioner of the admiralty; in which high station he died January 15th 1733, in the 70th year of his age, and was buried at Southill in Bedfordshire.

BYNG (the honourable George), esq; the unhappy son of the former, was bred to sea, and rose to the rank of admiral of the blue. He gave many proofs of courage; but was at last shot, upon a dubious sentence for neglect of duty, in 1757. See **BRITAIN**, n^o 428.

BYRLAW or **BURLAW**-Laws in Scotland. See **BY-LAWS**.

BYROM (John), an ingenious poet of Manchester, born in 1691. His first poetical essay appeared in the *Spectator*, n^o 603, beginning, “ My time, O ye muses, was happily spent.” which, with two humorous letters on dreams, are to be found in the eighth volume. He

was

was admitted a member of the royal society in 1724; and having originally entertained thoughts of practising physic, to which the title of *doct'or* is incident, that was the appellation by which he was always known: but reducing himself to narrow circumstances by a precipitate marriage, he supported himself by teaching a new method of writing short-hand, of his own invention; until an estate devolved to him by the death of an elder brother. He was a man of lively wit; of which, whenever a favourable opportunity tempted him to indulge it, he gave many humorous specimens. He died in 1763; and a collection of his Miscellaneous poems was printed at Manchester, in 2 vols 8^{vo}. 1773.

BYRRHUS, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are clavated, pretty solid, and a little compressed. There are five species, all of which are to be found on particular plants; and principally distinguished from one another by the colour and figure of the elytra, or crustaceous wing-cases.

BYSSUS, in botany, a genus of mosses belonging to the cryptogamia algae. The character is taken from this circumstance, that they are covered with a simple capillary filament or down, resembling soft dust. There are 15 species, all natives of Britain, growing upon rotten wood, old walls, &c.

Byssus, or *Byssum*, a fine thready matter produced in India, Egypt, and about Elis in Achaia, of which the richest apparel was anciently made, especially that wore by the priests both Jewish and Egyptian. Some interpreters render the Greek *βυσσος*, which occurs both in the Old and New Testament, by *fine linen*. But other versions, as Calvin's, and the Spanish printed at Venice in 1556, explain the word by *silk*; and yet byssus must have been different from our silk, as appears from a multitude of ancient writers, and particularly from Jul. Pollux. M. Simon, who renders the word by *fine linen*, adds a note to explain it; viz. "that there was a fine kind of linen very dear, which the great lords alone wore in this country as well as in Egypt." This account agrees perfectly well with that given by Helychius, as well as what is observed by Dochart, that the byssus was a finer kind of linen, which was frequently dyed of a purple colour. Some authors will have the byssus to be the same with our cotton; others take it for the *linum albesimum*; and others for the lock or bunch of silky hair found adhering to the pinna marina, by which it fastens itself to the neighbouring bodies. Authors usually distinguish two sorts of byssus; that of Elis; and that of Judaea, which was the finest. Of this latter were the priestly ornaments made. Bonfrerius notes, that there must have been two sorts of byssus, one finer than ordinary, by reason there are two Hebrew words used in Scripture to denote byssus, one of which is always used in speaking of the habit of the priests, and the other of that of the Levites.

BYZANTIUM, an ancient city of Thrace, situated on the Bosphorus. It was founded, according to Eusebius, about the 30th Olympiad, while Tullus Hostilius reigned in Rome. But, according to Diodorus Siculus, the foundations of this metropolis were laid in the time of the Argonauts, by one Byzas, who then reigned in the neighbouring country, and from whom the city was called *Byzantium*. This Byzas, according to Eusebius, arrived in Thrace a little

before the Argonauts came into those seas, and settled there with a colony of Megarenes. Velleius Paterculus ascribes the founding of Byzantium to the Milesians, and Ammianus Marcellinus to the inhabitants of Attica. Some ancient medals of Byzantium which have reached our times, bear the name and head of Byzas, with the prow of a ship on the reverse. The year after the destruction of Jerusalem by Titus, Byzantium was reduced to the form of a Roman province. In the year 193 this city took part with Niger against Severus. It was strongly garrisoned by Niger, as being a place of the utmost importance. It was soon after invested by Severus; and as he was universally hated on account of his cruelty, the inhabitants defended themselves with the greatest resolution. They had been supplied with a great number of warlike machines, most of them invented and built by Periscus a native of Nicæa, and the greatest engineer of his age. For a long time they baffled all the attempts of the assailants, killed great numbers of them, crushed such as approached the walls with large stones; and when stones began to fail, they used the statues of their gods and heroes. At last they were obliged to submit, through famine, after having been reduced to the necessity of devouring one another. The conqueror put all the magistrates and soldiers to the sword; but spared the engineer Periscus. Before this siege, Byzantium was the greatest, most populous, and wealthiest city of Thrace. It was surrounded by walls of an extraordinary height and breadth; and defended by a great number of towers, seven of which were built with such art, that the least noise heard in one of them was immediately conveyed to all the rest. Severus, however, no sooner became master of it, than he commanded it to be laid in ashes. The inhabitants were stripped of all their effects, publicly sold for slaves, and the walls levelled with the ground. But by the chronicle of Alexandria we are informed, that soon after this terrible catastrophe, Severus himself caused a great part of the city to be rebuilt, calling it *Antonina*, from his son Caracalla, who assumed the surname of *Antoninus*. In 262, the tyrant Gallienus wreaked his fury on the inhabitants of Byzantium. He intended to besiege it; but on his arrival, despaired of being able to make himself master of such a strong place. He was admitted the next day, however, into the city; and without any regard to the terms he had agreed to, caused the soldiers and all the inhabitants to be put to the sword. Trebellius Pollio says, that not a single person was left alive. What the reason was for such an extraordinary massacre, we are no where informed. In the wars between the emperors Licinius and Maximin, the city of Byzantium was obliged to submit to the latter, but was soon after recovered by Licinius. In the year 323, it was taken from Licinius by Constantine the Great, who, in 330, enlarged and beautified it, with a design to make it the second, if not the first city in the Roman empire. He began with extending the walls of the ancient city from sea to sea; and while some of the workmen were busied in rearing them, others were employed in raising within them a great number of stately buildings, and among others a palace no way inferior in magnificence and extent to that of Rome. He built a capitol and amphitheatre, made a circus maximus, several forums, porticoes, and public baths. He divided the whole city into 14 regions, and granted

Byzantium.

Byzantium. granted the inhabitants many privileges and immunities. By this means Byzantium became one of the most flourishing and populous cities of the empire. Vast numbers of people flocked thither from Pontus, Thrace, and Asia, Constantine having by a law, enacted this year (330), decreed, that such as had lands in those countries should not be at liberty to dispose of them, nor even leave them to their proper heirs at their death, unless they had an house in his new city. But however desirous the emperor was that his city should be filled with people, he did not care that it should be inhabited by any but Christians. He therefore caused all the idols to be pulled down, and all their churches consecrated to the true God. He built besides an incredible number of churches, and caused crosses to be erected in all the squares and public places. Most of the buildings being finished, it was solemnly dedicated to the Virgin Mary, according to Cedrenus, but, according to Eusebius, to the God of martyrs. At the same time

Byzantium was equalled to Rome. The same rights, immunities, and privileges, were granted to its inhabitants as to those of the metropolis. He established a senate and other magistrates, with a power and authority equal to those of Old Rome. He took up his residence in the new city; and changed its name to CONSTANTINOPLE, which it has ever since retained.

BZOVIVUS (Abraham), one of the most celebrated writers in the 17th century, with respect to the astonishing number of pieces composed by him. His chief work is the continuation of Baronius's annals. He was a native of Poland, and a Dominican friar. Upon his coming to Rome, he was received with open arms by the Pope, and had an apartment assigned him in the Vatican. He merited that reception, for he has imitated Baronius to admiration in his design of making all things conspire to the despotic power and glory of the papal see. He died in 1637, aged 70.
