lenage, or other cuſtomary ſervices; as diſtinguiſhed from the higher tenures in *capite*, or by military ſervice. *Baſe fee*, is to hold in fee at the will of the lord, as diſtinguiſhed from ſocage tenure. *Baſe court*, any court not of record.

BASELLA, CLIMBING NIGHTSHADE from *Mala-bar*; a genus of the trigynia order, belonging to the pentandria claſs of plants.

Species. 1. The rubra, with red leaves and ſimple footſtalks, has thick, frong, ſucculent ſtalks and leaves, which are of a deep purple colour. The plant will climb to the height of ten or twelve feet, provided it is kept in a ſtove; but in the open air it will not grow ſo large in this country; nor will the feeds come to perfection in the open air, unleſs in very warm ſeaſons. The flowers of this plant have no great beauty, but it is cultivated on account of the odd appearance of its ſtalks and leaves. There is a variety of this, with green ſtalks and leaves, and the flowers of a whitith green colour tipped with purple. 2. The alba, with oval waved leaves. This ſort hath flaccid leaves, and ſmaller flowers and fruit than the firſt. The plants will climb to a conſiderable height, and ſend forth a great number of branches; ſo they ſhould be trained up to a trellis, or faſtened to the back of the ſtove, otherwiſe they will twiſt themſelves about whatever plants ſtand near them, which will make a very diſagreeable appearance.

Culture. Theſe plants are propagated from feeds, which ſhould be ſown on a moderate hot-bed in the ſpring; and when the plants are fit to remove, they ſhould be each planted in a ſeparate pot, and plunged into the tan-bed, where they are to be treated like other tender exotics. They may be alſo propagated from cuttings, but as they ariſe ſo eaſily from the feeds, the latter method is ſeldom practiſed.

Uſes. The berries of the firſt ſpecies are ſaid to be uſed for ſtaining callicoos in India. Mr Miller affirms us, that he has ſeen a very beautiful colour drawn from them, but which did not continue long when uſed in painting. He is of opinion, however, that a method of fixing the colour might be invented, in which caſe the plant would be very uſeful.—This, we apprehend, might be accompliſhed by means of ſolution of tin in aqua regia, which hath a ſurpriſing effect both in brightning and giving durability to other vegetable colours.

BASEMENT, in architecture. See **ARCHITECTURE**, n^o 75. 76.

BASHARIANS, a ſect of Mahometans, being a branch or ſubdiviſion of the Motazalites. The Baſharians are thoſe who maintain the tenets of Baſhar Ebn Motamer, a principal man among the Motazalites, who varied, in ſome points, from the general tenets of the ſect, as carrying man's free agency to a great length, and even to the making him independent.

BASHAW, a Turkiſh governor of a province, city, or other diſtrict.

A baſhaw is made with the ſolemnity of carrying a ſtag or banner before him, accompanied with muſic and ſongs, by the miraleem, an officer on purpoſe for the inveſtiture of baſhaws. *Baſhaw*, uſed abſolutely, denotes the prime vizer; the reſt of the denomination being diſtinguiſhed by the addition of the province, city, or the like, which they have the command of; as the baſhaw of Egypt, of Paleſtine, &c. The baſhaws

shaws are the emperor's sponges. We find loud complaints among Christians of their avarice and extortions. As they buy their governments, every thing is venal with them. When gluttured with wealth, the emperor frequently makes them a present of a bow-string, and desires heir to all their spoils.

The appellation *basilicus* is given by way of courtesy to almost every person of any figure at the grand signior's court.

BASIL (St) the Great, one of the most learned and eloquent doctors of the church, was born at Cæsarea, in Cappadocia, about the year 328; and went to finish his studies at Athens, where he contracted a strict friendship with St Gregory Nazianzen. He returned to his native country in 355, where he taught rhetoric. Some time after, he travelled into Syria, Egypt, and Lybia, to visit the monasteries of these countries; and the monastic life so much suited his disposition, that upon his return home he resolved to follow it, and he was the first institutor thereof in Pontus and Cappadocia *. His reputation became so great, that, upon the death of Eusebius bishop of Cæsarea, in 370, he was chosen his successor. It was with some difficulty that he accepted of this dignity; and no sooner was he raised to it, than the emperor Valens began to persecute him because he refused to embrace the doctrine of the Arians. Being at length let alone, he began to use his utmost endeavours to bring about a reunion betwixt the eastern and western churches, who were then much divided about some points of faith, and in regard to Meletius and Paulinus two bishops of Antiochia. But all his efforts were ineffectual, this dispute not being terminated till nine months after his death. Basil had a share in all the disputes which happened in his time in the east in regard to the doctrine of the church; and died the 1st of January, 379.—There have been several editions of his works in Greek and Latin. The best is that of Father Garnier, printed in Greek and Latin, in three volumes folio. St Basil's style is pure and elegant, his expressions grand and sublime, his thoughts noble and full of majesty; and Erasmus places him among the greatest orators of antiquity.

BASIL, a Canton of Switzerland, which joined the confederacy in 1501. It is bounded on the south by the canton of Solothurn; on the north by part of the margravate of Baden Dourlach, and the territory of Rheinfelden; on the east by Frickthal; and on the west by part of Solothurn, the diocese of Basl, and the Sundgar; being upwards of 20 miles in length, and about 18 in breadth. It is entirely Protestant; and contains 27 parishes, and seven bailiwicks. The lower parts of it are fruitful in corn and wine, and also fit for pasture; but the mountains are extremely barren. Here are many medicinal springs and baths, and the air is wholesome and temperate. Both men and women for the most part wear the French dress; but the language commonly spoken is the High-Dutch, tho' the French also is much used. The government is aristocratical; and its revenues arise chiefly from secularized abbeys, and imposts on goods carried through the country, to and from France, Italy, and Germany. Besides the military establishment of the city of Basl, there are two provincial regiments, consisting each of ten companies, and a troop of dragoons.—The places of most note are

Basl the capital, Wallenburg, St Jacob, Neue-Haus, &c.

BASIL, the capital of the canton of that name, is the largest city in all Switzerland, having 220 streets, and six market-places or squares. Its environs are exceeding beautiful, consisting of a fine level tract of fields and meadows. The city is divided into two parts by the Rhine, over which there is a handsome bridge. It is thought by some to have risen on the ruins of the old Augusta Rauracorum. For its name of *Basilica* it is indebted to Julian the Apostle, who would have it so called in honour of his mother Basilina. It is fortified with walls, moats, towers, and bastions, and contains several churches, besides the cathedral, which is an old Gothic structure; a commandery of the order of St John, and another of the Teutonic order; a public granary and arsenal; a stately town-house, in which is an exquisite piece of the sufferings of Christ, by Holbein, and a statue of Munatius Plancus, a Roman general, who, about 50 years before Christ, built the ancient city of Augusta Rauracorum; an university, which was founded in 1459, and has a curious physic-garden, library, and museum; a gymnasium; a stately palace, belonging to the margrave of Baden-Dourlach; besides a chamber of curiosities, several hospitals, &c. In the arsenal is shewn the armour in which Charles the Bald lost his life, with the furniture of his horse, and the kettle-drums and trumpets of his army. On the stair-case of the council-house, is a picture of the last judgment, in which, though drawn before the reformation, popes, cardinals, monks, and priests, are represented in the torments of hell. Over-against the French church, on a long covered wall, is painted the dance of death; where the king of terrors is represented as mixing with all ranks and ages, and complimenting them, in German verses, on their arrival at the grave. St Peter's square, planted with elm and lime-trees, makes a pleasant walk; but a spot regularly planted with trees, close by the river, and near the minister, makes still a finer, as commanding a most beautiful and extensive prospect. The celebrated Erasmus died here, in 1536, in the 70th year of his age, and was buried in the great church. He left his library and cabinet of rarities to one Amberbach, a learned lawyer of this city, of whose heirs they were purchased by the university. Besides this cabinet, there are several other curious private ones. The clocks of this city go an hour faster than elsewhere, except at Constance; a circumstance which some ascribe to the famous councils held there, when it was thought the best expedient to bring the fathers earlier to the assembly, for the quicker dispatch of business; but others say, that, in Basl, it was owing to a conspiracy being defeated by that means. Trade still flourishes here, especially in silk, ribbons, and wines; and the police is under excellent regulations. Most of the offices are bestowed by lot among well qualified persons. No person, without the city, must wear lace of gold or silver. All young women are prohibited from wearing silks; and the nearest relations only are to be invited to a marriage-feast. For the government of the city there are several councils or colleges, and officers. Of the last, the two burgomasters, and two wardens of trades, are the chief. The great council is composed of the representatives of the several companies of the greater and lesser city. Basl was the see

Basil
Basilica.Basilica
Basilidi.

of a bishop till the Reformation; but though there is one that still bears the title, he has now no jurisdiction here, and lives at Porentru, near the Upper Alsace. The two Bostorffs, father and son, and the famous painter Holbein, were natives of this place. The council held here, in 1431, sat in the veltry of the cathedral.

BASIL, in botany. See **OXYMUM**.

BASIL, among joiners, the sloping edge of a chissel, or of the iron of a plane, to work on soft wood: they usually make the basil 12 degrees, and for hard wood 18; it being remarked, that the more acute the basil is, the better the instrument cuts; and the more obtuse, the stronger, and fitter it is for service.

BASILIAN MONKS; Religious of the order of St Basil. That saint, having retired into a desert, in the province of Pontus, founded a monastery for the convenience of himself and his numerous followers: and for the better regulation of this new society, he drew up in writing the orders and rules he would have them follow. This new order soon spread all over the east; nor was it long before it passed into the west. The rule of St Basil was approved by pope Liberius, the same year in which it was written and published; and afterwards by several other popes; and, in these last ages, by pope Gregory XIII. who approved the abridgement made of it by cardinal Bessarion, in the pontificate of Eugenius IV.—Some authors pretend, that St Basil, before he died, saw himself the spiritual father of more than 90,000 monks, in the east only. But this order, which flourished so greatly for more than three centuries, was afterwards considerably diminished by heresy, schism, and a change of empire. The greatest storm it felt, was in the reign of Constantine Copronymus; who persecuted the monks of St Basil, imprisoning some, and banishing others; inasmuch that the monasteries were abandoned and spoiled of all their goods.

The historians of this order tell us, that it has produced 1805 bishops; and beatified, or acknowledged as saints, 3010 abbots, 11,805 martyrs, and an infinite number of confessors and virgins. They likewise place among the religious of the order of St Basil 14 popes, some cardinals, and a very great number of patriarchs, archbishops, and bishops. This order likewise boasts of several emperors and empresses, kings and queens, princes and princesses, who have embraced its rule.

This order was introduced in the west in 1057; and was reformed in 1569, by pope Gregory XIII. who united the religious of this order in Italy, Spain, and Sicily, into one congregation; of which the monastery of St Saviour at Messina is the chief, and enjoys pre-eminence over the rest. Each community has its particular rule, besides the rule of St Basil, which is very general, and prescribes little more than the common duties of a Christian life.

BASILIC, or **BASILICA**, in the ancient architecture, denotes a kind of public hall or court of judicature, where the princes or magistrates sat to administer justice. The word is originally Greek, *Basilikos*, *q. d.* royal house, palace. In after times the denomination *basilica* was also given to other buildings of public use, as town-houses, exchanges, and the like.

BASILIC is also used, in ecclesiastical writers, for a church. In which sense, this name frequently occurs

in St Ambrose, St Austin, St Jerom, Sidonius Apollinaris, and other writers of the fourth and fifth centuries. It is thought that the name was thus applied, from many of the ancient churches having been formed of the Roman halls mentioned in the preceding article. In reality, on the conversion of Constantine, many of the ancient *basilicae* were given to the church, and turned to another use, viz. for Christian assemblies to meet in, as may be collected from that passage in Ausonius, where speaking to the emperor Gratian, he tells him, the *basilicae*, which heretofore were wont to be filled with men of business, were now thronged with votaries praying for his safety. By which he must needs mean, that the Roman halls or courts were turned into Christian churches: and hence, we conceive, the name *basilica* came to be a general name for churches in after ages.

BASILICS, in literary history, a name supposed to have been given by the emperor Leo to a collection of laws in honour of his father Basilus Macedo, who began it in the year 867, and in the execution chiefly made use of Sabbathius Protospatharius, who carried the work as far as 40 books. Leo added 20 books more, and published the work in 880. The whole, 30 years after, was corrected and improved by Constantine Porphyrogenitus, son of Leo; whence many have held him the author of the *basilica*.—Six books of the *basilica* were translated into Latin in 1557, by Gentian Hervetus. An edition of the Greek *basilics*, with a Latin version, has been since published at Paris, in 1647, by Annib. Fabrotus, in 7 volumes. There still want 19 books, which are supposed to be lost. Fabrotus has endeavoured to supply, in some measure, the defect from the synopsis of the *basilica*, and the glosses; of which several had been made under the succeeding emperors, and contained the whole Justinian law, excepting the superfluities, in a new and more consistent order, together with the later constitutions of the emperors posterior to Justinian.

BASILICA, in anatomy, the interior branch of the axillary vein, running the whole length of the arm.

BASILICATA, a territory of Italy, bounded on the north by the Otranto, Bari, and Capitanata; on the west by the Principato, and a small part of the Tuscan sea; on the south by Calabria; and on the east by the gulph of Taranto. It is watered by several rivers: but, as it is almost all occupied by the Apennine mountains, it is neither very populous nor fertile; however it produces enough to maintain its inhabitants, and has a small quantity of cotton. The principal towns are Cerenza the capital, Mesi, Turfi, Rapollo, Muro, Lavello, Tracarico, Monte Pelose and Venefo, which are all episcopal sees.

BASILICI, a denomination given in the Greek empire to those who carried the emperor's orders and commands.

BASILICON, in pharmacy, a name given to several compositions to be found in ancient medicinal writers. At present it is confined to three official ointments, distinguished by the epithets black, yellow, and green. See **PHARMACY**, n° 995.

BASILIDIANS, ancient heretics, the followers of Basilides, an Egyptian, who lived near the beginning of the second century. He was educated in the Gnostic school, over which Simon Magus presided; with whom

whom he agreed that Christ was a man in appearance, that his body was a phantom, and that he gave his form to Simon the Cyrenian, who was crucified in his stead. We learn from Eusebius, that this heresiarch wrote 24 books upon the gospel, and that he forged several prophets; to two of which he gave the names *Barcaba* and *Barcoph*. We have still the fragment of a Basilidian gospel. His disciples supposed there were particular virtues in names; and taught with Pythagoras and Plato, that names were not formed by chance, but naturally signified something.—Basilides, to imitate Pythagoras, made his disciples keep silence for five years.

In general, the Basilidians held much the same opinions with the Valentinians, another branch of the gnostic family. They asserted, that all the actions of men are necessary; that faith is a natural gift, to which men are forcibly determined, and should therefore be saved tho' their lives were ever so irregular. Ireneus and others assure us, they acted consistently with their principle; committing all manner of villainies and impurities, in confidence of their natural election. They had a particular hierarchy of divine persons, or *Eons*. Under the name *Abraxas*, they are said to have worshipped the supreme God, from whom as a principle, all other things proceeded. There are several gems still subsisting inscribed with the name *Abraxas*, which were used by the Basilidians as amulets against diseases and evil spirits. See *ABRASAX* and *ABRAX*.

BASILIPPUM, (anc. geogr.), a town of Bætica in Spain; now *Cantillana*, a citadel of Andalusia, above Seville on the Guadalquivir. See *CANTILLANA*.

BASILISCUS, in zoology, the trivial name of a species of lacerta. See *LACERTA*.

BASILISK, a fabulous kind of serpent, said to kill by its breath or sight only. Galen says, that it is of a colour inclining to yellow; and that it has three little eminences upon its head, speckled with whitish spots, which have the appearance of a fort of crown. Ælian says, that its poison is so penetrating, as to kill the largest serpents with its vapour only; and that if it but bite the end of any man's stick, it kills him. It drives away all other serpents by the noise of its hissing. Pliny says, it kills those who look upon it.—The generation of the basilisk is not less marvellous, being said to be produced from a cock's egg, brooded on by a serpent. These and other things equally ridiculous are related by Matthioli, Galen, Dioscorides, Pliny, and Erasistratus. Hirschmayer and Vander Wiel have given the history of the basilisk, and detected the folly and imposture of the traditions concerning it.—In some apothecaries shops there are little dead serpents shewn, which are said to be basilisks. But these seem rather to be a kind of small bird, almost like a cock but without feathers: its head is lofty, its wings are almost like a bat's, its eyes large, and its neck is very short. As to those which are shewn and sold at Venice, and in other places, they are nothing but little thornbacks artificially put into a form like that of a young cock, by stretching out their fins, and contriving them with a little head and hollow eyes: and this, Calmet says, he has, in reality, observed in a supposed basilisk, at an apothecary's shop at Paris, and in another at the Jesuits of Pont-a-Mousson.

BASILISK, in military affairs, a large piece of ord-
VOL. II.

nance, thus denominated from its resemblance to the supposed serpent of that name. The basilisk throws an iron ball of 200 pound weight. It was much talked of in the time of Solyman emperor of the Turks, in the wars of Hungary; but seems now out of use. Paulus Jovius relates the terrible slaughter made by a single ball from one of these basilisks in a Spanish ship; after penetrating the boards and planks in the ship's head, it killed above 30 men. Massius speaks of basilisks made of brass, which were drawn each by 100 yoke of oxen.—Modern writers also give the name *basilisk* to a much smaller and sizeable piece of ordnance, which the Dutch make 15 feet long, and the French only 10. It carries 48 pounds.

BASILIUS, surnamed the *Macedonian*, emperor of the Greeks. He was a common soldier, and of an obscure family in Macedonia, and yet raised himself to the throne; for having pleased the emperor Michael by his address in the management of his horses, he became his first equerry, and then his great chamberlain. He at length assassinated the famous Bardas, and was associated to the empire in 849. He held the eighth general council at Constantinople; deposed the patriarch Photius, but in 858 restored him to the patriarchate; and declared against the popes, who refused to admit him into their communion. He was dreaded by his enemies the Saracens, whom he frequently vanquished; and loved by his subjects, for his justice and clemency. He died in 886. Under his reign the Russians embraced Christianity, and the doctrine of the Greek church. He ought not to be confounded with Basilus the Young, who succeeded Zemices in 975, and after a reign of 50 years died in 1025.

BASINGSTOKE, a corporation town of Hampshire in England, and a great thoroughfare on the western road. It is seated on a small brook, in W. Long. 1. 10. N. Lat. 51. 20.

BASIOGLOSSUS, a muscle arising from the base of the os hyoides. See *ANATOMY, Table of the Muscles*.

BASIS, or *BASE*, in geometry. See *BASE*.

BASIS, or *Base*, in chemistry. Any body which is dissolved by another body, which it receives and fixes, and with which it forms a compound, may be called the *basis* of that compound. Thus, for example, the bases of neutral salts are the alkaline, earthy, and metallic matters which are saturated by the several acids, and form with them these neutral salts. In this sense it is that these neutral salts are called *salts with earthy bases*, *salts with alkaline bases*, *salts with metallic bases*: also the appellations *basis of alum*, *basis of nitre*, *basis of Glauber's salt*, *basis of vitriol*, &c. signify the argillaceous earth, which, with the vitriolic acid, forms alum; the vegetable alkali, which, with the nitrous acid, forms nitre; the mineral alkali, which, with the vitriolic acid, forms Glauber's salt; and the metal which, with the vitriolic acid, forms a vitriol; because these substances are supposed to be fixed, unactive, and only yielding to the action of the acids, which they fix, and to which they give a body and consistence.

BASIS, among physicians, denotes the principal ingredients in compound medicines.

BASKET, a machine made of twigs interwoven together, in order to hold fruit, earth, &c. It denotes an uncertain quantity; as, a basket of medlars is two bushels, of assa fetida from 20 to 50 pound weight.

Basket
Bafnage.

BASKETS of Earth, in the military art, called by the French *corbeilles*, are small baskets used in sieges, on the parapet of a trench, being filled with earth. They are about a foot and a half high, about a foot and a half in diameter at the top, and 8 or 10 inches at bottom; so that, being set together, there is a fort of embrasures left at their bottoms, thro' which the soldiers fire, without exposing themselves.

BASKET-Fish, or *Arborescent Sea-star*. See **ASTEROIAS**.

BASKET-Salt, that made from salt-springs, being purer, whiter, and composed of finer grains, than the common brine-salt. See **SALT**.

BASKING-SHARK, or *SUN-FISH of the Irish*. See **SQUALUS**.

BASNAGE (James), a learned and accomplished author, and pastor of the Walloon church at the Hague, was born at Roan in Normandy, August 8, 1653. He was the son of Henry Bafnage, one of the ablest advocates in the parliament of Normandy. At 17 years of age, after he had made himself master of the Greek and Latin authors, as well as the English, Spanish, and Italian languages, he went to Geneva, where he began his divinity studies under Melitrezat, Turretin, and Tronchin; and finished them at Sedan, under the professors Jurieu and Le Blanc de Beaulieu. He then returned to Roan, where he was received as minister, September 1676; in which capacity he remained till the year 1685, when, the exercise of the Protestant religion being suppressed at Roan, he obtained leave of the king to retire to Holland. He settled at Rotterdam; and was a minister pensionary there till 1691, when he was chosen pastor of the Walloon church of that city. In 1709, pensionary Heinsius got him chosen one of the pastors of the Walloon church at the Hague, intending not only to employ him in religious but in state affairs. He was employed in a secret negotiation with marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht; and he executed it with so much success, that he was afterwards entrusted with several important commissions, all which he discharged in such a manner as to gain a great character for his abilities and address; a celebrated modern writer has therefore said of him, that he was fitter to be minister of state than of a parish. The abbe du Bois, who was at the Hague in 1716, as ambassador plenipotentiary from his most Christian majesty, to negotiate a defensive alliance between France, England, and the States General, was ordered by the duke of Orleans, regent of France, to apply himself to M. Bafnage, and to follow his advice: they accordingly acted in concert, and the alliance was concluded in January 1717. He kept an epistolary correspondence with several princes, noblemen of high rank, and ministers of state, both Catholic and Protestant, and with a great many learned men in France, Italy, Germany, and England. The Catholics esteemed him no less than the Protestants; and the works he wrote, which are mostly in French, spread his reputation almost all over Europe: among these are, 1. The History of the Religion of the Reformed Churches. 2. Jewish Antiquities. 3. The History of the Old and New Testament; and many others. He died Sept' 22, 1723.

BASNAGE (Henry) sieur de Beauval, second son to Henry Bafnage, and brother to James mentioned in the

last article. He applied himself to the study of the law, and was admitted advocate in the parliament of Roan in the year 1679. He did not follow the bar immediately upon his admission; but went to Valencia, where he studied under M. de Marville. Upon his return from thence, he practised with great reputation till the year 1687, when the revocation of the edict of Nantz obliged him to fly to Holland, where he composed the greatest part of his works, and died there the 29th of March 1710. His chief work is *Histoire des ouvrages des Seavans*. Rotterd. 24 vol. in duodecimo. This work was begun in the month of September 1687, and continued till June 1709. When he arrived in Holland, Mr Bayle, through indisposition, had been obliged to drop his *Nouvelles de la Republique des lettres*, which induced Mr Bafnage to undertake a work of the same kind under a different title.

BASON, in hydraulics, a reservoir of water, used for various purposes: thus we say, *The basin of a jet d'eau*, the basin of a fountain, and likewise the basin of a port or harbour.

BASON, in Jewish antiquities, the laver of the tabernacle, made of the brass looking-glasses belonging to those devout women that watched and stood centinels at the door of the tabernacle.

BASON, in mechanics, a term used by glass-grinders for a dish of copper, iron, &c. in which they grind convex glasses, as concave ones are formed on spheres: and by latters for a round iron mould, in which they form the matter of their hats; and also for a leaden one for the brims of hats, having an aperture in the middle, of a diameter sufficient for the largest block to go through.

BASQUES, a small territory of France, towards the Pyrenean mountains. It comprehends Labour, Lower Navarre, and the district of Soule.

BASS, the lowest in the four parts of music: of uncertain etymology; whether from the Greek word *βασις*, a foundation; or from the Italian adjective *basso*, signifying low. Of all the parts it is the most important, and it is upon this that the chords proper to constitute a particular harmony are determined. Hence the maxim among musicians, that when the bass is properly formed, the harmony can scarcely be bad.

Basses are of different kinds. Of which in their order.

Thorough-Bass is the harmony made by the bass-voils, or theorbos, continuing to play both while the voices sing, and the other instruments perform their parts, and also filling up the intervals when any of the other parts stop. It is played by figures marked over the notes, on the organ, spinet, harpsichord, &c. and frequently simply and without figures on the bass-viol and bassoon.

Counter-Bass is a second or double bass, where there are several in the same concert.

BASS-VIOL, a musical instrument of the like form with that of a violin, but much larger. It is struck with a bow, as that is; has the same number of strings; and has eight stops, which are subdivided into semistops: Its sound is grave, and has a much nobler effect in a concert than that of the violin.

BASS (ISLE OF), a rock, about a mile in circumference, in the mouth of the Frith of Forth, at a small distance from the town of North Berwick in East Lothian.

Bafon
Bafs.

thian. It is steep and inaccessible on all sides, except to the south-west; and even there it is with great difficulty that a single man can climb up with the help of a rope or ladder. It was formerly kept as a garrison. A party of king James's adherents surpris'd it at the Revolution, and it was the last place in the three kingdoms that submitted to the new government; upon which, its fortifications were ordered to be neglected. In summer, this remarkable rock, which rises to a great height above the water, in form of a cone, is quite covered with sea-fowl which come hither to breed. The chief of these are the solan gese*, which arrive in June, and retire in September. It also contains a small warren for rabbits, and affords pasture for a few sheep. The force of the tides have now almost worn a hole quite thro' this rock. W. Long, 2. 15. N. Lat. 56. 3.

BASSAN (James de Pont), or LE BASSAN, a celebrated Venetian painter, excelled in landscapes and animals. His works are spread all over Europe; many of them were purchased by Titian; and there are several in the French king's cabinet, the royal palace, and the Hotel de Toulouse. He died in 1592, aged 82.—Francis and Leander, his sons, distinguished themselves in the same art; but inheriting a species of lunacy from their mother, both came to an untimely end.

BASSANI (Giovanni Battista), maestro di cappella of the cathedral church of Bologna about the middle of the last century, was a very voluminous composer of music, having given to the world no fewer than 31 different works. He is equally celebrated both as a composer for the church and for concerts; and was besides a celebrated performer on the violin, and, as it is said, taught Corelli on that instrument. His compositions consist of masses, psalms, motets with instrumental parts, and sonatas for violins: his fifth opera in particular, containing 12 sonatas for two violins and a bass, is much esteemed; it is written in a style wonderfully grave and pathetic, and abounds with evidences of great learning and fine invention. The first and third operas of Corelli are apparently formed after the model of this work. Bassani was one of the first who composed motets for a single voice, with accompaniments of violins; a practice which is liable to objection, as it assimilates church-music too nearly to that of the chamber; and of his solo-motets it must be confessed that they differ in style but little from opera airs and cantatas: two operas of them, viz. the eighth and thirteenth, were printed in London, by Pearson, above 50 years ago, with the title of *Harmonia Festiva*.

BASSANTIN (James), a Scotch astronomer, son of the laird of Bassantin in Mers, was born in the reign of James IV. He was educated at the university of Glasgow, travelled through Germany and Italy, and then fixed his abode in the university of Paris, where he taught mathematics with great applause. Having acquired some fortune in this occupation in 1562, he returned to Scotland, where he died in the year 1568. From his writings, he appears to have been no contemptible astronomer, considering the times; but, like most of the mathematicians of that age, he was not a little addicted to judicial astrology. Sir James Melvil, in his Memoirs, says that his brother Sir Robert, when he was exerting his abilities to reconcile the two queens Elizabeth and Mary, met with one Bassantin, a man learned in the high sciences, who told him, "that all

his travel would be in vain; for, said he, they will never meet together; and next, there will never be any thing but dissembling and secret hatred for a while, and at length captivity and utter wreck to our queen from England." He added, "that the kingdom of England at length shall fall, of right, to the crown of Scotland; but it shall cost many bloody battles; and the Spaniards shall be helpers, and take a part to themselves for their labour." Sir James Melvil is an author of credit; therefore it is probable that our astrologer ventured to utter his prediction: but, as it proved true only in part, either he misunderstood the stars, or they deceived the astrologer.—His works are, 1. *Astronomia Jacobi Bassantini Scotti, opus absolutissimum, &c. ter editum Latine et Gallice*. Genev. 1599, fol. This is the title given it by Tornæsius, who translated it into Latin from the French, in which language it was first published. 2. *Paraphrase de P. Astralabe, avec un amplification de l'usage de P. Astralabe*. Lyons 1555. Paris, 1617, 8vo. 3. *Mathematic. genethliaca*. 4. *Arithmetica*. 5. *Musica secundum Platonem*. 6. *De mathesi in genere*.

BASSE, or Bass, a town of the French Netherlands, in the county of Flanders, on the confines of Artois, remarkable on account of the many sieges it has sustained; but its fortifications are now demolished. It is seated on a canal which runs as far as Deule. E. Long. 3. 0. N. Lat. 50. 53.

BASSE TERRE, part of the island of St Christopher's, one of the Caribbee islands, formerly occupied by the French, but ceded to Great Britain by the treaty of Utrecht in 1713.

BASSET, a game at cards, said to have been invented by a noble Venetian, for which he was banished. The persons concerned in it are a dealer, or banker; his assistant, who supervises the losing cards; and the punter, or any one who plays against the banker.

BASSETT (Peter), a gentleman of a good family, was chamberlain, or gentleman of the privy-chamber, to king Henry V. a constant attendant on that brave prince, and an eye-witness of his most glorious actions both at home and abroad; all which he particularly described in a volume intitled, *The Acts of king Henry V.* which remains in MS. in the college of heralds.

BASSOON, a musical instrument of the wind fort, blown with a reed, furnished with 11 holes, and used as a bass in a concert of hautboys, flutes, &c.—To render this instrument more portable, it is divided into two parts, whence it is also called a *saquet*. Its diameter at bottom is nine inches, and its holes are stopped like those of a large flute.

BASSORA, BALSORA, or *Basrah*, a city between Arabia and Persia, situated in the extremity of the deserts of Irak, a little to the west of the Tigris, in about 57° east longitude, and 30° north latitude. It was built by the command of the khalif Omar, in the 15th year of the Hegira, for the sake of carrying on more commodiously an extensive commerce between the Syrians, Arabians, Persians, and Indians. It is at present a very famous emporium of the east; and stands upon a thick stony soil, as the word *basra* imports, about a day and a half's journey from one of the mouths of the Tigris, where it empties itself into the Persian Gulf, denominated likewise from this town the *Bay of Basra*. The circumjacent tract is looked upon by the

Arabs to be one of the most delightful spots in Asia, and even as one of the most beautiful gardens in the world; however, the hot winds that frequently blow there are very troublesome to travellers, and sometimes overwhelm them with sand driven by the force of these winds out of the neighbouring deserts. The city is inhabited by Jacobites, Nestorians, Jews, Mahometans, and Chaldean Christians, commonly called *Christians of St John*, which last are pretty numerous here.

The Abbe Raynal values the merchandise annually brought to Bassora at L. 525,000: of which the English furnish L. 175,000; the Dutch L. 87,500; and the Moors, Banians, Armenians, and Arabs, furnish the remainder. "The cargoes of these nations (says he) consist of rice; sugar; plain, striped, and flowered muslins from Bengal; spices from Ceylon and the Molucca islands; coarse, white, and blue cottons from Coromandel; cardamum, pepper, sanders-wood, from Malabar; gold and silver stuffs, turbans, shawls, indigo, from Surat; pearls from Baharen, and coffee from Mocha; iron, lead, and woollen-cloth, from Europe. Other articles of less consequence are imported from different places. Some of these commodities are shipped on board small Arabian vessels; but the greater part is brought by European ships, which have the advantage of a considerable freight.

"This merchandise is sold for ready money; and passes through the hands of the Greeks, Jews, and Armenians. The Banians are employed in changing the coin current at Bassora, for that which is of higher value in India.

"The different commodities collected at Bassora are distributed into three channels. One half of them goes to Persia, whither they are conveyed by the caravans; there being no navigable river in the whole empire. The chief consumption is in the northern provinces, which have not been so much ravaged as those of the south. Both of them formerly made their payments in precious stones, which were become common by the plunder of India. They had afterwards recourse to copper utensils, which had been exceedingly multiplied from the great abundance of copper mines. At last they gave gold and silver in exchange, which had been concealed during a long scene of tyranny, and are continually dug out of the bowels of the earth. If they do not allow time for the trees that produce gum, and have been cut to make fresh shoots; if they neglect to multiply the breed of goats which afford such fine wool; and if the silks, which are hardly sufficient to supply the few manufactures remaining in Persia, continue to be so scarce; in a word, if this empire does not rise again from its ashes; the mines will be exhausted, and this source of commerce must be given up."

BASSO RELIEVO, or **BASS-RELIEF**; a piece of sculpture, where the figures or images do not protuberate, jet, or stand out, far above the plane on which they are formed.—Whatever figures or representations are thus cut, stamped, or otherwise wrought, so that not the entire body, but only part of it, is raised above the plane, are said to be done in *relief*, or *relievo*; and when that work is low, flat, and but little raised, it is called *low relief*. When a piece of sculpture, a coin, or a medal, has its figure raised so as to be well distinguished, it is called *bold*, and we say its *relief is strong*.

BASTARD, a natural child, or one begotten and

born out of lawful wedlock.

The civil and canon laws do not allow a child to remain a bastard, if the parents afterwards intermarry: and herein they differ most materially from our law; which, though not so strict as to require that the child shall be *begotten*, yet makes it an indispensable condition that it shall be *born*, after lawful wedlock. And the reason of our law is surely much superior to that of the Roman, if we consider the principal end and design of establishing the contract of marriage, taken in a civil light; abstractedly from any religious view, which has nothing to do with the legitimacy or illegitimacy of the children. The main end and design of marriage, therefore, being to ascertain and fix upon some certain person, to whom the care, the protection, the maintenance, and the education, of the children should belong; this end is undoubtedly better answered by legitimating all issue born after wedlock, than by legitimating all issue of the same parties, even born before wedlock, so as wedlock afterwards ensues: 1. Because of the very great uncertainty there will generally be, in the proof that the issue was really begotten by the same man; whereas, by confining the proof to the birth, and not to the begetting, our law has rendered it perfectly certain, what child is legitimate, and who is to take care of the child. 2. Because by the Roman law a child may be continued a bastard, or made legitimate, at the option of the father and mother, by a marriage *ex post facto*; thereby opening a door to many frauds and partialities, which by our law are prevented. 3. Because by those laws a man may remain a bastard till 40 years of age, and then become legitimate by the subsequent marriage of his parents; whereby the main end of marriage, the protection of infants, is totally frustrated. 4. Because this rule of the Roman law admits of no limitation as to the time, or number, of bastards to be so legitimated; but a dozen of them may, 20 years after their birth, by the subsequent marriage of their parents, be admitted to all the privileges of legitimate children. This is plainly a great discouragement to the matrimonial state; to which one main inducement is usually not only the desire of having children, but also the desire of procreating lawful heirs. Whereas our constitutions guard against this indecency, and at the same time give sufficient allowance to the frailties of human nature. For, if a child be begotten while the parents are single, and they will endeavour to make an early reparation for the offence, by marrying within a few months after, our law is so indulgent as not to bastardize the child, if it be born, though not begotten, in lawful wedlock; for this is an incident that can happen but once; since all future children will be begotten, as well as born, within the rules of honour and civil society.

From what has been said it appears, that all children born before matrimony are bastards by our law; and so it is of all children born so long after the death of the husband, that, by the usual course of gestation, they could not be begotten by him. But, this being a matter of some uncertainty, the law is not exact as to a few days. But if a man dies, and his widow soon after marries again, and a child is born within such a time as that by the course of nature it might have been the child of either husband; in this case, he is said to be more than ordinarily legitimate; for he may, when he

arrives

arrives to years of discretion, choose which of the fathers he pleases. To prevent this, among other inconveniencies, the civil law ordained that no widow should marry *infra annum luctus*; a rule which obtained so early as the reign of Augustus, if not of Romulus: and the same constitution was probably handed down to our early ancestors from the Romans, during their stay in this island; for we find it established under the Saxon and Danish governments.

As bastards may be born before the coverture or marriage-state is begun, or after it is determined, so also children born during wedlock may in some circumstances be bastards. As if the husband be out of the kingdom of England (or, as the law loosely phrases it, *extra quatuor maria*) for above nine months, so that no access to his wife can be presumed, her issue during that period shall be bastards. But, generally, during the coverture, access of the husband shall be presumed, unless the contrary shall be shewn; which is such a negative as can only be proved by shewing him to be elsewhere: for the general rule is, *presumitur pro legitimatione*. In a divorce *a mensa et thero*, if the wife breeds children, they are bastards; for the law will presume the husband and wife conformable to the sentence of separation, unless access be proved: but, in a voluntary separation by agreement, the law will suppose access, unless the negative be shewn. So also, if there is an apparent impossibility of procreation on the part of the husband, as if he be only 8 years old, or the like, then the issue of the wife shall be bastard. Likewise, in case of divorce in the spiritual court *a vinculo matrimonii*, all the issue born during the coverture are bastards; because such divorce is always upon some cause that rendered the marriage unlawful and null from the beginning.

As to the duty of parents to their bastard children, by our law; it is principally that of maintenance. For, though bastards are not looked upon as children to any civil purposes; yet the ties of nature, of which maintenance is one, are not so easily dissolved: and they hold indeed as to many other intentions; as, particularly, that a man shall not marry his bastard sister or daughter. The method in which the English law provides maintenance for them is as follows. When a woman is delivered, or declares herself with child, of a bastard, and will by oath before a justice of the peace charge any person having got her with child, the justice shall cause such person to be apprehended, and commit him till he gives security, either to maintain the child, or appear at the next quarter-sessions to dispute and try the fact. But if the woman dies, or is married, before delivery, or miscarries, or proves not to have been with child, the person shall be discharged: otherwise the sessions, or two justices out of sessions, upon original application to them, may take order for the keeping of the bastard, by charging the mother or the reputed father with the payment of money or other sustentation for that purpose. And if such putative father, or lewd mother, run away from the parish, the overseers by direction of two justices may seize their rent goods, and chattels, in order to bring up the said bastard child. Yet such is the humanity of our laws, that no woman can be compulsively questioned concerning the father of her child, till one month after her delivery: which indulgence is however very frequently a hardship upon parishes, by giving the parents opportunity to escape.

As to the rights and incapacities which appertain to a bastard: The former are very few, being only such as he can acquire; for he can inherit nothing, being looked upon as the son of nobody, and sometimes called *filius nullius*, sometimes *filius populi*. Yet he may gain a firmage by reputation, though he has none by inheritance. All other children have their primary settlement in their father's parish; but a bastard in the parish where born, for he hath no father. However, in case of fraud, as if a woman either be sent by order of justices, or comes to beg as a vagrant, to a parish which she does not belong to, and drops her bastard there; the bastard shall, in the first case, be settled in the parish from whence she was illegally removed; or, in the latter case, in the mother's own parish, if the mother be apprehended for her vagrancy. Bastards also, born in any licensed hospital for pregnant women, are settled in the parishes to which the mothers belong.—The incapacity of a bastard consists principally in this, that he cannot be heir to any one; for, being *nullius filius*, he is therefore of kin to nobody, and has no ancestor from whom any inheritable blood can be derived: Therefore, if there be no other claimant upon an inheritance than such illegitimate child, it shall escheat to the lord. And as bastards cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. For as all collateral kindred consists in being derived from the same common ancestor, and as a bastard has no legal ancestors, he can have no collateral kindred; and, consequently, can have no legal heirs, but such as claim by a lineal descent from himself. And therefore, if a bastard purchases land, and dies seized thereof without issue, and intestate, the land shall escheat to the lord of the fee. A bastard was also, in strictness, incapable of holy orders; and, though that were dispensed with, yet he was utterly disqualified from holding any dignity in the church: but this doctrine seems now obsolete; and, in all other respects, there is no distinction between a bastard and another man. And really any other distinction, but that of not inheriting, which civil policy renders necessary, would, with regard to the innocent offspring of his parent's crimes, be odious, unjust, and cruel to the last degree; and yet the civil law, so boasted of for its equitable decisions, made bastards in some cases incapable even of a gift from their parents. A bastard may, lastly, be made legitimate, and capable of inheriting, by the transcendent power of an act of parliament, and not otherwise: as was done in the case of John of Gaunt's bastard children, by a statute of Richard II.

As to the punishment for having bastard children: By the statute 18 Eliz. c. 3. two justices may take order for the punishment of the mother and reputed father: but what that punishment shall be, is not therein ascertained; though the cotemporary exposition was, that a corporal punishment was intended. By statute 7 Jac. I. c. 4. a specific punishment (*viz.* commitment to the house of correction) is inflicted on the woman only. But, in both cases, it seems that the penalty can only be inflicted, if the bastard becomes chargeable to the parish; for otherwise the very maintenance of the child is considered as a degree of punishment. By the last mentioned statute the justices may commit the mother to the house of correction, there to be punished and set on work for one year; and, in case of a second offence,

Bastard, offence, till the find fueries never to offend again.

He that gets a bastard in the hundred of Middleton in Kent, forfeits all his goods and chattels to the king*.

If a bastard be got under the umbrage of a certain oak in Knollwood in Staffordshire, belonging to the manor of Terley-castle, no punishment can be inflicted, nor can the lord nor the bishop take cognizance of it†.

It is enacted by statute 21 Jac. I. c. 27. that if any woman be delivered of a child, which if born alive should by law be a bastard; and endeavours privately to conceal its death, by burying the child or the like; the mother so offending shall suffer death, as in the case of murder, unless she can prove by one witness at least that the child was actually born dead. This law, which favours pretty strongly of severity, in making the concealment of the death almost conclusive evidence of the child's being murdered by the mother, is nevertheless to be also met with in the criminal codes of many other nations of Europe; as the Danes, the Swedes, and the French: but it has of late years been usual with us, upon trials for this offence, to require some sort of presumptive evidence that the child was born alive, before the other constrained presumption (that the child, whose death is concealed, was therefore killed by its parent) is admitted to convict the prisoner.

BASTARDS is also an appellation given to a kind of faction or troop of banditti, who rose in Guienne, about the beginning of the 14th century, and, joining with some English parties, ravaged the country, and set fire to the city of Xaintes. Mezeray supposes them to have consisted of the natural sons of the nobility of Guienne, who, being excluded the right of inheriting from their fathers, put themselves at the head of robbers and plunderers to maintain themselves.

* *BASTARD Flower-fence.* See *ADENANTHERA*.—The flowers of this plant bruised and steeped in breast-milk are a gentle anodyne; for which purpose they are often given in the West Indies to quiet very young children. The leaves are used instead of fena in Barbadoes and the Leeward Islands. In Jamaica, the plant is called *fena*.

BASTARD-Hemp. See *DATISCA*.

BASTARD-Rocket, Dyers-weed, or Wild Wood. See *RESEDA*.

BASTARD Star-of-Bethlehem. See *ALBUCA*.

BASTARDY is a defect of birth objected to one born out of wedlock. Eustathius will have bastards among the Greeks to have been in equal favour with legitimate children, as low as the Trojan war; but the course of antiquity seems against him. Potter and others shew, that there never was a time when bastardy was not in disgrace.

In the time of William the Conqueror, however, bastardy seems not to have implied any reproach, if we may judge from the circumstance that monarch himself not scrupling to assume the appellation of bastard. His epistle to Alan count of Bretagne begins, *Ego Willielmus cognomento bastardus* *.

BASTARDY, in relation to its trial in law, is distinguished into general and special. *General* bastardy is a certificate from the bishop of the diocese, to the king's justices, after inquiry made, whether the party is a bastard or not, upon some question of inheritance. *Bastardy special* is a suit commenced in the king's courts,

against a person that calls another bastard.

Arms of BASTARDY should be crossed with a bar, fillet, or traverse, from the left to the right. They were not formerly allowed to carry the arms of their father, and therefore they invented arms for themselves; and this is still done by the natural sons of a king.

Right of BASTARDY, Droit de batardise, in the French laws, is a right, in virtue whereof the effects of bastards dying intestate devolve to the king or the lord.

BASTARNICÆ ALPES, (anc. geog.), mountains extending between Poland, Hungary, and Transylvania, called also the *Carpatæ*, and now the *Carpathian mountains*.

BASTERIA, ALL-SPICE; a genus of plants not described by Linnæus, but to which Mr Miller has given the name of *Basteria* from Dr Job Bafter F. R. S. a learned botanist of Holland. Of this there is only one species known, viz. with oval leaves placed opposite, flowers coming from the sides of the stalks, and a branched shrubby stalk. It is a native of Carolina in America. The flowers appear in May, are of a dull purple colour, and have a disagreeable scent. The bark is brown; and has a very strong aromatic flavour, from whence the plant takes its name of *All-spice*.

BASTI, (anc. geog.) a town of the province of Bætica in Spain, situated to the west of the Campus Spartarius. Now *Baza* in Granada. See *BAZA*.

BASTIA, a sea-port town of Albania in Turkey in Europe, over against the island of Corfu, at the mouth of the river Calamu. E. Long. 10. 35. N. Lat. 39. 40.

BASTIA, the capital of the island of Corfica in the Mediterranean. It has a good harbour; and is seated on the eastern part of the coast, in E. Long. 9. 42. N. Lat. 42. 35.

BASTILE, denotes a small antique castle, fortified with turrets. Such is the bastille of Paris, which seems the only castle that has retained the name: it was begun to be built in 1369 by order of Charles V. and was finished in 1383 under the reign of his successor.—Its chief use is for the custody of state-prisoners.

BASTIMENTOS, the name of some small islands near Terra Firma in South America, at the mouth of the bay of Nombre de Dios.

BASTION, in the modern fortification, a huge mass of earth, faced usually with sods, sometimes with brick, and rarely with stone, standing out from a rampart whereof it is a principal part, and is what, in the ancient fortification, was called a *bulwark*.

Solid BASTIONS, are those that have the void space within them filled up entirely, and raised of an equal height with the rampart.

Void and Hollow BASTIONS, are those that are only surrounded with a rampart and parapet, having the space within void and empty, where the ground is so low, that, if the rampart be taken, no retrenchment can be made in the centre, but what will lie under the fire of the besieged.

Flat BASTION, is a bastion built in the middle of the curtain, when it is too long to be defended by the bastion at its extremes.

Cut BASTION, is that whose point is cut off, and instead thereof has a re-entering angle, or an angle inwards, with two points outwards; and is used either when without such a contrivance the angle would be

too

Bastard,
Bastardy.

* Chamb.
Dict.

ford. p. 279.

* Du Cange.
Gloss. Lat.
T. 1. p. 502.

too acute, or when water or some other impediment hinders the carrying on the bastion to its full extent.

Composed BASTION, is when two sides of the interior polygon are very unequal, which makes the gorges also unequal.

Deformed BASTION, is when the irregularity of the lines and angles makes the bastion out of shape; as when it wants one of its demigorges, one side of the interior polygon being too short.

Demi BASTION, is composed of one face only, and but one flank, and a demigorge.

Double BASTION, is that which is raised on the plane of another bastion.

Regular BASTION, is that which has its true proportion of faces, flanks, and gorges.

BASTION of France, a fortress on the coast of Barbary, belonging to the French *.

BASTITANI, (anc. geog.) a people of the province of Bætica in Spain. See *BÆTICA*.

BASTOIGNE, a small town of the Netherlands, in the duchy of Luxemburgh. E. Long. 6. o. N. Lat. 50. 10.

BASTON, in law, one of the servants to the warden of the Fleet-prison, who attendd the king's courts with a red staff, for taking into custody such as are committed by the court. He also attends on such prisoners as are permitted to go at large by licence.

BASTON, or *Bateon*, in architecture, a moulding in the base of a column, called also a *torse* *.

BASTON, *Baton*, or *Batone*. This word is French, and signifies a staff or cudgel: it should be spelt *Biston*; but is, by most English writers, corruptly spelt as above. It is only borne in English coats-of-arms, as a badge of illegitimacy; but French heralds introduce it in arms as a difference, or mark of consanguinity.

BASTON (Robert), a Carmelite monk, afterwards prior of the convent of that order at Scarborough, and also poet laureat and public orator at Oxford, flourished in the fourteenth century. King Edward I. in his expedition into Scotland in 1304, took Robert Baston with him, in order to celebrate his victories over the Scots; but our poet being taken prisoner, was obliged to change his note, and sing the successes of Robert Bruce. He wrote several books in Latin, on the Wars of Scotland, the Luxury of Priests, Synodical Sermons, &c.; and also a volume of tragedies and comedies, in English. He died about the year 1310.

BASTONADO, *BASTONADE*, the punishment of beating or drubbing a criminal with a stick. The word is formed of the French *baston*, a stick or staff. The bastonade is a punishment used both among the ancient Greeks, Romans, and Jews, and still obtains among the Turks. The Romans called it *fustigatio*, *fistium admotio*, or *fustibus cædi*; which differed from the *flagellatio*, as the former was done with a stick, the latter with a rod, or scourge. The fustigation was a lighter punishment, and inflicted on freemen; the flagellation a severer, and reserved for slaves. It was also called *lympavum*, because the patient here was beat with sticks, like a drum.—The punishment is much in use in the east to this day. The method there practised is thus: the criminal being laid on his belly, his feet are raised, and tied to a stake, held fast by officers for the

purpose; in which posture he is beaten by a cudgel on the soles of his feet, back, chin, &c. to the number of 100 or more blows.

BASTWICK (Dr John), born at Writtle in Essex, in 1593; practised physic at Colchester; but being a man of warm imagination, and a good Latin scholar, applied himself to writing books against popery. About the year 1633, he printed in Holland a Latin treatise intitled, *Elenchus religionis Papiſticæ*, with *Flagellum pontificis et episcoporum Latialium*, in which the English Prelates thinking themselves also aimed at, he was fined L. 1000 in the high commission court, excommunicated, prohibited practising physic, his books ordered to be burnt, and himself to remain in prison until he made a recantation. Instead of recanting, he wrote in prison, *Apologeticus ad presules Anglicanos*; and another book called, *The Litany*; wherein he severely exclaimed against the proceedings of that court, and taxed the bishops with an inclination towards popery. Prynne and Burton coming under the lash of the star chamber-court at the same time, they were all censured as scandalous seditious persons, condemned to a fine of L. 5000 each, to be pilloried, to lose their ears, and to perpetual imprisonment in three remote parts of the kingdom. The parliament in 1640 reversed these proceedings; and ordered Dr Bastwick a reparation of L. 5000 out of the estates of the commissioners and lords who had prosecuted him, which the ensuing confusions prevented his receiving; however, his wife had, in 1644, an allowance ordered for her and her husband's maintenance. What became of him afterward, is not known.

BAT, in zoology. See *VESPERTILIO*.
BAT-Fowling, a method of catching birds in the night, by lighting some straw, or torches, near the place where they are at roost; for upon beating them up, they fly to the flame, where being amazed, they are easily caught in nets, or beat down with bushes fixed to the end of poles, &c.

BAT, *Bate*, or *Batz*, a small copper coin, mixed with a little silver, current in several cities of Germany: it is worth four cruzers. It is also a coin in Switzerland, current at five livres, or 100 fols, French money.

BATABLE GROUND, that land which lay between Scotland and England, when the kingdoms were distinct, to which both nations pretended a right.

BATACALA, a small kingdom on the coast of Malabar in the East Indies. It had a very large town of the same name; but there is nothing now left, except 11 or 12 small pagods covered with copper and stone. The country produces a good deal of pepper; the English formerly had a factory here; but were all massacred by the natives, because one of their bull-dogs had killed a consecrated cow.

BATACALA, a fortified town and castle on the east coast of the island of Ceylon in the East Indies. The Dutch drove away the Portuguese, and possessed themselves of part of the adjacent country. E. Long. 18. 3. N. Lat. 7. 55.

BATANISTS, or *BATENITES*. See *BATENITES*.
BATASEK, a town of lower Hungary, seated on the Danube, in E. Long. 19. 50. N. Lat. 46. 30.

BATAVA, (*Castra* understood), a citadel of Vin-delicia, so called from the Cohors Batava, in garrison under the commander in Rhetia; now *Passau*; being first

Batavia
 Bachelor.

first called *Bataui*, from the Batavi; then *Bassavi*, and *Passavi*; situated in Bavaria at the confluence of the Danube, Inn, and Ills. See *PASSAU*.

BATAVIA, the capital of the Dutch settlements in the East Indies; a city of the kingdom of Bantam in the island of Java. See *JAVA*.

BATAVORUM INSULA, the island of the Batavians, (anc. geog.) Of this island Tacitus gives the following description. "The Rhine flowing in one channel, or only broken by small islands, is divided at its entering Batavia, as it were into two rivers. One continues its course through Germany, retaining the same name, and violent current, till it falls into the ocean. The other washing the coast of Gaul, with a broader and more gentle stream, is called by the inhabitants *Vahalis*; which name it soon changes for that of *Mosa*, by the immense mouth of which river it discharges itself into the same ocean." According to Tacitus, therefore, the island of the Batavians was bounded by the ocean, the Rhine, and the *Vahalis*, now the *Wale*. *Cæsar* extends it to the *Mosa*, or *Menſes*; but *Pliny* agrees with *Tacitus*. However, this island was of greater extent in *Tacitus's* time than in *Cæsar's*; *Drusus*, the father of *Germanicus*, having by a new canal conveyed the waters of the Rhine into the ocean a considerable way north of the former mouth of that river. The Batavi were a branch of the Catti, who, in a domestic sedition, being expelled their country, occupied the extremity of the coast of Gaul, at that time uninhabited, together with this island situated among shoals. Their name *Batavi* they carried with them from Germany; there being some towns in the territory of the Catti called *Battenberg*, and *Battenhausen*. The bravery of the Batavi, especially the horse, procured them not only great honour from the Romans, being called their *brothers* and *friends*; but an exemption from taxes, being obliged only to furnish men and arms. The modern name of this island is *Betu*, or *Betaw*. See *BETUE* and *BATTÆ*.

BACHELOR, or **BACHELOR**, an appellation given to a man not married, or who is yet in a state of celibacy. For the derivation of the word, see *BACHELOR*.—The Roman censors frequently imposed fines on old bachelors. *Dion. Halicarnassensis* mentions an old constitution, by which all persons of full age were obliged to marry. But the most celebrated law of this kind was that made under *Augustus*, called the *lex Julia de maritandis ordinibus*; by which bachelors were made incapable of legacies or inheritances by will, unless from their near relations. This brought many to marry, according to *Plutarch's* observation, not so much for the sake of raising heirs to their own estates, as to make themselves capable of inheriting those of other men.—The rabbins maintain, that, by the laws of *Moses*, every body, except some few particulars, is obliged in conscience to marry at 20 years of age: this makes one of their 613 precepts. Hence those maxims so frequent among their casuists, that he who does not take the necessary measures to leave heirs behind him, is not a man, but ought to be reputed a homicide. *Lycurgus* was not more favourable: by his laws, bachelors are branded with infamy, excluded from all offices civil and military, and even from the shews and public sports. At certain feasts they were forced to appear, to be exposed to the public derision, and led

round the market-place. At one of their feasts, the women led them in this condition to the altars, where they obliged them to make *amende honorable* to nature, accompanied with a number of blows, and lashes with a rod at discretion. To complete the affront, they forced them to sing certain songs composed in their own derision.—The Christian religion is more indulgent to the bachelor state: the ancient church recommended it as preferable to, and more perfect than, the matrimonial. In the canon law, we find injunctions on bachelors, when arrived at puberty, either to marry, or to turn monks and profess chastity in earnest.—In England, there was a tax on bachelors, after 25 years of age, 12 l. 10 s. for a duke, a common person 1 s. by 7 Will. III. 1695.

BACHELORS, in an university sense. See *BACHELOR*.

BACHELORS, in the livery company of London, are those not yet admitted to the livery. Every company of the 12 consists of a master; two wardens; the livery; and the bachelors, who are yet but in expectation of dignity in the company, and have their function only in attendance on the master and wardens.

Knight-BACHELOR, the most ancient, but the lowest order of knights in England; known by the name of *knights* only. They are styled *knights-bachelors*, because this title does not descend to their posterity.—

The custom of the ancient Germans was to give their young men a shield and a lance in the great council: this was equivalent to the *toga virilis* of the Romans: before this, they were not permitted to bear arms, but were accounted as part of the father's household; after it, as part of the public. Hence some derive the usage of knighting, which has prevailed all over the western world, since its reduction by colonies, from those northern heroes. Knights are called in Latin *equites aurati*: *aurati*, from the gilt spurs they wore; and *equites*, because they always served on horseback: for it is observable, that almost all nations call their knights by some appellation derived from an horse. They are also called in our law *milites*, because they formed a part, or indeed the whole, of the royal army, in virtue of their feudal tenures; one condition of which was, that every one who held a knight's fee (which in *Henry the second's* time amounted to 20 l. *per annum*) was obliged to be knighted, and attend the king in his wars, or pay a fine for his non-compliance. The exertion of this prerogative, as an expedient to raise money in the reign of *Charles I.* gave great offence, though warranted by law and the recent example of queen *Elizabeth*: but it was, at the Restoration, together with all other military branches of the feudal law, abolished; and this kind of knighthood has, since that time, fallen into disregard. It is conferred indiscriminately upon gownsmen, burghers, and physicians, by the king's lightly touching the person, who is then kneeling, on the right shoulder with a drawn sword, and saying, *Rise Sir*. See the articles *KNIGHT* and *NOBILITY*.

BATE (*George*), an eminent physician, born at *Maid's Morton*, near *Buckingham*, in the year 1608. In 1629 he obtained a licence, and for some years practised in and about *Oxford*: his practice was chiefly amongst the puritans, who at that time considered him as one of their party. In 1637, he took his degree

Bat
 Bat

of doctor in physic, and became very eminent in his profession, so that when king Charles kept his court at Oxford, he was his principal physician. When the king's affairs declined, Dr Bate removed to London, where he accommodated himself so well to the times, that he became physician to the Charter-house, fellow of the college of physicians, and afterwards principal physician to Oliver Cromwell. Upon the restoration, he got into favour with the royal party, was made principal physician to the king, and fellow of the Royal Society; and this, we are told, was owing to a report raised on purpose by his friends, according to Mr Wood, that he gave the protector a dose which hastened his death. Dr Bate wrote in Latin an account of the late commotions in England, and some other pieces. He died at his house in Hatton-garden, and was buried at Kingston upon Thames in Surry.—There was another George Bate, who wrote a work entitled "The Lives, Actions, and Execution, of the prime Actors and principal Contrivers of that horrid Murder of our late pious and sacred king Charles I."

BATENITES, a sect of apostates from Mahometanism dispersed through the East, who professed the same abominable practices with the Ismaelians and Karmatians. The word properly signifies *esoteric*, or people of inward or hidden light.

BATES (William), D. D. an eminent Presbyterian divine, born in November 1625. He was admitted in Emanuel college, Cambridge, and from thence removed to King's college in 1644. He was one of the commissioners, at the conference in the Savoy, for reviewing the public liturgy, and was concerned in drawing up the exceptions against the Common Prayer: however, soon after the restoration, he was appointed chaplain to king Charles II. and became minister of St Dunstan's in the west, but was deprived of that benefice for nonconformity. Dr Bates bore a good and amiable character; and was honoured with the friendship of the lord keeper Bridgman, the lord chancellor Finch, the earl of Nottingham, and archbishop Tillotson. He was offered, at the restoration, the deanery of Litchfield; which he refused. He published Select Lives of illustrious and pious persons, in Latin; and since his death all his works, except his Select Lives, have been printed in one volume in folio. He died in July 14. 1699, in the 74th year of his age.

BATH, a city of Somersetshire in England, seated in W. Long. 2. 30. N. Lat. 51. 27. All the different names that this city has borne in different ages and languages have been taken from its medicinal waters, as the *Uvula Siqua*, or "hot waters," of Ptolemy; the *aque solis*, or "waters of the sun," of Antoninus; the *Caer Baden*, and *Caer Ebnant*, i. e. "the city of baths," and "the city of ointment," of the Britons; and the *Ackmanschaffer*, i. e. "the city of valetudinarians," of the Saxons. The baths consist of the King's-bath, the Queen's-bath, the Cross-bath, the Hot-bath, the Leper's-bath, and the duke of Kingston's-bath. This place was of old a resort only for cripples and diseased persons; but now it is more frequented by the sound for pleasure, than by the sick for health. The waters are very pleasant to the taste; and impregnated with a vitriolic principle, yielding, upon evaporation, a little neutral salt, and a calcareous earth and iron. They are very efficacious in strengthening the bowels and

stomach, bracing the relaxed fibres, and invigorating the circulation. In bilious complaints they are counted specific; and prove serviceable in most nervous, paralytic, rheumatic, and gouty complaints. At the King's-bath is a handsome pump-room, where the gentlemen and ladies go in a morning to drink the waters; and there is a band of music that plays all the time. In the Cross-bath is a monument of marble, representing the descent of the Holy Ghost attended by angels, erected by the earl of Melfort (who was secretary of state for Scotland) when king James II. met his queen here. The King's-bath is a large basin of 65 feet 10 inches by 40 feet 10 inches, containing 346 tuns 2 hogheads and 36 gallons of water when filled to its usual height. In the middle is a wooden building with niches and seats for the accommodation of the bathers. There are also iron rings all round for them to hold by; and guides, both male and female, to attend them in the bath. The person intending to bathe puts on, at his own lodgings, a bathing dress of brown canvas hired for the purpose; and is carried in a close chair, of a particular make, to one of the slips which open into the bath. There he descends by steps into the water, where he is attended by a guide. Having staid his staid time in the bath, he ascends again into the slip, where he puts off his bathing-dress, and being wrapt up in blankets, is carried home to bed, where he lies for some time to encourage perspiration. The King's-bath is overlooked by the company in the pump-room; and adjoining to it are places furnished with pumps to pour the hot streams on any particular part of the body. The Queen's-bath communicates with the King's, from which it is filled; therefore the water of it is not so hot, being at a greater distance from the source. As the heat is here more moderate, the bathers descend first into the Queen's-bath, and advance gradually to the centre of the other. In the year 1755, the abbey-house, or priory, belonging to the duke of Kingston, was taken down, in order to erect a more commodious pile of building; and in digging for the foundation, the workmen discovered, about twenty feet below the surface of the earth, the remains of Roman baths and sudatories constructed upon an elegant plan, with floors suspended on pillars, and surrounded with tubulated bricks, for the conveyance of heat and vapour. These were supplied by a spring of hot water, of the same properties and temperature with those of the King's-bath; and the sewer was found still entire, that conveyed the waste water into the river. The duke, having cleared the spring and the sewer, has erected several convenient baths and sudatories on the spot, where invalids may be accommodated at all hours, by night as well as by day. The two seasons are the spring and fall; but those who take the waters purely for their health do not regard the seasons, but drink them all the year round. There are a number of genteel sedan chairs, which carry people to any distance, not exceeding half a mile, for sixpence. The company assemble in the afternoon, alternately, at two stately rooms, to converse together, or play at cards. At a very pretty new theatre near the parades, plays are acted every other night; and there are balls twice a week, for which and the rooms, and books at the libraries, the gentry generally subscribe. The city is surrounded with hills on all sides, except a little open-

Bath.

ing to the east and west, through which the Avon runs. This river, which has been made navigable to Bristol by act of parliament, washes the city on the east and south sides, and there is an elegant bridge over it. This city hath formerly had a slight wall, of which some part still remains, as well as one or two of its gates; but almost all the new buildings, and much the greatest and finest part of the city, is without the walls, particularly the fine square called *Queen's-square*, in the middle of which is a small garden, with gravel walks, and an obelisk in the centre. But the greatest ornament at Bath is the circus: it is of a circular form, consisting of houses built on an uniform plan, with three openings at equal distances to the south, east, and west, leading into as many streets. The fronts of the houses, which are all three stories high, are adorned with three rows of columns in pairs, of the Doric, Ionic, and Corinthian orders, the frieze embellished with sculpture. The whole has an air of magnificence, which cannot fail to strike the most indifferent spectator. In the centre of the area is a reservoir, or basin, filled by two or three springs rising in the neighbouring hills; whence the fountains in this district are supplied with water. On the south side of the town are the north and south parades, two noble walks, paved with hewn stone, raised upon arches, facing each an elegant row of houses on one side, and having a stone balustrade on the other. These, with the two streets that join them, were planned and executed by one Mr Wood, an able architect, who likewise built the square, and projected the circus. The two public rooms stand betwixt the north parade and Orange-grove; which last is a square planted with trees, having in the middle a stone obelisk, inscribed in Latin to the late prince of Orange, who recovered his health in consequence of drinking the Bath waters, and gave his name to this part of the town. Several new streets and rows have of late years been built on the north-side of Bath, in the neighbourhood of the square, such as Gay-street, Milsom-street, Edgar-row, Harlequin-row, Bladud's-buildings, King's-mead-street, and Brock-street. Their advantages for building here are very great, having excellent free-stone, limestone, and slate, in the neighbourhood. One fort of their lime is as white as snow. The guild-hall of Bath stands in the market-place, and is said to be built on a plan of Inigo Jones, which, however, exhibits nothing worthy of that great architect: besides, one end of it has been rebuilt in a different stile. The hall is ornamented with some portraits of the late prince of Wales and other remarkable personages: but the greatest curiosity of the place is a Minerva's head in bronze, a real antique, dug up in Stall-street, in the year 1725. Bath boasts a noble infirmary, or general hospital, for the reception of the sick and lame from all parts of the three kingdoms. It extends 100 feet in front, and 90 in depth, being capable of receiving 150 patients. Here was anciently a monastery, of which the present cathedral was the church. It is a venerable pile; the principal front of which is adorned with angels ascending and descending. The bishop of the diocese is nominated both from Bath and Wells; yet he and his chapter always reside at Wells. There are three other churches in Bath, and several chapels and meeting-houses. Besides the infirmary, there are several other hospitals,

alms-houses, and charity-schools. The corporation consists of a mayor; eight aldermen, of whom two are justices of the peace; and 24 common-council men. The city is extremely well provided with stage-coaches, post-coaches, chaises, machines, and waggons. Bath is the general hospital of the nation, and a great number of invalids find benefit from the waters: but as the city lies in a bottom surrounded by very high hills, the air is constantly furcharged with damps; and indeed this place is more subject to rain than any other part in England. The markets are remarkably well supplied with provisions of all kinds at reasonable rates, particularly fish and poultry. They also afford excellent mutton fed upon Lansdown, one of the highest hills that overlook the city. This down, remarkable for its pure air, extends about three miles; and at the extremity of it there is a stone monument, with an inscription, erected to the memory of Sir Bevil Granville, who was here killed in a battle which he fought with the parliament's army in the reign of Charles I.

BATH, in medicæ, chemistry, &c. signifies a quantity of matter either moist or dry, included in a proper vessel, and sufficient for the total immersion of the human body, or any other substance which it may be judged necessary to cover with it. Hence baths are divided into moist and dry, according as the materials are either aqueous or not: the first are subdivided into hot and cold; and these are either natural or artificial. The natural hot baths are formed of the water of hot springs, of which there are many in different parts of the world; especially in those countries where there are or have evidently been volcanoes. The artificial hot baths consist either of water, or of some other fluid made hot by art. Sometimes indeed the vapour of water, either naturally or artificially heated, is made use of without suffering the person to enter the water itself; this is called the *vapour-bath*, and is a powerful sudorific. The cold bath consists only of water, either fresh or salt, in its natural degree of heat; or it may be made colder by art, as by a mixture of nitre, sal-ammoniac, &c.

Bathing seems to have been a very ancient practice. The Greeks, as early as the heroic age, are said to have bathed themselves in the sea, in rivers, &c. We even find mention in Homer of hot-baths in the time of the Trojan war; but these seem to have been very rare, and used only upon extraordinary occasions. Athenæus speaks of them as unusual even in his time. In reality, public baths seem to have been for some time discouraged if not prohibited by the Greeks, who were contented to wash themselves at home in a sort of bathing tubs. The method of bathing among them was by heating water in a large vessel with three feet, and thence pouring it on the head and shoulders of a person seated in a tub for that purpose, who at coming out was anointed with oil. The Greek baths consisted of seven different apartments, usually separated from one another, and intermixed with other buildings belonging to different kinds of exercises. These were, 1. The cold bath, *frigida lavatio*; in Greek *λυτρον*. 2. The *eleothesium*, or room where they were anointed with oil. 3. The *frigidarium*, or cooling room. 4. The *propugnæum*, or entrance of the *hypocaustum* or stove. 5. The vaulted room for sweating in, or vapour-bath, called by the Romans *concamerata sudatio*. 6. The

laconicum, or dry stove; and 7. The hot bath, called *calida lavatio*.

The Greek baths were usually annexed to *palaestra* or *gymnasia*, of which they were considered as a part. They appear to have been double, one for men, and the other for women; but so near, that one furnace served for heating both. The middle part was possessed by a large basin, which received water by several pipes, and into which they went down by steps, being surrounded by a balustrade, behind which was a kind of corridor, which formed a pretty large area to hold those who were waiting till there should be room for them in the bath. They were vaulted over, and only received light from the top.

The Romans were also long before they came into the use of baths; the very name of which, *thermae*, shews they borrowed the practice from the Greeks.—As the ancient Romans were chiefly employed in agriculture, their custom was, every evening after work, to wash their arms and legs, that they might sit down to supper with more decency; for it is to be observed, that the use of linen was then unknown, in Italy at least; and the people of that age went with their legs and arms bare, and consequently exposed to dust and filth. But this was not all; for, every ninth day, when they repaired to the *nundinae*, or to the assemblies of the people, they bathed all over in the Tiber, or some river that happened to be nearest to them. This seems to have been all the bathing used till the time of Pompey, when the custom began of bathing every day.—The Romans, when they found their stomachs overcharged with meat, went to the bath, as we learn from Juvenal, who inveighs against those that, having gorged themselves with eating, were forced to go into the bath to give themselves relief. They also found that a bath was good for refreshing them after some considerable fatigue, as we are informed by Celsus the physician. Hence, after Pompey's time, when luxury was prodigiously increased, the humour of bathing was carried to an extravagant height. Many by the immoderate use of the bath entirely ruined their constitution, being unable to taste food without bathing first. By this practice the emperor Titus is said to have lost his life. Hence Pliny inveighs severely against those physicians who held that hot baths digested the food. The emperor Adrian first laid a restraint on this immoderate humour of bathing, forbidding all persons to go to the bath before the eighth hour.

According to Dion, Mæcenas was the first who made a bath at Rome: yet there are instances of public baths before his time; but they were of cold water, small, and poorly decorated. Agrippa in his ædileate built a bath of 160 paces in length, where the citizens might be accommodated with either the hot or cold bath *gratis*. After his example Nero, Vespasian, Titus, Domitian, Severus, Gordian, Aurelian, Maximian, Dioclesian, and most other emperors who studied to gain the affections of the people, erected baths laid with the finest marble, and built according to the nicest rules of architecture. Alexander Severus was the first who allowed the public baths to be open during the night in the heats of summer.

In the Roman baths, the first part that appeared was a large basin called *natatio* and *piscina*. The middle was possessed by the *hypocaustum*, which had a string

of four apartments on each side called *balnearia*, so contrived, that one might easily go out of one into the other. There were two stoves called *laconicum* and *tepidarium*, which were joined together and built circular. Their floor was hollow and suspended, to receive the heat of the *hypocaustum*, which was a large furnace underneath. The same furnace also heated another room called *vasarium*, situated near the stoves, wherein were placed three large brazen vessels called *millaria* on account of their capacity; one for hot water, another for warm water, and a third for cold water; being so contrived, that the water might pass from one to the other by means of several siphons, and be distributed by pipes and cocks into the neighbouring bath, as occasion required. The rich had baths at home, and frequently very magnificent ones; but they used them only upon extraordinary occasions: the great men, and even emperors themselves, sometimes bathed in public with the rest of the people. At three in the afternoon, which is what Pliny calls *hora octava et nona*, the Romans all repaired to the baths, either the public or private ones; the public baths were all opened at the found of a bell, and always at the same hour.

The baths of Agrippa were built of brick, but painted in enamel; those of Nero were not only furnished with fresh water, but also had the sea water brought into them; those of Caracalla were adorned with 200 marble columns, and furnished with 1600 seats of the same matter. Lipsius assures us they were so large, that 1800 persons might conveniently bathe in them at once. But the baths of Dioclesian surpassed all the rest in magnificence; 140,000 persons were employed for many years in building them. Great part of these, as well as of the baths of Caracalla, are still standing; and with the vast high arches, the beautiful and stately pillars, &c. make one of the greatest curiosities in modern Rome.

The Celtic nations were not without the use of bathing: the ancient Germans bathed every day in warm water in winter, and in summer in cold. In England, the famous bath in Somersethshire is said by some to have been in use 800 years before Christ. Of this, however, it must be owned we have but very slender evidence: but Dr Musgrave makes it probable that it was a place of considerable resort in Geta's time; there being still the remains of a statue erected to that general, in gratitude for some benefactions he had conferred upon it.

Cold bathing was in high esteem among the ancient physicians for the cure of diseases, as appears from Strabo, Pliny, Hippocrates, and Orisbanus; whence frequent exhortations to washing in the sea, and plunging into cold water. The first instance of cold bathing, as a medicine, is Melampus's bathing the daughters of the king of Argos; and the first instance of warm bathing is Medea's use of it, who was said to boil people alive, because Pelias king of Theffaly died in a warm bath under her hands. The cold bath was used with success by Antonius Musa, physician to the emperor Augustus, for the recovery of that prince; but fell into neglect after the death of Marcellus, who was thought to have been destroyed by the improper use of it. It was again brought into request, towards the close of the reign of Nero, by means of a physician of Marseilles named *Gharmis*; but during the ig-

Bath.

norance of the succeeding ages, the practice was again banished for a long time. Both hot and cold bathing are now prescribed in many cases by the physicians, though they are not agreed as to the manner in which they operate on the human body*.

As to the origin of those hot waters, of which the natural hot baths are formed, we are very much in the dark. All we can affirm with certainty is, that where there are volcanoes, there also there are hot springs in great abundance; but how the heat of the volcano should be constantly communicated to the waters of a spring for many ages, during a great part of which the volcano itself has lain in a dormant state, seems almost beyond the reach of investigation. Another thing that creates a great difficulty is, that the fire of a volcano must certainly lie very deep in the earth, and most probably shifts from place to place, but the waters of a spring must always issue from a place situated lower than the origin of the spring itself. Besides, though we should suppose the water to come from the top of a volcano itself, and consequently boiling hot, it could not be supposed to percolate far through cold earth without losing all the heat it acquired from the volcano. From some observations, however, it certainly does appear, that there are some spots on the earth that have a power of producing heat within themselves, independent of any thing foreign; and that water is so far from being able to destroy this power, that it seems rather to promote and continue it. We know that water hath this effect upon a mixture of iron filings and sulphur; but whatever quantities of similar substances we may suppose to be contained in the earth, we must also suppose to be destroyed by one great conflagration soon after they have begun to act upon each other, so that by their means no lasting heat in waters could be produced. Dr Stukely indeed would solve this, and several other phenomena, by making the fire and smoke of volcanoes the effects of electricity: but here sufficient proof is wanting; for electricity, even in its most powerful state, is not very apt to set bodies on fire. The thought, however, deserves attention; for if electricity is capable of setting a volcano on fire, it is undoubtedly capable of producing solfaterras where it meets with proper materials, and from them springs of any degree of heat*.

* See the articles Sulfaterra and Volcano.

BATH, in Hebrew antiquity, a measure of capacity, containing the tenth part of an omar, or seven gallons and four pints, as a measure for things liquid; or three pecks and three pints, as a measure for things dry.

Knights of the BATH. See the article KNIGHT.

BATH-KOL, the daughter of a voice. So the Jews call one of their oracles, which is frequently mentioned in their books, especially the Talmud; being a fantastical way of divination invented by the Jews themselves, though called by them a revelation from God's will, which he made to his chosen people, after all verbal prophecies had ceased in Israel. It was in fact a method of divination similar to the *sortes Virgilianae* of the Heathens. For as, with them, the first words they happened to dip into, in the works of that poet, were a kind of oracle, whereby they predicted future events; so, with the Jews, when they appealed to Bath-kol, the first words they heard from any one's mouth were looked upon as a voice from heaven, directing them in the matter they inquired about. The Christians were not

quite free from this superstition, making the same use of the book of the Scriptures, as the Pagans did of the works of Virgil. It was practised by Heraclius, emperor of the east, in the beginning of the seventh century: for, being at war with Chosroes king of Persia, and in doubt, after a successful campaign, where to take up his winter-quarters, he consulted the book of the Scriptures in this way of divination, and was determined thereby. In France, it was the practice, for several ages, to use this kind of divination at the consecration of a bishop, in order to discover his life, manners, and future behaviour. This usage came into England with the Norman conquest; for we are told, that, at the consecration of William the second Norman bishop of the diocese of Norwich, the words which first occurred, on dipping into the Bible, were, *Not this man, but Barabbas*: soon after which, William died, and Herbert de Losinga, chief Simony-broker to King William Rufus, succeeded him; at whose consecration, the words, at which the Bible opened, were the same which Jesus spoke to Judas the traitor; *Friend, wherefore art thou come?* This circumstance so affected Herbert, that it brought him to a thorough repentance of his crime; in expiation of which he built the cathedral church of Norwich, the first stone of which he laid in the year 1096.

BATHA, BATH, or *Bactia*, a town of Hungary, and capital of a county of the same name, seated on the Danube. E. Long. 20. 40. N. Lat. 46. 40.

BATHURST (Ralph), M. D. an eminent physician, poet, and divine, born in the year 1620. He studied divinity in Trinity college, Oxford; but the times of confusion coming on, he changed the course of his studies, and applied himself to physic. He took a doctor's degree in that faculty; in which he rose to such eminence, that he was, in the time of the usurpation, appointed physician to the state. Upon the restoration, he quitted his profession of physic; was elected a fellow of the Royal Society, and president of his college; and having entered into holy orders, he was made chaplain to the king, and afterwards dean of Wells. Soon after, he served the office of vice-chancellor of Oxford, and was nominated by King William and Queen Mary to the see of Bristol; which he refused to accept. His learning and talents were various. He was an orator, a philosopher, and a poet: he possessed an inexhaustible fund of wit, and was a facetious companion at 80 years of age. Ridicule was the weapon with which he used to correct the delinquents of his college; and he was so absolute a master of it, that he had it always at hand. His poetical pieces in the *Musæ Anglicanæ* are excellent in their kind. He wrote several poems, both in English and Latin; and died June 14, 1704, in the 84th year of his age.

BATHURST (Allen), earl of Bathurst, one of the last worthies of Queen Anne's reign, that shining period of triumphs, taste, genius, and elegance, was born in the year 1684. His studies and his education were equally conducive to the brilliant figure he was destined to make in social life and in the senate, as a polite scholar, a patriot, and a statesman. These talents he had an opportunity to display as early as the year 1705; when, at the request of his father Sir Benjamin Bathurst, and the solicitation of the constituents of Cirencester, he served in parliament for that borough, his

Bath
Bathurst

native

native soil, with reputation and integrity. He distinguished himself particularly in the struggles and debates relative to the union between the two kingdoms, firmly supporting this measure, calculated to strengthen the vigour of government by uniting its force. Though he was contented to act a subordinate character in the great opposition planned by Mr Harley and Mr St John, his intimate friends, to sap the credit of the duke of Marlborough and his adherents, he was of infinite service to his party in arraigning, with spirit and eloquence, the conduct of the general and the earl of Godolphin, who had long governed the Queen, and lavished the treasures of the nation on conquests more splendid than serviceable. The loss of the battle of Almanza seconded his efforts to dispel the intoxication of former successes. His personal regard for Lord Somers, president of the council, was never altered, though they were of different opinions in politics; and when he was divested of his office, Mr Bathurst acted with such tenderness and delicacy, as to preserve the esteem of Lord Somers in a private station. In consideration of his zeal and services, the Queen advanced him, in 1711, to the dignity of a peer, by the title of Baron Bathurst, of Batlefen, in Bedfordshire.

His Lordship continued to speak his sentiments with an undaunted freedom in the upper house; and stepped forth as a formidable opponent to the court-measures in the reign of George I. and during Sir Robert Walpole's administration. The acrimony of the prosecution carried on against the Earl of Oxford, Lord Bolingbroke, and the Duke of Ormond, stimulated his indignation and his eloquence against such vindictive proceedings; and he observed, "that the king of a faction was but the sovereign of half his subjects."

The south-sea scheme having infected the whole nation with a spirit of avaricious enterprize, the people awaked from their delirium, and an infinite number of families was involved in ruin. Lord Bathurst publicly impeached the directors, whose arts had enabled them by these vain expectations to amass surprising fortunes: he represented that the national honour was concerned in stripping them of their ill-acquired wealth; and moved for having all the directors of the south-sea company punished by a forfeiture of their estates, for such a notorious act of sordid knavery.

When the bill was brought into the House of Lords against Dr Atterbury bishop of Rochester, that learned prelate, who joined to the graces of style and diction all the elegance of a just delivery; among the many friends the bishop's eloquence, politeness, and ingenuity had procured him, was Lord Bathurst. He spoke against the bill with great vehemence and propriety; observing, "that if such extraordinary proceedings were countenanced, he saw nothing remaining for him and others to do, but to retire to their country-houses, and there, if possible, quietly enjoy their estates within their own families, since the least correspondence, or intercepted letter, might be made criminal." Then turning to the bishops, he said, he "could hardly account for the inveterate hatred and malice some persons bore the ingenious bishop of Rochester, unless it was that they were infatuated like the wild Americans, who fondly believe they inherit not only the spoils, but even the abilities, of the man they destroy." He was one of the Lords who entered his pro-

test against the bill.

His Lordship was entirely averse to continental connexions; and animadverted severely upon the monarch whose thoughts were turned to foreign concerns and alliances which could never be useful; complaining of the immense sums lavished in subsidies to needy and rapacious princes.

The directors of the charitable corporation having embezzled 500,000 l. of the proprietors capital, Lord Bathurst declared, in the House of Lords, his abhorrence of this most iniquitous scene of fraud; asserting, that not one shilling of the money was ever applied to the proper service, but became the reward of avarice and venality.

His Lordship concurred, with all his power, in the opposition to Sir Robert Walpole, who now tottered on the brink of ruin. This minister, after obstinate struggles, having been forced to resign all his employments, Lord Bathurst was sworn of the privy-council, and made captain of the gentlemen-pensioners, which post he resigned in 1744. He was appointed treasurer to the present king, then Prince of Wales, in 1757, and continued in the list of privy-councillors at his accession to the throne; but, on account of his great age, he chose to enjoy *otium cum dignitate*.

Lord Bathurst's integrity gained him the esteem even of his opponents; and his humanity and benevolence, the affection of all that knew him more intimately. He added to his public virtues all the good breeding, politeness, and elegance, of social intercourse. Dr Friend, Congreve, Vanbrugh, Swift, Prior, Rowe, Addison, Pope, Arbuthnot, Gay, and most men of genius in his own time, cultivated his friendship, and were proud of his correspondence.

Pope, in his Epistle to him on the Use of Riches, thus addresses him:

The sense to value riches, with the art
To enjoy them, and the virtue to impart;
To balance fortune by a just expence,
Join with œconomy magnificence,
With splendor, charity, with plenty, health;
O teach us, Bathurst, yet unspoil'd by wealth!
That secret rare, between th' extremes to move,
Of mad good nature, and of mean self-love.

And Sterne, in his Letters to Eliza, thus speaks of him:

"This nobleman (says he) is an old friend of mine: he was always the protector of men of wit and genius; and has had those of the last century always at his table. The manner in which his notice began of me, was as singular as it was polite.—He came up to me one day, as I was at the Princess of Wales's court, 'I want to know you, Mr Sterne; but it is fit you should know also who it is that wishes this pleasure: you have heard (continued he) of an old Lord Bathurst, of whom your Pops and Swifts have sung and spoken so much: I have lived my life with geniuses of that cast, but have survived them; and despairing ever to find their equals, it is some years since I have closed my accounts, and shut up my books, with thoughts of never opening them again: but you have kindled a desire in me of opening them once more before I die, which I now do; so go home, and dine with me.' This nobleman, I say, is a prodigy: for at 85 he has all the wit and promptness of a man of 30; a disposition to be pleased, and a power to please others beyond what-

Batmanfon.

ever I knew! added to which, a man of learning, courtesy, and feeling."

His Lordship, in the latter part of his life, preserved his natural cheerfulness and vivacity, always accessible, hospitable, and beneficent. Lately he delighted in rural amusements; and enjoyed, with a philosophical satisfaction, the shade of the lofty trees he had planted himself. Till within a month of his death he constantly rode out on horseback two hours before dinner, and constantly drank his bottle of Claret or Madeira after dinner. He used to declare, in a jocular manner, he never could think of adopting Dr Cadogan's method, as Dr Cheyne had assured him, 50 years ago, he would never live seven years longer unless he abridged himself of his wine. Pursuant to this maxim, his Lordship having, about four years ago, invited several of his friends to spend a few cheerful days with him at his seat at Cirencester, and being one evening very loth to part with them; on his son the present chancellor's objecting to their sitting up any longer, and adding, that health and long life were best secured by regularity; he suffered him to retire: but, as soon as he was gone, the cheerful father said, "Come, my good friends, since the old gentleman is gone to bed, I think we may venture to crack another bottle."

His Lordship was advanced to the dignity of Earl in 1772; and lived to see the above nobleman, his eldest son, several years Lord High Chancellor of Great Britain, and promoted to the peerage in 1771 by the title of Baron Apsley. Lord Bathurst married Catherine daughter of Sir Peter Apsley, by whom he had two other sons, and five daughters. His death happened, after a few days illness, at his seat near Cirencester, in the 91st year of his age, and on the 16th of September 1775.

BATHYLLUS and **PYLADES**, inventors of pantomime entertainments on the stage. Bathyllus succeeded in representing comedy; Pylades, in tragedy. The art consisted in expressing the passions by gestures, attitudes, and dumb shew; not, as in modern times, in machinery, and the fooleries of Harlequin. They flourished at Rome, under Augustus, about A. D. 10. Each of them kept scholars, who perpetuated their master's name: for the followers of Bathyllus, who excelled in the comic part, called themselves *Bathylli*; and those of Pylades, who excelled in the tragic, called themselves *Pyladeæ*.

BATMAN, in commerce, a kind of weight used at Smyrna, containing six ounces of 400 drams each, which amount to 16 pounds six ounces and 15 drams of English weight.

BATMANSON (John), prior of the Carthusian monastery, or Charter-house in the suburbs of London. He was some time a student at Oxford, but it does not appear that he took any degree in that university. He was intimately acquainted with Edward Lee archbishop of York, at whose request he wrote against Erasmus and Luther. He died in the year 1531, and was buried in the chapel belonging to the charter-house. According to Bale, he was a proud forward person; and he says that Erasmus, in one of his letters to the bishop of Winchester, calls him an ignorant fellow. Pits, on the contrary, gives him the character of a man of singular genius, zeal, piety, and learning. He wrote 1. *Animadversiones in annotationes*

Erasmii in Nov. Testamentum. 2. A Treatise against some of Luther's works. These two he afterwards retracted. 3. Commentaria in proverbis Solomonis. 4. In cantica canticorum. 5. De unica Magdalena. 6. Institutiones noviciorum. 7. De contemptu mundi. 8. De Christo duodenni. 9. On the words, missus est, &c.

BATON, or **BASTON**. See **BASTON**.

BATRACHOMYOMACHIA, the battle of the frogs and the mice, the title of a fine burlesque poem generally ascribed to Homer.—The subject of the work is the death of Pylcharpax, a mouse, fon to Toxartes, who, being mounted on the back of Phylgignathus, a frog, on a voyage to her palace, to which he had invited him, was seized with fear when he saw himself in the middle of the pond, so that he tumbled off and was drowned. Phylgignathus being suspected to have shaken him off with design, the mice demanded satisfaction, and unanimously declared war against the frogs.

BATTAË, (anc. geog.), a people of Germany, formerly inhabitants of what is now called *Hesse*. Being dissatisfied with their situation there, they settled on the island formed by the Vahalis and Rhine, which from them took the name of *Batavia*, or *Batacorum Insula*. Their government was a mixture of monarchy, aristocracy, and democracy. Their chief was, properly speaking, nothing more than a principal citizen, whose business was rather to advise than to command. The principal men who exercised jurisdiction, and commanded the troops, in their respective districts, were chosen, as well as the kings, in an assembly of the people. A hundred persons selected from among the people presided over every county, and acted as chiefs in the different hamlets. The whole nation was, in some measure, an army always in readiness. Each family composed a body of militia, which served under a captain of their own choosing. See **BATAVORUM Insula**.

BATTALIA, an army ranged in order of battle, or ready for engagement. The word seems formed from the Latin *batalia*, sometimes also written *batalia*, denoting a sort of military or gladiatorial exercise, as fighting with foils, or tilting at a post. In this sense, we meet with the depth of a *battalia*; to march in *battalia*, with the baggage in the middle; to break the *battalia*, &c. In the Roman *battalia*, the *hastati* made the front.

BATTALION, a small body of infantry, ranged in form of battle, and ready to engage.

A battalion usually contains from 500 to 800 men; but the number it consists of is not determined. They are armed with firelocks, swords, and bayonets: and divided into 13 companies, one of which is grenadiers. They are usually drawn up three men deep. Some regiments consist of but one battalion, others are divided into four or five.

BATTATAS, the Indian name of the potatoe. See **LYCOPERSICON**.

BATTEL, a town of Suffex, five miles north-west of Hastings, situated in E. Long. 0. 35. N. Lat. 50. 55. It was formerly called *Epiton*; and is the place where William the Conqueror vanquished Harold king of England on October 14th 1066. William, in memory of this victory, erected an abbey, which he called *Battle Abbey*; and if a criminal could but reach this abbey, he was dismissed from thence, and was afterwards in no danger for his past faults. The abbey was a large and noble

noble structure, as may be judged by the gateway which is still entire, as well as from the other remains.

BATTEL, in law, or *Trial by wager of Battel*, a species of trial of great antiquity, but now much disused*. It seems to have owed its original to the military spirit of our ancestors, joined to a superstitious frame of mind; it being in the nature of an appeal to Providence, under an apprehension and hope (however presumptuous and unwarrantable) that heaven would give the victory to him who had the right. The decision of suits, by this appeal to the God of battels, is by some said to have been invented by the Burgundi, one of the northern or German clans that platted themselves in Gaul. And it is true, that the first written injunction of judiciary combats that we meet with, is in the laws of Gundebald, A. D. 501, which are preserved in the Burgundian code. Yet it does not seem to have been merely a local custom of this or that particular tribe, but to have been the common usage of all those warlike people from the earliest times. And it may also seem, from a passage in Velleius Paterculus, that the Germans, when first they became known to the Romans, were wont to decide all contents of right by the sword: for when Quintilius Varus endeavoured to introduce among them the Roman laws and method of trial, it was looked upon (says the historian) as a *novitarius incognita disciplina, ut solita armis decerni jure terminarentur*. And among the ancient Goths in Sweden we find the practice of judiciary duels established upon much the same footing as they formerly were in our own country.

This trial was introduced in England among other Norman customs by William the conqueror; but was only used in three cases, one military, one criminal, and the third civil. The first in the court-martial, or court of chivalry and honour; the second in appeals of felony; and the third upon issue joined in a writ of right, the last and most solemn decision of real property. For in writs of right the *jus proprietatis*, which is frequently a matter of difficulty, is in question; but other real actions being merely questions of the *jus possessionis*, which are usually more plain and obvious, our ancestors did not in them appeal to the decision of Providence. Another pretext for allowing it, upon these final writs of right, was also for the sake of such claimants as might have the true right, but yet by the death of witnesses or other defect of evidence be unable to prove it to a jury. But the most curious reason of all is given in the Mirror, that it is allowable upon warrant of the combat between David for the people of Israel of the one party, and Goliath for the Philistines of the other party: a reason which pope Nicholas I. very seriously decides to be inconclusive. Of battel therefore on a writ of right we shall first speak: and although the writ of right itself, and of course this trial thereof, be at present disused; yet, as it is law at this day, it may be matter of curiosity, at least, to inquire into the forms of this proceeding, as we may gather them from ancient authors.

1. The last trial by battel that was waged in the court of common pleas at Westminster (though there was afterwards one in the court of chivalry in 1631, and another in the county palatine of Durham in 1638) was in the 13th year of queen Elizabeth, A. D. 1571, as reported by Sir James Dyer; and was held in Tot-

hill-fields, Westminster, “*non sine magna juris consultorum perturbatione*,” saith Sir Henry Spelman, who was himself a witness of the ceremony. The form, as appears from the authors before cited, is as follows.

When the tenant in a writ of right pleads the general issue, *viz.* that he hath more right to hold, than the demandant hath to recover; and offers to prove it by the body of his champion, which tender is accepted by the demandant; the tenant in the first place must produce his champion, who, by throwing down his glove as a gage or pledge, thus wages or stipulates battel with the champion of the demandant; who, by taking up the gage or glove, stipulates on his part to accept the challenge. The reason why it is waged by champions, and not by the parties themselves, in civil actions, is because, if any party to the suit dies, the suit must abate and be at an end for the present; and therefore no judgment could be given for the lands in question, if either of the parties were slain in battel: and also that no person might claim an exemption from this trial, as was allowed in criminal cases, where the battel was waged in person.

A piece of ground is then in due time set out, of 60 feet square, enclosed with lifts, and on one side a court erected for the judges of the court of common pleas, who attend there in their scarlet robes; and also a bar is prepared for the learned serjeants at law. When the court sits, which ought to be by sunrising, proclamation is made for the parties, and their champions; who are introduced by two knights, and are dressed in a coat of armour, with red sandals, barelegged from the knee downwards, barcheaded, and with bare arms to the elbows. The weapons allowed them are only batons, or staves, of an ell long, and a four-cornered leather target; so that death very seldom ensued this civil combat. In the court military, indeed, they fought with sword and lance, according to Spelman and Rushworth; as likewise in France, only villeins fought with the buckler and baton, gentlemen armed at all points. And upon this, and other circumstances, the president Montequieu hath with great ingenuity not only deduced the impious custom of private duels upon imaginary points of honour, but hath also traced the heroic madness of knight errantry from the same original of judicial combats. But to proceed:

When the champions, thus armed with batons, arrive within the lifts or place of combat, the champion of the tenant then takes his adversary by the hand, and makes oath that the tenements in dispute are not the right of the demandant; and the champion of the demandant, then taking the other by the hand, swears in the same manner that they are; so that each champion is, or ought to be, thoroughly persuaded of the truth of the cause he fights for. Next an oath against forcery and enchantment is to be taken by both the champions, in this or a similar form: “Hear this, ye justices, that I have this day neither eat, drank, nor have upon me neither bone, stone, nor grass; nor any enchantment, forcery, or witchcraft, whereby the law of God may be abused, or the law of the devil exalted. So help me God and his saints.”

The battel is thus begun, and the combatants are bound to fight till the stars appear in the evening; and, if the champion of the tenant can defend himself till the stars appear, the tenant shall prevail in his cause; fer

Battel. for it is sufficient for him to maintain his ground, and make it a drawn battel, he being already in possession; but, if victory declares itself for either party, for him is judgment finally given. This victory may arise, from the death of either of the champions: which indeed hath rarely happened; the whole ceremony, to say the truth, bearing a near resemblance to certain rural athletic diversions, which are probably derived from this original. Or victory is obtained, if either champion proves *recreant*, that is, yields, and pronounces the horrible hath rarely happened; the whole ceremony, to say the truth, bearing a near resemblance to certain rural athletic diversions, which are probably derived from this original. Or victory is obtained, if either champion proves *recreant*, that is, yields, and pronounces the horrible word of *craven*; a word of disgrace and obloquy, rather than of any determinate meaning. But a horrible word it indeed is to the vanquished champion: since, as a punishment to him for forfeiting the land of his principal by pronouncing that shameful word, he is condemned, as a recreant, *amittere liberam legem*, that is, to become infamous, and not be accounted *liber et legalis homo*; being supposed by the event to be proved forsworn, and therefore never to be put upon a jury or admitted as a witness in any cause.

This is the form of a trial by battel; a trial which the tenant, or defendant in a writ of right, has it in his election at this day to demand; and which was the only election of such writ of right after the conquest, till Henry II. by consent of parliament introduced the *grand assise*, a peculiar species of trial by jury, in concurrence therewith; giving the tenant his choice of either the one or the other. Which example, of discontenancing these judicial combats, was imitated about a century afterwards in France, by an edict of Louis the Pious, A. D. 1260, and soon after by the rest of Europe. The establishment of this alternative, Glanvil, chief justice to Henry II. and probably his adviser herein, considers as a most noble improvement, as in fact it was, of the law.

2. In appeals* of felony, the trial by battel may be demanded, at the election of the appellee, in either an appeal or an approvement; and it is carried on with equal solemnity as that on a writ of right; but with this difference, that there each party hires a champion, but here they must fight in their proper persons. And therefore, if the appellant or approver be a woman, a priest, an infant, or of the age of 60, or lame, or blind, he or she may counterplead and refuse the wager of battel; and compel the appellee to put himself upon the country. Also peers of the realm, bringing an appeal, shall not be challenged to wage battel, on account of the dignity of their persons; nor the citizens of London, by special charter, because fighting seems foreign to their education and employment. So likewise, if the crime be notorious; as if the thief be taken with the *mainour*, or the murderer in the room with a bloody knife, the appellant may refuse the tender of battel from the appellee; and it is unreasonable an innocent man should stake his life against one who is already half-convicted.

The form and manner of waging battel upon appeals are much the same as upon a writ of right; only the oaths of the two combatants are vastly more striking and solemn. The appellee, when appealed of felony, pleads *not guilty*; and throws down his glove, and declares he will defend the same by his body: the appellant takes up the glove; and replies that he is ready to make good the appeal, body for body. And thereupon, the appellee taking the book in his right hand,

and in his left the right hand of his antagonist, swears to this effect: *Hoc audi, homo, quem per manum teneo, &c.* "Hear this, O man, whom I hold by the hand, who callest thyself *John* by the name of baptism, that I, who call myself *Thomas* by the name of baptism, did not feloniously murder thy father, *William* by name, nor am any way guilty of the said felony. So help me God, and the saints; and this I will defend against thee by my body, as this court shall award." To which the appellant replies, holding the bible and his antagonist's hand in the same manner as the other: "Hear this, O man whom I hold by the hand, who callest thyself *Thomas* by the name of baptism, that thou art perjured; and therefore perjured, because that thou feloniously didst murder my father, *William* by name. So help me God, and the saints; and this I will prove against thee by my body, as this court shall award." The battel is then to be fought, with the same weapons, *viz.* batons, the same solemnity, and the same oath against amulets and sorcery, that are used in the civil combat; and if the appellee be so far vanquished that he cannot or will not fight any longer, he shall be adjudged to be hanged immediately; and then, as well as if he be killed in battel, Providence is deemed to have determined in favour of the truth, and his blood shall be attained. But if he kills the appellant, or can maintain the fight from sunrising till the stars appear in the evening, he shall be acquitted. So also, if the appellant becomes recreant, and pronounces the horrible word *craven*, he shall lose his *liberam legem*, and become infamous; and the appellee shall recover his damages, and also be for ever quit, not only of the appeal, but of all indictments likewise for the same offence.

BATTEN, a name that workmen give to a scantling of wooden stuff, from two to four inches broad, and about one inch thick; the length is pretty considerable, but undetermined.—This term is chiefly used in speaking of doors and windows of shops, &c. which are not framed of whole deal, &c. with files, rails, and panels like wainscot; but are made to appear as if they were, by means of these battens, bradded on the plain board round the edges, and sometimes cross them, and up and down.

BATTENBURG, a town of Dutch Guelderland, seated on the north banks of the Meuse, almost opposite to Ravenstein. E. Long. 5. 35. N. Lat. 50. 55.

BATTERING, the attacking a place, work, or the like, with heavy artillery.

To batter in breach, is to play furiously on a work, as the angle of a half-moon, in order to demolish and make a gap therein. In this they observe never to fire a piece at the top, but all at the bottom, from three to six feet from the ground.

The battery of a camp is usually surrounded with a trench, and pallisadoes at the bottom, with two redoubts on the wings, or certain places of arms, capable of covering the troops which are appointed for their defence. See **BATTERY**.

BATTERING-RAM, in antiquity, a military engine used to batter and beat down the walls of places besieged. It is said to have been invented by Arctemanes of Clazomene, a Greek architect who flourished 441 B. C.—The machine is thus described by Josephus: It is a vast beam, like the mast of a ship, strengthened

* See App. 2^{ca}.

ing, at the one end with a head of iron, something resembling that of a ram, whence it took its name.

This was hung by the middle with ropes to another beam, which lay across two posts; and hanging thus equally balanced, it was by a great number of men drawn backwards and pushed forwards, striking the wall with its iron head. But this engine did most execution when it was mounted on wheels, which is said to have been first done at the siege of Byzantium under Philip of Macedon.

Plutarch informs us, that Marc Anthony, in the Parthian war, made use of a ram fourscore feet long; and Vitruvius tells us, that they were sometimes 106, and sometimes 120, feet in length; and to this perhaps the force and strength of the engine was in a great measure owing. The ram was managed at one time by a whole century of soldiers; and they being spent, were seconded by another century, so that it played continually without any intermission.

Plate LVII. fig. 1. represents the battering-ram suspended. 2, The ram. 3, The form of its head, fastened to the enormous beam by three or four bands of iron, four feet in breadth. At the extremity of each of these bands (4) was a chain (5) of the same metal, one end of which was fastened to a hook (6), and at the other extremity of each of these chains was a cable firmly bound to the last link. These cables ran the whole length of the beam to the end of the ram (7), where they were all bound together as fast as possible with small ropes. To the end of these cables another was fixed, composed of several strong cords platted together to a certain length, and then running single (8). At each of these several men were placed, to balance and work the machine. 10, The chain or cable by which it hung to the cross beam (11), fixed on the top of the frame. 12, The base of the machine.—The unsuspended ram differed from this only in the manner of working it: for, instead of being slung by a chain or cable, it moved on small wheels on another large beam.

BATTERING-Rams, in heraldry, a bearing, or coat of arms, resembling the military engine of the same name.

BATTERY, in the military art, a parapet thrown up to cover the gunners, and men employed about the guns, from the enemy's shot. This parapet is cut into embrasures, for the cannon to fire through. The height of the embrasures, on the inside, is about three feet; but they go sloping lower to the outside. Their wideness is two or three feet, but open to fix or seven on the outside. The mass of earth that is betwixt two embrasures, is called the *merlon*. The platform of a battery is a floor of planks and sleepers, to keep the wheels of the guns from sinking into the earth; and is always made sloping towards the embrasures, both to hinder there verse, and to facilitate the bringing back of the gun.

BATTERY of Mortars differs from a battery of guns; for it is sunk into the ground, and has no embrasures.

Cross-BATTERIES are two batteries, which play athwart one another upon the same object, forming there an angle, and beating with more violence and destruction; because what one bullet shakes, the other beats down.

BATTERY sunk or buried, is when its platform is sunk, or let down into the ground, so that there must be trenches cut in the earth, against the muzzles of the

guns, for them to fire out at, and to serve for embrasures.

BATTERY d' Enfilade, is one that scours or sweeps the whole length of a straight line.

BATTERY en Echarpe is that which plays obliquely.

BATTERY de Reverse, that which plays upon the enemy's back.

Camerade BATTERY is when several guns play at the same time upon one place.

BATTERY, in law, is the unlawful beating of another. The least touching of another's person wilfully, or in anger, is a battery: for the law cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it; every man's person being sacred, and no other having a right to meddle with it, in any the slightest manner. And therefore, upon a similar principle, the Cornelian law *de injuriis* prohibited *pulsation* as well as *verberation*; distinguishing verberation, which was accompanied with pain, from pulsation which was attended with none. But battery is, in some cases, justifiable or lawful; as where one who hath authority, a parent or master, gives moderate correction to his child, his scholar, or his apprentice. So also on the principle of self-defence: for if one strikes me first, or even only assaults me, I may strict in my own defence; and, if sued for it, may plead *son assault demesne*, or that it was the plaintiff's own original assault that occasioned it. So likewise in defence of my goods or possession, if a man endeavours to deprive me of them, I may justify laying hands upon him to prevent him; and in case he persists with violence, I may proceed to beat him away. Thus too in the exercise of an office, as that of church-warden or beadle, a man may lay hands upon another to turn him out of church, and prevent his disturbing the congregation. And, if sued for this or the like battery, he may set forth the whole case, and plead that he laid hands upon him gently, *molliter manus imposuit*, for this purpose. On account of these causes of justification, battery is defined to be the unlawful beating of another; for which the remedy is, as for assault, by action of *trepas vi et armis*: wherein the jury will give adequate damages.

BATTISTA (Franco), a celebrated painter, born at Venice, was one of the disciples of Michael Angelo, whose manner he followed so closely, that, in the correctness of his out-lines, he surpassed most of the masters of his time. His paintings are pretty numerous, and dispersed all over Italy, and other parts of Europe; but his colouring being very dry, they are not much more esteemed than the prints etched by his hand. He died in 1561.

BATTLE, a general engagement between two armies, in a country sufficiently open for them to encounter in front and at the same time. The word is also written *battel*, *battell*, and *battail*. It is formed from the French *bataille*, of the Latin verb *battuere*, to fence, or exercise with arms: whence *batalia*, and *batalia*, which properly denoted the action or exercise of those who learned to fence, and who were hence also denominated *batuatores*.

The ancients never joined battle without much ceremony and preparation; as taking auguries, offering sacrifices, haranguing the soldiers, giving the word or a *tessera*, &c. The signals of battle were,

founding the *classeum* or general charge, and displaying a peculiar flag called by Plutarch a *purple robe*. To which may be added, singing psalms, raising military shouts, and the like. A Roman legion, ranged in order of battle, consisted of *hastati*, placed in the front; of *principes*, who were all old experienced soldiers, placed behind the former; and of *triarii*, heavy armed with large bucklers, behind the *principes*. The *hastati* were ranked close; the ranks of the *principes* were much opener, so that they could receive the *hastati*; and those of the *triarii* opener still, inasmuch that they could receive both the *principes* and the *hastati* within them, without any disorder, and still facing the enemy. When therefore the *hastati* found themselves unable to stand the enemy's charge, they retired gently within the *principes*, where joining with them, they renewed the combat. If these found themselves too weak to sustain the enemy, both retired among the *triarii*, where rallying, they formed a new corps, and charged with more vigour than ever. If these failed, the battle was lost; the Romans had no further resource. The moderns are unacquainted with this method of inserting or embattling one company into another; without which the former cannot be well succoured or defended, and their places taken by others; which was a thing the Romans practised with great exactness. For the *velites*, and in later times the archers and slingers, were not drawn up in this regular manner, but either disposed of before the front of the *hastati*, or scattered up and down among the void spaces of the *hastati*, or sometimes placed in two bodies in the wings. These always began the combat, skirmishing in flying parties with the foremost troops of the enemy. If they were repulsed, which was usually the case, they fell back to the flanks of the army, or retired again in the rear. When they retired, the *hastati* advanced to the charge. As to the cavalry, it was posted at the two corners of the army, like the wings on a body; and fought sometimes on foot, sometimes on horseback. The auxiliary forces composed the two points of the battle, and covered the whole body of the Romans.—Other less usual forms of battle among the Romans were the *cuneus*, or wedge; *globus*, or round form; *forfex*, or pair of shears; *turris*, or an oblong square figure; *ferra*, or saw. The Greeks were inferior to the Romans in marshalling their armies for battle, as they drew up their whole army in a front, and trusted the success of the day to a single force. They had three forms of battle for the horse, viz. the square, the wedge, and the rhombus or diamond form. The first held best for the defensive; the latter for the offensive; the wedge being preferred as bringing most hands to fight.

The Greeks notified the places of their battles and victories by adding the word *Nisi*; whence Nicomedia, Nicopolis, Thessalonica, &c. The ancient Britons did the like, by adding the word *Mais*; whence Maisteveth, Malmaisbury, &c. The English by the word *Field*.—The Romans had their particular days, called *præliares dies*, wherein alone it was lawful to join battle; and others wherein it was unlawful, called *dies atri*. The Athenians, by the ancient laws of their country, were not to draw out their forces for battle till after the seventh day of the month. And Lucian relates of the Lacedæmonians, that, by the laws of Lycurgus,

they were not to fight before full moon. Among the Germans, it was reputed an impiety to fight in the wane of the moon; and Cæsar tells us, that Ariovistus was beaten by him, because, contrary to the laws of his country, he had fought when the moon was in her wane. The German soldiers were intimidated with the apprehension, and afforded Cæsar an easy victory; *acie commissa, impeditos religione hostes vicit*. It is well known that Jerusalem was taken by Pompey in an attack on the sabbath-day, when, by the Jewish superstitious notions, they were not allowed to fight, or even to defend themselves. The Romans did not carry their superstition so far: their *atri dies* were only observed in respect of attacking; no day was too holy for them to defend themselves in. Among the ancients, we find frequent instances of battles in the night: it was by the moonlight that Pompey beat Mithridates, and Scipio, Afrubal and Syphax.

The first pitched battle, of which we have any distinct account, is that between Cræsus and Cyrus, described by Xenophon, concerning which we have a dissertation expressly by M. Freret, wherein several points of the ancient tactics are well explained. In the modern war, we find few pitched or set battles: the chief view of the great commanders of late days is rather to harass or starve the enemy by frequent alarms, cutting off his provisions, carrying off his baggage, seizing his posts, &c. than to join issue with him, and put the whole on the event of one day; a battle generally deciding the fate of a campaign, sometimes of a whole war. Hence it is a rule, never to venture a general battle, unless either you fight to advantage, or be forced to it. Joining or giving battle should always be by design: a general should never suffer himself to be forced to fight. All the measures, movements, encampments, he makes, are to lead to the execution of his great design, which is to fight to advantage, till, by some mistake of the enemy, he at length find the favourable opportunity. It is in this that a superior genius will at length prevail over an inferior: in the course of a campaign, he will take a number of advantages over him, which, together, are equivalent to a battle, the event of which is ever doubtful.

BATTLE-AXE, an ancient military weapon. Axes were a principal part of the offensive armour of the Celts. At the siege of the Roman Capitol by the Gauls under Brennus, we find one of the most distinguished of their warriors armed with a battle-axe. And Ammiannus Marcellinus, many centuries afterwards describing a body of Gauls, furnishes them all with battle axes and swords. Some of these weapons have been found in the sepulchres of the Britons, on the downs of Wiltshire and in the north of Scotland. Within these four or five centuries the Irish went constantly armed with an axe. And the axe of Lochaber hath remained a formidable implement of destruction in the hands of our Highlanders, even nearly to the present period.

BATTLEMENTS, in architecture, are indentures or notches in the top of a wall or other building, in the form of embrasures, for the sake of looking thro' them.

BATTOLOGY, in grammar, a superfluous repetition of some words or things.

BATUA, **ΒΥΤΥΑ**, *Buthoe*, or *Buthoece*, (anc. geog.),

a town of Dalmatia, situated on the Adriatic: now *Bu-
doa*; which see.

BATZ, a copper coin mixed with some silver, and current at different rates, according to the alloy, in Nuremberg, Basil, Fribourg, Lucerne, and other cities of Germany and Switzerland.

BAVARIA, a duchy and electorate of Germany. This duchy was formerly a kingdom, which extended from the mountains of Franconia to the frontiers of Hungary and the Adriatic Gulph. It comprehended the countries of Tirol, Carinthia, Carniola, Stiria, Austria, and other states, which are now fallen to different princes. At present it is bounded on the east by Bohemia and Austria, on the west by Suabia, on the north by Franconia, and on the south by Tirol. But the duke of Bavaria is not absolute master of all this country; for within its bounds are situated many free cities, among which is Ratibon, and several lordships both ecclesiastical and secular. It is divided into Upper and Lower Bavaria; and these two provinces consist of twelve counties, which formerly sufficed to make a duchy, according to the laws of Franconia. The country is watered by five navigable rivers, besides several smaller ones, and 16 lakes.—It contains 35 cities, of which Munich is the capital; 94 towns; 720 castles; 4700 villages; eight great abbeys; and 75 cloisters or monasteries, besides those of the mendicants.—It is divided into four great bailliages called *governments*. These are Munich, Landshut, Straubing, and Burkhaußen. The principal cities are Ingolstadt, Donaert, Landberg, Freiberg, Straubingen, Wilshausen, Wasserberg, Eling, Rain, &c.

Besides these two provinces, the duke of Bavaria possesses the upper palatinate of Westphalia, which has been united to Bavaria, and comprehends several counties, cities, towns, and villages. On the other side of this province is *Chamb*, the chief city of the county of the same name, belonging likewise to the duke of Bavaria. He also possesses the landgraviate of Leichtenberg, which fell to him by the death of Maximilian Adam, in consequence of family pacts made between the house of Bavaria and that of Leichtenberg for their mutual succession. In 1567, the county of Kaag fell to the duke of Bavaria by the death of Ladislaus the last count of that name. There are likewise family pacts of mutual succession established betwixt the house of Bavaria and the Palatine of the Rhine.—The inhabitants of this country are strong and laborious, exercising themselves in shooting with rifled muskets at a mark, in order to render themselves more expert in war.

The house of Bavaria is universally allowed to be one of the most ancient in Germany. The counts of *Scheyren*, whose castle at present is a cloister, gave them the name. At that place are shewn the tombs of more than 26 lords of Scheyren. The emperor Otho I. established as counts-palatine of Bavaria and landgraves of Scheyren, Arnolph and Herman, sons of Arnolph brother to the duke of Berchtold of Carinthia, marquis of the county upon the Ens. After the death of Berchtold, the same emperor, instead of giving Bavaria to his son, gave it to duke Henry his brother, who had married Judith sister to Arnolph and Herman. This duke Henry of Bavaria, had, by his marriage, Henry Hezillon, who was succeeded by his son Henry, afterwards chosen emperor by the name of Henry II.

This emperor having no children by Saint Cunegond his wife, Bavaria passed again to the family of Franconia, and afterwards to that of Suabia, under Henry IV. who possessed it till the year 1071, when this last emperor gave that county to count Wolf, or Guelph, of Ravensburg in Suabia. To this Guelph, who died in the island of Cyprus, succeeded Guelph II. and to him his brother duke Henry IX. who was succeeded by his son Henry the Proud. This last had married the only daughter of the emperor Lotharius, and after the death of his father-in-law, became also duke of Saxony; but refusing to deliver up the imperial ornaments of his father-in-law to the emperor Conrad III. duke of Suabia, or to acknowledge him for emperor, he was put to the ban of the empire, and lost his states. After the death of Henry, Conrad made his brother Leopold marquis of Austria, and duke of Bavaria; who, dying without issue, was succeeded by his brother Henry XI. whom the emperor Frederic I. made duke of Austria, joining together the two counties above and below the Ens, and declaring them free and independent of the government of Bavaria. The same emperor gave Bavaria thus dismembered, with Saxony, to Henry the Lion, son of Henry the Proud. But Henry the Lion afterwards losing the favour of this emperor, was put to the ban of the empire; and lost all his possessions except Brunswick and Lunenburg, which still remain to his descendants. In 1180, the duchy of Bavaria was given by the emperor to Otho the Landgrave of Witelzbach, count Palatine of the house of Bavaria. In the time of this Otho, the castle of Scheyren was changed into a monastery in which the duke was buried. From him are descended the two great families that remain to this day in Germany; viz. the counts Palatine of the Rhine, and the present electors of Bavaria.

BAVAY, a small town of the province of Hainault in French Flanders; which has been often ruined by the wars of the low countries. E. Long. 3. 45. N. Lat. 50. 25.

BAUCIS, in fabulous history, an old woman who lived with Philemon her husband in a cottage in Phrygia. Jupiter and Mercury, travelling over that country, were well received by them, after having been refused entertainment by every body else. To punish the people for their inhumanity, these gods laid the country waste with water; but took Baucis and Philemon with them to the top of a mountain, where they saw the deluge, and their own little hut above the waters, turned into a temple: having a wish granted them, they desired to officiate in this temple as priest and priestess, and also that they might die both together; which was granted them.

BAUCONICA, (anc. geog.), a town of the Vangiones in Gallia Belgica; nine miles from Mogontiacum, and eleven from Borbitomagus; and therefore supposed to be *Oppenheim*, a town in the Palatinate of the Rhine, and situated on that river*.

BAUDELLOT (Charles Cæsar), a learned advocate in the parliament of Paris, distinguished himself by his skill in ancient monuments, and was received into the academy of Belles Lettres in 1705. He wrote a Treatise on the Advantages of Travelling; many Letters and Dissertations on Medals, &c.; and died in 1722, aged 74.

Bavaria
||
Baudelot.

* See *Oppenheim*.

BAUDIER (Michael), a gentleman of Languedoc, lived in the reign of Lewis XIII. and published several books, which procured him the character of a copious and laborious author; among which are, 1. An Inventory of the General History of the Turks. 2. The History of the Seraglio. 3. That of the Religion of the Turks. 4. That of the Court of the King of China. 5. The Life of Cardinal Ximenes, &c.

BAUDIUS (Dominic), professor of history in the university of Leyden, born at Lisse, the 8th of August, 1561. He began his studies at Aix la Chapelle, and continued them at Leyden. He removed from thence to Geneva, where he studied divinity: after residing here some time, he returned to Ghent, and from thence to Leyden, where he applied to the civil law, and was admitted doctor of law in June 1585. Soon after his admission, he accompanied the ambassadors from the States to England, and during his residence here became acquainted with several persons of distinction, particularly the famous Sir Philip Sidney. He was admitted advocate at the Hague, the 5th of January, 1587; but being soon tired of the bar, went to travel in France, where he remained 10 years. He was much esteemed in that kingdom, and gained many friends there. Achilles de Harlai, first president of the parliament of Paris, got him to be admitted advocate of the parliament of Paris in the year 1592. In 1602, he went to England with Christopher de Harlai, the president's son, who was sent ambassador to the court of London by Henry the Great. This same year Baudius having been named professor of eloquence at Leyden, went and settled in that university. He read lectures on history after the death of Morula, and was permitted also to do the same on the civil law. In 1611, the States conferred upon him the office of historiographer in conjunction with Meursius; and in consequence thereof he wrote The History of the Truce. Baudius is an elegant prose-writer, as appears from his Letters, many of which were published after his death. He was also an excellent Latin poet: the first edition of his poems was printed in the year 1587; they consist of verses of all the different measures: he published separately a book of iambics in 1591, dedicated to cardinal Bourbon. Some of his poems he dedicated to the king of England; others to the prince of Wales, in the edition of 1607, and went over to England to present them. He died at Leyden in 1613.

BAUDOBRIGA, (anc. geog.), a town of the Treviri in Germany; now *Boppart*, in the electorate of Triers. See *BOPPART*.

BAUDRAND (Michael Anthony), a celebrated geographer, born at Paris, July 18. 1633. He travelled into several countries; and then applied himself to the revival of Ferrarius's Geographical Dictionary, which he enlarged by one-half. He wrote, 1. Notes to Papirius Masso's Description of the Rivers of France. 2. A Geographical and Historical Dictionary. 3. Christian Geography, or an Account of the Archbishopricks and Bishopricks of the whole World; and made several maps. He died at Paris, May 29. 1700.

BAUHIN (John), a great botanist, was born about the middle of the 16th century. He took his doctor's degree in physic, in 1562; and afterwards became principal physician to Frederick duke of Wir-

temberg. The most considerable of his works is his *Universal History of Plants*.

BAUHIN (Caspar, or Gaspar), younger brother to the preceding, was born at Basil, 1550; and distinguished himself by his skill in anatomy and botany. In 1580, he was chosen first professor of these sciences at Basil; and in 1614, was made first professor of physic, and first physician of that city, which he held till his death, which happened in 1623, at the age of 63. He wrote, 1. Anatomical Influxions; 2. *Prodromus Theatri Botanici*; and other works.

BAUGE, a small town of Anjou in France, seated on the River Coesnon. E. Long. 10. N. Lat. 47. 30.

BAUGE, a town of Bresse in France, with the title of a marquise. It is pleasantly situated on a fruitful hill, in E. Long. 4. 54. N. Lat. 46. 20.

BAUHINIA, MOUNTAIN EBONY; (named *Bauhinia* by Father Plumier, in honour of the two famous botanists John and Caspar Bauhins); a genus of the monogynia order, belonging to the decandria class of plants.

Species, 1. The aculeata, with a prickly stalk, is very common in Jamaica, and other American sugar-islands, where it rises to the height of 16 or 18 feet, with a crooked stem, and divides into many irregular branches armed with strong short spines, garnished with compound winged leaves, each having two or three pair of lobes ending with an odd one, which are oblique, blunt, and indented at the top. The stalks are terminated by several long spikes of yellow flowers, which are succeeded by bordered pods about three inches long, containing two or three swelling seeds. These pods are glutinous, and have a strong balsamic scent, as have also the leaves when bruised. It is called in America the *Javin-tree*, from its strong odour somewhat resembling the common fava. 2. The tomentosa, with heart-shaped leaves, is a native of Campeachy; and rises to the height of 12 or 14 feet, with a smooth stem dividing into many branches, garnished with heart-shaped leaves, having two smooth-pointed lobes. The extremity of every branch is terminated by a long spike of yellow flowers, so that when these trees are in flower they make a fine appearance. 3. The acuminata, with oval leaves, is a native of both the Indies; and rises with several pretty strong, upright, smooth stems, sending out many slender branches, garnished with oval leaves deeply divided into two lobes. The flowers come out at the extremities of the branches, three or four in a loose bunch; some of the petals are red, or striped with white, but others are plain upon the same branch; the stamina and style are white, and stand out beyond the petals. These flowers are succeeded by long pods of a dark brown colour, each containing five or six roundish compressed seeds. The wood of this tree is very hard, and veined with black; whence its name of *mountain ebony*. 4. The variegata, with heart-shaped leaves, and lobes joining together; this is likewise a native of both the Indies. It rises with a strong stem upwards of 20 feet high, dividing into many strong branches, garnished with heart-shaped leaves having obtuse lobes which close together. The flowers are large, and grow in loose panicles at the extremity of the branches. They are of a purplish red colour marked with white, and have a yellow bottom. The flowers have a very agreeable scent, and are succeeded

ceeded by compressed pods about six inches long, and three quarters of an inch broad, containing three or four compressed seeds in each. 5. The divaricata, with oval leaves whose lobes spread different ways. This grows naturally in great plenty on the north side of the island of Jamaica. It is a low shrub, seldom rising more than five or six feet high, but divides into several branches garnished with oval leaves dividing into two lobes that spread out from each other. The flowers grow in loose panicles at the end of the branches, have a white colour, and a very agreeable scent. The flowers appear the greatest part of the summer, so the plant is one of the greatest beauties of the hot-house. The flowers are succeeded by taper pods about four inches long, each containing four or five roundish compressed seeds of a dark colour. Besides these, five other species of bauhinia are enumerated, but the above are the most remarkable. All the species of this plant are propagated by seeds, which must be sown on hot-beds, and the plants reared in a bark-house.

BAUM, in botany. See MELISSA.

BAUME (St), a mountain of Provence in France, between Marseilles and Toulon. Here Mary Magdalen is said to have died, on which account it is much frequented.

BAUME-les-Nonnes, a town of Franche Comte, with a rich nunnery, seated on the river Doux, in E. Long. 6. 20. N. Lat. 47. 12. Five miles from this town is a remarkable cavern, whose entrance is 20 paces wide; and after descending 300 paces, the gate of a grotto is seen, twice as large as that of a city. The grotto is 35 paces deep, 60 wide, and is covered with a kind of a vaulted roof, from which water continually drops. There is also a small brook, said to be frozen in summer, but not in winter; and at the bottom are stones that exactly resemble candied citron-peel. When the peasants perceive a mist rising out of this cave, they affirm that it will certainly rain the next day.

BAUMEN, or BAUMAN, a cave of Lower Saxony in Germany, about a mile from Wermigerode, and 18 from Goslar. The entrance is through a rock; and so narrow, that not above one person can pass at a time. There are several paths in it, which the peasants have turned up, in searching for the bones of animals which they fell for unicorn's horns. Some think this cave reaches as far as Goslar; but be this as it will, the skeletons of men have been found in it, who are supposed to have been lost in the turnings and windings.

BAUR (William), an eminent Flemish painter, was born at Strasbourg, and was the disciple of Brendel. He was some time at Rome, where his studies were wholly employed about architecture and landscapes, which prevented his studying the antique. He painted small figures in distemper on vellum. He etched with great spirit. His largest works are in the historical way. He has given us many of the sieges, and battles, which wasted Flanders in the 16th century. They may be exact, and probably they are: but they are rather plans than pictures; and have little to recommend them but historic truth, and the freedom of the execution. His best prints are some characters he has given us of different nations, in which the peculiarities of each are very well preserved. His Ovid is a poor performance. He died at Vienna in 1640.

BAUSK, or БАУТКО, a small but important town

in the duchy of Courland, on the frontiers of Poland, with a strong castle built on a rock. It was taken by the Swedes in 1625, and by the Ruffians in 1705, after a bloody battle between them and the Swedes. It is seated on the river Mufa, in E. Long. 24. 44. N. Lat. 56. 30.

BAUTRY, or BAWTRY, a town in the west riding of Yorkshire, on the road from London to York. It has long been noted for millstones and grindstones brought hither by the river Idle, on which it is seated. W. Long. 1. 0. N. Lat. 53. 27.

BAUTZEN, or BUDISEN, a considerable town of Germany and capital of Upper Lusatia, subject to the elector of Saxony, with a strong citadel. The Protestants as well as Papists have here the free exercise of their religion. E. Long. 14. 42. N. Lat. 51. 10.

BAUX, a town of Provence in France, with the title of a marquise, seated on a rock at the top of which is a strong castle. E. Long. 5. 0. N. Lat. 43. 42.

BAWD, a person who keeps a place of prostitution, or makes a trade of debauching women, and procuring or conducting criminal intrigues. Some think the word is derived from the old French *baude*, bold or impudent; though Vertegnan has a conjecture which would carry it higher, viz. from *bathe* an anciently written *bade*. In which sense *baud* originally imported no more than bath-holder, as if bagnios had anciently been the chief scenes of such prostitution.

The Romans had their male as well as female bawds; the former denominated *lenones* and *proagogi*, among us *panders*; the latter, *lena*. Donatus, speaking of the habits of the ancient characters in comedy, says, *Leno pallii varii coloris utitur*. But the ancient *lenones*, it is to be observed, furnished boys as well as girls for venereal service. Another sort of these merchants or dealers in human flesh, were called *managers*, by the Greeks *ανδραποδισται*, who sold eunuchs, slaves, &c. By a law of Constantine, bawds were to be punished by pouring melted lead down their throats. See the next article.

BAWDY-HOUSE, a house of ill fame, to which lewd persons of both sexes resort, and there have criminal conversation.

The keeping a bawdy-house is a common nuisance, not only on account that it endangers the public peace by drawing together debauched and idle persons, and promoting quarrels, but likewise for its tendency to corrupt the manners of the people. And therefore persons convicted of keeping bawdy-houses, are punishable by fine and imprisonment; also liable to stand in the pillory, and to such other punishment as the court at their discretion shall inflict. Persons resorting to a bawdy-house are likewise punishable, and they may be bound to their good behaviour.—It was always held infamous to keep a bawdy-house; yet some of our historians mention bawdy-houses publicly allowed here in former times till the reign of Hen. 8. and assign the number to be 18 thus allowed on the bank-side in Southwark. See STREWS and BROTHEL.

BAWLING, among sportsmen, is spoke of the dogs when they are too busy before they find the scent good.

BAXTER (Richard), an eminent divine among the nonconformists, was born at Rowton in Shropshire, November 12. 1615; and distinguished himself

by

Baxter.

by his exemplary life, his pacific and moderate principles, and his numerous writings. He was remarkable for his piety, even when he was very young. Upon the opening of the long parliament, he was chosen vicar of Kidderminster. In the heat of the civil wars he withdrew from that town to Coventry, and preached to the garrison and inhabitants. When Oliver Cromwell was made protector, he would by no means comply with his measures, though he preached once before him. He came to London just before the deposing of Richard Cromwell, and preached before the parliament the day before they voted the return of king Charles II. who upon his restoration appointed him one of his chaplains in ordinary. He assisted at the conference in the Savoy, as one of the commissioners for stating the fundamentals in religion, and then drew up a reformed liturgy. He was offered the bishoprick of Hereford; which he refused; affecting no higher preferment than the liberty of continuing minister of Kidderminster; which he could not obtain, for he was not permitted to preach there above twice or thrice after the restoration. Whereupon he returned to London, and preached occasionally about the city, till the act of uniformity took place. During the plague in 1665 he retired into Buckinghamshire; but afterward returned to Acton, where he laid till the act against conventicles expired; and then his audience was so large, that he wanted room. Upon this he was committed to prison; but procuring an habeas corpus, he was discharged. After the indulgence in 1672, he returned to London; and in 1682 he was seized for coming within five miles of a corporation. In 1684 he was seized again; and in the reign of king James II. was committed prisoner to the king's bench, and tried before the lord chief justice Jefferies for his Paraphrase on the New Testament, which was called a *scandalous* and *seditionous* book against the government. He continued in prison two years; from whence he was at last discharged, and had his fine remitted by the king. He died December the 8th, 1691; and was buried in Christ-Church.—He was honoured with the friendship of some of the greatest and best men in the kingdom, (as the earl of Lauderdale, the earl of Balcarras, lord chief justice Hales, Dr Tillotson, &c. and held correspondence with some of the most eminent foreign divines.—He wrote above 120 books, and had above 60 written against him. The former, however, it should seem, were greatly preferable to the latter; since Dr Barrow, an excellent judge, says, that "his practical writings were never mended, his controversial seldom confuted."—Among his most famous works were, 1. The Saints Everlasting Rest. 2. Call to the Unconverted, of which 20,000 were sold in one year; and it was translated not only into all the European languages, but into the Indian tongue. 3. Poor Man's Family Book. 4. Dying Thoughts; and, 5. A Paraphrase on the New Testament. His practical works have been printed in four volumes folio.

BAXTER (William), nephew and heir to the former, was an eminent schoolmaster and critic. He was born at Lanugany in Shropshire, in the year 1650; and it is remarkable, that at the age of 18, when he first went to school, he knew not one letter nor understood one word of any language but Welsh; but he so well improved his time, that he became a person of great and

extensive knowledge. His genius led him chiefly to the study of antiquities and philology, in which he composed several books. The first he published was a Grammar, in 1679, intitled *De Analogia seu Arte Latine Lingue Commentarius*. He also published a new and correct edition of Anacreon, with Notes; an edition of Horace; a Dictionary of the British antiquities, in Latin; and several other books. He was a great master of the ancient British and Irish tongues, was particularly skilled in the Latin and Greek, and in the northern and eastern languages. He died May 31st, 1723, after being above 20 years master of Mercer's School in London.

BAY, in geography, an arm of the sea shooting up into the land and terminating in a nook. It is a kind of lesser gulph bigger than a creek, and is larger in its middle within than at its entrance. The largest and most noted bays in the world are those of Biscay, Bengal, Hudson's, Panama, &c.

BAY denotes likewise a pond-head made to keep in store of water for driving the wheels of the furnace or hammer belonging to an iron mill, by the stream that comes thence through a flood-gate called the *pen-flock*.

BAY-Colour denotes a sort of red inclining to chestnut, chiefly used in speaking of horses. In this sense, the word *bay* is formed from the Latin *baius*, or *badius*, and that from the Greek βαιος, a palm branch; so that *badius* or *bay* properly denotes *color phœniceus*. Hence also, among the ancients, those now called *bay* horses, were denominated *equi palmati*. We have divers sorts and degrees of bays; as a light bay, a dapple bay, &c. All bay horses are said to have black manes; which distinguishes them from sorrels, which have red or white manes.

BAY, among huntsmen, is when the dogs have earthed a vermin, or brought a deer, boar, or the like, to turn head against them. In this case, not only the deer, but the dogs, are said to *bay*. It is dangerous going in to a hart at bay, especially at rutting-time; for then they are fiercest. There are bays at land, and others in the water.

BAY-Tree. See LAURUS.

BAY-Salt. See SALT.

BAYA, or **BAJA**, a town of Lower Hungary, in the county of Bath, situated near the Danube. E. Long. 19. 30. N. Lat. 46. 25.

BAYARD (Peter du Terrail de), esteemed by his contemporaries the model of soldiers and men of honour, and denominated *The knight without fear and without reproach*, was descended from an ancient and noble family in Dauphiné. He was with Charles VIII. at the conquest of the kingdom of Naples; where he gave remarkable proofs of his valour, especially at the battle of Fornoue. He was dangerously wounded at the taking of the city of Brescia; and there restored to the daughters of his host 2000 pistoles, which their mother had directed them to give him in order to prevent the house from being plundered: an action that has been celebrated by many historians. At his return to France, he was made lieutenant-general of Dauphiné. He fought by the side of Francis I. at the battle of Marignan; and that prince afterwards insisted on being knighted by his hand, after the manner of the ancient knights. The chevalier Bayard defended Meziens during six weeks, against Charles V.'s army. In 1524,

at

at the retreat of Rebec † (the general Bonivet having been wounded and obliged to quit the field), the conduct of the rear was committed to the chevalier Bayard, who, though so much a stranger to the arts of a court that he never rose to the chief command, was always called, in times of real danger, to the posts of greatest difficulty and importance. He put himself at the head of the men at arms; and animating them by his presence and example to sustain the whole flock of the enemy's troops, he gained time for the rest of his countrymen to make good their retreat. But in this service he received a wound which he immediately perceived to be mortal; and being unable to continue any longer on horseback, he ordered one of his attendants to place him under a tree, with his face towards the enemy: then fixing his eyes on the guard of his sword, which he held up instead of a cross, he addressed his prayers to God; and in this posture, which became his character both as a soldier and as a Christian, he calmly waited the approach of death. Bourbon, who led the foremost of the enemy's troops, found him in this situation, and expressed regret and pity at the sight. "Pity not me," cried the high-spirited chevalier, "I die as a man of honour ought, in the discharge of my duty: they indeed are objects of pity, who fight against their king, their country, and their oath." The marquis de Pescara, passing soon after, manifested his admiration of Bayard's virtue, as well as his sorrow for his fate, and the generosity of a gallant enemy; and finding that he could not be removed with safety from that spot, ordered a tent to be pitched there, and appointed proper persons to attend him. He died, notwithstanding their care, as his ancestors for several generations had done, in the field of battle. Pescara ordered his body to be embalmed, and sent to his relations; and such was the respect paid to military merit in that age, that the duke of Savoy commanded it to be received with royal honours in all the cities of his dominions: in Dauphiné, Bayard's native country, the people of all ranks came out in a solemn procession to meet it.

BAYEUX, a considerable town of France in Normandy, and capital of Bessin, with a rich bishop's see. The cathedral church is accounted the finest in that province; and its front and three high steeples are said to be the best in France. W. Long. o. 33. N. Lat. 49. 16.

BAYLE (Peter), author of the Historical and Critical Dictionary, was born November 18. 1657, at Carla, a village in the county of Foix, in France, where his father John Bayle was a Protestant minister. In 1666, he went to the Protestant university at Puy-lauroux, where he studied with the greatest application; and in 1669, removed to the university of Toulouse, whither the Protestants at that time frequently sent their children to study under the Jesuits: but here, to the great grief of his father, he embraced the Romish religion; however, being soon sensible of his error, he left that university, and went to study at Geneva. After which he was chosen professor of philosophy at Sedan: but that Protestant university being suppressed by Lewis XIV. in 1681, he was obliged to leave the city; and was soon after chosen professor of philosophy and history at Rotterdam, with a salary of about 45 l. a year. The year following he published

his Letter concerning Comets. And Father Maimbourg having published about this time his History of Calvinism, wherein he endeavours to draw upon the Protestants the contempt and resentment of the Catholics, Mr Bayle wrote a piece to confute his history.

The reputation which he had now acquired, induced the States of Friesland, in 1684, to offer him a professorship in their university; but he wrote them a letter of thanks, and declined the offer. This same year he began to publish his *Nouvelles de la republique des lettres*.

In 1686, he was drawn into a dispute in relation to the famous Christina queen of Sweden. In his Journal for April, he took notice of a printed letter, supposed to have been written by her Swedish majesty to the chevalier de Terlon, wherein she condemns the persecution of the Protestants in France. He inserted the letter itself in his Journal for May, and in that of June following he says, "What we hinted at in our last month, is confirmed to us from day to day, that Christina is the real author of the letter concerning the persecutions in France, which is ascribed to her: it is a remainder of Protestantism." Mr Bayle received an anonymous letter, the author of which says, that he wrote to him of his own accord, being in duty bound to it, as a servant of the queen. He complains that Mr Bayle, speaking of her majesty, called her only *Christina*, without any title; he finds also great fault with his calling the letter "a remainder of Protestantism." He blames him likewise for inserting the words "I am," in the conclusion of the letter. "These words (says this anonymous writer) are not her majesty's; a queen, as she is, cannot employ these words but with regard to a very few persons, and Mr de Terlon is not of that number." Mr Bayle wrote a vindication of himself as to these particulars; with which the author of the anonymous letter declared himself satisfied, excepting what related to "the remainder of Protestantism." He would not admit of the defence with regard to that expression; and, in another letter, advised him to retract that expression. He adds in a postscript, "You mention, in your Journal of August, a second letter of the queen, which you scruple to publish. Her majesty would be glad to see that letter, and you will do a thing agreeable to her if you would send it to her. You might take this opportunity of writing to her majesty. This counsel may be of some use to you; do not neglect it." Mr Bayle took the hint, and wrote a letter to her majesty, dated the 14th of November 1686; to which the queen, on the 14th of December, wrote the following answer:

"Mr Bayle, I have received your excuses; and am willing you should know by this letter, that I am satisfied with them. I am obliged to the zeal of the person who gave you occasion of writing to me; for I am very glad to know you. You express so much respect and affection for me, that I pardon you sincerely; and I would have you know, that nothing gave me offence but that *remainder of Protestantism*, of which you accused me. I am very delicate on that head, because no body can suspect me of it, without lessening my glory, and injuring me in the most sensible manner. You would do well, if you should even acquaint the public with the mistake you have made, and with your regret for it. This is all that remains to be done by you,

Bayle.

you, in order to deserve my being entirely satisfied with you. As to the letter which you have sent me, it is mine without doubt; and since you tell me that it is printed, you will do me a pleasure if you send me some copies of it. As I fear nothing in France, so neither do I fear any thing at Rome. My fortune, my blood, and even my life, are entirely devoted to the service of the church; but I flatter nobody, and will never speak any thing but the truth. I am obliged to those who have been pleased to publish my letter, for I do not at all disguise my sentiments. I thank God, they are too noble and too honourable to be disowned. However, it is not true that this letter was written to one of my ministers. As I have every where enemies, and persons who envy me, so in all places I have friends and servants: and I have possibly as many in France, notwithstanding of the court, as any where in the world. This is purely the truth, and you may regulate yourself accordingly. But you shall not get off so cheap as you imagine. I will enjoin you a penance; which is, that you will henceforth take the trouble of sending me all curious books that shall be published in Latin, French, Spanish, or Italian, on whatever subject or science, provided they are worthy of being looked into; I do not even except romances or fables: and above all, if there are any books of chemistry, I desire you may send them to me as soon as possible. Do not forget likewise to send me your Journal. I shall order that you be paid for whatever you lay out, do but send me an account of it. This will be the most agreeable and most important service that can be done me. May God prosper you.

CHRISTINA ALEXANDRA."

It now only remained that Mr Bayle should acquaint the public with the mistake he had made, in order to merit that prince's entire satisfaction; and this he did in the beginning of his Journal of the month of January, 1687.

The persecution which the Protestants at this time suffered in France affected Mr Bayle extremely. He made occasionally some reflections on their sufferings in his Journal; and he wrote a pamphlet also on the subject. Some time afterward he published his *Commentaire Philosophique* upon these words, "Compel them to come in:" but the great application he gave to this and his other works, threw him into a fit of sickness, which obliged him to discontinue his Literary Journal. Being advised to try a change of air, he left Rotterdam on the 8th of August, and went to Cleves; whence, after having continued some time, he removed to Aix la Chapelle, and from thence returned to Rotterdam on the 18th of October. In the year 1690, the famous book entitled, *Avis aux Réfugiés*, &c. made its appearance. Mr Jurieu, who took Mr Bayle for the author thereof, wrote a piece against it; and he prefixed an advice to the public, wherein he calls Mr Bayle a profane person, and a traitor engaged in a conspiracy against the state. As soon as Mr Bayle had read this libel against him, he went to the grand Schout of Rotterdam, and offered to go to prison, provided his accuser would accompany him, and undergo the punishment he deserved if the accusation was found unjust. He published also an answer to Mr Jurieu's charge; and as his reputation, nay his very life, was at stake in case the accusation of treason was proved, he therefore thought himself not obliged to keep any terms with

his accuser, and attacked him with the utmost severity. Mr Jurieu lost all patience: he applied himself to the magistrates of Amsterdam; who advised him to a reconciliation with Mr Bayle, and enjoined them not to publish any thing against each other till it was examined by Mr Boyer, the pensioner of Rotterdam. But notwithstanding this prohibition, Mr Jurieu attacked Mr Bayle again with so much passion, that he forced him to write a new vindication of himself.

In November 1690, Mr de Beauval advertised in his Journal *A scheme for a Critical Dictionary*. This was the work of Mr Bayle. The articles of the three first letters of the alphabet were already prepared; but a dispute happening betwixt him and Mr de Beauval, obliged him for some time to lay aside the work. Nor did he resume it till May 1692, when he published his scheme: but the public not approving of his plan, he threw it into a different form; and the first volume was published in August 1695, and the second in October following. The work was extremely well received by the public; but it engaged him in fresh disputes, particularly with Mr Jurieu and the abbe Renaudot. Mr Jurieu published a piece, wherein he endeavoured to engage the ecclesiastical assemblies to condemn the dictionary; he presented it to the senate sitting at Delft, but they took no notice of the affair. The consistory of Rotterdam granted Mr Bayle a hearing; and after having heard his answers to their remarks on his dictionary, declared themselves satisfied, and advised him to communicate this to the public. Mr Jurieu made another attempt with the consistory in 1698; and so far he prevailed with them, that they exhorted Mr Bayle to be more cautious with regard to his principles in the second edition of his dictionary; which was published in 1702, with many additions and improvements.

Mr Bayle was a most laborious and indefatigable writer. In one of his letters to Maizeaux, he says, that since his 20th year he hardly remembers to have had any leisure. His intense application contributed perhaps to impair his constitution, for it soon began to decline. He had a decay of the lungs, which weakened him considerably; and as this was a distemper which had cut off several of his family, he judged it to be mortal, and would take no remedies. He died the 28th of December 1706, after he had been writing the greatest part of the day. He wrote several books besides what we have mentioned, many of which were in his own defence against attacks he had received from the abbe Renaudot, Mr Clerc, M. Jaquelot, and others. Among the productions which do honour to the age of Lewis XIV. Mr Voltaire has not omitted the Critical Dictionary of our author: "It is the first work of the kind (he says) in which a man may learn to think." He censures indeed those articles, which contain only a detail of minute facts, as unworthy either of Bale, an understanding reader, or posterity. "In placing him (continues the same author) amongst the writers who do honour to the age of Lewis XIV. notwithstanding his being a refugee in Holland, I only conform to the decree of the parliament of Thoulouse, which, when it declared his will valid in France, notwithstanding the rigour of the laws, expressly said, *that such a man could not be considered as a foreigner.*"

BAYON, a town of France, in Lorraine, seated on the

the river Mofelle. E. Long. 14. 42. N. Lat. 48. 30.
BAYON, or *Bayona*, a town of Galicia, in Spain, seated on a small gulph of the Atlantic ocean, about 12 miles from Tuy. It has a very commodious harbour, and the country about it is fertile. W. Long. 9. 30. N. Lat. 43. 3.

BAYONET, in the military art, a short broad dagger, formerly with a round handle fitted for the bore of a firelock, to be fixed there after the soldier had fired; but they are now made with iron handles and rings, that go over the muzzle of the firelock, and are screw'd fast, so that the soldier fires with his bayonet on the muzzle of his piece, and is ready to act against the horse. This use of the bayonet fastened on the muzzle of the firelock was a great improvement, first introduced by the French, and to which, according to M. Folard, they owed a great part of their victories in the last century; and to the neglect of this in the next succeeding war, and trusting to their fire, the same author attributes most of the losses they sustained. At the siege of Malta, a weapon called *pila ignea* was contrived to oppose the bayonets, being in some measure the converse thereof; as the latter consists of a dagger added to a fire-arm, the former consisted of a fire-arm added to a pilum or pike.

BAYONNE, a city of Gascony, in France; seated near the mouth of the river Adour, which forms a good harbour. It is moderately large, and of great importance. It is divided into three parts. The great town is on this side the river Nive; the little town is between the Nive and the Adour; and the suburbs of Saint Esprit is beyond this last river. Both the former are surrounded with an old wall and a dry ditch, and there is a small castle in each. That of Great Bayonne is flanked with four round towers, and is the place where the governor resides. The new castle is flanked with four towers, in the form of bastions. The first inclosure is covered with another, composed of eight bastions, with a great horn-work, and a half moon; all which are encompassed with a ditch, and a covered way. There is a communication between the city and the suburbs by a bridge, and the suburbs is well fortified. The citadel is seated beyond the Adour, on the side of the suburbs abovementioned. The public buildings have nothing remarkable; it is the only city in the kingdom that has the advantage of two rivers, wherein the tide ebbs and flows. The river Nive is deeper than the Adour, but less rapid, by which means ships come up into the middle of the city. There are two bridges over this river, by which the old and new town communicate with each other. The trade of this town is the more considerable, on account of its neighbourhood to Spain, and the great quantity of wines which are brought hither from the adjacent country. The Dutch carry off a great number of pipes in exchange for spices and other commodities, which they bring thither. The inhabitants have the privilege of guarding two of their three gates, and the third is kept by the king. W. Long. 1. 20. N. Lat. 43. 20.

BAYS, in commerce, a sort of open woollen stuff, having a long nap, sometimes frized, and sometimes not. This stuff is without wale; and is wrought in a loom with two treddles, like flannel. It is chiefly manufactured at Colchester and Bockin in Essex, where there is a hall called the *Dutch-bay hall* or *raw-hall*.

This manufacture was first introduced into England, with that of fays, farges, &c. by the Flemings; who, being persecuted by the duke of Alva for their religion, fled thither about the fifth of Queen Elizabeth's reign; and had afterwards peculiar privileges granted them by act of parliament 12 Charles II. 1660, which the bays-makers in the above places still enjoy.—The exportation of bays was formerly much more considerable than at present when the French have learned to imitate them. However, the English bays are still sent in great quantities to Spain and Portugal, and even to Italy. Their chief use is for dressing the monks and nuns, and for linings, especially in the army. The looking-glass makers also use them behind their glasses, to preserve the tin or quicksilver; and the case-makers, to line their cases. The breadth of bays is commonly a yard and a half, a yard and three quarters, or two yards, by 42 to 48 in length. Those of a yard and three quarters are most proper for the Spanish trade.

BAZADOIS, a province of Guienne in France, which makes part of Lower Gascony. It is a barren heathy country. Its capital is Bazas.

BAZAR, or **BASAR**, a denomination among the Turks and Persians, given to a kind of exchanges, or places where their finest stuffs and other wares are sold. These are also called *bezestins*. The word *bazar* seems of Arabic origin, where it denotes sale, or exchange of goods. Some of the eastern bazars are open, like the market-places in Europe, and serve for the same uses, more particularly for the sale of the bulky and less valuable commodities. Others are covered with lofty ceilings, or even domes, pierced to give light; and it is in these the jewelers, goldsmiths, and other dealers in the richer wares, have their shops. The bazar or maidan of Ispahan, is one of the finest places in Persia, and even surpasses all the exchanges in Europe; yet, notwithstanding its magnificence, it is excelled by the bazar of Tauris, which is the largest that is known, having several times held 30,000 men ranged in order of battle. At Constantinople, there is the old and the new bazar, which are large square buildings, covered with domes, and sustained by arches and pilasters; the former chiefly for arms, harnesses, and the like; the latter for goldsmiths, jewelers, furriers, and all sorts of manufacturers.

BAZAS, a town of Guienne in France, capital of the Bazadois, with a bishop's see. It is built on a rock, in W. Long. 0. 30. N. Lat. 44. 20.

BAZAT, or **BAZA**, in commerce, a long, fine, spun cotton, which comes from Jerusalem, whence it is also called *Jerusalem-cotton*.

BAZGENDGES, in natural history, the name of a substance used by the Turks, and other eastern nations, in their scarlet-dying; they mix it for this purpose with cochineal and tartar, the proportions being two ounces of the bazgendges to one ounce of cochineal. These are generally esteemed a sort of fruit, and are produced on certain trees in Syria and other places; and it is usually supposed, that the scarcity and dearthness of them is the only thing that makes them not used in Europe. But the bazgendges seem to be no other than the horns of the turpentine-tree in the eastern parts of the world; and it is not only in Syria that they are found, but China also affords them. Many things of

Bazadois
 Bazgeniges.

Edellium
||
Beacon.

this kind were sent over to Mr Geoffroy at Paris from China, as the substances used in the scarlet-dying of that country, and they all proved wholly the same with the Syrian and Turkish bazzendges, and with the common turpentine horns. The lentisk, or mastic-tree, is also frequently found producing many horns of a like kind with these, and of the same origin, all being owing to the pucerons, which make their way into the leaves, to breed their young there.

BDELLIUM, a gummy resinous juice, produced by a tree in the East Indies, of which we have no satisfactory account. It is brought into Europe both from the East Indies and Arabia. It is in pieces of different sizes and figures, externally of a dark reddish brown, somewhat like myrrh; internally it is clear, and not unlike to glue; to the taste it is slightly bitterish and pungent; its odour is very agreeable. If held in the mouth, it soon becomes soft and tenacious, sticking to the teeth. Laid on a red-hot iron, it readily catches flame, and burns with a crackling noise, and, in proportion to its goodness, it is more or less fragrant. Near half of its substance dissolves either in water or in spirit of wine; but the tincture made with spirit is somewhat stronger, and by much more agreeable. Vinegar, or verjuice, dissolves it wholly. The simple gum is a better medicine than any preparation from it. It is one the weakest of the decoherent gums, but it is used as a pectoral and an emmenagogue.

BEACHY-HEAD, a promontory on the coast of Sussex, between Hastings and Shoreham, where the French defeated the English and Dutch fleet in 1690.

BEACON, a signal for the better securing the kingdom from foreign invasions. See **SIGNAL**.

On certain eminent places of the country are placed long poles erected, whereon are fastened pitch-barrels to be fired by night, and smoke made by day, to give notice in a few hours to the whole kingdom of an approaching invasion. These are commonly called *beacons*; whence also comes *beaconage* *. We find beacons familiarly in use among the primitive Britons and Western Highlanders. The besieged capital of one of our northern isles, in the third century, actually lighted up a fire upon a tower; and Fingal instantly knew "the green flame edged with smoke" to be a token of attack and distress †. And there are to this day several cairns or heaps of stones upon the heights along the coasts of the Harries, on which the inhabitants used to burn heath as a signal of an approaching enemy.

BEACONS are also marks and signs erected on the coasts, for guiding and preserving vessels at sea, by night as well as by day.

The erection of beacons, light-houses, and sea-marks, is a branch of the royal prerogative. The king hath the exclusive power, by commission under his great seal, to cause them to be erected in fit and convenient places, as well upon the lands of the subject as upon the demesnes of the crown: which power is usually vested by letters patent in the office of lord high admiral. And by statute 8 Eliz. c. 13, the corporation of the trinity-house are impowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or shall take down any steeple, tree, or other known sea-mark, he shall forfeit 100*l.* or, in case of inability to pay it, shall be *ipso facto* outlawed.

BEACONAGE, money paid towards the maintenance of a beacon *.—The word is derived from the Saxon *beacnian*, to nod, or shew by a sign: hence also the word *beckon*.

BEACONSFIELD, a town of Buckinghamshire in England, seated on a hill in the road between London and Oxford. It has several good inns, though not above 100 houses. W. Long. o. 25. N. Lat. 51. 36.

BEAD, a small glass ball, made in imitation of pearl, and used in necklaces, &c.—The Romanists make great use of beads in rehearsing their *Ave-Marias* and *Pater-noster's*; and the like usage is found among both the dervises and other religious throughout the East, as well Mahometan as Heathen. The ancient druids appear also to have had their beads, many of which are still found; at least, if the conjecture of an ingenious author may be admitted, who takes those antique glass globules, having a snake painted round them, and called *adder-beads*, or *snake-buttons*, to have been the beads of our ancient British druids. See **ANGUIS**.

BEAD, in architecture, a round moulding, commonly made upon the edge of a piece of stuff, in the Corinthian and Roman orders, cut or carved in short embossments, like beads in necklaces.

BEAD-Makers, called by the French *paternostriers*, are those employed in the making, stringing, and selling of beads. At Paris there are three companies of paternostriers, or bead-makers; one who make them of glass or crystal; another in wood and horn; and the third in amber, coral, jet, &c.

BEAD-Proof, a term used by our distillers, to express that sort of proof of the standard strength of spirituous liquors, which consists in their having, when shaken in a phial, or poured from on high into a glass, a crown of bubbles, which stand on the surface some time after. This is esteemed a proof that the spirit consists of equal parts of rectified spirits and phlegm. This is a fallacious rule as to the degree of strength in the goods; because any thing that will increase the tenacity of the spirit, will give it this proof, though it be under the due strength. Our malt-distillers spoil the greater part of their goods, by leaving too much of the sinking oil of the malt in their spirit, in order to give it this proof when somewhat under the standard strength. But this is a great deceit on the purchasers of malt spirits, as they have them by this means not only weaker than they ought to be, but sinking with an oil that they are not easily cleared of afterwards. On the other hand, the dealers in brandy, who usually have the art of sophisticating it to a great nicety, are in the right when they buy it by the strongest bead-proof, as the grand mark of the best; for being a proof of the brandy containing a large quantity of its oil, it is, at the same time, a token of its high flavour, and of its being capable of bearing a very large addition of the common spirits of our own produce, without betraying their flavour, or losing its own. We value the French brandy for the quantity of this essential oil of the grape which it contains; and that with good reason, as it is with us principally used for drinking as an agreeably flavoured cordial: but the French themselves, when they want it for any curious purposes, are as careful in the rectifications of it, and take as much pains to clear it from this oil, as we do to free our malt spirit from that nauseous and fetid oil which it originally contains.

BEAD-Roll, among Papists, a list of such persons, for the rest of whose souls they are obliged to repeat a certain number of prayers, which they count by means of their beads.

BEADLE, (from the Saxon *bydel*, a messenger), a crier or messenger of a court, who cites parties to appear and answer. Called also a *summoner* or *apparitor*.—*Beadle* is also an officer at an university, whose chief business is to walk before the masters with a mace, at all public processions.—There are also *church-beadles*, whose office is well known.

BEAGLES, a small sort of hounds or hunting dogs. Beagles are of divers kinds; as the *southern beagle*, something less and shorter, but thicker, than the deep-mouthed hound; the *fleet northern* or *cat beagle*, smaller, and of a finer shape than the southern, and a harder runner. From the two, by crossing the strains, is bred a third sort held preferable to either. To these may be added a still smaller sort of beagles, scarce bigger than lap-dogs, which make pretty diversion in hunting the coney, or even small hare in dry weather; but otherwise unserviceable, by reason of their size.

BEAK, the bill or nib of a bird *.

BEAK, or *Beak-head*, of a ship, that part without the ship, before the fore-castle, which is fastened to the stem, and is supported by the main keel.

The beak, called by the Greeks *εμβολα*, by the Latins *rostrum*, was an important part in the ancient ships of war, which were hence denominated *naves rostratae*. The beak was made of wood; but fortified with brass, and fastened to the prow, serving to annoy the enemies vessels. Its invention is attributed to Piseus an Italian. The first beaks were made long and high; but afterwards a Corinthian, named *Aristo*, contrived to make them short and strong, and placed so low, as to pierce the enemies vessels under water. By the help of these great havock was made by the Syraculians in the Athenian fleet.

BEAKED, in heraldry, a term used to express the beak or bill of a bird. When the beak and legs of a fowl are of a different tincture from the body, we say *beaked and membered of such a tincture*.

BEALE (Mary), particularly distinguished by her skill in painting, was the daughter of Mr Craddock, minister of Waltham upon Thames, and learned the rudiments of her art from Sir Peter Lely. She painted in oil, water-colours, and crayons, and had much business; her portraits were in the Italian style, which she acquired by copying pictures and drawings from Sir Peter Lely's and the royal collections. Her master, says Mr Walpole, was supposed to have had a tender attachment to her; but as he was reserved in communicating to her all the resources of his pencil, it probably was a gallant rather than a successful one. Dr Woodfall wrote several pieces to her honour, under the name of *Belesia*. Mrs Beale died in Pall-mall, on the 28th of December, 1697, aged 65. Her paintings have much nature, but the colouring is stiff and heavy.

BEALT, **BEALTH**, or *Builth*, a town of Brecknockshire in South Wales, pleasantly seated on the river Wye. It consists of about 100 houses, whose inhabitants have a trade in stockings. W. Long. 4. 10. N. Lat. 52. 4.

BEAM, in architecture, the largest piece of wood in a building, which lies cross the walls, and serves to

support the principal rafters of the roof, and into which the feet of these rafters are framed. No building has less than two of these beams, viz. one at each end; and into these the girders of the garret roof are also framed. The proportion of beams in or near London, are fixed by statute, as follows: a beam 15 feet long, must be 7 inches on one side its square, and 5 on the other; if it be 16 feet long, one side must be 8 inches, the other 6, and so proportionably to their lengths. In the country, where wood is more plenty, they usually make their beams stronger.

BEAMS of a Ship are the great main cross-timbers which hold the sides of the ship from falling together, and which also support the decks and orlops: the main beam is next the main-mast, and from it they are reckoned by first, second, third beam, &c. the greatest beam of all is called the *midship beam*.

BEAM-Compass, an instrument consisting of a square wooden or brass beam, having sliding sockets, that carry steel or pencil points; they are used for describing large circles, where the common compasses are useless.

BEAM-Bird, or *Petty-chaps*. See *MOTACILLA*.

BEAM also denotes the lath, or iron, of a pair of scales; sometimes the whole apparatus for weighing of goods is so called: Thus we say, it weighs so much at the king's beam.

BEAM of a Plough, that in which all the parts of the plough-tail are fixed *.

BEAM, or *Roller*, among weavers, a long and thick wooden cylinder, placed lengthwise on the back-part of the loom of those who work with a shuttle. That cylinder, on which the stuff is rolled as it is weaved, is also called the *beam* or *roller*, and is placed on the fore-part of the loom.

BEAMINSTER, a town of Dorsetshire in England, seated on the river Bert, in W. Long. 2. 50. N. Lat. 52. 45.

BEAN, in botany. See *VICIA*.

The ancients made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified *absolution*, and a black one *condemnation*. Beans had a mysterious use in the *lemuralia* and *parentalia*; where the master of the family, after washing, was to throw a sort of black beans over his head, still repeating the words, 'I redeem myself and family by these beans.' Ovid † gives a lively description of the whole ceremony in verse.—*S. V. 433.*

Abstinence from beans was enjoined by Pythagoras, one of whose symbols is, *κυμαν απαγορευται, abstine a fabis*. The Egyptian priests held it a crime to look at beans, judging the very sight unclean. The *flamen dialis* was not permitted even to mention the name. The precept of Pythagoras has been variously interpreted: some understand it of forbearing to meddle in trials and verdicts, which were then by throwing beans into an urn: others, building on the equivocal of the word *κυμαν*, which equally signifies a *bean* and a human *testicle*, explain it by abstaining from venery. Clemens Alexandrinus grounds the abstinence from beans on this, that they render women barren; which is confirmed by Theophrastus, who extends the effect even to plants. Cicero suggests another reason for this abstinence, viz. that beans are great enemies to tranquillity of mind. For a reason of this kind it is, that Amphiraus is said to have abstained from beans, even before Pythagoras, that

* See *Plough*; and *Agriculture*, no 78, &c.

† *Fast. lib.* 5. v. 433.

Beans
Beard.

that he might enjoy a clearer divination by dreams.

BEANS, as food for horses. See FARRIERY, § i. 6.

BEAN-COD, a small fishing vessel, or pilot-boat, common on the sea-coasts and in the rivers of Portugal. It is extremely sharp forward, having its stem bent inward above into a great curve: the stem is also plated on the fore-side with iron, into which a number of bolts are driven, to fortify it, and resist the stroke of another vessel, which may fall athwart-haule. It is commonly navigated with a large lateen sail, which extends over the whole length of the deck, and is accordingly well fitted to ply to windward.

BEAN-Flour, called by the Romans *lomentum*, was of some repute among the ancient ladies as a cosmetic, wherewith to smooth the skin, and take away wrinkles.

BEAN-FlY, in natural history, the name given by authors to a very beautiful fly, of a pale purple colour, frequently found on bean-flowers. It is produced from the worm or maggot called by authors *mida*.

BEAN-Goose, in ornithology. See ANAS.

KIDNEY-BEAN. See PHASEOLUS.

BEAR, in zoology. See URSUS.

BEAR, in astronomy. See URSA.

Order of the BEAR was a military order in Switzerland, erected by the emperor Frederick II. in 1213, by way of acknowledgement for the service the Swifs had done him, and in favour of the abbey of St Gaul. To the collar of the order hung a medal, on which was represented a bear raised on an eminence of earth.

BEAR'S-BREECH, in botany. See ACANTHUS.

BEAR'S FLESH was much esteemed by the ancients: even at this day, the paw of a bear salted and smoked is served up at the table of princes.

BEAR'S GREASE, was formerly esteemed a sovereign remedy against cold disorders, especially rheumatisms.

BEAR'S SKIN makes a fur in great esteem, and on which depends a considerable article of commerce, being used in housings, on coach-boxes, &c. In some countries, clothes are made of it, more especially bags wherein to keep the feet warm in severe colds. Of the skins of bears cubs are made gloves, muffs, and the like.

BEARALSTON, a poor town of Devonshire, which, however, is a borough by prescription, and sends two members to parliament.

BEARD, the hair growing on the chin, and adjacent parts of the face, chiefly of adults and males *

* See Hair.

Various have been the ceremonies and customs of most nations in regard of the beard. The Tartars, out of a religious principle, waged a long and bloody war with the Persians, declaring them infidels, merely because they would not cut their whiskers, after the rite of Tartary: and we find, that a considerable branch of the religion of the ancients, consisted in the management of their beard. The Greeks wore their beards till the time of Alexander the Great; that prince having ordered the Mæcedonians to be shaved, for fear it should give a handle to their enemies. According to Pliny, the Romans did not begin to shave till the year of Rome 454, when P. Ticius brought over a stock of barbers from Sicily.—Persons of quality had their children shaved the first time by others of the same or greater quality, who, by this means, became god-father, or adoptive father of the children. Anciently, indeed, a person became god-father of the child by

barely touching his beard: thus historians relate, that one of the articles of the treaty between Alaric and Clovis was, that Alaric should touch the beard of Clovis to become his god-father.

As to ecclesiastics, the discipline has been very different on the article of beards: sometimes they have been enjoined to wear them, from a notion of too much effeminacy in shaving, and that a long beard was more suitable to the ecclesiastical gravity; and sometimes again they were forbid it, as imagining pride to lurk beneath a venerable beard. The Greek and Roman churches have been long together by the ears about their beards: since the time of their separation, the Romanists seem to have given more into the practice of shaving, by way of opposition to the Greeks; and have even made some express constitutions *de radendis barbis*. The Greeks, on the contrary, espouse very zealously the cause of long beards, and are extremely scandalized at the beardless images of saints in the Roman churches. By the statues of some monasteries it appears, that the lay-monks were to let their beards grow, and the priests among them to shave; and that the beards of all that were received into the monasteries, were blessed with a great deal of ceremony. There are still extant the prayers used in the solemnity of consecrating the beard to God, when an ecclesiastic was shaven.

Le Comte observes, that the Chinese affect long beards extravagantly; but nature has balked them, and only given them very little ones, which, however, they cultivate with infinite care: the Europeans are strangely envied by them on this account, and esteemed the greatest men in the world. The Russians wore their beards till within this half century, when Peter the Great enjoined them all to shave; but notwithstanding his injunction, he was obliged to keep on foot a number of officers to cut off by violence the beards of such as would not otherwise part with them. Chrysofom observes, that the kings of Persia had their beards wove or matted together with gold-thread; and some of the first kings of France had their beards knotted and buttoned with gold.

Among the Franks, shaving or mutilating the beard was the greatest affront that could be offered any person. Taking away a single hair was an injury scarce to be forgiven. Among the Turks, it is more infamous for any one to have his beard cut off, than among us to be publicly whipt, or branded with a hot iron. There are abundance in that country, who would prefer death to this kind of punishment. The Arabs make the preservation of their beards a capital point of religion, because Mahomet never cut his. Hence the razor is never drawn over the Grand Signior's face. The Persians, who clip them, and shave above the jaw, are reputed heretics. It is likewise a mark of authority and liberty among them, as well as among the Turks. They who serve in the seraglio, have their beards shaven, as a sign of their servitude. They do not suffer it to grow till the sultan has set them at liberty, which is bestowed as a reward upon them, and is always accompanied with some employment.

Consecration of the BEARD was a ceremony among the Roman youth, who, when they were shaved the first time, kept a day of rejoicing, and were particularly careful to put the hair of their beard into a silver or gold box, and make an offering of it to some god,

par-

particularly to Jupiter Capitolinus, as was done by Nero, according to Suetonius.

Kissing the BEARD. The Turkish wives kiss their husbands beards, and children their fathers, as often as they come to salute them. The men kiss one anothers beards reciprocally on both sides, when they salute in the streets, or come off from any journey.

The Fashion of the BEARD has varied in different ages and countries; some cultivating and entertaining one part of it, some another. Thus the Hebrews wear a beard on their chin; but not on the upper-lip or cheeks. Moses forbids them to cut off entirely the angle or extremity of their beard; that is, to manage it after the Egyptian fashion, who left only a little tuft of beard at the extremity of their chin; whereas the Jews to this day suffer a little fillet of hair to grow from the lower end of their ears to their chins, where, as well as on their lower-lips, their beards are in a pretty long bunch. The Jews, in time of mourning, neglected to trim their beards; that is, to cut off what grew superfluous on the upper-lips and cheeks. In time of grief and great affliction, they also plucked off the hair of their beards.

Anointing the BEARD with unguents is an ancient practice both among the Jews and Romans, and still continues in use among the Turks; where one of the principal ceremonies observed in serious visits is to throw sweet-scented water on the beards of the visitant, and to perfume it afterwards with aloes-wood, which sticks to this moisture, and gives it an agreeable smell, &c. In middle-age writers we meet with *adentare barbam*, used for stroking and combing it, to render it soft and flexible. The Turks, when they comb their beards, hold a handkerchief on their knees, and gather very carefully the hairs that fall; and when they have got together a certain quantity, they fold them up in paper, and carry them to the place where they bury the dead.

BEARD of a Comet, the rays which the comet emits towards that part of the heaven to which its proper motion seems to direct it; in which the beard of a comet is distinguished from the tail, which is understood of the rays emitted towards that part from whence its motion seems to carry it.

BEARD of a Horse, that part underneath the lower mandible on the outside and above the chin, which bears the curb. It is also called the *chuck*. It should have but little flesh upon it, without any chops, hardness, or swelling; and be neither too high raised nor too flat, but such as the curb may rest in its right place.

BEARD of a Muscle, oyster, or the like, denotes an assemblage of threads or hairs, by which those animals fasten themselves to stones. The hairs of this beard terminate in a flat spongy substance, which being applied to the surface of a stone, sticks thereto, like the wet leather used by boys.

BEARDS, in the history of insects, are two small, oblong, fleshy bodies, placed just above the trunk, as in the gnats, and in the moths and butterflies.

BEARDED, denotes a person or thing with a beard, or some resemblance thereof. The faces on ancient Greek and Roman medals are generally bearded. Some are denominated *pogonati*, as having long beards, e. g. the Parthian kings. Others have only a lanugo about the chin, as the Seleucid family. *Adriaus* was the first

of the Roman emperors who nourished his beard: hence all imperial medals before him are beardless; after him, *bearded*.

BEARDED Women have been all observed to want the menstrual discharge; and several instances are given by Hippocrates, and other physicians, of grown women, especially widows, in whom the menses coming to stop, beards appeared. Eusebium Nicerebergius mentions a woman who had a beard reaching to her navel.

BEARERS, in heraldry. See *SUPPORTERS*.

BEARING, in navigation, an arch of the horizon intercepted between the nearest meridian and any distinct object, either discovered by the eye, or resulting from the sinical proportion; as in the first case, at 4 P. M. Cape Spado, in the isle of Candia, bore S. by W. by the compass. In the second, the longitudes and latitudes of any two places being given, and consequently the difference of latitude and longitude between them, the bearing from one to the other is discovered by the following analogy:

As the meridional difference of latitude

Is to the difference of longitude;

So is radius

To the tangent bearing.

BEARING is also the situation of any distant object, estimated from some part of the ship according to her position. In this sense, an object so discovered, must be either ahead, astern, abreast on the bow, or on the quarter. These bearings, therefore, which may be called *mechanical*, are on the beam, before the beam, abaft the beam, on the bow, on the quarter, ahead, or astern. If the ship sails with a side-wind, it alters the names of such bearings in some measure, since a distant object on the beam is then said to be to leeward or to windward; on the lee quarter or bow, and on the weather-quarter or bow.

BEARING, in the sea-language. When a ship sails towards the shore, before the wind, she is said to *bear in* with the land or harbour. To let the ship fail more before the wind, is to *bear up*. To put her right before the wind, is to *bear round*. A ship that keeps off from the land, is said to *bear off*. When a ship that was to windward comes under a ship's stern, and so gives her the wind, she is said to *bear under* her lee, &c. There is another sense of this word, in reference to the burden of a ship; for they say a ship *bears*, when, having too slender or lean a quarter, she will sink too deep into the water with an over light freight, and thereby can carry but a small quantity of goods.

BEARINGS, in heraldry, a term used to express a coat of arms, or the figures of armories by which the nobility and gentry are distinguished from the vulgar and from one another. See *HERALDRY*.

BEARN, a province of France, bounded on the east by Bigorre, on the south by the mountains of Aragon, on the west by Soule and part of Navarre, and on the north by Gascony and Armagnac. It lies at the foot of the Pyrenean mountains, being about 16 leagues in length, and 12 in breadth. In general it is but a barren country; yet the plains yield considerable quantities of flax, and a good quantity of Indian corn called *mailloc*. The mountains are rich in mines of iron, copper, and lead; some of them also are covered with vines, and others with pine trees; and they give rise to several mineral springs, and two

Bearn.

Beast
||
Beatification.

considerable rivers, the one called the *Gave of Oleron*, and the other the *Gave of Bearm*. Some wine is exported from this country; and the Spaniards buy up great numbers of the horses and cattle, together with most of their linen, of which there is a considerable manufactory. The principal places are Pau, Lescar, Ortez, Novarrains, Sallies, and Oleron.

BEAST, in a general sense, an appellation given to all four-footed animals, fit either for food, labour, or sport.

BEASTS of Burden, in a commercial sense, all four-footed animals which serve to carry merchandizes on their backs. The beasts generally used for this purpose, are elephants, dromedaries, camels, horses, mules, asses, and the sheep of Mexico and Peru.

BEASTS of the Chase are five, viz. the buck, the doe, the fox, the roe, and the martin.

BEASTS and Fowls of the Warren, are the hare, the coney, the pheasant, and partridge.

BEASTS of the Forest are the hart, hind, hare, boar, and wolf.

BEAST, among gamesters, a game at cards, played in this manner: The best cards are the king, queen, &c. whereof they make three heaps, the king, the play, and triolet. Three, four, or five, may play; and to every one is dealt five cards. However, before the play begins, every one stakes to the three heaps. He that wins most tricks, takes up the heap called the *play*; he that hath the king, takes up the heap so called; and he that hath three of any sort, that is, three fours, three fives, three sixes, &c. takes up the triolet heap.

BEAT, in a general signification, signifies to chastise, strike, knock, or vanquish.

This word has several other significations in the manufatures, and in the arts and trades. Sometimes it signifies to forge and hammer, in which sense smiths and farriers say, to *beat iron*. Sometimes it means to pound, to reduce into powder: Thus we say, to *beat drugs*, to *beat pepper*, to *beat spices*; that is to say, to pulverize them.

BEAT of Drum, in the military art, is to give notice by beat of drum of a sudden danger; or, that scattered soldiers may repair to their arms and quarters, is to beat an alarm, or to arms. Also, to signify, by different manners of sounding a drum, that the soldiers are to fall on the enemy; to retreat before, in, or after, an attack; to move, or march, from one place to another; to permit the soldiers to come out of their quarters at break of day; to order to repair to their colours, &c.; is to beat a charge, a retreat, a march, &c.

BEAT (St), a town of France, in the county of Comminges, at the confluence of the Garonne and the Pique. It is seated between two mountains which are close to the town on each side. All the houses are built with marble, because they have no other materials. W. Long. 1. 6. N. Lat. 42. 50.

BEATIFICATION, an act by which the Pope declares a person beatified, or blessed, after his death. It is the first step towards canonization, or raising any one to the honour and dignity of a saint. No person can be beatified till 50 years after his or her death. All certificates or attestations of virtues and miracles, the necessary qualifications for sainthood, are examined by the congregation of rites. This examination often

continues for several years; after which his holiness decrees the beatification. The corpse and relics of the future saint are from thenceforth exposed to the veneration of all good Christians; his images are crowned with rays, and a particular office is set apart for him; but his body and relics are not carried in procession: indulgences likewise, and remission of sins, are granted on the day of his beatification; which though not so pompous as that of canonization, is however very splendid.

BEATING, or PULSATION, in medicine, the reciprocal agitation or palpitation of the heart or pulse.*

BEATING Time, in music, a method of measuring and marking the time for performers in concert, by a motion of the hand or foot up and down successively and in equal times. Knowing the true time of a crotchet, and supposing the measure actually subdivided into four crotchets, and the half measure into two, the hand or foot being up, if we put it down with the very beginning of the first note or crotchet, and then raise it with the third, and then down with the beginning of the next measure; this is called *beating* the time; and, by practice, a habit is acquired of making this motion very equal. Each down and up is sometimes called a *time*, or *measure*. The general rule is, to contrive the division of the measure so, that every down and up of the beating shall end with a particular note, on which very much depends the distinctness, and, as it were, the sense of the melody. Hence the beginning of every time, or beating, in the measure, is reckoned the accented part thereof.

Beating time is denoted, in the Italian music, by the term *à battuta*, which is usually put after what they call *recitativo*, where little or no time is observed, to denote, that here they are to begin again to mark or beat the time exactly.

The Romans aimed at somewhat of harmony in the strokes of their oars; and had an officer called *portifculus* in each galley, whose business was to beat time to the rowers, sometimes by a pole or mallet, and sometimes by his voice alone.

The ancients marked the rhyme in their musical compositions; but, to make it more observable in the practice, they beat the measure or time, and this in different manners. The most usual consisted in a motion of the foot, which was raised from, and struck alternately against, the ground, according to the modern method. Doing this was commonly the province of the master of the music, who was thence called *μεισιχορῶν* and *χορηγῶν*, because placed in the middle of the choir of musicians, and in an elevated situation, to be seen and heard more easily by the whole company. These beaters of measure were also called by the Greeks *ποδοκτύτοι* and *ποδοφόροι*, because of the noise of their feet; and *ομοκαρῶν* because of the uniformity or monotony of the rhyme. The Latins denominated them *pedarii*, *podarii*, and *pedicularii*. To make the beats or strokes more audible, their feet were generally shod with a sort of sandals either of wood or iron, called by the Greeks *κρουκίσις*, *κρουκάλαι*, *κρουκίαι*, and by the Latins *pedicula*, *scabella*, or *scabilla*, because like to little stools or foot-stools. Sometimes they beat upon sonorous foot-stools, with the foot shod with a wooden or iron sole. They beat the measure not only with the foot, but also with the right-hand, all the fingers whereof they joined together,

gether, to strike into the hollow of the left. He who thus marked the rhythm, was called *manuductor*. The ancients also beat time or measure with shells, as oyster-shells, and bones of animals, which they struck against one another, much as the moderns now use castanets, and the like instruments. This the Greeks called *κρημαξία*, as is noted by Hesychius. The scholiast on Aristophanes speaks much to the same purpose. Other noisy instruments, as drums, cymbals, citterns, &c. were also used on the same occasion. They beat the measure generally in two equal or unequal times; at least, this holds of the usual rhythm of a piece of music, marked either by the noise of sandals, or the flapping of the hands. But the other rhythmic instruments last-mentioned, and which were used principally to excite and animate the dancers, marked the cadence after another manner; that is, the number of their percussions equalled, or even sometimes surpassed, that of the different sounds which composed the air or song played.

BEATING, with hunters, a term used of a flag, which runs first one way, and then another. He is then said to *beat up and down*.—The noise made by coues in rutting time is also called *beating* or *tapping*.

BEATING, in navigation, the operation of making a progress at sea against the direction of the wind, in a zig-zag line, or traverse, like that in which we ascend a steep hill. See **TACKLING**.

BEATITUDE, imports the supreme good, or the highest degree of happiness human nature is susceptible of; or the most perfect state of a rational being, wherein the soul has attained to the utmost excellency and dignity it is framed for. In which sense, it amounts to the same with what we otherwise call *bleffedness* and *sovereign felicity*; by the Greeks, *εὐδαιμονία*; and by the Latins, *summum bonum*, *beatitudo*, and *beatitas*.

BEATITUDE, among divines, denotes the beatific vision, or the fruition of God in a future life to all eternity.

BEATITUDE is also used in speaking of the theses contained in Christ's sermon on the mount, whereby he pronounces blessed the poor in spirit, those that mourn, the meek, &c.

BEATON (David), archbishop of St Andrews, and a cardinal of Rome, in the early part of the 16th century, was born in 1494. Pope Paul III. raised him to the degree of a cardinal in December 1538; and being employed by James V. in negotiating his marriages with the court of France, he was there consecrated bishop of Mirepoix. Soon after his instalment as archbishop of St Andrews, he promoted a furious persecution of the reformers in Scotland; when the king's death put a stop, for a time, to his arbitrary proceedings, he being then excluded from affairs of government, and confined. He raised however to strong a party, that, upon the coronation of the young queen Mary, he was admitted of the council, made chancellor, and procured commission as legate *a latere* from the court of Rome. He now began to renew his persecution of heretics; and among the rest, of the famous Protestant preacher Mr George Wishart, whose sufferings at the stake the cardinal viewed from his window with apparent exultation. It is pretended, that Wishart at his death foretold the murder of Beaton; which indeed happened shortly after, he being assassinated in his chamber, May 29th, 1547. He was a haughty

bigotted churchman, and thought severity the proper method of suppressing heresy: he had great talents, and vices that were no less conspicuous*.

BEATS, in a watch or clock, are the strokes made by the fangs or pallets of the spindle of the balance, or of the pads in a royal pendulum †.

BEUCAIRE, a town of Languedoc in France, situated on the banks of the river Rhone, in E. Long. 5. 49. N. Lat. 43. 39.

BEAUCE, a province of France, lying between the isle of France, Blaisois, and Orleannois. It is so very fertile in wheat, that it is called the *Granary* of Paris. Chartres is the principal town.

BEAVER, in zoology. See **CASTOR**.

BEAVER-SKINS, in commerce. Of these, merchants distinguish three sorts; the new, the dry, and the fat.

The new beaver, which is also called the *rubite beaver*, or *Muscovy beaver*, because it is commonly kept to be sent into Muscovy, is that which the savages catch in their winter hunting. It is the best, and the most proper for making fine furs, because it has lost none of its hair by shedding.

The dry beaver, which is sometimes called *lean beaver*, comes from the summer hunting, which is the time when these animals lose part of their hair. Tho' this sort of beaver be much inferior to the former, yet it may also be employed in furs; but it is chiefly used in the manufacture of hats. The French call it *summer castor* or *beaver*.

The fat beaver is that which has contracted a certain gross and oily humour, from the sweat which exhales from the bodies of the savages, who wear it for some time. Though this sort be better than the dry beaver, yet it is used only in the making of hats.

Besides hats and furs, in which the beaver's hair is commonly used, they attempted in France, in the year 1699, to make other manufactures of it: and, accordingly, they made cloths, flannels, stockings, &c. partly of beaver's hair, and partly of Segovia wool. This manufactory, which was set up at Paris, in St Anthony's suburbs, succeeded at first pretty well; and, according to the genius of the French, the novelty of the thing brought into some repute the fluffs, stockings, gloves, and cloth, made of beaver's hair. But they went out of fashion on a sudden, because it was found, by experience, that they were of a very bad wear, and, besides, that the colours faded very much: when they had been wet, they became dry and hard, like felt, which occasioned the miscarriage of the manufactory for that time.

When the hair has been cut off from the beavers skins, to be used in the manufacturing of hats, those skins are still employed by several workmen; namely, by the trunk-makers, to cover trunks and boxes; by the shoemakers, to put into slippers; and by turners, to make sieves for sifting grain and seeds*.

BEAUFORT, a town of Anjou in France, with a castle, near the river Authion. It contains two parishes and a convent of Recolets, and yet has not 100 houses. W. Long. 0. 3. N. Lat. 47. 26.

BEAUFORT, a strong town of Savoy in Italy, on the river Oron. E. Long. 6. 48. N. Lat. 45. 40.

BEAUGENCY, a town of the Orleannois in France, seated on the river Loire, in E. Long. 1. 46. N. Lat. 47. 48.

BEAU.

Beaujeu
Beaumont.

BEAUJEU, a town of France in Beaujolais, with an old castle. It is seated on the river Ardieres, at the foot of a mountain, in E. Long. 4. 40. N. Lat. 46. 9.

BEAUJOLOIS, a district of France, bounded on the south by Lionnois proper, on the west by Forez, on the north by Burgundy, and on the west by the principality of Dombes. It is 25 miles in length, and 20 in breadth: Ville Franche is the capital town.

BEAULIEU, (Sebastian de Pontault de), a celebrated French engineer, and field marshal under Louis XIV. He published plans of all the military expeditions of his master, with military lectures annexed. Died in 1674.

BEAUMARIS, a market-town of Anglesey in North Wales. W. Long. 4. 15. N. Lat. 53. 25.

BEAUMONT (Sir John), the elder brother of Mr Francis Beaumont the famous dramatic poet, was born in the year 1582, and in 1626 had the dignity of a baronet conferred upon him by king Charles I. In his youth he applied himself to the Muses with good success; and wrote, *The Crown of Thorns*, a poem, in eight books: a miscellany, intitled *Bosworth Field*: Translations from the Latin Poets: and several poems on religious and political subjects; as, *On the Festivals*; *On the Blessed Trinity*; *A Dialogue between the World, a Pilgrim, and Virtue*; *Of the miserable State of Man*; *Of Sickness*, &c. He died in 1628. His poetic genius was celebrated by Ben Johnson, Michael Drayton, and others.

BEAUMONT and FLETCHER, two celebrated English dramatic writers, who flourished in the reign of James I. and so closely connected both as authors and as friends, that it has been judged not improper to give them under one article.

Mr Francis Beaumont was descended from an ancient family of his name at Grace-dieu in Leicestershire, where he was born about the year 1585 or 1586, in the reign of queen Elizabeth. His grandfather, John Beaumont, was master of the rolls, and his father Francis Beaumont one of the judges of the common-pleas. He was educated at Cambridge, and afterwards admitted of the Inner Temple. It is not, however, apparent that he made any great proficiency in the law, that being a study probably too dry and unentertaining to be attended to by a man of his fertile and sprightly genius. And indeed, we should scarcely be surpris'd to find that he had given no application to any study but poetry, nor attended on any court but that of the Muses: but on the contrary our admiration might fix itself in the opposite extreme, and fill us with astonishment at the extreme assiduity of his genius and rapidity of his pen, when we look back on the voluminousness of his works, and then inquire into the time allowed him for them; works that might well have taken up a long life to have executed. For although, out of 53 plays which are collected together as the labours of these united authors, Mr Beaumont was concerned in much the greatest part of them, yet he did not live to complete his 30th year, the king of terrors summoning him away in the beginning of March 1615, on the 9th day of which he was interred in the entrance of St Benedict's chapel in Westminster-Abbey. There is no inscription on his tomb. But there are two epitaphs to his memory; one by his elder brother Sir John Beaumont:

On death, thy murderer, this revenge I take;
I slight his terrors, and just question make,
Which of us two the best precedence have,
Mine to this wretched world, thine to the grave.
Thou should'st have followed me; but death, to blame,
Mistook our years, and measur'd age by fame.
So dearly hast thou bought thy precious lines;
Their praise grew swiftly, so thy life declines.
Thy muse, the hearer's queen, the reader's love,
All ears, all hearts (but death's), could please and move.
Bosworth Field, p. 104.

The other is by bishop Corbet. (*Poems, p. 68.*)

He that hath such acuteness and such wit,
As would ask ten good heads to husband it;
He that can write so well, that no man dare
Resume it for the best; let him beware:
Beaumont is dead, by whose sole death appears,
Wit's a disease consumes men in few years.

He left a daughter, Frances Beaumont, who died in Leicestershire since the year 1700. She had in her possession several poems of her father's writing; but they were lost at sea in her voyage from Ireland, where she had lived for some time in the duke of Ormond's family.

Mr John Fletcher was not more meanly descended than his poetical colleague; his father, the reverend Dr Fletcher, having been first made bishop of Bristol by queen Elizabeth, and afterwards by the same monarch, in the year 1593, translated to the rich and honourable see of London. Our poet was born in 1576; and was, as well as his friend, educated at Cambridge, where he made a great proficiency in his studies, and was accounted a very good scholar. His natural vivacity of wit, for which he was remarkable, soon rendered him a devotee to the muses; and his close attention to their service, and fortunate connection with a genius equal to his own, soon raised him to one of the highest places in the temple of poetical fame. As he was born near ten years before Mr Beaumont, so did he also survive him by an equal number of years; the general calamity of a plague, which happened in the year 1625, involving him in its great destruction, he being at that time 49 years of age.

During the joint lives of these two great poets, it appears that they wrote nothing separately, excepting one little piece by each, which seem'd of too trivial a nature for either to require assistance in, viz. *The Faithful Shepherd*, a pastoral, by Fletcher; and *The Masque of Gray's-Inn Gentlemen*, by Beaumont. Yet what share each had in the writing or designing of the pieces thus compos'd by them jointly, there is no possibility of determining. It is however generally allowed, that Fletcher's peculiar talent was *wit*, and Beaumont's, though much the younger man, *judgment*. Nay, so extraordinary was the latter property in Mr Beaumont, that it is recorded of the great Ben Johnson, who seems moreover to have had a sufficient degree of self-opinion of his own abilities, that he constantly, so long as this gentleman lived, submitted his own writings to his censure, and, as it is thought, availed himself of his judgment at least in the correcting, if not even in the contriving, all his plots. It is probable, therefore, that the forming the plots and contriving the conduct of the fable, the writing of the more serious and pathetic parts, and lopping the redundant branches of Fletcher's wit, whose luxuriance, we are told, frequently stood in need of castration, might be in general Beaumont's portion in the work; while Fletcher, whose conversation with

the

the *beau monde* (which indeed both of them from their births and stations in life had been ever accustomed to), added to the volatile and lively turn he possessed, rendered him perfectly master of dialogue and polite language, might execute the designs formed by the other, and raise the superstructure of those lively and spirited scenes which Beaumont had only laid the foundation of; and in this he was so successful, that though his wit and raillery were extremely keen and poignant, yet they were at the same time so perfectly genteel, that they used rather to please than disgust the very persons on whom they seemed to reflect. Yet that Fletcher was not entirely excluded from a share in the conduct of the drama, may be gathered from a story related by Winstanley, viz. that our two bards having concerted the rough draught of a tragedy over a bottle of wine at a tavern, Fletcher said, he would undertake to *kill the king*, which words being overheard by the waiter, who had not happened to have been witnesses to the context of their conversation, he lodged an information of treason against them. But on their explanation of it only to mean the destruction of a theatrical monarch, their loyalty moreover being unquestioned, the affair ended in a jest.

On the whole, the works of these authors have undoubtedly very great merit, and some of their pieces deservedly stand on the list of the present ornaments of the theatre. The plots are ingeniously interlocking, and well managed; the characters strongly marked; and the dialogue sprightly and natural: yet there is in the latter a coarseness which is not suitable to the politeness of the present age; and a fondness of repartee, which frequently runs into obscenity, and which we may suppose was the vice of that time, since even the delicate Shakspeare himself is not entirely free from it. But as these authors have more of that kind of wit than the last-mentioned writer, it is not to be wondered if their works were, in the licentious reign of Charles II. preferred to his. Now, however, to the honour of the present taste it is spoken, the tables are entirely turned; and while Shakspeare's immortal works are our constant and daily fare, those of Beaumont and Fletcher, tho' delicate in their kind, are only occasionally served up; and even then great pains are taken to clear them of that *sumet*, which the *haut gout* of their contemporaries considered as their supremest relish, but which the more depraved taste of ours has been justly taught to look on as what it really is, no more than a corrupt and unwholesome taint.

Some of their plays were printed in quarto during the lives of the authors; and in the year 1645, there was published in folio a collection of such plays as had not been printed before, amounting to between 30 and 40. This collection was published by Mr Shirley, after the shutting up of the theatres; and dedicated to the earl of Pembroke, by ten of the most famous actors. In 1679, there was an edition of all their plays published in folio; another edition in 1711 by Mr Tonson, in seven volumes 8^{vo}, and the last in 1751.

BEAUMONT, a town of the Netherlands, in Hainault, on the confines of the territory of Liege. It was ceded to the French in 1684; and taken in 1691 by the English, who blew up the castle. It is situated between the rivers Maese and Sambre, in E. Long. 4. 1. N. Lat. 50. 12.

BEAUMONT *le Roger*, a town of Upper Normandy in France. E. Long. 0. 56. N. Lat. 49. 2.

BEAUMONT *le Vicomte*, a town of Maine in France. E. Long. 0. 10. N. Lat. 48. 12.

BEAUMONT *sur Oise*, a town in the Isle of France, seated on the declivity of a hill, with a bridge over the river Oise. E. Long. 2. 29. N. Lat. 49. 9.

BEAUNE, a handsome town of France, in Burgundy, remarkable for its excellent wine, and for an hospital founded here in 1443. Its collegiate church is also one of the finest in France; the great altar is adorned with a table enriched with jewels; and its organs are placed on a piece of architecture which is the admiration of the curious. E. Long. 4. 50. N. Lat. 47. 2.

BEAUSOBRE (Isaac de), a learned minister of the reformed religion, was born at Niort. He retired into Holland; and from thence to Berlin, where he was made chaplain to the king of Prussia, and counsellor of the Royal Consistory. He wrote a Defence of the Doctrines of the Reformation; a Translation of the New Testament into French, with notes, in two vols quarto; and several other works. He died in 1738, aged 79.

BEAUTY, in its native signification, is appropriated to objects of sight. Objects of the other senses may be agreeable, such as the sounds of musical instruments, the smoothness and softness of some surfaces; but the agreeableness called *beauty* belongs to objects of sight.

Objects of sight are more complex than those of any other sense: in the simplest, we perceive colour, figure, length, breadth, thickness. A tree is composed of a trunk, branches, and leaves; it has colour, figure, size, and sometimes motion: by means of each of these particulars, separately considered, it appears beautiful; but a complex perception of the whole greatly augments the beauty of the object. The human body is a composition of numberless beauties arising from the parts and qualities of the object, various colours, various motions, figures, size, &c. all united in one complex object, and striking the eye with combined force. Hence it is, that beauty, a quality so remarkable in visible objects, lends its name to every thing that is eminently agreeable. Thus, by a figure of speech, we say, a *beautiful sound*, a *beautiful thought*, a *beautiful discovery*, &c.

Considering attentively the beauty of visible objects, two kinds are discovered. The first may be termed *intrinsic beauty*, because it is discovered in a single object, without relation to any other: the other may be termed *relative*, being founded on the relation of objects. Intrinsic beauty is a perception of sense merely; for to perceive the beauty of a spreading oak, or of a flowing river, no more is required but singly an act of vision. Relative beauty is accompanied with an act of understanding and reflection: for we perceive not the relative beauty of a fine instrument or engine, until we learn its use and destination. In a word, intrinsic beauty is ultimate; and relative beauty is that of means relating to some good end or purpose. These different beauties agree in one capital circumstance, that both are equally perceived as belonging to the object; which will be readily admitted with respect to intrinsic beauty, but is not so obvious with respect to the other. The

Beauty.

Beauty.

utility of the plough, for example, may make it an object of admiration or of desire; but why should utility make it beautiful? A natural propensity of the human mind will explain this difficulty: By an easy transition of ideas, the beauty of the effect is transferred to the cause, and is perceived as one of the qualities of the cause. Thus a subject void of intrinsic beauty, appears beautiful by its utility; a dwelling house void of all regularity, is however beautiful in the view of convenience; and the want of symmetry in a tree, will not prevent its appearing beautiful, if it be known to produce good fruit.

When these two beauties concur in any object, it appears delightful. Every member of the human body possesses both in a high degree.

The beauty of utility, being accurately proportioned to the degree of utility, requires no illustration: But intrinsic beauty, being more complex, cannot be handled distinctly without being analysed. If a tree be beautiful by means of its colour, figure, motion, size, &c. it is in reality possessed of so many different beauties. The beauty of colour is too familiar to need explanation. The beauty of figure is more: for example, viewing any body as a whole, the beauty of its figure arises from regularity and simplicity; viewing the parts with relation to each other, uniformity, proportion, and order, contribute to its beauty. The beauties of grandeur and motion are considered separately*.

We shall here make a few observations on simplicity, which may be of use in examining the beauty of single objects. A multitude of objects crowding into the mind at once, disturb the attention, and pass without making any lasting impression: In the same manner, even a single object, consisting of a multiplicity of parts, equals not, in strength of impression, a more simple object comprehended in one view. This justifies simplicity in works of art, as opposed to complicated circumstances and crowded ornaments.

It would be endless to enumerate the effects that are produced by the various combinations of the principles of beauty. A few examples will be sufficient to give the reader some idea of this subject. A circle and a square are each perfectly regular: a square, however, is less beautiful than a circle; and the reason is, that the attention is divided among the sides and angles of a square; whereas the circumference of a circle, being a single object, makes one entire impression: And thus simplicity contributes to beauty. For the same reason, a square is more beautiful than a hexagon or octagon. A square is likewise more beautiful than a parallelogram, because it is more regular and uniform. But this holds with respect to intrinsic beauty only: for in many instances, as in the doors and windows of a dwelling-house, utility turns the scales on the side of the parallelogram.

Again, a parallelogram depends, for its beauty, on the proportion of its sides: A great inequality of its sides annihilates its beauty: Approximation toward equality hath the same effect; for proportion there degenerates into imperfect uniformity, and the figure appears an unsuccessful attempt toward a square. And hence proportion contributes to beauty.

An equilateral triangle yields not to a square in regularity nor in uniformity of parts, and it is more simple. But an equilateral triangle is less beautiful than

a square; which must be owing to inferiority of order in the position of its parts; the order arising from the equal inclination of the sides of such an angle, is more obscure than the parallelism of the sides of a square. And hence order contributes to beauty not less than simplicity, regularity, or proportion.

Uniformity is singular in one circumstance, that it is apt to disgust by excess. A number of things destined for the same use, as windows, chairs, &c. cannot be too uniform. But a scrupulous uniformity of parts in a large garden or field, is far from being agreeable.

In all the works of nature, simplicity makes a capital figure. It also makes a figure in works of art: Profuse ornament in painting, gardening, or architecture, as well as in dress or in language, shows a mean or corrupted taste. Simplicity in behaviour and manners has an enchanting effect, and never fails to gain our affection. Very different are the artificial manners of modern times. A gradual progress from simplicity to complex forms and profuse ornament, seems to be the fate of all the fine arts; resembling behaviour, which from original candor and simplicity, has degenerated into duplicity of heart and artificial refinements. At present, literary productions are crowded with words, epithets, figures: In music, sentiment is neglected for the luxury of harmony, and for difficult movement.

With regard to the final cause of beauty, one thing is evident, that our relish of regularity, uniformity, proportion, order, and simplicity, contributes greatly to enhance the beauty of the objects that surround us, and of course tends to our happiness. We may be confirmed in his thought, upon reflecting, that our taste for these particulars is not accidental, but uniform and universal, making a branch of our nature. At the same time, regularity, uniformity, order, and simplicity, contribute each of them to readiness of apprehension, and enable us to form more distinct ideas of objects than can be done where these particulars are wanting. In some instances, as in animals, proportion is evidently connected with utility, and is the more agreeable on that account.

Beauty, in many instances, promotes industry; and as it is frequently connected with utility, it proves an additional incitement to enrich our fields and improve our manufactures. These, however, are but slight effects, compared with the connections that are formed among individuals in society by means of beauty. The qualifications of the head and heart are undoubtedly the most solid and most permanent foundations of such connections: But, as external beauty lies more in view, and is more obvious to the bulk of mankind, than the qualities now mentioned, the sense of beauty has a more extensive influence in forming these connections. At any rate, it occurs in an eminent degree with mental qualifications, in producing social intercourse, mutual good-will, and consequently mutual aid and support, which are the life of society: it must not however be overlooked, that the sense of beauty does not tend to advance the interests of society, but when in a due mean with respect to strength. Love, in particular, arising from a sense of beauty, loses, when excessive, its social character; the appetite for gratification, prevailing over affection for the beloved object, is ungovernable, and tends violently to its end, regardless of the misery that must follow. Love, in
this.

* See Grandeur and Motion.

this state, is no longer a sweet agreeable passion: it becomes painful, like hunger or thirst; and produceth no happiness, but in the instant of fruition. This suggests an important lesson, that moderation in our desires and appetites, which fits us for doing our duty, contributes at the same time the most to happiness; even social passions, when moderate, are more pleasurable than when they swell beyond proper bounds.

BEAUTY, in architecture, painting, and other arts, is the harmony and justness of the whole composition taken together.

BEAUVAIS, an episcopal city in the Isle of France, and capital of the Beauvoisis. The cathedral church is dedicated to St Peter, and is much admired for its fine architecture. It contains a great number of relics, and a library of curious books. There are several other churches, among which is one dedicated to St Stephen, remarkable for its curious windows. The town was ineffectually besieged by the English in 1443, and by the duke of Burgundy with an army of 80,000 men. In this last siege the women signalized themselves under the conduct of Jeane Hachette, who set up a standard yet preserved in the church of the Jacobins. The duke was obliged to raise the siege; and in memory of the women exploits, they walk first in a procession on the 10th of July, the anniversary of their deliverance. The inhabitants carry on a good trade in beautiful tapestry. Beauvais is situated on the river Therin, in E. Long. 2. 15. N. Lat. 49. 26.

BEAUVAIS, a town of France, in Upper Languedoc, seated on the river Tescou. E. Long. 1. 43. N. Lat. 44. 2.

BEAUVIN, a city of Burgundy in France, in E. Long. 4. 50. N. Lat. 47.

BEAUVOIR *sur Mer*, a maritime town of Poitou, in France, with the title of marquissate. W. Long. 1. 5. N. Lat. 46. 45.

BEAUVOISIS, a territory of France, formerly part of Picardy, but now of the Isle of France. Beauvais is the capital.

BEBELINGUEN, a town of Germany, in the duchy of Wirtemberg, seated on a lake from which proceeds the river Worm. E. Long. 9. 8. N. Lat. 48. 45.

BEBRYCIA, (anc. geog.), an ancient name of Bithynia, so called from the Bebryces its inhabitants. The Bebryces were afterwards driven out by the Thracians, *viz.* the Bithyni and Thyni; from whom, in process of time, the country took the name of *Bithynia*. See BITHYNIA.

BEC, a town of France, in Normandy, seated on a tongue of land, at the confluence of two rivers, in E. Long. 0. 52. N. Lat. 48. 45.

BECAH, or BEKAH, a Jewish coin, being half a shekel. In Dr Arbuthnot's table of reductions, the bekah amounts to $13\frac{1}{2}$ d. in Dr Prideaux's computation to 1 s. 6 d. Every Israelite paid an hundred bekahs a head annually for the support of the temple.

BECALM, in a general sense, signifies to appease, to allay.

BECALM, in the sea language. A ship is said to be becalmed, when there is not a breath of wind to fill the sails.

BECANOR, a town of India, in Asia, seated on the river Ganges, in E. Long. 83. 5. N. Lat. 27. 40.

BECCABUNGA, BROOKLIME; the trivial name of *Beccabunga* a species of veronica. See VERONICA.

BECCLES, a large town of Suffolk in England, in E. Long. 1. 30. N. Lat. 52. 38.

BECHER (John Joachim), a celebrated chemist, was born at Spire, in 1645. He was connected with the most learned men in Europe; and the emperor, the electors of Mentz and Bavaria, and other persons of high rank, furnished him with the means of making experiments in mathematics, natural philosophy, medicine, and chemistry. As his thoughts were very judicious and uncommon with respect to economy and to increasing the revenues of a state, he was invited to Vienna, where he contributed greatly to the establishment of several manufactures, a chamber of commerce, and an India company; but the jealousy of some of the ministers occasioned his disgrace and ruin. He was not less unhappy at Mentz, Munich, and Wurtzburg; which determined him to go to Haerlem, where he invented a machine for working a great quantity of silk in a little time, and with few hands: but new misfortunes made him come to England, and he died at London in 1685. He wrote many works; the principal of which are, 1. *Physica Subterranea*, which was reprinted at Leipzig in 1703, and in 1739, in octavo, with a small treatise, by E. Stahl, intitled *Specimen Becherianum*. 2. *Experimentum chymicum novum*, 8vo. 3. *Character pro Notitia Linguarum universalis*. 4. *Institutiones Chymicae, seu Manuductio ad Philosophiam Hermeticam*, 4to. 5. *Institutiones Chymicae prodromus*, 12mo. 6. *Experimentum novum ac curiosum de Mineris arenaria perpetua*, &c.

BECHIN, a town of Bohemia, in a circle of the same name. It was taken and burnt by general Bequoy in 1619. It is seated on the river Laufnitz, in E. Long. 15. 12. N. Lat. 49. 14.

BECK, or BEKE, a word which imports a small stream of water issuing from some burn or spring. Hence *Hell-becks*, little brooks in the rough and wild mountains about Richmond near Lancashire, so called on account of their ghastliness and depth.

Beck is chiefly used among us in the composition of names of places originally situated on rivulets: hence Walbeck, Bournbeck, &c. The Germans use *back* in the same manner.

BECKET (Thomas), lord chancellor of England, archbishop of Canterbury in the 12th century. The story of his birth is as extraordinary as that of his life. It is related, that his father Gilbert Becket, some time sheriff of London, went on a pilgrimage to Jerusalem, where, being surprised and enslaved by a party of Saracens, his master's daughter fell in love with him; and that when he made his escape, she followed him to London. So singular an instance of heroic affection struck him; and after consulting with some bishops, he baptized her by the name of *Matilda*, and married her; from which marriage proceeded the haughty Thomas Becket. Being raised to the archbishoprick, he began the great dispute between the crown and the mitre, and sided with the pope: at which king Henry was greatly offended; and calling an assembly of the bishops at Westminster, offered six articles against papal encroachments, which he urged Becket to assent to. Becket, at the importunities of several lords, signed them; but relapsing, he was ordered to be tried as a

Becket,
Becking-
ham.

traitor; upon which he fled into Flanders. The king banished all his relations, and Becket excommunicated all his opposers. At last, after seven years, by the intercession of the French king and the pope, he returned; but refused to absolve these bishops and others he had excommunicated: whereupon the king grew enraged; and four of his knights, thinking to please the king, murdered Becket. Two years after, Becket was canonized; and the same year, a particular collect was appointed to be read in all the churches of the province of Canterbury, for expiating the guilt of his murder. The next year, king Henry returning from France, went to Canterbury, where he did penance, as a testimony of his grief for the murder. In 1221, Becket's body was taken up, 50 years after his murder, in the presence of king Henry III. and a great concourse of the nobility and others, and deposited in a rich shrine, erected at the expence of Stephen Langton archbishop of Canterbury, which was soon visited from all parts, and enriched with the most costly gifts and offerings; and the miracles said to be wrought at his tomb were so numerous, that Gervase of Canterbury tells us, there were two large volumes of them kept in that church. The monks used to raise his body every year; and the day on which this ceremony was performed, which was called the *day of his translation*, was a general holiday: every 50th year there was celebrated a jubilee to his honour, which lasted 15 days: plenary indulgences were then granted to all that visited his tomb; and 100,000 pilgrims have been registered at a time in Canterbury. The devotion towards him had quite effaced in that town the adoration of the Deity; nay, even that of the Virgin. At God's altar, for instance, there were offered in one year 3*l.* 2*s.* 6*d.* at the Virgin's, 63*l.* 5*s.* 6*d.* at St Thomas's, 832*l.* 12*s.* 3*d.* But next year, the disproportion was still greater: there was not a penny offered at God's altar; the Virgin's gained only 4*l.* 1*s.* 8*d.* but St Thomas had got for his share 954*l.* 6*s.* 3*d.* Lewis VII. of France had made a pilgrimage to this miraculous tomb, and had bestowed on the shrine a jewel which was esteemed the richest in Christendom. Henry VIII. to whom, it may easily be imagined, how obnoxious a faint of this character behoved to appear, and how much contrary to all his projects for degrading the authority of the court of Rome, not only pillaged the rich shrine dedicated to St Thomas; but made the faint himself be cited to appear in court, and be tried and condemned as a traitor: he ordered his name to be struck out of the calendar; the office for his festival to be expunged from all breviaries; and his bones to be burnt, and the ashes thrown in the air.

BECKINGHAM (Charles), an English dramatic writer, was the son of a linen-draper in London, and born in 1699. He was educated at that great nursery of learning Merchant-Taylor's school, under the learned Dr Smith, where he made a very great proficiency in all his studies, and gave the strongest testimonials of very extraordinary abilities. In poetry more particularly he very early discovered an uncommon genius, two dramatic pieces of his writing being represented on the stage before he had completed his 20th year: and those not such as required the least indulgence or allowance on account of his years; but such as bore evidence to a boldness of sentiment, an accuracy of dic-

tion, an ingenuity of conduct, and a maturity of judgment, which would have done honour to a much more ripened age. The titles of his plays, both of which are tragedies, are, 1. *Henry IV. of France.* 2. *Scipio Africanus.* At the representation of the last-mentioned piece, which indeed was the first he wrote, his school-master Dr Smith, as a peculiar mark of distinction and regard to the merit of his pupil, gave all his boys a holiday on the afternoon of the author's benefit, in order to afford an opportunity, to such of them as pleased, to pay their compliments to their school-fellow on that occasion. Besides these dramatic pieces, he wrote several other poems: but his genius was not permitted any very long period to expand itself in; for he died on the 18th of February, 1730, in the 32^d year of his age.

BECKUM, a town of the bishopric of Munster, in Germany, seated at the source of the river Verfe, in E. Long. 8. 18. N. Lat. 51. 46.

BECSANGIL, anciently Bithynia, a province of Natolia in Asia; bounded on the north, by the Black Sea; on the west, by the sea of Marmora; on the south, by Natolia Proper; and on the east, by the province of Boli. The principal town is Bursa.

BECTASSE, an order or sect of religious among the Turks, denominated from their founder *Bectasch*, preacher to sultan Amurath. All the Janizaries belonging to the Porte are of the religion of bectasse, being even said to have derived their origin from the founder of this sect. The habit of the bectasse is white: on their heads they wear white caps of several pieces, with turbans of wool, twisted rope-fashion. They observe constantly the hour of prayer, which they perform in their own assemblies, and make frequent declarations of the unity of God.

BED, a convenience for stretching and composing the body on, for ease, rest, or sleep, consisting generally of feathers inclosed in a ticken case. There are varieties of beds, as a standing bed, a fetter-bed, a tent-bed, a truckle-bed, &c.

It was universally the practice, in the first ages, for mankind to sleep upon skins of beasts. It was originally the custom of the Greeks and Romans. It was particularly the custom of the ancient Britons, before the Roman invasion; and these skins were spread on the floor of their apartments. Afterwards they were changed for loose rushes and heather, as the Welch a few years ago lay on the former, and the Highlanders of Scotland sleep on the latter to this present moment. In process of time, the Romans suggested to the interior Britons the use, and the introduction of agriculture supplied them with the means, of the neater convenience of straw-beds. The beds of the * Roman gentry at this period were generally filled with feathers, and those of the ins with the soft down of reeds. But for many ages the beds of the Italians had been constantly composed of straw; it still formed those of the soldiers and officers at the conquest of Lancashire; and from both, our countrymen learnt their use. But it appears to have been taken up only by the gentlemen, as the common Welsh had their beds thinly stuffed with rushes as late as the conclusion of the 12th century; and with the gentlemen it continued many ages afterwards. Straw was used even in the royal chambers of England, as late as the close of the 13th. Most of the peasants

fants about Manchester lie on chaff at present: and straw-beds remain to this day general in France and Italy.—But they were no longer suffered to rest upon the ground. The better mode that had anciently prevailed in the east, and long before been introduced into Italy, was adopted in Britain; and they were now mounted on pedestals †. This, however, was equally confined to the gentlemen. The bed still continued on the floor among the common people. And the gross custom, that had prevailed from the beginning, was retained by the lower Britons to the last; and these ground-beds were laid along the walls of their houses, and formed one common dormitory for all the members of the family. The fashion continued universally among the inferior ranks of the Welch within these four or five ages, and with the more uncivilized part of the Highlanders nearly to our own times. And even at no great distance from Manchester, in the neighbouring Buxton, and within these 60 or 70 years, the persons that repaired to the bath are all said to have slept in one long chamber together; the upper part being allotted to the ladies, and the lower to the gentlemen, and only partitioned from each other by a curtain.

Dining-BED, *lectus tricliniaris*, or *discubitorius*, that whereon the ancients lay at meals. The dining or discubitory beds were four or five feet high. Three of these beds were ordinarily ranged by a square table (whence both the table and the room where they eat were called *triclinium*) in such a manner, that one of the sides of the table remained open, and accessible to the waiters. Each bed would hold three or four, rarely five persons. These beds were unknown before the second Punic war: the Romans, till then, sat down to eat on plain wooden benches, in imitation of the heroes of Homer, or, as Varro expresses it, after the manner of the Lacedæmonians and Cretans. Scipio Africanus first made an innovation: he had brought from Carthage some of these little beds called *panicani*, or *archæici*; being of a wood common enough, very low, stuffed only with straw or hay, and covered with goats or sheep skins, *hædinis pellibus strati*. In reality, there was no great difference, as to delicacy, between these new beds and the ancient benches; but the custom of frequent bathings, which began then to obtain, by softening and relaxing the body, put men on trying to rest themselves more commodiously by lying along than by sitting down. For the ladies, it did not seem at first consistent with their modesty to adopt the mode of lying; accordingly they kept to the old custom all the time of the commonwealth; but, from the first Cæsars, they eat on their beds. For the youth, who had not yet put on the *toga virilis*, they were long kept to the ancient discipline. When they were admitted to table, they only sat on the edge of the beds of their nearest relations. Never, says Suetonius, did the young Cæsars, Caius and Lucius, eat at the table of Augustus; but they were set *in imo loco*, or, as Tacitus expresses it, *ad lecti fulera*. From the greatest simplicity, the Romans, by degrees, carried their dining-beds to the most surprising magnificence. Pliny assures us, it was no new thing to see them covered over with plates of silver, adorned with the softest mats, and the richest counterpanes. Lampridius, speaking of Heliogabalus, says, he had beds of solid silver, *solido argento habit lectos & tricliniarios, & cubiculares*. We may add,

that Pompey, in his third triumph, brought in beds of gold.—The Romans had also beds whereon they studied, and beds whereon the dead were carried to the funeral pile.

BED-Moulding in architecture, a term used for those members of a cornice which are placed below the coronet; and now usually consists of an ogee, a list, a large boustine, and another list under the coronet.

BED of Justice, in the French customs, a throne upon which the king is seated when he goes to the parliament. The king never holds a bed of justice unless for affairs that concern the state, and then all the officers of parliament are clothed in scarlet robes.

BED of the Carriage of a Great Gun, a thick plank, that lies under the piece; being, as it were, the body of the carriage.

BED, in masonry, a course or range of stones; and the joint of the bed is the mortar between two stones, placed over each other.

BED, in gardening, square or oblong pieces of ground, in a garden, raised a little above the level of the adjoining ground, and wherein they sow seeds or plant roots.

Hot-BED. See *HOT-BED*.

Lords of the BED-CHAMBER, in the British customs, ten lords who attend in their turns, each a week; during which time they lie in the king's bed-chamber, and wait on him when he dines in private.

BEDA, commonly called *venerable Bede*, one of our most ancient historians, was born in the year 672, in the neighbourhood of Weremouth, in the bishoprick of Durham. He was educated by the abbot Benedict in the monastery of St Peter, near the mouth of the river Wyre. At the age of 19 he was ordained deacon, and priest in the year 702. About this time he was invited to Rome by Pope Sergius; but there is no sufficient reason to believe that he accepted the invitation. In the year 731 he published his Ecclesiastical History; a work of so much merit, notwithstanding the legendary tales it contains, that it were alone sufficient to immortalize the author. He died in the year 735 of a lingering consumption, probably occasioned by a sedentary life, and a long uninterrupted application to study and literary compositions, of which he left an incredible number. He was buried in the church of his convent at Jarrow; but his bones were afterwards removed to Durham, and there deposited in the same coffin with those of St Cuthbert. Bede was undoubtedly a singular phenomenon in an ignorant and illiterate age. His learning, for the times, was extensive, his application incredible, his piety exemplary, and his modesty excessive. He was universally admired, consulted, and esteemed, during his life; and his writings are deservedly considered as the foundation of our ecclesiastical history. His language is neither elegant nor pure, but perspicuous and easy.—All his works are in Latin. The first general collection of them appeared at Paris, in 1544, in three volumes in folio. They were printed again at the same place in 1554, in eight volumes. They were also published in the same size and number of volumes at Basil in 1563, reprinted at Cologne in 1612, and at the same place in 1688. Besides this general collection, there are several of his compositions, which have been printed separately, or amongst

Bedall
Bedell.

amongst the collections of the writings of ancient authors; and there are several manuscripts ascribed to him, which are preserved in the different libraries in Oxford and Cambridge.

BEDALL, a town in the north riding of Yorkshire. Through this town passes a Roman causeway to Richmond, Barnard-castle, &c. The parts adjacent are noted for hunting and road horses. W. Long. 31. o. N. Lat. 54. 30.

BEDARIEUX, or BEC D' ARIEUX, a town of Languedoc in France, seated on the river Obe, in E. Long. 3. 24. N. Lat. 43. 29.

BEDEL. See BEADLE.

BEDEL, a small town in the north riding of Yorkshire, seated on a little brook; in W. Long. 1. 30. N. Lat. 54. 30.

BEDELL (Dr William), a learned prelate, born in Essex in 1570. He went with Sir Henry Wotton the English ambassador, to the republic of Venice, as his chaplain, in 1604; and continuing eight years in that city, contracted an intimate acquaintance with the famous father Paul, of whom he learned Italian so well as to translate the English Common-Prayer Book into that language: in return he drew up an English grammar for father Paul, who declared he had learned more from him in all parts of divinity, than from any one beside. He was accordingly much concerned when Bedell left Venice; and at his departure presented him with his picture, the MSS. of his History of the country of Trent, his History of the Interdict and Inquisition, with other literary donations. In 1629, he obtained the bishopric of Kilmore and Adragh in Ireland; and finding these dioceses in great disorder, applied himself vigorously to reform the abuses there. He was no persecutor of Papists, but laboured with great success to convert the better sort of the Popish clergy: he procured an Irish translation of the Common-Prayer Book, which he caused to be read in his cathedral every Sunday; and the New Testament having been translated by archbishop Daniel, he procured one of the Old Testament, which he having been prevented from printing himself, was afterward executed at the expense of the great Mr Robert Boyle. He published in 1624, a controversial book against the Roman-catholics, which he dedicated to Charles prince of Wales; and assisted the archbishop of Spalatro in finishing his famous work *De Republica Ecclesiastica*.

When the bloody rebellion broke out in Ireland, in October 1641, the bishop at first did not feel the violence of its effects; for the very rebels had conceived a great veneration for him, and they declared he should be the last Englishman they would drive out of Ireland. His was the only house in the county of Cavan that was unviolated, and it was filled with the people who fled to him for shelter. About the middle of December, however, the rebels, pursuant to orders received from their council of state at Kilkenny, required him to dismiss the people that were with him; which he refused to do, declaring he would share the same fate with the rest. Upon this they seized him, his two sons, and Mr Clogy who had married his daughter-in-law, and carried them prisoners to the castle of Cloughboughter, surrounded by a deep water, where they put them all, except the bishop, in irons; after some time, however, this part of their severity was abated. After being

confined for about three weeks, the bishop and his two sons, and Mr Clogy, were exchanged for some of the principal rebels: but the bishop died soon after, on the 7th of February 1642, his death being chiefly occasioned by his late imprisonment, and the weight of sorrows which lay upon his mind. The Irish did him unusual honours at his burial; for the chief of the rebels gathered their forces together, and with them accompanied his body to the church-yard.

BEDER, a strong town of Asia, in the dominions of the Great Mogul. E. Long. 95. 10. N. Lat. 16. 50. BEDFORD, the county town of Bedfordshire in England, seated on both sides of the river Ouse, over which there is a stone bridge; in W. Long. o. 20. N. Lat. 52. 6. It is an ancient town, and pleasantly situated, but not very large nor well built; though the buildings are much improved of late, and the river made navigable. At this place the Britons were overthrown in a great battle in 572, by Cuthwulf the Saxon king; and here was a strong castle, built in the time of the Normans by Pagan de Beauchamp, the third baron of Bedford. It was reduced by king Stephen after a long siege; and afterwards taken by king John, after a siege of 60 days, from Fulco de Brent, who rebelled against his sovereign, notwithstanding he had taken this castle before from the barons, and had it bestowed upon him by the king. The town is a very ancient corporation, and has long sent members to parliament. It is governed at present by a mayor, recorder, two bailiffs, twelve aldermen, two chamberlains, a town-clerk, and three serjeants. The neighbouring country is very fruitful in wheat, great quantities of which are carried from hence to Hitchen and Hertford markets, fold, ground, and conveyed to London. The town has five churches, a free-school, and several hospitals, and enjoys a good trade in corn by the way of Lynn. When the river is swelled by rains, especially in winter, it is usual in Cambridgehire to say, *the bailiff of Bedford is coming*, meaning, that it is going to lay their fens under water. At this town the noted John Bunyan, author of the Pilgrim's Progress, was educated, if not born.*

BEDFORDSHIRE, an inland county of England, in the Norfolk-circuit, and diocese of Lincoln; bounded on the east and south, by Cambridgehire and Hertfordshire; on the west, by Buckinghamshire; and on the north, by Northamptonshire and Huntingdonshire. It is of an oval form, about 22 miles long, 15 broad, and 73 in compass; within which it contains 260,000 acres, 9 hundreds, 10 market towns, and 124 parishes. The air is pleasant and healthy; and the soil fruitful, especially towards the north, where it is a deep clay. Towards the middle, the face of the country is somewhat hilly and woody, and the soil sandy. Towards the south, though the soil is not very rich, yet it produces abundance of excellent barley. A great part of the country is watered by the windings of the Ouse, which divides it into two parts; and, being navigable, affords an easy conveyance for commodities to or from it. It yields also a great deal of fuller's earth, plenty of wood except on the east side, wood for dyeing, butter and cheefe. Its principal manufactures are bone-lace and straw-hats. It sends four members to parliament, namely, two for Bedford, and two knights for the shire.

BEDLOE (William), who assumed the title of *capt ain*,

* See
Bunyan

captain, was an infamous adventurer of low birth, who had travelled over a great part of Europe under different names and disguises, and had passed among several ignorant persons for a man of rank and fortune. Encouraged by the success of Oates, he turned evidence, gave an account of Godfrey's murder, and added many circumstances to the narrative of the former. These villains had the boldness to accuse the queen of entering into a conspiracy against the king's life. A reward of 500 l. was voted to Bedloe by the Commons. He is said to have asserted the reality of the plot on his death-bed: but it abounds with absurdity, contradiction, and perjury; and still remains one of the greatest problems in the British annals. He died at Bristol 20th August, 1680. Giles Jacob informs us, that he was author of a play called *The Excommunicated Prince, or the False Relic*, 1679. The printer of it having, without the author's knowledge, added a second title, and called it *The Popish Plot in a Plays*, greatly excited the curiosity of the public, who were however much disappointed when they found the plan of the piece to be founded on a quite different story. Anth. a Wood will not allow the captain the merit of this play; but asserts that it was written partly, if not entirely, by one Tho. Walter, M. A. of Jesus college, Oxford.

BEDOUINS, or BEDOUIS, a modern name of the wild Arabs, whether in Asia or Africa*.

BEDRIACUM, (anc. geog.), a village of Italy, situated, according to Tacitus, between Verona and Cremona, but nearer the latter than the former. From the account given by that historian, Cluverius conjectures that the ancient Bedriacum stood in the place where the city of Caneto now stands †. This village was remarkable for the defeat of the emperor Galba by Otho, and afterwards of Otho by Vitellius.

BEDWIN-MAGNA, a village five miles south of Hungerford in Berkshire in England. It has neither market nor fair; but is a borough by prescription, and sends two members to parliament. It is said to have been a considerable place in the time of the Saxons, and that the traces of its fortifications are still extant.

BEE, in zoology. See APIS. But some late curious discoveries relating to bees having escaped the compiler of that article, we shall here supply the omission; and it is hoped that the importance of these discoveries, considered either in a philosophical or an economical view, will be a sufficient excuse for exhibiting them at so great length.

“*Discoveries on the sex of BEES, explaining the manner in which their species is propagated; with an account of the utility that may be derived from those discoveries by the actual application of them to practice †.*” The most skilful naturalists have been strangely misled in their opinion, that the bees, as well as the other tribes of animals, are perpetuated by copulation; though they acknowledge that they have never been able to detect them in the act. This part of physics has been the principal object of my researches for several years past, having been insensibly engaged in it by the pleasure I took in so curious an inquiry. The results of various experiments, made all in glass-hives, which carry with them an entire evidence, afford sufficient reasons to assert, that bees belong to that class of animals among which, altho' they have sexes, a true copulation cannot be proved; and that their ova, like the spawn of fishes,

most probably owe their fecundation to an impregnation from the males, as will appear in the sequel of this narrative.

“In order to be the better understood in the relation of my own experiments on the fecundation of bees, I here premise the outlines of the opinions generally adopted by naturalists on that head. They assert, that the queen is the only female in the hive, and the mother of the next generation; that the drones are the males by which she is fecundated; and that the working bees, or bees that collect wax on the flowers, that knead it and form from it the combs and cells which they afterwards fill with honey, are of neither sex.

“But of late Mr Schirach, a German naturalist, has given us a very different view of the classes that constitute the republic of bees, in an ingenious publication in his own language, under the title of *The Natural History of the Queen of the Bees*; from which I beg leave to relate the author's doctrine with regard to the working-bees only, the quality and functions of the drones being points which do not appear to be yet settled by Mr Schirach himself. He affirms, that all the common bees are females in disguise; in which the organs that distinguish the sex, and particularly the ovaria, are obliterated, or at least, through their excessive minuteness, have not yet been observed: that every one of those bees in the earlier period of its existence is capable of becoming a queen-bee, if the whole community should think proper to nurse it in a particular manner, and raise it to that rank. In short, that the queen-bee lays only two kinds of eggs; viz. those that are to produce the drones, and those from which the working-bees are to proceed.

“The trials made by Mr Schirach seem to evince the truth of his conclusions in the most satisfactory manner, singular as they appear to be at first sight; and indeed, in my own judgement, from the constant happy result of my numerous experiments, which I began near two years before Mr Schirach's publication, and repeated every season since, I am enabled to pronounce on their reality. Chance befriended me in that discovery, whilst I was most anxiously endeavouring to ascertain the use of drones. It was in the spring of the year 1770, that I for the first time discovered what Maraldi had only conjectured, I mean the impregnation of the eggs by the males, and that I was made acquainted with the difference of size in the drones or males observed by Maraldi in his *Observations upon Bees*”. “We have of late found great quantities of drones much smaller than those we had formerly observed, and which do not exceed in size the common bees; so that it would not have been easy to distinguish them in that hive from the common bees, had not the quantity of them been very considerable. It might certainly have happened that in those hives, where we have not been able to discover large drones, there were a great number of those little ones, which may have been intermixed among common bees when we were yet ignorant that any such small drones were existing.”

“Reaumur himself, says, ‘We have likewise found drones that were no bigger than the common bees.’—They have notwithstanding escaped the observation of Mr Schirach, and of his friend Mr Hattorf member of an academy in Lusatia, who, in a memoir he presented in the year 1769, annihilates entirely the use of drones

Arabia, &c.

Caneto.

Mr De-

Transf. LXVII &c.

* History of the Royal Academy of Sciences of Paris, p. 1712, p.

drones in a hive; and advances this singular opinion, that the queen-bee of a hive lays eggs which produce young ones, without having any communication with the drones. For what purpose should wife nature then have furnished the drones with that large quantity of seminal liquor? To what use so large an apparatus of fecundating organs, so well described by Reaumur and Maraldi?

“ But I beg leave to remark, that those gentlemen seem to have drawn too hasty conclusions from their experiments, in rejecting the drones as bearing no share in the propagation of those insects. Their observations, that hives are peopled at a time of the year when there are no drones in being, are no ways conclusive; as it is evident, that they had seen none but drones of a large size, their silence on the difference in the size of them justifying my remark. But to resume the narrative of my experiments: I had watched my glass-hives with indefatigable attention from the moment the bees, among which I had taken care to leave a number of drones, were put into them, to the time of the queen laying her eggs, which generally happens the fourth or fifth day. I observed the first or second day (always before the third) from the time the eggs are placed in the cells, that a great number of bees, fastening themselves to one another, hung down in the form of a curtain from the top to the bottom of the hive, in a similar manner they had done before at the time the queen deposited her eggs; an operation which (if we may conjecture at the instincts of insects) seems contrived to hide what is transacting: be that as it will, it answered the purpose of informing me that something was going forward. In fact, I presently after perceived several bees, the size of which through this thick veil (if I may so express myself) I could not rightly distinguish, inserting the posterior part of their bodies each into a cell, and sinking into it, where they continued but a little while. After they had retired, I saw plainly with the naked eye a small quantity of a whitish liquor left in the angle of the basis of each cell, containing an egg: it was less liquid than honey, and had no sweet taste at all. Within a day after, I found this liquor absorbed into the embryo; which on the fourth day is converted into a small worm, to which the working bees bring a little honey for nourishment during the first eight or ten days after its birth. After that time they cease to feed them; for they shut up the cells, where these embryos continue inclosed for ten days more, during which time they undergo various changes too tedious here to describe.

“ To evince the reality of this observation, and to prove that the eggs are fecundated by the males, and that their presence is necessary at the time of breeding, I proceeded to the next experiments. They consisted in leaving in a hive the queen with only the common bees, without any drones, to see whether the eggs she laid would be prolific. I accordingly took a swarm, shook all the bees into a tub of water, and left them in it till they were quite senseless, which gave me an opportunity to distinguish the drones without any danger of being stung. After I had recovered the working-bees and their queen from the state they were in, by spreading them on brown paper in the sun, I replaced them in a glass-hive, where they soon began to work as usual: the queen laid eggs, which I little suspected

to be impregnated, as I thought I had separated all the drones or males, and therefore omitted watching the bees; but at the end of 20 days (the usual time of their hatching) I found to my surprize some of the eggs hatched into bees, others withered away, and several of them covered with honey. I immediately inferred that some of the males, having escaped my notice, had impregnated only part of the eggs; but, in order to convince myself of the truth of my supposition, I thought it necessary to take away all the brood-comb that was in the hive, in order to oblige the bees to provide a fresh quantity, being fully determined to watch narrowly their motions after new eggs should be deposited in the cells. This was done accordingly, and at last the mystery was unravelled. On the second day after the eggs were placed in the cells, I perceived the same operation which I have related in a former experiment; I mean, the bees hung down in the form of a curtain, while others thrust the posterior part of their body into the cells: I then introduced my hand into the hive, broke off a piece of the comb containing two of those insects, and kept them for examination. I found in neither of them any sting (a circumstance peculiar to drones only); and upon dissection, by the help of a Dollond's microscope, discovered in them the four cylindrical bodies, which contain the glutinous liquor of a whitish colour, observed by Maraldi in the large drones.

“ Having till then never observed any difference in the size of drones, I immediately perused the Memoirs on Bees published by Messrs Maraldi and Reaumur, and found that they had remarked it frequently. The reason of that difference must, I doubt, be placed amongst other *arcana* of nature. I found myself therefore under a necessity, in my next experiments, to be more particular in destroying the males, even those which might be suspected to be such.

“ I once more immerged all the same bees in water; and, when they appeared to be in a senseless state, I gently pressed every one of them between my fingers, in order to distinguish those armed with stings from those that had none, which last I might suspect to be males. Of these I found 57, exactly of the size of common bees, yielding a little whitish liquor on being pressed between the fingers. I killed every one, and replaced the swarm in a glass-hive, where they immediately applied again to the work of making cells; and on the fourth or fifth day, very early in the morning, I had the pleasure to see the queen-bee depositing her eggs in those cells, which she did by placing the posterior part of her body in each of them. I continued on the watch most part of the ensuing days, but could discover nothing of what I had seen before.

“ The eggs, after the fourth day, instead of changing in the manner of caterpillars, were found in the same state they were in the first day, except that some of them were covered with honey. But a very singular event happened the next day about noon: all the bees left their own hive, and were seen attempting to get into a neighbouring common hive, on the stool of which I found their queen dead, having, no doubt, been slain in the engagement. The manner in which I account for this event is as follows: the great desire of perpetuating their species, which is most observable in these insects, and to which end the concurrence of the males seems

seems so absolutely necessary, made them desert their own habitation where no males were left, in order to fix their residence in a new one, in which, there being a good flock of males, they might the better accomplish their purpose. If this does not yet establish the reader's faith of the necessity of the males bearing a share in the fecundation of the ova, the next experiment cannot, I presume, fail to convince him.

"I took the brood-comb which, as I observed before, had not been impregnated; I divided it into two parts; one I placed under a glass-bell N° 1. with honey-comb for the bees' food; I took care to leave a queen, but no drones, among the common bees I confined in it. The other piece of brood-comb I placed under another glass-bell N° 2. with a few drones, a queen, and a number of common bees proportioned to the size of the glass; the rest I disposed of as before. The result was, that in the glass N° 1. no impregnation happened; the eggs remained in the same state they were in when put into the glass; and, upon giving the bees their liberty on the seventh day, they all flew away, as was found to be the case in the former experiment: whereas in the glass N° 2. I saw, the very day after the bees had been put under it, the impregnation of the eggs by the drones in every cell containing eggs; the bees did not leave their hive on receiving their liberty; and, in the course of 20 days, every egg underwent all the above-mentioned necessary changes, and formed a pretty numerous young colony, in which I was not a little startled to find two queens.

"Fully satisfied concerning the impregnation of the eggs by the males, I desisted for the present from any further experiments on that head, being exceedingly anxious to endeavour to account for the presence of this new queen.

"I conjectured that either two queens, instead of one, might have been left among the bees I had placed under that glass; or else that the bees could, by some particular means of their own, transform a common subject into a queen. In order to put this to the test, I repeated the experiment with some variation. I got four glass-hives blown flat, which I thought preferable to the bell-shaped ones I had used before, as I could with those better examine what was going forward. I took a large brood-comb from an old hive, and, after having divided it into several pieces, I put some of them, containing eggs, worms, and nymphs, with food, viz: honey, &c. under each of the glasses; and confined within each a sufficient number of common bees, among which I left some drones, but took care that there should be no queen.

"The bees finding themselves without a queen, made a strange buzzing noise, which lasted near two days; at the end of which they settled and betook themselves to work: on the fourth day I perceived in each hive the beginning of a royal cell, a certain indication that one of the inclosed worms would soon be converted into a queen. The construction of the royal cell being nearly accomplished, I ventured to leave an opening for the bees to get out; and found that they returned as regularly as they do in common hives, and showed no inclination to desert their habitation. But, to be brief, at the end of twenty days, I observed four young queens among the new progeny.

"On relating the result of these experiments to a mem-

ber of this university, well conversant in the natural history of bees, he deemed it necessary, that they should be repeated, in order the better to establish the truth of a fact seemingly so improbable, that the eggs destined by nature to produce neutral or common bees, should be transformed into females or queens. He started an objection, that the queen-bee of a hive, besides the eggs which she deposits in the royal cells, might also have laid royal or female eggs either in the common cells, or indiscriminately throughout the different parts of the hive. He further supposed, that in the pieces of brood-comb, which had been successfully employed in the last experiments for the production of a queen, it had constantly happened, that one or more of these royal eggs, or rather the worms proceeding from them, had been contained.

"But the force of his objection was removed soon after by the same success having attended a number of other experiments, an account of which would take up too much room here; and he was at last brought to admit, that the working-bees are invested with a power of raising a common subject to the throne, when the community stands in need of a queen; and that accordingly every worm of the hive is capable, under certain circumstances, of becoming the mother of a generation: that it owes its metamorphosis into a queen, partly to the extraordinary size of the cell, and its particular position in it; but principally to a certain nourishment appropriated to the occasion, and carefully administered to it by the working-bees while it is in the worm-flate, by which, and possibly other means as yet unknown, the development and expansion of the germ of the female organs, previously existing in the embryos, is effected, and those differences in its form and size are produced, which afterwards so remarkably distinguish the queen from the common working-bees. And finally it appears evident, from the experiments made by Mr Schirach and myself, that the received opinion, that the queen lays a particular kind of eggs, appropriated to the production of other queens, is erroneous.

"I shall now beg leave to point out the advantage that may accrue to the public from these observations, which is that of forming artificial swarms or new colonies; or, in other words, of furnishing the means to bring on a numerous increase of those useful insects: an object of some importance to this kingdom, as being the only means to prevent the annual exportation of considerable sums in the purchase of wax, a great quantity of which is lost every season for want of keeping up a sufficient stock of bees to collect it.

"The practice of this new art, Mr Schirach tells us, has already extended itself through Upper Lusatia, the Palatinate, Bohemia, Bavaria, Silesia, and even in Poland. In some of those countries it has excited the attention and patronage of government; and even the empress of Russia has thought it of such importance, that she has sent a person to Klein Baatzen, to be instructed in the general principles, and learn all the *minutiae* of this new art."

BEE is also used figuratively to denote sweetness, industry, &c. Thus Xenophon is called the *Attic bee*, on account of the great sweetness of his style. Antoinis got the denomination *Melissa* or *Bee*, on account of his collection of common-places.—Leo Allatius gave

the appellation *apes urbane* to the illustrious men at Rome from the year 1630 to the year 1632.

BEE'S-BREAD. See *APIS*, n° 12. par. ult.

BEE-EATER, in zoology. See *MEROPS*.

BEE-FLOWER. See *OPHRYS*.

BEE-GLUE, called by the ancients *propolis*, is a soft, unctuous, glutinous matter, employed by bees to cement the combs to the hives, and to close up the cells *.

BEE-HIVES. See *APIS*, n° 19, 28, 30.

BEECH-TREE, in botany. See *FAGUS*.

BEECH-MAST, the fruit of the beech-tree, said to be good for fattening hogs, deer, &c.—It has sometimes, even to men, proved an useful substitute for bread. Chios is said to have endured a memorable siege by means of it.

BEECH-OIL, an oil drawn by expression from the mast of the beech-tree, after it has been shelled and pounded. This oil is very common in Picardy, and used there and in other parts of France instead of butter; but most of those who take a great deal of it, complain of pains and a heaviness in the stomach.

BEEF, the flesh of black-cattle prepared for food.

According to Dr Cullen *, beef, though of a more firm texture and less soluble than mutton, is equally calefactive, perspirable, and nutritious: and if in the southern countries it is not esteemed so, it is on account of its impregnation there.

BEELE, a kind of pick-ax, used by the miners for separating the ores from the rocks in which they lie: this instrument is called a *tubber* by the miners of Cornwall.

BEER, is a spirituous liquor made from any farinaceous grain, but generally from barley. It is, properly speaking, the wine of barley. The meals of any of these grains being extracted by a sufficient quantity of water, and remaining at rest in a degree of heat requisite for the spirituous fermentation, naturally undergo this fermentation, and are changed into a vinous liquor. But as all these matters render the water mucilaginous, fermentation proceeds slowly and imperfectly in such liquors. On the other side, if the quantity of farinaceous matter be so diminished that its extract or decoction may have a convenient degree of fluidity, this liquor will be impregnated with so small a quantity of fermentable matter, that the beer or wine of the grain will be too weak, and have too little taste.

These inconveniences are remedied by preliminary operations which the grain is made to undergo.—These preparations consist in steeping it in cold water, that it may soak and swell to a certain degree; and in laying it in a heap with a suitable degree of heat, by means of which, and of the imbibed moisture, a germination begins, which is to be stopped by a quick drying, as soon as the bud shews itself. To accelerate this drying, and render it more complete, the grain is slightly roasted, by making it pass down an inclined canal sufficiently heated. This germination, and this slight roasting, changes considerably the nature of the mucilaginous fermentable matter of the grain.* The germination attenuates much, and in some measure totally destroys, the viscofity of the mucilage; and it does this, when not carried too far, without depriving the grain of any of its disposition to ferment. On the contrary, it changes the grain into a saccharine substance, as may be perceived by mashing grains beginning to germinate. The slight roasting contributes also to attenuate

the mucilaginous fermentable matter of the grain. When the grain is thus prepared, it is fit to be ground, and to impregnate water with much of its substance without forming a glue or viscous mass. The grain thus prepared is called *malt*. This malt is then to be ground; and all its substance, which is fermentable and soluble in water, is to be extricated by means of hot water. This extract or infusion is sufficiently evaporated by boiling in caldrons; and some plant of an agreeable bitterness, such as hops, is at that time added, to heighten the taste of the beer, and to render it capable of being longer preserved. Lastly, this liquor is put into casks, and allowed to ferment; nature performs the rest of the work, and is only to be assisted by the other most favourable circumstances for the spirituous fermentation. See *FERMENTATION*.

Foreigners have framed divers conjectures to account for the excellency of the British beer, and its superiority to that of other countries, even of Bremen, Mons, and Rostock. It has been pretended, our brewers throw dead dogs head'd into their wort, and boil them till the flesh is all consumed. Others, more equitable, attribute the excellency of our beer to the quality of our malt and water, and the skill of our brewers in preparing it.

Sour beer may be restored divers ways; as by salt made of the ashes of barley-straw, put into the vessel, and stirred; or by three or four handfuls of bech-ashes thrown into the vessel, and stirred; or, where the liquor is not very sour, by a little put in a bag, without stirring: chalk calcined, oyster-shells, egg-shells burnt, sea-shells, crabs eyes, calcined coral, &c. do the same, as they imbibe the acidity, and unite with it into a sweetness.—Beer, it is said, may be kept from turning sour in summer, by hanging into the vessel a bag containing a new-laid egg, pricked full of little pin-holes, some laurel-berries, and a few barley-grains; or by a new-laid mirr and walnut-tree leaves. Glauber commends his sal mirabile and fixed nitre, put in a linen bag, and hung on the top of the cask to as to reach the liquor, not only for recovering four beer, but preserving and strengthening it.

Laurel-berries, their skin being peeled off, will keep beer from *deadness*; and beer already dead may be restored by impregnating it with fixed air *.

Beer tasting of the cask may be freed from it by putting a handful of wheat in a bag, and hanging it in the vessel.

BEESTINGS, or **BREASTINGS**, a term used by country-people for the first milk taken from a cow after calving.—The beestings are of a thick consistence, and yellow colour, seeming impregnated with sulphur. Dr Morgan imagines them peculiarly fitted and intended by nature to cleanse the young animal from the recrements gathered in its stomach and intestines during its long habitation *in utero*. The like quality and virtue he supposes in womens first milk after delivery; and hence infers the necessity of the mother's suckling her own child, rather than committing it to a nurse whose first milk is gone.

BEE, in botany. See *BETA*.

BEE-TLE, in the history of insects. See *SCARABEUS*.

BEE-TLE also denotes a wooden instrument for driving piles, &c. It is likewise called a *stamper*, and by

BEFORT, a small but strong town of France, and capital of Suntgaw in Alsace. It was ceded to France, by the treaty of Westphalia in 1648. There are not above 100 houses in this town, but it is important on account of the great road by this place from Franche Comte. The fortifications were greatly augmented by Lewis XIV. It is seated at the foot of a mountain. E. Long. 6. 2. N. Lat. 47. 38.

BEG, or **BEX**, in the Turkish affairs. See **BEY**.

Beg is more particularly applied to the lord of a banner, called also in the same language *sangiac-beg*. A beg has the command of a certain number of the spahis, or horse, maintained by the province under the denomination of *timariots*. All the begs of a province obey one governor-general called *begler-beg*, or *beyler-beg*, q. d. lord of lords, or of the beys of the province.

BEGS, or **BEGHS**, of Egypt, denote twelve generals, who have the command of the militia or standing forces of the kingdom; and are to secure the country from the insults of Arabs, as well as to protect the pilgrims in their annual expeditions to Mecca. The begs, several of whom are descended from the ancient race of the Mamalukes, are very rich and powerful, maintaining each 500 fighting men for their own guard, and the service of their court. On discontents, they have frequently risen in rebellion. They are often at variance with the bashaw, whom they have more than once plundered and imprisoned.

BEGHARDS. See **BEGUARDS**.

BEGLERBEG, a governor of one of the principal governments in the Turkish empire, and next in dignity to the grand vizier. To every beglerbeg the grand signior gives three ensigns or slaves, trimmed with a horse-tail; to distinguish them from the bashaws, who have but two; and from simple begs, or sangiac begs, who have but one.

The province or government of beglerbeg is called *beglerbeglik*, or *beglierbeglik*. These are of two sorts; the first called *bajulo beglerbeglik*, which have a certain rent assigned out of the cities, countries, and signiories allotted to the principality; the second called *salianæ beglerbeglik*, for maintenance of which is annexed a salary or rent, collected by the grand signior's officers with the treasure of the empire. The beglerbegs of the first sort are in number 22, viz. those of Anatolia, Carmania, Diarbekir, Damascus, Aleppo, Tripoli, Trebizond, Buda, Temiswar, &c. The beglerbegs of the second sort are in number six, viz. those of Cairo, Babylon, &c. Five of the beglerbegs have the title of *viziers*, viz. those of Anatolia, Babylon, Cairo, Romania, and Buda.

The beglerbegs appear with great state, and a large retinue, especially in the camp, being obliged to bring a soldier for every 5000 aspers of rent which they enjoy. Those of Romania brought 10,000 effective men into the field.

The beglerbegs are become almost independent, and have under their jurisdiction several sangiacs or particular governments, and begs, agas, and other officers who obey them.

BEGUARDS, or **BEGHARDS**, religious of the third order of St Francis in Flanders. They were established at Antwerp in the year 1228, and took St Begge for their patroness, whence they had their name.

From their first institution they employed themselves in making linen cloth, each supporting himself by his own labour, and united only by the bonds of charity, without having any particular rule. But, when Pope Nicolas IV. had confirmed that of the third order of St Francis, in 1289, they embraced it the year following. They were greatly favoured by the dukes of Brabant, particularly John II. and John III. who exempted them from all contributions and taxes. In the year 1425, they began to live in common, and made solemn vows in 1467, after having taken the habit of the Tertiaries (or religious of the third order of St Francis) of Liege. At last, in 1472, they became subject to the general of the congregation of Zepperen in the diocese of Liege, to which they were united by Pope Sixtus IV. As the convent of Antwerp is since become very considerable, the name of *Beguards* has been given to all the other religious of the same congregation. But, in 1650, Pope Innocent X. having suppressed the general of the congregation of Zepperen, all the convents of the third order of St Francis, in the dioceses of Liege, Malines, and Antwerp, were submitted to the visitation, jurisdiction, and correction, of the general of Italy, and erected into a province, under the title of the *province of Flanders*. This province has at present 10 or 12 convents, the principal of which are those of Antwerp, Brussels, Maastricht, and Louvain.

BEGUINES, a congregation of religious or nuns founded either by St Begge, founder likewise of the *Beguards*, or by Lambert le Begue; of whom the former died about the end of the seventh century, the latter about the end of the 12th. They were established first at Liege, and afterwards at Neville, in 1207; and from this last settlement sprang the great number of *Beguinaiges*, which are spread over all Flanders, and which have passed from Flanders into Germany. In the latter country, some of these religious fell into extravagant errors, persuading themselves that it was possible, in the present life, to arrive at the highest perfection, even to impeccability, and a clear view of God; in short, to so eminent a degree of contemplation, that there was no necessity, after this, either to observe the falls of the church, or submit to the direction and laws of mortal men. The council of Vienna, in 1113, condemned these errors, and abolished the order of *Beguines*; permitting, nevertheless, those among them, who continued in the true faith, to live in chastity and penitence, either with or without vows. It is by favour of this latter clause, that there still subsist so many communities of *Beguines* in Flanders; who, since the council of Vienna, have conducted themselves with so much wisdom and piety, that Pope John XXII. by his decretal, which explains that of his predecessor made in the council of Vienna, took them under his protection; and Boniface VIII. in another, exempted them from the secular tribunal, and put them under the jurisdiction of the bishops.

There is scarce a town in the Low-Countries, in which there is not a society of *Beguines*; and, notwithstanding the change of religion at Amsterdam, there is a very flourishing one in that city. These societies consist of several houses placed together in one inclosure, with one or more churches, according to the number of *Beguines*. There is in every house a

Beheading
Behn.

priores, or mistres, without whose leave they dare not fit out. They make a sort of vow, which is conceived in the following terms: "I. N. promise to be obedient and chaste as long as I continue in this Beguinage." They observe a three years novitiate before they take the habit. The rector of the parish is superior of the Beguinage; and he does nothing without the advice of eight Beguines. They were formerly habited in different manners; some in grey, others in blue; but at present they all wear black. When they go abroad, in Amsterdam, they put on a black veil. Formerly they had as many different statutes as there were societies. In the visitations of the year 1600 and 1601, by the archbishop Matthias Hovius, they were forbidden, under the penalty of a fine, to have lap-dogs. The finest Beguinage in Flanders is that of Malines. That of Antwerp likewise is very spacious, and has two separate churches.

BEHEADING, a capital punishment, inflicted by cutting off the head with an ax, sword, &c.

Among the Romans, beheading was a military punishment, performed at first with an ax, but afterwards with a sword, as done at present in Holland and France. In England the ax is preferred; and in Scotland they use for this purpose a machine called a *maiden*. See MAIDEN.

BEHEMOTH, the hippopotamus, or river-horse*.

BEHEN, in botany. See CUCUBALUS.

BEHN (Aphara), a celebrated authoress, descended from a good family in the city of Canterbury, was born some time in Charles I.'s reign, but in what year is uncertain. Her father's name was *Johnson*, who through the interest of the lord Willoughby, to whom he was related, being appointed lieutenant-general of Surinam, and 36 islands, undertook a journey to the West-Indies, taking with him his whole family, among whom was our poetess, at that time very young. Mr Johnson died in the voyage; but his family reaching Surinam, settled there for some years. Here it was that she learned the history of, and acquired a personal intimacy with, the American prince Oroonoko and his beloved Imoinda, whose adventures she hath so pathetically related in her celebrated novel of that name, and which Mr Southerne afterwards made such an admirable use of in making it the ground-work of one of the best tragedies in the English language.

On her return to London, she became the wife of one Mr Behn, a merchant, residing in that city, but of Dutch extraction. How long he lived after their marriage, is not very apparent, probably not very long; for her wit and abilities having brought her into high estimation at court, king Charles II. fixed on her as a proper person to transact some affairs of importance abroad during the course of the Dutch war. To this purpose she went over to Antwerp, where, by her intrigues and gallantries, she so far crept into the secrets of state, as to answer the ends proposed by sending her over. Nay, in the latter end of 1666, she, by means of the influence she had over one Vander Albert, a Dutchman of eminence, whose heart was warmly attached to her, she wormed out of him the design formed by De Ruyter, in conjunction with the family of the De Wits, of sailing up the Thames and burning the English ships in their harbours, which they afterwards put in execution at Rochester. This she immediately communicated to

the English court: but though the event proved her intelligence to be well grounded, yet it was at that time only laughed at; which, together probably with no great inclination shewn to reward her for the pains she had been at, determined her to drop all further thoughts of political affairs, and during the remainder of her stay at Antwerp to give herself up entirely to the gaiety and gallantries of the place. Vander Albert continued his addresses, and after having made some unsuccessful attempts to obtain the possession of her person on easier terms than matrimony, at length consented to make her his wife; but while he was preparing at Amsterdam for a journey to England with that intent, a fever carried him off, and left her free from any amorous engagements. In her voyage back to England, she was very near being lost, the vessel she was in being driven on the coast by a storm; but happening to founder within sight of land, the passengers were, by the timely assistance of boats from the shore, all fortunately preserved.

From this period she devoted her life entirely to pleasure and the muses. Her works are extremely numerous, and all of them have a lively and amorous turn. It is no wonder then that her wit should have gained her the esteem of Mr Dryden, Southerne, and other men of genius, as her beauty, of which in her younger part of life she possessed a great share, did the love of those of gallantry. Nor does she appear to have been any stranger to the delicate sensations of that passion, as appears from some of her letters to a gentleman, with whom she corresponded under the name of Lycida, and who seems not to have returned her flame with equal ardor, or received it with that rapture her charms might well have been expected to command.

She published three volumes of Miscellany Poems; two volumes of Histories and Novels; translated Fontenelle's Plurality of Worlds, and annexed a Criticism on it; and her Plays make four volumes. In the dramatic line, the turn of her genius was chiefly to comedy. As to the character her plays should maintain in the records of dramatic history, it will be difficult to determine, since their faults and perfections stand in strong opposition to each other. In all, even the most indifferent of her pieces, there are strong marks of genius and understanding. Her plots are full of business and ingenuity, and her dialogue sparkles with the dazzling lustre of genuine wit, which every where glitters among it. But then she has been accused, and that not without great justice, of interlarding her comedies with the most indecent scenes, and giving an indulgence in her wit to the most indelicate expressions. To this accusation she has herself made some reply in the Preface to the Lucky Chance; but the retorting the charge of prudery and preciseness on her accusers, is far from being a sufficient exculpation of herself. The best and perhaps the only true excuse that can be made for it is, that, as she wrote for a livelihood, she was obliged to comply with the corrupt taste of the times.

After a life intermingled with numerous disappointments, she departed from this world on the 16th of April 1689, and lies interred in the cloysters of Westminster-Abbey.

BEJA, an ancient town of Portugal, in the province of Alentejo. It is seated in a very agreeable and fruitful plain, remarkable for excellent wine. There are three

* See Hippopotamus.

three gates remaining, which are of Roman architecture, and a great many Roman antiquities are dug out of the earth. The town has a strong castle for its defence, and is situated W. Long. 7. 20. N. Lat. 37. 58. It was taken from the Moors in 1162.

BEJAR, a town of Estremadura in Spain, famous for its baths. It is seated in a very agreeable valley surrounded with high mountains whose tops are always covered with snow. Here the dukes of Bejar have a handsome palace. In this neighbourhood are forests filled with game, and watered by fine springs; also a lake abounding with excellent fish, particularly trouts. They pretend that this lake makes such a noise before a storm, that it may be heard 15 miles off.

BEICHLINGEN, a town of Thuringia in Upper Saxony, in E. Long. 11. 50. N. Lat. 51. 20.

BELLA, a town of Italy, in Piedmont. E. Long. 7. 45. N. Lat. 45. 2.

BEILSTEIN, a town of the landgraviate of Hesse in Germany, in E. Long. 8. 0. N. Lat. 50. 30.

BEINHEIM, a fort of Alsace in France, seated on the river Sur, near its confluence with the Rhine, in E. Long. 8. 12. N. Lat. 45. 2.

BEIRA, a province of Portugal, bounded on the west by the ocean, on the south by the Portuguese Estremadura, on the south-east by the Spanish province of the same name, on the east by the province of Trallos Montos, and on the north by the river Douro. It extends in length about 34 leagues, and in breadth about 30 leagues, and is divided into six comarcas. Within this province lies Lamego, where the first assembly of the states was held; the chief episcopal city of Coimbra, or Coimbra, which is likewise an university; and Viseo, also a bishopric, and formerly the capital of a dukedom. The country is equally agreeable and fruitful, producing corn, wines, &c. in abundance, and the hills affording excellent pasture to cattle and sheep. The settled militia consists of about 10,000 men.

BEIRAM, or BAIKAM. See BAIKAM.

BEIZA, or BEIZATH, in Hebrew antiquity, a word signifying an egg; as also a certain measure in use among the Jews. The beiza was likewise a gold coin, weighing 40 drachms, among the Persians, who gave out, that Philip of Macedon owed their king Darius 1000 beizaths or golden eggs, for tribute-money; and that Alexander the Great refused to pay them, saying, that the bird which laid these eggs was flown into the other world.

BEK (David), a famous Dutch portrait painter, and disciple of Vandeyk; whose skill in his profession, and politeness of address, acquired him high esteem in most courts of Europe. He was in great favour with Charles I. king of England, and taught the principles of drawing to his sons Charles and James. He went afterward into the service of the kings of France, Denmark, and of Christina queen of Sweden, who made him first gentleman of her bedchamber. His manner of painting was so quick, that our king Charles told him, he believed he could paint if he was riding post. It is said, that in travelling through Germany, he fell sick at an inn, and was laid out for dead. His servants drinking for consolation by his bed-side, one of them in a drunken freak said, "Our master was fond of a glass while he was alive, and out of gratitude let us give him a glass now when he is dead." The proposal

proving agreeable, he raised up his master's head, and endeavouring to pour some wine into his mouth, Bek opened his eyes; and being compelled, nevertheless, to drink the glass-full, gradually revived. He lived some years after, though he died at 35 years old, in 1656.

BEKKER (Balthazar), one of the most famous Dutch divines, and author of the celebrated book, *The World bewitched*, an ingenious piece, against the vulgar notion of spirits. This raised a terrible clamour against him. He was deposed from the office of minister; but the magistrates of Amsterdam continued him his pension. He died in 1698.

BEL (MATTHIAS), was born in Hungary, and became a Lutheran minister at Presburg, and historiographer to the emperor Charles VI. He wrote, among other works, a *History of Hungary*, which was so much admired, that the emperor sent him letters of nobility; and notwithstanding his being a Lutheran, the pope, in 1736, sent him his picture, and many large gold medals. He was a member of the Royal Society of London, and of the academies of Berlin and Peterburg; and died in 1749, at 66 years of age.

BEL, or *Belus*, the supreme god of the ancient Chaldeans or Babylonians. He was the founder of the Babylonian empire; and is supposed to be the Nimrod of Scripture, and the same as the Phœnician Baal. This god had a temple erected to him in the city of Babylon, on the very uppermost range of the famous tower of Babel, or Babylon, wherein were many statues of this deity; and one, among the rest, of massy gold, 40 feet high. The whole furniture of this magnificent temple was of the same metal, and valued at 800 talents of gold.—This temple, with its riches, was in being till the time of Xerxes, who, returning from his unfortunate expedition into Greece, demolished it, and carried off the immense wealth which it contained. It was the statue of this god which Nebuchadnezzar, being returned to Babylon after the end of the Jewish war, set up and dedicated in the plain of Dura; the story of which is related at large in the third chapter of Daniel.

BEL and the Dragon (the history of); an apocryphal, and uncanonical, book of Scripture. It was always rejected by the Jewish church, and is extant neither in the Hebrew nor the Chaldean language, nor is there any proof that it ever was so. St Jerom gives it no better title than the *fable of Bel and the Dragon*. It is however permitted to be read, as well as the other apocryphal writings, for the instruction and improvement of manners.

BELAC, a small city of France, in the province of the Lyonnais, and district of La Marche. E. Long. 1. 15. N. Lat. 46. 15.

BELCASTRO, an episcopal city of Italy in the farther Calabria, and kingdom of Naples. It is seated on a mountain, in E. Long. 17. 15. N. Lat. 39. 6.

BELCHITE, a town of Spain, in the kingdom of Arragon, seated on the river Almonazir, in W. Long. 0. 30. N. Lat. 41. 19.

BELCHOE, a town of Ireland, in the province of Ulster, and county of Fermanagh, seated on Lough Nilly, in W. Long. 6. 6. N. Lat. 54. 2.

BELEM, a town of Estremadura in Portugal, about a mile from Lisbon. It is seated on the north side of the river Tajo, and is designed to defend the entrance

Belemnites
Beleſis.

to Liſbon; and here all the ſhips that ſail up the river muſt bring to. In this place they enter the kings and queens of Portugal.

BELEMNITES, vulgarly called *thunder-bolts* or *thunder-ftones*. They are compoſed of ſeveral cruſts of ſtone encircling each other, of a conical form, and various ſizes; uſually a little hollow, and ſomewhat transparent, formed of ſeveral ſtriae radiating from the axis to the ſurface of the ſtone; and when burnt or rubbed againſt one another, or ſcraped with a knife, yield an odour like raſped horn. Their ſize is various, from a quarter of an inch to eight inches; and their colour and ſhape differ. They are ſuppoſed to be originally either a part of ſome ſea-production; or a ſtone formed in the cavity of ſome worm-ſhell, which, being of a tender and brittle nature, has periſhed, after giving its form to the ſtone. They are very frequently found in many parts of England; and the common people have a notion, that they are always to be met with after a ſtorm. They are often incloſed in, or adhere to, other ſtones; and are moſt frequent amongſt gravel, or in clay: they abound in Glouceſterſhire; and are found near Dedington in Oxfordſhire, where they ſometimes contain the ſilver marcaſite. See Plate LV. fig. 10.

BELERIUM, (anc. geog.), a promontory of the Dumnonii or Damnonii, the weſtmoſt Britons. Now called the *land's end*, in Cornwall.

BELEſIS, or NANYBRUS, ſaid to have been the founder of the ancient Babyloniſh empire, and in conjunction with Arbaces the Mede to have put an end to the kingdom of the Aſſyrians by the defeat and death of Sardanapalus. This firſt prince is repreſented as a crafty and mean-ſpirited knave; and, at the ſame time, as nothing leſs than an hero. It is ſaid, he was baſe enough to circumvent Arbaces his colleague and friend in the moſt shameful manner; by pretending a vow he had, in the midſt of the war, made to his god Belus, That if ſucceſs was the event of it, and the palace of Sardanapalus was conſumed, as it was, he would be at the charge and trouble of removing the aſhes that were left, to Babylon; where he would heap them up into a mount near the temple of his god; there to ſtand as a monument to all who ſhould navigate the Euphrates, of the ſubverſion of the Aſſyrian empire. He, it ſeems, had been privately informed, by an eunuch, of the immenſe treaſure which had been conſumed in the conflagration at Nineveh; and, knowing it to be a ſecret to Arbaces, his avarice ſuggeſted to him this artifice. Arbaces not only granted him his requeſt; but appointed him king of Babylon, with an exemption from all tribute. Beleſis, by this artifice, carried a prodigious treaſure with him to Babylon; but when the ſecret was diſcovered, he was called to an account for it, and tried by the other chiefs who had been aſſiſtant in the war, and who, upon his confeſſion of the crime, condemned him to loſe his head. But Arbaces, a magnificent and generous prince, freely forgave him, left him in poſſeſſion of the treaſure, and alſo in the independant government of Babylon, ſaying, The good he had done ought to ſerve as a veil to his crime; and thus he became at once a prince of great wealth and dominion.

In proceſs of time, and under the ſucceſſor of Arbaces, he became a man of dreſs, ſhew, and effeminacy, unworthy of the kingdom or province he held. Nany-

brus, for ſo we muſt now call Beleſis, underſtanding a certain robuſt Mede, called *Parſondas*, held him in the utmoſt contempt, and had ſolicited the emperor of the Medes to diſveſt him of his dominions, and to confer them upon himſelf, offered a very great reward to the man who ſhould take Parſondas, and bring him to him. Parſondas, hunting ſomewhere near Babylon with the king of the Medes, and ſtraggling from the company, happened to fall in with ſome of the ſervants of the Babylonian Nanybrus, who had been tempted with the promiſed reward. They were purveyors to the king; and Parſondas being very thirſty, aſked them for a draught of wine, which they not only granted, but prevailed upon him to take a meal with them. As he drank freely, ſuſpecting no treachery, he was eaſily perſuaded to paſs that night in company with ſome beautiful women, brought on purpoſe to detain him. But, while he was in a profound ſleep, the ſervants of Nanybrus ruſhing upon him, bound him, and carried him to their prince; who bitterly reproached him for endeavouring to eſtrange his maſter the king of the Medes from him, and by that means place himſelf in his room on the throne of Babylon. Parſondas did not deny the charge; but with great intrepidity owned, that he thought himſelf more worthy of a crown than ſuch an indolent and effeminate prince as he was. Nanybrus, highly provoked at the liberty he took, ſwore by the gods Belus and Molis, or rather Mylitta, that Parſondas himſelf ſhould in a ſhort time become ſo effeminate as to reproach none with effeminacy. Accordingly, he ordered the eunuch who had the charge of his muſic-women, to ſhave, paint, and dreſs him after the manner of thoſe women, to teach him the art, and in ſhort to transform him by all poſſible means into a woman. His orders were obeyed; and the manly Parſondas ſoon exceeded the faireſt female in ſinging, playing, and the other arts of allure-ment.

In the mean time the king of the Medes, having in vain fought after his favourite ſervant, and in vain offered great rewards to ſuch as ſhould give him any information concerning him, concluded he had been deſtroyed by ſome wild beaſt in the chace. At length, after ſeven years, the Mede was informed of his fate and condition by an eunuch, who, being cruelly ſcourged by Nanybrus's order, ſled, at the iſtigitation of Parſondas, into Media; and there diſcloſed the whole to the king, who immediately diſpatched an officer to demand him. Nanybrus pretended to know nothing of any ſuch perſon; upon which, another officer was ſent by the Mede, with a peremptory order to ſeize on Nanybrus if he perſiſted in the denial, to bind him with his girdle, and lead him to immediate execution. This order had the deſired effect: the Babylonian owned what he had before denied, promiſing to comply, without further delay, with the king's demand; and in the mean time invited the officer to a banquet, at which 150 women, among whom was Parſondas, made their appearance, ſinging and playing upon various inſtruments. But, of all, Parſondas appeared by far the moſt charming; inſomuch that Nanybrus inquiring of the Mede, which he liked beſt, he immediately pointed at him. At this the Babylonian clapt his hands; and, falling into an immoderate fit of laughter, told him who the perſon was whom he thus preferred to all the reſt;

rest; adding, that he could answer what he had done before the king of the Medes. The officer was no less surpris'd at such an astonishing change, than his master was afterwards, when Parfondas appear'd before him. The only favour Parfondas begged of the king, for all his past services, was, that he would avenge on the Babylonian the base and highly injurious treatment he had met with at his hands. The Mede march'd accordingly, at his instigation, to Babylon; and, notwithstanding the remonstrances of Nanybrus, urging, that Parfondas had, without the least provocation, endeavoured to deprive him of both his life and kingdom, declar'd that in ten days time he would pass the sentence on him which he deserved, for presuming to act as judge in his own cause, instead of appealing to him. But Nanybrus having in the mean time gain'd with a large bribe Mitraphernes the Mede's favourite eunuch, the king was by him prevail'd upon to sentence the Babylonian only to a fine; which made Parfondas curse the man who first found out gold, for the sake of which he was to live the sport and derision of an effeminate Babylonian.

BELLESME, a town of Perche in France, in W. Long. $^{\circ}$ 16. N. Lat. 48. 23.

BELZER, a town of Russia, and capital of a province of the same name. It is situated on the south-east shore of the White sea, in E. Long. 36. 10. N. Lat. 61. 50.

BELFAST, a town of Ireland, in the county of Antrim. It is seated at the bottom of Carrickfergus bay, and is the chief town and port in this part of Ireland, as well for beauty and the number of its inhabitants, as for its wealth, trade, and shipping. It has a considerable trade with Glasgow, and the inhabitants are mostly Scots, and of the presbyterian religion. W. Long. 6. 15. N. Lat. 54. 38.

BELFRY, that part of a steeple where bells are hung, or the timber frame whereby they are supported.

BELGARDEN, a town of Germany, in East Pomerania, in the province of Cassubia, and subject to Prussia. E. Long. 16. 5. N. Lat. 54. 10.

BELGOROD, a town of Russia, and capital of a province of the same name. It is seated on the river Donnets, in E. Long. 18. 5. N. Lat. 51. 20.

BELGOROD, a strong town of Bessarabia in European Turkey, seated at the mouth of the river Niester, on the Black sea, 80 miles south-east of Bender. E. Long. 31. $^{\circ}$ N. Lat. 46. 30.

BELGRADE, a city of Turkey in Europe, and capital of Servia, seated at the confluence of the Save and the Danube, in E. Long. 21. 2. N. Lat. 45. 10. The Danube is very rapid near this city, and its waters look whitish. Belgrade is built on a hill, and was once large, strong, and populous; it was surrounded with a double wall, flank'd with a great number of towers, and had a castle situated on a rising ground, and built with square stones. The suburbs are very extensive; and reported to by Turkish, Jewish, Greek, Hungarian, and Slavonian merchants. The streets where the greatest trade is carried on are covered with wood, to shelter the dealers from the sun and rain. The rivers render it very convenient for commerce; and as the Danube falls into the Black-sea, the trade is easily extended to distant countries, which renders it the staple town in these parts; and as the Danube runs up to

Vienna, they send goods from thence with a great deal of ease. The Armenians have a church here, and the Jews a synagogue, both these being employ'd as factors: the shops are but small; and the sellers sit on tables, disposing of their commodities out of a window, for the buyers never go on the inside. The richest merchandize are expos'd to sale in two bazaars or bazars, built crosswise. There are two exchanges, built with stone, and supported with pillars not unlike the Royal Exchange at London. There is likewise a caravanserai or public inn, and a college for young students. It has been taken by the Turks and Imperialists alternately several times; but was ceded to the Turks in 1739, and the fine fortifications demolished.

BELGRADO, a town of Friuli in the Venetian territories in Italy. It stands near the river Tejamanto, in E. Long. 13. 5. N. Lat. 46. $^{\circ}$.

BELIA, (anc. geog.) a town of hither Spain, now *Belchite*, in the kingdom of Arragon. See *BELCHITE*.

BELIDOR (Bernard Forest de), a Catalonian engineer in the service of France, and member of the academies of sciences at Paris and Berlin, and of the royal society at London: A celebrated mathematician, and author of a number of military tracts in which the science of mathematics is applied to military uses. Died in 1765, aged 70.

BELIEF, the assent of the mind to the truth of any proposition *.

BELISARIUS, general of the emperor Justinian's army, who overthrew the Persians in the East, the Vandals in Africa, and the Goths in Italy. But after all his great exploits, being falsely accus'd of a conspiracy against the emperor, he unworthily put out his eyes. After that, Belisarius is reported to have begg'd at a little but erected for him by the road side, addressing passengers, *Date obolum Belisario!* But some say he was restor'd to his honours; others that he died in peace at Constantinople 565.

BELL, a well known machine rank'd by musicians among the musical instruments of percussion.

The constituent parts of a bell are, the body or *barrel*, the *clapper* on the inside, and the ear or *cannon* by which it hangs to a large beam of wood. The matter of which it is usually made is a composition called *bell-metal*; (See *CHEMISTRY*, n $^{\circ}$ 379). The thickness of a bell's edges is usually $\frac{1}{7}$ of the diameter, and its height 12 times its thickness. The bell-founders have a diapason, or bell-scale, wherewith they measure the size, thickness, weight, and tone, of their bells. For the method of casting bells, see *FOUNDERY*.

The sound of a bell is conjectured to consist in a vibratory motion of its parts, much like that of a musical chord. The stroke of the clapper must necessarily change the figure of the bell, and of a round make it oval: but the metal having a great degree of elasticity, that part will return back again which the stroke drove farthest off from the centre, and that even some small matter nearer the centre than before; so that the two parts which before were extremes of the longest diameter, do then become those of the shortest; and thus the external surface of the bell undergoes alternate changes of figure, and by that means gives that tremulous motion to the air in which the sound consists. M. Perrault maintains, that the sound of the same bell, or chord, is a compound of the sounds of the several parts thereof, so that

that where the parts are homogeneous, and the dimensions of the figure uniform, there is such a perfect mixture of all these sounds as constitutes one uniform, smooth, even sound; and the contrary circumstances produce harshness. This he proves from the bells differing in tone according to the part you strike; and yet strike it any where, there is a motion of all the parts. He therefore considers bells as a compound of an infinite number of rings, which according to their different dimensions have different tones, as chords of different lengths have; and when struck, the vibrations of the parts immediately struck determine the tone, being supported by a sufficient number of consonant tones in the other parts.

Bells are observed to be heard further, placed on plains than on hills; and still further in valleys, than on plains: the reason of which will not be difficult to assign, if it be considered that the higher the sonorous body is, the rarer is its medium; consequently, the less impulse it receives, and the less proper vehicle it is to convey it to a distance.

Mr Reamur, in the memoirs of the Paris academy, has the following observation relating to the shape most proper for bells, to give them the loudest and clearest sound. He observes, "that as pots and other vessels more immediately necessary to the service of life were doubtless made before bells, it probably happened that the observing these vessels to have a sound when struck, gave occasion to making bells, intended only for sound, in that form; but that it does not appear that this is the most eligible figure; for lead, a metal which is, in its common state, not at all sonorous, yet becomes greatly so on its being cast into a particular form, and that very different from the common shape of bells. In melting lead for the common occasions of casting in small quantities, it is usually done in an iron ladle; and as the whole is seldom poured out, the remainder, which falls to the bottom of the ladle, cools into a mass of the shape of that bottom. This is consequently a segment of a sphere, thickest in the middle, and thinner towards the edges: nor is the ladle any necessary part of the operation, since if a mass of lead be cast in that form in a mould of earth or sand, in any of these cases it is found to be very sonorous. Now if this shape alone can give sound to a metal which in other forms is perfectly mute, how much more must it necessarily give it to other metals naturally sonorous in whatever form? It should seem, that bells would much better perform their office in this than in any other form; and that it must particularly be a thing of great advantage to the small bells of common house-clocks, which are required to have a shrill note, and yet are not allowed any great size." He adds, "that had our forefathers had opportunities of being acquainted with the sound of metals in this shape, we should probably have had all our bells at present of this form."

The use of bells is very ancient, as well as extensive. We find them among Jews, Greeks, Romans, Christians, and Heathens, variously applied; as on the necks of men, beasts, birds, horses, sheep; but chiefly hung in buildings, either religious, as in churches, temples, and monasteries; or civil, as in houses, markets, baths; or military, as in camps and frontier towns.

Among the Greeks, those who went the nightly rounds in camps or garrisons, carried with them a

little bell, which they rung at each centry-box to see that the soldiers on watch were awake. A codonophorus or bell-man alway walked in funeral processions, at a distance before the corps, not only to keep off the crowd, but to advertise the *fiatnen dialis* to keep out of the way, for fear of being polluted by the fight, or by the funerary music. The priest of Proserpine at Athens, called *hierophantus*, rung a bell to call the people to sacrifice.

There were also bells in the houses of great men to call up the servants in a morning. Zonaras assures us, that bells were hung with whips on the triumphal chariots of their victorious generals, to put them in mind that they were still liable to public justice.

Bells were put on the necks of criminals going to execution, that persons might be warned by the noise to get out of the way of so ill an omen as the sight of the hangman, or the condemned criminal, who was devoted and just going to be sacrificed to the *di manes*.

For bells on the necks of brutes, express mention is made of them in Phædrus,—*Gelsa cervicæ eminentis, Glarumque collo jactans tintinnabulum*. Taking these bells away was construed by the civil law, theft; and if the beast was lost by this means, the person who took away the bells was to make satisfaction.

Among the Jews, we find mention in scripture of bells made use of in the temple. Their figure is not known; but they were made of copper, and their sound was sharp and heard to a great distance. The high-priest had a great number of little golden bells hung to the border of his garment, to give notice when he entered into, and when he came out of, the sanctuary, and save him the trouble of knocking at the door. The prophet Zachary speaks of bells hung to the bridles of war-horses, that thereby they might be accustomed to noise.

There are disputes about the number of bells which were intermixed with pomegranates on Aaron's garment. Some will have it only 12, others 50, others raise it to 66, others to 72, and some to 80. The kings of Persia are said to have had the like habit. We may add, that the Arabian ladies who are about the princes person, to serve and divert him, have little gold bells fastened to their legs, neck, and elbows, the motion of which, when they dance, makes an agreeable sort of harmony. The princesses of that country are also said to wear large hollow gold rings, filled with little flints, which found like bells when they walk. Sometimes also large circles, with little rings, hung round them, produce the same effect. Sometimes they wear a number of flat bobs fixed to the end of their hair, which is matted, and hangs long behind, serving to make a noise as often as they stir, and give notice of the mistress's passing by, that the servants may behave respectfully, and strangers retire, to avoid seeing the person who passes.

As to the origin of church-bells, Mr Whittaker * H.ß. observes, That bells being used, among other purposes, by the Romans to signify the times of bathing, were naturally applied by the Christians of Italy to denote the hours of devotion, and summon the people to church. The first application of them to this purpose is, by Polydore Virgil and others, ascribed to Paulinus bishop of Nola, a city of Campania, about the year 400. Hence, it is said, the names *nolæ* and *campanæ*

pans were given them; the one referring to the city, the other to the country. Though others say they took the latter of these names, not from their being invented in Campania, but because it was here the manner of hanging and balancing them, now in use, was first practised; at least that they were hung on the model of a sort of balance invented or used in Campania; for in Latin writers we find *campana flatera*, for a steelyard; and in the Greek *καρπανάριον*, and *ponderare*, to weigh. In Britain, bells were applied to church-purposes, before the conclusion of the seventh century, in the monastic societies of Northumbria, and as early as the sixth even in those of Caledonia. And they were therefore used from the first erection of parish-churches among us.—Those of France and England appear to have been furnished with *several* bells. In the time of Clothair II. king of France, and in the year 610, the army of that king was frightened from the siege of the city of Sens, by ringing the *bells* of St Stephen's church. The second excerpt of Egbert, about the year 750, which is adopted in a French Capitulary of 801, commands every priest, at the proper hours, to sound the *bells* of his church, and then to go through the sacred offices to God. And the council of Enham, in 1011, requires all the mulcts for sins to be expended in the reparation of the church, clothing and feeding the minister of God, and the purchase of church vestments, church-books, and *church-bells*. These were sometimes composed of iron in France; and in England, as formerly at Rome, were frequently made of brass. And as early as the ninth century, there were many cast of a large size and deep note.

Ingulphus mentions, that Turketulus abbot of Croiland, who died about the year 870, gave a great bell to the church of that abbey, which he named Guthlac; and afterwards six others, viz. two which he called *Bartholomew* and *Bettelin*, two called *Turketul* and *Tatwin*, and two named *Pega* and *Bega*, all which rang together; the same author says, *Non erat tunc tanta consonantia campanarum in tota Anglia*. Not long after, Kinseus archbishop of York gave two great bells to the church of St John at Beverley, and at the same time provided that other churches in his diocese should be furnished with bells. Mention is made by St Aldhem, and William of Malmesbury, of bells given by St Dunstan to the churches in the west. The number of bells in every church gave occasion to the curious and singular piece of architecture in the campanile or bell-tower; an addition, which is more susceptible of the grander beauties of architecture than any other part of the edifice, and is generally therefore the principle or rudiments of it. It was the constant appendage to every parish-church of the Saxons, and is actually mentioned as such in the laws of Athelstan.

The Greek Christians are usually said to have been unacquainted with bells till the ninth century, when their confuſion was first taught them by a Venetian. Indeed, it is not true that the use of bells was entirely unknown in the ancient eastern churches, and that they called the people to church, as at present, with wooden mallets. Leo Allatius, in his dissertation on the Greek temples, proves the contrary from several ancient writers. It is his opinion, that bells first began to be disused among them, after the taking of Constantinople by the Turks; who, it seems, prohibited them, lest

their sound should disturb the repose of souls, which, according to them, wander in the air. He adds, that they still retain the use of bells in places remote from the intercourse of the Turks; particularly, very ancient ones in mount Athos. F. Simon thinks the Turks prohibited the Christians the use of bells, rather out of political than religious reasons; inasmuch as the ringing of bells might serve as a signal for the execution of revolts, &c.

In the ancient monasteries, we find six kinds of bells enumerated by Durandus, viz. *Squilla*, rung in the refectory; *cymbalum*, in the cloister; *nola*, in the choir; *nolula* or *dupla*, in the clock; *campana*, in the steeple; and *signum* in the tower. Beletus has much the same; only that for *squilla* he puts *tintinabulum*, and places the *campana* in the tower, and *campanella* in the cloister. Others place the *tintinabulum* or *tinniculum* in the refectory or dormitory; and add another bell called *corrigiuncula*, rung at the time of giving discipline, to call the monks to be flogged. The *cymbalum* is sometimes also said to have been rung in the cloister, to call the monks to meat.

In the funeral monuments of Weever, are the following particulars relating to bells: 'Bells had frequently these inscriptions on them:

' *Fanera plango, Fulgura frango, Sabbata pango,*
' *Excito lentos, Dissipo ventos, Peco cruentos.*

' In the Little Sanctuary at Westminster king Edward III. erected a clochier, and placed therein three bells for the use of St Stephen's chapel: about the biggest of them were cast in the metal these words:

' King Edward made mee thirte thousand weight and three.
' Take me down and wey mee, and more you shall fynd mee.

' But these bells being to be taken down in the reign of king Henry VIII. one writes underneath with a coal:

' But Henry the eight
' Will bait me of my weight.' *Ibid.* 492.

This last distich alludes to a fact mentioned by Stow in his survey of London, ward of Farringdon Within, to wit, that near to St Paul's school stood a clochier, in which were four bells called *Jesur's bells*, the greatest in all England, against which Sir Miles Partridge staked an hundred pounds, and won them of king Henry VIII. at a cast of dice. Nevertheless it appears that abroad there are bells of greater magnitude. In the steeple of the great church at Roan in Normandy is a bell with this inscription:

' *J'e suis George de Ambois,*
' *Qui treute cinque mille pois.*
' *Mes lui qui me peisoit,*
' *Treute six mill me traouera.*
I am George of Ambois,
Thirte five thousand in pois:
But he that shall weigh me,
Thirte six thousand shall find me. *Ibid.*

And it is a common tradition that the bells of King's-college chapel, in the university of Cambridge, were taken by Henry V. from some church in France, after the battle of Agincourt. They were taken down some years ago, and sold to Phelps the bell-founder in White-Chapel, who melted them down.

The uses of bells were summed up in the following distich, as well as that first abovementioned:

Lauds Deum verum, plebem voco; conyugo clericum,
Defunctos ploro, pejem fugo, festo decoro.

Matthew Paris observes, that anciently the use of bells

bells was prohibited in time of mourning; though at present they make one of the principal ceremonies of mourning. Mabillon adds, that it was an ancient custom to ring the bells for pious about to expire, to advertise the people to pray for them; whence our ringing-bells. Lobineau observes, that the custom of ringing bells, at the approach of thunder, is of some antiquity; but that the design was not so much to shake the air, and so dissipate the thunder, as to call the people to church, to pray that the parish might be preserved from that terrible meteor.

In the times of Popery, bells were baptized and anointed *oleo chrismatis*; they were exorcised, and blessed by the bishop; from a belief, that, when these ceremonies were performed, they had power to drive the devil out of the air, to calm tempests, to extinguish fire, and to recreate even the dead. The ritual for these ceremonies is contained in the Roman pontifical; and it was usual in their baptism to give to bells the name of some saint. In Chauncy's history of Hertfordshire, page 383. is a relation of the baptism of a set of bells in Italy with great ceremony, a short time before the writing that book. The bells of the parish church of Winnington in Bedfordshire had their names cast about the verge of every one in particular, with these rhiming hexameters:

Nomina Campanis hec insculpta sunt quoque nostris.

1. Hæc figum Petri pulsator nomine Christi.
2. Nomen Magdalene campana sonat melode.
3. Sit nomen Domini benedictum semper in eum.
4. Musa Raphaelis sonat auribus Immanuelis.
5. Sum Rosa pulsata mundique Maria vocata. Weev. Fnn. 122.

By an old chartulary, once in the possession of Weever the antiquary, it appears that the bells of the priory of Little Dunmow in Essex were, anno 1501, new cast, and baptized by the following names:

Prima in honore Sancti Michaelis Archangelii.

Secunda in honore S. Johannis Evangeliste.

Tertia in honore S. Johannis Baptiste.

Quarta in honore Assumptiois beate Marie.

Quinta in honore sancti Trinitatis, et omnium sanctorum. Ib. 633.

The bells of Osney abbey near Oxford were very famous; their several names were Douce, Clement, Autlin, Hautecker [potius Hautcleri], Gabriel, and John.

Nankin in China was anciently famous for the largeness of its bells; but their enormous weight brought down the tower, the whole building fell to ruin, and the bells have ever lain on the ground. One of these bells is near 12 English feet high, the diameter seven and an half, and its circumference 23; its figure almost cylindrical, except for a swelling in the middle; and the thickness of the metal, about the edges, seven inches. From the dimensions of this bell, its weight is computed at 50,000 pounds, which is more than double the weight of that of Erfort, said by father Kircher to be the greatest bell in the world. These bells were cast by the first emperor of the preceding dynasty, about 300 years ago. They have each their name; the hanger (*choui*), the eater (*che*), the sleeper (*choui*), the will (*fi*). Father le Comte adds, that there are seven other bells in Pekin, cast in the reign of Youlo, each of which weighs 120,000 pounds. But the founds even of their biggest bells are very poor; being struck with a wooden in lieu of an iron clapper.

The practice of ringing bells in change, or regular

peals, is said to be peculiar to England; whence Britain has been termed the *ringing island*. The custom seems to have commenced in the time of the Saxons, and was common before the conquest. The ringing of bells, tho' a recreation chiefly of the lower sort, is in itself not incurious. The tolling a bell is nothing more than the producing a sound by a stroke of the clapper against the side of the bell, the bell itself being in a pendant position and at rest. In ringing, the bell, by means of a wheel and a rope, is elevated to a perpendicular; in its motion to this situation the clapper strikes forcibly on one side, and in its return downwards on the other side of the bell, producing at each stroke a sound. There are in London several societies of ringers, particularly one known by the name of the *College youths*: of this it is said Sir Matthew Hale, lord chief justice of the court of King's Bench, was, in his youthful days, a member; and in the life of this learned and upright judge, written by bishop Burnet, some facts are mentioned which favour this relation. In England the practice of ringing is reduced to a science, and peals have been composed which bear the name of the inventors. Some of the most celebrated peals now known were composed about 50 years ago by one Patrick. This man was a maker of barometers: in his advertisements he styled himself *Torriceilian Operator*, from Torricelli, who invented instruments of this kind. In the year 1684, one Abraham Rudhall, of the city of Gloucester, brought the art of bell-founding to great perfection. His descendants in succession have continued the business of casting bells; and by a list published by them, it appears that at Lady-day, 1774, the family, in peals and odd bells, had cast to the amount of 3594. The peals of St Dunstan's in the east, and St Bride's, London, and St Martin's in the Fields, Westminster, are in the number.

The music of bells is altogether melody; but the pleasure arising from it consists in the variety of interchanges, and the various succession and general predominance of the consonances in the sounds produced. Musical authors seem to have written but little upon this subject.

BELLAC, a town of La Marche in France, situated on the little river Union. It contains about 770 houses, and 3000 inhabitants. E. Long. 1. 14. N. Lat. 46. 4.

BELLADONA, in botany, the trivial name of a species of Atropa. See ATROPA.

BELLAI (William du), lord of Langey, a French general, who signalized himself in the service of Francis I. He was also an able negotiator, so that the emperor Charles V. used to say, "that Langey's pen had fought more against him than all the lances in France." He was sent to Piedmont, in quality of viceroy, where he took several towns from the Imperialists. His address in penetrating into the enemy's designs was surprising. In this he spared no expence, and thereby had intelligence of the most secret councils of the emperor and his generals. He was extremely active in influencing

cing some of the universities of France to give their judgment agreeable to the desires of Henry VIII. king of England, when this prince wanted to divorce his queen, in order to marry Anne Bullen. It was then the interest of France to favour the king of England in this particular, it being an affront to the emperor, and a gratification to Henry, which might serve to form a strict alliance between him and Francis I. He was sent several times into Germany to the princes of the Protestant league, and was made a knight of the order of St Michael. He was also a man of learning, having given proofs of his abilities and genius as a writer. He composed several works; the most remarkable of which was, the History of his Own Times, in Latin; divided into octoades, that is, several parts, each consisting of eight books; most of which, however, have been lost. When Langei was in Piedmont, in 1542, he had some remarkable intelligence which he was desirous himself to communicate to the king, and being very infirm, he ordered a litter for his conveyance; but after having passed the mountain of Tarara, betwixt Lyons and Roan, he found himself so extremely bad at St Saphorin, that he was obliged to stop there, where he died the 9th of January, in the year 1543. He was buried in the church of Mans, and a noble monument was erected to his memory.

BELLARMIN (Robert), an Italian Jesuit, one of the best controversial writers of his time. In 1576, he read lectures at Rome on controversies; which he did with such applause, that Sixtus V. sending a legate into France in 1590, appointed him as a divine, in case any dispute in religion should happen to be discussed. He returned to Rome, and was raised successively to different offices, till at last, in 1599, he was honoured with a cardinal's hat; to accept of which dignity, it is said, they were obliged to force him by the threats of an anathema. It is certain, that no Jesuit ever did greater honour to his order than he; and that no author ever defended the cause of the Romish church in general, and that of the pope in particular, to more advantage. The Protestants have owned this sufficiently: for, during the space of 50 years, there was scarcely any considerable divine among them who did not fix upon this author for the subject of his books of controversy. Notwithstanding the zeal with which this Jesuit maintained the power of the pope over the temporality of kings, he displeas'd Sixtus V. in his work *De Romano Pontifice*, by not insinuating that the power which Jesus Christ gave to his vicegerent, was direct, but only indirect; and had the mortification to see it put into the index of the inquisition, though it was afterwards removed. He left, at his death, to the Virgin Mary one half of his soul, and to Jesus Christ the other.—Bellarmine is said to have been a man of great chastity and temperance, and remarkable for his patience. His stature was low, and his mien very indifferent; but the excellence of his genius might be discovered from the traces of his countenance. He expressed himself with great perspicuity; and the words which he first made use of to explain his thoughts were generally so proper, that there appeared no failure in his writings.

BELLATRIX, in astronomy, a ruddy glittering star of the second magnitude, in the left shoulder of Orion. It takes its name from *bellum*, as being anciently

supposed to have a great influence in kindling wars, and forming warriors. Its longitude, according to Hevelius, for the year 1700, was 16° 47' 20"; and its latitude southward 16° 52' 11".

BELLCLARE, a town of Ireland, in the province of Connaught, and county of Sligo. W. Long. 9. 5. N. Lat. 53. 56.

BELLE, a town of the French Netherlands, seated in E. Long. 2. 40. N. Lat. 50. 45.

BELLE (Stephen de la), a celebrated engraver, born at Florence, who improved himself by imitating the designs of Callot. He was greatly honoured by the grand duke; and died in 1664.

BELLEAU (Remi), a French poet, born at Nogent le Rotrou, in the territory of Perche, and province of Orleanois. He lived in the family of Renatus of Lorraine, marquis of Elbeuf, general of the French galleys; and attended him in his expedition into Italy, in 1557. This prince highly esteemed Belleau for his courage; and having also a high opinion of his genius and abilities, entrusted him with the education of his son Charles of Lorraine. Belleau was one of the seven poets of his time who were denominated the *French Pleiades*. He wrote several pieces; and translated the odes of Anacreon into the French language, but in this he is thought not to have preserved all the natural beauties of the original. His pastoral pieces are in greatest esteem. His verses in that way (according to his eulogists) are expressed with such beauty and simplicity, that they seem to be a living picture of what they describe. He also wrote an excellent poem on the nature and difference of precious stones, which by some has been reputed his best performance. Belleau died at Paris, in the family of the duke d'Elbeuf, on the 6th of March, 1577. He was interred in the church De Pres Augustines, near the Pont-neuf: several eulogiums were made to his memory.

BELLEFOREST (Francis de), a French author, born in the province of Guienne, in 1530. He was but seven years of age when he lost his father; and his mother was left in poor circumstances, but she contributed all in her power to his education. He was supported some years by the queen of Navarre, sister to Francis I. Some time after, he went to study at Bourdeaux; thence he removed to Toulouse; and at last to Paris, where he got acquainted with several men of learning, and was honoured with the friendship of many persons of quality. He wrote, 1. A History of the nine Charles's of France; 2. Annotations on the books of St Augustin; 3. An universal history of the world; 4. The chronicles of Nicholas Gillet, augmented; 5. An universal cosmography; 6. Annals, or a general history of France; and many other works. In short, he supported his family by writing books on whatever subject was proposed to him by the booksellers, according to the taste of the public. He died in 1683.

BELLEGARDE, a strong town of France in Roussillon, on the frontiers of Catalonia. It is an important place on account of its being a passage to the Pyrenean mountains. E. Long. 3. 0. N. Lat. 42. 20.

BELLEGARDE, a town of Burgundy in France, with the title of a duchy. It is seated on the river Saone, in E. Long. 4. 0. N. Lat. 46. 57.

BELLEISLE, an island of France, on the coast of Brittany. It is the largest of all the European islands

Belleare
Belleife.

Belleisle.

belonging to the French king, being between 12 and 13 leagues in circumference. It is a mixture of craggy rocks and fertile soil; but the inhabitants are very poor, and the only trade carried on in it is the curing of pilchards. There are three harbours in the island, *viz.* Palais, Sauzon, and Goulford; every one of which harbours under some capital defect, either in being exposed, shallow, or dangerous in the entrance. It contains only one little city called *Le Palais*, three county towns, 103 villages, and about 5000 inhabitants. The island originally belonged to the earl of Cornouaille; but was afterwards yielded to the king, who in 1742 erected it into a duchy, in favours of marshal Belleisle. The town of Palais takes its name from a castle belonging to the duke de Belleisle, which stood in its neighbourhood; but was afterwards converted into a citadel fronting the sea, and strongly fortified. Its fortifications are composed principally of hornworks; and it is provided with two dry ditches, the one next the counterescarp, and the other so contrived as to secure the interior fortifications. This citadel is divided from the largest part of the town by an inlet of the sea, over which there is a bridge of communication. From the other part of the town, and which is most inhabited, it is only divided by its own fortifications and a glacis. In this state was the island in 1761, when an expedition was undertaken against it by a British fleet under the command of commodore Keppel, having on board a considerable land force commanded by general Hodgson. The fleet sailed from Spithead on the 20th of March, and arrived before Belleisle on the 7th of April. The next day it was agreed to attempt a landing on the south-east part of the island, in a sandy bay, near Lochmana point. Here the enemy were in possession of a little fort; they had moreover entrenched themselves on a hill excessively steep, the foot of which was scarped away. The attempt was made in three places with great resolution; but the British were at last repulsed with the loss of 500 men. It was not before the 25th of April that the weather allowed a second attempt. This was made on a very strong place, where the enemy were rather less attentive, on account of the excessive steepness and difficulty of climbing up the rocks. Besides the principal attack, two feints were made at the same time to distract the enemy, whilst the men of war directed their fire with great success on the hills. These manoeuvres gave brigadier-general Lambert, with a handful of men, an opportunity of climbing up a very steep rock without molestation. This little body formed themselves in good order without delay, and were immediately attacked by 300 French. The British, however, sustained this attack until the whole corps of brigadier Lambert, which had now likewise ascended, came to their assistance, with whose help they repulsed the enemy. The landing of all the forces being soon after made good, the French were driven into the town of Palais. Here the chevalier de St Croix who commanded them, a brave and experienced officer, resolved to hold out to the last extremity; and it was not till the 7th of June that he capitulated, and the garrison marched out with the honours of war. The island, however, was restored to the French by the treaty concluded in 1763.

BELLEISLE, an island of North America, lying at the mouth of the freight between the country of the

Esquimaux, or New Britain, and the north end of Newfoundland; whence the fruit takes also the name of *Belleisle*. W. Long. 58. 5. N. Lat. 51. 50.

BELLEROPHON, in fabulous history, the son of Glaucus king of Epirus, happening accidentally to kill his brother, fled to Prætus king of Argos, who gave him a hospitable reception; but Sthenobea, his queen, falling in love with the beautiful stranger, and finding that nothing could induce him to injure his benefactor, she accused him to her husband of an attempt to violate her honour. Prætus, however, not being willing to act contrary to the laws of hospitality, sent him to Iobates king of Lyfia, and the father of Sthenobea, with letters desiring him to put him to death: whence the proverb *Bellerophontis literas afferet*, equivalent to *Litera Urta*. That prince, at the receipt of these letters, was celebrating a festival of nine days, which prevented Bellerophon's destruction. Iobates, however, sent him in the mean time to subdue the Solymi, the Amazons, and Lyfians, and thought to get rid of him by exposing him to the greatest dangers; but by his prudence and courage he came off victorious. Iobates next employed him to destroy the Chimæra; when Minerva, or, according to others, Neptune, in consideration of his innocence, furnished him with the horse Pegasus, by whose assistance he killed the Chimæra, on his return, being convinced of his truth and integrity, and charmed with his heroic virtues, gave him his daughter Philonoe in marriage, and declared him his successor; which when Sthenobea heard, she killed herself. Bellerophon at length growing vain with his prosperity, resolved, by the assistance of Pegasus, to ascend the skies; when Jupiter checked his presumption, by striking him blind in his flight; on which he fell down to the earth, and wandered till his death in contempt and misery: but Pegasus mounting into heaven, Jupiter placed him among the constellations *.

BELLES LETTRES. Whether we consult the voluminous dictionaries of the French language, or those treatises that profess to point out the method of studying and teaching the belles lettres, we find not, in the one or the other, either a clear definition, or a succinct explication of the words *belles lettres*, nor any summary of those sciences which are comprehended under that general and collective denomination. It appears that to be a vague term, under which every one may include whatever he thinks proper. Sometimes we are told that by the belles lettres is meant, the knowledge of the arts of poetry and oratory; sometimes, that the true belles lettres are natural philosophy, geometry, and other essential parts of learning; and sometimes, that they comprehend the art of war, by land and sea: in short, they are made to include all that we know, and whatever we please; so that, in treating on the belles lettres, they talk of the use of the sacraments, &c. * Some comprehend under the term, all those instructive and pleasing sciences which occupy the memory and the judgment, and do not make part either of the superior sciences, of the *polite arts* †, or of mechanic professions: hence they make history, chronology, geography, genealogy, blazonry, philology, &c. the belles lettres. In a word, it were an endless task to attempt to enumerate all the parts of literature which different learned men have comprehended under this title. Nor would it be of any use to the reader

Bellerophon, Belles Lettres.

* See *Fis* and *msra.** *Rollin* the *Belles Lettres.*† *See A* (*polite*).

for

for us to pretend to fix the true import of the term. Whatever arts or sciences it may be supposed to include, they are severally explained in the course of this work.

BELLE-VILLE, a town of the Beaujolois in France, seated near the river Saone, in E. Long. 4. 46. N. Lat. 45. 5.

BELLEY, or **BELLAY**, a town of France, with a bishop's see, and capital of Bugey. It is seated near the river Rhone, in E. Long. 5. 50. N. Lat. 45. 43.

BELLIN (Gentil), a Venetian painter, born in the year 1421. He was employed by the republic of Venice, and to him and his brother the Venetians are indebted for the noble works which are to be seen in the council-hall. We are told that Mahomet II. emperor of the Turks, having seen some of his performances, was so struck with them, that he wrote to the republic, intreating them to send him. The painter accordingly went to Constantinople, where he did many excellent pieces. Amongst the rest, he painted the decollation of St John the Baptist, whom the Turks revere as a great prophet. Mahomet admired the proportion and shadowing of the work; but he remarked one defect in regard to the skin of the neck, from which the head was separated; and in order to prove the truth of his observation, he sent for a slave and ordered his head to be struck off. This sight so shocked the painter, that he could not be easy till he had obtained his dismissal; which the Grand Signior granted, and made him a present of a gold chain. The republic settled a pension upon him at his return, and made him a knight of St Mark. He died in 1501, in the 80th year of his age.

John Bellino, his brother, painted with more art and sweetness than he; and died in 1512, aged 90.

BELLINGHAM, a town of Northumberland in England. W. Long. 2. 10. N. Lat. 55. 10.

BELLINI (Laurence), an eminent physician, born at Florence in the year 1643. After having finished his studies in polite literature, he went to Pisa, where he was assisted by the generosity of the grand duke Ferdinand II. and studied under two of the most learned men of that age, Oliva and Borelli. Oliva instructed him in natural philosophy, and Borelli taught him mathematics. At 20 years of age, he was chosen professor of philosophy at Pisa, but did not continue long in this office; for he had acquired such a reputation for his skill in anatomy, that the grand duke procured him a professorship in that science. This prince was often present at his lectures, and was highly satisfied with his abilities and performances. Bellini, after having held his professorship almost 30 years, accepted of an invitation to Florence, when he was about 50 years of age. Here he practised physic with great success, and was advanced to be first physician to the grand duke Cosmus III. He wrote the following books in Latin, 1. An anatomical discourse on the structure and use of the kidneys. 2. A speech by way of thanks to the serene duke of Tuscany. 3. Some anatomical observations, and a proposition in mechanics. 4. Of the urine and pulse, of blood-letting, fevers, and discharges of the head and breasts. 5. Several tracts concerning urine, the motion of the heart, and bile, &c. He died January 8th, 1703, being 60 years of age. His works were read and explained publicly during his life, by the famous Scotch physician Dr Pitcairn, professor of physic in Leyden.

BELLINZONA, a town of Italy, in the Milanese; and one of the bailiwicks which the Swifs possess in that country. It is seated on the river Jesino, five miles above the place where it falls into the Lago Maggiore, and it is fortified with two strong castles formerly joined together by a wall flanked with towers; but the Swifs have demolished a part of the fortifications. E. Long. 9. o. N. Lat. 46. 8.

BELLIS, the **DAISY**; a genus of the syngenesia order, belonging to the polygamia superflua class of plants.

Species, &c. 1. The perennis, with a naked stalk, having one flower. This is the common daisy, which grows naturally in pasture-lands in moist parts of Europe. It is often a troublesome weed in the grass of gardens, so is never cultivated. Its leaves have a subtle subacid taste; and are recommended as vulneraries, and in asthma and hectic fevers, as well as in such disorders as are occasioned by drinking cold liquors when the body has been much heated. Ludovici prefers this plant to those commonly used as antiscorbutics and resolvents of coagulated blood in hypochondriacal disorders. 2. The annua, with leaves on the lower part of the stalk, is a low annual plant growing naturally on the Alps and the hilly parts of Italy. It seldom rises more than three inches high; and hath an upright stalk garnished with leaves on the lower part; but the upper part is naked, supporting a single flower like that of the common daisy, but smaller. 3. The hortensis, or garden daisy, with a large double flower. This is generally thought to be only a variety of the common daisy; but Mr Miller assures us, that he was never able to improve the common daisy by culture, or to make the garden daisy degenerate into the common sort for want of it. The varieties of this species cultivated in gardens are, the red and white garden daisy; the double variegated garden daisy; the childing, or hen and chicken garden daisy; and the cock's-comb daisy with red and white flowers. The garden daisies flower in April and May, when they make a pretty variety, being intermixed with plants of the same growth: they should be planted in a shady border, and a loamy soil without dung, in which they may be preserved without varying, provided the roots are parted and transplanted every autumn. This is all the culture they require, except keeping them free from weeds. Formerly they were planted as edgings to borders; but for this purpose they are improper, because where fully exposed to the sun, they frequently die in large patches, whereby the edgings become bald in many places.

BELLIS Major. See **CHRYSANTHEMUM**.

BELLON, a distemper common in countries where they smelt lead-ore. It is attended with languor, intolerable pains and sensations of gripings in the belly, and generally costiveness.—Beasts, poultry, &c. as well as men, are subject to this disorder: hence a certain space round the smelting houses is called *bellon-ground*, because it is dangerous for an animal to feed upon it.

BELLONA, in Pagan mythology, the goddess of war, is generally reckoned the sister of Mars, and some represent her as both his sister and wife. She is said to have been the inventress of the needle; and from that instrument is supposed to have taken her name *BELLONA*, signifying a *needle*. This goddess was of a cruel and savage disposition, delighting in bloodshed and slaughter;

Bellinzona

Bellona

Bellonarii
Bellows.

ter; and was not only the attendant of Mars, but took a pleasure in sharing his dangers. She is commonly represented in an attitude expressive of fury and distraction, her hair composed of snakes clotted with gore, and her garments stained with blood: she is generally depicted driving the chariot of Mars, with a bloody whip in her hand; but sometimes she is drawn holding a lighted torch or brand, and at others a trumpet. Bellona had a temple at Rome, near the Circus Flaminius, before which stood the column of war, from whence the consul threw his lance when he declared war. She was also worshipped at Comana, in Cappadocia; and Camden observes, that, in the time of the emperor Severus, there was a temple of Bellona in the city of York.

BELLONARII, in antiquity, priests of Bellona, the goddess of wars and battles. The bellonarii cut and mangled their bodies with knives and daggers in a cruel manner, to pacify the deity. In this they are singular, that they offered their own blood, not that of other creatures, in sacrifice. In the fury and enthusiasm wherewith they were seized on these occasions, they ran about raging, uttering prophecies, and foretelling blood and slaughter, devastations of cities, revolutions of states, and the like: whence Martial calls them *turba entheata Bellona*.-- In after-times, they seem to have abated much of their zeal and transport, and to have turned the whole into a kind of farce, contenting themselves with making signs and appearances of cutting and wounds. Lampridius tells us, the emperor Commodus, out of a spirit of cruelty, turned the farce again into a tragedy, obliging them to cut and mangle their bodies really.

BELLONIA, (so named from the famous Petrus Bellonius, who left many valuable tracts on natural history, &c.) a genus of the monogynia order, belonging to the pentandria class of plants. Of this genus there is only one species known, viz. the aspera, with a rough balm leaf. This is very common in the warm islands of America. It hath a woody stem which rises 10 or 12 feet high, sending out many lateral branches garnished with rough oval leaves placed opposite: the flowers come out from the wings of the leaves in loose panicles, and are succeeded by oval capsules ending in a point, and filled with small round seeds. This plant is propagated by seeds, which must be procured from the places where it grows naturally, and are to be sown in pots plunged into a hot-bed of tanners bark. The plants, when half an inch high, must be transplanted each into a separate pot, and again plunged into the hot-bed, and managed like other tender exotics. These plants may also be propagated by cuttings planted in light earth on a moderate hot-bed, and carefully watered till they have taken root.

BELLORI (John Peter), of Rome; a celebrated antiquary, and connoisseur in the polite arts: Author of the lives of the modern painters, architects, and sculptors, and of other works on antiquities and medals. Died in 1696.

BELLOVACI, (anc. geog.), a people of Gallia Belgica, reckoned the bravest of the Belgæ; now the *Beauvaisis*, in the isle of France.

BELLOWS, a machine so contrived as to expire and inspire the air by turns, by enlarging and contracting its capacity. This machine is used in chambers and kitchens, in forges, furnaces, and founderies,

to blow up the fire: it serves also for organs and other pneumatic instruments, to give them a proper degree of air. All these are of various constructions, according to their different purposes; but in general they are composed of two flat boards, sometimes of an oval, sometimes of a triangular figure: Two or more hoops, bent according to the figure of the boards, are placed between them: a piece of leather, broad in the middle, and narrow at both ends, is nailed on the edges of the boards, which it thus unites together; as also on the hoops which separate the boards, that the leather may be easier open and fold again: a tube of iron, brass, or copper, is fastened to the undermost board, and there is a valve within, that covers the holes in the underboard to keep in the air.

Anacharis the Scythian is recorded as the inventor of bellows. The action of bellows bears a near affinity to that of the lungs; and what we call blowing in the latter, affords a good illustration of what is called *respiration* in the former. Animal life itself may, on some occasions, be subsisted by blowing into the lungs with a pair of bellows. Dr Hooke's experiment to this effect is famous: having laid the thorax of a dog bare, by cutting away the ribs and diaphragm, pericardium, &c. and having cut off the aspera arteria below the epiglottis, and bound it on the nose of a bellows, he found, that as he blowed, the dog recovered, and as he ceased, fell convulsive; and thus was the animal kept alternately alive and dead above the space of an hour. There are bellows made wholly of wood, without any leather about them; one of which is preserved in the repository of the Royal Society; and Dr Plot describes another in the copper-works at Ellaston in Staffordshire. Ant. della Fruta contrived a substitute for bellows, to spare the expence thereof in the fusion of metals. This is called by Kircher *camera æolica*, and in England commonly the *water-bellows*; where water falling thro' a funnel into a close vessel, sends from it so much air continually as blows the fire. See the article FURNACE, where different blowing machines of this kind are described.

Smiths and founders bellows, whether single or double, are wrought by means of a rocker, with a string or chain fastened thereto, which the workman pulls. The bellows pipe is fitted into that of the twel. One of the boards is fixed, so as not to play at all. By drawing down the handle of the rocker, the moveable board rises, and, by means of a weight on the top of the upper board, sinks again. The bellows of forges and furnaces of mines usually receive their motion from the wheels of a water-mill. Others, as the bellows of enamellers, are wrought by means of one or more steps or treddles under the workman's feet. Lastly, the bellows of organs are wrought by a man called the *blower*; and in small organs by the foot of the player. Butchers have also a kind of blast or bellows of a peculiar make, by which they bloat or blow up their meat when killed, in order to piecing or parting it the better.

Bone-BELLOWS, *quæntuplex osseorum*, occur in Herodotus for those applied by the Scythians to the genitals of mares, in order to distend the uterus, and by this compression make them yield a greater quantity of milk.

Hessian BELLOWS are a contrivance for driving air into a mine for the respiration of the miners. This M.

Papa

Papin improved, changing its cylindrical form into a spiral one; and with this, working it only with his foot, he could make a wind to raise two pound weight.

Hydrostatic BELLOWS. See *HYDROSTATICS*, n^o 4.

BELLUNESE, a territory of Italy, belonging to the Venetians. It lies between Friuli, Codorino, Feltrino, the bishopric of Trent and Tirol. It has good iron mines, but the only considerable place is Belluno.

BELLUNO, a town of Italy, in the Venetian territories, and capital of the Bellunese. It is a bishop's see; and is situated among the Alps, on the river Piave, between the towns Cadora and Trevisini, in E. Long. 12. 15. N. Lat. 46. 9.

BELLY, in anatomy, the same with what is more usually called *abdomen*. See *ANATOMY*, Part IV.

BELMONTE, a town of Italy, in the hither Calabria, and kingdom of Naples. It is seated on the coast of the Tulcan sea, in E. Long. 16. 50. N. Lat. 39. 20.

BELMOMANCY, *BELMOMANTIA*, a kind of divination by means of arrows, practised in the east, but chiefly among the Arabians*. The word is of Greek origin; compounded of βέλος *arrow*, and μαντια *divination*.

Belmancy has been performed in different manners. One was to mark a parcel of arrows, and put 11 or more of them into a bag: these were afterwards drawn out; and according as they were marked, or not, they judged of future events.

Another way was to have three arrows, upon one of which was wrote, " God orders it me;" upon another, " God forbids it me;" and upon the third nothing at all. These were put into a quiver, out of which they drew one of the three at random: if it happened to be that with the first inscription, the thing they consulted about was to be done; if it chanced to be that with the second inscription, it was let alone; but if it proved that without inscription, they drew over again.

Belmancy is an ancient practice, and probably that which Ezekiel mentions, *chap. xxi. 21.* At least St Jerome understands it so, and observes that the practice was frequent among the Assyrians and Babylonians. Something like it is also mentioned in Hosea, *chap. iv.* only that staves are there mentioned instead of arrows, which is rather rhabdomancy than belmancy. Grotius, as well as Jerome, confounds the two together, and shews that it prevailed much among the Magi, Chaldeans, and Scythians; whence it passed to the Sclavonians, and thence to the Germans, whom Tacitus observes to make use of it. See *RHABDOMANCY*.

BELON (Peter), of Le Mans, the capital of le Maine a province of France, flourished about the middle of the 16th century. He published several books in Latin. He wrote, in French, of birds, beasts, fishes, serpents, and the neglected culture of plants; and a book of Travels, or observations of many singularities and memorable things found in Greece, Asia, Judæa, Egypt, Arabia, and other foreign countries. He was murdered near Paris by one of his enemies, in 1564.

BELONE, in ichthyology, the trivial name of a species of efox. See *ESOX*.

BELT, the Great, a famous strait of Denmark between the island of Zealand and that of Tunen, at the

entrance of the Baltic sea. It is not however so commodious, nor so much frequented, as the sound. In 1658 the whole strait was frozen so hard, that Charles Gustavus king of Sweden marched over it with a design to take Copenhagen.

BELT, the Lesser, lies to the west of the great belt, between the island of Funen and the coast of Jutland. It is one of the passages from the German ocean to the Baltic, though not three miles in breadth, and very crooked.

BELT, in the military art, a leathern girdle for sustaining the arms, &c. of a soldier.

BELTS, in astronomy, two zones, or girdles, surrounding the body of the planet of Jupiter*.

BELTS, in geography, certain straits between the German ocean and the Baltic. The belts belong to the king of Denmark, who exacts a toll from all ships which pass through them, excepting those of Sweden, which are exempted.

BEL-TEIN, a superstitious custom observed in the Highlands of Scotland. It is a kind of rural sacrifice, performed by the herdsmen of every village, on the 1st of May. They cut a square trench on the ground, leaving a turf in the middle: on that they make a fire of wood, on which they dress a large caudle of eggs, butter, oatmeal, and milk; and bring, besides the ingredients of the caudle, plenty of beer and whisky; for each of the company must contribute something. The rites begin with spilling some of the caudle on the ground, by way of libation: on that, every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them: each person then turns his face to the fire, breaks off a knob, and flinging it over his shoulder, says, *This I give to thee, preserve thou my horses; this to thee, preserve thou my sheep;* and so on. After that, they use the same ceremony to the noxious animals: *This I give to thee, O fox! spare thou my lambs; this to thee, O hooded crow! this to thee, O eagle!* When the ceremony is over, they dine on the caudle; and after the feast is finished, what is left is hid by two persons deputed for that purpose; but on the next Sunday they re-assemble and finish the reliques of the first entertainment.

BELTURBET, a town of Ireland in the county of Cavan, and province of Ulster, situated on the river Earn, in W. Long. 7. 35. N. Lat. 54. 7.

BELTZ, or *BELZO*, a province of Red Ruffia in Poland, bounded by Leopold on the south, by Chelm on the north, Little Poland on the east, and Volhynia on the west. Its capital town is Beltz.

BELTZ, or *Belzo*, a town of Poland, and capital of the province of the same name, seated on the confines of Upper Volhynia, among marshes, in E. Long. 25. 15. N. Lat. 50. 5.

BELVEDERE, in the Italian architecture, &c. denotes either a pavilion on the top of a building, or an artificial eminence in a garden; the word literally signifying a *fine prospect*.

BELVEDERE, a considerable town of Greece, and capital of a province of the same name in the Morea. The province lies on the western coast: it is the most fertile and rich in all the Morea; and from it the railins called *Belvederes* take their name. The town is situated

Belt

in E. Long. 22. o. N. Lat. 38. 5.

BELUNUM, (anc. geogr.), a town of Rhetia, above Feltria, in the territory of the Veneti; now *Belluno*, capital of the Bellunese in the territory of Venice*.

BELUS, (anc. geogr.), a small river of Galilee, at the distance of two Itadia from Ptolemais, running from the foot of mount Carmel out of the lake Cendevia. Near this place, according to Josephus, was a round hollow or valley, where was a kind of sand fit for making glass; which, though exported in great quantities, was found to be inexhaustible. Strabo says, the whole of the coast from Tyre to Ptolemais has a sand fit for making glass; but that the sand of the rivulet Belus and its neighbourhood is a better sort; and here, according to Pliny, the making of glass was first discovered.

BEMA, in antiquity, denotes a step or pace. The bema made a kind of itinerary measure among the Greeks, the length of which was equivalent to one cubit and two thirds, or to ten palms. Whence also the term *bematization*, *bematizatio*, to measure a road.

BEMA, in ecclesiastical writers, denotes the altar or sanctuary in the ancient churches. In which sense *bema* made the third or innermost part of the church, answering to the chancel among us.

BEMA was also used for the bishop's chair, seat, or throne, placed in the sanctuary. It was called *bema* from the steps by which it was to be ascended.

BEMA was also used for the reader's desk. This in the Greek church was denominated *βημα γινωσκων*, in the Latin church *ambo*.

BEMBEA, a province of the kingdom of Angola in Africa. It is divided into Higher and Lower; and extends on one side along the sea, and on the other divides Angola from the foreign states on the south. The country is large, populous, and abounding with cattle; with the fat of which the inhabitants anoint their heads and bodies, and clothe themselves with their hides coarsely dressed. They are addicted to the same idolatrous superstitions with the rest of the natives, but speak a quite different language. The province is watered by a river called *Lutano*, or *San Francisco*, which abounds with crocodiles, sea-horses, and monstrous serpents, that do a great deal of mischief.

BEMBO (Peter), a noble Venetian, secretary to Leo X. and afterwards cardinal, was one of the best writers of the 16th century. He was a good poet, both in Italian and Latin; but he is justly censured for the looseness and immodesty of some of his poems. He published, besides these, A History of Venice; Letters; and a book in praise of the duke and dutchess of Urbino. He died in 1547, in the 72^d year of his age.

BEMSTER, or BEMISTERS, a town of Dorsetshire in England, seated on the river Bert, in W. Long. 3. 15. N. Lat. 50. 45.

BEN. See BENH.

BEN, in pharmacy, the name of an exotic purgative fruit, of the size and figure of a nut; which is also called the *ben-nut*, sometimes *balanus myrsefica*, or *glans unguentaria*.

Naturalists distinguish two kinds of bens; viz. the great, *ben magnum*, which resembles the filbert, and is by some called *avellana purgatrix*, brought from America; and the small, *ben parvum*, brought from Ethiopia.

Ben-nuts yield, by expression, much oil, which, from its property of not becoming rancid, at least for years, is used as a menstruum for the extraction of the odoriferous part of flowers of jessamine, violets, roses, hyacinths, lillies of the valley, tuberoses, jonquils, clove-july flowers, and others, which, like these, yield little or no essential oil by distillation, but impart their fragrance to expressed oils. The method of impregnating oil of ben with the odour of flowers is this: Some fine carded cotton is dipt in the oil, and put in the bottom of a proper vessel. On this is spread a thick layer of fresh flowers, above which more cotton dipt in oil is placed; and thus alternately flowers and cotton are disposed, till the vessel (which may be made of tin, with a cover to be screwed on to it, or of porcelain) is full. By digestion during 24 hours in a water-bath, the oil will receive the odour of flowers.

BENAVARRI, a town of the kingdom of Arragon in Spain, seated on the frontiers of Catalonia. E. Long. o. 40. N. Lat. 41. 55.

BENAVENTO, a town of Spain, in the kingdom of Leon, and Terra di Campos, with the title of a duchy. It is seated on the river Ela, in W. Long. 5. o. N. Lat. 42. 4.

BENAVIDUS, or BONAVITUS (Marcus Mantua), a celebrated civilian, taught civil law with reputation, during 60 years, at Padua the place of his birth; and died in 1582, aged 93. His principal works are, 1. *Collectanea super Jus Casareum*. 2. *Consiliorum*, tom. ii. 3. *Problematum legalium*. 4. *De illustribus Jurisconsultis*, &c.

BENCH, or BANC, in law. See BANC.

Free BENCH signifies that estate in copyhold-lands which the wife, being espoused a virgin, has, after the decease of her husband, for her dower, according to the custom of the manor. As to this free-bench, several manors have several customs; and in the manors of East and West Enbourne, in the county of Berks, and other parts of England, there is a custom, that when a copyhold tenant dies, the widow shall have her free-bench in all the deceased husband's lands, whilst she lives single and chaste; but if she commits incontinency, she shall forfeit her estate: nevertheless, upon her coming into the court of the manor, riding on a black ram, and having his tail in her hand, and at the same time repeating a form of words prescribed, the steward is obliged, by the custom of the manor, to re-admit her to her free-bench.

King's-BENCH, a court in which the king was formerly accustomed to sit in person, and on that account was moved with the king's household. This was originally the only court in Westminster-hall, and from this it is thought that the courts of common pleas and exchequer were derived. As the king in person is still presumed in law to sit in this court, though only represented by his judges, it is said to have supreme authority; and the proceedings in it are supposed to be *coram nobis*, that is, before the king. This court consists of a lord chief justice and three other justices or judges, who are invested with a sovereign jurisdiction over all matters whether of a criminal or public nature. All crimes against the public good, though they do not injure any particular person, are under the cognizance of this court; and no private subject can suffer any unlawful violence or injury against his person, liberty,

erty, or possessions, but a proper remedy is afforded him here; not only for satisfaction of damages sustained, but for the punishment of the offender; and wherever this court meets with an offence contrary to the first principles of justice, it may punish it. It frequently proceeds on indictments found before other courts, and removed by *certiorari* into this. Persons illegally committed to prison, though by the king and council, or either of the houses of parliament, may be bailed in it; and in some cases, even upon legal commitments. Writs of mandamus are issued by this court, for the restoring of officers in corporations, &c. unjustly turned out, and freemen wrongfully disfranchised.

The court of king's bench is now divided into a crown-side and plea-side; the one determining criminal, and the other civil causes. In the first it determines criminal matters of all kinds, where the king is plaintiff; such as treasons, felonies, murders, rapes, robberies, riots, breaches of the peace, and all other causes that are prosecuted by indictment, information, &c. On the plea-side, it determines all personal actions commenced by bill or writ; as actions of debt, upon the case, detinue, trover, ejectment, trespass, waste, &c. against any person in the custody of the marshal of the court, as every person sued here is supposed to be by law.

The officers of this court on the crown side are the clerk and secondary of the crown; and on the side of the pleas there are two chief clerks or prothonotaries, and their secondary and deputy, the custos brevium, two clerks of the papers, the clerk of the declarations, the signer and sealer of bills, the clerk of the rules, clerk of the errors, and clerk of the bails; to which may be added the filazers, the marshal of the court, and the crier.

Amicable BENCH. See *AMICABLE*.

BENCHERS, in the inns of court, the senior members of the society, who are invested with the government thereof.

BENCOOLEN, a fort and town of Asia, on the south-west coast of the island of Sumatra, belonging to the British. The place is known at sea by a slender mountain called the *Sugar Loaf*, which rises about 20 miles inland. About a quarter of a mile from the sea stands an Indian village, whose houses are small and low, and built on posts. The country about Bencoolen is mountainous and woody, and the air unwholesome, the mountains being continually covered with thick heavy clouds that produce lightning, thunder, and rain. There is no beef to be had, except that of buffaloes, which is not very palatable; and indeed provisions of all kinds, except fruit, are pretty scarce. The chief trade is in pepper, of which great quantities grow on the island. There are frequent bickerings betwixt the natives and the factory, to the no small injury of the East India company. The factory was once entirely deserted; and had not the natives found that trade decreased by reason of their absence, it is scarce probable that ever the English would have been invited there again. E. Long. 101. 5. S. Lat. 4. 5.

BEND, in heraldry, one of the nine honourable ordinaries, containing a third part of the field when charged, and a fifth when plain. It is sometimes, like other ordinaries, indented, ingrailed, &c. and is either dexter or sinister. See *HERALDRY*, n^o 19, 20.

In BEND, is when any things, borne in arms, are placed obliquely from the upper corner to the opposite lower, as the bend lies.

BENDER, a town of Bessarabia in European Turkey, seated on the river Niefter, in E. Long. 29. 5. N. Lat. 46. 40. It is remarkable for being the place of retreat of Charles XII. after he was defeated by the Russians at the battle of Pultowa in 1709.

BENDERMASSEN, a town of the island of Borneo in Asia, and capital of a kingdom of the same name. It has a good harbour; and stands in E. Long. 113. 50. S. Lat. 2. 40.

BENDIDIA, in antiquity, a festival, not unlike the Bacchanalia, celebrated by the Athenians in honour of Diana.

BENDING, in a general sense, the reducing a straight body into a curve, or giving it a crooked form.

The bending of timber-boards, &c. is effected by means of heat, whereby their fibres are so relaxed that you may bend them into any figure.

BENDING, in the sea-language, the tying two ropes or cables together: thus they say, *bend the cable*, that is, make it fast to the ring of the anchor; *bend the sail*, make it fast to the yard.

BENDS, in a ship, the same with what is called *swails*, or *swales*; the outmost timbers of a ship's side, on which men set their feet in climbing up. They are reckoned from the water, and are called the *first*, *second*, or *third bend*. They are the chief strength of a ship's sides; and have the beams, knees, and foot-hooks, bolted to them.

BENDY, in heraldry, is the field divided into four, six, or more parts, diagonally, and varying in metal and colour.—The general custom of England is to make an even number; but in other countries they regard it not, whether even or odd.

BENCAPED, among sailors. A ship is said to be *bencaped* when the water does not flow high enough to bring her off the ground, out of the dock, or over the bar.

BENEDETTO (St), a considerable town of the Mantuan, in Italy, in E. Long. 11. 25. N. Lat. 45. 0.

BENEDICITE, among ecclesiastical writers, an appellation given to the song of the three children in the fiery furnace, on account of its beginning with the word *benedicite*.—The use of this song in Christian worship is very ancient, it appearing to have been sung in all the churches as early as St Chrysostom's time.

BENEDICT XIV. pope, (Prosper Lambertini of Bologna), celebrated for his learning and moderation, which gained him the esteem of all sensible Protestants. He was the patron of learned men and celebrated artists; and an elaborate writer, on theological subjects. His works make 12 vols in folio. He died in 1758.

BENEDICT (St), the founder of the order of the Benedictin monks, was born in Italy, about the year 480. He was sent to Rome when he was very young, and there received the first part of his education. At 14 years of age he was removed from thence to Sublaco, about 40 miles distant. Here he lived a most ascetic life, and shut himself up in a cavern, where nobody knew any thing of him except St Romanus, who, we are told, used to defend to him by a rope, and to supply him with provisions. But being afterwards discovered by the monks of a neighbouring monastery,

Benedict,
Benedictins.

they chose him for their abbot. Their manners, however, not agreeing with those of Benedict, he returned to his solitude; whither many persons followed him, and put themselves under his direction, so that in a short time he built 12 monasteries. In the year 528, or the following, he retired to mount Cassino, where idolatry was still prevalent, there being a temple of Apollo erected here. He instructed the people in the adjacent country, and having converted them, he broke the image of Apollo, and built two chapels on the mountain. Here he founded also a monastery, and instituted the order of his name, which in time became so famous and extended over all Europe. It was here too that he composed his *Regula Monachorum*, which Gregory the Great speaks of as the most sensible and best written piece of that kind ever published. The time of his death is uncertain, but is placed between 540 and 550. He was looked upon as the Elisha of his times; and is reported to have wrought a great number of miracles, which are recorded in the second book of the dialogues of St Gregory the Great.

BENEDICT, abbot of Peterborough, was educated at Oxford, became a monk in the monastery of Christ's church in Canterbury, and some time after was chosen prior by the members of that society. Though he had been a great admirer of Archbishop Becket, and wrote a life of that prelate, he was so much esteemed by Henry II. that by the influence of that prince he was elected abbot of Peterborough, A. D. 1177. He assisted at the coronation of Richard I. A. D. 1189; and was advanced to be keeper of the great seal, A. D. 1191. But he did not long enjoy this high dignity, as he died on Michaelmas day, A. D. 1193. Besides his Life of Archbishop Becket, he composed a History of Henry II. and Richard I. from A. D. 1170 to A. D. 1192; which hath been much and justly esteemed by many of our greatest antiquaries, as containing one of the best accounts of the transactions of those times. A beautiful edition of this work was published at Oxford, in two volumes, by Mr Hearne, A. D. 1735.

BENEDICTINS, in church-history, an order of monks, who profess to follow the rules of St Benedict.

The Benedictins, being those only that are properly called monks, wear a loose black gown, with large wide sleeves, and a capuche, or cowl, on their heads, ending in a point behind. In the canon law, they are styled *black friars*, from the colour of their habit.

The rules of St Benedict, as observed by the English monks before the dissolution of the monasteries, were as follows: They were obliged to perform their devotions seven times in 24 hours, the whole circle of which devotions had a respect to the passion and death of Christ: they were obliged always to go two and two together: every day in lent they were obliged to fast till six in the evening, and abated of their usual time of sleeping and eating; but they were not allowed to practise any voluntary austerity without leave of their superior: they never conversed in their refectory at meals, but were obliged to attend to the reading of the scriptures: they all slept in the same dormitory, but not two in a bed; they lay in their clothes: for small faults they were shut out from meals; for greater, they were debarred religious commerce, and excluded from the chapel; and as to incorrigible offenders, they were excluded from the monasteries. Every monk had two

coats, two cowls, a table-book, a knife, a needle, and a handkerchief; and the furniture of their bed was a mat, a blanket, a rug, and a pillow.

The time when this order came into England is well known; for to it the English owe their conversion from idolatry. In the year 596, Pope Gregory sent hither Augustin, prior of the monastery of St Andrew at Rome, with several other Benedictin monks. St Augustin became archbishop of Canterbury; and the Benedictins founded several monasteries in England, as also the metropolitan church of Canterbury, and all the cathedrals that were afterwards erected.

Pope John XXII. who died in 1334, after an exact inquiry, found, that, since the first rise of the order, there had been in it 24 popes, near 200 cardinals, 7000 archbishops, 15,000 bishops, 15,000 abbots of renown, above 4000 saints, and upwards of 37,000 monasteries. There have been likewise of this order 20 emperors and 10 empresses, 47 kings and above 50 queens, 20 sons of emperors and 48 sons of kings; about 100 princefles, daughters of kings and emperors; besides dukes, marquesses, earls, countesses, &c. innumerable. The order has produced a vast number of eminent writers and other learned men. Their Rabanus set up the school of Germany. Their Alcuinus founded the university of Paris. Their Dionysius Exiguus perfected the ecclesiastical computation. Their Guido invented the scale of music; and their Sylvester, the organ. They both to have produced Anselmus, Ildephonus, Venerable Bede, &c.

There are nuns likewise who follow the rule of St Benedict; among whom those, who call themselves *mitigated*, eat flesh three times a-week, on Sundays, Tuesdays, and Thursdays: the others observe the rule of St Benedict in its rigour, and eat no flesh unless they are sick.

BENEDICTION, in a general sense, the act of blessing, or giving praise to God, or returning thanks for his favours. Hence also benediction is still applied to the act of saying grace before or after meals. Neither the ancient Jews, nor Christians, ever eat without a short prayer. The Jews are obliged to rehearse 100 benedictions *per day*; of which, 80 are to be spoken in the morning. The first treatise of the first order in the Talmud, entitled *Seraim*, contains the form and order of the daily benedictions. It was usual to give benediction to travellers on their taking leave; a practice which is still preserved among the monks. Benedictions were likewise given among the ancient Jews, as well as Christians, by imposition of hands. And when at length the primitive simplicity of the Christian worship began to give way to ceremony, they added the sign of the cross, which was made with the same hand, as before, only elevated, or extended. Hence benediction, in the modern Romish church, is used, in a more particular manner, to denote the sign of the cross made by a bishop, or prelate, as conferring some grace on the people. The custom of receiving benediction, by bowing the head before the bishops, is very ancient; and was so universal, that emperors themselves did not decline this mark of submission.—Under the name *benediction*, the Hebrews also frequently understand the presents which friends make to one another, in all probability because they are generally attended with blessings and compliments, both from those who give, and those who receive them.

Nuptial

Nuptial BENEDICTION, the external ceremony performed by the priest in the office of matrimony. This is also called *sacerdotal* and *matrimonial benediction*, by the Greeks *επιφωγία* and *επιφωγία*. The nuptial benediction is not essential to, but the confirmation of, a marriage in the civil law.

Beatific BENEDICTION, *benedictio beatifica*, is the viaticum given to dying persons. The pope begins all his bulls with this form: *Salutem et apostolicam benedictionem*.

BENEDICTION is also used for an ecclesiastical ceremony, whereby a thing is rendered sacred or venerable. In this sense benediction differs from consecration, as in the latter unction is applied, which is not in the former: Thus the chalice is consecrated, and the pix blessed; as the former, not the latter, is anointed: though, in the common usage, these two words are applied promiscuously.—The spirit of piety, or rather of superstition, has introduced into the Romish church benedictions for almost every thing. We read of forms of benedictions for wax-candles, for boughs, for ashes, for church-vestels, and ornaments; for flags or ensigns, arms, first-fruits, houses, ships, paschal eggs, cilicium or the hair-cloth of penitents, church-yards, &c. In general, these benedictions are performed by aspersions of holy water, signs of the cross, and prayers suitable to the nature of the ceremony. The forms of these benedictions are found in the Roman pontifical, in the Roman missal, in the book of ecclesiastical ceremonies printed in pope Leo X.'s time, and in the rituals and ceremonies of the different churches which are found collected in father Martene's work on the rites and discipline of the church.

BENEFICE (*beneficium*), in middle-age writers, is used for a fee, sometimes denominated more peculiarly *beneficium militare*. In this sense, benefice was an estate in land, at first granted for life only; so called, because it was held *ex mero beneficio* of the donor; and the tenants were bound to swear fealty to the lord, and to serve him in the wars. In after-times, as these tenures became perpetual and hereditary, they left their name of *benefice* to the livings of the clergy; and retained to themselves the name of *seuds*.

BENEFICE, in an ecclesiastical sense, a church endowed with a revenue for the performance of divine service; or the revenue itself assigned to an ecclesiastical person, by way of stipend, for the service he is to do that church.

All church-preferments, except bishoprics, are called *benefices*; and all benefices are, by the canonists, sometimes styled *dignities*: but we now ordinarily distinguish between benefice and dignity; applying dignity to bishoprics, deanries, archdeacons, and prebendaries; and benefice to parsonages, vicarages, and donatives.

Benefices are divided by the canonists into simple and sacerdotal. In the first there is no obligation but to read prayers, sing, &c. such are canonries, chaplainships, chantries, &c.: the second are charged with the cure of souls, or the direction and guidance of consciences; such as vicarages, rectories, &c.

The Romanists again distinguish benefices into regular and secular. *Regular* or titular benefices are those held by a religious, or a regular, who has made profession of some religious order; such are abbeyes, priories, conventuals, &c.; or rather, a regular benefice is

that which cannot be conferred on any but a religious, either by its foundation, by the institution of some superior, or by prescription: for prescription, forty years possession by a religious makes the benefice regular. *Secular* benefices are only such as are to be given to secular priests, *i. e.* to such as live in the world, and are not engaged in any monastic order. All benefices are reputed secular, till the contrary is made to appear. They are called *secular benefices*, because held by seculars; of which kind are almost all cures.

The canonists distinguish three manners of vacating a benefice, *viz.* 1. *De jure*, when the person enjoying it is guilty of certain crimes expressed in those laws, as heresy, simony, &c. 2. *De facto*, as well as *de jure*, by the natural death or the resignation of the incumbent; which resignation may be either express, or tacit, as when he engages in a state, &c. inconsistent with it, as, among the Romanists, by marrying, entering into a religious order, or the like. 3. *By the sentence of a judge*, by way of punishment for certain crimes, as concubinage, perjury, &c.

BENEFICE in commendam is that, the direction and management of which, upon a vacancy, is given or recommended to an ecclesiastic, for a certain time, till he may be conveniently provided for.

BENEFICIARIUM, in Roman antiquity, denote soldiers who attended the chief officers of the army, being exempted from other duty. *Beneficarii* were also soldiers discharged from the military service or duty, and provided with *beneficia* to subsist on. These were probably the same with the former, and both might be comprised in the same definition. They were old experienced soldiers, who, having served out their legal time, or received a discharge as a particular mark of honour, were invited again to the service, where they were held in great esteem, exempted from all military drudgery, and appointed to guard the standard, &c. These, when thus recalled to service, were also denominated *evocati*; before their recall, *emeriti*.

BENEFICIARIUM was also used for those raised to a higher rank by the favour of the tribunes or other magistrates. The word *beneficiarius* frequently occurs in the Roman inscriptions found in Britain, where *consulis* is always joined with it; but besides *beneficiarius consulis*, we find in Grutar *beneficiarius tribunus, praetorii, legati, praefecti, proconsulis, &c.*

BENEFICIARY, in general, something that relates to benefices.

BENEFICIARY, *beneficiarius*, is more particularly used for a benefited person, or him who receives and enjoys one or more benefices. A beneficiary is not the proprietor of the revenues of his church; he has only the administration of them, tho' unaccountable for the same to any, but God.

BENEFICIARY is also used, in middle-age writers, for a feudatory or vassal. The denomination was also given to the clerks or officers who kept the accounts of the *beneficia*, and made the writings necessary thereto.

BENEFICIUM, in military matters among the Romans, denoted a promotion to a higher rank by the favour of some person in authority.

BENEFIELD (Sebastian), an eminent divine of the 17th century, was born in 1559, at Prestonbury in Gloucestershire, and educated at Corpus Christi college in Oxford. In 1608, he took the degree of

Benefit
||
Bengal.

Bengal

doctor in divinity; and five years after, was chosen Margaret professor in that university. He had been preferred several years before to the rectory of Meyfey-Hampton, in Gloucestershire. He published Commentaries upon the first, second, and third chapters of Amos; a considerable number of sermons; and some Latin treatises. He died in 1630.

BENEFIT OF CLERGY. See **CLERGY.**

BENESOEUF, a town of Egypt, seated on the western shore of the Nile, and remarkable for its hemp and flax. E. Long. 31. 0. N. Lat. 29. 10.

BENEVENTE, a town of the province of Leon in Spain, seated on the river Elsa, in W. Long. 5. 5. N. Lat. 42. 4.

BENEVENTO, a city of Italy, in the kingdom of Naples, with an archbishop's see. It is situated near the confluence of the rivers Sabato and Calore, in a fertile valley called the *strait of Benevento*, full of gentlemen seats and houses of pleasure. This town hath frequently suffered terribly by earthquakes; particularly in 1703, when a great part of it was overturned, and the rest much damaged. E. Long. 14. 57. N. Lat. 41. 6.

BENEVENTUM, (anc. geog.), a town of the Samnites, formerly called *Maleventum* from the unwholesomeness of the wind, and under that appellation it is mentioned by Livy; but after a Roman colony was led thither in the 485th year of the city, it came to have the name of *Beneventum*, as a more auspicious title. It is mentioned by Horace as an ancient city said to have been built by Diomedes before the Trojan war. Now *Benevento*: See that article.

BENEVOLENCE, in morals, signifies the love of mankind in general, accompanied with a desire to promote their happiness. See **MORALS.**

BENFIELD, a town of Alsace in France, whose fortifications were demolished in consequence of the treaty of Westphalia. E. Long. 7. 45. N. Lat. 48. 14.

BENGAL, a vast country of Asia, bounded by the kingdom of Asham and Arracan on the east; by several provinces belonging to the Great Mogul on the west; by frightful rocks on the north; and by the sea on the south. It extends on both sides the Ganges, which rises from different sources in Thibet; and, after several windings through Caucasus, penetrates into India, across the mountains on its frontier. This river, after having formed in its course a great number of large, fertile, and well-peopled islands, discharges itself into the sea, by several mouths, of which only two are known and frequented.

Towards the source of this river, was formerly a city called *Pallibothra*. Its antiquity was so great, that Diodorus Siculus makes no scruple of assuring us that it was built by that Hercules to whom the Greeks ascribed all the great and surprising actions which had been performed in the world. In Piny's time, its opulence was celebrated through the whole universe; and it was looked upon as the general mart for the people inhabiting both sides of the river that washed its walls.

The history of the revolutions that have happened in Bengal, is intermixed with so many fables, that it does not deserve our attention. All we can discover, is, that the extent of this empire has been sometimes greater, and sometimes less; that it has had fortunate and unfortunate periods; and that it has alternate-

ly been formed into one single kingdom, or divided into several independent states. It was under the dominion of one master, when a more powerful tyrant Akbar, grandfather of Aurengzebe, undertook the conquest of it; which was begun in 1590, and completed in 1595. Since this era Bengal has always acknowledged the Mogul for its sovereign. At first, the governor to whom the administration of it was intrusted, held his court at Raja-Mahul, but afterwards removed it to Dacca. Ever since the year 1718, it has been fixed at Muxadav, a large inland town two leagues distant from Cassimbuzar. There are several Nabobs and Rajahs subordinate to this viceroy, who is called *subah*.

This important post was occupied for a long time by the sons of the Great Mogul; but they so frequently misemployed the forces and treasure at their disposal, to raise disturbances in the empire, that it was thought proper to commit that province to men who had less influence, and were more dependent. True it is, the new governors gave no alarm to the court of Delhi; but they were far from being punctual in remitting the tribute they collected to the royal treasury. These abuses gained further ground after the expedition of Kouli Kan; and matters were carried so far, that the emperor, who was unable to pay the Marattas what he owed them, authorized them, in 1740, to collect it in Bengal themselves. These banditti, to the number of 200,000, divided themselves into three armies, ravaged this fine country for 10 years together, and did not leave it till they had extorted immense sums.

During all these commotions, despotic government, which unhappily prevails all over India, maintained its influence in Bengal; the small district of Bissenpour excepted, which had preserved, and still continues to preserve, its independence. See **BISSEPOUR.**

Though the rest of Bengal is far from enjoying the same happiness, it is nevertheless the richest and most populous province in the whole empire. Besides its own consumption, which is necessarily considerable, its exports are immense. One part of its merchandise is carried into the inland country. Thibet takes off a quantity of its cottons, besides some iron and cloths of European manufacture. The inhabitants of those mountains fetch them from Patna themselves, and give musk and rhubarb in exchange.

But the trade of Thibet is nothing in comparison of that which Bengal carries on with Agra, Delhi, and the provinces adjacent to those superb capitals, in salt, sugar, opium, silk, silk-luffs, and an infinite quantity of cottons, and particularly muslins. These articles, taken together, amounted formerly to more than 1,750,000 l. a-year. So considerable a sum was not conveyed to the banks of the Ganges; but it was the means of retaining one nearly equal, which must have issued from thence to pay the duties, or for other purposes. Since the viceroys of the Mogul have made themselves nearly independent, and send him no revenues but such as they chuse to allow him, the luxury of the court is greatly abated, and the trade we have been speaking of is no longer so considerable.

The maritime trade of Bengal, managed by the natives of the country, has not suffered the same diminution, nor was it ever so extensive, as the other. It may be divided into two branches, of which Catek is

Boundaries.

Comm³
inland.2
Revalu-
tions.4
Maritim

in

in possession of the greater part.

Catek is a district of some extent, a little below the most western mouth of the Ganges. Balasore, situated upon a navigable river, serves it for a port. The navigation to the Maldives, which the English and French have been obliged to abandon on account of the climate, is carried on entirely from this road. Here they load their vessels with rice, coarse cottons, and some silk-stuffs, for these islands; and receive cowries in exchange, which are used for money in Bengal, and are sold to the Europeans.

The inhabitants of Catek, and some other people of the Lower Ganges, maintain a considerable correspondence with the country of Aſham. This kingdom, which is thought to have formerly made a part of Bengal, and is only divided from it by a river that falls into the Ganges, deserves to be better known, if what is asserted here be true, that gun-powder has been discovered there, and that it was communicated from Aſham to Pegu, and from Pegu to China. Its gold, silver, iron, and lead mines, would have added to its fame, if they had been properly worked. In the midst of these riches, which were of very little service to this kingdom, salt was an article of which the inhabitants were so much in want, that they were reduced to the expedient of procuring it from a decoction of certain plants.

In the beginning of the present century, some Bramins of Bengal carried their superstitions to Aſham, where the people were so happy as to be guided solely by the dictates of natural religion. The priests persuaded them, that it would be more agreeable to Brahma if they substituted the pure and wholesome salt of the sea to that which they used. The sovereign consented to this, on condition that the exclusive trade should be in his hands; that it should only be brought by the people of Bengal; and that the boats laden with it should stop at the frontiers of his dominions. Thus have all these false religions been introduced by the influence and for the advantage of the priests who teach, and of the kings who admit, them. Since this arrangement has taken place, 40 vessels from 500 to 600 tons burden each are annually sent from the Ganges to Aſham laden with salt, which yields 200 per cent. profit. They receive in payment a small quantity of gold and silver, ivory, musk, eagle-wood, gum-lac, and a large quantity of silk.

Excepting these two branches of maritime trade, which, for particular reasons, have been confined to the natives of the country, all the rest of the vessels sent from the Ganges to the different sea-ports of India belong to the Europeans, and are built at Pegu*.

A still more considerable branch of commerce, which the Europeans at Bengal carry on with the rest of India, is that of opium. Patna, situated on the Upper Ganges, is the most celebrated place in the world for the cultivation of opium. The fields are covered with it. Besides what is carried into the inland parts, there are annually 3000 or 4000 chests exported, each weighing 300 pounds. It falls upon the spot at the rate of between 24 and 25 l. a chest on an average. This opium is not purified like that of Syria and Persia, which we make use of in Europe; it is only a paste that has undergone no preparation, and has not a tenth part of the virtue of purified opium.

The Dutch send rice and sugar from their settlements to the coast of Coromandel, for which they are paid in specie, unless they have the good fortune to meet with some foreign merchandise at a cheap rate. They send out one or two vessels laden with rice, cottons, and silk: the rice is sold in Ceylon, the cottons at Malabar, and the silk at Surat; from whence they bring back cotton, which is usefully employed in the coarser manufactures of Bengal. Two or three ships laden with rice, gum-lac, and cotton stuffs, are sent to Basora; and return with dried fruits, rose-water, and a quantity of gold. The rich merchandise carried to Arabia is paid for entirely in gold and silver. The trade of the Ganges with the other sea-ports of India brings 1,225,000 l. annually into Bengal.

Though this trade passes through the hands of the Europeans, and is carried on under their protection, it is not entirely on their own account. The Moguls, indeed, who are usually satisfied with the places they hold under the government, have seldom any concern in these expeditions; but the Armenians, who, since the revolutions in Persia, are settled upon the banks of the Ganges, to which they formerly only made voyages, readily throw their capitals into this trade. The Indians employ still larger sums in it. The impossibility of enjoying their fortunes under an oppressive government does not deter the natives of this country from labouring incessantly to increase them. As they would run too great a risque by engaging openly in trade, they are obliged to have recourse to clandestine methods. As soon as an European arrives, the Gentoos, who know mankind better than is commonly supposed, study his character; and, if they find him frugal, active, and well informed, offer to act as his brokers and cashiers, and lend or procure him money upon bottomry, or at interest. This interest, which is usually nine per cent. at least, is higher when he is under a necessity of borrowing of the Cheyks.

These Cheyks are a powerful family of Indians, who have, time immemorial, inhabited the banks of the Ganges. Their riches have long ago procured them the management of the bank belonging to the court, the farming of the public revenue, and the direction of the money, which they coin afresh every year in order to receive annually the benefit arising from the mint. By uniting for many advantages, they are enabled to lend the government 1,750,000 l. 2,625,000 l. or even 4,375,000 l. at a time. When the government finds it impossible to refund the money, they are allowed to indemnify themselves by oppressing the people. That so prodigious a capital should be preserved in the centre of tyranny, and in the midst of revolutions, appears incredible. It is not possible to conceive how such a structure could be raised, much less how it could be supported for so long a time. To explain the mystery, it must be observed, that this family has always maintained a superior influence at the court of Delhi; that the Nabobs and Rajahs in Bengal are dependent upon it; that those who are about the person of the subah have constantly been its creatures; and that the subah himself has been maintained or dethroned by the intrigues of this family. To this we may add, that the different branches of it, and the wealth belonging to them, being dispersed, it has never been possible to ruin above one half of the family at a time, which would still

brokers.

Cheyks, a
powerful
Indian fa-
mily.

Beng l.

still have left them more resources than were necessary to enable them to pursue their revenge to the utmost. The Europeans who frequent the Ganges have not been sufficiently alarmed at this despotism, which ought to have prevented them from submitting to a dependence upon the Cheyks. They have fallen into the snare, by borrowing considerable sums of these avaricious financiers, apparently at nine, but in reality at thirteen, *per cent.* if we take into the account the difference between the money that is lent them, and that in which they are obliged to make their payments. The engagements entered into by the French and Dutch companies have been kept within some bounds; but those of the English company have been unlimited. In 1755, they were indebted to the Cheyks about 1,225,000 l.

Such is the conduct of this considerable set of men, who are sole managers of the European trade at Bengal. The Portuguese, who first frequented this rich country, had the wisdom to establish themselves at Chatigan, a port situated upon the frontier of Arracan, not far from the most eastern branch of the Ganges. The Dutch, who, without incurring the resentment of an enemy at that time so formidable, were desirous of sharing in their good fortune, were engaged in searching for a port which, without obstructing their plan, would expose them the least to hostilities. In 1603, their attention was directed to Balafore; and all the companies, rather through imitation than in consequence of any well concerted schemes, followed their example. Experience taught them the propriety of fixing as near as possible to the markets from whence they had their merchandise; and they sailed up that branch of the Ganges which, separating itself from the main river at Mourcha above Callimbuzar, falls into the sea near Balafore under the name of the river *Hughly*. The government of the country permitted them to erect warehouses wherever there was plenty of manufactures, and to fortify themselves upon this river.

7
Principal
towns.

The first town that is met with in passing up the river is Calcutta, the principal settlement of the English company. See CALCUTTA.

Six leagues higher is situated Frederic Nagore, founded by the Danes in 1756, in order to supply the place of an ancient settlement where they could not maintain their ground. This new establishment has not yet acquired any importance, and there is all the reason imaginable to believe that it will never become considerable.

* See Chan-
dernagore.

Two leagues and an half higher, lies Chandernagore, a settlement belonging to the French*.

At the distance of a mile from Chandernagore, is Chinsura, better known by the name of *Doughly*, being situated near the suburbs of that anciently renowned city. The Dutch have no other possessions there, but merely their fort; the territory round it depending on the government of the country, which hath frequently made it feel its power by its extortions. Another inconvenience attending this settlement is a sand-bank that prevents ships from coming up to it: they proceed no further than Tulta, which is 20 miles below Calcutta; and this of course occasions an additional expence to the government.

The Portuguese had formerly made Bandel, which is eighty leagues from the mouth of the Ganges, and a quarter of a league above the Hughly, the principal

seat of their commerce. Their flag is still displayed, and there are a few unhappy wretches remaining there, who have forgotten their country after having been forgotten by it. This factory has no other employment than that of supplying the Moors and the Dutch with mistresses.

The exports from Bengal to Europe consist of musk, Exp gum-lac, nicaragua wood, pepper, cowries, and some other articles of less importance brought thither from other places. Those that are the immediate produce of the country are borax, salt-petre, silk-stuffs, muslins, and several different sorts of cottons.

It would be a tedious and useless task to enumerate all the places where ticken, and cottons, fit for table linen or intended to be worn, plain, painted, or printed, are manufactured. It will be sufficient to refer to *Daca*, which may be looked upon as the general mart of Bengal, where the greatest variety of finest cottons are to be met with, and in the greatest abundance. See DACa.

The sum total of the purchases made in Bengal by the European nations amounted, a few years ago, to no more than 870,000 l. One third of this sum was paid in iron, lead, copper, woollens, and Dutch spices: the remainder was discharged in money. Since the English have made themselves masters of this rich country, its exports have been increased, and its imports diminished, because the conquerors have carried away a greater quantity of merchandise, and pay for it out of the revenues they receive from the country. There is reason to believe, that this revolution in the trade of Bengal has not arrived at its crisis, and that sooner or later it will be attended with more important consequences and effects.

The conquest of Bengal by the British, which we are now to relate, is an event scarce less remarkable for its splendour and importance, than for the peculiarity of the circumstances that gave it birth; circumstances which, far from promising to open such a field of glory and power, seemed to threaten them with the most fatal reverse of fortune.

A pernicious custom had for some time prevailed in this part of Asia. The governors of all the European settlements took upon them to grant an asylum to such of the natives of the country as were afraid of oppression or punishment. As they received very considerable sums in return for their protection, they overlooked the danger to which the interests of their principals were exposed by this proceeding. One of the chief officers of Bengal, who was apprised of this resource, took refuge among the English at Calcutta, to avoid the punishment due to his treachery. He was taken under their protection. The subah, justly irritated, put himself at the head of his army, attacked the place, and took it. He put the garrison into a close dungeon, where they were suffocated in the space of 12 hours. Three and twenty of them only remained alive. These wretched people offered large sums to the keeper of their prison, to prevail upon him to get their deplorable situation represented to the prince. Their cries and lamentations were sufficient informations to the people, who were touched with compassion; but no one would venture to address the despotic monarch upon the subject. The expiring English were told that he was asleep; and there was not, perhaps, a single person

person in Bengal who thought that the tyrant's slumbers should be interrupted for one moment, even to preserve the lives of 150 unfortunate men.

Admiral Watson, who was just arrived in India with his squadron, and colonel Clive who had so remarkably distinguished himself in the war of the Carnatic, did not delay to avenge the cause of their country. They got together the English who had been dispersed, and were flying from place to place; they went up the Ganges in the month of December 1756, retook Calcutta, made themselves masters of several other places, and gained a complete victory over the subah.

Such a rapid and extensive success becomes in a manner inconceivable, when we consider that it was only with a body of 500 men that the British were to stand against the whole force of Bengal. But if their superiority was partly owing to their better discipline, and to other evident advantages that the Europeans have in battle over the Indian powers; the ambition of eastern chiefs, the avarice of their ministers, and the nature of a government whose only springs are fear and present interest, were of still more effectual service to them: they had experience enough to take advantage of the concurrence of these several circumstances in their first as well as in every succeeding enterprise. The subah was defeated by all his own people, as tyrants generally are; the principal officers sold their interest to the English; he was betrayed at the head of his army, the greatest part of which refused to engage; and he himself fell into the hands of his enemies, who caused him to be strangled in prison.

They disposed of the subahship in favour of Jaffier-Ally-Khan, the ring-leader of the conspiracy; who ceded to the company some provinces, with a grant of every privilege, exemption, and favour, to which they could have any pretension. But soon growing weary of the yoke he had brought upon himself, he was secretly looking out for means to get rid of it. His designs were discovered, and he was confined in the centre of his own capital.

Cosim-Ally-Khan, his nephew, was proclaimed in his stead. He had purchased that usurpation with an immense sum of money. But he did not enjoy it long. Impatient of the yoke, as his predecessor had been, he gave some tokens of his disposition, and refused to submit to the laws the company imposed upon him. Upon this the war broke out again. The same Jaffier-Ally-Khan, whom the English kept in confinement, was again proclaimed subah of Bengal. They marched against Cosim-Ally-Khan. His general officers were corrupted: he was betrayed and entirely defeated: too happy, that, whilst he lost his dignity, he still preserved the immense treasures he had amassed.

Notwithstanding this revolution, Cosim-Ally did not drop his hopes of vengeance. Full of resentment, and loaded with treasure, he set out for the nabob of Benares, chief vicer in the Mogul's empire. He and all the neighbouring princes re-united in opposition to the common enemy, who threatened them all equally. But now the contest lay no longer between them and a handful of Europeans just arrived from the coast of Coromandel; they were to engage with the whole strength of Bengal, of which the British were masters. Elated with their successes, they did not wait to be attacked: they set out directly, and made head against fo

formidable a league; marching on with all the confidence which Clive could inspire, a leader whose name seemed to have become the pledge of conquest. However, Clive did not care to hazard any thing. Part of the campaign was spent in negotiations; but in time the treasures which the English had already drawn from Bengal, served to ensure them new conquests. The heads of the Indian army were corrupted; and when the nabob of Benares was desirous of coming to action, he was obliged to fly with his men without ever being able to engage.

By this victory, the country of Benares fell into the hands of the British: and it seemed as if nothing could hinder them from annexing this sovereignty to that of Bengal: but, either from moderation or prudence, they were content to levy 8,000,000*l.* by contribution: and they offered peace to the nabob on conditions which would render him incapable of doing them any hurt; but such as they were, he most readily agreed to them, that he might regain the possession of his own provinces.

In the midst of these calamities, Cosim-Ally still found means to preserve part of his treasures, and retired to the Cheyks, a people situated in the neighbourhood of Delhi, from whence he made an attempt to procure some allies, and to raise up a body of enemies to oppose the British.

While matters were thus circumstanced in Bengal, the Mogul having been driven out of Delhi by the Patans, by whom his son had been set up in his room, was wandering from one province to another in search of a place of refuge in his own territories, and requesting succour from his own vassals, but without success. Abandoned by his subjects, betrayed by his allies, without support, and without any army, he was allured by the power of the English, and implored their protection: they promised to conduct him to Delhi, and re-establish him on his throne; but they insisted that he should previously cede to them the absolute sovereignty over Bengal. This cession was made by an authentic act, and attended with all the formalities usually practised throughout the Mogul empire.

The English, possessed of this title, which was to give a kind of legitimacy to their usurpation, at least in the eyes of the vulgar, soon forgot the promises they had made. They gave the Mogul to understand, that particular circumstances would not suffer them to be concerned in such an enterprise; that some better opportunity was to be hoped for; and to make up for all his losses, they assigned him a pension of 262,500*l.* with the revenue of Illahabad, and Sha Ichanabad or Delhi; upon which that unfortunate prince was reduced to submit himself in one of the principal towns of the province of Benares, where he had taken up his residence. Thus the Mogul empire comes to be shared between two governing powers, one of which is acknowledged in the several districts of India where the English company has any establishments and authority; the other in such provinces as border on Delhi, and in those parts to which the influence of that company does not extend.

The British, thus become sovereigns of Bengal, have thought it incumbent on them to keep up the shadow of ancient forms, in a country where they have the lead, and, perhaps, the only power that is likely to be secure

Bengal.

and

Bengal.

and lasting. They govern the kingdom fill under the name of a *subah*, who is of their nomination and in their pay, and seems to give his own orders. It is from him that all public acts seem to proceed and issue, tho' the decrees are in fact the result of the deliberations of the council at Calcutta; so that the people, notwithstanding their change of masters, have for a considerable time been induced to believe that they still submitted but to the same yoke.

19
Revenues
from Bengal.

If we should wish to know the amount of the public revenues of Bengal, we shall find, that at the period of its conquest it was equal to 3,500,000 l. The outgoings, either for the government or defence of the province, were stated at 1,797,750 l.; 262,500 l. were agreed to be given to the Mogul, and 131,250 l. to the nabob; so that the remainder to the company was 1,312,500 l. Their purchases in the different marts of India should absorb a great part of this sum; but still it has been thought there must after all remain a surplus of several millions to be carried into great Britain.

20
Methods
for securing
its subjection.

This new arrangement of matters, without having wrought any sensible change in the exterior form of the English company, has essentially changed their object. They are no longer a trading body; they are a territorial power which farm out their revenues in aid of a commerce that formerly was their sole existence, and which, notwithstanding the extension it has received, is no more than an additional object in the various combinations of their present real grandeur. The arrangements intended to give stability to a situation so prosperous are, perhaps, the most reasonable that can be. Britain has at present in India an establishment to the amount of 9800 European troops, and 54,000 sipahis well armed and well disciplined. Three thousand of these Europeans and 25,000 sipahis are dispersed along the borders of the Ganges.

The most considerable body of these troops has been stationed in Benaress, once the source of Indian science, and still the most famous academy of these rich countries, where European avarice pays no regard to any thing. This situation is chosen, because it appeared favourable for stopping the progress of those warlike people who might descend from the mountains of the north; and in case of attack, the maintaining of a war in a foreign territory would be less ruinous than in the countries of which the company is to receive the revenues. On the south, as far as it has been found practicable, they have occupied all the narrow passes by which an enterprising and active adversary might attempt to penetrate into the province. Dacca, which is in the centre of it, has under its walls a considerable force always ready to march wherever their preference may be necessary. All the nabobs and rajahs who are dependent on the subah of Bengal are disarmed, surrounded by spies in order to discover their conspiracies, and by troops to render them ineffectual.

21
Former laudable conduct of the English.

The English company till these latter times had always held a conduct superior to that of the other settlements. Their agents, their factors, were well chosen. The most part of them were young men of good families, already instructed in the rudiments of commerce, and who were not afraid, when the service of their country called upon them, to cross those immense seas which Britain considers but as a part of her empire. The company had generally taken their com-

merce in a great point of view, and had almost always carried it on like an association of true politicians as well as a body of merchants. Upon the whole, their planters, merchants, and soldiers, had retained more honestly, more regularly, and more firmness, than those of the other nations.

Who would ever have imagined that this same company, by a sudden alteration of conduct and change of system, could possibly make the people of Bengal regret the despotism of their ancient masters? That fatal revolution has been but too sudden and too real. A settled plan of tyranny has taken the place of authority occasionally exerted. The exactions are become general and fixed, the oppression continual and absolute. The destructive arts of monopolies are carried to perfection, and new ones have been invented. In a word, the company have tainted and corrupted the public sources of confidence and happiness.

Under the government of the Mogul emperors, the *subahs*, who had the care of the revenues, were, from the nature of the business, obliged to leave the receipt of them to the Nabobs, Polygars, and Jemidars, who were a sort of under-security to other Indians, and these still to others; so that the produce of the lands passed on, and was partly sunk amidst a multitude of intermediate hands, before it came into the coffers of the *subah*, who, on his part, delivered but a very small portion of it to the emperor. This administration, faulty in many respects, had in it one favourable circumstance for the people, that the farms never being changed, the rent of the farms remained always the same; because the least increase, as it disturbed the whole chain of advantage which every one received in his turn, would infallibly have occasioned a revolt: a terrible resource, but the only one left in favour of humanity in countries groaning under the oppressions of despotic rulers.

It is probable that in the midst of these regulations there were many injuries and partial distresses. But, at least, as the receipt of the public moneys was made upon a fixed and moderate assessment, emulation was not wholly extinguished. The cultivators of the land, being sure of laying up the produce of their harvest after paying with exactness the rate of their farm, assisted the natural goodness of the soil by their labour; the weavers, masters of the price of their works, being at liberty to make choice of the buyer which best suited them, exerted themselves in extending and improving their manufactures. Both the one and the other, having no anxiety with regard to their subsistence, yielded with satisfaction to the most delightful inclinations of nature, or the prevailing propensity of these climates; and beheld in the increase of their family nothing more than the means of augmenting their riches. Such are evidently the reasons why industry, agriculture, and population, have been carried to such a height in the province of Bengal. One would think they might still be carried further under the government of a free people, friends to humanity; but the thirst of money, the most tormenting, the most cruel of all passions, has given rise to a pernicious and destructive government.

The English, become sovereigns of Bengal, not content to receive the revenues on the same footing as the ancient *subahs*, have been desirous at once to aug-

ment

ment the produce of the farms, and to appropriate to themselves the rents. To accomplish both these objects, they are become the farmers to their own subah, that is, to a slave on whom they have just conferred that empty title, the more securely to impose upon the people. The consequence of this new plan has been to pillage the farmers, in order to substitute in their room the company's agents. They have also monopolized the sale of salt, tobacco, and betel, articles of immediate necessity in those countries; but they have done this under the name, and apparently on the account of, the subah. They have gone still further, and have obliged the very same subah to establish in their favour an exclusive privilege for the sale of cotton brought from any other province, in order to raise it to an exorbitant price. They have augmented the duties, and, to conclude all, have obtained an edict, which has been published, to forbid all Europeans, except the English, from trading freely in the interior parts of Bengal.

When we reflect on this cruel prohibition, it seems as if it had been contrived only to deprive of every power of mischief that unfortunate country, whose prosperity, for their own interest, ought to be the only object of the English company. Besides, it is easy to see, that the avarice of the members of the council at Calcutta has dictated that shameful law. Their design was to ensure to themselves the produce of all the manufactures, in order to compel the merchants of other nations, who chose to trade from one part of India to another, to purchase these articles of them at an exorbitant price, or to renounce their undertakings.

But still in the midst of this overbearing conduct, so contrary to the advantage of their constituents, these treacherous agents have attempted to disguise themselves under the mask of zeal. They have pretended, that as they were under the necessity of exporting to England a quantity of merchandise proportioned to the extent of her commerce, the competition of private traders was prejudicial to the purchases of the company.

Under the same pretence, and in order to extend this exclusion to the foreign settlements while they appear to respect their rights, they have of late years ordered more merchandise than Bengal could furnish. At the same time the weavers have been forbidden to work for other nations until the English orders were completed. Thus the workmen, not being any longer at liberty to chuse among the several purchasers, have been forced to deliver the fruits of their labour at any price they could get for them.

If to the picture of public distresses we were to add that of private extortions, we should find the agents of the company, almost every where, exacting their tribute with extreme rigour, and raising contributions for them with the utmost cruelty. We should see them carrying a kind of inquisition into every family, and sitting in judgment upon every fortune; robbing indiscriminately the artisan and the labourer, imputing it as a crime that he is not sufficiently rich, and punishing him accordingly. We should view them selling their favour and their credit, as well to oppress the innocent as to screen the guilty. We should find, in consequence of these irregularities, despair seizing every heart, and an universal dejection getting the better of every mind, and uniting to put a stop to the progress and activity of commerce, agriculture, and population.

It will be thought, without doubt, after these details, it was impossible that Bengal should have fresh evils to dread. But, however, as if the elements, in league with mankind, had intended to bring all at once upon the same people, every calamity that by turns lays waste the universe, a drought, of which there had never been an instance in those climates, came upon them, and prepared the way for a most dreadful famine in a country of all the most fertile.

In Bengal they have two harvests; one in April, the other in October. The first, called the *little harvest*, consists of the smaller grain: the second, styled the *grand harvest*, is singly of rice. The rains which commence regularly in the month of August, and end in the middle of October, are the occasion of these different productions; and it was by a drought which happened in 1769, at the season when the rains are expected, that there was a failure in the great harvest of 1769, and the less harvest of 1770. It is true, that the rice on the higher grounds did not suffer greatly by this disturbance of the seasons; but there was far from a sufficient quantity for the nourishment of all the inhabitants of the country: add to which, the English, who were engaged before hand to take proper care of their subsistence, as well as of the sipahis belonging to them, did not fail to keep locked up in their magazines a part of the grain, though the harvest was insufficient.

They have been accused of having made a very bad use of that necessary foresight, in order to carry on the most odious and the most criminal of all monopolies. It may be true, that such an infamous method of acquiring riches may have tempted some individuals: but that the chief agents of the company, that the council of Calcutta, could have adopted and ordered such a destructive scheme; that, to gain a few millions of rupees, the council should coolly have devoted to destruction several millions of their fellow creatures, and by the most cruel means; this is a circumstance we never can give credit to. We even venture to pronounce it impossible; because such wickedness could never enter at once into the minds and hearts of a set of men, whose business it is to deliberate and act for the good of others.

But still this scourge did not fail to make itself felt throughout the extent of Bengal. Rice, which is commonly sold at $\frac{1}{2}d.$ for three pounds, was gradually raised till it came so high as to be sold at $2d.$ per pound, and it was even up to about $3d.$ neither indeed was there any to be found, except in such places where the Europeans had taken care to collect it for their own use.

The unhappy Indians were every day perishing by thousands under this want of sustenance, without any means of help and without any resource, not being able to procure themselves the least nourishment. They were to be seen in their villages, along the public ways, in the midst of our European colonies, pale, meagre, fainting, emaciated, consumed by famine; some stretched on the ground in expectation of dying, others scarce able to drag themselves on to seek for any nutriment, and throwing themselves at the feet of the Europeans, intreating them to take them in as their slaves.

To this description, which makes humanity shudder, let us add other objects equally shocking; let imagination enlarge upon them, if possible; let us represent to ourselves infants deserted, some expiring on the breast

Bengal. of their mothers; every where the dying and the dead mingled together; on all sides the groans of sorrow, and the tears of despair; and we shall then have some faint idea of the horrible spectacle Bengal presented for the space of six weeks.

26
Three mil-
lions perish
by famine.

During this whole time the Ganges was covered with carcases; the fields and highways were choaked up with them; infectious vapours filled the air, and diseases multiplied; and one evil succeeding another, it was likely to happen, that the plague might have carried off the remainder of the inhabitants of that unfortunate kingdom. It appears, by calculations pretty generally acknowledged, that the famine carried off a fourth part, that is to say, about 3,000,000.

But it is still more remarkable, and serves to characterize the gentleness, or rather the indolence, as well moral as natural, of the natives, that amidst this terrible distress, such a multitude of human creatures, pressed by the most urgent of all necessities, remained in an absolute inactivity, and made no attempts whatever for their self-preservation. All the Europeans, especially the English, were possessed of magazines, and even these were not touched; private houses were so too; no revolt, no massacre, nor the least violence prevailed. The unhappy Indians, resigned to despair, confined themselves to the request of succour they did not obtain, and peaceably waited the relief of death.

Let us now represent to ourselves any part of Europe afflicted by a similar calamity. What disorder! what fury! what atrocious acts! what crimes would ensue! How should we have seen, among us Europeans, some contending for their food with their dagger in hand, some pursuing, some flying, and without remorse massacring one another! how should we have seen men at last turn their rage on themselves, tearing and devouring their own limbs, and, in the blindness of despair, trampling under foot all authority, as well as every sentiment of nature and reason!

27
Culpability
of the En-
glish.

Had it been the fate of the English to have had the like events to dread on the part of the people of Bengal, perhaps the famine would have been less general and less destructive. For setting aside, as perhaps we ought, every charge of monopoly, no one will undertake to defend them against the reproach of negligence and insensibility. And in what crisis have they merited that reproach? in the very instant of time when the life or death of several millions of their fellow-creatures was in their power. One would think, that, in such an alternative, the very love of human-kind, that sentiment innate in all hearts, might have inspired them with resources. Certain it is, that by timely exertions much of the misery that ensued might have been prevented. The barrenness had been announced by a drought; and it is not to be doubted, that if, instead of having solely a regard to themselves, and remaining in an entire negligence of every thing else, they had from the first taken every precaution in their power, they might have accomplished the preservation of many lives that were lost.

We must allow that the corruption to which the English have given themselves up from the first beginning of their power, the oppression which has succeeded it, the abuses every day multiplying, the entire loss of all principle; all these circumstances together form a contrast totally inconsistent with their

past conduct in India, and the real constitution of their government in Europe. But this sort of problem in morals will be easily solved, upon considering with attention the natural effect of circumstances and events. Being now become absolute rulers in an empire where they were but traders, it was very difficult for the English not to make a bad use of their power. At a distance from home, men are no longer restrained by the fear of being ashamed to see their countrymen. In a warm climate where the body loses its vigour, the mind must lose some of its strength. In a country where nature and custom lead to indulgence, men are apt to be seduced. In countries where they come for the purpose of growing rich, they easily forget to be just.

BENGO, a province of the kingdom of Angola in Africa, having the sea on the west, and the province of Mofese on the east. It produces plenty of banana trees; but the Portuguese have grubbed up vast quantities of these, and cultivated the land, which now abounds with maize, and the manioc root of which they make bread †. The province is divided into a great number of districts, of which the chiefs are natives, but tributary to Portugal, and obliged to till the lands belonging to the Portuguese. They are Christians, and have eight churches.

† See
Tropics

BENGUELA, a province of the kingdom of Angola in Africa, bounded on the east by the river Rimba, on the north by the Coanza, and it extends westward quite to Cape Negro. Benguela was formerly governed by its own kings; but was entirely ruined by the incursions of the barbarous Giagas, so that its being conquered by the Portuguese proved a great happiness. It still retains the title of *kingdom*, and is allowed to enjoy some small privileges; but is far from being restored to the state of plenty it enjoyed before its destruction by the Giagas already mentioned. It produces abundance of salt, but inferior in quality to that which is made in the province of Chissama. The zimbis also, whose shells are current as money through many countries of Africa, are caught upon the coast. The country, which is mostly mountainous, abounds with elephants, rhinoceroses, lions, tigers, crocodiles, &c. which are very dangerous, and destroy great numbers of cattle.

BENJAMIN. See LAURUS, and BENZON.

BENIARAX, an ancient and considerable town in the kingdom of Algiers in Africa, seated in W. Long. 0. 30. N. Lat. 35. 0.

BENIN, a country of Guinea, in Africa, has part of the gulph called the *Bite of Benin*, and the Slave Coast, on the west; part of Gago and Biafara, on the north; Myjac and Makoko, on the east; and Congo on the south, where it extends about one degree beyond the equinoctial line: the length, from east to west, is about 600 miles; but its north and south bounds are not so well determined. The land in general is low, and woody; in some parts it has rivers and lakes, but in others there is a scarcity of water. There are here a great number of wild beasts, particularly elephants, lions, tygers, leopards, baboons, monkeys, wild boars, deer, &c. The birds are partridges, of which some are blue and some green, turtles, wild ducks, woodcocks, &c. Their grain is Indian corn: they have no potatoes; but plenty of yams, which are of the potatoe kind, but vastly larger and more coarse: these are their ordinary

ordinary food, and serve in the room of bread; they have two sorts of beans, like horse-beans, but not near so good. The fruits are cocoa-nuts, cormantine apples, bananas, wild figs, &c.

The negroes have several colours which might serve for painting, and a good sort of soap made with palm-oil and wood-ashes; they have a great deal of cotton, which not only serves for their own use, but is exported to distant places. The river Rio or Benin has a great many arms; some of which are so large, that they deserve the name of rivers: it abounds with fish, which the inhabitants eat smoke-dried as well as fresh. The place of trade in this river is at Arebo, about 120 miles distant from its mouth; and to this place the ships may sail up. Those who take this voyage see the mouths of a great many rivers fall into the principal channel to the right and the left; but how far it ascends into the country is not known. A little higher up, the country is very low and marshy, and seems to be divided into islands; and yet there are trees of all sizes growing on the banks; this renders the country very unhealthy, as many of our British sailors have found to their cost; it is also incommoded with vast numbers of flies, called *mosquitoes*, which sting terribly, and render the skin full of pustules. There are three principal villages, to which the negroes come from the inland countries to traffic. One is called *Bodadou*, and consists of about 50 houses, or rather huts, for they are made with reeds and covered with leaves. The second, called *Arebo*, was mentioned above: this is much larger than the former, and pretty well stocked with inhabitants; and the houses have much more room, but they are built after the same manner. The third has the name of *Agaton*, and was built upon a hill. It was almost ruined by the wars; but the negroes lately rebuilt it, on account of its agreeable situation. Great Benin is the place of residence of the king.

The inhabitants of Benin are very exact in their trading, and will not recede from any of their old customs: this renders them very slow in their dealings, and backward to pay their debts, which sometimes obliges the traders to sail before they receive satisfaction; but then they are paid as soon as they return. Some of the merchants are appointed by the government, which demands a sort of custom; but it is very trifling. There are three sorts of officers under the king; the first are always near him, and none can address him but by their means: there are several of the second sort; one takes care of the slaves, another of the cattle, another of the streets, another of war, and so on.

Children go almost naked till they are 14, and then they wrap a cotton cloth round their middles: the richer sort put on a sort of callico gowns when they go abroad, with a kind of drawers; but within they are contented with their usual cloth: the better sort of women wear their cotton cloths like petticoats, and have a covering round their shoulders, but take care it shall be open before.

The richer sort of the inhabitants of Benin live upon beef, mutton, and poultry; their drink is water, and brandy when they can get it. The poorer sort live upon dried fish, bananas, and beans; their drink is water and palm-wine. Their chief handicraft men are smiths, carpenters, and curriers; but they perform all

their work in a very bungling manner. The men have as many wives as they can keep, which they take without any ceremony, except treating their relations. The wives of the lower sort may go wherever they have a mind; but those of the rich are shut up: they allow their wives to be very familiar with the Europeans, and yet pretend to be very jealous of their own countrymen. When a woman is caught in adultery, she is turned away, and the goods of the man are forfeited to the husband; but if the relations of the woman are rich, they prevail with him to overlook the fault by dint of presents.

They use circumcision, which is performed seven days after the children are born, at which time the father makes a feast for the relations; they have also customs, relating to uncleanness, resembling those of the Jews. Thieves are punished by making the party amends, if they can, otherwise they are bastinadoed; but murder is always punished with death. When a person is only suspected of a crime, they have several ways of putting him to a trial, like the fire ordeal, or the bitter water of the Jews; but they are of such a nature, that the innocent may be as often condemned as the guilty.

With regard to their religion, they believe in an almighty and invisible God; yet worship images in a human form, and in those of all sorts of animals, making them offerings, every one being his own priest: they look upon these lesser deities as mediators between him and man; some of these idols are in the house, and some in cabins by themselves. Every fifth day is holy; on which the rich kill cows, sheep, and goats, and others dogs, cats, and fowls, which they distribute among their poor neighbours.

BENIN, the capital of a kingdom of the same name, is the residence of their kings, and is seated pretty far in the country: it stands in a plain, and is about four miles in compass. The streets are long and broad; and there are markets twice a-day, where they sell cows, cotton, elephants teeth, European merchandizes, and whatever the country produces. The houses are large, with clay walls, and at a distance from each other; they are covered with reeds, straw, and leaves. The women in this place are the greatest slaves; for they go every day to market, manage the household affairs, take care of the children, cook the victuals, and till the ground. The king's palace makes great part of the town; and, its great extent excepted, there is nothing worth taking notice of, it being only a confused heap of buildings, made with boards and clay, without regularity or neatness. In the middle, there is a wooden tower, about 70 feet high, made like a chimney; and on the top is a brazen serpent, hanging with his head downwards: this is pretty well made, and is the most curious thing in the town: there is a gallery of statues, but so wretchedly carved, that there is no knowing what they represent without being told: behind a curtain, there are 11 brazen heads, with an elephant's tooth on each; these are the king's idols: his throne is made of ivory, on which he sits in a pavilion of India stuff. The king shows himself but once a-year, on the day of a certain festival; and then he is surrounded with his wives and a great number of his officers, who walk out in procession to begin the feast by sacrificing to their gods; this done, he bestows vic-

Benish,
Bennet.

tuals and wine among the multitude, which is imitated by his officers. All the inhabitants of this town and country go under the denomination of the king's slaves; and some relations say, that none of them wear any habit till given them by the king: but this seems to be only a salvo to account for the great number of men and women that are daily seen naked in the streets; for if it be true, that the king of Benin can bring 100,000 fighting men into the field, his subjects must be very numerous; and probably his majesty is not rich enough to bestow garments upon them all. The Europeans refer thither to purchase slaves. E. Long. 5. 4. N. Lat. 7. 40.

BENISH-DAYS, among the Egyptians, a term for three days of the week, which are days of less ceremony in religion than the other four, and have their name from the *benish*, a garment of common use, not of ceremony. In Cairo, on Sundays, Tuesdays, and Thursdays, they go to the pashaw's divan; and these are the general days of business. Fridays they stay at home, and go to their mosques at noon; but, though this is their day of devotion, they never abstain from business. The three other days of the week are the *benish-days*, in which they throw off all business and ceremony, and go to their little summer-houses in the country.

BENNET (Henry), earl of Arlington, was born of an ancient family in Middlesex. In the beginning of the civil war, he was appointed under-secretary to George Lord Digby, secretary of state; afterward entered himself as a volunteer for the royal cause, and did his majesty good service, especially at Andover in Hampshire, where he received several wounds. When the wars were ended, he left not the king when success did, but attended his interest in foreign parts. He was made secretary to the duke of York; received the honour of knighthood from Charles II. at Bruges, in 1658; and was sent envoy to the court of Spain. His majesty, upon his return to England, called him home, made him keeper of his privy purse, and principal secretary of state. He had always a peculiar hatred to the lord chancellor Hyde; who, on the other hand, considered him as a concealed Papist. In 1670 he was one of the council distinguished by the title of the **CABAL**, and one of those who advised shutting up the exchequer. In 1672 he was made Earl of Arlington and Viscount Thetford, and soon after Knight of the Garter. In 1673, he was appointed one of the three plenipotentiaries from the court of Great Britain to Cologne, to mediate a peace between the emperor and the king of France. The house of Commons, in 1673, drew up articles of impeachment against him. In 1674 he was made chamberlain of his majesty's household, with this public reason, that it was in recompense of his long and faithful service, and particularly for his having performed the office of principal secretary of state for the space of 12 years, to his majesty's great satisfaction. But afterward his interest began to decline, while that of the earl of Danby increased; for upon his return from his unsuccessful journey to Holland in 1675, his credit was so much sunk, that several persons at court diverted the king with mimicking his person and behaviour; yet he held his lord chamberlain's place to the day of his death, in 1685. His esteemed letters to Sir William Temple were published after his

death.

BENNET (Christopher), an eminent physician in the 16th century, was the son of John Bennet, of Raynton, in Somersetshire. He was educated at Lincoln college, Oxford; and gave the public a treatise on consumptions, intitled, *Theatri Tabidorum Vestibulum, &c. also Exercitationes Diagnosticae, cum Historiis demonstrativis, quibus Alimentorum et Sanguinis vitia deteguntur in perisique morbis, &c.*

BENNET (Dr Thomas), an eminent divine, born at Salisbury, on the 7th of May, 1673, and educated at St John's college, Cambridge. In 1700, he was made rector of St James's, in Colchester; afterwards he was lecturer of St Olave's, Southwark, and morning-preacher at St Lawrence, Jewry; and at last was presented to the vicarage of St Giles's, Cripple-gate, worth 500 l. a year. While he was in this station, he was engaged in several expensive law-suits in defence of the rights of the church, to which he recovered 150 l. a-year. He wrote, 1. An answer to the Dissenters Plea for Separation. 2. A Confutation of Popery. 3. A Discourse of Schism. 4. An Answer to a book intitled Thomas against Bennet. 5. A confutation of Quakerism. 6. A brief History of the joint-Use of pre-conceived Forms of Prayer. 7. An Answer to Dr Clarke's Scripture-doctrine of the Trinity. 8. A Paraphrase, with Annotations, on the Book of Common-Prayer. 7. An Hebrew Grammar; and other pieces. He died October 9th, 1728, in the 56th year of his age.

BENOIT (Renatus), a famous doctor of the Sorbonne, and curate of Eustathius at Paris in the 16th century. He was a secret favourer of the Protestant religion; and that his countrymen might be able to read the bible in their own tongue, he published at Paris the French translation, which had been made by the reformed ministers at Geneva. This translation was approved of by several doctors of the Sorbonne before it went to the press, and King Charles IX. had granted a privilege for the printing of it. Yet when it was published, it was immediately condemned. He had been before that time confessor to the unhappy Mary queen of Scotland, during her stay in France, and attended her when she returned into Scotland. Some time before the death of Henry III. Dr Benoit, or some of his friends with his assistance, published a book intitled, *Apologie Catholique*, i. e. The Catholic Apology; in which it was shewed, that the Protestant religion, which Henry king of Navarre professed, was not a sufficient reason to deprive him of his right of succeeding to the crown of France. When Henry IV. was resolved to embrace the Catholic religion, he assisted at that assembly in which King Henry abjured the reformed religion. The king promoted him to the bishoprick of Troyes in Champagne 1597, but he could never obtain the pope's bulls to be intalled. However, he enjoyed the temporalities of that bishoprick till he resigned it. He died in 1608.

BENSERADE (Isaac de), an ingenious French poet of the 17th century, was born at Lyons. He made himself known at court by his verses and his wit, and had the good fortune to please the cardinals de Richlieu and Mazarin. After the death of Richlieu, he got into favour with the duke de Breze, whom he accompanied in most of his expeditions; and when this noble-

man

man died, he returned to court, where his poetry became highly esteemed. He wrote, 1. A Paraphrase upon Job. 2. Verfes for Interludes. 3. Rondeaux upon Ovid. 4. Several Tragedies. A *sonnet* which he sent to a young lady with his paraphrase on Job, being put in competition with the *Urania* of Voiture, caused him to be much spoken of; for what an honour was it to be head of a party against this celebrated author? Those who gave the preference to Benferade's performance were styled the *Jobists*, and their antagonists the *Uranists*; and the dispute long divided the whole court and the wits. Some years before his death, he applied himself to works of piety, and translated almost all the Psalms.

M. L'Abbe Olivet says, that Benferade, towards the latter end of his life, withdrew from court, and made Gentilly the place of his retirement. When he was a youth, he says it was the custom to visit the remains of the ornaments with which Benferade had embellished his house and gardens, where every thing favoured of his poetical genius. The barks of the trees were full of inscriptions; and, amongst others, he remembers the first which presented itself was as follows:

*Adieu fortune, honneurs, adieu vous et les vôtres,
Je viens ici vous oublier,
Adieu toi-même amour, bien plus que les autres
Difficile à congédier.*

Fortune and honours, all adieu,
And whatsoever belong to you.

I to this retirement run,
All your vanities to shun.

Thou too adieu, O powerful love;
From thee 'tis hardest to remove.

Mr Voltaire is of opinion that these inscriptions were the best of his productions, and he regrets that they have not been collected.

Benferade suffered at last so much from the stone, that, notwithstanding his great age, he resolved to submit to the operation of cutting. But his constancy was not put to this last proof; for a surgeon letting him blood, by way of precaution, pricked an artery, and, instead of endeavouring to stop the effusion of blood, ran away. There was but just time to call F. Commire, his friend and confessor, who came soon enough to see him die. This happened the 19th of October, 1691, in the 82^d year of his age.

BENSHEIM, a town of Germany in the Palatine of the Rhine, seated in E. Long. 8. 45. N. Lat. 52. 23.

BENSON (Dr George), a learned dissenting minister, born at Great Salkeld, in Cumberland, in 1699. His love of learning was so successful, that, at 11 years of age, he was able to read the Greek Testament. He afterwards studied at Dr Dixon's academy at Whitehaven, from whence he removed to the university of Glasgow. In 1721, he was chosen pastor of a congregation of dissenters at Abingdon, in Berkshire: in 1729, he received a call from a society of dissenters in Southwark, with whom he continued 11 years; and in 1740, was chosen, by the congregation of Crutched Friars, colleague to the learned and judicious Dr Lardner. From the time of his engaging in the ministry he proposed to himself the critical study of the Scriptures, particularly of the New Testament, as a principal part of his business. The first fruits of these studies which he presented to the public was, A defence of the reasonableness of prayer, with A translation of a dis-

course of Maximus Tyrius containing some popular objections against prayer, and An answer to these. The light which Mr Locke had thrown on the obscure parts of St Paul's epistles, by making him his own expositor, encouraged and determined Mr Benson to attempt to illustrate the remaining epistles in the same manner. In 1731, he published A paraphrase and notes on the epistle to Philemon, as a specimen. This was well received, and the author encouraged to proceed in his design. With the epistle to Philemon, was published "A short dissertation, to prove from the spirit and sentiments the apostle discovered in his epistles, that he was neither an enthusiast nor impostor; and consequently that the religion which he asserted he received immediately from heaven, and confirmed by a variety of miracles, is indeed divine." This argument hath since been improved and illustrated, with great delicacy and strength, in a review of the apostle's entire conduct and character, by lord Lyttleton. Mr Benson proceeded with great diligence and reputation to publish Paraphrases and notes on the two epistles to the Thessalonians, the first and second to Timothy, and the epistle to Titus; adding, Dissertations on several important subjects, particularly on inspiration. In the year 1735, our author published his History of the first planting of Christianity, taken from the acts of the apostles, and their epistles, in two vols 4to. In this work, besides illustrating throughout the history of the acts, and most of the epistles, by a view of the history of the times, the occasion of the several epistles, and the state of the churches to whom they were addressed, he established the truth of the Christian religion on a number of facts, the most public, important, and incontrovertible. He also wrote, The reasonableness of the Christian religion; The history of the life of Jesus Christ; A paraphrase and notes on the seven catholic epistles; and several other works which procured him great reputation. One of the universities in Scotland sent him a diploma with a doctor's degree; and many of high rank in the Church of England, as Herring, Hoadley, Butler, Benson, Coneybear, &c. shewed him great marks of favour and regard. He pursued the same studies with great application and success, till the time of his death, which happened in the year 1763, in the 64th year of his age.

BENTHAM (Thomas), bishop of Litchfield and Coventry, was born at Shurbum in Yorkshire, in the year 1512, and educated in Magdalen college, Oxford. He took the degree of bachelor of arts in 1543, and in 1546 was admitted perpetual fellow, and proceeded master of arts the year following, which was that of Edward VI.'s accession to the crown. He now threw off the mask of Popery, which, during the equivocal reign of Henry VIII. he had worn with reluctance. When Mary came to the crown, being deprived of his fellowship by her visitors, he prudently retired to Basil in Switzerland, where for some time he expounded the scriptures to the English exiles in that city; but, being solicited by some Protestants in London, he returned to London before the death of the queen, and was appointed superintendent of a private congregation in the city. Immediately on the accession of Elizabeth, Bentham was preferred in the church, and in the second year of her reign was consecrated bishop of Litchfield and Coventry. He died at Ecclethall in Stafford-

Bentivoglio,
Bentley.

snirc, in 1578, aged 65. He was buried in the chancel of the church there; and a monument was erected, with the effigy of himself, his wife, and four children, with the following inscription:

*Hac jacet in tumba Benthamus, episcopus ille
Doctus, divinus, largus, pacifens, pius, almus.
Ob. 19 Feb. 1578.*

Bishop Bentham had the character of a pious and zealous reformer, and was particularly celebrated for his knowledge of the Hebrew language. His works are, 1. Exposition of the acts of the apostles; manuscript. 2. A sermon on Christ's temptation; Lond. 8vo. 3. Epistle to M. Parker; manuscript. 4. The Psalms, Ezekiel, and Daniel, translated into English, in queen Elizabeth's Bible.

BENTIVOGLIO (Guy), cardinal, born at Ferrara, in the year 1579. He went to study at Padua, where he made a considerable proficiency in polite literature. Upon his leaving the university, he went to reside at Rome, where he became universally esteemed. He was sent nuncio to Flanders, and then to France; in both which employments his behaviour was such as gave great satisfaction to Paul V. who made him a cardinal, which was the last promotion he made, a little before his death, which happened on the 28th of January 1621. Bentivoglio was at this time in France, where Lewis XIII. and all the French court congratulated him on his new dignity; and when he returned to Rome, his Christian majesty entrusted him with the management of the French affairs at that court. Pope Urban VII. had a high regard for him, on account of his fidelity, disinterestedness, and consummate knowledge in business. He was beloved by the people, and esteemed by the cardinals; and his qualities were such, that in all probability he would have been raised to the pontificate on the death of Urban, which happened on the 20th of July, 1644; but having gone to the conclave during the time of the most intolerable heats at Rome, it affected his body to such a degree, that he could not sleep for 11 nights afterwards; and this want of rest threw him into a fever, of which he died the 7th of September 1644, aged 65. He has left several works; the most remarkable of which are, A history of the civil wars of Flanders, An account of Flanders, with Letters and Memoirs.

BENTIVOGLIO, a small town of Italy in the territory of Bologna, with a castle, situated in E. Long. 11. 34. N. Lat. 44. 47.

BENTLEY (Richard), an eminent critic and divine, was the son of a mechanic tradesman at Wakefield in Yorkshire, where he was born in the year 1662, and probably received the first part of his education at the free-school in that town; whence being removed to St John's college in Cambridge, he followed his studies with indefatigable industry; and his inclination leading him strongly to critical learning, his skill and knowledge therein was taken notice of by Dr Edward Stillingfleet, who was bred at the same college, and in 1685 appointed him private tutor to his son. Mr Bentley had not been above a year in the Doctor's family, when he had compiled, in a thick volume in 4to, a kind of Hexapla; in the first volume of which was every word of the Bible alphabetically disposed; the various interpretations whereof from the Chaldee, Syriac, vulgar Latin, Septuagint, and the versions of Aquila,

Symmachus, and Theodosian, had their proper place in the other five volumes; besides another 4to volume of the various lections and emendations of the Hebrew text drawn out of those ancient versions. In 1692, his patron being advanced to the see of Worcester, collated him to a prebend in that church, and also made him his domestic chaplain. That learned prelate, as well as Dr Will. Lloyd, then bishop of Litchfield, had seen many proofs of our author's extraordinary merit, when they concurred in recommending him as a fit person to open the lectures upon Mr Boyle's foundation in defence of natural and revealed religion. This gave him a fine opportunity of establishing his fame. He saw it well; and resolved to push it to the utmost. Sir Isaac Newton's *Principia* had been published but a few years, and the book was little known and less understood: Mr Bentley therefore determined to spare no pains in displaying to the best advantage the profound demonstrations which that excellent work furnished in proof of a Deity; and that nothing might be wanting to complete the design, he applied to the author, and received from him the solution of some difficulties which had not fallen within the plan of his treatise*. In short, our author's sermons at Boyle's lectures were universally admired, and highly raised his reputation as a preacher; notwithstanding that escape which laid him open to the raillery of Dr Keil, viz. of proving the moon not to turn round her axis because she always shews the same face to the earth. In 1693, he was made keeper of the royal library at St James's; soon after which arose the famous dispute between him and the honourable Mr Boyle, in relation to the genuineness of the Epistles of Phalaris. In 1701 he was presented to the mastership of Trinity college, Cambridge, which is reckoned worth near 1000l. per annum. Upon this promotion he resigned his prebend of Worcester, and, in 1707, was collated to the archdeaconry of Ely; besides this, he was presented to a good benefice in that see. Being thus placed in a state of ease and affluence, he took his degree of doctor of divinity, entered into matrimony, and indulged his inclination in critical pursuits; and the fruits of his labours, which he occasionally published, all displayed such erudition and sagacity, that, by degrees, he obtained the character of being the greatest critic of the age. In the mean while, however, he carried matters with so high a hand in the government of his college, that, in 1709, a complaint was brought before the bishop of Ely, as visitor, against him, by several of the fellows, who charged him with embezzling the college money, and other misdemeanors. In answer to this, he presented his defence to the bishop, which he published in 1710, under the title of *The present State of Trinity College, 8vo*; and thus began a quarrel, which was carried on with the most virulent animosity on each side, for above 20 years, when it at last ended in the Doctor's favour. During the course of this dispute, he had been promoted to the regius professorship of divinity; and his majesty king George I. on a visit to the university in 1717, having, as usual, nominated by mandate several persons for a doctor's degree in that faculty, our professor, to whose office it belonged to perform the ceremony called *creation*, demanded four guineas from each person, besides a broad piece of gold, and absolutely refused to create any doctor without these fees: hence there arose a long

* Vid. Letters, Sir Isaac Newton, Dr Bentley, Lond. 1756.

and

and warm dispute, during which, the doctor was first suspended, and then degraded; but on a petition to his majesty for relief from that sentence, the affair was referred to the court of king's-bench, where the proceedings against him being reversed, a mandamus was issued, charging the university to restore him.—Dr Bentley was endued with a natural hardiness of temper, which enabled him to ride out both these storms without any extraordinary disturbance, or interruption to his literary pursuits. In his private character, tho' he is generally allowed to have been too fond of money, he was hearty, sincere, and warm in his friendship, an affectionate husband, and a most indulgent father. He loved hospitality and respect; maintained the dignity and manificence of the ancient abbots in house-keeping at his lodge, which he beautified; and, in conversation, tempered the severity of the critic with such a peculiar strain of vivacity and pleasantry, as was very entertaining. He died at his lodge in Trinity college, on the 14th of July, 1742, at 80 years of age. The Doctor's principal works, besides those already mentioned, were, 1. His animadversions and remarks on the poet Callimachus. 2. Remarks upon Collins's discourse of free-thinking. 3. Beautiful and correct editions of Horace, Terence, Phædrus, and Milton, with notes; but as the Doctor had not a poetic genius, many of his notes on our British poet, in which he has endeavoured to make emendations of the original, have been greatly and justly censured.

BENZOIN, in materia medica, a concrete resinous juice, obtained from a species of laurus *. The resin is brought from the East Indies in large masses, composed of white and light-brown pieces, with yellowish specks: it easily breaks betwixt the hands. That which is whitest is most esteemed. It has very little taste; but its smell is very fragrant and agreeable, especially when heated. The principal use of benzoïn is in perfumes, and as a cosmetic; and enters in substance only into one officinal composition, the balsamum tranmaticum. Its flowers, which is a white saline concrete obtained by committing it to the fire in proper vessels, are recommended in disorders of the breast †.

BERAMS, a coarse cloth, all made with cotton-thread, which comes from the East Indies, and particularly from Surat.

BERAR, a province of Asia, in the dominions of the Great Mogul, near the kingdom of Bengal. It abounds in corn, rice, pulse, and poppies, from which last they extract opium; and sugar-canes grow almost without cultivation. The capital town is called *Shampour*.

BERAUM, a royal city of Bohemia, and capital of a circle of the same name. E. Long. 14. 25. N. Lat. 50. 2.

BERAY, a town of Normandy in France, situated in W. Long. 1. 20. N. Lat. 49. 6.

BERBERIS, the **BARBERRY**, or *pipperidge bush*; a genus of the monogynia order, belonging to the hexandria class of plants.

Species. 1. The vulgaris, or common barberry, grows naturally in hedges in many parts of England, as also in some parts of Scotland; but is also cultivated in gardens on account of its fruit, which is pickled, and used for garnishing dishes. It rises to the height of eight or ten feet, with many stalks, which have a

white bark, yellow on the inside: the stalks and branches are armed with sharp thorns, which commonly grow by threes; the leaves are oval, obtuse, and slightly sawed on their edges. The flowers come out from the wings of the leaves, in small ramose bunches, like those of the currant bush, and are of a yellow colour; these are succeeded by oval fruit, which are at first green, but when ripe turn to a fine red colour. The flowers appear in May, and the fruit ripens in September. There are two or three varieties of this shrub, which, by some, have been taken for distinct species: one is the barberry without stone; another, the barberry with white fruit; and a third is called by Tournfort *taller eastern barberry* with a black sweet fruit. Of these Mr Miller observes, that the first certainly depends on the age of the plant; because the suckers taken from those bushes commonly produce fruit with stones: the second, he says, seldom bears any fruit; the leaves are of a lighter green colour, and the bark of the stalks are whiter than those of the common kind: the third appears to be the same with the common sort, excepting the colour and flavour of its fruit, which can never indicate a specific difference. 2. The canadensis, is a native of that country from whence it takes its name, and was formerly much more common in British gardens than at present. The leaves are much broader and shorter than those of the common sort, and the fruit is black when ripe. 3. The cretica, with a single flower in each footstalk, is at present very rare in Britain; the plants being tender whilst young, and most of them killed by severe frost. This never rises more than three or four feet high in Britain; but sends out many stalks from the root, which are strongly armed with spines at every joint: the leaves are produced without order, and are shaped like those of the narrow leaved box-wood: the flowers come out from between the leaves, each having a slender footstalk; but they are not succeeded by fruit in Britain.

Culture. The first sort is generally propagated by suckers, which are sent out in great plenty from the root; but such plants are very apt to send out suckers in greater plenty than those that are propagated by layers; so the latter method is preferable. The best time for laying down the branches is in the autumn, when the leaves begin to fall: the young shoots of the same year are the best for this purpose; these will be well rooted by the next autumn, when they may be taken off, and planted where they are designed to remain. Where this plant is cultivated for its fruit, it should be planted single, not in hedges as was formerly the practice; the suckers should be every autumn taken away, and the gross shoots pruned out: by this means the fruit will be much fairer and in greater plenty than on those that are suffered to grow wild. The other sorts may be propagated in the same manner; only the third should be planted in pots, and sheltered as soon as the young shoots are taken off, till the plants have acquired strength, when they may be turned out, and planted in a warm situation.

Medicinal and other qualities. The berries, which are so acid that birds will not feed upon them, are moderately astringent; and have been given with success in bilious fluxes, and diseases proceeding from heat, acrimony, and thinness of the juices. Among the Egyptians barberries are used in fluxes and in malignant fevers.

Berberis
Berengarianism.

fevers, for abating heat, quenching thirst, raising the strength, and preventing putrefaction: the fruit is macerated for a day and a night, in about 12 times its quantity of water, with the addition of a little fennel-feed, or the like, to prevent offence to the stomach; the liquor strained off, and sweetened with sugar or syrup of citrons, is given the patient liberally to drink. Prosper Alpinus, from whose treatise *de medicina Ægyptorum* Dr Lewis extracted this account, informs us, that he took this medicine himself with happy success, in a perennial fever accompanied with an immoderate bilious diarrhoea. The leaves also are gratefully acid. The flowers are offensive to the smell when near, but at a distance their odour is extremely fine. An infusion of the bark in white-wine is purgative. The roots boiled in ley dye wool yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root. The inner bark of the stems dyes linen of a fine yellow with the assistance of alum. This shrub should never be permitted to grow in corn lands; for the ears of wheat that grow near it never fill, and its influence in this respect has been known to extend across a field of 300 or 400 yards. Cows, sheep, and goats, eat it; horses and swine refuse.

BERBICE, a river of Terra Firma in America, which falls into the North Sea, in S. Lat. 6. 30. This is the only river in the country, and waters a great number of plantations of cotton, &c. belonging to the Dutch.

BERCHEROIT, or BERKOITS, a weight used at Archangel, and in all the Russian dominions, to weigh such merchandizes as are heavy and bulky: it weighs about 364 lib. English avoirdupois weight.

BERCHETT (Peter), an eminent history-painter, was born in France in 1659, and at the age of 18 was employed in the royal palaces. He came to England in 1681, to work under Rambour, a French painter & of architecture; but, after staying a year, returned to Marli. He came again, and was sent by king William to the palace he was building at Loo, where he was employed 15 months; and then came a third time to England, where he had sufficient business. We are informed by Mr Walpole, that he then painted the ceiling of the chapel of Trinity college, Oxford, the staircase at the duke of Schomberg's in Pall-Mall, and the summer-house at Ranelagh. His drawings in the academy were much approved. Towards the close of his life he retired to Marybone, where he painted only small pieces of fabulous history, and died there in January 1720.

BERECYNTHIA; the mother of the gods, in the Pagan theology.

BERENGARIANISM, a name given by ecclesiastical writers to the opinion of those who deny the truth and reality of the body and blood of Christ in the eucharist. The denomination took its rise from Berengarius, archdeacon and scholasticus of the church of St Mary at Anjou about the year 1035, who maintained, that the bread and wine, even after consecration, do not become the true body and blood of our Lord, but only a figure and sign thereof.

Berengarianism was strenuously opposed by Lanfranc, Guitmond, Adelmannus, Albericus, &c. Divers synods were held, wherein the author was condemned at Rome, Versailles, Florence, Tours, &c. He retracted,

and returned again more than once; signed three several catholic confessions of faith, the first in the second council of Rome, the second in the third, and the third in the fourth council of the same city. But he still relapsed to his former opinion when the storm was over; though Mabillon maintains he soon recovered from his fourth fall, and died an orthodox catholic in 1088.

BERENICE, daughter of Ptolemy Auletes king of Egypt, succeeded her father before his death. This banished prince implored the assistance of the Romans. Pompey restored him. Berenice, to support herself on the throne, allured a prince, whose name was Seleucus, descended from the kings of Syria, and admitted him to her nuptial bed, and to her sceptre. She was soon weary of him, and put him to death. She next cast her eye on Archelaus, who married her, and put himself at the head of her troops to repulse the Romans. He was killed in a battle. Ptolemy returned to Alexandria, and put his rebellious daughter to death.

BERENICE, wife of Ptolemy Evergetes king of Egypt, cut off her hair in pursuance of a vow, and consecrated it in the temple of Venus. This deposit being afterward lost, Conon the mathematician, in compliance to her, declared that the queen's locks had been conveyed to heaven, and composed those seven stars near the tail of the bull, called to this day *coma Berenices*.

BERENICE, daughter of Costobarus and of Salome sister to Herod the Great, was married first to Aristobulus, son of the same Herod and Mariamne. He having a brother who married the daughter of Archelaus king of Cappadocia, often upbraided Berenice that he was married below himself in wedding her. Berenice related all these discourses to her mother, and exasperated her so furiously, that Salome, who had much power over Herod's mind, made him suspect Aristobulus, and was the principal cause that urged this cruel father to get rid of him. She married again; and having lost her second husband, went to Rome, and got into the favour of Augustus. But, above all, she insinuated herself into the good graces of Antonia, the wife of Drusus, which in the end proved of great service to Agrippa.

BERENICE, grand-daughter of the preceding, and daughter of Agrippa I. king of Judaea, has been much talked of on account of her amours. She was betrothed to one Marcus, but he died before the marriage. Soon after, she married his uncle Herod, who at the desire of Agrippa both his brother and father-in-law, was created king of Chalcis by the emperor Claudius. She lost her husband in the 8th year of the emperor Claudius; and in her widowhood, it was rumoured, she committed incest with her brother Agrippa. To put a stop to this report, she offered herself in marriage to Polemon king of Cilicia, provided he would change his religion. He accepted her offers, was circumcised, and married her. Berenice soon left him to follow her own ways, and he abandoned Judaism to return to his former religion. She was always very well with her brother Agrippa, and seconded him in the design of preventing the desolation of the Jews. She got Titus into her snares; but the murmurs of the Roman people hindering her from becoming his wife, there remained nothing for her but the title of mistress or concubine of
the

the emperor. The French stage, in the 17th century, reckoned with the amours of Titus and Berenice.

BERENICE, (anc. geog.), the name of several cities, particularly of a celebrated port-town on the Sinus Arabicus, now *Suez*; which see.

BERENICE'S HAIR, *Goma Berenices*. See BERENICE.

BERE-REGIS, a town in Dorsetshire in England, in W. Long. 2. 15. N. Lat. 50. 40.

BERESOW, a division of the province of Tobolsk in Siberia. It is bounded on the north by the straits of Waigatz, on the east by a large bay of the frozen ocean which runs into the land towards the south, and at the 65th degree of latitude separates into two arms; one of which is called the *Obkaia-Guba*, or *Oby-bay*; and the other *Tazowkaia-Guba*, or the bay of *Tazow*. The river Oby empties itself into the former, and the Taz into the latter. This district was under the Russian dominion long before the other parts of Siberia were conquered, being reduced by the Czar Gabriel so early as the year 1530.

BERG, a duchy of Germany, in the circle of Westphalia. It is bounded on the north by the duchy of Cleves, on the west by the county of Mark and the duchy of Westphalia, on the south by Wetteravia, and on the east by the diocese of Cologne, from which it is separated by the Rhine. It is about 150 miles in length, and 24 in breadth. It is very fruitful along the Rhine, but mountainous and woody towards the county of Mark. It is subject to the elector Palatine, but his right is disputed by Prussia and Saxony. The principal towns are Dusseldorf; and the principal rivers, besides the Rhine, are the Wipper, Agger, and Sieg.

BERG (St WINOX), a town of the Low Countries, in the country of Flanders, fortified by Vauban, and subject to France. It is seated on the river Colme, six miles from Dunkirk, and 21 from Ypres. The air is often very unwholesome, especially to strangers. It has an hospital for soldiers, taken care of by friars called *Bons Fieux*, and two seminaries for young students. The river Colme serves instead of a canal to Hondshote, St Omer's, and Gravelines. There is likewise another canal to go to Dunkirk. The villages in its territory are very famous for butter and cheese, of which they send a great quantity to Flanders. Fort Lapin and Fort Suffle are within a cannon's shot of this place, and Fort St Francis is seated on the canal, near three miles from the town. E. Long. 2. 35. N. Lat. 50. 57.

BERG-ZABERN, a town of France, in Alsace. E. Long. 7. 55. N. Lat. 49. 4.

BERG-GRUIN, in natural history, the name of an earth used in painting, and properly called *green okre*, tho' not known among the colour-men under that name. It is found in many parts of Germany, Italy, and England, commonly in the neighbourhood of copper-mines, from particles of which metal it receives its colour. In many parts of Germany, they have a purer kind of this, distinguished by no peculiar name, but separated by art from the waters draining from the copper-mines, and differing no otherwise from this native substance, than as the washed okres of Oxfordshire, &c. do from these sent us in their natural condition. The characters by which the native kind is known from other green earths, are these: it is a dense compact substance, considerably heavy, and of a pale but not disagreeable

green; of a rough and uneven, but not dusty surface, and somewhat unctuous to the touch. It adheres firmly to the tongue; does not break easily between the fingers; nor at all stains the hands. It is of a brackish disagreeable taste, and does not ferment with acids.

BERGAMASCO, a province of Italy, in the territory of Venice. It is bounded on the east by the Bressan, on the north by the Valteline, on the west and south by the Milanese. It extends about 36 leagues from north to south, and 30 from east to west. It is watered by several rivers which render it very fertile, and particularly it produces a great number of chestnuts. It has mines of iron, and quarries of marble, and other stones of which they make millstones. There are a great number of villages, but no city except Bergamo the capital. The people are very indolent, and make the best of their natural productions. They are well stocked with cattle, and make fine tapestry. Their language is the most corrupt of any in Italy.

BERGAMO (James Philip de), an Augustin monk, born at Bergamo in 1434, wrote in Latin a Chronicle from the creation of the world to the year 1503, and a Treatise of Illustrious Women. He died in 1518.

BERGAMO, anciently *Bergomum*, a large and strong town of Italy, in the Venetian territory, and capital of the province of Bergamasco. It has a strong citadel, and is the see of a bishop. Its situation near the Alps makes the inhabitants subject to swellings in their throats, owing to the badness of the Alpine waters. E. Long. 9. 38. N. Lat. 45. 42.

BERGAMOT, a species of citron, produced at first casually by an Italian's grafting a citron on the stock of a bergamot pear-tree, whence the fruit produced by this union participated both of the citron-tree and the pear-tree. The fruit hath a fine taste and smell, and its essential oil is in high esteem as a perfume. The essence of Bergamot is also called *essentia de cedra*. It is extracted from the yellow rind of the fruit by first cutting it in small pieces, then immediately squeezing the oil out of them into a glass vessel. This liquor is an ethereal oil. A water is distilled from the peel as follows: Take the outer rind of three bergamots, a gallon of pure proof spirit, and four pints of pure water; draw off a gallon in a balneum marie, then add as much of the best white sugar as will be agreeable. Or, take of the essence of bergamot three drams and a half, of rectified spirit of wine three pints, of volatile sal ammoniac a dram; distil off three pints in a balneum marie.

BERGARAC, a very rich, populous, and trading town of France, seated on the river Dordogne, in E. Long. 0. 37. N. Lat. 50. 57.

BERGAS, a town of Romania in European Turkey, and the see of a Greek archbishop. It is seated on the river Larissa, in E. Long. 27. 30. N. Lat. 41. 17.

BERGEN, anciently *Bergi*, a city of Norway, and capital of the province of Bergenshus. It is the see of a bishop, and has a strong castle and a good port. It is a large place; but subject to fires, as being all built of wood. It is surrounded with mountains almost inaccessible; and little or no corn grows in all the country: that which they use is all imported, and distributed from thence throughout the kingdom. The principal trade is in stock-fish, firs, and deal-boards. E. Long. 5. 45. N. Lat. 60. 11.

Bergamasco
||
Bergen.

Mergen
Beria.

BERGEN, a town of Pomerania in Germany, and capital of the life of Rugen, subject to the Swedes. E. Long. 13. o. N. Lat. 54. 30.

BERGEN-OP-ZOOM, a town of the Low Countries, in Dutch Brabant, and in the marquisate of the same name. It is seated on an eminence, in the middle of a morass, about a mile and a half from the eastern branch of the Scheld, with which it has a communication by a navigable canal. The houses are well built, and the market-places and squares handsome and spacious. The church, before the last siege, was reckoned a good building, and so was the marquis's palace. It has a good tract of land under its jurisdiction, with several villages, and some islands in the Scheld. It has a very advantageous situation on the confines of Brabant, Holland, Zealand, and Flanders. It is strong by nature as well as by art, being so secured by the morasses about it, which are formed by the river Zoom, that it was reckoned impregnable. It was, however, taken in 1747 by the French, but it is thought not without the help of treachery. The fortifications are allowed to be the master-piece of that great engineer Cohorn. It had been twice besieged before, without success. The marquis of Spinola was the last but one who invested it, and he was forced to raise the siege with the loss of 10,000 men. E. Long. 4. 15. N. Lat. 51. 30.

BERGHEM (Nicholas), a Dutch painter and engraver, had a genius truly pastoral. The simplicity of Arcadian manners is no where better described than in his works. We have a large collection of prints from his designs; many etched by himself, and many by other masters. Those by himself are slight but masterly. His execution is inimitable. His cattle, which are always the distinguishing part of his pieces, are well drawn, admirably characterized, and generally well grouped. Few painters excelled more in composition than Berghem; and yet we have more beautiful instances of it in the prints etched by others, than in those by himself. Among his own etchings a few small plates of sheep and goats are exceedingly valued.—He died in 1683.

BERGHMONT, an assembly or court held upon a hill in Derbyshire, for deciding controversies among the miners.

BERIA, BERIE, *Berry*, signifies a large open field; and those cities and towns in England which end with that word are built on plain and open places, and do not derive their names from boroughs, as Sir Henry Spelman imagines. Most of our glossographers in the names of places have confounded the word *berie* with that of *bury* and *borough*, as if the appellative of ancient towns; whereas the true sense of the word *berie* is a flat wide campaign, as is proved from sufficient authorities by the learned Du Fresnoie, who observes that *Beria Sancti Edmundi*, mentioned by Mat. Paris. fub. ann. 1174. is not to be taken for the town, but for the adjoining plain. To this may be added, that many flat and wide meads, and other open grounds, are called by the name of *beries* and *beriefields*: the spacious meadow between Oxford and Iffay was in the reign of king Athelstan called *Bery*; as is now the largest pasture ground in Quarendon in the county of Buckingham, known by the name of *Beryfield*. And though these meads have been interpreted demesne or manor meadows, yet they were truly any flat or open meadows that lay adjoining

to any villa or farm.

BERING (Sinius), of Copenhagen, a Latin lyric poet, flourished about 1560.

BERKELEY (George), the celebrated bishop of Cloyne, was the son of a clergyman in Ireland, distinguished only by his piety and learning. He was educated at Trinity college in Dublin, of which he attained a fellowship. His first essays as a writer were published in the Spectator and Guardian, which entertaining works he adorned with many pieces in favour of virtue and religion. His learning and virtues, his wit and agreeable conversation, introduced him to the acquaintance, and procured him the esteem and friendship, of many great and learned men; and among others the earl of Peterborough, Dr Swift, and Mr Pope. The earl made him his chaplain, and took him as his companion on a tour through Europe.

He was promoted to the deanery of Clogher after his return; and in this situation, formed a most benevolent and charitable plan for the better supplying of the churches in our foreign plantations, and converting the savage Americans to christianity, by erecting a college in the Summer islands. The proposal was well received; and he obtained a charter for the foundation, with a parliamentary grant of 20,000*l.* toward carrying it into execution: but he could never get the money; so that, after two years stay in America on this business, the design dropped.

He was warmly engaged too, in concert with Swift, Bolingbroke, and others, in a scheme for establishing a society for the improvement of the English language, in imitation of the academy of France. But Harley, the great patron of it, falling from power, this design too proved abortive.

In the year 1734, he was advanced from the deanery of Derry to the bishoprick of Cloyne, where he distinguished himself by pastoral vigilance and constant residence; and at once endeared himself to his people, by promoting their temporal and spiritual happiness. He endeavoured by all means to raise a spirit of industry, and propagate the arts of cultivation and agriculture in that neglected country.

The earl of Chesterfield, when he was lord lieutenant of Ireland, offered him a richer see; but he declined it, saying, his neighbours and he loved one another, and he could not think of forming new connections in his old days, and tearing himself from those friends whose kindness to him was his greatest happiness. Finding the infirmities of age come upon him, and that he was unable to discharge the functions of his office, he retired to Oxford, there to spend the remainder of his days in conversation with learned men, and to superintend the education of his son. And that the revenues of the church might not be misapplied, nor the interests of religion suffer by his absence from his diocese, he made great interest for leave to resign his bishoprick, and to obtain in lieu of it a canonry of Christ-church. But soon after his arrival in Oxford he died very suddenly and without a groan, January 14. 1753, in the 73^d year of his age. His remains were interred at Christ-Church, Oxford; where there is a handsome monastery erected to his memory, with an inscription drawn up by Dr Markham, in Latin. Dr Watkinson says he was particularly fond of music, and that he always kept one or two exquisite per-

Ber
Berk

performers to amuse his leisure hours. Mr Pope sums up his character in one line. After he has mentioned some particular virtues that characterize other prelates, he ascribes

To Berkley ev'ry virtue under heav'n.

He published many ingenious works, particularly *The Principles of Human Knowledge*, the singular notions in which gave rise to much controversy: A new theory of vision: Alciphron, or the minute philosopher; one of the most elegant and genteel defences of that religion which he was born to vindicate both by his virtues and his ingenuity: and *Siris*, or a Treatise on tar water, which, under his sanction, became for a while a very popular medicine.

BERKSHIRE, an inland county of England, in the diocese of Salisbury, divided on the north and north-east by the Thames from Oxfordshire and Buckinghamshire, on the west it is bounded by Gloucestershire and Wiltshire, on the south-east by Surry, and on the south by Hampshire. It is 120 miles in circumference, and contains about 527,000 acres. The air is sweet, and soil fruitful. It has plenty of corn, cattle, wild-fowl, wool, and timber, especially oak and beech. The rivers are the Thames, Kennet, Ocke, Loddon, and Lambourn. The Kennet is now made navigable by act of parliament. This county sends nine members to parliament, has 140 parishes, and 12 market towns. The principal towns are Reading, Abingdon, Windsor, Wallingford, Maidenhead, Hungerford, Newbury, Farringdon, Wantage, Lower Lambourn, East Ilshy, and Oakingham. The royal palace and castle at Windsor, built by Edward III. are remarkable for their fine situation, rich furniture, paintings, and many other curiosities. In St George's chapel are held the chapters of the order of the garter instituted by the above king Edward III. A few miles to the south-east of this town is the figure of a white horse, covering an acre of ground, cut in a hill of chalk, from whence it may be seen at a great distance, and is said to have been made by direction of king Alfred, in memory of a great victory he obtained. The neighbouring people have from time immemorial a kind of festival, called *scouring the horse*, when they cleanse it of weeds, whereby the chalky bottom still preserves a fine effect at a considerable distance.—Near Reading is a natural curiosity, thought to have remained ever since the flood. It is a bed of oyster shells and sand, 30 or 40 feet under the surface of a hill, and covered with different strata. These shells retain the true figure and colour, but moulder with a small pressure. In this county are also remains of Roman antiquities and fortifications, with some of the famous causeway called *Icknield-street*.

BERLIN, a city of Germany, capital of the electorate of Brandenburg, and of the whole Prussian dominions, seated in E. Long. 13. 37. N. Lat. 52. 53. This city is one of the largest, best built, and best governed, of any in Germany. The streets are large, straight, clean, and well paved, and some of them very long and elegant. There are also several large and beautiful squares, with pleasant walks. It is surrounded with handsome gardens, which produce excellent fruit. The river Spree, that crosses the city, has a communication with the Havel, Oder, and Elbe, which greatly facilitate commerce. The French refugees

have greatly contributed to the embellishment of the grandeur of Berlin; inasmuch as they have introduced all kinds of manufactures, and various arts.

Berlin is divided into five parts, without reckoning the suburbs, which are very large. The houses in these last are almost all of wood; but so well plastered, that they seem to be of stone. In the suburb called *Spandau* is a house belonging to the royal family, with well contrived apartments, and furnished in a very fine taste. In the suburb of *Stralau* is a house and garden belonging to the king. The royal gate of the city is defended by a half moon, and two bastions, covered with brick; it fronts the royal street, which is one of the longest and most frequented in the city. It contains very handsome houses, particularly those belonging to some of the ministers of state.

The royal street is crossed by five others, which are large and fine. On the new bridge, which is of stone, over the Spree, is an equestrian statue of William the Great, which is esteemed an exquisite piece of workmanship. The elector is represented in a Roman habit, and his horse stands on a pedestal of white marble adorned with basso relievo, and four slaves bound to the base.

After this bridge is past, the king's palace appears, which is a grand and superb edifice; it is four stories high, and the apartments are extremely magnificent. No place in Europe has such a great quantity of silver tables, stands, lustres, branched candlesticks, &c. In the knights hall there is a buffet, which takes up all one side, where there are basins and cisterns of gilt silver, of an extraordinary magnitude. The furniture of the great apartment is extremely rich; and there is a very handsome gallery, adorned with paintings, representing the principal actions of Frederic I. Formerly there were fine gardens to the palace, but they are now turned into a place for arms. The king's stables are large, stand near the palace, and front the great street. Externally they make a Gothic appearance, but within they are very magnificent. The mangers are of stone, and the pillars that divide the stalls are of iron, adorned with the king's cypher, gilt. Over the racks are pictures representing the finest horses which the king's stud has produced. Over the stables there are large rooms, containing all sorts of horse furniture, particularly the horse-equipage of Frederic I. all the metallic part of which is gold, set with diamonds. Besides these, there are handsome lodgings for the officers of the stables. Over the riding house is a theatre, where plays have been acted, and balls have been made for the entertainment of the court.

The arsenal consists of four grand buildings, that form a court in the middle, like a college: each front has three large portico's. On the principal gate is a medallion of the late king, in bronze; and the four cardinal virtues, of a colossal stature, placed on pedestals on each side of the portico, seem to look at the portrait of the king, which is supported by Fame and Victory. The Corinthian order is prevalent in the first stage, and is managed with a great deal of art. The whole edifice is surrounded in the upper part with a balustrade, adorned with trophies and statues, among which is Mars seated on a heap of several sorts of arms. This altogether forms a noble and majestic decoration.

It is bounded with iron in the shape of cannon, which are placed at proper distances, and support iron chains, that hang like fetlocks, to prevent passengers from approaching the windows below. The lower rooms are filled with a great number of brass cannon; the walls and pillars which sustain the floor are set off with cuirasses and helmets. The upper story contains several rooms filled with arms, which are disposed in a curious order. Behind the arsenal is the house of the general of the artillery, which includes the foundery, where they are continually at work. Besides this there are other places where they keep the train of artillery.

The opera-house is an elegant modern edifice. The front has a noble portico supported by Corinthian columns, and a pediment adorned with basso relievo and statues. The columns that support the roof throw the whole into a grand saloon. It has three galleries, and is said to be capable of containing 2000 persons.

A rampart and fosse separate Worder from Dorothea Stadt, or the New Town, inhabited chiefly by French. There are seven great alleys or walks, which divide this quarter into two parts. The middle walk is broader than the rest, and is surrounded with ballustrades, having a grass-plot in the middle; this is for persons that take the air on foot. The alleys on each side are paved, and serve for those that come abroad in coaches. These alleys, which are about three miles in length, are terminated with a bar, that leads towards the park. The alleys with trees are bounded by rows of houses. In one of these is a building, formerly called the *lesser stables*, and now made into lodgings for the guards. The apartments above these are occupied by the academy of painting and the academy of arts and sciences. Behind these is the observatory, where there is a great number of astronomical and mathematical instruments.

There are other things worthy of observation, such as the cabinet of medals, and of the antiquities belonging to the king; that of natural curiosities; the chemical laboratory, and its furnaces and medals, of a new invention; the theatre for anatomical demonstrations; the royal library, which is one of the completest in Germany, and has many scarce books and manuscripts.

The city was taken in 1760 by an army of Russians, Austrians, Saxons, &c. who entered on the 9th of October. They totally destroyed the magazines, arsenals, and founderies, seized an immense quantity of military stores, and a number of canon and arms; called first for the immediate payment of 800,000 guilders, and then laid on a contribution of 1,900,000 German crowns: not satisfied with this, many irregularities were committed by the soldiery; but on the whole, though some shocking actions were committed, a far more exact discipline was observed than from such troops could have been expected upon such an occasion, where there was every incentive which could work upon the licence of a conquering army. Their officers no doubt with great difficulty preserved even that degree of order.

But though their behaviour was tolerable with regard to the private inhabitants, there was something shocking and ungenerous in their treatment of the king's palaces. The apartments of the royal castle of Charlottenburg were entirely plundered, the precious furniture spoiled, the pictures defaced, without even

sparing the antique statues collected by cardinal Polignac, which had been purchased by the house of Brandenburg. The castle of Schonhausen, belonging to the queen, and that of Fredericshof, belonging to the Margrave Charles, were also plundered.

The palace of Potsdam, the famous Sans-fouci, had a better fate; Prince Esterhasi commanded there, and it was preserved from the smallest violation. The prince, on viewing the palace, only asked which picture of the king resembled him most; and being informed, desired that he might have leave to take it, together with two German flutes which the king used, to keep them, he said, in memory of his majesty. This was a sort of taking very different from pillage.

They staid in the city four days: but hearing that the king, apprehensive of this stroke, was moving to the relief of his capital, they quitted it on the 13th of October; and having wasted the whole country round for a vast extent, and driven away all the cattle and horses they could find, retreated by different routes out of Brandenburg.

BERME, in fortification, a space of ground left at the foot of the rampart, on the side next the country, designed to receive the ruins of the rampart, and prevent their filling up the fosse. It is sometimes palisadoed, for the more security; and in Holland it is generally planted with a quick-set hedge. It is also called *liziere*, *relais*, *foreland*, *retraite*, *pais de jouris*, &c.

BERMUDAS, or SUMMER-ISLANDS, a cluster of small islands in the Atlantic ocean, lying almost in the form of a shepherd's crook, in W. Long. 65. N. Lat. 32. 30: between 200 and 300 leagues distant from the nearest place of the continent of America, or any of the other West-India islands. The whole number of the Bermudas islands is said to be about 400, but very few of them are habitable. The principal is St George's, which is not above 16 miles long, and three at most in breadth. It is universally agreed, that the nature of this and the other Bermudas islands has undergone a surprising alteration for the worse since they were first discovered; the air being much more inclement, and the soil much more barren, than formerly. This is ascribed to the cutting down those fine spreading cedar-trees for which the islands were famous, and which sheltered them from the blasts of the north-wind, at the same time that it protected the undergrowth of the delicate plants and herbs. In short, the Summer-islands are now far from being desirable spots; and their natural productions are but just sufficient for the support of the inhabitants, who, chiefly for that reason, perhaps, are temperate and lively even to a proverb: at first tobacco was raised upon these islands; but being of a worse quality than that growing on the continent, the trade is now almost at an end. Large quantities of ambergris were also originally found upon the coasts, and afforded a valuable commerce; but that trade is also reduced, as likewise their whale trade, tho' the perquisites upon the latter form part of the governor's revenue, he having L. 10 for every whale that is caught. The Bermudas islands, however, might still produce some valuable commodities, were they properly cultivated. There is here found, about three or four feet below the surface, a white chalk stone which is easily chiseled, and is exported for building gentlemen's houses in the West-Indies. Their palmetto leaves, if properly ma-

manufactured, might turn to excellent account in making womens hats; and their oranges are still valuable. Their soil is also said to be excellent for the cultivation of vines, and it has been thought that silk and cochineal might be produced; but none of these things have yet been attempted. The chief resource of the inhabitants for subsistence is in the remains of their cedar-wood, of which they fabricate small sloops, with the assistance of the New England pine, and sell many of them to the American colonies, where they are much admired. Their turtle-catching trade is also of service; and they are still able to rear great variety of tame-fowl, and have wild ones abounding in vast plenty. All the attempts to establish a regular whale-fishery on these islands have hitherto proved unsuccessful; they have no cattle, and even the black hog breed, which was probably left by the Spaniards, is greatly decreased. The water on the islands, except that which falls from the clouds, is brackish; and at present the same diseases reign there as in the Caribbee islands. They have seldom any snow, or even much rain; but when it does fall, it is generally with great violence, and the north or north-east wind renders the air very cold. The storms generally come with the new moon; and if there is a halo or circle about it, it is a sure sign of a tempest, which is generally attended with dreadful thunder and lightning. The inhabited parts of the Bermuda islands are divided into nine districts called *tribes*. 1. St George. 2. Hamilton. 3. Ireland. 4. Devonshire. 5. Pembroke. 6. Pagets. 7. Warwick. 8. Southampton. 9. Sandys. There are but two places on the large island where a ship can safely come near the shore, and these are so well covered with high rocks that few will choose to enter in without a pilot; and they are so well defended by forts, that they have no occasion to dread an enemy. St George's town is at the bottom of the priniepal haven; and is defended by nine forts, on which are mounted 70 pieces of cannon that command the entrance. The town has a handsome church, a fine library, and a noble town-house, where the governor, council, &c. assemble. Besides these there are about 1000 houses well built. The tribes of Southampton and Devonshire have each a parish-church and library, and the former has a harbour of the same name; there are also scattered houses and hamlets over many of the islands, where particular plantations require them. The inhabitants are clothed chiefly with British manufactures, and all their implements for tilling the ground and building are made in Britain.

It is uncertain who were the first discoverers of the Bermudas islands. John Bermudas a Spaniard is commonly said to have discovered them in 1527; but this is disputed, and the discovery attributed to Henry May an Englishman. As the islands were without the reach of the Indian navigation, the Bermudas were absolutely uninhabited when first discovered by the Europeans. May above-mentioned was shipwrecked upon St George's; and with the cedar which they felled there, assisted by the wreck of their own ship, he and his companions built another which carried them to Europe, where they published their accounts of the islands. When lord Delawar was governor of Virginia, Sir Thomas Gates, Sir George Summers, and captain Newport, were appointed to be his deputy governors; but their ship being separated by a storm from

the rest of the squadron, was in the year 1609 wrecked on the Bermudas, and the governors disagreeing among themselves, built each of them a new ship of the cedar they found there, in which they severally sailed to Virginia. On their arrival there, the colony was in such distress, that the lord Delawar, upon the report which his deputy-governors made him of the plenty they found at the Bermudas, dispatched Sir George Summers to bring provisions from thence to Virginia in the same ship which brought him from Bermudas, and which had not an ounce of iron about it, except one bolt in the keel. Sir George, after a tedious voyage, at last reached the place of his destination, where, soon after his arrival, he died, leaving his name to the islands, and his orders to the crew to return with black hogs to the colony of Virginia. This part of his will, however, the sailors did not chuse to execute; but setting sail in their cedar ship for England, landed safely at Whitchurch in Dorsetshire.

Notwithstanding of this dereliction of the island, however, it was not without English inhabitants. Two sailors, Carter and Waters, being apprehensive of punishment for their crimes, had secreted themselves from their fellows when Sir George was wrecked upon the island, and had ever since lived upon the natural productions of the soil. Upon the second arrival of Sir George they enticed one Chard to remain with them; but differing about the sovereignty of the island, Chard and Waters were on the point of cutting one anothers throats, when they were prevented by the prudence of Carter. Soon after, they had the good fortune to find a great piece of ambergris weighing about 80 pounds, besides other pieces, which in those days were sufficient, if properly disposed of, to have made each of them master of a large estate. Where they were, this ambergris was useless; and therefore they came to the desperate resolution of carrying themselves and it in an open boat to Virginia or to Newfoundland, where they hoped to dispose of their treasure to advantage. In the mean time, however, the Virginia company claimed the property of the Bermudas islands; and accordingly sold it to 120 persons of their own society, who obtained a charter from king James for their possessing it. This new Bermudas company, as it was called, fitted out a ship with 60 planters on board to settle on the Bermudas, under the command of one Mr Richard Moor, by profession a carpenter. The new colony arrived upon the island just at the time the three sailors were about to depart with their ambergris; which Moor having discovered, he immediately seized and disposed of it for the benefit of the company. So valuable a booty gave vast spirit to the new company; and the adventurers settled themselves upon St George's island, where they raised cabins. As to Mr Moor, he was indefatigable in his duty, and carried on the fortifying and planting the island with incredible diligence; for we are told, that he not only built eight or nine forts or rather blockhouses, but inured the settlers to martial discipline. Before the first year of his government was expired, Mr Moor received a supply of provisions and planters from England; and he planned out the town of St George as it now stands. The fame of this settlement soon awakened the jealousy of the Spaniards, who appeared off St George's with some vessels; but being fired upon from the forts, they

they steered off, tho' the English at that time were so ill provided for a defence, that they had scarce a single barrel of gun-powder on the island. During Moor's government the Bermudas were plagued with rats which had been imported into them by the English ships. This vermin multiplied so fast in St George's island, that they even covered the ground, and had nests in the trees. They destroyed all the fruits and corn within doors; nay, they encreased to such a degree, that St George's island was at last unable to maintain them, and they swam over to the neighbouring islands, where they made as great havock. This calamity lasted five years, tho' probably not in the same degree, and at last it ceased all of a sudden.

On the expiration of Moor's government, he was succeeded by captain Daniel Tucker, who improved all his predecessor's schemes for the benefit of the island, and particularly encouraged the culture of tobacco. Being a severe disciplinarian, he held all under him so rigidly to duty, that five of his subject planned as bold an enterprize for liberty as was perhaps ever put in execution. Their names were Barker, who is said to have been a gentleman; another Barker, a joiner; Goodwin, a ship-carpenter; Paet, a sailor; and Saunders, who planned the enterprize. Their management was as artful as their design was bold. Understanding that the governor was deterred from taking the pleasure of fishing in an open boat, on account of the dangers attending it, they proposed to build him one of a particular construction, which accordingly they did in a secret part of the island; but when the governor came to view his boat, he understood that the builders had put to sea in it. The intelligence was true: for the adventurers, having provided themselves with the few necessities they wanted, sailed for England; and notwithstanding the storms they encountered, their being plundered by a French privateer, and the incredible miseries they underwent, they landed in 42 days time at Corke in Ireland, where they were generously relieved and entertained by the earl of Thomond.

In 1619, captain Tucker resigned his government to captain Butler. By this time the high character which the Summer islands bore in England, rendered it fashionable for men of the highest rank to encourage their settlement; and several of the first nobility of England had purchased plantations among them. Captain Butler brought over with him 500 passengers, who became planters on the islands, and raised a monument to the memory of Sir George Summers. The island was now so populous, (for it contained about a thousand whites), that captain Butler applied himself to give it a new constitution of government by introducing an assembly, the government till this time being administered only in the name of the governor and council. A body of laws was likewise drawn up, as agreeable to the laws of England as the situation of the island would admit of. One Mr Barnard succeeded captain Butler as governor, but died six weeks after his arrival on the island; upon which the council made choice of Mr Harrison to be governor, till a new one should be appointed. No fewer than 3000 English were now settled in the Bermudas, and several persons of distinction had curiosity enough to visit it from England. Among these was Mr Waller, the poet, a man of fortune, who being embroiled with the parliament and

commonwealth of England, spent some months in the Summer islands, which he has celebrated in one of his poems as the most delightful place in the world. The dangers attending the navigation, and the untowardly situation of these islands, through their distance from the American continent, seem to be the reasons why the Bermudas did not now become the best peopled islands belonging to England; as we are told that some time ago they were inhabited by no fewer than ten thousand whites. The inhabitants, however, never showed any great spirit for commerce, and thus they never could become rich. This, together with the gradual alteration of the soil and climate already taken notice of, soon caused them to dwindle in their population; and it is computed that they do not now contain above half the number of inhabitants they once did, and even these seem much more inclined to remove to some other place than to stay where they are; so that, unless some beneficial branch of commerce be found out, or some useful manufacture established, the state of the Bermudas must daily grow worse and worse.

BERN, one of the cantons of Switzerland, which holds the second rank among the 13; but as it is by far the largest in extent, containing almost one third of the whole country, it seems justly entitled to the first. It is bounded to the north by the cantons of Basil and Solothurn, and the Austrian forest-towns; to the south by the lake of Geneva, the Valais, and duchy of Savoy; to the east by Uri, Underwald, Lucern, and the county of Baden; and to the west by Solothurn, Neuchâtel, Franche-Comte, the district of Biel, and the land of Gex. It is the most fruitful, the richest, and by much the largest, of all the cantons, extending in length about fifty leagues, and about thirty where broadest. It yields not only plenty of grain, fruit, and pasture; but also good wine, a variety of coloured earths and clays, sand-stone, mundick, gypsum, pit-coal, sulphur, and iron-ore. Here likewise are large herds of cattle, great and small; and, in consequence of that, great quantities of milk, butter, and cheese. The rivers that water this canton are the Aar, the Emmat, the Wigger, the Aaa, the Ruz, the Limmat, the Sanen, the Senen, and the Kandel. The principal lake is that of Geneva; the length of which is about 18 leagues, and the greatest breadth between three and four. The depth in some places is near 400 fathoms, in others not above 40. The Rhone enters it at the east end near Bouveret, and issues out again at the west close by Geneva. In summer its waters are much swelled by the melting of the snow on the mountains. This lake, however, is not entirely surrounded by the territory of Bern, but partly by Savoy and the country of Gex; the former of which belongs to the king of Sardinia, and the latter to France, and the territory of Sion. Its borders are extremely fertile and beautiful, being much embellished with vineyards, which yield excellent wine, and interspersed with towns and villages, betwixt which a considerable commerce is carried on. The other great lakes, that are wholly or partly within this canton, are those of Neuchâtel, Biel, Murte, Thun, Brien, and Halwyl, which all abound in fish, particularly that of Geneva, where trouts are sometimes caught weighing 40 or 50 pounds. In that of Biel, called also the *Nydau-lake*, are two small islands, one of which is very beautiful. This lake is about three leagues

leagues in length, and one in breadth. Along the whole west and north-west sides of the canton runs that chain of mountains called by the general name of *Jura*; but the several mountains of which it is composed have all their particular names. This canton is well cultivated, and very populous, the number of its subjects being computed at 400,000. German is the prevailing language, but almost all the people of fashion speak either French or Italian; even the common people in the *Pais de Vaud*, and other places that lie towards France or Italy, speak a corrupt French or Italian, or a jargon composed of both. The established religion here, and the other Protestant cantons, is Calvinism, the same both in doctrine and discipline as in Holland; nor is any other tolerated, except in the common bailiwicks, and the vale of Frick. The ministers are divided into deaneries and classes, and hold yearly chapters or synods. They are kept in a greater dependence on the civil power here, than in the other cantons, and not suffered to interfere with matters of state. The city of Bern first joined the confederacy in the year 1353. Towards the defence thereof the canton now furnishes 2000 men. Every male, from 16 to 60, is enrolled in the militia, and about a third of them regimented. There are officers for every district, whose province it is to see that the men be regularly exercised; that their arms, ammunition, and cloathing, be in good condition; and that they be kept in a constant readiness to march. Once a-year they are drawn out to a general review. The same attention is paid to those that belong to the train of artillery. Some regiments consist of married, and some of unmarried men; some of foot, others of dragoons. There is also one regiment and a troop of cuirassiers. The latter consists entirely of burghers of Bern. Both the horsemen and footmen find their horses, arms, and accoutrements. Besides the arms and artillery in the arsenal at Bern, all the castles, where the country governors or bailiffs reside, are well furnished with them. At Bern is a constant guard or garrison of 200 men, and a small garrison at fort Arburg. In the same city is also an office, which grants licences for levies to foreign powers, and where the recruits make their appearance, and are registered. The bailiffs have the chief direction of affairs in their several districts, being generals of the militia, and presiding in the courts of justice; but, in civil causes, above a certain value, an appeal lies from them to Bern; and, in capital cases, their sentence must be confirmed by the great council before it can be executed. When any bailiwick is to be disposed of, as many balls as there are competitors are put into a bag, whereof one is gilt, and he that draws that has the bailiwick.

Mr Keyser observes, that the wealthiest peasants in Switzerland are those of Bern; it being difficult to find a village without one, at least, who is worth between 20,000 and 30,000 guilders, and sometimes even 60,000. He says, the common people of both sexes wear straw-hats, and that the womens petticoats are tied up so near their arm-pits, that hardly an hand's-breadth is left for their shape; that the inns, not only in this canton but throughout Switzerland, are in general very good; that the manners of the people were, in many respects, greatly changed within 50 years before he visited them, which was about 39 years ago, and con-

sequently must be much more so now; that, instead of the plainness and honest simplicity of their ancestors, the love of superfluities and high living greatly prevailed; that luxury, pomp, and that insatiation for foreign productions, which had infected most parts of Europe, had also extended its contagious influence to Switzerland, though not to such a degree as in many other countries. Dr Burnet says, that drinking is so common, and produces so many quarrels and disorders, that the bailiffs not only submit by the fines payable for them, but often get estates, carrying, perhaps, twenty thousand crowns at the end of five years to Bern; that their law is short and clear, inasmuch that the most intricate suit is ended after two or perhaps three hearings, either in the first instance, before the bailiff, or in the second, at Bern; that the civility expressed in this country to women, at first meeting them, is not by saluting them, but by shaking them by the hand, and that none but strangers take off their hats to them. Mr Addison says, that the peasants are generally clothed in a coarse kind of canvas, the manufacture of the country, and that their holiday clothes go from father to son; so that it is not uncommon to see a countryman in his great-grandfather's doublet and breeches; that the belief of witchcraft prevailed among them so much, that there were some executions on that account while he was in the country; that the question, or torture, is used not only in this canton but all over Switzerland; that though the subjects of the state are rich, the public is poor; and though they could oppose a sudden invasion, yet that their unkindly soil requires such a number of hands to cultivate it, that they could not spare the reinforcements and recruits that would be necessary in a long war. Upon extraordinary occasions, however, they boast that they could raise eighty thousand men in 24 hours. This canton is divided into the German country, that is, that part of the canton in which the German tongue is spoken, and which is also called the *ancient canton*, extending from Morat to the county of Baden; and the Roman, called also the *Waal*, and *Pais de Vaud*. The former of these contains 35 bailiwicks, and about 300 parishes.

BERN, a city of Switzerland, and capital of the canton of that name, is situated in E. Long. 7. 40. N. Lat. 40. 0. It is said that the taking of a bear on the day on which the foundation of this city was laid, gave occasion to its name; hence it is often in Latin called *Arctopolis*, i. e. the city of the bear, and has a bear for its coat of arms. It is almost surrounded by the river Aar. The houses are mostly built of white free-stone, and, in the principal streets, have piazzas or arches under them, for the convenience of walking dry in wet weather. Most of the streets are paved with flints, and traversed by a canal lined with free-stone, which is brought from a considerable distance, and is very useful in carrying off the filth of the city, extinguishing fires, and other purposes. The city is large, standing almost in the middle of the canton, and containing several churches, of which one is called the *Great Church*, and the first minister thereof the *dean*, who is the head of the city-clergy. From an inscription near the great door of this church, it appears, that the first stone of it was laid in 1421. Over the same door is a representation of the last judgment, in which the sculptor hath placed the pope among the damned.

Bern.

In this city is also a college with eight professors, a large public library, and a museum; a stately granary, in which a great quantity of corn is always kept; a guildhall; a well stored arsenal; and several hospitals. In the arsenal is a wooden statue of the famous Tell, which represents him as taking aim at the apple placed on the head of his son. There is also the statue of Berch told von Zahringen, the founder of the city; and two large horns of buffaloes or wild bulls, called in Latin *Uri*, such as are used in war by the canton of Uri instead of trumpets, and taken from it in the year 1712. Hard by also hang the grotesque dresses of those who blew them. The inhabitants of Uri, who boast their descent from the old Tau, bear a buffalo's head in their rick, coat of arms; and the person who blows the great horn in time of war, is called the *bull of Uri*. In the Dominican church, a hole in the wall is always shewn to strangers, by means of which, it having a communication with the cell of a monk in an adjoining monastery, the pious fraud of making an image of the Virgin appear to speak was once carried on, which for a while answered the purposes of the monks very well; but they were at last detected and punished. This city, though larger, is not so populous nor so well built as that of Zurich. On the east side of it is a handsome stone bridge; and near the great church is a very fine platform some hundred feet in height, which makes a most delightful walk, being planted with limes, and commanding a charming prospect, particularly of the mountains of the Grisons, covered with snow in the midst of summer. In 1654 a student of divinity, being on horseback, and in liquor, leaped over this terrace without receiving any other hurt than breaking a leg, and lived many years after, but the horse was killed. In the upper part of the city are always kept a number of bears in two inclosures, with fir-trees for them to clamber and play upon. Of the burghers of Bern, only those are qualified for the government and magistracy of the city, who are the descendants of such as were made burghers before the year 1635. Other qualifications are also necessary; in particular, they must not be under 30 years of age, and must be enrolled in one of the 12 companies. To obtain a country government, or to hold any considerable employment, the candidate also must be married. The great council, in which the sovereignty of the canton is vested, consists, when full, of 229; but is generally much short of that number, 80 or more often dying before their places are filled up. The lesser council senate, or, as it is called, the *daily council*, because it meets every day, Sundays and holidays excepted, consists of 27 members, including the two preceptors or advoyers, the four tribunes of the people, the two treasurers, and the two heimlichers or secrecy-men, so called because to them all secrets relating to the state are discovered. The members of the great and little councils mutually fill up the vacancies that happen in these two colleges. How the bailiffs are chosen we have already taken notice. Our limits will not permit us to enter into any further detail with respect to the government: only it is to be observed in general, that all the officers of any note are chosen out of the great or little councils; and that all the bailiffs and castellans of the canton continue six years in office. The trade of the city is not very great, but was less

before the French refugees settled therein: some, however, doubt whether it has been a gainer by them; as by their introduction of French modes and luxury, they have helped to banish the ancient Helvetic simplicity and frugality. The territory immediately under its jurisdiction is divided into four governments, with which the four vengers, or standard-bearers, are invested. It declared for the reformation in 1528, after a solemn disputation. Here the British envoy to the cantons resides.

BERN-Machine, the name of an engine for rooting up trees, invented by Peter Sommer, a native of Bern in Switzerland.

This machine is represented by a figure on plate LVII. fig. 2. drawn from a model in the machine-room of the Society for the Encouragement of Arts, &c. It consists of three principal parts; the beam, the ram, and the lever. The beam ABC, (n^o 1.) of which only one side is seen in the figure, is composed of two stout planks of oak three inches thick at least, and separated by two transverse pieces of the same wood at A and C, about three inches thick. These planks are bored through with corresponding holes, as represented in the figure, to receive iron pins, upon which the lever acts between the two sides of the beam, and which are shifted higher and higher as the tree is raised or rather pushed out of its place. The sides are well secured at the top and bottom, by strong iron hoops. The iron pins on which the lever rests should be an inch and a quarter, and the holes through which they pass an inch and a half, in diameter. The position of these holes is sufficiently indicated by the figure. The foot of the beam, when the machine is in action, is secured by stakes, represented at G, driven into the earth. The ram D, which is made of oak, elm, or some other strong wood, is capped with three strong iron spikes, represented at *f*, which take fast hold of the tree. This ram is six or eight inches square; and a slit is cut lengthwise through the middle of it, from its lower end at K, to the first ferule *a*, in order to allow room for the chain *gh* to play round the pulley K, which should be four inches thick, and nine inches in diameter. This ram is raised by means of the chain *gh*, which should be about ten feet long, with links four inches and three quarters in length, and an inch thick. One end of this chain is fastened to the top of the beam at C, while the other, after passing through the lower part of the ram, and over the pulley K, terminates in a ring or link represented n^o 3. the two ears *mn* of which serve to keep it in a true position between the two planks of the beam. In this ring the hook P is inserted. The hook is represented in profile, n^o 2. where F is the part that takes hold of the ring. But it must be observed, that the parts of this machine, represented in n^o 2, 3, are drawn on a scale twice as large as the whole engine. The hook F, n^o 2. should be made of very tough iron, as well as the handle D, and the arch E *c*. This handle should be two inches thick at *z*, where it joins to the hook, and the thickness gradually lessen by degrees up to the arch, which need not be more than half an inch thick. On each side of the pin *z*, is a semi-circular notch, *x*, *y*, which rests alternately on the pins when the machine is worked. The hole D, and the arch E *c*, serve to fix a long lever of wood E F, n^o 1. by means

means of two iron pins; and by this contrivance the lever is either raised or depressed at pleasure, in order to render the working of the machine easy in whatever part of the beam the lever may be placed: for without this contrivance the extremity of the lever EF, would, when the handle was near the top of the beam, be much higher than men standing upon the ground could reach. It must however be remembered, that the lever is often shortened by this contrivance, and consequently its power lessened.

The machine is worked in the following manner: It is placed against a tree, in the manner represented in the figure, so that the iron spikes at *f* may have hold of the tree, and the end of the beam A be supported by stakes represented at G. The iron handle, n^o 2. is placed in the opening between the two planks of the beam, and the wooden lever fixed to it by means of the iron pins already mentioned. The hook F takes hold of the chain, and one of the iron pins is thrust into the outer row of holes, by which means the outer notch *x* will rest on the pin, which will be now the centre of motion; and the end of the lever E, n^o 1. being pressed downwards, the other notch *y*, n^o 2. will be raised, and at the same time the chain, and consequently the ram. The other iron pin is now to be thrust into the hole in the inner row, next above that which was before the centre of motion, and the end of the lever E elevated or pushed upwards, the latter pin on which the notch *y* rests now becoming the centre of motion. By this alternate motion of the lever, and shifting the pins, the chain is drawn upwards over the pulley K, and consequently the whole force of the engine exerted against the tree. There is a small wheel at L, in order to lessen the friction of that part of the machine.

From this account the reader will very easily perceive that the machine is nothing more than a single pulley, compounded with a lever of the first and second order. It must however be remembered, that as the push of the engine is given in an oblique direction, it will exert a greater or lesser force against the horizontal roots of the tree in proportion to the angle formed by the machine with the plane of the horizon; and that the angle of 45° is the maximum, or that when the machine will exert its greatest force against the horizontal roots of the tree.

BERNACLE, in ornithology. See ANAS.

BERNARD (St), the first abbot of Clairvaux, was born in the year 1091, in the village of Fountains, in Burgundy. He acquired to great a reputation by his zeal and abilities, that all the affairs of the church appeared to rest upon his shoulders, and kings and princes seemed to have chosen him for a general arbitrator of their differences. It was owing to him that Innocent II. was acknowledged sovereign pontiff, and after the death of Peter Leonis anti-pope, that Victor, who had been named *successor*, made a voluntary abdication of his dignity. He convicted Abelard at the council of Sens, in the year 1140. He opposed the monk Raoul; he persecuted the followers of Arnaut de Breffe; and, in 1148, he got Gilbert de la Porcicé, bishop of Poitiers, and Eonde l'Etoile, to be condemned in the council of Rheims. By such zealous behaviour he verified (says Mr Bayle) the interpretation of his mother's dream. She dreamed, when she was with

child of him, that she should bring forth a white dog, whose barking should be very loud. Being astonished at this dream, she consulted a monk, who said to her, "Be of good courage; you shall have a son who shall guard the house of God, and bark loudly against the enemies of the faith." But St Bernard went even beyond the prediction, for he barked sometimes against chimerical enemies: he was more happy in exterminating the heterodox, than in ruining the infidels; and yet he attacked these last, not only with the ordinary arms of his eloquence, but also with the extraordinary arms of prophecy. He preached up the crusade under Lewis the Younger, and by this means he enlarged the troops of the crusaders beyond expression: but all the fine hopes with which he flattered the people were disappointed by the event; and when complaint was made, that he had brought an infinite number of Christians to slaughter, without going out of his own country, he cleared himself, saying, that the sins of the Croises had hindered the effect of his prophecies. In short, he is said to have founded 160 monasteries, and to have wrought a great number of miracles. He died on the 20th of August, 1153, at 63 years of age. The best edition of his works is that of 1690, by father Mabillon.

BERNARD (Dr Edward), a learned astronomer, linguist, and critic, was born at Perry St Paul, on the 2^d of May, 1638, and educated at Merchant-Taylor's school, and St John's college, Oxford. During his stay at school, he had laid in an uncommon fund of classical learning; so that, on his going to the university, he was a great master of all the elegancies of the Greek and Latin tongues, and not unacquainted with the Hebrew. On his settling in the university, he applied himself with great diligence to history, philology, and philosophy; and made himself master of the Hebrew, Syriac, Arabic, and Coptic languages, and then applied himself to the study of the mathematics under the famous Dr Wallis. Having successfully taken the degrees of bachelor and master of arts, and afterwards that of bachelor of divinity in 1668, he went to Leyden to consult several oriental manuscripts left to that university by Joseph Scaliger and Levinus Warnerus. At his return to Oxford, he collated and examined the most valuable manuscripts in the Bodleian library; which induced those who published any ancient authors, to apply to him for his observations or emendations from the manuscripts at Oxford; which he readily imparted, grudging neither time nor pains to serve the learned; and by this means he became engaged in a very extensive correspondence with the learned of most countries. In the year 1669, the famous Christopher Wren, Savilian professor of astronomy at Oxford, having been appointed surveyor-general of his majesty's works, and being much detained at London by this employment, he obtained leave to name a deputy at Oxford, and pitched upon Mr Bernard, which engaged the latter in a more particular application to the study of astronomy. In 1676, he was sent by the earl of Arlington to France, in order to be tutor to the dukes of Grafton and Northumberland, sons to King Charles II. by the dutches of Cleveland, who then lived with their mother at Paris: but the simplicity of his manners not suiting the gaiety of the dutches's family, he returned, about a year after, to Oxford, and

Bernard.

purfued his ftudies; in which he made great proficiency, as his many learned aftronomical and critical works fhew. He compofed tables of the longitudes, latitudes, right afcenfions, &c. of the fixed ftars; Observations in Latin on the Obliquity of the Ecliptic; and other pieces inferted in the Philofophical Tranfactions. He alfo wrote, 1. A Treatife of the ancient Weights and Meafures. 2. *Chronologie Samaritane Synopfis*, in two tables. 3. Teftimonies of the Ancients concerning the Greek Verfion of the Old Teftament by the Seventy; and feveral other learned works. He was a perfon of great piety, virtue, and humanity; and died on the 12th of January, 1696, in the 59th year of his age, leaving behind him a great number of learned and valuable manufcripts.

BERNARD (James), profeflor of philofophy and mathematics, and minifter of the Walloon church at Leyden, was born September 1st, 1658, at Nions in Dauphine. Having ftudied at Geneva, he returned to France in 1679, and was chofen minifter of Venterol, a village in Dauphine. Some time after, he was removed to the church of Vinfobres in the fame province. But the perfecutions raifed againft the Proteftants in France having obliged him to leave his native country, he retired to Holland, where he was received with great civility, and was appointed one of the penfionary minifters of Ganda. In July 1688, he began a political publication intitled *Hiftoire abrégée de L'Europe*, &c. which he continued monthly till December 1688, and makes five volumes in 12^{mo}. In 1692, he began his *Lettres Hiftoriques*, containing an account of the moft important tranfactions in Europe, with neceffary reflections. He carried on this work, which was alfo publifhed monthly, till the end of the year 1698. It was afterwards continued by other hands, and confifts of a great many volumes. Mr Le Clerc having left off his *Bibliothèque univerfelle*, in 1691, Mr Bernard wrote the greateft part of the 20th volume, and by himfelf carried on the five following to the year 1693. In 1699, he collected and publifhed *Actes et négociations de la paix de Ryfwic*, in four volumes 12^{mo}. In 1698 he began the *Nouvelles de république des lettres*, which he continued till December 1710. Mr Bernard having acquired great reputation by his works, as well as by his fermons at Ganda, and the Hague, the congregation of the Walloon church at Leyden became extremely defirous to have him for one of their minifters; and a vacancy happening in 1705, he was unanimoufly chofen. About the fame time, Mr de Volder profeflor of philofophy and mathematics at Leyden having refigned, Mr Bernard was appointed his fucceffor; and the univerfity prefented him with the degrees of doctour of philofophy and mafter of arts. His public and private lectures took up a great part of his time; yet he did not neglect his paftoral function, but compofed his fermons with great care: he wrote alfo two excellent treatifes, one on a late repentance, the other on the excellency of religion. In 1716, he publifhed a fupplement to Moreri's dictionary in two volumes folio. The fame year he refumed his *Nouvelles de la république des lettres*; which he continued till his death, which happened the 27th of April, 1718, in the 60th year of his age.

BERNARD the Great (St); a mountain in Savoy and Switzerland, between Valais and the valley of Aouft,

at the fource of the rivers Drance and Doria. The top is always covered with fnow, and there is a great monaftery feated thereon, where the monks always entertain travellers without diftinction of religion for three days.

BERNARDINE (St), was born at Maffa in Tufcany, in 1380. In 1404 he entered into a Francican monaftery near Sienna, where he became an eminent preacher; and was afterward fent to Jerufalem, as commiffary of the Holy Land. On his return to Italy, he vifited feveral cities, where he preached with fuch applaufe, that the cities of Ferrara, Sienna, and Urbino, defired Pope Eugenius IV. to appoint him their bifhop: but Bernardine refufed the honour, accepting only the office of vicar-general of the friars of the obfervance for all Italy. He repaired and founded above 300 monafteries in that country; died in 1444; was canonized in 1450 by Pope Nicholas, and his works were publifhed at Venice, in 1591, in 4 vols 4^{to}.

BERNARDINES, an order of monks, founded by Robert abbot of Moleme, and reformed by St Bernard. They wear a white robe with a black feapulary; and when they officiate they are clothed with a large gown, which is all white, and hath great sleeves, with a hood of the fame colour.—The Bernardines differ very little from the Ciftercians. They had their origin toward the beginning of the 12th century.

BERNAY, a town of Upper Normandy in France, feated on the river Carantoue, in E. Long. o. 50. N. Lat. 49. 6.

BERNBURG, a town of Germany, in the circle of Upper Saxony, and principality of Anhalt, where a branch of the houfe of Anhalt refides. It is feated on the river Sara, in E. Long. 12. 30. N. Lat. 51. 55.

BERNERA, one of the Weftern Ifles of Scotland, lying about two leagues to the fouthward of Harries. It is about five miles in circumference; the foil is fandy, but, when manured with the alga marina, extremely fertile, producing an increafe of 30 fold of barley; nay, one grain has been known to produce 14 ears when the feafon was remarkably favourable. The face of the ifland is extremely agreeable in fummer, exhibiting a pleafing variety of corn fields and clover pature. Here is a frefh-water lake called *Lochbruis*, difperfed with fmall iflands, and abounding with eels, which the natives, by the help of lights, catch in the night-time, as they fall down a rivulet towards the fea in heaps twifted together. There are two chapels in this ifland dedicated to St Afaph and St Columbus; and near the former is a ftone ftanding about 8 feet above the ground. At the eaft end of this ifland there is a ftrange reciprocation of the flux and reflux of the fea, and another no lefs remarkable upon the weft fide of the long ifland. The tides from the fouth-weft run along northward; fo that during the ordinary courfe of the tides the flood runs eaft in the frith where Bernera lies, and the ebb runs weft: thus the fea ebbs and flows regularly for four days before, and as long after, the full and change of the moon; the fpring-tides generally rifing 14 feet perpendicular, and the others proportionably: but for four days before, and as many after, the quarter moons, there is a fingular variation; at that time a fotherly moon making high water, the courfe of the tide being eaftward, it begins to flow at half an hour after nine in the morning, and continues to flow till half an hour after

ter three in the afternoon, when it is high water; but when it begins to ebb, the current still runs eastward, until it is low water; so that the tide runs eastward 12 hours together, that is, from half past nine in the morning, till half past nine at night; yet when the night tide begins to flow, the current turns and runs westward all night for 12 hours, during both flood and ebb: thus the reciprocations continue, one flood and ebb running eastward, and another westward, till within four days of the full and change of the moon; then they resume their ordinary course, running east during the six hours of flood, and west during the six hours of ebb. There is another phenomenon in these tides no less remarkable than that just now mentioned. Between the vernal and autumnal equinox, that is, during one half of the year, the tides about the quarter moons run all day eastward, and all night westward; and during the other six months their course is reversed, being westward in the day, and eastward in the night.

BERNICLA, in ornithology, the trivial name of a species of anas. See **ANAS**.

BERNICLE, in zoology. See **LEPAS**.

BERNIER (Nicholas), an eminent musician and composer, was born at Mante on the Seine, in the year 1664. By his merit in his profession he attained to be conductor of the music in the chapel of St Stephen, and afterwards in that of the king. The regent duke of Orleans admired his works, and patronized their author. This prince having given him a motet of his own composition to examine, and being impatient for his observations thereon, went to the house of Bernier, and entering his study, found the abbe de la Croix there criticizing his piece, while the musician himself was in another room carousing and singing with a company of his friends. The duke broke in upon and interrupted their mirth, with a reprimand of Bernier for his inattention to the task assigned him. This musician died at Paris in 1734. His five books of Cantatas and Songs for one and two voices, the words of which were written by Rousseau and Fufelier, have procured him great reputation. There are besides of his composition *Les Nuits de Seceaux*, and many motets, which are still in great esteem.

BERNIER (Francis), surnamed the *Mogul*, on account of his travels and residence in that country, was born at Angers, in France; and after he had taken his degree of doctor of physic at Montpellier, left his country in 1654, went to Egypt, to the Holy Land, and to the kingdom of the Mogul, where he was physician to that monarch, attended him in his journeys, and stayed there 12 years. Upon his return to France, he published the History of the countries he had visited; and spent the remainder of his life in composing various other works, particularly an Abridgement of the philosophy of Gassendus in 8 vols 12mo. His first work is esteemed to be the best account we have of the countries which are the subject of it.

BERNINI (John Laurence), commonly called *Cavaliero Bernin*, a Neapolitan, famous for his skill in painting, sculpture, architecture, and mechanics. He first began to be known under the pontificate of Paul V. Rome is indebted to this artist for some of its greatest ornaments; and there are in the church of St Peter, no less than 15 different works of his hand. He died at Rome, in 1680.

BERNO, abbot of Richenon, in the diocese of Constance, who flourished about the year 1008, is celebrated as a poet, rhetor, musician, philosopher, and divine. He was the author of several treatises on music, particularly of one *De Instrumentis Musicalibus*, beginning with the words *Musican non esse contem!* which he dedicated to Aribon, Archbishop of Mentz. He also wrote *De Mensura Monochordi*. But the most celebrated of his works is a treatise *De Musica seu Tonis*, which he wrote and dedicated to Pelegrinus archbishop of Cologne, beginning *Verò mundi isti advenæ et peregrino*. This latter tract is part of the Ballol manuscript, and follows the Enchiridion of Odo: it contains a summary of the doctrines delivered by Boetius, an explanation of the ecclesiastical tones, intermixed with frequent exhortations to piety, and the application of music to religious purposes. He was highly favoured by the emperor Henry II. for his great learning and piety; and succeeded so well in his endeavours to promote learning, that his abbe of Richenon was as famous in his time as those of St Gaul and Cluni, then the most celebrated in France. He died in 1048; and was interred in the church of his monastery, which but a short time before he had dedicated to St Mark.

BERNOUILLI (James), a celebrated mathematician, born at Basil, the 27th of December 1654. Having taken his degrees in the university of Basil, he applied himself to divinity, not so much from inclination as complaisance to his father. He gave very early proofs of his genius for mathematics, and soon became a geometrician, without any assistance from masters, and at first almost without books: for he was not allowed to have any books of this kind; and if one fell by chance into his hands, he was obliged to conceal it, that he might not incur the reprimands of his father, who designed him for other studies. This severity made him chafe for his device, Phaeton driving the chariot of the sun, with these words, *Invito patre sidera verso*, "I traverse the stars against my father's inclination." This had a particular reference to astronomy, the part of mathematics to which he at first applied himself. But the precautions of his father did not avail, for he pursued his favourite study with great application. In 1656 he began his travels. When he was at Geneva, he fell upon a method to teach a young girl to write, though she had lost her sight when she was but two months old. At Bourdeaux he composed universal gnomonic tables, but they were never published. He returned from France to his own country in 1680. About this time there appeared a comet, the return of which he foretold; and wrote a small treatise upon it, which he afterwards translated into Latin. He went soon after to Holland, where he applied himself to the study of the new philosophy. After having visited Flanders and Brabant, he went to Calais, and passed over from thence to England. At London he contracted an acquaintance with all the most eminent men in the several sciences; and had the honour of being frequently present at the philosophical societies held at the house of the famous Mr Boyle. He returned to his native country in 1682; and he exhibited at Basil a course of experiments in natural philosophy and mechanics, which consisted of a variety of new discoveries. In 1682, he published his essay of a new system of comets; and the year following, his dissertation on the weight of air.

Bernouilli

Berron

Mr Leibnitz, about this time, having published in the *Acta Eruditorum* at Leipzig some essays of his new *Calculus differentialis*, or *infinitesimis petitis*, but concealed the art and method of it; Mr Bernouilli, and one of his brothers, discovered, by the little which they saw, the beauty and extent of it: they endeavoured to unravel the secret; which they did with such success, that Mr Leibnitz declared, that the invention belonged to them as much as to himself. In 1687, the professorship of mathematics at Basil being vacant, Mr Bernouilli was appointed his successor. He discharged this trust with universal applause; and his reputation drew a great number of foreigners from all parts to hear his lectures. He had an admirable talent in teaching, and adapting himself to the different genius and capacity of his scholars. In 1699, he was admitted into the academy of sciences at Paris as a foreign member, and in 1701 the same honour was conferred upon him by the academy of Berlin. He wrote several pieces in the *Acta Eruditorum* of Leipzig, the *Journal des Savans*, and the *Histoire de l'Academie des sciences*. His assiduous application to his studies brought upon him the gout, and by degrees a slow fever, of which he died the 16th of August 1705, in the 58th year of his age.—Archimedes having found out the proportion of a sphere to a cylinder circumscribed about it, ordered it to be engraven upon his monument. In imitation of him, Mr Bernouilli appointed, that a spiral logarithmical curve should be inscribed upon his tomb, with these words, *Eadem mutata resurgo*; in allusion to the hopes of the resurrection, which are represented in some measure by the properties of the curve which he had the honour of discovering.

BEROEA, (anc. geog.) a noble city of Macedonia to the south of Edessa, or *Ægeæ*, and south-east of Cyrtus. The people are commended in Scripture for their reception of the Gospel on a fair and impartial examination; now supposed to be *Aleppo*. See that article.

BEROOT, a town of Phœnicia, a province of Syria in Turkey in Asia. It is the ancient Berytus; but there are now no remains of its former beauty, except its situation, which is very agreeable, and in a fertile soil. It is just far enough from the sea to prevent the inconveniences of an inundation. There are very fine streams of water which flow from the mountains, and are dispersed into beautiful fountains through several parts of the town. The great Christian church is turned into a mosque, and there is a poor old one for the use of the Greeks. It is adorned with several old pictures, particularly that of St Nicophorus, with a beard down to his feet. The wall on the south side of the town is yet entire, and seems to have been built out of the ruins of the old city. At a little distance from the city there are pillars of granite, and the ruins of floors of Mosaic work. On the sea-shore is an old ruined castle, and the remains of a mole. E. Long. 35. 38. N. Lat. 34. 18.

BEROSUS, priest of the temple of Belus at Babylon, in the time of Ptolemy Philadelphus, wrote the History of Chaldea, which is often cited by the ancients, and of which Josephus gives some curious fragments. The Athenians, according to Pliny, caused his statue, with a golden tongue, to be placed in their Gymnasium.

BERRE, a town of Provence in France, seated on

a lake of the same name. It is remarkable for the quantity and goodness of the salt that is made there, but the air is very unwholesome. E. Long. 4. 32. N. Lat. 43. 32.

BERRIMAN (Dr William), was the son of Mr John Berriman apothecary in Bishopsgate-street, London, where he was born on the 24th of September 1688. He studied at Oriel-college, Oxford, where he took his several degrees, and became curate and lecturer of All-hallows, in Thames-street, and lecturer of St Michael's, Queenhithe. In 1720, he was appointed domestic chaplain to Dr Robinson bishop of London, who soon after collated him to the living of St Andrew's Underhaft; and in 1727, he was elected fellow of Eton-college. He died on the 5th of February, 1750, in the 62^d year of his age. He wrote, 1. A seasonable review of Mr Whiston's account of primitive doxologies. 2. An historical account of the Trinitarian controversy, in 8 sermons, at lady Moyer's lecture. 3. Brief remarks on Mr Chandler's introduction to the history of the inquisition. 4. Sermons at Boyle's lectures, 2 vols 8vo. 5. Christian doctrines and duties explained and recommended, in 2 vols 8vo; and other works.

BERRY. See *BACCA*.

BERRY, a province of France, with the title of a duchy. It is bounded on the north, by Solome; on the south, by Marche; on the east, by Nivernois and Bourbonnois; and on the west, by Touraine. It is 90 miles in length from north to south, and 73 in breadth from east to west. The air is very temperate; and the soil produces wheat, rye, and wine little inferior to Burgundy; that of Saucerre, St Satur, and Laverneuse, is the best. The fruits are in plenty, and pretty good. The pastures are proper to fatten sheep. This country produces also a good deal of hemp and flax. There are mines of iron and silver, but they are neglected. The stone quarries, within half a league of Bourges, are very servicable. In the parish of St Hilar there is a mine of oker, made use of in melting metals, and for painting. Near Bourges there is a cold mineral spring, which has a clammy fat pellicle over it every morning, of different colours. It lets fall a fine black smooth sediment, which has the same smell, and almost the same taste, as gunpowder, which makes some conclude it partakes of sulphur, vitriol, and oker. The pellicle is as thick as a crown-piece; and when put on a red hot fire-shovel will bounce and sparkle, as will also the sediment. It is certain there is salt-petre in these waters, though vitriol seems to be the most predominant. These waters, drunk on the spot, temperate the heat of the blood and humours, open obstructions, and strengthen the fibres. Berry is watered by several rivers, the principal of which are the Loire, the Creuse, the Cher, the Indre, the Orron, the Evre, the Aurette, the Maulon, the great and little Saudre, the Nerre, &c. Near Liniers, there is a lake 20 miles round. Berry is divided into the upper and the lower, and Bourges is the capital city. The inhabitants of Bourges carry on a small trade with corn down the Loire; but that of the wine above mentioned is much more considerable, it being transported to Paris by means of that river and the canal of Briare. But the principal commerce consists in the fat cattle which they send to Paris, and the great number of sheep; these last bear fine wool, which is used

used in the manufactures of this province, and other parts of the kingdom. There are two sorts of manufactures in Berry, the one for cloths and ferges, and the other for knit and wove stockings. There is likewise a great quantity of hemp, which is transported elsewhere, for they have not yet got the art of manufacturing it themselves. At Aubigny there are 2000 persons generally employed in the making of cloth.

BERSELLO, a fortified town of Italy in the Modeneffe. It was taken by prince Eugene in 1702, and by the French in 1703, who were obliged to abandon it in 1707. It is seated near the confluence of the rivers Linza and Po, in E. Long. 10. 30. N. Lat. 44. 55.

BERSUIRE, a town of France in Lower Poictou. W. Long. 0. 27. N. Lat. 46. 52.

BERTINERO, a town of Romagna in Italy, with a strong citadel. It is the see of a bishop; and is seated on an hill, in E. Long. 11. 47. N. Lat. 44. 8.

BERTRAND (St), an episcopal town of France, in Gascony, and capital of the country of Comminges. E. Long. 0. 38. N. Lat. 43. 2.

BERVY, a sea-port and parliament town in the county of Mearns in Scotland. W. Long. 2. 0. N. Lat. 56. 40.

BERWICK (the duke of), was natural son of James II. by Mrs Arabella Churchill, sister to the great duke of Marlborough. He followed the fate of his father, and came into France after the revolution with James II. Here the duke of Berwick was recommended to the court by his superior merit: he was created marshal of France, knight of the Holy Ghost, duke and peer of France, grandee of Spain, commander in chief of the French armies; in all which stations his behaviour was such, that few equalled, perhaps none surpassed, him. He lived in an age when the renowned prince of Orange and many other of the greatest men commanded against him. His courage was of the cool, steady kind; always possessing himself, taking all advantages, not foolishly, rashly, or wantonly throwing away the lives of his soldiers. He kept up on all occasions the most strict discipline; and did not spare punishment among his soldiers for marauding and other crimes, when properly deserved; for which some inconsiderate people have blamed him. He has been reflected upon by the very zealous and violent adherents of the Stuart family, for not being sufficiently attached to that party, which was his own family. But by a cool examination of his actions, it will appear, that his behaviour in this particular was, as in most parts of his life, sensible and just. When he accepted of employments, received honours, dignities, and became a naturalized Frenchman, he thought it his duty, as an honest man, to become a Frenchman, and a real subject to the monarch who gave him bread; and to be, or not to be, in the interest of the Stuart family, according to the will and commands of the sovereign whom he served, and in the interest of France according to time and circumstances; for there is no serving two masters well. But when ordered by his king to be in that family's interest, he acted with the greatest sincerity; and took the most effectual and sensible methods to serve that unhappy house, as the following anecdote, if true, and it has great appearance and probability on its side, proves. The duke of Marlborough, after the signing of the treaty of Utrecht, was censured by the British parlia-

ment for some of the army contracts in relation to bread and forage; upon which he retired into France; and it was then credibly asserted, the duke of Marlborough was brought over to the interest of the Stuart family; for it is now past a doubt that queen Anne had a very serious intention of having her brother upon the throne of England after her death; and several circumstances, as well as the time of that duke's landing in England, make many people believe he was gained over to the Stuart party. If the duke of Berwick was, directly or indirectly, the means of gaining his uncle over to that interest, he more effectually served it than that rash mock army of unhappy gentlemen who were taken prisoners at Preiton in 1715 had it in their power to do. In a word, the duke of Berwick was, without being a bigot, a moral and religious man; and shewed by his life and actions, that morality and religion are very compatible and consistent with the life of a statesman and a great general; and if they were oftener united in those two professions, it would be much happier for the rest of mankind. He was killed by a cannon-ball at the siege of Philipburgh, in 1738.

BERWICK, a shire in Scotland, bounded by the river Tweed, on the south; by Lothian, on the north; by the German Ocean, on the east; and by Teviotdale on the west. It abounds with corn and grass, and has in it several seats of persons of quality. The principal rivers are the Tweed, the Whiteater, Blackadder, Eye, and Ednel. The principal place is the town and castle of Dunfe, which is the best place for trade in the country. It sends two members to parliament.

BERWICK (North), a town of Scotland, in the county of Lothian, seated on the Frith of Forth. It was near this place that general Cope was defeated by the rebels in 1745, and made his escape to Berwick-upon-Tweed. W. Long. 2. 29. N. Lat. 5. 56.

BERWICK-upon-Tweed, is a town on the borders of England and Scotland, and a county of itself. It stands on the north or Scotch side of the river Tweed; and is pleasantly situated on an easy declivity, almost close to the sea. It has a ditch on the north and east; but on the south and west it has high walls, regularly fortified, and planted with cannon, and to which the river serves as a moat. The houses are generally well built; and the town-house is a handsome structure, with a lofty turret, in which are eight bells, and a fine clock, which tells the quarters, with four dials, one on each side the square. The church is a neat building, but has no bells. The bridge is 947 feet long, and is supported by fifteen arches. The barracks form a large regular square, and will hold two regiments of foot very conveniently. The town is governed by a mayor, recorder, town-clerk, and four bailiffs; and has a coroner, a treasurer, four sergeants at mace, and a water bailiff. It had a strong castle, which now lies quite in ruins. It has a market on Saturdays, extremely well supplied; and a fair on Friday in Trinity-week for black cattle and horfes. Corn and eggs are shipped from hence for London and other ports; but the principal trade is the salmon which are caught in the Tweed, and reckoned to be as good as any in the kingdom. Some are sent alive, and some pickled in kits by persons who subsist on that employment and are called *salmon coopers*. In June and July salmon is sold for a penny a pound. The living is a rectory, rated at 20l. a year in the king's

Beryl

Beryl.

king's books. W. Long. 1. 35. N. Lat. 55. 58.

BERY, or BURY, the vill or seat of habitation of a nobleman, a dwelling or mansion-house, being the chief of a manor: from the Saxon *beorg*, which signifies a *hill* or *castle*; for heretofore noblemen's seats were castles situated on hills, of which we have still some remains; as in Herefordshire, there are the *beries* of Stockton, Hope, &c. It was anciently taken for a sanctuary.

BERYL, in natural history, called by our lapidaries *aqua marina*, is a pellucid gem of a bluish green colour, found in the East Indies and about the gold mines of Peru: we have also some from Silesia, but what are brought from thence are oftener coloured crystals than real beryls; and when they are genuine, they are greatly inferior both in hardness and lustre to the oriental and Peruvian kinds.

The beryl, like most other gems, is met with both in the pebble and columnar form, but in the latter most frequently. In the pebble form it usually appears of a roundish but flattened figure, and commonly full of small flat faces, irregularly disposed. In the columnar or crystalline form it always consists of hexangular columns, terminated by hexangular pyramids. It never receives any admixture of colour into it, nor loses the blue and green, but has its genuine tinge in the degrees from a very deep and dusky to the palest imaginable of the hue of sea-water.

The beryl, in its perfect state, approaches to the hardness of the garnet, but it is often softer; and its size is from that of a small tare to that of a pea, a horse-bean, or even a walnut. It may be imitated, by adding to 20 pounds of crystal-glass made without magnesia, six ounces of calcined brass or copper, and a quarter of an ounce of prepared zaffre.—The properties of the beryl were very wonderful in the opinion of the ancient naturalists; it kept people from falling into ambushes of enemies, excited courage in the fearful, cured diseases of the eyes and stomach. It does none of these things now; because people are not simple enough to believe it has the virtue to do them.

BERYL-crystal, in natural history, a species of what Dr Hill calls *ellipomacrofystia*, or imperfect crystals, is of an extreme pure, clear, and equal texture, and scarce ever subject to the slightest films or blemishes. It is ever constant to the peculiarity of its figure, which is that of a long and slender column, remarkably tapering towards the top, and very irregularly hexangular. It is of a very fine transparency, and naturally of a pale brown; and carries such evident marks of distinction from all brown crystals, that our lapidaries call it, by way of eminence, the *beryl-crystal*, or simply the *beryl*.

BERYTUS, (anc. geog.), a sea-port town of Phœnicia on the Mediterranean, so ancient as to be thought to have been built by Saturn. It was destroyed by Tryphon, but rebuilt by the Romans. Agrippa placed here two legions, whence it became a colony. It enjoyed the *jus Italicum*, and had an excellent school for the study of the law in Justinian's time. Now *Beroot*; which see.

BES, or BESSIS, in Roman antiquity, two thirds of the as. See As.

BES also denotes two thirds of the jugerum*.

BESAILE, signifies the father of a grand-father.

BESAILE, in law, a writ that lies where the great-grandfather was seized in fee of any lands, &c. at the

time of his death; and after his decease, a stranger enters thereon, the same day, and keeps out the heir.

BESANCON, a city of France, capital of the Franche Comte, and one of the most ancient cities of Europe. It is the see of an archbishop, and has a parliament as well as a university. It is seated on the river Dreux, which divides it into two parts, the greatest of which is a peninsula. The entrance is shut up by a mountain, on which they have built a large citadel, which commands all the city. There are many names of places in and about the city, that are plainly corruptions of the Latin, and are marks of its antiquity, as Chamars, Campus Martis, Chamuse, Campus Musarum, Chandane, Campus Dianæ, &c. The metropolitan church is built at the bottom of St Stephen's hill; and is a very handsome structure, with a high tower steeple. The great altar is placed in the middle choir, where on high days they preserve reliques in silver shrines, enriched with gold and jewels. There are several tombs and other things remarkable in the churches; and after you have paid the church of Notre Dame, and the square that it looks into, you come to a triumphal arch, erected in honour of the emperor Aurelian, on which are several figures of men and animals, pretty entire. It serves as a gate to the cloister of St John the Great. The great hospital of the order of the Holy Ghost is a structure worth seeing. The streets are wide and handsome; and the houses are well built with free-stone, and covered with slate, chiefly about the square called *Battan*, which is adorned with a fountain, the water of which proceeds from the statue of Bacchus. The river Dreux is passed over on a stone bridge, to enter from one part of Besancon into the other. The market-place is at the entrance; and on the left is another square, adorned with a fountain, where the great street begins, which traverses all this part, from the bridge to St John the Great. The new square is not far from this street, from whence you go to the town-house, which is a large structure, with four wings, before the front of which is the statue of Charles V. in bronze, with a globe in one hand, and a sword in the other. The imperial eagle is raised over a large basin, and spouts out water by both his beaks. The governor's palace is the most magnificent in the province, and there is a fountain a little farther, adorned with the figure of a naked woman, with water springing out at her nipples. E. Long. 6. 10. N. Lat. 47. 26.

BESANT, or BEZANT, a coin of pure gold, of an uncertain value, struck at Byzantium, in the time of the Christian emperors; from hence the gold offered by the king at the altar, is called *besant* or *bisant*.

BESANTED, or BEZANTED. This word means *full of besants*; and is used to denote a field, ordinary or charge, covered with above eight besants: for if there be but eight or fewer, their number must be particularly mentioned.

BESELEEL and OOLIAH, architects, sculptors, and painters, supposed to have made all the ornaments in brass, silver, &c. of the first tabernacle in the wilderness, 1490 B. C.

BESIEKS, or BEZIERS, an ancient and handsome town of France, in Lower Languedoc, with a bishop's see, and the title of a viscounty. It has a delightful situation; and the country in which it stands is fertile in corn, oil, and produces excellent wine. It is seated

* See Jugerum.

on a hill near the river Orbe, in E. Long. 3. 23. N. Lat. 43. 21.

BESISTAN, or **BERSTEIN**: Thus at Constantinople, Adrianople, and in some other towms within the Grand Signior's dominions, they call those places where the merchants have their shops, and expose their merchandizes to sale. Each sort of merchants have their particular besistan, which must all be underflood of the workmen, all those of the same trade working in the same place. These besistans are commonly large galleries, vaulted over, whose gates are shut every night. Sometimes the wardens and keepers of the besistans will answer for the merchandizes, on paying them a very moderate perquisite for every shop.

BESLERIA, (from Basilus Bessler an apothecary at Nuremberg, author of a book intitled *Hortii Eystetensis*), a genus of the angiospermia order, belonging to the didynamia class of plants. Of this genus there are three species, the melitifolia, with branching foot-stalks and oval leaves; the lutea, with simple foot-stalks growing in clusters, and spear shaped-leaves; and the cristata, with stalks growing single, and a five-leaved involucre. All these are natives of the warm parts of America, and cannot be preserved in this country without artificial heat. But as they are remarkable neither for beauty nor any other property, we forbear any particular description.

BESORCH, a coin of tin, or some alloyed metal, current at Ormus, at the rate of $\frac{1}{47}$ parts of a farthing sterling.

BESSARABIA, a territory of Turkey in Europe, lying between Moldavia, the Danube, the Black-sea, and Little Tartary. It is inhabited by independent Tartars, who maintain themselves by their cattle, husbandry, and by robbery. Their religion, manners, and customs, are the same with those of the Crim Tartars. When there are any forces sent against them, they retire among the mountains near the Black-sea, where it is impossible to come at them on account of the morasses and defiles.

BESSICA, (anc. geog.), a district of Thrace towards mount Hæmus to the south of the Hebrus. It was inhabited by a fierce and barbarous people noted for their robberies. Their chief city Uscudama is now known by the name of *Adrianople*. They lived under their own kings till the consulate of M. Licinius Lucullus and C. Cassius Varus; when the consul Lucullus invaded their country, and having gained a great victory over them, took their metropolis, and subjected the whole nation to the Roman laws. The Romans, notwithstanding they had subdued them by force of arms, still suffered them to live under their own kings; for Pifo, while he governed Macedon in quality of proconsul, having treacherously seized Rabocentus, whom Suetonius calls *prince of the Bessii*, caused him to be publicly beheaded. This affront so exasperated the whole nation, that they revolted; but were overthrown in a great battle by Octavius the father of Augustus. During the civil wars of Rome they attempted anew to recover their liberty, but were again defeated by the famous M. Brutus. In the reign of Augustus one Vollogesus, a native of the country, and priest of Bacchus, having, under pretence of religion, drawn together great crowds of people, made himself master of the whole country, and, entering the Chersonesus, com-

mitted there the most dreadful ravages. He was at last, however, overcome by L. Pifo; who obliged the savage inhabitants to lay down their arms, and submit to such conditions as he was pleased to impose upon them. From this time the Bessii continued subject to the Romans without attempting any more to regain their liberty.

BESSIS. See **BES**.

BESTAIL, or **BESTIAL**, in ancient statutes, all kinds of beasts, or cattle, especially those purveyed for the king's provision.

BESTIARIUM, in Roman antiquity, such as fought against beasts, or those who were exposed to them by sentence of the law. There were four kinds of bestiarii: the first were those who made a trade of it, and fought for money; the second were such young men as, to shew their strength and dexterity in managing their arms, fought against beasts; the third kind was, where several bestiarii were let loose at once, well armed, against a number of beasts; and the fourth kind were those condemned to the beasts, consisting either of enemies taken prisoners in war, or as being slaves, and guilty of some enormous crime; those were all exposed naked, and without defence.

BESTRICIA, a town of Transylvania, remarkable for the gold mines in its neighbourhood. E. Long. 22. 5. N. Lat. 48. 0.

BETA, the **BEET**; a genus of the digynia order, belonging to the pentandria class of plants.

Species. 1. The *maritima*, or *sea-beet*, grows naturally by the sea-side, and in salt marshes, in many parts of England, as also on the Bass island at the mouth of the Forth in Scotland. It has been supposed by many to be only a variety of the common white beet; but Mr Miller assures us he has been unable to make any variation in them by culture. 2. The *hortensis*, or common white beet, is cultivated in gardens for the sake of its leaves, which are frequently used in soups. The root of this sort seldom grows larger than a man's thumb; the spikes of flowers come out from the wings of the leaves, which are long, and have narrow leaves placed between the flowers. The lower leaves of the plant are thick and succulent, and their footstalks broad. The varieties of this are, the white beet, the green beet, and the Swiss or chard beet. These will vary from the one to the other, but have never been found to change to the first or third sort. 3. The *vulgaris*, or red beet, with a pyramidal root, hath large, thick, succulent leaves, which are for the most part of a dark-green or purple colour. The roots of this are large, and of a deep red colour. The larger these roots grow, the tenderer they are; and the deeper their colour, the more they are esteemed. The varieties of this species are, the common red beet, the turnip-rooted beet, and the green-leaved red beet.

Culture. The common white beet is commonly sown by itself in the beginning of March, upon an open spot of ground, not too moist. When the plants have put out four leaves, the ground should be hoed as is practised for carrots, carefully cutting up all the weeds, and also the plants where they are too near each other, leaving them at least six inches asunder. In three weeks or a month's time the ground should be hoed a second time to cut up the weeds and thin the plants to a greater distance, for by this time they will

Beta
||
Betel.

be out of danger; so should not be left nearer than eight or nine inches, if regard is had to the goodness of the leaves; and if it is of the Swifs kind, with broad leaves, the plants must not be nearer than a foot. In six weeks after, the ground should be hoed over a third time, which if properly done will destroy all the weeds. After this the plants will spread and prevent the weeds from growing, therefore will want but little cleaning for a considerable time, and the leaves will soon be fit for use. The outer larger leaves should be first gathered, leaving the smaller inner ones to grow large; by which method a small spot of ground will supply a moderate family for a whole year, provided the plants are not allowed to run to seed, for in that case they will not be good.

The red beet is frequently sown with onions, carrots or parsnips; but if these are not to be soon removed, the beets ought to be sown by themselves. This sort requires a deep light soil; the seeds should be sown in March, and must be treated in the same manner as the former sort: but the plants should not be left nearer than a foot distance, or in a good land a foot and a half; for the leaves will cover the ground at that distance. The roots will be fit for use in autumn, and continue good all winter; but in the spring, when they begin to shoot, they will be hard and stringy.

Medicinal and other uses. Decoctions of beets gently loosen the belly; hence they have been ranked among the emollient herbs: the plants remaining after the boiling are supposed to have rather a contrary effect. They afford little nourishment, and are said by some to be prejudicial to the stomach. The juice expressed from the roots is a powerful erhine. The root of the red beet is sometimes used to improve the colour of claret; and Mr Margraff found that good sugar might be produced from the roots of the white kind by the methods practised abroad for procuring it from the sugar cane. By some it is recommended to cultivate the white beet in large quantities, as food for cattle*.

BETANZOS, a town of Galicia in Spain, seated on the Mandeo, and a bay of the sea, in W. Long. 7. 50. N. Lat. 43. 21.

BETEL, or BETLE, in botany, an Indian plant of great use and esteem in the east, where it makes a considerable article of commerce. It is a creeping and climbing plant like the ivy; and its leaves a good deal resemble those of the citron, though they are longer and narrower at the extremity. It grows in all parts of India, but thrives best in moist places. The natives cultivate it as we do the vine, placing props for it to run and climb upon; and it is a common practice to plant it against the tree which bears the areca-nut.

At all times of the day, and even in the night, the Indians chew the leaves of the betel, the bitterness of which is corrected by the areca that is wrapped up in them. There is constantly mixed with it the chinam, a kind of burnt lime made of shells. The rich frequently add perfumes, either to gratify their vanity or their sensuality.

It would be thought a breach of politeness among the Indians to take leave for any long time, without presenting each other with a purse of betel. It is a pledge of friendship that relieves the pain of absence. No one dares to speak to a superior unless his mouth is perfumed with betel; it would even be rude to neglect

this precaution with an equal. The women of gallantry are the most lavish in the use of betel, as being a powerful incentive to love. Betel is taken after meals; it is chewed during a visit; it is offered when you meet, and when you separate; in short, nothing is to be done without betel. If it is prejudicial to the teeth, it assists and strengthens the stomach. At least, it is a general fashion that prevails throughout India.

BETELFAGUI, a town of Asia, in Arabia Felix, famous for the vast quantity of coffee bought and sold there; being the mart where the country-people bring their coffee to sell; and where the Europeans come, or send their factors or brokers to purchase it. E. Long. 57. 20. N. Lat. 15. 40.

BETHLEHEM, a town of Palestine, famous for the birth of Jesus Christ. It was once a flourishing town, but is now only a poor village. It is seated on the ridge of a hill, which runs east and west. Here is a church, built by St Helena, in the form of a cross, which is very large; and from its top may be seen all the country round about. The roof is lofty, flat, and composed of cedar on the inside, and leaded without. Both sides of the nave are supported by two rows of marble pillars, each made of one piece, and eleven in a row, inasmuch that they make as it were five naves, separated from each other by these rows of pillars, in each of which is the picture of some saint. On the wall over the pillars there is a very beautiful Mosaic work, on a gold ground. The walls were formerly overlaid with fine marble, but the Turks have taken it to adorn their mosques. The three upper ends of the cross terminate in three semicircles, having in each an altar. Over the chancel there is a stately cupola, covered with lead on the outside, and within adorned with Mosaic work. Close to the church is the monastery of the Franciscans; which is large, but indifferently built. The gardens are defended with strong walls, and at the north-west of them stands a tower now almost in ruins. Their chapel is better taken care of. Through this there is a passage to a square cave, where they say the Innocents were buried. Beyond this there are passages to the tombs of St Jerom, St Paula, Eustochium, and Eusebius of Cremona. Beyond these there is a grot or cell, which they say was the lodging-place of St Jerom when he translated the Bible. Another entrance leads to a vault or chapel, 12 feet wide and 40 long, whose floor is paved, and sides lined with white marble, and the roof is adorned with Mosaic work, now much decayed. At the end of this there is an arched concavity, with an altar, over which is a picture of the nativity, and under it a vault, the middle of which is a star made with stones of various colours, to mark the place where they say our Saviour was born; and near this is the manger where they pretend he was laid; it is hewn out of a rock, and is now flagged with white marble. The few cottages that are yet standing are inhabited by Greeks and Armenians, who get a poor livelihood by selling the model of the sepulchre and grot of the nativity to strangers, cut in wood or stone; as also by attending on pilgrims. Bethlehem is about six miles west of Jerusalem. E. Long. 35. 55. N. Lat. 31. 30.

BETHLEHEM, a town of the Netherlands, in the province of Brabant, subject to the house of Austria. E. Long. 4. 40. N. Lat. 51. 2.

Betel
Beth

BETHUNE (Maximilian de), duke of Sully, grand-master of the artillery, and marshal of France, sovereign prince of Enrichemont and Bois-Bell, marquis of Roigny, and one of the ablest and most upright ministers France ever had, was descended from an illustrious house, and was born in 1560. He entered very young into the service of Henry of Bourbon then king of Navarre, afterwards Henry IV. of France, who was just seven years his elder. He was bred in the reformed religion, and continued in the profession of it to the end of his life, though from political motives he advised his master to abjure it, as the only method of putting an end to the miseries of France. After Henry had gained possession of the kingdom, Sully performed all the duties of a great and good minister, while his master exercised all the offices of a great and good king. He had been at the battles of Coutras, Arques, and Ivry; at the sieges of Paris, Noyon, Rouen, and Laon; and signalized himself on every important occasion. In 1597, he was made chief overseer of the highways of France; and the following year, was raised to the post of superintendent of the finances. Though he was then but 40 years of age, and had hitherto signalized himself only in the army, he put the king's finances in such order, that he paid his debts, which amounted to two hundred millions of livres, and laid up great sums in the king's treasury. In 1601, he was made grand-master of the artillery, the next year governor of the Bastille, and afterwards superintendent of the fortifications. He was then sent into England as ambassador extraordinary; and had, at his return, the government of Poitou. At last Henry IV. in 1606, erected, in his favour, the territory of Sully on the Loire into a duchy and peerage, and made him grand master of the ports and havens. After the murder of that great prince in 1610, the duke of Sully, who had served him with the greatest zeal and fidelity, was obliged to retire to one of his houses, where he enjoyed a private life; but in 1634 he was made marshal of France, upon which he resigned the post of grand-master of the artillery. He died in his castle of Villebon, on the 21st of December, 1641, at 82 years of age. His Memoirs are ranked among the best books of French history: they contain a most particular account of whatever passed from the peace of 1570, to the death of Henry IV. in 1610: and acquire additional value from the many curious personal anecdotes preserved in them. They were translated into English by Mrs Lennox in 1757.

BETHUNE, a town of France, in Artois, containing upwards of 5000 inhabitants. There is an entrance into this city through four gates, and it is surrounded with walls and fortified. The city and the castle taken together are of a triangular figure, but the castle itself is a very irregular building. The houses are very indifferent, and the streets ill paved; however, there is a large handsome square, and several churches. In the marshy lands, near the city, there are several canals, cut for the conveyency of whitening linen. It is seated on a rock by the river Belse. E. Long. 2. 48. N. Lat. 50. 32.

BETIS, governor of Gaza under Darius, famous for his valour and loyalty; he defended a place of consequence with a few men against Alexander, who was there shot through the shoulder. Betis thinking him

slain, returned triumphantly to the city; but in a second assault he was wounded and brought to Alexander, who cruelly ordered him to be put to death.

BETLEY, a town of Staffordshire in England. It is seated on the confines of the county, next to Cheshire, in a barren sandy soil. W. Long. 2. 15. N. Lat. 53. 0.

BETLIS, a strong town of Armenia or Turcomania belonging to a bey or prince of the country, who is very powerful, and is subject to neither the grand signior nor king of Persia. It lies on the road from Tauris to Aleppo, and the prince can stop caravans whenever he pleases; for the passage between the mountains is so narrow, that ten men can defend it against 1000. The town is seated between two mountains about a cannon shot from each other, and the castle is on an eminence exactly in the middle. This eminence is in the shape of a sugar loaf; and is so steep on all sides, that it is impossible to get up but by winding round about it. The people in and about the town are shepherds, but are ready to take up arms at the command of their prince. E. Long. 42. 40. N. Lat. 37. 20.

BETONICA, or **VERONICA**, (from the Vetones an ancient people of Spain who first used this plant), betony; a genus of the gymnosperma order, belonging to the didynamia class of plants.

Species, &c. Of this genus botanical writers enumerate the following species. 1. The officinalis, purple or wood betony. 2. The danica, or greater Danish betony. 3. The alpina, or least Alpine betony. 4. The orientalis, or eastern betony, with very long narrow leaves, and a thicker spike of flowers. 5. The incana, or hoary Italian betony, with a flesh coloured flower. Of these the first species only deserves notice. It is a low plant growing in woods and shady places in several parts both of England and Scotland; the flowers come forth in June and July, of a purplish colour, and stand in spikes on the top of the stalks. The leaves and flowers have an herbaceous, roughish, somewhat bitterish taste, accompanied with a very weak aromatic flavour. This herb has been long a favourite among writers on the materia medica, who have not failed to attribute to it abundance of good qualities. Experience, however, does not discover any other virtue in betony than that of a mild corroborant: as such, an infusion or light decoction of it may be drank as tea; or a saturated tincture in rectified spirits given in suitable doses, in laxity or debility of the viscera, and diseases proceeding from thence. The powder of the leaves snuffed up the nose provokes sneezing; and hence betony is sometimes made an ingredient in sternutatory powders: this effect does not seem to be owing, as is generally supposed, to any peculiar stimulating virtues in the herb, but to the rough hairs with which the leaves are covered. The roots of this plant differ greatly in their quality from the other parts: their taste is very bitter and nauseous; taken in a small dose, they vomit and purge violently, and are supposed to have somewhat in common with the roots of hellebore. According to Simon Paulli and Bartholinus, this plant affects those who gather any considerable quantity of it with a disorder resembling drunkenness. Its leaves are sometimes smoked like tobacco.

BETONICA Aquatica. See SCROPHULARIA.

BETONICA Paulli. See VERONICA.

Betony
||
Betterson.

BETONY. See *BETONICA*.

BETROTHMENT, a mutual promise or compact between two parties for a future marriage. The word imports as much as giving one's troth; that is, true faith, or promise. Betrothment amounts to the same with what is called by civilians and canonists *spouſalia*, or *ſponſals*; sometimes *deſponſation*, and by the French *fiancailles*.

BETTERTON (Thomas), the celebrated actor, was the ſon of Mr Betterton under-cook to King Charles I. and was born in Tothill-ſtreet, Weſtmiſter, in the year 1635. Having received the firſt rudiments of a genteel education, his fondneſs for reading induced him to requeſt of his parents that they would bind him apprentice to a book-ſeller, which was readily complied with, fixing on one Mr Rhodes, near Charing-croſs, for his maſter. This gentleman, who had been wardrobe-keeper to the theatre in Black-friars before the troubles, obtained a licence in 1659, from the powers then in being, to ſet up a company of players in the Cock-pit in Drury-Lane, in which company Mr Betterton entered himſelf, and, though not much above 20 years of age, immediately gave proof of the moſt capital genius and merit.

Preſently after the reſtoration, two diſtinct theatres were eſtabliſhed by royal authority; the one in Drury-Lane in conſequence of a patent granted to Henry Killigrew, Eſq; which was called the *king's company*: the other in Lincoln's-Inn-Fields who ſtyled themſelves the *duke of York's ſervants*, the patentee of which was the ingenious Sir William Davenant: which laſt mentioned gentleman having long had a cloſe intimacy with and warm friendſhip for Mr Rhodes, engaged Mr Betterton, and all who had acted under Mr Rhodes, into his company; which opened in 1662, with a new play of Sir William's, in two parts, called the *ſiege of Rhodes*. In this piece, as well as in the ſubſequent characters which Mr Betterton performed, he increaſed his reputation and eſteem with the public, and indeed became ſo much in favour with king Charles II. that by his majeſty's ſpecial command he went over to Paris, to take a view of the French ſtage, that he might the better judge what would contribute to the improvement of our own; and it was upon this occaſion, as is generally ſuppoſed, that moving ſcenes were firſt introduced upon the Engliſh theatre, which before had been only hung with tapeſtry.

In the year 1670, he married one Mrs Sanderſon, a female performer on the ſame ſtage, who, both as an actreſs and a woman, was every thing that human perfection was capable of arriving at, and with whom he through the whole courſe of his remaining life poſſeſſed every degree of happineſs that a perfect union of hearts can beſtow.

When the duke's company removed to Dorſet-Gardens, he ſtill continued with them; and on the coalition of the two companies in 1684, he acceded to the treaty, and remained among them; Mrs Betterton maintaining the ſame foremoſt figure among the women, that her huſband ſupported among the male performers. And ſo great was the elimination that they were both held in, that in the year 1675, when a paſtoral called *Calisto* or the *Chaſte Nymph*, written by Mr Crown at the deſire of queen Catherine conſort to Charles II. was to be performed at court by perſons

of the greateſt diſtinction, our Engliſh Roſcius was employed to inſtruct the gentlemen, and Mrs Betterton honoured with the tutorage of the ladies, among whom were the two princeſſes Mary and Anne, daughters of the duke of York, both of whom ſucceeded to the crown of theſe realms. In grateful remembrance of which, the latter of them, when queen, ſettled a penſion of 100 l. *per annum* on her old inſtructreſs.

In 1693, Mr Betterton having found the inclinations of a ſelect number of the actors whom he found ready to join with him, obtained, through the influence of the earl of Dorſet, the royal licence for acting in a ſeparate theatre; and was very ſoon enabled, by the voluntary ſubſcriptions of many perſons of quality, to erect a new play-houſe within the walls of the Tennis Court in Lincoln's-Inn-Fields. To this ſtep Mr Betterton is ſaid to have been induced, partly by ill treatment from the managers; and partly with a view to repair, by the more enlarged profits of a manager, the loſs of his whole fortune (upwards of 2000 l.) which he had undergone in the year 1692, by adventuring it in a commercial ſcheme to the Eaſt-Indies. Be this however as it will, the new theatre opened in 1695, with Mr Congreve's *Love for Love*, the ſucceſs of which was amazingly great. Yet in a few years it appeared that the profits ariſing from this theatre, oppoſed as it was by all the ſtrength of Cibber's and Vanbrugh's writings at the other houſe, were very inſignificant; and Mr Betterton growing now into the infirmities of age, and labouring under violent attacks of the gout, he gladly quitted at once the fatigues of management, and the hurry of the ſtage.

The public, however, who retained a grateful ſenſe of the pleaſure they had frequently received from this theatrical veteran, and ſenſible of the narrowneſs of his circumſtances, reſolved to continue the marks of their eſteem to him, by giving him a benefit. On the 7th of April 1709, the comedy of *Love for Love* was performed for that purpoſe, in which this gentleman himſelf, though then upwards of 70 years of age, acted the youthful part of Valentine; as in the September following he did that of Hamlet, his performance of which the author of the *Tatler* has taken a particular notice of. On the former occaſion, thoſe very eminent performers, Mrs Barry, Mrs Braecgirdle, and Mr Dogget, who had all quitted the ſtage ſome years before, in gratitude to one whom they had had ſo many obligations to, acted the parts of Angelica, Mrs Frail, and Ben; and Mr Rowe wrote an epilogue for that night, which was ſpoken by the two ladies, ſupporting between them this once powerful ſupporter of the Engliſh ſtage. The profits of this night are ſaid to have amounted to upwards of 500 l. the prices having been raiſed to the ſame that the operas and oratorios are at preſent; and when the curtain drew up, almoſt as large an audience appearing behind as before it.

The next winter Mr Betterton was prevailed on by Mr Owen M'Swinney, then manager of the opera houſe in the Hay market (at which plays were acted four times a-week), to continue performing, tho' but ſeldom. In conſequence of which, in the enſuing ſpring, viz. on the 25th of April 1710, another play was given out of this gentleman's benefit, viz. the *Maid's Tragedy* of Beaumont and Fletcher, in which he himſelf performed his celebrated part of Melanthus.

This,

This, however, was the last time of his appearing upon the stage. For having been suddenly seized with the gout, and being impatient at the thoughts of disappointing his friends, he made use of outward applications to reduce the swellings of his feet, which enabled him to walk on the stage, though obliged to have his foot in a slipper. But although he acted that day with unusual spirit and briskness, and met with universal applause, yet he paid very dear for this tribute he had paid to the public; for the fomentations he had made use of occasioning a revulsion of the gouty humour to the nobler parts, threw the distemper up into his head, and terminated his life on the 28th of that month. On the 2^d of May his body was interred with much ceremony in the cloyster of Westminster, and great honour paid to his memory by his friend the Tatler, who has related in a very pathetic, and at the same time the most dignified manner, the process of the ceremonial.

As an *author*, Mr Betterton had a considerable degree of merit. His dramatic works are, 1. Amorous Widow, a comedy. 2. Dioclesian, a dramatic opera. 3. Masque in the Opera of the Prophets. 4. Revenge, a comedy. 5. Unjust Judge, a tragedy. 6. Woman made a Justice, a comedy.

As an *actor*, he was certainly one of the greatest of either his own or any other age; but those who are desirous of having him painted out in the most lively colours to their imagination, we must refer to the description given of him by his cotemporary and friend Colley Cibber, in the Apology for his own life. And as a *man*, it is scarcely possible to say more, and it would be injustice to say less, than that he was as unblemished a pattern of private and social virtues, as he was a perfect model of theatrical action and dramatic execution.

BETUE, or BETAW, a territory of the Low Countries in the duchy of Guelderland, between the rivers Rhine and Leck. The ground is very moist, and the rains often render the roads impassible. It is divided into the Upper and Lower.

BETULA, the BIRCH-TREE; a genus of the tetrandria order, belonging to the monœcia class of plants.

Species. 1. The alba, or common birch-tree, is so well known as to need no description. 2. The nana, or dwarf-birch, with roundish leaves, grows naturally in the northern parts of Europe, and on the Alps. It seldom rises above two or three feet high, having slender branches garnished with round leaves, but seldom produces flowers here. It is preserved in some curious gardens for the sake of variety, but is a plant of no use. 3. The lenta, with oblong, pointed, heart-shaped, sawed leaves. 4. The nigra, or black Virginia birch-tree. Both these are natives of North America. In Canada they grow to a large size, and the third sort is there called *merisfer*. 5. The alnus, or alder-tree. Of this there are two varieties, one with round leaves, and the other with long ones.

Culture. The first sort is not much esteemed for its wood; but, however, may be cultivated to advantage upon barren land where better trees will not thrive; for there is no soil so bad but this tree will thrive in it. It will grow in moist springy land, or in dry gravel or sand where there is little surface; so that upon ground which produced nothing but moss, these trees have been known to succeed so well as to be fit for cutting in ten years after they were planted. The best method

of raising these trees is, to procure the young plants from the woods where they naturally grow, and where they are usually found in great plenty; but in places where these young plants cannot be procured, they may be raised from seeds, which should be carefully gathered in the autumn as soon as the scales under which they are lodged begin to open, otherwise they will soon fall out and be lost. The seeds are small, so should not be buried deep in the ground. The best time for sowing them is in the autumn in dry ground, and the spring in moist. The plants will thrive better in a shady situation than if exposed to the sun. If the wild plants are used, they ought to be taken up carefully, so as not to injure their roots. The ground where they are to be planted requires no preparation; all that is necessary to be done is to loosen the soil with a spade or mattock in the places where the plants are to stand, making holes to receive their roots, covering them again when the plants are placed, and closing the earth hard to their roots. If the plants are young, and have not much top, they will require no pruning; but where they have bushy heads, they should be shortened to prevent their being shaken and displaced by the wind. When the plants have taken root, they will require no other care but to cut down the great weeds which would overhang them. This need not be repeated oftener than twice in a summer the first two years; after which the plants will be strong enough to keep down the weeds, or at least be out of danger from them. These trees may be planted any time from the middle of October to the middle of March when the ground is not frozen. They ought to be planted four feet distance from each other, that they may soon cover the ground, and by standing close they will draw one another up. If the plants take kindly to the ground, they will be fit to cut in about ten years; and afterwards they may be cut every seventh or eighth year if designed for the broom-makers only; but if designed for hoops, they should not be cut oftener than every twelfth year. The nana, lenta, and nigra, are to be propagated in the same manner; but the alder may be propagated either by layers, or planting truncheons about three feet high. The best time for this is in February, or the beginning of March. They should be sharpened at one end, and thrust at least two feet deep in the ground, to prevent their being blown out of it after they have made strong shoots. The best time for laying down the branches is in the month of October, and they may be transplanted in October following.

Uses. In some of the northern parts of Europe the wood of the birch is much used for making carriages and wheels, being hard and of long duration. In France it is generally used for making wooden shoes, and in Britain for making womens shoe-heels, packing-boxes, brooms, hoops, &c. It also makes very good fuel, and is planted along with hazel to make charcoal for forges. The bark of the birch tree seems in a manner incorruptible. In Sweden the houses are covered with it, and it lasts many years. It frequently happens that the wood is entirely rotten, when the bark is perfectly sound and good. In Kamtschatka it is used for making drinking cups. It abounds with a refinous matter, to which its durability is certainly owing. In consequence of this matter, it is highly inflammable; and in the northern countries torches are made of this

bark sliced and twisted together. The bark itself consists of two different substances; a thick brittle brownish red one; and several very thin, smooth, white, transparent membranes. In these last the inflammable property resides. The thick brittle part is less resinous, and has a roughish taste. It has been thought to possess some medical virtues, but concerning these experience has as yet determined nothing certain. Upon deeply wounding or boring the trunk of the tree in the beginning of spring, a sweetish juice issues forth, sometimes, as is said, in so large quantity as to equal the weight of the whole tree and root; one branch will bleed a gallon or more in a day. This juice is recommended in scorbutic disorders, and other foulnesses of the blood; its most sensible effect is to promote the urinary discharge. By proper fermentation with the addition of sugar, this juice makes a pleasant wine. The birch-tree is said to be prejudicial to pasturage.

The *alder tree* flourishes best in low marshy situations, in which it is frequently planted to make hedges, and is also of great use for securing the banks of rivers. Grass grows well beneath its shade: the wood is soft and brittle; but lasts a long time under water, and consequently is of use for pipes, and to lay under the foundations of buildings situated upon bogs: womens shoe-heels, ploughman's clogs, and various articles of the turner kind, are made of it. The bark gives a red colour, and with the addition of copperas a black: it is chiefly used by fishermen to stain their nets. In the Highlands of Scotland near Dundonnel, Mr Pennant says the boughs cut in the summer, spread over the fields, and left to rot in the winter, are found to answer as a manure. In March, the ground is cleared of the undecayed parts, and then ploughed. The fresh gathered leaves are covered with a glutinous liquor; and some people strew them on their floors to kill fleas. These insects are said to be entangled in the glutinous liquor of the leaves, as birds are by birdlime. The whole plant is astringent, and its bark has been recommended in intermittent fevers. Horses, cows, goats, and sheep, eat all the species of betula; but swine refuse them.

BETULEIUS (Sixtus), an able grammarian, a good Latin poet, and philosopher, born at Memmingen, in the year 1500; his true name was *Birek*. He taught the belles lettres and philosophy with reputation; and became principal of the college of Augsburg, where he died on the 16th of June, 1554. He published several works in prose; and his dramatic pieces of Joseph, Susannah, and Judith, are esteemed.

BEVECUM, a town of the Austrian Netherlands, in the province of Brabant. E. Long. 4. 50. N. Lat. 50. 45.

BEVEL, among masons, carpenters, &c. a kind of square, one leg whereof is frequently crooked, according to the sweep of an arch or vault. It is moveable on a centre, and so may be set to any angle.

BEVEL-Angle, any other angle besides those of 90 or 45 degrees. See ANGLE.

BEVELAND (North and South), two islands in the province of Zealand, between the eastern and western branches of the river Scheld, making part of the United Provinces.

BEVELLING, in ship-building, the art of hewing a timber with a proper and regular curve, accord-

ing to a mould which is laid on one side of its surface.

In order to hew any piece of timber to its proper bevel, it will be necessary, first, to make one side *fair* and *out of winding*; a term used to signify that the side of a timber should be a plane. If this side be uppermost, and placed horizontally, or upon a level, it is plain, if the timber is to be hewed square, it may be done by a plummet and line; but if the timber is not hewed square, the line will not touch both the upper and lower edge of the piece; or if a square be applied to it, there will be wood wanting either at the upper or lower side. This is called *within* or *without* a square. When the wood is deficient at the under-side, it is called *under-bevelling*; and when it is deficient on the upper-side, it is called *standing-bevelling*; and this deficiency will be more or less according to the depth of the piece; so that before the proper bevellings of the timbers are found, it will be sometimes very convenient to assign the breadth of the timbers; nay, in most cases it will be absolutely necessary, especially afore and abaft: tho' the breadth of two timbers, or the timber and room, which includes the two timbers and the space between them, may be taken without any sensible error, as far as the square body goes. For as one line represents the moulding-side of two timbers, the fore-side of the one being supposed to unite with the aft-side of the other; the two may be considered as one entire piece of timber.' *Murray's Ship-building.*

BEVERAGE, in a general sense, signifies a drink. Hence nectar is said to be the beverage of the gods. In writers of the middle age, beverage, *beveragium*, or *biberagium*, denotes money given to an artificer, or other person, to drink, over and above his hire or wages.

BEVERIDGE (William), a learned English bishop, in the beginning of the 18th century, was born in the year 1638, and educated in St John's college, Cambridge, where he distinguished himself very early by his extensive learning, and particularly by his knowledge of the oriental languages. Upon the deprivation of Dr Thomas Ken, bishop of Bath and Wells, for not taking the oaths to the government in 1691, he refused the offer of that see, tho' he was then chaplain to king William and queen Mary. In 1704 he was consecrated to the bishopric of St Asaph; in which high function he so behaved himself all along, and discharged it in so exemplary a manner, that he approved himself a truly primitive prelate. He died at his lodgings in the Cloisters in Westminster-abbey, in 1707, aged 71. As his whole life was spent in acts of piety and charity, so he gave remarkable instances of both at his death, leaving the bulk of his estate for the propagation of the gospel, and promoting of Christian knowledge, at home as well as abroad. His *Private Thoughts upon a Christian Life*, is deservedly a very popular book. He wrote several other useful and learned works on various subjects, particularly on the oriental tongues.

BEVERLAND (Hadrian), a man of excellent genius in the end of the 16th century, but who prostituted it in the study and composition of books of a very obnoxious kind. He was a perfect master of Ovid, Catullus, Petronius, and authors of that stamp. He is famous for his book on *Original Sin*, in which he maintained, that Adam's sin consisted in his commerce with his wife, and that original sin is nothing else but the inclination of the sexes to each other: it was

condemned to be burnt. He led a scandalous life, but seems to have repented of his wicked manners and lewd writings; for he published a treatise in the end of his life, *De Fornicatione cavenda*, in 1698. It is said he died mad.

BEVERLEY, a town of Yorkshire, governed by a mayor, a recorder, 12 aldermen, &c. and sends two members to parliament. The minister here is a very fair and neat structure, and the roof is an arch of stone; in it are several monuments of the Percies, earls of Northumberland, who had added a little chapel to the choir, in the windows whereof there are several pictures of that family painted on glass; at the upper end of the choir, at the right of the altar-place, stands the freed-stool, made of one entire stone, to which every one that fled had a right of protection; and at the upper end of the body of the church, next the choir, hangs an ancient table, with the picture of king Athelstane, who founded the church; between them is this inscription:

Als free make I thee,
As heart can with, or egh can see.

Hence the inhabitants pay no toll in any town or port in England. In the body of the church stands an ancient monument, called the *virgins' tomb*, because two virgin-sisters lie buried there, who gave the town a piece of land, into which any free man may put three milk cows from Lady-day to Michaelmas; at the lower end of the body of the church is a large font of agate stone.

Near the minister, on the south side of it, is a place called *Hall-Garth*, wherein they keep a court of record, called *Provest's-court*; in this causes arising within the liberties may be tried for any sum. The liberties contain above 100 towns and parts of towns, in Holderness and other parts of the east-riding belonging to it. The town is a mile in length, having pleasant springs running quite through it. It is beautified with two stately churches; and has a free-school, with two fellowships, six scholarships, and three exhibitions in St John's college, Cambridge, belonging to it; besides six alms-houses, where none are admitted but those that give bond to leave their effects to the poor when they die. The principal trade of this town is making malt, oat-meal, and tanned leather; and the poor people chiefly support themselves by making bone-lace. About a mile east from the town, there is a mineral water, which cures eruptions of the skin, and is beneficial in the king's evil. E. Long. o. 9. N. Lat. 53. 50.

BEVERLY (John of), in Latin *Joannes Beverlacius*, archbishop of York in the eighth century, was born of a noble family, at Harpham, in Northumberland, and was justly esteemed one of the best scholars of his time. He was first a monk, and afterwards abbot of the monastery of St Hilda, when his merit recommended him to the favour of Alfred king of Northumberland, who, in the year 685, advanced him to the see of Haguitald, or *Hesham*, and, in 687, translated him to the archbishopric of York. This prelate was tutor to the famous Bede; and lived in the strictest friendship with Acca and other Anglo-Saxon doctors, several of whom he engaged to write comments on the Holy Scriptures. In 704, he founded a college at Beverly, for secular priests; and after he had governed the see of York 34 years, being tired of the

tumults and confusions that prevailed in the church, divested himself of his episcopal character, and retired to Beverly; where he died four years after, on the 7th of May, 721.—Bede and other monkish writers ascribe several miracles to him. Between 300 and 400 years after his death, his body was taken up by Alfric archbishop of York, and placed in a shrine richly adorned with silver, gold, and precious stones: and in 1416, the day of his death was, by a synod held at London, appointed a festival. We are told that William the Conqueror, when he ravaged Northumberland with a numerous army, spared Beverly alone, out of a religious veneration for St John of that place. This prelate wrote some pieces, which are mentioned by Bale and Pits, viz. 1. *Pro Luca exponenda*. 2. *Homiliæ in Evangelia*. 3. *Epistolæ ad Hildam Abbatissam*. 4. *Epistolæ ad Heribaldum, Andenum, et Bertinum*.

BEVERUNGEN, a town of Germany, in the diocese of Paderborn, seated at the confluence of the rivers Beve and Weser, in E. Long. 9. 30. N. Lat. 51. 40.

BEVILLE, in heraldry, a thing broken or opening like a carpenter's rule: Thus we say, he beareth argent, a chief beville, vert, by the name of *beverlis*.

BEVIN (Elway), a musician eminently skilled in the knowledge of practical composition, flourished towards the end of queen Elizabeth's reign. He was of Welsh extraction, and had been educated under Tallis, upon whose recommendation it was that, in 1589, he was sworn in, gentleman extraordinary of the chapel; from whence he was expelled in 1637, it being discovered that he adhered to the Romish communion. He was also organist of Bristol cathedral, but forfeited that employment at the same time with his place in the chapel. Child, afterwards doctor, was his scholar. He has composed sundry services, and a few anthems.

Before Bevin's time the precepts for the composition of canon were known to few. Tallis, Bird, Waterhouse, and Farmer, were eminently skilled in this most abstruse part of musical practice. Every canon as given to the public, was a kind of enigma. Compositions of this kind were sometimes exhibited in the form of a cross, sometimes in that of a circle: there is now extant one resembling a horizontal sun-dial; and the *resolution* (as it was called) of a canon, which was the resolving it in to its elements, and reducing it into score, was deemed a work of almost as great difficulty as the original composition: but Bevin, with a view to the improvement of students, generously communicated the result of many years study and experience in a treatise which is highly commended by all who have taken occasion to speak of it. This book was published in 4to, 1631, and dedicated to Goodman bishop of Gloucester, with the following title: 'A briefe and short instruction of the art of musicke, to teach how to make difant of all proportions that are in use: very necessary for all such as are desirous to attain to knowledge in the art; and may by practice, if they can sing, soone be able to compose three, four, and five parts, and also to compose all sorts of canons that are usual, by these directions of two or three parts in one upon the plain song.' The rules contained in this book for composition in general are very brief; but for the composition of canon there are in it a great variety of examples of almost all the possible forms in which it is

capa-

Bewdly
||
Beza.

capable of being constructed, even to the extent of 60 parts.

BEWDLY, a town of Worcestershire in England, seated on the bank of the river Severn, in W. Long. 2. 20. N. Lat. 52. 25. It has its name *Bewdley*, *Beawley*, or *Beaulieu*, from its pleasant situation on the declivity of a hill overlooking the river, and commanding a fine prospect of the country, and formerly of the forest of Wyre, remarkable for its tall stately oaks and other trees, which have since been either blown or cut down. It was formerly accounted to be a delightful place, that Henry VII. built a house here for prince Arthur, which he called *Tiken-hall*. Bewdley sent burgesses to parliament very early, and had charters and great privileges from Edward IV. and Henry VII. which were confirmed, with the addition of others, by Henry VIII. in whose time it was annexed to the county of Worcester. King James I. granted it a charter; of which a surrender was procured in Charles II.'s time, and the corporation was new-modelled. King James II. compelled it to accept of a new charter; but the former surrender, upon a trial, was held void, and a new charter was obtained of queen Anne. In consequence of this it is governed by a bailiff and burgesses, recorder, steward, town-clerk, &c. The town is neat and well built; and carries on a considerable trade, by means of the Severn, in salt, glass, iron ware, and Manchester goods; but its chief manufacture is in caps, commonly called *Monmouth caps*. It has a good market for corn, malt, leather, and hops.

BEWITS, in falconry, pieces of leather, to which a hawk's bells are fastened, and buttoned to his legs.

BEY, among the Turks, signifies a governor of a country or town. The Turks write it *begh*, or *bek*, but pronounce it *bey*.

This word is particularly applied to a lord of a banner, whom, in the same language, they call *sangiac beg* or *bey*. Every province in Turkey is divided into seven sangiacs, or banners, each of which qualifies a bey; and these are all commanded by the governor of the province, whom they also call *begler-beg*, that is, lord of all the beghs or beys of the province: these beys are much the same as bannerets were formerly in England.

BEY of Tunis, the same with the dey of Algiers, is the prince or king of that kingdom.

BEYS (Giles), a celebrated printer at Paris, in the 16th century, and the first introducer of the consonants *j* and *v*.

BEZA (Theodore),* one of the principal pillars of the reformed church, was born at Vezelai, in Burgundy, June 24th, 1519. He was brought up by his uncle Nicholas de Beza, counsellor of the parliament of Paris, till the month of December, 1528, when he sent him to study at Orleans, and afterwards at Bourges, where he was under the care of Melchior Wolmar, under whom he made an extraordinary progress in polite learning, and from him imbibed the principles of Calvinism. His uncle intended him for the bar; but the law not suiting his disposition, he spent most of his time in reading the Greek and Latin authors, and in composing verses. In 1539, he took up his licentiate's degree, and went to Paris. He fell into snares in his youth, and wrote some licentious things. Sickness awakened him; and he pursued a

vow he had formerly made, of entering into the reformed religion. According to this resolution he went to Geneva, and made public profession of the reformed religion. In 1549, he accepted of the Greek professorship at Lausanne, where he also read lectures in French on the New Testament to the refugees of both sexes who dwelt in that city. Having settled at Geneva, he adhered to Calvin in the strictest manner, and became in a little time his colleague in the church and in the university. He was sent to Neraç, at the solicitation of some great men of the kingdom, to convert the king of Navarre, and to confer with him upon affairs of importance. This was when the Guises had got the authority under the reign of Francis II. to the prejudice of the princes of the blood. The king of Navarre having testified, both by letters and deputies, that he desired that Beza might assist at the conference of Poissy, the senate of Geneva consented. The assembly hearkened attentively to his harangue, till, speaking of the real presence, he said, that the body of Jesus Christ was as distant from the bread and wine, as the highest heaven is from the earth. This made a murmur: some cried out, *Blasphemavit!* others got up to go away. Cardinal de Tournon, who sat in the first place, desired the king and queen either to silence Beza, or to permit him and his company to withdraw. The king did not stir, nor any of the princes, and leave was given to go on. Throughout the whole conference he behaved himself with great ability. He often preached before the queen of Navarre, the prince of Conde, and in the suburbs of Paris. After the massacre of Vassy, he was deputed to the king to complain of this violence. The civil war followed soon after, during which the prince of Conde kept him with him; and while the prince was imprisoned, he lived with admiral de Coligni, and did not return to Geneva till after the peace, 1563. In 1571, he was chosen moderator at the national synod of Rochelle; and the year after, assisted at that of Nismes; after this, he assisted at the conferences of Montheilard, and at those of Bern. The infirmities of old age beginning to fall heavily upon him in 1597, he could seldom speak in public; and at last he left it off entirely in the beginning of the year 1600. However, in 1597, he wrote some animated verses against the Jesuits, on occasion of the report that was made of his death, and of his having before he died made profession of the Roman faith. He lived till the 13th of October, 1605. He was a man of extraordinary merit, and one who did great services to the Protestant cause. This, however, exposed him to innumerable slanders and calumnies; but he shewed both to the Catholics and Lutherans, that he understood how to defend himself. He wrote, 1. A Translation of the New Testament; 2. Turned the Psalms into Latin verse; 3. Published a Treatise on the Sacraments; 4. Some Sermons on the Passion of Jesus Christ and on Solomon's Song; 5. A Version of the Canticles, in lyric verse; 6. A French tragi-comedy, intitled, *The Sacrifice of Abraham*; and many other pieces.

BEZANS, cotton cloths, which come from Bengal; some are white, and others striped with several colours.

BEZANTLER, the branch of a deer's horns next below the brow-antler.

BEZOAR, in natural history and medicine, a general name for certain animal-substances supposed to be effectual in preventing the fatal consequences of poison. The word comes from the Persian *batzcher*, *buzcher*, or *pabazar*, which signifies an antidote.

The first mention made of bezoar is in Avenzoar, an Arabian physician, who gives a very romantic account of its origin. He describes it as generated of the tears or gum of the eyes of stags; who, after eating serpents, used to run into the water up to the nose, where they stood till their eyes began to ooze a humour, which, collecting under the eyelids, gradually thickened and coagulated, till, being grown hard, it was thrown off by the animal in rubbing frequently. Other opinions no less fabulous obtained till the time of Garcias al Horto, physician to the Portuguese viceroy of the Indies, who gave the first genuine account of it. Kempfer afterwards gave a description of it, with some new particulars.

The bezoar is a calculus concretion found in the stomach of certain animals of the goat kind*. It is composed of concentric coats surrounding one another, with a little cavity in the middle, containing a bit of wood, straw, hair, or the like substances.

There are two sorts of bezoar; one brought from Persia and the East Indies, the other from the Spanish West Indies. The first or best sort, called *oriental bezoar*, is of a shining dark-green or olive colour, and an even smooth surface; on removing the outward coat, that which lies underneath it appears likewise smooth and shining. The *occidental* has a rough surface, and less of a green colour than the foregoing; it is likewise much heavier, more brittle, and of a looser texture; the coats are thicker, and on breaking exhibit a number of fibres curiously interwoven. The oriental is generally less than a walnut; the occidental for the most part larger, and sometimes as big as a goose egg. The first is universally most esteemed, and is the only sort now retained by the London college: the Edinburgh, in the edition of their pharmacopoeia preceding the present, directed both; but they now seem to allow them to be used promiscuously, retaining in their catalogue only the name *bezoar lapis*.

This stone is in high esteem among the Persians, and even of greater value than in Europe; which, with sundry other circumstances needless to relate here, has given occasion to many to suspect, that the true bezoar is never brought to us. Some authors relate with great confidence, that all the stones commonly sold under this name are artificial compositions. That some of them are so, is evident; hence the great differences in the accounts which different persons have given of their qualities: the stones examined by Slare as oriental bezoar did not dissolve in acids; those which Grew and Boyle made trial of, did; those employed by Geoffroy (in some experiments related in the French memoirs 1710) did not seem to be acted on by rectified spirit; whilst some of those examined by Neumann at Berlin almost totally dissolved therein. The common mark of the goodness of this stone, is its striking a deep green colour on white paper that has been rubbed with chalk.

Bezoar was not known to the ancient Greeks, and is first taken notice of by the Arabians, (as above mentioned), who extol it in a great variety of disorders, particularly against poisons. Later writers also bestow

extraordinary commendations on it as a sudorific and alexipharmac; virtues to which it certainly has no pretence. It has no smell or taste, it is not digestible in the stomach of the animal in which it is found, and is scarce capable of being acted on by any of the juices of the human body. It cannot be considered in any other light than as an absorbent; and is much the weakest of all the common substances of that class. It has been given to half a dram, and sometimes a whole dram, without any sensible effect; though the general dose (on account of its great price) is only a few grains.

BEZOAR, in a more extensive sense, includes all substances formed *stratum super stratum* in the stomachs or intestines of animals; in which sense pearls, the concretions called *crabs-eyes*, &c. belong to the class of bezoars. To this also belong the hippolithus, or *bezoar equinum*, a stone sometimes found in the stomach or intestines of a horse; the monkey-bezoar, a stone said to be found in the stomachs of certain monkeys in Brazil and the East Indies, harder than the oriental bezoar, of a dark-green colour, and very costly on account of its scarcity.—*Bezoar bovinum*, is a yellowish stone found in the ox's gall-bladder.—*Human bezoars* are stony substances found in the intestines of several persons, formed from the stones of plums, or other fruits, retained in the cœcum or other guts, and growing coated over, of which we have an instance given by Dr Cole, Phil. Trans. n° 235.—*Bezoar microscopium* is the same with the human calculus; and is various in its degrees of hardness, as well as in its size and figure. It has been used in the place of the more costly sorts.—As to the *bezoar hystricis*, a concretion found in the gall-bladder of an Indian porcupine; and the German bezoar, or that found in mountain-deer, especially on the Alps; these, not being stones, are more properly called by late writers *agagropile**; the former consisting of woolly fibres, and a bitter friable matter, having neither laminae nor membranes; the latter being a ball of hair or herbs, or perhaps roots, compacted in the stomach of the animal.—They are all, as medicines, unworthy of regard. The bezoar bovinum, or ox-bezoar, is used by miniature-painters in several casts of yellow. ☉

BEZOAR-mineral. See PHARMACY, n° 794.—From this preparation, mixed with other metals various ways, arise other compound bezoardics; as, the bezoardicum solare, lunale, martiale, joviale, &c. or bezoar with gold, with silver, with iron, with tin, &c. in dissepate. The last differs very little from the *antihellicum Poterii*, an exploded medicine.

Fossil BEZOAR, is a kind of figured stone, formed, like the animal bezoar, of several coats or strata ranged round some extraneous body which forms a nucleus, and supposed to have the same virtues. It is found chiefly in Sicily, in sand and clay pits. It is of a purple colour, with a rough surface, the size of a walnut, and light. When broken, it is found to be an iron crust, containing in its hollow a fine greenish white earth resembling pale bezoar. The earth is used, and not the shells. It seems to be of the nature of bole armeniac. It is also called *Sicilian earth*.

BEZOARDIC, an appellation given to whatever partakes of the nature of bezoar; also to compound medicines whereof bezoar makes an ingredient.

BEZOARDIC Powder. See PHARMACY, n° 814. DIA,

* See *Agagropile*.

Bia
||
Bias.

BIA, in commerce, a name given by the Siamese to those small shells which are called *cowries* throughout almost all the other parts of the East Indies †.

† See *Cowries*.

BLÆUM, *blasior*, in rhetoric, denotes a kind of counter-argument, whereby something alleged for the adversary is retorted against him, and made to conclude a different way: for instance, *Occidisti, quia adfististi interfecto.*—*Immo quia adfististi interfecto, non occidi; nam si id esset, in fugam me conjecissem.* “ You killed the person, because you were found standing by his body. *Blæum*, Rather I did not kill him because I was found standing by his body; since, in the other case, I should have fled away.”

BLÆUM, in the Grecian laws, was an action brought against those who ravished women, or used violence to any man's person.

BIAFAR, or BIAFRA, a kingdom of Africa, situated to the east of Benin, to the west of Medra, from which it is divided by a chain of mountains, and extending southward to the fourth degree of north latitude. The natives are the most of all negroes addicted to, and infatuated with, magic; imagining themselves capable of causing rain, thunder, and lightning: therefore they worship the devil with great zeal, and even sacrifice their children to him.

BIAFORA, in the customs of the middle age, a form of cry, or alarm to arms; on the hearing whereof, the inhabitants of towns or villages were to issue forth, and attend their prince. The word seems originally from Gascony; and the Italians even now, on a sudden insurrection of the people, commonly cry, *Via-fora*, by a usual change of the letter B into V.

BIARCHUS, an officer in the court of the emperors of Constantinople, intrusted with the care and inspection of the provisions of the soldiery.

BIALOGOROD, or AKERMAN, a strong town of Bessarabia, in European Turkey. It is seated on a lake called *Vidono*, near the sea side; in E. Long. 22. 50. N. Lat. 46. 24.

BIANA, a town of Asia in the dominions of the Great Mogul, remarkable for its excellent indigo. E. Long. 77. 0. N. Lat. 26. 20.

BIANCHINI (Francis), one of the most learned men of his time, was born at Verona, in 1662, of a noble and ancient family. His taste for natural philosophy and mathematics induced him to establish the academy of Aletosili, at Verona. He went to Rome in 1684; and was made librarian to cardinal Ottoboni, who was afterwards Pope under the name of Alexander VIII. He also became canon of St Mary de la Rotonda, and at length of St Lawrence in Damaso. He was esteemed by the learned; and was a member of many academies. He published several ingenious dissertations, &c. and died in 1729, aged 67.

BIAS, one of the seven sages of Greece, flourished about 608 before Christ. He was accustomed to say, “ It is a sickness of the mind to wish for impossible things.” During the siege of Priena, his native city, being asked why he was the only one who retired from the place without carrying any thing with him, he replied, That he carried his all with him; meaning, that his knowledge and virtue were the only blessings that were peculiarly his own, since they could not be taken from him. He expired while pleading for one of his friends.

BIAS, or *Biasis*, in a general sense, the inclination or bent of a person's mind to one thing more than another.—It also signifies the lead or weight put into a bowl, that draws or turns the course of it any way to which the bias looks.

BIBERACH, a free and imperial city of Suabia in Germany. It has a large manufacture in fustians, and is seated in a pleasant fertile valley on the river Rufe. E. Long. 10. 2. N. Lat. 48. 4.

BIBERSBERG, a town of Upper Hungary, situated in E. Long. 17. 25. N. Lat. 48. 35.

BIBIENA (Ferdinand Galli), an excellent painter and architect, was born at Bologna, in 1657; and was furnished *Bibiena* from a territory of that name in Tuscany, in which his father was born. He acquired such reputation by his skill in architecture, the decorations of the theatre, and perspective, that the duke of Parma invited him to his court, and made him his first painter and architect. Bibiena at length went to the emperor's court, where he had the same honours and advantages. He wrote two books of architecture; and died at Bologna, at above 80 years of age. His sons followed, with success, the same professions.

BIBLE, (in Greek *βιβλος*, the book), a name applied by Christians, by way of eminence or distinction, to the collection of sacred writings, or the holy scriptures of the Old and New Testaments; known also by various other appellations, as, the Sacred Books, Holy Writ, Inspired Writings, Scriptures, &c. The Jews styled the Bible (that is, the Old Testament) *mikra*; which signifies *Lesson*, or *Lecture*.

This collection of the sacred writings, containing those of the Old and New Testament, is justly looked upon as the foundation of the Jewish as well as the Christian religion. The Jews, it is true, acknowledged only the scriptures of the Old Testament, the correcting and publishing of which is unanimously ascribed, both by the Jews and Christians, to Ezra. Some of the ancient fathers, on no other foundation than that fabulous and apocryphal book, the second book of Edras, pretend, that the scriptures were entirely lost and destroyed at the Babylonish captivity, and that Ezra restored them all again by divine revelation. What is certain is, that in the reign of Josiah there was no other book of the law extant besides that found in the temple by Hilkiah; from which original, by order of that pious king, copies were immediately written out, and search made for all the other parts of the scriptures, (2 Kings xxii.) by which means copies of the whole became multiplied among the people, who carried them with them into their captivity. After the return of the Jews from the Babylonish captivity, Ezra got together as many copies as he could of the Sacred writings, and out of them all prepared a correct edition, disposing the several books in their proper order, and settling the canon of scripture for his time. These books he divided into three parts. 1. The Law. 2. The Prophets. 3. The Cetubim, or Hagiographia, i. e. *The holy writings*.

I. The Law contains. 1. Genesis. 2. Exodus. 3. Leviticus. 4. Numbers. 5. Deuteronomy.

II. The writings of the prophets are. 1. Joshua. 2. Judges, with Ruth. 3. Samuel. 4. Kings. 5. Isaiah. 6. Jeremiah, with his Lamentations. 7. Ezekiel. 8. Daniel. 9. The twelve minor Prophets.

10. Job. 11. Ezra. 12. Nehemiah. 13. Esther.

III. And the Hagiographia consists of, 1. The Psalms. 2. The Proverbs. 3. Ecclesiastes. 4. The Song of Solomon. This division was made for the sake of reducing the number of the sacred books to the number of the letters in their alphabet, which amount to 22. At present, the Jews reckon 24 books in their canon of scripture, in disposing of which the law stands as it did in the former division, and the prophets are distributed into the former and latter prophets.

The former prophets are,
Joshua, Judges, Samuel, Kings.

The latter prophets are,
Isaiah, Jeremiah, Ezekiel, and the 12 minor prophets.

And the hagiographia consists of,
The Psalms, the Proverbs, Job, the Song of Solomon, Ruth, the Lamentations, Ecclesiastes, Esther, Daniel, Ezra, the Chronicles.

Under the name of Ezra, they comprehend Nehemiah. It is true this order hath not always been observed; but the variations from it are of little or no moment.

The five books of the law are divided into 54 sections. This division many of the Jews hold to have been appointed by Moses himself; but others, with more probability, ascribe it to Ezra. The design of this division was, that one of these sections might be read in their synagogues every sabbath-day. The number was 54, because in their intercalated years, a month being then added, there were 54 sabbaths. In other years, they reduced them to 52, by twice joining together two short sections. Till the persecution of Antiochus Epiphanes, they read only the law; but the reading of it being then prohibited, they substituted in the room of it 54 sections out of the Prophets; and when the reading of the law was restored by the Maccabees, the section which was read every sabbath out of the law served for their first lesson, and the section out of the prophets for their second. These sections were divided into verses, of which division, if Ezra was not the author, it was introduced not long after him, and seems to have been designed for the use of the Targumists, or Chaldee interpreters; for after the return of the Jews from the Babylonish captivity, when the Hebrew language ceased to be their mother tongue, and the Chaldee grew into use instead of it, the custom was, that the law should be first read in the original Hebrew, and then interpreted to the people in the Chaldee language, for which purpose these shorter sections or periods were very convenient.

The division of the scriptures into chapters, as we at present have them, is of much later date. Some attribute it to Stephen Langton, archbishop of Canterbury, in the reigns of John and Henry III. But the true author of the invention was Hugo de Sancto Caro, commonly called *Hugo Cardinalis*, because he was the first Dominican that ever was raised to the degree of cardinal. This Hugo flourished about the year 1240. He wrote a comment on the scriptures, and projected the first concordance, which is that of the vulgar Latin bible. The aim of this work being for the more easy finding out any word or passage in the scriptures, he found it necessary to divide the book into sections, and the sections into subdivisions; for till that time the vulgar Latin Bibles were without any division at all.

VOL. II.

These sections are the chapters into which the Bible hath ever since been divided. But the subdivision of the chapters was not then into verses, as it is now. Hugo's method of subdividing them was by the letters A, B, C, D, E, F, G, placed in the margin at an equal distance from each other, according to the length of the chapters. The subdivision of the chapters into verses, as they now stand in our Bibles, had its original from a famous Jewish rabbi, named Mordecai Nathan, about the year 1445. This rabbi, in imitation of Hugo Cardinalis, drew up a concordance to the Hebrew Bible, for the use of the Jews. But though he followed Hugo in his division of the books into chapters, he refined upon his invention as to the subdivision, and contrived that by verses: this being found to be a much more convenient method, it has been ever since followed. And thus, as the Jews borrowed the division of the books of the holy scriptures into chapters from the Christians, in like manner the Christians borrowed that of the chapters into verses from the Jews.

The order and division of the books of the Bible, as well of the Old as the New Testament, according to the disposition made by the council of Trent, by decree I. session iv. are as follow; where we are to observe, that those books to which the asterisks are prefixed, are rejected by the Protestants, as apocryphal. * See Apocrypha.

St Jude,

The Revelations of St John.

The apocryphal books of the Old Testament, according to the Romaniſts, are, the book of Enoch (ſee Jude 14.), the third and fourth books of Eſdras, the third and fourth books of Maccabees, the prayer of Manaſſeh, the Teſtament of the twelve Patriarchs, the Pfalter of Solomon, and ſome other pieces of this nature.

The apocryphal books of the new Teſtament are the epiſtle of St Barnabas, the pretended epiſtle of St Paul to the Laodiceans, ſeveral ſpurious goſpels, Acts of the Apoſtles, and Revelations; the book of Hermas, intitled the Shepherd, Jeſus Chriſt's Letter to Abgarus, the epiſtles of St Paul to Seneca, and ſeveral other pieces of the like nature, as may be ſeen in the collection of the apocryphal writings of the New Teſtament made by Fabricius.

The books which are now loſt, and cited in the Old Teſtament, are theſe, the book of the *Righteous*, or of Jaſher, as our verſion of the Bible has it, (Joh. x. 13. and 2 Sam. i. 18.); the book of the wars of the Lord, (Numb. xxi. 14.); the annals of the kings of Iſrael, ſo often cited in the books of the Kings and Chronicles. The authors of theſe annals were the prophets, who lived in the kingdoms of Judah and Iſrael. We have likewiſe but a part of Solomon's 3000 proverbs, and his 1005 ſongs, (1 Kings iv. 32.); and we have entirely loſt what he wrote upon plants, animals, birds, fiſhes, and reptiles.

Ezra, in the opinion of moſt learned men, publiſhed the ſcriptures in the Chaldee character: for that lan-

guage being grown wholly into uſe among the Jews, he thought proper to change the old Hebrew character for it, which hath ſince that time been retained only by the Samaritans, among whom it is preferred to this day.

Prideaux is of opinion that Ezra made additions in ſeveral parts of the Bible, where any thing appeared neceſſary for illuſtrating, connecting, or completing the work; in which he appears to have been aſſiſted by the ſame ſpirit in which they were firſt written. Among ſuch additions are to be reckoned the laſt chapter of Deuteronomy, wherein Moſes ſeems to give an account of his own death and burial, and the ſucceſſion of Joſhua after him. To the ſame cauſe our learned author thinks are to be attributed many other interpolations in the Bible, which created difficulties and objections to the authenticity of the ſacred text, no ways to be ſolved without allowing them. Ezra changed the names of ſeveral places which were grown obſolete, and inſtead of them put their new names, by which they were then called, in the text. Thus it is that Abraham is ſaid to have purſued the kings who carried Lot away captive, as far as Dan; whereas that place in Moſes's time was called *Laiſh*; the name *Dan*, being unknown till the Danites, long after the death of Moſes, poſſeſſed themſelves of it.

The Jewiſh canon of Scripture was then ſettled by Ezra, yet not ſo but that ſeveral variations have been made in it. Malachi, for inſtance, could not be put in the Bible by him, ſince that prophet is allowed to have lived after Ezra; nor could Nehemiah be there, ſince mention is made, in that book, of Jaddus, as high-prieſt, and of Darius Codomannus, as king of Perſia, who were at leaſt 100 years later than Ezra. It may be added, that in the firſt book of Chronicles, the genealogy of the ſons of Zerubbabel is carried down for ſo many generations as muſt neceſſarily bring it to the time of Alexander, and conſequently this book could not be in the canon in Ezra's days. It is probable, the two books of Chronicles, Ezra, Nehemiah, Eſther, and Malachi, were adopted into the Bible in the time of Simon the Juſt, the laſt of the men of the great ſynagogue.

As the Jews were very backward in having any intercourſe with ſtrangers, it was a long time before their ſacred books came to be known and read in other nations. Joſephus aſcribes the little that is ſaid of the Jews by Pagan writers to this, that the latter had no opportunity of being acquainted with their hiſtorians, for want of a tranſlation of their books into the Greek language. Ariſteas indeed pretends, that there was an imperfect verſion of the Scriptures before the time of Demetrius Phalereus; and that Theopompus intending to infer a part of them in his verſes, was deprived of his understanding; but of this there is no proof.

The Jews, upon their return from the Babyloniſh captivity, having brought with them their Chaldaic or Aſſyrian language, which from that time became their mother-tongue, gave birth to the Chaldee tranſlations, or rather paraphraſes of the Bible, called *Targum* *. * See T. Greek Bible. It is a matter of diſpute among au- gum. thors whether there was a Greek verſion of the Old Teſtament more ancient than the Septuagint †. † See S. agint.

Before our Saviour's time, there was no other Greek verſion of the Old Teſtament, beſides that which went under the name of the *Septuagint*: but after the eſta- bliſhment

blishment of Christianity, some authors undertook new translations, under pretence of making them more conformable to the Hebrew text. The first who performed this design was the Jewish profelyte Aquila, of the city of Synope in Pontus, disciple to Rabbi Akiba, who put it in execution the twelfth year of the emperor Adrian, A. D. 128. St Epiphanius pretends, that being excommunicated after his conversion, for adding himself to judicial astrology, he set about this version out of hatred to the Christians, and with a wicked design of corrupting the passages of the prophets relating to Jesus Christ. St Jerom says, his version is made word for word, and with too scrupulous a nicety.

The second Greek version after the Septuagint is that of Symmachus, a Samaritan by birth, who first turned Jew, then Christian, and at last Ebionite. He composed it, according to Epiphanius, in the reign of the emperor Severus. His version was more free than the rest; for he applied himself chiefly to the sense, without translating word for word; wherefore his version comes nearer the Septuagint than that of Aquila. The third Greek version is that of Theodotus of Ephesus. It is said he was a disciple of Marcion, and that, having had some difference with those of his sect, he turned Jew. The version of this author was the best of the three, because he kept a just medium between Aquila and Symmachus, not confining himself so servilely to the letter as the first did, nor wandering so far from it as the second did.

There were, besides these, three other Greek versions, whose authors are unknown.

Syriac BIBLE. The Syrians have in their language a version of the Old Testament, which they pretend to be of great antiquity. A great part of it, they say, was made in Solomon's time, and the rest in the time of Abgarus king of Edeffa. They relate, that Hiram king of Tyre desired Solomon to communicate the use of letters and writing to the Syrians, and to get translated for them the sacred books of the Hebrews; which Solomon complied with, and sent them the Pentateuch, Joshua, Judges, Ruth, Samuel, Psalms, Proverbs, Ecclesiastes, Solomon's Song, and Job, which were the only books then extant; the remaining books of Scripture, they add, were translated into Syriac after the death of Christ, by the care of Abgarus king of Edeffa. But this account is looked upon as fabulous. It is true, the Syriac version which we have now must be very ancient, since it is often cited by the fathers. Dr Prideaux is of opinion, it was made within the first century; that the author of it was some Christian of the Jewish nation; and that it is the best translation of the Old Testament. This version is not always agreeable to the original; but in some places is more conformable to the Samaritan Pentateuch, and in some to the version of the Septuagint. In the Psalms, the translator has taken the liberty to leave out the ancient titles and inscriptions of each Psalm, instead of which he gives an abstract of the contents of each Psalm.

Latin BIBLE. It is past dispute, that the Latin churches had, even in the first ages, a translation of the Bible in their language, which being the vulgar language, and consequently understood by every one, occasioned a vast number of Latin versions. Among all these, there was one which was generally received, and called by St Jerom the *vulgar*, or *common translation*.

St Auſtin gives this version the name of the *Itala*, and prefers it to all the rest: but we reserve a distinct article for this version. See *VULGATE*.

St Jerom undertook to revise and correct the Latin version of the Bible; but, having afterwards attained to a more perfect knowledge of the Hebrew language, he set about a new translation of some books of the Old Testament from the Hebrew; and continuing, at the solicitation of his friends, to translate the rest, he at last perfected an entire new version of all the books contained in the Hebrew canon. In his translation he followed as nearly as he could the version of the Septuagint, and retained the very expressions of the ancient vulgar Latin; as far as was consistent with purity of style and true Latinity. This translation was so highly applauded by the Christian church, that some authors have pretended it was brought to perfection by the inspiration of the Holy Ghost. But St Augustine looked upon the author to be so well skilled in the Hebrew language, as to be able to undertake and bring to perfection such a work by the strength of his own abilities. St Jerom's version was soon received in many churches; and in the sixth century it became as general, and in as great esteem, as the ancient Vulgate.

It was not till the 16th century that any new Latin translations were made of the Bible from the Hebrew text. Sanctes Pagninus, a Dominican monk, was the first who undertook a new version of the books of Scripture from the modern Hebrew text. His design was encouraged by pope Leo X.; and his version made its first appearance at Lyons in the year 1527. It adheres too scrupulously to the words of the text, which makes it obscure, and favour of barbarity in many places. He is likewise often misted as to the sense, having affected too much to follow the explications of the Jewish Rabbins. It is however a very useful work, and very proper to explain the literal sense of the Hebrew text. Arias Montanus, when he compiled the edition of the *Biblia Polyglotta*, revised this translation of Pagninus.

Cardinal Cajetan, though not versed in the Hebrew, undertook a translation of some parts of the Bible by the assistance of two persons well skilled in that language, the one a Jew, the other a Christian. After him Isidore Clarius, a monk of Mount Cassin, set himself to reform the vulgar version of the Bible after the Hebrew text; in the doing of which, he pretends to have corrected above 8000 passages of the Bible. Besides these translations, made by Catholic authors, there are some likewise performed by Protestant translators; the first of whom was Sebastian Munster. His version is more intelligible, and in much better Latin, than that of Pagninus. Huetius bestows on him the character of a translator well versed in the Hebrew, and whose style is very exact and conformable to the original. The translation of Leo Juda, a Zuinglian, printed at Zurich in 1543, and afterwards by Robert Stephens in 1545, is written in a more elegant style than that of Munster; but he often departs from the literal meaning of the Hebrew text for the sake of an elegant Latin expression. However, in this he has not taken so great a liberty as Sebastian Castalio, who undertook to give the world an elegant Latin version of the Bible: but there are critics who censure him for departing from the noble simplicity and natural grandeur of the original, and deviating into an affected effeminate style.

Bible.

overcharged with false rhetoric, and not always true Latinity. The version of Junius and Tremellius, has much more of the true natural simplicity: the chief Hebraisms are preserved in it, and the whole is strictly conformable to the Hebrew text. We must not forget the version of Theodore Beza, a Protestant divine of Geneva, in the 16th century. Sebastian Castalio found fault with this version, and Beza wrote an apology for it about the year 1564.

Arabic BIBLE. The Arabic versions of the Bible are of two sorts; the one done by Christians, the other by Jews. There is one of the Old Testament, whose author is supposed to be Saadias Gaon, a Jew of Babylon, who wrote the same about the year of Christ 900. Of this whole work the Pentateuch alone is printed. The Jews have another Arabic version in Hebrew characters, which Erpenius published in Arabic characters at Leyden in the year 1622. Among the Arabic translations done by Christians, there is one printed in the polyglots of Paris and London; but both the author, and the time when it was written, are unknown. It must have been made since the publication of the Koran, because the author in many places has evidently followed it. In this version the Pentateuch is translated from the Hebrew text; Job, from the Syriac; and the rest from the Septuagint, and two other versions of the Pentateuch, the manuscripts of which are in the Bodleian library. There are also some Arabic translations of the Psalms; one printed at Genoa in 1516, the other at Rome in 1619; and there is a manuscript version of the prophets in this language preserved in the Bodleian library.

The gospel being preached in all nations, there is no doubt but that the Bible, which is the foundation of the Christian religion, was translated into the respective languages of each nation. St Chryostom and Theodoret both testify, that the books of the Old and New Testament had been translated into the Syrian, Egyptian, Indian, Persian, Armenian, Æthiopic, Scythian, and Samaritan languages. Socrates and Sozomen tell us, that Ulphilas bishop of the Goths, who lived about the middle of the fourth century, had translated the holy Scriptures into the Gothic language; and pope John VIII. gave his approbation to the version of the holy Scriptures made into the Slavonian.

Æthiopic BIBLE. The Æthiopic version of the Old Testament is made immediately from the Greek text of the Septuagint; and there is a very plain agreement between this translation and the Alexandrian manuscript: the order of the chapters, the inscriptions of the Psalms, and every thing else being exactly alike. The Æthiopians attribute this version to Frumentius, the apostle of Æthiopia, sent thither by Athanasius bishop of Alexandria.

Coptic or Egyptian BIBLE. The Coptic or Egyptian translation is likewise made from the Greek of the Septuagint, in which the Egyptian translator so punctually followed the Greek text, that he refused to make use of the labours of Origen and others, who had been at the pains to compare the Greek version with the Hebrew text. We are quite in the dark as to the author and the time of this version, but probably it is very ancient, since we cannot suppose the Egyptian church was long without a translation of the Scriptures in their mother tongue.

Bible.

Persian and Turkish BIBLE. There are several versions of the Bible in the Persian language, most of which are in manuscript. There is a translation of the Psalms by one father John, a Carmelite; and another of the same book done from the Latin by the Jesuits. Walton, in the London Polyglot, has published the Gospels, translated by one Simon son of Joseph, a Christian of Persia, who lived in the year 1341. We have likewise some manuscript translations of the Bible in the Turkish language, particularly a version of the New Testament printed at London in the year 1666.

Armenian and Georgian BIBLE. The Armenians have an old translation of the Scriptures in their language, taken from the Greek of the Septuagint. Three learned Armenians were employed about it, in the time of the emperor Arcadius, viz. Moses surnamed the *Grammarians*, David the Philosopher, and Mampræus. The Armenians, in 1666, procured an edition of the Bible in their language to be made at Amsterdam, under the direction of an Armenian bishop. Another was printed at Antwerp in 1670, by the procurement of Theodoros Patræus, and the New Testament separately in 1668.

The Georgians have likewise a translation of the Bible in the old Georgian language: but as this language is known only to a very few persons, and the people of the country are extremely ignorant, there is scarce any one who either reads or understands this version.

Whilst the Roman empire subsisted in Europe, the reading of the Scriptures in the Latin tongue, which was the universal language of that empire, prevailed every where. But since the face of affairs in Europe has been changed, and so many different monarchies erected upon the ruins of the Roman empire, the Latin tongue has by degrees grown into disuse: whence has arisen a necessity of translating the Bible into the respective languages of each people; and this has produced as many different versions of the Scriptures in the modern languages, as there are different nations professing the Christian religion. Hence we meet with French, Italian, Spanish, German, Flemish, Danish, Slavonian, Polish, Bohemian, and Russian or Muscovite Bibles; besides the Anglo-Saxon, and modern English and Irish Bibles.

French BIBLE. The oldest French Bible we hear of is the version of Peter de Vaux, chief of the Waldenses, who lived about the year 1160. Raoul de Presle translated the Bible into French in the reign of Charles V. king of France, about the year 1380. Besides these, there are several old French translations of particular parts of the Scripture. The doctors of Louvain published the Bible in French at Louvain, by order of the emperor Charles V. in 1550. There is a version by Isaac le Maitre de Sacy, published in 1672, with explanations of the literal and spiritual meaning of the text, which was received with wonderful applause, and has been often reprinted. As to the New Testaments in French, which have been printed separately, one of the most remarkable is that of F. Amclotte of the oratory, composed by the direction of some French prelates, and printed with annotations in the year 1666, 1667, and 1670. The author pretends he had been at the pains to search all the libraries in Europe, and collate the oldest manuscripts. But, in examining his work, it appears that he has produced no considerable various readings,

ings, which had not before been taken notice of either in the London Polyglott or elsewhere. The New Testament of Mons printed in 1665, with the archbishop of Cambray's permission, and the king of Spain's licence, made a great noise in the world. It was condemned by pope Clement IX. in 1668, and by pope Innocent XI. in 1679, and in several bishoprics of France at several times. The New Testament published at Trevoux in 1702, by M. Simon, with literal and critical annotations upon difficult passages, was condemned by the bishops of Paris and Meaux in 1702. F. Boursiers, a Jesuit, with the assistance of F. F. Michael Teller, and Peter Bernier, Jesuits likewise, published a translation of the New Testament in 1697: but this translation is, for the most part, harsh and obscure, which was owing to the author's keeping too strictly to the Latin text from which he translated.

There are likewise French translations published by Protestant authors; one by Robert Peter Olivetan, printed at Geneva in 1535, and since often reprinted with the corrections of John Calvin and others; another by Sebastian Castilio, remarkable for particular ways of expression never used by good judges of the language. John Diodati likewise published a French Bible at Geneva in 1644; but some find fault with his method, in that he rather paraphrases the text than translates it. Faber Stapalenis translated the New Testament into French, which was revised and accommodated to the use of the reformed churches in Piedmont, and printed in 1534. Lastly, M. John Le Clerc published a New Testament in French at Amsterdam in 1703, with annotations taken chiefly from Grotius and Hammond; but the use of this version was prohibited in Holland by order of the States-General, as tending to revive the errors of Sabellius and Socinus.

Italian Bible. The first Italian Bible published by the Romanists, is that of Nicholas Malerme, a Benedictine monk, printed at Venice in 1471. It was translated from the Vulgate. The version of Anthony Brucioli, published at Venice in 1532, was prohibited by the council of Trent. The Calvinists likewise have their Italian Bibles. There is one of John Diodati in 1607 and 1641, and another of Maximus Theophilus in 1551, dedicated to Francis de Medicis duke of Tuscany. The Jews of Italy have no entire version of the Bible in Italian; the inquisition constantly refusing to allow them the liberty of printing one.

Spanish Bible. The first Spanish Bible that we hear of, is that mentioned by Cyprian de Valera, which he says was published about the year 1500. The Epistles and Gospels were published in that language by Ambrose de Montefin in 1512; the whole Bible by Cassiodore de Reyna, a Calvinist, in 1569; and the New Testament, dedicated to the emperor Charles V. by Francis Enzinas, otherwise called *Driander*, in 1543. The first Bible which was printed in Spanish for the use of the Jews, was that printed at Ferrara in 1553, in Gothic characters, and dedicated to Hercules d'Est duke of Ferrara. This version is very ancient, and was probably in use among the Jews of Spain before Ferdinand and Isabella expelled them out of their dominions in 1492.

German Bible. The first and most ancient translation of the Bible in the German language, is that of Ulphilas bishop of the Goths, about the year 360. This

bishop left out the book of Kings, which treat chiefly of war, lest it should too much encourage the martial humour of the Goths. An imperfect manuscript of this version was found in the abbey of Verden near Cologne, written in letters of silver, for which reason it is called *Codex Argentens*; and it was published by Francis Junius in 1665. The oldest German printed Bible extant, is that of Nuremberg, printed in 1447; but who the author of it was, is uncertain. John Emzer, chaplain to George duke of Saxony, published a version of the New Testament in opposition to Luther. There is a German Bible of John Eckius in 1537, with Emzer's New Testament added to it; and one by Ulembergius of Westphalia, procured by Ferdinand duke of Bavaria, and printed in 1630. Martin Luther having employed eleven years in translating the Old and New Testament, published the Pentateuch in 1522, the historical books and the Psalms in 1524, the books of Solomon in 1527, Isaiah in 1529, the Prophets in 1531, and the other books in 1530: he published the New Testament in 1522. The learned agree, that his language is pure, and the version clear, and free from intricacies: it was revised by several persons of quality, who were masters of all the delicacies of the German language. The German Bibles which have been printed in Saxony, Switzerland, and elsewhere, are for the most part the same as that of Luther, with very little variation. In 1604, John Piscator published a version of the Bible in German, taken from that of Junius and Tremellius: but his turn of expression is purely Latin, and not at all agreeable to the genius of the German language: the Anabaptists have a German Bible printed at Worms in 1529. John Crellius published his version of the New Testament at Racovia in 1630; and Felbinger his, at Amsterdam, in 1660.

Flemish Bible. The Flemish Bibles of the Romanists are very numerous, and for the most part have no author's name prefixed to them, till that of Nicolas Vinck, printed at Lovain in 1548. The Flemish versions made use of by the Calvinists till the year 1637, were copied principally from that of Luther. But the synod of Dort having in 1618 appointed a new translation of the Bible into Flemish, deputies were named for the work, which was not finished till the year 1637.

Danish Bible. The first Danish Bible was published by Peter Palladius, Olaus Chrysofom, John Synningius, and John Maccabæus, in 1550, in which they followed Luther's first German version. There are two other versions, the one by John Paul Refenius bishop of Zealand, in 1605; the other, being the New Testament only, by John Michel, in 1524.

Swedish Bible. In 1534 Olaus and Laurence published a Swedish Bible from the German version of Martin Luther. It was revised in 1617, by order of king Gustavus Adolphus, and was afterwards almost universally received.

Bohemian, Polish, Russian or Muscovite, and Slavonian Bibles. The Bohemians have a Bible translated by eight of their doctors, whom they had sent to the schools of Wirtemberg and Basil, on purpose to study the original languages. It was printed in Moravia in the year 1539. The first Polish version of the Bible, it is said, was that composed by Hadewich wife of Jagellon, duke of Lithuania, who embraced Christianity in the year 1390. In 1599, there was a Polish translation

of the Bible published at Cracow, which was the work of several divines of that nation, and in which James Wicak, a Jesuit, had a principal share. The Protestants, in 1596, published a Polish Bible from Luther's German version, and dedicated it to Uladissaus IV. king of Poland. The Russians or Muscovites published the Bible in their language in 1581. It was translated from the Greek by St Cyril, the apostle of the Slavonians; but this old version being too obscure, Ernest Glik, who had been carried prisoner to Moscow after the taking of Narva, undertook a new translation of the Bible in the Slavonian; who dying in 1705, the Czar Peter appointed some particular divines to finish the translation: but whether it was ever printed, we cannot say.

English-Saxon, and modern English BIBLES. If we inquire into the versions of the Bible of our own country, we shall find that Adelm bishop of Sherburn, who lived in 709, made an English-Saxon version of the Psalms; and that Eadfrid, or Ecbert, bishop of Lindisferne, who lived about the year 730, translated several of the books of Scripture into the same language. It is said likewise, that venerable Bede, who died in 785, translated the whole Bible into Saxon. But Cuthbert, Bede's disciple, in the enumeration of his master's works, speaks only of his translation of the Gospel; and says nothing of the rest of the Bible. Some pretend, that king Alfred, who lived in 890, translated a great part of the Scriptures. We find an old version in the Anglo-Saxon of several books of the Bible, made by Elfric abbot of Malmesbury: it was published at Oxford, in 1699. There is an old Anglo-Saxon version of the four Gospels, published by Matthew Parker, archbishop of Canterbury, in 1571, the author whereof is unknown. Dr Mill observes, that this version was made from a Latin copy of the old Vulgate.

As to the English versions of the Bible, the most ancient is that of John de Trevisa, a secular priest, who translated the Old and New Testament into English, at the request of Thomas lord Berkley: he lived in the reign of Richard II. and finished his translation in the year 1357. The second author, who undertook this work, was the famous Wickliff, who lived in the reigns of Edward III. and Richard II. The manuscript of his version is in several libraries in England. In the year 1534, an English version of the Bible, done partly by William Tindal, and partly by Miles Coverdale, was brought into England from Antwerp. The bishops found great fault with this translation; upon which a motion was made in convocation for an English translation of the Bible to be set up in all churches. This motion, though opposed by bishop Gardiner and his party, succeeded at last. The king gave orders for setting about it with all possible haste, and within three years the impression of it was finished. Cromwell procured a general warrant from the king, allowing all his subjects to read it; for which Cranmer wrote his thanks to Cromwell, "rejoicing to see the work of reformation now risen in England, since the word of God did now shine over it all without a cloud." Cromwell likewise gave out injunctions, requiring the clergy to set up Bibles in all their churches, and to encourage the people to read them. In 1542, an act passed for restraining the use of the Bible. The preamble sets forth, that "many seditious and ignorant people had abused the liberty granted them for reading the Bible; and

that great diversity of opinions, animosities, tumults, and schisms had been occasioned by perverting the sense of the Scripture. To retrieve the mischiefs arising from hence, it is enacted, that a certain form of orthodox doctrine be set forth, as a standard of belief; and that Tindal's *false translation* of the Old and New Testament be suppressed, and forbidden to be read in any of the king's dominions." In the reign of Edward VI. Fuller mentions another translation of the Bible, printed in two editions; the first in 1549, the other in 1551, but neither of them divided into verses.

In the reign of queen Elizabeth came out the bishops Bible, so called, because several of that order were concerned in that version. The work was divided into several parcels, and assigned to men of learning and character. Most of the divisions are marked with great initial letters, signifying either the name or the titles of the persons employed. Archbishop Parker had the principal direction of this affair; he revised the performance, and perhaps put the finishing hand to it. He likewise employed several critics in the Hebrew and Greek languages, to review the old translation, and compare it with the original.

The last English Bible is that called *King James's Bible*, which proceeded from the Hampton-court conference in 1603, where many exceptions being made to the bishops Bible, king James gave orders for a new one, not, as the preface expresses it, for a translation altogether new, nor yet to make of a bad one a good one, but to make a good one better; or of many good ones, one best. Fifty-four learned persons were appointed for this office by the king, as appears by his letter to the archbishop, dated in 1604, which being three years before the translation was entered upon, it is probable seven of them were either dead, or had declined the task, since Fuller's list of the translators makes but 47, who, being ranged under six divisions, entered on their province in 1607. It was published in 1610, with a dedication to king James, and a learned preface, and is commonly called *king James's Bible*. After this all other versions dropped, and fell into disuse, except the Epistles and Gospels in the Common-prayer book, which were still continued, according to the bishops translation, till the alteration of the Liturgy in 1661, and the Psalms and hymns, which are to this day continued as in the old version.

The judicious Selden, in his Table Talk, speaking of the Bible, says, "The English translation of the Bible is the best translation in the world, and renders the sense of the original best, taking in for the English translation the bishop's Bible, as well as king James's. The translators in king James's time took an excellent way. That part of the Bible was given to him who was most excellent in such a tongue, (as the Apocrypha to Andrew Downs), and then they met together, and one read the translation, the rest holding in their hands some Bible either of the learned tongues, or French, Spanish, Italian, &c. If they found any fault, they spoke; if not, he read on."

King James's Bible is that now read by authority in all the churches in England.

Irish-BIBLE. Towards the middle of the 16th century, Bedell, bishop of Kilmore, set on foot a translation of the Old Testament into the Irish language; the New Testament and the Liturgy having been before

fore translated into that language. The bishop appointed one King to execute this work, who, not understanding the oriental languages, was obliged to translate it from the English. This work was received by Bedell, who, after having compared the Irish translation with the English, compared the latter with the Hebrew, the LXX. and the Italian version of Diodati. When this work was finished, the bishop would have been himself at the charge of the impression, but his design was stopped upon advice given to the lord-lieutenant and the archbishop of Canterbury, that it would prove a shameful thing for a nation to publish a Bible translated by such a despicable hand as King. However, the manuscript was not lost, for it went to press in the year 1685.

Some years ago, Dr Kennicott made a proposal for procuring a more correct copy of the Hebrew bible, by collecting and comparing together all the ancient manuscripts of it to be found in the British dominions. This was eagerly embraced by the learned, not only in Britain, but throughout all Christendom; and persons of the most eminent stations encouraged the work by liberal subscriptions. The work was begun in 1760, and in 1776 one volume was published in folio. To this work is prefixed such a list of subscribers as, we believe, never appeared in favour of any literary performance whatever. In this list are included no fewer than seven crowned heads, besides princes, cardinals, archbishops, bishops, universities, public libraries, and many of the most eminent literati in different parts of Europe. What is very extraordinary, Dr Kennicott's work seemed equally to draw the attention of Protestants and Papists, and was recommended and encouraged both by the church of Rome and of Geneva. The labour attending it must appear astonishing, when we consider that the Doctor collected, from all parts of the world, almost 700 MSS. and that these were compared together, and with the common Hebrew bible, not only word by word, but letter by letter. Certainly no undertaking ever deserved greater praise, nor promised to be of more important utility. In particular, the numerous various readings which he hath supplied cannot fail to demonstrate the expediency of a new translation of the Old Testament, or at least of an amendment of the present translation, at the same time that they will furnish the proper means of accomplishing it.

BIBLIANDER (Theodore), professor of divinity at Zurich in the 16th century. As he understood the Oriental languages, he set about a new edition of the Koran, the text of which he corrected, by collating the Arabic and Latin copies. To this edition he subjoined the life of Mahomet and his successors; and prefixed an apology by way of preface, which has been loudly exclaimed against.

BIBLIOTHECA, in its original and proper sense, denotes a library, or place for depositing books.

BIBLIOTHECA, in matters of literature, denotes a treatise giving an account of all the writers on a certain subject: thus, we have bibliothecas of theology, law, philosophy, &c.

There are likewise universal bibliothecas, which treat indifferently of all kinds of books; also select bibliothecas, which give account of none but authors of reputation.

Many of the bibliothecas agree, in most respects,

with what are otherwise called memoirs or journals of literature, except that these last are confined to new books; but there are other bibliothecas, that differ in nothing from catalogues of the writers on certain subjects.

BIBLISTS, to the Roman-catholics call those Christians who make scripture the sole rule of faith; in which sense, all Protestants either are, or ought to be, biblists.

BIBLUS, *Biblos*, in botany, an aquatic plant in Egypt, called also *papyrus*; of the skin whereof the ancient Egyptians made their paper. See **PAPYRUS**.

BIBRACTE, (anc. geog.), a citadel of the *Ædoui*, according to Strabo; but Cæsar describes it as a town well fortified, very large and populous, and of the greatest authority among that nation. Now *Beurell*, or *Bevray*; a desolate place four miles to the north-west of Autun.

BIBROCI, (anc. geog.), an ancient people of Britain, now the *Hundred of Bray* in Berks.

BICANER, a city of Afa, on the river Ganges, belonging to the great Mogul. E. Long. 87. 20. N. Lat. 28. 40.

BICE, or **BISE**, among painters, a blue colour prepared from the lapis armenus*.

Bice bears the best body of all bright blues used in common work, as house-painting, &c. but it is the palest in colour. It works indifferently well, but inclines a little to sandy, and therefore requires good grinding. Next to ultramarine, which is too dear to be used in common work, it lies best near the eye of all other blues.

BICEPS, the name of several muscles: as the biceps humeri, or cubiti; biceps tibiæ; &c. †.

BICESTER, a straggling town of Oxfordshire in England, seated on the road between Oxford and Buckingham.

BICHET, a quantity or measure of corn, which differs according to the places where it is used. The bichet is not a wooden measure, as the minot at Paris, or the bushel at London; but is compounded of several certain measures. It is used in many parts of France, &c.

BICLINIUM, in Roman antiquity, a chamber with two beds in it; or when two beds only were round a table.

BICORNES, an order of plants in the *fragmenta methodi naturalis* of Linnæus, so termed from the antlers having in appearance two horns. See **BOTANY**.

BIDACHE, a town of Lower Navarre in France, seated on the river Bidoufe. W. Long. 10. 0. N. Lat. 41. 31.

BIDAL, or **BIDALE**, in our ancient customs, denotes the invitation of friends to drink ale at some poor man's house, who, in consideration hereof, expects some contribution for his relief. This custom still obtains in the west of England, and is mentioned in some of our ancient statutes.

BIDDLE (John), one of the most eminent English writers among the Socinians, was born at Wotton-under-Edge in Gloucestershire, and educated in the free school of that place. Being a hopeful youth, he was taken notice of; particularly by lord George Berkeley, who allowed him an exhibition of ten pounds a-year. This caused him vigorously to apply himself to his studies; and he was, while at school, author of a translation of Virgil's *Bucolics*, and

Biblioth
Biddle.

* See *Armenus lapis*.

† See *Anatomy*, Table of the Muscles.

Blithe
Bidding.

and of the two first satires of Juvenal. He continued at school till he was 13 years of age. However, having manifested in that early period a singular piety and contempt of secular affairs, he was sent to the university of Oxford, and entered a student in Magdalen hall. In 1641, the magistrates of Gloucester chose him master of the free school of that city; and he was much esteemed: but falling into some opinions concerning the Trinity, different from those commonly received, and expressing his thoughts with too much freedom, he suffered various persecutions and imprisonments in the time of the commonwealth. During one of these confinements, which lasted for several years, being reduced to great indigence, he was employed by Roger Daniel of London to correct the impression of the Greek Septuagint Bible, which that printer was about to publish with great accuracy. In 1651, the parliament published a general act of oblivion, which restored him to his full liberty. He was afterwards imprisoned on account of his tenets; and at last the protector banished him for life to St Mary's castle in the isle of Scilly, and sent him thither in October 1655. Soon after, he was allowed 100 crowns a-year for subsistence. In 1658, he was set at full liberty. After the restoration of king Charles II. he was fined in 100 l. and each of his hearers in 20 l. to lie in prison till paid; which being put in execution, the want of the fresh air and exercise made him contract a disease, of which he died on 22^d of September 1662, in the 47th year of his age. His life was published in Latin, in 1682, by Mr Farrington of the Inner Temple, who represents him as possessed of extraordinary piety, charity, and humility: he would not discourse of those points in which he differed from others, with those that did not appear religious according to their knowledge; and was a strict observer himself, and a severe exactor in others, of reverence in speaking of God and Christ. He had for happy a memory, that he retained word for word the whole New Testament, not only in English, but in Greek, as far as the fourth chapter of the Revelations of St John.

BIDDIFORD, a town of Devonshire, seated on the river Torridge, over which there is a fine stone-bridge with 24 arches. It is a large and populous place, and carries on a considerable trade. W. Long. 4. 10. N. Lat. 51. 10.

BIDDING, or **OFFERING**, denotes the raising the price of a thing at a sale or auction*. The French call this *encherir*. It answers to what the Romans called *licitari*: they used to bid by holding up the hand or finger.

BIDDING is also used for proclaiming or notifying. In which sense we meet with *bidding of the bans*, the same with what is otherwise called *asking**.

* See Bans.

BIDDING-Prayer. It was one part of the office of the deacons in the primitive Christian church, to be a sort of monitors and directors of the people in the exercise of their public devotions in the church. To which end they made use of certain known forms of words, to give notice when each part of the service began. This was called by the Greeks *κηρυξίς*, and by the Latins *prædicare*: which therefore do not ordinarily signify to preach, as some mistake it; but to perform the office of a crier (*κηρυξ*, or *præco*) in the assembly: whence Synesius and others call the deacons *κηρυξίς*, the

holy criers of the church, appointed to bid or exhort the congregation to pray and join in the several parts of the service of the church. Agreeable to this ancient practice is the form *Let us pray*, repeated before several of the prayers in the English liturgy.

BIDDING of the Beads, a charge or warning which the parish-priest gave to his parishioners at certain special times, to say so many pater-nosters, &c. on their beads.

BIDENS, **WATER-HEMP** **AGRIMONY**, a genus of the polygama æqualis order, belonging to the sycnests class of plants. Of this genus Linnaeus enumerates 13 species; but none of them appear to merit notice except the tripartita, frequently found by the sides of rivulets, ditches, and lakes, both in Scotland and England. This grows to the height of two feet; and hath its leaves divided into three, or often five, lanceolate serrated lobes, with yellow flowers, which are succeeded by flattish angular seeds, having two beards arising from the angles, which are hooked or barbed downwards; and generally they have another shorter beard arising from the middle of the back of the seed.

"As this plant (says Mr Lightfoot †) is found by a † *Fl. sic.* chemical analysis to possess much the same qualities as the celebrated verbefina acemla, a plant belonging to a genus very nearly related to this, it is probable it would have the same good effects in expelling the stone and gravel. A decoction of this plant with alum dyes yarn of a yellow colour. The yarn must be first steeped in alum water, then dried and steeped in a decoction of the plant, and afterwards boiled in the decoction. The seeds have been known sometimes to destroy the *cyprinus auratus*, or gold fish, by adhering to their gills and jaws."

BIDENTAL, in Roman antiquity, a place blasted with lightning; which was immediately consecrated by an haruspex, with the sacrifice of a bidens. This place was afterwards accounted sacred, and it was unlawful to enter it or to tread upon it; for which reason it was commonly surrounded with a ditch, wall, hedge, ropes, &c. See next article.

BIDENTALES, in Roman antiquity, priests instituted to perform certain ceremonies and expiations when thunder fell on any place. Their principal office was the sacrificing a sheep of two years old, which in Latin is called *bidens*; from whence the place struck with thunder got the name of *bidental*.

BIDIS, (anc. geog.) a small city of Sicily not far from Syracuse, whose ruins are still to be seen in the territory of Syracuse, about fifteen miles to the south-west, with a church called *S. Giovanni di Bidini*.

BIDLOO (Godfrey), author of several treatises in anatomy, was born at Amsterdam, March 12th, 1649. In 1688, he was professor of anatomy at the Hague; and, in 1694, at Leyden; when king William III. of England appointed him his physician; which he would not accept but on condition of holding his professorship, which was readily granted him. He published, in Latin, 1. The Anatomy of the human Body, demonstrated in 105 cuts, explained by the discoveries of the ancient and modern writers. 2. An Oration upon the Antiquity of Anatomy. 3. A Letter to Anthony Leewenhoek on the animals sometimes found in the liver of sheep and other animals. 4. Two Decades of Dissertations in Anatomy and Chirurgery; and other

other pieces. He died at Leyden, in April, 1713.

BIDON, a liquid measure, containing about five pints of Paris, that is, about five quarts English wine-measure. It is seldom used but among English crews.

BIEEZ, a town of Poland, in the palatinate of Cracovia, remarkable for its mines of vitriol. It is seated on the river Wefeloke, in E. Long. 2. 21. N. Lat. 49. 50.

BIEL. See **BIENNA**.

BIELA, a town of Russia, and capital of a province of the same name, seated on the river Opfchaw, in E. Long. 34. 55. N. Lat. 55. 0

BIELA OSERO, or **BELOZERO**, a town of the Russian empire, capital of a duchy, and situated on a lake of the same name, at the mouth of the river Confa, in E. Long. 39. 10. N. Lat. 58. 55.

BIELA, a town of Piedmont in Italy, and capital of the Bellefe near the river Cerva, in E. Long. 8. 3. N. Lat. 45. 22.

BIELSKI, a town of Poland, in the palatinate of Polachia, near one of the sources of the river Narew. E. Long. 22. 55. N. Lat. 53. 50.

BIELSKOI, a town of Russia, in the province of Smolenko. E. Long. 35. 5. N. Lat. 56. 40.

BIENNA, a town of Switzerland, seated on a lake of the same name. The inhabitants are Protestants, and in alliance with those of Bern, Soleure, and Friburg. E. Long. 7. 14. N. Lat. 47. 11.

BIENNIAL PLANTS; plants, asthetically *biennial* imports, that are only of two years duration. Numerous plants are of this tribe, which being raised one year from seed, generally attain perfection either the same, or in about the period of a twelvemonth, or a little less or more, and the following spring or summer shoot up stalks, flower, and perfect seeds; soon after which they commonly perish; or if any particular sort survive another year, they assume a dwindling and straggling growth, and gradually die off; so that biennials are always in their prime the first or second summer. Biennials consist both of esculents and flower-plants. Of the esculent kinds, the cabbage, favy, carrot, parsnep, beet, onion, leek, &c. are biennials. Of the flowery tribe, the Canterbury-bell, French honeysuckle, wall-flower, stock-July-flower, sweet-William, China-pink, common-pink, matted-pink, carnation, scabious, holly-hock, tree-mallow, vervain-mallow, tree-primrose, honesty, or moonwort, &c. are all of the biennial tribe; all of which being sown in March, April, or May, rise the same year, and in spring following shoot up into stalks, flower, and perfect seeds in autumn; after which most of them dwindle: though sometimes the wall-flowers, hollyhocks, carnations, pinks, will survive and flower the following year; but the plants become straggling, the flowers small and badly coloured: it is therefore eligible to raise a supply annually from seed; although wall-flowers, carnations, and pinks, may be continued by slips and layers.

BIER, a wooden machine for carrying the bodies of the dead to be buried. The word comes from the French *biere*, which signifies the same. It is called in Latin *feretrum*, a *ferendo*. Among the Romans the common bier, whereon the poorer sort were carried, was called *sandapila*; that used for the richer sort, *lectica*, *lectica funebris*, sometimes *lectus*. The former was only a sort of wooden chest, *vilis arca*, which was

burnt with the body; the latter was enriched and gilded for pomp. It was carried bare, or uncovered, when the person died a natural and easy death; when he was much disfigured or distorted, it was veiled or covered over.

BIER is more particularly used for that whereon the bodies of saints are placed in the church to rest, and exposed to the veneration of the devout. This is also called, in middle-age writers, *lectus*, *feretrum*, *lectica*, and *loculus*; and was usually enriched with gold, silver, and precious stones, which was the cause that the bier of St Benedict was pillaged, and all its ornaments carried off.

BIEROLIET, a town of the Netherlands in Dutch Flanders, where William Bruckfield, or *Beukelings*, who invented the method of pickling herrings, died in 1397. E. Long. 3. 42. N. Lat. 51. 25.

BIFERÆ, plants that flower twice a-year, in spring, and autumn, as is common between the tropics.

BIGA, in antiquity, a chariot drawn by two horses abreast. Chariot-races, with two horses, were introduced into the Olympic games in the 93^d Olympiad: but the invention was much more ancient, as we find that the heroes in the Iliad fight from chariots of that kind. The moon, night, and the morning, are by mythologists supposed to be carried in *bigæ*, the sun in *quadrigæ*. Statues in *bigæ* were at first only allowed to the gods, then to conquerors in the Grecian games; under the Roman emperors, the like statues, with *bigæ*, were decreed and granted to great and well-deserving men, as a kind of half triumph, being erected in most public places of the city. Figures of *bigæ* were also struck on their coins. The drivers of *bigæ* were called *bigarii*; a marble bust of one Florus a *bigarius* is still seen at Rome.

BIGAMY, properly signifies being *twice married*; but with us is used as synonymous to polygamy, or having a plurality of wives at once. Such second marriage, living the former husband or wife, is simply void, and a mere nullity, by the ecclesiastical law of England: and yet the legislature has thought it just to make it felony, by reason of its being so great a violation of the public œconomy and decency of a well ordered state. For polygamy can never be endured under any rational civil establishment, whatever specious reasons may be urged for it by the eastern nations, the fallaciousness of which has been fully proved by many sensible writers: but in northern countries the very nature of the climate seems to reclaim against it; it never having obtained in this part of the world, even from the time of our German ancestors, who, as Tacitus informs us, "*prope soli barbarorum singulis uxoribus contenti sunt.*" It is therefore punished by the laws both of ancient and modern Sweden with death. And in Britain it is enacted by statute 1 Jac. I. c. 11. that if any person, being married, do afterwards marry again, the former husband or wife being alive, it is felony; but within the benefit of clergy. The first wife in this case shall not be admitted as an evidence against her husband, because she is the true wife; but the second may, for she is indeed no wife at all: and so, *vice versa*, of a second husband. This act makes an exception to five cases, in which such second marriage, though in the three first it is void, is yet no felony. 1. Where either party hath been only

Bigati
Biguon.

tinually abroad for seven years, whether the party in England hath notice of the other's being alive or no. 2. Where either of the parties hath been absent from the other seven years within this kingdom, and the remaining party hath had no knowledge of the other's being alive within that time. 3. Where there is a divorce (or separation *a mensa et thoro*) by sentence in the ecclesiastical court. 4. Where the first marriage is declared absolutely void by any such sentence, and the parties loosed *a vinculo*. Or, 5. Where either of the parties was under the age of consent at the time of the first marriage; for in such case the first marriage was voidable by the disagreement of either party, which the second marriage very clearly amounts to. But, if at the age of consent the parties had agreed to the marriage, which completes the contract, and is indeed the real marriage; and afterwards one of them should marry again; Judge Blackstone apprehends that such second marriage would be within the reason and penalties of the act.

BIGATI, in antiquity, a kind of ancient Roman silver coins, on one side whereof was represented a *biga*, or chariot drawn by two horses. The *bigatus* was properly the Roman denarius, whose impression, during the times of the commonwealth, was a chariot driven by victory, and drawn either by two horses or four, according to which it was either denominated *bigatus* or *quadrigatus*.

BIGGLESWADE, a town of Bedfordshire in England, seated on the river Ivel, over which there is a handsome bridge. The town is much more considerable now than formerly, on account of its commodious inns for passengers, it lying on the principal road from London to York. W. Long. o. 15. N. Lat. 52. 5.

BIGHT, among seamen, denotes one roll, or round, of a cable or rope, when coiled up.

BIGNON (Jerome), a French writer, was born at Paris in 1590. He gained an uncommon knowledge, under the care of his father, in philosophy, mathematics, history, civil law, and divinity, in a very short time; and was almost at the end of his studies at an age when it is usual to send children to school. At ten years of age he gave the public a specimen of his learning, in a Description of the Holy Land; and two years after, he published a Discourse concerning the principal antiquities and curiosities of Rome; and A summary treatise concerning the election of Popes. Henry IV. desired to see him, and appointed him page to the dauphin, who was afterwards Louis XIII. He appeared at court with all the politeness of manners imaginable. He wrote at that time a Treatise of the precedence of the kings of France, which he dedicated to Henry IV. who gave him an express order to continue his researches on that subject: but the death of that prince interrupted his design. He published, in 1613, the Formulae of Marculphus. He was in 1620 made advocate-general in the grand council; and discharged that post with such reputation, that the king nominated him some time after counsellor of state, and at last advocate-general in the parliament. He resigned his offices in 1641; and the year following was appointed chief library-keeper of the king's library. He was obliged to resume his office of advocate-general, and held it till his death. He was employed in the most important affairs of state. At last this great man, who

had always made religion the basis of his other virtues, died with the most exemplary devotion in 1656.

BIGNONIA, TRUMPET-FLOWER, or SCARLET JASMINE, a genus of the angiospermia order, belonging to the didynamia class of plants.

Species. Of this genus Linnæus enumerates 17 species; of which the following are the most remarkable. 1. The radicans, or climbing ash-leaved bigonia, is a native of Virginia and Canada. It rises 30 or 40 feet high, having pinnated opposite leaves of four pair of serrated lobes, and an odd one: all the shoots and branches being terminated by beautiful clusters of large trumpet-shaped scarlet flowers. The humming birds delight to feed on these flowers, and by thrusting themselves too far into them are sometimes caught. Of this species there is a variety with smaller flowers. 2. The sempervirens, or evergreen climbing Virginia bigonia, is a native of Virginia, Carolina, and the Bahama islands. The stalks are more slender than those of the former species; yet they rise, upon proper supports, to the height of 20 or 30 feet; the flowers are trumpet-shaped, erect, and of a yellow colour, proceeding from the sides and ends of the stalks and branches. 3. The catalpa, is a native of the same countries. It hath a strong woody stem and branches, rising 20 feet high, ornamented with large heart-shaped leaves, five or six inches long, and almost as broad, placed by threes, with whitish yellow-striped flowers coming out in panicles towards the end of the branches. This deserves a place in all curious shrubberies, as during the summer season no tree makes a more beautiful appearance; for which reason it should be placed conspicuously; or some might be planted singly upon spacious lawns, or other large opens of grass ground, and permitted to take their natural growth.

Culture. The two first species may be propagated by layers; every shoot laid down will readily grow, and will flower in two or three years. Cuttings of the strong shoots will also put out roots freely. They may be also propagated by seeds procured from America. These should be sown in the spring, in pots placed in a moderate hot-bed, from which the plants must be inured to the open air in summer; they are to be sheltered from the frost in winter, and next spring may be planted in the ground where they are to remain: but plants thus raised seldom flower in less than six or seven years. The catalpa may be propagated from the cuttings of its young shoots planted in the spring in pots plunged into a hot-bed. They will take root in a month or six weeks, when they must be hardened to the open air, in which they may stand till the month of October, and then be moved to a place of occasional shelter from frost, and in the following spring planted out in the nursery. They may be raised from seeds planted either in a warm border, or in pots plunged in a moderate hot-bed, which will facilitate the germination of the seed that is otherwise apt to remain a year in the ground before it begins to grow.

BIGORRE, a territory or county of France, in the province of Gascony. It is bounded on the east by the valley of Aure, the viscounty of Nebouffia, Riviere Verdun, and Pardiac; by Bearn on the west; on the south, by the valleys of Broton and Penticoise in Arragon; and on the north, by the county of Riviere-Bas incorporated with Armagnac. It is 40 miles long from

Big
Big

PL. I
fig.

from north to south, and 30 in breadth from east to west. It is divided into three parts, the mountains, the plains, and the ruffan. The mountains are inclosed between those of the valley of Aure on the east, those of Arragon on the south, and of Bearn on the west. This part contains two principal valleys, Lavedan and Barege. The valley of Bigorre is of an oval form, and has the hills of Ruffan on the east. The remarkable towns are Tarbes the capital, Bagneres, Lour, &c. The mountains are a barrier between France and Spain, and there are four different passages which the inhabitants are obliged to guard. Bigorre yields marble, jasper, stone, and slate: there are also mines of several sorts, but they are not worked. The rivers are the Adour, the Elches, the Arrofet, and the Gave of Lavedan; there are also three lakes.

BIGOT, a person obstinately and perversely wedded to some opinion or practice, particularly of a religious nature. Camden, perhaps, has hit upon the true original of the word. He relates, that when Rollo, duke of Normandy, received Gilla, the daughter of Charles the foolish, in marriage, together with the investiture of that dukedom, he would not submit to kiss Charles's foot: and when his friends urged him by all means to comply with that ceremony, he made answer in the English tongue, *NE SE BY GOD, i. e. Not so by God.* Upon which, the king and his courtiers deriding him, and corruptly repeating his answer, called him *bigot*; from whence the Normans were called *bigodi*, or *bigots*.

BIHAEZ, a strong town of Croatia in Hungary, seated in an isle formed by the river Anna, in E. Long. 16. 2. N. Lat. 44. 35.

BILBILIS, (anc. geog.), a town of Hispania Citerior, the birth-place of Martial; now supposed to be Calatajud in Arragon on the Xalon. See *CALATAJUD*.

BILBOA, a large, handsome, and rich town of Spain, capital of Biscay, with a well frequented harbour. It is remarkable for the wholesomeness of its air and the fertility of the soil about it. The inhabitants have always preserved themselves from a mixture with the Jews and Moors; and therefore will admit no family to settle among them but who can prove themselves to be of Christian extraction, nor will they admit any slaves among them as in the other parts of Spain. The exports are wool, and sword-blades, with some other manufactures of iron and steel. The town is seated at the mouth of the river Ibaicabal, in W. Long. 4. 20. N. Lat. 43. 23.

BILBOWS, a punishment at sea, answering to the stocks at land. The offender is laid in irons, or stocks, which are more or less ponderous according to the quality of the offence of which he is guilty.

BILDESTON, a town of Suffolk in England, seated on a creek on the river Breton. The principal manufacture is in woollen goods, especially blankets. E. Long. 0. 45. N. Lat. 52. 20.

BILDGE of a ship, the bottom of her floor, or the breadth of the place the ship rests on when she is aground. Therefore, *bilidge-water* is that which lies on her floor, and cannot go to the well of the pump: And *bilidge-pumps*, or *burr-pumps*, are those that carry off the bilidge-water. They likewise say the ship is *bilged*, when she has some of her timber struck off on a rock or anchor, and springs a leak.

BILE, a yellow, bitter juice, separated from the

blood in the liver, collected in the porus bilarius and gall-bladder, and thence discharged by the common duct into the duodenum*.

BILEDULGERID, or **BEHAD AL JERID**, the *Country of dates*, a kingdom of Africa. It is almost of a square form, extending itself more than 80 leagues every way, from 28. 30. to 32. 50. north latitude, and from 6 to 12 degrees of west longitude. It is bounded on the north by the kingdom of Tunis, on the east by a ridge of lofty mountains which divide it from Tripoli and part of Gadamis, on the west by the countries of Zeb and Mezeb, and on the south by the province of Verghela. The whole country is barren, sandy, and mountainous, producing little or nothing besides dates, which grow here in such profusion, that the face of half the kingdom is covered over with date-trees, and from hence the whole country takes its name. The climate is hot and unhealthy: the people lean, swarthy, and shrivelled in their complexions; with their eyes inflamed, owing to the reflection of the sun-beams from the white hard soil; and the showers of dust and sand driven by the high winds that blow here at certain seasons are frequently so violent as to bury men and cattle under them. Another inconvenience with which the inhabitants are afflicted, for which no other reason is given besides their constant living on dates, is, an inveterate scurvy in their gums, whence all their teeth drop out; though it frequently spreads over their whole bodies, and then they become the most unhappy and loathsome objects. They are almost entirely free from other diseases; so that when not afflicted with this, they live to a good old age; though it is observable that they discover a furrowed countenance, shrivelled skin, hoary locks, and other symptoms of old age, very early in life, and before decrepitude, infirmity, or any decay of their faculties, appear. The plague is not known in Biledulgerid, though so frequent in Barbary, and though a constant intercourse is kept up between the two countries; whence it would seem, that in certain cases this terrible distemper is not so infectious as it is usually thought to be. The same may be said of the small-pox, a disease little less contagious and fatal in hot countries than the plague itself. The natives are represented as a lewd, treacherous, thievish, and savage people, who delight in murder and robbery. They are mostly a mixture of Africans and wild Arabs who mingled themselves with them. The former live with some regularity and civil order in a kind of villages composed of a number of little huts; the latter in tents, ranging from place to place in quest of food and plunder. The Arabs, who pride themselves in their superiority of birth and talents above the primitive inhabitants, are wholly independent and free, frequently hiring themselves in the service of the neighbouring princes at war; from which policy arise the most valuable branches of their public revenue, if any thing can be called common or public in a nation of lawless robbers. The rest pursue no other occupation besides hunting and plundering; the first of which is their common employment, especially hunting of ostriches, which are said to be of a prodigious stature in this country, and as high as a man mounted on a tall horse. The inhabitants eat the flesh of these animals; barter their feathers for corn, pulse, and other things they want; use their hearts in their necromantic

Biledulgerid

* See *Anatomy*, n^o 358, 359.

Bilevelt
||
Bill.

tic and religious rites, their fat as a medicine of sovereign virtue, their talons for ear-pendants and other ornaments, and their skins they convert into pouches and knapsacks, so that not a part of the animal but is employed in some useful purpose. Besides dates and ostriches, the Arabs live likewise on the flesh of goats and camels; drinking either the liquor or broth in which that flesh is boiled, or the milk of their camels; for they seldom taste water, that element being more scarce in this country than milk itself. In the whole country there is scarce a town of any note, or even a stream of water that deserves notice, or that is not dried up half the year.

BILEVELT, a town of Germany, in the circle of Westphalia and county of Ravenburg, subject to the king of Prussia, in E. Long. 8. 20. N. Lat. 52. 0.

BILINGUIS, in a general sense, signifies one that speaks two languages; but in law, is used for a jury that passes in any case between an Englishman and a foreigner, whereof part ought to be English, and part strangers.

BILIOUS, in general, denotes something belonging to, or partaking of, the nature of bile. Hence,

Bilious Fevers are those occasioned by the over-copiousness or bad qualities of the bile *.

* See the
Index sub-
joined to
Medicine.

BILL, in mechanics, an instrument made of iron, edged in the form of a crescent, and adapted to a handle. It is used by plumbers, to perform several parts of their work; by basket-makers, to cut the largest pieces of chefnut-trees and other wood; and by gardeners, to prune trees. When short, it is called a *hand-bill*; and when long, a *hedge-bill*.

BILL, in law, a security for money under the hand, and sometimes the seal of the debtor. It is of two sorts, a single bill without or with a penalty; the latter is the same as a bond, except its being without a condition.

BILL also implies a declaration in writing, expressing either some wrong the complainant has suffered from the defendant, or a fault committed by the person complained of against some law or statute.—This bill is sometimes exhibited to justices at the general assizes, by way of indictment, or referred to others having jurisdiction; but is more generally addressed to the lord chancellor. It contains the fact complained of, the damage sustained, and a petition or process against the defendant for redress; and is used both in criminal and civil cases. In the former, the words *billâ vera* are indorsed by the grand jury upon a presentment, implying that they find the same founded on probable evidence, and therefore worthy of further consideration.

In Scots law, every summary application in writing, by way of petition to the court of session, is called a *bill*.

Bill of Attainder. See **ATTAINDER**.

Bill of Appeal. See **APPEAL**.

BILL signifies also a paper, either written or printed, in very large characters, which is posted up in some open and public place, to give notice of the sale of any merchandize or ship, or of the sailing of any vessel into foreign parts.

BILL, in trade, both wholesale and retail, as also among workmen, signifies an account of merchandizes, or goods delivered to a person, or of work done for one.

Bank-BILL, a private instrument whereby private persons become intitled to a part in the bank-stock.

BILL of Entry, an account of the goods entered at the custom-house, both inwards and outwards. In this bill must be expressed, the merchant exporting or importing; the quantity of merchandize, and the divers species thereof; and whither transported, or from whence.

BILL of Exchange, is a security, originally invented among merchants in different countries, for the more easy remittance of money from the one to the other, which has since spread itself into almost all pecuniary transactions. It is an open letter of request from one man to another, desiring him to pay a sum named therein to a third person on his account; by which means a man at the most distant part of the world may have money remitted to him from any trading country. If A lives in Jamaica, and owes B who lives in England 1000 l. now if C be going from England to Jamaica, he may pay B this 1000 l. and take a bill of exchange drawn by B in England upon A in Jamaica, and receive it when he comes thither. Thus does B receive his debt, at any distance of place, by transferring it to C; who carries over his money in paper-credit, without danger of robbery or loss. This method is said to have been brought into general use by the Jews and Lombards, when banished for their usury and other vices; in order the more easily to draw their effects out of France and England, into those countries in which they had chosen to reside. But the invention of it was a little earlier; for the Jews were banished out of Guienne in 1287, and out of England in 1290, and in 1236 the use of paper-credit was introduced into the Mogul empire in China.—In common speech, such a bill is frequently called a *draught*; but a bill of exchange is the more legal as well as mercantile expression. The person, however, who writes this letter is called, in law, the *drawer*; and he to whom it is written, the *drawee*; and the third person or negotiator to whom it is payable (whether specially named, or the bearer generally) is called the *payee*.

These bills are either foreign, or inland; foreign, when drawn by a merchant residing abroad upon his correspondent in England, or *vice versa*; and inland, when both the drawer and the drawee reside within the kingdom. Formerly foreign bills of exchange were much more regarded in the eye of the law than inland ones, as being thought of more public concern in the advancement of trade and commerce. But now by two statutes, the one 9 & 10 W. III. c. 17. the other 3 and 4 Ann. c. 9. inland bills of exchange are put upon the same footing as foreign ones; what was the law and custom of merchants with regard to the one, and taken notice of merely as such, being by those statutes expressly enacted with regard to the other. So that there is now in law no manner of difference between them.

BILL of Lading, an acknowledgment signed by the master of a ship, and given to a merchant, &c. containing an account of the goods which the master has received on board from that merchant, &c. with a promise to deliver them at an intended place for a certain salary. Each bill of lading must be treble, one for the merchant who loads the goods, another to be sent to the person to whom they are consigned, and the third to remain in the hands of the master of the ship. It
must

must be observed, however, that a bill of lading is used only when the goods, sent on board a ship, are but part of the cargo: for when a merchant loads a whole vessel for his own personal account, the deed passed between him and the master of the ship is called *charter-party*. See *CHARTER-party*.

Bills of Mortality, are accounts of the numbers of births and burials within a certain district, every week, month, quarter, or year. In this sense we say *weekly bills*, *monthly bills*, *quarterly bills*, *yearly bills*. The London bills of mortality, which were the first, are composed by the company of parish-clerks, and express the number of christenings of each sex, and the number of deaths from each disease.

Bill of Parcels, an account given by the seller to the buyer, containing the particulars of all the sorts and prices of the goods bought.

Bill of Sale, is when a person wanting a sum of money, delivers goods as a security to the lender, to whom he gives this bill, impowering him to sell the goods, in case the sum borrowed is not repaid, with interest, at the appointed time.

Bill of Store, a licence granted at the custom-house to merchants, by which they have liberty to carry, custom-free, all such stores and provisions as they may have occasion for during their voyage.

Bill of Suffrance, a licence granted to a merchant, at the custom-house, suffering him to trade from one English port to another, without paying custom.

Lombard Bills, are instruments of an uncommon kind and figure, used in Italy and Flanders, and of late also in France; consisting of a piece of parchment, cut to an acute angle about an inch broad at top, and terminating in a point at bottom; chiefly given, where private persons are concerned in the fitting out a ship on any long voyage. The manner is thus: The party, who is desirous to be concerned in the cargo or venture, carries his money to the merchant, who fits out the ship, where it is entered down in a register: at the same time the merchant writes down on a piece of parchment, upwards of an inch broad, and seven or eight inches long, the name of the lender, and the sum lent; which being cut diagonal-wise, or from corner to corner, each party retains his half. On the return of the vessel, the lender brings his moiety to the merchant; which being compared with the other, he receives his dividend accordingly. Much the same is practised in Holland by those who lend money on pledges: the name of the borrower, and the sum, are written on a like slip of parchment, which is cut in two, and half given to the borrower, and the other half stitched to the pledge; that, upon comparing them together again, the borrower may receive his goods on paying the money stipulated.

Bill in Parliament, a paper containing propositions offered to the houses to be passed by them, and then presented to the king to pass into a law.

To bring a bill into the house, if the relief sought by it is of a private nature, it is first necessary to prefer a petition; which must be presented by a member, and usually sets forth the grievance desired to be remedied. This petition (when founded on facts that may be in their nature disputed) is referred to a committee of members, who examine the matter alleged, and accordingly report it to the house; and then (or, other-

wife, upon the mere petition) leave is given to bring in the bill. In public matters, the bill is brought in upon motion made to the house, without any petition at all. Formerly, all bills were drawn in the form of petitions, which were entered upon the parliament-rolls, with the king's answer thereunto subjoined; not in any settled form of words, but as the circumstances of the case required: and at the end of each parliament the judges drew them into the form of a statute, which was entered on the statute-rolls. In the reign of Henry V. to prevent mistakes and abuses, the statutes were drawn up by the judges before the end of the parliament; and, in the reign of Henry VI. bills in the form of acts, according to the modern custom, were first introduced.

The persons directed to bring in the bill, present it in a competent time to the house, drawn out on paper, with a multitude of blanks, or void spaces, where any thing occurs that is dubious, or necessary to be settled by the parliament itself; (such, especially, as the precise date of times, the nature and quantity of penalties, or of any sums of money to be raised) being indeed only the skeleton of the bill. In the house of lords, if the bill begins there, it is (when of a private nature) referred to two of the judges, who examine and report the state of the facts alleged, to see that all necessary parties consent, and to settle all points of technical propriety. This is read a first time, and at a convenient distance a second time; and after each reading the speaker opens to the house the substance of the bill, and puts the question, Whether it shall proceed any farther. The introduction of the bill may be originally opposed, as the bill itself may at either of the readings; and, if the opposition succeeds, the bill must be dropped for that session; as it must also, if opposed with success in any of the subsequent stages.

After the second reading, it is committed; that is, referred to a committee: which is either selected by the house in matters of small importance; or else, upon a bill of consequence, the house resolves itself into a committee of the whole house. A committee of the whole house is composed of every member; and, to form it, the speaker quits the chair, (another member being appointed chairman), and may sit and debate as a private member. In these committees the bill is debated clause by clause, amendments made, the blanks filled up, and sometimes the bill entirely new-modelled. After it has gone through the committee, the chairman reports it to the house with such amendments as the committee have made; and then the house reconsiders the whole bill again, and the question is repeatedly put upon every clause and amendment. When the house hath agreed or disagreed to the amendments of the committee, and sometimes added new amendments of its own, the bill is then ordered to be engrossed, or written in a strong gross hand, on one or more long rolls (or presses) of parchment sewed together. When this is finished, it is read a third time, and amendments are sometimes then made to it; and if a new clause be added, it is done by tacking a separate piece of parchment on the bill, which is called a *ryder*. The speaker then again opens the contents; and, holding it up in his hands, puts the question, Whether the bill shall pass. If this is agreed to, the title to it is then settled; which used to be a general one for all the acts passed in the session, till in the fifth year of Hen. VIII. distinct titles were

were introduced for each chapter. After this, one of the members is directed to carry it to the lords, and desire their concurrence; who, attended by several more, carries it to the bar of the house of peers, and there delivers it to their speaker, who comes down from his woolfack to receive it.

If there passes thro' the same forms as in the other house, (except engrossing, which is already done); and, if rejected, no more notice is taken, but it passes *sub silentio*, to prevent unbecoming alterations. But if it is agreed to, the lords send a message by two masters in chancery (or sometimes two of the judges) that they have agreed to the same: and the bill remains with the lords, if they have made no amendment to it. But if any amendments are made, such amendments are sent down with the bill to receive the concurrence of the commons. If the commons disagree to the amendments, a conference usually follows between members deputed from each house; who for the most part settle and adjust the difference: but, if both houses remain inflexible, the bill is dropped. If the commons agree to the amendments, the bill is sent back to the lords by one of the members, with a message to acquaint them therewith. The same forms are observed, *mutatis mutandis*, when the bill begins in the house of lords. But, when an act of grace or pardon is passed, it is first signed by his majesty, and then read once only in each of the houses, without any new engrossing or amendment. And when both houses have done with any bill, it always is deposited in the house of peers, to wait the royal assent; except in the case of a bill of supply, which after receiving the concurrence of the lords is sent back to the house of commons.

The royal assent may be given two ways: 1. In person; when the king comes to the house of peers, in his crown and royal robes, and sending for the commons to the bar, the titles of all the bills that have passed both houses are read; and the king's answer is declared by the clerk of the parliament in Norman-French: a badge, it must be owned, (now the only one remaining) of conquest; and which one could wish to see fall into total oblivion; unless it be reserved as a solemn memento to remind us that our liberties are mortal, having been once destroyed by a foreign force. If the king consents to a public bill, the clerk usually declares, *Le roy le veut*, "The king wills it to be;" if to a private bill, *Soit fait come il est desire*, "Be it as it is desired." If the king refuses his assent, it is in the gentle language of *Le roy s'aviser*, "The king will advise upon it." When a bill of supply is passed, it is carried up and presented to the king by the speaker of the house of commons; and the royal assent is thus expressed, *Le roy remercie ses loyal subjects, accepte leur benevolence, et aussi le veut*; "The king thanks his loyal subjects, accepts their benevolence, and wills it to be." In case of an act of grace, which originally proceeds from the crown and has the royal assent in the first stage of it, the clerk of the parliament thus pronounces the gratitude of the subject: *Les prelatz, seigneurs, et commons, en ce present parliament assemblez, au nom de tous vus autres subjects, remercient tres humblement votre majeste, et prient a Dieu vous donner en sante bone vie et longue*; "The prelates, lords, and commons, in this present parliament assembled, in the name of all your other subjects, most humbly thank your majesty,

and pray to God to grant you in health and wealth long to live." 2. By the statute 33 Hen. VIII. c. 21. the king may give his assent by letters patent under his great seal, signed with his hand, and notified in his absence to both houses assembled together in the high house. And, when the bill has received the royal assent in either of these ways, it is then, and not before, a statute or act of parliament.

This statute or act is placed among the records of the kingdom; there needing no formal promulgation to give it the force of a law, as was necessary by the civil law with regard to the emperor's edicts: because every man in Britain is, in judgment of law, party to the making of an edict of parliament, being present thereat by his representatives. However, a copy thereof is usually printed at the king's press for the information of the whole land. And formerly, before the invention of printing, it was used to be published by the sheriff of every county; the king's writ being sent to him at the end of every session, together with a transcript of all the acts made at that session, commanding him, *ut statuta illa, et omnes articulos in eisdem contentos, in singulis locis ubi expedire viderit, publice proclamari, et firmiter teneri et observari faciat*. And the usage was to proclaim them at his county court, and there to keep them, that whoever would might read or take copies thereof; which custom continued till the reign of Henry VII.

An act of parliament, thus made, is the exercise of the highest authority that this kingdom acknowledges upon earth. It hath power to bind every subject in the land, and the dominions thereunto belonging; nay, even the king himself, if particularly named therein. And it cannot be altered, amended, dispensed with, suspended, or repealed, but in the same forms and by the same authority of parliament: for it is a maxim in law, that it requires the same strength to dissolve, as to create, an obligation. It is true, it was formerly held, that the king might in many cases dispense with penal statutes: but now by statute 1 W. and M. ft. 2. c. 2. it is declared, that the suspending or dispensing with laws by regal authority, without consent of parliament, is illegal.

BILL of Rights. See the article LIBERTY.

BILLERÏCAY, a town of Essex in England, seated on a hill, in E. Long. o. 25. N. Lat. 51. 35.

BILLET, in heraldry, a bearing in form of a long square. They are supposed to represent pieces of cloth of gold or silver; but Guillim thinks they represent a letter sealed up, and other authors take them for bricks. *Billeté* signifies that the escutcheon is all over-strewed with billets, the number not ascertained.

BILLET-WOOD, small wood for fuel, cut three feet and four inches long, and seven inches and a half in compass; the affize of which is to be inquired of by justices.

BILLETING, in military affairs, is the quartering of soldiers in the houses of a town or village.—And, among fox-hunters, it signifies the ordure and dung of a fox.

BILLIARDS, an ingenious kind of game, played on a rectangular table, covered with green cloth, and placed exactly level, with little ivory balls, which are driven by crooked sticks, made on purpose, into hazards or holes, on the edge and corners of the table, according to certain rules of the game.

BILLINGHAM, a town of Northumberland in England, seated in W. Long. 1. 35. N. Lat. 55. 20.

BILLON, in the history of coins, a composition of precious and base metals, where the latter predominate. Wherefore gold under twelve carats fine, is called billon of gold; and silver under six penny-weight, billon of silver. So little attention was paid formerly to the purity of gold and silver, that the term billon of gold was applied only to that which was under twenty-one carats, and billon of silver to that which was lower than ten penny-weight.

BILLOM, a town of Auvergne in France, situated in E. Long. 3. 30. N. Lat. 45. 36.

BILSDON, a small town of Leicestershire in England, situated in W. Long. 0. 15. N. Lat. 52. 40.

BILSEN, a town of Germany, in the circle of Westphalia and bishopric of Liege, seated on the river Demer, in E. Long. 5. 42. N. Lat. 50. 48.

BILSON (Thomas), bishop of Winchester, in which city he was born and educated. In 1565, he was admitted perpetual fellow of New college, and in 1570 completed his degrees in arts. He was made bachelor of divinity in 1579, and doctor the year following. His first preferment was that of master of Winchester school; he was next made prebendary, and afterwards warden, of Winchester college. In 1596 he was consecrated bishop of Worcester; and about a year after, translated to the see of Winchester, and sworn of queen Elizabeth's privy council. He was one of the principal managers of the Hampton-court conference in 1604; and the English translation of the Bible in the reign of king James I. was finally corrected by this prelate, and Dr Miles Smith bishop of Gloucester. He died in the year 1616; and was buried in Westminster abbey, near the entrance of St Edmund's chapel, on the south side of the monument of king Richard II. The several authors who have mentioned bishop Bilson, agree in giving him the character of a learned divine, an able civilian, and an upright man. His style is, in general, much more easy and harmonious than that of cotemporary ecclesiastics. His works are, 1. *Several Latin poems and orations.* Manuscript, in Ant. Wood's library. 2. *The true difference between Christian subjection and unchristian rebellion.* Oxf. 1585, 4to. Lond. 1586, 8vo. 3. *The perpetual government of Christ's church.* Lond. 1593, 4to. Black Letter. 4. *The effect of certain sermons touching the full redemption of mankind by the death and blood of Christ,* &c. Lond. 1599, 4to. 5. *The survey of Christ's sufferings for man's redemption, and of his descent to Hades, or Hell.* Lond. 1604, fol. 6. *A sermon preached before king James I. and his queen at their coronation.* Lond. 1603, 8vo.

BIMEDIAL, in mathematics. If two medial lines, as AB and BC, commensurable only in power, containing a rational rectangle, are compounded, the whole line AC will be irrational, and is called a *first bimedral line*.

See Euclid. lib. X. prop. 38.

BIMINI, one of the Lucaya islands in North America, near the channel of Bahama. It is about eight miles in length, and as much in breadth, covered with trees, and inhabited by the native Americans. It is

very difficult of access on account of the shoals, but is a very pleasant place. W. Long. 79. 30. N. Lat. 25. 0.

BIMLIPATAN, a sea-port town of Golconda in the East Indies, seated on the west side of the bay of Bengal. Here the Dutch have a very small factory, designed for buying up the cloth manufactured by the inhabitants. E. Long. 83. 5. N. Lat. 18. 0.

BINACLE, a wooden case or box, which contains the compasses, log-glasses, watch-glasses, and lights to shew the compass at night. As this is called *bittacle* in all the old sea-books, even by mariners, it appears evidently to be derived from the French term *bittacle* (a small habitation), which is now used for the same purpose by the seamen of that nation.—The binacle (Plate LVII. fig. 4.) is furnished with three apartments, with sliding shutters: the two side ones, a *b*, have always a compass in each, *d*, to direct the ship's way; while the middle division, *c*, has a lamp or candle with a pane of glass on either side to throw a light upon the compass in the night, whereby the man who steers may observe it in the darkest weather, as it stands immediately before the helm on the quarter deck. There are always two binacles on the deck of a ship of war, one being designed for the man who steers, and the other for the person who superintends the steerage, whose office is called *coming*.

BINAROS, a small town of Spain, in the kingdom of Valentia, remarkable for good wine. It is seated near the sea, in E. Long. 0. 15. N. Lat. 40. 24.

BINARY ARITHMETIC, that wherein unity or 1 and 0 are only used.—This was the invention of M. Leibnitz, who shews it to be very expeditious in discovering the properties of numbers, and in constructing tables: and Mr Dangeourt, in the history of the royal academy of sciences, gives a specimen of it concerning arithmetical progressionals; where he shews, that because in binary arithmetic only two characters are used, therefore the laws of progression may be more easily discovered by it than by common arithmetic. All the characters used in binary arithmetic are 0 and 1; and the cypher multiplies every thing by 2, as in the common arithmetic by 10. Thus 1 is one; 10, two; 11, three; 100, four; 101, five; 110, six; 111, seven; 1000, eight; 1001, nine; 1010, ten; which is built on the same principles with common arithmetic. The author, however, does not recommend this method for common use, because of the great number of figures required to express a number; and adds, that if the common progression were from 12 to 12, or from 16 to 16, it would be still more expeditious.

BINARY MEASURE, in music, is a measure which is beaten equally, or where the time of rising is equal to that of falling. This is usually called *common time*.

BINARY NUMBER, that composed of two units.

BINCH, a small fortified town of the Low Countries, in the county of Hainault, subject to the house of Austria. E. Long. 3. 21. N. Lat. 50. 23.

BIND, a country-word for a stalk of hops.

BIND OF BELS, a quantity, consisting of 250, or 10 strikes, each containing 25 cels.

BIND-WOED, in botany. See *CONVOLVULUS*.

BINDBROKE, a town of Lincolnshire in England, seated in E. Long. 0. 10. N. Lat. 53. 32.

BING, in the alum-works, denotes a heap of thrown

Bingazi
Bion.

thrown together in order to drain.

BINGAZI, a sea-port town of Africa, in the kingdom of Tripoli. E. Long. 19. 10. N. Lat. 32. 20.

BINGEN, an ancient and handsome town of Germany, in the archbishopric of Mentz, seated at the place where the river Nahe falls into the Rhine. E. Long. 7. 48. N. Lat. 50. 3.

BINGHAM (Joseph), a learned divine, born at Wakefield in Yorkshire, in September 1668, educated at University college, in Oxford, and afterwards presented by John Radcliffe, M. D. to the rectory of Headbournworthy, near Winchester. In this country retirement he began his learned and laborious work, *Origines Ecclesiasticæ*; or, The Antiquities of the Christian church. The first volume of which was published in 1708, and it was completed afterwards in nine volumes more. He published also several other books. But notwithstanding his great learning and merit, he had no other preferment than that of Headbournworthy till the year 1712, when he was collated to the rectory of Havant, near Portsmouth, by Sir Jonathan Trelawney bishop of Winchester, to whom he dedicated several of his books. He died August 17th, 1723, in the 55th year his age.

BINGHAM, a town of Nottinghamshire in England, seated in the vale of Belvoir, in W. Long. 1. 10. N. Lat. 50. 3.

BINGIUM, (anc. geog.), a village or town of the Vangiones in Gallia Belgica, seated at the confluence of the Nahe and Rhine. Now *Bingen*; which see.

BINGLEY, a town in the west riding of Yorkshire, seated on the river Aire, in W. Long. 1. 35. N. Lat. 53. 20.

BINN, in country affairs, a place boarded up to put corn in.

BINOCULAR TELESCOPE, a kind of dioptric telescope fitted with two tubes, joined in such a manner that one may see a distant object with both eyes at the same time. See **OPTICS**.

BINOMIAL, in algebra, a root consisting of two members connected by the sign + or —. Thus $a+b$, and $8-3$, are binomials, consisting of the sums and differences of these quantities. See **ALGEBRA**.

BINTAN, an island of Asia, in the East Indies, to the south of the peninsula of Malacca, situated in E. Long. 103. 50. N. Lat. 1. 0.

BIOGRAPHER, one who writes the lives of particular persons, as Plutarch, Suetonius, &c. See the next article.

BIOGRAPHY, a species of history which records the lives and characters of remarkable persons. This is at once the most entertaining and instructive kind of history. It admits of all the painting and passion of romance; but with this capital difference, that our passions are more keenly interested, because the characters and incidents are not only agreeable to nature, but strictly true. No books are so proper to be put into the hands of young people. See the *Preface* to this **WORK**.

BION, a bucolic poet, native of Smyrna, lived at the same time with Ptolemy Philadelphus, whose reign reached from the fourth year of the 123^d Olympiad to the second year of the 133^d. He was an incomparable poet, if we may believe the lamentations of his disciple Moschus. His few pieces which are left do not contradict this testimony. See **MOSCHUS**.

BION, surnamed *Borysphenites*, because he was of Borysphenes, was a philosopher of a great deal of wit, but of very little religion: he flourished about the 120th Olympiad; but falling sick, he, like other profane persons, became superstitious.

BIORNBURG, a town of north Finland in Sweden, seated on the river Kunc near its mouth in the Gulf of Bothnia. E. Long. 22. 35. N. Lat. 62. 6.

BIO THANATI, a term sometimes used for suicides. See **SUICIDES**.

BIOUAC, in military affairs, a night-guard, performed by the whole army, when there is any apprehension of danger from the enemy.

BIPENNIS, a two-edged ax, used anciently by the Amazons in fight; as also by the seamen, to cut asunder the ropes and cordage of the enemy's vessels. The bipennis was a weapon chiefly of the oriental nations, made like a double ax, or two axes joined back to back, with a short handle. Modern writers usually compare it to our halbard, or partizan; from which it differed in that it had no point, or that its shaft or handle was much shorter.

BIQUADRATIC POWER, ROOT, EQUATION, &c. See **ALGEBRA**.

BIR, or **BERR**, a town of the province of Diarbeck in Turkey in Asia, with a castle where the governor resides, seated on the eastern bank of the river Euphrates, near a high mountain in a very pleasant and fertile country. E. Long. 38. 6. N. Lat. 36. 10.

BIRAGUE (Clement), a Milanese engraver, and the inventor of the art of cutting diamonds, flourished about the year 1580.

BIRCH-TREE, in botany. See **BETULA**.

BIRD (William), an eminent musician and composer, was one of the children of the chapel in the reign of Edward VI. and, as it is asserted by Wood in the Ashmolean MS. was bred up under Tallis. It appears, that in 1575 Tallis and Bird were both gentlemen and also organists of the royal chapel; but the time of their appointment to this latter office cannot now be ascertained.

The compositions of Bird are many and various; those of his younger years were mostly for the service of the church. He composed a work, entitled *Sacrarum Cantionum, quinque vocum*, printed in 1589; among which is that noble composition *Civitas sancti tui*, which for many years past has been sung in the church as an anthem to the words "Bow thine ear, O Lord." He was also the author of a work entitled *Gradualia, ac Cantiones sacre, quinis, quaternis, trinisque vocibus concinnate. lib. primus*. Of this there are two editions, the latter published in 1610. Although it appears by these his works that Bird was in the strictest sense a church-musician, he occasionally gave to the world compositions of a secular kind: and he seems to be the first among English musicians that ever made an essay in the composition of that elegant species of vocal harmony, the madrigal; the *La Verginella* of Ariotto, which he set in that form for five voices, being the most ancient musical composition of the kind to be met with in the works of English authors. Of his compositions for private entertainment, there are extant, 'Songs of sundry natures, some of grauitie, and others of myrth, fit for all companies and voyces, printed in 1589;' and two other collections of the same kind, the last of them printed

printed in 1611. But the most permanent memorials of Bird's excellencies are his motets and anthems; to which may be added, a fine service in the key of D with the minor third, the first composition in Dr Boyce's Cathedral Music, vol. III. and that well known canon of his, *Non nobis Domine*.

Besides his salaries and other emoluments of his profession, it is to be supposed that Bird derived some advantages from the patent granted by queen Elizabeth to Tallis and him, for the sole printing of music and music-paper: Dr Ward speaks of a book which he had seen with the letters T. E. for Thomas East, Est, or Este, who printed music under that patent. Tallis dying in 1585, the patent, by the terms of it, survived to Bird, who, no doubt for a valuable consideration, permitted East to exercise the right of printing under the protection of it; and he in the title-page of most of his publications styles himself the assignee of William Byrd. Bird died in 1623.

BIRD of Paradise.

BIRD-Call, a little stick cleft at one end, in which is put a leaf of some plant, wherewith to counterfeit the cryer's call of several birds, and bring them to the net, or snare, or lime-twig, to be taken. A laurel-leaf fitted on the bird-call, counterfeits the voice of lapwings; a leek, that of nightingales, &c.

BIRD-Catching, the art of taking birds or wild-fowl, whether for food, for the pleasure of their song, or for their destruction as pernicious to the husbandman, &c. The methods are by bird-lime, nets, decoys, &c. See BIRD-Lime, infra; and DECOY.

In the suburbs of London (and particularly about Shoreditch) are several weavers and other tradesmen, who, during the months of October and March, get their livelihood by an ingenious, and, we may say, a scientific, method of bird-catching, which is totally unknown in other parts of Great Britain. The reason of this trade being confined to so small a compass, arises from there being no considerable sale for singing-birds except in the metropolis: as the apparatus for this purpose is also heavy, and at the same time must be carried on a man's back, it prevents the bird-catchers going to above three or four miles distance.

This method of bird-catching must have been long practised, as it is brought to a most systematical perfection, and is attended with a very considerable expense.

The nets are a most ingenious piece of mechanism; are generally twelve yards and a half long, and two

yards and a half wide; and no one, on bare inspection, would imagine that a bird (who is so very quick in all its motions) could be caught by the nets flapping over each other, till he becomes eye-witness of the pullers seldom failing.

The wild birds fly (as the bird-catchers term it) chiefly during the month of October, and part of September and November; as the flight in March is much less considerable than that of Michaelmas. It is to be noted also, that the several species of birds of flight do not make their appearance precisely at the same time, during the months of September, October, and November. The pipet (a), for example, begins to fly about Michaelmas; and then the woodlark, linnet, goldfinch, chaffinch, greenfinch, and other birds of flight succeed; all of which are not easily to be caught, or in any numbers, at any other time, and more particularly the pipet and the woodlark.

These birds, during the Michaelmas and March flights, are chiefly on the wing from day-break to noon, though there is afterwards a small flight from two till night; but this however is so inconsiderable, that the bird-catchers always take up their nets at noon.

It may well deserve the attention of the naturalist whence these periodical flights of certain birds can arise. As the ground, however, is ploughed during the months of October and March for sowing the winter and lent corn, it should seem that they are thus supplied with a great profusion both of seeds and insects, which they cannot so easily procure at any other season.

It may not be improper to mention another circumstance, to be observed during their sitting, viz. that they fly always against the wind: hence, there is great contention amongst the bird-catchers who shall gain that point; if (for example) it is westerly, the bird-catcher who lays his nets most to the east, is sure almost of catching every thing, provided his call-birds are good: a gentle wind to the south-west generally produces the best sport.

The bird-catcher, who is a substantial man, and hath a proper apparatus for this purpose, generally carries with him five or six linnets, (of which more are caught than any singing bird), two gold-finches, two green-finches, one wood-lark, one red poll, a yellow-hammer, tit-lark, and aberdavine, and perhaps a bullfinch; these are placed at small distances from the nets in little cages. He hath, besides, what are called *flur-birds*, which are placed within the nets, are raised upon the flur (s), and gently let down at the time the wild bird approaches them. These generally consist of the linnet, the gold-finch, and the green-finch, which are secured to the flur by what is called a *brace* (c); a contrivance that secures the birds without doing any injury to their plumage.

It having been found that there is a superiority between bird and bird, from the one being more in song than the other; the bird-catchers contrive that their call-birds should moult before the usual time. They, therefore, in June or July, put them into a close box,

(A) A small species of lark, but which is inferior to other birds of that genus in point of song.
 (B) A moveable perch to which the bird is tied, and which the bird-catcher can raise at pleasure by means of a long string fastened to it.
 (C) A sort of bandage, formed of a slender silken string that is fastened round the bird's body, and under the wings, in so artful a manner as to hinder the bird from being hurt, let it flutter ever so much in the raising.

under two or three folds of blankets, and leave their dung in the cage to raise a greater heat; in which state they continue, being perhaps examined but once a-week to have fresh water. As for food, the air is so putrid, that they eat little during the whole state of confinement, which lasts about a month. The birds frequently die under the operation; and hence the value of a stopped-bird rises greatly. When the bird hath thus prematurely moulted, he is in song whilst the wild birds are out of song, and his note is louder and more piercing than that of a wild one; but it is not only in his note he receives an alteration, the plumage is equally improved. The black and yellow in the wings of the gold-finch, for example, become deeper and more vivid, together with a most beautiful gloss, which is not to be seen in the wild bird. The bill, which in the latter is likewise black at the end, in the stopped-bird becomes white and more taper, as do its legs: in short, there is as much difference between a wild and a stopped-bird, as there is between a horse which is kept in body-clothes or at grass.

When the bird-catcher hath laid his nets, he disposes of his call-birds at proper intervals. It must be owned, that there is a most malicious joy in these call-birds to bring the wild ones into the same state of captivity; which may likewise be observed with regard to the decoy-ducks. See DECOY.

Their sight, and hearing, infinitely exceeds that of the bird-catcher. The instant that the (b) wild birds are perceived, notice is given by one to the rest of the call-birds, (as it is by the first hound that hits on the scent, to the rest of the pack); after which, follows the same sort of tumultuous ecstacy and joy. The call-birds, while the bird is at a distance, do not sing as a bird does in a chamber; they invite the wild ones by what the bird-catchers call *shoot-jerks*, which, when the birds are good, may be heard at a great distance. The ascendancy by this call or invitation is so great, that the wild bird is stopped in its course of flight; and, if not already acquainted with the nets (E), lights boldly within 20 yards of perhaps three or four bird-catchers, on a spot which otherwise it would not have taken the least notice of. Nay, it frequently happens, that if half a flock only are caught, the remaining half will immediately afterwards light in the nets, and share the same fate; and should only one bird escape, that bird will suffer itself to be pulled at till it is caught; such a fascinating power have the call-birds.

While we are on this subject of the jerking of birds, we cannot omit mentioning, that the bird-catchers frequently lay considerable wagers whose call-bird can jerk the longest, as that determines the superiority. They place them opposite to each other, by an inch of candle; and the bird who jerks the stiffest, before the candle is burnt out, wins the wager. We have been informed, that there have been instances of a bird's giving 170 jerks in a quarter of an hour; and we have known a linnet, in such a trial, persevere in its emulation till it swooned from the perch: thus, as Pliny says of the nightingale, *victa morte finit sepe vitam, spiritu prius deficiente quam cantu* *. It may be here observed, that

birds when near each other, and in sight, seldom jerk or sing. They either fight, or use flight and wheedling calls; the jerking of these call-birds, therefore, face to face, is a most extraordinary instance of contention for superiority in song.

To these we may add a few particulars that fell within our notice during our inquiries among the bird-catchers; such as, that they immediately kill the hens of every species of birds they take, being incapable of singing, as also being inferior in plumage; the pippets likewise are indiscriminately destroyed, as the cock does not sing well: they sell the dead birds for three-pence or four-pence a dozen. These small birds are so good, that we are surprised the luxury of the age neglects so delicate an acquisition to the table. The modern Italians are fond of small birds, which they eat under the common name of *beccaficos*: and the dear rate a Roman tragedian paid for one dish of singing-birds is well known; (see the article *Æsop*).

Another particular we learned, in conversation with a London bird-catcher, was the vast price that is sometimes given for a single song-bird, which had not learned to whistle tunes. The greatest sum we heard of, was five guineas for a chaffinch, that had a particular and uncommon note, under which it was intended to train others: and we also heard of five pounds ten shillings being given for a call-bird linnet.

A third singular circumstance, which confirms an observation of Linnæus, is, that the male chaffinches fly by themselves, and in the flight precede the females; but this is not peculiar to the chaffinches. When the tit-larks are caught in the beginning of the season, it frequently happens, that forty are taken and not one female among them: and probably the same would be observed with regard to other birds, (as has been done with relation to the wheat-eat), if they were attended to. An experienced and intelligent bird-catcher informed us, that such birds as breed twice a-year, generally have in their first brood a majority of males, and in their second, of females, which may in part account for the above observation.

We must not omit mention of the bullfinch, though it does not properly come under the title of a singing-bird, or a bird of flight, as it does not often move farther than from hedge to hedge; yet, as the bird sells well on account of its learning to whistle tunes, and sometimes flies over the fields where the nets are laid, the bird-catchers have often a call-bird to ensnare it, though most of them can imitate the call with their mouths. It is remarkable with regard to this bird, that the female answers the purpose of a call-bird as well as the male, which is not experienced in any other bird taken by the London bird-catchers.

The nightingale is not a bird of flight, in the sense the bird-catchers use this term. Like the robin, wren, and many other singing birds, it only moves from hedge to hedge, and does not take the periodical flights in October and March. The persons who catch these birds, make use of small trap-nets, without call-birds; and are considered as inferior in dignity to other bird-catchers, who will not rank with them. The arrival of

the

(D) It may be also observed, that the moment they see a hawk, they communicate the alarm to each other by a plaintive note; nor will they then jerk or call though the wild birds are near.

(E) A bird, acquainted with the nets, is by the bird-catchers termed a *sharper*; which they endeavour to drive away, as they can have no sport whilst it continues near them.

the nightingale is expected by the trappers in the neighbourhood of London, the first week in April: at the beginning, none but cocks are taken; but in a few days the hens make their appearance, generally by themselves, though sometimes a few males come along with them. The latter are distinguished from the females not only by their superior size, but by a great swelling of their vent, which commences on the first arrival of the hens. They are caught in a net trap, the bottom of which is surrounded with an iron ring; the net itself is rather larger than a cabbage net. When the trappers hear or see them, they strew some fresh mould under the place, and bait the trap with a meal-worm from the baker's shop. Ten or a dozen nightingales have been thus caught in a day.

BIRD-Lime, a viscid substance, prepared after different ways. The most common bird-lime among us, is made from holly-bark, boiled ten or twelve hours; when the green coat being separated from the other, it is covered up a fortnight in a moist place; then pounded into a tough paste, so that no fibres of the wood are discernible, and washed in a running stream till no motes appear; put up to ferment four or five days, skimmed as often as any thing arises, and laid up for use. To use it, a third part of nut-oil, or thin grease, must be incorporated with it over the fire.

The juice of holly-bark, is a very peculiar substance. But if trials were made, it seems probable, that many other juices would be found to have the same clammy nature. The mistletoe affords a juice, even superior to that of the holly; and if a young shoot of the common alder be cut through, there will a stringy juice draw out in threads, and follow the knife like bird-lime, or the juice of the holly. It seems in this tree to be lodged, not in the bark, but in certain veins just within the circle of the wood. The roots of all the hyacinths also afford a tough and stringy juice of the same kind; and so does the asphodel, the narcissus, and the black bryony root, in a surprising quantity.

When twigs, &c. smeared with bird-lime are to be put in places subject to wet, the common bird-lime is apt to have its force soon taken away. It is necessary, therefore, to have recourse to a particular sort, which from its property of bearing water unharmed, is called *water bird-lime*; and is prepared thus. Take a pound of strong and good bird-lime; wash it thoroughly in spring-water, till the hardcocks is all removed; and then beat it well, that the water may be clean separated, so as not a drop remains; then dry it well, and put it into an earthen pot; add to it as much capon's grease as will make it run. Then add two spoonfuls of strong vinegar, one spoonful of oil, and a small quantity of Venice turpentine. Let the whole boil for some minutes over a moderate fire, stirring it all the time. Then take it off; and when there is occasion to use it, warm it, and cover the sticks well with it. This is the best sort of bird-lime for snipes, and other birds that love wet places.

The most successful method of using the common bird-lime is this: Cut down the main branch or bough of any bushy tree, whose twigs are thick, straight, long, and smooth, and have neither knots nor prickles. The willow and the birch-tree afford the best of this kind. Let all the superfluous shoots be trimmed off, and the

twigs all made neat and clean; they must all be well covered with the bird-lime, within four inches of the bottom; but the main bough from which they grow, must not be touched with the lime. No part of the bark, where the lime should come, must be left bare: but it is a nice matter to lay it on properly; for if it be too thick it will give the birds a distaste, and they will not come near it; and if there be too little of it, it will not hold them when they are there. When the bush is thus prepared, it must be set up in some dead hedge, or among some growing bushes near the outskirts of a town, a farmer's back-yard, or the like, if it be in the spring; for these places are the resort of the small birds at that time. If it be used in summer, the bush must be placed in the middle of a quick-set hedge, or in groves, bushes, or white-thorn trees, near fields of corn, hemp, flax, and the like; and in the winter, the proper places are about stacks of corn, hovels, barns, and the like. When the lime-bush is thus planted, the sportsman must stand as near it as he can, without being discovered; and with the mouth, or otherwise, make such sort of notes as the birds do when they attack or call to one another. There are bird-calls to be bought for this use; but the most expert method is to learn the notes of call of the several birds, and imitate them by a sort of whistling. When one bird is thus enticed to the bush, and hung fast, the business of the sportsman is not to run up to take it, but to be patient: for it will hang itself more fast, by its struggling to get away; and its fluttering will bring more to the bush, so that several may be taken together. The time of the day for this sport is from sun-rise to ten o'clock, and from one to sun-set. Another very good method of bringing the birds together, is by a stale: a bat makes a very good stale; but it must be fastened, so as to be in sight at a distance. An owl is a still better stale; for this bird never goes abroad, but it is followed by all the small birds in the neighbourhood. They will gather together in great numbers about it; and having no convenient place to sit on, but the lime-bush, will be taken in great numbers. If a living owl or bat is not to be had, the skin stuffed will serve the purpose, and will last 20 years. Some have used the image of an owl carved in wood, and painted in the natural colours; and it has been found to succeed very well.

Methods of preserving BIRDS from putrefaction, and so as to retain their natural form and position, as well as the beauty of their colours and plumage. A good antiseptic for animal substances has been much inquired after; as, for want of it, many curious animals, and birds particularly, come to our hands in a very imperfect state; some from foreign parts entirely miscarry, and others of the finest plumage are devoured by insects. Various methods of preservation, therefore, have been of late described; but the following improved methods by Dr Lettson * seem to be the least troublesome and the most complete.

"After opening the bird by a longitudinal incision from the breast to the vent; dissecting the fleshy parts from the bones; and removing the entrails, eyes, brains,

† See Phil. Transf. for 1776, p. 185, 302.

* Naturalist's and Traveller's Companion, p. 12. et seq.

Bird.

brains (r), and tongue; the cavities and inside of the skin are to be sprinkled with the powders mentioned below: the eyes (c) are then to be inferted, and the head stuffed with cotton or tow: in the next place, a wire is to be passed down the throat through one of the nostrils, and fixed into the breast-bone: wires are also to be introduced through the feet, up the legs and thighs, and inferted into the same bone: next, fill the body with cotton to its natural size, and sew the skin over it: the attitude is lastly to be attended to; and in whatever position the subject is placed to dry, that same position will be retained afterwards.

“ The drying compound is as follows:

Corrosive sublimate, - - -	$\frac{1}{4}$ lb.
Saltpetre prepared or burnt, - - -	$\frac{1}{2}$ lb.
Alum burnt, - - -	$\frac{1}{2}$ lb.
Flowers of sulphur, - - -	$\frac{1}{2}$ lb.
Camphor, - - -	$\frac{1}{4}$ lb.
Black pepper, - - -	1 lb.
Tobacco ground coarse, - - -	1 lb.

Mix the whole together, and keep it in a glass vessel stopp'd close.

“ Small birds may be preserved in brandy, rum, arrack, or spirit runnings; though in this manner the colour of the plumage is liable to be extracted by the spirit.

“ Large sea-fowl have thick, strong skins, and such may be skinned; the tail, claws, head, and feet, are carefully to be preserved, and the plumage stained as little as possible with blood. The inside of the skin may be stuffed as recommended above.

“ Kuckahn observes †, that ‘baking is not only useful in fresh preservations, but will also be of very great service to old ones, destroying the eggs of insects; and it should be a constant practice once in two or three years to bake them over again, and to have the cases fresh washed with camphorated spirit, or the sublimate solution, which would not only preserve collections from decay much longer, but also keep them sweet.’

“ One of the best preservatives, is to procure close boxes, well glazed: with such a precaution I have kept them in a dry room many years without the least appearance of injury.—Baking is apt to crimp and injure the plumage, unless great care be used; and therefore the proper degree of heat should be ascertained by means of a feather, before such subjects are baked.

“ When the subject is to be kept for some time in a hot climate, it should be secured in a box filled with tow, oakum, or tobacco, well sprinkled with the sublimate solution.”

In Guiana, the number and variety of beautiful birds is so great, that several persons in the colony advantageously employ themselves, with their slaves and dependants, in killing and preserving these animals for the cabinets of naturalists in different parts of Europe. The method of doing this, as related by Mr Bancroft *, is, “ to put the bird which is to be preserved in a proper vessel, and cover him with high wines, or the first running of the distillation of rum. In this spirit he is suffered to remain for 24 or 48 hours, or longer, ac-

cording to his size, till it has penetrated through every part of his body. When this is done, the bird is taken out; and his feathers, which are no ways changed by this immersion, are placed smooth and regular. It is then put into a machine, made for the purpose, among a number of others, and its head, feet, wings, tail, &c. are placed exactly agreeable to life. In this position they are all placed in an oven, very moderately heated, where they are slowly dried; and will ever after retain their natural position, without danger of putrefaction.”

Mr Edwards Recipe for making Pictures of BIRDS, with their natural feathers.* Firrit, take a thin board, or pannel of deal, or waincoat well seasoned, that it may not shrink; then smoothly paste on it white paper, and let it dry; and if the wood casts its colour thro', you may paste on a second paper, and it will be whiter: let the second paper dry; then get ready any bird that you would represent, and draw it as exact as may be on your papered pannel, of its natural size, (middle-sized birds are best for this work); then paint what ground-work, or tree, or other thing, you design to set your bird on, together with the bill and legs of the bird in water-colours, leaving the bird to be covered with its own natural feathers. You must first prepare the part to be feathered, by laying on pretty thick gum Arabic, dissolved in water, with a large hair-pencil: then lay the pannel flat, and let it dry hard; and when dry, cover it with your gum-water a second time, and let it dry; and then a third, in case you do not find it lie with a good body on the paper; the thickness of a shilling, when dried hard, is sufficient. When your piece is thus prepared, take the feathers off from your bird, as you use them; beginning always at the tail, and points of the wing, and working upwards to the head; observing to cover that part of your draught with the feather, that you take from the same part in your bird, letting them fall one over another in their natural order: you must prepare your feathers by cutting off the downy part that is about their bottoms; and the larger feathers must have the insides of their shafts shaved off with a knife to make them lie flat; the quills of the wings must have their inner webs clipped off, that in laying them the gum may hold them by their shafts. When you begin to lay them, take a pair of steel pliers to hold the feathers in; and have some gum-water, not too thin, and a large pencil, ready to moisten the gummed ground-work by little and little as you work it: then lay your feathers on the moistened parts; which must not be waterish, but something tacky or clammy to hold the feathers. You should prepare a parcel of small leaden weights, in the form of fugar-loaves; which you may cast in sand, by first making holes in its surface with a pointed stick: these weights will be necessary to set on the feathers you have newly layed on, to hold them to the gum till they are dry and fixed: but you must be cautious lest the gum come through the feathers; for it not only smears them, but dries to the bottoms of the weights, and you will be apt to pull off the feathers with the weights, which will disorder your work:

when

(F) In large birds, the brains may be extracted by the eyes; the best instrument for this purpose is a director used by surgeons, which may be had of an instrument-maker at a trifling expence.

(G) Wax (used by some) is not a proper substance for eyes; there are persons in London, whose business it is to make glass-eyes of any size or colour, at a penny or two-pence a pair.

* Nat. of Birds Vol. II. p. 119

† Phil. Transf. Vol. LX. p. 319.

* Natural History of Guiana.

when you have wholly covered your bird with feathers, you milt with a little thick gum stick on a piece of paper cut round, of the bigness and in the place of the eye, which you milt colour like the eye of the bird. When the whole is dry, drefs the feathers round the out-line that may chance to flare a little, and rectify what may be mended in any other part: then lay a sheet of clean paper on it; and on that a heavy book, or some such thing, to press it: after which it may be preserved in a frame covered with a glass.

BIRDS, in heraldry, according to their several kinds, represent either the contemplative or active life. They are the emblems of liberty, expedition, readines, swiftness, and fear. They are more honourable bearings than fishes, because they participate more of air and fire, the two noblest and lightest elements, than of earth and water.—Birds must be borne in coat-armour, as is best fitting the propriety of their natural actions of going, sitting, standing, flying, &c. Birds that are either whole footed, or have their feet divided, and yet have no talons, are said to be *membered*; but the cock, and all birds of prey with sharp and hooked beaks and talons for encounter or defence, are termed *armed*. In the blazoning of birds, if their wings be not displayed, they are said to be borne close; as, *he beareth an eagle*, &c. close.

BIRDS-Nests, in cookery, the nest of a small Indian swallow, very delicately tasted, and frequently mixed among soups. On the sea-coasts of China, at certain seasons of the year, there are seen vast numbers of these birds; they leave the inland country at their breeding time, and come to build in the rocks, and fashion their nests out of a spumous matter, which they find on the shore, washed thither by the waves. The nature of this substance is not yet ascertained. According to Kæmper, it is mollusc or sea-worms; according to M. le Poivre, fish-spawn; and according to Dalrymple, sea-weeds. The nests are of a hemispheric figure, and of the size of a goose's egg, and in substance much resemble the ichthyocolla or *isinglass*. The Chinese gather these nests, and sell them to all parts of the world; they dissolve in broths, &c. and make a kind of jelly of a very delicious flavour.

BIREMIS, in Roman antiquity, a vessel with two rows of oars; concerning the disposition of which authors are not agreed.

BIRETUM, or **BIRRETUM**, a sort of black bonnet, or covering of the head, in form of a pyramid, much used in Italy and France, about 500 or 600 years ago, as a badge of victory, honour, or sacerdotal preference.

BIRKENHEAD, or **BERKENHEAD** (Sir John), a famous political author, born about the year 1615. Being recommended to Dr William Laud archbishop of Canterbury, he became his secretary; in which office he shewed such capacity and diligence, that the archbishop, by his diploma, created him master of arts in 1639; and in the year following, by letter commendatory from the same prelate, he was chosen probationer fellow of All-Soul's College. This obliged him to reside constantly at Oxford; and on King Charles I.'s making that city his head-quarters during the civil war, our author was made choice of to write a kind of journal in defence of the royal cause, by which he gained great reputation. By his majesty's recommen-

dation, he was chosen reader in moral philosophy; which employment he enjoyed till 1648, when he was expelled by the parliament visitors. He retired afterwards to London, where he wrote several poetical pieces; and having adhered steadily to his principles, he acquired the title of the *loyal poet*, and suffered several imprisonments. He published, while he thus lived in obscurity, some very satirical compositions, mostly levelled against the republican grandees, and written with great poignancy. Upon the restoration of King Charles II. our author was rewarded for his loyalty. He was created, April 6th, 1661, on the king's letters sent for that purpose, doctor of the civil law by the university of Oxford; and in that quality, as an eminent civilian, was consulted by the convocation on the question, Whether bishops ought to be present in capital cases. He was about the same time elected to serve in parliament for Wilton, in the county of Wilts. He was knighted November 14th, 1662; and upon Sir Richard Fanshawe's going in a public character to the court of Madrid, he was appointed to succeed him as master of requests. He lived afterwards in credit and esteem, and received various favours from the court, which, however, drew upon him some very severe attacks from those who opposed the court. Mr Wood has treated him with great severity; but his memory has been transmitted with honour to posterity by others, particularly by Dryden, Langbaine, and Winstanly. He died in Westminster, December 4th, 1679; and was interred in St Martin's in the Fields.

BIRKENFIELD, a town of Germany, capital of a county of the same name in the circle of the Upper Rhine. It is seated near the river Nave, in E. Long. 7. 9. N. Lat. 49. 35.

BIRMINGHAM, a very large town of Warwickshire in England, situated in W. Long. 1. 35. N. Lat. 52. 30. It is no corporation, being only governed by two constables and two bailiffs; and it is therefore free for any person to come and settle there; which has contributed greatly not only to the increase of the buildings, but also of the trade, which is the most flourishing of any in England for all sorts of iron work besides many other curious manufactures. The town stands on the side of a hill, nearly in the form of a half-moon. The lower part is filled with the workshops and warehouses of the manufacturers, and consists chiefly of old buildings. The upper part of the town contains a number of new and regular streets, and a handsome square elegantly built. It has two churches, one in the lower part of the town, which is an ancient building with a very tall spire: the other is a very grand modern structure, having a square stone tower with a cupola and turret above it. The houses in this town amount to between 6000 and 7000, and their number is continually increasing.

BIRON (Armand de Gontault, lord of), marshal of France, and a celebrated general in the 16th century, signalized himself by his valour and conduct in several sieges and battles. He was made grand master of the artillery in 1569, and no body dared to assault him at the massacre of St Bartholomew. He was the first who declared for Henry IV. He brought a part of Normandy under his subjection, and dissuaded him from retiring to England or Rochelle. But he was killed by a cannon-ball, at the siege of Eperuay, on the 26th of

July.

Bifa.

July, 1592. He was a very universal scholar : and used to carry a pocket-book, in which he wrote down every thing that appeared remarkable ; which gave rise to a proverb very much used at court : When a person happened to say any thing uncommon, they told him, *Tou have found that in Biron's pocket-book.*

BIROTA, or **BIROTUM**, in Roman antiquity, a kind of vehicle, so denominated from its moving upon two wheels. It carried about 200 pound weight, and was drawn by three mules.

BIRRUS, in Roman antiquity, a cloak, made of woollen cloth, worn by the soldiers. Also a robe anciently worn by the priests or bishops.

BIRTH, in midwifery, signifies the same with delivery. See **MIDWIFERY**.

BIRTH, or *Berth*, the station in which a ship rides at anchor, either alone or in a fleet ; or the distance between the ship and any adjacent object ; comprehending the extent of the space in which she ranges at the length of her cables : as, *she lies in a good berth*, i. e. in a convenient situation, or at a proper distance from the shore and other vessels ; and where there is good anchoring-ground, and shelter from the violence of the wind and sea.

BIRTH also signifies the room or apartment where any particular number of the officers or ship's company usually mess and reside. In a ship of war there is commonly one of these between every two guns.

BIRTH-DAY, the anniversary return of the day whereon a person was born. The ancients placed a good deal of religion in the celebration of birth-days, and took omens from thence of the felicity of the coming year. The manner of celebrating birth-days was by a splendid dress ; wearing a sort of rings peculiar to that day ; offering sacrifices, the men to their genius, of wine, frankincense ; the women to Juno ; giving suppers, and treating their friends and clients ; who, in return, made them presents, wrote and sung their panegyrics, and offered vows and good wishes for the frequent happy returns of the same day. The birth-days of emperors were also celebrated with public sports, feasts, vows, and medals struck on the occasion.—But the ancients, it is to be observed, had other sorts of birth-days besides the days on which they were born. The day of their adoption was always reputed as a birth-day, and celebrated accordingly. The emperor Adrian, we are told, observed three birth-days ; viz. the day of his nativity, of his adoption, and of his inauguration. In those times it was held, that men were not born only on those days when they first came into the world, but on those also when they arrived at the chief honours and commands in the commonwealth, *c. gr.* the consulate. Hence that of Cicero in his oration *ad Quirites*, after his return from exile : *A parentibus, id quod necesse erat, parvus sum procreatus ; a vobis natus sum consularis.*

BIRTH-WORT, in botany. See **ARISTOLOCHIA**.

BIRVIESCA, a town of Old Castile in Spain, and capital of a small territory called *Bureva*. W. Long. 2. 15. N. Lat. 56. 35.

BIRZA, a town of Poland in the province of Sarmogitia. E. Long. 25. 5. N. Lat. 56. 35.

BISA, or **BIZA**, a coin of Pegu, which is current there for half a ducat. It is also a weight used in that kingdom.

BISACCIA, a small handsome town of Italy, in the Ulterior Principato, and in the kingdom of Naples, with a bishop's see. E. Long. 15. 35. N. Lat. 41. 3.

BISCARA, a town of Africa, in the kingdom of Algiers, seated in the eastern or Levantine government, in E. Long. 5. 50. N. Lat. 35. 10. This city belonged to the province of Zeb in Numidia, which lies south of the kingdom of Labez ; but the Algerines, in their annual incursions to carry off slaves, made themselves masters of Biscara, in order to facilitate their entrance into the southern provinces. It retains still some remains of the ancient city that gave name to this territory ; and hath a garrison to keep the inhabitants in awe, and who usually bring lions, tigers, and other wild beasts for sale to strangers. The city of Algiers is never without a great number of Biscarans, who are employed in the hardest and lowest offices, as cleaning of streets, emptying of vaults, sweeping chimneys, &c. ; and when they have got about 10 or 12 crowns by this drudgery, they return to their country, where they are respected as worthy men on account of their money, the inhabitants of this province being almost entirely destitute of coin, and reckoned the most miserable of all the Arabian tribes.

BISCAY, a province of Spain, bounded on the north by the sea called the *Bay of Biscay*, on the south by Old Castile, on the west by Asturias of Santilana, and on the east by the territories of Alava and Guipuscoa. It is in length about seventy-four miles ; but the breadth is much less, and very unequal. This country in general is mountainous and barren ; but in some places it produces corn, and every where a great quantity of apples, oranges, and citrons. They make cyder with the apples, which is their common drink. Besides this, they have wine called *chacolino*, which is pleasant, but will not keep long, and therefore is used instead of small-beer. Their valleys produce a little flax, and their hills a great deal of timber for ships. The sea affords them excellent fish of all sorts. The wool that is exported here comes from Old Castile ; but their greatest riches are produced by their mines of iron, which metal is extremely good, and is transported to all parts. They have likewise artificers that work in iron, and are, in particular, famous for working swords and knives. The natives of this province, who are of Celtic extraction, still retain their old laws, customs, and language. They are active, industrious, brave, hardy, choleric, and make the best soldiers and sailors in all Spain. Some say their language has no analogy with any now spoken in Europe. The chief towns in it are Bilboa, Ordunna, Durango, Fontarabia, St Sebastian, Tolosa, and Victoria.

BISCAY (New), a province of North America, in the audience of Guadalajara. It has New Mexico on the north, Culiacan on the west, Zacatecas on the south, and Panuca, with Florida, on the east. It is about 300 miles from east to west, and 360 from north to south. In general it is well watered, fruitful, moderately temperate, and abounds in all sorts of provisions, except the mountains of Topia, which are barren. The original inhabitants are not all brought under subjection, they having four large towns in the morasses, that are of difficult access ; for this reason the Spaniards have built three small fortified towns, which

are

are well inhabited, for the defence of their silver mines. The latitude is from 25 to 28 degrees.

BISCHOFISHEIM, a town of Germany, in the archbishoprick of Mentz, and circle of the Lower Rhine, seated on the river Tauber, near the frontiers of Franconia, E. Long. 9. 37. N. Lat. 49. 40.

BISCHOFF-ZELL, a town of Switzerland, belonging to the bishop of Constance. There is a castle wherein the bishop's bailiff resides, who receives half the fines; but he has nothing to do with the town, nor is there any appeal from the council of the town. It is seated on the Thur, at the place where the Sitter falls into this river, almost half way between Constance and St Gall. E. Long. 9. 23. N. Lat. 47. 33.

BISCHWELLER, a fortress of Alsace, seated in E. Long. 7. 0. N. Lat. 48. 40.

BISCHROMA, in music, the fame as our triple quaver. See **CHROMA**.

BISCUTELLA, **BUCKLER-MUSTARD**, or *Bastard Mithridate-mustard*; a genus of the tetradynamia order, belonging to the filiculosa class of plants. Of this there are three species; the *articulata*, with small pods joined to the style; the *didyma*, with a double orbicular pod diverging from the style; and the *apula*, with flowers growing in spikes and a shorter style. They are natives of France, Italy, and Germany.

BISEGLIA, a populous town of Italy, in the kingdom of Naples and Terra de Bari, with a bishop's see, seated near the Gulf of Venice, in E. Long. 16. 49. N. Lat. 41. 18.

BISERRULA, a genus of the decandria order, belonging to the diadelphica class of plants, for which there is no English name. Of this genus there is only one species known, viz. the *pelecinus*, an annual plant with purple flowers, growing in Italy, Sicily, Spain, and the south of France.

BISERTA, a town of the kingdom of Tunis in Africa, seated on a gulf of the same name, in E. Long. 10. 40. N. Lat. 37. 20. The gulf is a very large one, and the *Sinus Hipponensis* of the ancients. It is formed by the Capes Blanco and Ziebeb; and has a beautiful sandy inlet near four leagues wide, which once admitted the largest vessels, but through the negligence of the Turks can now admit only those of the smallest size, and is in danger in a short time of being totally choaked up. Some remains of the great pier of Hippo are still extant; by which it appears to have run out into the sea so as to break the north-east wind, and make this one of the safest and most beautiful havens in these parts. On the fourth, this gulf hath a communication with a lake of the same name, so as to form a kind of canal between it and the Mediterranean sea. Through this canal a constant stream is observed alternately discharging itself from the sea to the lake, and from the lake to the sea, in the same manner as the Atlantic ocean is observed to do in the Mediterranean, and back again; so that what the lake loses by exhalations is soon recruited by the sea, which in hot seasons runs into it with a very brisk current to keep up the equilibrium. The town was formerly very considerable; and, though not above a mile in circuit, is said to have contained 6000 houses; whereas both it and the villages under it now scarce contain that number of inhabitants. It has still, however, some strong castles and batteries to defend it, especially towards the sea. There are also

two very capacious prisons for slaves, a large magazine or ware-house for merchandize, and two towers with some other outworks to defend the entrance of the haven. The city, though so near the sea, is well supplied with fresh water from springs that surround it on every side towards the land. It is likewise well furnished with variety of fish from the adjacent lake. Most of the inhabitants of Biserta, as well as of the adjacent country on both sides of the canal, are employed in the fishing trade, which begins about the end of October, and ends in the beginning of May; for the rains then sweetening the waters, make the fish come into it in vast quantities during that season; but afterwards they either disappear, or grow lean, dry, and unfit to eat.

The people here are extremely poor; yet very proud, ill natured, and faithless; inasmuch that Muley Hafun Bey, one of their sovereigns, used to say, that none of his subjects deserved his resentment so much as they, since neither fear nor love could keep them faithful.—Biserta hath about eight villages under its government; a large plain called *Matter* or *Mater*; and the territory of Choros, the *Clypea* or *Gorobis* of the ancients. This is a tract of great extent, and would be very fertile were it not for the frequent incursions of the Arabs. The people are very poor, live meanly, and go worse clad. Their choicest dainties is their couscou, a kind of cake made of flour, eggs, and salt, which they dry and keep all the year round. Their dress is nothing else than a piece of coarse cloth wrapped round their bodies, and another round their heads by way of a turban; and most of them go barefooted and barelegged. The poorer sort have nothing but a few skins laid on the floor to sleep upon; but the rich have narrow couches fixed against the wall, about five or six feet high, to which they mount by a ladder. They are very expert horsemen, as most in these countries are, and ride without saddle or bridle; nor do they ever shoe their horses. They are still more miserable from the neighbourhood of the Arabs, who living altogether by plunder, robbery, and murder, oppress the poor inhabitants with their frequent inroads and cruel exactions. The Bisertines, both of the city and country, are the most superstitious people in Barbary, scarce going any where without hanging a quantity of amulets about their own, or, if they ride, their horses neck also. These amulets are only scrapes of parchment or paper with some strange characters written upon them, which they sew up in a piece of leather, silk, &c. and imagine when worn about them to be a preservative against all accidents.

BISHOP, (in Greek *ἐπίσκοπος*, *Overseer*, or *Superintendent*), is the highest ecclesiastical dignitary, the chief officer in the hierarchy or œconomy of church-government. The apostles, after our Saviour's ascension, went forth preaching the gospel in the particular provinces allotted to them; and appointed the first converts of every place through which they passed, or, as Clemens Romanus expresses it, *the first fruits of their ministry*, to be the bishops and deacons of the churches planted by them. Thus Tertullian says, Clemens was ordained bishop of Rome by St Peter, and Polycarp bishop of Smyrna by St John.

There appears to have been but one bishop in a church; the titles of which supreme officer are reckoned up by Cyprian, and are, *Bishop*, *President*, *Pastor*, *Governor*, *Superintendent*, and *Priest*. And, as there

Biserta,
Bithop.

Bishop.

was but one bishop to a church, so there was but one church to a bishop; as appears from hence, that the ancient dioceses are never said to contain *churches* in the plural, but only a *church* in the singular: for authors speak of the church of Corinth, the church of Smyrna, the church of Philadelphia, the church of Antioch, &c. The word *diocese*, by which a bishop's flock is now usually expressed, is never used in that sense by the writers of the three first centuries: but the bishop's cure is frequently denoted by the word *παροικία, parish*; as appears from the synodical epistle of Irenæus to pope Victor, and from numberless places of Eusebius's Ecclesiastical History, which speaks of the bishops of the parish of Alexandria, of the parish of Ephesus, of the parish of Corinth, of the parish of Athens, of the parish of Carthage, &c. denoting the very same thing, which we now mean by the word *parish*; viz. a competent number of Christians, dwelling near together, having one bishop, or *pastor*, set over them.

The peculiar acts of the episcopal function were, preaching the word, praying with his people, administering the two sacraments of baptism and the eucharist, taking care of the poor, ordaining of ministers, governing his flock, excommunicating offenders, absolving of penitents. To the constant discharge of these offices the primitive bishops sedulously applied themselves; to which purpose they resided constantly on their cures: indeed, residence on their parishes was deemed so necessary, that Cyprian, enumerating the sins which brought the wrath of God on the church in the bloody persecution of Decius, mentions the non-residence of the bishops as one.—If we inquire into the peculiar powers and privileges of the ancient bishops, we shall find, first, that they had a liberty of framing their own liturgies, only keeping to the analogy of faith and sound doctrine; to express the same creed in different forms; and to appoint days of fasting in their particular churches. They were allowed to sit and judge in secular causes, when appealed to as arbitrators of mens differences; and Constantine made a law to confirm all such decisions of bishops in their consistories. There are two laws, of Arcadius and Honorius, to the same purpose; but with these two limitations, viz. that they should only have power to judge when both parties agreed by consent to refer their causes to their approbation; and that they should not be allowed to judge in criminal causes, where life and death might be concerned. To these privileges we may add that of disposing of the revenues of the church. There are several canons to this purpose. The apostolical constitution speak of this power; and Cyprian observes, that all, who received maintenance from the church, had it, *Episcopo dispensante*, by order and appointment of the bishop. For this purpose he had his *œconomus*, or *steward*, which some canons order to be one of the clergy of every church. Such was the state of episcopacy in the primitive Christian church; which did not long continue such: for dioceses, in after times, became enlarged, and comprehended several *παροικίας, or parishes*; the bishops degenerated from their original and apostolical simplicity; and wealth, power, and grandeur, began to distinguish the episcopate from the inferior orders of the hierarchy.

A bishop, or an archbishop (see ARCHBISHOP), is elected by the chapter of his cathedral church, by vir-

tue of a license from the crown. Election was, in very early times, the usual mode of elevation to the episcopal chair throughout all Christendom; and this was promiscuously performed by the laity as well as the clergy: till at length, it becoming tumultuous, the emperors and other sovereigns of the respective kingdoms of Europe took the appointment in some degree into their own hands; by reserving to themselves the right of confirming these elections, and of granting investiture of the temporalities, which now began almost universally to be annexed to this spiritual dignity; without which confirmation and investiture, the elected bishop could neither be consecrated nor receive any secular profits. This right was acknowledged in the emperor Charlemagne, A. D. 773, by pope Hadrian I. and the council of Lateran, and universally exercised by other Christian princes: but the policy of the court of Rome at the same time began by degrees to exclude the laity from any share in these elections, and to confine them wholly to the clergy, which at length was completely effected; the mere form of election appearing to the people to be a thing of little consequence, while the crown was in possession of an absolute negative, which was almost equivalent to a direct right of nomination. Hence the right of appointing to bishoprics is said to have been in the crown of England (as well as other kingdoms in Europe) even in the Saxon times; because the rights of confirmation and investiture were in effect (though not in form) a right of complete donation. But when, by length of time, the custom of making elections by the clergy only was fully established, the popes began to except to the usual method of granting these investitures, which was *per anulum et baculum*, by the prince's delivering to the prelate a ring and pastoral staff or *crozier*; pretending, that this was an encroachment on the church's authority, and an attempt by these symbols to confer a spiritual jurisdiction: and pope Gregory VII. towards the close of the eleventh century, published a bull of excommunication against all princes who should dare to confer investitures, and all prelates who should venture to receive them. This was a bold step towards effecting the plan then adopted by the Roman see, of rendering the clergy entirely independent of the civil authority: and long and eager were the contests occasioned by this papal claim. But at length, when the emperor Henry V. agreed to remove all suspicion of encroachment on the spiritual character, by conferring investitures for the future *per sceptrum*, and not *per anulum et baculum*; and when the kings of England and France consented also to alter the form in their kingdoms, and receive only homage from the bishops for their temporalities, instead of investing them by the ring and crozier; the court of Rome found it prudent to suspend for a while its other pretensions.

This concession was obtained from king Henry I. in England, by means of that oblate and arrogant prelate archbishop Anselm: but king John (about a century afterwards) in order to obtain the protection of the pope against his discontented barons, was also prevailed upon to give up by a charter, to all the monasteries and cathedrals in the kingdom, the free right of electing their prelates, whether abbots or bishops: reserving only to the crown the custody of the temporalities during the vacancy; the form of granting a license

cfence

cence to elect, (which is the original of our *conge d'eshire*), on refusal whereof the electors might proceed without it; and the right of approbation afterwards, which was not to be denied without a reasonable and lawful cause. This grant was expressly recognized and confirmed in king John's *magna carta*, and was again established by statute 25 Edw. III. ff. 6. § 3.

But by statute 25 Hen. VIII. c. 20. the ancient right of nomination was, in effect, restored to the crown: it being enacted, that, at every future avoidance of a bishopric, the king may send the dean and chapter his usual licence to proceed to election; which is always to be accompanied with a letter missive from the king, containing the name of the person whom he would have them elect: and, if the dean and chapter delay their election above twelve days, the nomination shall devolve to the king, who may by letters patent appoint such person as he pleases. This election or nomination, if it be of a bishop, must be signified by the king's letters patent to the archbishop of the province; if it be of an archbishop, to the other archbishop and two bishops, or to four bishops; requiring them to confirm, invest, and consecrate the person so elected: which they are bound to perform immediately, without any application to the se. of Rome. After which the bishop elect shall sue to the king for his temporalities, shall make oath to the king and none other, and shall take restitution of his secular possessions out of the king's hands only. And if such dean and chapter do not elect in the manner by this act appointed, or if such archbishop or bishop do refuse to confirm, invest, and consecrate such bishop elect, they shall incur all the penalties of a *præmunire*.

The dean and chapter having made their election, the archbishop, by the king's direction, confirms the bishop, and afterwards consecrates him, by imposition of hands, according to the form laid down in the Common-Prayer book. Hence we see that a bishop differs from an archbishop in this, that an archbishop with bishops consecrates a bishop, as a bishop with priests consecrates a priest: other distinctions are, that an archbishop visits a province, as a bishop a diocese; that an archbishop convokes a provincial synod, as a bishop does a diocesan one; and that the archbishop has canonical authority over all the bishops of his province, as a bishop has over the priests of his diocese.

The power and authority of a bishop, besides the administration of certain holy ordinances peculiar to that sacred order, consist principally in inspecting the manners of the people and clergy, and punishing them in order to reformation, by ecclesiastical censures. To this purpose he has several courts under him, and may visit at pleasure every part of his diocese. His chancellor is appointed to hold his courts for him, and to assist him in matters of ecclesiastical law; who, as well as all other ecclesiastical officers, if lay or married, must be a doctor of the civil law, so created in some university. It is also the business of a bishop to institute, and to direct induction, to all ecclesiastical livings in his diocese.

Archbishops and bishops may become void by death, deprivation for any very gross and notorious crime, and also by resignation. All resignations must be made to some superior. Therefore a bishop must resign to his metropolitan; but the archbishop can re-

sign to none but the king himself.

All bishops of England are peers of the realm, except the bishop of Man; and, as such, fit and vote in the House of Lords: they are barons in a threefold manner, viz. feudal, in regard to the temporalities annexed to their bishoprics; by writ, as being summoned by writ to parliament; and lastly, by patent and creation: accordingly they have the precedence of all other barons, and vote as barons and bishops; and claim all the privileges enjoyed by the temporal lords, excepting that they cannot be tried by their peers, because, in cases of blood, they themselves cannot pass upon the trial, for they are prohibited by the canons of the church (as already observed) to be judges of life and death. They have the title of *Lords and Right Reverend Fathers in God*. There are 24 bishops in England; besides that of Sodor and Man, who has no seat in the House of Peers. The bishops of London, Durham, and Winchester, take place from the other bishops, who are to rank after them according to their seniority of consecration.

BISHOP'S COURT, an ecclesiastical court, held in the cathedral of each diocese, the judge whereof is the bishop's chancellor, who judges by the civil and canon law; and if the diocese be large, he has his commissaries in remote parts, who hold what they call *consistory courts*, for matters limited to them by their commission.

BISHOP and his Clerks, some little islands and rocks on the coast of Pembrokehire near St David's in Wales, which are very dangerous to mariners.

BISHOP'S CASTLE, a town of Shropshire in England, seated near the river Clun. It is a corporation, sends two members to parliament, and its market is much frequented by the Welch. W. Long. 2. 55. N. Lat. 52. 30.

BISHOP'S-STORTFORD, a town of Hertfordshire in England, seated on the side of a hill, in E. Long. 0. 25. N. Lat. 51. 50. It has several good inns, but the streets are not paved. It has a large church, one Presbyterian, and one Quaker meeting. Here was formerly a castle called *Weymore castle*, wherein a garrison was kept, but no remains of it are now left.

BISHOPING, a term among horse-dealers, to denote the sophistications used to make an old horse appear young, a bad one good, &c.

BISHOPRIC, the district over which a bishop's jurisdiction extends, otherwise called a diocese †.

In England there are 24 bishoprics, besides that of Sodor and Man; in Scotland, none at all; in Ireland, eighteen.

BISIGNANO, a town of Italy, in the kingdom of Naples, and in the hither Calabria. It hath a strong fort, a bishop's see, and the title of a principality. It is seated on a mountain near the river Boccona, in E. Long. 16. 40. N. Lat. 39. 37.

BISKET, a kind of bread prepared by the confectioners, of fine flour, eggs, and sugar, and rose or orange water; or of flour, eggs, and sugar, with aniseeds and citron-peel, baked again and again in the oven, in tin or paper moulds. There are divers sorts of biscuits; as feed-bisket, fruit-bisket, long-bisket, round-bisket, Naples-bisket, sponge-bisket, &c.

SEA-BISKET, is a sort of bread much dried by passing the oven twice, to make it keep for sea-service. For long voyages they bake it four times, and prepare it

one's
ent.
l. 377.

† See Bishop.

B'millah
||
Bifniagar.

fix months before the embarkation. It will hold good a whole year.

To preserve sea-bisket from insects, Mr Hales advices to make the fumes of burning brimstone pass through the casks full of bread. Bisket may be likewise preserved a long time, by keeping it in casks well calked, and lined with tin.

The ancients had their bisket prepared after the like manner, and for the like use, as the moderns. The Greeks called it *αψιδος βρωσιον*, *q. d.* bread put twice to the fire. The Romans gave it the name of *panis nauticus*, or *capta*. Pliny denominates it *vetus aut nauticus panis iustus atque iterum coctus*. By which it appears, that, after the first baking, they ground or pounded it down again for a second. In some middle-age writers, it is called *paximas*, *paximus*, and *panis paximatus*. Among the Romans, we also meet with a kind of land-bisket for the camp-service, called *bucellatum*, sometimes *expeditionalis annona*, which was baked much, both to make it lighter for carriage, and less liable to corrupt, the coction being continued till the bread was reduced one fourth of its former weight.

BISMILLAH, a solemn form used by the Mahometans at the beginning of all their books and other writings, signifying, *In the name of the most merciful God.*

BISMILLAH is also used among the Arabs as a word of invitation to eat. An Arab prince will frequently sit down to eat in the street before his own door, and call to all that pass, even beggars, in this word, who do not fail to come and sit down to eat with him; for the Arabs are great levellers, and set every body upon a footing with them.

BISMUTH, called also *tin-glasi*, a ponderous brittle semi-metal, resembling zinc and the regulus of antimony, but differing greatly from them in quality.—Bismuth is sometimes found native, in small compact masses, of a pale lead-colour on the outside, but a silvery white within. It is very common in Germany, and not unfrequently found in the tin-mines of Cornwall, though little known, or at least regarded, there*.

BISNAGAR, formerly a very large and powerful kingdom of Asia, comprehending the kingdoms of Kanara, Messowr, Travankor, Madura, Marava, and Tanjour. It was called *Bisnagar* from its capital city, and took the name of *Nasfinga* from one of its rajahs or kings. We know nothing certain concerning this kingdom before the year 1520, when Khirifa Rajah, king of Bifniagar, made war with Adel Khan king of Vifapur, from whom he resolved to take the city of Rachol, situated in the island of Salfette near Goa, which he said had belonged to his ancestors. The king of Bifniagar's army consisted of 733,000 foot, 35,000 horse, 586 elephants with towers on their backs, each of which had four men in it; besides these were 12,000 water-carriers, and the army was followed by 20,000 common women. The city, however, resisted this formidable army for three months; at the end of which, Adel Khan came to its relief with an army of 120,000 foot, 18,000 horse, 150 elephants, and many heavy cannon. In the engagement the king of Bifniagar proved victorious, and almost entirely destroyed the army of Adel Khan, taking from him 4000 horses, 100 elephants, 400 cannon, &c. Soon after, he took the city by assault; but consented to restore the booty

taken in the former battle, provided Adel Khan consented to come and kiss his foot as the sovereign lord of Kanara. This base condition was accepted, but accidentally prevented from being put in execution. From this time we hear of nothing remarkable till the year 1558, when a Portuguese of the city of *Meliapur* or *St Thomas*, on the coast of Coromandel, persuaded Rama Rajah, then king of Bifniagar, to march against that place, telling him the plunder would be worth 2,000,000, and that the destruction of *Meliapur* would be of great service to the images in the Pagods which were thrown down by the Christians. The king set out accordingly with an army of 500,000 men; but the inhabitants, instead of preparing for their defence, sent him a present of 4000 ducats. This somewhat appeased him: however, he would not enter the city, but ordered the inhabitants of both sexes, with all their valuable effects, to be brought into his presence; which being done, he found that the value of their whole substance did not exceed 80,000 ducats. On this he ordered the informer to be thrown to the elephants, who tore him in pieces; after which he dismissed the citizens, and restored all their goods so punctually, that only a silver spoon happening to be missing, it was fought for, and returned to the owner. In 1565, the happy state of this kingdom excited the envy of the kings of Dekan; who, having raised an army of 500,000 foot and 50,000 horse, defeated and killed the king of Bifniagar, though at the head of an army almost twice as numerous, and took the royal city itself. They are said to have spent five months in plundering it, although the inhabitants had before carried off 1550 elephants loaded with money and jewels to the amount of upwards of 100,000,000 of gold; besides the royal chair for state days, whose price could not be estimated. The victors, however, found a diamond of the size of an ordinary egg, besides another of a size somewhat inferior, and several other jewels of immense value. Afterwards, however, they were forced to abandon the kingdom, as being too large for them to keep in their hands. From this time the kingdom of Bifniagar remained pretty much unmolested till about the year 1627, when it was subdued by Aurengzebe, second son to Shah Jehan, and hath ever since remained subject to the Great Mogul. In some places of this kingdom it is said the roads have great forests of bamboes on each side, which are so thick that it is impossible for a man to pass. These forests are full of monkeys; and what is singular, those on the one side seem to be enemies to those on the other; for if a basket of rice is set down on the road with a parcel of small sticks about it, the monkeys on each side will come out, and fall a-fighting with the sticks till one of the parties retreats. This, it is said, is often done by travellers for diversion. They catch the wild elephants here in pitfalls, and then tame them by means of others already tamed: the latter seldom fail of beating the wild ones into a good behaviour. The town of Bifniagar is situated in E. Long. 78. o. N. Lat. 13. 20.

BISNOW, or **BISCHNOR**, a sect of the Banians in the East Indies; they call their god Ram-ram, and give him a wife: They adorn his image with golden chains, necklaces of pearls, and all sorts of precious stones. They sing hymns in honour of their god, mixing their devotion with dances and the sound of drums, flagelets,

* See further, *Chemistry*, n^o 208, 447.

flagelets, brazen basons, and other instruments. This sect lives wholly upon herbs and pulse, butter and milk.

BISOMUM, or **DISOMUM**, in Roman antiquity, a tomb for two dead bodies, or the ashes of two. The ancients frequently buried two, three, or four bodies in the same sepulchre, disposed aside of each other; for it was held an impiety to lay one a-top of another. Hence the sepulchres of the primitive Christians had the words *bisomi*, *trisomi*, *quadrifomi*, &c. inscribed on them, to indicate the number of bodies deposited in them.

BISON, in zoology, the trivial name of a species of bos. See **BOS**.

BISQUET, or **BISKET**. See **BISKET**.

BISSAGOS, a cluster of islands on the coast of Negroeland in Africa, situated between the mouth of the river Gambia and Rio Grande. Their names are *Bulam*, *Cassuabac*, *La Gallinci*, *Cazegur*, *Galacha*, and *Oranguana*, with some other small islands; but the only one which merits a particular description is that of *Bulam* *. Each of these islands is governed by a king of its own; and as all these petty monarchs are quite independent, they frequently make war with each other, yet they always unite against the inhabitants of *Bisafara*, who are their common enemies. They have canoes that carry from 25 to 40 men with their provisions and arms, which are sabres, and bows, and arrows. The inhabitants are negroes; who are tall, strong, and healthy, though they live only on fish, nuts, and palm-oil; chusing rather to sell the rice, mullet, and other grain produced in their country, to the Europeans, than not to gratify their passion for trinkets and ornaments. In general, they are idolaters; cruel and savage in their disposition, not only to strangers but to one another, when they happen to quarrel, as they frequently do about trifles; and if they happen to be disappointed of their revenge, they frequently drown or flab themselves.

BISSAO, an island on the coast of Africa, a few leagues to the south-east of the river Gambia, and separated from the continent only by the channel of the river Geves. In this island the French have a factory, and there is also a fort belonging to the Portuguese, at both of which a great trade is carried on. The island is about 35 or 40 miles in circumference, having an agreeable prospect to the sea, from which it rises by a gentle ascent on every side to an eminence in the centre of the island. There are however a great many hills inferior in height to that in the middle, and separated by beautiful and fertile valleys divided by little rivulets, which at the same time augment the richness and elegance of the scene. So rich is the soil of *Bissao*, that wheat and maize spring up to the size of Indian corn, or rather resemble a field covered over with reeds or bamboos. The cattle also are of an extraordinary size, and seem to keep pace with the extravagant growth of the corn. Milk and wine are in the greatest abundance; but the island affords neither hogs nor horses. The former are forbid by the natives to be imported; and something in the soil or climate renders it unfit for the increase of the latter, which never thrive here. The dress of the men of all ranks in *Bissao* is only a skin fixed to the girdle before and behind. The dress of the married women consists of a cotton petticoat; but virgins go entirely naked,

wearing only bracelets of different kinds on their arms and legs. If they are of high quality, their bodies are marked or painted with a variety of hideous forms of snakes and other figures, which, as their colour is jet-black, gives their skins somewhat the appearance of flowered fatten. Even the prince's royal herself, the eldest daughter of the emperor, is only distinguished from other women by the elegance of those paintings and the richness of her bracelets. One very extraordinary ornament used in this country is a large iron ring, with a flat round surface on the outside instead of a stone, upon which the ring changes with a bit of iron, in such a manner as to converse with the greatest facility by means of the different sounds produced; but this kind of language is used only among the polite and the great. All the *Bissoans* are idolaters, nor has commerce introduced the smallest change in their manners, but their ideas of religion are exceedingly confused. Their chief idol is a little image called *China*, of which the worshippers give very absurd accounts; but, besides this, every man invents a god for himself: trees are held sacred; and if not adored as gods, are worshipped as the residence of some divinity. The government is despotic, the will of the emperor being a law to his people. Of this we have an instance in *Bissao*, not to be matched in any other country whatever. This is no other than a present which one subject may make of the house and estate of his neighbour to the emperor; and as it is most commonly his majesty's pleasure to accept of such presents, the proprietor dares not resist, but immediately sets about building another house, though even this he cannot do without the prince's leave; and if this should not be readily granted, he must live with his family in the open air till permission to build a new house can be obtained.

BISSAT (Peter), professor of canon law in the university of Bononia in Italy, was descended from the earls of Fife in Scotland, and born in that county in the reign of James V. He was educated at St Andrews: from thence he removed to Paris; and, having spent some time in that university, proceeded to Bononia, where he commenced doctor of laws, and was afterwards appointed professor of canon law. He continued in that honourable employment several years with great reputation, and died in the year 1568. He is said to have been not only a learned civilian, but an excellent poet, orator, and philosopher. *Patrii Bissati opera omnia*, viz. *poemata*, *orationes*, *lectiones feriales*, &c. *Lib. de irregularitate*, &c. were published at Venice in 1565, 4to.

BISSEPOUR, a small district of the kingdom of Bengal, in the East Indies, which has all along preserved its independence *. It has been governed time immemorial by a Bramin family of the tribe of Rajahput. Here the purity and equity of the ancient political system of the Indians is found unadulterated. This singular government, the finest and most striking monument in the world, has till now been beheld with too much indifference. We have no remains of ancient nations but brass and marble, which speak only to imagination and conjecture, those uncertain interpreters of manners and customs that no longer exist. Were a philosopher transported to *Bissenpour*, he would immediately be a witness of the life led by the first inhabi-

Biffen-pour
||
Bift.

tants of India many thousand years ago; he would converse with them; he would trace the progress of this nation, celebrated as it were from its very infancy; he would see the rise of a government which, being founded in happy prejudices, in a simplicity and purity of manners, in the mild temper of the people, and the integrity of the chieftains, has survived those innumerable systems of legislation, which have made only a transitory appearance in the stage of the world with the generations they were designed to torment. More solid and durable than those political structures, which, raised by impetuosity and enthusiasm, are the scourges of human kind, and are doomed to perish with the foolish opinions that gave them birth, the government of Biffen-pour, the offspring of a just attention to order and the laws of nature, has been established and maintained upon unchangeable principles, and has undergone no more alteration than those principles themselves. The singular situation of this country has preserved to the inhabitants their primitive happiness and the gentleness of their character, by securing them from the danger of being conquered, or of imbruing their hands in the blood of their fellow-creatures. Nature has surrounded them with water; and they need only open the sluices of their rivers to overflow the whole country. The armies sent to subdue them have so frequently been drowned, that the plan of enslaving them has been laid aside; and the projectors of it have thought proper to content themselves with an appearance of submission.

Liberty and property are sacred in Biffen-pour. Robbery, either public or private, is never heard of. As soon as any stranger enters the territory, he comes under the protection of the laws, which provide for his security. He is furnished with guides at free cost, who conduct him from place to place, and are answerable for his person and effects. When he changes his conductors, the new ones deliver to those they relieve an attestation of their conduct, which is registered and afterwards sent to the Raja. All the time he remains in the country, he is maintained and conveyed with his merchandise at the expence of the state, unless he desires leave to stay longer than three days in the same place. In that case, he is obliged to defray his own expences; unless he is detained by any disorder, or other unavoidable accident. This beneficence to strangers is the consequence of the warmth with which the citizens enter into each others interests. They are so far from being guilty of an injury to each other, that whoever finds a purse, or other thing of value, hangs it upon the first tree he meets with, and informs the nearest guard, who give notice of it to the public by beat of drum. These maxims of probity are so generally received, that they direct even the operations of government. Out of about 350,000l. on an average it annually receives, without injury to agriculture or trade, what is not wanted to supply the unavoidable expences of the state, is laid out in improvements. The Raja is enabled to engage in these humane employments, as he pays the Moguls only what tribute and at what times he thinks proper.

BISSEXTILE, in chronology, a year consisting of 366 days, being the same with our leap-year*.

BISTI, in commerce, a small coin of Persia: Some say that it is among the current silver coins of Persia, and worth only a little above three farthings of our

money; others speak of it again as a money of account.

BISTONIS, (anc. geog.), a lake of Thrace near Abdera, on which dwelt the Bistonæ: hence *Bistonius Tyrannus* is by Lucan used to denote Diomedes king of Thrace, who fed his horses with human flesh; and *Bistonius turbo*, a wind blowing from Thrace.

BISTORT, or ΚΝΟΤΟΓΡΑΣΣ, in botany, the trivial name of a species of polygonum. See **POLYGONUM**.

BISTOURY, in surgery, an instrument for making incisions; of which there are different kinds, some being of the form of a lancet, others straight and fixed in the handle like a knife, and others crooked with the sharp edge on the inside.

BISTRE, among painters, signifies the burnt oil extracted from the foot of wood.

It is of a brown transparent colour, having much the same effect in water-painting, where alone it is used, as brown pink in oil. Though this colour is extremely serviceable in water-colours, and much valued by those who know and can procure it; yet it is not in general use here, perhaps on account of its not being easily procured of a perfect kind; hardly any of it being good, except that imported from France. Perhaps the principal reason for this is, that dry beech-wood affords the best foot for making it: and it is not easy to procure such here without mixture of the foot of green wood, or other combustibles that deprave it for this purpose: or it is possible that they who have pretended to prepare it, have been ignorant of the proper means; there not being any recipe or directions in books that treat of these matters, from whence they could learn the proper process.

Bistre may, however, be prepared with great ease in the following manner.—Take any quantity of foot of dry wood, but let it be of beech wherever that can be procured. Put it into water in the proportion of two pounds to a gallon; and boil them half an hour: then after the fluid has stood some little time to settle, but while yet hot, pour off the clearer part from the earthy sediment at the bottom; and if on standing longer it forms another earthy sediment, repeat the same method, but this should be done only while the fluid remains hot: evaporate then the fluid to dryness; and what remains will be good bistre, if the foot was of a proper kind.—The goodness of bistre may be perceived by its warm deep brown colour, and transparency when moistened with water.

BISTRICZ, a handsome strong town of Transylvania, seated on a river of the same name, in E. Long. 25. 3. N. Lat. 47. 33.

BIT, or **BITT**, an essential part of a bridle. Its kinds are various. 1. The mufrol, snaffle, or watering-bit. 2. The canon-mouth, jointed in the middle. 3. The canon with a fast mouth, all of a piece, only kneed in the middle, to form a liberty or space for the tongue; fit for horses too sensible, or ticklish, and liable to be continually bearing on the hand. 4. The canon-mouth, with the liberty in form of a pigeon's neck; proper where a horse has too large a tongue. 5. The canon with a port mouth, and an upset or mounting liberty; where a horse has a good mouth, but large tongue. 6. The scatch-mouth, with an upset; ruder but more secure than a canon mouth. 7. The canon mouth with a liberty; proper for a horse with a large tongue, and round bars. 8. The

* See *Astronomy*,
no 292.

maficadour, or flaving bit, &c. The several parts of a snaffle, or curb-bit, are the mouth piece, the cheeks and eyes, guard of the cheek, head of the cheeks, the port, the welts, the campanel or curb and hook, the bolles, the bolsters and rabbits, the water-chains, the side-bolts, and rings, kirbles of the bit or curb, trench, top-rol, flap and jieve. The importation of bits for bridles is now prohibited.

BIT, or *Bitis*, in ship-building, the name of two great timbers, usually placed abast the manger, in the ship's loof, through which the cross-piece goes: The use of it is to belay the cable thereto, while the ship is at anchor.

BITBURG, a town of the Netherlands, in the duchy of Luxemburg. E. Long. 6. 43. N. Lat. 50. 0.

BITCH, the female of the dog kind. See **CANIS**.

BITCHE, a town of Lorrain, capital of a territory of the same name, and seated at the foot of the mountains near the river Swolbe. E. Long. 7. 44. N. Lat. 49. 5.

BITETO, a town of Italy, in the kingdom of Naples, and in the Terra di Bari. E. Long. 16. 56. N. Lat. 41. 8.

BITHYNIA, an ancient kingdom of Asia formerly known by the names of *Mysia*, *Mygdonia*, *Babrycia*, *Mariandynia*, and *Bithynia*. It was bounded on the west by the Bosphorus Thracicus and part of the Propontis, on the south by the river Rhynacus and mount Olympus, on the north by the Euxine sea, and on the east by the river Parthenius. The chief cities were *Myrlea*, *Nicomedia*, *Chalcedon*, *Heraclea*, and *Prusa*: See these articles. As to its history, we find nothing of moment recorded; except the infamous conduct of Prusias, one of its kings, in delivering up to the Romans Hannibal, the great Carthaginian general, who fled to him for protection. His great grandson Nicomedes IV. bequeathed the kingdom to the Romans. From them it was taken by the Turks, to whom it still remains subject, but has no modern name.

BITONTO, an episcopal town of Italy, in the kingdom of Naples and Terra di Bari. It is seated in a plain eight miles south of the gulph of Venice, in E. Long. 16. 52. N. Lat. 41. 13.

BITTACLE. See **BINACLE**.

BITTER, an epithet given to all bodies of an opposite taste to sweetness. For the medical virtues of bitters, see **MATERIA MEDICA**, n^o 51.

BITTER, a sea-term, signifying any turn of the cable about the bits, so as that the cable may be let out by little and little. And when a ship is stopped by a cable, she is said to be brought up by a bitter. Also that end of the cable which is wound about the bits is called the bitter end of the cable.

BITTER-Apple, in botany. See **COLOCENTHIS**.

BITTER-Salt. See **EPSOM-Salt**.

BITTER-Sweet, in botany. See **SOLANUM**.

BITTERN, in ornithology. See **ARDEA**.

BITTERN, in the salt-works, the brine remaining after the salt is concreted: this they ladle off, that the salt may be taken out of the pan, and afterwards put in again; when, being farther boiled, it yields more salt. See **SALT**.

BITUMENS, in natural history, are oily matters, of a strong smell, and of different consistencies, which are found in many places within the earth *.

BITUMEN JUDAICUM. See **ASPHALTUM**.

BIVALVES, a term sometimes used for such shells as consist of two pieces.—It is also an appellation given by botanists to such pods, or capsules, as consist of two valves inclosing the seeds.

BIVENTER, in anatomy, called also digastric, or two-bellied, a muscle of the lower jaw *.

BIUMBRES, in geography, an appellation given to the inhabitants of the torrid zone, by reason, at two different seasons of the year, their shadows are projected two different ways. The biumbres are the same with those otherwise denominated *amphiscii*.

BIXA, **ANNOtta**, or *Roucou*; a genus of the monogynia order, belonging to the polyandria class of plants. Of this genus there is but one species known, viz. the orellana, a native of the warm parts of America. This rises with an upright stem to the height of eight or ten feet, sending out many branches at the top forming a regular head, garnished with heart-shaped leaves ending in a point, and having long footstalks. The flowers are produced in loose panicles at the end of the branches: these are of a pale peach-colour, having large petals, and a great number of brittle stamina of the same colour in the centre. After the flower is past, the germen becomes a heart-shaped, or rather a mitre-shaped, vessel, covered on the outside with bristles opening with two valves, and filled with angular seeds. These seeds are covered with a red pulp or paste, from which the colour called ANOTTO is prepared, according to the process described under that article. This plant must be propagated by seeds procured from America. They are to be sown in pots in the spring, and plunged in a bed of tanners bark: the plants must afterwards be removed into separate pots, and always kept in the stove.

BIZARRO, in the Italian music, denotes a fanciful kind of composition, sometimes fast, slow, soft, strong, &c. according to the fancy of the composer.

BIZOCHI, or **BISOCI**, in church-history, certain heretical monks, said to have assumed the religious habit contrary to the canons, rejected the sacraments, and maintained other errors.

BLACK, a well known colour, supposed to be owing to the absence of light, most of the rays falling upon black substances being not reflected but absorbed by them. Concerning the peculiar structure of such bodies as fits them for appearing of this or that particular colour, see the article **COLOUR**.

Concerning black colours in general, we have the following remarks by Dr Lewis.

“ 1. Of black, as of other colours, there are many shades or varieties; different bodies, truly and simply black, or which have no sensible admixture of any of the rest of the colours, as black velvet, fine black cloth, the feathers of the raven, &c. appearing, when placed together, of tints very sensibly different.

“ 2. One and the same body also assumes different degrees of blackness, according to the disposition of the sensible parts of its surface; and in this respect, there is not, perhaps, any other colour, which is so much affected by an apparent mechanism. Thus black velvet, when the pile is raised, appears intensely black, much more so than the silk it was made from; but on pressing the pile smooth, it looks pale, and in certain positions shews somewhat even of a whitish cast.

“ 3. This

Bitumens.

Black.

* See *Anatom.*
m^o, Table of
the Muscles.

" 3. This observation is agreeable to the physical theory, which ascribes the blackness of bodies to the luminous rays, that fall upon them, being in great part absorbed or stifled in their pores. When the surface is composed of a multitude of loose filaments, or small points, with the extremities turned towards the eye, much of the light is stifled in the interstices between them, and the body appears dark : when the filaments are pressed close, or the surface smoothed and polished, more of the light is reflected from it, and the intensity of the blackness is diminished ; though the beauty may be improved by the glossiness which results from the smoothing.

" 4. There is one case, however, in which a high polish may, on the same principle, produce blackness, in bodies otherwise even white. We find that specula of white metal, or of quicksilvered glass, which reflect the rays of light to one point or in one direction, look always dark, unless when the eye is directly opposed to the reflected rays.

" 5. As the absorption of the luminous rays, except in the case just mentioned, makes the physical cause of blackness ; it is concluded that black bodies receive heat more freely than others. Black marble or tiles, exposed to the sun, become sensibly hotter than white ones. Black paper is kindled by a burning glass much sooner than white, and the difference is strongly marked : a burning-glass, too weak to have any visible effect at all upon white paper, shall readily kindle the same paper rubbed over with ink. Hence black clothes, when wetted, are said to dry faster ; black habits, and rooms hung with black, to be warmer ; black mould to be a hotter soil for vegetables ; and garden walls, painted black, to answer better for the ripening of wall fruit than those of lighter colours.

" 6. It is not, however, to be affirmed that the like differences obtain in the impressions made by common fire. Black paper, held to the fire, does not seem to be affected sooner, or in a greater degree, than such as is white. It may be proper to observe also, that the combustibility of the paper may be increased, by impregnating it with substances of themselves not combustible, and which give no colour to it. This is the foundation of one of the *sympathetic inks*, as they are called, made of a strong solution of sal ammoniac in water, which, though colourless when written with on paper, becomes very legible on exposing the paper to the fire ; that is, it occasions the parts moistened with it to sear or burn, before the rest of the paper is hurt, to a brown or black. All the salts I have tried produced this effect in a greater or less degree ; nitre, alum, tartar, very weakly ; sea-salt more strongly ; fixed alkaline salts still more so ; sal ammoniac the most strongly of all. Metallic solutions, made in acids, and diluted so as not to corrode the paper, acted in the same manner.

" 7. Besides the simple blacks, there are a multitude of compound ones, inclining more or less to other colours. Thus the painters have blue-blacks, brown-blacks, &c. which may be made by mixing pigments of the respective colours with simple black ones, in greater or less quantity, according to the shade required. The dyers also have different blacks, and often darken other colours by slightly passing them through the black dying liquor ; but the term *brown-black* is in

this business unknown, brown and black being here looked upon as opposite to one another. In effect, the colour called *brown-black* is no other than that which ill-dyed black clothes change to in wearing : no wonder then that it is excluded from the catalogue of the dyers colours.

" 8. The true or simple blacks, mixed with white, form different shades of grey, lighter or darker according as the white or black ingredients prevails in the mixt. The black pigments, spread thin upon a white ground, have a like effect.

" 9. Hence the painter, with one true black pigment, can produce on white paper, or on other white bodies, all the shades of grey and black, from the slightest discoloration of the paper, up to a full black : and the dyer produces the same effect on white wool, silk, or cloth, by continuing the subjects for a shorter or longer time in the black bath, or making the bath itself weaker or stronger.

" 10. Hence also the dilution of black pigments with white, or the spreading of them thin upon a white ground, affords a ready method of judging of the quality or species of the colour ; which, if it be a true black, will in this diluted state look of a pure or simple grey ; but if it has a tendency to any other colour, that colour will now betray itself.

" 11. All the colours, in a very deep or concentrated state, approach to blackness. Thus the red liquor prepared by boiling or infusing madder-root in water, and the yellow decoction or infusion of liquorice-root, evaporated in a gentle heat till they become thick, look of a dark black colour, or of a colour approaching to blackness ; and these thick masses, drawn out into slender strings, or diluted with water, or rubbed on paper, exhibit again the red and yellow colours, which the liquors had at first. Nature affords many black objects, whose blackness depends upon the same principle, being truly a concentration of some of the other colours. Thus in black-berries, currants, elderberries, &c. what seems to be black is no other than an opaque deep red : their juice appears black when its surface is looked down upon in an opaque vessel, but red when diluted or spread thin. The black flint, as it is called, of the island of Ascension, held in thin pieces between the eye and the light, appears greenish ; and one of the deep black stones called *black agate*, viewed in the same manner, discovers its true colour to be a deep red."

The most remarkable black colours in the mineral kingdom are, *Black CHALK*, *PITCOAL*, *Black SANDS*, and *Black LEAD* ; (see these articles.)—The only native vegetable black is the juice of the anacardium orientale, which possibly may be the tree that produces the excellent black varnish of China and Japan ; (see *VARNISH*).—The juices of most astringent vegetables produce a black with iron, and for this purpose some of them are used in dyeing and callico-printing ; (see the article *DYEING*).—There are also a number of black colours artificially prepared for the use of painters, such as lamp-black, ivory-black, German-black, &c. for an account of the preparation and qualities of which, see the article *COLOUR-MAKING*.

Black-Bird, in ornithology. See *TURDUS*.

Black-Book of the Exchequer. See *EXCHEQUER*.

Black-Books, a name given to those which treat of necromancy, or, as some call it, *nigromancy*. The black-

black-book of the English monasteries was a detail of the scandalous enormities practised in religious houses, compiled by order of the visitors under King Henry VIII. to blacken, and thus hasten their dissolution.

BLACK-Caps, in ornithology. See **MOTACILLA**.

BLACK-Cock. See **TETRAO**.

BLACK-Eagle. See **FALCO**.

BLACK-Eunuchs, in the customs of eastern nations, are Ethiopians castrated, to whom their princes commonly commit the care of their women.

BLACK-Forest, a forest of Germany, in Suabia, running from north to south between Ortnau, Brisgaw, part of the duchy of Wirtemberg, the principality of Fultemburg towards the source of the Danube, as far as the Rhine above Basil. It is part of the ancient Hyrcanian forest.

BLACK-Friers, a name given to the dominican order; called also *predicants* and *preaching fryers*; in France, *jacobins*.

BLACK-Lead. See **LEAD**.

BLACK-Leather is that which has passed the curriers hands, where, from the russet as it was left by the tanners, it is become black, by having been scored and rubbed three times on the grain-side with copperas-water.

BLACK-Mail, a link of mail, or small pieces of metal or money. In the counties of Northumberland, Cumberland, Westmoreland, and several parts of Scotland, it was formerly taken for a certain rent of money, corn, cattle, or other consideration, paid by poor people near the borders, to persons of note and power, allied with some moss-troopers, or known robbers, in order to protect them from pillage.

BLACK-Rod. See **ROD**.

BLACK-Sea. See **EUXINE SEA**.

BLACK-Water, the name of two rivers in Ireland; one of which runs through the counties of Cork and Waterford, and falls in Youghal bay; and the other, after watering the county of Armagh, falls into Lough-Neah.

BLACKBANK, a town of Ireland, in the county of Armagh and province of Ulster, seated in W. Long. 6. 55. N. Lat. 54. 12.

BLACKBERRY, in botany. See **RUBUS**.

BLACKBURN, a town of Lancashire in England, seated near the river Derwent. It takes its name from the brook Blackwater which runs thro' it. W. Long. 2. 15. N. Lat. 53. 40.

BLACKALL (Dr Offspring), bishop of Exeter in the beginning of the 18th century, was born at London 1654, and educated at Catherine-Hall, Cambridge. For two years he refused to take the oath of allegiance to king William and queen Mary, but at last submitted to the government, though he seemed to condemn the Revolution, and all that had been done pursuant to it. He was a man of great piety, had much primitive simplicity and integrity, and a constant evenness of mind. In a sermon before the House of Commons, Jan. 30th, 1699, he animadverted on Toland's assertion in his *Life of Milton*, that Charles I. was not the writer of the *Icon Basilike*, and for some insinuations against the authenticity of the Holy Scriptures; which produced a controversy between him and that author. In 1700, he preached a course of sermons in St Paul's at Boyle's lecture, which were af-

terwards published; and was consecrated bishop of Exeter in 1707. He died at Exeter in 1716, and was interred in the cathedral there.

BLACKMORE (Sir Richard), a physician, and voluminous writer, of theological, poetical, and physical works. Having declared himself early in favour of the Revolution, king William, in 1697, chose him one of his physicians in ordinary, and conferred the honour of knighthood on him. On queen Anne's accession, Sir Richard was also appointed one of her physicians, and continued so for some time. Dryden and Pope treated the poetical performances of Blackmore with great contempt; and in a note to the mention made of him in the *Dunciad*, we are informed that his "indefatigable muse produced no less than six epic poems: *Prince and King Arthur*, 20 books; *Eliza*, 10; *Alfred*, 12; *The Redeemer*, six; beside *Job*, in folio; the whole book of *Psalms*; *The Creation*, seven books; *Nature of Man*, three books; and many more." But notwithstanding Blackmore was much ridiculed by the wits, he is not without merit: and Addison has, in the *Spectator*, bestowed some liberal commendations on his poem on the Creation. It must be mentioned too in honour of Sir Richard, that he was a chaste writer, and a warm advocate for virtue, at a time when an almost universal degeneracy prevailed. He had been very free in his censures on the libertine writers of his age; and it was owing to some liberty he had taken of this kind, that he drew upon him the resentment of Mr Dryden. He had likewise given offence to Mr Pope; for having been informed by Mr Curl that he was the author of a traveltic on the first Psalm, he took occasion to reprehend him for it in his essay on polite learning. Besides what are above mentioned, Sir Richard wrote some theological tracts, and several treatises on the plague, small pox, consumptions, the spleen, gout, dropsy, &c. and many other poetical pieces. He died October 9. 1720.

BLACKS, in physiology. See **NEGROES**.

BLADDER (Urinary), in anatomy. See **ANATOMY**, n^o 364.—See also **COMPARATIVE Anatomy**, n^o 26, 28, 95, 122, 149.

Air-BLADDER. See **COMPARATIVE Anatomy**, n^o 147.

Gall-BLADDER. See **ANATOMY**, n^o 358.

BLADDER-Nut. See **STAPHYLÆA**.

BLADDER-Senna. See **COLUTÆA**.

BLADEN (Martin), a translator and dramatic author, was formerly an officer in the army, bearing the commission of a lieutenant-colonel in queen Anne's reign, under the great duke of Marlborough, to whom he dedicated a translation of Cæsar's Commentaries, which he had completed, and which is to this day a book held in good estimation. In 1714, he was made one of the Lords Commissioners of Trade and Plantations; and in 1717 was appointed envoy extraordinary to the court of Spain, in the room of — Brett. Esq; but declined it, chusing rather to keep the post he already had, which was worth L. 1000 per annum, and which he never parted with till his death, which was in May 1746. He was also many years member of parliament for the town of Portsmouth. He wrote two dramatic pieces; both of which (for the one is only a masque introduced in the third act of the other) were printed in the year 1705, without the author's consent.

Thir

Blair
Blair.

Their names are, 1. Orpheus and Euridice, a Masque.
2. Solon, a Tragic Comedy.

BLAEU (William), a famous printer of Amsterdam, a disciple and friend of Tycho Brahe's: his Atlas, his Treatise of the Globes, Astronomical Institutions, &c. and his fine impressions, have secured his memory. He died in 1638.

BLAFART, in commerce, a small coin, current at Cologn, worth something more than a farthing of our money.

BLAGRAVE (John), the second son of John Blagrave, of Bulmarsh-court near Sunning in Berkshire, descended of an ancient family in that country. From a grammar-school at Reading he was sent to St John's college in Oxford, where he applied himself chiefly to the study of mathematics, and, without taking any degree, afterwards retired to his patrimonial seat of Southcole-lodge near Reading, where he spent the remainder of his life. In this mansion he died in the year 1611; and was buried in the church of St Lawrence, where a sumptuous monument was erected to his memory. Having never married, he bequeathed to all the posterity of his three brothers, the sum of 50 l. each payable at the age of 26; and he calculated his donation so well, that near fourscore of his nephews and their descendants have reaped the benefit of it. He also settled certain lands at Swallowfield in the same county, as a provision for the poor for ever. Among other charities, he left ten pounds to be annually disposed of in the following manner: On Good-Friday, the church-wardens of each of the three parishes of Reading send to the town-hall *one virtuous maid, who has lived five years with her master*: there, in the presence of the magistrates, these three virtuous maids throw dice for the ten pounds. The two losers are returned with a fresh one the year following, and again the third year, till each has had three chances. He is said to have been not more remarkable for his mathematical knowledge, than for his candour and generosity to his acquaintance. His works are, 1. *A mathematical jewel*. Lond. 1585, fol. 2. *Of the making and use of the familiar staff*. Lond. 1590, 4to. 3. *Astrabium uranicum generale*. Lond. 1596, 4to. 4. *The art of dialing*. Lond. 1609, 4to.

BLAIN, among farriers, a distemper incident to beasts, being a certain bladder growing on the root of the tongue, against the wind-pipe, which swells to such a pitch as to stop the breath. It comes by great chaffing and heating of the stomach, and is perceived by the beast's gaping and holding out his tongue, and foaming at the mouth. To cure it, cast the beast, take forth his tongue, and then, sitting the bladder, wash it gently with vinegar and a little salt.

BLAIR (John), a Scottish author, was cotemporary with, and the companion, some say the chaplain, of Sir William Wallace. He attended that great hero in almost all his exploits; and, after his death, which left so great a stain on the character of Edward I. of England, he wrote his memoirs in Latin. The injury of time has destroyed this work, which might have thrown the greatest light on the history of a very busy and remarkable period. An inaccurate fragment of it only has descended to us, from which little can be learned, and which was published, with a commentary, by Sir Robert Sibbald.

BLAIR (James), an eminent divine, was born and bred in Scotland, where he had at length a benefice in the episcopal church; but meeting with some discouragements, he came to England, in the latter end of the reign of king Charles II. and was sent by Dr Compton as a missionary to Virginia, and was afterwards, by the same bishop, made commissary for that colony, the highest office in the church there. He distinguished himself by his exemplary conduct and unwearied labours in the work of the ministry; and finding that the want of proper seminaries for the advancement of religion and learning was a great damp upon all attempts for the propagation of the gospel, he formed a design of erecting and endowing a college at Williamsburgh, in Virginia, for professors and students in academical learning. He therefore not only set on foot a voluntary subscription; but, in 1693, came to England to solicit the affair at court: when queen Mary was so well pleased with the noble design, that she espoused it with particular zeal; and king William readily concurring with her majesty, a patent was passed for erecting and endowing a college by the name of the *William and Mary college*, of which Mr Blair was appointed president, and enjoyed that office near 50 years. He was also rector of Williamsburgh, and president of the council in that colony. He wrote, *Our Saviour's divine Sermon on the Mount* explained in several sermons, 4 vols. octavo; and died in 1743.

BLAIR of Athol, a castle belonging to the duke of Athol, seated in the county of Athol in Scotland, 28 miles north-west of Perth. W. Long. 3. 30. N. Lat. 56. 46.

BLAISOIS, a province of France, bounded on the north by Beauce, on the east by the Orleanois, on the south by Berry, and on the west by Touraine. Blois is the capital town.

BLAKE (Robert), a famous English admiral, born August 1589, at Bridgwater, in Somersetshire, where he was educated at the grammar-school. He went from thence to Oxford in 1615, where he was entered at St Alban's hall. From thence he removed to Wadham college; and on the 10th of February 1617, he took the degree of bachelor of arts. In 1623, he wrote a copy of verses on the death of Mr Camden, and soon after left the university. He was tainted pretty early with republican principles; and disliking that severity with which Dr Laud, then bishop of Bath and Wells, pressed uniformity in his diocese, he began to fall into the puritanical opinions. His natural bluntness causing his principles to be well known, the puritan party returned him member for Bridgwater in 1640; and he served in the parliament army with great courage during the civil war: but when the king was brought to trial, he highly disapproved the measure as illegal, and was frequently heard to say, *he would as freely venture his life to save the king, as ever he did to serve the parliament*. But this is thought to have been chiefly owing to the humanity of his temper, since after the death of the king he fell in wholly with the republican party, and, next to Cromwell, was the ablest officer the parliament had.

In 1648-9, he was appointed, in conjunction with colonel Deane and colonel Popham, to command the fleet; and soon after blocked up prince Maurice and prince Rupert in Kinsale harbour. But these getting out,

Blake

Blake followed them from port to port: and at last attacked them in that of Malaga, burnt and destroyed his whole fleet, two ships only excepted, the Reformation in which prince Rupert himself was, and the Swallow commanded by his brother prince Maurice. In 1652, he was constituted sole admiral; when he defeated the Dutch fleet commanded by Van Trump, Ruyter, and De Wit, in three several engagements, in which the Dutch lost 11 men of war, 30 merchant-ships, and, according to their own accounts, had 15,000 men slain. Soon after, Blake and his colleagues, with a grand fleet of 100 sail, stood over to the Dutch coast; and forced their fleet to fly for shelter into the Texel, where they were kept for some time by Monk and Dean, while Blake sailed northward. At last, however, Trump got out, and drew together a fleet of 120 men of war; and, on the 3^d of June, the generals Dean and Monk came to an engagement with the enemy off the North Foreland, with indifferent success: but the next day Blake coming to their assistance with 18 ships, gained a complete victory; so that if the Dutch had not saved themselves on Calais sands, their whole fleet had been sunk or taken.

In April 1653, Cromwell turned out the parliament, and shortly after assumed the supreme power. The states hoped great advantages from this; but were disappointed. Blake said on this occasion to his officers, "It is not for us to mind state-affairs, but to keep foreigners from fooling us."—In November, 1654, Cromwell sent him with a strong fleet into the Mediterranean, with orders to support the honour of the English flag, and to procure satisfaction for the injuries that might have been done to our merchants. In the beginning of December, Blake came into the road of Cadiz, where he was treated with all imaginable respect: a Dutch admiral would not hoist his flag while he was there; and his name was now grown so formidable, that a French Squadron having stopped one of his tenders, which had been separated from Blake in a storm, the admiral, as soon as he knew to whom it belonged, sent for the captain on board, and drank Blake's health before him with great ceremony, under a discharge of five guns, and then dismissed him. The Algerines were so much afraid of him, that, stopping the Sallee rovers, they obliged them to deliver up what English prisoners they had on board, and then sent them freely to Blake, in order to purchase his favour. This, however, did not prevent his coming on the 10th of March before Algiers, and sending an officer on shore to the dey to demand satisfaction for the piracies committed on the English, and the release of all the English captives. The dey, in his answer, alleged, that the ships and captives belonged to private men, and therefore he could not restore them without offending all his subjects, but that he might easily redeem them; and if he thought good, they would conclude a peace with him, and for the future offer no acts of hostility to the English: and having accompanied this answer with a large present of fresh provisions, Blake left Algiers, and sailed on the same errand to Tunis; the dey of which place not only refused to comply with his request, but denied him the liberty of taking in fresh water. "Here," said he, "are our castles of Goletto and Porto Ferino; do your worst." Blake, at hearing this, began, as his custom was when highly provoked, to curl his whiskers; and,

after a short consultation with his officers, bore into the bay of Porto Ferino with his great ships and their seconds; and, coming within musquet-shot of the castle and the line, fired on both so warmly, that in two hours time the castle was rendered defenceless, and the guns on the works along the shore were dismounted, though 60 of them played at a time on the English. Blake found nine ships in the road, and ordered every captain to man his long-boat with choice men, to enter the harbour and fire the Tunisians; which they happily effected, with the loss of 25 men killed, and 48 wounded, while he and his men covered them from the castle by playing continually on them with their great guns. This daring action spread the terror of his name thro' Africa and Asia. From Tunis he sailed to Tripoli, caused the English slaves to be set at liberty, and concluded a peace with that government. Thence returning to Tunis, the Tunisians implored his mercy, and begged him to grant them peace, which he did upon terms highly advantageous to England. He next sailed to Malta, and obliged the knights to restore the effects taken by their privateers from the English; and by these great exploits, so raised the glory of the English name, that most of the princes and states in Italy thought fit to pay their compliments to the protector, by sending solemn embassies to him.

He passed the next winter either in lying before Cadiz, or in cruising up and down the Straights; and was at his old station, at the mouth of that harbour, when he received information that the Spanish plate fleet had put into the bay of Sancta Cruz, in the island of Teneriffe: upon this he weighed anchor, with 25 men of war, on the 13th of April 1657; and, on the 20th, rode with his ships off the bay of Sancta Cruz, where he saw 16 Spanish ships lying in the form of a half-moon. Near the mouth of the haven stood a castle, furnished with great ordnance; besides which there were seven forts round the bay, with six, four, and three guns on each, joined to each other by a line of communication manned with musqueteers. To make all safe, Don Diego Diagne, general of the Spanish fleet, caused all the smaller ships to be moored close along the shore; and the six large galleons stood farther out at anchor, with their broadsides towards the sea. Blake having prepared for the fight, a squadron of ships was drawn out to make the first onset, commanded by captain Stayner in the Speaker frigate: who no sooner received orders, than he sailed into the bay, and fell upon the Spanish fleet, without the least regard to the forts, which spent their shot prodigally upon them. No sooner were these entered into the bay, but Blake, following after, placed several ships to pour broadsides into the castle and forts; and these played their part so well, that, after some time, the Spaniards found their forts too hot to be held. In the mean time, Blake struck in with Stayner, and bravely fought the Spanish ships, out of which the enemy were beaten by two o'clock in the afternoon; when Blake, finding it impossible to carry them away, ordered his men to set them on fire; which was done so effectually, that they were all reduced to ashes, except two, which sunk downright, nothing remaining above the water but part of the masts. The English having now obtained a complete victory, were reduced to another difficulty by the wind, which blew so strong into the bay, that they despaired of getting out. They

Blake lay under the fire of the castles and of all the forts, which must in a little time have torn them to pieces. But the wind suddenly shifting, carried them out of the bay; where they left the Spaniards in astonishment at the happy temerity of their audacious victors. This is allowed to have been one of the most remarkable actions that ever happened at sea. "It was so miraculous (says the earl of Clarendon), that all men who knew the place, wondered that any sober man, with what courage he ever endured, would ever have undertaken it; and they could hardly persuade themselves to believe what they had done; whilst the Spaniards comforted themselves with the belief, that they were devils and not men, who had destroyed them in such a manner." This was the last and greatest action of the gallant Blake. He was consumed with a dropsy and scurvy; and hastened home, that he might yield up his last breath in his native country, which he had so much adorned by his valour. As he came within sight of land, he expired.—Never man, so zealous for a faction, was so much respected and esteemed even by the opposite factions. Disinterested, generous, liberal; ambitious only of true glory, dreadful only to his avowed enemies; he forms one of the most perfect characters of that age, and the least stained with those errors and violences which were then so predominant. The protector ordered him a pompous funeral at the public charge: but the tears of his countrymen were the most honourable panegyric on his memory. The lord Clarendon observes, "that he was the first man who brought ships to contemn castles on shore, which had ever been thought very formidable, and were discovered by him to make a noise only, and to fright those who could be rarely hurt by them. He was the first that infused that degree of courage into seamen, by making them see by experience what mighty things they could do, if they were resolved; and the first that taught them to fight in fire as well as in water."

BLAMONT, a town of Lorraine in France, seated on a little river called *Vesouze*. E. Long. 6. 51. N. Lat. 48. 35.

BLANC. See BLANK.

BLANC, a town of Berry in France, seated on the river Creufe, by which it is divided into two parts. The land about it is barren, and full of trees, heath, and lakes. E. Long. 1. 13. N. Lat. 46. 38.

BLANCH-HOLDING, in law, a tenure, by which the vassal is only bound to pay an elufury yearly duty to his superior merely as an acknowledgment of his right*.

BLANCHARD (James), an excellent painter, was born at Paris, and learnt the rudiments of his profession under Nicholas Bollerri his uncle; but left him at 20 years of age, and travelled into Italy. He staid two years at Rome, and from thence went to Venice, where he was so charmed with the works of Titian, Tintoret, and Paul Veronese, that he resolved to follow their manner; and in this he succeeded so far, that at his return to Paris, he soon became generally esteemed for the novelty, beauty, and force of his pencil. He painted two galleries at Paris, one belonging to Perault, the first president, and the other to Bullion, superintendent of the finances; but his capital piece is a picture of the descent of the Holy Ghost in the church of Notre Dame. He was seized, in the flower of his age, with a fever and imposthume in the lungs, of which he died

in 1683. Of all the French painters Blanchard was esteemed the best colourist, he having carefully studied this part of painting in the Venetian school.

Carte-BLANCHE. See CARTE.

BLANCHING, the art or manner of making any thing white. See BLEACHING.

BLANCHING of *Iron-plates*, is performed with aquafortis and tin.

BLANCHING of *Woollen Stuffs*, is done with soap, or with chalk, or with sulphur or brimstone.

BLANCHING of *Silk*, is performed with soap and brimstone.

BLANCHING of *Wax*, is by exposing it to the sun and dew. See WAX.

BLANCHING of *Copper*. See CHEMISTRY, n^o 381.

BLANCHING, in coinage, the operation performed on the planchets or pieces of silver, to give them the requisite lustre and brightness. They also blanch pieces of plate, when they would have them continue white, or have only some parts of them burnished.—Blanching, as it is now practised, is performed by heating the pieces on a kind of peel with a wood fire, in the manner of a reverberatory; so that the flame passes over the peel. The pieces being sufficiently heated and cooled again, are put successively to boil in two pans, which are of copper: in these they put water, common salt, and tartar of Montpellier. When they have been well drained of this water in a copper sieve, they throw sand and fresh water over them; and when dry, they are well rubbed with towels.

BLANCHING, among gardeners, an operation whereby certain fallots, roots, &c. are rendered whiter than they would otherwise be.—It is thus: After pruning off the tops and roots of the plants to be blanched, they plant them in trenches about ten inches wide, and as many deep, more or less, as is judged necessary; as they grow up, care is taken to cover them with earth, within four or five inches of their tops: this is repeated from time to time, for five or six weeks; in which time they will be fit for use, and of a whitish colour where covered by the earth.

BLANCHING also denotes the operation of covering iron plates with a thin coat or crust of tin.

BLANCO, a cape or promontory of Africa, in the Atlantic Ocean. W. Long. 18. 30. N. Lat. 20. 0.

BLANCO, a promontory of Peru in South America, in the South Sea. W. Long. 81. 10. N. Lat. 11. 50.

BLANDA, (anc. geog.), a Roman city in the territory of Barcino in Hispania Citerior; now *Blanes*, a sea-port town of Catalonia, situated near the river Tordara. E. Long. 3. 40. N. Lat. 41. 30.

BLANDFORD, a town of Dorsetshire in England. It is pleasantly seated on the river Stour near the Downs, but has been subject to several dreadful fires, particularly in 1731, when almost the whole town was burnt down; but it has since been rebuilt finer than before. It has the title of a marquissate, and lies in W. Long. 2. 15. N. Lat. 50. 50.

BLANDONONA, (anc. geog.), a small city of Liguria in Italy; now *Bron*, or *Broni*. See that article.

BLANES. See BLANDA.

BLANK, or BLANC, properly signifies white*.

BLANK, in commerce, a void or unwritten place which merchants sometimes leave in their day-books or journals.

BLANK-

* See Law, Part III. n^o clxv. 3.

* See

Blank-Verse, in the modern poetry, that composed of a certain number of syllables, without the assistance of rhyme. See POETRY.

Point-Blank. See *Point-Blank*.

BLANKENBERG, a town of Germany, in the circle of Westphalia and duchy of Berg. E. Long. 7. 18. N. Lat. 50. 54.

BLANKENBURG, a town of Germany, in the circle of Lower Saxony, and capital of the county of the same name, subject to the duke of Brunswic-Wolfenbuttle. The castle or palace is a modern building, and is the residence of the prince's dowager. E. Long. 11. 20. N. Lat. 51. 50.

BLANKENHEIM, a small territory of Germany with the title of a county, which is part of that of Eysfel, near the archbishopric of Cologne and duchy of Juliers.

BLANKET, a coverlet for a bed. A stuff commonly made of white wool, and wrought in a loom like cloth; with this difference, that they are crossed like ferges.

When they come from the loom, they are sent to the fuller; and after they have been filled and well cleaned, they are napped with a fuller's thistle.

There are blankets made with the hair of several animals; as that of dogs, goats, and others.

BLANQUILLE, in commerce, a small silver coin current in the kingdom of Morocco, and all that part of the coast of Barbary; it is worth about three-halves of our money.

BLARE, in commerce, a small copper coin of Bern, nearly of the same value with the ratz.

BLAREGNIES, a town of the Austrian Netherlands, in the province of Hainault, seated in E. Long. 3. 35. N. Lat. 50. 30. Near this place the English and their allies under the duke of Marlborough obtained a very bloody victory over the French in 1709. This is most commonly called the *battle of Malplaquet* *.

BLASE, bishop of Sebasta in Cappadocia, in the second and third centuries, suffered death under Dioclesian by decapitation, after being whipped and having his flesh torn with iron combs. He is a person of great note among the vulgar, who in their processions relative to the woollen trade, always carry a representation of him as the inventor or patron of the art of wool-combing; though that art must have been known long before his time. It is difficult to say how the invention came to be attributed to him; but it had probably no better origin than the circumstance of his being tortured by instruments used in combing of wool.

BLASIA, *LEATHER-CUP*, a genus of the order of algae, belonging to the cryptogamia class of plants. Of this genus there is but one species known, which grows naturally on the banks of ditches and rivulets, in a gravelly or sandy soil, both in England and Scotland. It grows flat upon the ground in a circle or patch, composed of numerous thin, green, pellucid, leaves, marked with a few whitish veins near the base, divided and subdivided into obtuse segments obscurely crenated on the edges. The margins of the leaves are a little elevated, but the interior parts adhere close to the ground by a fine down which answers the purpose of roots. The seeds are so small as to be almost imperceptible.

BLASPHEMY, an indignity or injury offered to the Almighty, by denying what is his due and of right belonging to him; or by attributing to the creature that which is due only to the Creator.

The primitive church distinguished blasphemy into three sorts. 1. The blaspheming of apostates, whom the heathen persecutors obliged not only to deny, but to curse, Christ. These blasphemers were punished with the highest degree of ecclesiastical censure. 2. The blaspheming of heretics, and other profane Christians. In this sense, they included not only those who maintained impious doctrines, but those who uttered profane or blasphemous words, derogatory to the majesty and honour of God. The same punishment that was inflicted upon heretics and sacrilegious persons, was consequently the lot of this sort of blasphemers. 3. The blaspheming against the Holy Ghost, concerning which the opinions of the ancients varied. Some apply it to the sin of lapsing into idolatry and apostasy, and denying Christ in time of persecution. Others made it to consist in denying Christ to be God: others, in denying the divinity of the Holy Ghost; and others place it in a perverse and malicious ascribing the operations of the Holy Spirit to the power of the devil, and that against express knowledge and conviction of conscience.

Blasphemy, among the Jews, was punished by stoning the offender to death. In England, it is punishable at common law, by fine and pillory. And by a statute of William III. if any person shall, by writing or speaking, deny any of the persons in the Trinity, he shall be incapable of any office; and for the second offence, be disabled to sue in any actions, to be an executor, &c. According to the law of Scotland, the punishment of blasphemy is death *.

BLAST, in a general sense, denotes any violent explosion of air, whether occasioned by gun-powder, &c. or by the action of a pair of bellows.

BLASTS, among miners, the fame with damps *.

BLAST, or **BLIGHT**, in husbandry. See **BLIGHT**.

BLASTING, a term used by miners for the tearing up rocks which lie in their way, by the force of gun-powder.

BLATTA, or **COCKROACH**, a genus of insects belonging to the order of hemiptera, or such as have four femicrutaceous incumbent wings. The head of the blatta is inflected towards the breast; the antennæ, or feelers, are hard like bristles; the elytra and wings are plain, and resemble parchment; the breast is smooth, roundish, and is terminated by an edge or margin; the feet are fitted for running; and there are two small horns above the tail. This insect resembles the beetle; and there are 10 species, viz. 1. The *gigantea* is of livid colour, and has square brownish marks on the breast. It is found in Asia and America, and is about the size of a hen's egg. 2. The *alba* is red, and the margin of the breast is white. It is found in Egypt. 3. The *surinamensis* is livid, and the breast edged with white. It is a native of Surinam. 4. The *americana* is of an iron colour, and the hind part of the breast is white. The wings and elytra are longer than its body. It is found in America and the south of France. 5. The *pivea* is white, with yellow feelers. It is a native of America. 6. The *africana* is ash-coloured, and has some hairs on its breast. It is found

Blasphemy
Blatta.

* See *Law*,
Part III.

no cxxxv.

* See *Damps*.

Blatta
||
Blavet.

in Africa. 7. The *orientalis* is of a dusky ash colour, has short elytra, with an oblong furrow in them. This species is frequent in America. They get into chests, &c. and do much hurt to cloaths; they infest peoples beds in the night, bite like bugs, and leave a very unfavourable smell behind them. They avoid the light, and seldom appear but in the night time. The female resembles a kind of caterpillar, as it has no wings; she lays an egg of about one half the bulk of her belly. They eat bread, raw or dressed meat, linen, books, silk-worms and their bags, &c. Sir Hans Sloane says, that the Indians mix their ashes with sugar, and apply them to ulcers in order to promote the suppuration. 8. The *germanica*, is livid and yellowish, with two black parallel lines on the breast. It is found in Denmark. 9. The *laponica*, is yellow, and the elytra are spotted with black. It is found in Lapland; and feeds upon cheese, fishes, &c. 10. The *oblongata* is of an oblong figure; the colour is livid and shining; and it has two black spots on the breast. The feelers are red and clavated; and the feet are very hairy. It is a native of America.

BLATTARIE, (from *Blatta*, a moth or little worm), the title of Scopoli's 12th natural class, in his *Flora Carniolica*. It is taken from the *Blattaria*, which was Tournefort's generic name for the verbascom of Linnæus. See **VERBASCUM**.

BLAUBEUREN, a town of Germany in the circle of Suabia, and duchy of Wirtemberg. E. Long. 9. 57. N. Lat. 48. 22.

BLAVET, a sea-port town of Brittany in France, situated at the mouth of a river of the same name. It is one of the stations of the royal navy of France, and

is sometimes called *Port Lewis*. W. Long. 3. 5. N. Lat. 47. 40.

BLAVIA, or **BLAVIUM**, (anc. geog.), a town of Aquitain, on the north bank of the Garonne, below its confluence with the Dordone: Now *Blaye*; which see.

BLAYE, an ancient and strong town of France, in Guienne. It is situated on the river Garonne, has a harbour much frequented by foreigners, and the ships which sail to Bourdeaux are obliged to leave their guns here. The river is 3800 yards broad at Blaye; for which reason a battery was built upon an island in 1689, to command the vessels that sail up. The city is built on a rock, and has a citadel with four bastions, which is called the *Upper Town*. The lower town is separated from the upper by a small river; and in the lower town the merchants reside with their magazines. The neighbourhood produces a great deal of corn, which they send abroad when the exportation of it is allowed. W. Long. 1. 23. N. Lat. 45. 6.

BLAZE, a white spot in a horse's face.

BLAZONING, or **BLAZONRY**, in heraldry, the decyphering the arms of noble families. The word originally signified the blowing or winding of a horn; and was introduced into heraldry as a term denoting the description of things borne in arms, with their proper significations and intendments, from an ancient custom the heralds, who were judges, had of winding an horn at jousts and tournament, when they explained and recorded the achievements of knights.*

BLEA, in the anatomy of plants, the inner rind or dry bark. See **PLANTS**.

B L E A C H I N G

IS the art of whitening linen cloth, thread, &c.; which is conducted in the following manner by the bleachers of this country.

After the cloth has been sorted into parcels of an equal fineness, as near as can be judged, they are latched, linked, and then steeped. Steeping is the first operation which the cloth undergoes, and is performed in this manner. The linens are folded up, each piece distinct, and laid in a large wooden vessel; into which is thrown, blood-warm, a sufficient quantity of water, or equal parts of water and lye, which has been used to white cloth only, or water with rye-meal or bran mixed with it, till the whole is thoroughly wet, and the liquor rises over all. Then a cover of wood is laid over the cloth, and that cover is secured with a post betwixt the boards and the joisting, to prevent the cloth from rising during the fermentation which ensues. About six hours after the cloth has been steeped in warm water, and about twelve in cold, bubbles of air arise, a pellicle is formed on the surface of the liquor, and the cloth swells when it is not pressed down. This intestine motion continues from 36 to 48 hours, according to the warmth of the weather; about which time the pellicle or scum begins to fall to the bottom. Before this precipitation happens, the cloth must be taken out; and the proper time for taking it out, is when no more air-bubbles arise. This is allowed to be the justest guide by the most experienced bleachers.

The cloth is then taken out, well rinsed, disposed regularly by the selvage, and washed in the put-mill to carry off the loose duff. After this it is spread on the field to dry: When thoroughly dried, it is ready for bucking; which is the second operation.

Bucking, or the application of salts, is performed in this manner. The first, or mother-lye, is made in a copper, which we shall suppose, for example, when full, holds 170 Scots gallons of water. The copper is filled three fourths full of water, which is brought to boil: just when it begins, the following proportion of ashes is put into it, viz. 30 lb. of blue, and as much white pearl-ashes; 200 lb. of Marcott ashes, (or, if they have not these, about 300 lb. of Castuh); 300 lb. of Muscovy, or blanch ashes; the three last ought to be well pounded. This liquor is allowed to boil for a quarter of an hour, stirring the ashes from the bottom very often; after which the fire is taken away. The liquor must stand till it has settled, which takes at least six hours, and then it is fit for use.

Out of their first, or mother-lye, the second, or that used in bucking, is made in this manner. Into another copper, holding, for example, 40 Scots gallons, are put 38 gallons of water, 2 lb. soft soap, and 2 gallons of mother-lye; or, for cheapness, in place of the soap, when they have lye which has been used to white linen, called *white-linen lye*, they take 14 gallons of it, leaving out an equal quantity of water. This is called *buck-*
ing-

ing-lye.

After the linens are taken up from the field dry, they are set in the *vat* or *cave*, as their large vessel is called, in rows, endwise, that they may be equally wet by the lye; which, made blood-warm, is now thrown on them, and the cloth is afterwards squeezed down by a man with wooden shoes. Each row undergoes the same operation, until the vessel is full, or all the cloth in it. At first the lye is put on milk-warm, and, after standing a little time on the cloth, it is again let off by a cock into the bucking-copper, heated to a greater degree, and then put on the cloth again. This course is repeated, for six or seven hours, and the degree of heat gradually increased, till it is, at the last turn or two, thrown on boiling hot. The cloth remains after this for three or four hours in the lye; after which the lye is let off, thrown away, or used in the first buckings, and the cloth goes on to another operation.

It is then carried out, generally early in the morning, spread on the grass, pinned, corded down, exposed to the sun and air, and watered for the first six hours, so often, that it never is allowed to dry. Afterwards it is allowed to lie till dry spots appear before it is watered. After seven at night it gets no more water, unless it be a very drying night. Next day, in the morning and forenoon, it is watered twice or thrice if the day be very dry; but if the weather be not drying, it gets no water: After which it is taken up dry if the green be clean; if not, it is rinsed, mill-washed, and laid out to dry again, to become fit for bucking.

This alternate course of bucking and watering, is performed for the most part, from ten to sixteen times, or more, before the linen is fit for fouring; gradually increasing the strength of the lye from the first to the middle bucking, and from that gradually decreasing it till the fouring begins. The lyes in the middle buckings are generally about a third stronger than the first and last.

Souring, or the application of acids to cloth, is the fourth operation. It is difficult to say when this operation should commence, and depends mostly on the skill and experience of the bleacher. When the cloth has an equal colour, and is mostly freed from the sprat, or outer bark of the lint, it is then thought fit for souring; which is performed in the following manner. Into a large vat or vessel is poured such a quantity of buttermilk, or sour milk, as will sufficiently wet the first row of cloth; which is tied up in loose folds, and pressed down by two or three men bare-footed. If the milk is thick, about an eighth of water is added to it; if thin, no water. Sours made with bran, or rye-meal and water, are often used instead of milk, and used milk-warm. Over the first row of cloth a quantity of milk and water is thrown, to be imbibed by the second; and so it is continued till the linen to be soured is sufficiently wet, and the liquor rises over the whole. The cloth is then kept down by covers filled with holes, and secured with a post fixed to the joist, that it may not rise. Some hours after the cloth has been in the sour, air-bubbles arise, a white scum is found on the surface, and an intestine motion goes on in the liquor. In warm weather it appears sooner, is stronger, and ends sooner, than in cold weather. Just before this fermentation, which lasts five or six days, is finished, at which time the scum falls down, the cloth should be taken out, rinsed, mill-

washed, and delivered to the women to be washed with soap and water.

Washing with soap and water, is the fifth operation; and is performed thus. Two women are placed opposite at each tub, which is made of very thick flaves, so that the edges, which slope inwards, are about four inches in thickness. A small vessel full of warm water is placed in each tub. The cloth is folded so that the selvage may be first rubbed with soap and warm water lengthways, till it is sufficiently impregnated with it. In this manner all the parcel is rubbed with soap, and afterwards carried to be bucked.

The lye now used has no soap in it, except what it gets from the cloth: and is equal in strength to the strongest formerly used, or rather stronger, because the cloth is now put in wet. From the former operation these lyes are gradually made stronger, till the cloth seems of an uniform white, nor any darkness or brown colour appears in its ground. After this the lye is more speedily weakened than it was increased; so that the last which the cloth gets, is weaker than any it got before.

But the management of sours is different; for they are used strongest at first, and decreased so in strength, that the last four, considering the cloth is then always taken up wet, may be reckoned to contain three fourths of water.

From the bucking it goes to the watering, as formerly, observing only to overlap the selvages, and tie it down with cords, that it may not tear; then it returns to the four, milling, washing, bucking, and watering again. These operations succeed one another alternately till the cloth is whitened; at which time it is blued, starched, and dried.

This is the method used in the whitening fine cloths. The following is the method used in the whitening of coarse cloths.

Having sorted the cloths, according to their quality, they are steeped in the same manner as the fine, rinsed, washed in the mill, and dried before boiling.

In this process, boiling supplies the place of bucking, as it takes less time, and consequently is thought cheaper. It is done in the following manner: 200 lb. Castile-sap, 100 lb. white Muscovy, and 30 lb. pearl-ashes, boiled in 105 Scots gallons of water for a quarter of an hour, as in the process for the fine cloth, makes the mother or first lye. The cloth-boiler is then to be filled two thirds full with water and mother-lye, about nine parts of the former to one of the latter; so that the lye used for boiling the coarse cloth, is about a third weaker than that used in bucking the fine. Such a quantity of cloth is put into the foregoing quantity of lye, when cold, as can be well covered by it. The lye is brought gradually to the boil, and kept boiling for two hours; the cloth being fixed down all the time, that it does not rise above the liquor. The cloth is then taken out, spread on the field, and watered, as mentioned before in the fine cloth.

As the salts of the lye are not exhausted by this boiling, the same is continued to be used all that day, adding, at each boiling, so much of the mother-lye as will bring it to the same strength as at first. The lye by boiling loses in quantity somewhat betwixt a third and a fourth; and they reckon that in strength it loses about a half, because they find in practice, that adding to it half its former strength in fresh lye, has the same effect

effect on cloth. Therefore some fresh lye, containing a fourth part of the water, and the half of the strength of the first lye, makes the second boiler equal in strength to the first. To the third boiler they add somewhat more than the former proportion, and go on still increasing gradually to the fourth and fifth, which is as much as can be done in a day. The boiler is then cleaned, and next day they begin with fresh lye. These additions of fresh lye ought always to be made by the master-bleacher, as it requires judgment to bring succeeding lyes to the same strength as the first.

When the cloth comes to get the second boiling, the lye should be a little stronger, about a thirtieth part, and the deficiencies made up in the same proportion. For six or seven boilings, or fewer, if the cloth be thin, the lye is increased in this way, and then gradually diminished till the cloth is fit for scouring. The whitest cloth ought always to be boiled first, that it may not be hurt by what goes before.

In this process, if the cloth cannot be got dry for boiling, business does not stop as in the fine; for after the coarse has dreeped on racks made for the purpose, it is boiled, making the lye stronger in proportion to the water in the cloth.

The common method of scouring coarse linen is, to mix some warm water and bran in the vat, then put a layer of cloth, then more bran, water, and cloth; and so on, till the cave is full. The whole is tramped with mens feet, and fixed as in the former process. A thousand yards of cloth, yard-broad, require betwixt four and six pecks of bran. The cloth generally lies about three nights and two days in the four. Others prepare their four twenty-four hours before, by mixing the bran with warm water in a separate vessel; and before pouring it on the cloth, they dilute it with a sufficient quantity of water. After the cloth is taken from the four, it ought to be well washed and rinsed again. It is then given to men to be well soaped on a table, and afterwards rubbed betwixt the rubbing-boards. When it comes from them, it should be well milled, and warm water poured on it all the time, if convenience will allow of it. Two or three of these rubbings are sufficient, and the cloth very seldom requires more.

The lye, after the scouring begins, is decreased in strength by degrees; and three boilings after that are commonly sufficient to finish the cloth. Afterwards it is starched, blueed, dried, and bottled in a machine made for that purpose, which supplies the place of a calender, and is preferred by many to it.

This method used in the bleaching of our coarse cloths, is very like that practised in Ireland for both fine and coarse. The only material difference is, that there the bleachers use no other dyes but the kelp or cashub. A lye is drawn from the former by cold water, which dissolves the salts, and not the sulphureous particles of the kelp-ashes. This lye is used till the cloth is half whitened, and then they lay aside the kelp-lye for one made of cashub-ashes.

In the preceding history of bleaching we may observe, that it naturally divides itself into several different branches or parts, all tending to give linen the degree of whiteness required. How they effectuate that, comes next to be considered.

The general process of bleaching divides itself into these different parts. 1. Steeping and milling. 2. Buck-

ing and boiling. 3. Alternate watering and drying. 4. Souring. 5. Rubbing with soap and warm water, starching, and bluing. We shall treat of these different parts in their order.

STEEPING.

GREEN linen, in the different changes which it has undergone before it arrives at that state, contracts a great foulness. This is chiefly communicated to it by the dressing composed of tallow and fowen, which is a kind of flummery made of bran, flower, or oat-meal feeds. The first thing to be done in the bleachfield is to take off all that filth which is foreign to the flax, would blunt the future action of the salts, and might, in unskillful hands, be fixed in the cloth. This is the design of steeping.

To accomplish this end, the cloth is laid to steep in blood-warm water. A smaller degree of heat would not dissolve the dressing so soon; and the greater might coagulate and fix, in the body of the linen, those particles which we design to carry off. In a few hours the dressing made use in weaving is dissolved, mixed with the water; and, as it had acquired some degree of acidity, before application, it becomes a species of ferment. Each ferment promotes its own particular species of fermentation, or intestine motion; the putrid ferment sets in motion the putrefactive fermentation; the vinous ferment gives rise to the vinous fermentation; and the acid ferment to the acetous fermentation. That there is a real fermentation going on in steeping, one must be soon convinced, who attends to the air-bubbles which immediately begin to arise, to the scum which gathers on the surface, and to the intestine motion and swelling of the whole liquor. That it must be the acetous fermentation, appears from this, that the vegetable particles, already in part soured, must first undergo this process.

The effect of all fermentations is to set the liquor in motion; to raise in it a degree of heat; and to emit air-bubbles, which, by carrying up some of the light oleaginous particles along with them, produce a scum. But as the dressing is in small quantity in proportion to the water, these effects are gentle and slow. The acid salts are no sooner separated, by the acetous fermentation, from the absorbent earth, which made them not perceptible to the tongue in their former state, than they are united to the oily particles of the tallow, which likewise adhere superficially, dissolve them, and render them, in some degree, miscible with water. In this state they are soon washed off by the intestine motion of the liquor. The consequence of this operation is, that the cloth comes out freed in a great measure from its superficial dirt; and more pliant and soft than what it was.

Whenever this intestine motion is pretty much abated, and before the scum subsides, bleachers take out their cloth. The scum, when no more air-bubbles rise to support it, separates and falls down; and would again communicate to the cloth great part of the filth. But a longer stay would be attended with a much greater disadvantage. The putrid follows close upon the acetous fermentation: when the latter ends, the former begins. Were this to take place in any considerable degree, it would render the cloth black and tender. Bleachers cannot be too careful in this article.

The first question that arises to be determined on these

these principles is, What is the properest liquor for steeping cloth? those used by bleachers are plain water; white-linen lye and water, equal parts; and rye-mal or bran mixed with water. They always make use of lye when they have it.

After steeping, the cloth is carried to the puttock-mill, to be freed of all its loose foulness. There can be nothing contrived so effectual to answer the purpose as this mill. Its motion is easy, regular, and safe. While it presses gently, it turns the cloth; which is continually washed with a stream of water. Care must be taken that no water be detained in the folds of the linen, otherwise that part may be damaged.

BUCKING AND BOILING.

This is the most important operation of the whole process, and deserves a thorough examination. Its design is to loosen, and carry off, by the help of alkaline lixives or lyes, that particular substance in cloth, which is the cause of its brown colour.

All ashes used in lye, the pearl excepted, ought to be well washed, before they are put into the copper; for the Marcot and Caslub are very hard, and with some difficulty yield their salt. As these two last contain a very considerable proportion of a real sulphureous matter, which must in some degree tinge white cloth; and as this is dissolved much more by boiling, than by the inferior degrees of heat, while the salts may be as well extracted by the latter; the water should never be brought to boil, and should be continued for some time longer under that degree of heat. The pearl-ashes should never be put in till near the end, as they are easily dissolved in water.

If the salts were always of an equal strength, the same quantities would make a lye equally strong; but they are not. Salts of the same name differ very much from one another. The Muscovy ashes are turning weaker every day, as every bleacher must have observed, till at last they turn quite effete. A decoction from them when new, must differ very much from one when they have been long kept. Hence a necessity of some exact criterion to discover when lyes are of an equal strength. The taste cannot serve, as that is so variable, cannot be described to another, and is blunted by repeated trials. The proof-ball will serve the purpose of the bleachfield sufficiently; and, by discovering the specific gravity, will show the quantity of alkaline salts dissolved. But it cannot show the dangerous qualities of these salts; for the less caustic and less heavy this liquor is, the more dangerous and corrosive it may be for the cloth.

The third lye, which they draw from these materials by an infusion of cold water, in which the taste of lime is discoverable, appears plainly to be more dangerous than the first. The second lye, which they extract from the same ashes, and which is reckoned about a third in strength, when compared to the first, must be of the same nature; nor should it be used without an addition of pearl-ashes, which will correct it.

It is taken for a general rule, That the solution of any body in its menstruum is equally diffused through the whole liquor. The bleachers depending on this, use equal quantities of the top and bottom of their lye, when once clear and settled; taking it for granted, that there is an equal quantity of salts in equal quantities of the lye. But if there is not, the mistake may be of

fatal consequence, as the lye may be in some places stronger than what the cloth can with safety bear. That general law of solution must have taken its rise from particular experiments, and not from reasoning. Whether a sufficient number of experiments have been tried to ascertain this point, and to establish an undoubted general rule, may be called in question.

“But, says Dr Home, when I had discovered that lime makes part of the dissolved substance, and reflected how long its grosser parts will continue suspended in water, there appeared stronger reasons for suspecting that this rule, tho’ it may be pretty general, does not take place here; at least it is worth the pursuit of experiment.

“I weighed at the bleachfield a piece of glass in some cold lye, after it had been boiled, stood for two days, and about the fourth part of it had been used. The glass weighed 3 drachms $1\frac{1}{2}$ grains in the lye, and 3 drachms $7\frac{1}{2}$ grains in river-water. The same glass weighed in the same lye, when almost all used, 2 grains less than it had done before. This shows, that the last of the lye contained a third more of the dissolved body; and, consequently, was a third stronger than the first of the lye.

“As this might, perhaps, be owing to a continuation of the solution of the salts, I repeated the experiment in a different way.

I took from the surface some of the lye, after the salts were dissolved, and the liquor was become clear. At the same time I immersed a bottle, fixed to a long stick, so near the bottom, as not to raise the ashes there, and, by pulling out the cork by a string, filled the bottle full of the lye near the bottom. The glass weighed in river-water 3 drachms $38\frac{1}{2}$ grains; in the lye taken from the surface 3 drachms $34\frac{1}{2}$ grains; and in the lye taken from the bottom 3 drachms $31\frac{1}{2}$ grains. This experiment shows, that the lye at the bottom was, in this case, $\frac{1}{3}$ stronger than the lye at the surface.

“At other times when I tried the same experiment, I found no difference in the specific gravity; and therefore, I leave it as a question yet doubtful, though deserving to be ascertained by those who have an opportunity of doing it. As the lye stands continually on the ashes, there can be no doubt but what is used last must be stronger than the first. I would, therefore, recommend, to general practice, the method used by Mr John Christie, who draws off the lye, after it has settled, into a second receptacle, and leaves the ashes behind. By this means it never can turn stronger; and he has it in his power to mix the top and bottom, which cannot be done so long as it stands on the ashes.”

Having considered the lye, let us next inquire how it acts. On this inquiry depends almost the whole theory of bleaching, as its action on cloth is, at least in this country, absolutely necessary. It is found by experiment, that one effect they have on cloth is the diminishing of its weight; and that their whitening power is, generally, in proportion to their weakening power. Hence arises a probability, that these lyes act by removing somewhat from the cloth, and that the loss of this substance is the cause of whiteness. This appears yet plainer, when the bucking, which lasts from Saturday night to Monday morning, is attended to.

There

There are various and different opinions with regard to the operations of these salts: that they act by altering the external texture of the cloth, or by separating the mucilaginous parts from the rest, or by extracting the oil which is laid up in the cells of the plant. The last is the general opinion, or rather conjecture, for none of them deserves any better name; but we may venture to affirm, that it is so without any better title to pre-eminence, than what the others have. Alkaline salts dissolve oils, therefore these salts dissolve the cellular oil of the cloth, is all the foundation which this theory has to rest on; too slight, when unsupported by experiment, to be relied on.

Dr Home endeavours to settle this question by the following experiments and observations.

“Wax, says he, is whitened by being exposed to the influence of the sun, air, and moisture. A discovery of the change made on it by bleaching, may throw a light upon the question.

“Six drachms of wax were sliced down, exposed on a south window, September 10. and watered. That day being clear and warm, bleached the wax more than all the following. It seemed to me to whiten quicker when it had no water thrown on it, than when it had. September 15. it was very white, and 1 drachm 3 grains lighter. $3\frac{1}{4}$ drachms of this bleached wax, and as much of unbleached, taken from the same piece, were made into two candles of the same length and thickness, having cotton wicks of the same kind. The bleached candle burnt 1 hour 33 minutes; the unbleached 3 minutes longer. The former run down four times, the latter never. The former had an obscure light and dull flame; the latter had a clear pleasant one, of a blue colour at the bottom. The former when burning seemed to have its wick thicker, and its flame nearer the wax, than the latter. The former was brittle, the latter not. It plainly appears from these facts, that the unbleached wax was more inflammable than the bleached; and that the latter had lost so much of an inflammable substance, as it had lost in weight; and consequently the substance lost in bleaching of wax is the oily part.

“As I had not an opportunity of repeating the former experiment, I do not look on it as entirely conclusive; for it is possible that some of the dust, flying about in the air, might have mixed with the bleached wax, and so have rendered it less inflammable. Nor do I think the analogical reasoning from wax to linen without objections. Let us try then if we cannot procure the substance extracted from the cloth, show it to the eye, and examine its different properties. The proper place to find it, is in a lye already used, and fully impregnated with these colouring particles.

“I got in the bleachfield some lye, which had been used all that day for boiling coarse linen, which was tolerably white, and had been twice boiled before. There could be no dressing remaining in these webs. No soap had ever touched that parcel; nor do they mix soap with the lye used for coarse cloth. Some of this impregnated lye was evaporated, and left a dark coloured matter behind. This substance felt oily betwixt the fingers, but would not lather in water as soap does. It deflagrated with nitre in fusion, and afforded a tincture to spirit of wine. By this experiment the salts

seem to have an oily inflammable substance joined with them.

“Could we separate this colouring substance from these salts, and exhibit it by itself, so that it might become the object of experiment, the question would be soon decided. Here chemistry lends us its assistance. Whatever has a stronger affinity or attraction to the salts with which it is joined, than this substance has, must set it at liberty, and make it visible. Acids attract alkaline salt from all other bodies; and therefore will serve our purpose.

“Into a quantity of the impregnated lye mentioned in the former experiment, I poured in oil of vitriol. Some bubbles of air arose, an intestine motion was to be perceived, and the liquor changed its colour from a dark to a turbid white. It curdled like a solution of soap, and a scum soon gathered on the surface, about half an inch in thickness, the deepness of the liquor not being above six inches. What was below was now pretty clear. A great deal of the same matter lay in the bottom; and I observed, that the substance on the surface was precipitated, and showed itself heavier than water, when the particles of air, attached to it in great plenty, were dispelled by heat. This substance was in colour darker than the cloth which had been boiled in it.

“I procured a considerable quantity of it by skimming it off. When I tried to mix it with water, it always fell to the bottom. When dried by the air, it diminished very much in its size, and turned as black as a coal. In this state it deflagrated strongly with nitre in fusion; gave a strong tincture to spirit of wine; and when put on a red-hot iron, burnt very slowly, as if it contained a heavy ponderous oil; and left some earth behind.

“From the inflammability of this substance, its rejecting of water, and dissolving in spirit of wine, we discover its oleaginous nature; but from its great specific gravity we see that it differs very much from the expressed or cellular oil of vegetables; and yet more from their mucilage. That it dissolves in spirit of wine, is not a certain argument of its differing from expressed oils; because these, when joined to alkaline salts, and recovered again by acids, become soluble in spirit of wine. The quantity of earthy powder left behind after burning, shows that it contains many of the solid particles of the flax. The substance extracted from cloth by alkaline lyes appears then to be a composition of a heavy oil, and the solid earthy particles of the flax.

“In what manner these salts act so as to dissolve the oils, and detach the solid particles, is uncertain; but we see evidently how much cloth must be weakened by an improper use of them, as we find the solid particles themselves are separated.”

It is necessary that cloth should be dry before bucking, that the salts may enter into the body of the cloth along with the water; for they will not enter in such quantity, if it be wet; and by acting too powerfully on the external threads, may endanger them.

The degree of heat is a very material circumstance in this operation. As the action of the salts is always in proportion to the heat, it would appear more proper to begin with a boiling heat, by which a great deal of time and labour might be saved. The

reason

reason why this method is not followed, appears to be this. If any vegetable or vegetable substance is to be softened, and to have its juices extracted, it is found more proper to give it gentle degrees of heat at first, and to advance gradually, than to plunge it all at once in boiling water. This last degree of heat is so strong, that when applied at once to a vegetable, it hardens, instead of softening its texture. Dried vegetables are immediately put into boiling water by cooks, that these substances may preserve their green colour, which is only to be done by hindering them from turning too soft. Boiling water has the same effect on animal substances; for if salt beef is put into it, the water is kept from getting at the salts, from the outside of the beef being hardened.

But when we consider how much of an oily substance there is in the cloth, especially at first, which will for some time keep off the water, and how the twisting of the threads, and closeness of the texture, hinders the water from penetrating, we shall find, that if boiling water were put on it at once, the cloth might be liable, in several parts, to a dry heat, which would be much worse than a wet one. That the lyes have not access to all parts of the cloth, at first, appears plainly from this, that when it has lain, after the first bucking, till all the lyes are washed out, it is as black, in some parts, as when it was steeped. This must be owing to the discharge of the colouring particles from those places to which the lye has access, and to their remaining where it has not. It would seem advisable, then, in the first bucking or two, when the cloth is foul, to use the lye considerably below the boiling point; that by this soaking or maceration, the foulness may be entirely discharged, and the cloth quite opened for the speedy reception of the boiling lye in the buckings which follow.

The lyes should likewise be weakest in the first buckings, because then they act only on the more external parts; whereas, when the cloth is more opened, and the field of action is increased, the active powers ought to be so too. For this reason they are at the strongest after some fourings.

The only thing that now remains to be considered, is, the management of the coarse cloth, where boiling is substituted in place of bucking. This species of linen cannot afford the time and labour necessary for the latter operation; and therefore they must undergo a shorter and more active method. As the heat continues longer at the degree of boiling, the lyes used to the coarse cloth must be weaker than those used to the fine. There is not so much danger from heat in the coarse as in the fine cloth, because the former is of a more open texture, and will allow the lye to penetrate more speedily. In the closer kinds, however, the first application of the salts should be made without a boiling heat.

ALTERNATE WATERING AND DRYING.

AFTER the cloth has been bucked, it is carried out to the field, and frequently watered for the first six hours. For if, during that time, when it is strongly impregnated with salts, it is allowed to dry, the salts approaching closer together, and, assisted by a greater degree of heat, increasing always in proportion to the dryness of the cloth, act with greater force, and de-

stroy its very texture. After this time, dry spots are allowed to appear before it gets any water. In this state it profits most, as the latter part of the evaporation comes from the more internal parts of the cloth, and will carry away most from those parts. The bleaching of the wax, in a preceding experiment, helps to confirm this; for it seemed to whiten most when the salt particles of water were going off.

This continual evaporation from the surface of the cloth shows, that the design of the operation is to carry off somewhat remaining after the former process of bucking. This appears likewise from a fact known to all bleachers, that the upper side of cloth, where the evaporation is strongest, attains to a greater degree of whiteness than the under side. But it is placed beyond all doubt by experiment, which shews, that cloth turns much lighter by being exposed to the influence of the sun, air, and winds, even tho' the salts have been washed out of it.

What, then, is this substance? As we have discovered in the former section, that the whitening, in the operation of bucking, depends on the extracting or loosening the heavy oil, and solid particles of the flax; it appears highly probable, that the effects of watering, and exposition to the sun, air, and winds, are produced by the evaporation of the same substance, joined to the salts, with which composite body the cloth is impregnated when exposed on the field. That these salts are in a great measure carried off or destroyed, appears from the cloth's being allowed to dry without any danger, after the evaporation has gone on for some time. "If we can show (says Dr Home) that oils and salts, when joined together, are capable of being exhaled, in this manner, by the heat of the atmosphere, we shall reduce this question to a very great degree of certainty.

"September 10. I exposed in a south-west window, half an oz. of Castile soap, sliced down and watered. September 14. when well dried, it weighed but 3 dr. 6 gr. September 22. it weighed 2 dr. 2 gr. September 24. it weighed 1 dr. 50 gr. It then seemed a very little whiter; but was much more mucilaginous in its taste, and had no degree of saltiness, which it had before.

"It appears from this experiment, that soap is so volatile, when watered, and exposed to air not very warm, that it loses above half its weight in 14 days. The same must happen to the saponaceous substance, formed from the conjunction of the alkaline salts, heavy oil, and earthy particles of the flax. The whole design, then, of this operation, which, by way of pre-eminence, gets the name of *bleaching*, is to carry off, by the evaporation of water, whatever has been loosened by the former process of bucking.

"Against this doctrine there may be brought two objections, seemingly of great weight. It is a general opinion amongst bleachers, that linen whitens quicker in March and April, than in any other months: but as the evaporation cannot be so great at that time, as when the sun has a greater heat; hence the whitening of cloth is not in proportion to the degree of evaporation; and therefore the former cannot be owing to the latter. This objection vanishes, when we consider, that the cloth which comes first into the bleachfield, in the spring, is closely attended, having no other to interfere

with it for some time; and, as it is the whitest, gets, in the after-buckings, the first of the lye; while the second parcel is often bucked with what has been used to the first. Were the fact true, on which the objection is founded, this would be a sufficient answer to the objection. But it appears not to be true, from an observation of Mr John Christie, That cloth laid down in the beginning of June, and finished in September, takes generally less work, and undergoes fewer operations, than what is laid down in March, and finished in June.

“ The other objection is, That cloth dries much faster in windy weather than in calm sunshine; but it does not bleach so fast. This would seem to show, that the sun has some particular influence independent on evaporation. In answer to this objection, let it be considered, that it is not the evaporation from the surface, but from the more internal parts, that is of benefit to the cloth. Now, this latter evaporation must be much stronger in sunshine than in windy weather, on account of the heat of the sun, which will make the cloth more open; while the coldness of windy weather must shut it up, so that the evaporation will all be from the surface. Clear sunshine, with a very little wind, is observed to be the best weather for bleaching; a convincing proof that this reasoning is just.

“ It would seem to follow as a corollary from this reasoning, that the number of waterings should in general be in proportion to the strength of the lye; for the stronger the lye is, the more there is to be evaporated; and the greater the danger, in case the cloth should be allowed to dry. But there is an exception to this general rule, arising from the consideration of another circumstance. It is observed, that cloth when brown, dries sooner than when it becomes whiter, arising from the closeness and oiliness which it then has not allowing the water a free passage. Perhaps that colour may retain a greater degree of heat, and in that way assist a very little. Cloth therefore, after the first buckings, must be more carefully watered than after the last.

“ It follows likewise from this reasoning, that the soil of the bleach-field should be gravelly or sandy, that the water may pass quickly through it, and that the heat may be increased by the reflection of the soil, for the success of this operation depends on the mutual action of heat and evaporation. It is likewise necessary that the water should be light, soft, and free from mud or dirt, which not being able to rise along with the water, must remain behind. When there is much of this, it becomes necessary to rinse the cloth in water, and then give it a milling, to take out the dirt; else it would be fixed in the cloth by the following bucking, as it is not soluble by the lye.

“ This operation has more attributed to it by bleachers than it can justly claim. The cloth appears, even to the eye, to whiten under these alternate waterings and dryings; and these naturally get the honour of it, when it more properly belongs to the former operation. Here lies the fallacy. Alkaline salts give a very high colour to the decoctions or infusion of vegetables. This is probably owing to the solution of the oleaginous colouring particles of the plant; which particles, being opened and separated by the salts, occupy a greater space, and give a deep colour to the liquor. The cloth

participates of the liquor and colour. Hence bleachers always judge of the goodness of the bucking by the deepness of its colour. The rule, in general, is good. I observe that in those buckings which continue from the Saturday night to the Monday morning, the cloth has always the deepest colour. When that cloth has been exposed some hours to the influence of the air, these colouring particles which are but loosely attached to it, are evaporated, and the linen appears of a brighter colour. This operation does no more than complete what the former had almost finished. If its own merit were thoroughly known, there would be no occasion to attribute that of another operation to it. Thread, and open cloths, such as diaper, may be reduced to a great degree of whiteness, after one bucking, by it alone. No cloth, as would appear, can attain to a bright whiteness without it.

“ Since the only advantage of watering is the removal of the salts, and what they have dissolved, might we not effectuate this by some cheaper and more certain method? For it occupies many hands; and must depend altogether on the uncertainty of the weather; so that in the beginning of the season, the bleacher is often obliged to repeat his buckings without bleaching. We might take out the alkaline salts by acids; but then the other substance would be left alone in the cloth, nor would any washing be able to remove it. Mill-washing appears a more probable method of taking out both salts and oils; and it would seem that this might in a great measure, supply the place of watering; but upon trial it does not succeed. Two parcels of linen were managed equally in every other respect, except in this, that one was watered, and exposed to the influence of the air, and the other was only mill-washed. This method was followed until they were fit for scouring. The cloth which had been mill-washed had a remarkable green colour, and did not recover the bright colour of the pieces managed in the common way, until it had been treated like them for a fortnight. The green colour was certainly owing to a precipitation of the sulphureous particles, with which the lye is impregnated, upon the surface of the cloth; owing to the salts being washed off more speedily than the sulphur, to which they are united in the lye. The attachment betwixt these two bodies we know is very loose, and the separation easily made. Evaporation then alone is sufficient to carry off these sulphureous particles.”

S O U R I N G .

It is well known to all chymists, that alkaline salts are convertible, by different methods, into absorbent earths. Frequent solution in water, and evaporation of it again, is one of these. This transmutation then of these salts, which are not volatilised or washed away, must be continually going on in the cloth under these alternate waterings and dryings of the former process; not much indeed after the first two or three buckings; because the salts, not having entered deep into the cloth, are easily washed off, or evaporated. But when they penetrate into the very composition of the last and minutest fibres, of which the first vessels are made, they find greater difficulty of escaping again, and must be more subject to this transmutation. But if we consider the bleaching ashes as a composition of lime and alkaline salts, we must discover a fresh fund for the deposition

position of this absorbent earth. The common caustic, a composition of this very kind, soon converts itself, if exposed to the open air, into a harmless earthy powder.

Frequent buckings and bleachings load the cloth with this substance. It becomes then necessary to take it out. No washing can do that, because earth is not soluble in water. Nothing but acids can remove it. These are attracted by the absorbent earth, join themselves to it, and compose a kind of neutral imperfect salt, which is soluble in water, and therefore easily washed out of the cloth. The acid liquors commonly used are butter-milk, which is reckoned the best, four-milk, infusion of bran, rye-meal, &c. kept for some days till they four. Sour whey is thought to give the cloth a yellow colour.

The linen ought to be dried before it is put in the four, that the acid particles may penetrate, along with the watery, through the whole. A few hours after it has been there, air-bubbles arise, the liquor swells, and a thick foam is formed; manifest signs of a fermentation. The following experiment, says Dr Home, shews the degree of heat which attends it.

“ May 25. I put a thermometer of Fahrenheit’s into some butter-milk, of which the bleachers were composing their fours, and which stood in a vat adjoining to another, where the milk was the same, and the fouring process had been going on for two days. After the thermometer had been 20 minutes in the butter-milk, the mercury stood at 64 degrees. In the fouring vat it rose to 68 degrees. An increase of four degrees shews a pretty brisk intestine motion.

“ To what are all these effects owing? To the acetous fermentation going on in those vegetable liquors, whose acids, extricating themselves, produce heat, intestine motion, and air-bubbles. As the change is slow, the process takes five or six days before it is finished. During this time the acid particles are continually uniting themselves to the absorbent earth in the cloth. That this fermentation goes on in the liquor alone, appears from this consideration, that the same effects, viz. air-bubbles, and foam, are to be seen in the butter-milk alone. The only effect then it has is, by the small degree of heat, and intestine motion, which attend it, to assist the junction of the acid and absorbent particles. We shall presently see that this process may be carried on to as great advantage, without any fermentation; and therefore it appears not absolutely necessary.

“ When these absorbent particles are fully saturated, the remaining acids may unite with, and have some small effect in extracting, the colouring particles. This appears from the two following experiments.

“ Sept. 20. A piece of cloth which had been steeped, weighing 41½ gr. was put into a half-pound of butter-milk, whigged, and well soured, by a mixture of water, and by boiling. Sept. 24. When taken out, and washed in water, it appeared a very little whiter. The mineral acids, as will appear afterwards, whiten cloth, even though they are very much diluted.

“ Just before the acetous fermentation is finished, the cloth should be taken out; otherwise the foam will fall down and lodge in the cloth, and the putrefaction which then begins will weaken it. This appears from the following experiment.

“ Sept. 16. A piece of cloth weighing 42 gr. was laid in butter-milk unwhigged. Novem. 15. The

milk had a putrified smell. The cloth was a little whiter, but very tender; and weighed, when well washed in warm water and dried, 40 gr.”

All the fours made of bran, rye-meal, &c. ought to be prepared before use; for by this means so much time will be saved. Besides, when the water is poured upon the cloth and bran, as is done in the management of coarse cloth, the linen is not in a better situation than if it had been taken up wet from the field; and by this means the acid particles cannot penetrate so deep. Again, this method of mixing the bran with the cloth, may be attended with yet worse consequences. All vegetable substances, when much pressed, fall into the putrescent, and not the acetous fermentation. This often happens to the bran pressed betwixt the different layers on the linen, which must weaken the cloth. Hence, all fours should be prepared before the cloth is steeped in them; and none of the bran or meal should be mixed with the cloth.

The fours are used strongest at first, and gradually weakened till the cloth has attained to its whiteness. In the first fourings, there is more of the earthy matter in the cloth, from the many buckings it has undergone, than what there can be afterwards. As the quantity of this matter decreases, so should the strength of the four. There is not, however, the least danger, at any time, from too strong a four.

What is most wanted in this operation is a more expeditious and cheaper method of obtaining the same end. As it takes five or six days, it retards the whitening of the cloth considerably; and as bleachers are obliged to send for milk to a great distance, it becomes very dear. This last consideration makes them keep it so long, that, when used, it can have no good effect; perhaps it may have a bad one.

There is one consideration that may lead us to shorten the time. It is observed, that the fouring process is sooner finished in warm than in cold weather. Heat quickens the fermentation, by aiding the intestine motion. The vats therefore should not be buried in the ground, as they always are, which must keep them cold; there should rather be pipes along the walls of the room, to give it that degree of heat which, on trial, may be found to answer best. There are few days in summer so hot as is necessary; and the beginning and end of the season is by much too cold. That this is no ideal scheme, the following fact is a sufficient proof. There are two vats in Salton bleachfield, adjoining to a partition-wall, at the back of which there is a kitchen-fire. In these vats the fouring process is finished in three days, whereas it lasts five or six days in the other placed round the same room.

This improvement, tho’ it shortens the time of fouring a very little, yet is no remedy against the scarcity and dearth of milk fours. Such a liquor as would serve our purpose, must be found either among the vegetable acids, which have no further fermentation to undergo, or among the mineral acids. The former are a large class, and contain within themselves many different species; such as the acid juice of several plants, vinegars made of fermented liquors, and acid salts, called tartars. But there is one objection against these vegetable acids: they all contain, along with the acid, a great quantity of oily particles, which would not fail to discolour the cloth. Besides, the demand of

the bleachfields would raise their price too high.

The mineral acids have neither of these objections. They are exceedingly cheap, and contain no oil. "I will freely own, says Dr Home, that at first I had no great opinion of success from the mineral, from two reasons; their want of all fermentation, which I then looked on as necessary; and their extreme corrosiveness. But the experience of two different summers, in two different bleachfields, has convinced me, that they will answer all the purposes of the milk and bran fours; nay, in several respects, be much preferable to them. I have seen many pieces of fine cloth, which had no other fours but those of vitriol, and were as white and strong as those bleached in the common way. I have cut several webs through the middle, and bleached one half with milk, and the other with vitriol; gave both the same number of operations, and the latter were as white and strong as the former."

The method in which it has been hitherto used is this. The proportion of the oil of vitriol to the water, with which it is diluted, is half an ounce, or at most three quarters, to a gallon of water. As the milk-fours are diminished in strength, so ought the vitriol-fours. The whole quantity of the oil of vitriol to be used, may be first mixed with a small quantity of water, then added to the whole quantity of water, and well mixed together. The water should be milk-warm; by which means the acid particles will penetrate further, and operate sooner. The cloth should then be put dry into the liquor.

It is observed, that this four performs its task much sooner than those of milk and bran; so that Mr John Chrystie, in making the trial, used to lay the milk-fours 24 hours before the vitriol. Five hours will do as much with this four, as five days with the common sort. But the cloth can receive no harm in allowing it to remain for some days in the four; but rather, on the contrary, an advantage. The cloth is then taken out, well rinsed, and mill-washed in the ordinary way.

The liquor, while the cloth lies in this four, is less acid the second day than the first, less the third than the second, and so diminishes by degrees. At first it is clear, but by degrees a mucilaginous substance is observed to float in it, when put into a glass. This foulness increases every day. This substance, extracted by the acid, is the same with what is extracted by the alkaline salts; and blunts the acidity of the former, as it does the alkaline of the latter. Hence the liquor loses by degrees its acidity. But as the acid salts do not unite so equally with oily substance as the alkaline do, the liquor is not so uniformly tinged in the former as in the latter case, and the mucous substance presents itself floating in it.

It is observed, that, in the first fouring, which is the strongest, the liquor, which was a pretty strong acid before the cloth was put in, immediately afterwards becomes quite vapid; a proof how very soon it performs its task. But in the following operations, as the linen advances in whiteness, the acidity continues much longer; so that in the last operations the liquor loses very little of its acidity. This happens although the first buckings, after the first fourings, are increased in strength, while the fours are diminished. There are two causes to which this is owing. The texture of the cloth is now so opened, that although the lyes are strong, the alka-

line salts and absorbent earth are easily washed out; and the oily particles are, in a great measure, removed which help to blunt the acidity of the liquor.

Two objections are made against the use of vitriol-fours. One is, that the process of fouring with milk is performed by a fermentation; and, as there is no fermentation in the vitriol-fours, they cannot serve the purpose so well: the other, that they may hurt the texture of the cloth. The answer to the former objection is very short; that the vitriol-fours operate successfully without a fermentation, as experience shows; and therefore in them a fermentation is not necessary.

As to the latter objection, that oil of vitriol, being a very corrosive body, may hurt the cloth; that will vanish likewise, when it is considered how much the vitriol is diluted with water, that the liquor is not stronger than vinegar, and that it may be safely taken into the human body.

That it may be used with safety, much stronger than what is necessary in the bleachfield, appears from the following experiment with regard to the stamping of linen. After the linen is boiled in a lye of ashes, it is bleached for some time. After this, in order to make it receive the colour, it is steeped in a four of water and oil of vitriol, about 15 times stronger than that made use of in the bleachfield; for, to 100 gallons of water are added two and a half of oil of vitriol. Into this quantity of liquor, made so warm as the hand can just be held in it, is put seven pieces of 28 yards each. The linen remains in it about two hours, and comes out remarkably whiter. The fine cloth often undergoes this operation twice. Nor is there any danger if the oil of vitriol is well mixed with the water. But if the two are not well mixed together, and the oil of vitriol remains in some parts undiluted, the cloth is corroded into holes.

Let us now take a view of the advantages which the vitriol-fours must have over the milk. The latter is full of oily particles, some of which must be left in the cloth: but the case is worse when the scum is allowed to precipitate upon the cloth. The former is liable to neither of these objections.

The common fours hasten very fast to corruption; and if, from want of proper care, they ever arrive at that state, must damage the cloth very much. As the milk is kept very long, it is often corrupted before it is used; and, without acting as a four, has all the bad effects of putrefaction. The vitriol-fours are not subject to putrefaction.

The milk takes five days to perform its task; but the vitriol-fours do it in as many hours; nay, perhaps as many minutes. Their junction with the absorbent particles in the cloth must be immediate, whenever these acid particles enter with the water. An unanswerable proof that the fact is so, arises from the circumstances which happen when the cloth is first steeped in the vitriol-four; the cloth has no sooner imbibed the acid liquor, than it loses all acidity, and becomes immediately vapid. This effect of vitriol-fours must be of great advantage in the bleachfield, as the bleachers are at present hindered from enjoying the season by the tediousness of the fouring process. The whole round of operations takes seven days; to answer which they must have seven parcels, which are often mixing together, and causing mistakes. As three days, at most, will be sufficient for all the operations when vitriol-fours are used,

used, there will be no more than three parcels. The cloth will be kept a shorter time in the bleachfield, and arrive sooner at market.

The milk-fours are very dear, and often difficult to be got; but the vitriol are cheap, may be easily procured, and at any time.

There is yet another advantage in the use of vitriol, and that is its power of whitening cloth. Even in this diluted state, its whitening power is very considerable. We have already seen, that it removes the same colouring particles, which the alkaline lyes do. What of it then remains, after the alkaline and absorbent particles are neutralized in the cloth, must act on these colouring particles, and help to whiten the cloth. That this is really the case, appears from the following fact. Mr Chrystie being obliged to chuse 20 of the whitest pieces out of 100, five of the twenty were taken out of seven pieces which were bleached with vitriol.

From both experience and reason, it appears, that it would be for the advantage of our linen-manufacture to use vitriol in place of milk-fours.

HAND-RUBBING with Soap and Warm Water, RUBBING-BOARDS, STARCHING, and BLUING.

AFTER the cloth comes from the souring, it should be well washed in the washing-mill, to take off all the acid particles which adhere to its surface. All acids decompose soap, by separating the alkaline salts and oily parts from one another. Were this to happen on the surface of the cloth, the oil would remain; nor would the washing-mill afterwards be able to carry it off.

From the washing-mill the fine cloth is carried to be rubbed by womens hands, with soap and water. As the liquors, which are generally employed for souring, are impregnated with oily particles, many of these must lodge in the cloth, and remain, notwithstanding the preceding milling. It is probable, that all the heavy oils are not evaporated by bleaching. Hence it becomes necessary to apply soap and warm water, which unite with, dissolve, and carry them off. It is observed, that if the cloth, when it is pretty white, gets too much soap, the following bleaching is apt to make it yellow; on that account they often wring out the soap.

It is a matter worth inquiring into, whether hard or soft soap is best for cloth. Most bleachers agree, that hard soap is apt to leave a yellowness in the cloth. It is said, that the use of hard soap is discharged in Holland. As there must be a considerable quantity of sea-salt in this kind, which is not in the soft, and as this salt appears prejudicial to cloth, the soft soap ought to be preferred.

The management of the coarse cloth is very different, in this operation, from fine. Instead of being rubbed with hands, which would be too expensive, it is laid on a table, run over with soap, and then put betwixt the rubbing-boards, which have ridges and grooves from one side to another, like teeth. These boards have small ledges to keep in the soap and water, which saves the cloth. They are moved by hands, or a water-wheel, which is more equal and cheaper. The cloth is drawn, by degrees, through the boards, by men who attend; or, which is more equal and cheaper, the same water-wheel moves two rollers, with ridge and groove, so that the former enters the latter, and, by a gentle motion round their own axis, pull the cloth gradually

through the boards.

This mill was invented in Ireland about thirty years ago. The Irish bleachers use it for their fine, as well as coarse cloth. These rubbing-boards were discharged, some years ago, in Ireland, by the trustees for the manufactures of that country, convinced from long experience of their bad effects. But as proper care was not taken to instruct the bleachers by degrees in a safer method, they continued in the old, made a party, and kept possession of the rubbing-boards. There were considerable improvements made in them in this country; such as the addition of the ledges, to keep the cloth moist; and of the rollers, which pull the cloth more gradually than mens hands. These improvements were first made in Salton bleachfield.

The objections against these rubbing-boards, are unanswerable. By rubbing on such an unequal surface, the solid fibrous part of the cloth is wore; by which means it is much thinned, and in a great measure weakened before it comes to the market. As a proof of this, if the water which comes from the cloth in the rubbing-boards be examined, it will be found full of cottony fibrous matter. These boards give the cloth a cottony surface, so that it does not keep long clean. Again, they flatten the threads, and take away all that roundness and firmness, which is the distinguishing property of cloth bleached in the Dutch method.

For these reasons they must be very prejudicial to fine cloth, and should never be used in bleaching it. As they seem to be, in some measure, necessary to lessen the expence of bleaching coarse linen, they ought never to be used above twice, or thrice at most. They might be rendered much more safe, by lining their insides with some soft elastic substance, that will not wear the cloth so much as the wooden teeth do. Mr Chrystie at Perth has lined his boards with short hair for some years past, and finds that it answers very well.

After the coarse linen has undergone a rubbing, it should be immediately milled for an hour, and warm water poured now and then on it to make it lather. This milling has very good effects; for it cleans the cloth of all the dirt and filth which the rubbing-boards have loosened, and which, at the next boiling, would discolour the cloth. Besides, it is observed, that it makes the cloth less cottony, and more firm, than when whitened by rubbing alone.

The last operation is that of starching and bluing. It often happens, that the cloth, when exposed to the weather to be dried after this operation, gets rain; which undoes all again, and forces the bleacher to a new expence. To remedy this inconvenience, Mr Chrystie, some years ago, invented the dry-house, where the cloth may be dried, after this operation, in any weather. This invention meets with universal approbation.

A METHOD OF BLEACHING SAFELY WITH LIME.

Dr Home has found by repeated trials, that alkaline salts added to lime, diminish its power of weakening and corroding cloth; and that in proportion to the quantity of these salts added to the lime. This composition, as it is not so dangerous as lime alone, so it is not so expeditious in whitening. When equal parts of each are used, the whitening power is strong, and the weakening power not very considerable; so that the

they might be used with safety to bleach cloth, in the proportion of one part of lime to four of pure alkaline salts. This fully accounts for an observation made by all bleachers, That the bleaching salts, when mixed together, operate safer and better than when used separately. For the corrosive power of the Muscovy, Maroeti, and Castub ashes is corrected by the pearl ashes, and the whitening quality of the latter is increased by that of the former.

There is not a more corroding substance, with regard to animals, than alkaline salts and lime joined together, especially when fused in the fire. This is the composition of the common caustic. But lime, and lime-water alone, preserve animal substances in a sound entire state. It appears then surprising, that salts and lime should be found so little destructive of cloth, when lime, or lime-water alone, destroys it so remarkably. But that this is a fact, is made evident by many experiments, and has been practised both with success and safety, by a bleacher who gives the following account of his method of bleaching with lime.

“First (says he) I steep the cloth in warm water for 24 hours; then clean it in a washing-mill, of all the dressing, or fowen, as the vulgar term it. Afterwards I buck cloth with cow-dung and water, and bleach it with this for three days; then clean it again, and boil it with a lye made of Castub ashes. A pound to each piece of 18 or 20 yards long is sufficient. This I do twice, as no lime ought to be given to cloth before it is a full third whitened; as it by no means advances the whitening of the cloth, but, on the contrary, protracts it: For, instead of loosening the oil and dirt in the cloth, when brown, it rather fixes them; just as when fine cloth is bucked with over-warm lyes in the first buckings. Lime is by no means fit for discharging the oil in the cloth, but for cleaning it of the dead part, commonly called *sprat*. The cloth, being cleaned, is laid upon a drepper. It must not be drier before bucking with lime, otherwise it will take in more than can be got out again before the next application: for as I have observed already, that lime is only fit for discharging the dead part, bucking thus wet makes it rest on the outside of the cloth. I take a lippy of the finest and richest powdered lime that can be got, of the brightest white colour, as poor lime does more hurt than good, to thirty pieces of the above length; and make a cold lye of it, by stirring and pouring water off the lime, until all be dissolved, but the dross, which is thrown away: then I add a little soap, which makes the lye have the nearest resemblance to milk that breaks in boiling, of any thing I can think of: for this soap blunts the hotness of the lime. Then I take the cloth, and dip it in the lime-lye, and that moment out again, and lay it on a drepper until it be bucked; then put it on the field, watering it carefully; for if allowed to dry, it is much damaged. This is done always in the morning; as it cannot be done at, night in regard of

the hot quality of the lime, which soon heats the cloth, and tenders it. If a hot sun-shine follows, it has great effect; for lime is just like all other materials for bleaching, that have more or less effect according as the weather is good or bad. I take it up the second day after bucking, and give it a little milling, or hand-rubbing, or biting, commonly called *knocking*; and lay it on the field again, watering it carefully as before. The effect is more visible the second than the first day. As all cloth when limed should have a great deal of work, otherwise more than half the effect is lost; and not only that, but a great deal of labour and pains is requisite to take the lime out of the cloth again; it must never be exposed on the Sabbath day, but carefully kept wet always while used in this way. Thus bucking for three or four times at most, is sufficient for any cloth, except that made of flax pulled either over-green, or which grows in a droughty season, or perhaps not so well heckled as it should be. This sort occasions great trouble and expence to the bleacher. But the most effectual and expeditious way I ever found for this kind, was, after boiling, to take a little of the warm lye, and mix a very small quantity of lime with it, and draw the cloth through that as hot as possible, and put it on the field directly, watering it carefully. This will clean it of the *sprat* surprisngly. Then I boil it with pearl ashes, and give it the last boil with soap.

“There are innumerable mistakes in the use of lime committed by the vulgar, who are ignorant of its quality and effects. They know only this in general, that it is a thing which whitens cloth cheap, and is easy purchased; therefore they will use it. Some of them begin whitening of their cloth with it, which I have already observed to be wrong, and given reasons for it, and continue it until the cloth is bleached; give it a boil or two at most, and then wash it up while the gross body of the lime is in the substance of the cloth. This makes limed cloth easily distinguishable from unlimed, as the former has a yellowish colour, and is full of a powder. Besides, as lime is of a very hot corroding nature, it must by degrees weaken the cloth. The bad effects of this substance do not end here. When the cloth is put on board, it contracts a dampness, which not only makes it yellow, and lose any thing of colour it has, but directly rots it. And although it should escape this, which it is possible it may, by a quick and speedy passage; yet whenever it is put in any warehouse, it will meet with moisture there, especially if the winter-season should come on before it is disposed or made use of. These I take to be the principal reasons for so much complaint in bleaching with this material.”

The whole art and safety in using the lime, according to this method, depends on the junction of the alkaline salts, during the bucking, to the particles of lime which were on the surface of the cloth.

B L E

BLEAK, in ornithology. See *CYPRINUS*.

BLEACHINGLY, a town of Surry in England, which sends two members to parliament, and the bailiff who returns the members, is chosen annually at the lord of the manor's court. The town stands on a hill, and has a fine prospect as far as the South Downs in Suffex.

BLEEDING, in therapeutics; see the *Index* subjoined to *MEDICINE*. As a chirurgical operation, see *SURGERY*, chap. i.

BLEEDING at the Nose, called *Epistaxis*. See the *Index* subjoined to *MEDICINE*.

BLEED-

BLEEDING, in *Ferriery*. See there, § ii. 1.

BLEEDING, is also used for a hæmorrhage or flux of blood from a wound, rupture of a vessel, or other accident. See HÆMORRHAGE.

BLEEDING of a *Corps*, is a phenomenon said to have frequently happened in the bodies of persons murdered, which, on the touch, or even the approach, of the murderer, began to bleed at the nose, ears, and other parts; so as formerly to be admitted in England, and still allowed in some other parts, as a sort of detection of the criminal, and proof of the fact. Numerous instances of these posthumous hæmorrhages are given by writers. But this kind of evidence ought to be of small weight: for it is to be observed, that this bleeding does not ordinarily happen, even in the presence of the murderer; yet sometimes in that even of the nearest friends, or persons most innocent; and sometimes without the presence of any, either friend or foe. In effect, where is the impossibility that a body, especially if full of blood, upon the approach of external heat, having been considerably stirred or moved, and a putrefaction coming on, some of the blood-vessels should burst, as it is certain they all will in time? *

BLEEDING is also used for the drawing out the sap of plants, otherwise called *tapping*. See TAPPING.

BLEKING, a territory in the south part of Sweden, having the Baltic Sea on the south, Smaland on the north, and the province of Schonon on the west. Its principal towns are Christianstadt, Elleholm, Ahuys, Roterby, and Christianople, which last is the capital.

BLEMYES, or BLEMYES, a fabulous people of Ethiopia, said to have had no heads; their eyes, mouth, &c. being situated in their breasts †.

BLENCH, or BLANCH. See BLANCH.

BLEND, or BLENDE, a mineral substance resembling lead-ore, but containing very little of that metal.

BLEND-*Water*, called also *morebough*, a distemper incident to black cattle, comes either from the blood, from the yellows, or from the change of ground.—In order to cure it, take bole armoniac, and as much charcoal dust as will fill an egg-shell, a good quantity of the inner bark of an oak, dried and pounded together to a powder, and give it to the beast in a quart of new milk and a pint of earning.

BLÉNHEIM, a village of Germany, in the circle of Susbia, situated in E. Long. 2. 30. N. Lat. 48. 40. This village is remarkable for the defeat of the French and Bavarians in 1704, by the English and their confederates under prince Eugene and the duke of Marlborough. In this engagement the French army consisted of 82 battalions and 160 squadrons, while that of the confederates did not exceed 64 battalions and 152 squadrons. The right wing of the French army was commanded by Mons. Tallard; the elector, and count Marfin, were on the left. Tallard was esteemed an active, penetrating officer, and a man of genius; Marfin's merit consisted rather in his experience and application, than in his resources from the efforts of genius. In the village of Blenheim were posted 20 battalions and 12 squadrons, from a presumption that there the confederates would make their chief attack. Accordingly, at noon, the village was furiously attacked by a body of English supported by another of Hessians; but the French behaved with such bravery, that they re-

pulled their enemies in three successive attempts. Part of the centre and right wing of the confederates then advanced; but were so vigorously opposed by the French horse, and so miserably galled in the flank by the troops posted in the village of Blenheim, that they were obliged to retreat with precipitation: but in the mean time the French cavalry, being attacked by the left wing of the confederates, were forced to retreat in their turn, though commanded by Tallard in person, who rallied them three times. The infantry were disordered by the falling back of the cavalry; and being unsupported, gave way to the vigorous efforts of their enemies. Marlborough pushed between the battalions placed in Blenheim and the wing of the army commanded by Tallard; and thus the army was separated and almost surrounded; for prince Eugene had succeeded in his fourth attempt, and driven the French and Bavarians out of the village. All was now in confusion; and Tallard, being short-sighted, mistook a squadron of the enemy for his own, and was taken prisoner. The troops who had been posted in the village being driven out by prince Eugene, and then finding it impossible to escape, being hemmed in on the other side by the duke of Marlborough, were forced to surrender prisoners of war, while the rest of the army fled in the utmost confusion and consternation. Vast numbers threw themselves into the Danube, inasmuch that in that river the greater part of 30 squadrons perished. Ten thousand were left dead on the field; 13,000 made prisoners; 100 pieces of cannon, 22 mortars, and upwards of 100 pair of colours, were taken; besides near 200 standards, 17 pair of kettle-drums, upwards of 3000 tents, 34 coaches, 300 loaded mules, two bridges of boats, and all the French baggage, with their military chest. This was the most terrible defeat the French had for a long time sustained: Mons. Tallard was blamed for detaching so many troops to Blenheim, in consequence of which Marlborough pierced the centre, and divided the army in two; also for suffering the confederates to pass a rivulet, and form quietly on the other side. These accusations, however, seem but weakly founded; and the victory is undoubtedly to be ascribed to the superior valour of the confederate troops and genius of their commanders, rather than to any material blunders of the French generals.

BLÉNHEIM-*House*, a noble and princely house erected in honour of the duke of Marlborough at Woodstock near Oxford, which with the manor of Woodstock is settled on the duke and his heirs, in consideration of the eminent services by him performed for the public; and for building of which house the sum of L. 500,000 was granted by parliament, &c.

BLÉNNIUS, in ichthyology, a genus of fishes belonging to the order of jugulares; the characters of which are these: The head slants or declines to one side; there are six rays in the membrane of the gills; the body tapers towards the tail; the belly-fins have only two blunt bones; and the tail-fin is distinct. The species are 13, viz. 1. The galeria, with a transverse membranous crest upon the head. It is found in the European seas. 2. The cristatus, with a longitudinal bristly crest betwixt the eyes. 3. The cornutus, with a simple ray above the eyes, and a single back-fin. The above two are natives of the Indies. 4. The ocellaris, with a furrow betwixt the eyes, and a large spot on the back.

Blenheim,
Blennius.

Blowin
Bligh.

back-fin. 5. The gattorugine, with small palmed fins about the eye-brows and neck. It is about seven or eight inches long. These two last are found in the European seas. 6. The superciliosus, with small fins about the eye-brows, and a curved lateral line. It is a native of India. 7. The phylis, with a kind of crested nostrils, a cirrus or beard on the under lip, and a double fin on the back. It has seven rays in the gill-membrane; the anus is surrounded with a black ring; and the tail is roundish. 8. The pholis has a smooth head, a curve line upon the sides, and the upper jaw is larger than the under one. The two last are found in the Mediterranean sea. 9. The genullus has 10 black spots on the back-fin. It is found in the Atlantic ocean. 10. The muscellaris has three rays on the fore-part of the back-fin. It is a native of India. 11. The viviparus has two tentacula at the mouth. Schonevelde first discovered this species; Sir Robert Sibbald afterwards found it on the Scotch coast. They bring forth two or three hundred young at a time. Their season of parturition is a little after the depth of winter. Before midsummer, they quit the bays and shores; and retire into the deep, where they are commonly taken. They are a very coarse fish, and eaten only by the poor. They are common in the mouth of the river Elk, at Whitby, Yorkshire; where they are taken frequently from off the bridge. They sometimes grow to the length of a foot. Their form is slender, and the backbone is green, as that of a sea-needle. 12. The lumpenus has several dusky-coloured areolæ running across its body. The two last are found in the European seas. 13. The raninus, with six divisions in the belly-fins, is found in the lakes of Sweden. It is remarkable, that when this fish appears in the lake, all the other fishes retire; and what is worse, it is not fit for eating.

BLENNY. See the above article.

BLIGHT, in husbandry, a disease incident to plants, which affects them variously, the whole plant sometimes perishing by it, and sometimes only the leaves and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing.

Some have supposed that blights are usually produced by an easterly wind, which brings vast quantities of insects eggs along with it, from some distant place, that, being lodged upon the surface of the leaves and flowers of fruit trees, cause them to shrivel up and perish.

To cure this distemper, they advise the burning of wet litter on the windward side of the plants, that the smoke thereof may be carried to them by the wind, which they suppose will stife and destroy the insects, and thereby cure the distemper.

Others direct the use of tobacco-dust, or to wash the trees with water wherein tobacco-stalks have been infused for 12 hours; which they say will destroy those insects, and recover the plants.

Pepper-dust scattered over the blossoms of fruit-trees, &c. has been recommended as very useful in this case; and there are some that advise the pulling off the leaves that are distempered.

The true cause of blights seem to be continued dry easterly winds for several days together, without the intervention of showers, or any morning dew, by which the perspiration in the tender blossom is stopped; and if it so happens, that there is a long continuance of the

fame weather, it equally affects the tender leaves, whereby their colour is changed, and they wither and decay.

The best remedy for this distemper, is gently to wash and sprinkle over the tree, &c. from time to time with common water; and if the young shoots seem to be much infected, let them be washed with a woollen cloth, so as to clear them, if possible, from this glutinous matter, that their respiration and perspiration may not be obstructed. This operation ought to be performed early in the day, that the moisture may be exhale before the cold of the night comes on: nor should it be done when the sun shines very hot.

Another cause of blights in the spring, is sharp hoary frosts, which are often succeeded by hot sunshine in the day-time: this is the most sudden and certain destroyer of the fruits that is known.

BLIGHTED-Corn. See SMUT.

BLIND, an epithet applied to a person or sensitive creature deprived of the use of his eyes; or, in other words, to one from whom light, colours, and all the glorious variety of the visible creation, are intercepted by some natural or accidental disease. Such is the literal acceptation of the term: but it is likewise used in a metaphorical sense, to signify mental or intellectual darkness; and frequently implies, at the same time, some moral or spiritual depravity in the soul thus blinded, which is either the efficient or continuing cause of this internal malady. Yet, even in metaphor, the epithet of *blind* is sometimes applied to a kind of ignorance, which neither involves the ideas of real guilt, nor of voluntary error. It is, however, our present intention to consider the word, not in its figurative, but in its natural and primary sense. Nor do we mean in this place to regard it as a subject of medical speculation, or to explore its causes and enumerate its cures. These are in the department of another science †. It is rather our design to consider, By what means this inexpressible misfortune may be compensated or alleviated to those who sustain it; what advantages and consolations they may derive from it; of what acquisitions they may be susceptible; what are the proper means of their improvement; or by what culture they may become useful to themselves, and important members of society.

There is not, perhaps, any sense or faculty of the corporeal frame, which affords so many resources of utility and entertainment, as the power of vision; nor is there any loss or privation which can be productive of disadvantages or calamities so multiform, so various, and so bitter, as the want of sight. By no avenue of corporeal perception is knowledge in her full extent, and in all her forms, so accessible to the rational and inquiring soul, as by the glorious and delightful medium of light. For this not only reveals external things in all their beauties, in all their changes, and in all their varieties; but gives body, form, and colour, to intellectual ideas and abstract essences; so that the whole material and intelligent creation lie in open prospect, and the majestic frame of nature in its whole extent, is, if we may speak so, perceived at a single glance. To the blind, on the contrary, the visible universe is totally annihilated; he is perfectly conscious of no space but that in which he stands, or to which his extremities can reach. Sound, indeed, gives him some ideas of distant objects;

objects; but those ideas are extremely obscure and indistinct. They are obscure, because they consist alone of the objects whose oscillations vibrate on his ear, and do not necessarily suppose any other bodies with which the intermediate space may be occupied, except that which gives the sound alone: they are indistinct, because sounds themselves are frequently ambiguous, and do not uniformly and exclusively indicate their real causes. And though by them the idea of distance in general, or even of some particular distances, may be obtained; yet they never fill the mind with those vast and exalting ideas of extension which are inspired by ocular perception. For though a clap of thunder, or an explosion of ordnance, may be distinctly heard after they have traversed an immense region of space; yet, when the distance is uncommonly great, it ceases to be indicated by sound; and therefore the ideas, acquired by auricular experiment of extension and interval, are extremely confused and inadequate. The living and comprehensive eye darts its instantaneous view over extensive valleys, lofty mountains, protracted rivers, illimitable oceans. It measures, in an indivisible point of time, the mighty space from earth to heaven, or from one star to another. By the assistance of telescopes, its horizon is almost indefinitely extended, its objects prodigiously multiplied, and the sphere of its observation nobly enlarged. By these means, the imagination, inured to vast impressions of distance, can not only recal them in their greatest extent with as much rapidity as they were at first imbibed; but can multiply them, and add one to another, till all particular boundaries and distances be lost in immensity. Thus nature, by profusely irradiating the face of things, and clothing objects in a robe of diversified splendour, not only invites the understanding to expatiate on a theatre so extensive, so diversified, and so attractive; but entertains and inflames the imagination with every possible exhibition of the sublime or beautiful. The man of light and colours beholds the objects of his attention and curiosity from far. Taught by experience, he measures their relative distances; distinguishes their qualities; determines the situations, positions, and attitudes; presages what these tokens may import; selects his favourites; traverses in security the space which divides them from him; stops at the point where they are placed; and either obtains them with ease, or immediately perceives the means by which the obstacles that intercept his passage to them may be surmounted. The blind not only may be, but really are, during a considerable period, apprehensive of danger in every motion towards any place from whence their contracted powers of perception can give them no intelligence. All the various modes of delicate proportion, all the beautiful varieties of light and colours, whether exhibited in the works of nature or art, are to them irretrievably lost. Dependent for every thing, but mere subsistence, on the good offices of others; obnoxious to injury from every point, which they are neither capacitated to perceive, nor qualified to resist; they are, during the present state of being, rather to be considered as prisoners at large, than citizens of nature. The sedentary life, to which by privation of sight they are destined, relaxes their frame, and subjects them to all the disagreeable sensations which arise from dejection of spirits. Hence the most feeble exertions create lassitude and uneasiness. Hence

the native tone of the nervous system, which alone is compatible with health and pleasure, destroyed by inactivity, exasperates and embitters every disagreeable impression. Natural evils, however, are always supportable; they not only arise from blind and undesigned causes, but are either mild in their attacks, or short in their duration: it is the miseries which are inflicted by conscious and reflecting agents alone, that can deserve the name of evils. These excruciate the soul with ineffable poignancy, as expressive of indifference or malignity in those by whom such bitter potions are cruelly administered. The negligence or wantonness, therefore, with which the blind are too frequently treated, is an enormity which God alone has justice to feel or power to punish.

Those amongst them who have had sensibility to feel, and capacity to express, the effects of their misfortunes, have described them in a manner capable of penetrating the most callous heart. The venerable father of epic poetry, who in the person of Demodocus the Phæætan bard is said to have described his own situation, proceeds thus:

Τὸν παρὶ Μῆσ' ἐκίλισε, διδὸν δ' ἀγαθὸν τι, κακὸν τε
 Ὀρβηλῶαν μὲν ἀμείρεται, διδὸν δ' ἄδικον αἰσῖνον. O D Y S. 6.
 Dear to the muse, who gave his days to flow
 With mighty blessings mix'd with mighty wo,
 In clouds and darkness quench'd his visual ray,
 Yet gave him power to raise the lofty lay. P O P E.

Milton, in his address to light, after a sublime description of his arduous and gloomy journey from the regions of primeval darkness to this our visible diurnal sphere, thus continues to apostrophise the celestial beam:

Taught by the heav'nly muse to venture down
 The dark descent, and up to reascend,
 Though hard and rare; thee I revisit oft,
 And feel thy sov'reign vital lamp: but thou
 Reviv'st not these eyes, that roll in vain
 To find thy piercing ray, and find no dawn;
 So thick a dropping hath quench'd their orbs,
 Or dim insuasion veil'd. Yet not the more
 Cease I to wander, where the muses haunt
 Clear spring, or shady grove, or sunny hill,
 Smit with the love of sacred song: but chief
 Thee, Sion, and the flow'ry brooks beneath,
 That wash thy hallow'd feet, and warbling fount,
 Nightly I visit; nor sometimes forget
 Those other two equal'd with me in fate,
 So were I equal'd with them in renown,
 Blind Thamyris, and blind Mezonides,
 And Terpsichore and Phineus prophets old:
 Then feed on thoughts, that voluntary move
 Harmonious numbers; as the weak-fid hind
 Sings darkling, and in shade'st covert hid
 Tunes her nocturnal note. Thus with the year
 Seasons return; but not to me returns
 Day, or the sweet approach of ev'n or morn,
 Or sight of vernal bloom, or summer's rofe,
 Or flocks, or herds, or human face divine;
 But cloud instead, and ever-during dark,
 Surrounds me, from the cheerful ways of men
 Cut off, and for the book of knowledge fair
 Present'd with a universal blank,
 Of nature's works to me expung'd and ras'd,
 And wisdom at one entrance quite shut out.

PAR. LOST, Book II.

The same inimitable author, in his tragedy of Sampson Agonistes, and in the person of his hero, deploras the misfortune of blindness with a pathos and energy sufficient to extort the deepest sighs from the most insensible hearts:

Blind.

—But chief of all,
 O loss of sight, of thee I must complain!
 Blind among enemies, O worse than chains,
 Dungeon, or beggary, decrepid age,
 Light, the prime work of God, to me is extinct,
 And all her various objects of delight
 Annul'd, which might in part my grief have eas'd,
 Inferior to the vilest now become
 Of man or worm. The vilest here excel me:
 'They creep, yet see; I dark in light expos'd,
 To daily fraud, contempt, abuse, and wrong,
 Within doors, or without, still as a fool,
 In power of others, never in my own;
 Scarce half I seem to live, dead more than half.
 O dark, dark, dark, amid the blaze of noon,
 Irrecoverably dark, total eclipse
 Without all hope of day!
 O first-created Being, and thou great Word,
 Let there be light, and light was over all;
 Why am I thus bereav'd thy prime decree?
 'The sun to me is dark,
 And silent, as the moon
 When she deserts the night,
 Hid in her vacant interlunar cave.
 Since light so necessary is to life,
 And almost life itself, if it be true
 That light is in the soul,
 She all in every part; why was the sight
 To such a tender ball as th' eye confin'd?
 So obvious, and so easy to be quench'd?
 And not, as feeling, throughout all parts diffus'd,
 That the might look at will through ev'ry pore?
 'Then had I not been thus exil'd from light,
 As in the land of darkness, yet in light
 To live a life half dead, a living death;
 And bury'd; but yet more miserable!
 Myself the sepulchre, a moving grave;
 Bury'd, yet not exempt
 By privilege of death and burial
 From worst of other evils, pains and wrongs,
 But made hereby obnoxious more
 To all the miseries of life.

Ossian, the Caledonian bard, who lived before the authenticated history of his nation dates its origin, who in his old age participated the same calamity, has in more than one passage of his works described his situation in a manner so delicate, yet so pathetic, that it pierces the inmost recesses and excites the finest feelings of the heart. Of these passages, take the following:

“ O thou that rollest above, round as the shield of my fathers! whence are thy beams, O sun! whence thy everlasting light? Thou comest forth in thy awful beauty, and the stars hide themselves in the sky; the moon, cold and pale, sinks in the western wave. But thou thyself movest alone: who can be a companion of thy course? The oaks of the mountains fall; the mountains themselves decay with years; the ocean shrinks and grows again; the moon herself is lost in heaven: but thou art for ever the same; rejoicing in the brightness of thy course. When the world is dark with tempests; when thunder rolls and lightning glances through the heavens; thou lookest in thy beauty from the clouds, and laughest at the storm. But to Ossian thou lookest in vain: for he beholds thy beams no more; whether thy yellow hair flows on the eastern clouds, or thou tremblest at the gates of the west. But thou art, perhaps, like me, for a season; and thy years will have an end: thou shalt sleep in thy clouds, careles of the voice of the morning.—Exult then, O sun, in the strength of thy youth! age is dark and unlovely; it is like the glimmering light of the moon, when it shines through broken clouds, and the mist is on the hills, the howling blast of the north is on the plain,

the traveller shrinks in the midst of his journey.”

Thus dependent on every creature, and passive to every accident, can the world, the uncharitable world, be surpris'd to observe moments when the *blind* are at variance with themselves and every thing else around them? With the same instincts of self-preservation, the same irascible passions which are common to the species, and exasperated by a sense of debility either for retaliation or defence; can the blind be real objects of resentment or contempt, even when they seem peevish or vindictive? This, however, is not always their character. Their behaviour is often highly expressive, not only of resignation, but even of cheerfulness; and tho' they are often coldly, and even inhumanly, treated by men, yet are they rarely, if ever, forsaken of heaven. The common Parent of nature, whose benignity is permanent as his existence and boundless as his empire, has neither left his afflicted creatures without consolation nor resource. Even from their loss, however oppressive and irrevocable, they derive advantages; not indeed adequate to recompense, but sufficient to alleviate, their misery. The attention of the soul, confined to these avenues of perception which she can command, is neither dissipated nor confounded by the immense multiplicity nor the rapid succession of surrounding objects. Hence her contemplations are more uniformly fixed upon herself, and the revolutions of her own internal frame. Hence her perceptions of such external things as are contiguous and obvious to her observation become more lively and exquisite. Hence even her instruments of corporeal sensation are more assiduously cultivated and improved, so that from them she derives such notices and presages of approaching pleasure or impending danger as entirely escape the attention of those who depend for security on the reports of their eyes. A blind man, when walking swiftly, or running, is kindly and effectually checked by nature from rudely encountering such hard and extended objects as might hurt or bruise him. When he approaches bodies of this kind, he feels the atmosphere more sensibly resist his progress; and in proportion as his motion is accelerated, or his distance from the object diminished, the resistance is increased. He distinguishes the approach of his friend from far by the sound of his steps, by his manner of breathing, and almost by every audible token which he can exhibit. Prepared for the dangers which he may encounter from the surface of the ground upon which he walks, his step is habitually firm and cautious. Hence he not only avoids those falls which might be occasioned by its less formidable inequalities, but from its general bias he collects some ideas how far his safety is immediately concerned; and though these conjectures may be sometimes fallacious, yet they are generally so true, as to preserve him from such accidents as are not incurred by his own temerity. The rapid torrent and the deep cascade not only warn him to keep a proper distance, but inform him in what direction he moves, and are a kind of audible synofures to regulate his course. In places to which he has been accustomed, he as it were recognises his latitude and longitude from every breath of varied fragrance that tinges the gale, from every ascent or declivity in the road, from every natural or artificial sound that strikes his ear; if these indications be stationary, and confined to particular places.

Regu-

Regulated by these signs, the *blind* have not only been known to perform long journeys themselves, but to conduct others through dangerous paths at the dark and silent hour of midnight, with the utmost security and exactness (A).

It were endless to recapitulate the various mechanical operations of which they are capable, by their nicety and accuracy of touch. In some the tactile powers are said to have been so highly improved, as to perceive that texture and disposition of coloured surfaces by which some rays of light are reflected and others absorbed, and in this manner to distinguish colours. But the testimonies for this fact still appear to us too vague and general to deserve public credit. We have known a person who lost the use of his sight at an early period of infancy, who in the vivacity or delicacy of his sensations was not perhaps inferior to any one, and who had often heard of others in his own situation capable of distinguishing colours by touch with the utmost exactness and promptitude. Stimulated, therefore, partly by curiosity to acquire a new train of ideas, if that acquisition were possible; but still more by incredulity with respect to the facts related; he tried repeated experiments by touching the surfaces of different bodies, and examining whether any such diversities could be found in them as might enable him to distinguish colours; but no such diversity could he ever ascertain. Sometimes, indeed, he imagined that objects which had no colour, or (in other words) such as were black, were somewhat different and peculiar in their surfaces; but this experiment did not always nor universally hold. His scepticism therefore still continues to prevail (B). That their acoustic perceptions are distinct and accurate, we may fairly conclude from the rapidity with which they ascertain the acuteness or gravity of different tones, as relative one to another; and from their exact discernment of the various kinds and modifications of sound, and of sonorous objects, if the sounds themselves be in any degree significant of their causes. From this vivacity and accuracy of external sensation, and from the assiduous and vigorous applications of a comprehensive and attentive mind, alone, we are able to account for the rapid and astonishing progress which some of them have made, not only in those departments of literature which were most obvious to their senses and accessible to their understandings, but even in the abstractest, and (if we may be allowed the expression) in the most occult, sciences. What, for instance, can be more remote from the conceptions of a blind man than the abstract relations and properties of space and quantity? yet the incomprehensible attainments of Mr Saunderson in all the branches of mathematics are now fully known and firmly believed by the whole literary world, both from the testimony of his pupils and the publication of his works. But should the fact be still uncertain, it might be sufficiently verified by a living prodigy (C) of this kind, with which our country is at present honoured. The gentleman of whom we now speak, though blind from his infancy, by the ardour and assiduity of his ap-

plication, and by the force of a genius to which nothing is impetrable, has not only made incredible advances in mechanical operations, in music, and in the languages; but is likewise profoundly skilled in geometry, in optics, in algebra, in astronomy, in chemistry, and in all the other branches of natural philosophy as taught by Newton and received by an admiring world. We are sorry that neither the modesty of this amiable philosopher, nor the limits of this article, will permit us to delineate his character in its full proportions. All we can do is to exhibit his example, that by it the vulgar prejudice, which presumes to think blindness and learning incompatible, may be dissipated; and that an instance of success so noble and recent may inflame the emulation and encourage the efforts of such as have genius and opportunity to pursue the same laudable path. If these glorious attempts should neither be perceived nor rewarded by an unfeeling world, if human nature should forget to recognize its own excellence so nobly displayed in instances of this kind; yet, besides the enjoyments resulting from a sublime and comprehensive understanding, besides the immortal and inexhaustible sources of delight which are the peculiar portion of a self-approving mind, these happy pupils and favourites of nature are, as it were, indulged with her personal intercourse. They become more intimately acquainted with her laws, till, by exploring the beneficence of her economy, the sublimity of her ends, the regularity of her procedure, and the beauties of her frame, they imbibe the spirit, and feel the presence, of her glorious Author:

By swift degrees the love of nature works,
And warms the bosom; till at last, sublim'd
To rapture and enthusiastic heat,
We feel the present deity, and taste
The joys of God to see a happy world.

THOMSON.

Much labour has been bestowed to investigate, both from reason *a priori*, and from experiment, what might be the primary effects of light and luminous objects upon such as have been born blind, or early deprived of sight, if at a maturer period they should instantaneously recover their visual powers. But upon this topic there is much reason to fear, that nothing satisfactory has yet been said. The fallacy of hypothesis and conjecture, when formed *a priori* with respect to any organ of corporeal sensation and its proper object, is too obvious to demand illustration. But from the nature of the eye, and the mediums of its perception, to attempt an investigation of the various and multifiform phenomena of vision, or even of the varieties of which every particular phenomenon is susceptible according as the circumstances of its appearance are diversified, would be a project worthy of philosophy in a delirium. Nay, even the discoveries which are said to accrue from experiment, may still be held as extremely doubtful and suspicious; because, in these experiments, it does not appear to have been ascertained, that the organs to which visible objects were presented immediately after surgical operations, could be in a proper state to perceive them. Yet, after all, it is extremely probable, that figure, distance, and magnitude, are not immediate objects of ocular sensation, but acquired and adjusted

7 L 2

by

(A) We have read, in authors of good credit, of a very surprising blind guide who used to conduct the merchants through the sands and deserts of Arabia. Vide *Leo Afric. Descr. Afr. lib. vi. p. 246.* and *Casaub. Treat. of Enthuf. c. ii. p. 45.*

(B) See, however, the extraordinary case subjoined to this article.

Blind. by long and reiterated experience (D). There are, however, many desiderata, which the perceptions of a man born blind might considerably illustrate, if his instruments of vision were in a right state, and assisted by a proper medium. Such a person might perhaps give a clearer account, why objects, whose pictures are inverted upon the retina of the eye, should appear to the mind in their real positions; or why, though each particular object is painted upon the retina of both our eyes, it should only be perceived as single. Perhaps, too, this new spectator of visible nature might equally amuse our curiosity and improve our theory, by attempting to describe his earliest sensations of colour, and its original effects upon his organ and his fancy. But, as we have already hinted, it is far from being certain, that trials of this kind have ever been fairly made. Such readers as may wish to see a more minute detail of these questions, may consult Mr Diderot's *Lettre sur les aveugles, a l'usage de ceux qui voyent*: "A letter concerning the blind for the use of those who see." To these may be added, *Mr Cheffelden's Anatomy*, and *Locke's essay on the human understanding*.

When we ruminate on the numberless advantages derived from the use of light, and its immense importance, in extending the human capacity, or in improving and cultivating every faculty and every function of the mind, we might be strongly tempted to doubt the fidelity of those reports which we have heard, concerning such persons as, without the assistance of light, have arrived at high degrees of eminence even in those sciences which appear absolutely unattainable but by the interposition of external mediums. It has, however, been demonstrated by a late ingenious author, that *blind men*, by proper instruction, are susceptible almost of every idea and of every truth which can be impressed on the mind by the mediation of light and colours, except the sensations of light and colours themselves †.

Yet there is one phenomenon of this kind which seems to have escaped the attention of that great philosopher, and for which no author either of this or any former period has been able to offer any tolerable account. Still, however, it seems to merit the attention of a philosopher. For though we should admit, that the blind can understand with great perspicacity all the phenomena of light and colours; though it were allowed, that in these subjects they might extend their speculations beyond their instructions, and investigate the mechanical principles of optics by the mere force of genius and application, from the data which they had already obtained; yet it will be difficult, if not impossible, to assign any reason why these objects should be more interesting to a blind man, than any other abstract truths whatever. It is possible for the blind, by a retentive memory, to tell you, That the sky is an azure; that the sun, moon, and stars, are bright; that the rose is red, the lily white or yellow, and the tulip variegated. By continually hearing these substantives and adjectives joined, he may be mechanically taught to join them in the same manner: but, as he never had any sensation

of colour, however accurately he may speak of coloured objects, his language must be like that of a parrot; without meaning, or without ideas. Homer, Milton, and Ossian, had been long acquainted with the visible world before they were surrounded with clouds and ever-during darkness. They might, therefore, still retain the warm and pleasing impressions of what they had seen. Their descriptions might be animated with all the rapture and enthusiasm which originally fired their bosoms when the grand or delightful objects which they delineated were immediately beheld. Nay, that enthusiasm might still be heightened by a bitter sense of their loss, and by that regret which a situation so dismal might naturally inspire. But how shall we account for the same energy, the same transport of description, exhibited by those on whose minds visible objects were either never impressed, or have been entirely obliterated. Yet, however unaccountable this fact may appear, it is no less certain than extraordinary. But delicacy and other particular circumstances forbid us to enter into this disquisition with that minuteness and precision which it requires. We only mention the fact as one amongst the few resources for entertainment, and avenues to reputation, which are still reserved for the *blind*. Whoever thinks the subject of sufficient consequence to merit a nicer scrutiny, may consult the *Preface to Blacklock's Poems*, written by G. G. Esq. and printed at Edinburgh 1754; or the account of his life and writings by the Rev^d Mr Spence, prefixed to a quarto edition of his poems published at London in 1756.

It is hoped, however, that we shall not be suspected of partiality for inserting a character of the same author by one who was a foreigner, a stranger to his person, and prepossessed in his favour by his works alone.

"Blacklock will appear to posterity a fabulous character: even now he is a prodigy. It will be thought a fiction and a paradox, that a man quite blind since he was three years old (†), besides having made himself so good a master of various languages, of Greek, Latin, Italian, and French, should also be a great poet in his own; and, without hardly ever having seen the light, should be so remarkably happy in description †."

It is impossible to enter into a detail of particulars with respect to the education of the blind. These must be left to be determined by the genius, the capacity, the circumstances, of those to whom the general rules which may be given should be applied. Much therefore must depend on their fortunes, much on their temper and genius; for, unless these particulars were known, every answer which could be given to questions of this kind must be extremely general, and of consequence extremely superficial. Besides, the task is so much more arduous, because whoever attempts it can expect to derive no assistance from those who have written on education before him: And though the blind have excelled in more than one science; yet, except in the case of Saunderson, professor of mathematics in the university of Cambridge, concerning whom we shall afterwards have occasion to speak, it does not appear, that any of them have been conducted to that degree

(D) The gentleman conched by Mr Cheffelden, had no idea of distance; but thought that all the objects he saw, touched his eyes, as what he felt did his skin. It was also a considerable time before he could remember which was the cat, and which the dog, though often informed, without first feeling them.

(E) The author is here mistaken: Dr Blacklock only saw the light for five months.

of eminence, at which they arrived, upon a premeditated plan. One should rather imagine, that they have been led through the general course and ordinary forms of discipline; and that, if any circumstances were favourable to their genius, they rather proceeded from accident than design.

This fact, if not supported by irrefragable evidence, should, for the honour of human nature, have been suppressed. When contemplated by a man of benevolence and understanding, it is not easy to guess whether his mortification or astonishment would be most sensibly felt. If a heart that glows with real philanthropy must feel for the whole vital creation, and become, in some measure, the *sensorium* of every suffering insect or reptile; how must our sympathy increase in tenderness and force, when the distressed individuals of our own species become its objects? Nor do the blind bear so small a proportion to the whole community, as, even in a political view, to be neglected. But in this, as in every other political crime, the punishment returns upon the society in which it is committed. Those abandoned and unimproved beings, who, under the influence of proper culture and discipline, might have successfully concurred in producing and augmenting the general welfare, become the nuisances and burdens of those very societies who have neglected them.

There is perhaps no rank of beings in the sensible universe, who have suffered from nature or accident, more meritorious of public compassion, or better qualified to repay its generous exertions, than the blind. They are meritorious of compassion; for their sphere of action and observation is infinitely more limited than that of the deaf, the lame, or of those who labour under any other corporeal infirmity consistent with health. They are better qualified to repay any friendly interposition for their happiness; because, free from the distraction which attends that multiplicity of objects and pursuits that are continually obvious to the sight, they are more attentive to their own internal economy, to the particular notices of good and evil impressed on their hearts, and to that peculiar province in which they are circumscribed by the nature and cultivation of their powers.

It will easily occur to the reader, that, if the pupil should not be placed in easy circumstances, music is his readiest and most probable resource. Civil and ecclesiastical employments have either something in their own nature, or in the invincible prejudices of mankind, which renders them almost entirely inaccessible to those who have lost the use of sight. No liberal and cultivated mind can entertain the least hesitation in concluding, that there is nothing, either in the nature of things, or even in the positive institutions of genuine religion, repugnant to the idea of a blind clergyman. But the novelty of the phenomenon, while it astonishes vulgar and contracted understandings, inflames their zeal to rage and madness. Besides, the adventitious trappings and ceremonies assumed by some churches as the drapery of religion, would, according to these systems, render the sacerdotal office painful, if not impracticable, to the blind.

We have, some years ago, read of a blind gentleman*, descended from the same family with the celebrated lord Verulam, who, in the city of Brussels, was with high approbation created doctor of laws; since that period

we have been honoured with his correspondence. He was deprived of sight at nine years of age by an arrow from a cross-bow whilft he was attempting to shoot it. When he had recovered his health, which had suffered by the shock, he pursued the same plan of education in which he had been engaged; and having heard that one Nicasius de Vourde, born blind, who lived towards the end of the 15th century, after having distinguished himself by his studies in the university of Lovain, took his degree as doctor of divinity in the university of Cologne; this motive prevailed with him to make the same attempt. But the public, cursed with prejudices for which the meanest sensitive nature might blush, prejudices equally beneath the brutality and ignorance of the lowest animal-instinct, treated his intention with ridicule: even the professors were not far from being of that sentiment; and they admitted him into their schools, rather from an impression that it might amuse him, than become of any use to him. He had the good fortune, however, contrary to their expectations, to obtain the first places amongst his condisciples. It was then said, that such rapid advances might be made in the preliminary branches of his education; but would soon be effectually checked by studies of a more profound and abstracted nature. This, it seems, was repeated from school to school, through the whole climax of his pursuits; and when, in the course of academical learning, it became necessary to study poetry, it was the general voice that all was over, and that at length he had reached his *ne plus ultra*. But here he likewise confronted their prepossessions, and taught them the immense difference between blindness of body and blindness of soul. After continuing his studies in learning and philosophy for two years more, he applied himself to law, took his degree in that science, commenced pleading counsel for, and was afterwards in the council of Brabant, and has had the pleasure of terminating almost every suit in which he has been engaged to the satisfaction of his clients.

Had it not been for a fact so striking and so well authenticated, though there could have been no doubt that a blind man might discharge the office of a chamber-counsel with success; yet, as a barrister, his difficulties must have appeared more formidable, if not absolutely insuperable. For he should remember all the sources, whether in natural equity or positive institutions, whether in common or statutory law, from whence his argument ought to be drawn. He must be able to specify, and to arrange in their proper order, all the material objections of his antagonists: these he must likewise answer as they were proposed, *extempore*.

When, therefore, it is considered how difficult it is to temper the natural associations of memory with the artificial arrangements of judgment, the desultory flights of imagination with the calm and regular deductions of reason, the energy and perturbation of passion with the coolness and tranquillity of deliberation, some idea may be formed of the arduous task which every blind man must achieve, who undertakes to pursue the law as a profession. Perhaps assistances might be drawn from Cicero's treatise on Topics and on Invention; which, if happily applied and improved, might lessen the disparity of a blind man to others, but could scarcely place him on an equal footing with his brethren. And it ought to be fixed as an inviolable maxim, that no

Law difficult, though not impossible, for the blind.

blind

Blind.

19 The blind, naturally subject to dependency, should be stimulated by the prospect of attainable excellence.

blind man ought ever to engage in any province in which it is not in his power to excel. This may at first sight appear paradoxical; but it is easily explained. For the consciousness of the obvious advantages possessed by others, habitually predisposes a blind man to depondency: and if he ever gives way to despair (which he will be too apt to do when pursuing any acquisition where others have a better chance of success than himself), adieu, for ever adieu, to all proficiency. His soul sinks into irremediable depression; his abortive attempts incessantly prey upon his spirit; and he not only loses that vigour and elasticity of mind which are necessary to carry him through life, but that patience and serenity which alone can qualify him to enjoy it.

20 Physic perhaps impracticable to the blind.

In this recapitulation of the learned professions, we have intentionally omitted physic; because the obstacles which a blind man must encounter, whether in the theory or practice of that art, will be more easily conceived by our readers than described in detail. From this, therefore, let us pass to more general subjects.

It has been formerly hinted, that the blind were objects of compassion, because their spheres of action and observation were limited: and this is certainly true. For what is human existence, in its present state, if you deprive it of action and contemplation? Nothing then remains but the distinction which we derive from form or from sensitive and loco-motive powers. But for these, unless directed to happier ends by superior faculties, few rational beings would, in our opinion, be grateful. The most important view, therefore, which we can entertain in the education of a person deprived of sight, is to redress as effectually as possible the natural disadvantages with which he is encumbered; or, in other words, to enlarge as far as possible the sphere of his knowledge and activity. This can only be done by the improvement of his intellectual, imaginative, or mechanical, powers; and which of these ought to be most assiduously cultivated, the genius of every individual alone can determine. Were men to judge of things by their intrinsic natures, less would be expected from the blind than others. But, by some pernicious and unaccountable prejudice, people generally hope to find them either possessed of preternatural talents, or more attentive to those which they have than others: For it was not Rochester's opinion alone,

That if one sense should be suppress'd,
It but retires into the rest.

Hence it unluckily happens, that blind men, who in common life are too often regarded as rare-shows, when they do not gratify the extravagant expectations of their spectators, too frequently sink in the general opinion, and appear much less considerable and meritorious than they really are. This general diffidence of their powers at once deprives them both of opportunity and spirit to exert themselves; and they descend, at last, to that degree of insignificance in which the public estimate has fixed them. From the original dawning, therefore, of reason and spirit, the parents and tutors of the blind ought to inculcate this maxim, That it is their indispensable duty to excel, and that it is absolutely in their power to attain a high degree of eminence. To impress this notion on their minds, the first objects presented to their observation, and the first methods of improvement applied to their understanding, ought, with no great difficulty, to be comprehensible

22 The elements of education for the blind should neither be too difficult nor too easy.

by those internal powers and external senses which they possess. Not that improvement should be rendered quite easy to them, if such a plan were possible. For all difficulties, which are not really or apparently insuperable, heighten the charms and enhance the value of those acquisitions which they seem to retard. But, care should be taken that these difficulties be not magnified or exaggerated by imagination; for it has before been mentioned, that the blind have a painful sense of their own incapacity, and consequently a strong propensity to despair continually awake in their minds. For this reason, parents and relations ought never to be too ready in offering their assistance to the blind in any office which they can perform, or in any acquisition which they can procure for themselves, whether they are prompted by amusement or necessity. Let a blind boy be permitted to walk through the neighbourhood without a guide, not only though he should run some hazard, but even though he should suffer some pain.

If he has a mechanical turn, let him not be denied the use of edge-tools; for it is better that he should lose a little blood, or even break a bone, than be perpetually confined to the same place, debilitated in his frame, and depressed in his mind. Such a being can have no employment but to feel his own weakness, and become his own tormentor; or to transfer to others all the malignity and peevishness arising from the natural, adventitious, or imaginary, evils which he feels. Scars, fractures, and dislocations, in his body, are trivial misfortunes compared with imbecility, timidity, or fretfulness of mind. Besides the sensible and dreadful effects which inactivity must have in relaxing the nerves and consequently in depressing the spirits, nothing can be more productive of jealousy, envy, peevishness, and every passion that corrodes the soul to agony, than a painful impression of dependence on others, and of our insufficiency for our own happiness. This impression, which, even in his most improved state, will be too deeply felt by every blind man, is redoubled by that utter incapacity of action which must result from the officious humanity of those who would anticipate or supply all his wants, who would prevent all his motions, who would do or procure every thing for him without his own interposition. It is the course of nature, that blind people, as well as others, should survive their parents; or it may happen that they should likewise survive those who, by the ties of blood and nature, are more immediately interested in their happiness than the rest of mankind. When, therefore, they fall into the hands of the world in general, such exigencies as they themselves cannot redress will be but coldly and languidly supplied by others. Their expectations will be high and frequent, their disappointments many and sensible; their petitions will often be refused, seldom fully gratified; and, even when granted, the concession will be so ungrateful, as to render its want infinitely more tolerable than its fruition. For all these reasons, we repeat it once more (because it can never be too frequently reiterated), that, in the formation of a blind man, it is infinitely better to direct than supercede his own exertions. From the time that he can move and feel, let him be taught to supply his own exigencies; to dress and feed himself; to run from place to place, either for exercise, or in pursuit of his own toys or necessities.

The prospect of attainable excellence should be pursued.

In these excursions, however, it will be highly proper for his parent or tutor to superintend his motions at a distance, without seeming to watch over him. A vigilance too apparent, may impress him with a notion that malignity or some other selfish motive may have produced it. When dangers are obvious and great, such as we incur by rivers, precipices, &c. those who are entrusted with the blind will find it neither necessary nor expedient to make their vigilance a secret. They ought then to acquaint their pupil, that they are present with him; and to interpose for his preservation, whenever his temerity renders it necessary. But objects of a nature less noxious, which may give him some pain without any permanent injury or mutilation, may with design be thrown in his way, providing, however, that this design be always industriously concealed. For his own experience of their bad effects will be an infinitely more eloquent and sensible monitor, than the abstract and frigid counsels of any adviser whatever.

When the volatile season of puerile amusement is expired, and the impetuous hurry of animal-spirits subsides, through the whole demeanour of his pupil the tutor will probably observe a more sensible degree of timidity and precaution, and his activity will then require to be stimulated more than restrained. In this crisis, exercise will be found requisite, rather to preserve health, and facilitate the vital functions, than merely for recreation. Of all the different kinds of exercise, riding, not in a machine, but on horseback, is by far the most eligible, and most productive of its end. On these occasions, however, care must be taken that the horses employed may neither be capricious nor unmanageable; for on the manufacture of the creature which he rides, not only his safety, but his confidence, will entirely depend. In these expeditions, whether long or short, his companion or attendant ought constantly to be with him; and the horse should always either be taught implicitly to follow its guide, or be conducted by a leading rein besides the bridle which he himself holds. Next to this mode of exercise, is walking. If the constitution of the blind boy be tolerably robust, let him be taught to endure every vicissitude of weather which the human species can bear with impunity. For if he has been bred with too much delicacy, particular accidents may supersede all his former scruples, and subject him to the necessity of suffering what will not only be severe in its immediate sensation, but dangerous in its future consequences. Yet, when the cold is so intense, or the elements so tempestuous, as to render air and exercise abroad impracticable, there are methods of domestic exercise, which, though not equally salutary, may still be eligible; such as dumb-bells, or the bath-chair. The first of these are made of lead, consisting of a cylinder, the middle of which may either be rectilinear or arcuated for the conveniency of holding, and terminates at each end in a semiglobular mass. Their weight should be conformed to the strength and age of the person who uses them. The method of employing them is to take one in each hand, and swing them backwards and forwards over his head, describing a figure somewhat like a parabola. This not only strengthens the arms, and opens the chest, but promotes the circulation of the fluids. The bath-chair is a deal of 12 feet in length, as free from knots and as elastic as possible, supported by a fulcrum at each end, upon

which may be placed two rolling cylinders to give it greater play; when seated upon this, by alternately depressing it with his own weight, and suffering it to return to its natural situation, he gives himself a motion though not equal in its energy, yet somewhat resembling the trot of a horse. There are other elastic seats of the same kind constructed with steel springs, but one of this simple fabrication may answer the purpose.

His meals should be temperate, his diet light and of easy digestion. If the tone of his stomach be vigorous, vegetables should be preferred to animal-food, particularly those vegetables which are most farinaceous and least acceft. Fermented liquors and ardent spirits should never be given him but to gratify the real demands of exhausted nature. For though they exhilarate the spirits, they at the same time corrode the vessels and relax the nerves, a misfortune doubly pernicious to sedentary life. The safest and most wholesome beverages are milk and water. If he should be tired with these, he may be indulged with the variety of chocolate, balm, sage, or ground-ivy. Coffee may sometimes be taken with impunity: but tea should be interdicted with inflexible severity; for no vegetable juice under heaven is more noxious to sedentary people*. Let him also, for similar reasons, be prohibited the use of tobacco in all its forms. In the observations of diet and exercise, let him neither be mechanically regular, nor entirely excentric. In the one case, he will be a slave to habit, which may create some inconvenience; in the other, he will form no habits at all, which may still be productive of greater.

The natural curiosity of children renders them extremely and indefatigably inquisitive. This disposition is often peculiarly prevalent in the blind. Parents and tutors, therefore, should gratify it whenever their answers can be intelligible to the pupil; when it is otherwise, let them candidly confess the impossibility or impropriety of answering his questions. At this period, if their hearts be tender and their powers inventive, they may render his amusements the vehicles, and his toys the instruments, of improvement: why, for instance, may not the centrifugal and centripetal forces be illustrated from the motion of a top, or the nature and power of elasticity by the rebound of a ball. These hints may lead to others, which, if happily improved and applied, may wonderfully facilitate the progress of knowledge. Nor will the violence of exercise, and the tumult of play, be productive of such perils and accidents as may be apprehended.

For the encouragement of such parents as chuse to take these advices with regard to exercise, let us inform them, that though, till the age of twenty, some blind persons were on most occasions permitted to walk, to run, to play at large, they have yet escaped without any corporeal injury from these excursions.

Parents of middle, or of higher rank, who are so unfortunate as to have blind children, ought, by all possible means, to keep them out of vulgar company. The herd of mankind have a wanton malignity, which eternally impels them to impose upon the blind, and to enjoy the painful situations in which these impositions place them. This is a stricture upon the humanity of our species, which nothing but the love of truth and the dictates of benevolence could have extort-

blind.

ed from us. But we (F) have known some who have suffered so much from this diabolical mirth in their own persons, that it is natural for us, by all the means in our power, to prevent others from becoming its victims.

Blind people have infinitely more to fear from the levity and ignorance, than from the selfishness and ill-nature, of mankind. In serious and important negotiations, pride and compassion suspend the efforts of knavery or spleen; and that very infirmity, which so frequently renders the blind defenceless to the arts of the insidious, or to the attempts of malice, is a powerful incentive to pity, which is capable of disarming fury itself. Villany, which frequently piques itself more upon the arts by which it prevails, than upon the advantages which it obtains, may often with contempt reject the blind, as subjects beneath the dignity of its operation; but the ill-natured buffoon considers the most malicious effects of his merriment as a mere jest, without reflecting on the shame or indignation which they inspire when inflicted on a sensible temper.

32 They must not be permitted to hear marvellous and frightful tales.

33 The association between darkness and spectres founded in nature.

But vulgar credulity and ignorance are no less dangerous to those who want fight, than the false and mechanical wit so universally practised in common life. We know, we sympathetically feel, the strong propensity of every illiterate mind, to relate or to believe whatever is marvellous and dreadful. These impressions, when early imbibed, can scarcely be eradicated by all the conspiring efforts of mature reason, and confirmed experience. Those philosophers who have attempted to break the alliance between darkness and spectres, were certainly inspired by laudable motives. But they must give us leave to assert, that there is a natural and essential connection betwixt night and *orcus*. Were we endued with senses to advertise us of every noxious object before its contiguity could render it formidable, our panics would probably be less frequent and sensible than we really feel them. Darkness and silence, therefore, have something dreadful in them, because they supersede the vigilance of those senses which give us the earliest notices of things. If you talk to a blind boy of invisible beings, let benevolence be an inseparable ingredient in their character. You may, if you please, tell him of departed spirits, anxious for the welfare of their surviving friends; of ministering angels, who descend with pleasure from heaven to execute the purposes of their Maker's benignity; you may even regale his imagination with the sportive gambols and innocent frolics of fairies; but let him hear as seldom as possible, even in stories which he knows to be fabulous, of plaintive ghosts, vindictive fiends, or avenging furies. They seize and pre-occupy every avenue of terror which is open in the soul; nor are they easily dispossessed. Sooner should we hope to exorcise a ghost, or appease a fury, than to obliterate their images in a warm and susceptible imagination, where they have been habitually impressed, and where these feelings cannot be dissipated by external phenomena. If horrors of this kind should agitate the heart of a blind boy, (which may happen notwithstanding the most strenuous endeavours to prevent it), the stories which

34 The method of dissipating the fears of the blind.

he has heard will be most effectually discredited by ridicule. This, however, must be cautiously applied, by gentle and delicate gradations. If he is inspired with terror by effects upon his senses, the causes of which he cannot investigate, indefatigable pains must be taken to explain these phenomena, and to confirm that explanation, whenever it can be done, by the testimony of his own senses and his own experience. The exertion of his locomotive and mechanical powers (the rights of which we have formerly endeavoured to assert) will sensibly contribute to dispel these terrors.

His inventive faculties ought likewise to be indulged with the same freedom. The data which they explore may be presented in such a manner, as to render discoveries easy; but still let invention be allowed to cooperate. The internal triumph and exultation which the mind feels from the attainment and conviction of new truths, heightens their charms, impresses them deep on the memory, and gives them an influence in practice of which they could not otherwise have boasted.

There are a sort of people in the world, whose views and education have been strictly confined to one province, and whose conversation is of consequence limited and technical. These, in literary intercourse, or fashionable life, are treated with universal contempt, and branded with the odious name of *mere men of business*. Nor is it any wonder, that the conversation of such should prove nauseous and disgusting. It would be arrogant in them to expect, that indifferent persons should either enter into their private interests, or the peculiarities of their craft, with a warmth equal to their own. We have known the intrusion of such a person involve a numerous company in gloom, and terminate the freedom and vivacity of agreeable discourse in lazy yawning and discontented silence. Of all innocent characters, this ought to be avoided by the blind; because, of all others, it is the character which they run the greatest hazard of adopting. The limitation of their powers naturally contracts their views and pursuits, and, as it were, concentrates their whole intellectual faculties in one, or at best in few objects. Care should therefore be taken to afford the mind a theatre for its exertions, as extensive as possible, without diverting it from one great end, which, in order to excel, it ought for ever to have in prospect.

There are few sciences in which the blind have not distinguished themselves: even those whose acquisition seemed essentially to depend upon vision, have at last yielded to genius and industry, tho' deprived of that advantage. Mr Sanderfon, whom we formerly mentioned, has left behind him the most striking evidences of astonishing proficiency in those retired and abstract branches of mathematics which appeared least accessible to persons of his infirmity. Sculpture (c) and painting are not, perhaps, the most practicable arts for a blind man; yet is he not excluded from the pleasing creation and extensive regions of fancy. However unaccountable it may appear to the abstract philosopher, yet nothing is more certain in fact, than that a blind man may, by the inspiration of the muses, or, to strip

(F) The author of these observations, though he chuses to express himself in this manner, is blind.

(C) Yet there are instances of persons who have been enabled to take the figure and idea of a face by the touch, and mould it in wax with the utmost exactness; as was the case of the blind sculptor mentioned by De Piles, who thus took the likeness of the duke de Bracciano in a dark cellar, and made a marble statue of king Charles I. with great elegance and justness. Vid. *De Piter Cours de Peint.* p. 329. and *Wolf. Psychol. Rat.* § 162.

the figure of its mythological drefs, may, by the efforts of a cultivated genius, exhibit in poetry the most natural images and animated descriptions, even of visible objects, without either incurring or deferving the imputation of plagiarism.

In the filer art of mufic, there are, at prefent, living and noble inflances how far the blind may proceed.

If we look into former periods, we fhall find illuftrious and pregnant examples, how amply nature has capacitated the blind to excel both in the fcientific and practical departments of mufic. In the 16th century, when the progrefs of improvement both in melody and harmony was rapid and conspicuous, Francisus Salinas was eminently diftinguifhed. He was born A. D. 1513, at Burgos in Spain; and was fon to the treafurer of that city. Tho' afflicted with incurable blindness, he was profoundly skilled both in the theory and practice of mufic. As a performer, he is celebrated by his cotemporaries with the higheft encomiums. As a theorift, his book, if we may believe Sir John Hawkins, is equal in value to any now extant in any language. Tho' he was deprived of fight in his earlieft infancy, he does not content himfelf to delineate the various phenomena in mufic, but the principles from whence they refult, the relations of found, the nature of arithmetical, geometrical, and harmonical ratios, which at that period were efteemed effential to the theory of mufic, with a degree of intelligence which would have deferved admiration tho' he had been in full poffeffion of every fenfe requifite for thefe difquisitions. He was taken to Rome in the retinue of Petrus Sarmentus archbifhop of Compafella; and having paffed twenty years in Italy, he returned to Salamanca, where he obtained the profefhorfhip of mufic, an office at that time equally refpectable and lucrative. Having difcharged it with reputation and fuccefs for fome time, he died at the venerable age of 77.

In the fame period flourifhed Caspar Krumbhorn, blind from the third year of his age: yet he compofed feveral pieces in many parts with fo much fuccefs, and performed both upon the flute and violin fo exquisitely, that he was diftinguifhed by Auguftus elector of Saxony. But preferring his native Silefia to every other country, he returned thither, and was appointed organift of the church of St Peter and Paul in the city of Lignitz, where he likewife had often the direction of the mufical college, and died June 11th 1621.

To thefe might be added Martini Pefenti of Venice, a compofer of vocal and inftrumental mufic almoft of all kinds, tho' blind from his nativity; with other examples equally worthy of public attention. But if vulgar prejudice is capable of blufhing at its own contemptible character, or of yielding to conviction, thofe already quoted are more than fufficient to fhew the mufical jugglers of our time, who are generally as absolute ftrangers to learning and tafte as to virtue, that their art is no monopoly with which thofe alone who fee are invefted by the irrevocable decree of heaven.

For Sanderfon's method of calculation, both in arithmetic and algebra, fee the account prefixed to his own treatife on that fubject. But there is a much fuller and more circumftantial detail both of its nature and its various ufes, given by Mr Diderot in his "Letter concerning the Blind, for the ufe of thofe who "fee," which we fhall here tranflate.

"It is much eafier (fays that author) to ufe figns already invented, than to become their inventor; as one is forced to do, when engaged in circumftances for which he is not provided. Of what advantage might not this be to Sanderfon to find a palpable arithmetic already prepared for him at five years of age, which he might otherwife have felt the neceffity of inventing for himfelf at the advanced period of twenty-five? This Sanderfon, Madam, is an author deprived of fight, with whom it may not be foreign to our purpofe to amufe you. They relate prodigies of him; and of thefe prodigies there is not one, which his progrefs in the belles lettres, and his mathematical attainments, do not render credible.

"The fame inftrument ferved him for algebraical calculations, and for the construction of rectilinear figures. You would not, perhaps, be forry that I fhould give you an explication of it, if you thought your mind previoufly qualified to understand it: and you fhall foon perceive that it prefuppofes no intellectual preparations of which you are not already miftrefs; and that it would be extremely ufeful to you if you fhould ever be feized with the inclination of making long calculations by touch.

"Imagine to yourfelf a fquare, fuch as you fee, fig. 1. n^o 1. divided into four equal parts by perpendicular lines at the fides, in fuch a manner, that it may prefent you the nine points 1, 2, 3, 4, 5, 6, 7, 8, 9. Suppofe this fquare pierced with nine holes capable of receiving pins of two kinds, all of equal length and thicknefs, but fome with heads a little larger than the others. Plate LVI.

"The pins with large heads are never placed any where elfe but in the centre of the fquare; thofe with fmaller heads never but at the fides, except in one fingle cafe, which is that of making the figure 1, where none are placed at the fides. The fign of nothing is made by placing a pin with a large head in the centre of the little fquare, without putting any other pin at the fides*.
The number 1 is represented by a pin with a fmall head placed in the centre of the fquare, without putting any other pin at the fides: the number 2 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 1: the number 3 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 2: the number 4 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 3: the number 5 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 4: the number 6 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 5: the number 7 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 6: the number 8 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 7: the number 9 by a pin with a large head placed in the centre of the fquare, and by a pin with a fmall head placed on one of the fides at the point 8. * See Fig. 1. n^o 2.

No 2.

"Here are plainly ten different expressions obvious to the touch, of which every one answers to one of our ten arithmetical characters. Imagine now a table as large as you please, divided into small squares, horizontally ranged, and separated one from the other at similar distances, as you see it in No 3. Thus you will have the instrument of Sanderfon.

38
This notation applied to numerical operations.

"You may easily conceive that there is not any number which one cannot express upon this table; and, by consequence, no arithmetical operation which one cannot execute upon it.

"Let it be proposed, for instance, to find the sum, or to work the addition, of the nine numbers following.

1	2	3	4	5
2	3	4	5	6
3	4	5	6	7
4	5	6	7	8
5	6	7	8	9
6	7	8	9	0
7	8	9	0	1
8	9	0	1	2
9	0	1	2	3

"I express them on the table in the order as they are dictated to me; the first figure at the left of the first number, upon the first square to the left of the first line; the second figure, to the left of the first number, upon the second square to the left of the same line; and so of the rest.

"I place the second number upon the second row of squares, units beneath units, and tens beneath tens, &c.

"I place the third number upon the third row of squares, and so of the rest. Then with my fingers running over each of the rows vertically from the bottom to the top, beginning with that which is nearest to my right, I work the addition of the numbers which are expressed, and mark the surplus of the tens at the foot of that column. I then pass to the second column, advancing towards the left; upon which I operate in the same manner; from thence to the third; and thus in succession I finish my addition.

39
The same instrument applied to the construction of rectilinear figures.

"We shall now see how the same table served him for demonstrating the properties of rectilinear figures. Let us suppose this proposition to be demonstrated, That parallelograms which have the same basis and the same height are equal in their surfaces. He placed his pins as may be seen fig. 1. No 4. He gave names to the angular points, and finished his demonstration with his fingers.

"If we suppose that Sanderfon only employed pins with large heads, to mark the limits of his figures, around these he might arrange his pins with small heads in nine different manners, all of which were familiar to him. Thus he scarcely found any embarrassment but in those cases where the great number of angular points which he was under a necessity of naming in his demonstration obliged him to recur to the letters of the alphabet. We are not informed how he employed them.

"We only know, that his fingers ran over the board with astonishing agility; that he undertook with success the longest calculations; that he could interrupt the series, and discover his mistakes; that he proved them with the greatest ease; and that his labours required infinitely less time than one could have

imagined, by the exactness and promptitude with which he prepared his instruments and disposed his table.

"This preparation consisted in placing pins with large heads in the centres of all the squares: having done this, no more remained to him but to fix their values by pins of smaller heads, except in cases where it was necessary to mark an unit; then he placed in the centre of a square a pin with a small head, in the place of a pin with a large head with which it had been occupied.

"Sometimes, instead of forming an entire line with these pins, he contented himself with placing some of them at all the angular points, or points of intersection; around which he tied silk threads, which finished the formation of the limits of his figures *."

It may be added by way of improvement, that for the division of one series of numbers from another, a thin piece of timber in the form of a ruler with which lines are drawn, having a pin at each end for the holes in the squares, might be interposed between the two series to be distinguished.

This geometriician left other instruments behind him; but as we do not know their uses, we need not add their descriptions.

In the higher parts of mathematics, such as conic sections, the same solid figures which are mediums of perception to those who see, may perform the same useful office to the blind. But, for the structure of superficial figures, we should imagine, that a kind of matter might be found, soft enough to be easily susceptible of impressions, yet hard enough to retain them till effaced by an equal pressure. Suppose, for instance, a table were formed, four feet broad and eight in length; for the figures, that they may be the more sensible to the touch, ought to be larger than ordinary. Suppose this table had brims, or a moulding round it, rising an inch above the surface: let the whole expanse, then, be filled with bee's-wax, and the surface above pressed extremely even with a polished board, formed exactly to fit the space within the mouldings. This board will always be necessary to efface the figures employed in former propositions, and prepare the surface for new ones. We think we have pondered the minutest inconvenience that can arise from this method of delineating and conceiving geometrical truths; and, after all, the table appears to us the best and the least troublesome apparatus which a blind man can use. We can see no reason, why general ideas of geography or topography might not be conveyed to him in the same manner, by spheres composed of or covered with the same inexpressible matter. The knowledge of astronomy might likewise be of infinite use, both by enlarging his ideas of the universe, and by giving him higher and more confirmed impressions of that energy by which the stars are moved, and of that design by which their motions are regulated. But these objects are too vast; their distances, their magnitudes, their periods of revolution, are too complex to be comprehended in the mind, or impressed on the memory, without sensible mediums. For this purpose, an orrery, or some machine of a similar construction, will be indispensably requisite.

The science of causes and effects might likewise yield him the most sublime and rational entertainment of which

which an intelligent being, in his present state, is susceptible. By this he might enter into the laws, the vicissitudes, the œconomy, of nature. Nor is it absolutely necessary that he should be an ocular witness of the experiments by which these laws are detected and explained. He may safely take them for granted; and if, at any time, a particular experiment should prove faithless, he may, from general principles, be able to discover its fallacy, whether in the nature of the subject, the inaptitude of the instruments, or the process of the execution. The laws of motion, the various ratios or proportions of forces whether simple or compound, he may calculate and ascertain by the same means, and in the same method, so happily used by Sanderfon.

Moral and theological knowledge he may easily obtain, either from books, or instructions delivered *viva voce*. The last, if communicated by one who understands and feels the subject, with a proper degree of perspicuity and sensibility, are infinitely the most eligible. By morals, we would not merely be understood to mean a regular and inculpable series of action, but the proper exertion and habitual arrangement of the whole internal œconomy, of which external actions are no more than mere expressions, and from which the highest and most permanent happiness alone can proceed. By theology, we do not mean that systematic or scholastic jargon, which too frequently usurps its venerable name; but those sublime and liberal ideas of the nature and government of a Supreme Being, whether discoverable by nature, or revealed in scripture, which enforce every moral obligation, which teach us what is the ultimate good of our nature, which determine our efforts, and animate our hopes in pursuing this most important of all objects. What Cicero says of the arts and sciences may, with great propriety, be applied to religion: *Nam cœtera neque temporum sunt, neque ætatum omnium, neque locorum; at hæc studia adolescentiam alunt, senectutem oblectant, secundas res ornant, adversis perfugium ac solatium præbent: delectant domi, non impediunt foris; pernoctant nobiscum, perigrinantur, rusticantur.* Translated thus:

‘ For other studies are not suited to every time, to every age, and to every place: but these give strength in youth, and joy in old age; adorn prosperity, and are the support and consolation of adversity; at home they are delightful, and abroad they are easy; at night they are company to us; when we travel, they attend us; and in our rural retirements, they do not forsake us.’

To this may be added, that the joys of religion are forever adequate to the largest capacity of a finite and progressive intelligence; and as they are boundless in extent, so they are endless in duration. We have already, more than once, observed, that the soul of a blind man is extremely obnoxious to melancholy and dejection. Where, therefore, can he find a more copious, intimate, permanent, and efficacious source of comfort than in religion? Let this then be inculcated with the utmost care and assiduity. Let the whole force of the soul be exerted in shewing him that it is reasonable. Let all the noblest affections of the heart be employed in recommending it as amiable; for we will venture to assert, that the votary of religion alone is the man,—

*Quem, si fractus illabatur orbita,
Impavidum seriemus ruina.*

Thus translated;

Whom, though with nature's wreck oppress'd,
Unmanly fears could ne'er infect.

When the situation of the blind, and its natural effects upon their characters, are considered; when we reflect how exquisite their distresses, how pungent their disappointments, how sensible their regrets, how tedious and gloomy their periods of solitude; we must be wretches indeed, if we can grudge either labour or expence in procuring them every source of entertainment, which, when procured, remains in their own power, and yields what may be in some measure termed *self-derived enjoyment*. These amusements are prolific of numberless advantages: they afford us at once entertainment and exertion: they teach us to explore a thousand resources for preservation and improvement, which would otherwise have escaped our attention: they render us awake and sensible to a thousand notices both of external and intellectual objects, which would otherwise have passed unobserved.

Thus far have we proceeded without mentioning philological learning; though we know it to be attainable by the blind in a high degree, and though we are conscious of its importance both to their life and ornament. But as it is not indispensible, and as its acquisition is tedious and operose, we thought it less necessary to be early and minutely specified. We cannot doubt, that learning different languages adds to the treasure of our ideas, and renders those which we possess more clear and definite. It must be acknowledged, that the possession of other languages elucidates our own. The technical terms of almost every science are exotic; and without clearly understanding those, we cannot properly possess the ideas of which they are the vehicles. But these motives are common to every candidate for philological improvement with the blind.

The paths of grammar, however, are dry and rugged; and it will be necessary for the pedagogue, whoever he is, to take all the opportunities that offer of enlightening the darkness and polishing the asperities of the road. When, therefore, the intellect of the pupil begins to open and exert its penetration, it will be proper to shew him how the nature, the forms, and arrangements, of words, flow from our ideas and their relations. Every substance must naturally be in some state; it must either act, or be acted upon. The actions which it performs or suffers must be performed or suffered in some definite manner or degree. It must likewise have some qualities, whether temporary and accidental, or natural and permanent. These qualities must likewise be susceptible of degrees. When different substances are considered in the same state, its common participation forms a connection: when regarded in different states, that difference forms an opposition. The constant repetition of the names of substances and qualities produces a disagreeable monotony in language. They must therefore be implied in other words, which likewise in some cases serve to connect the parts of a sentence. There is a difference between such words as imply the connection of sentences, and such as imply the connection of states or circumstances. Actions to be performed or suffered may be either positively affirmed

Blind.

of any substance, or merely attributed to them. Living and percipient substances have immediate sensations of pain or pleasure, which likewise are productive of desire and aversion. To these sentiments particular sounds are adapted, whether immediately inspired by nature, or resulting from association and tacit convention.

Thus we have a foundation for all the different parts of speech; and from their natures and offices their forms and arrangements may be deduced, according to the analogy of every language.

The art of reasoning, the knowledge of history, and a taste for the *belles lettres*, are easily attainable by the blind; and as they are copious funds of entertainment, they should be inculcated, tho' at the expense of care and labour.

The relations of persons subjected to this misfortune, if in easy circumstances, will find it highly conducive to the improvement of their charge, to select some one among his coevals, of a sound understanding, a sweet and patient temper, a docile mind, a warm heart, and a communicative disposition. These two should be taught to find their interest and happiness in their connection one with another. Their bed, their board, their walks, their entertainments, their lessons, should be common. These are the best eyes with which art can endow a blind man; and, if properly selected, they will on some occasions yield very little, in utility and perfection, to those of nature; nay, at some junctures they may be preferable.

If the blind must depend upon the exercise of their own powers for bread, we have already pointed out music as their easiest and most obvious province; but let it at the same time be remembered, that mediocrity in this art may prove the bitterest and most effectual curse which a parent can inflict upon his offspring, as it subjects them to every vicious impression or habit which may be imbibed or contracted from the lowest and most abandoned of mankind. If your pupil, therefore, be not endowed with natural talents exquisitely proper both for the theory and practice of this art, suffer him by no means to be initiated in it. If his natural genius favours your attempts, the spinet, harp, or organ, are the most proper instruments for him to begin; because, by these instruments, he may be made more easily acquainted with the extent of musical scales, with the powers of harmony, with the relations of which it is constituted, and of course with the theory of his art. It would be not only unnecessary, but impracticable, to carry him deep into the theory, before he has attained some facility in the practice. Let, therefore, his head and his hands, (if we may use the expression), be taught to go *pari passu*. Let the one be instructed in the simplest elements; and the others conducted in the easiest operations, first: contemplation and exercise will produce light in the one and promptitude in the other. But, as his capacity of specula-

tion and powers of action become more and more mature, discoveries more abstract and retired, talks more arduous and difficult, may be assigned him. He should be taught the names and gradations of the diatonic scale, the nature and use of time, the diversity of its modes whether simple or mixed. He should be taught the quantity or value of notes, not only with respect to their pitch, but to their duration. Yet, let him be instructed not to consider these durations as absolutely fixed, but variable according to the velocity of the movements in which they are placed. Thus we reckon a semibreve equal to 4 vibrations of a pendulum; a minim to 2; a crotchet to 1, &c. But, if the number of aliquot parts, into which a semibreve is divided, be great, and consequently the value of each particular part small, the minim, crotchet, quaver, &c. will increase in their intrinsic durations, though they must always preserve the same proportions relatively one to another. He should never be habituated to take a piece of music, either from the sound of a voice or an instrument. His companion ought to read the music by the names and values of its characters, with the same exactness as the words in any other language. When he becomes a considerable adept in the art, tangible signs may be invented, by which he may not only be enabled to read, but even to set, music for himself. Such exercises will render him infinitely more accurate, both in his principles and practice, than he would otherwise be.

There is a hint of such tangible signs given in Tansure's musical grammar, p. 93. and which, tho' (like the rest of the book) obscure and indigested, may be improved and applied with advantage.

For the sake of those in whose hands it may not be, we quote the passage at length.

"As it is the pleasure of the Almighty, that some persons are destitute of *eye-sight*; in like manner it is his infinite goodness to make them a double amends another way, by giving them a greater share of memory, &c. whereby they become very dexterous in playing on musical instruments, mathematics, &c. as we may observe by Dr Stanley, organist of St Andrews, Holburn, in London; and the blind professor of mathematics in the university of Cambridge; and many others, too tedious here to mention, who were born *blind*, and never saw the least glance of light; yet God gave them such a light in *knowledge*, that they became the wonder of all such as had the benefit of seeing, &c.

"And as *blind persons*, at first, cannot possibly have so clear an idea of *notes*, and *musical characters*, as they that see them, until they are taught by a master or tutor; I have (for the good-will I bear to such unfortunate persons) contrived the following table; that, by *feeling*, they may understand notes, and learn any tune that shall be set them, in their master's absence.

47
The blind susceptible of logic, history, and the belles lettres.

48
A companion should be united to the blind by more than the ties of interest and convenience.

49
Music one of the most proper employments for the blind. Mediocrity, however, pernicious.

Blind.

50
Scheme musical notation.

A New MUSIC-TABLE for such as are BLIND.

EXPLANATION.

“ Let A—B be a smooth board, 3 or 4 feet long, 1 inch thick, and 9 inches wide, with 5 square ledges glued thereon, each being half an inch asunder, half an inch wide, and half an inch high; which rising ledges represent our 5 lines of music, and their spaces: and the two outward lines, being made a little lower, may serve as leger lines, on occasion. The cyphers represent so many holes bored into every line and space, half an inch asunder; wherein *pegs* of different shapes are to be set, to represent the several sorts of notes and characters of the tune: which *pegs* the blind person may know by feeling, as well as he does his keys of the organ or harpsichord: so that, by keeping his fingers on the 5 lines, he feels the several *pegs* as they come on, and are set to represent the several sorts of notes, on both line and space; whilst his right hand strikes the respective key, &c. he first knowing the names of all his keys, his lines, spaces, and the mark of every *peg*. Let each *peg* be about half an inch high, when let in very fall.

“ N. B. The blind person must first be taught the names of the above lines and spaces in both the treble and bass cliffs; and that he must feel his treble with his right hand, and his bass with the left hand; each being contrary, as you may see by the letters of the above table, A and B; and must learn each part separate.

Of Pegs for Notes, &c.

“ Of *pegs*, he must have a great number of every fort, to set his tune with, which he may mark as follows:

For a *Semibreve*, 4 top-notches.

Minim, 2 top-notches.

Crotchet, 1 top-notch.

Quaver, one corner cut off.

Semiquaver, 2 corners cut off.

Demisemiquaver, all 4 corners cut off.

Rests, a notch in the corner.

A *Flat*, 1 notch on the side.

Sharp, 2 notches on the side.

Point, 3 notches on the side.

Bar, a flat thin top.

Repeat, a sharp-pointed top, &c. &c. &c.

“ But it is best for every performer to make and mark his own *pegs*; and deliver them one by one as they are called for by the person that sets his *tune*.”

Thus far our author. It is certain, that when playing concerto's, or, if you please, when performing in

score, the blind must depend upon memory, and upon memory alone: but happily their retentive powers are remarkably strong; and there are few pieces in music which will be found either too intricate to be acquired, or too long to be remembered, by a person deprived of sight. Mr Stanley, the gentleman formerly mentioned by Tanfure, performs what is still more astonishing. If our information, which we cannot doubt, be true, he accompanies any lesson with a thorough bass, tho' he never has heard it before. We have never yet heard of any person, though blessed with the full use of sight, and with all the advantages accruing from it, who could thus anticipate harmony before the chords were founded, and accompany it in a manner suitable to its nature.

When he becomes a more profound theorist, if he has adopted the notion that music and geometry are congenial and inseparable, (which, however, in our judgment is frivolous), he may peruse Malcolm's essay on music, and Treydell's theory and practice of music. But, if he chuses to hear the same principles delivered without that unnecessary parade and ostentation of profundity, let him be instructed by D' Alembert, (see the article *Music*, in this Dictionary); by Rameau, in his principles of composition; and by Rousseau's musical dictionary, (the substance of which is engrossed in the present Work, either under the respective detached articles, or in the notes added to the article *Music*). It is true, that the forms and proportions of instruments, the thickness, length, and tension of musical strings, may be mathematically adjusted; their relations one to another may be determined by the coincidence of their vibrations, or by the number and velocity of these vibrations when dissonant; but experience and a good ear are amply sufficient for these purposes. Yet, if the necessity of geometry in music should still remain an indelible article in his creed, he may peruse Dr Smith's philosophical principles of harmony. There has also lately been published an explanation of Tartini's theory, entitled, *The principles and power of harmony*; which, after he has made considerable progress, may be read to him with sensible improvement.

Thus we have endeavoured to form an estimate of the inconveniences suffered, and the advantages possessed, by the blind; we have attempted to show, of what kind of culture their remaining faculties are susceptible, and what appeared to us the easiest and properest means of their improvement. We have illustrated not only its possibility, but its certainty, by incontestable facts, which

As Apollonius
to the pe-
blic.

Blind.

which demonstrate, even in the eyes of scepticism and incredulity, to what degrees of eminence, both in the mechanical and liberal arts, the blind may be carried. It now remains to demand a categorical answer from society, whether it is more humane and eligible, that such unhappy persons should be suffered to languish out their lives in torpid and miserable obscurity, wretched in themselves and burdensome to others; or to cultivate and improve their powers in such a manner, as that they may be qualified for internal enjoyment and public utility? Surely there is not a human being, who does not disgrace the works of God, that can be at any loss in answering this question. Have we not then a right to call the world to an account? have we not a right to demand, why rational beings susceptible of felicity in themselves, and capable of transferring happiness through the societies with whom they are connected, should be abandoned to a state of insignificance and misery? Is it possible that men who are every moment subjected to the same contingencies with which they behold their fellow-creatures afflicted, should not with all their souls endeavour to alleviate the misfortunes of their suffering brethren? Is the native and hereditary portion of human life so light and supportable in itself, that we should neglect and despise those to whom it is embittered by accidental circumstances of horror and distress? You who are parents, who feel the strong and powerful pleadings of nature, do not, by a brutal negligence and insensibility, render the existence which you have given a curse to its possessors. Do not give them reason to upbraid your memory; and to answer those who ask what patrimony you have left them, that their sole inheritance was ignorance, incapacity, and indigence. You men of wealth and eminence, you whom Providence has rendered conspicuous on the theatre of nature, to whom it has given the noblest opportunities of participating the divine beatitude by the exercise of universal benevolence and genuine patriotism, yours is the glorious province of bringing neglected merit from obscurity, of healing the wounds inflicted by adverse fortune, and of cultivating these talents which may be exerted for your own advantage and the honour of your species. Thus you shall rise in the heraldry of heaven, and your names diffuse a lustre through the extent of space and the archives of eternity. Otherwise the temporary glare and parade of your situation can produce nothing else but a despicable mimicry of real and intrinsic greatness, and are no more than a splendid mask to cover what in itself is infamous or detestable.

By way of appendix to the preceding article, we shall add one or two very singular histories, with which it is hoped our readers will not be displeas'd.

An account of some remarkable particulars that happened to a lady after having had the constant kind of small-pox. “ In the course of this disease, during which the lady was attended by the late Sir Hans Sloane, several threatening symptoms appeared, which however were at length overcome; and the patient being thought out of danger, took several doses of such purgative medicines as are usually administered in the decline of the disease, without any bad consequence.

“ But in the evening of the day on which she had taken the last dose that was intended to be given her

on that occasion, she was suddenly seized with pains and convulsions in the bowels; the pain and other symptoms became gradually less violent as the force of the medicine abated, and by such remedies as were thought best adapted to the case they seem'd at length to be entirely subdued.

“ They were, however, subdued only in appearance; for at eleven o'clock in the forenoon of the next day they return'd with great violence, and continued some hours: when they went off, they left the muscles of the lower jaw so much relaxed, that it fell down, and the chin was supported on the breast. The strength of the patient was so much exhausted during this paroxysm, that she lay near two hours with no other signs of life than a very feeble respiration, which was often so difficult to be discerned, that those about her concluded she was dead.

“ From this time the fits return'd periodically every day, at about the same hour. At first they seem'd to affect her nearly in the same degree; but at length all the symptoms were aggravated, the convulsions became more general, and her arms were sometimes convulsed alternately; it also frequently happened, that the arm which was last convulsed remained extended and inflexible some hours after the struggles were over. Her neck was often twist'd with such violence, that the face look'd directly backwards, and the back part of the head was over the breast; the muscles of the countenance were also so contracted and writh'd by the spasms, that the features were totally chang'd, and it was impossible to find any resemblance of her natural aspect by which she could be known. Her feet were not less distort'd than her head; for they were twist'd almost to dislocation at the instep, so that she could not walk but upon her ancles.

“ To remove or mitigate these deplorable symptoms, many remedies were tri'd; and, among others, the cold bath: but either by the natural effect of the bath, or by some mismanagement in the bathing, the unhappy patient first became *blind*, and soon afterwards deaf and dumb. It is not easy to conceive what could increase the misery of deafness, dumbness, blindness, and frequent paroxysms of excruciating pain: yet a very considerable aggravation was added; for the loss of her sight, her hearing, and her speech, was followed by such a stricture of the muscles of her throat, that she could not swallow any kind of aliment either solid or liquid. It might reasonably be suppos'd that this circumstance, though it added to the degree of her misery, would have shorten'd its duration: yet in this condition she continued near three quarters of a year; and during that time was support'd in a very uncommon manner, by chewing her food only; which having turn'd often, and kept long in her mouth, she was oblig'd at last to spit out. Liquors were likewise gargled about in her mouth for some time; and then return'd in the same manner, no part of them having pass'd the throat by an act of deglutition: so that whatever was convey'd into the stomach, either of the juices of the solid food, or of liquids, was either gradually imbib'd by the sponginess of the parts, which they moisten'd, or trickled down in a very small quantity along the sides of the vessels.

“ But there were other peculiarities in the case of this lady, yet more extraordinary. During the privation

Blind.

tion of her *sight* and *hearing*, her *touch* and her *smell* became so exquisite, that she could distinguish the different colours of silk and flowers, and was sensible when any stranger was in the room with her.

“ After she became blind, and deaf, and dumb, it was not easy to contrive any method by which a question could be asked her, and an answer received. This however was at last effected, by talking with the fingers, at which she was uncommonly ready. But those who conversed with her in this manner, were obliged to express themselves by touching her hand and fingers instead of their own.

“ A lady who was nearly related to her, having an apron on, that was embroidered with silk of different colours, asked her, in the manner which has been described, if she could tell what colour it was? and after applying her fingers attentively to the figures of the embroidery, she replied, that it was red, and blue, and green; which was true. The same lady having a pink coloured ribbon on her head, and being willing still further to satisfy her curiosity and her doubts, asked what colour that was? her cousin, after feeling some time, answered that it was pink colour: this answer was yet more astonishing, because it shewed not only a power of distinguishing different colours, but different kinds of the same colour; the ribbon was not only discovered to be red, but the red was discovered to be of the pale kind called a *pink*.

“ This unhappy lady, conscious of her own uncommon infirmities, was extremely unwilling to be seen by strangers, and therefore generally retired to her chamber, where none but those of the family were likely to come. The same relation, who had by the experiment of the apron and ribbon discovered the exquisite sensibility of her *touch*, was soon after convinced by an accident, that her power of *smelling* was acute and refined in the same astonishing degree.

“ Being one day visiting the family, she went up to her cousin's chamber, and after making herself known, she intreated her to go down, and sit with her among the rest of the family, assuring her, that there was no other person present: to this she at length consented, and went down to the parlour door; but the moment the door was opened, she turned back, and retired to her own chamber much displeas'd; alleging, that there were strangers in the room, and that an attempt had been made to deceive her: it happened indeed that there were strangers in the room; but they had come in while the lady was above stairs, so that she did not know they were there. When she had satisfied her cousin of this particular, she was pacified; and being afterwards asked how she knew there were strangers in the room, she answered, by the smell.

“ But though she could by this sense distinguish in general between persons with whom she was well acquainted, and strangers, yet she could not so easily distinguish one of her acquaintance from another without other assistance. She generally distinguished her friends by feeling their hands; and when they came in, they used to present their hands to her, as a mean of making themselves known: the make and warmth of the hand produced in general the differences that she distinguished; but sometimes she used to span the wrist, and measure the fingers. A lady, with whom she was very well acquainted, coming in one very hot day, after

having walked a mile, presented her hand, as usual; she felt it longer than ordinary, and seem'd to doubt whose it was; but after spanning the wrist, and measuring the fingers, she said, ‘ It is Mrs M. but she is ‘ warmer to-day than ever I felt her before.’

“ To amuse herself in the mournful and perpetual solitude and darkness to which her disorder had reduced her, she used to work much at her needle; and it is remarkable, that her needle-work was uncommonly neat and exact: among many other pieces of her work that are preserved in the family, is a pin-cushion, which can scarce be equalled. She used also sometimes to write; and her writing was yet more extraordinary than her needle-work: it was executed with the same regularity and exactness; the character was very pretty, the lines were all even, and the letters placed at equal distances from each other: but the most astonishing particular of all, with respect to her writing, is, that she could by some means discover when a letter had by some mistake been omitted, and would place it over that part of the word where it should have been inserted, with a caret under it. It was her custom to sit up in bed at any hour of the night, either to write or to work, when her pain or any other cause kept her awake.

“ These circumstances were so very extraordinary, that it was long doubted whether she had not some faint remains both of hearing and sight, and many experiments were made to ascertain the matter; some of these experiments she accidentally discovered, and the discovery always threw her into violent convulsions. The thought of being suspected of insincerity, or supposed capable of acting so wicked a part as to feign infirmities that were not infixed, was an addition to her misery which she could not bear, and which never failed to produce an agony of mind not less visible than those of her body. A clergyman who found her one evening at work by a table with a candle upon it, put his hat between her eyes and the candle, in such a manner that it was impossible she could receive any benefit from the light of it if she had not been blind. She continued still at her work, with great tranquillity; till, putting up her hand suddenly to rub her forehead, she struck it against the hat, and discovered what was doing; upon which she was thrown into violent convulsions, and was not without great difficulty recovered. The family were, by these experiments, and by several accidental circumstances, fully convinced that she was totally deaf and blind; particularly by sitting unconcerned at her work, during a dreadful storm of thunder and lightning, though she was then facing the window, and always used to be much terrified in such circumstances. But Sir Hans Sloane, her physician, being still doubtful of the truth of facts which were scarce less than miraculous, he was permitted to satisfy himself by such experiments and observations as he thought proper; the issue of which was, that he pronounced her to be absolutely deaf and blind.

“ She was at length sent to Bath, where she was in some measure relieved; her convulsions being less frequent, and her pains less acute: but she never recovered her speech, her sight, or her hearing in the least degree.

“ Many of the letters dated at Bath, in some of which there are instances of interlineations with a caret, the writer of this narrative hath seen, and they are now

Blind.

in the custody of the widow of one of her brothers, who, with many other persons, can support the facts here related, however wonderful, with such evidence as it would not only be unjustice, but folly, to disbelieve."

An account of a French lady, blind from her infancy, who can read, write, and play at cards, &c. ["A young gentleman of a good family in France, now in her 18th year †, lost her sight when only two years old, her mother having been advised to lay some pigeons blood on her eyes, to preserve them in the small-pox; whereas, so far from answering the end, it eat into them. Nature, however, may be said to have compensated for the unhappy mistake, by beauty of person, sweetness of temper, vivacity of genius, quickness of conception, and many talents which certainly much alleviate her misfortune.

"She plays at cards with the same readiness as others of the party. She first prepares the packs allotted to her, by pricking them in several parts; yet so imperceptibly, that the closest inspection can scarce discern her indexes. She sorts the suits, and arranges the cards in their proper sequence, with the same precision, and nearly the same facility, as they who have their sight. All she requires of those who play with her, is to name every card as it is played; and these she retains so exactly, that she frequently performs some notable strokes such as shew a great combination and strong memory.

"The most wonderful circumstance is, that she should have learned to read and write; but even this is readily believed on knowing her method. In writing to her, no ink is used, but the letters are pricked down on the paper; and by the delicacy of her touch, feeling each letter she follows them successively, and reads every word with her fingers ends. She herself in writing makes use of a pencil, as she could not know when her pen was dry; her guide on the paper is a small thin ruler and of the breadth of her writing. On finishing a letter, she wets it, so as to fix the traces of her pencil, that they are not obscured or effaced; then proceeds to fold and seal it, and write the direction: all by her own address, and without the assistance of any other person. Her writing is very straight, well cut, and the spelling no less correct. To reach this singular mechanism, the indefatigable cares of her affectionate mother were long employed, who accustomed her daughter to feel letters cut in cards or paste-board, brought her to distinguish an A from a B, and thus the whole alphabet, and afterwards to spell words; then, by the remembrance of the shape of the letters, to delineate them on paper; and, lastly, to arrange them so as to form words and sentences.

"She has learned to play on the guitar, and has even contrived a way of pricking down the tunes as an assistance to her memory. So delicate are her organs, that in singing a tune, though new to her, she is able to name the notes.

"In figured dances she acquits herself extremely well, and in a minuet with inimitable ease and gracefulness. As for the works of her sex, she has a masterly hand; she sews and hems perfectly well; and in all her works she threads the needles for herself however small.

"By the watch her touch never fails telling her exactly the hour and minute."

From this account, however, it would appear, that except reading and writing, the French lady has nothing to boast of in which she is not excelled by Mr Stanley already mentioned, if we may credit all that is reported of him. The works peculiar to her sex are gained mechanically; but the *distinguishing colours*, telling the precise time by a watch, naming the notes in music, and many other things depending upon the ear and touch, are said to be so familiar to him, that his friends cease to think them extraordinary. Attainments still more wonderful are ascribed to him; as, the naming the number of persons in a room on entering it; the directing his voice to each person in particular, even to strangers when they have once spoken; the missing any person absent, and telling who that person is; and lastly, his being able to form just conceptions of youth, beauty, symmetry, and shape.

Pore-Blind, or *Pur-blind*. A person who is very short-sighted is said to be *pur-blind*.

Moon-Blind, denotes horses that lose their sight at certain times of the moon*.

Blind-Worm. See ANGIUS.

BLINDS, or **BLINDES**, in the art of war, a sort of defence commonly made of ozers, or branches interwoven, and laid across between two rows of stakes, about the height of a man, and four or five feet asunder, used particularly at the heads of trenches, when they are extended in front towards the glacis; serving to shelter the workmen, and prevent their being overlooked by the enemy.

BLINDNESS, a total privation of sight, arising from an obstruction of the functions of the organs of sight, or from an entire deprivation of them †.

BLISTER, in medicine, a thin bladder containing a watery humour, whether occasioned by burns, and the like accidents, or by vesicatories applied to different parts of the body for that purpose*.—*Cantharides*, or Spanish flies, applied in the form of a plaster, are chiefly used with this intention. See CANTHARIDES.

BLITE, in botany. See BLITUM.

BLITH, a town of Nottinghamshire, in England, seated in W. Long. o. 55. N. Lat. 53. 25.

BLITUM, **BLITE**, or *Strawberry Spinach*; a genus of the digynia order, belonging to the monandria class of plants.

Species. 1. The capitatum, with flowers in clustered heads at the joints and crown of the stalks, is a native of Spain and Portugal, but has been long preferred in the British gardens on account of the beauty of its fruit. It is an annual plant, with leaves somewhat like those of spinach; the stalk rises two feet and an half high; the upper part of the stalk hath flowers coming out in small heads at every joint, and is terminated by a little cluster of the same: after the flowers are past, the heads swell to the size of wood strawberries, and when ripe have the same appearance, but are not eatable: they are full of a purple juice, which stains the hands of those who bruise them of a deep purple colour.

2. The virgatum, with small heads growing from the sides of the stalks, is a native of the south of France and Italy. This seldom grows more than a foot high: the leaves are smaller than the first, but of the same shape: the flowers are produced at the wings of the leaves, almost the length of the stalk; they are smaller and not so deeply coloured as the first. 3. The tartaricum,

rium, triangular, acutely indented leaves, is a native of the country from which it takes its name. Mr Miller received the seeds from Petersburg. It rises to very near three feet high; the flowers come out from the sides of the stalks, but are smaller than those of the first, as is also the fruit.

Culture. All these plants, being annuals, must be propagated by seeds; and, as they are very hardy, will succeed in the common borders, if sown in March or April, covering the seed about half an inch deep with earth, and leaving the plants five or six inches asunder. When they come up, each must be supported with a small stick, or they will be borne down by the weight of the berries.

BLOATING, among physicians. See **EMPHYSEMA**.

BLOCK, a large mass of wood, serving to work or cut things on.

Mounting Block, an eminence usually of stone, cut in steps or notches, serving as a help to mount on horseback. These were much in use among the ancients, who were unacquainted with stirrups. The Romans erected them at proper stations along all their great roads.

BLOCKADE, in the art of war, the blocking up a place, by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it; and by these means proposing to starve it out, without making any regular attacks.

To *raise a blockade*, is to force the troops that keep the place blocked up from their posts.

BLOCZIL, a fortress of Over-yffel in the United Provinces, seated on the river Aa, at the place where it falls into the Zuider Zee. It has a port sufficient to contain 200 vessels, and serves to defend those ships that cross this sea. It has six good bastions, and several other regular fortifications. E. Long. 6. o. N. Lat. 52. 44.

BLOEMART (Abraham), a celebrated painter, born at Gorcum in Holland in 1567. We are not informed what particular means of improvement he had; but it is certain he designed in a more elegant taste than any of his countrymen. His figures are often graceful; excepting only that he gives them sometimes an affected twilt, which is still more conspicuous in the fingers. The resurrection of Lazarus is one of Bloemart's master-pieces; in which are many faults, and many beauties; both very characteristic. There have been a great number of prints engraved after his works. He died in 1647; and left three sons: two of them, Henry and Adrian, were painters; and the youngest, Cornelius, was an excellent engraver.

BLOIS, a town of France, the capital of Blaisois, in Orleansois, is seated on the banks of the river Loire, partly on a plain, and partly on an eminence, in the midst of one of the most agreeable countries of France. The castle is the ornament of this city. At the first view, it seems to be two distinct buildings; but it is joined by a passage cut out of the rock. Joining to this, on the west-side, is the tower of *Chateau-Regnard*, so called because that lordship may be discovered from hence, though 20 miles distant. At the east-end of this is another small tower, which is partly ancient and partly modern. That part of the castle which was built by the duke of Orleans, in the room of that

which he demolished in 1632, is a superb edifice, but unfinished. The court before it, where the church of St Saviour is built, is very large, and was formerly used for tournaments. The most remarkable thing in this castle is a fine long gallery, adorned with many curious and uncommon pieces; it is in the midst of two gardens, one of which is full of fruit-trees, and the other of parterres, fountains, cascades, and marble statues brought from Italy. Beyond these, there is a large park, where there is game in abundance. On all the gates of the city there is the image of the Virgin Mary, who they believe freed them from the plague in 1631. There are several parish-churches, chapters, and religious houses for both sexes. The church of St Solenne is the cathedral, and is the handsomest in the city. The front of the Jesuits church is decorated with three orders of architecture, the Doric, Ionic, and Corinthian; but there is only the Doric on the inside. The town-house is a tolerable building, and stands in a street which terminates at the quay, where there is a public walk that has a fine prospect on the Loire, over which there is a bridge that leads to the suburbs of Vienna. There are a few houses on the bridge, and a tower at each end to guard the entrance. About three quarters of a mile from the city, the water runs down the clefts of a rock into a large aqueduct, by which it is conveyed to a reservoir near the walls, and from hence distributed by leaden pipes to the several parts of the city. The country about Blois produces corn, wine, cattle, and game of every kind, and the waters a great quantity of fish. The meadows are so rich and fertile, that the cows yield excellent milk, good in consumptive cases, and which affords the best cream in the kingdom. About a league from Blois, there are mineral springs, which have the same virtues as those of Forges. The trade of Blois is chiefly in wine and brandy; but they also make some ferges and stuffs at this place. Several kings have kept their courts at Blois, for which reason they speak the French language in perfection, and the inhabitants are accounted witty and polite. E. Long. 1. 30. N. Lat. 47. 35.

BLOMARY, or **BLOOMARY**, in metallurgy, the first forge through which iron passes, after it is melted out of the ore.

BLON (James Christopher le), an artist who invented a method of producing paintings by printing. He was a Frenchman of surprising vivacity and volubility; and Mr Walpole, who knew him, says, he had a head admirably mechanic, but was an universal projector. His method of printing paintings was performed by several mezzotinto plates for one piece, each expressing different shades and parts of the piece in different colours. In this manner he perfected many large pictures that were very tolerable copies of the best masters. He distributed those by a kind of lottery, but the subscribers did not find their prizes much valued. However, some heads coloured progressively, according to their several gradations, bear witness to the success and beauty of his invention. He had another merit to the public, with which few inventors begin; for he communicated his secret in a thin quarto, entitled *Coloritto*, or "The harmony of colouring in painting, reduced to mechanical practice, under easy precepts and infallible rules." In 1732, he also published,

Blondel
||
Blood.

in French, a Treatise on ideal Beauty, which has been since translated into English; he afterwards set up a project for copying the cartoons in tapestry, and made some very fine drawings for that purpose, but did not meet with the success he expected. The affair therefore was dropped, and he disappeared.

BLONDEL (David), a protestant minister in the 17th century, distinguished by his skill in ecclesiastical and civil history, was born at Chalons sur Marne; and was admitted minister at a synod of the isle of France, in 1614. He wrote, 1. A defence of the reformed churches of France. 2. A work against the decretal epistles. 3. *De Episcopis & Presbyteris*; and other pieces. Bayle informs us that he had a very singular way of studying; he lay on the ground, and had round about him the books which he wanted for the work he was about. He died in 1655, aged 64.

BLONDEL (Francis), regius professor of mathematics and architecture, was employed in several negotiations, arrived at the dignity of marshal de camp and counsellor of state, and had the honour of being chosen to teach the dauphin the mathematics; he was also made member of the Academy of Sciences at Paris, and director of the Academy of Architecture. He died at Paris in 1688, aged 68. He wrote, 1. Notes on the architecture of Savot. 2. A course of architecture and mathematics. 3. The art of throwing bombs. 4. A new manner of fortifying places. 5. A comparison between Pindar and Horace; and other works.

BLONDUS (Flavius), an historian born at Forli, in Italy, in 1388, was secretary to Eugenius IV. and other popes. He composed a great many books; and, among others, a History from the year 400 to 1440. He died in 1463.

BLONIEZ, a town of Poland, in the province of Warfovia. E. Long. 20. 35. N. Lat. 52. 0.

BLOOD, a red liquor circulating through the vessels of the human body and the bodies of the larger animals, which appears immediately and essentially necessary to the preservation of life.

Though there is no living creature as yet known, whose life doth not immediately depend upon the circulation of some kind of fluid through its vessels, yet unless such fluid is of a red colour, it doth not obtain the name of *blood*; and therefore such creatures as have a colourless or milky liquor circulating through their vessels, are called *exsanguious animals*.

The blood has a very different degree of thicknes or viscosity in different animals, and even in the same animal at different times. Though it is in all cases endowed with a considerable degree of tenacity, yet in strong animals that tenacity is remarkably greater than in weak ones; and hence the blood of bulls was made use of by the ancients as a poison, its extreme viscosity rendering it totally indigestible by the powers of the human stomach. It is well known also by physicians, that there are some states of the human body in which the blood becomes vastly tenacious, so as in a great measure to refuse any intimate connection with water; and others, in which its crasis is almost totally dissolved, so as to appear, when drawn out of the body, like a fluid and half putrid mass*.

The common appearance of the blood when drawn from a vein in the human body is well known. It first seems an homogeneous red liquor; then it consolidates

into one uniform mass; in a little time, a yellowish watery liquor begins to separate from it, which is more or less in quantity according to the state in which the blood happens to be; the red mass, in the mean time, contracts greatly in its dimensions, and increases in solidity. But this increase of solidity is likewise proportional to the state of the blood at the time: in strong people, if attacked with a violent inflammatory disease, the solid part is exceedingly tough, inasmuch that Dr Huxham says he has sometimes found it almost like a piece of flesh itself; whereas, in other diseases, the solid part is very soft and tender, breaking in pieces with the slightest touch. The spontaneous separation of the blood into crassamentum, serum, and coagulable lymph, hath been already taken notice of under ANATOMY, n^o 389.

The attention of physiologists hath been very much engaged by inquiries into the nature and composition of the blood, and accordingly it hath been examined in all possible ways. By a chemical analysis, it discovers the same principles with other animal substances; giving over in distillation a great quantity of phlegm, a volatile spirit, with much fetid oil; after which, there remains a charred matter, that, burnt in an open fire, leaves a white earth similar to calcined hartshorn. Some eminent chemists, Mr Homberg particularly, have asserted that blood contains an acid as well as an alkali, but that the former doth not arise till towards the end of the distillation: but what is very singular, and indeed must throw no small suspicion on the whole account, is, that the acid and alkali, notwithstanding their great tendency on all other occasions to unite with each other, do here remain separate, so that the liquor may be even redistilled without their forming any neutral compound.

An experiment in confirmation of this is recorded in the memoirs of the Royal Academy for 1712. Six pounds of human blood distilled to dryness with a gentle heat, were reduced to a pound and an half; after which, the mass was urged with a graduated fire, till the retort at last became red hot. The produce was 17 ounces of liquor; 12 of which were a red and very empyreumatic volatile spirit, the other five were oil. The caput mortuum was a light coal weighing four ounces and a half. On rectifying the volatile spirit in a small retort, about an ounce of a red fetid liquor remained, which had a very acid smell, and turned the juice of turnsole red. Mr Homberg now imagined, that the acid contained in the blood of animals could not disengage itself perfectly by these distillations without addition. He therefore determined to distil human blood with an admixture of some other substance; but as earths contain a salt, which might render the operation uncertain, he determined to use only the caput mortuum of a former distillation of the same substance. For this purpose, four pounds of the coagulum of human blood being well mixed with a large quantity of this residuum, and the whole dried in the sun, it was put into a retort, and distilled with a fire raised, towards the end of the operation, to the utmost violence. The oil being separated from the volatile spirit, the latter was rectified; and the consequence was, that there came over four pounds of a red acid liquor, that turned the tincture of turnsole very red. All the distillations of the aqueous liquors already mentioned, obtained by similar processes, being mixed together, and separated from their yet remaining

maining oil, by careful dilution with water and filtration, they were at length distilled together; the liquor that came over was clear as water, and its first quantities contained a great deal of volatile salt, but the last two ounces were found to be as four as distilled vinegar.—The same products were obtained from the blood of carnivorous animals, as well as from that of animals feeding solely upon vegetables.

In Dr Lewis's notes on Newman's Chemistry we have the following account of the blood, and the parts into which it may be resolved. "Recent blood is equally fluid, and in taste somewhat saline. Viewed by a microscope, it appears composed of numerous red globules swimming in a transparent fluid. On standing for a little time, it separates into a thick crassamentum, and fluid serum. By agitation, it continues fluid: A consistent polypous matter adheres to the stirrer, which, by repeated ablation with water, becomes white.—Received from the vein in warm water, it deposits a quantity of transparent filamentous matter, the red portion continuing dissolved in the water. On evaporating the fluid, a red powdery substance is left.—It congeals by frost, and becomes fluid again by warmth; after liquefaction, it quickly putrefies.—Fluid and florid blood exposed to a temperate air, putrefies sooner than such as is more dense. Infused into dryness, it leaves a dark-coloured mass, amounting, at a medium, to about one fourth of the weight of the blood, of a bitter saline taste, easily inflammable, burning with a bluish flame. The exsiccated blood is not soluble in acid or alkaline liquors; but gives some tincture to water and to spirit of wine, and is more powerfully acted upon by dulcified spirit of nitre. Recent blood is coagulated by the mineral acids, and by most of the combinations of them with earthy and metallic bodies. With vegetable acids, and with solutions of neutral salts, it mingles equally without coagulation. Alcais, both fixed and volatile, render it more fluid, and preserve it from coagulating.

"The serum of blood is more saline than the crassamentum, and does not so speedily putrefy. It freezes somewhat more difficultly than pure water; and its aqueous part evaporates, by a gentle warmth, somewhat more readily, leaving about one twelfth of the weight of the serum of a solid yellowish pellicular matter. Exposed to heat a little greater than that of the human body, it coagulates into a solid mass, without any considerable evaporation. Both this coagulum and the infiltrated serum are readily inflammable in the fire, not dissoluble in water, or in spirit of wine, in acid or in alkaline liquors."

But the texture of the blood discoverable by a microscope, hath engaged the attention of the learned much more than the chemical analysis ever did. Lewenhoeck was the first who discovered, or fancied he discovered, that the blood, as it exists in the body of an animal, consists of a quantity of red globular particles swimming in a large quantity of transparent liquor. Each of these globules, he imagined, was composed of six smaller ones packed together. While the six continued to adhere, their colour was red; but when separated, they became yellow, and thus formed what is called the *serum*. He even pretended to have discovered that each of the serous globules consisted of six smaller ones, and that these when broken down constituted some

more subtle and penetrating liquor than the serum, &c. This was for a long time received almost universally as an undoubted fact; and many theories were built upon it, and elaborate calculations made, of which (we hope) no account needs now be given, as the falsity of these pretended discoveries is generally allowed. Father de Torre, with microscopes which he pretended were capable of magnifying to an incredible degree, found that the red particles of the blood were of an annular figure, with a perforation in the middle; and that the ring itself was formed of several joints. Some of these extraordinary magnifiers, however, being sent over to England, those who were appointed by the Royal Society to make trial of them found them totally useless, so that the credit of Father de Torre's discoveries must have rested principally on his own evidence. The falsity of his hypothesis, as well as that of Lewenhoeck, was detected by the late Mr Hewson, whose microscopical experiments on the blood being the latest that have appeared, we shall transcribe the following particular account of them given by himself in a letter to Dr Haygarth physician in Chester.—"The red particles of the blood, improperly called *globules*, are flat in all animals, and of very different sizes in different animals. In man they are small, as flat as a shilling, and appear to have a dark spot in the middle. In order to see them distinctly, I dilute the blood with fresh serum. My predecessors, not having thought of this, could not see them distinctly. And Lewenhoeck in particular, imagining a round figure fittest for motion, concluded they must be round in the human body; though he and others allowed that in frogs, &c. where they viewed them distinctly from the blood being thinner, they were flat. Now I prove that they are flat in all animals. In the human blood, where these particles are small, it is difficult to determine what that black spot is which appears in the centre of each. Some have concluded that it was a perforation: but in a frog, where it is six times as large as in a man, it is easy to show that it is not a perforation, but on the contrary is a little solid, which is contained in the middle of a vesicle. Instead, therefore, of calling this part of the blood red *globules*, I should call it red *vesicles*; for each particle is a flat vesicle, with a little solid sphere in its centre.

"I find that the blood of all animals contains vesicles of this sort. In human blood there are millions of them; and they give it the red colour. But in insects they are white, and less numerous in proportion than in man and quadrupeds. As they are flat in all animals, I suspect that shape is a circumstance of importance, but can be altered by a mixture with different fluids. And I find that it is by a determinate quantity of neutral salt contained in the serum, that this fluid is adapted to preserving these vesicles in their flat shape: for, if they be mixed with water, they become round, and dissolve perfectly; but add a little of any neutral salt to the water, and they remain in it, without any alteration in their shape, and without dissolving.

"Now, when it is considered, that the blood of all animals is filled with these particles, we must believe that they serve some very important purpose in the animal œconomy; and since they are so complicated in their structure, it is improbable they should be made by mechanical agitation in the lungs or blood-vessels,

Blood.

Mr Hewson.

as has been suspected, but probably have some organs set apart for their formation. This I shall endeavour to prove, when I have explained their structure a little more particularly, and mentioned the manner in which I exhibit it. I take the blood of a toad or frog, in which they are very large; I mix it with the serum of human blood to dilute it; I find them appear all flat; so they do in the blood-vessels of this animal, as I have distinctly seen in the web between its toes, whilst the animal was alive and fixed in the microscope. Their appearance in these animals is not unlike slices of cucumber. I next mix a little of the blood with water, which immediately makes them all round, and then begins to dissolve them whilst they are round. I incline the stage of the microscope, so as to make them roll down it; and then I can distinctly see the solid in the middle fall from side to side like a pea in a bladder. A neutral salt added to them at this time brings them back to their flat shape: but if the salt be not added, the water gradually dissolves away the vesicle; and then the little sphere is left naked. Such is the composition of these particles. I have exhibited these experiments to a considerable number of my acquaintance, who all agree in their being satisfactory.

“The microscope I use is a single lens, and therefore as little likely to deceive us as a pair of spectacles, which, as is allowed by all who use them, do not disguise objects, but only represent them larger.

“From farther experiments, I am convinced, that the use of the thymus and lymphatic glands is to make the middle solid pieces: and I can prove it in as satisfactory a manner as you can do the use of any viscus in the human body; that is, by opening these glands, and examining the fluid contained in their cells, which I find to be full of these little solids. I moreover find, that the lymphatic vessels take them up from those glands, and convey them into the blood-vessels which carry them to the spleen, in whose cells they have the vesicles laid over them; so that the thymus and lymphatic glands make the central particles, and the spleen makes the vesicles that surround them. That this is the use of the spleen appears from examining the lymph which is returned from it by its lymphatic vessels; for that lymph, contrary to what is observed in other parts of the body, is extremely red.

“But besides having these glands set apart for making the red vesicles of the blood, I find that they are also made in the lymphatic vessels in different parts of the body, whose coats have blood-vessels properly constructed for this secretion. So that the thymus and lymphatic glands are no more than appendages of the lymphatic system, for making the middle particles; and the spleen an appendage to the lymphatic vessels, for making the vesicles which contain these middle particles.

“I conjecture that it is the coagulable lymph which is converted into this red part of the blood, from a curious fact that has long been known; namely, that the blood in the splenic vein does not coagulate when exposed to the air, as the blood of other veins does; so that it seems to be robbed of its coagulable lymph in passing through the spleen.

“It is very remarkable, that the spleen can be cut out of an animal, and the animal do well without it. I made the experiment on a dog, and kept him a year

and a half without observing his health to be in the least impaired. From this some have concluded the spleen to be an useless weight; which is absurd, when we consider that all animals with red blood have it. Therefore it is more consistent with what we know of the animal economy, to conclude, that since an animal can do well without it, there is probably some part of the body that can supply its place.

“Insects have vesicles constructed in a similar way to ours, but differing in colour. But insects have neither spleen, thymus, nor lymphatic glands; and therefore in them probably these vesicles are entirely fabricated in the lymphatic vessels. But to us, and other of the more perfect animals, besides the lymphatic vessels, nature has given those glands, that a proper quantity of those important vesicles might be the better secured to us; just as she has given us two ears, the better to secure us hearing through life, though we can hear perfectly well with one.”

This letter, we apprehend, contains the strength of Mr Hewson's evidence for his hypothesis; on which we shall only remark, that if the red globules are prepared in the manner above mentioned, and the lymphatic vessels are excretories of those glands where the red particles are formed; then if there is any vessel where all these excretories unite, as mentioned ANATOMY, n^o 370, in that vessel the lymph ought to appear very red, on account of the accumulated quantity of red vesicles brought thither from all parts of the body. But no such redness seems ever to have been taken notice of by any anatomist: this therefore must be an objection to Mr Hewson's hypothesis; and such an one, perhaps, as will not be easily removed.

Many other hypotheses have been invented concerning the formation of the red blood, and various opinions delivered concerning its red colour. In a lecture delivered at Newcastle in 1773, by Dr Wilson of that place, he asserts “that it is self-evidently the office of the “veins to elaborate the fluids into that form and composition which we know by the name of red blood.” The self-evidence here, however, is by no means apparent to us; nor doth he at all point it out in an intelligible manner.—Dr Cullen, in his physiological part of The Institutions of Medicine, acknowledges that we know but little of the formation of any of the animal fluids; and concerning the microscopical observations, &c. on the blood gives his opinion in the following words, § ccliv. “The red globules have been considered as an oily matter, and from thence their distinct and globular appearance has been accounted for: but there is no direct proof of their oily nature; and their ready union with, and diffusibility in, water, renders it very improbable. As being microscopical objects only, they have been represented by different persons very differently. Some have thought them spherical bodies, but divisible into six parts, each of which in their separate state were also spherical; but other persons have not observed them to be thus divisible. To many observers they have appeared as perfectly spherical; while others judge them to be oblate spheroids, or lenticular. To some they have appeared as annular, and to others as containing a hollow vesicle. All this, with several other circumstances relating to them, very variously represented, shew some uncertainty in microscopical observations; and it leaves me, who am not

converfant in fuch obfervations, altogether uncertain with refpect to the precise nature of this part of the blood. The chemical history of it is equally precarious; and therefore what has been hitherto faid of the production and changes happening to thefe red globules, we chufe to leave untouched.—We fuppofe that the red globules, when viewed fingly, have very little colour; and that it is only when a certain number of them are laid upon one another, that the colour appears of a bright red: but this alfo hath its limits; fo that when the number of globules laid on one another is confiderable, the colour becomes of a darker red. Upon this fuppofition, the colour of the mafs of blood will be brighter or darker as the colouring part is more or lefs diffufed among the other parts of the mafs; and we think this appears to be truly the cafe from every circumftance that attends the changes which have been at any time obferved in the colour of the blood.”

Concerning the uncertainty of microfcoical, as well as chemical experiments, we fhall not difpute; though the conclufion againft them feems carried too far. But with regard to the colour of the blood, we apprehend it hath been known, almoft, if not altogether, fince the difcovery of the circulation, that the florid or dark colour depends on the prefence or abfence of air, and not upon any number of globules.—Thus the blood returning from the veins is of a dark colour. Though diluted with the frefh chyle from the fubclavian vein, it continues of the fame dark colour till it paffes thro’ the lungs, upon which it instantly affumes a very florid red; but it can never be proved that the globules in the pulmonary vein are at all lefs numerous than in the pulmonary artery.—That this change of colour may be effected by the air through membranes much thicker than we can fuppofe the veffels of the lungs to be, hath been demonstrated by Dr Priestley’s experiments mentioned under the article AIR, n^o 47, 48. but whether the change is occafioned by the mere feparation of phlogifton from the blood, or by the abforption of fome other principle in its ftead, is not yet determined, or indeed inquired into, as far as we have heard.

This leads us to confider the ufes to which the blood is fubfervient in the animal œconomy, and the changes that happen to it in refpiration. The ufes of this fluid are fo various, and of fuch an important nature, that fome have not fcrupled to affirm the blood to be actually poffeffed of a living principle, and that the life of the whole body is derived from it. This opinion was firft broached by the celebrated Harvey, the difcoverer of the circulation: but in this he was never much followed; and the hypothesis itfelf, indeed, has been pretty much laid afide and neglected, till of late that it was revived by Dr J. Hunter, profefor of anatomy in London. This gentleman fupports his opinion by the following arguments: 1. The blood unites living parts, in fome circumftances, as certainly as the yet recent juices of the branch of one tree unite it with that of another. Were either of thefe fluids to be confidered as extraneous or dead matters, he thinks they would act as ftimuli, and no union would take place in the animal or vegetable kingdom. This argument, Mr Hunter imagines, is ftill farther eftablifhed by the following experiment. Having taking off the tefticle from a living cock, he introduced it into the belly of a living hen. Many weeks afterwards, upon injecting

the liver of the hen, he injected the tefticle of the cock; which had come in contact with the liver, and adhered to it. He alleges, that, in the nature of things, there is not a more intimate connection between life and a folid, than between life and a fluid. For, although we are more accuftomed to connect it with the one than the other, yet the only real difference which can be fhewn between a folid and a fluid is, that the particles of the one are lefs moveable among themfelves than thofe of the other. Befides, we often fee the fame body fluid in one cafe, and folid in another. 2. The blood becomes vascular like other living parts. Mr Hunter affirms, that, after amputations, the coagula in the extremities of arteries may be injected by injecting thefe arteries; and he has a preparation in which he thinks he can demonftrate veffels rifing from the centre of what had been a coagulum of blood, and opening into the fream of the circulating blood. 3. Blood taken from the arm in the moft intense cold which the human body can bear, raifes the thermometer to the fame height as blood taken in the moft fultry heat. This he confiders as a ftrong proof of the blood’s being alive; as living bodies alone have the power of refifting great degrees both of heat and cold, and of maintaining in almoft every fituation, while in health, that temperature which we diftinguifh by the name of *animal heat*. 4. Blood is capable of being acted upon by a ftimulus. In proof of this, he obferves, that it coagulates from expofure, as certainly as the cavities of the abdomen and thorax inflame from the fame caufe. The more it is alive, that is, the more the animal is in health, it coagulates the fooner on expofure; and the more it has loft of its living principle, as in the cafe of violent inflammations, the lefs it is fenfible to the ftimulus produced from its being expofed, and it coagulates the later. 5. The blood preserves life in different parts of the body. When the nerves going to a part are tied or cut, the part becomes paralytic, and lofes all power of motion; but it does not mortify. If the artery be cut, the part dies, and mortification enfues. What keeps it alive in the firft cafe? Mr Hunter believes it is the living principle which alone can keep it alive; and he thinks that this phenomenon is inexplicable on any other fuppofition, than that life is fupported by the blood. 6. Another argument he draws from a cafe of a fractured os humeri he had occafion to obferve. A man was brought into St George’s hospital for a fimple fracture of the os humeri, and died about a month after the accident. As the bones had not united, Mr Hunter injected the arm after death. He found that the cavity between the extremities of the bones was filled up with blood which had coagulated. This blood was become vascular. In fome places it was very much fo. He does not maintain that all coagulated blood becomes vascular: and indeed the reafon is obvious; for it is often thrown out and coagulated in parts where its becoming vascular could anfwer no end in the fyftem; as, for example, in the cavities of aneurifmal facs. If it be fuppofed, that, in fuch cafes as that juft now mentioned, the veffels are not formed in the coagulum, but come from the neighbouring arteries, he thinks it equally an argument that the blood is alive; for the fubftance into which veffels fhoot muft be fo. The very idea, that fuch a quantity of dead matter as the whole mafs of blood, circulates in a living body, appears to him

Blood. him absurd.

Blood.

20
Nervous
system alone
thought by
some to con-
tain the vi-
tal prin-
ciple.

The system which at present stands opposed to that of Dr Hunter, considers the brain and nervous system as the fountain of life; and that, so far from receiving its life from the blood, the nervous system is capable of instantaneously changing the crasis of the blood, or any other animal fluid; and though the nervous system cannot continue its actions for any length of time if the action of the blood-vessels is suspended, yet the heart and blood-vessels cannot act for a single moment without the influence of the nervous fluid. Hence, say they, it is plain we must suppose the nervous system, and not the blood, to contain properly the life of the animal, and consequently to be the principal vital organ. The secretion of the vital fluid from the blood by means of the brain, is, by the supporters of this hypothesis, denied. They say, that any fluid secreted from the blood must be aqueous, inelastic, and inactive; whereas the nervous fluid is full of vigour, elastic, and volatile in the highest degree. The great necessity for the circulation of the blood through all parts of the body, notwithstanding the presence of the nervous fluid in the same parts, they say, is, because some degree of tension is necessary to be given to the fibres, in order to fit them for the influx of the nervous fluid; and this tension they receive from the repletion of the blood-vessels, which are every where dispersed along with the nerves.

21
Decisive ar-
guments in
favour of
Dr Hunter's
opinion.

To follow this dispute through every argument that hath been, or that may be, used by both parties, would prove tedious, and to us appears in a great measure unnecessary, as the following short considerations seem to decide the matter absolutely against the patrons of the nervous system. In the first place, then, if we can prove the life of the human body to have existed in, or to have been communicated from a fluid to the nervous system, the analogical argument will be very strongly in favour of the supposition that the case is so still. Now, that the case once was so, is most evident; for the human body, as well as the body of every other living creature, in its first state, is well known to be a gelatinous mass, without muscles, nerves, or blood-vessels. Nevertheless, this gelatinous matter, even at that time, contained the nervous fluid. Of this there can be no doubt, because the nerves were formed out of it, and had their power originally from it; and what is remarkable, the brain is observed to be that part of the animal which is first formed. Of this gelatinous fluid we can give no other account, than that it was the nutritive matter from which the whole body appears to be formed. At the original formation of man, and other animals, therefore, the nutritive matter was the substratum of the whole body consisting of muscles, nerves blood-vessels, &c. nay more, it was the immediate efficient cause of the nervous power itself. Why should it not be so now, as well as then? Again, in the formation of the embryo, we see a vital principle existing as it were at large, and forming to itself a kind of regulator to its own motions, or a habitation in which it chooses to reside, rather than to act at random in the fluid. This habitation, or regulator, was undoubtedly the nervous system, and continues so to this moment; but at the same time, it is no less evident that a nutritive fluid was the immediate origin of these same nerves, and of that very nervous fluid. Now we know, that the fluid which in the womb nourishes the bodies of all em-

bryo animals, is necessarily equivalent to the blood which nourishes the bodies of adult ones; and consequently, as soon as the blood became the only nutritious juice of the body, at that same time the vital or nervous fluid took up its residence there, and from the blood diffused itself along the nerves, where it was regulated exactly according to the model originally formed in the embryo. Perhaps it may be said, that the vital power, when once it hath taken possession of the human or any other body, requires no addition or supply, but continues there in the same quantity from first to last. If we suppose the nervous power to be immaterial, this will indeed be the case, and there is an end of reasoning upon the subject; but if we call this power a volatile and elastic fluid, it is plain that there will be more occasion for recruits to such a power than to any other fluid of the body, as its volatility and elasticity will promote its escape in great quantities through every part of the body. It may also be objected, that it is absurd to suppose any fluid, or mechanical cause, capable of putting matter in such a form as to direct its own motions in a particular way: but even of this we have a positive proof in the case of the electric fluid. For if any quantity of this matter hath a tendency to go from one place to another where it meets with difficulty, thro' the air, for instance, it will throw small conducting substances before it, in order to facilitate its progress. Also, if a number of small and light conducting substances are laid between two metallic bodies, so as to form a circle, for example; a shock of electricity will destroy that circle, and place the small conducting substances nearer to a straight line between the two metals, as if the fluid knew there was a shorter passage, and resolved to take that, if it should have occasion to return*. Lastly, it is universally allowed, that the brain is a secretory organ, made up of an infinite number of small glands, which have no other excretories than the medullary fibres and nerves. As a considerable quantity of blood is carried to the brain, and the minute arteries end in these small glands, it follows, that the fluid, whatever it is, must come from the blood. Now, there is no gland whatever, in the human, or any other body, but will discharge the fluid it is appointed to secrete, in very considerable quantity, if its excretory is cut. Upon the cutting of a nerve, therefore, the fluid secreted by the brain ought to be discharged; but no such discharge is visible. This makes it plain, even to demonstration, that the fluid secreted in the brain is *invisible* in its nature; and as we know the nervous fluid hath its residence in the brain, it is very probable, to use no stronger expression, that it is the peculiar province of the brain to secrete this fluid from the blood, and consequently that the blood originally contains the vital principle.

* See Electricity.

After it is allowed that the blood contains the vital principle, it becomes another question not very easily solved, Whence is this vital principle derived?—For this we can only discover two sources; namely, the chyle or aliment from which the blood is prepared, and respiration. The latter hath been commonly held as the principal source of the vital principle; and, for a long time, it was generally thought that there was a kind of vivifying spirit in the air, which being absorbed by the blood at each inspiration, communicated to that fluid the quality necessary for preserving animal life. As a

proof

Blood.

proof of this it was urged, that life cannot be supported without respiration, and that air which hath been often breathed ceases to be capable of supporting life; because when once it has been totally deprived of its vivifying spirit, it can communicate none to the blood in any subsequent respirations.—This doctrine, however, hath been denied, and, as is generally thought, exploded by modern discoverers. Dr Hales brings several experiments against it; of which the following may serve for a specimen, and which we shall give in his own words.

“ I tied a middle-sized dog alive on a table, and, having laid bare his wind-pipe, I cut it asunder just below the larynx, and fixed fast to it the small end of a common folet: the other end of the folet had a large bladder tied to it, which contained 162 cubic inches; and to the other end of the bladder was tied the great end of another folet whose orifice was covered with a valve which opened inwards, so as to admit any air that was blown into the bladder, but none could return that way; yet, for further security, that passage was also stopped by a spigot.

“ As soon as the first folet was tied fast to the wind-pipe, the bladder was blown full of air through the other folet: when the dog had breathed the air in the bladder to and fro for a minute or two, he then breathed very fast, and shewed great uneasiness, as being almost suffocated.

“ Then with my hand I pressed the bladder hard, so as to drive the air into his lungs with some force; and thereby make his abdomen rise by the pressure of the diaphragm, as in natural breathings; then taking alternately my hand off the bladder, the lungs with the abdomen subsided: I continued in this manner to make the dog breathe for an hour; during which time, I was obliged to blow fresh air into the bladder every five minutes, three parts in four of that air being either absorbed by the vapours of the lungs, or escaping through the ligatures upon my pressing hard on the bladder.

“ During this hour, the dog was frequently near expiring, whenever I pressed the air but weakly into his lungs; as I found by his pulse, which was very plain to be felt in the great crural artery near the groin, which place an assistant held his finger on most part of the time: but the languid pulse was accelerated so as to beat fast, soon after I dilated the lungs much by pressing hard upon the bladder; especially when the motion of the lungs was promoted by pressing alternately the abdomen and the bladder, whereby both the contraction and dilatation of the lungs was increased.

“ And I could by this means rouse the languid pulse whenever I pleased, not only at the end of every five minutes, when more air was blown into the bladder from a man's lungs, but also towards the end of the five minutes, when the air was fullest of fumes.

“ At the end of the hour, I intended to try whether I could have by the same means kept the dog alive some time longer, when the bladder was filled with the fumes of burning brimstone; but being obliged to cease for a little time from pressing the air into his lungs, while matters were preparing for this additional experiment, in the mean time the dog died, which might otherwise have lived longer if I had continued to force the air into the lungs.

“ Now, though this experiment was so frequently

disturbed, by being obliged to blow more air into the bladder 12 times during the hour; yet since he was almost suffocated in less than two minutes, by breathing of himself to and fro the first air in the bladder, he would have died in less than two minutes when one fourth of the old air remained in the bladder, immediately to taint the new air admitted from a man's lungs; so that his continuing to live through the whole hour, must be owing to the forcible dilatation of the lungs by compressing the bladder, and not to the vivifying spirit of the air.”

Dr Priestley, who hath carried his discoveries to a much greater length than any of his predecessors, concludes from his own observations, and no doubt very justly, that air which hath been often breathed becomes pernicious by its accumulated phlogiston, which stimulates the lungs, and makes the animal fall into convulsions. Respiration therefore, he thinks, indeed we may say he demonstrates, to be a phlogistic process, in which the blood parts with its superfluous phlogiston. He doth not say, that the blood receives nothing in exchange; he rather thinks that it may receive some nitrous principle, which gives it the red colour: but as to a vivifying-spirit, he doth not appear to have the least idea of any such thing being received at that time. Nay, in his first volume, p. 277. he expressly adopts the other hypothesis, namely, that the vital principle is received from the chyle. “ My conjecture (says he) is, that animals have a power of converting phlogiston, from the state in which they receive it in their nutriment, into that state in which it is called the *electrical fluid*; that the brain, besides its other proper uses, is the great laboratory and repository for this purpose; that by means of the nerves this great principle, thus exalted, is directed into the muscles, and forces them to act in the same manner as they are forced into action when the *electrical fluid* is thrown into them *ab extra*.”

With regard to the experiment made by Dr Hales, that the want of elasticity, or pressure, is the reason why phlogisticated air cannot support animal-life, we are of opinion that it is totally inconclusive, because it doth not at all appear that phlogisticated air wants elasticity; on the contrary, from Dr Priestley's experiments it appears to be more elastic than common air: besides, we know that the elasticity of every fluid must always be in proportion to the pressure upon it, as reaction is always equal to action. Supposing therefore the elasticity of any portion of air to be destroyed, the pressure of the superincumbent atmosphere will reduce it into a proportionably less bulk, and then it is equally elastic with the rest; for if it was not, it behaved still to yield under the pressure. Hence we may see, that as the bladder made use of in Dr Hales's experiment was by no means sufficient to keep off the pressure of the external atmosphere, the death of the dog could not be fairly ascribed to want of elasticity in the tainted air. When he applied more force than the natural elasticity of the air, he kept the dog *alive*, as he calls it, for an hour; but we can by no means allow a mechanical circulation of the blood to be life, any more than we can allow a dead body to be alive on account of the motion of its arm or any other member by mechanical means. The experiment, however, is valuable, because it shews that respiration is one of the immediate mechanical agents by which the circulation of the blood is carried.

carried on; but in order to prove that the dog was really kept alive by this means, he ought to have recovered from the effects of the experiment. Had Dr Hales tried a similar experiment on himself, by taking the fosslet in his mouth, closing his nostrils, and causing another person compress the bladder, we have not the least doubt, that he would then have felt such a method of breathing not to be a way of preserving life, but of destroying it.

As to any conclusions which may be derived from Dr Priestley's experiments, we are sorry to observe, that very many philosophers, sometimes indeed Dr Priestley himself, seem to attend but to one half of the consequences of their own experiments. In the present case this is exceedingly remarkable. Dr Priestley finds, that by admitting phlogiston to air, it is considerably diminished in quantity. But by what means is it so? Certainly the mere accession of any material substance can never diminish, but must increase, its bulk. The diminution therefore, on the accession of phlogiston, is an evident proof that some part of the air is actually taken away. That the phlogiston received is not incorporated with the air is likewise evident, as well as that it takes up space in the tainted air, because, by agitation in water, the phlogistic matter separates from the air, and enters into the water. The consequence of this is, that the air is still farther diminished in bulk; and what remains is pure air, fit for supporting animal-life, and of being farther diminished by phlogiston as before. It is also certain, that phlogiston is not endowed with any inherent power by which it can expand itself; otherwise it would fly off *in vacuo*, which it never is known to do. Another circumstance we must also attend to is, that the action of phlogiston seems to be entirely confined to a particular part of the atmosphere; namely, that which is now so well known by the name of *fixed air*. This it entirely deprives of its elastic principle, so that it is actually no longer air, but becomes a solid substance, making a part, and that no inconsiderable one, of innumerable terrestrial substances, as chalk, brimstone, &c.

That the justness of the conclusion which we are now about to draw from Dr Priestley's experiments may be more apparent, we shall briefly sum up the phenomena from whence it is drawn, in the two following propositions. 1. Phlogiston cannot act by itself without the assistance of air. 2. The emission of phlogiston is attended with the total destruction of the elasticity of a certain quantity of fixed air, which then ceases to be fluid. Hence we affirm, that it is not the phlogistic substance which acts upon the air, but the elastic principle in the fixed air contained in the common atmosphere that acts on the phlogistic substance. This elastic principle, entering the phlogistic body, displaces a quantity of phlogiston equivalent to its own quantity, and takes its place; and hence proceeds the first diminution of the air, not from an accession of phlogiston, but from an escape of the elastic principle belonging to fixed air. The phlogiston and fixed particles of the air now hang loose like smoke or vapour, and are ready to be attracted by any thing capable of imbibing them; and hence proceeds the second diminution by agitation in water.

Now, to apply this reasoning to the point in question. The blood is found to emit phlogiston from the lungs

at every expiration; therefore we affirm it hath received a proportional quantity of elastic vapour which it had not before. Again: The air expelled from the lungs is found to contain much of the fixable part floating loose, and capable of being attracted by lime-water, &c.; therefore we say, this elastic principle hath come from that part of the atmosphere. But, to put the matter beyond doubt, the very inspection of arterial and venous blood will shew, that the first hath a quantity of elastic matter in it which the last wants: and as the brain as well as all other parts of the body are supplied with arterial blood, we think it abundantly evident, that this elastic principle is absolutely and essentially necessary to life; that it is continually expended thereon; and that it may be said with the utmost propriety, that every time we draw the air into our lungs, we receive a portion of vivifying or vital spirit from it into our blood. Add to all this, that many substances which are commonly observed to phlogisticate air, appear to receive an elastic spirit by so doing. Putrefying bodies swell: they would not do so *in vacuo*; and therefore we must conclude, that they receive this elastic principle which swells them from the external air, and experience shews that it is communicated by this fixable part of the atmosphere.

The foregoing reasoning, which to us appears sufficiently conclusive, leads to a very important discovery in natural philosophy, viz. That it is to the atmosphere, and to that particular part of it which goes by the name of *fixed air*, that we are every moment indebted for that vital spirit which animates our bodies, and is the immediate bond of union betwixt our immaterial spirit and this visible world. It may be asked indeed, if fixed air is capable of supplying this spirit in such plenty, how comes it to be so instantaneously fatal when breathed? The reply to this, however, is obvious: it communicates too great a degree of elasticity to the blood; whence the circulation is stopped, and instant death ensues. That this is really the case, appears from the following account of the symptoms observed on the dissection of persons who have been suffocated by this kind of air.

1. The vessels of the brain are gorged with blood, and the ventricles of that viscus are filled sometimes with a frothy, sometimes with a bloody, serosity. 2. The trunk of the pulmonary artery is much distended, and the lungs appear nearly in a natural state. 3. The right ventricle and auricle of the heart, the venæ cavæ, and jugular veins, are full of frothy blood. 4. Bloody serosity is often found in the bronchiæ. 5. The trunk of the pulmonary veins, and the left auricle, are either empty, or almost empty, of blood. 6. The blood found in the places that have been mentioned, is generally fluid, and as it were in a dissolved state. It is easily extravasated into the cellular texture, of the head particularly, because it is in this part that it abounds most. 7. The epiglottis in suffocated persons is raised, and the glottis open and free. 8. The tongue is much swelled, and can hardly be contained within the mouth. 9. The eyes protrude, and preserve their lustre to the second or third day. They are often even brighter than natural. 10. The body preserves its heat for a long time. Nay the heat is sometimes greater than it is during life, or at least consistently with health. 11. The limbs are flexible for a long time after death. 12. The

face is more swelled, and often more red than usual. The neck and upper extremities are sometimes so much swelled, that they appear to be inflamed. These swellings, however, do not, like œdematous ones, preserve the impression of the finger.

33
Fixed air
the cause of
animal heat.

This account is so much in favour of what we have already advanced concerning the action of fixed air, that we shall make no observation upon it farther than that this elastic principle would seem also to be the cause of animal-heat; for as the blood evidently received a vast quantity of elastic fluid, it also received a much greater proportion of heat than usual.

33
Circulation
of the blood
how carried
on.

It now remains only to give some account of the means by which the circulation of the blood is carried on in the living body. From the time of Harvey till very lately, this was supposed to be chiefly the muscular power of the heart and arteries, which by some physiologists have been thought to be prodigiously great; and accordingly many calculations, requiring no small degree of mathematical knowledge to understand them, have been made of the forces requisite to perform this circulation. Other physiologists, however, have thought proper to take in several auxiliary helps, as the motion of the muscles, respiration, &c. and from Dr Hales's experiment abovementioned, it appears, that respiration hath a considerable influence in this matter. It cannot, however, be the sole cause, seeing the circulation is carried on in animals which do not respire.—In 1773, Dr Wilson, in the lecture already quoted, suggested a new principle of motion, which we believe was never used before to account for the circulation of animal fluids. It is shortly this. "As the fluids of the human body do all of them suffer a continual waste, and consequently require a constant supply in proportion, we must look upon their going out of the body to be the end of their motion, and on their entering into the body to be the beginning of it; and hence we are to look for the origin of all the motion of the fluids in that part of the system where the new supplies are taken in. This is the primæ viæ, where the lacteals absorb a fluid from the digested aliment, and convey it into the blood. The power by which this is accomplished, is necessarily independent of the heart, as having not the least connection with it. It has been said to be the same with that which causes fluids rise in capillary tubes; but though very probably the powers in both cases may be the same, there is this remarkable difference between them, that in the capillary tubes the fluids only rise to a certain height, and will not rise at all unless the tubes are empty. In the lacteals they rise in vessels already full, and continue to do so. Neither is the force, whereby this absorption is performed, to be accounted little; seeing the supply by the chyle must constantly be equal to the waste which is continually taking place in the fluids already contained in the vessels. We see also, with what force an absorption of this kind sometimes takes place in other cases; thus, ropes will absorb water with such strength as to raise immense weights fastened to them, and which no mechanical injection of water into small tubes could possibly accomplish. What is already said of the lacteals applies also to the lymphatics; and from thence we are almost tempted to conclude, that the case is the same with the sanguiferous veins also; that though there may be a continuation of some arteries into the veins correspond-

34
New hypo-
thesis by Dr
Wilson.

ing with them, yet that for the most part these vessels extravasate the blood into small cavities, which is then taken up by the absorbent power of the veins, and returned to the heart.

"If, however, the vessels continued absolutely full, it would be impossible that any motion could be carried on in them; and to continue and regulate the circulation, the heart with its cavities is provided. Let us suppose, that by the abovementioned power the veins are all full, and the auricles or chambers into which the veins empty themselves are full also: where is the collected stream in the veins to go next? There is no room for more in the auricle. What must be done? The auricle contracts and empties itself. The consequence is a sudden vacuum, equal to what the auricle could contain; the turbid veins, urged by the absorbing power abovementioned, rush their contents into the auricle to fill up the vacuum again, and all behind moving in the venous direction advances forward with so much force, that the veins near the heart sustain a pulsation from the regurgitation of this impetuous stream, when the auricle shuts upon it to empty itself. In short, the full auricle occupies a determinate quantity of space in the breast: when it is emptied, there is a nonresisting vacuum of so much space as was full before, and thither there is a mechanical nifus from the remotest filament of a vein over the whole body, which becomes conspicuous in the torrent that rushes every other moment from the mouth of the vena cava into this vacuum."

This is a short abstract of Dr Wilson's new theory of the circulation. According to him, this absorbing power of the veins is the principal agent, while the heart and arteries do no more than empty themselves of the blood with which they are filled by the veins. Even this cause, however, he says would not be sufficient to carry on the circulation for a single moment, without the presence of another which he calls *life*, and does not consider as absolutely unmechanical, tho' we cannot reduce it either to mechanical rules or ideas. But, as we apprehend all speculations concerning such causes must be arbitrary and without foundation, we forbear to give any account of the Doctor's opinions on this subject.

It hath been a general opinion, that blood, as it exists in the bodies of animals, contains a considerable quantity of common air; and indeed it is certain, that blood, after it has been drawn from the veins of any animal, and afterwards placed under the receiver of an air-pump, yields a very considerable quantity of air upon exhaling the receiver: but if a portion of any blood-vessel is tied up so as to prevent the escape of its contents, and then cut out of the body and placed under a receiver, it will not swell, or shew the least sign of its containing any quantity of air whatever.

Blood was formerly held in great esteem as a medicine for some particular diseases. Baths of the blood of infants have been recommended as an infallible remedy for the elephantiasis, &c.; and the blood of goats and some other animals was used by the Galenists, and is recommended even by Dr Mead in pleuritis: but the first abominable medicine, as well as the other, is now deservedly exploded. The principal use of blood in the arts is for making Prussian blue, or sometimes for clarifying certain liquors; it is also recommended in

Blood.

Blood.

agriculture as an excellent manure for fruit-trees. A mixture of blood with lime makes an exceedingly strong cement; and hence it is of use in the preparation of some chemical lutes, the making floors †, &c.—As a food, it hath been disputed whether blood really affords any nourishment or not. The best judges now, however, are generally agreed that it is very nutritious; and 't' out of the body, like the white of an egg, it is very insoluble, yet, like that too, *in* the body it is commonly of easy digestion: It is, however, highly acalestic in hot climates; on which account the prohibition of it to the Israelites was very proper. Even in this country, when blood was used as food in great quantity, the scurvy was more frequent than at other times; but to a moderate use of it here no such objection takes place.

Religious uses of Blood. Among the ancients blood was used for the sealing and ratifying covenants and alliances, which was done by the contracting parties drinking a little of each others blood; and for appeasing the manes of the dead, in order to which blood was offered on their tombs, as part of the funeral ceremony.

The blood of victims was anciently the portion of the Gods; and accordingly was poured or sprinkled on the altars in oblation to them.

The priests made another use of blood, *viz.* for divination: the streaming of blood from the earth, fire, and the like, was held a prodigy, or omen of evil.

The Roman priests were not unacquainted with the use of blood in miracles: they had their fluxes of blood from images, ready to serve a turn; witnesses that said to have streamed from the statue of Minerva at Modena, before the battle at that place. But we know not whether in this their successors have not gone beyond them. How many relations in ecclesiastical writers of Madonas, crucifixes, and wafers, bleeding? At least the liquefaction of the blood of St Januarius at Naples, repeated annually for so many ages, seems to transcend by far all the frauds of the Grecian or Roman priesthood. But the chemists at last got into the secret; and we find M. Neumann at Berlin to have performed the miracle of the liquefaction of dried blood, with all the circumstances of the Neapolitan experiment.

Among the schoolmen we find a famous dispute, under Pope Pius II. whether the blood of Christ, which fell from him in the three days passion, retained or lost the hypostatic union; and consequently whether it was the proper object of adoration. The Dominicans maintained the former, the Franciscans the latter. It seems the dominican doctrine gained the ascendant, as being fitter to favour the profits of the monks; who becoming possessed some way or other of a few drops of this precious liquor, were secured of ample offerings from the deluded laity, who stocked to pay their homage to the sacred relic. Joseph of Arimathea is said to have first brought into Britain two silver vessels filled with the blood of Christ, which by his order was buried in his tomb. King Henry III. had a crystal, containing a portion of the same blood, sent him by the master of the temple at Jerusalem, attested with the seals of the patriarch; which treasure the king committed to the church of St Peter's, Westminster, and obtained from the bishops an indulgence of six years and 116 days to all that should visit it. Mat. Paris even assures us, that

the king summoning his nobles and prelates to celebrate the feast of St Edward in St Peter's church, was chiefly *pro venerazione sancti sanguinis Christi nuper adepti*, "in veneration of the holy blood of Christ lately acquired." Divers others of our monasteries were possessed of this profitable relic; as the college of Bon Hommes at Ashridge, and the abbey of Hales, to whom it was given by Henry, son of Richard duke of Cornwall, and king of the Romans. To it resorted a great concourse of people for devotion and adoration; till in 1538, as the reformation took place, it was perceived to be only honey clarified, and coloured with saffron, as was shewn at Paul's cross by the bishop of Rochester. The like discovery was made of the blood of Christ, found among the reliques in the abbey of Fescamp in Normandy, pretended to have been preserved by Nicodemus, when he took the body from the cross, and given to that abbey by William duke of Normandy: it was buried by his son Richard, and again discovered in 1171, and attended with different miracles; but the cheat, which had been long winked at, was at length exposed, the relation of which is given by Speed.

Avenger of Blood. among the Jews, was the next of kin to the person murdered, who was to pursue the murderer.

Ecclesiastical judges retire, when judgment is to be given in *cases of blood*, by reason the church is supposed to abhor blood: it condemns no person to death; and its members become irregular, or disabled from their functions, by the effusion of blood.

Field of Blood. *αγορα αιματος*, in Syriac *acclama*, was a field purchased by the Jews, with the thirty pieces of silver which had been given to Judas for betraying his Master, and which he had restored. It still serves for a burial-ground, in which all pilgrims who die in their pilgrimage at Jerusalem are interred.

BLOOD-HOUND, in zoology, the *canis sagax* of Linnæus *, *le chien courant* of Buffon, the *scout-hounds* of the Scots: The hound, or dog, with long, smooth, and pendulous ears.—It was a dog of great use, and in high esteem with our ancestors: its employ was to recover any game that had escaped wounded from the hunter, or been killed and stole out of the forest. It was remarkable for the acuteness of its smell, tracing the lost beast by the blood it had spilt; from whence the name is derived. This species could, with the utmost certainty, discover the thief by following his footsteps, let the distance of his flight be ever so great, and through the most secret and thickest covert: nor would it cease its pursuit, till it had taken the felon. They were likewise used by Wallace and Bruce during the civil wars. The poetical historians of the two heroes, frequently relate very curious passages on this subject; of the service these dogs were of to their masters, and the escapes they had from those of the enemy. The blood-hound was in great request on the confines of England and Scotland; where the borderers were continually preying on the herds and flocks of their neighbours. The true blood-hound was large, strong, muscular, broad breasted, of a stern countenance, of a deep tan-colour, and generally marked with a black spot above each eye.

Blood-White, in ancient law-writers, a mulct or fine for shedding of blood.

Blood-Wort, in botany. See *RUMEX*.

BLOOD (Thomas), generally known by the appellation of *Col. Blood*, was a disbanded officer of Oliver Cromwell's, famous for his daring crimes and his good fortune. He was first distinguished by engaging in a conspiracy to surprise the castle of Dublin; which was defeated by the vigilance of the duke of Ormond, and some of his accomplices were executed. Escaping to England, he meditated revenge against Ormond; and actually seized him one night in his coach in St James's-street, where he might have finished his purpose if he had not studied refinements in his vengeance. He bound him on horseback behind one of his associates, resolving to hang him at Tyburn, with a paper pinned to his breast: but when they got into the fields, the duke, in his efforts for liberty, threw himself and the assassin, to whom he was fastened, to the ground; and while they were struggling in the mire, he was rescued by his servants, but the authors of this attempt were not then discovered. A little after, in 1671, Blood formed a design of carrying off the crown and regalia from the tower; a design, to which he was prompted, as well by the surprising boldness of the enterprize, as by the views of profit. He was very near succeeding. He had bound and wounded Edwards the keeper of the jewel-office, and had got out of the tower with his prey; but was overtaken and seized, with some of his associates. One of them was known to have been concerned in the attempt upon Ormond; and Blood was immediately concluded to be the ringleader. When questioned, he frankly avowed the enterprize; but refused to discover his accomplices. "The fear of death (he said) should never engage him either to deny a guilt or betray a friend." All these extraordinary circumstances made him the general subject of conversation; and the king was moved with an idle curiosity to see and speak with a person so noted for his courage and his crimes. Blood might now esteem himself secure of pardon; and he wanted not address to improve the opportunity. He told Charles, that he had been engaged, with others, in a design to kill him with a carabine above Battersea, where his majesty often went to bathe: that the cause of this resolution was the severity exercised over the consciences of the godly, in restraining the liberty of their religious assemblies: that when he had taken his stand among the reeds, full of these bloody resolutions, he found his heart checked with an awe of majesty; and he not only relented him-

self, but diverted his associates from their purpose: that he had long ago brought himself to an entire indifference about life, which he now gave for lost; yet could he not forbear warning the king of the danger which might attend his execution: that his associates had bound themselves by the strictest oaths to revenge the death of any of their confederacy; and that no precaution nor power could secure any one from the effects of their desperate resolutions. Whether these considerations excited fear or admiration in the king, they confirmed his resolution of granting a pardon to Blood; but he thought it a requisite point of decency first to obtain the duke of Ormond's consent. Arlington came to Ormond in the king's name, and desired that he would not prosecute Blood, for reasons which he was commanded to give him. The duke replied, that his majesty's commands were the only reason that could be given; and being sufficient, he might therefore spare the rest. Charles carried his kindness to Blood still farther: he granted him an estate of 500*l.* a-year in Ireland; he encouraged his attendance about his person; he shewed him great countenance; and many applied to him for promoting their pretensions at court. And while old Edwards, who had bravely ventured his life, and had been wounded, in defending the crown and regalia, was forgotten and neglected, this man, who deserved only to be stared at, and detested as a monster, became a kind of favourite.—Blood enjoyed his pension about 10 years, till being charged with fixing an imputation of a scandalous nature on the duke of Buckingham, he was thrown into prison, where he died, August 24th, 1680.

BLOODY, something belonging to, or abounding with, blood.

Bloody-Flux. See the *Index* subjoined to *MEDICINE*.

Bloody-Hand, is when a trespasser is apprehended in a forest with his hands or other parts bloody; which is a circumstance of his having killed the deer, though he be not found chasing or hunting them.

Bloody-Rain. See *RAIN*.

Bloody-Urine. See *URINE*.

BLOOM, a mass of iron after having undergone the first hammering called *blomary* †.—It has yet to undergo many hammerings before it become iron fit for the smith's use, and be first made what they call the *anconny*. See *ANCONY*. † See *Bloomary*.

BLOSSOM, in a general sense, denotes the flower of any plant. See the article *FLOWER*.

BLOSSOM, in a more proper sense, is restrained to the flowers of trees, which they put forth in the spring as the fore-runners of their fruit, otherwise called their *bloms*. The office of the blossom is partly to protect, and partly to draw nourishment to, the embryo, fruit, or seed.

BLOSSOM, or *Peach-coloured*, in the menage, a term applied to a horse that has his hair white, but intermixed all over with sorrel and bay hairs. Such horses are so insensible and hard both in the mouth and the flanks, that they are scarce valued; besides they are apt to turn blind.

BLOSSOMING OF PLANTS, the act of blowing, or putting forth flowers or blossoms, called also *flowering* *. The blossoming of the spina acuta, or Glasterbury thorn, piously on Christmas-day-morning, is a vulgar

Blood
|
Blossoming.

Blount.

error; owing to this, that the plant, besides its usual blossoming in the spring, sometimes puts forth a few white transient blossoms in the middle of winter. For the blossoming of the rose of Jericho on the same day, as it is commonly held in England, or in the time of midnight mas, as it is held in France, is somewhat more than an error, being really a fraud on one side, and a superflition on the other. This rose, whose leaves are only closed and shrivelled up in winter, will, at any time, upon setting its pedicle in water, expand and blossom a-new; because the pedicle being spongy imbibes the fluid apace, and thus fills and swells out the shrivelled leaves: which property some monks have turned to good account.

BLOUNT (Thomas), a learned English writer of the 17th century, born at Bordesley in Worcestershire. He had not the advantage of an university education; but, by strength of genius and great application, made a considerable progress in literature. Upon the breaking out of the popish plot in the reign of king Charles II. being much alarmed on account of his being a zealous Roman-catholic, he contracted a palsy; and died in December 1679, aged 61. He wrote, 1. The academy of eloquence, containing a complete English rhetoric. 2. Glossographica, or a dictionary interpreting such hard words, whether Hebrew, Greek, Latin, Italian, &c. that are now used in our refined English tongue, &c. 3. Bosobel; or the history of his majesty's escape after the battle of Worcester. 4. A law dictionary. 5. Animadversions upon Sir Richard Baker's chronicle. 6. *Fragmenta Antiquitatis*; and other works.

BLOUNT (Sir Henry), an English writer, born at his father's seat in Hertfordshire in 1602. After a regular education, he set out on his travels in 1634; and getting acquainted with a janizary at Venice, he accompanied him into the Turkish dominions; having been abroad two years, he returned and published a relation of his travels in the Levant, which went thro' several editions. He was knighted by Charles I. and was at the battle of Edge-hill, at which time he is supposed to have had the care of the young princes; but, after the king's death, was employed by the parliament, and by Cromwell. Yet after the restoration of the royal family, he was appointed high sheriff of the county of Hertford, and from that time lived as a private gentleman above 20 years. He published, 1. An account of his travels. 2. Six comedies, written by John Lilly, under the title of *Court Comedies*. 3. The exchange walk, a satire; and 4. An epistle in praise of tobacco. He died October 9th, 1682.

BLOUNT (Sir Thomas Pope), baronet, an eminent writer, and the eldest son of the former, was born at Upper Holloway, in the county of Middlesex, September 12th, 1649. He was educated under the eye of his father; and always distinguished himself as a lover of liberty, a sincere friend to his country, and a true patron of learning. He was advanced to the degree of baronet by king Charles II. in whose reign he was elected burgess for St Alban's in two parliaments, and was knight of the shire in three parliaments after the Revolution. He wrote in Latin, 1. A critique on the most celebrated writers. 2. Essays on several subjects. 3. A natural history, extracted out of the best modern writers; and, 4. Remarks upon poetry, with characters and censures of

the most considerable poets, whether ancient or modern. He died June 30th, 1697.

BLOUNT (Charles), younger brother of Sir Thomas Pope Blount, had also an excellent capacity, and was an eminent writer. His *Anima Mundi*, or *An historical narration of the opinions of the ancients, concerning man's soul after this life, according to unenlightened nature*, gave great offence, and was complained of to the bishop of London. But the work which rendered him most known, was his translation of Philostratus's *Life of Apollonius Tyaneus*, published in 1680; which was soon suppressed, as an attack on revealed religion. Another work of the same complexion he published the same year, called *Great is Diana of the Ephesians*, &c. in which, under colour of exposing superstition, he struck at revelation: In 1684, he printed a kind of *Introduction to Polite Literature*. In the warmth of his zeal for the Revolution, he writ a pamphlet to prove king William and queen Mary conquerors; which was condemned to be burnt by both houses of parliament. The close of his life was very unhappy. For, after the death of his wife, he became enamoured of her sister, who was only scrupulous against their union on account of their prior connection by the marriage; on which he writ a letter on the subject, as the case of a third person, with great learning and address. But the archbishop of Canterbury and other divines deciding against him, and the lady on this growing inflexible, it threw him into a frenzy in which he shot himself, in 1693. After his death, his miscellaneous pieces were collected and published.

BLOW (Dr John), a famous musician and composer, was a native of North Collingham in the county of Nottingham; and was one of the first set of children after the restoration, being bred up under Captain Henry Cook. He was also a pupil of Hingelton, and after that of Dr Christopher Gibbons. On the 16th day of March, 1673, he was sworn one of the gentlemen of the chapel in the room of Roger Hill; and in July, 1674, upon the decease of Mr Pelham Humphrey, was appointed master of the children of the chapel.

In 1685, he was made one of his majesty's private music; and in 1687, was appointed almoner and master of the choristers of the cathedral church of St Paul. Blow was not a graduate of either university; but archbishop Sancroft, in virtue of his own authority in that respect, conferred on him the degree of doctor in music. Upon the decease of Purcell in 1695, he became organist of Westminster-abbey. In the year 1699, he was appointed composer to his majesty, with a salary.

Blow was a composer of anthems while a chapel-boy, and on the score of his merit was distinguished by Charles II. The king admired very much a little duet of Carissimi to the words 'Dite o Ciel!' and asked of Blow if he could imitate it. Blow modestly answered he would try; and composed in the same measure, and the same key of D with a minor third, that fine song, 'Go perjured man.'

The *Orpheus Britannicus* of Purcell had been published by his widow soon after his decease; and contained in it some of that author's finest songs: the favourable reception it met with was a motive with Blow to the publication, in the year 1700, of a work of the same kind, entitled *Amphion Anglicus*, containing compositions for one, two, three, and four voices, with

Blount,
Blow.

accompaniments of instrumental music, and a thorough-bass figured for the organ, harpsichord, or theorbo-lute. To this book are prefixed commendatory verses by sundry persons; and among them an ode, in the second stanza of which are the following lines:

His *Gloria Patri* long ago reach'd Rome,
Sung and rever'd too in St Peter's dome;
A canon will outlive her jubilees to come.

The canon here meant is that fine one to which the *Gloria Patri* in Dr Blow's gamut service is set. Dr Blow set to music an ode for St Cecilia's day, in 1684, the words by Mr Oldham, published together with one of Purcell on the same occasion performed the preceding year. He also composed and published a collection of lessons for the harpsichord or spinnet, and an ode on the death of Purcell, written by Mr Dryden. There are also extant of his composition sundry hymns printed in the *Harmonia Sacra*, and a great number of catches in the latter editions of the musical companion.

This great musician died in the year 1708, and lies buried in the north aisle of Westminster-abbey. On his monument is the canon above mentioned, engraven on a book with an inscription above it.

BLOW, in a general sense, denotes a stroke given either with the hand, a weapon, or instrument. In fencing, blows differ from thrusts, as the former are given by striking, the latter by pushing.

Military Blow, *alapa militaris*, that given with a sword on the neck or shoulder of a candidate for knighthood, in the ceremony of dubbing him. The custom seems to have taken its rise from the ancient ceremony of manumission. In giving the blow, the prince used the formula *Esto bonus miles*, "Be a valiant soldier;" upon which the party rose a complete knight, and qualified to bear arms in his own right.

BLOW, in law. See **BATTERY**.

Fly-Blows, the ova of flies deposited on flesh, or other substances proper for hatching them.

Blow-Pipe, among jewellers and other artificers, is a glass tube, of a length and thickness at discretion, wherewith they quicken the flame of their lamp, by blowing through it with their mouth. It is used in works of quicker dispatch, which do not need the bellows. Though the wind blown out at a small bent tube of glass, called a *blow-pipe*, seems not to have any great celerity, in comparison of the parts of flame, and is itself of little force; yet, when the flame of a lamp or candle is directed by it, so as to beat upon a body at a convenient distance, it may be made to melt silver, or even copper itself, which yet may be kept, for many hours, unmelted in a red-hot crucible, or the flame of the lamp or candle unaffected by the blast. The enamellers have also tubes of divers sizes, wherewith to blow their enamel, answering to the same purpose as the *portillo*, or *blow-pipe*, of glassmen.

The *blow-pipe* has also been a little used by chemists and mineralists. But Mr Cronsted has lately extended its use to the examination of all mineral bodies; which by means thereof, with a candle and piece of charcoal, may, in portions sufficient for mineralogical experiments, be burnt, calcined, melted, or scorified, &c. as well as in any great works.—This instrument is composed of two parts; and this for the facility both of making, carrying it along, and cleaning it in the

inside when necessary. The two parts are represented separate †, and of the true size; the figure of the instrument, when these are put together, may be easily conceived. The globe *a* ($n^{\circ} 2.$) is hollow, and made on purpose to condense the vapours, which always happen to be in the blow-pipe when it has been used some time: if this globe was not there, the vapours would go directly with the wind out into the flame, and thereby cool the assay. The hole in the small end *b*, thro' which the wind comes out, ought not to be larger than the size of the finest wire. This hole may now and then happen to be stopped up by something coming into it, so as to hinder the force of the wind: one ought therefore to have a piece of the finest wire, to clear it with when required; and, in order to have this wire the better at hand, it may be fastened round the blow-pipe, in such a manner as is represented in $n^{\circ} 1.$: *c* is the wire fastened round the blow-pipe, and afterwards drawn through a small hole at *e*, made in the ring *f*, to keep it more steady. In order to determine the most convenient proportions of this instrument, several blow-pipes of different sizes, both bigger and smaller, have been tried: the former have required too much wind; and the latter, being too soon filled with the wind, have returned it back again upon the lungs: both these circumstances hindered greatly the experiments, and are perhaps even prejudicial to the health. The size here given is found to answer best; and though the hole must be as small as above-mentioned, yet the sides of the pipe at the point must not be thinner, nor the point narrower, than here represented, else it will be too weak, and not give so good a flame. It is also to be observed, that the canal throughout the pipe, but particularly the hole at the small end, must be made very smooth, so that there be no inequalities in it; the wind would else be divided, and consequently the flame made double. That blow-pipe is to be reckoned the best, through which can be formed the longest and most pointed flame from off a common-sized candle. These blow-pipes are commonly made of brass or silver. The manner of using them in mineralogical experiments are explained under the article **MINERALOGY**.

BLOWING, in a general sense, denotes an agitation of the air, whether performed with a pair of bellows, the mouth, a tube, or the like. Butchers have a practice of blowing up veal, especially loins, as soon as killed, with a pipe made of a sheep's shank, to make it look larger and fairer.

Blowing of Glass, one of the methods of forming the various kinds of works in the glass manufacture. It is performed by dipping the point of an iron blowing-pipe in the melted glass, and blowing through it with the mouth, according to the circumstances of the glass to be blown. See **GLASS**.

Blowing of Tin denotes the melting its ore, after being first burnt to destroy the muddle.

Machines for Blowing the Air into Furnaces. See the article **FURNACE**.

BLOWING, among gardeners, denotes the action of flowers, whereby they open and display their leaves. In which sense, blowing amounts to much the same with flowering or blossoming.

The regular blowing season is in the spring; though some plants have other extraordinary times and manners of blowing, as the Glastebury thorn. Divers flowers

Blow,
Blowing.

Blubber
Bluing.

flowers also, as the tulip, close every evening, and blow again in the morning. Annual plants blow sooner or later, as their seeds are put in the ground; whence the curious in gardening sow some every month in summer, to have a constant succession of flowers. The blowing of roses may be retarded by shearing off the buds as they put forth.

BLUBBER, denotes the fat of whales and other large sea-animals, whereof is made train-oil. It is properly the *adeps* of the animal: it lies immediately under the skin, and over the muscular flesh. In the porpoise, it is firm and full of fibres, and invests the body about an inch thick. In the whale, its thickness is ordinarily six inches; but, about the under lip, it is found two or three feet thick. The whole quantity yielded by one of these animals ordinarily amounts to 40 or 50, sometimes to 80 or more, hundred weight. The use of blubber to the animal seems to be partly to poise the body, and render it equiponderant to the water; partly to keep off the water at some distance from the blood, the immediate contact whereof would be apt to chill it; and partly also for the same use that clothes serve us, to keep the fish warm, by reflecting or reverberating the hot steams of the body, and so redoubling the heat; since all fat bodies are, by experience, found less sensible of the impressions of cold than lean ones. Its use in trade and manufactures is to furnish train-oil, which it does by boiling down. Formerly this was performed ashore, in the country where the whales were caught; but of late the fishers do not go ashore; they bring the blubber home stowed in casks, and boil it down here.

Sea-Blubber. See **MEDUSA**.

BLUE, one of the seven colours into which the rays of light divide themselves when refracted through a glass prism.—For an account of the particular structure of bodies by which they appear of a blue colour, see the article **CHROMATICS**.—The principal blues used in painting are Prussian blue, bice, Saunders blue, azure, or smalt, verditer, &c; for the preparation of which, see **COLOUR-Making**.—In dyeing, the principal ingredients for giving a blue colour are indigo and woad. See **DYEING**.

BLUE Colour of the Sky. See **SKY**.

BLUE Bird. See **MOTACILLA**.

BLUE Fish. See **CORYPHENA**.

BLUE Japan. Take gum-water, what quantity you please, and white lead a sufficient quantity; grind them well upon a porphyry; then take singlars size what quantity you please, of the finest and best smalt a sufficient quantity; mix them well: to which add, of your white lead, before ground, so much as may give it a sufficient body. Mix all these together to the consistence of a paint.

BLUING, the act or art of communicating a blue colour to bodies otherwise destitute thereof. Landresses blue their linen with smalt; dyes their stuffs and wools with woad or indigo.

BLUING of Metals is performed by heating them in the fire, till they assume a blue colour; particularly practised by gilders, who blue their metals before they apply the gold and silver leaf.

BLUING of Iron, a method of beautifying that metal sometimes practised; as for mourning buckles, swords, and the like. The manner is thus: Take a piece of

grind-stone or whet-stone, and rub hard on the work, to take off the black scurf from it: then heat it in the fire; and as it grows hot, the colour changes by degrees, coming first to light, then to a darker gold colour, and lastly to a blue. Sometimes also they grind indigo and fallad-oil together; and rub the mixture on the work with a woollen rag, while it is heating, leaving it to cool of itself. Among sculptors we also find mention of bluing a figure of bronze, by which is meant the heating of it, to prepare it for the application of gold-leaf, because of the bluish cast it acquires in the operation.

BLUFF-HEAD, among sailors. A ship is said to be bluff-headed, that has an upright stern.

BLUNDERBUSS, a short fire-arm with a wide bore, capable of holding a number of bullets at once.

BOA, in zoology, a genus of serpents, belonging to the order of amphibia. The characters of this genus are, that the belly and tail are both furnished with scuta. The species are ten, viz. 1. The constrictor, has 150 scuta on the belly, and 40 on the tail: the head is broad, very convex, and has poison-bags in the mouth, but no fang, for which reason its bite is not reckoned poisonous: the body is ash-coloured, interspersed with large dusky spots; and the tail is about a third of the length of the body. This serpent is found in Carolina. 2. The canina, has 203 scuta on the belly, and 77 on the tail; it is greenish, and variegated with white belts. It is a native of America, and lodges in the hollow trunks of trees, and is about two feet long. The bite of the canina is not poisonous. 3. The hipnale, is of a dull yellow colour, and is found in Asia. It has 179 scuta on the belly, and 120 on the tail.

4. The constrictor, has 240 scuta on the belly, and 60 on the tail. This is an immense animal: it often exceeds 36 feet in length; the body is very thick, of a dusky white colour, and its back is interspersed with 24 large pale irregular spots; the tail is of a darker colour; and the sides are beautifully variegated with pale spots. Besides, the whole body is interspersed with small brown spots. The head is covered with small scales, and has no broad laminae betwixt the eyes, but has a black belt behind the eyes. It wants the large dog-fangs, and of course its bite is not poisonous. The tongue is fleshy, and very little forked. Above the eyes, on each side, the head rises high. The scales of this serpent are all very small, roundish, and smooth. The tail does not exceed one eighth of the whole length of the animal. The Indians, who adore this monstrous animal, use the skin for cloaths, on account of its smoothness and beauty. There are several of these skins of the above dimensions preserved, and to be seen in the different museums of Europe, particularly in the library and botanic garden of Upsal in Sweden, which has of late been greatly enriched by count Grillinborg. The flesh of this serpent is eat by the Indians, and the negroes of Africa. Pifo, Margraave, and Kempfer, give the following account of its method of living and catching its prey. It frequents caves and thick forests, where it conceals itself, and suddenly darts out upon strangers, wild beasts, &c. When it cluseth a tree for its watching-place, it supports itself by twisting its tail round the trunk or a branch, and darts down upon sheep, goats, tigers, or any animal that comes with-

in its reach. When it lays hold of animals, especially any of the larger kinds, it twists itself several times round their body, and by the vast force of its circular muscles bruises and breaks all their bones. After the bones are broke, it licks the skin of the animal all over, befmearing it with a glutinous kind of saliva. This operation is intended to facilitate deglutition, and is a preparation for swallowing the whole animal. If it be a flag, or any horned animal, it begins to swallow the feet first, and gradually sucks in the body, and last of all the head. When the horns happen to be large, this serpent has been observed to go about for a long time with the horns of a flag sticking out from its mouth. As the animal digests, the horns putrify and fall off. After this serpent has swallowed a flag or a tiger, it is unable for some days to move; the hunters, who are well acquainted with this circumstance, always take this opportunity of destroying it. When irritated, it makes a loud hissing noise. This serpent is said to cover itself over with leaves in such places as flags or other animals frequent, in order to conceal itself from their sight, and that it may the more easily lay hold of them. See Plate LVIII.

5. The murina, has 254 scuta on the belly, and 65 on the tail. The colour of it is a light blue, with round spots on the back. It is a native of America, and its bite is not poisonous. 6. The scytale, has 250 scuta on the belly, and 70 on the tail. The body is ash-coloured and bluish, with round black spots on the back, and black lateral rings edged with white. This serpent is a native of America; and, like the constrictor, tho' not so long, twists itself about sheep, goats, &c. and swallows them whole. 7. The cenchria, has 265 scuta on the belly, and 57 on the tail. It is of a yellow colour, with white eye-like spots. It is a native of Surinam, and its bite is not poisonous. 8. The ophiasia, has 281 scuta on the belly, and 64 on the tail; the colour is nearly the same with that of the constrictor, but browner. The place where this serpent is to be found is not known; but its bite is not venomous. 9. The enydris, has 270 scuta on the belly, and 105 on the tail. The colour is a dusky white, and the teeth of the lower jaw are very long; but its bite is not poisonous. It is a native of America. 10. The hortulana, has 290 scuta on the belly, and 128 on the tail. It is of a pale colour, interspersed with livid wedge-like spots. It is a native of America, and its bite is not poisonous.

BOADADA BASHEE, in the Turkish military orders, an officer of the janizaries, whose business it is to walk every day about the principal parts of the city, with a number of janizaries to attend him, to keep order, and see that all things are regular, even to the dress. This office is for three months, and from this the person is usually advanced to be a serach.

BOADICEA, a valiant British queen in the time of Nero the emperor, wife to Prafutagus king of the Icen in Britain, who by his will left the emperor and his own daughters co-heirs to his great treasures, in expectation of procuring by that means Nero's protection for his family and people: but he was no sooner dead, than the emperor's officers seized all. Boadicea opposed these unjust proceedings; which was resented to such a pitch of brutality, that they ordered the lady to be publicly whipped, and her daughters to be ra-

vished by the soldiers. The Britons took arms, with Boadicea at their head, to shake off the Roman yoke; and made a general and bloody massacre of the Romans in all parts. The whole province of Britain would have been lost, if Suetonius Paulinus had not hastened from the isle of Mona to London; and with 10,000 men engaged the Britons, who had an army of 200,000. The battle was fought for a long time with great vigour and doubtful success, till at last victory inclined to the Romans. Boadicea, who had behaved with all bravery imaginable, dispatched herself by poison.

BOAR, in the menage. A horse is said to boar, when he shoots out his nose as high as his ears, and tosses his nose in the wind.

BOAR, a male swine. See *Sus*.

The wild boar, among hunters, has several names, according to its different ages: the first year, it is called a *pig of the faunder*; the second it is called a *hog*; the third, a *hog-steer*; and the fourth, a *boar*; when leaving the faunder, he is called a *singler* or *sangler*. The boar generally lives to 25 or 30 years, if he escapes accidents. The time of going to rut is in December, and lasts about three weeks. They feed on all sorts of fruits, and on the roots of many plants; the root of fern in particular seems a great favourite with them: and when they frequent places near the sea-coasts, they will descend to the shores and demolish the tender shell-fish in very great numbers. Their general places of rest are among the thickest bushes that can be found; and they are not easily put up out of them, but will stand the bay a long time. In April and May they sleep more sound than at any other time of the year, and this is therefore the successful time for the taking them in the toils. When a boar is rouzed out of the thicket, he always goes to it, if possible, the same way by which he came to it; and when he is once up, he will never stop till he comes to some place of more security. If it happens that a faunder of them are found together, when any one breaks away, the rest all follow the same way. When the boar is hunted in the wood where he was bred, he will scarce ever be brought to quit it; he will sometimes make towards the sides to listen to the noise of the dogs, but retires into the middle again, and usually dies or escapes there. When it happens that a boar runs a-head, he will not be stoppt, or put out of his way, by man or beast, so long as he has any strength left. He makes no doubles nor crossings when chased; and when killed makes no noise, if an old boar; the fows and pigs will squeak when wounded.

The season for hunting the wild boar begins in September, and ends in December, when they go to rut. If it be a large boar, and one that has lain long at rest, he must be hunted with a great number of dogs, and those such as will keep close to him; and the huntsman, with his spear, should always be riding in among them, and charging the boar as often as he can, to discourage him: such a boar as this, with five or six couple of dogs, will run to the first convenient place of shelter; and there stand at bay, and make at them as they attempt to come up with him. There ought always to be relays also set of the best and staunchest hounds in the kennel; for if they are of young eager dogs, they will be apt to seize him, and be killed or spoiled before the rest come up. The putting collars with

Boar,
Board.Board
Boat.

with bells about the dogs necks is a great security for them; for the boar will not so soon strike at them when they have these, but will rather run before them. The huntmen generally kill the boar with their swords or spears; but great caution is necessary in making the blows; for he is very apt to catch them upon his snout or tusks; and if wounded and not killed, he will attack the huntman in the most furious manner. The places to give the wound with the spear is either between the eyes in the middle of the forehead, or in the shoulder; both these places make the wound mortal.

When this creature makes at the hunter, there is nothing for it but courage and address; if he flies for it, he is surely overtaken and killed. If the boar comes straight up, he is to be received at the point of the spear: but if he makes doubles and windings, he is to be watched very cautiously; for he will attempt getting hold of the spear in his mouth; and if he does so, nothing can save the huntman but another person attacking him behind: he will on this attack the second person, and the first must then attack him again: two people will thus have enough to do with him; and were it not for the forks of the boar-spears that make it impossible to press forward upon them, the huntman who gives the creature his death's wound would seldom escape falling a sacrifice to his revenge for it. The modern way of boar-hunting is generally to dispatch the creature by all the huntmen striking him at once: but the ancient Roman way was, for a person on foot, armed with a spear, to keep the creature at bay; and in this case the boar would run of himself upon the spear to come at the huntman, and push forward till the spear pierced him through.

The hinder claws of a boar are called *guards*. In the corn, he is said to *feed*; in the meadows or fallow-fields, to *root*, *sworm*, or *fern*; in a close, to *graze*. The boar is farrowed with as many teeth as he will ever have; his teeth increasing only in bigness, not in number: among these there are four called *tushes*, or *tusks*; the two biggest of which do not hurt when he strikes, but serve only to whet the other two lowest, with which the beast defends himself, and frequently kills, as being greater and longer than the rest.

It is very remarkable, that these creatures in the West Indies are subject to the stone: few of them are absolutely free from it, yet scarce any have the stones of any considerable size. It is common to find a great number in the same bladder; and they are usually of about a scruple weight, and are angular, and that with great regularity, each having five angles.

Among the ancient Romans, boar's flesh was a delicacy; a boar served up whole was a dish of state.

The boar was sometimes also the military ensign borne by the Roman armies, in lieu of the eagle.

Among physicians, a boar's bladder has been reputed a specific for the epilepsy. The tush of the wild boar still passes with some as of great efficacy in quinies and pleurisy.

BOARD, a long piece of timber, sawed thin for building and several other purposes. See **TIMBER**.

Deal-boards are generally imported into England ready sawed, because done cheaper abroad, in regard we want saw-mills. Cap-boards are imported from Sweden and Dantzic. Oak-boards chiefly from Sweden and Holland; some from Dantzic. We also im-

port white boards for shoemakers; mill and scale-boards, &c. for divers artificers. Scale-board is a thinner sort, used for the covers of primers, thin boxes, and the like. It is made with large planes; but might probably be sawed with mills to advantage.

BOARD is also used for a kind of table or bench, whereon several artificers perform their work. In this sense, we say a work-board, shop-board, tailor's-board, &c.

BOARD is also used for a flat machine, or *frame*, used in certain games, and the like. In this sense, we say a draught-board, a chess-board, a shovel-board, and the like.

BOARDS, in book-binding See **BOOK-BINDING**.

BOARD, Bureau, is also used for an office where accounts are taken, payments ordered, and the like. In this sense, we say the board of works, board of ordinance, board of treasury, and the like.

BOARD, among seamen. *To go aboard*, signifies to go into the ship. *To slip by the board*, is to slip down by the ship's side. *Board and board*, is when two ships come so near as to touch one another, or when they lie side by side. *To make a board*, is to turn to windward; and the longer your boards are, the more you work into the wind. *To board it up*, is to beat it up, sometimes upon one tack, and sometimes upon another. *She makes a good board*, that is, the ship advances much at one tack. *The weather-board*, is that side of the ship which is to windward.

BOARDING, in a naval engagement, a desperate and furious assault made by one ship on another, after having found every other method to reduce her ineffectual: it may be performed in different places of the ship, according to their circumstances and situation, by the assailant detaching a number of men armed with pistols and cutlasses on the decks of his antagonist, who stands in the same predicament with a city stormed by the besiegers. This expedient, however, is rarely attempted by king's ships, which generally decide the combat without grappling each other; but chiefly practised by privateers, which, bearing down on the enemy's quarter or broadside, drop from the bowsprit, which projects over the defendant's deck, an earthen shell, called a *stink-pot*, charged with fiery and suffocating combustibles, which immediately bursts, catches fire, and fills the deck with insufferable stench and smoke: in the middle of the confusion thus occasioned, the privateer's crew rush aboard, under cover of the smoke, and easily overpower the astonished enemy; unless they have close quarters to which they can retreat and beat them off the deck.

BOAT, a small open vessel, conducted on the water by rowing or sailing. The construction, machinery, and even the names of boats, are very different, according to the various purposes for which they are calculated, and the services on which they are to be employed. Thus they are occasionally slight or strong, sharp or flat bottomed, open or decked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbour or at sea, and for convenience or pleasure.

The largest boat that usually accompanies a ship is the *long-boat*, which is generally furnished with a mast and sails: those which are fitted for men of war, may be occasionally decked, armed, and equipped, for cruising

cruising short distances against merchant-ships of the enemy, or smugglers, or for impressing seamen, &c. The *barques* are next in order, which are longer, slighter, and narrower: they are employed to carry the principal sea-officers, as admirals, and captains of ships of war, and are very unfit for sea. *Pinnaces* exactly resemble barges, only that they are somewhat smaller, and never row more than eight oars; whereas a barge properly never rows less than ten. These are for the accommodation of the lieutenants, &c. *Cutters* of a ship, are broader, deeper, and shorter, than the barges and pinnaces; they are fitter for sailing, and are commonly employed in carrying stores, provisions, passengers, &c. to and from the ship. In the structure of this sort of boats, the lower-edge of every plank in the side overlays the upper edge of the plank below, which is called by ship-wrights *clinch-work*. *Yawls* are something less than cutters, nearly of the same form, and used for similar services; they are generally rowed with six oars.

The above boats more particularly belong to men of war; as merchant-ships seldom have more than two, viz. a long-boat and yawl: when they have a third, it is generally calculated for the countries to which they trade, and varies in its construction accordingly. Merchant-ships employed in the Mediterranean find it more convenient to use a *lanch*, which is longer, more flat-bottomed, and better adapted every way to the harbours of that sea, than a long-boat.

A *wherry* is a light sharp boat, used in a river or harbour for carrying passengers from place to place. *Punts* are a sort of oblong flat-bottomed boats, nearly resembling floating stages; they are used by ship-wrights and caulkers, for breacing, caulking, or repairing a ship's bottom. A *mofes* is a very flat broad boat, used by merchant-ships amongst the Caribbee-islands, to bring hogheads of sugar off from the sea-beach to the shipping which are anchored in the roads. A *felucca* is a strong passage-boat used in the Mediterranean, from 10 to 16 banks of oars. The natives of Barbary often employ boats of this sort as cruisers.

For the larger sort of boats, see the articles CRAFT, CUTTER, PERIAGUA, and SHALLOP.

Of all the small boats, a *Norway yawl* seems to be the best calculated for a high sea, as it will often venture out to a great distance from the coast of that country, when a stout ship can hardly carry any fail.

An account of several trials made on a BOAT, or Sloop, fit for inland navigation, coasting voyages, and short passages by sea, which is not, like ordinary vessels, liable to be overjet or sunk by winds, waves, water-spouts, or too heavy a load; contrived and constructed by Monsieur Bernieres, director of the bridges and causeway in France, &c. &c. Some of these trials were made on the first of August 1777, at the gate of the invalids in Paris, in the presence of the provost of the merchants, of the body of the town, and a numerous concourse of spectators of all conditions.

The experiments were made in the way of comparison with another common boat of the same place, and of equal size. Both boats had been built ten years, and their exterior forms appeared to be exactly similar. The common boat contained only eight men, who rocked it and made it incline so much to one side, that it presently filled with water, and sunk; so that the

men were obliged to save themselves by swimming; a thing common in all vessels of the same kind, either from the imprudence of those who are in them, the strength of the waves or wind, a violent or unexpected shock, their being overloaded, or overpowered in any other way.

The same men who had just escaped from the boat which sunk, got into the boat of M. Bernieres; rocked it; and filled it, as they had done the other, with water. But, instead of sinking to the bottom, though brim full, it bore being rowed about the river, loaded as it was with men and water, without any danger to the people in it.

M. Bernieres carried the trial still farther. He ordered a mast to be erected in this same boat, when filled with water; and to the top of the mast had a rope fastened, and drawn till the end of the mast touched the surface of the river, so that the boat was entirely on one side, a position into which neither winds nor waves could bring her: yet, as soon as the men who had hauled her into this situation let go the rope, the boat and mast recovered themselves perfectly in less than the quarter of a second; a convincing proof that the boat could neither be sunk nor overturned, and that it afforded the greatest possible security in every way. These experiments appeared to give the greater pleasure to the public, as the advantages of the discovery are not only so sensible, but of the first importance to mankind.

A boat of the same sort had been tried, October 1th, 1771, at Choisy, before Lewis XV. and his present majesty, then Dauphin, &c. to whom M. Bernieres, as much distinguished by his disinterestedness and his virtues as a citizen, as by his inventive genius, referred for the satisfactory result of the experiments.

In consequence of the above trials, the provost of the merchants, and the corporation of Paris, at their meeting on the 20th of September, gave the Sieur de Bernieres permission to establish his boats on the river Seine, at the port near Pont-Royal; and moreover promised him all the protection and encouragement in their power. And the Sieur de Bernieres, on his side, proposes to supply the public with a certain number of these boats before the end of next year.

The known humanity of the inventor warrants the pleasing belief, that this very capital discovery will neither be unnecessarily concealed, nor illiberally restricted. It is due to mankind; and we doubt not but that its importance will be enhanced by an early, free, and extensive communication.

In Britain especially, where so much business of every kind is transacted on the water, we must more anxiously wish to derive from the ingenuity and benevolence of the Sieur Bernieres, a comfortable resource against the many distressful and dangerous accidents to which we are perpetually exposed.

BOATSWAIN, the officer who has the boats, sails, rigging, colours, anchors, and cables, committed to his charge.

It is the duty of the boatswain particularly to direct whatever relates to the rigging of a ship, after she is equipped from a royal dock-yard. Thus he is to observe that the masts are properly supported by their shrouds, stays, and back-stays, so that each of those ropes may sustain a proportional effort when the mast is strained by the violence of the wind, or the agitation

Boatswain
||
Boccace.

of the ship. He ought also to take care that the blocks and running-ropes are regularly placed, so as to answer the purposes for which they are intended; and that the sails are properly fitted to their yards and stays, and well furled or reefed when occasion requires.

It is likewise his office to summon the crew to their duty; to assist with his mates in the necessary business of the ship; and to relieve the watch when it expires. He ought frequently to examine the condition of the masts, sails, and rigging; and remove whatever may be judged unfit for service, or supply what is deficient: and he is ordered by his instructions to perform this duty with as little noise as possible.

BOATSWAIN'S *Mate* has the peculiar command of the long boat, for the setting forth of anchors, weighing or fetching home an anchor, warping, towing, or mooring; and is to give an account of his store.

BOB, a term used for the ball of a short pendulum.

BOBARTIA, in botany, a genus of the digynia order, belonging to the triandria class of plants. Of this genus there is only one species known, which is a native of the Indies, and hath no remarkable property.

BOBBIN, a small piece of wood turned in the form of a cylinder, with a little border jutting out at each end, bored through to receive a small iron pivot. It serves to spin with the spinning-wheel, or to wind thread, worsted, hair, cotton, silk, gold, and silver.

BOBBING, among fishermen, a particular manner of catching eels, different from snigging. Bobbing for eels is thus performed: They scour well some large lobs, and with a needle run a twisted silk through them from end to end, taking so many as that they may wrap them about a board a dozen times at least: then they tie them fast with the two ends of the silk, that they may hang in so many hanks; which done, they fasten all to a strong cord, and, about an handful and an half above the worms, fix a plummet three-quarters of a pound weight, and make the cord fast to a strong pole. With this apparatus fishing in muddy water, they feel the eels tug lustily at the bait; when they think they have swallowed it sufficiently, they gently draw up the rope to the top, and bring them ashore.

BOBIO, an episcopal town of Italy, in the Milanese and territory of Pavia, seated on the river Trebia, in E. Long. 9. 30. N. Lat. 44. 48.

BOCA-CHICA, the freight or entrance into the harbour of Carthage in South America. It is defended by several forts belonging to the Spaniards, all which were taken by the English in 1741; they were nevertheless obliged to raise the siege of Carthage in a short time after.

Boca-del-Drago, a freight so called, between the island of Trinidad and Andalusia, in the province of Terra Firma in South America.

BOCANUM, (anc. geog.), a town of Mauritania Tingetana, to the south of mount Atlas; said to be that of Morocco in Africa. W. Long. 9. 0. N. Lat. 31. 0.

BOCCACE (John), one of the most polite and learned writers of his age, was born in Tuscany in 1313. His father first placed him with a merchant; but as he gave signs of genius, he was put afterward to study the canon law: he lost almost as much time at this as at the last occupation; and thought of nothing but poetry. He came under the instruction of Petrarch; but did not go to entirely devote himself to

poetry, as to forget other studies. In the prosecution of these, however, as he fought every where for the best masters, and had not an income sufficient for his expenses, he was reduced to such circumstances as to stand in need of the bounty of others: he was particularly obliged to Petrarch, who furnished him with money as well as books, and assisted him in many other respects. Boccace was a great admirer of the Greek language: he found means to get Homer translated into Latin for his own use; and procured a professor's chair at Florence for Leontius Pylatus, in order to explain this poet. The republic of Florence honoured Boccace with the freedom of that city; and employed him in public affairs, particularly to negotiate the return of Petrarch: but this poet not only refused to return to Florence, but persuaded Boccace also to retire from thence, on account of the factions which prevailed in that republic. Having quitted Florence, he went to several places in Italy; and stopped at last at the court of Naples, where King Robert gave him a very kind reception. He conceived a violent affection for the natural daughter of that prince, which made him remain a considerable time at Naples. He also made a long stay in Sicily, where he was in high favour with queen Joan. He returned to Florence when the troubles were a little appeased: but not liking the course of life he must have followed there, he retired to Cortaldo; and, far from the noise of business, he spent his time in study agreeably to his own humour. His great application brought on him an indisposition, of which he died in 1376. He wrote several books, some learned and serious, others of gallantry and full of stories. It is by his *Decameron* chiefly that he has immortalized himself. Petrarch found so many charms in this composition, that he was at the pains to translate it into Latin for his own satisfaction.

BOCCALINI (Trajan), a celebrated satirical writer, born at Rome, who, in the beginning of the 17th century, obtained the admiration of all Italy by his refined and delicate criticisms. Sovereign princes themselves did not escape the lash of his satire. The cardinals Borghese and Cætan having declared themselves his protectors, he published his *Ragguaglio di Parnasso*, and *La Secretaria di Apollo*, which is the continuation of the former. These two works were received by the public with uncommon applause. He there feigns, that Apollo, holding his court at Parnassus, heard the complaints of the whole world, and did justice according to the cases required. He at length printed his *Pietra di Parangone*; wherein he attacks the court of Spain, setting forth their designs against the liberty of Italy, and inveighing particularly against them for the tyranny they exercised in the kingdom of Naples. The Spaniards complained of him in form, and were determined at any rate to be revenged. Boccacini was frightened, and retired to Venice; but was there assassinated in a very strange manner. He lodged with one of his friends, who having got up early one morning, left Boccacini in bed: a minute after, some armed men entered his chamber, and gave him so many blows with bags full of sand, that they left him for dead; so that his friend returning some time after, found him speechless. Great search was made at Venice for the authors of this murder; and though they were never discovered, it was universally believed that they were employed by

Boccace,
Boccalini.

Bocconi
Bochart.

the court of Spain.

BOCCONI (Sylvio), a celebrated natural historian, born at Palermo in Sicily. After he had gone through the usual course of studies, he applied himself chiefly to the natural history, in which he made a most fruitful progress. He was afterwards ordained priest, and entered into the Cistercian order, at which time he changed his Christian name *Paul* into that of *Sylvio*. This new way of life did not in the least divert him from his favourite study: for he pursued it with greater vigour than ever, and travelled not only over Sicily, but likewise visited the isle of Malta, Italy, the Low Countries, England, France, Germany, Poland, and several other nations; and, in 1696, was admitted a member of the academy of the virtuosi in Germany. Upon his return to Sicily, he retired to a convent of his own order near Palermo; where he died in 1704, being 71 years of age. He left many curious works.

BOCCONIA, (so called from the Rev^d Paul Bocconi of Sicily, who published some curious books on botany), GREATER TREE CELANDINE; a genus of the monogynia order, belonging to the doceandria class of plants. Of this genus there is but one known species, viz. the frutescens, which is esteemed for the beauty of its large foliage. It is very common in Jamaica and other warm parts of America, where it grows to the height of 10 or 12 feet, having a straight trunk as large as a man's arm, and covered with a white smooth bark. At the top it divides into several branches, on which the leaves are placed alternately. These leaves are eight or nine inches long, and five or six broad; are deeply sinuated, sometimes almost to the midrib; and are of a fine glaucous colour. The whole plant abounds with a yellow juice of an acrid nature; so that it is used by the inhabitants of America to take off warts and spots from the eyes. The singular beauty of this plant renders it worthy of a place in every curious collection: and it seems the Indians are very fond of it; for Hernandez tells us, their kings used to plant it in their gardens. It is propagated by seeds from America, sowing them in spring, in pots of light earth, which must be plunged in a hot-bed. When the plants come up, they are to be put in separate pots, which must always be kept in the stove.

BOCHART (Samuel), one of the most learned men in the 17th century, was born at Roan in Normandy. He made a very early progress in learning, and became a great proficient in the oriental languages. He was many years pastor of a protestant church at Caen; where he was tutor to Wentworth Dillon earl of Roscommon, author of the *Essay on Translated Verse*. Here he particularly distinguished himself by his public disputations with father Veron, a very famous controversialist. The dispute was held in the castle of Caen, in the presence of a great number of Catholics and Protestants. Bochart came off with great honour and reputation; which were not a little increased in the year 1646, upon the publication of his *Phaleg and Canaan*, which are the titles of the two parts of his *Geographica Sacra*. He acquired also great fame by his *Hierozolicon*, printed in London in 1675. This treats of *animalibus sacrae scripture*. The great learning he displayed in his works rendered him esteemed not only amongst those of his own profession, but amongst all lovers of knowledge of whatever denomination. In 1652, the queen

Bochius
Bodin.

of Sweden invited him to Stockholm, where she gave him many proofs of her regard and esteem.

At his return to Caen, he refused the functions of the ministry, and was received into the academy of that city. His learning was not his principal qualification, he had a modesty equal to it; and hence enjoyed his great reputation in tranquillity, sheltered from those unhappy quarrels which so many other learned men draw upon themselves. He died suddenly while he was speaking in the above academy, on the 16th of May, 1667, aged 78. A complete edition of his works was published in Holland, in two volumes folio, 1712.

BOCHIUS, or **BOCQUI** (John), a Latin poet, born at Brussels in 1555. He travelled into Italy, Germany, Poland, and Muscovy, and at his return became secretary to the duke of Parma. He died on the 13th of January, 1609. The critics in the Netherlands set so great a value on his poetry, that they gave him the name of the *Belgic Virgil*. He wrote, 1. *De Belgii Principatu*. 2. *Parodia Heroica Psalmorum Davidicorum*. 3. *Observationes Physicæ, Ethicæ, Politicæ, et Historicæ, in Psalmos*. 4. *Vita Davidis*. 5. *Orationes*. 6. *Poemata*.

BOCHETTA, a place of Italy, famous in the war of 1746 and 1747. It is a chain of mountains over which the great road lies from Lombardy to Genoa; and on the very peak of the highest mountain is a narrow pass, which will hardly admit three men to go abreast. This pass is properly called the *Bochetta*; for the defence of which there are three forts. It is the key of the city of Genoa; and was taken in 1746 by the Imperialists, by which means they opened a way to that city.

BOCKHOLT, a town of Germany in the circle of Westphalia and diocese of Munster, capital of a small district, and subject to the bishop of Munster. E. Long. 6. 20. N. Lat. 51. 40.

BOCKING, a very large village of Essex in England, adjoining to Brain-tree, from which it is separated only by a small stream. Its church is a deanry, and very large; and there are here two or three meeting houses; but the market is kept at Brain-tree. In both parishes there are about 1500 houses, which in general are but indifferent, and the streets narrow and badly paved. There is a large manufactory of bays, chiefly for exportation. It is 42 miles north-east of London.

BOCK-LAND, in the Saxons time, is what we now call *freehold land*, held by the better sort of persons by charter or deed in writing; by which name it was distinguished from *folkland*, or copy-hold land, holden by the common people without writing.

BODERIA, or **BODOTRIA**, the ancient name for the frith of Forth in Scotland.

BODIN (John), native of Angers, one of the ablest men in France in the 16th century, famous for his *Method of History*, his *Republic*, and other works. He was in great favour with Henry III. who imprisoned John de Serre for writing an injurious piece against Bodin, and forbid him upon pain of death to publish it. But his favour was not of long continuance. The duke of Alençon, however, gave him several employments; and carried him to England with him as one of his counsellors, where he had the pleasure and glory to see his books *de Republica* read publicly in the

Bodkin
||
Bodley.

Bodmin
||
Boece.

university of Cambridge, having been translated into Latin by the English. He had written them in French. In the Raguagli of Boccalini he is condemned as an atheist to the fire, for having said in his books that liberty of conscience ought to be granted to sectaries. He declared himself pretty freely against those who asserted that the authority of monarchs is unlimited; but yet he displeas'd the republicans. Upon the death of the duke of Alençon, Bodin retired to Laon, where he married. He had an office in the presidial of this city; and in Charles the Ninth's time he was the king's solicitor with a commission for the forests of Normandy. He died of the plague at Laon, in 1596.

BODKIN, a small instrument made of steel, bone, ivory, &c. used for making holes.

BODLEY (Sir Thomas), founder of the Bodleian library at Oxford, was born at Exeter in Devonshire, in 1544. When he was about 12 years of age, his father, Mr John Bodley, being a Protestant, was obliged to leave the kingdom. He settled at Geneva with his family, and continued there till the death of Queen Mary. In that university, then in its infancy, young Bodley studied the learned languages, &c. under several eminent professors. On the accession of Queen Elizabeth, he returned with his father to England; and was, soon after, entered of Magdalen college in Oxford. In 1563, he took the degree of bachelor of arts, and the year following was admitted fellow of Merton college. In 1565, he read a Greek lecture in the hall of that college. He took a master of arts degree the year after, and read natural philosophy in the public schools. In 1569, he was one of the proctors of the university, and, for some time after, officiated as public orator. In the year 1576, he quitted Oxford, and made the tour of Europe; but returned to his college after four years absence.

He became gentleman usher to Queen Elizabeth, in the year 1583; and in 1585 he married the widow of Mr Ball, daughter of Mr Carew of Brittol, a lady of considerable fortune. Mr Bodley was soon after sent ambassador to the king of Denmark, and other German princes. He was next charged with an important commission to Henry III. of France; and, in 1588, went ambassador to the United Provinces, where he continued till the year 1597.

On his return to England, finding his preferment obstructed by the jarring interests of Burleigh and Essex, he retired from court, and could never afterwards be prevailed on to accept of any employment. He now began the foundation of the Bodleian library, which was completed in 1599. Soon after the accession of King James I. he received the honour of knighthood, and died in the year 1612. He was buried in the choir of Merton college. His monument is of black and white marble, on which stands his effigy in a scholar's gown, surrounded with books. At the four corners are the emblematical figures of Grammar, Rhetoric, Music, and Arithmetic; two angels, &c.; with a short inscription, signifying his age and time of his death. Sir Thomas Bodley was a polite scholar, an able statesman, and a worthy man. Mr Granger observes, that he merited much as a man of letters; but incomparably more in the ample provision he made for literature, in which he stands univalued; and that his library is a mausoleum which will perpetuate his memory as long

as books themselves endure. Sir Thomas wrote his own Life to the year 1609; which, together with the first draught of the Statutes, and his Letters, have been published from the originals in the Bodleian library, by Mr Thomas Hearn, in 1703.

BODMIN, a town of Cornwall in England, seated in a bottom between two high hills, which renders the air very unwholesome. It consists chiefly of one street, and the many decayed houses shew that it has once been a place of greater note. It is a mayor-town, sends two members to parliament, and had formerly the privilege of the coinage of tin. W. Long. 4. 5. N. Lat. 50. 32.

BODON, a fortified town of Bulgaria in Turkey in Europe, with an archbishop's see. It is seated on the Danube, in E. Long. 45. 24. N. Lat. 45. 10.

BODROCH, a town of Hungary, seated on the north-east shore of the river Danube, in E. Long. 20. 20. N. Lat. 46. 15.

BODY, in physics, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest.

Colour of BODIES. See CHROMATICS.

BODY, with regard to animals, is used in opposition to soul, in which sense it makes the subject of anatomy. The height of the human body is said to be different in different parts of the day; ordinarily it is an inch more in the morning than at night †. The body ceases to grow in height, when the bones are arrived at a degree of firmness and rigidity which will not allow of farther extension by the effort of the heart and motion of the blood.

BODY, among painters, as to *bear a body*, a term signifying that the colours are of such a nature, as to be capable of being ground so fine, and mixing with the oil so entirely, as to seem only a very thick oil of the same colour.

BODY, in the menage. A horse is chiefly said to have a *good body*, when he is full in the flank. If the last of the short ribs be at a considerable distance from the haunch bone, although such horses may for a time have pretty good bodies, yet, if they are much laboured, they will lose them; and these are properly the horses that have no flank. It is also a general rule, that a man should not buy a light bodied-horse, and one that is fiery, because he will soon destroy himself.

BODY, in the art of war, a number of forces, horse and foot, united and marching under one commander.

Main BODY of an army, the troops encamped in the centre between the two wings, and generally infantry; the other two bodies are the vanguard and the rear-guard; these being the three into which an army, ranged in order of battle, is divided.

BODY, in matters of literature, denotes much the same with system, being a collection of every thing belonging to a particular science or art, disposed in proper order: thus we say, a body of divinity, law, physics, &c.

BODY-Corporate. See CORPORATION.

BOECE, or **BOETHIUS**, (HECTOR), the historian, was born at Dundee about the year 1470, and studied with applause in the university of Paris. It was there he became acquainted with Erasmus, and laid the foundation of a friendship which was so honourable to him. In 1500

he

Boehmen.

he was recalled to Aberdeen by bishop Elphington, who made him principal of that university. Gratitude for this promotion engaged him to write with particular attention the Life of that prelate. It appeared in his history of the diocese of Aberdeen; and may be considered, perhaps, as the most valuable portion of that work. His history of Scotland, a more useful undertaking, was first published in the 1526. In 1574, it underwent a second impression, and was enriched with the 18th book, and a part of the 19th. A farther continuation of it was executed by Joannes Ferrerius Pedemontanus. Boece died about the year 1550. He has been compared, and not without reason, to Geoffroy of Monmouth. He had a propensity to fable and exaggeration; a fault which the elegance of his expression does not compensate. His judgment was not equal to his genius; and his fictions as an historian are a contrast to his probity as a man. John Ballenden, archdeacon of Murray, translated his history into the Scottish language, at the desire of James V. This translation William Harrison converted, though with imperfections, into English; and his associate Hollingshed published his work in his chronicle, with additions and improvements by the ingenious Francis Thynne.

BOEDROMIA, in antiquity, solemn feasts held at Athens in memory of the succour brought by Ion to the Athenians, when invaded by Eumolpus son of Neptune, in the reign of Erechtheus. Plutarch gives another account of the boedromia; which, according to him, were celebrated in memory of the victory obtained by Theseus over the Amazons, in the month Boedromion.

BOEDROMION, in chronology, the third month of the Athenian year, answering to the latter part of our August and beginning of September.

BOEHMEN (Jacob), called the *Teutonic philosopher*, was a noted visionary of the 17th century, born in a village of Germany near Gorlitz, in 1575. He was bred a shoemaker; and marrying, supported a large family by this occupation; until, after amusing himself with chemistry, a visionary turn of mind, heated by sermons and German divinity, got the upper hand of his common sense, and produced raptures and notions of divine illumination. These he first gave vent to in 1612, by a treatise intitled *Aurora, or the rising of the Sun*; being a mixture of astrology, philosophy, chemistry, and divinity, written in a quaint obscure style. This being censured by the magistrats of Gorlitz, he remained silent for seven years: but improving that interval by pursuing the flights of his imagination, he resumed his pen; and resolving to redeem the time he had lost, he, in the remaining five years of his life, published above 20 books, which greatly needed what he concluded with, *A table of his principles, or a key to his writings*; though this has not proved sufficient to render them intelligible to common apprehensions. The key above mentioned appeared in 1624, and he did not long survive it. For early in the morning of the 18th of November, that year, he called one of his sons, and asked him "if he also heard that excellent music;" to which being answered in the negative, he ordered the door to be set open, that the music might be the better heard. He asked afterwards, what a clock it was; and being told it had struck two, he said "It is not yet my time, my time is three hours

hence." In the interim he was heard to speak these words, "O thou strong God of hosts, deliver me according to thy will. O thou crucified Lord Jesus, have mercy upon me, and receive me into thy kingdom." When it was near six o'clock, he took his leave of his wife and sons, and blessed them, and said, "Now I go hence into paradise;" then bidding his son turn him, he immediately expired his last breath in a deep sigh.

A great number of persons have been inveigled by the visions of this fanatic, notwithstanding his talents in involving the plainest things in mystery and enigmatical jargon. Among others, the famous Quirinus Kahlman may be reckoned the principal of his followers in Germany; who says, he had learned more being alone in his study, from Boehmen, than he could have learned from all the wise men of that age together; and, that we may not be in the dark as to what sort of knowledge this was, he acquaints us, that amidst an infinite number of visions it happened, that, being snatched out of his study, he saw thousands of thousands of lights rising round about him. Nor has he been without admirers, and those in no small number, in England; among the foremost of whom stands the famous Mr William Law, author of *Christian Perfection*, &c. who has favoured his countrymen with an English edition of Jacob Boehmen's works in 2 vols 4to.

BOEOTIA, the name of two ancient kingdoms, one of which was founded or rather restored by Cadmus, and named by him *Bœotia*, from the ox which is said to have directed him to the place where he built the capital of his new kingdom, better known afterwards by the name of *Thebes*. But as the inhabitants were scarce ever distinguished as a nation by the name of *Bœotians*, but of *Thebans*, we refer to the article **THEBES**, for their history, &c.

The other Bœotia was in Thessaly, and is said to have been founded by Bœotus the son of Neptune and brother of Æolus, by Arne the daughter of Æolus king of Æolis. This last, having sent his daughter to Metapontium a city of Italy, she was there delivered of those two sons, the eldest of whom she called after her father's name *Æolus*; and he possessed himself of the islands in the Tyrrhenian, now the Tuscan sea, and built the city of Lipara. Bœotus the younger son went to his grandfather and succeeded him in his kingdom, called it after his own name, and the capital city *Arne*, from his mother. All that we know of these Bœotians is, that they held this settlement upwards of 200 years; and that the Thessalians expelled them from it; upon which they came and took possession of that country, which till then had been called *Cadmeis*, and gave it the name of *Bœotia*. Diodorus and Homer tell us, that these Bœotians signalized themselves at the Trojan war; and the latter adds, that five of Bœotus's grandsons, viz. Peneus, Leitus, Prothænor, Arcefilaus, and Clonius, were the chiefs who led the Bœotian troops thither.

BOERHAAVE (Herman), one of the greatest physicians as well as the best men, that this or perhaps any age has ever produced, was born, in 1668, at Vorhout, a village near Leyden. At the age of 16, he found himself without parents, protection, advice, or fortune. He had already studied theology, and the other ecclesiastical sciences, with the design of devoting himself to a clerical life; but the science of nature, which

Boehmew
||
Boerhaave.

Boerhaave

which equally engaged his attention, soon engrossed his whole time. This illustrious person, whose name afterwards spread throughout the world, and who left at his death above L. 200,000, could at that time barely live by his labours, and was compelled to teach the mathematics to obtain necessaries. But in 1693, being received doctor in the science of physic, he began practice; and his merit being at length discovered, many powerful friends patronized him, and procured him three valuable employments: the first was that of professor of medicine in the university of Leyden; the second, that of professor of chemistry; and, thirdly, that of professor of botany. The Academy of Sciences at Paris, and the Royal Society at London, invited him to become one of their members. He communicated to each his discoveries in chemistry. The city of Leyden became in his time the school of Europe for this science, as well as medicine and botany. All the princes of Europe sent him disciples, who found in this skilful professor, not only an indefatigable teacher, but even a tender father, who encouraged them to pursue their labours, consoled them in their afflictions, and solaced them in their wants.

When Peter the Great went to Holland in 1715, to instruct himself in maritime affairs, he also attended Boerhaave to receive his lessons.

His reputation was spread as far as China: a Mandarin wrote to him with this inscription, "To the illustrious Boerhaave, physician in Europe;" and the letter came regularly to him.

The city of Leyden has raised a monument in the church of St Peter, to the salutary genius of Boerhaave, *Salutifera Boerhaavii genio sacrum*. It consists of an urn upon a pedestal of black marble: six heads, four of which represent the four ages of life, and two the sciences in which Boerhaave excelled, form a group issuing between the urn and its supporters. The capital of this basis is decorated with a drapery of white marble, in which the artist has shewn the different emblems of disorders and their remedies. Above, upon the surface of the pedestal, is the medallion of Boerhaave: at the extremity of the frame, a ribbon displays the favourite motto of this learned man; *Simplex vigilam veri*, "Truth unarrayed."

From the time of the learned Hippocrates, no physician has more justly merited the esteem of his contemporaries, and the thanks of posterity, than Boerhaave. He united to an uncommon genius, and extraordinary talents, the qualities of the heart, which give them so great a value to society. He made a decent, simple, and venerable appearance, particularly when age had changed the colour of his hair. He was an eloquent orator, and declaimed with dignity and grace. He taught very methodically, and with great precision; he never tired his auditors, but they always regretted that his discourses were finished. He would sometimes give them a lively turn with raillery; but his raillery was refined and ingenious, and it enlivened the subject he treated of, without carrying with it any thing severe or satirical. A declared foe to all excess, he considered decent mirth as the salt of life. It was the daily practice of this eminent person, through his whole life, as soon as he rose in the morning, which was generally very early, to retire for an hour to private prayer, and meditation on some part of the Scriptures. He often

Boerhaave

told his friends, when they asked him how it was possible for him to go through so much fatigue? that it was *this* which gave him spirit and vigour in the business of the day. *This* he therefore recommended as *the best rule* he could give: for nothing, he said, could tend more to the health of the body, than the tranquillity of the mind; and that he knew nothing which could support himself, or his fellow-creatures, amidst the various distresses of life, but a well-grounded confidence in the supreme Being upon the principles of Christianity. This was strongly exemplified in his own illness in 1722, which can hardly be told without horror; and by which the course of his lectures as well as his practice was long interrupted. He was for five months confined to his bed by the gout, where he lay upon his back without daring to attempt the least motion; because any effort renewed his torments, which were so exquisite, that he was at length not only deprived of motion but of sense. Here his medical art was at a stand; nothing could be attempted, because nothing could be proposed with the least prospect of success. But, having (in the sixth month of his illness) obtained some remission, he determined to try whether the juice of fumitory, endive, or succory, taken thrice a-day in a large quantity, (*viz.* above half a pint each dose), might not contribute to his relief; and by a perseverance in this method he was wonderfully recovered. This patience of Boerhaave's was founded not on vain reasonings, like that of which the Stoics boasted; but on a religious composure of mind, and Christian resignation to the will of God.

Of his fagacity and the wonderful penetration with which he often discovered and described, at the first sight of a patient, such distempers as betray themselves by no symptoms to common eyes, such surprising accounts have been given, as scarcely can be credited, tho' attested beyond all doubt. Yet this great master of medical knowledge was so far from a presumptuous confidence in his abilities, or from being puffed up by his riches, that he was condescending to all, and remarkably diligent in his profession; and he often used to say, that the life of a patient (if trifled with or neglected) would one day be required at the hand of the physician. He always called the poor his *best patients*; for God (said he) is their paymaster.

The activity of his mind sparkled visibly in his eyes. He was always cheerful, and desirous of promoting every valuable end of conversation; and the excellency of the Christian religion was frequently the subject of it: for he asserted, on all proper occasions, the divine authority and sacred efficacy of the Scriptures; and maintained, that they only could give peace of mind, that sweet and sacred peace which passeth all understanding; since none can conceive it, but he who has it; and none can have it, but by divine communication. He never regarded calumny nor detraction, (for Boerhaave himself had enemies), nor ever thought it necessary to confute them. "They are sparks (said he) which, if you do not blow, will go out of themselves. The surest remedy against scandal, is to *live it down* by a perseverance in well-doing; and by praying to God that he would cure the disordered minds of those who traduce and injure us."

Being once asked by a friend, who had often admired his patience under great provocations, whether he

knew

Boerhaave
Boethius.

knew what it was to be angry, and by what means he had to entirely suppressed that impetuous and ungodly passion? he answered, with the utmost frankness and sincerity, that he was naturally quick of sentiment, but that he had, by daily prayer and meditation, at length attained to this mastery over himself.

About the middle of the year 1737, he felt the first approaches of that fatal illness which brought him to the grave, viz. a disorder in his breast, which was at times very painful, often threatened him with immediate suffocation, and terminated in an universal drop-sy; but during this afflictive and lingering illness, his constancy and firmness did not forsake him. He neither intermitted the necessary cares of life, nor forgot the proper preparations of death. About three weeks before his dissolution, when the Rev. Mr. Schultens, one of the most learned and exemplary divines of the age, attended him at his country-house, the Doctor desired his prayers, and afterwards entered into a most remarkably judicious discourse with him on the spiritual and immaterial nature of the soul; and this he illustrated to Mr. Schultens with wonderful perspicuity, by a description of the effects which the infirmities of his body had upon his faculties; which yet they did not so oppress or vanquish, but his soul was always master of itself, and always resigned to the pleasure of its maker—and then he added, “ He who loves God ought to think nothing desirable but what is most pleasing to the supreme goodness.” These were his sentiments, and such was his conduct in this state of weakness and pain. As death approached nearer, he was so far from terror or confusion, that he seemed less sensible of pain, and more cheerful under his torments, which continued till the 23^d day of September, 1738, on which he died (much honoured and lamented) between four and five in the morning, in the 70th year of his age—often recommending to the by-standers a careful observation of St. John’s precepts concerning the love of God, and the love of man, as frequently inculcated in his first epistle, particularly in the fifth chapter.

His funeral oration was spoken in Latin before the university of Leyden, to a very numerous audience, by Mr. Schultens, and afterwards published at their particular desire.

He wrote, 1. *Institutiones Medicæ*. 2. *Aphorismi de cognoscendis & curandis Morbis*. 3. *Institutiones & Experimenta Chemicæ*. 4. *Libellus de Materia Medica, et remediis formalis que servantur aphorismi*. Swieten published *Commentaries upon his Aphorismi*, in 5 vols 4to; and several other works, all greatly esteemed.

BOERHAAVIA, a genus of the monogynia order, belonging to the monandria class of plants. It has its name from the celebrated Herman Boerhaave, physician at Leyden. There are six species, all natives of the Indies. Some of these plants rise five or six feet high, but most of them only 18 inches or two feet. They carry flowers of a yellow or red colour, but are by no means so remarkable as to merit any particular description.

BOESCHOT, a town of the Austrian Netherlands, in the province of Brabant, seated on the river Nethe, in E. Long. 4. 45. N. Lat. 51. 5.

BOETHIUS, or **BOETIUS**, (Flavius Anicius Manlius Torquatus Severinus), a prose as well as poetical

writer of the 6th century, born of one of the noblest families of the city of Rome. The time of his birth is related to have been about that period in the Roman history when Augustulus, whose fears had induced him to a resignation of the empire, was banished, and Odoacer king of the Herulians began to reign in Italy, viz. in the year of Christ 476, or somewhat after. The father of Boetius dying while he was yet an infant, his relations undertook the care of his education and the direction of his studies. His excellent parts were soon discovered; and, as well to enrich his mind with the study of philosophy, as to perfect himself in the Greek language, he was sent to Athens. Returning young to Rome, he was soon distinguished for his learning and virtue, and promoted to the principal dignities in the state, and at length to the consulate. Living in great affluence and splendor, he addicted himself to the study of theology, mathematics, ethics, and logic; and how great a master he became in each of these branches of learning appears from those works of his now extant. The great offices which he bore in the state, and his consummate wisdom and inflexible integrity, procured him such a share in the public councils, as proved in the end his destruction; for as he employed his interest with the king for the protection and encouragement of deserving men, so he exerted his utmost efforts in the detection of fraud, the repressing of violence, and the defence of the state against invaders. At this time Theodoric the Goth had attempted to ravage Campania; and it was owing to the vigilance and resolution of Boetius that that country was preserved from destruction. At length, having murdered Odoacer, Theodoric became king of Italy, where he governed 33 years with prudence and moderation, during which time Boetius possessed a large share of his esteem and confidence. It happened about this time that Justin, the emperor of the east, upon his succeeding to Anastasius, made an edict condemning all the Arians, except the Goths, to perpetual banishment from the eastern empire: in this edict Hormisdas bishop of Rome, and also the senate, concurred. But Theodoric, who, as being a Goth, was an Arian, was extremely troubled at it; and conceived an aversion against the senate for the share they had borne in this proscription. Of this disposition in the king, three men of profligate lives and desperate fortunes, Gaudentius, Opilio, and Basilus, took advantage. Having entertained a secret desire of revenge against Boetius, for having been instrumental in the dismissal of the latter from a lucrative employment under the king, they accused him of several crimes; such as the stifling a charge, the end whereof was to involve the whole senate in the guilt of treason; and an attempt, by de-throning the king, to restore the liberty of Italy; and, lastly, they suggested, that, to acquire the honours he was in possession of, Boetius had had recourse to magical arts.

Boetius was at this time at a great distance from Rome; however, Theodoric transmitted the complaint to the senate, enforcing it with a suggestion that the safety, as well of the people as the prince, was rendered very precarious by this supposed design to exterminate the Goths. The senate, perhaps fearing the resentment of the king, and having nothing to hope from the success of an enterprise which, supposing it ever to have been meditated, was now rendered abortive, with-

Boethius.

Boethius
||
Bogho.

out summoning him to his defence, condemned Boetius to death. The king, however, apprehending some bad consequence from the execution of a sentence so flagrantly unjust, mitigated it to banishment. The place of his exile was Ticinum, now the city of Pavia, in Italy: being in that place separated from his relations, who had not been permitted to follow him into his retirement, he endeavoured to derive from philosophy those comforts which that alone was capable of affording to one in his forlorn situation, sequestered from his friends, in the power of his enemies, and at the mercy of a capricious tyrant; and accordingly he there composed that valuable discourse, entitled *De Consolatione Philosophiæ*.

About two years after his banishment, Boetius was beheaded in prison by the command of Theodoric. His tomb is to be seen in the church of St Augustine, at Pavia, near the steps of the chancel.

The extensive learning and eloquence of this great man are conspicuous in his works, which seem to have been collected with great care: an edition of them was printed at Venice, in one volume folio, in 1499. In 1570, Glareanus, of Basil, collated that with several manuscripts, and published it, with a few various readings in the margin. His chief performance is that abovementioned *De Consolatione Philosophiæ*; a work well known in the learned world, and to which the afflicted have often applied. In particular, our Saxon king Alfred, whose reign, though happy upon the whole, was attended with great vicissitudes of fortune, had recourse to it at a time when his distresses compelled him to seek retirement; and, that he might the better impress upon his mind the noble sentiments inculcated in it, he made a complete translation of it into the Saxon language, which, within these few years, has been given to the world in its proper character. And Camden relates, that queen Elizabeth, during the time of her confinement by her sister Mary, to mitigate her grief, read and afterwards translated it into very elegant English. But it deserves also particular notice, that he is the most considerable of all the Latin writers on music; and that his treatise *De Musica* supplied for some centuries the want of those Greek manuscripts which were supposed to have been lost.

BOG properly signifies a quagmire, covered with grafs, but not solid enough to support the weight of the body; in which sense it differs only from marshes or fens, as a part from the whole: some even restrain the term *bog* to quagmires pent up between two hills; whereas fens lie in champaign and low countries, where the descent is very small—To drain boggy lands, a good method is, to make trenches of a sufficient depth to carry off the moisture; and if these are partly filled up with rough stones, and then covered with thorn-bushes and straw to keep the earth from filling up the interstices, a stratum of good earth and turf may be laid over all; the cavities among the stones will give passage to the water, and the turf will grow at top as if nothing had been done.

BOG, or *Bog of Gight*, a small town of Scotland, seated near the mouth of the river Spey, in W. Long. 2. 23. N. Lat. 57. 48.

BOG-*Spavin*. See FARRIERY, § xxii. 3.

BOGARMITÆ. See BOGOMILI.

BOGHO, or BUEIL, a town in the county of Nice

in Piedmont, situated on the frontiers of France, in E. Long. 6. 45. N. Lat. 44. 12.

BOGLIO, a district in the territories of the duke of Savoy, lying on the river Tinca on the frontiers of Provence; the capital is of the same name.

BOGLIO, a town of Piedmont, and county of Nice, being the capital of a territory of the same name. E. Long. 4. 50. N. Lat. 44. 12.

BOGOMILI, or BOGARMITÆ, in church history, a sect of heretics, which sprung up about the year 1179. They held, that the use of churches, of the sacrament of the Lord's supper, and all prayer, except the Lord's prayer, ought to be abolished; that the baptism of Catholics is imperfect; that the Persons of the Trinity are unequal, and that they oftentimes made themselves visible to those of their sect. They said, that devils dwelt in the churches, and that Satan had resided in the temple of Solomon from the destruction of Jerusalem to their own time.

BOGOTO, the capital of New Granada in Terra Firma in South America, near which are gold mines. It is subject to Spain. W. Long. 73. 55. N. Lat. 4. 0.

BOHEA, in commerce, one of the best kinds of tea that come from China. There are three sorts of it: the first is bought at Canton for 80 tals *per picé*; the second for 45; and the third for 25. See THEA.

BOHEMIA, a kingdom of Europe, subject to the house of Austria, and surrounded on every side with woods and mountains as with a natural rampart. It is bounded on the east by Moravia and part of Silesia, on the north by Lusace and Upper Saxony, on the west by Franconia, and on the south by Bavaria. Altho' this kingdom is situated in the middle of Germany, and its king is an elector of the empire, it has nevertheless its particular assemblies, customs, and language, different from the Germans. It is one of the most elevated countries of Europe: for no river enters into it, though many have their source there; the chief of which are the Elbe, the Oder, the Vistula, and the Morava. The air is cold and unwholesome, for they have more epidemical diseases than in the neighbouring countries. There are mines of silver, copper, lead, and even some veins of gold. The capital city is Prague; the others are Cutenburg, Konigengretz, Pilsen, Czaflaw, Budweys, Egra, Glatz, Tabor, and a great number of others: for they reckon more than 100 cities, among which almost 40 have the title of *Royal*. The name *Bohemia*, in the German language, signifies the *Home*, or *Abode*, of the *Boii*, a people of ancient Gaul, who under their leader Sergovefus settled in that country about 590 years before the Christian æra. These Boii were soon after expelled by the Marcomanni, a nation of the Suevi, who were afterwards subdued by the Sclavi, a people of Scythia, whose language is still spoken in Bohemia and Moravia. Notwithstanding this expulsion of the Boii, the present inhabitants are still called *Bohemians* by foreigners, but the natives call themselves *Zechi*. At first they were governed by dukes; but the emperor Otho I. conquered the duke of Bohemia, and reduced the province under the empire. Afterwards Henry V. gave the title of *king* to Ladislaus duke of Bohemia; and since that time these kings have been electors and chief cup-bearers of the empire, and the kingdom has been elective; which privileges have been confirmed by the golden bull. Formerly

Boglio
||
Bohemia.

hemia. Formerly the kings of Bohemia received the kingdom as a fief of the empire, which ceremony was practised upon the frontiers; after which, the standards of the principalities of which it is composed were given to them, without being torn and given to the people, as is done with the ensigns of the other fiefs of the empire. Ferdinand I. of Austria, having married Anne, sister of Lewis, last king of Bohemia, who died without issue, and being elected king, that kingdom has remained in his family ever since. But the crown is conferred with some appearance of election; which right the states of Bohemia still pretend to claim, notwithstanding that, by the treaty of Westphalia, Bohemia is declared hereditary in the house of Austria.

The king of Bohemia is the first secular elector, and gives his opinion after the elector of Cologne; though he does not assist at the assembly of electors, except at the election of an emperor. For these 200 years past they have not appeared at the collegiate assemblies, nor even at the imperial diets. However, in 1708, the emperor caused one of his deputies, in quality of king of Bohemia, to enter into the college of electors at the diet of Ratibon, by the form of re-admission, together with the deputy of the elector of Brunswick. The states of Bohemia have never been comprehended in the government, or in the circles of the empire; they are not subject to any of its jurisdictions, nor to the Roman months, taxes, or public contributions; and they owe nothing to the empire but what the emperor Leopold voluntarily imposed upon himself, which amounts to 6000 livres a-year for the imperial chamber. The king pays homage to the emperor and the empire for his states as first secular elector; otherwise he has a right to exercise, through the whole extent of his dominions, all authority that the royalty can give, provided he do not violate the laws of the kingdom; according to which he cannot raise contributions or taxes but at the time when the states are assembled, the appointing of which is entirely in their own power. The government of Bohemia is different from that of all other states, the affairs of the kingdom being managed by six different courts. First, the council of the regency, or the great royal council, in which presides the great judge or burgrave of Bohemia, and who has under him 18 lieutenants of the king and other assessors. Secondly, the council, or superior chamber of justice, at which the great master of the kingdom is president. Thirdly, the chamber of fiefs. Fourthly, the new tribunal to judge the appeals of the German vassals in their differences on the account of fiefs; which court has also its president, vice-president, and assessors. Fifthly, the royal chamber of finances, which has a president and vice-president. Sixthly, the chancery, which always follows the court. Besides, every circle of Bohemia is governed by two bailiffs, who administer justice in their prefecture. The states are composed of the clergy, lords, nobles, and burghers. As to Moravia, there is a grand bailiff who governs it in the name of the king of Bohemia, as Margrave of Moravia. He is at the head of the royal council, which is composed of three assessors, and in which all is transacted in the name of the king. This province is divided into five circles, each of which has its bailiff. There are, besides, other officers of justice, who have a right of judging only at certain times, and in particular cases,

Vol. II.

where an appeal is allowed.

Bohemia was divided by the emperor Charles IV. into 12 provinces, in each of which he ordered two captains to be appointed every year for the administration of the government. The same emperor caused the church of Prague to be erected into an archbishopric, with this advantage, that the archbishop of Prague should have the prerogative that the archbishop of Mentz formerly enjoyed, viz. of crowning the king of Bohemia. The duchy of Silesia, the marquise of Moravia, and that of Luface, formerly held of this crown, but now only that of Moravia, which is incorporated with the kingdom of Bohemia, and is in the possession of the house of Austria.

The only remarkable occurrence in the Bohemian history is the rebellion of the disciples of John Hus, and Jerome of Prague, on account of their leaders having been burnt as heretics. This occasioned a bloody war of 16 years continuance; for a particular account of which, see the article HUSSITES.

BOHEMIAN BOLE. See BOLE.

BOHEMIAN BRETHREN, a sect of Christian reformers which sprung up in Bohemia in the year 1467. They treated the Pope and cardinals as antichrist, and the church of Rome as the whore spoken of in the Revelation. They rejected the sacraments of the Romish church, and chose laymen for their ministers. They held the Scriptures to be the only rule of faith, and rejected the Popish ceremonies in the celebration of the mass, nor did they make use of any other prayer than the Lord's Prayer. They consecrated leavened bread. They allowed no adoration but of Jesus Christ, in the communion. They re-baptized all such as joined themselves to their congregation. They abhorred the worship of saints and images, prayers for the dead, celibacy, vows, and fasts; and kept none of the festivals but Christmas, Easter, and Whitsuntide.

In 1504, they were accused by the Catholics to King Ladislaus II. who published an edict against them, forbidding them to hold any meetings either privately or publicly. When Luther declared himself against the church of Rome, the Bohemian brethren endeavoured to join his party. At first that reformer shewed a great aversion to them; but the Bohemians sending their deputies to him in 1523 with a full account of their doctrines, he acknowledged that they were a society of Christians whose doctrine came nearest to the purity of the gospel. This sect published another confession of faith in 1535, in which they renounced anabaptism, which they at first practised: upon which a union was concluded with the Lutherans, and afterwards with the Zuinglians, whose opinions from thenceforth they continued to follow.

BOHOL, one of the Philippine islands in Asia, lying to the northward of Mindanao, in E. Long. 122. 5. N. Lat. 10. 0.

BOIANO, a town of Italy, in the kingdom of Naples, and county of Molese, with a bishop's see. It is seated at the foot of the Appennines, near the river Tlerno, in E. Long. 14. 38. N. Lat. 41. 30.

BOIARDO (MATTEO MARIA OF Ferrara), count of Scandiano, celebrated for his Italian poems, lived in the 15th century. His principal work is his *Orlando innamorato*. His Latin eclogues and sonnets are also much admired.

Bojars
Boiling.

BOJARS denote Russian noblemen. See RUSSIA.
BOIGUACU, in zoology, a synonyme of the boa constrictor. See BOA.

BOIL. See BOHEMIA.

BOIL, or FURUNCLE. See the *Index* subjoined to MEDICINE, and SURGERY.

BOILEAU SIEUR DESPREAUX (Nicholas), the celebrated French poet, was born at Paris in 1636. After he had gone through his course of polite literature and philosophy, his relations engaged him to the study of the law, and he was admitted advocate. But tho' he had all the talents necessary for the bar, yet he could not adapt himself to a science which turns upon continual equivocations, and often obliges those who follow it to clothe falsehood in the garb of truth. He therefore determined to study theology; but he could not long endure the thorns of school divinity. He imagined, that, to allure him more cunningly, chicanery, which he thought to avoid, had only changed her habit; and so he renounced the Sorbonne, betook himself entirely to the belles lettres, and took possession of one of the foremost places in Parnassus. The public gave his works the encomium they deserved; and Lewis XIV. who always loved to encourage the sciences and polite literature, was not only pleased to have Mr Boileau's works read to him constantly as he composed them, but settled a yearly pension of 2000 livres upon him, and gave him the privilege of printing all his works. He was afterwards chosen a member of the French academy, and also of the academy of medals and inscriptions. This great man, who was as remarkable for his integrity, his innocence, and diffusive benevolence, as for the keenness of his satires, died on the 2^d of March 1711, in the 75th year of his age. The best edition of his works is that published by Mr Brossette, with his notes and commentary.

BOILING, or EBULLITION, the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of fire, though that which ensues on the mixture of an acid and alkali is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil; and the appearance is the same, whether it is common air, fixed air, or steam, that makes its way through the fluid. The boiling of water is proved by Dr Hamilton of Dublin, in his essay on the ascent of vapour, to be occasioned by the lowermost particles of the water being heated and rarified into vapour by reason of the vicinity of the bottom of the containing vessel; in consequence of which, being greatly inferior in specific gravity to the surrounding fluid, they ascend with great velocity, and, lacerating and pushing up the body of water in their ascent, give it the tumultuous motion called *boiling*. That this is occasioned by steam, and not by particles of air or fire, as some have imagined, may be very easily proved in the following manner: Let a common drinking glass be filled with hot water, and then inverted into a vessel of the same: as soon as the water in the vessel begins to boil, large bubbles will be observed to ascend in the glass, which will displace the water in it, and in a short time there will be a continual bubbling from under its edge; but if the glass is then drawn up, so that its mouth may only touch the water, and a cloth dipt in cold water be applied to the

outside, the steam within it will be instantly condensed, and the water will ascend so as to fill it entirely, or very nearly so. See the article EVAPORATION.

Boiling
Bois.

BOILING, in trade and manufactures, is a preparation given to divers sorts of bodies by making them pass over the fire, chiefly in water, tho' sometimes in other liquors. In this sense we speak of the boiling of salt, boiling of sugar, coppersas, &c.

BOILING of *Silk with Soap* is the first preparation in order to dyeing it. Thread is also boiled in a strong lixivium of ashes to prepare it for dyeing.

BOILING, in the culinary art, is a method of dressing meats by coction in hot water, intended to soften them, and dispose them for easier digestion. The effects of boiling are different according to the kinds and quantities of the water. Pulse boiled in sea-water grow harder; mutton boiled in the same becomes softer and tenderer than in fresh water, but tastes saltish and bitter.

BOILING to *Death*, (*caldarii decoquere*), in the middle age; a kind of punishment inflicted on thieves, false coiners, and some other criminals.

BOILING, is also a method of trying or essaying the goodness or falseness of a colour or dye. The stuff is to be boiled in water with certain drugs, different according to the kind or quality of the colour, to try whether or no it will discharge, and give a tincture to the water. With this view crimson silks are boiled with alum, and scarlets with soap, in quantity equal to the weight of the silk.

BOILING-Well, in natural history. See BURNING-Springs.

BOINITZ, a town of Upper Hungary, in the county of Zell, remarkable for its baths and the quantity of saffron that grows about it. E. Long. 19. 10. N. Lat. 48. 42.

BOIOBI, in zoology, the name of a species of serpent found in America, and called by the Portuguese *cobra de verd*. It is about an ell in length, of the thickness of a man's thumb, and is all over of a very beautiful and shining green. Its mouth is very large, and its tongue black. It loves to be about houses, and never injures any creature unless provoked or hurt; but it will then bite, and its poison is very fatal. The natives take, as a remedy against its poison, the root *caa apia* bruised, and mixed with water. See *CAA Apia*.

BOQUIRA, the American name for the rattlesnake.

BOIS-LE-DUC, called by the Dutch *Hertogenbosch*, a large, strong, and handsome town of the Netherlands, in Dutch Brabant, seated between the rivers Dommel and Aa among morasses, in E. Long. 6. 16. N. Lat. 51. 45.

Bois de *Soignies*, the forest of Soignies, in the Austrian Netherlands and province of Brabant, about three miles south-east of Brussels.

Bois de *Coffin*, the name given to a South American tree growing about Surinam, held in the highest estimation by the Indians in that part of the world, and now recommended to the physicians in Europe by Dr Ferrius in a treatise lately published at Amsterdam. The root is esteemed an excellent stomachic, restoring the appetite, and assisting digestion; but it is chiefly celebrated as an infallible remedy against even the most inveterate intermittents. It is said also to be used with great safety and advantage in several species of remit-

tem.

tent and continued fever, with patients of all ages, sexes, and conditions, even during pregnancy, and in the puerperal state. Before employing it, however, it is absolutely necessary to administer either a purgative or emetic. The best method of exhibiting it is in decoction: half an ounce of the bark of the root must be boiled in a close vessel with six pints of water till one half be consumed; the decoction is then strained off, and a cupful taken every two hours till the fever is entirely extinguished. Six or seven days after a cure is thus performed, it is generally necessary to repeat the purgative.

BOISSARD (John James), a famous antiquarian, born at Besançon the capital of Franche Compté in France. He published several collections which are of great use to such as are desirous to understand the Roman antiquities. He had a great passion for this study; and drew with his own hand plans of all the ancient monuments of Italy. He died at Metz, October 30th 1602. His principal works are, 1. Four volumes in folio of Roman antiquities, adorned with plates engraved by Theodore de Bey and his two sons. 2. *Theatrum vite humane*; which contains the lives of 198 famous persons, with their portraits. 3. A treatise *de divinatione & magicis præstigiis*. These works are scarce, and esteemed by the antiquarians.

BOIT, an excellent painter in enamel. He was born in Stockholm, and bred a jeweller: which profession he intended to follow in England; but changed his design, and went into the country, where he taught children to draw. He there engaged a gentleman's daughter, who was one of his scholars, to promise him marriage; but the affair being discovered, he was thrown into prison. In that confinement, which lasted two years, he studied enamelling; an art to which he fixed, on his return to London, and practised with the greatest success. The prices he is said to have obtained for his work are almost incredible: but being engaged in a very large design for the court, and Queen Anne dying before it was completed, he ran in debt, his goods were seized by execution, and he fled to France; where he changed his religion, was contumacious by the regent, and obtained a pension of 250*l.* per annum, but died suddenly at Paris in 1726. There is a large piece done by him at Kensington, representing Queen Anne sitting, and prince George standing by her; and at Bedford-house is another very large plate of the duke's father and mother.

BOITJAPO, in zoology, the name of a species of serpent found in America; and called by the Portuguese there, *cobra di apo*. It grows to seven or eight feet long, is about the thickness of a man's arm, and very small and taper towards the tail. Its back is of an olive colour; its belly yellow, and covered with very regular and elegant triangular scales. It feeds on frogs, &c. but is very poisonous, and its bite extremely fatal.

BOKHARA, a city of Tartary in Asia, and capital of Great Bukharia, situated one day's journey to the north of the river Jehun, or Amu; in E. Long. 65. 50. N. Lat. 39. 15. In 1219 it was besieged by Jenghiz Khan, as being part of Sultan Mohammed's dominions, a descendant of the famous Mahmud Gazari. At that time, besides the city-walls, which were very strong, Bokhara had an outward inclosure 12 leagues

in compass; which shut in not only the suburbs, but also many pleasant seats and farms watered by the river Soghd, from whence the ancient Sogdiana took its name. The Mogul army arrived before the place in July, and continued the siege during the following winter. In March 1220, they forced the outer wall, and began to besiege the city in form. Sultan Mohammed had left in the city a very numerous garrison under the command of three generals, who made a sally at the head of 20,000 men: but being repulsed with great loss, their courage failed them; and, instead of staying to defend the inhabitants, as soon as they had got into the city by one gate, passed out by another with their families, and almost all their soldiers, hoping to escape by the darkness of the night: but their design being discovered, they were pursued by a detachment of 30,000 Moguls; and being overtaken at the river Amu, they were, after a bloody dispute, almost all cut to pieces. Mean time, Jenghiz Khan, being informed of the confusion into which the city had been thrown by the desertion of the garrison, ordered an attack to be made on all sides at once; but while he was preparing for this, the magistrates and clergy went out and presented him with the keys of the city. Jenghiz Khan granted them their lives, on condition that they gave no shelter to any of the sultan's soldiers, and put out all who should be suspected of being in that prince's interest; which they promised to do upon oath. All the young people, however, who were displeased with the surrender, retired with the governor to the castle, which was very strong, and resolved to defend themselves to the last extremity. Jenghiz Khan, having taken possession of Bokhara, entered on horseback into the great mosque, and asked merrily if that was the sultan's palace? On being answered that it was the house of God, he alighted; and giving the principal magistrate his horse to hold, mounted the gallery where the ecclesiastics usually sat, and then taking up the Koran, threw it under the feet of his horses. Having staid here for some time, he retired to his camp; where, some days after, having assembled the principal people of Bokhara, and ascended a pulpit erected for that purpose in the midst of them, he began his speech by praising God, and recounting all the favours he had received from the Almighty: he then mentioned the perfidious behaviour of their sultan towards himself, telling them that God had sent him to rid the world of such wicked men. As to them, he testified his satisfaction for their having freely furnished his army with necessaries; and promised that his soldiers should not meddle with any goods which they made use of in their houses; but commanded them to deliver up what they had hidden, under pain of being tortured. This speech had such an effect, that the poor inhabitants delivered up every thing, as well what they had concealed, as what they had present use for; notwithstanding which, the tyrant soon after caused the city to be burnt, on pretence that some of the sultan's soldiers were concealed in it. As all the houses were made of wood, except the sultan's palace which was built of stone, and some few private houses of brick, the whole was utterly consumed; and Jenghiz Khan having found some few soldiers that had actually concealed themselves, put them all to death without mercy. The castle surrendered at discretion soon after; and

Bokharia
||
Boles.

though it was demolished, the governor and garrison, out of a very extraordinary piece of clemency from so bloody a tyrant, had their lives spared. Bokhara continued in ruins for some years, but at length Jenghiz Khan ordered it to be rebuilt. It is now large and populous; and is the residence of a khan who is altogether despotic, though his power reaches but a little way without the city. The town is seated on a rising ground, with a slender wall of earth and a dry ditch. The houses are low, built mostly of mud; but the caravanserais and mosques, which are numerous, are all of brick. The bazars or market-places, which have been lately buildings, are now mostly in ruins. The inhabitants are more civilized and polite than some of their neighbours; and yet are cowardly, cruel, effeminate, and very perfidious. Great numbers of Jews and Arabians frequent this place, though they are much oppressed, and frequently deprived of all their properties by the khan or his attendants at pleasure. At best they pay heavy taxes, and it is almost criminal to be rich.

BOKHARIA. See **BUKHARIA.**

BOLANDUS (John), a famous Jesuit, born at Tillemont in the Netherlands, in 1596. He distinguished himself by writing the lives of the saints, under the title of *Acta Sanctorum*, of which he published five volumes in folio; but died while he was labouring at the sixth, in the 70th year of his age. The continuators of that work are called *Bollandists*.

BOLBITINUM, (anc. geog.), the second mouth of the Nile reckoning from west to east; now very small, choaked up with sand, and called *le Bras de Belin*.

BOLENTIUM, (anc. geog.), a town of Pannonia Superior; now *Rackerburg* in Stiria *.

BOLES, are viscid earths, less coherent and more friable than clay; more readily uniting with water, and more freely subsiding from it. They are soft and unctuous to the touch; adhere to the tongue; and by degrees melt in the mouth, impressing a light sense of astringency. There are a great variety of these earths, the principal of which are the following.

1. Armenian bole, when pure, is of a bright red colour with a tinge of yellow: It is one of the hardest and most compact bodies of this class, and not smooth and glossy like the others, but generally of a rough and dusty surface. It does not effervesce with acids, though some part of it is dissolved by all of them. Neumann observes, that four ounces of Armenian bole distilled in a glass retort in an open fire, yielded three drachms of a saline phlegm, which smelt a little urinous, and changed syrup of violets green. In the neck of the retort was found a little powdery saline matter which had an ammoniacal taste, but it was in too small quantity to be collected or further examined. Like most other coloured earths, this kind of bole contains a portion of ferruginous matter, to which the colour is owing; and which may be separated by the magnet, after the bole has been calcined with oil or other inflammable matters. It is likewise impregnated with vitriolic acid; and hence, when mixed with nitre or sea-salt, it extricates the acids of these salts in the fire.

2. French bole is of a pale red colour, variegated with irregular specks of white and yellow. It is much softer than the Armenian, and slightly effervesces with

acids.

3. Bole of Blois is yellow, remarkably lighter than most of the other yellow earths, and effervesces strongly with acids.

4. Bohemian bole is of a yellow colour, with a cast of red, and generally of a flaky texture. It is not acted on by acids.

5. Lemnian earth is of a pale red colour, and slightly effervesces with acids.

6. Silefian bole is of a pale yellow colour, and acids have no sensible effect upon it.

These and other earths, made into little masses, and stamped with certain impressions, are called *terra sigillata*. They have been recommended as astringent, sudorific, and alexipharmic; but these and many other virtues that have been ascribed to them appear to have no foundation. They are still, however, prescribed in fluxes and complaints of the primæ viæ.

BOLESLAFF, or **BUNTZLAU**, a town of Silesia seated on the river Bobar, in E. Long. 16. 0. N. Lat. 51. 12.

BOLES LAUS I. and **II.** kings of Poland *.

BOLETUS, **SPUNK**; a genus of the order of fungi, belonging to the cryptogamia class of plants; of which botanists enumerate 17 species. The following are the most remarkable. 1. The suberosus, or white cork spunk, grows commonly on the trunks of birch and willow trees in England and Scotland. It grows sessile and horizontal; its figure is femicircular; the upper side convex, the under nearly plain; of various sizes, from that of an ass's hoof, to a peck-measure. The upper surface is quite white, generally covered with a short strong down, but sometimes smooth. The flesh or internal substance is thick, white, tough, light, and spongy, like cork; and is sometimes cut and shaped by the country people, and used as corks in their bottles: but such corks must not be suffered to touch the liquid, for moisture soon renders them soft and useless.

2. The igniarius, or touchwood-spunk, is frequent on the trunks of old trees of all kinds, especially ash. It consists of a very hard woody substance, in shape like a horse's hoof, and grows of various sizes, from a man's fist to that of his head and larger. The upper side is smooth, but uneven, distinguished near the rim by elevated zones of different colours, brown, grey, tawny, &c. The flesh is of a tawny brown colour, extremely hard and tough. This fungus is made use of in Germany and some parts of England for tinder. The Germans boil it in strong lye, dry it and boil it again in solution of saltpetre. The Laplanders burn it about their habitations, in order to keep off a species of the gaddy which is fatal to the young reindeer. It has been used to stop the bleeding of the vessels after amputations†.

3. The bovinus, or cow-spunk, is frequent in woods and pastures. It is generally of a brown colour, though sometimes it is tawny, yellowish brown, reddish brown, deep red, purple, or greenish brown. The flesh is yellow, white, or reddish. The young plants are eaten in Italy, and esteemed a great delicacy. The Germans also account them a dainty, calling them *gombas*, and *brat-bulz*. Cows, deer, sheep, and swine, will feed upon this and other boleti, and are sometimes

greatly

Boleyn,
Bolingbroke

greatly disordered by them. In cows and other cattle they have been known to create bloody urine, nauseous milk, swellings of the abdomen, inflammations of the bowels, stoppages, diarrhæas, and death. In sheep they bring on a scirrhous liver, a cough, a general wasting, and dropsy. *Scarabs, dermeses*, and many other insects, feed upon and breed in them in abundance.

BOLEYN (Ann), queen of Henry VIII. of England; memorable in the English history, as the first cause of the reformation, as the mother of queen Elizabeth under whom it was completely established, and also on account of her own sufferings. She was born in 1507, and beheaded in 1536 †.

See (Hi-
story of)
England.

BOLINGBROKE, or BULLINGBROKE, a town of Lincolnshire in England. It hath the title of an earldom, and is a very ancient place, but is now in a mean condition. E. Long. o. 40. N. Lat. 53. 15.

BOLINGBROKE (Henry St John), lord viscount, a great statesman and philosopher, descended from an ancient and noble family, was born about the year 1672. He had a regular and liberal education; and, by the time he left the university, was considered as a person of uncommon qualifications: but, with great parts, he had, as it usually happens, great passions, and these hurried him into many indiscretions and follies. Contrary to the inclinations of his family, he cultivated Tory connections; and gained such an influence in the House of Commons, that in 1704 he was appointed secretary of war and of the marines. He was closely united in all political measures with Mr Harley: when, therefore, that gentleman was removed from the seals in 1707, Mr St John resigned his employment; and in 1710, when Mr Harley was made chancellor of the exchequer, the post of secretary of state was given to Mr St John. In 1712 he was created Baron St John of Lediard-Tregeze in Wiltshire, and Viscount Bolingbroke. But being overlooked in the bestowal of vacant ribbons of the order of the garter, he resented the affront, renounced the friendship of Harley then earl of Oxford, and made his court to the whigs. Nevertheless, on the accession of George I. the seals were taken from him; and being informed that a resolution was taken to pursue him to the scaffold, for his conduct regarding the treaty of Utrecht, he withdrew to France. Here he accepted an invitation to enter into the Pretender's service, and accepted the seals as his secretary: but he was as unfortunate in his new connections as in those he had renounced; for the year 1715 was scarcely expired, when, at the same time that he was attainted of high treason at home, the seals and papers of his foreign secretary's office were taken from him; followed by an accusation from the Pretender and his party, of neglect, incapacity, and treachery. Such a complication of distressful events threw him into a state of reflection, that produced by way of relief a *consolatio philosophica*, which he wrote the same year under the title of *Reflections upon exile*; and the following year drew up a vindication of his conduct with respect to the Tories, in the form of *A Letter to Sir William Wyndham*. His first lady being dead, he about this time espoused a niece of the famous Madam Maintenon, and widow of the marquis de Villette, with whom he had a very large fortune. In 1723 the king was prevailed on to grant him a free pardon, and he returned in consequence to England; but was

by no means satisfied within, while he was yet no more than a mere titular lord, and remained excluded from the house of peers. This stigma operated to fix him in enmity to Sir Robert Walpole, to whose secret enmity he attributed his not receiving the full extent of the king's clemency: hence he distinguished himself by a multitude of political writings, till the year 1735; when, being thoroughly convinced that the door was finally shut against him, he returned once more to France. In this foreign retreat he began his course of Letters on the study and use of History, for the use of Lord Combury, to whom they are addressed. Upon the death of his father, who lived to be extremely old, he settled at Battersea, the ancient seat of his family, where he passed the remainder of his life in philosophical dignity. Pope and Swift, one the greatest poet, the other the greatest wit, of the time, perfectly adored him; and it is well known that the former received from him the materials for his incomparable poem the "Essay on Man."—He died in 1751, and left the care and benefit of his MSS. to Mr Mallet, who published them together with his former printed works, in 5 vols 4to: they are also printed in 8vo.

BOLISAW, a town of the kingdom of Bohemia in Germany, situated in E. Long. 14. 35. N. Lat. 50. 25.

BOLKOWITZ, a town of Silesia, in the duchy of Glogaw. E. Long. 15. 20. N. Lat. 51. 27.

BOLLARDS, large posts set into the ground on each side of a dock. On docking or undocking ships, large blocks are lashed to them; and through these blocks are reeved the transporting hawsers to be brought to the capstons.

BOLLITO, a name by which the Italians call a sea-green colour in artificial crystal. To prepare this colour, you must have in the furnace a pot filled with 40 lb. of good crystal, first carefully skimmed, boiled, and purified, without any manganese: then you must have twelve ounces of the powder of small leaves of copper thrice calcined, and half an ounce of saffre in powder: mix them together; and put them at four times into the pot, that they may the better mix with the glass; stirring them well each time of putting in the powder, lest the mixture should swell and run over.

BOLOGNA, an ancient, large, and very handsome town of Italy, in the territory of the church, and capital of the Bolognese; an archbishop's see, and an university. The public buildings are magnificent, as well with regard to the architecture, as the ornaments, especially the paintings, which are done by the greatest masters. There are a vast number of palaces, in one of which the pope's nuncio resides; the private houses are also well built. Here are 169 churches, and the town is said to contain about 80,000 inhabitants. All the gates and windows are open during the summer; inasmuch that one may see into their apartments and gardens, where there are vast numbers of orange-trees that perfume the air. It is a place of great trade, which is in some measure owing to a canal that runs from this city to the river Po. The Reno, which runs near Bologna, turns 400 mills that are employed in the silk-works; besides, they deal in wax, soap, hams, saffages, and even lap-dogs, which are greatly esteemed. It is seated at the foot of the Apennine mountains, in E. Long. 11. 30. N. Lat. 44. 27.

BOLOGNE, by the English commonly called *Bullen*,

Bol fav
Bologne.

len, a city of Picardy in France, and capital of the Bolonois, seated near the sea. It is divided into two towns, the Upper and Lower; the first is strongly fortified, the other is inclosed by walls only. The port is at the mouth of the river Liane, but the water is so shallow that no ships of burden can enter it. It is defended on the side of the river by a mole, which shelters it from the winds, and at the same time prevents the river from filling it with filth. E. Long. 9. 17. N. Lat. 50. 42.

BOLOGNESE, a small province of Italy, in the territory of the church, bounded on the north by the Ferrarese, on the west by the duchy of Modena, on the south by Tuscany, and on the east by Romania. It is watered by a great number of small rivers, which render its soil the most fertile of any in Italy. Bologna is the capital, and from the great produce of the land about it is called *Bologna the fat*. It produces abundance of all sorts of grain and fruits; particularly muscadine grapes, which are in high esteem. Here are mines of alum and iron; and the inhabitants fabricate large quantities of linen, silk stockings, and cloth.

BOLOGNIAN STONE. See CHEMISTRY, n^o 339.

BOLSANE, a town of Germany, in the territory of Tyrol, and circle of Aultria. It is very agreeably situated in the midst of a fine large valley, full of villages, and abounding in vineyards. The vines in this valley are the best in all Tyrol; but they must be drank the year after that of their growth, otherwise they become unfit for use. E. Long. 11. 17. N. Lat. 46. 42.

BOLSENNA, a town of Italy, in the territories of the pope, seated on a lake of the same name. E. Long. 11. 3. N. Lat. 42. 37.

BOLSTER, among surgeons, a soft yielding substance, either laid under the head, or a broken limb. In this sense, bolsters are contrived for crooked, bunched, and otherwise distorted backs, shoulders, &c.

By a constitution made under archbishop Burchier, the clergy are forbidden to wear bolsters about their shoulders, in their gowns, coats, or doublets. The occasion of the prohibition is variously construed. Some say that bolsters came in fashion in the reign of king Richard III. who being necessitated by his natural deformity, to pad, the courtiers, and even the clergy, did the same, out of complaisance to their prince; so that every body who had the misfortune to be born straight, was obliged to wear a bolster on his shoulders to be in the fashion. Others, however, controvert this; alleging that the constitution above mentioned was made 20 years before the usurpation of Richard.

BOLSTERS of a Saddle, those parts of a great saddle which are raised upon the bows, both before and behind, to hold the rider's thigh, and keep him in a right posture.

BOLSWAERT, a town of the United Provinces, in West Friesland, and in the county of Westergoe. E. Long. 5. 35. N. Lat. 53. 6.

BOLT, among builders, an iron-fastening fixed to doors and windows. They are generally distinguished into three kinds, *viz.* plate, round, and spring bolts.

BOLTS, in gunnery, are of several sorts; as, 1. Transum bolts, that go between the cheeks of a gun carriage, to strengthen the transums. 2. Prife bolts; the large knobs of iron on the cheeks of a carriage, which keep the hand-spike from sliding, when it is poizing up

the breech of a piece. 3. Traverse bolts; the two short bolts, that, being put one in each end of a mortar carriage, serve to traverse her. 4. Bracket-bolts; the bolts that go through the cheeks of a mortar, and by the help of quoins keep her fixed at the given elevation. And, 5. Bed-bolts; the four bolts that fasten the brackets of a mortar to the bed.

BOLTS, in a ship, are iron pins, of which there are several sorts, according to their different makes and uses. Such are drive-bolts, used to drive out others. Ray-bolts, with jags or barbs on each side, to keep them from flying out of their holes. Clencl-bolts, which are clenched with rivetting hammers. Forelock-bolts, which have at the end a forelock of iron driven in to keep them from starting back. Set-bolts, used for forcing the planks, and bringing them close together. Fend or fender bolts, made with long and thick heads, and struck into the uttermost bends of the ship, to save her sides from bruises. And ring-bolts, used for bringing to of the planks, and those parts whereto are fastened the breeches and tackle of the guns.

BOLT of Canvas, in commerce, the quantity of 28 ells.

BOLT-Rope, in naval affairs, a rope passing round the sail, to which the edges of it are sewed, to prevent the sail from tearing: the bottom part of it is called the *foot-rope*; the sides, *leeches*; and if the sail be oblong or square, the upper part is called the *head-rope*.

BOLTED FLOUR, that which has passed thro' the bolters. See the following article.

BOLTERS, or **BOULTERS**, a kind of sieves for meal, having the bottoms made of woollen, hair, or even wire. The bakers use bolters which are worked by the hand; millers have a larger sort, wrought by the motion of the mill.

BOLTING, a term of art used in our inns of court, whereby is intended a private arguing of cases. The manner of it at Gray's inn is thus: An ancient and two barristers sit as judges; three students bring each a case, out of which the judges choose one to be argued; which done, the students first argue it, and after them the barristers. It is inferior to *mooting*; and may be derived from the Saxon word *bolt*, a house, because done privately in the house for instruction. In Lincoln's inn, Mondays and Wednesdays are the bolting days in vacation time; and Tuesdays and Thursdays the moot days.

BOLTING, or *Boulting*, the act of separating the flour from the bran, by means of a sieve or bolter *.

BOLTING-Cloth, or *Bolster-cloth*, sometimes also called *bolting-cloth*, denotes a linen or hair cloth for sifting meal or flour.

BOLTING Mill, a versatile engine for sifting with more ease and expedition. The cloth round this is called the *bolter*.

BOLTING, or *Boulting*, among sportsmen, signifies rousing or dislodging a coney from its resting place. The say, to *bolt* a coney, *start* a hare, *rouse* a buck, &c.

BOLTON or **BOULTON** (Edmund), an ingenious English antiquarian, who lived in the beginning of the 17th century. His most considerable work is that intitled *Nero Caesar*, or *Monarchie depraved*, dedicated to the duke of Buckingham, lord-admiral, printed at London 1624, folio, and adorned with several curious and

Bolt
Bolton.

* See Bolter.

valuable medals. It is divided into 55 chapters, in some of which are introduced curious remarks and observations. In the 24th and 25th chapters he gives an account of the revolt in Britain, against the Romans, under the conduct of Boadicea, which he introduces with a recapitulation of the affairs in Britain from the first entrance of the Romans into this island under Julius Cæsar, till the revolt in the reign of Nero. In chapter 36th he treats of the East-India trade in Nero's time, which was then carried on by the river Nile, and from thence by caravans over land to the Red-Sea, and thence to the Indian ocean; the ready coin carried yearly from Rome upon this account, amounting, according to Pliny's computation, to above 300,000 pounds sterling; and the usual returns in December and January, yielding, in clear gain, an hundred for one. Besides this he wrote, 1. An English translation of Lucius Florus's Roman history. 2. Hypercritica, or a rule of judgment for reading or writing our histories. 3. The elements of armories, &c.; and some other works.

BOLTON, a town of Lancashire in England, seated on the river Croell, and pretty well built. It has a manufacture for fustians, and the market is considerable for cloth and provisions. W. Long. 2. 15. N. Lat. 53. 55.

BOLUS, an extemporaneous form of a medicine, soft, coherent, a little thicker than honey, and the quantity of which is a little morfel or mouthful; for which reason it is by some called *buccella* *.

BOMAL, a town of Luxemburg in the Austrian Netherlands, situated on the river Ourt, in E. Long. 5. 30. N. Lat. 50. 20.

BOMB, in military affairs, a large shell of cast iron, having a great vent to receive the fusee, which is made of wood. The shell being filled with gunpowder, the fusee is driven into the vent or aperture, within an inch of the head, and fastened with a cement made of quicklime, ashes, brick-dust, and steel-slings, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turpentine, and one of wax. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gunpowder-dust, well rammed. To preserve the fusee, they pitch it over, but uncase it when they put the bomb into the mortar, and cover it with gunpowder dust; which having taken fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the air; and the composition in the fusee being spent, it fires the powder in the bomb, which bursts with great force, blowing up whatever is about it. The great height a bomb goes in the air, and the force with which it falls, makes it go deep into the earth.

Bombs may be used without mortar-pieces, as was done by the Venetians at Candia, when the Turks had possessed themselves of the ditch, rolling down bombs upon them along a plank set sloping towards their works with ledges on the sides, to keep the bomb right forward. They are sometimes also buried under ground to blow up *.—Bombs came not into common use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus an English engineer is said to have first carried them into France, where they were put in use at the siege of Collioufe. The French

have lately invented a new sort of bombs of vast weight called *comminges*.—The art of throwing bombs makes a branch of gunnery, founded on the theory of projectiles, and the laws and qualities of gunpowder *.

BOMBARD, a piece of ordnance anciently in use, exceedingly short and thick, and with a very large mouth. There have been bombards which have thrown a ball of 300 pound weight. They made use of cranes to load them. The bombard is by some called *basilisk*, and by the Dutch *donderbus*.

BOMBARDIER, a person employed about a mortar. His business is to drive the fusee, fix the shell, and load and fire the mortar.

BOMBARDIER, in zoology. See **CARABUS**.

BOMBARDMENT, the havoc committed in throwing bombs into a town or forts.

BOMBARDO, a musical instrument of the wind kind, much the same as the bassoon, and used as a basis to the hautboy.

BOMBASINE, a name given to two sorts of stuffs, the one of silk, and the other crossed of cotton.

BOMBAST, in composition, is a serious endeavour, by strained description, to raise a low or familiar subject beyond its rank; which, instead of being sublime, never fails to be ridiculous. The mind in some animating passions is indeed apt to magnify its objects beyond natural bounds: but such hyperbolic description has its limits; and, when carried beyond these, it degenerates into burlesque, as in the following example.

Senjus. ————— Great and high,

The world knows only two, that's Rome and I.

My roof receives me not; 'tis air I tread,

And at each step I feel my advance'd head

Knock out a star in heaven. *SEJAN*. of *Ben. Johnson*, act 5.

A writer who has no natural elevation of genius is extremely apt to deviate into bombast. He strains above his genius, and the violent effort he makes carries him generally beyond the bounds of propriety.

BOMBAX, or **SILK-COTTON TREE**; a genus of the polyandria order, belonging to the monodelphia class of plants.

Species. 1. The ceiba, with a prickly stalk. 2. The pentandrum, with a smooth stalk. 3. The heptaphyllum, with leaves cut into seven parts. The first and second sorts grow naturally in both the Indies, where they arrive at a great magnitude, being some of the largest trees in these parts; inasmuch that Bosman says he has seen in Guinea, trees of this kind so widely diffused that 20,000 armed men might stand under the branches of one. They generally grow with very straight stems. Those of the first sort are armed with short strong spines: but the second hath very smooth stems, which in the young plant are of a bright green; but after a few years they are covered with a grey or ash-coloured bark, which turns brown as the tree grows older. The branches toward the top are garnished with leaves composed of five, seven, or nine oblong smooth little leaves, which are spear-shaped, and join to one common centre at their base, where they adhere to the long footstalk. The flower-buds appear at the end of the branches; and soon after the flowers expand, which are composed of five oblong purple petals, with a great number of stamina in the centre: when these fall off, they are succeeded by oval fruit as large.

large as a swan's egg, having a thick ligneous cover, which when ripe opens in five parts, and is full of a dark short cotton, inclosing many roundish seeds as large as small pease. The cotton of the third sort is of a fine purple colour, but the size of the tree is not particularly mentioned by botanical writers. Besides these species, Mr Miller mentions another which he saw in the gardens of the late duke of Richmond at Goodwood, and was raised from seeds which came from the East Indies. The stem was very straight and smooth, the leaves were produced round the top upon very long footstalks, each being composed of seven or nine narrow silky small lobes, joined at their base to the footstalk in the same manner as the first and second; but they were much longer and reflected backward, so that at first sight it appeared very different from either of them.

Culture. These plants, being natives of warm climates, must always be kept in a stove. They are raised from seeds procured in the capsules from the places where they grow naturally. These are to be sown in the spring, in pots of light earth, plunged in a substantial hot-bed of dung or tan, where the plants will appear in three or four weeks. They must then be placed separately in small pots, plunging them in the bark-bed, giving them shade and water, and shifting them occasionally into larger pots with fresh earth. They must be watered plentifully in summer, but moderately in winter.

Uses. The dark short cotton of the first two species is used by the poorer inhabitants of those places where such trees grow to stuff pillows or chairs, but is generally deemed unwholesome to lie upon. The beautiful purple down of the third is spun, wrought into clothes, and wore, without being dyed any other colour, by the inhabitants of the Spanish West Indies, where the tree naturally grows. Large pirogues, or canoes fit to carry a sail, are made both at Senegal, and in America, of the trunk of the silk-cotton tree, the wood of which is very light, and found unfit for any other purpose. In Columbus's first voyage, says Miller, it was reported, that a canoe was seen at Cuba made of the hollowed trunk of one of these trees, which was 95 palms long, of a proportional width, and capable of containing 150 men.

BOMBAX, in zoology, a synonyme of a species of conus†.—*Bombax* is also used sometimes for silk or cotton; but the true botanic name of cotton is *Gossypium*. It is likewise applied by Linnaeus to signify such insects as have incumbent wings, and feelers resembling a comb.

BOMBAY, an island of Asia, in the East Indies, on the west coast of the peninsula on this side the Ganges. It is about seven miles in length, and 20 in circumference, and is situated in E. Long. 73.0. N. Lat. 19.0. The principal town is near a mile long; but the houses are mean, low, and paltry, a few only excepted which belong to the Portuguese. The soil is barren, and incapable of any improvement, nor has the island any good water on it. The best is what they preserve in their cisterns after the rains, that which is afforded by the wells having a brackish disagreeable taste. The estates on the island are chiefly laid out in groves of fine cocoa-trees. Their gardens also produce mangoes, jacks, and other Indian fruits. They make salt in large quantities by letting the sea into pits, where the sun

evaporates the water, leaving the salt behind. The air and climate are rather unhealthy, although the natives, and persons accustomed to the country, live to a good old age. Most people on their arrival are seized with fevers, fluxes, feropulous disorders, or a disease they call the *barbiers*, which wholly enervates the body, reducing it to a total state of inactivity, and deprivation of all its loco-motive faculties. After rains a multitude of venomous creatures appear, which grow to an extraordinary size. Their spiders are as large as a walnut, and their toads almost equal a duck in magnitude. The inhabitants are a mixture of several nations, English, Portuguese, and Indians, amounting in all to 50,000 or 60,000. Formerly the president of Bombay appeared with all the pomp of a crowned head; being attended when he went abroad by troops of Moors and Bandarins, colours flying, drums beating, and music playing; but after the presidency was removed to Surat, this splendor greatly diminished.

Bombay formerly belonged to the Portuguese: but on the setting on foot a treaty of marriage between Charles II. and the infanta of Lisbon, it was thought a proper opportunity for procuring the cession of some convenient port and mart for the India company, as part of the infanta's portion; and thus the island of Bombay came into the hands of the English, with whom it has ever since continued. After the king's marriage, a squadron, conducted by lord Marleburgh, was sent to receive the possession and investiture of the island from the viceroy, who had received his Portuguese majesty's commands to that effect. But on lord Marleburgh's arrival in September 1633, with a squadron of five men of war, the clergy made such violent opposition, and so positively refused to yield the island to heretics, that the viceroy was terrified, and determined to keep possession of the island. The governor of Surat, under whose jurisdiction Bombay then was, threatened the English factory at Surat, in case the English troops did not reembark from that place, to which lord Marleburgh had been obliged to retire on account of the viceroy's obstinate refusal. His lordship therefore set sail in January 1664, with two ships for England; leaving the rest under the command of Sir Abraham Shipman, to spend the remainder of the western monsoons in some of the neighbouring ports. During his stay he buried above 200 of his men on a desolate island called *Anjadiva*, where he had wintered. The monsoons being over, Sir Abraham threatened the viceroy and clergy who opposed his pretensions with the vengeance of the kings of England and Portugal if they continued longer obstinate, or denied obedience to their majesties instructions and contracts. At last the terrors of a British fleet got the better of religion; the church began to abate of her zeal, and consented to a treaty, by which the inhabitants were to be continued in the free exercise of their religion and possession of their estates under the crown of England. Sir Abraham dying, Mr Cook, next in commission, signed the treaty; and, in quality of governor, took possession of the island in the name of the king his master. Here he immediately set about building a fortress; but a capital mistake he made in concluding the treaty, by not including the appendages to Bombay, extending to Verica on Salet, has been a bone of contention ever since. The fort was laid out in a regular manner, and

Bombay

Bombay
||
Bomonici.

an old square house fitted out for himself as governor; but Mr Hamilton observes, that both Mr Cook, and some of his successors, never once thought of a church.

Thus the trade of Bombay flourished exceedingly; but the revenues of the place not being equal to the expence of keeping it, and other political and commercial reasons superadded, the crown was obliged to make it over in fee-tail to the East India Company, who still continue to hold it in that manner. After the fort was traced and the foundation laid, Sir George Lucas arrived from England with two ships; but affairs being accommodated before he came, he continued here no longer than January 1666, when he returned to England, leaving the government as he found it, in the hands of Mr Cook and the council, under the presidency of the settlement at Surat. Mr Cook shewed his ignorance of architecture, by building the fort upon the ground on which it stands, and which is exceedingly inconvenient. As an engineer, too, he committed a capital error; his fort being commanded by a hill called *Dangersee*, about 800 paces distance. The consequences of this unfortunate choice were apparent in the year 1689, when it was besieged by the Mogul. In this he is the more inexcusable, as common sense, though joined with the greatest ignorance of architecture and engineering, might have pointed out a much more commodious situation about 500 paces to the southward. As for the magnitude, figure, and materials of the fort, says captain Hamilton, there is nothing considerably faulty. It is a regular tetragon, whose outside polygon is about 500 paces, built of an excellent hard stone. It can mount 100 pieces of cannon; and these particulars are all that can be alleged in its favour. It has not a single spring of fresh water; which very circumstance must, in case of a siege, render all its fortifications of little or no value, since a little patience must render the enemy masters of it at discretion.—For the further particulars of the history of Bombay, see the article EAST INDIES.

BOMB-KETCH, a small vessel built and strengthened with large beams for the use of mortars at sea.

BOMBUS, in medicine, a refounding and ringing noise in the ears. It is a bad sign in acute diseases.

BOMBYLIUS, in zoology, a genus of insects belonging to the order of diptera. The rostrum is long, bristly, and bivalved; the bristles being fixed between the horizontal valves. There are five species, viz. 1. The major, with black wings. 2. The medius, with a yellowish body, white behind, and the wings spotted with yellow. 3. The minor, with unspotted wings. 4. The ater, has red wings, but a little blackish at the base; and green feet. The above four are natives of Europe. 5. The capensis, with the wings spotted with black, an ash-coloured body, and white behind. It is a native of the Cape of Good Hope.

BOMENE, a sea-port town of the United Provinces, in Zealand, seated on the northern shore of the island of Schonen, opposite to the island of Goree, in E. Long. 4. 0. N. Lat. 51. 50.

BOMMEL, a town of Dutch Guelderland, situated on the northern shore of the river Waal, in E. Long. 5. 50. N. Lat. 52. 0.

BOMONICI, in Grecian antiquity, young men of Lacedæmon, who contended at the sacrifices of Diana which of them was able to endure most lashes; being

VOL. II.

scourged before the altar of this goddess.

BONA, by the Moors called *Balederna*, a sea-port town of the kingdom of Algiers in Africa, situated in E. Long. 7. 57. N. Lat. 36. 5. It was formerly rich, populous, capital of the province of the same name under the kingdom of Constantina, and is supposed by some to be the ancient Hippo, once the seat of the great St Austin, and a sea-port built by the Romans. The inhabitants, however, deny it to be the ancient Hippo, which had been so often taken, retaken, and destroyed by the wars; and pretend it to be since rebuilt at the distance of two or three miles from the ancient Hippo, out of its ruins, and called *Baled-el-Ugued*, from a sort of trees of that name that grow in the neighbourhood. It is now a very mean place, poorly built, and thinly inhabited, with scarce any traces of its former grandeur, except the ruins of a cathedral, or, as others guess, of a monastery, built by St Austin about three miles distance from the city. Near these ruins is a famed spring called by his name, much resorted to by the French and Italian sailors, who come to drink of its waters, and pay their devotions to a maimed statue said also to belong to the saint, but so mutilated that no traces either of face or dress are remaining; and as each of them strives to break off some splinter, or to scrape off some part of it on account of its supposed sanctity, it will probably be soon reduced to a state of non-existence. Bona was taken by the pirate Barbarossa, and joined to his new kingdom of Algiers; but as quickly lost, and recovered by its old masters the Tunisians, who soon after lost it again. It is commanded by a little fort, in which is a garrison of about 300 Turks, under the command of an aga, who is also governor of the town. The road for the ships is good for nothing before the town, but a little farther west is very deep and safe. Dr Shaw tells us, that the continual discharging of ballast into the road, and the neglect of cleaning the port which came to the very walls, is the cause of both becoming so unsafe and incommodious; though this might be easily remedied so as to make the town one of the most flourishing in all Barbary.

BONA Dea, the good goddess, in Pagan mythology, one of the names of Cybele. Others say, she was a Roman lady, the wife of one Faunus, and was famous for her chastity, and that after her death she was deified. Her sacrifices were performed only by matrons; and in so secret a manner, that it was no less than death for any man to be present at the assembly*. Cicero reproaches Clodius with having entered into this temple disguised as a singing woman, and having by his presence polluted the mysteries of the good goddess. What kind of mysteries these were, we may learn from Juvenal, Sat. VI. 313. The poet then mentions the adventure of Clodius.

*Atque vinam ritus veteres, et publica saltem
His intacta manas agerentur sacra: sed omnes
Noverunt Mauri, atque Indi, que psittiris penem
Majorem, quam nisi duo Cesaris Anticatores,
Illuc testiculi sibi conscius, unde fugit mus,
Intulerit.*

I with at least our sacred rites were free
From these pollutions of obscenity:
But 'tis well known what finger, how disguised,
A lewd audacious action enterpriz'd:
Into the fane, with women mix'd, he went,
Arm'd with a huge two-handed instrument;

* See *Cybele*.

Bona
||
Bond.

A grateful present to these holy choirs,
Where the mouse, conscious of his sex, retires. DRYDEN.

BONA FIDES, in law. When a person performs any action which he believes at the time to be just and lawful, he is said to have acted *bona fide*.

BONA MOBILIA, the same with moveable effects or goods.

BONA NOTABILIA, are such goods as a person dying has in another diocese than that wherein he dies, amounting to the value of 5 l. at least; in which case the will of the deceased must be proved, or administration granted in the court of the archbishop of the province, unless by composition, or custom, any dioceses are authorized to do it, when rated at a greater sum.

BONA PATRIA, an assize of countrymen, or good neighbours, where 12 or more are chosen out of the country to pass upon an assize, being sworn judicially in the presence of the party.

BONAIRE, an island of South America, near the north coast of Terra Firma. It belongs to the Dutch; and abounds in kabrites and salt. W. Long. 66. 18. N. Lat. 20. 16.

BONAIs, very high mountains of Italy, in the duchy of Savoy, not far from Lafloweburg: in some seasons they cannot be ascended without great danger.

BONARELLI (Gui Ubaldo), an Italian count. He was intrusted with several important negotiations, and was esteemed an able politician and learned philosopher. He was the author of a fine Italian pastoral entitled *Filli di Sciro*. He died at Fano, in 1608, aged 45.

BONAVENTURA, (the bay of), in America, on the coast next the South Sea, in the Popayan. It has a port, and harbour for ships; but the air is very unwholesome. W. Long. 75. 18. N. Lat. 3. 20.

BONAVENTURE, a celebrated cardinal, called, from his works, the *seraphic doctor*. He was born at Bagnarea, a small town of Tuscany, in 1221; and his original name was *John Fidauze*. He took the habit of a monk of the order of St Francis in 1243, became doctor of Paris in 1255, and the next year general of his order. After the death of Clement IV. the cardinals disagreeing about the election of a new pope, engaged themselves by a solemn promise to elect him who should be named Bonaventure, even tho' it should be himself; but he chose Theobald archdeacon of Liege, who was then in the Holy Land, and took the name of *Gregory X*. This pope, in return, in 1272, made him cardinal and bishop of Alba, and ordered him to assist at the second general council of Lyons, where he died in 1274. His works were printed at Rome in 8 vols folio.

BONAVISTA, an island in the Atlantic ocean, the most easterly and first discovered of the Cape de Verd islands. It is 20 miles long, and 13 broad; has plenty of goats and cotton, and some indigo. The inhabitants are remarkable for slothfulness; they have a town and two roads where ships come to an anchor. W. Long. 23. 6. N. Lat. 16. 5.

BOND (John), a commentator on Horace and Persius, was born in Somersetshire in the year 1550, and educated at Winchester school. In 1569 he was entered a student of the university of Oxford, probably in the New college, of which he became either one of the clerks or one of the chaplains. He took his bachelor of arts degree in 1573, and that of master in 1579; soon after which he was appointed, by his col-

lege, master of the free school in Taunton in Somersetshire. In this employment he continued many years with great reputation; but being at length weary of his laborious employment, he commenced physician, and we are told became eminent in that capacity. He died in the year 1612, possessed of several lands and tenements in his neighbourhood; but whether acquired by the practice of physic, does not appear. He wrote, 1. *Commentarii in poemata Q. Horatii*, 8vo. 2. *Commentarii in sex tyras Persii*, Lon. 1614, 8vo.

BOND, in law, is a deed whereby the obligor obliges himself, his heirs, executors, and administrators, to pay a certain sum of money to another at a day appointed. If this be all, the bond is called a simple one, *simplex obligatio*. But there is generally a condition added, that if the obligor does some particular act, the obligation shall be void, or else shall remain in full force: as, payment of rent; performance of covenants in a deed; or repayment of a principal sum of money borrowed of the obligee, with interest, which principal sum is usually one half of the penal sum specified in the bond. In case this condition is not performed, the bond becomes forfeited, or absolute at law, and charges the obligor while living; and after his death the obligation descends upon his heir, who (on defect of personal assets) is bound to discharge it, provided he has real assets by descent as a recompense.

If the condition of a bond be impossible at the time of making it, or be to do a thing contrary to some rule of law that is merely positive, or be uncertain, or impossible, the condition alone is void, and the bond shall stand single and unconditional: for it is the folly of the obligor to enter into such an obligation from which he can never be released. If it be to do a thing that is *malum in se*, the obligation itself is void: for the whole is an unlawful contract, and the obligee shall take no advantage from such a transaction. And if the condition be possible at the time of making it, and afterwards becomes impossible by the act of God, the act of law, or the act of the obligee himself, there the penalty of the obligation is saved: for no prudence or foresight of the obligor could guard against such a contingency. On the forfeiture of a bond, or its becoming single, the whole penalty was recoverable at law: but here the courts of equity interposed, and would not permit a man to take more than in conscience he ought, viz. his principal, interest, and expences, in case the forfeiture accrued by non-payment of money borrowed; the damages sustained upon non-performance of covenants; and the like. And the statute 4 and 5 Ann. c. 16. hath also enacted, in the same spirit of equity, that in case of a bond, conditioned for the payment of money, the payment or tender of the principal sum due, with interest and costs, even though the bond be forfeited and a suit commenced thereon, shall be a full satisfaction and discharge.

BONDAGE, properly signifies the same with slavery, but in old law books is used for villenage*. — * See Villenage. Tenants in bondage paid kenots, and did fealty; they were not to fell trees in their own garden, without licence of the lord. The widow of a tenant in bondage held her husband's estate *quam diu vixerit sine marito*, "as long as she lived single."

BONDAGE by the Forelocks, or *Bondagium per anteriores crines capitis*, was when a freeman renounced his liberty,

Bond,
Bondage.

liberty, and became slave to some great man: which was done by the ceremony of cutting off a lock of hair from the forehead, and delivering it to his lord; denoting that he was to be maintained by him for the future. Such a bondman, if he reclaimed his liberty, or were fugitive from his master, might be drawn again to his servitude by the nose; whence the origin of the popular menace to pull a man by the nose.

BONDMAN, in the English law, is used for a villain, or tenant in villenage &c.—The Romans had two kinds of bondmen; one called *servi*, who were those either bought for money, taken in war, left by succession, or purchased by some other lawful acquisition; or else born of their *bondwomen*, and called *vernae*. We may add a third kind of bondmen mentioned by Justinian, called *adscriptii glebae*, or *agricensii*; who were not bound to the person, but to the ground or place, and followed by him who had the land. These in our law are called *villains regardants*, as belonging to the manor or place.

BONE-ACE, a game at cards played thus: The dealer deals out two cards to the first hand, and turns up the third, and so on through all the players, who may be seven, eight, or as many as the cards will permit: he that has the highest card turned up to him, carries the bone; that is, one half of the stake; the other half remaining to be played for. Again, if there be three kings, three queens, three tens, &c. turned up, the eldest hand wins the bone. But it is to be observed, that the ace of diamonds is bone-ace, and wins all other cards whatever. Thus much for the bone; and as for the other half of the stake, the nearest to 31 wins it; and he that turns up or draws 31, wins it immediately.

BONES, their origin, formation, composition, texture, variety, offices, &c. See ANATOMY, Part I.

BONES Whitened for Skeletons. Two processes are described in the *Acta Hoffnieri* for whitening bones. Professor Rau had a method of giving them a great degree of whiteness. By bare exposure to the air, sun, and rain, for a length of time, they become notably white; but the whitest bones, kept in rooms tainted with smoke or fuliginous vapours, grow in a little time yellowish, brownish, and unsightly. It is customary for the purification of bones, to boil them in alkaline liquors; which, by dissolving and extracting the superfluous fat, improve their whiteness.

BONES Hardened and Softened. Boerhaave observes, that alkaline salts render bones harder and firmer, and that acids make them softer and more flexible. These effects succeed in certain circumstances, but not universally; for bones may be hardened and softened both by acids and by alkalies, according to the quantity of saline matter employed, and the manner in which it is applied. Newmann made bones harder and more compact by treating them with the strongest of the mineral acids; though, when the acid is in sufficient proportion, it destroys or dissolves them. In Papin's digester (a strong close vessel, in which the steam of boiling liquors is confined, and the fluid by this means made to undergo a greater degree of heat than it could otherwise sustain), the hardest bones are reduced in a short time, by the action of simple water, into a soft pap, or jelly; and alkaline liquors produce this effect still sooner.

In the history of the French Academy for the years 1742 and 1743, there is an account that Mr Geoffroy

produced before the academy a small ivory spoon, which, by long lying in mustard, was become flexible and transparent like horn; that Mr Fouchy saw an ivory spoon, which, by lying for a considerable time in milk, was become supple like leather; and that Mr Hunauld produced bones, which had been softened by steeping in vinegar, afterwards hardened to their natural state by steeping in water, and softened a second time by steeping in vinegar. Dr Lewis observed that the nitrous and marine acids diluted, and the aceticous acid, make bones flexible and tough like leather; but that the diluted vitriolic acid, though it renders them notably soft, makes them at the same time brittle. It seems as if a great part of the earthy matter, which is the basis of the bone, and on which its hardness depends, was dissolved and extracted by the three first; whilst the latter, incapable of dissolving this kind of earth into a liquid form, only corrodes it into a kind of felenitic concrete, which remains intermixed in minute particles among the gelatinous matter. Dr Lewis did not find that the softened bones, whatever acid they were softened by, recovered their hardness by steeping in water. Slips of softened ivory, after lying above a month in water, continued nearly as soft as when they were taken out of the acid liquor.

There is a singular induration of bones produced by fire; the effects of which agent are here remarkably different according to its degree and the circumstances of its application. Bones exposed to a moderate fire, either in open vessels, or in contact with the burning fuel, become opaque, white, and friable throughout; and an increase of fire, after they have once suffered this change, renders them only more and more friable. But if they are urged at first with a strong fire, such as that in which copper or iron melts, they become hard, semitransparent, and sonorous, like the hard mineral stones. This curious experiment deserves to be further prosecuted.

Colouring of BONES. Bones may be stained of a variety of colours by the common dyeing infusions and decoctions of animal and vegetable substances. They are stained also, without heat, by metallic solutions; and by means of these may be spotted or variegated at pleasure. Thus, solution of silver in aqua fortis gives a brown or black according to its quantity; solution of gold in aqua regia or in spirit of salt, a fine purple; solution of copper in the aceticous acid, a fine green; and solutions of the same metal in volatile alkalies, a blue, which at first is deep and beautiful, but changes, upon exposure to the air, into a green or bluish-green. If the bone is but touched with the two first solutions, and exposed to the air, it does not fail to acquire the colour in a few hours: In the two latter, it requires to be steeped for a day or longer in order to its imbibing the colour. In these and other cases where immersion for some time is necessary, the bone may be variegated, by covering such parts as are to remain white, with wax or any other matter that the liquor will not dissolve or penetrate.

Oeconomical Uses of BONES. Bones are a very useful article, not only for making different kinds of toys, but likewise in several of the chemical arts; as, For making cast iron malleable, for absorbing the sulphur of sulphureous ores; for forming tests and cupels, or vessels for refining gold and silver with lead, (burnt

bones composing a mass of a porous texture, which absorbs the vitrified lead and other matters, while the unvitrefcible gold and silver remain entire behind; for the preparation of milky glasses and porcelains; for the rectification of volatile salts and empyreumatic oils; and for making glue. The bones of different animals are not equally fit for these uses: even the glue, or gelatinous part of the bones of one animal is notably different both in quantity and cohesiveness from that of another.

The human skull-bone, or cranium, the natural defence of the seat of sensation and perception in the noblest animal, has been recommended medicinally as a cure for epilepsies, deliria, and all disorders of the senses, from the same philosophy which ascribed antiaethmatic virtues to the lungs of the long-winded fox; and expected, because fowls are said to digest even small stones, that the skin of the gizzard, dried and powdered, would produce a similar effect in the human stomach. To such lengths of extravagance have the fons of physic been carried by the blind superstition of former ages!

BONES in the Funeral Solemnities of the Ancients.—Divers usages and ceremonies relating to the bones of the dead have obtained in different ages; as gathering them from the funeral pile, washing, anointing, and depositing them in urns, and thence into tombs; translating them, which was not to be done without the authority of the pontiffs; not to say worshipping of them, still practised to the bones of the saints in the Romish church. Among the ancients, the bones of travellers and soldiers dying in foreign countries were brought home to be buried; till, by an express S. C. made during the Italic war, it was forbid, and the soldiers bones ordered to be buried where they died.

The Romans had a peculiar deity under the denomination of *Osifago*, to whom the care of the induration and knitting of the human bones was committed; and who, on that account, was the object of the adoration of all breeding women.

Fossile, or Petrified BONES, are those found in the earth, frequently at great depths, in all the strata, even in the bodies of stones and rocks; some of them of a huge size, usually supposed to be the bones of giants, but more truly of elephants or hippopotami. It is supposed they were reposit in those strata when all things were in a state of solution; and that they incorporated and petrified with the bodies where they happened to be lodged.

We often find in the earth petrified bones, greatest part of their gelatinous matter being extracted by the moisture, and a stony one introduced in its room. In some parts of France petrified bones are met with which have an impregnation of copper. Hence, on being calcined in an open fire, a volatile salt is produced from the remains of their gelatinous principle, and the bone is tinged throughout of a fine greenish-blue colour, copper always striking a blue with volatile alkalies. The French turcoise stones are no other than these bones prepared by calcination: they are very durable, and bear to be worked and polished nearly in the same manner as glass; without the imperfection, inseparable from glassy bodies, of being brittle. See the article *TURCOISE*.

There have lately been discovered several enormous

skeletons, five or six feet beneath the surface, on the banks of the Ohio, not far from the river Miume in America, 700 miles from the sea-coast. Some of the tusks are near seven feet long; one foot nine inches at the base, and one foot near the point; the cavity at the root or base, 19 inches deep. Besides their size, there are several other differences which will not allow the supposition of their having been elephants: the tusks of the true elephant have sometimes a very slight lateral bend; these have a larger twist, or spiral curve, towards the smaller end: but the great and specific difference consists in the shape of the grinding teeth; which, in these newly found, are fashioned like the teeth of a carnivorous animal; not flat and ribbed transversely on their surface like those of the modern elephant, but furnished with a double row of high and conic processes, as if intended to masticate, not to grind, their food. A third difference is in the thigh-bone, which is of great disproportionable thickness to that of the elephant; and has also some other anatomical variations. These fossile bones have been also found in Peru and the Brazils; and when cut and polished by the workers in ivory, appear in every respect similar. It is the opinion of Dr Hunter, that they must have belonged to a larger animal than the elephant; and differing from it, in being carnivorous. But as yet this formidable creature has evaded our search; and if, indeed, such an animal exists, it is happy for man that it keeps at a distance; since what ravage might not be expected from a creature, endowed with more than the strength of the elephant, and all the rapacity of the tiger?

BONE-SHAVIN. See *FARRIERY*, § XXVI.

BON-ESPERANCE, the fame with the Cape of Good Hope. See *GOOD HOPE*.

BONET (*Theophilus*), an eminent physician born at Geneva, March 15th 1620. He took his degree in physic in 1643, after he had gone through most of the famous universities, and was for some time physician to the duke of Longueville. Mean while his skill in his profession got him considerable practice; but being seized with deafness, it obliged him to retire from business, which gave him leisure to collect all the observations he had made during a practice of 40 years. He wrote, 1. *Polyalthes, sive Thesaurus Medico Practico*, 3 vols folio. 2. *Labyrinthi Medici extricati*. 3. *Medicini Septentrionalis Collatitia*; and other works.

BONFADIO (James), one of the most polite writers of the 16th century, was born in Italy, near the lake Garda. He was secretary to the cardinal de Bari, and after his death to the cardinal Ghinucci. He afterwards read public lectures on Aristotle's politics, and on rhetoric; and was made historiographer to the republic of Genoa. He applied himself to compose the annals of that state, in which he wrote too satirically on some families. This creating him enemies who were resolved to ruin him, they accused him of the unnatural sin; and, as witnesses were found to convict him of it, he was condemned to be burnt. Some say that this sentence was executed; and others, that his punishment was changed, and that he was beheaded. This was in the year 1560. Upon the day of his execution he wrote a note to John Baptist Grimaldi, to testify his gratitude to the persons who had endeavoured to serve him; and promised to inform them how he

found

Bonfinius
Boniface.

found himself in the other world, if it could be done without frightening them. But it does not appear that he performed his promise, any more than the many who had promised the like before him.—His history of Genoa is esteemed. We have also some letters, some orations, and Latin and Italian poems, of his, which were printed at Bologna, in the year 1744, octavo.

BONFINIUS (Anthony), flourished in the 15th century. He was a native of Ascoli in Italy, and attached himself to the study of the belles lettres. Matthias Cowin king of Hungary, having heard of his learning, sent for him, retained him, and settled upon him a good pension. He wrote, 1. A history of Ascoli. 2. A treatise of virginity and conjugal chastity. 3. An history of Hungary; and other works.

BONFRERIUS (James), a learned Jesuit, born at Dinant, in 1573. He wrote a commentary on the Pentateuch, and learned notes on the Onomasticon of the places and towns mentioned in the Scripture. He died at Toumay in 1643, aged 70.

BONGARS (James), in Latin *Bongarsius*, a native of Orleans, was one of the most learned men of the 16th century. He applied himself to the study of critical learning, and was for near 30 years employed in the most important negotiations of Henry IV. whose resident he was several times at the courts of the princes of Germany, and at length his ambassador. He was of the Protestant religion; and, when very young, had the courage to write and post up in Rome a very spirited answer to a bull of Pope Sixtus V. The public is obliged to him for the edition of several authors who have written the History of the expeditions to the Holy Land; he also published, among other works, an edition of Justin, in which he restored several passages that had been corrupted, by consulting valuable manuscripts, and added notes which explained many difficulties. He died in 1612, aged 58.

BONIFACE, the name of several eminent men, particularly of nine popes. To the first of these, who was chosen pope in 418, St Augustine dedicated his four books against the two epistles of the Pelagians. The third of that name prevailed upon the emperor Phocas to consent that the title of *Universal Bishop* should be conferred on no other than the bishop of Rome. Boniface IV. obtained from the same emperor, the pantheon, a famous heathen temple built by Agrippa, and converted it into a church which is now called "Our Lady della Rotunda." Several works are also attributed to him, but they appear to be spurious. Boniface VII. hath the title of *antipope*; because in 974 he caused Benedict VI. to be strangled in prison, and after the election of Benedict VII. removed the treasures of the church to Constantinople. He, however, at length returned after the death of Benedict, and caused his successor John XIV. to be murdered; but died himself soon after, and was dragged naked by the feet about the streets. Boniface VIII. canonized St Lewis in 1297, and in 1300 appointed the jubilee to be solemnized every 100 years after.

BONIFACE is also the name of a faint, who before he took that name was called *Winifred*, and was born at Kirton in Devonshire. He chose to go and preach the gospel among the barbarous nations; and though created archbishop of Mentz, soon after resigned his office, to go and preach in East Friesland, where he

was killed by the Pagans on the 5th of June 754. His letters were published by Senarius.

BONIFACIO, a town in the island of Corfica, beyond the mountains, near the straight called *Bocca di Bonifacio*. It is well fortified, and pretty populous. E. Long. 9. 20. N. Lat. 41. 25.

BONIS NON AMOVENDIS, in law, is a writ directed to the sheriffs of London, &c. charging them, that a person against whom judgment is obtained, and prosecuting a writ of error, be not suffered to remove his goods until the error is determined.

BONN, an ancient and strong city of Germany, in the Electorate of Cologne, and the usual residence of the elector. It is of great consequence in the time of war; because it is seated on the Rhine, in a place where it can stop every thing that comes down that river. It is well fortified by the elector, who has a fine palace and beautiful gardens in the city. E. Long. 7. 5. N. Lat. 50. 44.

BONNA, (anc. geog.), one of the 50 citadels built by Drusus on the Rhine; supposed by some to be the same with the *Ara Ubionum*: now *Bonn* *.

BONNEFONS (John), a Latin poet born at Clermont in Auvergne, and lieutenant-general of Bar fur Seine, acquired great reputation by his *Pancharis*, and other poems. He died under the reign of Lewis XIII. He ought not to be confounded with John Bonnefons his son, another Latin poet.

BONNER (Edmund), bishop of London, of infamous memory, was born at Hanley in Worcestershire, and generally supposed to be the natural son of one Savage a priest; and that priest was the natural son of Sir John Savage of Clifton in the same county. Strype, however, says, he was positively assured that Bonner was the legitimate offspring of a poor man, who lived in a cottage known to this day by the name of *Bonner's place*. About the year 1512, he entered student of Broadgate Hall in Oxford. In 1519, he was admitted bachelor of the canon and civil law. About the same time he took orders, and obtained some preferment in the diocese of Worcester. In 1525, he was created doctor of canon law. Having now acquired the reputation of a shrewd politician and civilian, he was soon distinguished by cardinal Wolsey, who made him his commissary for the faculties, and heaped upon him a variety of church-preferences. He possessed at the same time the livings of Blaydon and Cherry-Burton in Yorkshire, Ripple in Worcestershire, east Dereham in Norfolk, prebend of St Paul's, and the archdeaconry of Leicester. Bonner was with the cardinal at Caw-wood, when he was arrested for high treason. After the death of that minister, he soon found means to insinuate himself into the favour of Henry VIII. who made him one of his chaplains, and employed him in several embassies abroad, particularly to the pope. In 1532, he was sent to Rome, with Sir Edward Kame, to answer for the king, whom his Holiness had cited to appear in person or by proxy. In 1533, he was again dispatched to pope Clement VII. at Marfeilles, upon the excommunication of king Henry on account of his divorce. On this occasion he threatened the pope with so much resolution, that his Holiness talked of burning him alive, or throwing him into a caldron of melted lead; upon which Bonner thought fit to decamp. His infallibility did not foresee that the man whom he thus threat-

Bonifacio
Bonner.

Bononcin.

threatened was predestined to burn heretics in England. In 1538, being then ambassador at the court of France, he was nominated bishop of Hereford; but, before consecration, was translated to the see of London, and enthroned in April 1540.—Henry VIII. died in 1547, at which time Bonner was ambassador with the emperor Charles V. During this reign he was constantly zealous in his opposition to the pope; and, in compliance with the king, favoured the reformation. Henry VIII. was not to be trifled with; but, on the accession of young Edward, Bonner refused the oath of supremacy, and was committed to the fleet; however, he soon thought fit to promise obedience to the laws, and was accordingly released. He continued to comply with reformation; but with such manifest neglect and reluctance, that he was twice reprimanded by the privy council, and in 1549, after a long trial, was committed to the Marshalsea, and deprived of his bishopric. The succeeding reign gave him ample opportunity of revenge. Mary was scarce seated on the throne before Bonner was restored to his bishopric; and soon after appointed vicar-general and president of the convocation. From this time he became the chief instrument of papal cruelty: he is said to have condemned no less than 200 Protestants to the flames in the space of three years. Nor was this monster of a priest more remarkable for his cruelty than his impudence. When Queen Elizabeth came to the crown, he had the insolence to meet her, with the rest of the bishops, at High-gate. In the second year of her reign, refusing to take the oath of allegiance and supremacy, he was again deprived, and committed to the Marshalsea; where he died in 1569, after ten years confinement. There cannot be a stronger instance of the comparative lenity of the Protestant church, than its suffering this miscreant to die a natural death. Several pieces were published under his name.

BONNESTABLE, a town of Le Maine in France, which carries on a great trade in corn. E. Long. o. 30. N. Lat. 48. 11.

BONNET, in a general sense, denotes a cover for the head, in common use before the introduction of hats. Bonnets are still used in many parts of Scotland.

BONNET, in fortification, a small work consisting of two faces, having only a parapet with two rows of palisadoes, of about ten or 12 feet distance; it is generally raised before the salient angle of the counterescarp, and has a communication with the covered way, by a trench cut through the glacis, and palisadoes on each side.

BONNET à Pretre, or *Priest's Bonnet*, in fortification, is an out-work, having at the head three salient angles, and two inwards. It differs from the double tenaille only in this, that its sides, instead of being parallel, are like the *queue d'aronde*, or swallow's tail, that is, narrowing, or drawing close at the gorge, and opening at the head.

BONNET, in the sea-language, denotes an addition to a sail; thus we say, lace on the bonnet, or shake off the bonnet.

BONNEVAL (Claudius Alexander de) count, known in the latter part of his life by the name of *Ojnan Bashaw*, descended from a family related to the blood-royal of France, entered himself at the age

of 16 in the service of that crown, and married the daughter of marshal de Biron. He made the campaign in Flanders in 1690; but soon after left the French army, and entered into the imperial service under prince Eugene, who honoured him with an intimate friendship. The intrigues of the marquis de Prié, his inveterate enemy, ruined his credit, however, at the court of Vienna, and caused him to be banished the empire. He then offered his service to the republic of Venice, and to Russia; which being declined, his next tender was to the Grand Signior, who gladly received him; it was stipulated, that he should have a body of 30,000 men at his disposal; that a government should be conferred on him, with the rank of Bahaw of three tails, and a salary of 10,000 aspers a day; and that, in case of a war, he should be commander in chief. The first expedition he engaged in after his arrival at Constantinople, was to quell an insurrection in Arabia Petrea, which he happily effected; and at his return had large offers made him by Kouli Khan, but he did not choose to accept them. Some time after, he commanded the Turkish army against the emperor, over whose forces he gained a victory on the banks of the Danube. But success does not always protect a person against disgrace; for Bonneval, notwithstanding his service, was first imprisoned, and then banished to the island of Chio. The sultan, however, continued his friend; and the evening before his departure made him Bashaw-general of the Archipelago, which, with his former appointment of begerbeg of Arabia, rendered him one of the most powerful persons in the Ottoman empire. In this island he found a retirement quite agreeable to his wishes; but did not long enjoy it, being sent for back, and made *sopigi* or master of the ordnance, a post of great honour and profit. He died in this employment, aged 75, in 1747; and wrote the memoirs of his own life.

BONNEVAL, a town of France, in Beauce, with a fine Benedictine abbey. It is seated on the river Loire, in E. Long. 1. 30. N. Lat. 48. 10.

BONNEVILLE, a town of Savoy, situated on the north side of the river Arve, and subject to the king of Sardinia. E. Long. 6. 50. N. Lat. 46. 18.

BONNY, among miners, a bed of ore, differing only from a squar as being round, whereas the squar is flat. † See *Squat*.

BONNY, a town of France, in the Gatinois, seated at the confluence of a river of the same name with the Loire. E. Long. 2. 54. N. Lat. 47. 36.

BONONIA, (anc. geog.) a town of Italy, in the Gallia Cispadana; a name probably given by the Gauls, there being a *Bononia* in Gallia Belgica. Its ancient name when in the hands of the Tuscan, who were expelled by the Gauls, was *Falquina*. In the 563^d year of the city the Romans led a colony thither; which, about the beginning of the Aetian war, was increased by Augustus, and is the *Colonia Bononiensis* of Tacitus. Now *Bologna*; which see.

BONONIA, (anc. geog.) a town of Panonia Inferior, between Muria to the north-west, and Taurinum to the east.—Another Bononia, a town of Mœsia Superior, on the Danube; now *Bodon*, in Bulgaria. See **BODON**.

BONONIAN. See **BOLONIAN**.

BONONCINI (Giovanni), an eminent composer of music, for some time divided the opinions of the *conservanti* of this kingdom with respect to the comparative merits

merits of himself and the great Handel, which gave occasion for the following epigram said to have been written by Dr Swift:

Some say that Signior Bononcini
Compar'd to Handel's a meer minion;
Others aver, that to him Handel
Is scarcely fit to hold the candle.
Strange! that such high disputes should be
'Twixt *Tweedle Dum* and *Tweedle Dee*.

There is one opera (Italian) published, with his name prefixed to it, intitled *Pharances*; but whether the words, or only the music, are his composition, is uncertain; and indeed, in the general, the language of those pieces written merely for musical representation, is so extremely paltry, and so opposite to every thing that can be deemed poetry, that the greatest compliment that can be paid to the authors of them is, to suffer their names to lie buried in the shades of obscurity.

BONOSIANI, or **BONOSIACI**, an ancient branch of *Adoptians*, in the fourth century, denominated from their leader Bonofus, a bishop of Macedonia. The Bonofiani were prior to the Feliciani, and even to Nestorius; whence some rather consider them as a branch of Arians. They allowed Christ to be no otherwise the Son of God than by adoption.

BONPOURNICKEL, a coarse kind of bread used in Westphalia. See **BREAD**.

BONTIA, **WILD OLIVE** or **BARBADOES**; a genus of the angiospermia order, belonging to the didymia class of plants. Of this genus there are two species, the daphnoides and the germinans. The first hath a woody stem and branches; rising to the height of ten feet, with narrow, smooth, thickish leaves, crenated at the edges; and flowers from the sides of the branches, succeeded by large oval fruit that sometimes ripen in England. This species is greatly cultivated in the gardens at Barbadoes for making of hedges; for which purpose it is exceedingly proper, it being an evergreen of very quick growth. It is said, that from cuttings planted there in the rainy season, when they have immediately taken root, there has been a complete hedge, four or five feet high, in 18 months. The second sort has been reckoned by many botanic writers to be a species of the mangrove tree, as it grows in swamps, which they also do. It rises 14 or 16 feet high, sending out several small branches which incline downward toward the water, and as soon as they reach that, put out roots into the mud, whereby they propagate very fast: these branches are garnished with leaves placed opposite; they are of a thick substance like those of the bay tree, about two inches long and one broad, very smooth on their surface: the flowers are white, and come out in spikes from the upper branches. This hath been also by some supposed to be the *anacardium orientale*. These plants are easily propagated, either by seeds or cuttings, sown or planted on a hot-bed; but they must be kept constantly in the stove.

BONUS HENRICUS. See **CHENOPodium**.

BONZES, Indian priests. The Tonquinese have a pagod or temple in each town; and each pagod has at least two bonzes belonging to it: some have 30 or 40. These bonzes, in order to distinguish themselves from the laity, wear a chaplet about their necks consisting of 100 beads; and carry a staff, at the end of which is a wooden bird. They live upon the alms of the people; yet are very charitably disposed, and main-

tain several orphans and widows out of their own collections.

The bonzes of China are the priests of the Fohists, or sect of Fohi. It is one of their established tenets, that there are rewards allotted for the righteous, and punishments for the wicked, in the next world; and that there are various mansions in which the souls of men will reside, according to their different degrees of merit. But, in order to deserve the favour of heaven, the bonzes instruct the people to treat the priests with respect and reverence, to support and maintain them, and to erect temples and monasteries for them. They tell them, that, unless they comply with these injunctions, they will be cruelly tormented after death, and pass through a disagreeable variety of transmigrations: in short, that they will be changed into mules, asses, rats, and mice.

The Chinese bonzes, according to F. le Compte, are no better than a gang of dissolute idle fellows. All their aim is to incite people to commiserate their abject condition: to which end they have recourse to several tricks and impostures. When the common arts of address fail them, they try what public acts of penance will do. Some of them drag heavy chains 30 feet long after them; some sit in the highway knocking their heads against flint-stones; others set particular drugs on fire upon their heads: all these are several ways of drawing the attention and exciting the compassion of the people, and they seldom fail of success.

The bonzes of Japan are, for the generality, gentlemen of the highest extraction; for when a gentleman of quality finds his family grow too numerous, nay, when he has only two sons, he generally makes the youngest a bonze, to prevent all domestic broils and confusions. These priests are dressed in various colours; their apartments are very commodious, and situated in the healthiest parts of the country.

F. Navarette tells us, that the bonzes are obliged to chastity; and that, on the 2^d of April 1667, a petty king of Canton had condemned 11 of them to be burnt alive for incontinence. He adds, that it was reported of an empress of the last reigning family, who had a particular kindness for the bonzes, that she granted them a dispensation for the use of women during three days. The bonzes of China, according to the same author, are computed at 50,000.

BOOBY, in ornithology. See **PELICANUS**.

BOOK, the general name of almost every literary composition; but, in a more limited sense, is applied only to such compositions as are large enough to make a volume. As to the origin of books or writing, those of Moses are undoubtedly the most ancient that are extant: But Moses himself cites many books that behoved to be written before his time.

Of profane books, the oldest extant are Homer's poems, which were so even in the time of Sextus Empiricus; though we find mention in Greek writers of seventy others prior to Homer; as Hermes, Orpheus, Daphne, Horus, Linus, Musæus, Palamedes, Zoroaster, &c.: but of the greater part of these there is not the least fragment remaining; and of others, the pieces which go under their names are generally held, by the learned, to be supposititious.

Several sorts of materials were used formerly in making books: Plates of lead and copper, the barks of trees,

trees, bricks, stone, and wood, were the first materials employed to engrave such things upon as men were willing to have transmitted to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes mention of some pillars, preserved in Crete, on which the ceremonies practised by the Corybantes in their sacrifices were recorded. Hesiod's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Bœotia: The ten commandments, delivered to Moses, were written upon stone; and Solon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients: When of wood, they were frequently covered with wax, that people might write upon them with more ease, or blot out what they had written. The leaves of the palm-tree were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees, as the lime, the ash, the maple, and the elm; from hence comes the word *liber*, which signifies the inner bark of the trees: and as these barks are rolled up, in order to be removed with greater ease, these rolls were called *volumen*, a volume; a name afterwards given to the like rolls of paper or parchment.

Thus we find books were first written on stones, witness the Decalogue given to Moses: Then on the parts of plants, as leaves chiefly of the palm-tree; the rind and barks, especially of the tilia, or phillyrea, and the Egyptian papyrus. By degrees wax, then leather, were introduced, especially the skins of goats and sheep, of which at length parchment was prepared: then lead came into use; also linen, silk, horn, and lastly paper itself.

The first books were in the form of blocks and tables; but as flexible matter came to be wrote on, they found it more convenient to make their books in the form of rolls: These were composed of several sheets, fastened to each other, and rolled upon a stick, or *umbilicus*; the whole making a kind of column, or cylinder, which was to be managed by the umbilicus as a handle, it being reputed a crime to take hold of the roll itself: The outside of the volume was called *frons*; the ends of the umbilicus, *cornua*, which were usually carved, and adorned with silver, ivory, or even gold and precious stones: The title *συλλαβὴς*, was struck on the outside; the whole volume, when extended, might make a yard and a half wide, and fifty long. The form which obtains among us is the square, composed of separate leaves; which was also known, tho' little used, by the ancients.

To the form of books belongs also the internal œconomy, as the order and arrangement of points and letters into lines and pages, with margins and other appurtenants. This has undergone many varieties. At first the letters were only divided into lines; then into separate words; which, by degrees, were noted with accents, and distributed, by points and stops, into periods, paragraphs, chapters, and other divisions. In some countries, as among the orientals, the lines began from the right and ran leftward; in others, as the northern and western nations, from left to right; others, as the Greeks, followed both directions, alternately going in the one, and returning in the other, called *boustrophædon*: In most countries, the lines run from one side

to the other; in some, particularly the Chinese, from top to bottom.

Everlasting Book.—We find in Signior Castaquo's account of the asbestus, a scheme for the making of a book, which, from its imperishable nature, he is for calling the *book of eternity*. The leaves of this book were to be of the asbestus paper, the covers of a thicker sort of work of the same matter, and the whole sewed with thread spun from the same substance. The things to be commemorated in this book were to be written in letters of gold; so that the whole matter of the book being incombustible, and everlastingly permanent against the force of all the elements, and subject to no changes from fire, water, or air, must remain for ever, and always preserve the writing committed to it. He carried this project so far towards execution, as to find a way of making a sort of paper from the asbestus, which was so tractable and soft, that it very well resembled a thin parchment; this, by the same process, was capable of being thickened or thinned at pleasure, and in either state equally resisted the fire. The covering of the thinnest kind of this paper with fire, only makes it red hot and very clear, the fire seeming to pass through it without wasting or altering any part of it. Copper, iron, or any other metal except gold or silver, exposed to the same degree of fire in the same thin plates, would be found not to bear it in this manner, but to scale, and burn it into scoræ at the surface, which this stone does not.

Book-Binding. The art of gathering together and sewing the sheets of a book, and covering it with a back, &c. It is performed thus: The leaves are first folded with a folding-stick, and laid over each other in the order of the signature; then beaten on a stone with an hammer, to make them smooth and open well; and afterwards pressed. They are sewed upon bands, which are pieces of cord or packthread; six bands to a folio book; five to a quarto, octavo, &c.; which is done by drawing a thread through the middle of each sheet, and giving it a turn round each band, beginning with the first and proceeding to the last. After this the books are glued, and the bands opened and scraped, for the better fixing the pasteboards; the back is turned with a hammer, and the book fixed in a press between two boards, in order to make a groove for fixing the pasteboards; these being applied, holes are made for fixing them to the book, which is pressed a third time. Then the book is at last put to the cutting press, betwixt two boards; the one lying even with the press, for the knife to run upon; the other above it, for the knife to run against: after which the pasteboards are squared.

The next operation is the sprinkling the leaves of the book; which is done by dipping the brush into vermilion and sap-green, holding the brush in one hand, and spreading the hair with the other; by which motion the edges of the leaves are sprinkled in a regular manner, without any spots being bigger than the other.

Then remains the covers, which are either of calf-skin or of sheep-skin: these being moistened in water, are cut out to the size of the book; and then smeared over with paste made of wheat-flour; and afterwards stretched over the pasteboard on the outside, and doubled over the edges withinside; after having first taken off the

the four angles, and indented and platted the cover at the head-band: which done, the book is covered, and bound firmly between two bands, and then set to dry. Afterwards it is washed over with a little paste and water, and then sprinkled with a fine brush, unless it

should be marbled; when the spots are to be made larger by mixing the ink with vitriol. After this the book is glazed twice with the white of an egg beaten, and at last polished with a polishing iron passed hot over the glazed cover.

B O O K - K E E P I N G

IS the art of recording mercantile transactions in a regular and systematic manner.

1. A merchant's books should contain every particular which relates to the affairs of the owner. They should exhibit the state of all the branches of his business, the connection of the different parts, the amount and success of the whole. They should be so full and so well arranged, as to afford a ready information in every point for which they may be consulted.

The matter which the books should contain is comprehended under the three following heads: First, The debts which are owing to the owner, and the debts which he owes to others. Secondly, The goods and other articles of property which belonged to him; the quantity and value sold, or otherwise disposed on; and the quantity and value which still remain in his possession. Thirdly, The amount of his stock when the books were opened; the profits he has obtained, and the losses he has suffered, since; and the amount of his stock at present.

That method of book-keeping which answers these purposes most clearly and concisely, is the best. The Italian method by *double entry*, is generally preferred; at least, it is founded upon the most universal principles, and is the most convenient in extensive and complicated business: and the accountant who understands it, will find little difficulty in following, or even in inventing other methods that are better accommodated to any particular purpose.

The Italian method requires three principal books; the Waste-Book, Journal, and Leger.

SECT. I. *Of the WASTE-BOOK.*

2. The waste-book, or day-book, contains an exact register of all occurrences in business in the same order as they take place. It begins with an inventory of every thing belonging to the owner, a list of the debts due to him, and of the debts he owes to others: It is carried on with a full relation of all the money he receives or pays; of all the goods he buys or sells; and of every other occurrence in his business. Each article should be entered as soon as the transaction takes place, and should be clearly expressed in the plainest language. It should require no supply from the accountant's memory, but should be fully intelligible to any person, however unacquainted with the business: at the same time, it should be written with all convenient brevity; and, therefore, sometimes refers to invoices and other accounts, for particulars. The accountant's first care should be to have nothing defective or ambiguous; his second, to have nothing superfluous.

3. The date is written in text on the top of each page. The articles are separated from each other by

VOL. II.

a line; and the transactions of one day are separated from those of another by a double line, in the middle of which there is left a blank space for inserting the day of the month. This book must be kept with the greater care, as it contains the materials from which the other books are composed; and any error or defect will occasion a like one in the others. Besides, it is the book whose authority is trusted to, and which must be exhibited to judges, or arbiters, when an account is disputed. As the journal is filled up from the waste-book, the authority of the former is esteemed more authentic, unless there be an obvious mistake through hurry; and either of these books is depended on rather than the ledger, which, from its form, is more liable to error, and may be more easily vitiated by a fraudulent design.

4. As the waste-book contains the whole substance of the business, it may be applied so as to afford any information that can be wanted: but the labour of consulting it would be very great. For instance, if it were required to know how much any person owes us, we must look over the book from the beginning, and mark down every article in which we have dealt with him: or, if it were required to know what quantity of goods we should have on hand, we must look over the whole book, and mark down every article bought or sold. This operation would not only be found very tedious, but much exposed to the risk of omissions. To prevent these inconveniencies, another book is used, in which the articles are arranged in a methodical order. This book is called the *Leger*, and we shall consider it next; because the journal, though it comes before it in the order of writing, cannot be well understood, till the nature of the ledger be explained.

SECT. II. *Of the LEGER.*

5. In the ledger, articles of the same kind are collected together; and, for that purpose, it is divided into many accounts, under which the different branches of business are arranged. Each account is introduced by a proper title, to explain the nature of the articles it contains; and articles of opposite kinds, which belong to the same account, are placed on the opposite pages of the same folio: for instance, money received on the one side, and money paid on the other; or goods bought on the one side, and goods sold on the other. The left-hand page is called the *Debtor* or *Dr.* side of the account, and the right-hand page the *Creditor* or *Cr.* side. The difference between the sums of the *Dr.* and *Cr.* sides is called the *Balance*.

Accounts in the ledger are of three kinds, which answer to the three purposes of book keeping mentioned § 1.

6. First, Personal Accounts. It is necessary to

open an account for every person or company with whom there are any dealings on credit. At opening the books, if they be indebted to the owner, the debt is entered on the Dr.; but, if he be indebted to them, it is entered on the Cr. During the course of the business, goods sold on trust, money paid, and every thing for which they are accountable to him, is entered on the Dr.; but goods bought on trust, money received, and every thing for which he is accountable to them, is entered on the Cr. The balance shews how much they owe him, when the Dr. side is greatest; and how much he owes them, when the Cr. side is greater.

7. Secondly, Real Accounts. By this we understand accounts of property of whatever kind, such as ready money, goods, houses, lands, ships, shares in public companies, and the like.

The account of ready money is entitled *Cash*. On the Dr. side, the money on hand at opening the books is entered, and afterwards every article of money received. On the Cr. side, there is entered every article of money paid out; and the balance shows how much ought to be on hand. The sum of the Dr. side of this account is always greater than that of the Cr. side.

8. Accounts of goods are generally ruled with inner columns for entering the quantities. When the books are opened, the goods on hand are entered on the Dr. side of the respective accounts; the quantities being placed in the inner, and the values in the outer column. Goods bought are entered in the same manner, and goods sold are entered on the Cr. side; the quantities and values being placed in the proper columns. Charges laid out on goods are entered on the Dr. side; and, when an incidental advantage arises from them, such as public bounty, it is entered on the Cr.

If the sums of the inner columns on the opposite sides be equal, it shows that the goods are all sold, and then the balance of the money-column shows the gain or loss. If the Cr. side be greater, it is gain; if the Dr. side be greater, it is loss. If the sum of the inner column be greater on the Dr. side, it shows that part of the goods are on hand; and their value must be added to the sum of the Cr. side, in order to determine the gain or loss.

9. If there be two or more kinds of the same sort of goods, they may be entered in the same account, allowing as many inner columns as there are kinds, and entering the quantities of each kind in the inner column reserved for it. This method exhibits the gain or loss on the whole goods; but does not shew how much of it arises from each kind.

Or, a separate account may be opened for each kind, distinguishing the titles by the qualities, or by some other mark. Thus, one account may be kept for fine linen, another for coarse linen; one for port-wine crop 1772, another for port-wine crop 1773; one for rum from Jamaica, another for rum from Barbadoes. This method shews the gain or loss on each kind.

When there are more kinds than can be conveniently introduced in the same account, they may be divided into several classes, each class being placed in a separate account; and the particular kinds distinguished in inner columns. Thus the account of fine linen may be divided into several columns, for different kinds, distinguished by the number of threads in the breadth, or by any other convenient character.

10. Accounts of ships contain on the Dr. the value of the ship when the books are opened, and all expences laid out thereon; on the Cr. all freights received. In like manner, accounts of houses or lands have the value of the subject, and all repairs, or other charges, entered on the Dr. and all rents or other profits received on the Cr. If the subject be sold in whole or in part, the sale is entered on the Cr. And the balance, after valuing the subject (if any) on hand, shows the gain or loss.

Accounts of property in the public funds, or shares in companies, public or private, contain the value, or money paid in, on the Dr. and the dividends received on the Cr. and are balanced as other real accounts.

Some persons open accounts for household furniture, plate, jewels, books, or the like. The entries on these accounts are made in the same manner.

In general, real accounts contain the value of the property, and all charges on the Dr. and the sales and other returns on the Cr. When the account is to be balanced, if any property remains, the value thereof is placed on the Cr.; and then the balance shows the loss or gain, according as the Dr. or Cr. side is greatest.

11. Thirdly, Accounts of STOCK, PROFIT and LOSS, and its subsidiary accounts, which are sometimes called *fictitious accounts*.

The *Stock* account contains on the Dr. the amount of the debts which the owner owes when the books are opened; and, on the Cr. the amount of ready money, goods, debts, and property of every kind belonging to him: therefore the balance shows what his net stock is; or, in case of bankruptcy, how much his debts exceed his effects. There is nothing further entered on this account till the books are balanced: and then, if the business has yielded profit, the net gain is entered on the Cr.; if it has been unsuccessful, the net loss is entered on the Dr.: after which, the balance shows the net stock at the time the books are closed.

12. The *Profit and Loss* account contains every article of gain on the Cr. and every article of loss on the Dr. The balance shews the net gain or loss, and is transferred to the proper side of the stock-account, as mentioned above. This account is partly composed of articles that occur while the books are running. For example, legacies received are entered on the Cr. goods destroyed on the Dr. The rest of the articles are those of gain and loss, arising from the real accounts, which are collected when the books are balanced.

13. It has been found convenient to open several subsidiary accounts, in order to shorten and methodize that of profit and loss. These contain certain articles of gain or loss, which may be reduced under distinct heads. They are in effect so many parts of the profit and loss account, and their balances are entered on the proper side of that account when the books are closed. The chief of these accounts are the following.

Interest account, Which contains on the Dr. sums paid or incurred for interest; and on the Cr. sums received, or become due for the same.

Commission account, Which contains on the Cr. articles of gain received or owing us for our trouble in transacting business for others. There are seldom any entries on the Dr.

Charges merchandize, Which contains on the Dr. all charges paid or incurred on the business, which do

not belong to any particular account, as shop-rent, public burdens for trade, clerks wages, postages, and the like. If any of these should afterwards be charged to some other account, the sum so charged is entered on the Cr.

Proper expenses, Which contains on the Dr. money or any thing else, withdrawn from the trade for our private use. There are seldom any entries on the Cr. The amount of this account, as well as the former, is not properly loss; but as it has the same effect in diminishing the stock, it is placed in the same manner to the Dr. of profit and loss.

Loss by bad debts, Which contains on the Dr. such debts as we reckon desperate; and on the Cr. any of these which may happen to be unexpectedly recovered.

Account of abatements, Which contains on the Dr. discounts allowed by us on payments received; on the Cr. discounts (if any) allowed to us on payments made. It is particularly useful in retail business, where discounts are often given, to shew how much they amount to.

Insurance account, Which contains on the Cr. premiums received for making insurances; and, on the Dr. losses sustained on the same. There may be several accounts of this kind, such as insurance against sea hazard, which is the most common; insurance against fire; insurance of lives; and insurance of debts. The balance shows the gain or loss which arises from being concerned in insurance.

More or fewer of these accounts may be used, according as the articles are frequent; and others may be invented to suit the purposes of the business which the books are kept for.

14. Every simple transaction in business belongs to two accounts, and must be entered on the Dr. of the one, and on the Cr. of the other. Thus, when a person becomes indebted to us, the article he owes must be entered on the Dr. of his account; and, if it be for money paid him, it is also entered on the Cr. of cash; if for goods sold, it is entered on the Cr. of the account of goods; if for any thing delivered him by another person at our desire, it is entered on the Cr. of the deliverer's account; if for any wager or bargain, by which we are gainers, it is entered on the Cr. of profit and loss. Thus, in whatever way the debt arises, it is entered on the Cr. of some other account, as well as on the Dr. of the persons account who owes it.

In like manner, when we become indebted to any person, the article we owe must be entered on the Cr. of his account. If it be for money received, it is also entered on the Dr. of cash; if for goods bought, it is entered on the Dr. of the account of goods; if for any thing delivered to another person at our desire, it is entered to the Dr. of the receiver's account; and if it be in consequence of a losing bargain, it is entered on the Dr. of profit and loss.

Again, when goods are received, the transaction is entered on the Dr. of the account of goods. If they be bought for ready money, it is also entered on the Cr. of cash; if on trust, it is entered on the Cr. of the seller; if they be exchanged for other goods, it is entered on the Cr. of the goods delivered; if they be obtained by some profitable business, without any return, it is entered on the Cr. of profit and loss.

When goods are delivered, the transaction is entered

on the Cr. of the account of goods; and, if they be sold for ready money, it is also entered on the Dr. of cash; if on credit, it is entered on the Dr. of the purchaser; if exchanged for other goods, it is entered on the Dr. of the goods received; and, if they be given gratis, or destroyed, it is entered on the Dr. of profit and loss.

Lastly, When any article of loss occurs, the transaction is entered on the Dr. of profit and loss; and as we must either pay it in money or goods, or remain indebted to some person for it, it must be entered on the Cr. of cash, or of goods delivered, or of the person intitled to receive it. And, when an article of gain occurs, it is entered on the Cr. of profit and loss, and also on the Dr. of cash or goods, if money or goods be received; and on the Dr. of the person accountable for it, if not immediately paid.

Thus, every article in any account, whether personal or real, or belonging to profit and loss, corresponds to some other article on the opposite of a different account. The same sum is entered on the Dr. of one account, and on the Cr. of the other; and it follows from this, that, *If all the accounts in the ledger be added, the amount of the sums of the Dr. will be equal to those of the Cr.*

SECT. III. *Of the JOURNAL.*

15. THE journal is a fair record of all the transactions compiled from the waste-book, in the same order as they stand there; but expressed in a technical stile, that it may be transferred to the ledger with more ease.

When we are to enter any article in the journal, we must consider which accounts in the ledger it will require to be placed to, both on the Dr. and Cr. and write [*the former account*] Dr. to [*the latter account*]; then we annex an explanation of the article, and place the sum in the money-column.

EXAMPLE.

Waste-book.) Sold for ready money, 30 yards linen, at 3 s L 4 10 —
 Journal.) Cash Dr. to Linen. Sold 30 yards, at 3 s L 4 10 —

Here we consider, that the article must be entered on the Dr. of cash, because money is received; and on the Cr. of linen, because linen is delivered: Therefore we write *Cash Dr. to Linen*, to which we annex the nature of the transaction. The article thus entered is called a *journal-post*; *Cash* is called the *Dr.*; *Linen* the *Cr.*; the words "*Cash Dr. to Linen*," the *Entry*, and the following words the *Narration*.

The purpose of expressing the article in this form, is to point out the accounts in the ledger, to which it will require to be posted, and thereby enable the accountant to write the ledger with more ease than he could do if it were filled up immediately from the waste-book.

The learner will be able, from this example, to enter any simple article in the journal, providing he knows the accounts to which it should be posted on the Dr. and Cr. of the ledger. This must be collected from the description of the ledger accounts already given, § 6—13. and the nature and tendency of the article.

16. GENERAL RULES for the JOURNAL-ENTRIES.

I. Every thing received, or person accountable to us, is Dr.

II. Every thing delivered, or person to whom we are accountable, is Cr.

17. As the whole art of writing the journal depends on a proper choice of the Drs. and Crs. we shall give some particular rules for the most common cases, and a few examples for the illustration and practice of each.

Rule I. *The person to whom any thing is delivered is Dr. to the thing delivered, when nothing is received in return.*

Therefore when money is paid, the receiver is Dr. to cash.

When goods or other property is sold on credit, the purchaser is Dr. to the thing sold. Thus,

Waite-book.) Paid John Bell in full L 52 — —

Journal.) *John Bell Dr. to Cash*, paid him in full, 52 — —

Waite-book.) Sold 50 yards cloth to J. Hill, at 12 s 30 — —

Journal.) *J. Hill Dr. to Cloth*, sold him 50 yards, at 12 s 30 — —

18. Rule II. *A thing received is Dr. to the person from whom it is received, when nothing is delivered in return.*

Therefore, when money is received, Cash is Dr. to the payer: when goods are bought, the goods are Dr. to the seller. Thus,

Waite-book.) Received from Thomas Gay in full L 72 — —

Journal.) *Cash Dr. to Thomas Gay*, received in full 72 — —

Waite-book.) Bought from J. Hawley 60 lb. wool, at 9 d 2 5 — —

Journal.) *Wool Dr. to J. Hawley*, bought 60 lb. at 9 d 2 5 — —

19. Rule III. *A thing received is Dr. to the thing given for it.*

Therefore goods bought for ready money are Dr. to cash.

When goods are sold for ready money, Cash is Dr. to the goods.

When goods are bartered, the goods received are Dr. to the goods delivered. Thus,

Waite-book.) Bought for ready money 10 hds. wine, at L 15 L 150 — —

Journal.) *Wine Dr. to Cash*, bought 10 hds. at L 15 150 — —

Waite-book.) Sold for ready money 100 gallons rum, at 9 s 45 — —

Journal.) *Cash Dr. to Rum*, sold 100 gallons, at 9 s 45 — —

Waite-book.) Bartered 3 hds. wine, at L 15, for 100 gallons rum, at 9 s 45 — —

Journal.) *Rum Dr. to Wine*, received 100 gallons at 9 s in barter for 3 hds. at L 15 45 — —

20. Rule IV. *Goods and other real accounts are Dr. for all charges laid out on them. If money be laid out,*

they are Dr. to Cash; if any thing else be delivered, they are Dr. to the thing delivered; if the charge be taken on trust, they are Dr. to the person to whom it is due. Thus,

Waite-book.) Paid for repairs to ship Traffick, L 18 — —

Journal.) *Ship Traffick Dr. to Cash*, paid for repairs, 18 — —

Waite-book.) Delivered wood from my timber-yard for repairing the Angel-tavern 15 — —

Journal.) *Angel-tavern Dr. to Wood*, delivered for repairing the same 15 — —

Waite-book.) Due to William Carpenter for repairs to the Angel-tavern 12 — —

Journal.) *Angel-tavern Dr. to William Carpenter*, due him for repairs 12 — —

21. Rule V. *When rents of houses or lands, freights of ships, bounties on goods, or any other profits from real accounts, are received, Cash is Dr. to the account from which the profit arises: if any thing besides money be received, the article received is Dr.: if they remain unpaid, the person who owes them is Dr.* Thus,

Waite-book.) Received freight of the ship Traffick for a voyage to London L 35 — —

Journal.) *Ship Traffick Dr. to Cash*, received freight to London 35 — —

Waite-book.) Received 100 barrels salmon, being the rent of Inver fishery, at 52 s 260 — —

Journal.) *Salmon Dr. to Inver fishery*, received the rent, being 100 barrels, at 52 s 260 — —

Waite-book.) John Public owes me a year's rent of the Angel-tavern 52 — —

Journal.) *John Public Dr. to Angel-tavern*, for a year's rent due by him 52 — —

22. Rule VI. *When an article of loss occurs, Profit and Loss, or some subsidiary account, is Dr. If the loss be paid in ready money, it is Dr. to Cash; if it be paid in any thing else, it is Dr. to the thing delivered. If it remain unpaid, it is Dr. to the person to whom it is owing.* Thus,

Waite-book.) Given my daughter at her marriage L. 500 — —

Journal.) *Profit and Loss Dr. to Cash*, given my daughter at her marriage 500 — —

Waite-book.) Taken for family use from my granary 3 bolls meal, at 13 s 4 d 2 — —

Journal.) *Profit and Loss [or Proper expenses] Dr. to Meal*, taken for family use 3 bolls, at 13 s 4 d 2 — —

Waite-book.) Due James Rich for a year's interest on L. 1000, at 4 per cent 40 — —

Journal.) *Profit and Loss [or Interest account] Dr. to James Rich*, due him a year's interest on L. 1000 at 4 per cent. 40 — —

23. Rule VII. *When an article of gain occurs, that is not immediately connected with any real account, Cash, the article received, or the person accountable for it, is Dr. to Profit and Loss, or to some subsidiary account.* Thus,

Waite-book.) Received for repairs to ship Traffick, L 18 — —

Journal.) *Cash Dr. to Profit and Loss*, received for repairs to ship Traffick 18 — —

Waite-book.) Received 100 barrels salmon, being the rent of Inver fishery, at 52 s 260 — —

Journal.) *Inver fishery Dr. to Profit and Loss*, received the rent, being 100 barrels, at 52 s 260 — —

Waite-book.) Given my daughter at her marriage L. 500 — —

Journal.) *Profit and Loss Dr. to Cash*, given my daughter at her marriage 500 — —

Waite-book.) Taken for family use from my granary 3 bolls meal, at 13 s 4 d 2 — —

Journal.) *Profit and Loss [or Proper expenses] Dr. to Meal*, taken for family use 3 bolls, at 13 s 4 d 2 — —

Waite-book.) Due James Rich for a year's interest on L. 1000, at 4 per cent 40 — —

Journal.) *Profit and Loss Dr. to James Rich*, due him a year's interest on L. 1000 at 4 per cent. 40 — —

Thus,

Waste-book.) Received in a gift from my father,	L 100	---
Journal.) <i>Cash Dr. to Profit and Loss</i> , received from my father	100	---
Waste-book.) Received in like manner at opening shop, 100 yards cloth at 12 s	60	---
Journal.) <i>Cloth Dr. to Profit and Loss</i> , received from my father at opening shop 100 yards, at 12 s	60	---
Waste-book.) James Barbour owes me a year's interest of L. 1000	50	---
Journal.) <i>James Barbour Dr. to Profit and Loss</i> [or <i>Interest account</i>] due by him for a year's interest of L. 1000	50	---

24. Rule VIII. *When one person pays money, or delivers any thing else to another on our account, the person who receives it is Dr. to the person who pays it.* Thus,

Waste-book.) James Goldsmith has paid the bank of Scotland on my account	L 100	---
Journal.) <i>Bank of Scotland Dr. to James Goldsmith</i> , paid them by him	100	---
Waste-book.) Arthur Young has delivered James Baker 100 quarters wheat, for which I am to account to him, at 30 s	150	---
Journal.) <i>James Baker Dr. to Arthur Young</i> , for 100 quarters wheat delivered him on my account, at 30 s	150	---

Payments of this kind are often transacted by bills of exchange.

25. These examples will make the learner acquainted with the form of the journal, and the rules extend to the greatest part of the simple transactions that occur in domestic trade. We may observe, that the technical sense of the words *Dr.* and *Cr.* has an analogy to their meaning in common language, but is not precisely the same. Thus, in *Ex. 1.* Rule VIII. the journal-entry is, *Bank of Scotland Dr. to James Goldsmith*; by which we are not to understand that the bank is indebted to James Goldsmith; for a debt between them has no connection with our business; and therefore ought not to be entered in our books: the meaning of the entry is, that the bank becomes indebted to us by the transactions narrated; and that we become indebted to James Goldsmith by the same.

26. An article which contains more Drs. or more Crs. than one, is called a *complex post*. The form of these will appear from the following examples,

<i>Ex. 1.] Sold William Drapier,</i>	
25 pieces cloth, at L. 15	
per piece	L 375
130 stones wool, at 5 s 6d	
per stone	35 15
	-----L 410 15

If the two articles sold to William Drapier were entered separately in the waste-book, and transferred to

the journal by Rule I. they would stand thus:	
<i>William Drapier Dr. to Cloth</i> , fold him	
25 pieces, at L. 15	L 375
<i>William Drapier Dr. to Wool</i> , fold him	
150 stones, at 5 s 6d	35 15
And if these were posted to the ledger, there would be two articles placed to the Dr. of William Drapier, one to the Cr. of Cloth, and one to the Cr. of Wool.	
But the facts may be entered in the form of one complex journal post, as follows:	
<i>William Drapier Dr. to Sundries,</i>	
<i>To Cloth</i> , for 25 pieces,	
at L. 15	L 375
<i>To Wool</i> , for 150 stones,	
at 5 s 6d	35 15
	-----L 410 15

And then there is only one article on the Dr. of William Drapier in the ledger.

<i>Ex. 2.] Sold 10 pieces cloth to W. Drapier,</i>	
at L 15	L 150
12 ditto to J. Mercer, at do	180
	-----L 330

This example also falls under Rule I. But whereas there was one Dr. and two Crs. in the former example, there are two Drs. and one Cr. in this: William Drapier and John Mercer, the purchasers, are Drs. for their respective quantities; and cloth, which is the only thing delivered, is Cr. for the whole quantity. The journal post is,

<i>Sundries Drs. to Cloth,</i>	
<i>W. Drapier</i> , for 10 pieces, at 15 l.	L 150
<i>J. Mercer</i> , for 12 ditto at 15 l.	180
	-----L 330

<i>Ex. 3.] Bought from H. Hood,</i>	
5 puncheons rum, at L 42,	L 210
3 hds. claret, at 33,	99
2 pipes madeira, at 56,	112
	-----L 421

This example falls under Rule II. The articles received, rum, claret, and madeira, are Drs.; and the person from whom they are received is the only Cr.

<i>Sundries Dr. to Henry Hood,</i>	
<i>Rum</i> , for 5 puncheons, at 42 l.	L 210
<i>Claret</i> , for 3 hds. at 33,	99
<i>Madeira</i> , for 2 pipes, at 56,	112
	-----L 421

<i>Ex. 4.] Bt. 50 qrs. wheat from J. Tull,</i>	
at 35 s	L 87 10
12 from S. Ellis, 36 s 2 1/2	
	-----L 109 2

This example also falls under Rule II. There is only one Dr. wheat being the only thing received; and two Crs. because it is received from different persons.

<i>Wheat Dr. to Sundries.</i>	
<i>To J. Tull</i> , for 50 qrs. at 35 s	L 87 10
<i>To S. Ellis</i> , for 12 qrs. 36 s	21 12
	-----L 109 2

In like manner, examples might be given of complex posts under every rule, which contained either several Drs. or several Crs.; but, as it is unnecessary to enlarge so far, we shall only add a few examples of cases, in which the different parts of the complex article fall under different rules.

Ex. 5.] Sold 150 qrs. beans to A. Arnot,		
at 13s 4d	L. 100	— —
75 ditto to S. Berry,		
at 13s 4d	50	— —
18 ditto, for ready money,	13s 2d	11 17 —
	243	L. 161 17 —

Here beans are delivered, some to different purchasers on trust, and some for ready money. The purchasers are Drs. for the quantities sold to each, by Rule I.; Cash is Dr. for the quantity sold for ready money, by Rule III.; and beans are Cr. for the whole.

<i>Sundries Dr. to Beans.</i>		
A. Arnot for 150 qrs. at 13s 4d	L. 100	— —
S. Berry, for 75	13s 4d	50 — —
Cash, for 18	13s 2d	11 17 —
		L. 161 17 —

Ex. 6.] Bought from David Young		
8 cwt. 3 qrs. copper, at L. 12 per cwt.	L. 105	— —
Paid in part,	L. 50	— —
Balance,	55	— —
		L. 105 — —

Here the article received, copper, is the only Dr.; but, as it is bought partly for ready money, and partly on credit, it is Dr. to Cash for the value of the former, by Rule III. and to the seller for the value of the latter, by Rule II.

<i>Copper Dr. to Sundries.</i>		
For 8 cwt. 3 qrs. at L. 12 per cwt.	L. 105	— —
To Cash in part,	L. 50	— —
To D. Young, for balance due him,	55	— —
		L. 105 — —

Ex. 7.] James Wilson being bankrupt, I have accepted a composition on the debt due by him to me of L. 150, and discharged the same.		
The composition received, at 15s per L., is,	L. 112 10 —	
And the balance left	37 10 —	
		L. 150 — —

Here the whole debt of L. 150, due by James Wilson, is cancelled, and he must therefore be stated as Cr. for that sum. Cash is Dr. for the sum received, by Rule II.; and Profit and Loss, or Loss by bad debts, for the rest, by Rule VI.

<i>Sundries Dr. to James Wilson.</i>		
Cash, for compt. on L. 150,		
at 15s. per L.	L. 112 10 —	
Profit and Loss, for balance left	37 10 —	
		L. 150 — —

Ex. 8.] Shipped for William Smith, per the Bonaventure, Forbes, from Leith to London

1000 yds linen, at 1s 2d	L. 58 6 8
600 lb leather, bought from J. Currier, at 1s	30 — —
Paid charges at shipping	— 13 4
	L. 89 — —

Here William Smith is Dr. for the amount of the cargo; he is debtor to Linen for the quantity delivered, as by Rule I. and to J. Currier for the leather delivered by him, by Rule VIII. and to Cash for the charges paid by us, by Rule I.

<i>William Smith Dr. to Sundries.</i>		
To Linen, for 1000 yards, at 1s 2d	L. 58 6 8	
To J. Currier, for 600 lb. leather, at 1s	30 — —	
To Cash, for charges at shipping	— 13 4	
Shipped per the Bonaventure, Forbes, from Leith to London.		L. 89 — —

27. The learner may be assisted in understanding these and other complex posts, by resolving them into simple ones. Most of them might have been stated in that manner; and the complex form is only preferred, for abridging the ledger. In some articles, the different clauses are so connected, that they cannot be separated with propriety.

The narration is sometimes equally diffused through the post, after the Dr. and Cr. as in the five first examples. Sometimes the chief circumstances are narrated before the Drs. or Crs. be specified, as in Ex. 6.; sometimes after the first, as in Ex. 7.; and sometimes at the end, as in Ex. 8.

28. In some articles, there are both more Drs. and more Crs. than one. These may be entered in one journal-post, *Sundries Dr. to Sundries*, specifying first the Drs. and then the Crs. But, as this method is somewhat confused, we would recommend it, as a better way, to divide the transaction into two journal-posts; so that the first may contain only one Dr. and the second only one Cr.

Ex. Bartered with James Fotheringal 100 pieces ofsnaburgs, at 12s	L. 60 — —
100 lb thread, at 3s 6d	17 10 —
	L. 77 10 —
For 10 hds lintseed, at 50s	L. 25 — —
500 yds linen, at 1s 6d	37 10 —
And received the balance in money	15 — —
	L. 77 10 —

<i>JOURNAL. Sundries Dr. to Sundries.</i>		
Lintseed, for 10 hds at 50s	L. 25 — —	
Linen, for 500 yds, at 1s 6d	37 10 —	
Received in barter from J. Fotheringal		
Cash, for balance	15 — —	
	L. 77 10 —	

To Snaburgs, for 100 pieces, at 12s	L. 60 — —
To Thread, for 100 lb at 3s 6d	17 10 —
Delivered him in barter	
	L. 77 10 —

Or rather,		
<i>Sundries Dr. to James Fotheringal.</i>		
<i>Lintseed</i> , for 10 hds at 50s	L. 25	— —
<i>Linen</i> , for 500 yds, at 15s 6d	37	10 —
Received in barter		
<i>Cash</i> , received balance	15	— —
		L. 77 10 —
<i>James Fotheringal Dr. to Sundries.</i>		
<i>To Ofnaburgs</i> , for 100 pieces, at 12s	L. 60	— —
<i>To Thread</i> , for 100 lb at 3s 6d	17	10 —
Delivered in barter		L. 77 10 —

29. It is neither practicable nor necessary to enumerate all kinds of complex posts that may occur in business. We shall here only mention the entries which occur at opening the books.

The first journal-post contains the substance of the inventory. The entry is *Sundries Drs. to Stock*; the particular Drs. are Cash, the different kinds of goods and other property belonging to us, and the persons indebted to us.

The second journal-post contains the debts due by us. The entry is, *Stock Dr. to Sundries*; the particular Crs. are the persons to whom we are indebted.

The form of these entries is more fully exhibited at the beginning of the following texts.

30. The journal should be written by one person, in a fair hand, and at leisure hours. The articles are separated, and the titles and dates marked in the same manner as in the waste-book, § 3. The entries are written in half text, for ornament and distinction. In the inventory, the designation (or the business, station, and place of residence) of every person is mentioned; and the same is done the first time that any name occurs in journal-entry. At other times, it is sufficient to enter the name without the designation, unless we have dealings with two persons of the same name; in which case, it is always necessary to annex the designation, in order to distinguish them. The narration should be complete, without referring to the waste-book; and so clear, that every person, acquainted with the stile of the journal, may understand it with ease. When the post is written, we mark a dash / against the article, on the margin of the waste-book, to show how far the writing of the journal is advanced.

Sec't. IV. Of POSTING and BALANCING the LEGER.

31. The first thing to be done in the ledger, is to allot a proper space for each account. The accounts may be either opened in the same order that they occur in the journal; or accounts of the same kind may be placed together, the personal accounts on one part of the leger, and the real accounts in another. The accounts of Stock, and Profit and Loss, are generally placed at the beginning. The room which each will require cannot be exactly known, but must be conjectured from the number of transactions that are likely to follow.

The number of the folio is marked in strong text at each corner of the top-line; and the titles of the accounts are written in fair text through both folios, if necessary. The designations of the personal accounts may be written on half text, or Italian hand; and some

write the titles in Saxon hand, for ornament. The word *Dr.* is prefixed to the title on the left-hand page; and *Contra Cr.* annexed to it on the right-hand page.

32. Next, An Index must be provided, for pointing out the folio's where the accounts are opened. The titles of the accounts are entered alphabetically in the index, and the number of the folio annexed. Personal accounts are entered by the first letter of the surname; companies, by the first letter of the firmame of the first partner; and all other accounts, by the first letter of the first word. The most convenient kind of index is a long narrow book, of 24 leaves, one for each letter of the alphabet. A is marked on the top of the first leaf, and the paper pared away below it; B is marked on the second leaf, under A; and the other letters on the following leaves, in the same manner; by means of which we can turn at once to any letter required.

33. In posting the leger, proceed by the following directions. First, look for the *Dr.* of the journal-post in the index, under the proper letter, and this directs you to the folio of the leger where the account is, if it be already opened: if not, you must allot a space for it, write the title, and enter it in the index. Then enter the article on the left-hand page of the account under the title, or the former article, by writing the date on the margin, and the name of the creditor on the line, with the word *To* prefixed, and a short narration of the transaction annexed, and inserting the sum in the money-column, and the quantity, if it be an account of goods, in the inner column. Then turn to the account of the *Cr.* of the journal-post, and enter the article in the right-hand page, prefixing the word *By* to the name of the *Dr.*

34. This being done, turn to the journal, and mark on the margin the number of the folio's to which the article is posted. The figures which point out the reference to the *Dr.* and *Cr.* folio's should be separated by a line: for example, if the *Dr.* entry be on the third folio, and the *Cr.* entry on the fifth, the reference is marked $\frac{3}{5}$. These figures show how far the posting is advanced, and are useful in comparing the books.

The figures for dates or references should be written in a lighter hand than the figures in the columns for money or quantity.

35. There is often a reference-column ruled in the leger, for pointing out the other entry, corresponding to any article. In this column, the folio of the *Cr.* entry is marked against the *Dr.* article, and the folio of the *Dr.* entry against the *Cr.* article.

Sometimes the accounts are numbered according to their order in the leger; and the references, both in the journal and leger, point out the number of the account instead of the folio.

36. In complex posts, turn to the several *Drs.* or *Crs.* in their order, and enter the articles according to the foregoing directions; placing the sums belonging to each in the money-column, against the respective entries.

37. An article in the leger is generally comprehended in one line. The narration should be as full as can be contained in that bounds. If it cannot be narrated completely, the journal is referred to for further particulars, by writing *per Journal*, (or *p. J.*), either after an incomplete narration, or immediately after the *Dr.* or *Cr.* when there is no room for a proper narration.

tion. In complex posts, there can seldom be any narration annexed to the single Dr. or the single Cr. The entry is generally *To Sundries per J. or, By Sundries per J.* If the sense of the whole article can be narrated, it should be done; but it is improper to narrate the first or any other part of the article, and omit the others.

38. When the space allotted for an account in the ledger is filled up, the account must be transported to another folio. For this purpose, add the columns on both sides, and write against the sum, *Transported to folio* , inserting the number of the folio where the new account is opened, in the reference-column, or on the line, if no reference-column be used. Then, after titling the new account, and entering the number of the folio in the index, write on the Dr. *To amount, brought from folio* , inserting the number of the folio where the old account was; and on the Cr. *By amount brought from folio* ; and place the sums, and quantities, if any, in the proper columns.

When either side of an account is full, both sides should be transported, and diagonal lines drawn, to fill up the vacant space of the side which requires it.

39. The books should be written up as frequently as can be done conveniently; so that the journal may keep pace nearly with the waste-book, and the ledger with the journal. Each book should be carefully revised, till it correspond with the journal, and when it is posted. In comparing the ledger, observe the following directions:

Begin with the first journal-post, and turn to the folio of the ledger where the Dr. is entered, which you are directed to by the marginal reference, and compare the date, entry, and sum. If you find them to correspond, it is well; if not, the ledger must be altered, till it correspond with the journal. Then place a dot before the reference-figure in the journal, and a mark A before the sum in the ledger.

Proceed in the same manner to compare the Cr. of the journal-post, and all the following posts in their order. The dots in the journal show how far the comparison is advanced, and the marks in the ledger show what articles are compared.

The sums of accounts transported should be left blank till the books be compared; as an error in any article will occasion an alteration in the sum.

40. Some accountants correct all errors in the ledger, without erasing any thing, by the following methods: 1st, If the sum be entered too small, they make a second entry for the deficiency. 2^d, If it be entered too large, they make an entry on the opposite side for the excess. 3^d, If it be entered on the wrong side of the account, they enter it twice on the other; once, to counterbalance the error, and a second time for the true entry. 4th, If it be entered on a wrong account, they charge the wrong account Dr. to, or Cr. by, the right one.

41. We do not much approve of these methods, as they give the books a confused appearance; and would rather recommend the following rules: 1st, If an article be omitted, do not attempt to interline at the place where it should have been; but insert it under the last article when you discover the omission, and mark a cross X against it on the margin, and another at the place where it should have been. 2^d, If you discover

a mistake immediately when committed, correct it without cancelling any thing, as in this example. *To Cash, say, To James Speirs received to account.* 3^d, If you have written a line entirely wrong, or in a wrong place, write the word *Error* at the end, prefix a cross, and omit or cancel the sum. 4th, Cancel errors, by drawing a line lightly through them, so that the old writing may still be legible; by which it will be evident, that the book has not been vitiated for a fraudulent purpose. The same method should be followed in correcting errors in the journal.

42. When the comparison of the books is finished, glance over the ledger, to observe if the mark of comparison be affixed to every article. If not, you must turn to the journal, and observe if the articles be right which had not been marked.

43. Because the whole sum of the Dr. side of the ledger should be equal to the whole sum of the Cr. § 14. it is proper to try if they correspond. For this purpose, you may add the Dr. of every account, except such as are already balanced, placing the sums in an inner column, and extending them at the end of one or more folios, as you find most convenient, to the outer column; and, as you go along, add the Cr. in the same manner. If the sum total of both sides be equal, it gives a presumption that the books are right; if they differ, there is certainly some mistake. This is called the *Trial-balance*. The labour bestowed upon it is not lost, as the sums may be referred for assisting us to collect the balances; the method of which will be explained afterwards.

44. If the sums of the trial-balance do not correspond, the books must be examined again. For this purpose, begin with the first article on the Dr. side of the first account, and turn to the account where the corresponding entry is, which you will find by the figure in the reference-column. If the articles agree, mark them with a dot. Proceed in like manner with the other articles on the Dr. of the first account; then with the articles on the Cr. of the same; and then with the following accounts in their order, till the error or errors be discovered. In complex entries, observe if the amount of the sums on one side be equal to the sum on the other. When you come to a dotted article, you may pass it by, because it has been examined already.

If the errors be not discovered at the first revival, you must repeat the same operation again, till you bring the books to balance. Marks different from the former ones, or differently placed, may be used, to signify that an article has been examined a second or a third time. As the detection of errors is the most tedious and disagreeable part of book-keeping, the accountant will be induced to guard against them with all possible care, when he has once experienced the trouble which they occasion.

45. Before we explain the method of balancing the books, it will be proper to direct the learner how to balance particular accounts. When we settle accounts with any person, and ascertain how much is owing at either hand, it is necessary to balance his account in the ledger, and open a new one, beginning with the sum that was due according to the settlement; and when we clear accounts again, we must go back to that article, and no farther.

If any articles be charged on either side, at the time
of

of settling, they must be immediately entered on the waste-book; from which they will pass in course to the journal and ledger; and a remark must be entered in the waste-book, that the account was settled, and the balance transferred to the proper side of the new account. This remark is transcribed in the journal; and the ledger account is balanced, when it occurs, in the course of posting.

If the balance be due to you, write on the Cr. *By balance due by him to Dr. new accounts*, and insert the sum due you; after which, the amount of both sides will be equal. Add the account, placing the sums opposite to each other; and, if the sides be unequal, draw a diagonal line through the vacant space of the shorter side, and close the old account by drawing lines under the sums. Then open the new account immediately under the old one, or in a new folio if the old one be full, by writing on the Dr. *To balance of former account due by him*. If the balance be due by you to him, the entries are made on the opposite sides, with the necessary alterations. When the new account is opened in the same folio, it is unnecessary to repeat the title; but the year and month, as well as the day, are repeated at the date of the first article.

46. Sometimes when an account is balanced, one or more articles are left out on purpose: For example, goods lately bought on credit may be left out, and the settlement may only relate to articles of longer standing. When this is the case, if the articles omitted be on the Dr. of the ledger, we write on the Cr. thus, *By articles sold him since 1st January replaced*: and when we have balanced the account, and opened a new one, we write on the Dr. *To articles replaced at settling, furnished since 1st January*: or, if the articles were left out for any other reason, we explain the same in the narration. If the omitted articles be on the Cr. the like entries are made on the opposite sides. It should be noticed in the waste-book and journal when this operation is necessary.

47. When we post any common article from the journal, we enter the sum on the Dr. of one account, and on the Cr. of another: when we balance an account, we place the balance sum on the Dr. of the old account, and on the Cr. of the new one, or contrarywise: and when we replace an article, as above directed, to the Dr. or Cr. of the old account, we place it after balancing to the Cr. or Dr. of the new one. Thus, in these entries, as well as in common posts, there are like sums entered on the Dr. and Cr. of the ledger, and the general equality of the sides is still preserved.

48. Merchants generally balance their books once a year. The design of this operation is, to collect the various branches of their business, diffused through the books, into a concise abstract; to ascertain their gain or loss since the last balance; and exhibit the present state of their funds. If the business be of such a kind, that most of the branches naturally come to an issue at a certain time of year, that time is the proper one for making the balance. Otherwise the end of the year, or the least busy time, may be chosen.

49. It is proper, before balancing, to settle as many personal accounts as possible; to clear all arrears and small charges; to take an exact inventory of the goods on hand, as far as can be done; and affix a moderate value to each article, according to the current prices at

the time; such a value as you would be willing at present to buy for. It is more proper to value the goods on hand in conformity to the current prices, than at prime cost: for the design of affixing any value is to point out the gain or loss, and the gain is in reality obtained, so soon as the prices rise, or the losses suffered so soon as they fall; therefore it is impossible to make up a just state of the affairs, unless the present prices be attended to.

50. These things being done, proceed to make the balance as follows: Prepare two sheets of paper, ruled with money-columns, in the form of Dr. and Cr.; write *Profit and Loss* as the title of the first, and *Balance* as the title of the second.

Prepare also some paper for computing the balances, and mark down the folios, titles, and sums of each account in the ledger, in a regular order. If a trial-balance was made, the sums may be transcribed from it. Pass by such accounts as are already closed; also the accounts of Stock and Profit and Loss, which are always the last of being balanced. Then subtract the lesser sum from the greater, and enter the difference on either of the sheets that the nature of the article points out, and on the side of that sheet which corresponds to the greater sum of the account. More particularly,

In personal accounts, enter the difference, which is the debt owing to you, or by you, on the proper side of the balance-sheet.

In the cash-account, enter the difference, which is the money in hand, on the Dr. side of the balance-sheet.

In accounts of goods or other property, if there be nothing remaining on hand, enter the difference, which is the gain or loss, on the proper side of the profit and loss sheet.

If the whole be still on hand, enter the present value on the Dr. of the balance-sheet; and, if this be different from the prime cost, charges included, enter the difference in the proper side of the profit and loss sheet.

If part be sold, and part on hand, place the value of the quantity on hand under the sum of the Cr. and add them. The sum is the whole return that will be obtained, if the rest of the goods be sold at the estimated value; and this, being compared with the sum of the Dr. which is the whole expense, shows the gain or loss. Enter the same in the proper side of the profit and loss sheet, and enter the quantity and value on hand on the Dr. of the balance-sheet.

Observe if the quantities in the inner columns be equal on both sides, when the goods are all sold; or, if the difference, when only part is sold, be equal to the quantity in hand. If they correspond, you have a just account of the goods. If the Dr. be greater, there is something amissing, which you must enter on the Dr. of the balance-sheet, and mark the cause of the deficiency, as inlake, waste, or the like. If the Cr. be greater, there is an excess, which you must enter on the Cr. of the balance-sheet, together with the occasion of it, as difference of measure, or the like.

In accounts subsidiary to profit and loss, enter the difference on the proper side of the profit and loss sheet.

When there is nothing written on one side of an account, enter the sum of the article or articles on that sheet which the kind of the account points out.

51. When you have collected all the balances, sum up both sheets, and add to the profit and loss sheet the

sums of the profit and loss account in the ledger: then subtract the lesser sum of each sheet from the greater.

This being done, mark the sums of the stock-account on your computation-paper, and add thereto the balance of the profit and loss sheet, on the side which corresponds with the greater sum of that account: then subtract the lesser sum from the greater. The remainder will be equal to the difference of the sides of the balance-sheet, if the books be right, and the balances exactly collected.

52. We shall prove that this equality must always hold, from the nature of the articles collected. The Dr. of the balance-sheet contains every kind of property belonging to you, and every debt owing to you; and the Cr. contains every debt owing by you: therefore the difference of the sides shows what your net estate amounts to. The profit and loss sheet, when the articles from the ledger are included, contains every thing you have gained on the Cr. and every thing you have lost on the Dr.; and the difference of the sides is your net gain or loss. The stock-account contained your effects and debts at the time the books were opened; and therefore, when the gain or loss is added to the proper side, it must show the extent of your net estate at present. Thus the stock-account and the balance-sheet both point out how much you are worth at present; the one from your former stock, allowance being made for your gains or losses; the other from a view of your present effects and debts; and they will correspond, because both must be agreeable to the truth, if the books be correct.

53. Though the books must balance, if free from error, yet it is sometimes difficult to adjust them exactly, especially when the business is extensive, and the error trifling. If there be still a difference, which we do not think it worth while to make further search for, we may close the books, by making Profit and Loss Dr. or Cr. for the same. This introduces an article on one side of the ledger, which has none corresponding to it on the other, but is balanced by some undiscovered error.

54. The balance being struck, your next work is to close the books. Every article in the ledger should be posted from the journal; therefore, the most regular way of finishing both is by inserting the following articles in the journal, and posting them in the common manner to the ledger.

1st, *Profit and Loss Dr. to Sundries, for loss, on the following accounts.* The particulars are taken from the Dr. of the Profit and Loss sheet.

2d, *Sundries Dr. to Profit and Loss, for gain, on the following accounts.* The particulars are taken from the Cr. of the Profit and Loss sheet.

3d, *Balance-account Dr. to Sundries, for debts and property belonging to me.*

4th, *Sundries Dr. to Balance-account, for debts due by me.* The particulars of this and the former are ta-

ken from the respective sides of the balance-sheet.

5th, *Profit and Loss Dr. to Stock for nett gain; or Stock Dr. to Profit and Loss, for nett loss.*

6th, *Balance-account Dr. to Stock, for nett loss.*
55. When the four first of these articles are posted in the ledger, all the personal, real, and subsidiary accounts will balance, and you may add them as you go along. In accounts of goods, if there be any deficiency, you must enter it on the Cr. in the inner column; and, if there be any outcome, you must enter it on the Dr. before you add the account. Then the sums of every account and every column on the opposite sides will be equal.

The only accounts that remain open are, *Profit and Loss, Stock, and Balance.* The fifth post balances the profit and loss account, and the sixth balances the stock-account. It was noticed, § 14, that the whole sums of Dr. and Cr. of the ledger are equal; and therefore, if the sides of every account, except one, be balanced, that one will balance of its own accord. The balance-account alone remains open, and, upon trial, you will find that the sides are equal. This affords an additional proof, or, at least, a different view, of what was demonstrated, with respect to the balance of the books, in § 52.

The lines above and under the sums, at a general balance, may be drawn with red ink; and, at the balancing of particular accounts, with black ink, for distinction.

56. Some chuse to insert the particulars of the profit and loss and balance sheets in the respective accounts of the ledger. If this be done, it is unnecessary to enumerate them also in the journal.—Some chuse to balance the accounts of goods, whenever the quantity is sold off; and we approve of this method, as it lessens the work at the general balance, which is always sufficiently laborious.

57. Thus is the state of a person's affairs brought together, in a short compass, under his view; and the articles of the balance-sheet supply materials for a new inventory. It is convenient, however, to alter the order, and arrange the real accounts together, and the personal ones together.

58. It is not necessary to begin new books, nor open the accounts anew, unless the old folios be full. The accounts may be continued in the former folios; but it is best to begin a new ledger, if the old one be not likely to hold all the business of the next year. When one comes to have several sets of books, it is common to distinguish them by the letters of the alphabet. The first waste-book, journal, and ledger, are marked A, the second, B; and so on.

In the following specimen, the waste-book and journal are placed on opposite pages, that the learner may easily compare them; and the rules are referred to by their numbers.

The present article, it is hoped, will appear sufficiently extended for a work of this nature. It contains the general principles of Italian book-keeping; and is sufficient to unfold the nature and design of that art to the speculative inquirer, to direct the accountant in common and easy cases, and prepare him for understanding those that are more complicated. In fact, if he have a clear apprehension of the sense of the transactions, the tendency of the journal-entries, and the import of the balances in the ledger, he will seldom be at a loss how to proceed.

Subsidiary Books used by merchants.

Tho' all merchant-accounts may be kept by the *Waste-book, Journal, and Ledger*, alone; yet men of great business find it convenient, either for abridging these, or for other ends, to use some others, generally called *Subsidiary or Subserving Books*; the most common of which are these nine following, *viz.*

1. *Cash-book.* This book is kept in a folio form, like the ledger, and serves to abridge the cash-account there. On the left-hand page, or Dr. side, *Cash* is charged Dr. for all the sums received; and on the right-hand page, *Cash* is made Cr. for all the sums paid. Once a-week, or, which is more ordinary, once a month, this book is posted to the ledger; or, if you please first to the journal, by two entries, *viz. Cash* Dr. to *Sundries*, for all the receipts, and *Sundries* Drs. to *Cash*, for all the payments. By this means the cash-account in the ledger will be so far contracted as to consist of 12 lines, *viz.* one for each month in the year.

2. *Book of Charges of Merchandise.* This book is only paged, and designed to abbreviate the cash-book. It contains particular charges on goods and voyages; such as, carriage, custom, freight, crantage, wharfage, &c: as also other expences that affect trade in general; such as, warehouse-rent, shop-rent, accountant's wages, postage of letters, and the like. At the end of each month the money-columns of this book are added up, and the sum carried to the credit-side of the cash-book.

3. *Book of House-expences.* This book is also paged, and designed likewise to ease the cash-book. It contains all disbursements for family provisions, servant's wages, house-rent, apparel, utensils, &c. The money-columns of this book are also added up at the end of each month, and the sum transferred to the credit-side of the cash-book.

4. *Invoice-book.* This book, which is used chiefly by factors, is paged, and contains doubles or copies of the invoices of goods sent to sea, or of goods received from abroad.

5. *Saler-book.* This book too is chiefly used by factors; and into it is posted, from the waste-book, the particular sales of every consigned cargo; by which means the several articles of a sale, that lie scattered in the waste-book, are brought together, and represented under one view, and that in a manner more full and minute than they are collected in the ledger-account. This book exhibits the sales of every consignment sepa-

rately and by themselves: to which are subjoined the respective charges, such as freight, custom, the factor's commission, as also abatements allowed to buyers, &c. whose sum subtracted from the gross amount of sales, gives the neat proceeds. From this book, when a cargo is sold off, an account of sales is drawn out, in order to be transmitted to the employer.

6. *Bill-book.* The design of this *Bill-book*, or *Mont-book*, is to furnish a merchant with a ready way of knowing the time when bills or other debts become payable to or by him. It consists of 12 folios, one for each month in the year. The left-hand page contains the debts that fall due to the merchant in the month on the top, and the right-hand page contains the debts payable by him to others in the same month.

7. *Receipt-book.* In this book a merchant takes receipts of the payments he makes. The receipt should contain the date; the sum received, expressed in words at large, and also in figures in the money-columns; the reason why; and whether in full or in part; and must be signed by the person receiving. But there is no occasion to mention the merchant's name; for the book being his own, sufficiently implies that.

8. *Letter-book.* It is very imprudent in any person to send away a letter of business, without keeping a double of it to himself; and therefore, to prevent the bad consequences of such a careless practice, merchants are provided with a large book in folio, into which is copied *verbatim* every letter of business before it be sent off. So that this book, together with the letters received (which must also be carefully kept in files or boxes), makes a complete history of all the dealings that pass betwixt a merchant and his correspondents; which may be very useful and necessary on many occasions.

9. *Pocket-book.* This is a small book, of a portable size, which a merchant carries in his pocket when business calls him abroad to a tavern, a fair, the country, or other places. In this he sets down the bargains he makes, the expences he is at, the debts he pays, or sums he receives, with every other part of business he transacts while abroad; as also any occurrence or piece of news he thinks worth while to record. And when he comes home to his counting-house or shop, he transfers the things contained in this book, each to their proper places in the waste-book, or books subsidiary.

Factors of great business sometimes keep another small book, called the *Memoirandum-book*. Into this book is copied, from letters as they come to hand, short notes of the several commissions for buying goods contained in them; and as the commissions are effected, the notes are crossed, or have some mark affixed to them. This is more convenient in doing business, than to be continually running to the letters themselves.

The above are the subsidiary books most in use: but a merchant is not tied down or restricted to them; he may keep some, and neglect others, or invent more, as the nature of his business requires, and he finds convenient.

B O O

B O O

BOOKSELLER, one who trades in books, whether he prints them himself, or gives them to be printed by others.

Bookfellers are in many places ranked among the members of universities, and intitled to the privilege of students, as at Tubingen, Salisburg, and Paris, where

they have always been distinguished from the vulgar and mechanical traders, and exempted from divers taxes and impositions laid upon other companies.

The traffic of books was anciently very inconsiderable, inasmuch that the book-merchants of England, France, Spain, and other countries, were distinguished by the appellation of *stationers*, as having no shops, but only stalls and stands in the streets. During this state, the civil magistrates took little notice of the book-sellers, leaving the government of them to the universities, to whom they were supposed more immediate retainers; who accordingly gave them laws and regulations, fixed prices on their books, examined their correctness, and punished them at discretion.

But when, by the invention of printing, books and book-sellers began to multiply, it became a matter of more consequence; and the sovereigns took the direction of them into their own hands, giving them new statutes, appointing officers to fix prices, and granting licences, privileges, &c.

BOOM, in the sea language, a long piece of timber with which the clew of the fludding sail is spread out; and sometimes the boom is used to spread or boom out the clew of the main-mast.

BOOM, denotes also a cable stretched athwart the mouth of a river or harbour; with yards, top-masts, battling or spars of wood lashed to it, to prevent an enemy's coming in.

BOOMING, among sailors, denotes the application of a boom to the sails. A ship is said to come booming forwards, when she comes with all the sail she can make.

BOOPHTHALMUS, a kind of agate with large circles in it, bearing some resemblance to an ox's eye, from whence it has got this name.

BOOPS, in zoology, the trivial name of a species of balæna. See *BALÆNA*.

BOOT, a leathern cover or defence for the leg, used on horseback, both to keep the body more firm, and defend the part from the injuries of the weather. Boots seem to have taken their name from the resemblance they bear to a sort of jacks or leathern bottles formerly in use, and called *bottæ*, in the old French *bouts*. Borel derives the name from the old French word *bot*, a stump, by reason the boot gives the leg this appearance. The Chinese have a kind of boots made of silk or fine stuff lined with cotton, a full inch thick, which they always wear at home. This people are always booted; and when a visit is made them, if they happen to be without their boots, their guest must wait till they put them on. They never stir out of doors without their boots on; and their scrupulousness in this respect is the more remarkable as they are always carried in their chairs.

The boot was much used by the ancients, by the foot as well as by the horsemen. It was called by the ancient Romans *ocrea*; in middle-age writers, *greva*, *gamberia*, *bainberga*, *bembarga*, or *benbarga*. The boot is said to have been the invention of the Carians. It was at first made of leather, afterwards of brass or iron, and was proof both against cuts and thrusts. It was from this that Homer calls the Greeks *brazen-booted*. The boot only covered half the leg; so may the right leg, which was more advanced than the left, it being advanced forwards in an attack with the sword; but

in reality it appears to have been used on either leg, and sometimes on both. Those who fought with darts or other missile weapons, advanced the left leg foremost, so that this only was booted.

Boot-Tree, or **Boot-laft**, an instrument used by shoemakers to widen the leg of a boot. It is a wooden cylinder slit into two parts, between which, when it is put into the boot, they drive by main force a wedge or quoin.

BOOTES, a constellation of the northern hemisphere, consisting of 23 stars according to Ptolemy's catalogue, of 18 in Tycho's, of 34 in Bayer's, of 52 in Hevelius's, and of 54 in Mr Flamsteed's catalogue.

BOOTH (Barton), a famous English actor, born in Lancashire in 1681, and educated in Westminster school under the celebrated Dr Bulby, where his success in the Latin plays customarily performed by the scholars gave him an inclination for the stage. He was intended for the church; but running away from school to Dublin, he there commenced actor. His first appearance was in the part of Oroonoko, in which he came off with every testimonial of approbation from the audience. From this time he continued daily improving; and, after two successful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the English stage. To this end, he first, by letter, reconciled himself to his friends; and then, as a farther step towards insuring his success, obtained a recommendation from Lord Fitzharding (one of the lords of the bed-chamber to prince George of Denmark) to Mr Betterton, who with great candour and good-nature took him under his care, and gave him all the assistance in his power. The first part Mr Booth appeared in at London was that of Maximus in Lord Rochester's Valentianian, his reception in which exceeded even his most sanguine expectations; and very soon after his performance of Artaban in Rowe's Ambitious Step-mother, which was a new tragedy, established his reputation, as second at least to his great instructor. Pyrrhus, in the Distressed Mother, was another part in which he shone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr Addison, in 1712. For this play being considered as a party one, the Whigs, in favour of whose principles it was apparently written, thought it their duty strongly to support it, while at the same time the Tories, who had too much sense to appear to consider it as a reflection on their administration, were still more vehement in their approbation of it, which they carried to such an height, as even to make a collection of 50 guineas in the boxes during the performance, and present them to Mr Booth with this compliment, "That it was a slight acknowledgment for his honest opposition to a perpetual dictator, and his dying so bravely in the cause of liberty." Besides this, he had a present of an equal sum from the managers, in consideration of the great success of the play, which they attributed in a good measure to his extraordinary merit in the performance; and certain it is, that no one since that time has ever equalled, or even nearly approached, his excellence in that character.— But these were not the only advantages which were to accrue to Mr Booth from his success in this part; for

Booth,
Booty.

Lord Bolingbroke, then one of the principal secretaries of state, in a little time after procured a special licence from queen Anne, recalling all the former ones, and nominating Mr Booth as joint manager with Wilks, Cibber, and Dogget; none of whom were pleased at it; but the last especially took such disgust as to withdraw himself from any further share in the management. In 1704, Mr Booth had married a daughter of Sir William Barkham Bart. who died in 1710, without issue. Being now established in the management, he once more turned his thoughts towards matrimony; and in the year 1719 united himself to the celebrated Miss Hester Santlow, a woman of a most amiable disposition, whose great merit as an actress, added to the utmost discretion and prudential economy, had enabled her to save up a considerable fortune. During the 20 years in which Mr Booth continued a manager, the theatre was in the greatest credit; and his illness and death, which happened on the 10th of May 1733, contributed not a little to its decline.

Mr Booth wrote a dramatic entertainment called *Dido and Eneas*; but his master-piece was a Latin inscription to the memory of Mr William Smith, a celebrated actor, who died while he was young.—As an actor, his excellency lay wholly in tragedy, not being able to endure such parts as had not strong passion to inspire him. And, even in this walk, dignity rather than complacency, rage rather than tenderness, seemed to be his taste. For a particular idea of his abilities, we must refer to the description Mr Cibber has given of him in his Apology; and the admirable character drawn of him by that excellent judge of dramatic perfection, Aaron Hill, Esq. in a political paper published by him called the *Prompter*, which may be seen at length in Theoph. Cibber's *Lives of the Poets*, and Chetwood's *History of the Stage*.—His character as a man was adorned with many amiable qualities, among which, a goodness of heart, the basis of every virtue, was remarkably conspicuous; and so particularly was he distinguished and cared for, and his company sought by the great, that, as Chetwood relates of him, not one nobleman in the kingdom had so many sets of horses at command as he had.

BOOTY, whatever is taken from an enemy in time of war.—Among the Greeks, the booty was divided in common among the army, the general only claiming a larger share. By the military discipline of the Romans, spoils taken from the enemy belonged to the republic, particular persons having no right to them. The generals who piqued themselves on their probity carried it wholly to the public treasury. Sometimes indeed they divided it among the soldiery, to animate them, and serve in lieu of a reward. But this distribution depended on the generals, who were to conduct themselves herein with great equity and moderation; otherwise it became a crime of peculate to lay hands on the pillage, as regularly belonging only to the state. The consuls Romulus and Vaturius were condemned for having sold the booty taken from the *Æqui*.—Among the Jews, the booty was divided equally between the army and the people, though under the kings a different kind of distribution obtained.—Among the Mahometans, two thirds of the spoils are allowed to the army; the other third to God, to Mahomet and his relations, and to the orphans, the poor, and the pilgrims.—

Among us, formerly the booty was divided among the soldiery. If the general be in the field, every body takes what he can lay hold on: if the general be absent, the booty is distributed among the soldiery, two parts being allowed to the cavalry, and one to the infantry. A captain is allowed ten shares, a lieutenant six, and a cornet four.

BOPPART, a town of Germany, in the circle of the Rhine, and Electorate of Treves; it is seated at the foot of a mountain near the Rhine, in E. Long. 7. 35. N. Lat. 50. 19.

BOPSINGEN, a town of Suabia in Germany, seated on the river Egar, in E. Long. 9. 55. N. Lat. 48. 51.

BOQUINIANS, in church-history, a sect of heretics, so called from Boquinius their founder, who taught that Christ did not die for all mankind, but only for the faithful, and consequently was only a particular Saviour.

BORAGO, in botany, a synonyme of the *ACHUSA*.

BORAK, among Mahometans, a fabulous animal, supposed to be of the middle kind between an ass and a mule, whereon their prophet was carried in his nocturnal flight from Jerusalem into the heavens. This animal the Arabians call *Al-Borak*, q. d. *shining*. The night when the journey was performed is called *Lailat al-Meeraga*, i. e. *the night of ascension*; and the flight itself *Al-Mesra*; concerning which there are a multitude of traditions.

BORAX, a saline substance brought from the East Indies, much used in the soldering of metals, making glass, &c. As a medicine too it has by some been held in considerable esteem; but its virtues in this way have never yet been sufficiently ascertained by experience, tho' Dr Lewis thinks there are strong reasons for believing them greater than they are generally supposed. In doses of half a dram or two scruples, it is recommended as a diuretic, emmenagogue, and promoter of delivery; with this last view it was an ingredient in the *pulsis ad partum*, or powder to promote delivery, of the Edinburgh college. Mr Bisset, in an essay on the medical constitution of Great Britain, recommends a solution of this salt in water, as the most powerful dissolvent yet known of apthous crusts in the mouth and fauces of children. Dr Astruc of Edinburgh says that it should be dissolved when taken inwardly, for that the stomach is not able to melt it; but that, if given in a dissolved state, it enters the vasa minima, mixes with the blood, and dilutes it. If given in powder, it is emetic; but, mixed with aromatics, this quality is checked; and in the fluor albus it is said to be specific. Its doze is from five grains to half a dram. Externally used, borax is said to be a better cosmetic than bismuth, and is undoubtedly much safer.

BORBETOMAGUS, (anc. geog.), a city of the Vangiones on the Rhine; now *Worms*, in Germany.

BORBONIA, in botany, a genus of the decandria order, belonging to the diadelphia class of plants, for which there is no English name. There are six species, all of which are natives of warm countries. They are a kind of broom; and in the places where they grow naturally, they rise to the height of ten or twelve feet, but in Europe seldom rise more than four or five. They must be kept constantly in the stove, and may be propagated by laying down the young shoots; but as these

stry, no 265
—273; and
Glass.

Barbarities

Borde
||
Boreas.

are generally two years before they put forth proper roots, the most eligible method is by seeds, which must be procured from those places where they grow naturally, as they do not come to perfection in this country.

BORBORITES, in church-history, a sect of gnostics, in the second century, who, besides embracing the errors of these heretics, denied the last judgment. Their name comes from the Greek *Borboros*, filth; on account of a custom they had of daubing their faces and bodies with dirt and filth.

BORCH, a town of the duchy of Magdeburgh in Lower Saxony, seated on the river Elbe, in E. Long. 12. 14. N. Lat. 52. 25.

BORCHLOEN, a town of the bishopric of Liege in Germany, situated in E. Long. 5. 28. N. Lat. 50. 50.

BORCOVIUM, (anc. geog.), a town of the Ottadini in Britain, now *Berwick on Tweed*.

BORD-HALFPENNY, a small toll by custom paid to the lord of the town for letting up boards, tables, booths, &c. in fairs and markets.

BORD-Lands, the demesnes which lords keep in their lands for the maintenance of their board or table.

BORD-Lode, a service required of tenants to carry timber out of the woods of the lord to his house. It is also used to signify the quantity of provision which the bordarii or bordmen paid for their bord-lands.

BORD-Service, the tenure of bord-lands, by which some lands in certain places are held of the bishop of London, and the tenants now pay sixpence per acre, in lieu of sending provision anciently for their lord's table.

BORDAT, in commerce, a small narrow stuff, which is manufactured in some parts of Egypt, particularly at Cairo, at Alexandria, and Damietta.

BORDE (Andrew), a physician, was born at Pevensey in Suffex, early in the 16th century, and supposed to have been educated at Westminster school. In his *Introduction to Knowledge*, he says that he was a student of Oxford; but of what college, he does not mention. He left the university without a degree, and entered himself a brother of a Carthusian convent in or near London; but, not liking the severe discipline of that order, he returned to Oxford, and applied himself to the study of physic. Some time after, he embarked for the Continent; and, as he himself expresses it, "travelled through and round about Christendom, and out of Christendom into some parts of Africa." In the years 1541 and 1542, he resided at Montpellier in France, where he was made doctor of physic, and after his return to England was incorporated into the same degree at Oxford. From the preface to his *introduction* above mentioned, it appears that he had been in Scotland, which probably was soon after his return from France. Having now satisfied his inclination for travelling, he settled first at Pevensey where he was born, afterwards at Winchester, and finally in London, where he is said to have become a fellow of the college of physicians, and first physician to king Henry VIII. But, notwithstanding his eminence in his profession, he had the misfortune to spend the latter end of his life in the Fleet prison, where he died in the year 1549. As to his character, Wood says, that "he was esteemed a noted poet, a witty and ingenious person, and an excellent physician." Pits calls him a man of sufficient

learning, but too volatile and inconstant. Bale and some others, on the contrary, abuse him grossly. His writings are, 1. A book of the introduction of knowledge, the which doth teach a man to speak part of all manner of languages, &c. Lond. 1542, 4to; dedicated, from Montpellier, to the lady Mary daughter to Henry VIII. It is written partly in verse, and partly in prose, containing 39 chapters, before each of which is a wooden print of a man. 2. The breviary of health, wherein are remedies for all manner of sicknesses and diseases, &c. Lond. 1547, &c. 4to. 3. Dietary of health, Lond. 1576, 8vo. 4. The merry tales of the madmen of Gotham. Printed, says Wood, in the time of Henry VIII. in whose reign, and after, it was accounted a book full of wit and mirth by scholars and gentlemen. Afterwards being often printed, it is now sold only on the stalls of ballad-vendors. 5. A right pleasant and merry history of the mylner of Abington, with his wife and his fair daughter, and of two poor scholars of Cambridge. Lond. printed by Richard Jones, 4to. 6. A book of every region, country, and province; which shews the miles and leagues distance from city to city, and from town to town, with the noted things in the said cities and towns. Wood says that the author lent the manuscript of this book to his friend Thomas Cromwell, who lost it, to the great grief of the author, who would otherwise have published it. In this instance, however, the antiquary was misinformed; for it has since been published by Hearne at the end of *Benedictus abbas Peterb. de vita Henrici II.* Oxf. 1735, 8vo. 7. The principles of astronomy, the which diligently perfected is in a manner a prognostication to the world. Lond. printed by Robert Copland, 12mo. The author says that he wrote this little book in four days, with one old pen without mending.

BORDER, in gardening, is made to inclose parterres, that they may not be injured by walking in them. Borders are made either circular, straight, or in cauts; and are turned into knots, scrolls, volutes, and other compartments. They are rendered very ornamental by the flowers, shrubs, yews, &c. that are raised in them. They are always laid with a sharp rising in the middle; because, if they are flat, they are noways agreeable to the eye; and as for their breadth, the largest are allowed five or six feet, and the smallest commonly four.

BORDUNI, or **BORDONE**, (Paris), an excellent Italian painter, was born at Venice about the year 1512; and, being of a noble family, had a polite education. He was the disciple of Titian; but has been admired more for the delicacy of his pencil than for the truth of his outlines. He was at the court of France in the reign of Francis I. who had a great esteem for him, and for whom he drew not only abundance of history-pieces, but the portraits of several court-ladies, in so fine a manner, that original nature was hardly more charming. He at length returned to Venice, laden with riches and honour; and having gained great reputation in all parts of Italy, died in 1587, aged 75.

BORDURE, in heraldry. See there, n^o 10.

BORE, among engineers, denotes the diameter of the barrel of a gun or cannon, or rather the whole cavity.

BOREAS, a Greek name, now in common use for the

Borde

||

Boreas.

Horcel
Borgia.

the north-wind. Pezron observes, that anciently Boreas signified the *north-east wind*, blowing at the time of the summer solstice. Boreas is represented in painting like an old man with a horrible look, his hair and beard covered with snow or hoar frost, with the feet and tail of a dragon. M. Spierlingius has a treatise in praise of Boreas, wherein he shews the honours paid to him by antiquity. Boreas, according to this author, purifies the air, renders it calm and salubrious, preserves buildings from decay, drives away the plague and other noxious diseases, and expels locusts and other vermin hurtful to the grounds.

BOREL (Peter), a learned physician, was the son of James Borel who published several poems, and was born at Castrès in 1620. He applied himself to the study of physic, of which he was created doctor, and practised with great success in the city of Castrès. Towards the end of the year 1653, he went to Paris, and was soon after made physician in ordinary to the king. In 1674, he was received into the academy of sciences, and distinguished himself by writing a great number of works. The most esteemed are, 1. *Historiarum & observationum medico-physicarum*. 2. *Bibliotheca Chymica, duodecimo*. 3. *De vero telescopii inventore, cum brevis omnium conspiciolorum historia*. He died in 1678.

BORELLI (John Alphonso), a famous philosopher and mathematician born at Naples the 28th of January 1608. He was professor of philosophy and mathematics in some of the most celebrated universities of Italy, particularly at Florence and Pisa, where he became highly in favour with the princes of the house of Medicis; but having been engaged in the revolt of Messina, he was obliged to retire to Rome, where he spent the remainder of his life under the protection of Christina queen of Sweden, who honoured him with her friendship, and by her liberality towards him softened the rigour of his hard fortune. He continued two years in the convent of the regular clergy of St Pantaleon, called the *pious schools*, where he instructed the youth in mathematical studies. He died there of a pleurisy, the 31st of December 1679, in the 72^d year of his age. He wrote, in Latin, 1. Euclid restored. 2. The theory of the influence of the planets in medicine, deduced from physical causes. 3. Of percussive force. 4. Of natural motions depending upon gravity. 5. An historical and meteorological account of the burning of mount *Ætna*, in the year 1669. 6. Of the motion of animals; and several other works, some of which are in Italian.

BORGIA (Cæsar), natural son of pope Alexander VI. was a brave general, but a most abandoned villain. See (*History of*) ITALY.—It is incredible what numbers he caused to be taken off by poison, or by the sword; and it is notorious that swarms of assassins were constantly kept in pay by him at Rome, for the sake of removing all who were either obnoxious or inconvenient to him. He experienced various turns of fortune; and was sometimes very prosperous, sometimes the reverse. He very narrowly escaped dying by poison in 1503; for having concerted with the pope a design of poisoning nine newly created cardinals at once, for the sake of possessing their effects, the poisoned wine, destined for the purpose, was by mistake brought to and drank by themselves. The pope died of it; but

Cæsar, by the vigour of his youth, and the force of antidotes, after many struggles, recovered. He only recovered to outlive his fortune and grandeur, to see himself depressed, and his enemies exalted; for he was soon after divested of all his acquisitions, and sent a prisoner to Spain, in order to free Italy from an incendiary, and the Italian princes from those dangers which the turbulent and restless spirit of Cæsar made them fear even though he was unarmed. He escaped from thence; and got safe to Navarre, to king John his brother-in-law, who was then at war with his subjects. Cæsar served as a volunteer in that war, and was killed in 1507.

BORGÓ, an ancient town of Sweden, seated on the gulf of Finland, in the province of Nyland. E. Long. 26. 25. N. Lat. 60. 34.

Borgo *de St Sepulchro*, a town of Tuscany, in Italy, situated in E. Long. 13. 0. N. Lat. 43. 30.

Borgo *de val de Faro*, a town of Italy, in the duchy of Parma, in E. Long. 10. 36. N. Lat. 44. 35.

Borgo-*Fortè*, a town of the Mantuan in Italy, situated at the confluence of the rivers Po and Menzo. E. Long. 11. 0. N. Lat. 44. 50.

Borgo *San Domino*, a town of Italy, in the duchy of Parma, with a bishop's see. E. Long. 10. 31. N. Lat. 41. 53.

BORGOGNONE, a celebrated painter, whose true name was *Giacomo Cortesi*; but he is commonly called *Borgognone*, from the country where he was born, about the year 1605. He was much admired and highly applauded for his admirable gusto, and grand manner of painting battles. He had for several years been conversant in military affairs, was an officer of considerable rank in the army, made the camp his school, and formed all his ideas from what he had seen performed in the field. His style is roughly noble, full of fire and spirit, and there are a few prints etched by his own hand. Towards the close of his life he retired to the Jesuits convent in Rome, where he is said to have taken sanctuary to rid his hands of an ill bargain he had got of a wife. But happily suriving her, he lived in great esteem and honour till after the year 1675.

BORIA, a small town of Spain, in the kingdom of Arragon. W. Long. 2. 2. N. Lat. 41. 50.

BÖRING, in a general sense, the art of perforating, or making a hole through any solid body.

BORING of *Water-pipes*. The method of boring water-pipes is as follows. The poles of alder, which is a very useful wood in making pumps, water-pipes, &c. being laid on horses or trassels of a foot height, to rest the augre upon while they are boring, they set up a lath to turn the least end of the poles, to fit them to the cavities of the great end of the others. They turn the small ends of the poles about five or six inches in length, to the size they intend to bore the bigger ends about the same depth, viz. five or six inches. This is designed to make a joint to shut each pair of poles together, the concave part being the female part, and the other the male of the joint. In turning the male part, they turn a channel in it, or a small groove at a certain distance from the end; and in the female part they bore a small hole to fit over this channel. This being done, they bore the poles through; and to prevent them from boring out at the side, they stick great nails at each end to be a guide in boring. It is usual, however,

Boring
||
Borneo.

Borneo.

however, to bore them at both ends, so that if a pole be crooked one way, they can bore it through and not spoil it.

BORING, in farriery, a cruel and absurd method of treating a wrenched shoulder. See **FARRIERY**, §xxiii. 7.

BORING, in mineralogy, a method of piercing the earth with scooping irons, which being drawn back at proper times, bring up with them famples of the different strata through which they have passed; by the examination of which the skilful mineralogist will be able to guess whereabouts a vein of ore may lie, or whether it will be worth while to open a mine there or no.

BORIQUEN, one of the Caribbee islands in North America, near that of Porto Rico. The English formerly had a settlement there, but were driven away by the Spaniards. It is at present without inhabitants, tho' agreeable and fertile; the air being wholesome, and the water good. There are a great number of land-crabs, whence some have called it *Crab-island*. W. Long. 64. 35. N. Lat. 18. 0.

BORISTHÈNES, (anc. geog.), the largest river of Sarmatia Europea, thus described by Mela, who copies *verbatim* from Herodotus: "It runs through a cognominal people, is the most pleasant of all the rivers of Scythia, and calmer than all of them in its course, and very agreeable to drink: it feeds very rich pastures, and produces large fish of the best flavour, and without bones: it comes a great way, rising from springs unknown; its course is a distance of 40 days, and so far it is navigable." It is now called the *Dnieper* or *Nieper*.

BORKELO, a strong town in the United Provinces, in the county of Zutphen, seated on the river Borkel, in E. Long. 6. 30. N. Lat. 52. 15.

BORLASE (Dr Edmund), an eminent physician and English writer in the 17th century, was the son of Sir John Borlase, master of the ordnance, and one of the Lord Justices of Ireland in 1643. He studied in Dublin college, and afterwards at the university of Leyden, at which last place he took the degree of doctor of physic. He afterwards practised physic with great success in the city of Chester, and was incorporated doctor of the faculty in the university of Oxford. Among the books which he wrote and published are the following. 1. *Latham Spaw* in Lancashire, with some remarkable cases and cures performed by it. 2. *The reduction of Ireland to the crown of England*. 3. *The history of the Irish rebellion*. 4. *Brief reflections on the earl of Castlehaven's memoirs, &c.* He died after the year 1682.

BORMIO, a county depending on the republic of the Grisons in Switzerland. It is bounded on the south by the estate of Venice, on the east by the territory of the house of Austria, and on the south and west by Caddea. It is 15 miles over both ways; and is divided into five communities, viz. the town of Bormio, the valley of Forbia, the Interior Valley, the Lower Valley, and the Valley of Luveno. Bormio is the only town in this district; and has a governor called a *podesla*, sent by the Grisons to preside in civil and criminal affairs. It is seated at the confluence of the rivers Addo and Ifalacua, in E. Long. 10. 10. N. Lat. 46. 45.

BORNE, a market-town of Lincolnshire in England. W. Long. 0. 20. N. Lat. 52. 40.

BORNEO, an island of Asia, in the East Indies,

and one of the three great Sunda islands. It is thought to be the largest island in the world, next to New Holland; being 1500 miles in circumference. It is seated under the equator, that line cutting it almost through the middle. It is almost of a circular figure; abounds with gold; and the finest diamonds in the Indies are found in its rivers, being probably washed down from the hills by torrents. Here are also mines of iron and tin, and loadstones. Birds nests † are to be had in this island, which are eatable, and reckoned a great delicacy. The beasts are, oxen, buffaloes, deer, goats, elephants, tigers, and monkeys. This island has fine rivers, especially towards the west and south. In their moonsoon from April to September, the wind is westerly; and they have continual heavy rains, attended with violent storms of thunder and lightning. The rainy season continues for eight months of the year; and as during that time all the flat country near the coast is overflowed, the air is rendered very unhealthful, and the inhabitants are forced to build their houses on floats, which they make fast to trees. The houses have but one floor, with partitions made with cane; and the roofs are covered with palmetto leaves, the eaves of which reach within four or five feet of the bottom. The west and north-east sides of the island are almost desert, and the east is but little known. The inland parts are very mountainous; and the south-east, for many leagues together, is a sinking morass, which being overflowed in the wet season is very unhealthful.

The Portuguese, who first discovered Borneo, had arrived in the Indies above 30 years before they knew any thing of it more than the name, and its situation, by reason of their frequently passing by its coasts. At last one captain Edward Corril had orders to examine it more narrowly; and being once acquainted with the worth of the country, they made frequent voyages thither. They found the coasts inhabited by Malayaa Moors, who had certainly established themselves there by conquest; but the original inhabitants still remain in the mountains, and are siled *Beajus*, which in the Malayan language signifies a *wild man*. The most authentic account of these people is the following, which was extracted from the papers of father Antonio Ventimiglia, an Italian missionary. He was sent to Borneo from Macao, on board a Portuguese ship, converted great numbers to Christianity, and died on the island about the year 1691. The Beajus have no kings, but many little chiefs. Some are subject to the Moorish kings, and pay them tribute; but such as live far up the country, are altogether independent, and live according to their own customs. They are generally very superstitious, and much addicted to augury. They do not adore idols; but their sacrifices of sweet wood and perfumes are offered to one God, who, they believe, rewards the just in heaven, and punishes the wicked in hell. They marry but one wife; and look upon any breach of conjugal faith, either in the man or woman, as a capital offence. The Beajus are naturally honest and industrious, and have a brotherly affection for one another. They have a notion of property, which yet does not render them covetous. They sow and cultivate their lands; but, in the time of harvest, each reaps as much as will serve his family, and the rest belongs to the tribe in common; by which means they prevent necessity

† See Birds-Nests.

Bornholm,
Bornou.

necessity or disputes. With the Moors on the coasts the Portuguese for some time carried on a considerable trade, and at their request settled a factory there; which, however, was afterwards surpris'd and plundered by the Moors, who put most of the people to the sword. The most considerable river in Borneo is called *Banjar*, at the mouth of which our East-India company have a factory.

BORNHOLM, an island in the Baltic sea, to the south-east of the province of Schonen in Sweden. It is twenty-one miles in length, and above thirteen in breadth. It has three considerable towns, Rattum, Sandwick, and Nexia; with a great number of villages; and is fertile and populous. It was conquered by the Swedes in 1658; but the inhabitants, under the conduct of Jens Roefods, voluntarily surrendered it to the king of Denmark, on account of the bad usage they received from the former. In 1678, a body of 5000 Swedish troops, in their passage from Pomerania to Sweden, being shipwrecked on this island, such of them as remained were made prisoners of war. The inhabitants defend the island by their own militia, without any expense to the crown. The commandant or governor resides at Rattum. E. Long. 14. 56. N. Lat. 55. 15.

BORNOU, a kingdom or province of Zaara in Africa, extending from 12 to 22 degrees of east longitude, and from 17 to 21 degrees of north latitude. The northern part is poor, and like the rest of the provinces of Zaara: but all the rest is well watered by springs and rivers that tumble down with a dreadful noise from the mountains; rendering the country prolific in corn, grass, and fruits, and giving it a pleasing aspect. The eastern and western frontiers are divided into mountains and valleys, the latter being all covered with flocks of cattle, fields of rice and millet, and many of the mountains with wood, fruit-trees, and cotton. On the north-west stands the mountain of Tarton, having plenty of good iron mines; and on the south flows the river Niger, which, it is said, after running a great many leagues under a long chain of mountains, rears up its head again, and mingles its stream with the waters of the lake Bornou in its course, from whence it washes the walls of the capital of this kingdom. The compilers of the Universal History, however, are of opinion, that in these mountains the river Niger hath its source, because no river hath been traced to the eastward, except the Nile, which runs in a different course from north to south, and the White river, on the western frontiers of Abyssinia, which is a branch of the Nile. The eastern and western parts of Bornou are inhabited by a people of a roving disposition, who live in tents, and have their women, children, and every thing else, in common; the word *property*, or any idea equivalent to it, being utterly unknown among them. They have neither religion, laws, government, nor any degree of subordination; and hence they have been supposed by Cluverius to be the lineal descendants of the ancient Garamantes, and this to have been the residence of that people. In these parts, the natives are almost to a man shepherds and husbandmen. In summer they go naked, except a short apron before; but in winter they are warmly clothed with the softest sheepskins, of which they also form their bed-cloaths; and indeed this is scarce a sufficient defence against the in-

Doromzeu
Borough.

clemency of the weather at certain seasons of the year, when a cold piercing wind blows from the northern mountains, that chills the blood in proportion as the pores of the body have been opened by the scorching heats of summer. Baudrand and Daper affirm that the natives are scarce superior in their understanding to brutes; not even having any names whereby to distinguish each other, except what they take from some personal defect or singularity; such as lean, fat, fainting, hump-backed, &c. In the towns, however, it is acknowledged that they are something more civilized and polite, being many of them merchants; but of these towns, or indeed of the kingdom in general, very little is known.

BOROMEUS (Frederic), cardinal and archbishop of Milan. He, in 1609, celebrated the council of Milan. He founded the Ambrosian library, which he enriched with 9000 manuscripts. He left several works behind him, and died in 1632.

BORONDON, (S^t), an island in the Atlantic Ocean, mentioned by some writers, particularly Linschotten, in their description of the Canary islands, as something supernatural. It is said to be about 100 leagues distant from Ferro, probably west, though no writer has pretended to lay down its exact situation. Here it is affirmed several ships have touched by accident, and all agree in their relations of the state of the inhabitants and island. They affirm, that it is perpetually clothed with a great variety of wood, chiefly fruit-trees: that the valleys are in a perpetual state of verdure; and continually decked with flowers, grass, and plants, the spontaneous productions of the earth; or with corn and pulse, cultivated with great care by the inhabitants: that the soil is so prolific as to raise large quantities of corn for exportation; and that the ships that call here never fail of meeting with refreshments of every kind. It is said to be peopled by Christians, who have a language of their own, apparently combined of a variety of modern languages; for, say they, whoever understands the European tongues may make shift to hold conversation with this people. It is remarkable, that no ships, expressly sent upon this discovery, were ever fortunate enough to fall in with the island of S^t Borondon, though the Spaniards have several times attempted it from the Canaries. Hence it has been called the *marvellous island*; and hence indeed we may conclude, either that it exists wholly in imagination, or at least that it is surrounded with such currents as infensibly carry ships out of their course, and prevent their meeting with it. Some writers affirm that it actually disappears upon certain occasions, and shifts its position; while others, with more appearance of truth, allege, that it is frequently overcast with thick and impenetrable clouds, which occasion the disappointment of all the adventurers who have gone in search of it.

BOROUGH, BURROUGH, *Borow*, or *Burgh*, a corporation or town which is not a city. The word in its original signification meant a company consisting of ten families, which were bound together as each others pledge. Afterwards *borough* came to signify a town having a wall or some inclosure round it: and all places that in old time had the name of *borough*, it is said, were fortified or fenced in some shape or other. *Borough* is a place of safety and privilege: and some are called *free burghs*, and the tradesmen in them *free burghers*.

Borough
Borrellists.

burgesses, from a freedom they had granted to them originally to buy and sell without disturbance, and exempt from toll.

BOROUGH-English, a customary descent of lands or tenements, in some ancient boroughs and copy-hold manors, by which the youngest son, and not the eldest, succeeds to the burgage tenement on the death of his father. For which Littleton gives this reason; because the younger son, by reason of his tender age, is not so capable as the rest of his brethren to help himself. Other authors have indeed given a much stranger reason for this custom; as if the lord of the fee had anciently a right to break the seventh commandment with his tenant's wife on her wedding night; and that therefore the tenement descended, not to the eldest, but to the youngest son, who was more certainly the offspring of the tenant. But it cannot be proved that this custom ever prevailed in England, though it certainly did in Scotland, (under the name of *mercheta*, or *marcbeta*), till abolished by Malcom III. But perhaps a more rational account than either may be brought from the practice of the Tartars; among whom, according to Father Duhalde, this custom of descent to the youngest son also prevails. That nation is composed totally of shepherds and herdsmen; and the elder sons, as soon as they are capable of leading a pastoral life, migrate from their father with a certain allotment of cattle, and go to seek a new habitation. The youngest son, therefore, who continues latest with his father, is naturally the heir of his house, the rest being already provided for. And thus we find, that among many other northern nations it was the custom for all the sons but one to migrate from the father, which one became his heir. So that possibly this custom, wherever it prevails, may be the remnant of that pastoral state of the ancient Britons and Germans which Cæsar and Tacitus describe.

BOROUGH-head, or *Head-borough*, called also *borough-holder*, or *burgholder*, the chief man of the decenna, or hundred, chosen to speak and act in behalf of the rest.

Head-borough also signifies a kind of head constable, where there are several chosen as his assistants, to serve warrants, &c. See **CONSTABLE**.

BOROUGHBRIDGE, a town in the north riding of Yorkshire in England, seated on the river Yore, over which there is a handsome stone bridge. The town is not large, but commodious, and sends two members to parliament. W. Long. 1. 15. N. Lat. 54. 10.

BOROZAIL, or the zail of the Ethiopians, a disease epidemic in the countries about the river Senega. It principally affects the pudenda, but is different from the lues venerea. It owes its rise to excessive venery; in the men this distemper is called *asab*, and in women *asabat*.

BORRACHIO. See **CAUCHOUK**.

BORRAGE. See **ANCHUSA**.

BORRELLISTS, in church-history, a Christian sect in Holland; so deominated from their founder Borrel, a person of great learning in the Hebrew, Greek, and Latin tongues. They reject the use of the sacraments, public prayer, and all other external acts of worship. They assert, that all the Christian churches of the world have degenerated from the pure apostolical doctrines, because they have suffered the word of God, which is infallible, to be expounded, or rather corrupted, by doctors which are not infallible.

They lead a very austere life, and employ a great part of their goods in alms.

Borrichius
&
Bos.

BORRICHIVS, one of the most learned men of his age, the son of a Lutheran minister in Denmark, was born in 1626. He applied himself to physic in the university of Copenhagen, and began to practise during a most terrible plague that made great havoc in that city. He travelled: but before his departure, in 1660, he was appointed professor in poetry, botany, and chemistry; and at his return discharged his duties with great aliduity, of which the works he published afford full proof. He was raised to the office of counsellor in the supreme council of justice, in 1686; to that of counsellor of the Royal Chancery, in 1689; and died of the operation for the stone, in 1690. He published, 1. *Lingua pharmacopœorum*. 2. *Dissertationes de poeticis Græcis et Latinis*. 3. *De ortu et progressu chemiæ*; and several other works.

BORROWING AND HIRING, in law, are contracts by which a qualified property may be transferred to the hirer or borrower; in which there is only this difference, that hiring is always for a price or stipend, or additional recompense; borrowing is merely gratuitous. But the law in both cases is the same. They are both contracts, whereby the possession and transient property is transferred for a particular time or use, on condition and agreement to restore the goods so hired or borrowed, as soon as the time is expired, or the use performed, together with the price or stipend (in case of hiring) either expressly agreed upon by the parties, or left to be implied by law, according to the value of the service. By this mutual contract, the hirer or borrower gains a temporary property in the thing hired, accompanied with an implied condition to use it with moderations, and not abuse it; and the owner or lender retains a reversionary interest in the same, and acquires a new property in the price or reward. Thus if a man hires or borrows a horse for a month, he has the possession and a qualified property therein during that period; on the expiration of which his qualified property determines, and the owner becomes (in case of hiring) intitled also to the premium or price for which the horse was hired.

There is one species of this price or reward the most usual of any, but concerning which many good and learned men have in former times very much perplexed themselves and other people, by raising doubts about its legality *in foro conscientiæ*. That is, when money is lent on a contract to receive not only the principal sum again, but also an increase by way of compensation for the use, which is generally called *interest* by those who think it lawful, and *usury* by those who do not so. But as to this, see the article **INTEREST**.

BORROWSTONESS. See **BURROWSTONESS**.

BORZONI (Luciano), a Genoese historian and portrait-painter of great genius and abilities, flourished about the middle of the 17th century. His three sons were professors of the same art: but only one, Francis Maria, succeeded; and that was in sea-pieces, particularly storms.

BOS (John Baptist du), a celebrated author and member of the French academy, was born at Beauvais in 1670, and finished his studies at the Sorbonne. In 1695, he was made one of the committee for foreign affairs under Mr Torez; and was afterwards charged with

with some important transactions in England, Germany, Holland, and Italy. At his return to Paris, he was handsomely preferred, made an abbé, and chosen perpetual secretary of the French academy. He was the author of several excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols 12mo. 2. The history of the four Gordians, confirmed and illustrated by medals. 3. A critical history of the establishment of the French monarchy among the Gauls, 2 vols 4to, 4 vols 12mo. He died at Paris, on the 23^d of March 1742.

BOS, in zoology, a genus of quadrupeds belonging to the order of pecora. The characters of this genus are taken from the horns and teeth. The horns are hollow within; and turned forward, in the form of crescents: There are eight fore-teeth in the under jaw, and none in the upper, their place being supplied by a hard membrane; and there are no dog-teeth in either jaw. Linnæus enumerates six species, viz.

1. The **TAURUS**, including the bull and cow, has cylindrical horns bent outwards, and loose dewlaps. The bull, or male, is naturally a fierce and terrible animal. When the cows are in season, he is perfectly ungovernable, and often altogether furious. When chafed, he has an air of fullen majesty, and oft tears up the ground with his feet and horns. The principal use of the bull is to propagate the species; although he might be trained to labour, his obedience cannot be depended on. A bull, like a stallion, should be the most handsome of his species. He should be large, well-made, and in good heart; he should have a black eye, a fierce aspect, but an open front; a short head; thick, short, and blackish horns, and long shaggy ears; a short and straight nose, large and full breast and shoulders, thick and fleshy neck, firm reins, a straight back, thick fleshy legs, and a long tail well covered with hair. Castration remarkably softens the nature of this animal; it destroys all his fire and impetuosity, and renders him mild and tractable, without diminishing his strength; on the contrary, after this operation, his weight is increased, and he becomes fitter for the purposes of plowing, &c.

The best time for castrating bulls is at the age of puberty, or when they are 18 months or two years old; when performed sooner, they often die. However, it is not uncommon to castrate calves a few days after birth. But such as survive an operation so dangerous to their tender age, generally grow larger and fatter, and have more courage and activity than those who are castrated at the age of puberty. When the operation is delayed till the age of six, seven, or eight years, they lose but few of the qualities of bulls; are much more furious and untractable than other oxen; and when the cows are in season, they go in quest of them with their usual ardor.

The females of all those species of animals which we keep in flocks, and whose increase is the principal object, are much more useful than the males. The cow produces milk, butter, cheese, &c. which are principal articles in our food, and besides answer many useful purposes in various arts.

Cows are generally in season, and receive the bull, from the beginning of May to the middle of July. Their time of gestation is nine months, which naturally brings the veal or calves to our markets from the beginning of

January to the end of April. However, luxury has fallen upon methods of interrupting this natural course, and veal may be had almost every month in the year.

Cows, when improperly managed, are very subject to abortion. In the time of gestation, therefore, they ought to be observed with more than ordinary care, lest they should leap ditches, &c. Neither should they be suffered to draw in the plough or other carriage, which is a practice in some countries. They should be put into the best pasture, and should not be milked for six weeks or two months before they bring forth their young. The calf should be allowed to suck and follow its mother during the first six or eight days. After this it begins to eat pretty well, and two or three weeks in a day will be sufficient. But if the object be to have it quickly fattened for the market, a few raw eggs every day, with boiled milk, and a little bread, will make it excellent veal in four or five weeks. This management of calves applies only to such as are designed for the butcher. When they are intended to be nourished and brought up, they ought to have at least two months suck; because the longer they suck, they grow the stronger and larger. Those that are brought forth in April, May, or June, are the most proper for this purpose; when calved later in the season, they do not acquire sufficient strength to support them during the winter.

The cow comes to the age of puberty in 18 months, but the bull requires two years: but although they are capable of propagating at these ages, it is better to restrain them till they be full three years. From three to nine years those animals are in full vigour; but when older, they are fit for nothing but to be fed for the butcher. A milk-cow ought to be chosen young, fleshy, and with a brisk eye.

The heaviest and most bulky animals neither sleep so profoundly, nor so long, as the smaller ones. The sleep of the ox is short and slight; he wakes at the least noise. He lies generally on the left side, and the kidney of that side is always larger than the other. There is great variety in the colour of oxen. A reddish or black colour is most esteemed. The hair should be glossy, thick, and soft; for, when otherwise, the animal is either not in health, or has a weakly constitution. The best time for inuring them to labour is at the age of two and a half or three years.

The ox eats very quick, and soon fills his first stomach; after which he lies down to ruminate, or chew the cud. The first and second stomachs are continuations of the same bag, and very capacious. After the grafs has been chewed over again, it is reduced to a kind of mass, not unlike boiled spinage; and under this form it is sent down to the third stomach, where it remains and digests for some time; but the digestion is not fully completed till it comes to the fourth stomach, from which it is thrown down to the guts. The contents of the first and second stomachs are a collection of grafs and other vegetables roughly macerated; a fermentation however soon commences, which makes the grafs swell. The communication between the second and third stomach is by an opening much smaller than the gullet, and not sufficient for the passage of the food in this state. Whenever, then, the two first stomachs are distended with food, they begin to contract, or rather perform a kind of re-acton. This re-acton

compresses the food, and makes it endeavour to get out : now the gullet being larger than the passage between the second and third stomachs, the pressure of the stomach necessarily forces it up the gullet. The action of ruminating, however, appears to be in a great measure voluntary ; as animals of this kind have a power of increasing the re-action of their stomachs. After the food undergoes a second maceration, it is then reduced into a thin pulp, which easily passes from the second to the third stomach, where it is still further macerated ; from thence it passes to the fourth, where it is reduced to a perfect mucilage, every way prepared for being taken up by the lacteals, and converted into nourishment. What confirms this account of chewing the cud is, that as long as these animals suck or feed upon liquid aliment, they never ruminate ; and in the winter, when they are obliged to feed upon hay and other dry victuals, they ruminate more than when they feed upon fresh grafs.

Bulls, cows, and oxen, are fond of licking themselves, especially when lying at rest. But this practice should be prevented as much as possible ; for as the hair is an undigestible substance, it lies in the stomach or guts, and is gradually coated by a glutinous substance, which in time hardens into round stones of a considerable bulk, which sometimes kills them, but always prevents their fattening, as the stomach is rendered incapable of digesting the food so well as it ought.

The age of these animals may be distinguished by the teeth and horns. The first fore-teeth fall out at the age of six months, and are succeeded by others of a darker colour, and broader. At the end of sixteen months, the next milk-teeth likewise fall out ; and at the beginning of the fourth year all the fore-teeth are renewed, and then they are long, pretty white, and equal : However, as the animal advances in years, they become unequal and blackish. The horns of oxen four years of age are small pointed, neat, and smooth, but thickest near the head : This thick part next season is pushed further from the head by a horny cylinder, which is also terminated by another swelling part, and so on, (for as long as the ox lives, the horns continue to grow) ; and these swellings become so many annular knots by which the age may easily be reckoned : But, from the point to the first knot must be counted three years, and every succeeding knot only one year. The bull, cow, and ox, generally live about fourteen or fifteen years.

Ox-beef is very nourishing, and yields a strong aliment ; the flesh of a cow, when well fattened and young, is not much inferior. Bull-beef is hard, tough, and dry ; for which reason it is not much used for food. Veal is well tasted, easy of digestion, and rather keeps the body open than otherwise.

The northern countries of Europe produce the best cattle of this kind. In general, they bear cold better than heat ; for this reason, they are not so plenty in the southern countries. There are but few in Asia to the south of Armenia, or in Africa beyond Egypt and Barbary. America produced none till they were carried there by the Europeans. But the largest are to be met with in Denmark, Podolia, the Ukrain, and among the Calmuck Tartars ; likewise those of Ireland, England, Holland, and Hungary, are much larger than those of Persia, Turkey, Greece, Italy, and Spain ; but

those of Barbary are least of all. In all mountainous countries, as Wales, the Highlands of Scotland, &c. the black cattle are small ; but hardy, and when fattened make excellent beef. In Lapland, they are mostly white, and many of them want horns.

The British breed of cattle, Mr Pennant observes, has in general been so much improved by foreign mixture, that it is difficult to point out the original kind of these islands. Those which may be supposed to have been originally British are far inferior in size to those on the northern part of the European continent : the cattle of the Highlands of Scotland are exceedingly small ; and many of them, males as well as females, are hornless : the Welsh runts are much larger : the black cattle of Cornwall are of the same size with the last. The large species that is now cultivated through most parts of Great Britain, are either entirely of foreign extraction, or our own improved by a cross with the foreign kind. The Lincolnshire kind derive their size from the Holftein breed ; and the large hornless cattle that are bred in some parts of England, come originally from Poland.

About 250 years ago, there was found in Scotland a wild race of cattle, which were of a pure white colour, and had, if we may believe Boethius, manes like lions. Mr Pennant says he cannot but give credit to the relation ; having seen in the woods of Drumlanrig in North Britain, and in the park belonging to Chillingham castle in Northumberland, herds of cattle probably derived from the savage breed. They have lost their manes, but retain their colour and fierceness : they were of a middle size, long legged ; and had black muzzels and ears ; their horns fine, and with a bold and elegant bend.—The keeper of those at Chillingham said, that the weight of the ox was 38 stones ; of the cow, 28 : that their hides were more esteemed by the tanners than those of the tame ; and they would give sixpence per stone more for them. These cattle were wild as any deer : on being approached, they would instantly take to flight, and gallop away at full speed ; never mix with the tame species ; nor come near the house, unless constrained to it by hunger in very severe weather. When it is necessary to kill any, they are always shot : if the keeper only wounds the beast, he must take care to keep behind some tree, or his life would be in danger from the furious attacks of the animal, which will never desist till a period is put to its life.

Frequent mention is made of our savage cattle by historians. One relates that Robert Bruce was (in chasing these animals) preserved from the rage of a wild bull by the intrepidity of one of his courtiers, from which he and his lineage acquired the name of *Turn-bull*. Fitz-Stephen * names these animals (*ari sivostris*) among those that harboured in the great forest that in his time lay adjacent to London. Another, enumerates, among the provisions at the great feast of Nevil archbishop of York, six wild bulls ; and Sibbald assures us, that in his days a wild and white species was found in the mountains of Scotland, but agreeing in form with the common sort. They were probably the same with the *bifontes jabati* of Pliny, found then in Germany, and might have been common to the continent and our island : the loss of their savage vigour by confinement might occasion some change in the external

Bos.

ternal appearance, as is frequent with wild animals deprived of liberty; and to that we may ascribe their loss of mane. The urus of the Hercynian forest described by Cæsar, (*lib. vi.*) was of this kind; the same which is called by the modern Germans, *aurochs*, i. e. *bos sylvestris*.

The ox is the only horned animal in these islands that will apply his strength to the service of mankind. It is now generally allowed, that, in the draught, oxen are in many cases more profitable than horses; their food, harness, and shoes, being cheaper; and should they be lamed or grow old, an old working beast will be as good meat, and fatten as well, as a young one.

There is scarce any part of this animal without its use. The blood, fat, marrow, hide, hair, horns, hoofs, milk, cream, butter, cheese, whey, urine, liver, gall, spleen, bones, and dung, have each their particular use in manufactures, commerce, and medicine.

The skin has been of great use in all ages. The ancient Britons, before they knew a better method, built their boats with osiers, and covered them with the hides of bulls, which served them for short coasting voyages.

Primum cana felix madefacto vinum parvum
Texitur in puppim, casaque induta juvenca,
Vestibus pœnæ, tumidum super emicat ansem;
Sic Venetus stagnante Pado, fuscque Britannus
Navigat oceanum. LUCAN. lib. iv. 131.

The bending willow into barks they twine;
 Then line the work with spoils of slaughter'd kine.
 Such are the floats Venetian fishers know,
 When in dull marshes stands the settling Po;
 On such to neighb'ring Gaul, allur'd by gain,
 The bold'ring Britons cross the swelling main.

ROWE.

Vessels of this kind are still in use on the Irish lakes; and on the Dee and Severn: In Ireland they are called *curachs*, in English *coracles*; from the British *curragh*, a word signifying a boat of that structure. At present, the hide, when tanned and curried, serves for boots, shoes, and numberless other conveniences of life.—

Vellum is made of the thinnest calves-skins, and the skins of abortions. Of the horns are made combs, boxes, handles for knives, and drinking vessels; and when softened by water, obeying the manufacturer's hands, they form pellucid laminæ for the sides of lanterns. These last conveniences were invented by the great king Alfred, who first used them to preserve his candle time-measurers from the wind; or (as other writers will have it) the tapers that were set up before the reliques in the miserable tattered churches of that time. The very smallest fragments, and even the dust and filings, of horn, are found very serviceable in manuring cold lands. The matter lying within, on which the horn is formed, is called the *slough*; and, when dry, is used in making walls or fences, in which, covered from wet, it will last a long time. It is also most admirable in mending roads, where the soil is soft and spewy; for, dissolving, it becomes a glutinous substance, that binds amazingly with gravel. As a manure, they allow between two and three quarter-sacks to an acre. Horn saw-dust with mould is an excellent compost for flowers. It is also of use in hardening, and giving what is called a proper temper, to metals. In medicine, horns were employed as alexipharmics, or antidotes against poison, the plague, or the small-pox; they have been dignified with the title of *English bazaar*, and are said to have been found to answer the end of the oriental kind.

Bos.

The teguments, cartilages, and gristles, for the indifferent,—and, for the finer, all the cuttings, parings, and scraps of hides,—are boiled in water, till the gelatinous parts of them are thoroughly dissolved; and the mass, properly dried, becomes glue. See *GLUE*.

The bones are used by mechanics where ivory is too expensive; by which the common people are served with many neat conveniences at an easy rate. From the tibia and carpus bones is procured an oil much used by coach-makers and others in dressing and cleaning harness, and all trappings belonging to a coach; and the bones calcined afford a fit matter for tests for the use of the refiner in the smelting trade.

The blood is used as an excellent manure for fruit-trees, and is the basis of that fine colour the Prussian blue.

The sinews are prepared so as to become a kind of thread or small cord, used in sewing saddles, in making racquets, and other things of a like nature.

The hair hath also its value, and is employed in many different ways. The long hair of the tail is frequently mixed with horse-hair spun into ropes, and sometimes wove. The short hair serves to stuff saddles, seats of several kinds, mattresses, and chairs. The refuse is a good manure, and operates more speedily than the horns.

The fat, tallow, and suet, furnish us with light; and are also used to precipitate the salt that is drawn from briny springs. The gall, liver, spleen, and urine, had also their place in the materia medica, though they have now resigned it to more efficacious and agreeable medicines.

The uses of butter, cheese, cream, and milk, in domestic economy, and the excellence of the latter in furnishing a palatable nutriment for most people whose organs of digestion are weakened, are too obvious to be insisted on.

2. The *BONASUS* has a long mane; its horns are bent round towards the cheek, and are not above a span long. It is about the size of a large bull, and is a native of Africa and Asia. When enraged, he throws out his dung upon dogs or other animals that annoy him; the dung has a kind of caustic quality, which burns the hair off any animal it falls upon.

3. The *BISON* has likewise a long thick mane, which covers the whole neck and breast on each side. The horns are turned upwards, and exceedingly large; there is a large protuberance or bunch on the back; his eyes are red and fiery, which gives him a furious aspect. He is fierce, cruel, and so bold that he fears nothing. It is unsafe to hunt him but where the trees are so large as to hide the hunters. He is a native of Mexico and Florida.

The *musk-ox* of Hudson's bay, a variety of this species, wants the hump between the shoulders. It is about the size of a Scotch bullock; has a thick body, and short legs. The horns are large, and very remarkable: they are united at their origin in the skull; but immediately after, they fall down on each side of the crown of the head, then taper away small, the points turning up. The hair is black, and grows to a great length; underneath which is a fine wool superior to Vigonia wool. The male only has the curious scalp; the female is covered with hair. These animals frequent the country about 100 miles inwards to the north-west of Churchill river, in Hudson's bay, where they are very

numerous. The Indians kill great numbers of them: but the flesh is coarse eating; and so musky tasted at certain seasons, as not to be eatable. From 2000 to 4000 weight of the flesh frozen, is brought to Prince of Wales's fort annually, and is served out as provisions to the Europeans.

A specimen of the head of this animal is now in Edinburgh, in the possession of Mr. Graham from Hudson's bay. A figure of it is given in Plate LXV.

4. The GRUNNIENS, or hog-cow, has cylindrical horns bent backwards. The body is so hairy, that the hair hangs down upon its knees like a goat. The colour of the body is black, but the front is white. It has bristles on its back, tail, and hind-legs, and it grunts like an hog. It is an inhabitant of the north of Asia.

† PL. LVIII. A variety of this species is the *Indian ox*, with a vast hump on the shoulders. They differ much in size, and in the form of their horns. Some are very large, and of a reddish colour; with horns short, and bending close to the neck: others very small, with horns almost upright, bending a little forward. In Surat, is a minute kind not bigger than a great dog, which have a very fierce look, and are used to draw children in small carts. In Celebes is a small species not bigger than a middle-sized sheep, called *Anoa*, very fierce and wild, of a dark ash-colour, inhabiting the rocks. Mr Loten, when in India, put some of them into a paddock, and in one night's time they killed 14 or 15 of his deer by ripping up their bellies.

5. The BUBALIS, or buffalo, has large black horns bent backward and inward, and plain before. The hair on the back is very hard, but thinly scattered over the body. It is a native of Asia. But they are tamed in Italy, and used for the same purposes as black cattle in other countries. They draw carriages, and are guided by a rope tied to a string thrust through their noses. The buffalo is larger than an ox, has a thicker body, and a very hard hide. His pace is slow; but he will carry a great burden. They feed in herds like cows; and yield plenty of milk, of which very good butter and cheese is made. Their flesh is pretty good, but not to be compared to beef. The wild buffalo is a very fierce and dangerous animal; he often attacks travellers, and tears them in pieces. However, they are not so much to be feared in woods as in the plains, because their horns, which are sometimes ten feet long, are apt to be entangled in the branches of trees, which gives those who are surprised by them time to escape. They are excellent swimmers, and will cross the largest rivers without any difficulty. They run wild in great troops on the coast of Malabar; for which reason strangers are allowed to hunt and kill them at pleasure.

6. The INDICUS, or little Indian buffalo, has horns shorter than its ears, a bunch on its back, and no mane. It is about the size of a calf six months old, and used in the East Indies for drawing coaches.

BOS, in antiquity, was peculiarly used for an ancient Greek silver coin, which was *didrachmus*, or equivalent to two drachms. It was so called as having on it the impression of an ox, and chiefly obtained among the Athenians and Delians; being sometimes also struck of gold. From this arose the phrase *Bos in lingua*, applied to those who had taken bribes to hold their tongue.

BOSA, a maritime town in the western part of the

island of Sardinia, with a castle, a good port, and a bishop's see. It is seated on the river Bosa, to the north-east of an island of the same name; and has good salt pits. E. Long. 8. 30. N. Lat. 40. 19.

BOSCAGE, the same with a grove, or thicket.

Boscage, in a law sense, is that food which trees yield to cattle; as mast, &c. But Manwood says, to be quit of boscage is to be discharged of paying any duty for windfall wood in the forest.

BOSCAGE, among painters, denotes a landscape representing much wood and trees.

BOSCAN (John), a Spanish poet of the 16th century, born at Barcelona. He was the friend of Garcilasso de Vega, another Spanish poet. These two were the first who made any great improvement in the poetry of their nation, and their pieces were printed together. Boscan, who died about the year 1542, principally succeeded in sonnets.

BOSCAWEN (Edward), a brave British admiral, was the second son of Hugh late lord viscount Falmouth. Having early entered into the navy, he was, in 1740, captain of the *Shoreham*; and behaved with great intrepidity as a volunteer under admiral Vernon, at the taking of Porto Bello. At the siege of Carthagena, in March 1740-1, he had the command of a party of seamen who resolutely attacked and took a battery of 15 twenty-four pounders, though exposed to the fire of another fort of five guns. Lord Abrey Beauclerk being killed at the attack of Boca-Chica, captain Boscawen succeeded him in the command of the prince Frederic of 70 guns. In May 1742, he returned to England, and married Frances daughter of William Glanville, Esq; and the same year was elected representative for Truro in Cornwall. In 1744, he was made captain of the *Dreadnought* of 60 guns; and soon after he took the *Medea*, a French man of war commanded by M. Hoquart, the first king's ship taken in that war. May 3^d, 1747, he finalized himself under the admirals Anson and Warren, in an engagement with the French fleet off Cape Finisferre, and was wounded in the shoulder with a musquet ball. Here M. Hoquart, who then commanded the *Diamont* of 56 guns, again became his prisoner; and all the French ships of war, which were ten in number, were taken. On the 15th of July, he was made rear-admiral of the blue, and commander in chief of the land and sea forces employed on an expedition to the East Indies; and on the 4th of November, sailed from St Helens, with six ships of the line, five frigates, and 2000 soldiers. On the 29th of July 1748, he arrived at St David's, and soon after laid siege to Pondicherry; but the men growing sickly, and the monsoons being expected, the siege was raised, and Mr Boscawen shewed himself as much the general as the admiral in his retreat. Soon after he had news of the peace, and Madras was delivered up to him by the French. In April 1750, he arrived at St Helens in the *Exeter*, and found that in his absence he had been appointed rear-admiral of the white. He was the next year made one of the lords commissioners of the admiralty, and chosen an elder brother of the trinity-house. In February 1755, he was appointed vice-admiral of the blue. On the 16th of April, sailing in order to intercept a French squadron bound to North America, he fell in with the *Alcide* and *Lys* of 64 guns each, which were both taken:

Bosswen
Bosca.

taken : on this occasion M. Hoquart became his prisoner a third time, and he returned to Spithead with his prizes and 1500 prisoners. In 1756, he was appointed vice-admiral of the white; and in 1758, admiral of the blue, and commander in chief of the expedition to Cape Breton; when, in conjunction with general Amherst, and a body of troops from New England, the important fortrefs of Louisbourg and the whole island of Cape Breton was taken, for which he afterwards received the thanks of the House of Commons. In 1759, being appointed to command in the Mediterranean, he arrived at Gibraltar, where hearing that the Toulon fleet, under M. de la Clue, had passed the Streights, in order to join that at Brest, he got under sail, and on the 18th of August, saw, pursued, and engaged the enemy. His ship, the *Namur*, of 90 guns, losing her main-mast, he shifted his flag to the *Newark*; and, after a sharp engagement, took three large ships, and burnt two in Lagos bay, and the same year arrived at Spithead with his prizes and 2000 prisoners. On December 8th 1760, he was appointed general of the marines, with a salary of L. 3000 *per annum*, and was also sworn one of the privy-council. He died in 1761.

BOSCHAERTS (Thomas Vuillebos), a celebrated painter, was born at Bergen-op-zoom; and, like the great painters who flourished at that time, began to draw, when very young, in the books that were intended for other studies. Preferring his pencil to every thing else, he drew his own picture, by his resemblance in a looking-glass, so like, that those who saw it were astonished. This he did before he had the least instruction from any one, and when he was only 12 years of age. Upon this, his parents sent him to a master, that he might follow the bent of his genius; but his first master being only an indifferent painter, and incapable of satisfying his earnest desire of learning, he left him, and engaged himself with Gerard Segers, under whom, after four years practice, he proved a most accomplished artist. Antwerp being at that time the seat of arts, where there was a confux of the most eminent painters, he thought it the fittest place for his improvement; and there executed such a number of noble pieces as added greatly to the splendour of that wealthy city. In 1642, Henry Frederick prince of Orange, and his son prince William, employed him in their service; in which he continued several years, and made those excellent pieces that are to be seen in that prince's palace at the Hague, and other parts of Holland, and painted portraits for most of the persons of quality that were then living. He died in the flower of his age, in 1670.

BOSCO, or **BOSCHI**, a town of Italy, in the Milanese, seated on the river Orbe. E. Long. 9. 44. N. Lat. 44. 53.

BOSEA, **GOLDEN-ROD TREE**; a genus of the digynia order, belonging to the pentandria class of plants. Of this genus there is but one species, viz. the *yervamora*. This is a native of the Canary islands, and also some of the Caribbees. It hath been long an inhabitant of the British botanic gardens, but hath never been observed to flower in this country. It is a pretty strong woody shrub, growing with a stem as large as a middling person's leg; the branches come out very irregular, and make considerable shoots every summer, which should be shortened in the spring. These branches

retain their leaves till towards the spring, when they fall away, and new leaves are produced in their place. It may be propagated by cuttings planted in the spring; and the plants must be housed in winter, for they are too tender to bear the open air at that season of the year.

BOSNA-SERAGO, a large and strong town of Turkey in Europe, and capital of the province of Bosnia. E. Long. 18. 57. N. Lat. 44. 40.

BOSNIA, a province of Turkey in Europe, seated between Slavonia and Dalmatia. It belongs entirely to the Turks; but they were on the point of being expelled from it by the Christians, when the Spaniards invaded Sicily, and obliged the emperor to conclude the peace of Passarowitz in 1718, by which he gave up Bosnia to the Turks. It is 200 miles in length, and 75 in breadth. It is a barren country, and but little cultivated; the principal revenue arising chiefly from the silver mines. Among the game there are falcons, which are held in great esteem.

BOSPHORUS, in geography, denotes, in general, a narrow sea, or channel, separating two continents, and serving as a communication between two seas.

BOSPHORUS is more particularly used for the straits of Constantinople, which divide Europe from Asia. This was the original *Bosphorus*, so called because oxen could swim over it; and from the resemblance between it and the straits of Kassa, these last were anciently called the *Gimmerian*, and the former the *Thracian*, *Bosphorus*. This strait, which is the communication between the Black sea and that of Marmora, is about 20 miles in length, and a mile and a quarter in breadth where it is narrowest. The Turks have built two castles over against each other to defend the passage. The country about it is very pleasant: on one side stands Constantinople; and on the other Scutari, where the Grand Signior has a palace, and is looked upon as a suburb to Constantinople. The entrance of this strait is dangerous, and sometimes fatal to vessels.

BOSQUETS, in gardening, groves so called from *boschetto*, an Italian word which signifies a *little wood*. They are compartments in gardens formed by branches of trees disposed either regularly in rows, or wildly and irregularly, according to the fancy of the owner. A bosquet is either a plot of ground inclosed with palisades of hornbeam, the middle of it being filled with tall trees, as elm or the like, the tops of which make a tuft or plume; or it consists of only high trees, as horse-chestnut, elm, &c. The ground should be kept very smooth and rolled, or else covered with grass, after the manner of green plots. In planting bosquets, care should be taken to mix the trees which produce their leaves of different shapes, and various shades of green, and hoary or mealy leaves, so as to afford an agreeable prospect. Bosquets are only proper for spacious gardens, and require a great expence to keep them up.

BOSSAGE, in architecture, a term used for any stone that has a proecture, and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms, &c. Bossage is also that which is otherwise called *ruffic work*; and consists of stones which advance beyond the naked, or level, of the building, by reason of indentures or channels left in the joinings. These are chiefly used in the corners of edifices, and thence called *ruffic quoins*. The cavities or indentures

Bosna
Boslage.

are sometimes round, sometimes chain-framed, or bevelled, sometimes in a diamond form, sometimes inclosed with a cavetto, and sometimes with a listel.

BOSSE (Abraham), an able engraver, born at Tours, was well skilled in perspective and architecture. He wrote two treatises, which are esteemed; the one on the manner of designing, and the other upon engraving.

BOSSINEY, or **BOSS-CASTLE**, a town of Cornwall, in England, which sends two members to parliament. W. Long. 5. o. N. Lat. 50. 40.

BOSSU (Rene le), born at Paris in 1631, was admitted a canon regular in the abbey of St Genevieve, in 1649; and after a year's probation, took the habit. He taught polite literature with great success in several religious houses for 12 years, when he gave up the task for retirement. He then published a parallel betwixt the principles of Aristotle's natural philosophy and those of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatise was on epic poetry; which Boileau declared one of the best compositions on that subject in the French language, and which produced a great friendship between them. He died in 1680, and left a great number of MSS. which are kept in the abbey of St John de Chartres.

BOSSUET (James Benigne), bishop of Meaux, was born at Dijon, on the 27th of September, 1627. He distinguished himself by his preaching, and the zeal he discovered in his endeavours to bring over the Protestants of France to the Romish church; by his opposition to Quietism; and by his numerous writings both in French and Latin, which have been collected together, and printed at Paris in 17 vols 4to. This famous divine died at Paris, in 1704, aged 77.

BOSSUPT, a town of the Austrian Netherlands, in the province of Brabant. E. Long. 4. 30. N. Lat. 50. 52.

BOSSUS (Matthew), distinguished by his virtue and his learning, was born in 1427. He devoted himself to the ecclesiastical state in 1451, in the congregation of regular canons of Lateran, and afterwards taught divinity at Padua. His orations, his sermons, and his letters, have been often printed. He also wrote a sort of an apology for Phalaris, and other works. He died at Padua in 1502, aged 75.

BOST, a very strong town of Persia, and capital of the province of Zablestan. E. Long. 64. 15. N. Lat. 31. 50.

BOSTANGIS, in the Turkish affairs, persons employed in the garden of the seraglio, out of whose number are collected those that are to row in the Grand Signior's brigantines, when he has a mind to divert himself with fishing, or to take the air upon the canal. They who row on the left hand are only capable of mean employments in the gardens: but they who row on the right hand may be promoted to the charge of *bofangi-bachi*, who has the general intendency of all the Grand Signior's gardens, and commands above 10,000 *bofangers*.

BOSTON, a corporation-town of Lincolnshire in England, which sends two members to parliament. It is commodiously seated on both sides the river Witham, over which it has a handsome, high, wooden bridge; and, being near the sea, enjoys a good trade. It has a spacious market-place, and the largest parish

church without cross-ises in Europe, the steeple of which serves for a land-mark to sailors. E. Long. o. 15. N. Lat. 53. 3.

BOSTON, the capital of New England in North America, built in 1630, in a peninsula of about four miles in circumference, at the bottom of Massachusetts bay, in a very convenient situation for trade. The following is a description of this capital before the commencement of the present American war. "The town stands in W. Long. 71. 5. N. Lat. 42. 24. about nine miles from the mouth of the bay. At the entrance of this bay are several small rocks which appear above water, and upwards of a dozen of small islands, some of which are inhabited. There is but one safe channel to approach the harbour; and that so narrow, that two ships can hardly sail through abreast; but within the harbour, there is room for 500 sail to lie at anchor in a good depth of water. On one of the islands of the bay stands Fort William, the most regular fortrefs in British America. This castle is defended by 100 guns, 20 of which lie on a platform level with the water, so that it is scarce possible for an enemy to pass the castle. To prevent surprize, they have a guard placed on one of the rocks, at two leagues distance, from whence they make signals to the castle when any ships come near it. There is also a battery of guns at each end of the town. At the bottom of the bay is a noble pier near 2000 feet in length; along which on the north side extends a row of warehouses for the merchants; and to this pier, ships of the greatest burden may come and unload, without the help of boats. The greatest part of the town lies round the harbour in the form of a half moon, the country beyond it rising gradually and affording a delightful prospect. The neck of land which joins the peninsula to the continent is but 40 yards over; which situation, if properly improved, might render the town impregnable on the land side. Boston contains only about 18,000 inhabitants. They were more numerous 50 years ago; but the surprizing increase of Newbury-port, Salem, Marble-head, Cape Ann, Plymouth, Dartmouth, and the island of Nantucket, checked the growth and trade of the capital. The trade of Boston, however, was so considerable, that, in 1768, 1200 sail entered and cleared at the custom-house there. The predominant religion is the Independent; though there are other persuasions, and ten churches serve for them all, but the Independents have six." Boston has frequently suffered by fire, but the houses that were thus destroyed have always been rebuilt to advantage.

BOSWORTH, a town of Leicestershire in England, situated in W. Long. 1. 24. N. Lat. 52. 45.—It has a lofty situation on a hill, and the country about it is fertile in corn and grafs. It is memorable for the decisive battle fought near it between Richard III. and Henry earl of Richmond, wherein the former lost his crown and life.

BOTALLUS, (Leonard), physician to the duke of Alencon, and to Henry III. was born at Asti in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty; but soon after his death it came into practice with all the physicians. He published several books in physic and surgery; the best edition of which is that of Leyden in 1660, octavo.

B O T A N Y,

IN the utmost extent of the word, signifies a knowledge of plants, and of the uses to which they may be applied, either in medicine, chemistry, or in the different arts.—But as the medical virtues of plants fall properly under the province of the physician, their chemical properties belong to the chemist, &c.; hence the science of botany is commonly restricted to a bare knowledge of the different plants themselves, and of the distinguishing marks whereby each individual species may be known from every other. This knowledge is indispensably necessary for those who propose to apply plants to any useful purpose: for example, though we should suppose a physician ever so well acquainted with the virtues of opium, and a chemist ever so well acquainted with the method of preparing it, yet if both of them were entirely ignorant of botany, so as to be unable to distinguish the particular species of poppy which produces opium from others of the same genus, 'it is evident their medicinal and chemical skill could be of no use.

The utility of botanical classifications may be further illustrated from the following considerations.

1. With regard to *Food*. Many animals are endowed with an instinctive faculty of distinguishing with certainty whether the food presented to them be salutary or noxious. Mankind have no such instinct. They must have recourse to experience and observation. But these are not sufficient to guide us in every case. The traveller is often allured by the agreeableness of smell and taste to eat poisonous fruits. Neither will a general caution not to eat any thing but what we know from experience to be salutary, answer in every emergency. A ship's company, in want of provisions, may be thrown upon an uninhabited coast or a desert island. Totally ignorant of the nature of the plants they meet with, diseases, or scarcity of animals, may make it absolutely necessary to use vegetable food. The consequence is dreadful: they must first eat before any certain conclusion can be formed. This is not the description of danger arising from an imaginary situation. Before the vegetables that grow in America, the East and West Indies, &c. became familiar to our sailors, many lives were lost by trials of this kind: neither has all the information received from experience been sufficient to prevent individuals from still falling a prey to ignorance or rashness.—If the whole science of botany were as complete as some of its branches, very little skill in it would be sufficient to guard us infallibly from committing such fatal mistakes. There are certain orders and classes which are called *natural*, because every genus and species comprehended under them are not only distinguished by the same characteristic marks, but likewise possess the same qualities, though not in an equal degree. For example: Shew a botanist the flower of a plant whose calix is a double valved glume, with three stamina, two pistils, and one naked seed; he can pronounce with absolute certainty, that the plant from which the flower was taken, bears seeds of a farinaceous quality, and that they may be safely used as food. In like manner, shew him a flower with 12 or more stamina all inserted into the internal side of the calix, tho'

it belonged to a plant growing in Japan, he can pronounce without hesitation, that the fruit of it may be eat with safety. On the other hand, shew him a plant whose flower has five stamina, one pistil, one petal, or flower-leaf, and whose fruit is of the berry kind, he will tell you to abstain from it, because it is poisonous. Facts of this kind render botany not only a respectable, but a most interesting, science.

2. With respect to *Medicine*, the same thing holds good. It is found by experience, that plants which are distinguished by the same characters in the flower and fruit, have the same qualities, though not always in an equal degree as to strength or weakness; so that, upon inspection of the flower and fruit, a botanist can determine *a priori* the effects that will result when taken into the stomach. In order, therefore, to determine the medical virtues of all the plants belonging to a natural class, the physician has nothing to do but to ascertain by a set of clear and unquestionable experiments, the virtues of any one of them. This greatly shortens the labour of investigation. Supposing the number of known species to be 20,000; by ascertaining the virtues of one genus, at a medium, you determine the virtues of 12 species. But by ascertaining the virtues of one genus belonging to a natural order, the virtues of perhaps 300 or 400 species are ascertained.

SECT. I. *History of Botany.*

THE origin of this science, like that of most others, cannot be found out from the most ancient histories; but it is very probable, that some degree of botanical knowledge has existed in every age of the world. The first botanical writings of which we have any account are those of Solomon, who we are informed by scripture did write a treatise upon this subject; but that is absolutely lost, not being quoted by any ancient author, nor the least fragment of the treatise itself remaining. Among the Greeks, Anaxagoras, Pythagoras, and other ancient philosophers, wrote treatises on plants; but their works are also lost; and from the quotations that yet remain in the works of Theophrastus, Dioscorides, and Pliny, we learn, that those first botanical writings could convey but very little knowledge.

The historical æra of botany, therefore, commences with Theophrastus the disciple of Aristotle. He was born at Erethium, in the island of Lesbos; and flourished in the third century before the Christian æra, being about 100 years posterior to Hippocrates. His work is entitled *The History of Plants*, and treats of their origin, propagation, anatomy, and construction; of vegetable life, and of vegetation. It consisted originally of ten books; but of these only nine are now extant. In these, vegetables are distributed into seven classes or primary divisions; which have for their object, the generation of plants; their place of growth; their size as trees and shrubs; their use as pot herbs and esculent grains; and their lactescence, or the liquor of whatever colour, that flows from plants when cut. In his work, about 500 different plants are described. The next botanist of any note was Dioscorides, a Grecian by birth, but under the Roman empire, being near

near 400 years posterior to Theophrastus. He describes about 600 plants; and these he has arranged, from their uses in medicine and domestic economy, into four classes, which are thus designated: aromatics; alimentary vegetables, or such as serve for food; medicinal, and vinous plants.

Almost cotemporary with Dioscorides flourished Antonius Musa, Cato, Varro, Virgil, and Columella; the first, author of a treatise still extant on the plant *betony*; the four others celebrated for their useful tracts on agriculture and rural economy.

Pliny the Elder, in his voluminous work intitled *The History of the World*, hath a botanical part which is contained in 15 books. In these, besides the plants of Theophrastus and Dioscorides, he has given descriptions of several new species, extracted probably from works which would otherwise have been totally lost. Pliny uses scarce any mode of arrangement, except the ancient, but very incorrect, distinction into trees, shrubs, and herbs. His plan, however, extends not only to botanical distinctions, but to gardening, agriculture, and whatever is connected either more nearly or remotely with the science of plants. He gives descriptions of above 1000 different species; but from the want of a proper systematic arrangement, it is often difficult, and perhaps impossible, to determine what plants he or other ancient botanists do really describe.

This want of precision in properly arranging their plants was the reason why the botany of the ancients was always very limited, and after the time of Pliny declined so rapidly. On the destruction of the western empire by the Goths and other barbarous nations, it is not to be thought that botany could survive any more than the other sciences. It was not till near the close of the eighth century, that the ancient botany began again to appear in Arabia. Serapion, well known in medicine, stands first in the Arabian catalogue of botanists; to him succeeded Razis, Avicenna, Avernhoes, Actuarius, &c. An author known by the name of *Plato Apuleius*, or *Apulensis*, of whose *herbarium* very old manuscript copies are preserved in some curious libraries, is supposed to have lived near this period. The works of most of these botanists, however, were only translations and compilations from the Greek writers; so that, for want of a proper systematic arrangement, the science sunk a second time into total oblivion. For near 400 years after Abengueist, an Arabian physician who flourished in the end of the 12th century, scarce any attempts were made in the botanical way. Some obscure writers indeed appeared in several parts of Europe; as, Arnoldus de Villa Nova; Platearius; Matthæus Sylvaticus; and Bartholomew Glanvil, commonly called *Bartholomæus Anglus*, a Franciscan monk, descended of the family of the earls of Suffolk, who lived in the reign of King Edward III. and wrote a book of natural history, intitled *De proprietatibus rerum*, which was translated into English by John de Trevisa in 1398: but though all these wrote of plants, they were so totally destitute of method, that their works remain one great chaos, from whence it is impossible to extract any thing.

On the revival of letters in the beginning of the 16th century, the botany of the ancients was restored a second time. The Greek writings were translated into Latin, the common language of Europe. Gaza, a

Greek refugee at Rome, made elegant translations of Aristotle and Theophrastus, who afterwards were commented upon by Scaliger and Stapel. Dioscorides was also translated and commented on. His best commentators are Hermolæus Barbarus, Fuchsius, Ruellius Cordus, Gesner, and Matthioli. The most distinguished commentators of Pliny are Dalechamp in 1604, Salmasius in 1689, Harduin, and Guilandinus. Mercurius and Ursinus have written commentaries upon Cato; Campegius and Monardes upon Mesue the Arabian, and Lonicer upon Avicenna. This last hath been translated by several writers, particularly Alpagus, Costæus, and Plempius, into Latin; and by one writer, Amalthæus, into Hebrew.

Hieronymus Bock, or Bouc, a German, generally known by the name of *Tragus*, is the first modern who has given a methodical distribution of vegetables. In 1532, he published a History of Plants, in which he describes 800 species; and these he divides into three classes, founded on the qualities of vegetables, their figure, habit, and size. The same method of arrangement was followed by Lonicer, Dodonæus, L'Obel, Clusius, Brunstelsius, Monardes, Cordus, and some other botanists of this period. How far such a method was deficient, shall be considered in the following section; however, it was not till 1560 that Conrad Gesner first proposed to the world an arrangement of vegetables from the parts of the flower and fruit. He did not establish any plan founded upon this principle; but, having suggested the idea, left the application to be made by others: and in 1582, Dr Andrew Cæsalpinus, physician at Pisa, and afterwards professor of botany at Padua, first availing himself of the ingenuity of his predecessor, proposed a method of arrangement which has the fruit for its basis; and thus gave origin to systematic botany, the second grand æra in the history of that science.

Even this improved method of Cæsalpinus was not without very great inconveniences, which shall be taken notice of hereafter. As it was, however, so greatly superior to every thing that had appeared before, it might have been expected that the learned would have immediately adopted it, and that all the former equivocal and insufficient characters would have been rejected. But the fact was otherwise. Cæsalpinus's method of arrangement died with him; and it was not till near a century after, that Dr Robert Morison of Aberdeen, attaching himself to the principles of Gesner and Cæsalpinus, re-established scientific arrangement upon a solid foundation; so that, from being only the restorer of system, he has been generally celebrated as its founder. In the long interval between Cæsalpinus and Morison, flourished some eminent botanists. The most noted are, Dalechamp, author of *A general history of plants*; Theodore, surnamed *Tabernaemontanus*, and Thalius, two German writers; Porta, an Italian, famous for an arrangement of plants from their relations to the stars, to men, and other animals; Prosper Alpinus, author of a Catalogue of the plants of Egypt; Fabius Columna, inventor of many of the botanical terms now used; the two Bauhins; Gerard and Parkinson; Zaluzianski, a Pole, author of an arrangement from the qualities and habit of plants; Marggrave and Pifo, celebrated for their *Natural History of Brasil*; Hernandez, equally celebrated for his history of Mexi-

to; Pafſæus, or Du Pas, author of an arrangement of plants from the time of flowering, of all characters the most uncertain and insufficient; Johnſon; Bontius, a Dutchman, author of a Natural History of the East Indies; Aldrovandus, the celebrated naturalist; and Rheede, governor of Malabar, and author of the well-known *Hortus Malabaricus*.

The method propoſed by Morison has the fruit for its basis, as well as that of Cæſalpinus; to which, however, it is greatly inferior both in the plan and execution. It is indeed of all others the most difficult in practice; and was therefore not adopted by any succeeding writer, except Bobart who in 1699 completed Morison's Universal History of Plants, and an anonymous author whose work appeared in 1720. Imperfect, however, as his method is, it furnished many useful hints, which succeeding botanists have not failed to improve. Ray and Tournefort have owed him much, and are not ashamed to own the obligation. The fame has been done even by Linnæus; who hath established the science of botany on the most solid foundation, by introducing a method of arrangement, if not absolutely perfect, at least as nearly approaching to perfection as can be expected; and therefore hath been deservedly followed, in preference to every other, by all botanists, since its first publication. But to give a particular account of all the different botanical systems, with the particular advantages and disadvantages attending each, shall be the business of the subsequent sections.

Seçt. II. *Of the Ancient Method of arranging Vegetables.*

In giving an account of the works of Theophrastus and Dioscorides, we have already taken notice that the former chofe seven distinguishing characters, viz. the generation of plants; their place of growth; their size, as trees and shrubs; their use, as pot-herbs and esculent grains; and their lactescence, or liquor that flows from them when cut. Dioscorides divided them into aromatics, alimentary, medicinal, and vinous plants. The good properties of this method are, that the botanist, as it were, comes to the point at once; and when he knows the plant, knows also its virtues and uses, or at least part of them: but this convenience is greatly overbalanced by innumerable disadvantages; for the qualities and virtues of plants are neither fixed and invariable, nor are they impressed in legible characters on the plants themselves. The different parts of a plant often possess different and even opposite virtues; so that, supposing the virtues to be known, and applied to the purpose of vegetable arrangement, the root must frequently fall under one division, the leaves under a second, and the flower and fruit under a third. Besides, if we reflect that the sole end of such arrangement is to facilitate the knowledge of plants to others, the insufficiency and even absurdity of methods founded upon their virtues will immediately appear. A stalk of vervain, for instance, is presented to me, which I am to investigate from a presupposed knowledge of the virtues of plants. Before I can settle the class to which it belongs, I must discover whether or not it has the virtues belonging to any of the plants I know; and this discovery being the result of repeated experiments on various parts of the human body, may require many years

for its accomplishment.

The same causes which render methods founded on the virtues of plants unfavourable for the purpose of investigation, must evidently disqualify all their other variable qualities and accidents from having a place in a genuine systematic arrangement. The *natale solum* of plants, which is one of Theophrastus's divisions, affords no better distinctive characters than their powers and virtues. Many countries as well as many soils produce the same individual plants. The same species which crown the mountains, frequently cover the fens; and plants which have long been reckoned the peculiar inhabitants of some parts of Asia and America, are now found to grow naturally in equal perfection in the very different climates of Lapland and Siberia. The size of plants, which suggested the ancient division into trees and shrubs, is no less an equivocal mark of distinction than the circumstances already mentioned. The vine, which modern botanists denominate a shrub, was ranged by Theophrastus in his third class containing trees. In fact, every thing respecting size is so much affected by differences of soil, climate, and culture, that the same plant, in different circumstances, shall differ exceedingly in height; and in a method founded upon the size, would sometimes be ranged as a tree, and sometimes as a shrub, or even an under shrub, according as it happens to exceed, equal, or fall short of, a given standard. No less insufficient are characteristical marks drawn from the colour, taste, and smell of plants. Of all the attributes of vegetable nature, colour is perhaps the most inconstant. Heat, climate, culture, soil, &c. contribute to the production of endless diversities of colour, and render the transition from one to another natural and easy. Red and blue pass easily into white, white into purple; yellow into white; red into blue; blue into yellow, &c. In the same leaf or flower, different colours are frequently observed. Variations too in point of colour, are frequently observed to take place not only in different individuals of the same species, but even in similar parts of the same plant. Marvel of Peru and Sweet William produce flowers of different colour upon the same stalk. Objections equally valid lie against characteristical marks drawn from the taste and smell. The former varies in different individuals from differences of age, and even in the same individual at different times, according to the morbid or sound state of the organ. The latter is different in different subjects, and varies in each; nor are the effluvia sent forth from the same body always of equal intensity. In plants, taste is subject to continual variations from differences of climate, soil, and culture. Garlic in some climates, particularly in Greece, is said to lose its rankness: apples and pears, that grow naturally in the woods, are intolerably acid; celery and lettuce, which culture renders sweet and palatable, are in their wild uncultivated state, bitter, disagreeable, and in some cases noxious.

These considerations are abundantly sufficient to shew the imperfection of the ancient system of botany; and indeed, considering the vague and uncertain marks by which they distinguished one plant from another, we may rather wonder how such a science as botany came to have an existence among them, than that they arrived at no greater perfection in it, or suffered it so soon to fall into oblivion.

SECT. III. *Of the different Botanical Systems, from the time of Gesner to that of Linneus.*

THE insufficiency of the ancient botanical system being so fully shewn in the last section, we think it needless to take much notice of the methods used by Tragus and his contemporaries and followers. The virtues of plants being found an insufficient characteristic, succeeding botanists had taken in the root, stem, and leaves; but these being also found insufficient and variable, Gesner turned his eye to the flower and fruit, as being the most permanent and unchangeable parts of the plant. In proposing the parts of fructification, however, as the most proper for arranging plants, he communicated no hints respecting the choice of some of those parts in preference to others. Each particular organ of the flower and fruit furnishes sufficient variety to serve as the foundation of a method; but all of them are not equally proper for this purpose. Cæsalpinus, the first follower of Gesner, made a mistake in his choice, and took his distinguishing characteristics only from the fruit. The parts of the flower, therefore, being employed by the first systematic writers only as subaltern distinctions in finding out orders and genera, it is evident that the plant could not be fully investigated for several months. Suppose a plant ripens its fruit in October, and does not produce flowers till the following May; the class, upon inspection of the fruit in the month of October, is immediately ascertained; but the plant still remains unknown, and will continue so upwards of six months after, if the characters of the order and genus have been made to depend on any part of the flower. Methods founded on the fruit have another inconvenience; plants constantly ripen their fruit in those countries where they grow naturally, but not always in the countries to which they may be accidentally transported. So far from this, many plants that are natives of a warm climate neither ripen, nor form fruit, in a cold one. Few of the African, Asiatic, and West-Indian plants produce fruit in Britain. A method, therefore, founded upon the fruit, could only facilitate the knowledge of such plants to the inhabitants of those countries where they grow: to the English botanist they could be of little or no service. The same objection cannot reasonably be urged against methods founded on the flower, since the influence of climates much colder than that of Britain has not been able to destroy the faculty of producing flowers in many, perhaps in most, of the plants just mentioned.

Cæsalpinus sets out with an ancient distinction of vegetables, from their duration, into trees and herbs. With the former he combines shrubs; with the latter, undershrubs; and distributes his plants into the 15 following classes. 1. Trees with the germ, (radicle or principle of life in the seed) on the point of the seed. 2. Trees with the germ on the base of the seed. 3. Herbs having one seed only. 4. Herbs having two seeds. 5. Herbs having four seeds. 6. Herbs having many seeds. 7. Herbs having one grain or kernel. 8. Herbs having one capsule. 9. Herbs having two capsules. 10. Herbs having fibrous roots. 11. Herbs having bulbous roots. 12. Herbs having fucyory or endive-like flowers. 13. Herbs having a common flower. 14. Herbs having several follicles or seed-bags.

15. Herbs having neither flower nor seed.

The inconveniences of this method have been already pointed out pretty fully, and will evidently appear upon an attempt to refer any common plant to one of the 15 abovementioned classes. His sections, orders, or secondary divisions, are 47 in number, and depend upon a variety of parts and circumstances. The principal of these are, the disposition, situation, and figure, of the flowers; the nature of the seed-vessel, or cover of the seeds; the situation of the radicle in the seed; the number of seed-lobes, or fennial leaves; the disposition of the leaves, and colour of the flowers. The lactescence too, or milkiness, which is observed in the compound flowers with flat florets, is made a characteristic distinction, and discriminates the first order of the 12th class. Thus, in the first systematic arrangements, the characters of the classes only were borrowed from the parts of fructification; while those of the subaltern divisions were very numerous, and respected every part of the plant; but that such divisions might be perfect, they should be constituted, like the classes, from the modifications of a single part of the fructification.

The great object had in view by Morison, who comes next in order to Cæsalpinus, was to investigate the order of nature, not to fabricate an easy method of arranging plants. Hence his system is devoid of uniformity, and clogged with a multiplicity of characters; his classes are frequently not sufficiently distinguished from one another, and the key of arrangement seems totally lost. He sets out with a division of plants, from their consistence, into ligneous or woody, and herbaceous. He founds his system on the fruit, the corolle or blossoms, and the habit of the plants. His classes are as follow. 1. Trees. 2. Shrubs. 3. Undershrubs. 4. Herbs climbing. 5. Herbs leguminous or papilionaceous. 6. Herbs podded. 7. Herbs tricapular, or with three capsules. 8. Herbs with four or five capsules. 9. Herbs corymbiferous. 10. Herbs having a milky juice, or downy tops. 11. Herbs culmiferous, as grasses. 12. Herbs umbelliferous. 13. Herbs having three kernels. 14. Herbs having helmet-shaped flowers. 15. Herbs having many capsules. 16. Herbs berry-bearing. 17. Herbs called *capillary plants*, as the fern kind. 18. Anomalous or irregular herbs.

Of these classes, the fourth and eighth possess no genuine distinctive character; nor are the ninth and tenth classes sufficiently distinguished; the fifteenth class is not sufficiently distinguished from the eighth, nor the 16th from the fourth. His sections or secondary divisions, which are 108 in number, arise from the figure and substance of the fruit; the number of seeds, leaves, and petals; the figure of the root; the direction of the stem; the colour of the flowers; the place of growth; and, in one class, from the medicinal virtues of some of the plants that compose it.

In 1682, Ray proposed his method to the world, two years after the publication of Morison's, which served in some measure as its basis. It consisted originally of the following 25 classes. 1. Trees. 2. Shrubs. 3. Herbs imperfect. 4. Herbs having no flower. 5. Capillary plants. 6. Staminous herbs having only the stamina. 7. Those having one naked seed. 8. Umbelliferous herbs. 9. Verticillated, annular, or ring-shaped ones. 10. Rough-leaved plants. 11. Stellated or star-shaped ones. 12. Apple-bearing herbs. 13. Berry-bearing

bearing herbs. 14. Herbs having many pods. 15. Monopetalous uniform, or regular herbs. 16. Monopetalous irregular, or having different forms. 17. Tetrapetalous, having large pods. 18. Tetrapetalous, having small pods. 19. Papilionaceous. 20. Pentapetalous herbs. 21. Corns. 22. Graffes. 23. Grafs-leaved plants. 24. Bulbous-rooted plants. 25. Plants near akin to the bulbous.

This method Ray carefully corrected and amended at different times; so that the plan of arrangement which now bears the name of that author, and was first published in 1700, is entirely different from what had appeared in 1682. It now consists of 33 classes. Their distinguishing marks are taken from the port or habit of the plants; their greater or less degree of perfection; their place of growth; the number of seed-lobes, or feminal leaves, petals, capsules, and seeds; the situation and disposition of the flowers, flower-cup, and leaves; the absence or presence of the buds, flower-cup, and petals; the substance of the leaves and fruit; and the difficulty of classing certain plants. They are as follow.

1. Submarine, or sea-plants. 2. Fungi. 3. Mosses.
4. Capillary plants. 5. Those without petals. 6. *Planipetale*, those with compound flowers; semistofculous, or half-flowers. 7. Those with compound flowers radiated. 8. Those with compound flowers, stofculous, or with whole florets. 9. Plants with one feed.
10. Plants umbellated. 11. Those stellated or star-shaped. 12. Rough-leaved plants. 13. Plants verticillate or whorled. 14. Those with many seeds.
15. Apple-bearing herbs. 16. Berry-bearing herbs. 17. Those with many pods. 18. Monopetalous herbs. 19. Those with two and three petals. 20. Those with great and small, or long and short, pods. 21. Leguminous plants. 22. Pentapetalous ones. 23. Bulbs, and bulbous-like plants. 24. Stamineous ones, or those having only the stamina. 25. Anomalous plants, or those of an uncertain family. 26. The palms. 27. Trees without petals. 28. Trees with an umbilicated fruit. 29. Trees with fruit not umbilicated. 30. Trees with a dry fruit. 31. Trees with podded fruit. 32. Anomalous, or irregular trees.

The distinction into herbs and trees with which Ray's method sets out, acknowledges a different, though not more certain, principle than that of Cæsalpinus and Morison. The former, in making this distinction, had an eye to the duration of the stem; the latter, to its consistence. Ray called in the buds as an auxiliary; and denominates trees, "all such plants as bear buds;" herbs, "such as bear none." But against this auxiliary there lies an unanswerable objection; namely, that though all herbaceous plants rise without buds, all trees are not furnished with them: many of the largest trees in warm countries, and some shrubby plants in every country, being totally destitute of that scaly appearance which constitutes the essence of a bud. In other respects, it is evident that neither Mr Ray's plan nor execution is in any degree calculated to facilitate the knowledge of plants. In fact, it seems to have been Ray's great object, no less than Morison's, to collect as many natural classes as possible; and these being separately investigated, a multiplicity of characters and steps was necessarily required to connect them: and hence the intricacy complained of in both these methods, which must always take place where the classes give rise to the connecting characters, and not the cha-

acters to the classes. The characters of the orders, or secondary divisions, in Ray's method, are no less multifarious than those of the classes. They respect the place of growth of plants; their qualities; the figure of the stem; the number, situation, substance, and division, of the leaves; the situation and disposition of the flowers and calix; the number and regularity of the petals; with the number and figure of the fruit. In his improved method, Ray has adopted Tournefort's characters of the genera, wherever his plan would permit. His general History of Plants contains 18,655 species and varieties. The third volume, which was not published till 1704, and was designed as a supplement to the two former, contains the plants discovered by Tournefort in the Levant, and by Camelli at Luzon one of the Phillipin islands. Ray's method was followed by Sir Hans Sloane, in his Natural History of Jamaica; by Petiver, in his British Herbal; by Dillenius, in his Synopsis of British plants; and by Martyn, in his Catalogue of plants that grow in the neighbourhood of Cambridge.

To Ray's original method succeeded that of Christopher Knaut, a German; which acknowledges the same principle, and is manifestly founded upon it. In his enumeration of the plants that grow round Häl in Saxony, published in 1687, he divides vegetables into 17 classes, which have for their basis the size and duration of plants, the presence or absence of the petals, the disposition of the flowers, the substance of the fruit, the number of capsules or seeds, the number and figure of the petals, and the presence, absence, or figure of the calix. His classes are, 1. Herbs berry-bearing. 2. Monopetalous, or with one flower-leaf. 3. Tetrapetalous and regular, with four petals. 4. Tetrapetalous and irregular. 5. Pentapetalous, or with five petals. 6. Hexapetalous, or six petals. 7. Polypetalous, or many petals. 8. Multicapular, or many capsules. 9. Naked seeds. 10. Solid, or not downy. 11. Downy seeds. 12. Without petals. 13. Stamineous, without petals or calix. 14. Imperceptible. 15. Imperfect. 16. Trees. 17. Shrubs.

The sections or subdivisions of the classes in Knaut's method are 62 in number; and arise from the figure of the stem and petals, the number of capsules and cells, their figure, the number of seeds and leaves, and situation of the flowers.

In 1696, a new method proposed by Dr Herman professor of botany at Leyden, was published by Zumbac, who arranged according to it the plants contained in the public garden of Leyden. Rudbeckius the Younger, in a dissertation published the same year, on the fundamental knowledge of plants, adopted Herman's method with a few inconsiderable variations. The classes of Dr Herman are 25 in number. They are founded on the size and duration of the plants; the presence or absence of the petals and calix; the number of capsules, cells, and naked seeds; the substance of the leaves and fruit; the form and consistence of the roots; the situation and disposition of the flowers, leaves, and calix; and figure of the fruit. 1. Herbs having one naked seed and a simple flower. 2. Having one naked seed and a compound flower. 3. With two naked seeds, and stellated or star-shaped. 4. Twonaked seeds, and umbelliferous. 5. Four naked seeds, and rough leaves. 6. Four naked seeds, and verticillated or whorl-shaped. 7. With

many naked seeds. 8. Having feed-veffels, bulbous and tricapfular. 9. Having one feed-veffel. 10. With two feed-veffels. 11. With three feed-veffels. 12. With four feed-veffels. 13. With five feed-veffels. 14. Podded, which are always tetrapetalous. 15. Leguminous and papilionaceous. 16. With many capfules. 17. Having fleffy fruit, berry-bearing. 18. With fleffy fruit, apple-bearing. 19. Without petals, but having a calix. 20. Without petals, chaffy or flamineous. 21. Without petals, calix, chaff, or flamina, *i. e.* a naked anthera, as the moffes. 22. Trees. Imperfect fructification, bearing catkins. 23. Trees with a fleffy fruit umbilicated. 24. Trees with a fleffy fruit not umbilicated. 25. Trees with a dry fruit.

The claffes in Herman's method are subdivided into 82 fections or orders; which have for their bafis the number of petals, feeds, capfules, and cells, the figure of the feeds and petals, and difpofition of the flowers.

To the method of Dr Herman fucceeded that of Dr Boerhaave, who fucceeded to the botanical chair of Leyden in 1709. His method is that of Herman, blended with part of the fyftems of Tournefort and Ray; and contains the following claffes. 1. Herbs fubmarine, or fea-plants. 2. Imperfect land-plants. 3. Capillary plants, or the fern kind. 4. Many naked feeds. 5. Four naked feeds, and verticillated. 6. Four naked feeds, and rough leaves. 7. Four naked feeds, and four petals. 8. Plants having one feed-veffel. 9. Two feed-veffels. 10. Three feed-veffels. 11. Four feed-veffels. 12. Five feed-veffels. 13. Many feed-veffels. 14. Two naked feeds, and umbelliferous. 15. Two naked feeds, and ftar-shaped. 16. One naked feed, and a fimple flower. 17. One naked feed, and compound flowers femifofculous. 18. One naked feed, and compound flowers radiated. 19. One naked feed and compound flowers corymbiferous. 20. One naked feed, and compound flowers, fofculous. 21. Berry-bearing herbs. 22. Apple-bearing herbs. 23. Without petals. 24. One cotyledon, and having petals. 25. One cotyledon and without petals. 26. Trees having one cotyledon. 27. Many podded. 28. Podded. 29. Tetrapetalous and cruciform. 30. Leguminous. 31. Having no petals. 32. Bearing catkins. 33. Monopetalous flowers. 34. Rafaceous flowers.

Thefe 34 claffes of Dr Boerhaave are subdivided into 104 fections, which have for their characters, the figure of the leaves, ftem, calix, petals, and feeds; the number of petals, feeds, and capfules; the fubftance of the leaves; the fituation of the flowers, and their difference in point of fex. By this method, Dr Boerhaave arranged near 6000 plants, the produce of the botanical garden at Leyden, which he carefully fuperintended for the fpace of 20 years, and left to his fucceffor Dr Adrien Royen, in a much more flourifhing ftate than he himfelf had received it. His Index or Catalogue of the Leyden plants was publifhed in octavo in 1710; and afterwards, with great additions, in quarto, in 1720. This laft edition contains defcriptions of 5650 plants; of which number upwards of two thirds had been introduced into the garden fince the time of Herman, by his illuftrious fucceffor. Boerhaave's characters are derived from the habit or general appearance of plants combined with all the parts of fructification; fo that, as Linnæus very properly obferves, he was the firft who employed the calix, ftamina, and ftyle, in de-

termining the genus. About 17 new genera were eftablifhed by this author; among others, the very fplendid family of the protea and filver-tree, which, although partly defcribed by Morifon, had remained generally unknown till this period. His method was adopted by one Emfling, a German, in a treatife intitled *The firft principles of Botany*, publifhed in octavo at Wolfenbuttle, in 1748.

Hitherto all the botanifts had been intent upon investigating the order of nature, rather than facilitating the arrangement of vegetables: therefore their methods were very intricate and perplexed; and their writings, however entertaining to the learned, could afford but very little inftruction to the young botanift. In 1690, however, Auguftus Quirinus Rivinus, a German, profeffor of botany at Leipfic, relinquifhing the purfuit of natural affinities, and convinced of the infufficiency of characteristic marks drawn only from the fruit, attached himfelf to the flower, which, he was fenfible would furnifh characters no lefs numerous, permanent, and conspicuous, than thofe drawn from the fruit. The calix, petals, ftamina, and ftyle or pointal, which conftitute the flower, are fufficiently diverfified in point of number, figure, proportion, and fituation, to ferve as the bafis of a mode of arrangement; yet all are not equally proper for this purpofe. Rivinus made ufe of the petals as the largeft and moft beautiful part, and that from which the flower itfelf is commonly characterized. His method confifts of the following 18 claffes, which have for their bafis the perfection and difpofition of the flowers, and regularity and number of the petals. 1. Regular monopetalous, or having one petal. 2. Dipetalous. 3. Tripetalous. 4. Tetrapetalous. 5. Pentapetalous. 6. Hexapetalous. 7. Polypetalous, or having many petals. 8. Irregular monopetalous. 9. Irregular dipetalous. 10. Irregular tripetalous. 11. Irregular tetrapetalous. 12. Irregular pentapetalous. 13. Irregular hexapetalous. 14. Irregular polypetalous. 15. Compound flowers of regular forets. 16. Compound flowers of regular and irregular forets. 17. Compound flowers of irregular forets only. 18. Incomplete, or imperfect plants.

As Rivinus fet out with the profefled defign of imparting facility to botany, he judged very properly in diveltling his method of all extraneous matter, and rendering it as fimple and uniform as the nature of the fciences would admit. The diftinction into herbs and trees had been adopted by every writer on plants fince the time of Ariftotle. Rendered in fome meafure facred by its antiquity, this diftinction maintained a kind of importance to which it was by no means effentially intitled. Rivinus was the firft who in this matter dared to think for himfelf. He was early fenfible of the inconveniences to which thofe had fubmitted who employed it as a primary divifion; and therefore refolved at once to get rid of a diftinction that is frequently uncertain, always destructive to uniformity, and in its nature repugnant to the genuine fpirit of fyftem, becaufe totally unconnected with the parts of fructification. In the uniformity of its orders or fecondary divifions, which are 91 in number, and acknowledge the fruit for their principle, Rivinus's method equals, perhaps excels, all that went before or fucceeded it. Only three claffes of his method were publifhed by Rivinus himfelf. Thefe are the 11th, 14th and 15th, which were offered

offered to the public at different times, illustrated with very splendid figures. The method was completed and published entire by Heucher, in a work intitl'd *Hortus Wittenbergenfis*, printed in quarto at Wittenberg in 1711.

Several German authors have followed Rivinus's method, either wholly or in part, without offering any considerable amendment. The principal of these are, Koenig, in a work on vegetables, published at Basil in 1696; Welch in his *Basis Botanica*, printed at Leipzig in octavo, in 1697; Gemeinhart, in a catalogue of plants published in 1725; Kramer, in a work intitl'd *Tentamen Botanicum*, published at Dresden in 1728, and afterwards reprinted with additions at Vienna in 1744; and Hecker, in a dissertation on botany published at Hal in Saxony, in 1734. To these may be added Hebenfret, an ingenious botanist, who in a treatise on plants published at Leipzig in 1731, just before his famous African expedition, established general characters, which had hitherto been wanting in Rivinus's method.

The writers who have attempted to improve upon Rivinus's method are Bernard Ruppis, Christoph Ludwig, and Christian Knaut. Ruppis in his *Flora Jenensis*, published at Frankfort in 1718, has arranged the 1200 plants there described by a method partly Rivinus's, and partly his own. It consists of 17 classes, and sets out with the same divisions and subdivisions as that of Rivinus; with this difference, however, that, whereas in Rivinus's method all perfect flowers are divided into simple and compound, in Ruppis the division of regular and irregular flowers precedes that just mentioned, and simple and compound flowers are made subdivisions of the regular flowers only.

Christoph Ludwig's method, which was published in 1737, and consists of 20 classes, differs but little from that of Rivinus. The author accompanied Hebenfret on his expedition into Africa, and seems to have made plants his favourite study. The improvement, however, which he has made on Rivinus's plan, consists only in rendering it more universal, having enriched it with a multitude of genera collected from the works of Tournefort, Ray, Boerhaave, Dillenius, and other eminent botanists, whose general characters he has likewise adopted. His plan of arrangement has been followed by two succeeding writers; M. Wedel, in a botanical essay published in 1747; and three years after by M. Boehmer, in his catalogue of the plants which grow in the garden of Leipzig.

The method of Christian Knaut is much more properly his own, and departs in a much greater degree from that of Rivinus than either of the two former. The regularity and number of the petals furnished the elassical divisions in Rivinus's method: in that of Knaut, number takes place of regularity; so that it is very properly termed by Linnæus, "The system of Rivinus inverted." This method was published in 1716; and sets out with a division into flowers which have one petal, and such as have more than one. It consists of the 17 following classes. 1. Monopetalous uniform or regular. 2. Monopetalous difform or irregular. 3. Monopetalous compound uniform or regular. 4. Monopetalous compound difform or irregular. 5. Monopetalous compound uniform and difform together. 6. Dipetalous uniform or regular. 7. Dipetalous difform or irregular. 8. Tripetalous uniform or regular. 9. Tripeta-

lous difform or irregular. 10. Tetrapetalous uniform or regular. 11. Tetrapetalous difform or irregular. 12. Pentapetalous uniform or regular. 13. Pentapetalous difform or irregular. 14. Hexapetalous uniform or regular. 15. Hexapetalous difform or irregular. 16. Polypetalous uniform or regular. 17. Polypetalous difform or irregular.

The sections or secondary divisions in Knaut's method are 121, and depend upon the internal divisions of the fruit; and upon this his opinions are somewhat singular. Every kind of fruit, whether pulpy or membranaceous, is termed by our author a *capsule*. Neither is the term restricted to fruits properly so called: it is extended also to those termed by botanists *naked seeds*, the existence of which Knaut absolutely denies. Agreeable to this opinion, capsules, he says, with respect to their consistence or substance, are of two sorts; pulpy, or membranaceous. The former correspond to the fruits of the apple, berry, and cherry kind; the latter to the capsules properly so called, and naked seeds of other botanists. Again, with respect to their cells or internal divisions, capsules are either simple or compound. Simple capsules have an undivided cavity or a single cell; compound capsules are internally divided into two or more cells. With other botanists, the umbelliferous flowers bear two, the lip-flowers four, naked seeds; according to Knaut, the former produce two, the latter four, simple capsules. Ranunculus, adonis, anemony, herb-bennet, and some other plants, have their flowers succeeded by a number of naked seeds collected into an aggregate or head: each of these seeds passes with Knaut for a simple capsule; so that the whole is an aggregate of several capsules with an undivided cavity or single cell. In numbering the cells or internal divisions of the pulpy fruits, our author has adopted a very singular method. Some fruits of the apple kind inclose a capsule that is divided into five membranaceous cells. It might then be very reasonably expected to find such fruits arranged with compound capsules of five cells; but, instead of this, the author whimsically enough combines in their arrangement the idea both of a simple and compound capsule. The pulpy part is undivided; in other words, it is a simple capsule furnished with one cell; the compound capsule inclosed contains five cells, which added to that of the pulp make the number six; and thus these kinds of fruits are arranged with those having capsules of six cells. By the same kind of reasoning, the fruit of the dogwood, which is of the cherry kind, and contains a stone with two cells or cavities, is placed by Knaut among compound capsules with three cells; the pulp passing for one division, and cavities of the stone or nut for the remaining two. This method of calculation is not the only singularity for which Knaut is remarkable. The essence of the flower is made by Ray, Tournefort, Rivinus, and most other botanists, to consist in the stamina and style. This position Knaut absolutely denies; and has established for a principle, that the flower is essentially constituted by the petals only. With him, the flower-cup, stamina, and style, are of little significance: their presence does not constitute a flower if the petals are wanting; neither is their absence sufficient to destroy its existence if the petals are present. From this it follows, 1. That there can be no flowers without petals; and, 2. That the regularity or irregularity

gularity of the flower can never depend on the stamina and style, which are only occasionally present, and no wife essential to its existence; both of which are evidently false to every botanical reader.

Since the time of Rivinus, no leading method in botany has appeared except that of Tournefort and Linnæus. Tournefort sets out with reviving the distinction of plants into herbs and trees, which had been exploded by Rivinus. His system is founded on the regularity and figure of the petals, together with the two-fold situation of the receptacle of the flowers; his orders, on the pistillum or calix. The classes are, 1. Herbs with simple flowers monopetalous, and bell-shaped. 2. Simple flowers monopetalous, tunnel and wheel-shaped. 3. Simple flowers monopetalous, labiated or lipped. 4. Simple flowers monopetalous, anomalous, or irregular. 5. Simple flowers polypetalous, cruciform or cross-shaped. 6. Simple flowers polypetalous, and rosaceous or like a rose. 7. Simple flowers polypetalous, umbellated. 8. Simple flowers polypetalous, caryophyllaceous, clove-form. 9. Simple flowers polypetalous, liliaceous or lily-form. 10. Simple flowers polypetalous, papilionaceous, or butterfly form. 11. Simple flowers polypetalous, anomalous or irregular. 12. Compound flowers, sterculous, tubular or whole florets. 13. Compound flowers semistilocular, flat or half florets. 14. Compound flowers radiated, like the spokes of a wheel. 15. Apetalous, having no petals. 16. No flower, but bearing seed. 17. No flower nor seed, in the vulgar estimation. 18. Trees with no petals, but bare stamina. 19. Trees with no petals, bearing catkins. 20. Trees monopetalous. 21. Trees rosaceous. 22. Trees papilionaceous.

The secondary divisions in Tournefort's method, which are 122 in number, have obtained the name of *sections*. Their general distinctions are founded principally upon the fruit, as those of the classes are upon the flower.

Tournefort hath been followed by a vast number of botanical writers, of whom the most considerable are, Dr William Sherard, an eminent botanist of the last and present centuries. In 1689, he published the first sketch of Tournefort's method, under the title of *Schola Botanica*; or a catalogue of the plants demonstrated by Dr Tournefort, in the royal garden at Paris. It was not till five years after, that the *Elementa Botanica*, a work which contains the rudiments and illustration of his method, was published by Tournefort himself.—Father Plumier, termed by way of eminence, the *Tournefort of America*, published in 1703, at Paris, a description of American plants, which he has arranged according to the system of Tournefort. In this work he accurately characterized 96 new genera. Falugi, an Italian, has described, in pretty elegant Latin verse, all the genera of Tournefort, in a work intitled *Protopopæia Botanica*, published at Florence, 12^{mo}, 1705. Several celebrated French academicians, particularly Marchant, Dodart, Nissole, Jusseu, and Vaillant, have also occasionally paid their tribute of acknowledgment to this author, from the year 1700 to 1740. The other authors of note who have followed Tournefort's method, are, M. Petit, an ingenious French botanist; Johnen, a German, author of a treatise published at Colberg in 1710, entitled *Vade mecum Botanicum, seu Odegius Botanicus*; Feuille, in his description of the

plants of Chili and Peru, published at Paris in quarto, 1714; Christopher Valentin, a German, author of a book intitled *Tournefortius Contractus*, published at Francfort, in folio, in 1715; Ripa, an Italian, in a work intitled *Historia Unioersalis Plantarum Conscribendi Propositum*, published in quarto, at Padua, in 1718; Michael Valentin, a German, in his *Viridarium Reformatum*, published in folio, at Francfort, in 1719; the celebrated Dillenius, professor of botany at Oxford, and author of several much esteemed publications on botany, particularly the *Hortus Elthamensis*, and History of Mosses, in his *Flora Gilifensis*, printed at Francfort in 1719; Pontedera, an Italian, author of the delineation of a method which combines those of Tournefort and Rivinus, published at Padua, in his botanical dissertations, in 1720; Monti, an Italian, in a work published at Bologna in 1724, under the title of *Indices Plantarum Varii*; Lindem, a German, in his *Tournefortius Alsaticus*, first published in 1728; Signior Micheli, author of several curious discoveries respecting mosses and mushrooms, in his *Nova Genera Plantarum*, published in folio at Florence, in 1729; Elvebemes, a Swede, in a work published in the Swedish language, at Upsal, in 1730; Fabricius, a German, author of a work intitled *Primitie Floræ Butisbacensis, seu sex Decades Plantarum Rariorum*, published in 1743; Sabbati, an Italian, in his catalogue of the plants that grow in the neighbourhood of Rome, printed at Rome in 1745; and the ingenious Dr Charles Alston, late professor of botany at Edinburgh, in his *Tyrocinium Botanicum*, published at Edinburgh in 1753.

Of all this numerous list of writers, Father Plumier and Pontedera alone have ventured to quit the track pointed out by Tournefort. The former, in his arrangement of American plants, has relinquished the distinction into herbs and trees; but the latter has attempted more considerable variations. His classes are, 1. Uncertain. 2. Having no flowers. 3. Without buds, imperfect plants. 4. Anomalous or irregular. 5. Labiated. 6. Bell-shaped. 7. Saucer-shaped. 8. Wheel-shaped. 9. Tunnel-shaped. 10. Floscular. 11. Semifloscular. 12. Radiated. 13. Irregular. 14. Papilionaceous. 15. Liliaceous. 16. Caryophyllaceous. 17. Cruciform, or cross-shaped. 18. Umbellated. 19. Staminous, or with naked stamina. 20. Bearing buds, apetalous, or without petals. 21. Bearing buds irregular. 22. Bearing buds bell-shaped. 23. Bearing buds wheel-shaped. 24. Bearing buds tunnel-shaped. 25. Bearing buds, papilionaceous. 26. Bearing buds, rosaceous.

Besides all these methods, there have been invented two others, founded upon the calix. The first of these was the invention of Peter Magnol, a celebrated professor of botany at Montpellier, and published in 1720, five years after the author's death. The other was delineated by Linnæus, and published in his *Classes Plantarum*, in 1738, three years after the publication of the sexual system. Magnol distinguishes two kinds of calix; one external, which envelops and sustains the flower, and is the flower-cup properly so called; the other internal, which is the seed vessel or fruit. According to this idea, all plants, whether herbaceous or woody, are furnished with either the external calix only, or with both. His classes are, 1. Herbs with the calix external, including a flower unknewn. 2. Calix external, including a flower staminous. 3. Calix external, including

including a flower monopetalous. 4. Calix external, including a flower polyptetalous. 5. Calix external, including a flower compound. 6. Calix external, supporting a flower monopetalous. 7. Calix external, supporting a flower polyptetalous. 8. Calix internal only, which is the corolla. 9. Calix external and internal, flower monopetalous. 10. Calix external and internal, flower with two and three petals. 11. Calix external and internal, tetrapetalous. 12. Calix external and internal, polyptetalous. 13. Trees with the calix external only. 14. Calix internal only. 15. Calix external and internal both.

The characters of the orders, or secondary divisions, in Magnol's method, are derived chiefly from the figure of the calix, petals, and feeds; from the disposition of the flowers, from the number of petals, and substance of the fruit. Fifty-five sections or orders arise from the combination of these characters with those of the classes; and these are again subdivided into genera, which possess this singularity, that, in place of distinctive characters hitherto employed, they exhibit complete descriptions of all the parts of fructification of one or two species of each genus. From this improvement Linnaeus manifestly borrowed the hint of his general characters.

Sir John Hill, in his vegetable system, endeavours to class plants according to their internal structure*. "Perhaps, (says he), upon the foundation of a true anatomy of plants a natural method may be established: for it is certain, the forms of all the external parts of vegetables depend on the disposition of the internal; and all their differences are founded there. On the different inner structure of the vegetable body under certain courses of its vessels evidently depend the differences which characterize the seven first families, to the distinctions of which all classes are subordinate; and as these original distinctions are truly natural, we may here begin very safely.

"The seven families are these, 1. The mushrooms. 2. The algae, or foliaceous sea and land plants. 3. The mosses. 4. The ferns. 5. The grasses. 6. The palms. 7. The common race of plants. Their distinctions one from another are these:

"1. The mushrooms are fleshy; and are destitute of leaves and visible flowers. 2. The algae are merely foliaceous, the entire plant consisting of a leafy matter without other visible parts. 3. The mosses have processes of the inner rind for leaves. 4. The ferns consist of a single leaf raised on a stalk; and bear their flowers upon its back. 5. The grasses have jointed stalks and undivided leaves, and husks to hold the feeds. 6. The palms have a simple trunk, with leaves only on the top, and have the flowers and fruit in divided ears."

Lastly, the seventh class, which he calls the *common*

race of plants, are such as have their roots, leaves, stalks, flowers, and fruits, distinct and obvious; and have not the characters of any of the other six families.

To this natural method his artificial one, consisting of 43 classes, and which takes up the whole of his voluminous work, is designed only as an index; but as this is universally allowed to be inferior to Linnaeus's, tho' he pretends to improve that system, we think it needless to take any farther notice of it.

Besides the sexual system of Linnaeus, which is now almost universally followed, he formed another, which, like that of Magnol, had the calix for its basis; but greatly superior both in the idea and execution, being indeed singularly serviceable to the novice in botany, by familiarizing to him various appearances of an organ so important in its nature, and so diversified in its form, as the calix is. The classes are, 1. Spathaceous like a sheath or hose. 2. Glumose or chaffy. 3. Amentaceous, or catkins. 4. Umbelated. 5. Common calix or flower-cup. 6. Double calix. 7. Flowering; the petals and stamina inserted into the flower-cup. 8. Crowned, or crown-shaped, with a radius. 9. Irregular. 10. Difform, or different shapes. 11. Caducous, which fall off or shed their leaves. 12. Not caducous, uniform and monopetalous. 13. Not caducous, uniform and polyptetalous. 14. Not caducous, difform and monopetalous. 15. Not caducous, difform and polyptetalous. 16. Incomplete calix. 17. Apetalous, or a bare calix without petals. 18. Naked, or neither petals nor calix.

SECT. IV. *Of the Method of reducing Plants to Classes, Orders, Genera, and Species, according to Linnaeus's Sexual System.*

THIS method of reducing plants to classes, genera, and species, is founded upon the supposition that vegetables propagate their species in a manner similar to that of animals. Linnaeus endeavours to support this hypothesis by the many analogies that subsist between plants and animals, which shall be more particularly pointed out in the next section. It is from this circumstance that Linnaeus's system of botany has got the name of the *sexual system*. The names of his classes, orders, &c. are all derived from this theory. He calls the stamina of flowers the *males*, or the male parts of generation; and the pistils *females*, or the female parts of generation. Plants whose flowers contain both male and female parts, are said to be *hermaphrodites*, &c. His classes, orders, and genera, are all derived from the number, situation, proportion, and other circumstances attending these parts, as will appear from the following

SCHEME of the SEXUAL SYSTEM.

See Plate LIX.

PLANTS celebrate their nuptials

Either publicly, *i. e.* have visible flowers.*Monoclinia*, males and females in the same bed:—*i. e.* The flowers are all hermaphrodite, having stamina and pistils in the same flower.*Diffinitas*, the males or stamina unconnected with each other.*Indifferentissimus*, the males or stamina having no determinate proportion betwixt each other as to length.1. MONANDRIA, *i. e.* one male or stamen in a hermaphrodite flower.

2. DIANDRIA, — two males or stamina.

3. TRIANDRIA, — three males.

4. TETRANDRIA, — four males.

5. PENTANDRIA, — five males.

6. HEXANDRIA, — six males.

7. HEPTANDRIA, — seven males.

8. OCTANDRIA, — eight males.

9. ENNEANDRIA, — nine males.

10. DECANDRIA, — ten males.

11. DODECANDRIA, — eleven males.

12. ICOSANDRIA, — twenty, or more males inserted into the calix, and not into the receptacle.

13. POLYANDRIA, — all above twenty males inserted into the receptacle.

Subordinatio, two of the males or stamina uniformly shorter than the rest.

14. DIDYNAMIA, — four males, two of them uniformly shorter than the other two.

15. TETRADYNAMIA, — six males, two of which are uniformly shorter than the rest.

Affinitas, the males or stamina either connected to each other, or to the pistillum.

16. MONDELPHIA, the males or stamina united into one body by the filaments.

17. DIADELPHIA, the stamina united into two bodies or bundles by the filaments.

18. POLYDELPHIA, the stamina united into three or more bundles by the filaments.

19. SYNGENESIA, the stamina united in a cylindrical form by the antheræ.

20. GYNANDRIA, the stamina inserted into the pistillum.

Diclinia, males and females in separate beds; *i. e.* plants that have male and female flowers in the same species.

21. MONOECIA, male and female flowers in the same plant.

22. DIOECIA, male flowers in one plant, and females in another, of the same species.

23. POLYGAMIA, male, female, and hermaphrodite flowers in the same species.

Or clandestinely, *i. e.* whose parts of fructification are invisible.

24. CRYPTOGAMIA, the flowers invisible, so that they cannot be ranked according to the parts of fructification.

These 24 classes comprehend every known genus and species. It is an easy matter to class a plant belonging to any of the first 11 classes, as they all depend on the number of stamina or male parts, without regard to any other circumstance. The 12th class requires more attention. When the stamina amount to above 20, a tyro will be apt to imagine that the plant belongs to the polyandria class. In reducing plants of this kind to their classes, particular regard must be had to the insertion of the stamina. If they are inserted into the calix or cup, the plant belongs to the icosandria class; if to the receptacle or basis of the flower, it belongs to the polyandria.

The 14th class is likewise in danger of being confounded with the 4th. In the 4th, the number of stamina is the same with that of the 14th: But, in the 14th, two of the stamina are uniformly much shorter than the other two; at the same time each particular stamen belonging to the different pairs stands directly opposite to one another.

The 15th class may be mistaken for the 6th, as they consist of the same number of stamina. But in the 15th, four of the stamina are uniformly longer than the other two; and these two are always opposite to each other.

O R D E R S.

In the first 13 classes, the orders, which are inferior divisions, and lead us a step nearer the genus, are taken from the pistils or female parts, in the same manner as the classes from the stamina: monogynia, digynia, trigynia, tetragynia, &c. *i. e.* one, two, three, four, &c. female parts: when the pistils or female parts have no stalk or filament like the stamina, they are numbered by the stigmata or tops of the pistils, which in that case adhere to the capsule in the form of small protuberances, as may be observed in the flowers of the poppy, &c.

The orders of the 14th class are derived from a different source. The plants belonging to it have their seeds either inclosed in a capsule, or altogether uncovered. Hence they naturally admit of a division into the following orders, *viz.* *gymnospermia*, comprehending such as have naked seeds; and *angiospermia*, which comprehends such as have their seeds covered, or inclosed in a capsule.

The 15th class is divided into two orders, *viz.* the *siliquosa*, or those which have a short siliqua or pod; and the *siliquosa*, or those which have a longer siliqua.

The

17
1717

The orders of the 16th, 17th, 18th, and 20th classes, are taken from the number of stamina; e. g. monodelphia pentandria, decandria, polyandria, &c.

The SYNGENESIA, or 19th class, consists of plants whose flowers are compounded of a great number of small flowers or floscules included in one common calix. The orders of this class are,

Polygamia aequalis, or such whose floscules are all furnished with stamina and pistils.

Polygamia spuria, comprehends those which have hermaphrodite floscules in the disk, and female floscules in the margin. This circumstance is made the foundation of the three following orders. 1. *Polygamia superflua*, includes all those whose hermaphrodite flowers in the disk are furnished with stigmata, and bear seed; and whose female flowers in the radius likewise produce seeds. 2. *Polygamia frustranea*, include such as have hermaphrodite seed-bearing floscules in the disk; but whose floscules in the radius, having no stigmata, are barren. 3. *Polygamia necessaria*, is the reverse of the former: the hermaphrodite flowers in the disk want stigmata, and are barren; but the female floscules in the radius are furnished with stigmata, and produce seeds.

Polygamia segregata, many floscules included in one common calix, and each of the floscules likewise furnished with a perianthium proper to itself.

Monogamia. This order consists only of seven genera, viz. the strumphia, seriphium, corymbium, jassone, lobelia, viola, and impatiens; none of which have properly compound flowers, but are ranked under this class purely from the circumstance of having their stamina united by the antheræ.

The orders of the 21st class are partly taken from the number of stamina, and partly from the names and characters peculiar to some of the other classes; e. g. monœcia triandria, monœcia syngencia, monœcia gynandria.

The orders of the 23^d are all taken from classial characters; e. g. polygamia monœcia, polygamia diœcia, and polygamia triœcia.

The 24th, or CRYPTOGAMIA class, is divided into the four following orders: 1. *Filices*, comprehending all plants that bear their seed in the back or edges of the leaf, and those that are called *capillary plants*. 2. *Musci*, which comprehends all the moss kind. 3. *Algae*, including the lichens, fuci, and many others whose parts of fructification are either altogether invisible or exceedingly obscure. 4. *Fungi*, comprehending all the mushroom tribe.

Having thus explained the method of reducing plants to their classes and orders, we shall proceed to inform the young botanist how to investigate the genus. This depends upon minuter distinctions, and requires more attention. But it is impossible to investigate the genera, without being previously acquainted with a considerable number of terms. All the terms necessary for this purpose belong to the parts of fructification. To attempt to give an idea by words of the parts to which particular terms are applied, would not only be difficult, but, in a great measure, useless, especially to such as are totally ignorant of botany. We shall therefore give a list of the terms themselves, with proper references to the figures of the things signified by them,

VOL. II.

which will both be shorter, and more intelligible than the most accurate description that language is capable of.

List of TERMS belonging to the Flowers and Parts of Fructification. See Plate LX.

- FIG. 1. *Spatha*, a species of calix opening longitudinally when the flower breaks through it.
- Spadix*, a species of receptacle peculiar to palm-trees, which consists of fruit-bearing branches included in a spathe.
 - a, *Gluma*, another species of calix, belonging chiefly to grasses and corns, and consists of different valves; b, *arista*, or awn.
 - a a, *Umbella universalis*, comprehends the whole flowers, &c. arising from a common centre, and resembling a large fan. b, *Umbella partialis*, or a smaller parcel of the flowers, &c. resembling a small fan. c c, *Involucrum universale*, a species of calix in which the whole flowers were inclosed before their blowing. d d, *Involucrum partiale*, a lesser calix, which includes a smaller bundle of flowers, and which, before their blowing, is inclosed in the involucrum universale. Examples of these are found in the Hemlock, Carrot, &c.
 - c, *Calyptra*; b, *operculum*; a, *capitulum*. These terms are peculiar to infusies.
 - Amentum*, a species of calix, e. g. in the Willow, Birch-tree, &c.
 - Strobilus*, a pericarpium or capsule composed of an amentum, an example of which occurs in the magnolia.
 - Fungi*. a, *Pileus*; b, *volva*; c, *stipes*. These terms are mostly applied to the parts of mushrooms.
 - a, *Receptaculum commune nudum*, the common receptacle, or base of the flower, when the stamina, pistil, capsule, &c. are taken off.
 - Receptaculum commune paleis imbricatum*, or common receptacle imbricated or tiled with paleæ, or membranaceous lamellæ.
 - Corolla monopetala*. a, *Tubus*; b, *limbus*: i. e. a, the tube; b, the edge or margin of a monopetalous corolla. The corolla signifies the flower-leaf, when it consists but of one, and the whole flower-leaves, when it consists of more.
 - Is a flower laid in a proper position for shewing its different parts. a, *Germen*, which includes the seeds and capsule in which they are inclosed; b, *stylus*, which is a continuation of the germen; c, *stigma*, or top of the stylus; d d d d, *filamenta*, or threads; e e e e, *antheræ*. The filaments and antheræ, considered as a whole, are called *stamina*; and the germen, stylus, and stigma, as a whole, are called *pistillum*. f f f f, *Petala*, or flower-leaves.
 - a, The *ungues*, or claws; b, the *lamina*, or plates of a polypetalous corolla, or corolla consisting of several flower-leaves.
 - a, *Nectarium campanulatum in narcisso*, or bell-shaped nectarium of the narcissus. *Nectarium* is applied to every glandular part of a flower which secretes a sweet juice. Their structure is very different in different plants.
 - Nectaria cornuta in aconito*, horned nectaria of the monkshood.
 - Horned nectarium* in the calix of the tropæolus.

8 A

17.

Fig.

17. *a a a a*, *Nectarium in parnassia*; the nectaria of the parnassia grafs are six in number, each of which have 13 styli, with round buttons on their tops.
18. *a*, *Perianthium*, that species of calix which is contiguous to the fructification; *b*, *germen*; *c*, *stylus*; *d*, *stigma*; *e e*, *filamenta*; *f f*, *antheræ debiscentes*, or antheræ shedding the pollen or dust; *g*, *anthera integra*, *i. e.* the appearance of the anthera before it sheds the pollen.
19. *a*, The filament, and *b*, the anthera, separated from the flower.
20. *a*, One grain of the pollen magnified by a microscope; *b*, *halius elasticus*, *i. e.* an elastic aura supposed to be necessary for impregnating the seeds.
21. *a*, *Germen*; *b*, *stylus*; *c c*, *stigma*.
22. *Folliculus*; *i. e.* a pericarpium consisting only of one valve, opening longitudinally, and in which the seeds do not adhere to the future, but are inclosed in a particular receptacle *a*.
23. *Legumen*, is a double-valved pericarpium, having the seeds fixed only to one of the futures *a a*.
24. *Siliqua*, is a double-valved pericarpium with the seeds fixed to both futures or margins *a b*.
25. *Pomum*, a pericarpium without any valve, but made up of a pulpy substance, and containing a capsule in which the seeds are inclosed, as in the apple, &c. *a*, The pericarpium; *b*, the capsule, or seed-case.
26. *a*, *Drupa*, or a pericarpium containing a nut or stone, and having no valve, *e. g.* plumbs, &c. *b*, The nucleus, or stone.
27. *Bacca*, or berry, is a pericarpium containing naked seeds dispersed through the pulpy part.
28. *Capsula apice debiscentis*, a capsule opening at the top to allow the seeds to fall out.
29. Four capsules included in a common pericarpium. *a a*, The valves; *b b*, the dissepimentum, or partition which separates the different seed-capsules from one another; *c*, columella, or central column, by which the capsules are connected.
30. A capsule cut open longitudinally, to show the receptacle of the seeds.
31. *Pappus*, a kind of corona or crown which is either hairy or penniform, and connected to the seeds of some plants, by means of which they are blown about by the wind. *a*, *Pappus pilosus*, or pappus resembling a hair; *b*, *pappus plumosus*, or feathered pappus; *c*, *femur*; *d*, *sipes*. The Dandelion, and many plants of the syngenesia class, afford examples of these parts.

TERMS belonging to the Pedunculus or Footstalks of Flowers. Plate LXI.

32. *Corymbus*, *i. e.* flowers upon alternate pedunculi and foot-stalks, elevated proportionally above each other.
33. *Racemus*, a pedunculus or foot-stalk furnished with lateral branches.
34. *Spica*, alternate sessile flowers [*i. e.* flowers without any particular foot-stalk, but inserted directly into one common to the whole], upon a common foot-stalk; as in the Scirpus.
35. *Verticillus*. This term is applied to such plants as have clusters of flowers at different distances surrounding the caulis or stem; as in several species of Mint.

Fig.

36. *Panicula*, *i. e.* flowers placed sparsely upon separate foot-stalks; as in Oats, &c.

When these terms are understood, the genus may be easily investigated. But, in order still further to assist the young botanist, we shall give a systematic description of a few common plants belonging to different classes.

DIANDRIA MONOGYNIA.

VERONICA, or SPEEDWELL.

THE CALIX is a perianthium (18) divided into four parts or segments, and persistent (*i. e.* does not fall off till the seeds are ripe); the segments are sharp and lance-shaped.

THE COROLLA (11) consists of one rotated petal; the *tubus* (11) is about the same length with the calix; the *limbus* (11) is plane, and divided into four oval segments, the lowest of which is narrower than the rest, and the one immediately opposite broader.

THE STAMINA (12) are two, narrower below, and inclined upwards; the antheræ (12) are oblong.

THE PISTILLUM (12) has a compressed germen (12), a filiform or thread-like stylus (12), about the same length with the stamina, and a little declined to one side: the stigma (12) is simple.

THE PERICARPIUM (12) is a heart-shaped capsule, compressed at the top, and having two cells or partitions, and four valves.

THE SEEDS are roundish and numerous.

ICOSANDRIA POLYGAMIA.

FRAGARIA, or STRAWBERRY.

THE CALIX is a perianthium, consisting of one plain leaf, divided into ten segments, each alternately narrower.

THE COROLLA has five roundish open petals inserted into the calix.

THE STAMINA are 20 in number, subulated or tapering, shorter than the corolla, and inserted into the calix. The antheræ are lunulated, or shaped like a crescent.

THE PISTILLUM consists of many small germina, collected into a little head or knob. The styli are simple, and inserted into the sides of their respective germina. The stigmata are simple.

THE PERICARPIUM is wanting in this plant. But the common receptacle of the seeds, which supplies the place of a pericarpium, is a roundish oval berry, plain at the base, pretty large, soft, pulpy, coloured, and deciduous, *i. e.* falls off before the seeds are ripe.

THE SEEDS are small, pointed, very numerous, and dispersed through the superficial part of the receptacle.

DIDYNAMIA ANGIOSPERMIA.

DIGITALIS, or FOX-GLOVE.

THE CALIX is a perianthium, divided into four deep-cut segments, which are roundish, sharp at the top, persistent, and the highest one is narrower than the rest.

THE COROLLA consists of one bell-shaped petal; the *tubus* is large, open, ventricose or bellied at the back-side; the base is cylindrical and narrow: the *limbus* is small, and divided into four segments; the superior seg-

segment is more open and more emarginated than the rest.

The STAMINA are four, subulated (44), inserted into the base of the corolla, and inclined to the same side; two of them are longer than the other two: the antheræ are divided into two parts, and pointed at the top.

The PISTILLUM consists of a germen sharp at the top, a simple stylus situate like the stamina, and an acute stigma.

The PERICARPIUM has an oval capsule, of the same length with the calix, sharp at the top, having two cells, and two valves which burst open at both sides.

The SEEDS are many and small.

TETRADYNAMIA SILIQUOSA.

SINAPIS, or MUSTARD.

The CALIX is a perianthium consisting of four open or spreading leaves; the leaves are linear (43), concave, furrowed, disposed in the form of a cross, and deciduous.

* The COROLLA consists of four cruciform petals: the petals are roundish, plain, open, entire or not emarginated, with erect linear unguis (13) scarcely so long as the calix.

The NECTARIA (14, &c.), or glandule nectariferæ, are four, of an oval figure, one of which is situate on each side betwixt the short stamina and stylus, and likewise one on each side between the long stamina and the calix.

The STAMINA have six subulated erect filaments, two of which are of the same length with the calix, and always opposite to each other, and the other four are uniformly longer: the antheræ are erect, and sharp at the top.

The PISTILLUM has a cylindrical germen; the stylus is of the same length with the germen, and the same height with the stamina; the stigma is entire, with a little knob or button.

The PERICARPIUM is an oblong, scabrous, double-celled, two-valved pod, gibbous, and full of little protuberances on the under parts: the dissepimentum (29) is large, compressed, and often twice the length of the valves.

The SEEDS are many and round.

MONODELPHIA POLYANDRIA.

MALVA, or COMMON MALLOW.

The CALIX is a double perianthium: the exterior one consists of three lanceolated, loose, persistent leaves; the interior has but one large, broad, persistent leaf, divided into five segments.

The COROLLA has five plain leaves, united at the base, heart-shaped, and premoise (54).

The STAMINA consist of numerous filaments, united into a cylindrical form below, loose above, and inserted into the corolla: the antheræ are kidney-shaped.

The PISTILLUM has an orbicular germen, a cylindrical short stylus, and many bristly stigmata of an equal length with the stylus.

The PERICARPIUM consists of several distinct capsules joined by an articulation, resembling a depressed globe, and opening from within when ripe: the receptaculum is a kind of column binding the capsules together.

The SEEDS are solitary, and kidney-shaped.

SYNGENESIA POLYGAMIA ÆQUALIS.

LEONTODON, or DANDELION.

The common CALIX is oblong, and imbricated: the interior scales are linear, parallel, equal, and open at the top; the exterior scales are fewer in number, and frequently reflected at the base.

The compound COROLLA is uniform and imbricated.

The small hermaphrodite corollæ are very numerous and equal.

The corolla proper to each floscule consists of one ligulated (i. e. plain and expanded outwards), linear, truncated (i. e. terminated by a transverse line), and five-toothed petal.

The STAMINA consist of five very small capillary filaments: the antheræ are connected together, and form a cylindrical tube.

The GERMEN of the pistillum is situate below the proper corolla. The stylus is filiform, and nearly of the same length with the corolla: the stigmata are two, and turned back in a spiral form.

This plant has no pericarpium.

The SEEDS are solitary, oblong, rough, and terminated by a long pappous stipes (31).

The receptacle, or common base of the floscules (9), is naked, and full of small hollow points.

GYNANDRIA PENTANDRIA.

PASSIFLORA, or PASSION-FLOWER.

The CALIX is a perianthium consisting of five plain, coloured leaves, similar to those of the corolla.

The COROLLA consists of five plain obtuse semi-lanceolated leaves, of the same magnitude and figure with those of the calix.

The nectarium is a triple corona, the exterior of which is longest, surrounding the stylus within the petals, and flattened above.

The STAMINA are five, subulated, open, and connected to the stylus at the base of the germen: the antheræ are oblong, obtuse, and incumbent.

The PISTILLUM consists of an erect cylindrical stylus, upon the top of which an oval germen is placed: the styli are three, thicker, and wider above: the stigmata are roundish knobs.

The PERICARPIUM is a fleshy, suboval, one-celled berry, resting upon the stylus.

The SEEDS are numerous, oval, and each of them inclosed in a small membrane.

MONOECIA TETRANDRIA.

URTICA, or COMMON NETTLE.

The CALIX of the male flowers is a four-leaved perianthium; the leaves are roundish, concave, and obtuse.

The COROLLA has no petals; but there is a small ureolated (i. e. an inflated skin, gibbous on each side) nectarium in the centre of the flower.

The STAMINA consist of four subulated open filaments, of an equal length with the calix, and one of them is placed between each leaf of the calix: the antheræ have no cells.

The CALIX of the female flowers is a double-valved, oval, concave, erect, persistent perianthium.

The COROLLA is wanting.

The PISTILLUM has an oval germen, no stylus, and

a downy stigma.

They have no *pericarpium*.

The SEED is single, oval, shining, and a little compressed.

These examples will not only illustrate most of the generic terms, but will likewise fix them in the mind more successfully than any formal explanation.

But the young botanist, after advancing thus far, must still be conducted a step further. Though he may be able to reduce plants to their classes, orders, and genera, he is hitherto totally ignorant of the specific characters. Before he be able to investigate the species, he must again submit to learn a considerable number of terms necessary for that purpose.

List of TERMS necessary for investigating the Species of Plants. Plate LXI.

Fig.

37. *Orbiculatum*, of a circular figure.
38. *Subrotundum*, roundish or nearly circular.
39. *Ovatum*, ovate; or having its longitudinal diameter longer than the transverse, with its base forming a segment of a circle, and the top also roundish, but narrower.
40. *Ovale*, *sive* *Ellipticum*, oval or elliptical.
41. *Oblongum*, oblong; or having its longitudinal diameter exceeding the transverse any number of times, as twice, thrice, &c.
42. *Lanceolatum*, lanceolate, or oblong, and drawing to a point at each end.
43. *Lineare*, linear, or every where of the same breadth.
44. *Subulatum*, subulated, linear at the base, and afterwards tapering to a point, like an awl.
45. *Reniforme*, reniform, kidney-shaped; *i. e.* roundish, with the base hollow, and having no sharp points behind.
46. *Cordatum*, cordate, heart-shaped, *i. e.* nearly ovate, with a *sinus*, or hollow at the foot-stalk, but no sharp points or angles behind.
47. *Lunulatum*, lunulated, resembling a crescent or half-moon.
48. *Triangulare*, triangular, or three cornered.
49. *Sagittatum*, sagittated, like an arrow head, *i. e.* triangular, with a *sinus* or hollow betwixt the two hinder angles or points.
50. *Cordato-sagittatum*, heart-shaped behind and sharp like the point of an arrow before.
51. *Hastatum*, halberd-shaped; *i. e.* like an arrow-head, with a *sinus* or hollow betwixt the hinder angles, and the angles themselves projecting on each side.
52. *Fissum*, notched, nicked, or cut in at the top, so as to have the bottom of the notch or cut sharp, and its sides straight.
53. *Trilobum*, three-lobed, or having three (55) lobes.
54. *Præmorsum*, fore-bitten, or as if a piece were bitten out of the fore-part of it.
55. *Lobatum*, lobed; or divided, down to the middle, into parts or segments standing asunder from one another.
56. *Quinquangulare*, having five points or angles.
57. *Erosum*, eroded, or as if it had bits irregularly gnawed out of the fore-part of it.
58. *Palmatum*, palmated; divided down, lower than the middle, into nearly eq. allobes.

Fig.

59. *Pinnatum*, pinnated, or having any number of feuillets or small leaves connected on each side to one simple petiole.
60. *Laciniatum*, lacinated; having the disc variously cut, or as it were slit downwards, into parts of no determinate or regular figure.
61. *Sinuatum*, sinuated; having wide sinuses or hollows in the sides.
62. *Dentato-sinuatum*, sinuated so that the segments betwixt the sinuses resemble teeth.
63. *Retrosum-sinuatum*; sinuated, with the parts betwixt the sinuses turned towards the base.
64. *Partitum*, partite; divided almost to the base.
65. *Repandum*, having a serpentine edge and the disc plain.
66. *Dentatum*, dentated; toothed, or having the tops of the segments patent or remote from each other.
67. *Serratum*, serrated, or having all the points of the teeth turned towards the fore-part.
68. *Duplicato-serratum*, doubly serrated, or having the larger serratures or teeth surrounded with smaller ones.
69. *Duplicato-crenatum*, doubly crenated, or having the larger crenæ or notches surrounded with smaller ones (74).
70. *Cartilagineum*, cartilaginous, the margin of which is gritty.
71. *Acute-crenatum*, acutely crenated, or having the crenæ or notches sharp at the top.
72. *Obtuse-crenatum*, obtusely crenated, or having the tops of the crenæ or notches blunt.
73. *Plicatum*, plaited, having the disc towards the edge raised and depressed so that each turn forms an angle: *Alchemilla*.
74. *Crenatum*, crenated, cut in or notched so that the notches turn towards neither extremity.
75. *Crispum*, curled; when the margin grows larger than the disc, and runs into irregular waves.
76. *Obtusum*, obtuse; blunt, or terminated within the segment of a circle.
77. *Acutum*, acute; sharp, or terminated by an acute angle.
78. *Acuminatum*, acuminated, or terminated by a subulated or sharp point.
79. *Obtusum cum acumine*, obtuse with a sharp point superadded.
80. *Emarginatum acutè*, acutely emarginated, or having a sharp notch at the top.
81. *Cuneiforme-emarginatum*, cuneiform, and emarginated; or wedge-shaped, with a notch at the top.
82. *Retusum*, retuse, terminated by an obtuse *sinus* or notch.
83. *Pilosum*, hairy; covered with long distinct hairs.
84. *Tomentosum*, tomentose; covered with fine downy hairs interwoven together and scarcely discernible, like flax silk.
85. *Hispidium*, bristly, having brittle and hard bristles scattered over its disc.
86. *Ciliatum*, ciliated; having parallel bristles, resembling eye-lashes, round the margin.
87. *Rugosum*, wrinkly, or full of wrinkles.
88. *Venosum*, venose; having veins or nerves with many ramifications.

Fig.

89. *Nervosum*, nervose, with veins or nerves extending from the base to the top without any branches.
90. *Papillosum*, papillose, covered with minute fleshy points convex or elevated above the disc.
91. *Linguiforme*, linguiform, tongue-shaped, *i. e.* fleshy, linear, obtuse, and convex below.
92. *Acinaciforme*, cimeter-shaped; *i. e.* compressed, fleshy, with the one edge convex and thin, and the other thicker and straighter.
93. *Dolabriforme*, hatchet-shaped; compressed, roundish above, and gibbous on the fore side with a sharp edge, and somewhat cylindrical below.
94. *Deltoides*, deltoid; of an irregular rhomboidal figure, of which the two side-angles are nearer the base than the top. See the leaf of the black Poplar.
95. *Triquetrum*, prismatical, or having three plain sides.
96. *Canaliculatum*, channelled, or having a deep longitudinal furrow.
97. *Sulcatum*, having more deep furrows than one.
98. *Teretis*, cylindrical.
- Plate L.XII. 99. *Binatum*, binate, or having a simple petiole with two leaves connected to its apex.
100. *Ternatum foliis petiolatis*, ternated with sessile feuilletts; or having three sessile leaves (*i. e.* without petioles) connected to the apex of one common petiole.
101. *Ternatum foliis petiolatis*, ternated with petioleated feuilletts, or having three leaves upon a common petiole, and each of these having at the same time a petiole of its own.
102. *Digitatum*, digitated, fingered, *i. e.* when a simple petiole has two, three, four, or more leaves connected to its apex.
103. *Pedatum*, pedated; having a bifid or forked petiole, with two or more small leaves connected to the interior side of the forks.
104. *Pinnatum cum impari*, pinnated with an odd feuillet, or small leaf, at the top.
105. *Pinnatum abruptè*, abruptly pinnated, or pinnated without any odd leaf or cirrus at the top.
106. ——— *alteratim*, pinnated alternately, or having the feuilletts placed alternately on each side of the petiole.
107. ——— *interruptè*, pinnated with the feuilletts alternately larger and smaller.
108. ——— *cirrhosum*, pinnated with a cirrus or clasper at the end of the petiole.
109. ——— *conjugatum*, pinnated with only two feuilletts.
110. ——— *decursivè*, pinnated with feuilletts running down the sides of the petiole in the form of a web or membrane.
111. ——— *articulatè*, pinnated with an articulated or jointed petiole.
112. *Lyratum*, lyre-shaped; *i. e.* divided transversely into oblong horizontal segments, of which the lower ones are lesser and more distant from each other than the upper ones.
113. *Bitermatum*, or *duplicato-ternatum*, biternate, or double-ternate, or having three ternated (100) leaves upon one petiole. See Epimedium.
114. *Bipinnatum*, or *duplicato-pinnatum*, bipinnated, or

Fig.

- double pinnated, *i. e.* having the primary pinnae pinnated again a second time.
115. *Tritermatum*, or *triplicato-ternatum*, triple ternated, or consisting of three biternated (113) leaves.
116. *Trippinnatum sine impari*, triple-pinnated without an odd feuillet, or having the secondary pinnae pinnated again, and these last pinnae not terminated by an odd feuillet.
117. ——— *cum impari*, triple-pinnated with an odd feuillet.
- TERMS respecting the Determination of Leaves.
118. *Inflexum*, incurved; bending upwards, with the point leaning towards the stem.
119. *Erectum*, erect; upright, or making a very acute angle with the stem.
120. *Patens*, patent; forming any angle with the stem greater than the former and less than half a right angle.
121. *Horizontale*, horizontal, or standing at a right angle with the stem.
122. *Reclinatum*, or *reflexum*, reclined or reflex, bending down arch-wise till the apex be lower than the base.
123. *Revolutum*, revolute, or rolled backwards in a spiral form.
124. *Seminata*, seminal leaves, or seed-leaves; *i. e.* the lobes of the seed, which in many plants arise entirely out of the ground, are always the first that appear, and generally of a form or consistency different from those that succeed them.
125. *Caulinum*, cauline, or rising immediately from the stem or stalk.
126. *Rameum*, a branch-leaf, or rising out of a branch.
127. *Florale*, floral; leaf next the flower, and differing in its form from the other leaves of the plant. This is also termed a *bractea*, or *spangle*.
128. *Peltatum*, peltated; or having the petiole inserted not into the base, but into the inferior disc, at or near its centre.
129. *Petiolum*, petioleated; connected with the plant by a petiole, or foot-stalk, inserted into the margin of its base.
130. *Sessile*, sessile, or connected immediately with the plant, without the intervention of a petiole.
131. *Decurrens*, decurrent, or having its base running down along the stalk; as in the Verbena, Carduus, &c.
132. *Amplexicaule*, amplexicaule; embracing the stalk on all sides with its base.
133. *Perfoliatum*, perfoliate; having its base entirely surrounding the stalk, or the stalk perforating, or appearing to perforate it. See the Thoroughwax.
134. *Connatum*, connate; having its base united, or so close to its opposite as to form, or appear to form, with it but a single leaf, with the stem rising up through it.
135. *Vaginum*, sheathing, or with its base forming a cylindrical tube investing the stem. See Polygonum; Rumex.
136. *Articulatum*, articulated, or jointed, having one leaf growing out of the top of another.
137. *Stellatum*, stellated, or verticillated, when more than two leaves surround the stem at the same height

like

Fig.

like a whirl.

138. *Quaterna, quina, sena*, &c. are only different species of stellated, or verticillated leaves, when there are four, five, six, &c. leaves in one verticillus or whirl.
139. *Opposita*, opposite; or when two leaves stand exactly opposite to each other, and each pair stands at right angles with the pairs immediately above and below it.
140. *Alternæ*, alternate, or rising one above another by degrees.
141. *Acrofa*, linear and perfoliate; as in the Pine, Fir, Juniper, and Yew.
142. *Imbricata*, imbricated; erect, and so thick set as partly to cover one another like tiles or slates on a roof.
143. *Fasciculata*, fasciculated, or rising in a pencil from the same point; as in the Larix.
144. *Frons*. This term is applied to a species of stalk or trunk, consisting of branches and leaves, and sometimes the fructifications, all united together; and is peculiar to the Filices or Ferns, and the Palmæ.
145. *Folium spatulatum*, (Sav.) spatulated, or roundish above, with a long linear base.
146. — *parabolicum*, parabolic; having its longitudinal diameter longer than the transverse, and growing narrower from the base till it terminate somewhat like an oval.

TERMS relating to the Caules or Stems. Plate LXIII.

147. *Culmus squamosus*, a scaly culm or stalk. *Culmus* is peculiarly appropriated to corns and grasses.
148. *Caulis repens*, a repent or creeping stalk or stem, giving out small roots here and there as it runs along the surface of the ground or upon another plant. *Caulis* is appropriated to denote the trunk of an herbaceous plant.
149. *Scapus*, is a species of trunk, which supports the parts of fructification, but has no leaves. See Narcissus, Pyrola, Convallaria, Hyacinthus.
150. *Culmus articulatus*, a jointed culm (147) or stalk.
151. *Caulis volubilis*, a twining stem, or which ascends by twisting itself like a spiral round the stem or branches of another plant.
152. — *dichotomus*, a dichotomous stem, or which is first divided into two, and each of these divisions into other two, and so on regularly for any number of times.
153. — *brachiatus*; having each pair of branches opposite the one to the other, and standing at right angles with the pairs next them, either above or below; so that, when viewed lengthwise, the whole branches appear to go out at right angles four different ways.

TERMS relating to the Fulcra or Supports of Plants.

154. a, *Cirrus*, a clasper, tendril, or spiral thread, by which a plant fixes itself to any other body. b, *Stipule*, or little scales at the base of the petiole, or foot-stalk of the leaf, or at the base of the peduncle, or flower-stalk. c, *Glandula concava*, small hollow glands for the secretion of some particular fluid.
155. a, *Glandula pedicellate*, small pedicellate glands.
156. a, *Bractea*, a spangle, or flower-leaf, differing

Fig.

from the other leaves of the plant.

157. a, *Spina simplex*, a simple or one-pointed spine. b, *Spina triplex*, a triple or three-pointed spine. *Spina* is appropriated to such spines or sharp points as are protruded from the wood or inner substance of the plant.
158. *Aculeus simplex*, a simple or one-pointed prickle. An aculeus, or prickle, differs from a spine in being only fixed to the bark, and not protruded from the wood or internal substance.
159. *Aculeus triplex*, a triple or three-pointed prickle.
160. *Folia opposita*, opposite leaves. a, the *Axilla*, or angle betwixt the leaf and the stalk.

TERMS relating to the Roots.

161. *Bulbus squamosus*, a scaly bulb, or a root composed of scales imbricated, or lying over one another; as in that of the White Lily.
162. — *solidus*, a solid bulb, or of one uniform substance throughout; as in the Hyacinth.
163. — *tunicatus*, a tunicated or coated bulb, or consisting of coats lying above one another; as in the Onion.
164. *Radix tuberosa*, a tuberous root, or consisting of many little knots, or roundish bodies, collected into a bunch; as in the Filipendula.
165. — *fusiformis*, fusiform, or spindle-shaped; i. e. oblong, thick, and tapering downwards; as in the Carrot, and Parsnip.
166. — *ramosa*, a branchy root, or which is divided into many lateral branches.
167. — *repens*, a repent or creeping root, or which runs out to a great length, and sends off small roots at different distances.

These are the principal terms necessary for understanding Linnæus's description of the specific characters of plants.—To make the reader acquainted with the manner in which these terms are used, we shall give a few examples.

Class II. DIANDRIA.

Order, MONOGYNIA.

Genus, VERONICA, or SPEEDWELL.

Species, *Veronica arvensis*, has solitary flowers; cut, sessile (130), and cordate (46) leaves.*Veronica agrestis*, has solitary flowers; cut, cordate (46), and petiolated (129) leaves.

Class XVI. MONODELPHIA.

Order, POLYGINIA.

Genus, MALVA, or MALLOW.

Species, *Malva spicata*, has tomentose (84), crenate (74), and cordate (46) leaves, and oblong hairy spike (34).*Malva sylvestris*, has an erect (119) herbaceous caulis (148), with acute (74), seven-lobed (50) leaves, and hairy pedunculi and petioli (129).

Class XIX. SYNGENESIA.

Order, POLYGAMIA ÆQUALIS.

Genus, CARDUUS, or THISTLE.

Species, *Carduus helenoides*, or *melancholy thistle*, has

Bell & Sculp

HERN. LINDLEY
PLATE XLIV

Ed *Ed* *Ed* *Ed* *Ed*

RHEUM PALMATUM
or
TRUE RHUBARB.

A. Bell sculp

has lanceolated (42), teetled (66), amplexicaule (132) leaves; with unequal, ciliated (86), small spines (157).

Class XXIV. CRYPTOGAMIA.
Order, FILICES.
Genus, ASPLENIUM, or MAIDENHAIR.
Species, *Asplenium trichomanes*, has a pinnated (104) frons (144); the pinnae are roundish (38) and crenated (74).

To these examples we shall add a complete description of a plant reduced to its class, order, genus, and species, with figures of all the parts necessary for that purpose.

Plate LXIV RHEUM PALMATUM, or True Rhubarb.

The flower of this plant has no CALIX.

The COROLLA *dd*, consists of one petal, narrower at the base, not perforated, and divided in the margin into six obtuse segments, one less and one larger alternately; the petal is marcescent, *i. e.* decays, but does not fall off till the seeds be ripe.

The STAMINA *ee*, consist of nine capillary filaments inserted into the corolla, and about the same length with it. The *antheræ* are didymous, (*i. e.* appear to be double), oblong, and obtuse.

The PISTILLUM *f*, has a short three-sided germen. It can hardly be said to have any styli; but has three reflected plumose stigmata.

The PERICARPUM is wanting.

Each flower contains but one large, three-sided, acute seed *g*, with a membranaceous edge.

The number of stamina determines this plant to belong to the ENNEANDRIA Class; and the number of STIGMATA fixes its Order to be TRIGYNIA. The other parts of the above description clearly demonstrate the genus to be the Rheum or Rubarb, and sufficiently distinguish it from the Laurus, Tinus, Cassia, and Butomus; the only other genera belonging to this class.

The SPECIFIC mark is taken from the leaves, which are PALMATED (58), and sharp and tapering at the points. There are but five species of Rheum, none of whose leaves are palmated, except the species now described.

SECT. V. Of the Sexes of Plants.

As many philosophers and botanists deny that such a thing as the distinction of sexes takes place in vegetables, it will be necessary to give a narration of the arguments employed by both parties on this subject. We shall begin with the arguments in favour of the sexes.

I. Linnæus is at great pains in tracing the notion of sexes in plants to the remotest periods of antiquity. He informs us, that Empedocles, Anaxagoras, and other ancient philosophers, not only attributed the distinction of sexes to plants, but maintained that they were capable of perceiving pleasure and pain.

Hippocrates and Theophrastus are next introduced as distinguishing the conyza, the abies, the flax, &c. into male and female. The latter of these writers affirms that the fruit of the male palm will not germinate, unless the pollen of the male be shaken over the spathe of the female previous to the ripening of the seed.

Dioscorides takes notice of a male and female mandragora, mercurialis, ciftus, &c.

Pliny does not confine his views of sex to animals, but exclaims, that every thing this earth produces is characterized by the distinction of sex.

From the days of Pliny to those of Cæsalpinus, who lived in the 16th century, the analogy between the vegetable and animal seems to have been entirely neglected. Cæsalpinus tells us, that the males of the oxycedrus, taxus, mercurialis, urtica, and cannabis, are barren; and that the females of these plants only bear fruit.

After Cæsalpinus, we find Dr Grew and Sir Thomas Millington engaged in a conversation concerning the utility of the stamina and styli of plants. The result of this conversation was the mutual agreement of these two eminent naturalists, that the stamina and styli of vegetables were analogous to the organs of generation in animals, and that they were adapted by nature to answer the same purposes. Dr Grew in his anatomy of plants, after enumerating the analogies between plants and animals, concludes, that the pollen probably emits certain *viscific* effluvia, which may serve for the impregnation of the seeds.

Mr Ray gave a further sanction to the doctrine of sexes, by concurring with Grew, and adding some further illustrations from analogy.

In the year 1695, Camerarius attempted to prove the sexes of plants. But, as he trusted solely to the palm-tree, and which seemed to be doubtful as to the authenticity of the fact, he cannot be considered as having done any thing in confirmation of the sexual hypothesis.

Mr Morland, in the year 1703, adopted the same hypothesis; but gave it a new modification, by supposing that the pollen contained the femal plant in miniature, and consequently that one pollen at least behoved to be conveyed into every separate seed before it could be properly impregnated. Analogy and the structure of the parts are the only arguments he employs.

Some years after this, Mr Geoffroy wrote a treatise on the sexes of plants: but as he advanced nothing new, we shall take no further notice of him.

Vaillant, in the year 1717, judiciously considering that the canal in the stylus of most plants was too narrow to admit the pollen itself, republished Dr Grew's theory of impregnation by means of a subtle femal aura.

These are the sentiments of the principal botanists with regard to the generation of plants, till the celebrated Linnæus made his appearance as a botanical writer, who has extended the idea so far as to compose a complete system upon it.

Although Linnæus can have no claim to the supposed discovery of the sexual hypothesis, his being precisely the same with that of Dr Grew; yet, as he is the chief supporter and improver of this doctrine, we shall give a succinct narration of the arguments he makes use of in order to prove that vegetables propagate their species by a regular commerce of sexes.

In a treatise, intitled *Sponsalia Plantarum*, published as an inaugural dissertation by Wahlbom, in the first volume of the *Annuitates Academicæ*, all the arguments made use of by Linnæus in his *Fundamenta Botanica* and other works, are collected and arranged in one view. But as Wahlbom honestly attributes all the merit

rit of this dissertation to his great master, we shall here drop his name altogether, and give the arguments as the property of Linnæus, by whom they were originally employed.

Linnæus, then, first attempts to show, that vegetables are endowed with a certain degree of life; and, secondly, that they propagate their species in a manner similar to that of animals.

“That vegetables are really living beings, (says he), must be obvious at first sight; because they possess all the properties contained in that accurate definition of life laid down by the great Dr Harvey, namely, *Vita est spontanea propulso humorum*. But universal experience teaches, that vegetables propel humours or juices: hence it is plain that vegetables must be endowed with a certain degree of life.”

Not trulling solely to a syllogism founded on a definition, Linnæus proceeds to support the life of vegetables by arguments drawn from the following particulars in their œconomy; the first of which he intitles

“*Nutritio*.—The very idea of nutrition implies a propulsion of humours, and, of course, the idea of life. But vegetables derive their nourishment from the earth, air, &c. and consequently must be considered as living creatures.

“2. *Ætas*.—Every animal must not only begin to exist, and have that existence dissolved by death, but must likewise pass through a number of intermediate changes in its appearance and affections. *Infancy, youth, manhood, old age*, are characterised by *imbecility, beauty, fertility, dotage*; are not all these vicissitudes conspicuous in the vegetable world? Weak and tender in *infancy*; beautiful, and salacious in *youth*; grave, robust, and fruitful, in *manhood*; and when *old age* approaches, the head droops, the springs of life dry up, and, in fine, the poor tottering vegetable returns to that dust from whence it sprung:

“3. *Motus*.—No inanimate body is capable of self-motion. Whatever moves spontaneously, is endowed with a living principle: for motion depends on the spontaneous propulsion of humours; and where-ever there is a spontaneous propulsion of humours, there also is life. That vegetables are capable of motion, is evident from the following facts: plants, when confined within doors, always bend towards the light, and some of them even attempt to make their escape by the windows. The flowers of many plants, especially those of the syngenesia class, pursue the sun from east to west, rejoicing in his beams. Who then can deny that vegetables are possessed of living and self-moving powers?

“4. *Morbus*.—The term *disease* means nothing more than a certain corruption of life. It is well known, that vegetables are subject to diseases, as well as animals: when over-heated, they turn thirsty, languish, and fall to the ground; when too cold, they are tormented with the chilblain, and not infrequently *expire*: they are sometimes afflicted with cancers; and every plant is infested with lice peculiar to its species.

“5. *Mors*.—Death is opposed to life, the former being only a privation of the latter. Experience shows, that every living creature must die. But, as vegetables are daily cut off by internal diseases and external injuries; as they are subject to death from the attacks of hunger, thirst, heat, cold, &c. with what propriety could vegetables be thus said to *die*, unless we allow

that they previously *lived*?

“6. *Anatomia*.—Under this article we are referred to Malpighius and Grew for the organic fibres, membranes, canals, vesicles, &c. of plants, as additional proofs of their living powers.

“7. *Organizatio*.—Vegetables not only propel humours, but also prepare and secrete a number of different juices for the fruit, the nectar, &c. analogous to the various secretions in animal bodies.”

From these facts and observations, Linnæus concludes, that plants are unquestionably endowed with life as well as animals; and then proceeds in the following manner to show how these animated vegetables propagate their species.

After discussing the long exploded doctrine of equivocal generation, he lays hold of another maxim of Dr Harvey, *viz. Omne vivum ex ovo*.—“It being fully evident, (says he), from the foregoing chain of reasoning, that vegetables are endowed with life, it necessarily follows, agreeable to this maxim of Harvey’s, that every vegetable must in like manner derive its existence from an *egg*. But as vegetables proceed from eggs, and as it is the distinguishing property of an egg to give birth to a being similar to that which produced it, the seeds must of course be the *eggs* of vegetables.

“Granting then that the seeds of vegetables are intended by nature to answer the same end as the eggs of animals, and considering at the same time that no egg can be fecundated without receiving an impregnation from the male, it follows, that the seed or eggs of vegetables cannot be fecundated by any other means. Hence also the necessity of vegetables being provided with organs of generation. But where are these organs situated? The answer is easy:—We have already found impregnated seeds within the flowers of plants; and it is natural to expect that the *genitalia* should not be at a greater distance. Now, as *copulation* always precedes *birth*, and every *flower* precedes the *fruit*, the *generating faculty* must be ascribed to the *flower*, and the *birth* to the *fruit*. Again, as the *antheræ* and *stigmata* are the only essential parts of flowers, these parts must necessarily be the *organs of generation*.”

Being thus far advanced, Linnæus affirms, that the *antheræ* are the *testes*, and that the pollen performs the office of the male *semen*. These affirmations he attempts to establish by the following arguments; the first of which he terms,

“1. *Præcedentia*.—The antheræ, or vegetable testes, always precede the fruit; and as soon as the antheræ come to maturity, which constantly happens before the maturity of the fruit, they continue to throw out their pollen as long as the flower lasts; but decay and fall off whenever the fruit comes to perfection.

“2. *Situs*.—The antheræ of all plants are uniformly situated in such a manner that the pollen may with the greatest facility fall upon the stigma or female organ.

“3. *Tempus*.—The antheræ and stigmata always flourish at the same time, whether the flowers be of the hermaphrodite or dioicous kind.

“4. *Localimenta*.—When the antheræ are dissected, they discover as great a variety of structure as the pericarpia or seed capsules: for some of them have one cell, as the mercury; some two, as the hellebore, &c.

“5. *Castratio*.—If all the antheræ be cut off from an hermaphrodite plant, just before the flowers begin to expand

expand, taking care at the same time that no plant of the same species grows near it, the fruit will either prove entirely abortive, or produce barren seeds.

“6. *Figura*.—When the pollen of different plants is examined by the microscope, it exhibits as great a variety of figures as is discoverable in the seeds themselves.

“The accumulated force of these arguments (concludes Linnæus) amounts to a full demonstration that the antheræ are the testes, and that the pollen is the femina or genitura, of vegetables.

“The male organ being thus investigated, we hope, (says Linnæus), that none will hesitate to pronounce the stigma to be the female organ, especially when the following observations are sufficiently attended to.

“The pistillum is composed of the germen, stylus, and stigma. The germen, being only a kind of rudiment of the future fetus or seed, ceases to exist as soon as the flower comes to maturity. Neither is the stylus an essential part, as many flowers have no stylus. But no fruit ever comes to maturity without the assistance of the stigma. It follows, that the stigma must be the female organ adapted by nature for the reception of the pollen or impregnating substance. This will appear still clearer from the following chain of reasoning.

“1. *Situs*.—The stigmata are always situate so that the pollen may with most ease fall upon them. Besides, it is remarkable, that in most plants (though not in all) the number of the stigmata exactly corresponds with the loculamenta or cells of the pericarpium.

“2. *Tempus*.—Here the observation, that the stigmata and antheræ constantly flourish at the same time, is repeated.

“3. *Decidentia*.—The stigmata of most plants, like the antheræ, decay and fall off as soon as they have discharged their proper function; which evidently shows, that their office is not to ripen the fruit, but solely to answer the important purpose of impregnation.

“4. *Alcisio*.—The argument here is precisely the same with the castration of the antheræ; and the result is likewise the same, namely, the destruction of the fruit.

“These arguments (concludes Linnæus) are sufficient to demonstrate, that the stigma is the female organ of generation, or that organ which is suited for the reception and conveyance of the semen to the vegetable egg. Hence, plants may be said to be *in actu venenis*, when the antheræ, or testicles, spread their pollen over the stigma or female vulva.”

To show how the *coitus* of vegetables is effected, is our author's next object of investigation. He affirms, that the pollen is conveyed, by means of the wind or insects, to the moist stigma, where it remains until it discharges a subtle fluid, which being absorbed by the vessels of the stigma, is carried to the seeds or ova, and impregnates them. His proofs are taken from the following particulars.

“1. *Oculus*.—When the flowers are in full blow, and the pollen flying about, every one may then see the pollen adhering to the stigma. This he illustrates by mentioning as examples the *viola tricolor*, *iris*, *campanula*, &c.

“2. *Proportio*.—The stamina and pistilla, in most plants, are of equal heights, that the pollen, by the intervention of the wind, may, with the greater facility,

fall upon the stigma.

“3. *Locus*.—The stamina of most plants surround the pistillum, to give the pollen an opportunity of falling upon the stigma at every breeze of wind. Even in the monœcia class, the male flowers stand generally above the female ones, to afford an easier conveyance of the pollen to the stigma.

“4. *Tempus*.—It is remarkable that the stamina and pistilla constantly appear at the same time, even in plants belonging to the monœcia class.

“5. *Pluvie*.—The flowers of most plants expand by the heat of the sun, and shut themselves up in the evening or in rainy weather. The final cause of this must be to keep the moisture from the pollen, lest it should be thereby coagulated, and of course prevented from being blown upon the stigma.

“6. *Palmicole*.—That the cultivators of palm-trees were in use to pull off the spadices from the males, and suspend them over the spathe of the females, is attested by Theophrastus, Pliny, Prosper Alpinus, Kempfer, and many others. If this operation happened to be neglected, the dates were four and destitute of nuts. Kempfer adds this singular circumstance, that the male spadix, after being thoroughly dried and kept till next season, still retained its impregnating virtue.

“7. *Flores nutantes*.—As the pollen is specifically heavier than air, such flowers as have their pistillum longer than the stamina, hang down, or incline to one side, *e. g.* the *fritillaria*, *campanula*, &c. An easy admission of the pollen to the stigma is the final cause of this appearance.

“8. *Submersi*.—Many plants that grow below water, emerge when their flowers begin to blow, and swim upon the surface till they receive their impregnation, and then sink down.

“9. *Omnium forum genuina consideratio*.—Here a number of particulars are recited. We shall confine ourselves to those that are most striking and applicable to the subject.

“When the flowers of the male hemp are pulled off before those of the female are fully expanded, the females do not produce fertile seeds. But as a male flower is sometimes found upon a female plant, this may be the reason why fertile seeds are sometimes produced even after this precaution has been observed.

“The tulip affords another experiment to the same purpose.—Cut off all the antheræ of a red tulip before the pollen is emitted; then take the ripe antheræ of a white tulip, and throw the pollen of the white one upon the stigma of the red; the seeds of the red tulip being thus impregnated by one of a different complexion, will next season produce some red, some white, but most variegated flowers.”

In the year 1744, Linnæus published a description of a new genus, which he called *peloria*, on the supposition of its being a *hybrid* or *mule* plant, *i. e.* a plant produced by an unnatural mixture of two different genera. The root, leaves, caulis, &c. of this plant are exceedingly similar to those of the *antirrhinum linaria*; but the flower and other parts of the fructification are totally different. On account of its similarity to the *linaria* in every part but the flower, Linnæus imagined it to have been produced by a fortuitous mixture of the *linaria* with some other plant, although he has never yet been able to point out the father. This doctrine

of the production of *mule* plants has since been greatly prized and carefully propagated by Linnæus and the other supporters of the sexual hypothesis. In the third volume of the *Annuitates Academica*, there is a complete dissertation, intitled *Plantæ Hybridæ*, wherein the doctrine of *vegetable mules* is much improved and extended. This dissertation contains a list of 47 mules, with their supposed fathers and mothers. For example,

The *VERONICA SPURIA* is said to be a *mule* plant *begot* by the *verberna officinalis* upon the *veronica maritima*.

The *delphinium hybridum*, a *mule* *begot* by the *aconitum napellus* upon the *delphinium elatum*.

The *arctotis calendula*, a *mule* *begot* by the *calendula pluvialis* upon the *arctotis tritifolia*.

The *asclepias nigra*, a *mule* *begot* by the *cynanchum acutum* upon the *asclepias vincetoxicum*, &c.

From the examples given in this dissertation, Linnæus draws this conclusion, that only two species of each genus existed *ab origine*; and that all the variety of species which now appear have been produced by unnatural embraces betwixt species of different genera.

Under this head, Linnæus likewise quotes from Ray the story of Richard Baal gardener at Brentford. This Baal sold a large quantity of the seeds of the *brassica florida* to several gardeners in the suburbs of London. These gardeners, after sowing their seeds in the usual manner, were surpris'd to find them turn out to be plants of a different species from that which Baal made them believe they had purchased; for, instead of the *brassica florida*, the plants turned out to be the *brassica longifolia*. The gardeners, upon making the discovery, commenced a prosecution of fraud against Baal in Westminster-hall. The court found Baal guilty of fraud, and decreed him not only to restore the price of the seeds, but likewise to pay the gardeners for their lost time, and the use of their ground. "Had these judges (says Linnæus) been acquainted with the sexual hypothesis, they would not have found Baal guilty of any crime, but would have ascribed the accident to the fortuitous impregnation of the *brassica florida* by the pollen of the *brassica longifolia*."

Linnæus next proceeds to celebrate the utility of insects, because they convey the pollen of the male to the stigma of the female. "In this way, (says he), it is reasonable to think that many dioecious plants are impregnated. Nay, even the hermaphrodites themselves are greatly obliged to the different tribes of insects, which, by fluttering and treading in the corolla, are constantly scattering the pollen about the stigmas."

"Upon the whole, then, (concludes Linnæus), the coitus of vegetables is evident to a demonstration. This coitus is nothing more than the conveyance of the pollen to the stigma, to which it adheres till it bursts and discharges a subtile elastic fluid. This fluid or aura is absorbed by the vessels of the stylus, and carried directly to the ovarium or germen, where the mysterious work of impregnation is fully completed."

THESE are the arguments employed by Linnæus and other advocates for the sexual commerce of vegetables.—Let us next attend to those employed by the opposers of this hypothesis.

It is admitted by Ponteder, Dr Allston, &c. that

some of the ancients applied the terms *male* and *female* to several plants. But then they deny that these terms conveyed the same ideas to the ancients that they do to the moderns. *Male* and *female*, when applied to plants, were to the ancients mere terms of distinction, serving only as trivial names to distinguish one species or variety from another. The ancients were ignorant of the very characters which constitute the difference between what is called a *male* and *female* plant among the moderns. Theophrastus, Dioscorides, Pliny, and, in a word, the whole ancient botanical writers, confound the very notion of the modern sexes: they call the real female, or seed-bearing plant, the *male*; and the male, or barren plant, the *female*. Nay, they have even applied the terms *male* and *female* to many plants which bear nothing but hermaphrodite flowers.

Such is the nature of this controversy, that it cannot be determined with any degree of certainty, but by experiments made upon dioecious plants. If a female plant can produce fertile seeds without having any communication with the pollen of the male, the use of this pollen with respect to the impregnation of seeds must of necessity be entirely superfluous.

Now, both Camerarius and Dr Allston tried these experiments with the same success. Those two eminent botanists took female plants of the mercury, spinage, and hemp; transplanted them at a great distance from any males of the same genus, and besides had them inclosed by double rows of hedges. The result was, that each of these plants produced great quantities of fertile seeds. Tournfort made the same trial upon the lupulus, Miller upon the bryony, and Geoffroy upon the may; and all of them declare that the seeds of these plants were as fertile as if they had been surrounded by a thousand males.

Linnæus, in his first argument for the coitus of plants, refers every man to the evidence of his senses.

"Do we not see (says he) the stigmas of almost every hermaphrodite flower covered over with the pollen or impregnating substance? Do not we see the parietaria, the urtica, &c. by violent explosions, discharging their pollen in the open air, that it may be carried in that vehicle to the stigmas of their respective females?"—All this is admitted by the opposers of the sexes: but then they deny that these explosions, &c. are intended to create any intercourse between the male and the female; and further allege, that this ejection of the pollen is intended by nature to throw off something excrementitious, or at least something which, if retained, would prove noxious to the fructification.

Linnæus takes his second argument from the proportion which the stamina bear to the stylus, alleging that they are generally of the same height.—This observation (say the anti-sexualists) is not only contrary to experience, but, allowing it to be universal, no conclusion can be drawn from it either for or against the sexual hypothesis.

The third argument is taken from the *locus* or situation of the stamina with respect to the stylus: "and as the male flowers in the monœcia class stand always above the female flowers, it must be concluded (says Linnæus) that the intention of nature, in this disposition of the parts, is to allow a free and easy access of the pollen to the stigma.—But the stamina cannot be said to surround the pistillum in the monandria and diandria

andria classes; and the position of the male flowers in the monœcia class is a mere chimæra; for in the ricinus, one of the examples which Linnæus mentions in confirmation of his doctrine, the female flowers stand uniformly some inches above the males.

That the stamina and pistilla generally come to perfection at the same time, and that this happens even in the dioicous plants, is Linnæus's fourth argument. But, as it is acknowledged by Linnæus himself, that there are many exceptions with respect to this fact, the opposers of the sexual hypothesis allege that it carries the best answer in its own bosom.

The fifth argument is founded on the circumstance of some flowers shutting up their petals in rainy or moist evenings.—But many flowers do not shut themselves up, either in the night or moist weather, as the passion-flower, &c. The *lychnis noctiflora*, *mirabilis peruviana*, &c. open their flowers in the night, and shut them at the approach of the sun. Hence this is another final cause (say the anti-sexualists) perverted to support a favourite hypothesis.

We come now to the culture of the palm-tree, which is the sixth and most plausible argument employed by the sexualists. Of this, the most authentic account we have is the following by Dr Hasselquist, in one of his letters to Linnæus, dated Alexandria May 18th, 1750. "The first thing I did after my arrival was to see the date-tree, the ornament and a great part of the riches of this country. It had already blossomed; but I had, nevertheless, the pleasure of seeing how the Arabs assist its fecundation, and by that means secure to themselves a plentiful harvest of a vegetable, which was so important to them, and known to them many centuries before any botanist dreamed of the difference of sexes in vegetables. The gardener informed me of this before I had time to inquire; and would shew me, as a very curious thing, the male and female of the date or palm-trees: nor could he conceive how I, a Frank, lately arrived, could know it before; for, says he, all who have yet come from Europe to see this country, have regarded this relation either as a fable or miracle. The Arab seeing me inclined to be further informed, accompanied me and my French interpreter to a palm-tree, which was very full of young fruit, and had by him been wedded or fecundated with the male when both were in blossom. This the Arabs do in the following manner: When the spadix has female flowers, that come out of its spathe, they search on a tree that has male flowers, which they know by experience, for a spadix which has not yet burst out of its spathe: this they open, take out the spadix, and cut it lengthwise in several pieces, but take care not to hurt the flowers. A piece of this spadix with male flowers they put lengthwise between the small branches of the spadix which hath female flowers, and then lay the leaf of a palm over the branches. In this situation I yet saw the greatest part of the spadices which bore their young fruit; but the male flowers which were put between were withered. The Arab besides gave me the following anecdotes: First, unless they, in this manner, wed and fecundate the date-tree, it bears no fruit. Secondly, they always take the precaution to preserve some unopened spathe with male flowers from one year to another, to be applied for this purpose, in case the male flowers should miscarry or suffer damage. Third-

ly, if they permit the spadix of the male flowers to burst or come out, it becomes useless for fecundation: it must have its *maidenhead*, (these were the words of the Arab), which is lost in the same moment the blossoms burst out of their case. Therefore the person who cultivates date-trees must be careful to hit the right time of assisting their fecundation, which is almost the only article in their cultivation. Fourthly, on opening the spathe, he finds all the male flowers full of a liquid which resembles the finest dew; it is of a sweet and pleasant taste, resembling much the taste of fresh dates, but much more refined and aromatic: this was likewise confirmed by my interpreter, who hath lived 32 years in Egypt, and therefore had opportunities enough of tasting both the nectar of the blossoms, and the fresh dates."

Now, though this account seems fully to confirm the fact, *viz.* that such a practice obtains among the Arabs, and that they assist its efficacy in fecundating the trees, it is certain (say the opposers of this doctrine) that no intelligent person, who is not already wedded to an hypothesis, will attempt to found an argument upon the assertions of a people so full of ridiculous superstitions. Before Dr Hasselquist, or any other person, can draw any argument from the abovementioned account, he ought to see the experiment several times repeated, with his own eyes, and not take it upon the word of a people who, besides their superstition, may very probably find it their interest to impose upon travellers.

Mr Milne, author of the Botanical Dictionary, however, relates an experiment, near akin to the abovementioned, which merits some attention: "In the garden of M. de la Serre, of the Rue S. Jacques at Paris, was a female turpentine tree, which flowered every year, without furnishing any fruit capable of vegetation. This was a sensible mortification to the owner, who greatly desired to have the tree increased. Messieurs Duhamel and Jusseu very properly judged that they might procure him that pleasure by the assistance of a male pistachio tree. They sent him one very much loaded with flowers. It was planted in the garden of M. de la Serre, very near the female turpentine tree, which the same year produced a great quantity of fruits, that were well-conditioned, and rose with facility. The male plant was then removed; the consequence of which was, that the turpentine-tree of M. de la Serre in none of the succeeding years bore any fruit that, upon examination, was found to germinate."

Upon this experiment it is observed by the antifexualists, that, though it were a thousand times repeated, it never could be decisive. The nature of the controversy, say they, is such, that one experiment is more decisive in favour of their opinion, than 10,000 can be against them. The reason is plain: If there is such a thing as a sexual intercourse in vegetables, it is as wonderful that any seeds should be perfected without that intercourse, as that a virgin should have a child; the last is not in the least more extraordinary than the first. One experiment, therefore, which shews that seeds may be perfected without such sexual intercourse, is either to be resolved into a miracle, or must prove absolutely decisive against the sexual system; while numberless experiments such as that abovementioned could prove nothing,

thing, because we know not what effect vegetables may have by growing in each others neighbourhood, independent of any sexual intercourse.

In Milne's Botanical Dictionary, under the article *Sexus Plantarum*, the author quotes Dr Allston's experiments partially. The facts recorded by Dr Allston are as follow. 1. Three sets of spinach, planted at a great distance from each other, proved all of them fertile, and ripened plenty of seeds, which were found to answer as well as other spinach feed. 2. A plant of hemp growing by itself, being taken care of, produced about 30 good feeds, though in a situation very much exposed, and plucked up too soon, on account of bad weather, in the autumn. 3. This experiment, which is the most remarkable of the three, we shall give in the Doctor's own words. "In the spring of 1741, I carried two young seedling plants of the French mercury, long before there was any in, from the city physic-garden, the only place where it was then to be found in this country, to the king's garden at the Abbey; which are more than 700 yards distant from one another, with many high hedges, trees, hedges, and part of a high hill, between them: and planted one of them in one inclosure, where it was shaded from the sun the greatest part of the day; and the other in another, 25 yards distant, exposed to the south and west. Both plants ripened fertile feeds; and the last shed them so plentifully, that it proved a troublesome weed for several years, though none of the species was to be found in that garden for more than 20 years preceding."

This experiment Mr Milne hath thought proper not to take any notice of, though he quotes the other two, and on them has the following remark. "The result of these, and such like experiments, can be accounted for, on the principle of the sexes, in no other way than on the supposition that some male flowers have been intermixed with the female, and operated the fecundation in question. This appears the more probable, as only a part of the feeds in the above experiments attained to perfect maturity, so as to be capable of vegetation."

The seventh argument of Linnæus is taken from the *flores nutantes*.—The pistils of these flowers, according to Linnæus, are always longer than the stamina; and nature has assigned them this pensile posture, that the pollen, which is specifically heavier than air, may the more conveniently fall upon the stigma.—But the pistils of the campanula, lilium, and many other *flores nutantes*, are not longer than the stamina. Besides, granting this were uniformly the case; yet, as the pollen is heavier than air, this posture must of necessity either make the pollen miss the pistillum altogether, or, at any rate, it can only fall upon the back part of the pistil in place of the stigma; and, of course, such a direction would rather tend to frustrate than promote the impregnation of the feed.

The eighth argument is taken from the *plantæ submersæ*, which are said to emerge as soon as their flowers begin to blow, left the pollen should be coagulated or washed off by the water.—But many submarine and aquatic plants fructify entirely below water; and, supposing they did not, the same argument would equally prove it to be the intention of nature, that the pollen should be blown away by the winds, as that it should be subservient to the impregnation of the feed.

The ninth and last argument is intitled *Omnium florum genuina consideratio*; which (say the antifexualists) is nothing more than a collection of vague observations upon the structure and economy of particular plants, some of them true, others false, but all of them evidently thrust in as supports to a favourite hypothesis.

Thus we have given a short view of the fundamental principles of the sexual system; of the arguments made use of, and the facts adduced to support it: to these we have subjoined the principal arguments brought against it; together with the most noted experiments made by its opposers; and shall now, according to our general plan, leave the reader to determine for himself. Only, before putting a period to this section, we shall beg leave to observe, that, in our humble opinion, the facts hitherto brought in support of the sexual system are, on the one hand, too few, and those not so fully authenticated as could be wished; and, on the other hand, that the experiments adduced by its opposers seem neither to have been made with sufficient accuracy, nor perhaps upon such plants as would have been most proper for determining the point in dispute. In the mean time, we make no doubt but the gentlemen on both sides will continue to make the most exact and careful inquiries and experiments in order to bring it to a final determination; though from the nature of the question itself, as well as the remoteness of place where some of the plants grow that may be thought necessary to be subjected to experiment, and the difficulty of getting access to perform those experiments in a proper manner, it is not improbable that many years may yet elapse before the world be favoured with that determination.

Sect. VI. Of the Natural Method of Classification.

BESIDES all the abovementioned methods of classing and distributing plants into their different orders, genera, &c. which are deduced from the fructification, and are therefore called *artificial*, Linnæus and most other botanists are of opinion that there is a natural method, or nature's system, which we should diligently endeavour to find out. That this system, say they, is no chimera, as some imagine, will appear particularly from hence, That all plants, of what order soever, show an affinity to some others; and thus, as formerly observed, not only the virtues of a great number of species may be ascertained, but we may know with certainty how to find a proper succedaneum for plants which cannot easily be had.—Linnæus divides vegetables into the 59 natural orders following.

1. *Palme*. These are perennial, and mostly of the shrub and tree kind. The stem is in height from 2 to 100 feet and upwards. The roots form a mass of fibres which are commonly simple and without any ramifications. The stem is generally simple, without branches, cylindrical, and composed of strong longitudinal fibres. The leaves, which are a composition of a leaf and a branch, by Linnæus called *frondes*, are of different forms; being sometimes shaped like an umbrella or fan; sometimes singly or doubly winged; the small or partial leaves, which are often three feet in length, being ranged alternately. The branches, or principal leaves, are six, eight, ten, or twelve feet long; the length varying according to the age and size of the plant. They are

are covered at first with a thick brown dust, like those of the ferns. The base of the leaves frequently embraces the greater part of the stem. The flowers are male and female upon the same or different roots; except in stratiotes, which bears hermaphrodite flowers only; and palmetto, in which the flowers are hermaphrodite and male upon distinct roots. The flowers are all disposed in a panicle or diffusid spike, except in the hydrocharis, stratiotes, and valeriana; in which they proceed singly from the wings or angles of the leaves. The common calix, in this order, is that termed a *spatha* or *sheath*, and has either one or two valves. The spadix, or head of flowers protruded from the sheath, is generally branched. Each flower is generally furnished with a perianthium or proper flower-cup, consisting of three leaves or divisions that are small and permanent. The petals are three in number, of a substance like leather, and permanent like the leaves of the calix. The flowers of zamia have no petals. The stamina are from 2 to 20 and upwards, cohering slightly at their base. The seed-buds are from one to three in number, placed in the middle of the flower, and supporting a like number of styles which are very short. The seed-vessel is generally a pulpy fruit of the berry or cherry kind, containing one cell filled with fibrous flesh, and covered with a skin which is of a substance like leather. The seeds are in number from one to three in each pulpy fruit, of a hard bony substance, round or oval, and attached by their base to the bottom of the fruit.—These plants, particularly the feeds, are astringent, and of efficacy in dysenteries.

2. *Piperites*. These plants are mostly herbaceous and perennial. The stalks of pothos creep along rocks and trees, into which they strike root at certain distances. The greatest height which any of them is known to attain, is 15 feet; the greater part do not exceed three or four. The fleshy roots of many of these plants are extremely acrid when fresh. They lose this pungent quality, however, by being dried, and become of a soapy nature. The smell of many of them is extremely fetid, frequently resembling that of human excrements. The flowers, however, of an Ethiopian dracunculus or arum, and the cover in which they are involved, are said to emit a very fragrant odour. With regard to their virtues, these plants are commonly astringent.

3. *Calamariæ*. In this class the base of the leaf, which embraces the stalk like a glove, has no longitudinal aperture, but is perfectly entire. The stalk is generally triangular, and without knots or joints. The roots of some are long and knotty; in others, they are composed of fleshy fibres which pierce deep into the ground; and in others, of a bulb. The flowers are either hermaphrodite, or male and female upon the same root. The mode of inflorescence in this order is generally a spike; sometimes a capitulum or head. The calix is either a gluma or an amentum. The corolla is wanting. The filaments of the stamina are three in number, short, slender like a hair, and sometimes bristly. The anthers are generally long, slender, and erect. The seed-bud is very small, blunt, and sometimes three-cornered. The style is thread-shaped, and of the length of the scaly calix. The stigmata are generally three in number; slender, hairy, and sometimes permanent. The virtues, uses, and sensible qualities, of this order

of plants are the same with those of the following.

4. *Gramina*. Most of these plants are annual or perennial herbs; some of them creep upon the ground, others are erect. The roots, in the greatest number, are creeping, and emit fibres from each knot or joint; in others they are simply branching and fibrous. The stems and branches are round. The leaves are simple, alternate, entire, very long, and commonly narrow. They form below a sort of sheath, which embraces or surrounds the stem, and is generally cleft or divided on one side through its whole length. The flowers are either hermaphrodite, male and female on the same root, or hermaphrodite and male on the same root. They proceed either singly from the sheath of the leaves, or are formed into a panicle or loose spike. The calix and corolla in this order are not sufficiently ascertained; in some a single scale or husk, in others two, supply the place of both covers; some grasses have four husky scales, two of which serve for the calix, and the other two for the corolla; some have five; others six, four of which constitute the calix, and the other two are termed improperly enough the *husky petals*. The corolla is sometimes composed of one petal with two divisions; and in general the husks of the calix are always placed opposite to those of the corolla. The stamina are generally three in number, and placed irregularly with regard to the situation of the calix and corolla. The anthers are long, furnished with two cells, and slightly attached to the filaments. The seed-bud is placed upon the same receptacle as the calix, corolla, and stamina. The style is generally double, and crowned with a hairy stigma or summit. The seed-vessel is wanting. The seeds are single, oval, and attached below to the bottom of the flower.—The roots of the grasses are opening; such as have an aromatic smell are stomachic; their seeds are mealy, mucilaginous, and nourishing. All the parts of these plants are wholesome.

5. *Tripeloides*, (from *tree*, three; and *petalum*, a petal). These plants have no very striking characters, and are nearly allied to the grasses. All the genera of this order have not the circumstance expressed in the title.

6. *Ensatæ*. This order, which is very nearly allied to the grasses and liliaceous plants, furnishes a very beautiful collection of perennial herbs, which are of different heights, from one inch to 15 feet. The roots are tuberous or fleshy, and garnished with fibres; the stalks are simple, and commonly flat or compressed on the sides. The leaves are simple, alternate, entire, sword-shaped, and, like the liliaceous plants, form at their origin a sheath or glove, which in the greatest number is cleft or divided through the whole length, except at the base, where it is entire, and embraces the stalk like a ring. The flowers are hermaphrodite, and generally proceed from the summit of the stalks either singly, in an umbel, a spike, or in a panicle. In *pondicæria* they proceed from the wings or angles of the leaves either singly or in an umbel. Most of these plants want the perianthium or flower-cup; the flowers burst from a common cover or sheath, termed by Linnaeus *spatha*, which in this order is frequently permanent. The petals are in number from one to six. The stamina are generally three. The seed-bud is placed sometimes above the flower, sometimes below it. The style is generally single, and crowned with a triple stigma.

stigma. The seed-vessel is a dry capsule, generally of an oblong shape, and opens at three valves, discovering the fame number of cells, each inclosing a quantity of roundish seeds.—These plants resemble the liliaceous in their powers and sensible qualities; very few of them, however, are used in medicine.

7. *Orchideæ*. The roots of many of these plants are composed of one or more fleshy tubercles or knobs, attached to the lower part of the stem, and sending forth fibres from the top. Those of orchis bear an obvious resemblance to the scrotum in animals: from which circumstance the genus has derived its name. The leaves are of a moderate size, inscribed with a number of longitudinal nerves or ribs, and without any footstalk. At their origin they form, round the stalk, a kind of sheath, which is long, entire, cylindrical, but not furnished, like the grasses and some other plants, with a crown at top. The flowers are hermaphrodite, and placed at the summit of the stalk either in a spike or in a panicle. The calix is that sort termed by Linnæus a *spatha* or *sheath*, that curling open protrudes a head or cluster of flowers, termed the *spadix*, which have no perianthium or flower-cup. The petals are five in number, and very irregular. The nectarium in this order is remarkably conspicuous; yet so different in the different genera, that Linnæus has employed it for his principal character, or mark of distinction, instead of the root, which had chiefly engaged the attention of former botanists. It has the appearance of a sixth petal. The filaments are always two in number, and placed upon the pistillum or female organ. The antheræ are erect, and generally covered by the upper lip of the nectarium. The seed-bud is either oblong or pillar-shaped, twisted like a screw, and universally placed below the receptacle of the flower. The style is single, very short, and forms one substance with the inner margin of the nectarium. The seed-vessel is generally a capsule with one cavity or cell, and three valves or openings, which are keel-shaped, and open on the angular sides, being jointed both at the bottom and top. The seeds are numerous; very small, like saw-dust; and attached, without footstalks, to a slender receptacle or rib, which extends itself lengthwise in the middle of each inclosure or valve. The plants of this order are reckoned strong aphrodisiacs.

8. *Scitamineæ*. This class consists of beautiful exotic plants, all natives of very warm countries. Some of them furnish exquisite fruits; but though the plants rise very high, they are perennial only by their roots. Those which have only one filament, have in all their parts an aromatic odour, and an acrid or poignant taste; qualities, however, possessed in a much greater degree by the roots, which are hot and resinous.

9. *Spathaceæ*, so called because their flowers are protruded from a *spatha* or sheath. They are nearly allied in habit and structure to the liliaceous plants, from which they are chiefly distinguished by the *spatha* out of which their flowers are protruded.

10. *Coronariæ*. These plants are herbaceous, perennial, and from one inch to 15 feet high. The roots are either bulbous, fibrous, or composed of small fleshy knots, which are jointed at top. The bulbs either consist of scales laid over each other like tiles, or are solid. The stem of the liliaceous bulbous plants is properly wanting; what supplies its place being nothing else than the base of the leaves, which, wrapping or enfold-

ing each other, form at bottom a roundish fleshy bulb hitherto distinguished, though perhaps improperly, by the name of *root*. In the others the stem is simple, that is, has few branches, and is either furnished with leaves, or rises naked. The branches are alternate and cylindrical. The leaves are simple, alternate, and entire. Those next the root, termed *radical leaves*, generally form at their origin a sheath, which in a great number is entire; that is, goes all round; whilst in others, it is cleft or divided longitudinally on one side. The flowers are universally hermaphrodite, except in white lilliebob, which has both male and hermaphrodite flowers mixed together on the same root. The flowers are sometimes single, and terminate the stem; sometimes they form an umbel, sometimes a spike, and sometimes a panicle. The calix or flower-cup, in this order, according to Linnæus, is generally wanting. In strict propriety, however, the single cover that is present in most of these plants, though beautifully coloured, ought to be denominated a *calix*; as its divisions, generally fix in number, are placed opposite to the stamina. The petals, or, to speak more properly, the coloured leaves of the flower, are in number from one to six. Plants which have a single petal, have the limb or upper part split into six divisions or segments. The petals in some species are rolled or turned back. The nectarium is various; in the lily it is a longitudinal line which runs through each petal, and reaches from the base to the middle. In crown imperial, it is a small hollow or pore, formed at the base of each petal; in aphrodite it consists of six very small valves, which, approaching, form a globe, and are inserted into the base of the petal; in hyacinth, it is composed of three melliferous pores, situated on the top of the seed-bud. In pineapple, it is a small scale lying within the substance of each petal above the base; and in albuca, or bastard star of Bethelhem, it consists of two sharp-pointed bodies proceeding from the furrows of the seed-bud, and covered by the broader base of the three fertile filaments. In some species of lily the nectarium is hairy; in others it is naked. The stamina are six in number; erect, and inserted into the common receptacle, if the flower consists of many petals; into the tube, or divisions of the corolla, if it consists of one. The antheræ are long, commonly divided below, and slightly attached by their sides to the filaments on which they turn like a vane or the needle of a compass. The seed-bud is single, and placed either within the flower-cup, or below it. The style is single, thread-shaped, and generally of the length of the petals. The stigma is generally single, of a conic form, and shaggy or hairy at the extremity. The seed-vessel is generally a capsule, divided externally into three valves, internally into three cells.—With respect to the powers of the plants of this order, it may be affirmed in general, that such as have little taste or smell, as the roots of tulip, and star of Bethelhem, are perfectly innocent; whilst those which have a heavy nauseous smell, as squill, hyacinth, crown imperial, and spider-weed, are at least suspicious, and frequently prove noxious.

11. *Sarmentose*, (from *sarmentum*, a long shoot, like that of a vine). This order consists of plants which have climbing stems and branches, that, like the vine, attach themselves to the bodies in their neighbourhood for the purpose of support. These plants are far

far from being a true natural assemblage; in fact they scarce agree in a single circumstance, except that expressed in the title, which is far from being peculiar to this order.

12. *Holeracea*. This order consists of plants which are used for the table, and enter into the economy of domestic affairs: it contains trees, shrubs, perennial, and annual herbs. Some of the woody vegetables retain their green leaves during the winter. The roots are very long, and frequently spindle-shaped; from the knots on the stems and branches of such plants as creep on the ground, or float on the water, proceed fibrous and branching roots. The stems and young branches are cylindrical; and in the greatest part of the aquatic plants of this order, the stalks are hollow within. The buds are of a conic form, and naked; that is, not accompanied with scales. The leaves are generally simple, entire, alternate, and attached to the branches by a cylindrical foot-stalk, which is sometimes very long, but commonly very short. Some plants of this kind have two stipule or scales which are attached to the branches near the origin of the foot-stalk of each leaf. In many others, instead of stipule, each leaf bears on its foot-stalk a membranaceous sheath, which is cylindrical, frequently fringed on the margin, and pierced or penetrated by the stem. The flowers are either hermaphrodite; male and female upon the same root; male and female upon different roots; hermaphrodite and male on the same root; hermaphrodite and female on the same root; or hermaphrodite and male on different roots.

13. *Succulentæ*. This order consists of flat, fleshy, and juicy plants, most of them ever-greens. They are astringent, refreshing, and very wholesome.

14. *Grainales*, from *grus* a crane. These consist of *geranium*, vulgarly called *cranes-bill*, and a few other genera which Linæus considers as allied to it in their habit and external structure. This order furnishes both herbaceous and woody plants. The roots are sometimes fibrous, sometimes tuberous. In some species of wood-forrel they are jointed. The stems are cylindrical; the young branches, in some, nearly square. The buds are of a conic form, and covered with scales. The leaves are either simple or compound. The flowers are hermaphrodite; they proceed from the wings of the leaves either singly or in clusters. The calyx or flower-cup consists of five distinct leaves, or of one leaf divided almost to the bottom into five parts. It generally accompanies the seed-bud to its maturity. The petals are five in number, spreading, and frequently funnel-shaped. The stamina are generally ten in number, awl-shaped, erect, and of the length of the petals. The stamina are generally oblong; and frequently attached to the filaments by the middle, so as to lie, and sometimes to veer about, upon them. The seed-bud is either oblong, or five-cornered. The number of styles is either one, or five. In *tribulus*, the style is wanting. The seed-vesicle is generally a five-cornered capsule, with one, three, five, or ten cells. The seeds are generally equal in number to the internal divisions or the cells of the seed-vesicle; one seed being placed in each cell.

15. *Inundatæ*. The plants of this order are aquatic, of low stature, herbaceous, and mostly perennial. The roots are fibrous. The stem is generally wanting,

in its place are an assemblage of leaves, which wrapping or enfolding each other mutually form a sheath; and from the middle of this sheath is produced the foot-stalk of the flower. The leaves are sometimes alternate, sometimes placed in whirls round the stem. In a great many genera the foot-stalk is extended at its origin into a membranaceous substance, which forms a sheath that is cleft through the whole length, on the side opposite to the leaf. The flowers are hermaphrodite, or male and female on the same root. The flower-cup is either wanting, or consists of three, four, or five divisions or leaves, which accompany the seed-bud to its maturity. The petals are generally wanting. The stamina are in number from one to 16 and upwards. The filaments in some genera are so short, that they seem wanting. The antheræ are short, and generally marked with four longitudinal furrows. The seed-buds are in number from one to four, the style is frequently wanting. The seed-vesicle is universally wanting, except in *Elatine*, which has a dry capsule, with four external openings, and the same number of cells. The seeds are generally four in number.

16. *Calyctifloræ*, (from *calix* the flower-cup, and *floræ* the flower), consisting of such plants as have the stamina (the flower inserted into the calix). All the plants of this order are of the shrub and tree kind. Some of them rise to the height of 12 or 14 feet; others not above two or three. The roots are branching, fibrous, and woody. The stems are cylindrical. The branches, when young, are cornered; the buds of a conic form, and without scales. The leaves are simple, alternate, and attached to the branches by a very short foot-stalk. The flowers are either male or female upon distinct roots, or hermaphrodite and male on the same root. The calix is a perianthium composed of one leaf divided into two, three, or four segments. It is commonly placed upon the germen or seed-bud, which accompanies it to maturity. The corolla is universally wanting, except in *trophis*, the male plants of which, according to Linæus, have four obtuse and spreading petals. The stamina are generally four in number, slender like a hair, short, placed at a considerable distance from the style, and inserted into the tube of the calix. The pistillum is composed of a roundish germen, crowned with the calix; a single thread-shaped style; and a cylindrical stigma. The seed-vesicle is either an obtuse oval fruit of the cherry kind, or a globular berry with one cell, containing a roundish seed. The plants of this order are astringent.

17. *Calycantemæ*, (from *calix* the flower-cup, and *antemæ* the flower); consisting of plants, which, among other characters, have the corolla and stamina inserted in the calix. This order furnishes trees, shrubs, and annual, biennial, and perennial herbs. The herbaceous annuals are by much the most numerous. The roots are branching and fibrous; the stems and branches cylindrical, square, or four-cornered while young. The buds are of a conic form, and without scales. The leaves are generally either alternate, simple, and attached to the branches by a short foot-stalk, or opposite at the bottom of the stem; and in some, alternate towards the top. They are universally sessile; that is, attached to the branches, without any footstalk. The calix is universally a perianthium, and generally monophyllous, or composed of one leaf. The corolla consists of four, five, and

and six petals, which are attached to the tube of the calix, and are sometimes placed alternate, sometimes opposite to the divisions of the limb. The stamina, which are in number from 4 to 20 and upwards, are attached to the tube of the calix either on its margin, or lower down. When the number of stamina is double the divisions of the calix, the stamina which stand opposite to these divisions are a little longer than the rest. The antheræ are generally of a hemispherical figure; frequently cleft or slit below; and by that aperture attached slightly to the filaments, on which they often veer about like a vane or needle. They are surrounded longitudinally, and open on the sides into two loculi or cells. The pollen, or male dust, consists of a number of minute particles, of an oval figure, yellow and transparent. The germen or seed-bud is placed either above or under the receptacle of the flower. The style is single, thread-shaped, and of the length of the stamina. The stigma is generally single and undivided. The seed-vessel is a capsule, which is generally divided internally into four loculi or cells. The seeds are numerous, minute, and frequently three-cornered. The plants of this order are reckoned astringent.

18. *Bicornes*, (from *bis* twice, and *cornu* a horn), plants whose antheræ have the appearance of two horns. This appearance, however, is not very conspicuous, unless in a few genera. The plants of this order are all of the shrub and tree kind. The roots are branching and fibrous. The stems and branches are cylindrical. The buds conic, sometimes covered with scales, and sometimes naked. The leaves are generally alternate. In most plants of this order they are either sessile, or supported by a very short foot-stalk, which is semicylindric, and flat above. The flowers are universally hermaphrodite, except in one genus, the Indian date-plumb, where hermaphrodite and male flowers are produced in the same species upon distinct roots. They proceed either solitary, or in a corymbus from the angles formed by the leaves and branches; or hang down in spikes and clusters at the end of the branches; each flower having a small scale or floral leaf placed under it. In most plants of this order the calix is placed around or below the germen. The calix is universally a perianthium, and generally monophyllous or of one piece, deeply divided into four or five segments, which are permanent, that is, accompany the germen to its maturity. The segments are often acute, and sometimes coloured. The corolla is generally monopetalous, and bell or funnel shaped; the figure, however, is not very constant, even in plants of the same genus. The limb, or upper part of the petal, is generally divided into four or five segments, which are sometimes rolled back, sometimes bent inwards. The limb too is sometimes slightly cut, sometimes divided almost to the bottom. The tube, or lower part of the petal, is cylindrical, and generally of the same length with the calix. The number of stamina is from 4 to 20. These are generally erect, and attached to the lower part of the tube of the corolla. The antheræ are bifid or forked below, and, being slightly attached to the filaments, are frequently inverted in such a manner as to exhibit the appearance of two horns at top. The germen or seed-bud is generally roundish, and seated above the receptacle. The style is single, thread-shaped, of the same length with the corolla, and in a few genera permanent.

The seed-vessel is either a capsule with five cells, a roundish berry, or an oblong four-cornered nut with two cells.—The plants of this order are astringent.

19. *Hesperides*, (from the Hesperides, whose orchards are said to have produced golden apples). The plants of this order are of the shrub and tree kind, and mostly evergreen. The bark of the stalks is slender, and comes off in thin plates. The leaves are generally opposite, and covered with small transparent points. In some, the leaves are placed opposite at the bottom of the stalks, and alternate above. The buds are of a conic form, the flowers generally hermaphrodite; they proceed from the wings of the leaves either singly, or in clusters like ivy-berries. The calix is placed above the seed-bud, and accompanies it to its maturity. The petals are three, four, or five in number, and stand upon the brims of the tube of the calix. The seed-bud is large, oblong, and placed below the receptacle of the flower. The style is single, awl-shaped, of the length of the stamina, and terminated with a single stigma. The seed-vessel in some genera is a berry furnished with one or three cells; a capsule with four cells, or of the nature of a cherry, containing a stone. The seeds are generally numerous, small and oblong. The leaves and fruits are astringent, the berries esculent.

20. *Rotaceæ*, (from *rota*, a wheel), consisting of plants with one wheel-shaped petal without a tube. They resemble in quality those of the order of præciæ, to which they are in all respects very nearly allied; but very few of them can be laid in strict propriety to possess the character specified in the title.

21. *Præciæ*, (from *preciosus* early). These consist of primrose, an early flowering plant, and some others which agree with it in habit and structure, though not always in the character or circumference expressed in the title. These plants, which possess no striking uniform characters, are, in general, innocent in their quality; yet the root of sow-bread is dangerous, if taken internally.

22. *Caryophyllææ*. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds do not rise above an inch, and the tallest exceed not seven or eight feet. The roots are branching, fibrous, and of a moderate length. The stems are cylindrical. The branches proceed from the wings or angles of the leaves, and are generally opposite, and as it were jointed at each knot. In some species of cerastium the branches are square. The leaves are generally placed opposite in pairs, so as to resemble a cross; and are slightly united at the bottom by their foot-stalks, which form a sort of glove round the stem. The hairs are simple, like silk. The flowers are hermaphrodite; but some have male and female flowers upon distinct roots. They either stand single on their foot-stalks, and proceed from the wings or angles of the leaves and branches, or are disposed in a spike, corymbus, umbel, or panicle. The calix is permanent, and composed either of one piece with five indentments, or of four or five distinct leaves. The corolla generally consists of five petals, which have claws of the length of the calix; and a spreading limb, sometimes entire, but oftener cleft or divided in two. The stamina are in number from 3 to 15, and of a moderate length. When their number is double the divisions of the calix, they are attached alternately to the claws of the petals, those

those so attached being shorter than the rest; the remaining stamina are inserted into the common receptacle, and stand opposite to the segments of the calix. In some genera of this order the number of stamina is found to vary, even in the different flowers of the same plant. The antheræ are short, hemispherical, marked with four longitudinal furrows, frequently divided or cleft below, most commonly erect; sometimes, however, *incumbent*, that is, fastened to the filaments by the sides. The point is composed of a single seed-bud, which is generally roundish, sometimes cornered. The styles are thread-shaped, of the length of the stamina, and crowned with a simple stigma, which is sleek or smooth externally, and slightly hollowed or vaulted within. The seed-vessel is a dry capsule, of an oval form, of the length of the calix, and consists of one or three cells. The plants of this order are innocent in their quality; they abound in a watery sort of phlegm, and have bitter feeds. With respect to their virtues, they are reckoned astringent, attenuating, and detergent.

23. *Trihillates*, (from *tres* three, and *hilum* an external mark on the seed); consisting of plants with three feeds, which are marked distinctly with an external cicatrix or scar, where they were fastened within to the fruit.

24. *Corydales*, (from *κορυς* a helmet); consisting of plants which have irregular flowers, somewhat resembling a helmet or hood. These plants are mostly herbaceous and perennial. The roots are tuberous or knobby. The stems are generally branching. The leaves are alternate, sometimes simple, but most commonly winged. The foot-stalk of the leaves is strait or narrow, except in *epimedium*, where it is large, and has a membranaceous edge or border. The flowers are universally hermaphrodite. They proceed either singly from the wings or angles of the leaves, or are collected in clusters at the end of the branches. The calix consists of two, four, five, or six leaves, which are frequently coloured, and commonly fall off immediately before or very soon after the expansion of the petals. The corolla is generally irregular; of one, or many pieces; gaping; and furnished with a nectarium, which is very different in the different genera. The stamina are in number from two to six, and of a proportionate length, except in honey-flower, which has two shorter than the rest. The filaments are distinct, except in two genera, fumitory and *monnieria*, which have two sets of strings or filaments united in a cylinder. The antheræ are universally distinct, except in *impatiens*, where they are formed into a cylinder divided at the base. The seed-bud is generally roundish, but sometimes angular or cornered. The style is commonly single, extremely short, slender, or thread-shaped, and crowned with a simple stigma. The seed-vessel is either a hollow blown-up berry, a capsule of one cell, a longish, or a roundish pod. The feeds are generally numerous and round.

25. *Putamineæ*, (from *putamen* a shell); consisting of a few genera of plants allied in habit, whose fleshy seed-vessel or fruit is frequently covered with a hard woody shell. Most of these plants are acrid and penetrating; and yield, by burning, a great quantity of fixed alkali. With respect to their virtues, they are powerful aperients. The Indians pretend that the fruit of a species of caper-bush, which they call *baducça*,

extinguishes the flames of love.

26. *Multifloraæ*, (from *multus* many, and *siliqua* a pod); consisting of plants which have more feed-vessels than one. From the etymology of the term, one would naturally imagine that the feed-vessels in question were of that kind called by Linnæus *siliqua*, or pod; but the fact is, that not a single plant of this order bears pods; the greater part having many dry capsules, and the remainder being furnished properly with no feed-vessel, but bearing numerous distinct feeds. Plants of this order are mostly perennial herbs; the stems of some are erect; others creep upon the ground, and produce roots near the origin of each leaf; lastly, others climb, and attach themselves to the bodies in their neighbourhood, either by the footstalk of the leaves, or by tendrils and claspers which terminate the footstalk. The greatest height of those which rise erect, seldom exceeds eight feet. Those which climb rarely exceed 15 or 20 feet. The roots are generally fleshy. In some they are hand-shaped; in others finger-shaped, or cylindrical. In some species of hellebore and ranunculus they are divided into spherical knobs. Lastly, in some plants of this order, the roots are fibrous. The stems and young branches are cylindrical. The leaves, which are of different forms, being sometimes simple and entire, sometimes hand-shaped or winged, are generally alternate. The footstalk, which is sometimes cylindrical, sometimes angular, is membranous, and very large at its origin, surrounding a great part of the stem from which it proceeds. The flowers are hermaphrodite. They proceed either singly from the wings of the leaves or termination of the branches, or terminate the branches in a spike, panicle, or head. The calix in some is wanting; in others it is generally composed of five pieces, which fall off with the petals. The petals are in number from 4 to 15; generally equal, and sometimes disposed in two or three series; five is the prevailing number. The stamina are in number from 5 to 300, distinct, and attached generally in several rows or series to the receptacle. The seed-buds are generally numerous; the style is frequently wanting. In some the seed-vessel is wanting; in others it is composed of several dry capsules, each containing a single cell. The feeds are numerous, and frequently angular. Most of these plants are acrid, and many of them poisonous. In general, plants that have a great number of stamina are noxious in their quality. When burnt, these plants furnish a fixed alkali; by distillation there is drawn from them a kind of nitrous and aluminous substance. With respect to their virtues, they are caustic and purgative.

27. *Rhœadææ*, consisting of poppy, and a few genera which resemble it in habit and structure. These plants, upon being cut, emit plentifully a juice, which is white in poppy, and yellow in the others. With respect to their virtues, they seem to operate principally upon the nerves. Their juice is soporific and narcotic, their seeds less so, their roots aperient. Applied externally, they are slightly corrosive.

28. *Luridæ*, consisting of plants whose pale and ominous appearance seems to indicate something baleful and noxious in their nature and quality. Most of these plants are herbaceous and perennial. Many of them are of the masked tribe of flowers; others resemble these in their general appearance, but differ from them essentially

essentially in the equality of their stamina. The roots are generally branched, sometimes tuberous. The stems and branches are cylindrical. The leaves are generally simple, and placed alternate. The flowers are hermaphrodite. They proceed either singly or in clusters from the angle formed by the leaves and branches. In some species of lycium, they terminate the branches. The calix is generally of one piece deeply divided into five parts. The corolla consists of one petal, which is either bell, funnel, or wheel shaped. The stamina are four or five in number; and those either of equal lengths, as in the greater, or unequal. The seed-bud is placed above the receptacle of the flower. The style is single; and is terminated by a summit which is hemispherical, and frequently channelled or furrowed. The seed-vessel, in such as have equal stamina, is a berry; in the rest, it is generally a capsule. The seeds are numerous, and frequently kidney-shaped.—These plants in general are poisonous. They have an insipid taste, and a nauseous disagreeable smell.

29. *Campanaceæ* (from *campana* a bell); plants with bell-shaped flowers. The plants of this order are herbaceous and perennial. The roots are either spindle-shaped, or branching and fibrous. The stems are round. The branches are generally alternate. The leaves are simple, alternate, and commonly attached to the branches by a semi-cylindric foot-stalk, which is furrowed above. The indentments are terminated by a small white tubercle or knob, which renders them conspicuous. The flowers are hermaphrodite; and proceed either solitary from the wings of the leaves, or are collected into a spike and head at the end of the flower-stalk. The calix is universally a perianthium situated upon or round the germen, and generally composed of one leaf deeply divided into five segments. The corolla is monopetalous, and of the bell, funnel, or wheel shape. The tube, in flowers of the bell and wheel shape, is very short; in those of the funnel-shape, very long. In Greek valerian, the tube is shut with five valves, which are placed on its apex or top. The limb or upper part of the corolla is deeply divided into five segments, which spread, and are alternate with the divisions of the calix. The corolla is generally permanent. The stamina are five in number, attached to the base of the tube of the corolla, alternate with its divisions, and opposite to those of the calix. The filaments are distinct; very large at their origin; and frequently approach so as to form a sort of vault, which covers the summit of the germen. They are slender and awl-shaped above. The antheræ are very long; oval; marked with four longitudinal furrows, either distinct, or united in a cylinder. The pollen is composed of very small, spherical, white, shining, and transparent particles. The germen is roundish, and situated either wholly or in part under the flower. The style is generally single, and of the length of the stamina or corolla. The stigma is commonly single, but deeply divided. The seed-vessel is a roundish capsule, generally divided into three cells, and furnished externally with the same number of valves. The seeds are small, numerous, attached to a receptacle in the centre of the fruit, generally rounded, and sometimes cornered.—This order furnishes many excellent medicines. The plants abound with a white milky juice, which, upon the stalk being cut, flows out in great quantities.

30. *Contortæ*, (from *con* together, and *torqueo* to twist); consisting of plants which have a single petal that is twisted, or bent towards one side. This order furnishes trees, shrubs, and fat succulent plants, some of which retain their leaves during the winter. The herbaceous vegetables in this order are generally perennial. The roots are sometimes branching, but commonly fleshy, succulent, and garnished with fibres or strings like those of turnip. The stems are round, and in some genera pulpy and succulent. The branches are sometimes placed alternate, and sometimes opposite. The buds are of a conic form, and naked or without scales. The leaves are sometimes alternate, sometimes placed opposite in pairs, and not seldom furrowed the stem in whorls. They are attached to the branches by a cylindrical foot-stalk, which is short, and frequently united to the foot-stalk of the opposite leaf. The defensive and offensive weapons in this order are a downy sort of pubescence, and simple, or forked prickles, which, in some genera, issue from the wings of the leaves. The flowers are hermaphrodite; and stand either singly upon their foot-stalks, or are collected into umbels and clusters. These bunches or collections of flowers sometimes terminate the branches, sometimes proceed from the angles of the branches, and sometimes stand at the side of the wings without issuing from them. The flower-cup is composed of one leaf divided almost to the base in five unequal segments, which embrace each other, and are permanent, or accompany the seed-bud to its maturity. The corolla consists of one petal, which in the different genera is bell, salver, funnel, or wheel shaped. The limb, or upper spreading part of the petal, is generally divided into five equal parts, which are slightly bent or twisted to the left, and embrace or enfold each other like the petals of the mallow tribe. The tube is generally long and cylindrical; sometimes club-shaped, and often wanting. In several flowers of this order the petal is accompanied with that species of superfluity termed a *nectarium*. In the different genera, however, it assumes very different appearances. The stamina are five in number, short, equal, attached at the same height to the tube of the petal, alternate with its divisions, and opposite to those of the calix. The antheræ are generally erect, and frequently approach so as to form a compact body in the middle of the flower. The seed-bud is either single or double. In some the style is wanting. The stigma is frequently double. The seed-vessel in some genera is a pulpy fruit, of the berry and cherry kind; but most frequently that species termed by Linneus *conceptaculum*, and *folliculus*, which has one valve or external inclosure, opens lengthways on one side, and has not the seeds fastened to it. Two of these dry fruits, with a single cell, compose the seed-vessel of most plants of this order. The seeds are generally numerous, and in several genera crowned with a long pappus or downy wing like that of the compound flowers, by means of which they easily disperse and sow themselves.—The plants of this order being cut, emit a juice which is generally milky, and sometimes of a greenish white. From the circumstance of their abounding in this milky juice, the greater part are deemed poisonous; repeated observations having established this aphorism, That milky plants, except those of the plain compound flowers, are generally of a baneful destructive nature, and ought

at least to be administered with caution. With respect to their sensible qualities, they are bitter; particularly the seeds, roots, and bark, in which resides their principal virtue.

31. *Veprecule*, (from *vepres* a briar or bramble), consisting of plants resembling the daphne, dirca, guida, &c. but which, however, do not constitute a true natural assemblage.

32. *Papilionaceæ*, plants that have papilionaceous flowers, i. e. somewhat resembling a butterfly in shape; of which number are all the leguminous plants. The plants of this order are of very different duration; some of them being herbaceous, and those either annual or perennial; others woody vegetables of the shrub and tree kind, a few of which rise to the height of 70 feet and upwards. The herbaceous plants of this order generally climb; for, being weak and as it were helpless of themselves, they are provided by nature with tendrils, and even sharp-pointed hooks, at their extremities, to fasten upon the neighbouring trees or rocks; or the stalks are endowed with a faculty of twisting themselves, for the purpose of support, around the bodies in their neighbourhood. The pea, vetch, and kidney-bean, afford familiar examples of this appearance. The shrubs and trees of this order are mostly armed with strong spines. The roots are very long, and furnished with fibres; but some genera have fleshy knobs or tubercles placed at proper intervals along the fibres. The stems are cylindric, as likewise the young branches, which are placed alternately: those which climb, twist themselves from right to left, in a direction opposite to the apparent motion of the sun. The bark of the large trees is extremely thick and wrinkled, so as to resemble a net with long meshes; the wood is very hard in the middle, and commonly coloured or veined. The buds are hemispherical, without scales, and proceed from the branches horizontally a little above the angle which they form with the leaves. The leaves are alternate, and of different forms, being either simple, finger-shaped, or winged. This last form is very common; the lobes or lesser leaves are entire, and sometimes placed in pairs, but most commonly the winged leaf is terminated by an odd lobe. The winged or pinnated leaves of this order have a daily or periodical motion, depending upon the progress of the sun in his diurnal course. The common footstalk of the winged and compound leaves is marked on the upper surface with a cavity or furrow which runs through its whole length. The flowers are hermaphrodite; and proceed either from the wings of the leaves, or from the extremity of the branches. The calix is a perianthium of one leaf, bell-shaped, bunching out at the bottom, and cut on its brim or margin into five irregular divisions or teeth; the lowermost of which, being the odd one, is longer than the rest: the other four stand in pairs, of which the uppermost is shortest, and stands farthest asunder. The bottom of the calix is moistened with a sweet liquor like honey, so may be deemed the nectarium of these plants. The petals are four or five in number, very irregular, and from their figure and position bear an obvious resemblance to a butterfly expanding its wings for flight. These petals have been characterized by distinct names: the upper one, which is commonly the largest, is termed the *standard*, (*vexillum*); the two side petals, the wings, (*alæ*); and the lowermost, which is generally united

at top, and divided at bottom, the *keel*, (*carina*). The stamina are generally ten: these are either totally distinct, or united by the filaments into one or two bundles involving the feed-bud. In the latter case, where there are two sets of united filaments, one of the sets is composed of 9 stamina, which are united into a crooked cylinder, that is cleft on one side thro' its whole length: along this cleft lies the tenth filament or stamen, which constitutes the second set, and is often so closely attached to the second bundle, that it cannot be separated without some difficulty. The anthers are small, round, marked with four longitudinal furrows, and slightly attached to the filaments. In lupine, the anthers are alternately round and oblong. The feed-bud is single, placed upon the receptacle of the flower, oblong, cylindrical, slightly compressed, of the length of the cylinder of the united stamina by which it is involved, and sometimes elevated by a slender footstalk which issues from the centre of the calix. The style is single, slender, and generally crooked or bent. The stigma is commonly covered with a beautiful down, and placed immediately under the anthers. The feed-vesicle is that sort of pod termed a *legumen*, which is of an oblong figure, more or less compressed, with two valves, and one, two, or more cavities. These cavities are often separated, when ripe, by a sort of joints. The seeds are generally few in number, round, smooth, and fleshy. Jointed pods have generally a single seed in each articulation. The seeds are all fattened along one future, and not alternately to both, as in the other species of pod termed *siliqua*.—The plants of this family are, in general, mucilaginous. From the inner bark of most of them flows, either naturally or by incision, a clammy liquor, which dries and hardens like gum; the juice of others is sweet like sugar; some taste bitter, and are purgative, emetic, or even mortal. A species of eastern astragalus, with goats-rue leaves, is said to be remarkably caustic, and to burn the tongue excessively when chewed. In general, however, these plants are soft and clammy. With respect to their virtues, the plants of this order are highly emollient; some of them are vulnerary and astringent; and the root of anonis, or rest-harrow, is diuretic.

33. *Lomentaceæ*: (from *lomentum*, a colour used by painters). Many of these plants furnish beautiful tinctures, and some of them are much used in dyeing. They very much resemble the last order, differing only in the following particulars. 1. In all plants of this order, except milk-wort, the stamina are distinct. The flower is not shaped like a butterfly, but is less irregular, and frequently consists but of one petal. The leaves are sometimes simple, but most commonly winged. The seeds are generally marked with a circular furrow on both sides. Like those of the leguminous tribe, the plants of this order are generally mucilaginous. From the inner bark of the greater number exudes, either naturally or by incision, a mucilaginous liquor, which sometimes dries upon the plant, and becomes a gummy substance.

34. *Cucurbitaceæ*, (from *cucurbita* a gourd); consisting of plants which resemble the gourd in external figure, habit, virtues, and sensible qualities.—The plants of this order, which generally climb, and have long diffused branches, are mostly herbaceous and perennial. The roots in the perennial plants of this order

der are shaped like those of the turnip; in the annuals, they are branching and fibrous. The stems are cylindrical and fuculent. The young branches have generally five corners. In some species of passion-flower they are square. The leaves are alternate, angular, and sometimes hand-shaped. They are attached to the branches by a foot-stalk, which is pretty long and cylindrical, without any furrow. From the wing or angle of each of the upper leaves proceeds a tendril, which is either simple, or branching, and twists itself spirally round the different bodies in its neighbourhood, for the purpose of supporting and training of the branches. The lower leaves have no tendril. The flowers are either hermaphrodite, or male and female. In this last, the male flowers are generally separated from the female upon the same root; and that either in the same wing or angle of the leaves, or in different angles. The flower-cup, in the female flowers, is placed upon the seed-bud; and generally consists of one bell-shaped leaf, that is deeply divided into five unequal segments, and, unlike the other plants which have the calix seated upon the fruit, falls off with the petals and the other parts of the flower. The corolla consists of one petal, with five equal divisions, which adhere to the tube of the calix, as if glued to it. A species of passion-flower, termed by Linnæus *passiflora suberosa*, wants the petals. The stamina are in number from one to five, short, and generally inserted into the calix. The filaments are distinct; and the antheræ of many genera are united in a cylinder. In the passion-flower they are slightly attached to the filaments, on which they turn like a vane or the needle of a compass. The feed-bud is single, and placed below the receptacle of the flower. The style is generally single, cylindrical, of the length of the calix, and crowned with a triple stigma. The feed-vessel is generally pulpy, of the apple or berry kind, and consists of one, two, or three cells. The seeds are numerous, generally flat or compressed, and sometimes covered with that kind of proper coat called by Linnæus *arillus*.—The fruit of these plants is generally purgative and refreshing; that of some of them proves a very violent emetic when used too freely.

35. *Senticosæ*, (from *sentis* a briar or bramble); consisting of the rose, bramble, and other plants which resemble them in port and external structure. These plants are so nearly allied in form, habit, and structure, to those of the natural order *Pomaceæ*, that they ought never to have been separated from it. The leaves have a styptic taste; the fruits are acid and cooling. With respect to their virtues, the leaves are vulnerary and astringent, the roots are diuretic. The acid fruits, as strawberry and raspberry, are used with success in putrid and bilious fevers, as likewise in contagious and epidemic dysenteries, which prevail in summer and autumn, and are occasioned by a sudden transition from a hot to a cold air, or by the acrid humour which flows into the intestines.

36. *Pomaceæ*, (from *pomum* an apple); consisting of those which have a pulpy esculent fruit, of the apple, berry, or cherry kind. The plants of this order, which furnishes many of our most esteemed fruits, are mostly of the shrub and tree kind. The roots are branched, fibrous, and in the greater part very long. The stems and branches are cylindrical. These last are placed alternate; and when young, are, in some genera, angu-

lar. The bark is thick and wrinkled. The buds are of a conic form, placed in the angles of the leaves, and covered with scales which lie over each other like tiles. The leaves, which differ in form, being in some genera simple, in others winged, are, in the greater number, placed alternate. The footstalk of the leaves is furrowed above, and frequently accompanied by a number of knobs like glands. Most of these plants are furnished with two stipulæ at the origin of the young footstalks of the leaves. These, in some genera, are pretty large; in others, they are so small as scarce to be perceived; and in cocoa-plumb in particular, they by their minuteness resemble hairs. The flowers are universally hermaphrodite, except in *spirea aruncus*, in which male and female flowers are produced on distinct plants. In the greater number of genera they are produced in clusters or heads at the end of the branches. The calix is of one piece, with five segments or divisions, which are permanent, and placed above the feed-bud in some; in the rest, they either fall off with the flower, or wither upon the stalk. The petals are five in number, and are inserted into the tube of the calix. The stamina are generally 20 and upwards, and attached like the petals to the margin of the tube of the calix. The antheræ are short, and slightly attached to the filaments. The feed-bud is single; and in those genera which have the calix permanent, it is placed below the receptacle of the flower. The feed-vessel is a pulpy fruit of the apple, berry, or cherry kind. Those of the apple kind are divided internally into a number of cavities or cells. The seeds are numerous.—The pulpy fruits of this order are acid, esculent, and of great efficacy in putrid and bilious fevers.

37. *Columniferæ*, (from *columna* a pillar, and *fero* to bear); consisting of plants whose stamina and pistil have the appearance of a column or pillar in the centre of the flower. This order furnishes a choice collection of herbs both annual and perennial, shrubs, and trees. These are very different in size and height, from the creeping mallows, and low shrubby tea-tree, to the fleshy limes, and the more lofty silk-cotton trees, which by some modern writers are affirmed to be so large as not to be fathomed by 16 men, and so tall that an arrow cannot reach their top. The shrubs and trees of this order are deciduous, pretty thick, of a beautiful appearance, with an erect stem, which is formed by its branches and foliage into a round head. The roots are extremely long, branch but little, and either run perpendicularly downwards, or extend themselves horizontally below the surface. The stems are cylindrical. The young branches, though commonly of the same figure, are sometimes angular. The bark is thick and pliant. The wood, in general, very soft and light. The buds are of a conic form, naked, or without scales; and situated either at the extremity of the branches, or in the angle formed by the branch and leaf. The leaves are alternate, simple, divided into several lobes, and frequently hand or finger shaped. The ribs or nerves on the back of the leaf, in some genera of this order, are provided near their origin with a number of hollow furrows or glands, which, being filled with a clammy honey-like liquor, have been considered as so many vessels of secretion. The footstalk of the leaves is cylindrical, swelled at its origin, and appears jointed at its junction with the branch. The flowers are universally hermaphrodite,

phrodite, except in *biggalaria*, and a species of Virginian marshmallow, called by Linnæus *napea dioica*; the former of which bears male and female, the latter male and hermaphrodite, flowers on different roots. In many plants of this order, the flowers generally open about nine in the morning, and remain expanded till one in the afternoon. The flowers either terminate the branches, proceed from the angles of the leaves, or are disposed either singly or in a corymbus along the branches or stem. In most of these genera the calix is single, but in others frequently double. In these last the inner calix is always of one piece, generally divided into five segments; the outer consists either of one leaf, of three distinct leaves, or of many. The calix, when single, is sometimes composed of one leaf which is permanent, or of several distinct leaves which are generally coloured, and fall off with the petals. In plants that have a double calix, both flower-cups are generally permanent. The petals in this order are from four to nine; five is the prevailing number. The stamina, which are in number from 5 to 20 and upwards, are generally inserted into the common receptacle of the calix, or into the pitillum or feed-bud. The filaments are either distinct, or united in a cylinder, which, proceeding from the receptacle of the calix, surrounds the feed-bud, and attaches itself to the base of the petals, with which it slightly unites. The antheræ are frequently roundish, and placed erect on the filament; most commonly, however, they are oblong or kidney-shaped, and slightly attached by the middle, or sides, to the filaments, on which they turn like a vane or needle. This last is particularly the characteristic of all the mallow tribe. The feed-bud is generally roundish or conic; and sometimes, as in the tea-tree, angular. The feed-vessel is generally a capsule; sometimes a pulpy fruit of the berry or cherry kind. In some, it is a woody or membranous capsule, divided into as many cells internally as there were partitions in the feed-bud. The seeds are generally solitary, sometimes angular, and sometimes kidney-shaped.—These plants are mucilaginous and lubricating.

38. *Tricocceæ*, (from *τρις* three, and *κοκκος* a grain); consisting of plants with a single three-cornered capsule, having three cells or internal divisions, each containing a single seed. The single seed-vessel of these plants is of a singular form, and resembles three capsules, which adhere to one common footstalk as a centre, but are divided externally into three pretty deep partitions. This family is not completely natural. It must be observed, however, that the character expressed in the title is a striking one; and that tho' the plants which possess it are not connected by such numerous relations as to form a true natural assemblage, yet they are by that circumstance distinguished from all other plants with as great, nay greater facility, than by any artificial character yet known. But all the genera of this order have not the striking character just mentioned.

39. *Siliquosæ*, (from *siliqua* a pod), consisting of plants which have a pod for their feed-vessel. This order chiefly furnishes biennial and perennial herbs of an irregular figure. The roots are long, branched, crooked, and fibrous. In some they are succulent and fleshy, in others jointed. The stems and young branches are cylindrical. The leaves, which differ in point of form, being sometimes simple, sometimes winged, are generally

placed alternate. The flowers are hermaphrodite, and in the greater number disposed in a spike at the extremity of the branches. The flower-cup is composed of four leaves, which are oblong, hollow, blunt, bunched at the base, and fall with the flower. These leaves are sometimes erect, and sometimes spread horizontally. The petals, which are four in number, spread at top, and are disposed like a cross: the claws or lower part of the petals are erect, flat, awl-shaped, and somewhat longer than the calix. The upper part widens outwards. The stamina are six in number; two of which are of the length of the calix, and the remaining four somewhat longer, but shorter than the petals. The antheræ are of an oblong figure, pointed, thicker at the base, and erect. Betwixt the stamina, in plants of this order, are generally lodged one, two, or four, round greenish knots, which in some genera are so small as to elude the sight. These glands, called by Linnæus *glandule nectariferæ*, and used very improperly by that author as an essential character in discriminating the genera, seem to be prominences of the receptacle of the flower, occasioned by the stamina being deeply lodged in its substance. The feed-bud is single, and stands upon the receptacle of the flower. The style, which is either cylindrical or flat like a scale, is of the length of the four longer stamina in some genera; in others it is very short, or even wanting. It accompanies the feed-bud to its maturity. The stigma is blunt, and sometimes deeply divided into two parts. The feed-vessel is either a long pod, or a short and round one. Either sort has two valves or external openings, and in a great many genera the same number of internal cavities or cells, the partition of which projects at the top beyond the valves. The seeds are roundish, small, and attached alternately by a slender thread to both sutures or joinings of the valves. These plants have a watery, sharp, lixivial taste; and are charged with a fixed alkaline salt, which is drawn from them by burning, and being distilled without any addition produces a volatile alkali. Most of them have a stinking smell. With respect to their virtues, they are diuretic, attenuating, detergent, and antiscorbutic. These qualities, however, are most eminently possessed by the live plants; when dried, they either entirely disappear, or are greatly diminished. Applied externally, these plants are useful in diseases of the skin, as the itch, leprosy, &c.

40. *Personatæ*, (from *persona*, a masque); consisting of a number of plants whose flowers are furnished with an irregular, gaping, or grinning petal, in figure somewhat resembling the snout of an animal. This order furnishes both herbaceous and woody vegetables of the shrub and tree kind. The roots are generally fibrous and branched. The stems and branches are cylindrical when young, except in some species of figwort, in which they are square. The leaves are simple, generally placed opposite in pairs at the bottom of the branches, but in many genera stand alternate towards the top. The flowers are universally hermaphrodite; they proceed either singly or in clusters from the wings of the leaves, or terminate the branches in a spike, panicle, or head. The calix is of one leaf, which is cut into two, three, four, or five segments, or divisions, that are permanent. The corolla is composed of one irregular petal, with two lips resembling, as was already observed, the head

or snout of an animal. In some plants the stamina are two or four in number, and of an equal length; in others they are universally four in number, two of which are long, and two short. The seed-bud is single, and placed above the receptacle of the flower. The style is single; thread-shaped; bent in the direction of the stamina; and crowned with a stigma, which is generally blunt, and sometimes divided in two. The seed-vessel is a capsule, generally divided internally into two cavities or cells, and externally into the same number of valves or inclosures. The seeds are numerous, and affixed to a receptacle in the middle of the capsule.—These plants possess nearly the same qualities with the lip-flowers, though in a less degree. With respect to their virtues, many of them are aperient, anodyne, purgative, and even emetic. The internal use of many of them is extremely pernicious; applied externally, they are anodyne, and powerful resolvents.

41. *Asperifoliae*, rough-leaved plants. The greatest part of these are herbaceous and perennial. The roots are branching and fibrous; the stems and branches rounded; the buds of a conic form, naked or without scales. The leaves are simple, alternate, commonly very rough to the touch, and in most of the herbaceous plants sessile or attached to the stem and branches without any foot-stalk. In the few trees, however, of this order, the leaves have a foot-stalk, the lower part of which, after the fall of the leaves, remains like a spine or thorn. The hairs are simple, and generally very rough to the touch. The flowers are in some genera solitary; but commonly collected into a spike or corymbus. They do not proceed from the angle formed by the stem or branch with the leaf, as in many plants; but from the side of the leaf, or from that part of the stem which is opposite to the leaf. They are almost universally hermaphrodite: in a few species of *cordia*, male and female flowers are produced upon different roots. The calix is composed of one leaf, which is divided from three to ten equal or unequal parts. Those with four naked seeds have the calix deeply divided into five parts which are permanent. The corolla is monopetalous, or composed of one petal, which in different plants is bell, funnel, salver, and wheel shaped. The divisions of the limb or upper part of the petal are generally five, alternate with those of the calix; equal and regular, except in *achium*. The stamina are five in number, alternate with the divisions of the corolla. They are equal, attached to the tube of the corolla a little above its origin, and of the same height. The antheræ are in some genera connivent; that is, approach, and form a compact body above the filaments. The pistillum is generally composed of a slender style of the same length with the stamina, and crowned with a simple stigma. It proceeds from a germen or seed-bud, which in some plants is undivided, but generally split into four. The seeds are generally four in number, and lodged in the bottom of the calix.—Most of the rough-leaved plants are used in medicine: the flowers are esteemed cordial, the leaves and roots vulnerary and altringent; and the hard bony seeds are reckoned powerful promoters of urine. Externally, these plants are used for burnings and poisonous bites; they extirpate warts, and relieve disorders of the loins.

42. *Verticillatae*, consisting of herbaceous vegetables,

having four naked seeds, and the flowers placed in whorls round the stalk. The roots are branched and fibrous. The stems are round when old, but square when young; as are likewise the young branches, which stand opposite. The leaves are opposite, and in the greater number covered with transparent points. Those which are placed next the flower, generally differ from the stem-leaves. In the greater number of plants of this kind, the leaves are supported upon a long cylindrical foot-stalk that is furrowed above. The flowers are universally hermaphrodite, except in a species of thyme mentioned by Mr Adanson, which appears to have male or barren flowers on one root, and female or fertile flowers on the other. They are disposed round the stem in whorls or small heads with short foot-stalks. The calix is of one piece, that is generally cut into five unequal divisions, whose disposition sometimes represents two lips; the uppermost of which has commonly a less number of divisions; it accompanies the seeds, which it nourishes in its bosom, to their maturity. The petal is of the gaping or lip kind, and in the different genera is more or less irregular or unequal, either in its tube, or in the divisions of the lips; the number of which varies from two to five. These divisions frequently form two lips; of which the uppermost, termed the *crest* and the *helmet*, is sometimes entire, sometimes more or less deeply cut into two; the lowermost, termed the *beard*, generally into three. The stamina are two or four in number. In the greater part there are four stamina of unequal length, two of them being long, and two short. These four unequal stamina are frequently dissimilar, and approach by pairs; they are inclined towards the back of the petal, and parallel; the two innermost being shortest, and attached somewhat lower than the two others to the tube of the flower. The seed-bud, which consists of four distinct ovaries, is placed upon the feat of the flower, and elevates from their centre a common style, which is slender, bent in the same manner as the filaments, which it somewhat exceeds in length, and terminated by a double stigma or summit, the divisions of which are unequal, and turned backwards. The seed-vessel in this order is wanting. The seeds are four in number, and lodged in the bottom of the calix as in a matrix or seed-vessel. Each seed has two covers; the one external, of a cartilaginous or leathery substance; the other internal, membranaceous, of a very fine texture, and placed immediately above the radicle or embryo plant.—The plants of this order are fragrant, warm, penetrating, and accounted cordial and cephalic. Their chief virtue resides in the leaves.

43. *Dumoseæ*, (from *dumus* a bush); consisting of a number of shrubby plants, which are thick set with irregular branches, and bushy. The plants of this order are all of the shrub and tree kind, thick and bushy, rising from 6 to 25, 30, and even 40 feet high. Many of them too, as bastard jalaternus, holly, iron-wood, New-Jersey-tea, star-apple, viburnum, winter-berry, and some others, retain their beautiful leaves during the whole year. The roots are branched and fibrous. The stems are cylindrical; the young branches sometimes angular. The buds are naked, that is, without scales, in the evergreen shrubs of this order; covered with scales in most of the others. The leaves, which in some genera are simple, in others compound, are placed alternate

ternate in some, and opposite in others. The flowers are mostly hermaphrodite. They proceed from the wings of the leaves either singly or in clusters; or they terminate the stem in that sort of flowering head called a *corymbus*. The calix is generally very small, placed below or around the seed-bud; and consists of one leaf, with four, five, or six divisions, which are permanent. The rhamnus has no calix. The petals are in number from one to five. The stamina are either four, five, six, or ten. The seed-bud is generally roundish, and placed within the flower. The style is commonly single, and sometimes wanting. The stigma is either single or triple. The seed-vessel is generally a berry, sometimes a dry capsule; the seeds are generally single and egg-shaped. The berries, bark, and flowers of many of these plants are purgative, and act particularly on the lymph and bile.

44. *Septariae*, (from *Jepes* a hedge), consisting of a beautiful collection of woody plants, some of which from their size, elegance, and other circumstances, are very proper furniture for hedges. This order furnishes woody plants both of the shrub and tree kind, most of which do not drop their leaves till nearly the time when the new leaves begin to appear.

45. *Umbellatæ*, (from *umbella* an umbel); consisting of plants whose flowers grow in umbels, with five petals that are often unequal, and two naked seeds that are joined at top and separated below. These plants are herbaceous, and chiefly perennial. The roots are either tuberous or spindle-shaped, and sometimes forked. The stems are cylindrical, full of pith, and frequently hollow. The branches are alternate. The leaves, which like the branches are put on alternately, are very different in point of form; being simple and entire in some; target-shaped, in a species of navel-wort; finger or hand shaped, in some others; and winged or pinnated with numerous minute divisions, as in the greater number. They are supported by a foot-stalk, which is very broad and membranous at its origin, and commonly embraces the whole contour of the stem and branches. The flowers are in general hermaphrodite. There are, however, some that have male or barren flowers in the same umbel. This is particularly the case with those umbelliferous plants which have the petals in the flowers of the circumference large and unequal. In these plants the flowers in the circumference only prove fertile; those in the centre, or disc, proving abortive. *Oenanthe* and *imperatoria*, on the contrary, have the flowers in the circumference abortive. In *ginseng*, hermaphrodite and male flowers are produced upon distinct plants. The flowers are disposed in an umbel, which is either simple or compound. The common calix in this order is that sort termed very improperly by Linnæus *involacrum*, or the flower-cover; which in the greater number consists of one or more leaves placed under the partial or universal umbel, or both, for the purpose of support. The presence or absence of one or both of these covers affords excellent marks in discriminating the genera of this very similar order of plants. The proper calix of each flower, in the aggregate, consists of five minute indentments placed upon the seed-bud, which it envelops, and accompanies to its maturity. The petals are five in number, and disposed upon the sides of the flower-cup in form of a rose. In the florets of the

centre, the petals are generally pretty equal and small; in those of the circumference, they are frequently unequal and larger; in the greater number, they are heart-shaped, and cut almost to the middle in two. The stamina are five in number, placed opposite to the divisions of the flower-cup, and alternate with the petals. The seed-bud is universally placed under the seat of the flower, and supports two styles which are turned backwards, and crowned with simple funnits which do not differ in appearance from the styles. The seed-vessel in this order is wanting. The seeds are two in number, which, when ripe, separate below, but remain closely attached at top. The plants of this order, which grow in dry places, are sudorific, stomachic, and warming. Their virtue resides chiefly in the seeds and leaves. Those which grow in marshy places are generally poisonous; but, notwithstanding the extremely warm and even caustic quality of most of these plants, many of them are employed in the kitchen, and in the œconomy of domestic affairs.

46. *Hederacæ*, (from *hedera* ivy), consisting of ivy and a few other genera that seem nearly allied to it. This order furnishes both herbaceous and shrubby plants; most of which, particularly ivy and vine, have creeping branches, which attach themselves by roots or tendrils to the bodies in their neighbourhood. The roots are long, with few branches. The stems and young branches are cylindrical. In some species of vine they are square. The leaves are alternate; sometimes simple, sometimes winged, in which the surface of the leaves is covered with points. The foot-stalk of the leaves is cylindrical, and without any furrow. The buds are of a conic form, and without any scales. The flowers are either hermaphrodite, male and female upon different roots, or hermaphrodite and male upon different roots. In some, they terminate the branches in an umbel; in others, they proceed in clusters from the side opposite to the leaves; and in some, they are produced along the branches. The calix consists of one leaf divided into five parts, which are small and generally permanent. The petals in this order are generally five. The stamina are in number five; awl-shaped, erect, and generally of the length of the petals. Ciffus has only four stamina, which are inserted into the nectarium, a sort of border surrounding the seed-bud. The antheræ are roundish, and sometimes, as in ivy, attached to the filaments by the sides. The seed-bud is sometimes round, sometimes shaped like a top or pear, and ends in one, two, or five awl-shaped styles, which are crowned with a simple stigma. The flowers of the vine have no style. The seed-vessel is of the berry kind, with one, two, or five styles. The seeds are from one to five in number; placed either in distinct cells, or dispersed through the pulp without any partition.

47. *Stellatæ*, (from *stella* a star); consisting of plants with two naked seeds, and leaves disposed round the stem in form of a radiant star. This order contains herbs, shrubs, and trees. The herbs, which are most numerous, are chiefly annual, and creep along the surface of the ground. The shrubs and trees are mostly evergreens, which rise erect, and are of an agreeable conic form.—These plants are opening; some of their seeds, particularly those of coffee, are bitter and cordial; some of them are used in dyeing, and others in medicine.

48. *Aggregate*, (from *aggregare*, to assemble or collect); comprehending those plants which have aggregate flowers, consisting of a number of florets or small flowers, each of which have a proper and common calix.

49. *Compositæ*, consisting of plants with compound flowers. In this order Linnæus has constructed his first or primary divisions from the different sexes of the florets, which he terms *polygamy*; the subaltern divisions are constructed from the figure of the petals, the disposition of the flowers, the pappus or crown of the seed, the common receptacle, and other circumstances which characterize the subaltern divisions in other authors.

50. *Amentacea*, (from *amentum* a catkin), plants bearing catkins; as *salix*, *populus*, *platanus*, &c.

51. *Coniferae*, (from *conus* a cone, and *fero* to bear); consisting of plants, whose female flowers, placed at a distance from the male, either on the same or distinct roots, are formed into a cone. In this character, the only one expressed in the title, the plants in question seem to be nearly allied to the family of mosses; from which, however, they are easily distinguished by their habit, as well as by the structure of the small flowers, in which the stamina are united below into a cylinder, and distinct at top. The plants of this order are mostly of the shrub and tree kind, and retain their leaves all the year. The form of these plants is generally conic, and extremely beautiful, from the disposition of the branches, which cover the stems even to the roots, extending themselves horizontally and circularly like so many rays. The height of some genera of this order does not exceed half a foot, that of others approaches to a hundred. The roots are short, branching, not very fibrous, and extend horizontally. The stems and branches are cylindrical. The bark is thin, and split into slender scales. The wood, except that of the yew-tree, possesses little hardness. The buds are of a conic form, and naked, or without scales. The leaves are entire, small, and thick, frequently triangular, and generally pointed. Juniper has a prickly and thorny leaf. With respect to situation, they admit of great variety, being either alternate, opposite, placed in whirls round the stem, or collected into small bundles which proceed from a single point. They are placed on the branches without any sensible footstalk. The flowers in this order are universally male and female. In some genera, the male flowers are collected into a spike or cone at the end of the branches; in others, they proceed singly from the wings of the leaves, or termination of the branches. The female flowers are generally collected into a cone; but in yew-tree and shrubby horse-tail they are single, and terminate the branches. The calix of the male flowers is a catkin; of the female, a cone. The petals of this order are wanting; except in the female flowers of juniper, which have three sharp, rigid, and permanent petals. The stamina are in number from 3 to 20 and upwards; united by their filaments into a cylinder or pillar, which rises out of the centre of the calix. The antheræ are erect, distinct, of a roundish form, and divided into internal partitions or cells, which, in the different genera, are in number from two to ten. The seed-buds are generally numerous, and placed betwixt the scales of the cone, which serve for a calix. From each seed-bud arises a very short cylindrical style, crowned with a simple stigma,

of a conic form. These plants have probably no seed-vessel or fruit; the seeds being naked, and involved only by the scales of the calix. In some genera, these scales are of a bony nature, and almost united; in others, they are of a substance like leather; in juniper, they are united, and become fleshy and succulent like a berry. The seeds in this order, being nourished, as in a seed-vessel, by the scales of the cone, or common calix, differ in nothing from the germina or seed-buds.—Most of the cone-bearing plants are resinous, or gummy; and the gums proceeding from them have a bitter taste, but generally a very agreeable smell.

52. *Coadunatae*, (from *coadunare*, to join or gather together); so termed from the general appearance of the seed-vessels, which are numerous, and, being slightly attached below, form all together a single fruit in the shape of a sphere or cone; the parts of which, however, are easily separated from one another. This order, which consists of exotic plants, furnishes a beautiful and choice collection of shrubs and trees, both evergreen and deciduous. The trees are often 60 feet high, and garnished from the bottom to the top with spreading branches and leaves of a bright green colour, which assume a very agreeable conic form. The roots are branching and fibrous. The stems are cylindrical, and the wood very hard. The buds are conic, flat, and generally without scales. The leaves are universally simple and alternate. The footstalk is cylindrical, without furrows, frequently swelled at its origin, and appears jointed at its insertion into the branch. The flowers are hermaphrodite, and are generally produced either along or at the end of the branches. The calix generally consists of three oblong plain leaves, like petals, which fall off with the flower. The petals are in number from 6 to 18, oblong, concave, and frequently disposed in two or three series or rows, the outermost of which are largest. The stamina are numerous, short, and inserted into the common receptacle in some, and into the seed-bud in others. The filaments are very short and slender, some genera having scarce any at all. The antheræ are numerous, slender, and placed round the seed-bud. The pistillum generally consists of a number of seed-buds disposed in the form of a cone, and seated upon a receptacle which rises like a small pillar above the receptacle of the calix. From each seed-bud generally arises a cylindrical style, which is very short. The stigma is commonly blunt. The seed-vessel is commonly a berry; but in magnolia it is an oval cone, consisting of a number of roundish capsules laid over each other like tiles. The fruits, or seed-vessels, whether of the berry, capsule, or cherry kind, are equal in number to the seed-buds, and generally slightly attached below. The seeds are numerous, hard, roundish, and sometimes cornered. The plants of this order have a strong, agreeable, and aromatic smell; the fruits and seeds have a pungent taste like pepper; the bark and wood are bitter.

53. *Scabridae*, (from *scaber* rough, rugged, or bristly), consisting of plants with rough leaves. There seems to be some impropriety in characterizing these plants by a name expressive of the roughness of their leaves, as that circumstance had previously furnished the classic character of the *Asperifoliæ*. The degree of roughness, however, is much greater in the plants which make the subject of the present article.—The plants of this order are in general of an astringent nature; their taste

is bitter and styptic.

54. *Miscellanea*, miscellaneous plants. This order consists of such genera as are not connected together by very numerous relations. They are, datifca, potirium, refeda, fanguiforba, lemna, piftia, coriaria, empetrum, achyranthes, amaranthus, celofia, gomphrena, refine, phytolacca, nymphæa, farrencina, cedrela, fwicenia, corrigiola, limeum, telphium.

55. *Filices*, ferns; confifting of plants which bear their flower and fruit on the back of the leaf or ftalk. Thefe plants, in figure, approach the more perfect vegetables; being furnifhed, like them, with roots and leaves. The roots creep, and extend themfelves horizontally under the earth, throwing out a number of very flender fibres on all fides. The ftem is not to be diftinguifhed from the common footftalk, or rather middle rib of the leaves: fo that in ftict propriety the greater number of ferns may be faid to be *acaules*; that is, to want the ftem altogether. In fome of them, however, the middle rib, or a ftalk proceeding from the root, overtops the leaves, and forms a ftem upon which the flowers are fupported. The leaves proceed either fingly, or in greater numbers from the extremities of the branches of the main root. They are winged or hand-shaped in all the genera, except in adders-tongue, pepper-grafs, and fome fpecies of fpleen-wort. The flowers, whatever be their nature, are, in the greater number of genera, fattened, and as it were glued, to the back of the leaves; in others, they are fupported upon a ftem which rifes above the leaves; but in fome, are fupported on a flower-ftalk, as already mentioned. The ftamina are placed apart from the feed-bud in a genus termed by Mr Adanfon *palmæ filix*: in the other ferns, where we have been able to difcover the ftamina, they are found within the fame covers with the feed-bud. Moft of the ferns have a heavy difagreeable fmell: as to their virtues, they are opening and attenuating.

56. *Mufci*, moffes. Thefe plants refemble the pines, firs, and other evergreens of that clafs, in the form and difpofition of their leaves, and manner of growth of the female flowers, which are generally formed into a cone. They frequently creep, and extend themfelves like a carpet upon the ground, trees, and ftones, being generally collected into bunches and tufts; the fmalleft are only one third of an inch in height, and the largeft do not exceed five or fix. Few of the moffes are annual; fmall as they are, the greater number are perennial and evergreens. Their growth is remarkably flow, as may be judged by the time that the antheræ take to ripen. This, reckoning from the firft appearance of the antheræ, to the difperfon of its powder or male duft, is generally four or fix months. Although preferved dry for feveral years, thefe plants have the fingular property of refuming their original verdure, upon being moistened. It would be worth while to determine whether they do not alfo refume their vegetative quality. The roots of plants of this order are fibrous, flender, branched, and fhort. The ftems are cylindric and weak, as are alfo the branches; they creep upon the ground, and ftrike root on every fide. The leaves are very fmall and undivided. They differ with refpect to fituation; being either alternate, oppofite, or placed by fours round the ftalk. They have no perceptible footftalk nor middle

rib, and are feated immediately upon the ftem. The flowers are univerfally male and female; in fome, the male flowers are produced upon the fame plants with the female, and ftand before them; in others, they are produced fometimes on the fame, and fometimes on diftinct plants. The male flowers confift entirely of antheræ, and their covering; proceed either fingly, or in clufters, from the extremity of the branches, or angles of the leaves; and are either feated immediately upon the branches, or fupported by a long footftalk. The female flowers, which generally refemble capfules or cones, are all placed immediately upon the ftem or branches, without any footftalk; and proceed fingly, either from the wings of the leaves, or fummit of the branches; when produced upon the fame plant with the male, they are always placed under them. The female cones of the moffes greatly refemble thofe of the pines, and evergreen trees of that clafs; the fcales which form them are true leaves, each containing in its wing or angle a fingle feed. When the feeds are ripe, the cones probably open for their difperfon. When fhat, they refemble buds, and have fometimes been ignominly miftaken for fuch. The calix, in this order, if it can be called fuch, is that appearance refembling a veil or monk's cawl, which in the male flowers covers or is fufpended over the tops of the ftamina like an extinguiſher, and is termed by Linnæus *calyptra*. The petals are univerfally wanting. The moffes in general are almoft taftelefs, have few juices, and being once dried do not readily imbibed moiſture from the air. Thofe which grow in water, being thrown into the fire, grow red, and are reduced to afhes without receiving or communicating any flame; on which account fome fuperftitious people, the Siberians in particular, place water mofs in their chimnies as a prefervative againft fire. Moft of the moffes are purgative; fome violently fo, and even emetic. They are all of wonderful efficacy in preferring dry fuch bodies as are fufceptible of moiſture; and in retaining, for a long time, the humidity of young plants without expofing them to putrefaction. For this reafon, fuch plants as are to be fent to any confiderable diftance, are generally wrapped up in them.

57. *Algæ*, fags; confifting of plants whofe root, leaf, and ftem, are all one. Under this defcription are comprehended all the fea-weeds, and fome other aquatic plants.

58. *Fungi*, mufhrooms. Thefe plants are rarely branched, fometimes creeping, but moft commonly erect. Such as are furnifhed with branches have them of a light fpongy fubftance like cork. Mufhrooms differ from the fuci, in that thofe which, like the fuci, have their feeds contained in capfules, are not branched, as that numerous clafs of fea-weeds are. The greateft part of mufhrooms have no root; fome, inftead of roots, have a number of fibres, which, by their inoculations, frequently form a net with unequal meshes, fome of which produce plants fimilar to their parent vegetable. The ftamina in thefe plants are ftill undetermined. The feeds are fpread over the furface of the plant, or placed in open holes or cavities, refembling the open capfules of fome of the fuci. In mufhrooms which are branched, the feeds are frequently vifible by the naked eye, and always to be diftinctly obferved by

the assistance of a good microscope. These plants are very astringent, and some of them are used for stopping violent hæmorrhages. As a vegetable food, they are at best suspicious: some of them are rank poison.

59. *Dubii ordinis*. Under this name Linnæus classes

all the other genera which cannot be reduced to any of the abovementioned orders, and which are near 120 in number.—In the following Table, the number placed at the end of each generic description points out the natural order to which the genus belongs.

TABLE

BOTARGO, a kind of sausage, made with the eggs and blood of the mullet, a large fish common in the Mediterranean. The best kind comes from Tunis in Barbary: It must be chofen dry and reddish. The people of Provence use a great deal of it, the common way of eating it being with olive oil and lemon juice. There is also a great consumption of it throughout the Levant.

BOTE, (Sax.), signifies a recompence, satisfaction, or amends: hence comes *manbote*, compensation or amends for a man slain, &c. In king Ina's laws is declared what rate was ordained for expiation of this offence, according to the quality of the person slain. From hence likewise we have our common phrase, *to boot*, i. e. *compensationis gratia*. There are *boufe-bote*, *plough-bote*, &c. privileges to tenants in cutting of wood, &c.

BOTELESS, (*sine remedio*). In the charter of Hen. I. to Tho. archbishop of York, it is said, "that no judgment, or sum of money, shall acquit him that commits sacrilege; but he is in English called *boteless*, viz. without emendation." We retain the word still in common speech: as, It is *boteless* to attempt such a thing; that is, It is in vain to attempt it.

BOTH (John and Andrew), Flemish painters, and pupils of Bloemart. The union of these brothers was very singular; they were inseparable in their studies, travels, and paintings. John painted the landscape part of their pictures in the manner of Lorrain, and Andrew the figures and animals in the style of Bamberge. They both died in 1650. John's taste in landscape is elegant; his ideas are grand; his composition beautiful; and his execution rich and masterly in the highest degree. His light is not always well distributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the best landscapes we have.

BOTHNIA, a province of Sweden, at the end of the gulph of the same name. It is divided into two parts called *east* and *west Bothnia*, the former of which belongs to Finland. West Bothnia is full of mountains; the earth is sandy, and yet a scarcity of provisions is seldom known. Cattle and game are so common, salmon and a fort of herrings so plenty, and the trade of skins is so gainful, that the inhabitants can command what they want from their neighbours. There are only two towns worth mentioning, viz. Tornea and Uma. The inhabitants of this province are Protestants; and are a civil well-behaved people.

BOTT, among bone-lace weavers, a kind of round cushion of light matter placed on the knees, whereon they work or weave their lace with bobbins, &c.

BOTT, in zoology. See **BOTTS**.

BOTTLE, a vessel proper to contain liquors, made of leather, glass, or stone. There are bottles of boiled leather which are made and sold by the cafe-makers. Those amongst the ancient Hebrews were generally made of goat-skin, with the hair on the inside, well pitched and sewed together; the mouth of the bottle was through the animal's paw that furnished the matter of it.

There are now in use bottles of fine glass, which are commonly covered with oser; and others of thick glass, which are not covered. Formerly all these bottles made in France held exactly a pint Paris measure, (about a

quart of English wine measure); but since the tavern-keepers fell moit of their wine in such bottles, notwithstanding an ordinance to the contrary, so that one would think the glass-makers had entered into an agreement with them not to make any bottles that hold the full measure, there are none but hold less, and some considerably so.

Dr Percival cautions against the practice of cleansing of wine-bottles with leaden shot. It frequently happens (he thinks), through inattention, that some of the little pellets are left behind; and when wine or beer is again poured into the bottles, this mineral poison will slowly dissolve, and impregnate those vinous liquors with its deleterious qualities. The sweetness which is sometimes perceived in red port wine, may arise from this cause, when such an adulteration is neither designed nor suspected.

BOTTOM, in a general sense, denotes the lowest part of a thing, in contradistinction to the top or uppermost part.

BOTTOM, in navigation, is used to denote as well the channel of rivers and harbours, as the body or hull of a ship. Thus, in the former sense, we say, a *gravelly bottom*, *clayey bottom*, *sandy bottom*, &c. and in the latter sense, a *British bottom*, a *Dutch bottom*, &c.—By statute, certain commodities imported in foreign bottoms pay a duty called *petty customs*, over and above what they are liable to if imported in British bottoms.

BOTTOMRY, in commerce, (a practice which originally arose from permitting the master of a ship in a foreign country to hypothecate the ship in order to raise money to refit), is in the nature of a mortgage of a ship; when the owner takes up money to enable him to carry on his voyage, and pledges the keel or bottom of the ship (*pars pro toto*) as a security for the repayment. In which case it is underflood, that if the ship be lost, the lender loses also his whole money; but if it return in safety, then he shall receive back his principal, and also the premium or interest agreed upon, however it may exceed the legal rate of interest. And this is allowed to be a valid contract in all trading nations, for the benefit of commerce, and by reason of the extraordinary hazard run by the lender. And in this case, the ship and tackle, if brought home, are answerable (as well as the person of the borrower) for the money lent. But if the loan is not upon the vessel, but upon the goods and merchandize, which must necessarily be sold or exchanged in the course of the voyage, then only the borrower, personally, is bound to answer the contract; who therefore, in this case, is said to take up the money *at respondentia*. These terms are also applied to contracts for the repayment of money borrowed, not on the ship and goods only, but on the mere hazard of the voyage itself; when a man lends a merchant 1000*l.* to be employed in a beneficial trade, with condition to be repaid with extraordinary interest, in case such a voyage be safely performed; which kind of agreement is sometimes called *fenus nauticum*, and sometimes *usura maritima*. But as this gave an opening for usurious and gaming contracts, especially upon long voyages, it was enacted by the statute 19 Geo. II. c. 37. that all monies lent on bottomry, or at *respondentia*, on vessels bound to or from the East Indies, shall be expressly lent only upon the ship, or upon the merchandize; that the lender shall have the benefit of

falvage; and that if the borrower has not on board effects to the value of the sum borrowed, he shall be responsible to the lender for so much of the principal as hath not been laid out, with legal interest and all other charges, though the ship and merchandize be totally lost.

BOTTONY. A cross bottony, in heraldry, terminates at each end in three buds, knots, or buttons, resembling, in some measure, the three-leaved grass; on which account Scoging, in his *Treſor Heraldique*, terms it *croix treflee*. It is the badge of the order of St Maurice. See *HERALDRY Plates*.

BOTTRIGARO (Hercole), a person eminently skilled in the science of music, though not a musician by profession. He was a man of rank in Bologna; and appears, from several letters to him that have been printed, to have had the title of *count*. He published several controversial pieces on the subject of music. It seems that he entertained strong prejudices in favour of the ancient music; and that he attempted, as Vincentino and others had done, to introduce the chromatic genus into practice, but with no better success than had attended the endeavours of others. He corrected Gogavino's Latin version of Ptolemy in numberless instances; and that to so good a purpose, that Dr Wallis has in general conformed to it in that translation of the same author which he gave to the world many years after. He also translated into Italian *Boetius de Musica*, and as much of Plutarch and Macrobius as relates to music: besides this, he made annotations upon Aristoxenus, Franchinus, Spataro, Vicentino, Zarlino, and Galilei; and, in short, on almost every musical treatise he could lay his hands on, as appears by the copies which were once his own, and are now deposited in many libraries in Italy. Of Bottrigaro's works it is said, that they contain greater proofs of his learning and skill in music, than of his abilities as a writer, his style being remarkably elegant: nevertheless, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo, printed in 1557. Walther † represents him as an able mathematician, and a collector of rarities; and says that he was possessed of a cabinet, which the emperor Ferdinand II. had a great desire to purchase. He died in 1609.

BOTTS, in zoology, a species of worms which can be produced and nourished only in the intestines of a horse. It is there alone they can enjoy the proper temperature of heat, and receive the nourishment necessary for them.

Besides the long worms which have been observed in the bodies of horses, there are also short ones.—By these are to be understood what we call *botts*.

All authors, both ancient and modern, who have treated of the diseases of horses, have taken notice of these worms; but M. Vallisneri is the first who has traced them to the last stage of their transformation, and has seen them change into a hairy kind of fly like the drone.

The flies from which these botts are produced inhabit the country, and do not come near houses, at least not near those of great towns; and therefore horses are never liable to have these worms (*i. e.* botts) in their bodies, if they have been kept in the house, especially in a town, during the summer and autumn.

It is in the former of these seasons, and perhaps too

in the beginning of the latter, that the females of these flies apply themselves to the anus of horses, and endeavour to gain admittance, in order there to deposit their eggs, or perhaps their worms.

The precise instant of their entrance will scarce admit of an eye-witness, but by the mere chance; yet M. Vallisneri says, that Dr Galpari had attained this very uncommon sight. The Doctor (he tells us) was one day looking at his mares in the field; and from being very quiet, he observed, that on a sudden they became very restless, and ran about in great agitation, prancing, plunging, and kicking, with violent motions of their tails. He concluded, that these extraordinary effects were produced by some fly buzzing about them, and endeavouring to settle upon the anus of one of them; but the fly not being able to succeed, he observed it to go off with less noise than before, towards a mare that was feeding at a distance from the rest; and now the fly taking a more effectual method to obtain its design, passed under the tail of the mare, and so made its way to the anus. Here at first it occasioned only an itching, by which the intestine was protruded with an increased aperture of the anus; the fly taking the advantage of this, penetrated further, and secured itself in the fold of the intestine:—this effected, it was in a situation proper for laying its eggs. Soon after this, the mare became very violent, running about, prancing, and kicking, and throwing herself on the ground; in short, was not quiet, nor returned to feeding, till after a quarter of an hour.

The fly then, we see, can find means of depositing its eggs, or perhaps its worms (*i. e.* botts), in the fundament of the horse; which once effected, it has done all that is necessary for them. If these bott worms are not hatched when first deposited in the horse, but are then only eggs, it will not be long before it happens, from the nutritive heat they there receive.

These bott worms soon make their way into the intestines of the horse: they occupy such parts of this region, as are to them most convenient; and sometimes (as we shall see presently) they penetrate even to the stomach. All the hazard they appear to be exposed to, is that of being carried away from the places they have fixed on by the excrement, which may seem likely to drive all before it. But nature has provided for all things; and when we shall have further described these bott worms, it will be seen that they are able to maintain their situation, and to remain in the body of the horse, as long as they please.

There is a time when these bott worms are of themselves desirous to leave their habitation, it being no longer convenient for them after the purposes of their growth are answered. Their transformation to a fly must be performed out of the horse's body; and accordingly, when the time of their transformation draws near, they approach towards the anus of the horse; and then leave him of their own accord, or with the excrement, with which they then suffer themselves to be carried along.

According to Mr de Reaumur's observations, the bott worms have two unequal claws, by which they are enabled to remain in the intestines of the horse in opposition to all efforts of the excrement to force them out.—These claws are a sort of anchor, differently disposed from those of common anchors, but contrived to

pro-

produce the same effect. Besides these two claws, nature has given them a very great number of triangular spines or bristles, very sufficient to arm them against the coats of the intestines, and to resist the force employed to drive them towards the anus, provided the head be directed towards the stomach of the horse.

It will be asked, no doubt, if these bott worms are not dangerous to horses?—The mares which afforded Mr de Reaumur, for several years, those on which he made his observations, did not appear to be less in health than those which had none; but it may sometimes happen, that they are in so great a quantity in the body of the horse as to prove fatal to him. M. Vallisneri supposes these bott-worms to have been the cause of an epidemical disease that destroyed a great many horses about Verona and Mantua in the year 1713.—The observations communicated to him by Dr Gafpari sufficiently confirm his supposition. This gentleman, upon dissecting some horses that died of this distemper, found in their stomachs a surprising quantity of short worms; of which to give us some idea, he compares them to the kernels of a pomegranate opened: each of these, by gnawing on the coat of the stomach, had made for itself a kind of cellule therein, each of which would easily contain a grain of Indian wheat. It is easy to imagine by this means the stomach must be reduced to a wretched condition; the outer membranes were inflamed, and the inner ones ulcerated and corrupted; a very small quantity of these worms were found in the small intestines, and only a few in the larger, to which last they were found affixed, but had not corroded them. It is only perhaps when these bott worms are in great numbers, and thereby incommode each other in the intestines of the horse, that they make their way towards the stomach; and indeed a very few flies must be enough to overlook the inside of a horse, provided they should deposit all their eggs, and such should all be animated, M. Vallisneri having counted 700 and odd in the body of one single fly.

When one of these bots has left the anus of the horse, it falls on the ground; and immediately seeks out for some place of safety, where it may retire, to prepare for the last stage of its transformation, by which it is to become a fly. And now by degrees the skin hardens and thickens; and at length forms a solid shell or cocoon, the form of which scarce differs from that of the worm. It is first of a pale red colour, which changes into chestnut; and at length, by the addition of gradual and successive shades of brown, the shell is rendered black. The worm or bott, before it passes into a nymph, is of the form of an oblong ball; it remains in this form much longer than worms of the flesh fly kind. M. de Reaumur met with worms that retained this figure five or six days; as yet, one can perceive no traces of the legs, wings, and head of the nymph. Hence he first learned, that those bott worms do not become nymphs immediately upon their first change; but that, in order to become flies, they must undergo one change more than caterpillars ordinarily do to become butterflies.

For the cure of horses troubled with bots, see FARRIERY, § xv.

BOTWAR, a town of Germany, in the circle of Suabia, and subject to the duke of Wirtemberg. E. Long. 9. 15. N. Lat. 49. 0.

BOTZENBURG, a town of Germany, in the duchy or Mecklenburg. It had a castle, which was destroyed by the Danes in 1202. It is seated on the Elbe, and the vessels that pass by are obliged to pay a considerable toll. E. Long. 10. 48. N. Lat. 53. 34.

BOVA, an episcopal town of Italy, in the kingdom of Naples, seated near the Apennine mountains. E. Long. 16. 15. N. Lat. 37. 15.

BOUCHAIN, a fortified town of the French Netherlands, in the province of Hainault. It is divided into two parts by the river Scheld. It was taken by the French in 1676; and by the allies under the duke of Marlborough in 1711, which was the last military achievement of that great general; but the following year it was retaken by the French. E. Long. 3. 15. N. Lat. 50. 17.

BOUCHE OF COURT, the privilege of having meat and drink at court costfree. This privilege is sometimes only extended to bread, beer, and wine; and was anciently in use as well in the houses of noblemen, as in the king's court.

BOUCHET (John), a French poet and historian, flourished in the 16th century. The most considerable of his writings are the Annals of Aquitaine, and his *Chapelet des Princes*.

BOUDRY, a small town of Switzerland, in the province of Neuchâtel, and capital of a châtellainry of the same name. E. Long. 7. 5. N. Lat. 47. 11.

BOUFLERS (Lewis Francis, duke of), a peer and marshal of France, was born in 1644. He distinguished himself by his valour and conduct in several sieges and battles, and had the command of the right wing when the French were defeated at the bloody battle of Malplaquet. He died at Fountainbleau in 1711.—Marshal Boufflers, his son, died at Genoa, after having delivered that republic.

BOUGEANT (William Hyacinth), a famous Jesuit, first taught humanity at Caen and Nevers, and afterwards settled at the college of Lewis the Great, where he employed himself in writing several works; the principal of which were, 1. A collection of physical observations, extracted from the best authors. 2. An history of the wars and negotiations which preceded the treaty of Westphalia. 3. The female doctor, a philosophical amusement on the language of beasts, &c. He died in 1743.

BOUGH, denotes much the same with BRANCH.—Green boughs anciently made part of the decoration of altars and temples, especially on festival occasions. Oaken boughs were offered to Jupiter; those of laurel, to Apollo; of olive, to Minerva; myrtle, to Venus; ivy, to Bacchus; pine, to Pan; and cypress, to Pluto. Some make them the primitive food of mankind before acorns were invented.

BOUGIE. In the French language it signifies a wax candle, and is applied to a machine which (as the wax candle formerly was) is introduced into the urethra for removing obstructions there. Monf. Daran, a French surgeon, lately boasted of his introducing them as an improvement in his art, and acquired considerable profit by making and selling them. Scutetus, about the middle of the 17th century, used bougies in diseases of the urethra, and Monf. Daran probably took the hint from him. Different compositions have been used, and generally mercury was a part of them. Riverius made

Bougie,
Bouhours.Bouhours
&
Boulaivilliers.

made a plaster as follows: B. ol. oliv. lb. iv. ceræ citrin. lb. ii. minii & cerull. aa lb. iss. terreb. venet. & rez. alb. aa § iii m. Whether the bougies are made up of this or any other composition, they must be of different sizes, from the bigness of a knitting needle, to that of a goose quill. They are made of linen rags, spread with a proper matter, and then rolled up as follows. Having spread any quantity of the linen rag with the composition that is chosen for the purpose, cut it into slips from six to ten inches long, and from half an inch to an inch broad: then dextrously roll them on a glazed tile into the form of a wax candle; and, as the end of the bougie that is to be entered first into the urethra should be somewhat smaller than the rest, it would be as well to cut the slips a little tapering. It should also be observed, that when the bougies are rolled up, that side must be outward on which the plaster is spread.

Mons. Daran, and some others, attributed the action of their bougies to the composition they made use of in forming them. Mr Sharp apprehended, that as much of their efficacy was owing to the compression they made on the affected part, as to any other principle; and Mr Aiken very justly says, As it is evident that bougies of very different compositions succeed equally well in curing the same disorders in the urethra, it is plain that they do not act by means of any peculiar qualities in their composition, but by means of some property common to them all. This must be their mechanical form and texture, therefore their mode of action must be simple compression. The efficacy of mere compression in many cases of constriction is well known, from the use of sponge tents for widening parts that are straitened by cicatrices; and admitting obstructions in the urethra to be from a constriction formed by cicatrized ulcers, or a projection of the spongy substance of the urethra into the canal, we may easily conceive, that a gentle continued elastic compression will in time overcome the disease. We may also readily account for the inferior efficacy of metallic and whalebone bougies, from their not having the property of swelling with moisture, and therefore not making so equal a compression. As to bougies procuring a discharge of matter, there is no doubt but the mechanical stimulus of a foreign body in such a tender part, though free from disease, must produce it in some degree; and that this will be varied according to the chemically irritating quality of the composition, and the irritable state of the urethra: but it seems an absurdity to apply a topic, made uniform throughout, to the whole length of a canal, with a view of producing extraordinary effects upon a particular part of it, by means of some powerful quality in the ingredients. As to that part of the bougie which was in contact with the diseased part, being particularly covered with matter; this circumstance is probably owing to the greater irritation of that part of the urethra where the disorder is, than any other.

BOUHOURS (Dominic), a celebrated French critic, was born at Paris in 1628; and has been by some considered as a proper person to succeed Malherbe, who died about that time. He was entered into the society of Jesuits at the age of 16; and was appointed to read lectures upon polite literature in the college of Clermont at Paris, where he had studied: but he was so incessantly attacked with the head-ach, that he could not pursue the destined task. He afterwards undertook the

education of two sons of the duke of Longueville, which he discharged with great applause. The duke had such a regard for Bouhours, that he would needs die in his arms; and the "Account of the pious and Christian death" of this great personage was the first work which Bouhours gave the public. He was sent to Dunkirk to the Popish refugees from England; and, in the midst of his missionary occupations, found means to compose and publish books. Among these were, *Entretiens d'Ariste & d'Eugene*, or "Dialogues between Arilus and Eugenius;" a work of a critical nature, and concerning the French-language. His book was printed no less than five times at Paris, twice at Grenoble, at Lyons, at Brussels, at Amsterdam, at Leyden, &c. and embroiled him in quarrels with a great number of censors, with Menage in particular, who, however, lived in friendship with our author before and after. The fame of this piece, and the pleasure he took in reading it, recommended Bouhours so effectually to the celebrated minister Colbert, that he trusted him with the education of his son the marquis of Segnelai. He wrote afterwards several other works; the chief of which are, 1. Remarks and doubts upon the French language. 2. Dialogues upon the art of thinking well in works of genius. 3. The life of St Ignatius. 4. The art of pleasing in conversation. 5. The life of St Francis Xavier, apostle of the Indies and of Japan. This last work was translated from the French into English by Mr Dryden, and published at London in the year 1688, with a dedication prefixed to James II's queen.

BOUILLON, a town of France, in the duchy of the same name, and in the county of Luxemburg, with a fortified castle. The French took it in 1676; upon which it was given to the duke of Bouillon; but the king keeps the castle to himself, which is seated on a rock that is almost inaccessible. E. Long. 5. 20. N. Lat. 49. 45.

BOUILLON, in the menage, a lump or excrescence of flesh that grows either upon or just by the frush, inasmuch that the frush shoots out, just like a lump of flesh, and makes the horse halt; and this is called the *frush blowing upon the frush*. Menage horses, that never wet their feet, are subject to these excrescences, which make them very lame. See FRUSH.

BOVINA AFFECTIO, a distemper of black cattle, caused by a worm lodged between the skin and the flesh, and perforating the same. This distemper is not mentioned by the ancient Greeks, and is but little known in Europe.

BOVINES, a small town of the Austrian Netherlands, in the province of Namur, seated on the river Maese or Meuse, in E. Long. 4. 50. N. Lat. 49. 45.

BOVINO, an episcopal town of Italy, in the Capitanata, seated at the foot of the Apennine mountains, in E. Long. 16. 15. N. Lat. 41. 17.

BOULAINVILLIERS (Henry de), Lord of St Saive, and an eminent French writer, was descended from a very ancient and noble family, and born at St Saive in 1658. His education was among the fathers of the oratory; where he discovered from his infancy those uncommon abilities for which he was afterwards distinguished. He applied himself principally to the study of history; and his performances in this way are numerous and considerable. He was the author of a history of the Arabians; Fourteen letters upon the ancient

Boulay
Boulogne.

ejent parliaments of France; a History of France to the reign of Charles VIII; the State of France, with historical memoirs concerning the ancient government of that monarchy, to the time of Hugh Capet, "written (says Mr Montefquieu) with a simplicity and honest freedom worthy of that ancient family from which their author was descended." Mr Boulainvilliers died at Paris in 1722; and after his death was published his Life of Mahomet.

BOULAY (Cæsar Egaffe du), in Latin *Bulaeus*, was born at St Ellier, a village of Maine in France; and became professor of humanity at the college of Navarre, regifter, rector, and hiftiographer of the univerfity of Paris. He died in 1678, after having published feveral works. The principal of them are, *A History of the Univerfity of Paris*, in Latin, 6 vols folio; and the *Treafure of Roman Antiquities*, in 1 vol. folio.

BOULDER-WALL, a kind of wall built of round flints or pebbles, laid in ftrong mortar, and ufed where the fea has a beach caft up, or where there are plenty of flints.

BOULETTE, in the menage. A horfe is called *boulette*, when the fetlock, or pattern-joint, bends forward, and out of its natural fituation, whether thro' violent riding, or by reafon of being too short-jointed, in which cafe the leaft fatigue will bring it.

BOULONNE (Lewis), painter to the French king, and professor of the academy of painting, diftinguifhed himfelf by his art; and died at Paris in 1674, aged 65. There are three of his pictures in the church of Notre Dame.—He left two fons who were admired for their fkill in painting. The elder, who is well known under the name of *Bon Boulonne*, was firft inſtructed by his father; after which he went to perfeft himfelf in Italy, and for that purpofe the king allowed him a penfion: at his return, he was made professor of the academy of painting. Lewis XIV. employed him in adorning feveral of his palaces; and there are a great number of his pictures at Paris. He died in 1717.—*Lewis Boulonne* his brother, after being alfo inſtructed by his father, gained the prize of painting at 18 years of age; upon which he obtained the king's penfion. He fet out for Italy at his brother's return, and acquired great fkill in defigning and colouring. At his return to Paris, he was much employed; and at length became direftor of the academy of painting, knight of the Order of St Michael, and firft painter to the king. Lewis XIV. allowed him feveral penfions, and raifed him and his pofterity to the rank of nobility. He embellifhed the church of the Invalids, the chapel of Verfailles, &c. and died at Paris in 1733.

BOULOGNE, a large and handfome town of Picardy in France, and capital of the Boulognois, with a harbour, and a bifhop's fee. It is divided into two towns; the higher, and the lower. The former is ftrong both by nature and art; and the latter is only furrounded with a fingle wall. The harbour has a mole for the fafety of the fhips, which at the fame time prevents it from being choaked up. The lower town is inhabited by merchants, and has three large ftreets, one of which leads to the high town, and the other two run in a line on the fide of the river. Many of the Englifh and Scots refide here, who, from a rebellion, or any other caufe, are obliged to fly from their native country. E. Long. 1. 42. N. Lat. 50. 42.

Boulognois,
Koulier.

BOULOGNOIS, a territory of France, in the north part of Picardy, about 30 miles in length, and 20 in breadth. The chief town is Boulogne, and the chief trade is in pit-coal and butter.

BOULTER (Dr Hugh), was born in or near London, of reputable and wealthy parents. He was educated at Merchant-taylor's fchool; and, before the Revolution, was from thence admitted a commoner of Chrift-church in Oxford. Some time after, he was choſen a demy of Magdalen-college, at the fame election with Mr Addison and Dr Wilcox. From the merit and learning of the perfons elected, this was commonly called by Dr Hough, prefident of the college, the *golden election*. He afterwards became fellow of the fame college; in which ftation he continued in the univerfity till he was invited to London by Sir Charles Hodges, principal fecretary of ftate, in the year 1700, who made him his chaplain, and recommended him to Dr Tenifon archbifhop of Canterbury; but his firft preferences were owing to the earl of Sunderland, by whose intereft and influence he was promoted to the parfonage of St Olave in Southwark, and the archdeaconry of Surry. Here he continued difcharging very faithfully and diligently every part of his parifonal office, till he was recommended to attend George I. as his chaplain, when he went to Hanover in 1719. He had the honour to teach prince Frederic the Englifh language; and by his conduft he fo won the king's favour, that he promoted him to the deanery of Chrift-church, and the bifhopric of Briſtol, in the fame year. As he was viſiting his dioceſe five years afterwards, he received a letter from the fecretary of ftate, acquainting him that his majeſty had nominated him to the archbifhopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and defired the fecretary to ufe his good offices with his majeſty to excuſe him from accepting it. Ireland happened to be at this juncture in a great flame, occaſioned by Wood's ruinous project; and the miniſtry thought that the bifhop would greatly contribute to quench it by his judgment, moderation, and addrefs. The king therefore laid his abſolute commands upon him: to which he fubmitted, but with ſome reluctance. As ſoon as he had taken poſſeſſion of the primacy, he began to confider that country, in which his lot was caſt for life, as his own; and to promote its true intereſt with the greateſt zeal and affiduity. Accordingly, in innumerable inſtances, he exerted himfelf in the nobleſt acts of beneficence and public ſpirit. In ſeaſons of the greateſt ſcarcity, he was more than once inſtrumental in preventing a famine which threatened that nation. On one of theſe occaſions he diſtributed vaſt quantities of corn throughout the kingdom, for which the Houſe of Commons paſſed a vote of public thanks; and at another time 2500 perfons were fed at the poor-houſe in Dublin, every morning, and as many every evening, for a conſiderable time together, moſtly at the primate's expence. When ſchemes were propoſed for the advantage of the country, he encouraged and promoted them not only with his counſel but his purſe. He had great compaſſion for the poor clergy of his dioceſe, who were diſabled from giving their children a proper education; and he maintained feveral of the children of ſuch in the univerfity. He erected four houſes at Drogheda for the reception of clergymens widows, and purchaſed an eſtate for the endow-

endowment of them. His charities for augmenting small livings and buying glebes amounted to upwards of 30,000*l.* besides what he devised by will for the like purposes in England. In short, the instances he gave of his generosity and benevolence of heart, his virtue, his piety, and his wisdom, are almost innumerable, and the history of his life is his noblest panegyric. This excellent prelate died at London, on the 2^d of June 1742; and was interred in Westminster abbey, where a beautiful monument of finely polished marble is erected to his memory.

BOULTINE, a term which workmen use for a moulding, the convexity of which is just one fourth of a circle; being the member just below the plinth in the Tuscan and Doric capital.

BOUNCE, in ichthyology, the English name of a species of squalus. See **SQUALUS**.

BOUND-BAILIFFS, are sheriffs officers for executing of process. The sheriffs being answerable for their misdemeanors, the bailiffs are usually bound in a bond for the due execution of their office; and thence are called *bound-bailiffs*, which the common people have corrupted into a much more homely appellation.

BOUNDS OF LANDS. See **ABUTTALS**.

BOUNTY, in commerce, a premium paid by government to the exporters of certain British commodities, as sail-cloth, gold and silver lace, silk-stockings, fish, corn, &c. The happy influence which bounties have on trade and manufactures is well known: nor can there be a more convincing proof of the good intentions of the government under which we live, than the great care that is taken to give all possible encouragement to those who shall establish, or improve, any hazardous branch of trade.

All undertakings, in respect either to mercantile enterprizes, or in the establishment of manufactures, are weak and feeble in their beginnings; and if unsuccessful, either sink entirely, or at least are seldom revived in the same age. Accidents of this nature are not only destructive to private persons, but exceedingly detrimental to the public interest. On this principle, more especially since trade, for which Providence designed us, hath been attended to, such attempts have been thought deserving, and have been favoured with, public support. This in former times usually flowed from the crown, in the form of letters-patent, charters, or other grants of privileges, which, however requisite they might be, were notwithstanding very frequently objects of censure. If such as obtained them failed in their endeavours, they were reputed *projectors*; if, on the other hand, they succeeded, they were considered as *monopolizers*. Corporations, which imply the uniting certain individuals into a body, that they may thereby become more useful to the community, are created by the crown. Many of these were formed for promoting trade; and, according to the old system of our government, were necessary and useful. On the same principle, privileges were granted to private persons, on a suggestion, that what was immediately of use to them, would terminate in public utility. These also did good in bringing in many arts and manufactures; though, in some cases, tending to private interest more than public emolument, they were liable to legal correction. In later times, and in concerns of moment, a much better method has been adopted, as

often as it hath been found practicable, by rejecting private or particular interest, and proposing the designed advantages to such as should perform the stipulations on which they are granted. These bounties, as they are paid by the public, so they are solely calculated for the benefit of the public. They are sometimes given to encourage industry, and application in raising a necessary commodity; which was intended by the bounty on exporting corn. The intention of this bounty was to encourage agriculture; and the consequence hath been, that we now grow more than twice as much as we did at the establishment of the bounty; we even consume twice as much bread as we then grew; yet in A. D. 1697, we exported a fifteenth part of what we grew, of late years a twentieth-ninth part only. The bounty on this twenty-ninth part amounted to somewhat more than L 50,000, and the produce to more than L 400,000. It is evident that all this is so much clear gain to the nation. But this is far from being all that we have annually gained. For if our cultivation is doubled, as indeed it is, then the rent of lands, the subsistence of working hands, the profits of the tradesmen supplying them with utensils, clothes, the value of horses employed, &c. must all be taken into the account. Besides this we must add the freight (amounting to half the bounty), to make the idea of the advantages complete.

Sometimes bounties are given with a view to promote manufactures, as in the case of those made of silk. Many laws are to be found in our statute-books in favour of the silk manufacture, made with great wisdom and propriety, for the encouragement and support of many thousands of industrious persons employed therein. By statute 8 Geo. I. cap. 15. § 1. a bounty was given on the due exportation of ribbons and stuffs, of silk only, of three shillings upon a pound weight; silks, and ribbons of silk, mixed with gold and silver, four shillings a pound; on silk gloves, silk stockings, silk fringes, silk laces, and sewing silk, one shilling and three pence a pound; on stuffs of silk and program yarn, eight pence a pound; on silks mixed with incl or cotton, one shilling; on stuffs of silk mixed with worsted, six-pence a pound, for three years; and, from experience of their utility, these were continued by subsequent statutes.

Sometimes bounties are given to support a new manufacture against foreigners already in possession of it, as in making linen and sail-cloth. The promoting of the manufacture of British sail-cloth was undoubtedly a very important national object, as the consumption was very large, and of consequence the purchase of it from foreigners an heavy expence on the public. Many methods were therefore devised, and countenanced by law, both here and in Ireland, for introducing and encouraging our own in preference to that of strangers, more especially in the royal navy. By stat. 12. Anne, cap. 16. § 2. a bounty was given of one penny per ell on all that was exported for a term, and continued by subsequent statutes. By 4 Geo. II. cap. 27. § 4. an additional bounty of another penny an ell is granted. These bounties were to be paid out of an additional duty on imported sail-cloth. By the same statute every ship built in Britain, or in the plantations, is, under the penalty of L 50. to be furnished with a complete suit of sails of British manufacture. The amount of these bounties

bounties mark the progress of the manufacture, which is also assisted by the fund on which the payment is assigned.

These assistances, however, are never bestowed on mature deliberation, in virtue of strong proofs, and with a moral certainty of a rational benefit. The great intention of bounties is to place the British trader on such ground as to render his commerce beneficial to his country. In order to this, some profit must accrue to himself, otherwise he would not embark therein; but this, whatever it be, must prove inconsiderable in comparison of what results to the public. For if, by the help of such a bounty, one or many traders export to the value of 1000, 10,000, or 100,000 pounds worth of commodities or manufactures, whatever his or their profit or loss (for the latter, through avidity and overloading the market, sometimes happens) may be, the nation gains the L 1000, L 10,000, or L 100,000; which was the object of the legislature in granting the bounty. Upon this consideration, that the entire produce of what is exported accrues to the nation, the legislature, when an alteration of circumstances required it, have made no scruple of augmenting a bounty; as in the case of refined sugar exported, from three to nine shillings per hundred weight. In like manner, the original bounty of one pound per ton in favour of vessels employed in the whale-fishing hath been doubled, and many new regulations made, in order to render this fishery more advantageous to the public. As a bounty is given on malt when allowed to be exported, so an equivalent of 30 shillings per ton hath been granted on all British made malt-spirits when exported, which is a common benefit to land, manufacture, and commerce.

It is indeed true, that on whatever account, or to whatever amount, this reward is given, the public seem to pay, and private persons seem to receive. But these private persons receive it as the hire from the public, for performing a service which otherwise they would not perform, the benefit of which accrues to the public, and who can therefore very well afford to pay that reward in reality, which, as we have stated it, the only seems to do. For, looking a little closer, we cannot help observing, that the bounty is paid to individuals, who, as such, make a part of the public. But the commodities or manufactures exported are sold to foreigners; and the whole produce of them, be it what it will, comes into the purse of the public. By attending to this self-evident doctrine, every reasonable and public-spirited man will be easily reconciled to bounties; and the three following considerations will be sufficient to obviate the most common objections that have been made to the practice of giving them. 1. That no bounty can be desired but on the plea of national utility, which always deserves notice, and cannot be mistaken. It must likewise be alleged and proved, that this is the only means whereby the national benefit can be attained. 2. The sums issued on this account not only shew the clear expense of the bounty, but also indicate the profit gained by the public; for as the one cannot exist without the other, that amount must be the incontestable index of both. 3. It must be remembered, (and of this too some instances might be given), that if bounties should be improperly bestowed, they will of course prove ineffectual, and after a few fruit-

less trials will remain unclaimed, and consequently produce no expense. There is indeed another objection which hath been made against the giving of bounties. This is grounded on the frauds to which they are supposed to be liable; and particularly the re-lending of the goods on which the bounty hath been paid, and thereby deceiving and cheating the public. But whoever peruses the laws made on this head, and attentively considers the numerous precautions taken to fix every circumstance relative to the obtaining the bounty, the checks on the shipping of goods, the securities taken for their due exportation, the certificates required to ascertain their being actually delivered and sold in a foreign market, must be convinced, that to discharge all those securities, in case of an intended fraud, is a thing very difficult, if not impossible.

To these remarks we may add, that bounties are usually granted only for a limited time, and then expire; are always liable to be suspended; and of course can never be the cause of any great national loss. There is no doubt that, exclusive of frauds, the immoderate thirst of gain may tempt interested men to aim at converting what was calculated for public benefit to its detriment, for their own private advantage. Thus, on a prospect of short crops in other countries, men may take measures within the letter, but directly against the spirit of the law, to send so much of our corn abroad as to endanger a famine at home. For this the wisdom of parliament provides, not barely by suspending the bounty, but by prohibiting exportation and opening the ports for foreign supplies. We cannot with any shadow of justice ascribe scarcity to the bounty on the exportation. If this was the case, suspensions would be frequent, whereas there have been but five in a course of 70 years. If the bounty had any share, the larger the exportation, the greater would be the scarcity. In A. D. 1750 we exported more than one fifth of our growth of wheat, which was notwithstanding but at four shillings per bushel; whereas a century before, A. D. 1650, when we had neither bounty nor exportation, wheat was at nine shillings and sixpence per bushel. The causes of scarcity are unkindly seasons; which though human policy cannot prevent, yet their sad effects have been evidently lessened by our increased growth, since the taking place of bounty and exportation.

BOURBON, or MASCARENHAS, (isle of), an island in the Indian ocean, lying to the east of Madagascar, in E. Long. 58. 30. S. Lat. 21. 23. This island has no port, and is in some places inaccessible. Its length and breadth have not been well determined; but the circumference, according to the account of a person who resided there some time, is about 57 leagues. It is for the most part mountainous, but in some places there are very beautiful and fertile plains. In the fourth part of the island there is a burning mountain, which has thrown out vast quantities of bitumen, sulphur, and other combustible materials; neither does it cease throwing them out still, so that the country about it is useless, and is called by the inhabitants *payi brule*, that is, burnt land. The shore is high and rocky all round; but though on this account it hath no ports, there are several good roads, particularly one on the west, and another on the north-east. As to its form, this island is irregular, so that it is difficult to

Bourbon.

judge from the maps whether it is round or long. The air is equally pleasant and wholesome, inasmuch that the people live to a great age without feeling either infirmities or diseases. This is occasioned by the hurricanes, of which they have one or two every year. These purge and cleanse the air, so as to render it highly salubrious; the certainty of which is thus distinguished, that when they fail of making their annual visits, as sometimes they do, diseases and death find an entrance into the island, which otherwise would soon be overstocked with inhabitants. The climate is hot, but not to such a degree as might be expected from its situation, the breezes from the mountains being constant and very refreshing. The tops of these mountains are in winter covered with snow; which, melting in the summer, furnishes abundance of rivers and rivulets, with which the country is plentifully watered: so that the soil, though not very deep, is wonderfully fruitful, producing Turkey corn and rice twice a-year, and the latter in great abundance. Most sorts of cattle are found here, good in their kind, and are very cheap; wild goats and wild hogs are found in the woods and on the tops of the mountains; here also are vast quantities of wild fowl of different kinds, fish, and land tortoises, affording at once the most delicate and wholesome food. As to fruits, they have bananas, oranges, citrons, tamarinds, and other kinds; neither does it want valuable commodities, particularly ebony, cotton, white pepper, gum benzoin, aloes, and tobacco; all excellent in their kind, when compared with those of other countries. This island is also happy in its deficiencies; for no animals that are venomous are to be found therein, and only two sorts that are disagreeable to the sight, *viz.* spiders of the size of a pigeon's egg, which weave nets of a surprising strength, reckoned by some capable of being treated so as to become as valuable as silk; and bats of a most enormous size, which are not only skinned and eaten, but esteemed also the greatest delicacy that they have.

The island of Bourbon was discovered by the Portuguese in 1545, as appears by a date inscribed by them upon a pillar when they first landed; but when the French settled in Madagascar, this island was totally desolate. Three Frenchmen being banished thither, and left there for three years, made such a report of it at their return as surprised their countrymen. They lived most of that time upon pork; and though they were in a manner naked, yet they affirmed that they never had the least pain or sickness whatever. This tempted one Anthony Taureau to go over thither in 1654, accompanied by seven French and six negroes, who carried with them the cattle from which the island has been stocked ever since. The first thing they did was to erect the arms of France, by order of Mr Falcourt who was governor of Madagascar, and to bestow upon the island a new name. Then they set up huts, and laid out gardens, in which they cultivated melons, different sorts of roots, and tobacco; but just as the last became ripe, the whole plantation was destroyed by a hurricane. The French, however, went to work again; and by having some acquaintance with the climate, succeeded better, and added aloes to the rest of their plantations: but receiving no succour from Madagascar, and being tired of living by themselves in the isle of Bourbon, they very readily embraced the

Bourbon.

offer of an English captain, and in the year 1658 embarked for Madras. When the last great blow was given to the French at Madagascar by the natives, who surprised and cut them off in one night, they were escaped as many men, as with their wives, who were natives, filled two canoes; and these being driven by the wind on the isle of Bourbon, were the next set of people who inhabited it. This last colony, for want of an opportunity to remove, were constrained to cultivate this new country of theirs, and to remain in it. It was not long before a further flock of inhabitants arrived. A pirate that had been committing depredations in the Indies, returning to Europe, ran ashore and was split to pieces upon the rocks, so that the crew were forced to join themselves to the former inhabitants; and as they had on board their vessel a great many Indian women whom they had made prisoners, they lived with them, and in process of time had a numerous posterity. As East India ships touched frequently here, when too late to double the Cape, many of the sailors, for the sake of the women, deserted at the time of their departure, and staying behind became planters in the isle of Bourbon. As the place grew more populous, the people naturally became more civilized, and desirous of living in a more commodious manner; which induced them to build small vessels, that in these they might sometimes make a trip to Madagascar, in order to purchase slaves, whom they employed in their plantations to cultivate aloes, tobacco, and other things, with which they drove a small trade, when ships of any nation anchored in their roads for the sake of refreshments. In this situation they were, when the French East India company put in their claim; and assuming the property of the island, sent thither five or six families and a governor. At first the inhabitants expected to reap some benefit from their new masters; but finding very little, and thinking the governor took too much upon him, they revolted at the instigation of a priest, seized their governor, and put him into a dungeon, where he died of hunger and grief. For this some of the ringleaders were punished, a kind of fort was erected, some guns placed on it, and the French flag kept flying; but, in other respects, so little care was taken, that, till within these 40 years, the island was in no state of defence.

The number of inhabitants, in the year 1717, was computed at 2000; *viz.* 900 free, and 1100 slaves. Amongst these people the usual distinction of whites and blacks entirely fails: for even the free are of different colours; and a French writer assures us, that he saw in a church one family, consisting of five generations, of all complexions. The eldest was a female, 108 years of age, of a brown black, like the Indians at Madagascar; her daughter, a mulatto; her grand-daughter, a mestizo; her great-grand-daughter, of a dusky yellow; her daughter, again, of an olive colour; and the daughter of this last, as fair as any English girl of the same age. These people are, generally speaking, of a gentle quiet disposition; very industrious; and submissive enough to authority, provided it is exercised with a tolerable degree of equity and decency: for otherwise the whole of them are apt to rise in rebellion at once; and the slaves have so little reason to complain of their masters, that they are always on the same side. The island is divided into four quarters. The first is that of St Paul, which is the
largest

Bourbon.

largest and best peopled; their houses are built at the foot of a steep mountain, on both sides of a fresh-water lake. As for the plantations, they are on the top of a mountain, which they ascend by a very rough and troublesome passage. On the summit there is a spacious plain, a great part of which is divided into plantations of rice, tobacco, corn, sugar, and fruits. The quarter of St Denis lies seven leagues from that of St Paul, towards the east; and there the governor resides. It is not so well peopled as the former; but the country is more pleasant, and the situation better. At two leagues distance, proceeding along the sea-coast, is the quarter of St Mary's, which is but thinly peopled. The last and most fertile quarter is that of St Sufannah, which is at the distance of four leagues from St Denis. The road between these two quarters is tolerable, though part of it has been cut with much difficulty through a wood; but the passage from St Denis to St Paul is only by sea.

When the present company of India became, by their perpetual establishment, possessed of the island of Bourbon, they began to improve it exceedingly: raising new forts and batteries, so as to render it in a manner inaccessible; and importing coffee-trees from Arabia, which have succeeded so well, that it is believed they produce an eighth, according to some a sixth, part as much coffee as is raised in the kingdom of Yemen in Arabia, and it is likewise held next in goodness to that. — In 1763, the population amounted to 4627 white people, and 15149 blacks; the cattle consisted of 8702 heaves, 4084 sheep, 7405 goats, and 7619 hogs. Upon an extent of 125,909 acres of cultivated land, they gathered as much cassava as would feed their slaves, 1,135,000 pounds weight of corn, 844,100 pounds of rice, 2,879,100 pounds of maize, and 2,535,100 pounds of coffee; which last the company bought up at about 3d. per pound.

In 1748, Admiral Boscawen appeared before this island with a British fleet; but found it so well fortified both by nature and art, that he was obliged, after some cannonading to very little purpose, to pursue his voyage.

BOURBON (Nicholas), a famous Latin poet in the 16th century, was a native of Vandœuvre near Langres, and the son of a wealthy man who was master of several forges. Margaret de Valois appointed him preceptor to her daughter Jane d'Albret of Navarre, the mother of king Henry IV. At length he retired to Conde, where he had a benefice, and died about the year 1550. He wrote eight books of Epigrams; and a poem on the forge, which he has intitled *Ferraria*. He had great knowledge of antiquity and of the Greek language. Erasmus praises his epigrams.

BOURBON (Nicholas), a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in several colleges of Paris; and the cardinal de Perron caused him to be nominated professor of eloquence in the Royal College: he was also canon of Langres, and one of the 40 of the French academy. At length he retired to the fathers of the oratory, where he died in 1644, aged 70. He is esteemed one of the greatest Latin poets France has produced. His poems were printed at Paris in 1630.

BOURBON-Lancy, a town of France, in the duchy of Burgundy, and in the Autunnois. It is remarkable for

Bourbon
Bourdeaux.

its castle and baths; and there is a large marble pavement, called the *great bath*, which is a work of the Romans. It is seated near the river Loire, in E. Long. 3. 46. N. Lat. 46. 37.

BOURBON *L'Archambaud*, a small town of France, remarkable for its baths, which are exceedingly hot. E. Long. 3. 28. N. Lat. 46. 35.

BOURBON-LE-BAINS, a town of France in Champagne, and in the Bassigni, famous for its hot baths. E. Long. 5. 45. N. Lat. 47. 54.

BOURBONNOIS, a province of France, with the title of a duchy; bounded on the north, by Nivernois and Berry; on the west, by Berry and a small part of upper Marche; on the south, by Auvergne; and on the east, by Burgundy and Forez. It abounds in corn, fruits, pastures, wood, game, and wine. Its principal town is Moulins; and the rivers are the Loire, the Allier, and the Chur.

BOURBOURG, a town in French Flanders, whose fortifications are demolished. It is seated on a canal that goes to Dunkirk, in E. Long. 2. 15. N. Lat. 50. 55.

BOURCHIER (John), lord Bernars, grandson and heir of a lord of the same name, who was descended from Thomas of Woodstock, duke of Gloucester, and had been knight of the Garter, and constable of Windsor-castle, under Edward IV. Our lord John was created a knight of the Bath at the marriage of the duke of York second son of Edward IV. and was first known by quelling an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, in 1495, which recommended him to the favour of Henry VII. He was captain of the pioneers at the siege of Therouenne, under Henry VIII. by whom he was made chancellor of the exchequer for life, lieutenant of Calais and the Marches, appointed to conduct the lady Mary the king's sister into France on her marriage with Lewis XII. and had the extraordinary happiness of continuing in favour with Henry VIII. for the space of 18 years. He died at Calais in 1532, aged 63. He translated, by king Henry's command, Froilart's Chronicle; which was printed in 1523, by Richard Pinfon, the scholar of Caxton, and the fifth on the list of English printers. His other works were a whimsical medley of translations from French, Spanish, and Italian novels, which seem to have been the mode then, as they were afterwards in the reign of Charles II. These were, *The life of Sir Arthur*, an Armorican knight; *The famous exploits of Sir Hugh Bourdeaux*; *Marcus Aurelius*; and, *The cattle of love*. He composed also a book, *Of the duties of the inhabitants of Calais*; and a comedy entitled *Ite in Vincam*, which is mentioned in none of our catalogues of English plays. Anthony Wood says it was usually acted at Calais after vespers.

BOURDALOUE (Lewis), a celebrated preacher among the Jesuits, and one of the greatest orators France has produced, was born at Bourges, on the 20th of August 1632. After having preached at Provence, he, in 1699, went to Paris; and there met with such applause, that the king resolved to hear him: on which he was sent for to court, and frequently preached before Lewis XIV. He assisted the sick, visited the prisons and hospitals, and was very liberal in giving alms. He died at Paris on the 15th of May 1704. The best edition of his sermons is in octavo.

BOURDEAUX, an ancient, large, handsome, and

rich

Bourdines
||
Bourg.Bourg
||
Bourgogne.

rich town of France, capital of Guienne, an archbishop's see; has an university and an academy of arts and sciences. It is built in the form of a bow, of which the river Garonne is the string. This river is bordered by a large key, and the water rises four yards at full tide, for which reason the largest vessels can come up to it very readily. The castle called the *Trumpet*, is seated at the entrance of the quay, and the river runs round its walls. Most of the great streets lead to the quay; but are all very narrow except one. The town has 12 gates; and near another castle are fine walks under several rows of trees. The most remarkable antiquities were, an ancient temple dedicated to the tutelary gods, now entirely demolished, to make room for the fortifications; the palace of Gallienus built like an amphitheatre; and several aqueducts in different places. It is a town of very considerable trade, and they ship every year 100,000 tons of wine and brandy. This is the place where Edward the Black Prince resided several years; and his son, afterwards Richard II. was born here. There is a handsome square near the river, with an equestrian statue of Lewis XV. W. Long. o. 39. N. Lat. 44. 50.

BOURDINES, a town of the Austrian Netherlands, in the province of Namur. E. Long. 5. o. N. Lat. 50. 35.

BOURDELOT (John), a learned French critic, who lived at the close of the 16th and beginning of the 17th centuries. He distinguished himself by writing notes on Lucian, Petronius, and Heliodorus; by an Universal History; Commentaries on Juvenal; a Treatise on the Etymology of French words; and by some other works which were never published.—There was also an abbe Bourdelot, his sister's son, who changed his name from Peter Michon to oblige his uncle. He was a celebrated physician at Paris, who gained great reputation by a Treatise on the Viper, and other works. He died in 1685.

BOURDON (Sebastian), a famous painter, born at Montpellier, in 1619. He studied seven years at Rome; and acquired such reputation, that at his return to France he had the honour of being the first who was made rector of the academy of painting at Paris. He succeeded better in his landscapes than in his history-painting. His pieces are seldom finished; and those that are so, are not always the finest. He once laid a wager with a friend, that he should paint 12 heads after the life, and as big as the life, in one day. He won it, and these are said not to be the worst things he ever did. He drew a vast number of pictures. His most considerable pieces are, The gallery of M. de Bretonvilliers, in the life of Notre Dame; and The seven works of mercy, which he etched by himself. But the most esteemed of all his performances is, The martyrdom of St Peter, drawn for the church of Notre Dame: It is kept as one of the choicest rarities of that cathedral. Bourdon was a Calvinist; much valued and respected, however, in a Popish country, because his life and manners were good. He died in 1673, aged 54.

BOUDONÈE, in heraldry, the same with POMÈE.

BOURG, the capital of the island of Cayenne, a French colony on the coast of Guiana, in South America; in W. Long. 52. o. N. Lat. 5. o.

BOURG-en-Bresse, a town of France, and capital of Bresse, in the province of Burgundy. It is seated on the river Reussie, almost in the centre of Bresse, in

E. Long. 4. 19. N. Lat. 46. 13.

BOURG-sur-Mer, a sea-port town of France in Guienne, and in the Bourdelois, with a tolerable good harbour; seated at the confluence of the rivers Dordogne and Garonne, in W. Long. 3. 35. N. Lat. 45. o.

BOURGES, an ancient and large town of France, the capital of Berry, an archbishop's see, and a famous university. The archbishop assumes the title of *Patriarch of the Aquitains*, and enjoys the rights of primacy with regard to Albi. It is seated between two small rivers, the Evry and the Orron, upon a hill that has a gentle descent down to these rivers, by which it is almost surrounded, for there is but one avenue to it by land, which is that of Port Bourbonnoux. It stands upon a great deal of ground: but one part of it is without houses; and the rest is but thinly peopled with gentlemen, students, and ecclesiastics, the whole number of souls amounting only to about 1800. They have no manner of trade but for their own necessities. It is divided into the old and new town. The walls of the old are almost entire, and the new town is almost as large as the old. There are several churches, convents, and nunneries. The parish church, dedicated to St Stephen, is a fine old Gothic structure: it is seated on the highest part of the city, and on each side of the front are two handsome high towers. The new one, which is built in the room of one which fell down, is almost 200 feet high. Bourbon square is the largest in the city, where there was formerly an amphitheatre, and now a market. There is a fine walk from St Michael's-gate into the fields, and three alleys, formed by four ranks of trees, the middlemost of which is spacious; besides which, there is a very long mall. The university is famous for the study of the law. This city stands almost in the centre of France. E. Long. 2. 30. N. Lat. 47. 10.

BOURGET, a town of Savoy, subject to the king of Sardinia, seated at the southern extremity of a lake of the same name. E. Long. 5. 55. N. Lat. 45. 45.

BOURGOGNE, or BURGUNDY, as we call it; a considerable province of France with the title of a duchy. It is 130 miles in length, and 75 in breadth. It is bounded on the east, by the Franche Comte; on the west, by Bourbonnois and Nivernois; on the south, by Lyonnais; and on the north, by Champagne. It is very fertile in corn and fruit, and produces excellent wine. It is watered by the rivers Seine, Dehune, Brebine, Armançon, Ouche, Souzon, Tille, and Saone. There are four mineral springs at Apoiny, Premeau, Bourbon-Lancy, and St Reine. The first are obscure, and the two last in high reputation. In the canton of Bresse, there are two Subterranean lakes which often overflow in times of the greatest drought, and lay a large tract of ground under water: one of them has no apparent spring or opening; and yet in a dry season, it throws out water enough to overflow the meadow-land near it. The grottos or caves of Arcy are seated about 18 miles from Auxerre, and over them is soil about 10 feet deep. The entrance into these cavities is 200 paces long, but narrow. There are arches which form several vaults, from whence drop clear water, which turns into a brilliant hard stone. Twenty paces from the entrance is a lake, which seems to be formed by that part of the water that will not petrify. The highest of these vaults is not above eight feet. About 80 paces from

from the entrance there is a kind of hall, with a coffee-coloured ceiling, wherein there are a thousand odd figures, which have a very agreeable effect. Dijon is the capital town.

BOURGUIGNONS, or BURGUNDIANS, one of the northern nations who over-ran the Roman empire, and settled in Gaul. They were of a great stature, and very warlike; for which reason the emperor Valentinian the Great engaged them in his service against the Germans. They lived in tents which were close to each other, that they might the more readily unite in arms on any unforeseen attack. These conjunctions of tents they called *burghs*; and they were to them what towns are to us. Sidonius Apollinaris tells us, that they wore long hair, took great pleasure in singing, and were fond of praise for their vocal talents. He adds, that they ate great quantities; and anointed their hair with butter, deeming that unctuous very ornamental. Their crown was at first elective, and the authority of their kings expired with their success. They were not only accountable for their own misconduct, but likewise for the calamities of nature, and the caprice of fortune. They were deposed if they had lost a battle; if they succeeded ill in any enterprize; or if, in short, any great event had not corresponded with the hopes of the public. They were not more favourably treated in case of a bad harvest or vintage, or if any epidemical distemper had ravaged the state. At first they were governed by many kings, and *hendi* was the title of the royal dignity. But in latter times they were subjected to one sovereign; and they grew humane and civilized, especially when Christianity was propagated in their country. Before that epocha, their religion was much the same with that of the other northern nations. They had many priests, the chief of whom was distinguished by the name of *sniflreus*. He was perpetual, and they paid him great respect and veneration.

BOURIGNON (Antonicetta), a famous enthusiastic preacher and pretended prophetess, was born at Lisle in 1616. At her birth she was so deformed, that it was debated some days in the family whether it was not proper to stifle her as a monster: but her deformity diminishing, she was spared; and afterwards obtained such a degree of beauty, that she had her admirers. From her childhood to her old age she had an extraordinary turn of mind. She set up for a reformer, and published a great number of books filled with very singular notions; the most remarkable of which are intitled *The Light of the World,* and *The testimony of Truth*. She was an enemy to reason and common sense, which she maintained ought to give place to the illumination of divine faith; and asserted, that whenever any one was born again by embracing her doctrines, she felt the pains and throes of a woman in labour. Of her pretended visions and revelations we shall give one instance as a sample. In one of her ecstasies she saw Adam in the same form in which he appeared before his fall, and the manner in which he was capable of procreating other men, since he himself possessed in himself the principles of both sexes*. Nay, she pretended it was told her that he had carried this procreating faculty so far as to produce the human nature of Jesus Christ. "The first man (says she), whom Adam brought forth without any concurrent assistance in his glorified state, was chosen by God to be the throne of the Divinity; the or-

gan and instrument by which God would communicate himself externally to men: This is Christ the first born united to human nature, both God and man." Besides these and such like extravagancies, she had other forbidding qualities: her temper was morose and peevish, in which, however, she was not much unlike other devotees; but, contrary to the generality of such persons, she was extremely avaricious and greedy of amassing riches. She dressed like an hermit, and travelled to France, Holland, England, and Scotland. In the last she made a strong party, and some thousand sectarists, known by the name of *Bourignonists*. She died at Fanneker in the province of Frite, October 30th, 1680. Her works have been printed in 18 vols octavo.

BOURN, a town of Lincolnshire in England, situated in E. Long. 1. 17. N. Lat. 52. 40. It is a pretty large place, has a good market for corn and provisions, and is noted for the coronation of King Edmund.

BOURO, an island in the East Indian ocean, between the Moluccas and Celebes. It is well cultivated; and is now subject to the Dutch, who have built a fortress here. Some mountains in it are exceeding high, and the sea on one side is uncommonly deep. It produces nutmegs and cloves, as well as cocoa and banana trees; besides many vegetables introduced by the Dutch. It is about 50 miles in circumference. E. Long. 129°. S. Lat. 4. 30.

BOUTANT, or ARCH-BOUTANT, in architecture, an arch, or part of an arch, abutting against the reins of a vault to prevent its giving way.

A Pillar BOUTANT, is a large chain or pile of stone, made to support a wall, terrace, or vault.

BOUTE, in the menage. A horse is called *boute*, when his legs are in a straight line from the knee to the coronet: short-jointed horses are apt to be *boute*, and on the other hand long-jointed horses are not.

BOUTON, an island in the East Indian ocean, about 12 miles distant from the south-east part of the island of Macassar, or Celebes. The inhabitants are small, but well shaped, and of a dark olive complexion. The principal town is Callasjung, which is about a mile from the sea, on the top of a small hill, and round it a stone wall. The houses are not built upon the ground, but on posts. The religion of the inhabitants is Mahometanism. E. Long. 122. 30. S. Lat. 4. 30.

BOUVILLON, a city of Luxemburg in the Austrian Netherlands, situated in E. Long. 5. 0. N. Lat. 49. 55.

BOW, a weapon of offence made of steel, wood, horn, or other elastic substances, which after being bent by means of a string fastened to its two ends, in returning to its natural state, throws out an arrow with prodigious force.

The use of the bow is, without all doubt, of the earliest antiquity. It has likewise been the most universal of all weapons, having obtained among the most barbarous and remote people, who had the least communication with the rest of mankind.

The figure of the bow is pretty much the same in all countries where it has been used; for it has generally two inflections or bendings, between which, in the place where the arrow is drawn, is a right line. The Grecian bow was in the figure of a 3, of which form we meet with many, and generally adorned with gold or silver. The Scythian bow was distinguished from the

bows

* See the article *Adam*.

bows of Greece and other nations, by its incurvation, which was so great as to form a half moon or semicircle.

Though it does not appear that the Romans made use of bows in the infancy of the republic, yet afterwards admitted them as hostile weapons, and employed auxiliary archers in all their wars.

In drawing back the bow, the primitive Grecians did not pull back their hand towards their right ear, according to the fashion of modern ages, and of the ancient Persians; but, placing their bow directly before them, returned their hand upon their right breast. This was also the custom of the Amazons.

The bow is a weapon of offence among the inhabitants of Asia, Africa, and America, at this day; and in Europe, before the invention of fire-arms, a part of the infantry were armed with bows. Lewis XI. first abolished the use of them in France, introducing in their place the halbard, pike, and broad-sword. The long bow was formerly in great vogue in England, and many laws were made to encourage the use of it. The parliament under Henry VII. complained of the diluse of long bows, heretofore the safeguard and defence of this kingdom, and the dread and terror of its enemies.

Bow, is also an instrument used at sea, for taking the sun's altitude; consisting of a large arch of 90° graduated, a skank or staff, a side vane, a sight vane, and an horizon vane. It is now out of use.

Bow, among builders, a beam of wood or brags, with three long screws that direct a lathe of wood or steel into any arch; chiefly used in drawing draughts of ships and projections of the sphere, or wherever it is requisite to draw large arches.

Bow, in music, a small machine, which, being drawn over the strings of a musical instrument, makes it resound. It is composed of a small stick, to which are fastened 80 or 100 horse-hairs, and a screw which serves to give these hairs a proper tension. In order that the bow may touch the strings briskly, it is usual to rub the hairs with rosin. The ancients do not appear to have been acquainted with bows of *hair*: in lieu hereof they touched their instruments with a plectrum; over which our bows have great advantage, for giving long and short sounds, and other modifications which a plectrum cannot produce.

Bow, among artificers, an instrument so called from its figure; in use among gunsmiths, locksmiths, watch-makers, &c. for making a drill go. Among turners it is the name of that pole fixed to the ceiling, to which they fasten the cord that whirls round the piece to be turned.

Bow, a town of Devonshire in Wales, situated in W. Long. 4. o. N. Lat. 50. 45.

Bows of a *Saddle*, are two pieces of wood laid archedwife to receive the upper part of a horse's back, to give the saddle its due form, and to keep it tight.

The fore-bow which sustains the pommel, is composed of the withers, the breasts, the points or toes, and the corking. See *WITHERS*, &c.

The hind-bow bears the trouzenquin or quilted roll. The bows are covered with sinews, that is with bull's pizzles beaten, and so run all over the bows to make them stronger. Then they are strengthened with bands of iron to keep them tight; and on the lower side are nailed on the saddle straps, with which they make fast

the girths.

Bow, *Epaule*, in ship-building, the rounding part of a ship's side forward, beginning at the place where the planks arch inwards; and terminated where they close, at the stem or prow. It is proved by a variety of experiments, that a ship with a narrow bow is much better calculated for sailing swiftly, than one with a broad bow; but is not so well fitted for a high sea, into which she always *pitches*, or plunges her fore-part very deep, for want of sufficient breadth to repel the volume of water which she so easily divides in her fall. The former of these is called by seamen a *lean*, and the other a *bluff* bow. "The bow which meets with the least resistance in a direct course, not only meets with the least resistance in oblique courses, but also has the additional property of driving the least to leeward; which is a double advantage gained by forming the bow so as to give it that figure which will be least resisted in moving through any medium *."

On the Bow, in navigation, an arch of the horizon comprehended between some distant object and that point of the compass which is right a-head, or to which the ship's stern is directed. This phrase is equally applicable when the object is beheld from the ship, or discovered by trigonometrical calculation: As, we saw a fleet at day-break bearing three points on the *Starboard-bow*; that is, three points from that part of the horizon which is right a-head, towards the right hand *.

Bow-Legged, or Bandy-legged. Some children are bow-legged from their birth; others become so from setting them on their feet too early. The tibia of some is crooked; the knees of others are distorted; from a fault in the ankle, the feet of some are turned inwards. These are called *vari*; and in others, who are called *valgi*, they are turned outwards. The best method of preventing these disorders in weakly children is to exercise them duly, but not violently, by dancing or tossing them about in one's arms; and not setting them much upon their feet, at least not without properly supporting them: if the disorder attends at the birth, or increases after it is begun, apply emollients, then apply boots of strong leather, wood, &c. so as gradually to dispose the crooked legs to a proper form; or other instruments may be used instead of boots, which, when not too costly, are usually to be preferred. Slighter instances of these disorders yield to careful nursing, without instruments.

Bow-Line. See *BOWLING*.

Bow-Pieces, are the pieces of ordnance at the bow of a ship.

Rain-Bow. See *RAIN-BOW*.

Bow-Bearer, an inferior officer of the forest, who is sworn to make inquisition of all trespasses against vert or venison, and to attack offenders.

Bow-China. See *CHINA*.

BOWELS, in anatomy, the same with intestines *. * See *Anatomy*, m^o 354.

BOWER, in gardening, a place under covert of trees, differing only from an arbour, as being round or square, and made with a kind of dome or ceiling at top; whereas the arbour is always built long and arched.

BOWER, in the sea-language, the name of an anchor carried at the bow of a ship. There are generally two bows, called *first* and *second*, *great* and *little*, or *best* and *small* bower. See *ANCHOR*.

BOWESS, or BOWET, in falconry; a young hawk, when

* *Bougiers*
Traité de
Navire.

* See the ar-
ticle *Bear-*
ing.

when she draws any thing out of her nest, and covets to clamber on the boughs.

BOWL, denotes either a ball of wood; for the use of bowling; or a vessel of capacity, wherein to hold liquors.

BOWLDER-STONES, small stones, of a roundish figure, and no determinate size, found on the sea-shore, and on banks or rather channels of rivers.

BOWLING, the art of playing at bowls. The first thing to be observed in bowling is, the right chusing your bowl, which must be suitable to the ground you design to run on. Thus, for close alleys, the flat bowl is the best; for open grounds of advantage, the round biased bowl; and for plain and level swards, the bowl that is as round as a ball. The next is to chuse your ground; and, lastly, to distinguish the rifings, fallings, and advantages of the places where you bowl.

BOWLING, or *Bow-Line*, a rope fastened near the middle of the leech, or perpendicular edge of the square fail, by three or four subordinate parts called *bridles*. It is only used when the wind is so unfavourable that the fails must be all braced sideways, or close-hauled to the wind: in this situation the bow-lines are employed to keep the weather or windward edges of the principal fails tight forward and steady, without which they would always be shivering, and rendered incapable of service. To check the bow-line is to slacken it, when the wind becomes large.

BOWLING-Bridles, are the ropes by which the bow-line is fastened to the leech of the fail.

BOWSE, in the sea-language, signifies as much as to hale or pull. Thus *bowsing upon a tack*, is haling upon a tack. *Bowse away*, that is, Pull away all together.

BOWSPRIT, or **BOLTSPRIT**, a kind of mast, resting sloopwise on the head of the main stern, and having its lower end fastened to the partners of the fore-mast, and farther supported by the fore-stay. It carries the sprit-fail, sprit-top-fail, and jak-staff; and its length is usually the same with that of the fore-mast.

BOWYERS, one of the ancient companies of the city of London. A bowyer dwelling in London, was always to have ready 50 bows of elm, hazel, or ash, well made and wrought, under the penalty of 10s. for every bow wanting; and to sell them at certain prices, under the penalty of 40s. And parents and masters were to provide for their sons and servants, a bow and two shafts, and cause them to exercise shooting, on pain of 6s. 8d. &c. by our ancient statutes.

BOX, in its most common acceptation, denotes a small chest or coffer for holding things.

Dice-Box, a narrow deep corset, channelled within, wherein the dice are shaken and thrown. This answers to what the Romans called *fritillus*; whence, *crepitantes fritilli*; and, in Seneca, *resonante fritillo*. The same author uses also *concutere fritillum*, figuratively, for playing.—Besides the fritillus, the Romans, for greater security, had another kind of dice-box called *pyrgus*, *πυργος*, and sometimes *turricula*. It was placed immovable in the middle of the table, being perforated or open at both ends, and likewise channelled within; over the top was placed a kind of funnel, into which the dice were cast out upon the fritillus; whence descending, they fell through the bottom on the table; by which all practising on them with the fingers was

effectually prevented. For want of some contrivance of this kind, our sharpers have opportunities of playing divers tricks with the box, as palming, topping, slabbing, &c.

Box, is also used for an uncertain quantity or measure: thus a box of quicksilver contains from one to two hundred weight; a box of prunella only 14 pounds; a box of rings for keys, two grofs, &c.

Box-Tree, in botany. See *Buxus*.

BOXERS, a kind of *athleta*, who combat or contend for victory with their fists. Boxers among the same with what among the Romans were called *pugiles*. The ancient boxers battled with great force and fury, inasmuch as to dash out each others teeth, break bones, and often kill each other. The strange disfigurements these boxers underwent were such that they frequently could not be known, and rendered them the subject of many raileries. In the Greek anthology there are four epigrams of the poet Lucilius, and one of Lucian, wherein their disfigurements are pleasantly enough exposed.

BOXHORNIIUS (Marc Zuerius), a learned critic, born at Bergen-op-Zoom in 1612, was professor of eloquence at Leyden, and at length of politics and history in the room of Heinſius. He published, 1. *Theatrum urbium Hollandiæ*. 2. *Scriptores historie Augustæ, cum notis*. 3. *Poeta satyrici minores, cum comment.* 4. Notes on Justin, Tacitus; and a great number of other works. He died in 1653, aged 41.

BOXING, the exercise of fighting with the fists, either naked, or with a stone or leaden ball grasped in them. In this sense, boxing coincides with the *πυγμαχία* of the Greeks, the *pugillatus* of the Romans, and what on our amphitheatres is sometimes called *the trial of manhood*. When the champions had *σπαίρα*, or balls, either of lead or stone, it was properly denominated *σπαίρα λίθια*. The ancient boxing differed from the *pugna castuum*, in which the combatants had leathern thongs on their hands, and balls, to offend their antagonists; though this distinction is frequently overlooked, and fighting with the cestus reckoned a part of the business of *pugiles*: in which view we may discover three species of boxing; the first, where both the hands and the head are absolutely naked, as is practised among us; the second, where the hands were armed with *sphærae*, but the head naked; and the third, where the head was armed with a kind of cap or cover called *amphitides*, chiefly to defend the ears and temples, the hands being also armed with cestuses. Boxing is an ancient exercise, having been in use in the heroic times before the invention of iron or other weapons. Those who prepared themselves for it, used all the means that could be contrived to render themselves fat and fleshy, that they might be better able to endure blows; whence corpulent men or women were usually called *pugiles*. Mr Burette † has given the history of the ancient pugilate, or boxing, with great exactness.

BOXING, among sailors, is used to denote the rehearsal the several points of the compass in their proper order.

BOXING is also used for the tapping of a tree to make it yield its juice. The boxing of maple is performed by making an hole with an ax or chissel into the side of the tree about a foot from the ground; out of it flows a liquor of which sugar is made.

† Mem. Acad. Inſer. iv. 353.

BOXTEHUDE, a town of Germany, in the circle of Lower Saxony, subject to the Danes. It is seated on the rivulet Eisse, which falls into the Elbe, in E. Long. 9. 35. N. Lat. 53. 40.

BOXTEL, a town in Dutch Brabant, with sluices, seated on the river Bommel. E. Long. 5. 15. N. Lat. 51. 30.

BOYAR, a term used for a grandee of Russia and Transylvania. Becman says, that the boyars are the upper nobility; and adds, that the Czar of Muscovy, in his diplomas, names the boyars before the waywodes. See **WAYWODE**.

BOYAU, in fortification, a ditch covered with a parapet, which serves as a communication between two trenches. It runs parallel to the works of the body of the place; and serves as a line of contravallation, not only to hinder the sallies of the besieged, but also to secure the miners. But when it is a particular cut that runs from the trenches to cover some spot of ground, it is drawn so as not to be enfiladed or scoured by the shot from the town.

BOYD (Mark Alexander), an extraordinary genius, was son of Robert Boyd, who was eldest son of Adam Boyd of Pinkhill, brother to Lord Boyd. He was born in Galloway on the 13th of January 1562, and came into the world with teeth. He learned the rudiments of the Latin and Greek languages at Glasgow under two grammarians; but was of so high and intractable a spirit, that they despaired of ever making him a scholar. Having quarrelled with his masters, he beat them both, burnt his books, and forswore learning. While he was yet a youth, he followed the court, and did his utmost to push his interest there; but the fervour of his temper soon precipitated him into quarrels, from which he came off with honour and safety, though frequently at the hazard of his life. He, with the approbation of his friends, went to serve in the French army, and carried his little patrimony with him, which he soon dissipated at play. He was shortly after roused by that emulation which is natural to great minds, and applied himself to letters with unremitting ardour, till he became one of the most consummate scholars of his age. He is said to have translated Cæsar's Commentaries into Greek in the style of Herodotus, and to have written many Latin poems which were little inferior to the first productions of the Augustan age. He also left several manuscripts on philological, political, and historical subjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility dictate to three amanuenses at the same time, in different languages, and on different subjects. He was also one of the best Scottish poets of the age. To all this we must add, that his personal beauty and accomplishments were equal to his mental superiority. He died at Pinkhill in Scotland, in 1601. The following works, which are all that have been printed, were published in *Delicia Poetarum Scotorum*; Amstel. 1637. 12mo. 1. *Epigrammata*, lib. ii. 2. *Heroidum Epistola* XIV. lib. i. 3. *Hymni* XIV.

BOYER (Abel), a well known glossographer and historiographer, born at Caïres in France, in 1664. Upon the revocation of the edict of Nantz, he went first to Geneva, then to Franeker, where he finished his studies; and came finally to England, where he applied himself so closely to the study of the English language,

and made so great a proficiency therein, that he became an author of considerable note in it, being employed in the writing of several periodical and political works. He was for many years concerned in, and had the principal management of, a newspaper called the *Post-boy*. He likewise published a monthly work intitled the *Political state of Great Britain*. He wrote a life of queen Anne in folio, which is esteemed a very good chronicle of that period of the English history. But what has rendered him the most known, and established his name to the latest posterity, are the excellent Dictionary and Grammar of the French language, which he compiled, and which have been and still are reckoned the best in their kind. He also wrote, or rather translated from the French of M. de Racine, the tragedy of Iphigenia, which he published under the title of *the Victim*. It was performed with success at the theatre of Drury-lane, and is far from being a bad play.—Nor can there perhaps be a stronger instance of the abilities of its author, than success in such an attempt; since writing with any degree of correctness or elegance, even in prose, in a language which we were not born to the speaking of, is an excellence not very frequently attained; but to proceed so far in the perfection of it as to be even sufferable in poetry, and more especially in that of the Drama, in which the diction and manner of expression require a peculiar dignity and force, and in a language so difficult to attain the perfect command of as the English, is what has been very seldom accomplished. He died in 1729.

BOYER, in navigation, a kind of Flemish sloop, or small vessel of burden, having a boltsprit, a castle at each end, and a tall mast; chiefly fit for the navigation of rivers, and in many of its parts resembling a smack.

BOYES, idolatrous priests among the savages of Florida. Every priest attends a particular idol, and the natives address themselves to the priest of that idol to which they intend to pay their devotion. The idol is invoked in hymns, and his usual offering is the smoke of tobacco.

BOYLE (Richard), one of the greatest statesmen of the last century, and generally styled the *Great earl of Cork*, was the youngest son of Mr Roger Boyle, and was born at Canterbury, on the 3^d of October, 1566. He studied at Bennet college, Cambridge; afterwards became a student in the Middle Temple. Having lost his father and mother, and being unable to support himself in the prosecution of his studies, he became clerk to Sir Richard Manhood, one of the chief barons of the exchequer; but finding that by his employment he could not raise his fortune, he went to Ireland, in 1588, with few pounds in his pocket but he afterwards acquired thousands a year. He was then about 22, had a graceful person, and many accomplishments, which enabled him to render himself useful to several of the principal persons employed in the government, by drawing up for them memorials, cases, and answers. In 1595, he married Joan the daughter and coheirs of William Ansfley, who had fallen in love with him; and the dying in labour of her first child, who was born dead, in 1599, left him an estate of 500*l.* a year in land. In consequence of various services, and the great abilities he displayed, he gradually rose to the highest offices, and even to the dignity of the peerage of Ireland; to which he was raised by king James I. on the 29th of Sep-

September, 1616, by the style and title of *baron of Youghall*, in the county of Cork: four years after, he was created viscount Dungarvan and earl of Cork; and, in 1631, was made lord treasurer of Ireland, an honour that was made hereditary to his family. He particularly distinguished himself by the noble stand he made, when the fatal rebellion broke out in that kingdom, in the reign of Charles I.; and in his old age acted with as much bravery and military skill, as if he had been trained from his infancy to the profession of arms. He turned the castle of Lismore, his capital seat, into a fortress capable of demanding respect from the Irish. He immediately armed and disciplined his servants and Protestant tenants; and by their assistance, and a small army raised and maintained at his own expence, which he put under the command of his four sons, defended the province of Munster, and in the space of a year took several strong castles, and killed upwards of 3000 of the enemy: during which time he paid his forces regularly; and, when all his money was gone, like a true patriot, converted his plate into coin. This great man died on the 15th of September, 1634.

BOYLE (Richard), earl of Burlington and Corke, son to the former, was a nobleman of unblemished loyalty in rebellious times, and of untainted integrity in times of the greatest corruption. He was born at Youghall, October 20th, 1612, while his father was in the beginning of his prosperity, and only Sir Richard Boyle. He distinguished himself by his loyalty to king Charles I. He not only commanded troops, but raised and for a long time paid them, and continued to wait upon the king as long as any one place held out for him in England, and then was forced to compound for his estate. He contributed all in his power to the Restoration; on which king Charles II. raised him to the dignity of earl of Burlington, or Bridlington, in the county of York, in the year 1663. He died Jan. 15. 1697-8, in the 86th year of his age.

BOYLE (Roger), earl of Orrery, younger brother of the former, and the fifth son of Richard, styled the *Great earl of Cork*, was born April 25th, 1621; and, by the credit of his father with the lord deputy Faulkland, raised to the dignity and title of *baron Broghill*, when only seven years old. He was educated at the college of Dublin, where he soon distinguished himself as an early and promising genius. He afterwards made the tour of France and Italy; and at his return assisted his father in opposing the rebellious Irish, in which he behaved with all the spirit of a young, and all the discretion of an old, officer. Upon the murder of the king, he retired to Marston in Somersetshire, and hid himself in the privacy of a close retirement; but being at length ashamed to sit the tame spectator of all the mischief that appeared round him, he resolved to attempt something in favour of the king; and, under the pretence of going to the Spa for the recovery of his health, he determined to cross the seas, and apply himself to king Charles II. for a commission to raise what forces he could in Ireland, in order to restore his majesty, and recover his own estate. To this purpose, he prevailed on the earl of Warwick to procure a licence for his going to the Spa; and having raised a considerable sum of money, came up to London to prosecute his voyage: but he had not been long in town when he received a message from Cromwell, who was then general of the

parliament's forces, that he intended to wait upon him.

The lord Broghill was surpris'd at this message, having never had the least acquaintance with Cromwell; and desired the gentleman to let the general know, that he would wait upon his excellency. But while he was waiting the return of the messenger, Cromwell entered the room; and, after mutual civilities had pass'd between them, told him in few words, that the committee of state were apprized of his design of going over and applying to Charles Stuart for a commission to raise forces in Ireland; and that they were determined to make an example of him, if he himself had not diverted them from that resolution. The lord Broghill interrupted him, by assuring him that the intelligence which the committee had received was false, and that he neither was in a capacity nor had any inclination to raise disturbances in Ireland: but Cromwell, instead of making any reply, drew some papers out of his pocket, which were the copies of several letters which the lord Broghill had sent to those persons in whom he most confided, and put them into his hands. The lord Broghill, upon the perusal of these papers, finding it to no purpose to dissemble any longer, asked his excellency's pardon for what he had said, returned him his humble thanks for his protection against the committee, and intreated his direction how to behave in such a delicate conjuncture. Cromwell told him, that though till this time he had been a stranger to his person, he was not so to his merit and character: he had heard how gallantly his lordship had behaved in the Irish wars; and therefore, since he was named lord lieutenant of Ireland, and the reducing that kingdom was now become his province, he had obtained leave of the committee to offer his lordship the command of a general officer, if he would serve in that war; and he should have no oaths or engagements imposed upon him, nor be obliged to draw his sword against any but the Irish rebels.

The lord Broghill was infinitely surpris'd at so generous and unexpected an offer. He saw himself at liberty, by all the rules of honour, to serve against the Irish, whose rebellion and barbarities were equally detested by the royal party and the parliament. He desired, however, some time to consider of what had been proposed to him. But Cromwell briskly told him, that he must come to some resolution that very instant: that he himself was returning to the committee, who were still sitting; and if his lordship rejected their offer, they had determined to send him to the tower. Upon this, the lord Broghill, finding that his liberty and life were in the utmost danger, gave his word and honour that he would faithfully serve him against the Irish rebels: on which Cromwell once more assured him, that the conditions which he had made with him should be punctually observed; and then ordered him to repair to Bristol, adding, that he himself would soon follow him into Ireland. Lord Broghill, therefore, having settled the business of his command, went over into that country; where, by his conduct and intrepidity, he performed many important services, and fully justified the opinion Cromwell had conceived of him. By his own interest he now raised a gallant troop of horse, consisting chiefly of gentlemen attached to him by personal friendship; which corps was soon increased to a complete regiment of 15,000 men. These he led into the field against the Irish rebels; and was speedily

joined by Cromwell, who placed the highest confidence in his new ally, and found him of the greatest consequence to the interest of the commonwealth.

Among other considerable exploits performed by lord Broghill, the following deserves to be particularly mentioned. Whilst Cromwell laid siege to Clonwell, Broghill being detached to disperse a body of 5000 men who had assembled to relieve the place, he, with 2000 horse and dragoons, came up with the enemy at Maccroons on the 10th of May 1650; and, without waiting for the arrival of his foot, immediately attacked and routed them, making their general prisoner. Then proceeding to the castle of Carrigdroghid, he sent a summons to the garrison to surrender before the arrival of his battering cannon, otherwise they were to expect no quarter. His own army was surprised at this summons, as knowing he had not one piece of heavy cannon: but Broghill had ordered the trunks of several large trees to be drawn at a distance by his baggage horses; which the besieged perceiving, and judging from the slowness of the motion that the guns must be of a vast bore, immediately capitulated. He afterwards relieved Cromwell himself at Clonwell, where that great commander happened to be so dangerously situated, that he confessed, nothing but the seasonable relief afforded him by lord Broghill could have saved him from destruction. When Ireton sat down before Limeric, he gave Broghill 600 foot and 400 horse, with orders to prevent lord Mulkerry's joining the pope's nuncio, who had got together a body of 8000 men, and was determined to attempt the relief of Limeric. Mulkerry was at the head of 1000 horse and dragoons, and about 2000 foot: notwithstanding which, lord Broghill fell resolutely upon him. The Irish, having the advantage of the ground and numbers, would have conquered, but for a stratagem of lord Broghill. In the heat of the action he desired those about him to repeat what he said; and then cried out as loud as he could, "They run, they run." The first line of the Irish looked round to see if their rear broke, and the rear seeing the faces of their friends, and hearing the shouts of the enemy, imagined that the first line was routed, and fled. The taking of Limeric, which put an end to the war in Ireland, was the consequence of this defeat.

When Cromwell made protector, he sent for lord Broghill, merely to take his advice occasionally. And we are told, that, not long after his coming to England, he formed a project for engaging Cromwell to restore the old constitution. The basis of the scheme was to be a match between the king (Charles II.) and the protector's daughter. As his lordship maintained a secret correspondence with the exiled monarch and his friends, it was imagined that he was beforehand pretty sure that Charles was not averse to the scheme, or he would not have ventured to have proposed it seriously to Cromwell; who at first seemed not to think it not unfeasible. He soon changed his mind, however, and told Broghill that he thought his project impracticable: "For (said he) Charles can never forgive me the death of his father." In fine, the business came to nothing, altho' his lordship had engaged Cromwell's wife and daughter in the scheme; but he never durst let the protector know that he had previously treated with Charles about it.

On the death of the protector, lord Broghill continued attached to his son Richard, till, when he saw that the honesty and good nature of that worthy man would

infallibly render him a prey to his many enemies, he did not think it advisable to sink with a man that he could not save. The dark clouds of anarchy seemed now to be hovering over the British island. Lord Broghill saw the storm gathering, and he deemed it prudent to retire to his command in Ireland, where he shortly after had the satisfaction of seeing things take a turn extremely favourable to the design he had long been well-wisher to, *viz.* that of the king's restoration. In this great event Lord Broghill was not a little instrumental; and, in consideration of his eminent services in this respect, Charles created him earl of Orrery by letters-patent bearing date Sept. 5th, 1660. He was soon after made one of the lords justices of Ireland; and his conduct, while at the head of affairs in that kingdom, was such as greatly added to the general esteem in which his character was held before.

His lordship's active and toilsome course of life at length brought upon him some diseases and infirmities which gave him much pain and uneasiness; and a fever which fell into his feet, joined to the gout with which he was often afflicted, abated much of that vigour which he had shewn in the early part of his life: but his industry and application were still the same, and bent to the same purposes; as appears from his letters, which shew at once a capacity, and an attention to business, which do honour to that age, and may serve as an example to his.

Notwithstanding his infirmities, on the king's desiring to see his lordship in England, he went over in 1665. He found the court in some disorder; where his majesty was on the point of removing the great earl of Clarendon, lord high chancellor; and there was also a great misunderstanding between the two royal brothers. Lord Orrery undertook to reconcile the king with the duke of York; which he effected by prevailing on the latter to ask his majesty's pardon for some steps he had taken in support of the lord chancellor.

On his return to Ireland, he found himself called to a new scene of action. The Dutch war was then at its height; and the French, in confederacy with the Hollanders, were endeavouring to stir up the ashes of rebellion in Ireland. The duke de Beaufort, admiral of France, had formed a scheme for a descent upon Ireland; but this was rendered abortive by the extraordinary diligence, military skill, and prudent measures, of lord Orrery.

But in midst of all his labours, a dispute arose, founded on a mutual jealousy of each other's greatness, betwixt him and his old friend the duke of Ormond, then lord lieutenant; the bad effects of which were soon felt by both disputants, who resorted to England to defend their respective interests and pretensions, both having been attacked by secret enemies who suggested many things to their prejudice. This quarrel, though of a private beginning, became at last of a public nature; and producing first an attempt to frame an impeachment against the duke of Ormond, occasioned in the end, by way of revenge, an actual impeachment against the earl of Orrery. He defended himself, however, so well against a charge of high crimes, and even of treason itself, that the prosecution came to nothing. He nevertheless lost his public employments; but not the king's favour: he still came frequently to court, and sometimes to council. After this revolution in his affairs, he made several voyages to and from Ireland;

land; was often consulted by his majesty on affairs of the utmost consequence; and on all occasions gave his opinion and advice with the freedom of an honest plain-dealing man and a sincere friend; which the king always found him, and respected him accordingly.

In 1678, being attacked more cruelly than ever by his old enemy the gout, he made his last voyage to England for advice in the medical way. But his disorder was beyond the power of medicine; and having, in his last illness, given the strongest proofs of Christian patience, manly courage, and rational fortitude, he breathed his last on the 16th of October 1679, in the 59th year of his age. His lordship wrote, 1. A work intitled *The art of war*. 2. *Parthenissa*, a romance, in one volume folio. 3. Several poems. 4. Dramatic pieces, two volumes. 5. *State-tracts*, in one volume folio, &c. Mr Walpole, speaking of this nobleman, says, he never made a bad figure but as a poet. As a soldier, his bravery was distinguished, his stratagems remarkable. As a statesman, it is sufficient to say, that he had the confidence of Cromwell. As a man, he was grateful, and would have supported the son of his friend: but, like Cicero, and Richelieu, he could not be content without being a poet; though he was ill qualified, his writings of that kind being flat and trivial.

BOYLE (Robert), one of the greatest philosophers as well as best men that our own or indeed any other nation has produced, was the seventh son and the 14th child of Richard earl of Cork, and born at Lismore in the province of Munster in Ireland, Jan. 25th, 1626-7. Before he went to school, he was taught to write a very fair hand, and to speak French and Latin, by one of the earl's chaplains, and a Frenchman that he kept in the house. In the year 1635, his father sent him over to England, in order to be educated at Eaton school, under Sir Henry Wotton, who was the earl of Cork's old friend and acquaintance. Here he soon discovered a force of understanding which promised great things, and a disposition to cultivate and improve it to the utmost. While he remained at Eaton, there were several very extraordinary accidents that befel him, of which he has given us an account; and three of which were very near proving fatal to him. The first was, the sudden fall of the chamber where he was lodged, when himself was in bed; when, besides the danger he run of being crushed to pieces, he had certainly been choaked with the dust during the time he lay under the rubbish, if he had not had presence of mind enough to have wrapped his head up in the sheet, which gave him an opportunity of breathing without hazard. A little after this, he had been crushed to pieces by a starting horse that rose up suddenly, and threw himself backwards, if he had not happily disengaged his feet from the stirrups, and cast himself from his back before he fell. A third accident proceeded from the carelessness of an apothecary's servant, who, by mistaking the phials, brought him a strong vomit instead of a cooling julep.

He remained at Eaton, upon the whole, between three and four years; and then his father carried him to his own seat at Stalbridge in Dorsetshire, where he remained for some time under the care of one of his chaplains who was the parson of the place. In 1638, he attended his father to London; and remained with him at the Savoy, till his brother Mr Francis Boyle

espoused Mrs Elisabeth Killigrew; and then, towards the end of October, within four days after the marriage, the two brothers Francis and Robert were sent abroad upon their travels, under the care of Mr Marcombes. They embarked at Rye in Suffex, and from thence proceeded to Dieppe in Normandy: then they travelled by land to Rowen, fo to Paris, and from thence to Lyons; from which city they continued their journey to Geneva, where his governor had a family; and there the two gentlemen pursued their studies without interruption. Mr Boyle, during his stay here, refused his acquaintance with the mathematics, or at least with the elements of that science, of which he had before gained some knowledge. For he tells us in his own memoirs, that while he was at Eaton, and afflicted with an ague, before he was ten years old, by way of diverting his melancholy, they made him read Amadis de Gaul, and other romantic books, which produced such a selfishness in him, that he was obliged to apply himself to the extraction of the square and cube roots, and to the more laborious operations of algebra, in order to fix and settle the volatile operations of his fancy.

In September 1641, he quitted Geneva, after having spent 21 months in that city; and passing through Switzerland and the country of the Grisons, entered Lombardy. Then, taking his rout through Bergamo, Brescia, and Verona, he arrived at Venice; where having made a short stay, he returned to the continent, and spent the winter at Florence. Here he employed his spare hours in reading the modern history in Italian, and the works of the celebrated astronomer Galileo, who died in a village near this city during Mr Boyle's residence in it. It was at Florence that he acquired the Italian language; which he understood perfectly, though he never spoke it so fluently as the French. Of this indeed he was such a master, that as occasion required he passed for a native of that country in more places than one during his travels.

About the end of March 1642, he began his journey from Florence to Rome, which took up but five days. He surveyed the numerous curiosities of that city; among which, he tells us, "he had the fortune to see Pope Urban VIII. at chapel, with the cardinals, who, severally appearing mighty princes, in that assembly looked like a company of common friars." He visited the adjacent villages which had any thing curious or antique belonging to them; and had probably made a longer stay, had not the heats disagreed with his brother. He returned to Florence; from thence to Leghorn; and so by sea to Genoa: then passing through the county of Nice, he crossed the sea to Antibes, where he fell into danger from refusing to honour the crucifix: from thence he went to Marseilles by land. He was in that city, in May 1642, when he received his father's letters, which informed him that the rebellion had broken out in Ireland, and how difficultly he had procured the L 250 then remitted to them in order to help them home. They never received this money; and were obliged to go to Geneva with their governor Marcombes, who supplied them with as much at least as carried them thither. They continued there a considerable time, without either advice or supplies from England; upon which, Marcombes was obliged to take up some jewels upon his own credit, which were afterwards disposed of with as little loss as might be;

and with the money thus raised, they continued their journey for England, where they arrived in the year 1644. On their arrival, Mr Boyle found his father dead; and though the earl had made an ample provision for him, by leaving him his manor of Stalbridge in England, as well as other considerable estates in Ireland, yet it was some time before he could receive any money. However, he procured protections for his estates in both kingdoms from the powers then in being; from which he also obtained leave to go over to France for a short space, probably to settle accounts with his governor Mr Marcombes.

In March 1646, he retired to his manor at Stalbridge, where he resided for the most part till May 1650. He made excursions sometimes to London, sometimes to Oxford; and in February 1647, he went over to Holland; but he made no considerable stay any where. During his retirement at Stalbridge, he applied himself with incredible industry to studies of various kinds, to those of natural philosophy and chemistry in particular. He omitted no opportunity of obtaining the acquaintance of persons distinguished for parts and learning; to whom he was in every respect a ready, useful, generous assistant, and with whom he held a constant correspondence. He was also one of the first members of that small but learned body of men which, when all academical studies were interrupted by the civil wars, secreted themselves about the year 1645; and held private meetings, first in London, afterwards at Oxford, for the sake of canvassing subjects of natural knowledge upon that plan of experiment which Lord Bacon had delineated. They styled themselves then *The philosophical college*; and after the Restoration, when they were incorporated and distinguished openly, they took the name of the *Royal Society*.

In the summer of 1654, he put in execution a design he had formed for some time of residing at Oxford, where he chose to live in the house of one Mr Cross, an apothecary, rather than in a college, for the sake of his health, and because he had more room to make experiments. Oxford was indeed the only place at that time in England where Mr Boyle could have lived with much satisfaction; for here he found himself surrounded with a number of learned friends, such as Wilkins, Wallis, Ward, Willis, Wren, &c. suited exactly to his taste, and who had resorted thither for the same reasons that he had done, the philosophical society being now removed from London to Oxford. It was during his residence here that he improved that admirable engine the air-pump; and by numerous experiments was enabled to discover several qualities of the air, so as to lay a foundation for a complete theory. He was not, however, satisfied with this; but laboured incessantly in collecting and digesting, chiefly from his own experiments, the materials requisite for this purpose. He declared against the philosophy of Aristotle, as having in it more of words than things; promising much, and performing little; and giving the inventions of men for indubitable proofs, instead of building upon observation and experiment. He was so zealous for, and so careful about, this true method of learning by experiment, that, though the Cartesian philosophy then made a great noise in the world, yet he would never be persuaded to read the works of Des Cartes, for fear he should be amused and led away by plausible accounts of things founded on

conjecture, and merely hypothetical. But philosophy, and inquiries into nature, though they engaged his attention deeply, did not occupy it entirely; since we find that he still continued to pursue critical and theological studies. In these he had the assistance of some great men, particularly Dr Edward Pocock, Mr Thomas Hyde, and Mr Samuel Clarke, all of great eminence for their skill in the oriental languages. He had also a strict intimacy with Dr Thomas Barlow, at that time head keeper of the Bodleian library, and afterwards bishop of Lincoln, a man of various and extensive learning. In the year 1659, Mr Boyle, being acquainted with the unhappy circumstances of the learned Sanderfon, afterwards bishop of Lincoln, who had lost all his preferences on account of his attachment to the royal party, conferred upon him an honorary stipend of 50l. a-year. This stipend was given as an encouragement to that excellent master of reasoning to apply himself to the writing of "*Cases of Conscience*;" and accordingly he printed his lectures *De obligatione conscientie*, which he read at Oxford in 1647, and dedicated them to his friend and patron.

Upon the restoration of Charles II. Mr Boyle was treated with great civility and respect by the king, as well as by the two great ministers the lord treasurer Southampton and the lord chancellor Clarendon. He was solicited by the latter to enter into holy orders, not only out of regard to him and his family, but chiefly with a view to serve the church itself; for Mr Boyle's noble family, his distinguished learning, and above all his unblemished reputation, induced Lord Clarendon to think that any ecclesiastical preferments he might attain would be worthily discharged, so as to do honour to the clergy, and service to the established communion. Mr Boyle considered all this with due attention: but, to balance these, he reflected, that, in the situation of life in which he was, whatever he wrote with respect to religion would have so much the greater weight as coming from a layman; since he well knew that the irreligious fortified themselves against all that the clergy could offer, by supposing, and saying, that it was their trade, and that they were paid for it. He considered likewise, that, in point of fortune and character, he needed no accessions; and indeed he never had any appetite for either. He chose, therefore, to pursue his philosophical studies in such a manner as might be most effectual for the support of religion; and began to communicate to the world the fruits of these studies.

The first of these was printed at Oxford in 1660, in 8vo, under the title of, 1. *New experiments, physico-mechanical, touching the spring of the air and its effects.* 2. *Seraphic love; or some motives and incentives to the love of God, pathetically discoursed of in a letter to a friend.* 3. *Certain physiological essays and other tracts,* 1661, 4to. 4. *Sceptical chemist,* 1662, 8vo; a very curious and excellent work, reprinted about the year 1679, 8vo, with the addition of divers experiments and notes about the producibleness of chemical principles.

In the year 1663, the royal society being incorporated by king Charles II. Mr Boyle was appointed one of the council; and as he might be justly reckoned among the founders of that learned body, so he continued one of the most useful and industrious of its mem-

bers during the whole course of his life. In June 1663, he published, 5. Considerations touching the usefulness of experimental natural philosophy, 4to. 6. Experiments and considerations upon colours; to which was added a letter containing Observations on a diamond that shines in the dark, 1663, 8vo. This treatise is full of curious and useful remarks on the hitherto unexplained doctrine of light and colours; in which he shews great judgment, accuracy, and penetration; and may be said to have led the way to that mighty genius the great Sir Isaac Newton, who has since set that point in the clearest and most convincing light. 7. Considerations on the style of the Holy Scriptures, 1663, 8vo. It was an extract from a larger work, intitled *An essay on scripture*; which was afterwards published by Sir Peter Pett, a friend of Mr Boyle's.

In 1664, he was elected into the company of the royal mines; and was all this year taken up in the prosecution of various good designs, which probably was the reason why he did not lend abroad any treatises either of religion or philosophy. The year following, came forth, 8. Occasional reflections upon several subjects; whereto is prefixed a discourse about such kind of thoughts, 1665, 8vo. This piece is addressed to *Sophronia*, under whose name he concealed that of his beloved sister the viscountess of Ranelagh. The thoughts themselves are on a vast variety of subjects, written many years before; some indeed upon trivial occasions, but all with great accuracy of language, much wit, more learning, and in a wonderful train of moral and pious reflection. Yet this exposed him to the only severe censure that ever was passed upon him; and that too from no less a man than the celebrated Dean Swift, who, to ridicule these discourses, wrote *A pious meditation upon a broomstick, in the style of the Honourable Mr Boyle*. But, as his noble relation the late Lord Orrery has said, "to what a height must the spirit of sarcasm arise in an author, who could prevail on himself to ridicule so good a man as Mr Boyle? The sword of wit, like the scythe of time, cuts down friend and foe, and attacks every object that lies in its way. But, sharp and irresistible as the edge of it may be, Mr Boyle will always remain invulnerable."

The same year, he published an important work intitled, 9. New experiments and observations upon cold, 1665, 8vo. In the year 1666, he published, 10. Hydrostatical paradoxes made out by new experiments, for the most part physical and easy, in 8vo. 11. The origin of forms and qualities, according to the corporeal philosophy, illustrated by considerations and experiments. This treatise did great honour to Mr Boyle, whether we consider the quickness of his wit, the depth of his judgment, or his indefatigable pains in searching after truth. We must not forget to observe, that, both in this and the former year, he communicated to his friend Mr Oldenburgh, who was secretary to the royal society, several curious and excellent short treatises of his own, upon a great variety of subjects, and others transmitted to him by his learned friends both at home and abroad, which are printed and preserved in the Philosophical Transactions.

In the year 1668, Mr Boyle resolved to settle in London for life; and removed for that purpose to the house of his sister, the lady Ranelagh, in Pall-Mall. This was to the infinite benefit of the learned in gene-

ral, and particularly to the advantage of the royal society, to whom he gave great and continual assistance, as the several pieces communicated to them from time to time, and printed in their Transactions, do abundantly testify. Those who applied to him, either to desire his help, or to communicate to him any new discoveries in science, he had his set hours for receiving; otherwise, it is easy to conceive that he would have had very little of his time for himself. But, besides these, he kept a very extensive correspondence with persons of the greatest figure, and most famous for learning, in all parts of Europe. In the year 1669, he published, 12. A continuation of new experiments touching the weight and spring of the air; to which is added, A discourse of the atmospheres of consistent bodies: and the same year he revised and made many additions to several of his former tracts, some of which were now translated into Latin, in order to gratify the curious abroad. 13. Tracts about the comical qualities of things; comical suspensions; the temperature of the subterraneous regions; the bottom of the sea: to which is prefixed an introduction to the history of particular qualities. This book occasioned much speculation, as it seemed to contain a vast treasure of knowledge which had never been communicated to the world before; and this too grounded upon actual experiments, and arguments justly drawn from them, instead of that notional and conjectural philosophy which in the beginning of the 17th century had been so much in fashion.

In the year 1671, he published, 14. Considerations on the usefulness of experimental and natural philosophy; the second part; 4to. And, 15. A collection of tracts upon several useful and important points of practical philosophy, 4to. Both of which works were received as new and valuable gifts to the learned world. 16. An essay about the origin and virtues of gems, 1672, 8vo. 17. A collection of tracts upon the relation between flame and air; and several other useful and curious subjects; besides furnishing, in this and the former year, a great number of short dissertations upon a vast variety of topics, addressed to the royal society, and inserted in their Transactions. 18. Essays on the strange subtilty, great efficacy, and determinate nature, of effluvia; to which were added a variety of experiments on other subjects; 1673, 8vo. 19. A collection of tracts upon the saltiness of the sea, the moisture of the air, the natural and preternatural state of bodies; to which is prefixed a dialogue concerning cold; 1674, 8vo. 20. The excellency of theology compared with philosophy, 1673, 8vo. This discourse was written in the year 1665, while Mr Boyle, to avoid the great plague which then raged in London, was forced to go from place to place in the country, and had little or no opportunity of consulting his books. It contains a great number of curious and useful, as well as just and natural, observations. 21. A collection of tracts containing suspensions about hidden qualities of the air; with an appendix touching celestial magnets; animadversions upon Mr Hobbes's problem about a vacuum; a discourse of the cause of attraction and fusion; 1674, 8vo. 22. Some considerations about the reconcilableness of reason and religion. By T. E. a layman. To which is annexed a discourse about the possibility of the resurrection. By Mr Boyle. 1675, 8vo. The reader must be informed, that both these pieces were of his writing;

writing; only he thought fit to mark the former with the final letters of his name. Among other papers that he communicated this year to the royal society, there were two connected into one discourse: the first was intitled An experimental discourse of quicksilver growing hot with gold; the other related to the same subject; and both of them contained discoveries of the utmost importance.

In the year 1676, he published, 23. Experiments and notes about the mechanical origin or production of particular qualities, in several discourses on a great variety of subjects, and among the rest on electricity. In 1678, he communicated to Mr Hooke a short memorial of some observations made upon an artificial substance that shines without any preceding illustration; which that gentleman thought fit to publish in his *Lectioes Cutlerianæ*. 24. Historical account of a degradation of gold made by an anti-elixir. This made a great noise both at home and abroad, and is looked upon as one of the most remarkable pieces that ever fell from his pen; since the facts contained in it would have been esteemed incredible, if they had been related by a man of less integrity and piety than Mr Boyle. The regard which the great Newton had for Mr Boyle, appears from a very curious letter, which the former wrote to him, at the latter end of this year, for the sake of laying before him his sentiments of that ethereal medium, which he afterwards considered, in his Optics, as the cause of gravitation. This letter is to be found in the life of our author by the reverend Dr Birch.

In the year 1680, Mr Boyle published, 25. The aerial nœstiluca; or some new phenomena, and a process of a factitious self-shining substance, 8vo. This year the Royal Society, as a proof of the just sense of his great worth, and of the constant and particular services, which through a course of many years he had done them, made choice of him for their president; but he being extremely, and, as he says, peculiarly tender in point of oaths, declined the honour done him, by a letter addressed to "his much respected friend Mr Robert Hooke, professor of mathematics at Gresham College." 26. Discourse of things above reason; inquiring, whether a philosopher should admit any such, 1681, 8vo. 27. New experiments and observations upon the icy nœstiluca; to which is added a chemical paradox, grounded upon new experiments, making it probable that chemical principles are transmutable, so that out of one of them others may be produced, 1682, 8vo. 28. A continuation of new experiments, physico-mechanical, touching the spring and weight of the air, and their effects, 1682, 8vo. In 1683, he published nothing but a short letter to Dr Beale, in relation to the making of fresh water out of salt. In 1684, he published two very considerable works, viz. 29. Memoirs for the natural history of human blood, especially the spirit of that liquor, 8vo; and, 30. Experiments and considerations about the porosity of bodies, 8vo.

In 1685, Mr Boyle obliged the world with, 31. Short memoirs for the natural experimental history of mineral waters, with directions as to the several methods of trying them; including abundance of new and useful remarks, as well as several curious experiments. 32. An essay on the great effects of even languid and unheeded motion; whereunto is annexed an experimental discourse of some hitherto little regarded causes of the fa-

lubrity and infalubrity of the air, and its effects. None of his treatises, it is said, were ever received with greater or more general applause than this. 33. Of the reconcilableness of specific medicines to the corpuscular philosophy; to which is annexed a discourse about the advantages of the use of simple medicines; 8vo. Besides these philosophical tracts, he gave the world, the same year, an excellent theological one, 34. Of the high veneration man's intellect owes to God, peculiarly for his wisdom and power, 8vo.

At the entrance of the succeeding year, came abroad his, 35. Free inquiry into the vulgarly received notion of nature; a piece which was then, and will always be, greatly admired by those who have a true zeal and relish for pure religion and philosophy. In 1687, he published, 36. The martyrdom of Theodora and Didymia; a work he had drawn up in his youth. 37. A dissertation about the final causes of natural things; wherein it is inquired, whether, and (if at all) with what caution, a naturalist should admit them; with an appendix about vitiated light; 1688, 8vo. In the month of May this year, our author, though very unwillingly, was constrained to make his complaint to the public, of some inconveniences under which he had long laboured; and this he did by an advertisement, about "the loss of many of his writings addressed to J. W. to be communicated to those of his friends that are virtuosi; which may serve as a kind of preface to most of his mutilated and unfinished writings." He complains in this advertisement of the treatment he had met with from plagiarists both at home and abroad; and though it might have been difficult in any other man to have done so without incurring the imputation of self-conceit and vanity, yet Mr Boyle's manner is such as only to raise in us a higher esteem and admiration of him. This advertisement is inserted at length in his life by Birch.

He began now to find that his health and strength, notwithstanding all his care and caution, gradually declined, as he observes in a letter to Mr Le Clerc, dated May 30th, 1689; which put him upon using every possible method of husbanding his remaining time for the benefit of the learned. It was with this view that he no longer communicated particular discourses, or new discoveries, to the royal society; because this could not be done without withdrawing his thoughts from tasks which he thought of still greater importance. It was the more steadily to attend to these, that he resigned his post of governor of the corporation for propagating the gospel in New-England; nay, he went so far as to signify to the world that he could no longer receive visits as usual, in an advertisement which begins in the following manner: "Mr Boyle finds himself obliged to intimate to those of his friends and acquaintance, that are wont to do him the honour and favour of visiting him, 1. That he has by some unlucky accidents, namely, by his servant's breaking a bottle of oil of vitriol over a chest which contained his papers, had many of his writings corroded here and there, or otherwise so maimed, that without he himself fill up the lacunæ out of his memory or invention, they will not be intelligible. 2. That his age and fickleness have for a good while admonished him to put his scattered and partly defaced writings into some kind of order, that they may not remain quite useless. And, 3. That his skillful and friendly physician, Sir Edmund King, seconded by Mr Boyle's

Boyle's best friends, has pressingly advised him against speaking daily with so many persons as are wont to visit him, representing it as what cannot but waste his spirits, &c. He ordered likewise a board to be placed over his door, with an inscription signifying when he did, and when he did not, receive visits."

Among the other great works, which by this means he gained time to finish, there is great reason to believe, that one was, a collection of elaborate processes in chemistry; concerning which he wrote a letter to a friend, which is still extant; wherein we read, that "he left it as a kind of hermetic legacy to the studious disciples of that art." Besides these papers committed to the care of one whom he esteemed his friend, he left very many behind him at his death, relating to chemistry; which, as appears by a letter directed to one of his executors, he desired might be inspected by three physicians whom he named, and that some of the most valuable might be preserved.

In the mean time, Mr Boyle published some other works before his death; as, 38. *Medicina Hydrostatica*; or, Hydrostaticks applied to the materia medica, shewing, how by the weight that divers bodies used in physic have in water, one may discover whether they be genuine or adulterated. To which is subjoined a previous hydrostatical way of estimating ores. 1690, 8vo. 39. The Christian virtuoso; shewing, that by being addicted to experimental philosophy, a man is rather assisted than indisposed to be a good Christian. To which are subjoined, 1. A discourse about the distinction that represents some things as above reason, but not contrary to reason. 2. The first chapters of a discourse intitled *Greatness of mind promoted by Christianity*. The last work which he published himself, was in the spring of 1691; and is intitled, 40. *Experimenta et Observations Physicæ*; wherein are briefly treated of several subjects relating to natural philosophy in an experimental way. To which is added a small collection of strange reports. 8vo.

About the entrance of the summer, he began to feel such an alteration in his health as induced him to think of settling his affairs; and accordingly, on the 18th of July, he signed and sealed his last will, to which he afterwards added several codicils. In October, his distempers increased; and on the last day of December 1691, he departed this life, in the 65th year of his age. He was buried in St Martin's church in the Fields, Westminster, on the 7th of January following; and his funeral sermon was preached by Dr Gilbert Burnet, bishop of Salisbury. The bishop made choice upon this occasion of a text very apposite to the subject; namely, "For God giveth to a man that is good in his sight, wisdom, knowledge, and joy *." After explaining the meaning of the words, he applies the doctrine to the honourable person deceased; of whom, he tells us, he was the better able to give a character from the many happy hours he had spent in conversation with him, in the course of 29 years. He gives a large account of Mr Boyle's sincere and unaffected piety; and more especially of his zeal for the Christian religion, without having any narrow notions concerning it, or mistaking, as so many do, a bigotted heat in favour of a particular sect, for that zeal which is an ornament of a true Christian. He mentions, as a proof of this, his noble foundation for lectures in defence of the gospel against

infidels of all sorts; the effects of which have been so conspicuous in the many volumes of excellent discourses which have been published in consequence of that noble and pious foundation. He was at the charge of the translation and impression of the New Testament into the Malayan tongue, which he sent over all the East Indies. He gave a noble reward to him that translated Grotius's incomparable book, "Of the truth of the Christian religion" into Arabic; and was at the charge of a whole impression, which he took care should be dispersed in all the countries where that language was understood. He was resolved to have carried on the impression of the New Testament in the Turkish language; but the company thought it became them to be the doers of it, and so suffered him only to give a large share towards it. He was at 700*l.* charge in the edition of the Irish bible, which he ordered to be distributed in Ireland; and he contributed liberally, both to the impression of the Welsh bible, and of the Erse bible for Scotland. He gave, during his life, 300*l.* to advance the design of propagating the Christian religion in America; and as soon as he heard that the East India company were entertaining propositions for the like design in the east, he sent 100*l.* for a beginning, as an example, but intended to carry it much farther when it should be set on foot to purpose.

In other respects his charities were so bountiful and extensive, that they amounted, as this prelate tells us, from his own knowledge, to upwards of 1000*l.* a year. But as our limits will not allow us to follow the bishop in the copious and eloquent account he has given of this great man's abilities, we must therefore content ourselves with adding the short eulogium by the celebrated physician, philosopher, and chemist, Dr Herman Boerhaave; who, after having declared lord Bacon to be the father of experimental philosophy, asserts, that "Mr Boyle, the ornament of his age and country, succeeded to the genius and inquiries of the great chancellor Verulam. Which (says he) of all Mr Boyle's writings shall I recommend? All of them. To him we owe the secrets of fire, air, water, animals, vegetables, fossils: so that from his works may be deduced the whole system of natural knowledge." The reader perhaps may here be pleased to know, that Mr Boyle was born the same year in which lord Bacon died.

As to the person of this great man, we are told, that he was tall, but slender; and his countenance pale and emaciated. His constitution was so tender and delicate, that he had divers sorts of cloaks to put on when he went abroad, according to the temperature of the air; and in this he governed himself by his thermometer. He escaped indeed the small-pox; but for almost forty years he laboured under such feebleness of body, and such lowness of strength and spirits, that it was astonishing how he could read, meditate, make experiments, and write, as he did. He had likewise a weakness in his eyes; which made him very tender of them, and extremely apprehensive of such distempers as might affect them. He imagined likewise, that if sickness should confine him to his bed, it might raise the pains of the stone to a degree which might be above his strength to support; so that he feared his last minutes should be too hard for him. This was the ground of all the caution and apprehension with which he was observed to live; but as to life itself, he had that just indifference for it

which

Boyle.

which became a philosopher and a Christian. However, his sight began to grow dim not above four hours before he died; and when death came upon him, he had not been above three hours in bed, before it made an end of him with so little pain, that the flame appeared to go out merely for want of oil to maintain it.

Mr Boyle was never married; but Mr Evelyn was assured, that he courted the beautiful and ingenious daughter of Cary earl of Monmouth, and that to this passion was owing his "Seraphic Love." In the memorandum of Mr Boyle's life set down by bishop Burnet, it is remarked that he abstained from marriage, at first out of policy, afterwards more philosophically; and we find by a letter of Dr John Wallis to him, dated at Oxford, July 17th, 1669, that he had an overture made him with respect to the lady Mary Hastings, sister to the earl of Huntingdon: But it does not appear from any of his papers, that he had ever entertained the least thoughts of that kind; nay, there is a letter of his, wrote when he was young, to the lady Barrymore his niece, who had informed him of a report that he was actually married, which almost shows that he never did. The letter is written with great politeness, and in the true spirit of gallantry; and is a clear proof, that though Mr Boyle did not chuse to marry, yet it was no misanthropic cynical humour which restrained him from it. It is impossible to entertain the reader better than by presenting him with that part of it which concerns the point in question. "It is high time for me to hasten the payment of the thanks I owe your ladyship for the joy you are pleased to wish me, and of which that wish possibly gives me more than the occasion of it would. You have certainly reason, madam, to suspend your belief of a marriage, celebrated by no priest but Fame, and made unknown to the supposed bridegroom. I may possibly ere long give you a fit of the spleen upon this theme; but at present it were incongruous to blend such pure railery, as I ever prate of matrimony and amours with, among things I am so serious in as those this scribble presents you. I shall therefore only tell you, that the little gentleman and I are still at the old defiance. You have carried away too many of the perfections of your sex to leave enough in this country for reducing so stubborn a heart as mine; whose conquest were a task of so much difficulty, and so little worth it, that the latter property is always likely to deter any that hath beauty and merit enough to overcome the former. But though this untamed heart be thus insensible to the thing itself called *love*; it is yet very accessible to things very near of kin to that passion; and esteem, friendship, respect, and even admiration, are things that their proper objects fail not proportionably to exact of me, and consequently are qualities which in their highest degrees are really and constantly paid my lady Barrymore by her most obliged humble servant, and affectionate uncle, ROBERT BOYLE."

We shall conclude this account of Mr Boyle with the mention of his posthumous works, which are as follow. 1. "The general History of the air designed and begun." 2. "General heads for the natural history of a country, great or small; drawn out for the use of travellers and navigators." 3. "A paper of the honourable Robert Boyle's, deposited with the secretaries of the Royal Society, October 14th, 1680, and opened since his death; being an account of his making the

Boyle.

"phosphorus, September 30th, 1680." Printed in the Philosophical Transactions. 4. "An account of a way of examining waters, as to freshness or saltness." 5. "A free discourse against customary swearing, and a dissuasive from curing," 1695, 8vo. 6. "Medicinal experiments; or a collection of choice remedies, chiefly simple and easily prepared, useful in families, and fit for the service of the country people. The third and last volume, published from the author's original manuscript; whereunto is added several useful notes explicatory of the fame." 1698, 12mo. Beautiful editions of all his works have been printed at London, in 5 volumes folio, and 6 volumes 4to.

BOYLE (Charles) earl of Orrery in Ireland, and baron of Marston in the county of Somerset, was the second son of Roger the second earl of Orrery, and was born in August 1679. He was educated at Christ-church in Oxford, and soon distinguished himself by his learning and abilities. Like the first earl of Orrery, he was an author, a soldier, and a statesman. He translated the life of Lyfander from the Greek of Plutarch; and published a new edition of the epistles of Phalaris, which engaged him in a literary dispute, in which he defended the genuineness of these epistles against Dr Bentley. He was three times member for the town of Huntingdon; but his elder brother, Lionel earl of Orrery, dying on the 23d of August 1703 without issue, he succeeded to that title; and, entering into the Queen's service, had a regiment given him, when he behaved with such bravery, that in 1709 he was raised to the rank of major-general, and sworn one of her majesty's privy council. At the famous battle of the wood, he gave the strongest proofs of his intrepid courage, remaining at the head of his regiment in the warmest part of the action, till the victory was complete, which, as it was one of the most glorious, so it was the dearest bought, of any of that war. His lordship had the honour of being appointed the Queen's envoy to the states of Brabant and Flanders; and having honourably discharged that trust, was raised to the dignity of a British Peer, by the title of lord Boyle, baron of Marston, in Somersetshire. He enjoyed several other additional honours in the reign of King George I.; but having the misfortune to fall under the suspicion of the government, his lordship was committed to the tower: he was, however, at length admitted to bail; and nothing being found that could be esteemed a sufficient ground for a prosecution, he was discharged. His lordship died August 28th 1731, in the 66th year of his age. To his tutor, Mr Atterbury, he probably owed a good part of that fine relish he had for the writings of the ancients. He made these his constant study, and expressed a high contempt, says Budgell, for the greater part of our modern wits and authors. He was delighted with the company of two sorts of persons; either such as were really geniuses of the first rank, who had fine understandings, strong judgements, and true tastes; or such as had a few foibles, and an eye of ridicule in them, which served to make him laugh. He would rally these in so agreeable, and yet in so tender a manner, that, though it diverted himself and others, it was never offensive to the person rallied. The instrument which was invented by him, and bears his name, representing the solar system according to the sentiments of the new astronomers, is an undeniable

undeniable

Boyle

Boyle.

Boyle.

undeniable proof of his mechanic genius. His lordship had also a turn for medicine; which led him not only to buy and read whatever was published on that subject, but also to employ his friends to fend him accounts of herbs and drugs in foreign countries.

BOYLE (John), earl of Cork and Orrery, a nobleman distinguished by his learning and genius, was the only son of Charles earl of Orrery, and was born on the 2^d of January 1707. He was educated at Christ-church college in Oxford; but, as he himself declares, early disappointments, indifferent health, and many untoward accidents, rendered him fond of retirement, and of improving his talents for polite literature and poetry; of which last art he gave several excellent specimens. He also wrote a Translation of Pliny the Younger's letters, with various notes, for the service of his eldest son the lord Boyle, in two volumes 4to. This was first published in 1751. The year following, he published the Life of Dean Swift, in several letters, addressed to his second son Hamilton Boyle; and afterwards printed Memoirs of Robert Cary earl of Monmouth, a manuscript presented to him by a relation, with explanatory notes. He died in 1762.

BOYNE, a river in Ireland, which rises in Queen's county in the province of Leinster, and runs north-east by Trim and Cavan, falling at last into the Irish channel a little below Drogheda. It is memorable for a battle fought on its banks between James II. and king William III. in which the former was defeated.

BOYSE, Boys, or Bois (John), one of the translators of the Bible in the reign of James I. was son of William Bois, rector of West Stowe, near St Edmundsbury Suffolk, and born at Nettleshead in Suffolk on the 3^d of January 1560. He was taught the first rudiments of learning by his father; and his capacity was such, that at the age of five years he read the Bible in Hebrew. He went afterwards to Hadley school; and at 14 was admitted of St John's college, Cambridge, where he distinguished himself by his skill in Greek. Happening to have the small-pox when he was elected fellow, he, to preserve his seniority, caused himself to be carried in blankets to be admitted. He applied himself for some time to the study of medicine; but, fancying himself affected with every disease he read of, he quitted that science. He was ten years chief Greek lecturer in his college, and read every day. He voluntarily read a Greek lecture for some years at four in the morning, in his own chamber, which was frequented by many of the fellows. On the death of his father, he succeeded him in the rectory of West Stowe. At the age of 36, he married the daughter of Mr Holt, rector of Boxworth in Cambridgeshire; whom he succeeded in that living, October 13th 1596. On his quitting the university, the college gave him 100l. His young wife, who was bequeathed to him with the living, which was an adwoson, proving a bad economist, and he himself being wholly addicted to his studies, he soon became so much involved in debt, that he was obliged to sell his choice collection of books, consisting of almost every Greek author then extant. When a new translation of the Bible was by king James I. directed to be made, Mr Bois was elected one of the Cambridge translators. He performed not only his own, but also the part assigned to another with great reputation; though with no profit, for he had no al-

lowance but his commons. He was also one of the six who met at Stationers Hall to revise the whole; which task they went through in nine months, having each from the company of stationers, during that time, 30s. a-week. He afterwards assisted Sir Henry Saville in publishing the works of St Chryostom. In 1615, Dr Lancelot Andrews, bishop of Ely, bestowed on him, unasked, a prebend in his church. He died on the 14th of January 1643, in the 84th year of his age. He left a great many manuscripts behind him, particularly a Commentary on almost all the books of the New Testament.—When he was a young student at Cambridge, he received from the learned Dr Whitaker three rules for avoiding those distempers which usually attend a sedentary life, to which he adhered with equal constancy and success. The first was, To study always standing; the second, Never to study in a window; and the third, Never to go to bed with his feet cold.

BOYSE (Joseph), a late eminent dissenting minister in Dublin, much respected not only for learning and abilities, but his extensive humanity and undisturbed piety. During his ministerial charge at Dublin, he published many sermons which compose several folio volumes, a few poems, and other tracts; but what chiefly distinguished him as a writer, was the controversy he carried on with Dr King, archbishop of Dublin, and author of the *Origin of Evil*, concerning the office of a scriptural bishop. This controverted point was managed on both sides with great force of argument and calmness of temper. The bishop asserted, that the episcopal right of jurisdiction had its foundation in the New Testament: Mr Boyse, consistent with his principles, denied that any ecclesiastical superiority appeared there, with the greatest candour and good manners. He was father to

BOYSE (Samuel), the poet, a man remarkable for the fineness of his genius, the lowness of his manners, and the wretchedness of his life. He was born in 1708, and received the rudiments of his education in a private school in Dublin. When he was but 18 years old, his father, who probably intended him for the ministry, sent him to the university of Glasgow, that he might finish his education there. He had not been a year at the university, when he fell in love with the daughter of a tradesman in that city, and was imprudent enough to interrupt his education by marrying her before he had entered into his 20th year. The natural extravagance of his temper soon exposed him to want; and as he had now the additional charge of a wife, his reduced circumstances obliged him to quit the university, and go over with his wife (who also carried a sifter with her) to Dublin, where they relied on the old gentleman for support. Young Boyse was of all men the furthest removed from a gentleman; he had no graces of person, and fewer still of conversation. Never were three people of more libertine characters than young Boyse, his wife, and sifter-in-law; yet the two ladies wore such a mask of decency before the old gentleman, that his fondness was never abated. The estate his father possessed in Yorkshire was sold to discharge his debts; and when the old man lay in his last sickness, he was entirely supported by presents from his congregation, and buried at their expence. We have no further account of Mr Boyse, till we find him soon after his father's death at Edinburgh. At this place his poetical genius raised

Boyle.

him many friends, and some patrons of very great eminence. He published a volume of poems in 1731, to which is subjoined *The Tablature of Cebers*, and *A letter upon liberty*, inserted in the *Dublin journal* 1726; and by these he obtained a very great reputation. They are addressed to the countess of Eglinton. This amiable lady was the patroness of all men of wit, and very much distinguished Mr Boyle while he resided in that country. Upon the death of the viscountess Stormont, Mr Boyle wrote an elegy, which was very much applauded by her ladyship's relations. This elegy he intitled *The tears of the muses*, as the deceased lady was a woman of the most refined taste in the sciences, and a great admirer of poetry. The lord Stormont was so much pleased with this mark of esteem paid to the memory of his lady, that he ordered a very handsome present to be given to Mr Boyle by his attorney at Edinburgh. The notice which lady Eglinton and the lord Stormont took of our poet, recommended him likewise to the patronage of the duchess of Gordon, who was so solicitous to raise him above necessity, that she employed her interest in procuring the promise of a place for him. She gave him a letter, which he was next day to deliver to one of the commissioners of the customs at Edinburgh. It happened that he was then some miles distant from the city; and the morning on which he was to have rode to town with her Grace's letter of recommendation proved to be rainy. This slender circumstance was enough to discourage Boyle, who never looked beyond the present moment: he declined going to town on account of the rainy weather; and while he let slip the opportunity, the place was bestowed upon another, which the commissioner declared he kept for some time vacant, in expectation of seeing a person recommended by the duchess of Gordon. Boyle at last, having defeated all the kind intentions of his patrons towards him, fell into contempt and poverty, which obliged him to quit Edinburgh. He communicated his design of going to London to the duchess of Gordon; who, having still a very high opinion of his poetical abilities, gave him a letter of recommendation to Mr Pope, and obtained another for him to Sir Peter King the lord chancellor of England. Lord Stormont recommended him to the solicitor-general his brother, and many other persons of the first fashion. Upon receiving these letters, he, with great caution, quitted Edinburgh, regretted by none but his creditors. Upon his arrival in London, he went to Twickenham, in order to deliver the duchess of Gordon's letter to Mr Pope; but that gentleman not being at home, Mr Boyle never gave himself the trouble to repeat his visit. He wrote poems; but those, though excellent in their kind, were lost to the world, by being introduced with no advantage. He had so strong a propensity to groveling, that his acquaintance were generally of such a cast as could be of no service to him; and those in higher life he addressed by letters, not having sufficient confidence or politeness to converse familiarly with them. Thus unfit to support himself in the world, he was exposed to variety of distresses, from which he could invent no means of extricating himself but by writing mendicant letters. It will appear amazing, that this man, of so abject a spirit, was voluptuous and luxurious: he had no taste for any thing elegant, and yet was to the last degree expensive. Can it be believed, that often when he had

Boyle.

received but a guinea, in consequence of a supplicating letter, he would go into a tavern, order a supper to be prepared, drink of the richest wines, and spend all the money that had just been given him in charity, without having any one to participate the regale with him, and while his wife and child were starving at home?

It was about the year 1740, that Mr Boyle, reduced to the last extremity of human wretchedness, had not a shirt, a coat, or any kind of apparel, to put on; the sheets in which he lay were carried to the pawnbroker's, and he was obliged to be confined to his bed with no other covering than a blanket. He had little support but what he got by writing letters to his friends in the most abject style; but was perhaps ashamed to let this instance of his distress be known, which probably was the occasion of his remaining six weeks in that situation. During this time he had some employment in writing verses for the Magazines; and whoever had seen him in his study, must have thought the object singular enough: he sat up in bed with the blanket wrapt about him, through which he had cut a hole large enough to admit his arm, and, placing the paper upon his knee, scribbled in the best manner he could the verses he was obliged to make: whatever he got by those, or any other of his begging letters, was but just sufficient for the preservation of life. And perhaps he would have remained much longer in this distressful state, had not a compassionate gentleman, upon hearing this circumstance related, ordered his clothes to be taken out of pawn, and enabled him to appear again abroad.

About the year 1745, Mr Boyle's wife died. He was then at Reading, and pretended much concern when he heard of her death. His business at Reading was to compile a Review of the most material transactions at home and abroad during the last war: in which he has included a short account of the late rebellion. Upon his return from Reading, his behaviour was more decent than it had ever been before; and there were some hopes that a reformation, though late, would be wrought upon him. He was employed by a bookseller to translate *Fenelon on the existence of God*; during which time he married a second wife, a woman in low circumstances, but well enough adapted to his taste. He began now to live with more regard to his character, and supported a better appearance than usual; but while his circumstances were mending, and his irregular appetites losing ground, his health wisely declined. He had the satisfaction, while in this lingering illness, to observe a poem of his, intitled *The Deity*, recommended by two eminent writers, the ingenious Mr Fielding, and the reverend Mr James Hervey author of *The Meditations*.

Mr Boyle's mind was often religiously disposed; he frequently talked upon that subject, and probably suffered a great deal from the remorse of his conscience. The early impressions of his good education were never entirely obliterated; and his whole life was a continued struggle between his will and reason, as he was always violating his duty to the one, while he fell under the subjection of the other. It was in consequence of this war in his mind, that he wrote a beautiful poem called *The Recantation*. In May 1749, he died in obscure lodgings near Shoe-lane; but in sentiments, there is the greatest reason to believe, very different from those

in

Boyle
||
Brabejum.

in which he had spent the greatest part of his life. An old acquaintance of his endeavoured to collect money to defray the expences of his funeral, so that the scandal of being buried by the parish might be avoided; but in vain; the remains of this son of the muses were, with very little ceremony, hurried away by the parish-officers.

Never was a life spent with less grace than that of Mr Boyle, and never were such distinguished abilities given to less purpose. His genius was not confined to poetry only: he had a taste for painting, music, and heraldry; with the latter of which he was very well acquainted. His poetical pieces, if collected, would make fix moderate volumes. Many of them are scattered in *The Gentleman's Magazine*, marked with the letter *Z*, and *Aleus*. Two volumes were published in London. An ode of his in the manner of Spenser, intitled *The Olive*, was addressed to Sir Robert Walpole, which procured him a present of ten guineas. He translated a poem from the High Dutch of Van Haren, in praise of peace, upon the conclusion of that made at Aix la Chapelle; but the poem which procured him the greatest reputation was that upon the attributes of the Deity. He was employed by Mr Ogle to translate some of Chaucer's tales into modern English, which he performed with great spirit, and received at the rate of three pence a line for his trouble. Mr Ogle published a complete edition of that old poet's *Canterbury Tales modernized*; and Mr Boyle's name is put to such tales as were done by him. In 1743, Mr Boyle published, without his name, an ode on the battle of Dettingen, intitled *Albion's Triumph*.

BOZOLLO, a town of Italy, in the duchy of Mantua, capital of a territory of the same name, and subject to the house of Austria. E. Long. 10. 25. N. Lat. 45. 9.

B QUADRO, **QUADRATO**, or *Durale*, in music, called by the French *b quarre*, from its figure \square . This is what we call *B natural* or *sharp*, in distinction to *B mol* or *flat*. See **FLAT**, and **SHARP**.

If the flat \flat be placed before a note in the thorough bass, it intimates, that its third is to be minor; and if placed with any cypher over a note in the bass, as $\flat 6$, or $\flat 5$, &c. it denotes, that the fifth or sixth thereto are to be flat. But if the quadro \square be placed over any note, or with a cypher, in the thorough bass, it has the contrary effect; for thereby the note or interval thereto is raised to its natural order.

BRABANT, a large province of the Netherlands, with the title of a duchy. It is bounded on the north by the province of Holland and the duchy of Guelderland; on the east, by the same duchy and the bishopric of Liege; on the south, by the province of Namur and Hainhalt; and on the west, by Zealand. It is divided into Dutch Brabant and Austrian Brabant; watered by several rivers, of which the Scheld, the Ruppel, and the Dommel, are the chief. The soil is very fertile; and it contains 26 fortified towns, of which Brussels is the capital.

BRABEJUM, the **AFRICAN ALMOND**; a genus of the monogynia order, belonging to the tetrandria class of plants. Of this genus there is but one species, viz. the stellatifolium, which is a native of the Cape of Good Hope. In Europe it seldom grows above eight or nine feet high, but in its native soil is a tree of a middling

growth. It rises with an upright stem, which is soft, and full of pith within, and covered with a brown bark. The leaves come out all round the branches at each joint: they are indented at their edges, standing on very short foot-stalks. The flowers are produced towards the end of their shoots, which are of a pale colour inclining to white. This may be propagated, though with difficulty, by layers made in April; but they are often two years before they produce roots strong enough to be taken from the plants. When the branches are laid down, it will be proper to fit them at the point (as is practised in laying carnations), which will promote their taking root. In winter, the plants should have a good greenhouse; but in summer they should be placed abroad in a sheltered situation.

BRABEUTES, or **BRABEUTA**, in antiquity, an officer among the Greeks, who presided at the public games, and decided controversies that happened among the antagonists in the gymnallal exercises. The number of brabeute was not fixed; sometimes there was only one, but more commonly they amounted to nine or ten.

BRACCIANO, a town of St Peter's patrimony, about 12 miles north of Rome, situated on the west side of a lake to which it gives name. E. Long. 13°. N. Lat. 42°.

BRACCIOLINI (Francis), an Italian poet, a native of Postoia, and the friend of Pope Urban VIII. died about the year 1644, aged 80. He wrote, 1. An epic poem, intitled, *The Cross reconquered*, under the emperor Heraclius. 2. An heroic poem, intitled, *The mockery of the Pagan gods*. 3. The election of Pope Urban VIII. in 23 books.

BRACE is commonly taken for a couple or pair, and applied by hunters to several beasts of game, as a brace of bucks, foxes, hares, &c.

BRACE, or *Brasse*, is also a foreign measure, answering to our fathom. See **FATHOM**.

BRACE, in architecture, a piece of timber framed in with bevil joints, the use of which is to keep the building from swerving either way. When the brace is framed into the kingleses or principal rafters, it is by some called a *strut*.

BRACE, in writing or printing, a crooked line inclining a passage, as in a triplet.

BRACES, in the sea-language, are ropes belonging to all the yards of a ship, except the mizen, two to each yard, reeved through blocks that are fastened to pennants, seized to the yard-arms. Their use is either to square or traverse the yards. Hence to brace the yard, is to bring it to either side. All braces come aftward on; as, the main brace comes to the poop, the main-top-fail brace comes to the mizen-top and thence to the main shrouds, the fore and fore-top-fail braces come down by the main and main-top-fail stays, and so of the rest. But the mizen-bowline serves to brace to the yard, and the cross-jack braces are brought forwards to the main shrouds, when the ship sails close by a wind.

BRACES of a Coach, thick straps of leather on which it hangs.

BRACELET, an ornament worn on the wrist, much used among the ancients: it was made of different materials, and in different fashions, according to the age and quality of the wearer.

Brabeutes
||
Bracelet.

Brachiæus
||
Brachyp-
renia.

Bracelets are still worn by the savages of Africa, who are so excessively fond of them, as to give the richest commodities, and even their fathers, wives, and children, in exchange for those made of no richer materials than shells, glass-beads, and the like.

BRACHIÆUS, the name of a muscle. See ANATOMY, *Table of the Muscles*.

Coraco-BRACHIALIS. See ANATOMY, *ibid.*

BRACHIUM, or ARM. See ANATOMY, n° 48, &c.

BRACHMINS, or BRACHMANS, a branch of the ancient Gymnosophists, or philosophers of India, remarkable for the severity of their lives and manners. See the article GYMNOSOPHISTS.

Some say they derive their name from the patriarch Abraham, whom they call in their language *Brachma*, or *Brama*. Others deduce it from the name of their god *Brachma*; which some again take to be the same with Abraham; whence Pottel calls them *Abrachmanes*. F. Thomassin derives the word from the Hebrew *barach*, to fly or escape; because the Brachmans retire into the country and live in deserts. The same author gives us another derivation, viz. from the Hebrew *barach*, (*benedicere, orare*), to bless or pray; in regard this is their principal occupation.—The Greeks ascribe to them the doctrine of the immortality of the soul, and certain notions concerning the nature of the Supreme Being, and future rewards and punishments. To this species of knowledge the Brachmans added an infinite number of religious observances, which were adopted by Pythagoras in his school; such as fasting, prayer, silence, and contemplation. They were looked upon as the friends of the gods, because they affected to pay them so much regard; and as the protectors of mankind, because they paid them no regard at all. No bounds were therefore set to the respect and gratitude that were shewn them: princes themselves did not scruple to consult these recluses upon any critical conjuncture, from a supposition, no doubt, that they were inspired; since it was impossible to imagine that they had the advantages of experience. We can scarcely, however, deny, that there might be among them some men of real virtue, whose minds relished the pure and ingenious delights of study and science; and who, by nobly raising their thoughts to the contemplation of the First Being, must have had more powerful incitements to render themselves worthy of his care, and none to justify them in deceiving and tyrannizing over their fellow-creatures.

There appear still some remains of the ancient brachmans in the east, under the denomination of Bramins †. BRACHYGRAPHY, the art of short-hand writing. See SHORT-HAND.

BRACHYLOGY, *βραχυλογία*, in rhetoric, the expressing any thing in the most concise manner. This, as far as is consistent with perspicuity, is a beauty and virtue of the style; but if obscurity be the consequence, which is often the case, it becomes a blemish, and inexcusable defect. Quintilian gives us an instance of brachylogy from Sallust: *Mithridates corpore ingenti perinde armatus*; “Mithridates armed, as it were, with the hugeness of his stature.” See BREVITY.

BRACHYPTERA, a term used by Willoughby, to denote those hawks which have their wings so short, as not to reach to the end of the tail: Of this kind are the goshawk, sparrowhawk, &c.

BRACHYPYRENIA, in the history of fossils, a

genus of septaria, with a short roundish nucleus*.

BRACHYTELOSTYPYLA, in natural history, the name by which Dr Hill calls those crystals which are composed of a short hexangular column terminated at each end by an hexangular pyramid. See CRYSTAL.

BRACKET, among carpenters, &c. a kind of wooden stay, serving to support shelves, and the like.

BRACKETS, in a ship, the small knees, serving to support the galleries, and commonly carved. Also the timbers that support the gratings in the head, are called brackets.

BRACKETS, in gunnery, are the cheeks of the carriage of a mortar: they are made of strong planks of wood, of almost a semicircular figure, and bound round with thick iron plates; they are fixed to the beds by four bolts, which are called bed-bolts; they rise up on each side of the mortar, and serve to keep her at any elevation, by means of some strong iron bolts, called *bracket-bolts*, which go through these cheeks or brackets.

BRACKLAU, a strong town in Poland, capital of a palatinate of the same name. The houses are built of wood. It was taken by the Turks in 1672, but retaken three years afterwards. It is seated on the river Bog, in E. Long. 29. 20. N. Lat. 48. 5.

BRACKLAW, a palatinate of that name, which is the eastern part of Podolia; it is also called Lower Podolia, and is of greater extent than Upper Podolia, but is more desolate, on account of the neighbourhood of the Tartars.

BRACKLEY, a borough-town in Northamptonshire, in England, seated on the edge of the county, next Buckinghamshire, on a branch of the river Ouse. It is an ancient and large corporation-town, containing two parish-churches; is governed by a mayor and aldermen; and sends two members to parliament. It had formerly a college, which is turned into a free school. W. Long. 1. 15. N. Lat. 52. 0.

BRACTEA, in natural history, denotes a spangle, or thin flake of any substance.

BRACTEA, in botany, a thin leaf or plate of any *folium florale*, ranged by Linnæus among the *fulcra* of plants. These floral leaves differ in shape and colour from the other *folia* of the plant; are generally situated on the pedunculus, and often so near the corolla as to be easily mistaken for the *calix*; than which, however, the *bractea* are generally more permanent. Examples of the floral leaves are seen in the tilia, fumaria bulbosa, lavender, and hornimin. See p. 1297. n° 127.

BRACTEARIA, in natural history, a genus of tales, composed of small plates in form of spangles, each plate either being very thin, or fissile into very thin ones.

Of this genus there are a great many species, called, from their different colours, *mica aurea*, or gold-glimmer; and *mica argentea*, silver-glimmer, or cats-silver, &c.

BRACON (Henry), lord chief justice of England in the reign of Henry III. was probably a native of Devonshire. He was educated at Oxford, where he took the degree of doctor of laws, and was made one of the itinerant judges about the year 1244. Ten years after, he became chief justice, and had the earl of Derby's house in London assigned him for his town residence, during the minority of that nobleman. He

ria.

† See Bra-
minis.

Brad is said to have filled this important office with singular reputation during 20 years. When he died is not known; probably it was in the reign of Edward I. He wrote *De legibus et consuetudinibus Angliæ*, which is one of the most ancient, and also most methodical books on our laws. His method is copied from Justinian. This work was printed at London in 1569, folio; and in 1640, 4^{to}. The first is very incorrect.

BRAD, a town of Slavonia, seated on the north side of the river Save, in E. Long. 18. 40. N. Lat. 45. 20.

BRADFIELD, a town of Essex in England, in E. Long. 0. 30. N. Lat. 51. 14.

BRADFORD, a town of Wiltshire in England, seated in W. Long. 2. 40. N. Lat. 51. 20.

BRADFORD (John), a divine, and martyr to the reformation, was born in the former part of the reign of Henry VIII. at Manchester in Lancashire. Being a remarkable penman and accountant, he became secretary to Sir John Harington, who was several times employed by king Henry, and his successor Edward VI. as paymaster to the troops abroad. Bradford at this time was a gay man, and to support his extravagance made free with the king's money; but being at last unable to support the reflection of his guilt, he determined to make restitution, and actually repaid the money. Quitting his employment of secretary, about the year 1547, he took chambers in the inner temple, and for some time studied the law; but finding in himself an inclination to preach the gospel, in the following year he removed to Catherine-hall in Cambridge, where he applied with such uncommon assiduity to the study of divinity, that in a much shorter time than usual he was admitted to the degree of master of arts, and soon after made fellow of Pembroke-hall. Bishop Ridley, who, in 1550, was translated to the see of London, charmed with Bradford's application and zeal, now sent for him to the metropolis, ordained, and appointed him his chaplain. In 1553, he was also made chaplain to Edward VI. during which time he became one of the most popular preachers in the kingdom. Such a reformer was too dangerous to be suffered in the succeeding reign. Mary was hardly in possession of the crown, before Bradford's persecutions began. He was first confined in the tower for sedition, where he continued a year and an half; during which time he wrote several epistles that were dispersed in various parts of the kingdom. He was afterwards removed to other prisons, and at last brought to his trial before that infernal court of inquisition in which Gardiner sat as chief inquisitor, where he defended his principles to the last, in contempt of their utmost power. They condemned him to the flames; and he was accordingly burnt alive in Smithfield, on July 1. 1555. His works are, 1. Seventy-two letters, written to various people, whilst the author was in prison; printed in bishop Coverdale's collection. 2. Ten letters, printed in Fox's acts and monuments. 3. Complaint of verity, 1559, 8vo. 4. Three examinations before the commissioners, and his private talk with the priests, with the original of his life, 1561, octavo. 5. Two notable sermons, 1574, octavo, 1631. 6. Godly meditations and prayers, 1614, 24^{to}. 7. Treatise of repentance, 1622. With several translations and other pieces.

BRADFORTH, a town in the west of Yorkshire,

seated on a branch of the river Aire, in W. Long. 1. 35. N. Lat. 53. 40. Bradley.

BRADLEY (Dr James), a famous English astronomer, was the third son of William and Jane Bradley, and was born at Sherborne in Dorsetshire in the year 1692.

He was fitted for the university at North Leach by Mr Egles, and Mr Brice, who kept a boarding school there; and from North Leach he was sent to Oxford.

His friends intended him for the church, and his studies were regulated with that view; and as soon as he was of sufficient age to receive holy orders, the bishop of Hereford, who had conceived a great esteem for him, gave him the living of Bridport, and soon after he was inducted to that of Welfrie in Pembroke-shire. But notwithstanding these advantages, from which he might promise himself still farther advancement in the church, he at length resigned his livings, that he might be wholly at liberty to pursue his favourite study the mathematics, and particularly astronomy.

He was nephew to Mr Pound, a gentleman who is well known in the learned world by many excellent observations, and who would have enriched it with more, if the journals of his voyages had not been burnt at Pulo Condor, when the place was set on fire, and the English who were settled there cruelly massacred, Mr Pound himself very narrowly escaping with his life. With this gentleman, Mr Bradley passed all the time that he could spare from the duties of his function; and perhaps he sometimes trespassed upon them: he was then sufficiently acquainted with the mathematics to improve by Mr Pound's conversation; yet it does not appear that, in this study, he had any preceptor but his genius, or any assistant but his labour.

It may be easily imagined, that the example and conversation of Mr Pound did not render Bradley more fond of his profession than he was before; he continued, however, as yet to fulfil the duties of it, though at this time he had made such observations as laid the foundation of those discoveries which afterwards distinguished him as one of the greatest astronomers of his age.

Though these observations were made as it were by stealth, they gained him at first the notice, and then the friendship, of the lord chancellor Macclesfield, Mr Newton afterwards Sir Isaac, Mr Halley, and many other members of the royal society, into which he was soon elected a member.

About the same time, the chair of Savilian professor of astronomy became vacant by the death of the celebrated Dr Keil; and Mr Bradley was elected to succeed him on the 31st of October 1721, being then just 29 years old; and his colleague was Mr Halley, who was professor of geometry on the same foundation.

Bradley, upon his being elected into this professorship, gave up both his livings, and with great joy quitted a situation in which his duty was directly opposite to his inclination.

From this time, he applied himself wholly to the study of his favourite science; and in the year 1727 he published his theory of the aberration of the fixed stars, which is allowed to be one of the most useful and ingenious discoveries of modern astronomy.

Three years after this discovery, by which Mr Bradley

Bradley. ley acquired very great reputation, he was appointed lecturer in astronomy and physics, at the museum at Oxford.

He pursued his studies with equal application and delight; and in the course of his observations, which were innumerable, he discovered that the inclination of the earth's axis upon the plane of the ecliptic was not always the same, but that it varied backwards and forwards some seconds, and that the period of these variations was nine years. This period seemed altogether unaccountable, as it could not be supposed to have any thing in common with the revolution of the earth, which is performed in one year. Mr Bradley, however, discovered the cause of this phenomenon in the Newtonian system of attraction.

He published this discovery in 1737, so that in the space of about ten years he communicated to the world two of the finest discoveries in modern astronomy, which will for ever make a memorable epocha in the history of that science.

Mr Bradley always preserved the esteem and friendship of Mr Halley; who, being worn out by age and infirmities, thought he could do nothing farther for the service of astronomy, than procure for Mr Bradley the place of regius professor of astronomy at Greenwich, which he had possessed himself many years with the greatest reputation. With this view, he wrote many letters, which have been since found among Mr Bradley's papers, desiring his permission to apply for a grant of the reversion of it to him, and even offering to resign in his favour, if it should be thought necessary; but before Mr Halley could bring this kind project to bear, he died. Mr Bradley, however, obtained the place afterwards, by the favour and interest of my lord Macclesfield, who was afterwards president of the royal society.

As soon as the appointment of Mr Bradley to this place was known, the university of Oxford sent him a diploma creating him doctor of divinity.

The appointment of astronomer at Greenwich placed Mr Bradley in his proper element, and he pursued his observations with unwearied diligence.

However numerous the collection of astronomical instruments at the observatory at Greenwich, it was impossible that such an observer as Dr Bradley should not desire to increase them, as well to answer those particular views, as in general to make observations with greater exactness. In the year 1748, therefore, he took the opportunity of the annual visit made by the royal society to the observatory, in order to examine the instruments and receive the professor's observations for the year, to represent so strongly the necessity of repairing the old instruments, and purchasing new, that the society thought proper to consent to it to his majesty, and his majesty gave them 1000*l.* for that purpose. This sum was laid out under the direction of Dr Bradley, who, with the assistance of the late celebrated Mr Graham and Mr Bird, furnished the observatory with as complete a collection of astronomical instruments, as the most skilful and diligent observer could desire.

Dr Bradley, furnished with such assistance, pursued his observations with new assiduity, an incredible number of which were found after his death, and put into the hands of the royal society.

It has been already observed, that when Dr Bradley was elected to the professor's chair at Oxford, he gave up his two livings, which were at such a distance, that he could not possibly fulfil the duties of them himself; but it happened that after he was settled at Greenwich, the living of that parish became vacant, which is very considerable, and which was offered to him, as he was upon the spot to perform the duty, and had the claim of uncommon merit to the reward. This living, however, Dr Bradley, very greatly to his honour, refused, fearing the duties of the astronomer would too much interfere with those of the divine. His majesty, however, hearing of the refusal, was so pleased with it, that he granted him a pension of 250*l.* a year in consideration of his great abilities and knowledge in astronomy and other branches of the mathematics, which had procured so much advantage to the commerce and navigation of Great Britain, as is particularly mentioned in the grant which is dated the 15th of February 1752.

Dr Bradley, about the same time, was admitted into the council of the royal society. In the year 1748, he was admitted a member of the royal academy of sciences and belles lettres of Berlin, upon the death of M. Crevier, first physician to his catholic majesty; in the year 1752, a member of the imperial academy at Peterburgh; and in 1757, of that instituted at Bologna.

Dr Bradley was still indefatigable in his observations, and whatever honour he received became an incitement to obtain new distinctions; his corporal abilities, however, at length declined, though his intellectual suffered no abatement. In the year 1760, he became extremely weak and infirm; and towards the end of June 1762, he was attacked with a total suppression of urine, caused by an inflammation of the reins, which on the 12th of July following put an end to his life, in the 70th year of his age. He was buried at Mitchin-Hampton in Gloucestershire, in the same grave with his mother and his wife.

In the year 1744, he married Susannah Peach, the daughter of a gentleman of that name in Gloucestershire, by whom he had only one daughter, now living.

As to his character, he was remarkable for a placid and gentle modesty, very uncommon in persons of an active temper and robust constitution. It was still more remarkable, that, with this untroubled equanimity of temper, he was compassionate and liberal in the highest degree. Although he was a good speaker, and possessed the rare but happy art of expressing his ideas with the utmost precision and perspicuity, yet no man was a greater lover of silence, for he never spoke but when he thought it absolutely necessary. He did indeed think it necessary to speak when he had a fair opportunity to communicate any useful knowledge in his own way; and he encouraged those that attended his lectures to ask him questions, by the exactness with which he answered, and the care he took to adapt himself to every capacity.

He was not more inclined to write than to speak, for he has published very little: he had a natural diffidence, which made him always afraid that his works should injure his character; and therefore suppressed many, which probably were well worthy of the public attention. He was even known, as it were, in spite of himself; and, in spite of himself, he was known
much,

Bradninch
Bradwardin

much, and consequently much esteemed. He was acquainted with many of the first persons in this kingdom, persons eminent as well for their rank as their abilities: he was honoured by all men of learning in general; and there was not an astronomer of any eminence in the world, with whom he had not a literary correspondence.

Upon the whole, it may be said of Dr Bradley, that no man cultivated great talents with more success, or had a better claim to be ranked among the greatest astronomers of his age.

BRADNINCH, a town of Devonshire, once a considerable place, but some time ago totally destroyed by fire. W. Long. 3. 35. N. Lat. 50. 45.

BRADS, among artificers, a kind of nails used in building, which have no spreading heads as other nails have. They are distinguished by iron-mongers, by six names; as, joiner's-brads, flooring-brads, batten-brads, bill-brads, or quarter-heads, &c. Joiner's-brads are for hard waincot, batten-brads are for soft waincot; bill-brads are used when a floor is laid in halts, or for shallow joists subject to warp. See NAIL.

BRADSHAW (Henry), a Benedictine monk, was born at Chester, about the middle of the 15th century. Discovering an early propensity to religion and literature, he was received while a boy into the monastery of St Werberg in that city; and having there imbibed the rudiments of his education, he was afterwards sent to Gloucester college, in the suburbs of Oxford, where for a time he studied theology with the novices of his order, and then returned to his convent at Chester; here, in the latter part of his life, he applied himself chiefly to the study of history, and wrote several books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his contemporaries. His works are, 1. *De antiquitate et magnificentia urbis Cestriae*. 2. *Chronicon*. 3. The life of the glorious virgin of St Werberg. Printed Lond. 1521, 4to, in verse. The life of St Werberg makes only part of this work; for it contains also a description of the kingdom of Mercia, life of St Etheldred, the life of St Sexburg, the foundation and history of Chester, and the chronicles of some kings. Possibly this work may include the two first. Bishop Tanner says, that he wrote a chronicle in English verse, extracted from Bede, Malmsbury, Geraldus, and others. Probably this is the chronicle abovementioned.

BRADWARDIN (Thomas), archbishop of Canterbury, was born at Hartfield in Suffex, about the close of the 13th century. He was educated at Merton College, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound scholar, a skilful mathematician, and consummate divine. Authors are not agreed as to his first preferments. Pits says he was professor of divinity at Oxford. They agree, however, in asserting that from being chancellor of the diocese of London, he became a courtier and confessor to Edward III. whom he constantly attended during his war with France, assisting that victorious prince with his advice, animating the troops, and fervently praying for their success. After his return from the war, he was made prebendary of Lincoln, and afterwards archbishop of Canterbury. He died at Lambeth in the year 1349, forty days after his consecration; and was buried in St Anselm's chapel, near

the fourth wall. His works are, 1. *De causa Dei*, printed London, 1618, published by J. H. Savil. 2. *De geometria speculativa*, &c. Paris, 1495, 1512, 1530. 3. *De arithmetica practica*, Paris, 1502, 1512. 4. *De proportionibus*, Paris, 1495; Venice, 1505, folio. 5. *De quadratura circuli*, Paris, 1495, folio.

BRADY (Robert), born in Norfolk in 1643, was master of Caius college, Cambridge, regius professor there, and twice representative of that university in parliament. In 1685, he was made keeper of the records in the tower, and was physician in ordinary to James II. He wrote, An introduction to the Old English history; An history of England from the time of the Romans, to the end of the reign of Richard II.; and, A treatise on English boroughs. He died in 1700.

BRADY (Nicholas), an excellent divine and poet, born at Bandon, in the county of Cork, October 28th, 1659. He studied at Westminster-school, and afterwards at Oxford and Dublin college. He was a zealous promoter of the Revolution; and, in 1690, when the troubles broke out in Ireland, by his interest with M'Carty, king James's general, he thrice prevented the burning of the town of Bandon. Having quitted several preferments in Ireland, he settled in London, where he was successively promoted to several livings; and at the time of his death was rector of Clapham, minister of Richmond, and chaplain to the duke of Ormond's troop of horse-guards. He wrote part of the new version of the Psalms, now sung in many churches in England and Ireland; the *Æneids* of Virgil, in 4 vols; and 3 vols of sermons. He died May 20th, 1726.

BRADYPUS, or ΣΛΟΤΗ, a genus of quadrupeds belonging to the order of bruta. The characters are these: They have no fore-teeth in either jaw; the dog-teeth are blunt, solitary, and longer than the grinders; they have five grinders on each side. The body is covered with hair. There are only two species of bradypus, viz.

1. The tridactylus, or American sloth, has a short tail, and only three toes on each foot. It is about the size of a fox. The body is covered over with hair of a grey colour; the face is naked; the throat is yellowish; the fore-feet are longer than the hind-feet; the claws, which are three on each foot, are compressed, and very strong; and they have no mammae on the breast; they have no external ears, but only two winding holes. It is the most sluggish and most slow of all animals, and seems to move with the utmost pain. Its food is fruit, or the leaves of trees. If it cannot find fruit on the ground, it looks out for a tree well loaded, and with great pain climbs up: to save the trouble of descending, it flings off the fruit; and, forming itself into a ball, drops from the branches, continues at the foot till it has devoured all, nor ever stirs till compelled by hunger. It never drinks, and is terrified at rain *. * See Plate LXXVIII.

The following wonderful account of this animal, from Kircher's *Mujurgia*, is quoted by Mr Stillingfleet in his miscellaneous tracts. "The description (says Kircher) I had from father Torus, who resided in America, who had animals of this kind in his possession, and made many experiments in relation to their nature and qualities. Its figure is extraordinary; it is about the bigness of a cat, of very ugly countenance, and has claws extended like fingers. The hinder part of the head and neck are covered with hair. It sweeps the ground

Brady,
Bradypus.* See Plate
LXXVIII.
fig. 1.

Bradypus
||
Brag.

Braga
||
Brahe.

ground with its fat belly, never rises upon its feet, and moves so slowly, that it would scarce go the length of a bow-shot in 15 days, though constantly moving, and it is therefore called the *loth*. It lives generally upon tops of trees, and employs two days to crawl up, and as many to get down again. Nature has doubly guarded this animal against its enemies. First, by giving it such strength in its feet, that whatever it seizes, it holds so fast, that it never can be freed from its claws, but must there die of hunger. Secondly, in giving it such a moving aspect, when it looks at any man who should be tempted to hurt it, that it is impossible not to be touched with compassion; besides, that at the same time it sheds tears, and upon the whole persuades one, that a creature so defenceless, and of so unhappy a body, ought not to be tormented. To make an experiment of this, the abovementioned father procured one of these animals to be brought to our college at Carthage. He put a long pole under its feet, which it seized upon very firmly, and would not let go again. The animal therefore thus voluntarily suspended was placed between two beams along with the pole, and there it remained without meat, drink, or sleep, 40 days; its eyes being always fixed on people that looked at it, who were so touched, that they could not forbear pitying it. At last being taken down, they let loose a dog on it, which after a little while the sloth seized with his feet, and held him four days, till he died of hunger. This was taken from the mouth of the father. They add, (continues Kircher), that this creature makes no noise but at night, but that very extraordinary. For by interruptions, that last about the length of a sigh or femipault, it goes through the six vulgar intervals of music Ut, re, mi, fa, sol, la, La, sol, fa, mi, re, ut, ascending and descending, and these perfectly in tune. So that the Spaniards, when they first got possession of this coast, and heard these notes, they imagined that some people brought up to our music were singing. This animal is called by the natives *haut*; certainly because, going through these musical intervals, it repeats Ha, ha, ha, ha, ha, &c." To this account Linnaeus refers, in his *Systema Naturæ*, to give credit. For he says, in his short way of description, among other things, "It utters an ascending hexachord: its noise is horrible; its tears are piteous." He quotes Musgrave, Clusius, Gesner, &c.

2. The didactylus has two toes on each foot, and no tail: The head is round; the ears are large; and it has two mammae on the breast: The body is covered with ash-coloured hair. It is a native of Ceylon.

BRAE-MAR, a mountainous territory of Scotland, in the shire of Aberdeen, where the last earl of Mar began to raise a rebellion in 1715. It is 27 miles north-west of Aberdeen.

BRAE-Murray, a mountainous and woody tract of land, lying in the shires of Elgin and Nairn in Scotland.

BRAG, an ingenious and pleasant game at cards, where as many may partake as the cards will supply; the eldest hand dealing three to each person at one time, and turning up the last card all round. This done, each gameter puts down three flakes, one for each card.—The first flake is won by the best card turned up in the dealing round; beginning from the ace, king, queen, knave, and so downwards. When cards of the

same value are turned up to two or more of the gameters, the eldest hand gains; but it is to be observed, that the ace of diamonds wins, to whatever hand it be turned up.—The second flake is won by what is called the *brag*, which consists in one of the gameters challenging the rest to produce cards equal to his: Now it is to be observed, that a pair of aces is the best brag, a pair of kings the next, and so on; and a pair of any fort wins the flake from the most valuable single card. In this part consists the great diversion of the game; for, by the artful management of the looks, gestures, and voice, it frequently happens, that a pair of fives, treys, or even duces, out-brags a much higher pair, and even some pairs royal, to the no small merriment of the company. The knave of clubs is here a principal favourite, making a pair with any other card in hand, and with any other two cards a pair royal.—The third flake is won by the person who first makes up the cards in his hand one and thirty; each dignified card going for ten, and drawing from the pack, as usual in this game.

BRAGA, the capital of the province of Entre-minhoduero, in Portugal, situated on the river Cavado, in W. Long. 8. 40. N. Lat. 41. 20.

BRAGANZA, a city of Portugal, and capital of a duchy of the same name. It is seated on an eminence, by a brook called *Fervença*; and is divided into two parts, the old city, and the town. The former is upon an eminence, and fortified with a double wall. That part next the town has five bastions, but no ditch; the citadel is on the opposite side joined to the wall. The town is in a plain, and defended by a fort with four bastions. It is seated near the river Sabor on the frontiers of Galicia, in W. Long. 6. 15. N. Lat. 41. 27.

BRAGGET, a kind of drink made of malt, honey, and spices, much used in Wales.

BRAHE (*Tycho*), a celebrated astronomer, descended of an illustrious family originally of Sweden but settled at Denmark, was born December 14th 1546, at Knudstorp in the county of Schonen. He was taught Latin when seven years old, and studied five years under private tutors. His father dying, his uncle sent him, in April 1559, to study philosophy and rhetoric at Copenhagen. The great eclipse of the sun on the 21st of August 1560, happening at the precise time the astronomers had foretold, he began to look upon astronomy as something divine; and purchasing the tables of Stadius, gained some notion of the theory of the planets. In 1562, he was sent by his uncle to Leipzig to study law; but astronomy wholly engrossed his thoughts, and in purchasing books on that science he employed all his pocket-money. Having procured a small celestial globe, he was wont to wait till his tutor was gone to bed, in order to examine the constellations and learn their names; and when the sky was clear, he spent whole nights in viewing the stars. In 1565, a difference arising between Brahe and a Danish nobleman, they fought, and the former had part of his nose cut off; which defect he so artfully supplied with one made of gold and silver, that it was not perceivable. It was about this time that he began to apply to chemistry, proposing nothing less than to obtain the philosopher's stone. In 1571, he returned to Denmark; and was favoured by his mother's brother, Steno Belle, a lover of learning, with a convenient place at his castle

of Herritzvad near Knudtorp, for making his observations, and building a laboratory. His marrying a country girl, beneath his rank, occasioned such a violent quarrel between him and his relations, that the king was obliged to interpose to reconcile them. In 1574, by his majesty's command, he read lectures upon the theory of the comets at Copenhagen. The year following he began his travels through Germany, and proceeded as far as Venice: he then resolved to remove his family, and settle at Basil; but Frederic II. king of Denmark being informed of his design, and unwilling to lose a man that was capable of being such an ornament to his country, promised to enable him to pursue his studies, to bestow upon him for life the island of Huen in the sound, to erect an observatory and laboratory there, and to defray all the expences necessary for carrying on his designs. Tycho Brahe readily embraced this proposal; and accordingly the first stone of the observatory was laid Aug. 8th 1576. The king also gave him a pension of 2000 crowns out of his treasury, a fee in Norway, and a canony of Roskilde, which brought him in 1000 more. James VI. of Scotland, afterwards raised to the crown of England, going to Denmark in order to marry the princess Anne, paid a visit to our author in his retirement at Uraniburg, made him several presents, and with his own hand wrote a copy of verses in his praise: but, soon after the death of king Frederic, he was deprived of his pension, fee, and canony; upon which, finding himself incapable of bearing the expences of his observatory, he went to Copenhagen, whither he brought some of his instruments, and continued his astronomical observations in that city, till Valkendorf, chamberlain to the household of Charles IV. commanded him by the king's order to discontinue them. He then removed his family to Roslock, and afterwards to Holstein, in order to solicit Henry Ranzou to introduce him to the emperor; and that gentleman complying with his request, he was received by the emperor at Prague with the utmost civility and respect. That prince gave him a magnificent house, till he could procure one for him more fit for astronomical observations; assigned him a pension of 3000 crowns; and promised, upon the first opportunity, a fee for him and his descendants: but he did not long enjoy this happy situation; for, upon the 24th of October 1601, he died of a retention of urine, in the 55th year of his age, and was interred in a very magnificent manner in the principal church at Prague, where a noble monument was erected to him.—His skill in astronomy is universally known, and he is famed for being the inventor of a new system *, which he endeavoured, tho' without success, to establish upon the ruins of that of Copernicus. He was very credulous with regard to judicial astrology, and presages. If he met an old woman when he went out of doors, or an hare upon the road on a journey, he used to turn back immediately, being persuaded that it was a bad omen. When he lived at Uranibourg, he had at his house a madman, whom he placed at his feet at table, and fed himself. As he imagined that every thing spoken by mad persons presaged something, he carefully observed all that this man said; and because it sometimes proved true, he imagined it might always be depended on. A mere trifle put him in a passion; and against persons of the first rank, with whom it was his duty to keep on good terms, he openly

discovered his resentment. He was very apt to rally others, but highly provoked if the same liberty was taken with himself. His principal works are, 1. *Progymnasmata astronomicæ*. 2. *De mundi ætherei recentioribus phenomenis*. 3. *Epistolarum astronomicarum liber*.

BRAHMA. See BRAMA.

BRAIDALBIN, a district of Perthshire in Scotland, stretching 32 miles from east to west, and 13 where broadest from south to north; is a mountainous country, lying among the Grampian hills, supposed to be the country anciently known by the name of *Albanii*; whence the Highlanders to this day call themselves *Albinich*. It is bounded on the west by Lochaber, Lorn, and Knapdale; on the north and east, by part of Lochaber and part of Athol; and on the south, by Strathern and Monteth. It produces plenty of game and black cattle; is inhabited by Highlanders said to be the most ferocious in all Scotland; and gives the title of earl to a branch of the Campbell family, which is possessed of a noble and magnificent feat in this division. Much flax is cultivated here. Some years ago, when premia were given for the greatest crops, from 70 to 120 hogheads of lintseed were annually sown, each peck yielding two stones of drest flax; and when the yarn fold highest, 2000*l* worth has been fold out of the country. Oats and potatoes are the other crops. Oats yield from four to six fold at the most, oftener less; bear, from eight to ten, at an average six. The corn raised seldom suffices the number of inhabitants, so they are often obliged to have recourse to importation. From their potatoes some have distilled a very strong spirit, which has been found cheaper than what is distilled from any grain. Starch is also made from them; and, in some places, bread. Corcur, or the lichen omphaloides, is an article of commerce; great quantities have been scraped from the rocks, and exported for the use of the dyers, at the price of 1*s*. or 16*d*. per stone. A good many sheep are reared here, and much wool is sent out of the country. There are few horses raised in this country: such as feed on the tops of the higher hills are often afflicted with a distemper that commonly proves fatal, if a remedy is not applied within 24 hours. It attacks them in the months of July and August, usually after a fall of rain, or before the dew rises in the morning. An universal swelling spreads over the body: the remedy is exercise, chasing, or any method that promotes urine and perspiration. The common people attribute this evil to a certain animal that scatters its poison over the grass; but, more probably, it arises from some noxious vegetable hitherto unobserved. Before the year 1745, lord Braidalbin was obliged to keep a constant guard for the protection of his vassals cattle, or to retain spies among the thievish clans, having too much spirit to submit to pay an infamous tax; called *blackmeal*, to the plundering chieftains as the price of their safety.

BRALL, or **BRAILS,** in a ship, are small ropes made use of to furl the sails across: they belong only to the two courses and the mizen-sail; they are reeved thro' the blocks, seized on each side the ties, and come down before the sail, being at the very skirt thereof fastened to the cringles; their use is, when the sail is furled across, to hale up its bunt, that it may the more easily be taken up or let fall. Hale up the brails, or brail

Bramhall.

up the fail; that is, Hale up the fail, in order to be furl-
ed or bound close to the yard.

BRAILOW, a town of Poland, in the province of
Podolia, seated on the river Bog, in E. Long. 29. 0.
N. Lat. 43. 50.

BRAIN. See *ANATOMY*, n° 16, 394, 400; also
COMPARATIVE Anatomy, n° 68, *et seq.* and n° 128,
153.

BRAIN le Comte, a town of the Austrian Nether-
lands, in the province of Hainault. E. Long. 4. 11.
N. Lat. 50. 35.

BRAINTREE, a large town of Essex in England,
situated in E. Long. 0. 35. N. Lat. 51. 50.

BRAKE, denotes female fern, or the place where it
grows.—Also a sharp bit or snaffle for horses; and a
baker's kneading-trough.—Also an instrument with
teeth to bruise flax or hemp; see *FLAX-DRESSING*.

BRAKEL, a town of Germany, in the circle of
Westphalia, and in the bishopric of Paderborn, seated
on the rivulet Brught, in E. Long. 9. 8. N. Lat. 51.
46.

BRAMA, or **BRUMA**, a pagan deity of the East
Indies. He is the first person of a kind of trinity in
their theology; is the great progenitor of mankind;
and has created as many worlds as there are consider-
able parts in his body †.

BRAMA, in ichthyology, the trivial name of a
species of cyprinus. See *CYPRINUS*.

BRAMANT, a town of Savoy, in the valley of
Maurich, seated on the river Arck, in E. Long. 4. 15.
N. Lat. 45. 0.

BRAMBER, a town of Suffex in England, for-
merly of some account, but has neither market nor fair;
however, it sends two members to parliament. W.
Long. 0. 15. N. Lat. 50. 50.

BRAMBLE, in botany, the English name of the
RUBUS.

BRAMBLE-Net, otherwise called *hallier*, is a net to
catch birds in of several sizes: the great meshes must
be four inches square; those of the least size are three
inches square; and those of the biggest, five. In the
depth they should not be above three or four inches:
but as for the length, they may be enlarged at plea-
sure; the shortest being 18 feet long.

BRAMBLE, or *Brambling*, in ornithology, the trivial
name of a species of *FRINGILLA*.

BRAMHALL (Dr John), archbishop of Armagh,
was born of an ancient family at Pontefract in York-
shire, about the year 1593. He was invited over to
Ireland by the lord deputy Wentworth; and soon after
obtained the arch-deacoury of Meath, the best in that
kingdom. In 1634, he was made bishop of London-
derry, which see he improved very much; but the great-
est service he did to the church of Ireland, was by
getting, with the deputy's assistance, several acts passed
for abolishing fee-farms, recovering impropriations, &c.
by which and by other means he regained to the church
in the space of four years 30,000 or 40,000*l.* a year. In
the convocation he prevailed upon the church of Ireland
to unite in the same faith with the church of England,
by adopting the 39 articles of that church; and would
willingly have introduced the English canons, but could
only prevail on their accepting such as they deemed
proper. Articles of treason were exhibited against
him in the Irish parliament; and at the treaty of Ux-

Bramins.

bridge in 1644, the English parliament made it a pre-
liminary article, that bishop Bramhall, with archbishop
Laud, and others, should be excepted from the general
pardon. He went abroad; but on the restoration was
appointed archbishop of Armagh, primate and metro-
politan of all Ireland, and was chosen speaker of the
house of lords. He died in 1663; and was the author
of several works, which are collected in one vol. folio.

BRAMINS, the name of the priests among the i-
dolatrous Indians; the successors of the ancient Brach-
mans. See the title *BRACHMANS*.

Their name is formed from *Brama*, their particular
deity. They are found in Siam, Malabar, China, Co-
romandel, and most other eastern nations anywise civil-
ized; but their chief seat is in Indostan †, or the Mog-
ul's country. They have a language peculiar to them-
selves; in which they have several ancient books, written
(as is alleged) by their great prophet Brama, and
dictated by God himself.

There are several orders of Bramins. Those who
mix in society are for the most part very corrupt in
their morals: they believe that the water of the Ganges
will wash away all their crimes; and, as they are not
subject to any civil jurisdiction, live without either re-
straint or virtue, excepting that character of compassion
and charity which is so commonly found in the mild
climate of India. The others, who live abstracted
from the world, are either weak-minded men or enthu-
siasts; and abandon themselves to laziness, superstition,
and the dreams of metaphysics. We find in their dis-
putes the very same ideas that occur in the writings of
our most celebrated metaphysicians; such as, substance,
accident, priority, posteriority, immutability, indivisi-
bility, &c.

Their religion, which was anciently of the allegori-
cal and moral kind, hath degenerated into a heap of
extravagant and obscene superstitions, owing to their
having realized those fictions which were intended mere-
ly as so many symbols and emblems. Were it possible
to obtain a sight of their sacred books, the only re-
mains there are of the Indian antiquities, we might in
some measure be enabled to remove the veil that envelops
those numerous mysteries; but the following story will
show how little reason there is to hope that we shall
ever be intrusted with such a communication.

The emperor Mshmod Akbar had an inclination
to make himself acquainted with the principles of all
the religious sects throughout his extensive provin-
ces. Having discarded the superstitious notions with
which he had been prepossessed by his education in the
Mahometan faith, he resolved to judge for himself. It
was easy for him to be acquainted with the nature of
those systems that are formed upon the plan of making
prophets; but he found himself disappointed in his
design when he came to treat with the Indians, who
will not admit any person whatever to the participation
of their mysteries. Neither the authority nor promises
of Akbar could prevail with the Bramins to disclose
the tenets of their religion; he was therefore obliged
to have recourse to artifice. The stratagem he made
use of was to cause a boy, of the name of Feizi, to
be committed to the care of these priests, as a poor or-
phan of the sacerdotal line, who alone could be initiated
into the sacred rites of their theology. Feizi, having
received the proper instructions for the part he was to
act,

Bramins,
Brampton.

act, was conveyed privately to Benares, the seat of knowledge in Indoftan; he was received into the house of a learned Bramin, who educated him with the same care as if he had been his own son. After the youth had spent ten years in study, Akbar was desirous of recalling him; but he was struck with the charms of the daughter of his preceptor. The women of the sacerdotal tribe are looked upon as the greatest beauties in Indoftan. The old Bramin laid no restraint upon that growing passion of the two lovers; he was fond of Feizi, who had gained his affection by his address and docility; and offered him his daughter in marriage. The young man, divided between love and gratitude, resolved to conceal the fraud no longer; and falling at the feet of the Bramin, discovered the imposture, and asked pardon for his offence. The priest, without reproaching him in the least, seized a poniard which hung at his girdle, and was going to plunge it in his breast, if Feizi had not prevented him by taking hold of his arm. The young man used every means to pacify him, and declared himself ready to do any thing to expiate his treachery. The Bramin, bursting into tears, promised to pardon him on condition that he should swear never to translate the *Bedas*, or sacred volumes, or disclose to any person whatever the symbol of the Bramin creed. Feizi readily promised all that the Bramin required; how far he kept his word is not known; but the sacred books of the Indians have never been translated by him, or any one else, to this day. As the Bramins are the only persons who understand the language of the sacred book, their comments on the text are the same as those that have ever been made on religious books; all the maxims which fancy, interest, passion, or false zeal can suggest, are to be found in these volumes †.

They own a supreme God, who created Brama, and gave him a power to create the world. They have also their subaltern deities, their pagods or temples, and idols, whom they fan to defend from flies, dancing before them. They also hold a feast in honour of the sun, considered as the source of light and heat, whereby all nature is fecundified.

Their pagods or temples consist of three parts. The first is a vaulted roof, supported on stone columns: it lies open, and all persons, without distinction, are allowed to enter into it. It is adorned with symbolical figures, made of wood, as elephants, oxen, and horses. The second part is open in the day-time, and shut at night. It is filled with grotesque and monstrous figures, as men with many heads and arms. The third, which is a kind of chancel, is kept always shut, with a very strong gate. In this is placed the statue of the deity, to whom the pagod is dedicated. A great number of lamps burn day and night before the idol. The Bramins, before they go into the pagod, pull off their shoes, and leave them at the door.

BRAMPOUR, or BRAMPORE, a city of Asia, in the dominions of the great Mogul, and capital of Candish. It formerly stood on as much ground as London; but is now greatly decayed, and chiefly inhabited by Banians. The streets are numerous, but narrow, with low thatched houses made of earth, though a few are covered with varnished tiles. In rainy weather many of the streets are overflowed. In the market place is the statue of an elephant in red stone, as big as the life. On the other side of the river they have built

a new town, which is in a better situation. A great trade is carried on in this town, and throughout all the province, where there is made a prodigious quantity of cotton-cloths, as cotton is in greater plenty here than in any other place of the empire. E. Long. 77. 25. N. Lat. 21. 10.

BRAMPTON, a town of Cumberland in England, seated not far from the Picts wall, and on the river Irthin. It is a very ancient place, but at present is very small. W. Long. 2. 40. N. Lat. 54. 50.

BRAN, the skins or hulks of corn, especially wheat ground, separated from the flour by a sieve or boulder. It contains, besides, a portion of the farinaceous matter; this is less glutinous than the finer flour, and is supposed to have a detergent quality; infusions of bran are not unfrequently employed in this intention externally, and sometimes likewise taken inwardly.

Among the ancients, bran was used as an erotic, to excite love. Bran boiled, purges scurf, dandriff, and cleanses the hands in lieu of soap. The dyers reckon it among the not-colouring drugs; and use it for marking what they call the *four waters*, with which they prepare their several dyes. Bran is also used as a medicine for horses; see FARRIERY, § 1. 6.

BRANCH, in botany, an arm of a tree, or a part which, sprouting out from the trunk, helps to form the head or crown thereof. Branches do not spring out of the mere surface of the trunk, but are profoundly rooted therein, so as not only to penetrate the cortical, but also the woody substance, and even the pith. The constituent parts therefore of a *branch* are the same as of the trunk, viz. skin, bark, wood, and pith*.

BRANCHES of a *Bridle*, in the menage, are two pieces of iron bended, which, in the interval, between the one and the other, bear the bit-mouth, the cross-chains, and the curb; so that on one end they answer to the head-stall, and on the other to the reins, in order to keep the horse's head in subjection. With regard to their form and structure, branches are either straight, in form of a pistol, for young horses to form their mouth; or after the countable of France's fashion, proper for a horse that carries his head well. Some are in form of a gigot or leg, which will prevent horses from carrying too low: Some are in form of a bent knee, contrived for horses that arm themselves against the operation of the bit; and others after the French fashion, which is hardly above $\frac{1}{2}$ of an inch at the seville hole, and kneed $1\frac{1}{2}$ inch at the jarret or ham.

It is to be observed, 1. That the farther the branch is from the horse's neck, the more effect it will have. 2. That short branches, *cateris paribus*, are ruder, and their effects more sudden, than those of longer. 3. That the branch is to be proportioned to the length of a horse's neck; and one may sooner err in chusing one too short than too long.

BRANCHES of *Ogives*, in architecture, are the arches of Gothic vaults. These arches, traversing from one angle to another diagonal-wise, form a cross between the other arches, which make the sides of the square, of which the arches are diagonals.

BRANCH of a *Trench*. See BOLLAY.

BRANCH of a *Mine*. See GALLERY.

BRANCH-*Stand*, with falconers, a term used to signify the making a hawk leap from tree to tree, till the dog springs the game.

Brampton
Branch.* See the ar-
ticle Plants.† See the ar-
ticles Skof-
tab and Ve-
dan.

BRANCHER, among sportsmen, a young hawk, newly taken out of the nest, that can hop from bough to bough.

BRANCHIÆ, or **GILLS**, in the anatomy of fishes, the parts corresponding to the lungs of land-animals. All fishes, except the cetaceous ones, and the pterygium, which have lungs, are furnished with these organs of respiration. See *COMPARATIVE Anatomy*, n° 152.

BRANCHIDÆ, in Grecian antiquity, priests of the temple of Apollo, which was at Didymus in Ionia, a province of lesser Asia, towards the Ægean sea, upon the frontiers of Caria. They opened to Xerxes the temple of Apollo, the riches whereof he took away. After which, thinking it unsafe to stay in Greece, they fled to Sogdiana, on the other side of the Caspian sea, upon the frontiers of Persia, where they built a city, called by their own name: but they did not escape the punishment of their crime; for Alexander the Great having conquered Darius king of Persia, and being informed of their treachery, put them all to the sword, and razed their city, thus punishing the impiety of the fathers in their posterity.

BRANCHON, a town of the Austrian Netherlands, in the province of Namur, seated on the river Mehaigne. E. Long. 4. 40. N. Lat. 50. 32.

BRÄNDEIS, a town of Bohemia, seated on the river Elbe. E. Long. 14. 25. N. Lat. 50. 15.

BRANDENBURG (Marquissate of), a large country of Germany, having Mecklenburgh and Pomerania on the north; Poland, on the east; Silesia, with the Lusitias, the electorale of Saxony, Anhalt, and duchy of Magdebourg, on the south; and part of the same duchy, and that of Lunenburg, on the west. Its greatest length is near 200 miles, and its greatest breadth near 100. Its northern situation makes it very cold for seven or eight months in winter. The soil in general is far from being fruitful, a great part of it consisting of sand; yet there are several fruitful spots in it; and the whole, under the last and present reign, has been greatly improved, and much better peopled. In some parts there is great plenty of potatoes and turnips; in others of buck-wheat, millet, and flax; in others of tobacco, woad, and other herbs for dyeing. All sorts of colour earths, together with alum, saltpetre, amber, iron, stone, and medicinal springs, are found in it. Abundance of cattle, especially sheep, are bred here; and the woods not only supply the inhabitants with fuel, but with timber, charcoal, tar, and wood-ashes, both for domestic uses and for exportation. The culture of silk also is carried on in this country with great success. The principal rivers by which it is watered are the Elbe, the Oder, the Prignitz, the Havel, the Wart, and the Spre. Some of the rivers and lakes abound in fish, and are united by canals, for the benefit of navigation. They reckon in the whole Mark 120 towns, above 2500 villages, and about 800,000 inhabitants. The states here consist of the nobility and towns, whose assembly-house is in the Spandau-treec at Berlin, and who still enjoy some small remains of their ancient privileges. The hereditary officers of the marquissate are a marshal, chamberlain, cup-bearer, purveyor, sewer, treasurer, and ranger. The king of Prussia, who is also elector of Brandenburg, with his whole court, are Calvinists; but the religion of most of the inhabitants is Lutheranism. The churches of both

perquisitions are well endowed, and the laity jointly employed by the government. The Roman-catholics are also tolerated here. In short, every inhabitant enjoys full liberty of conscience. A great variety of manufactures, most of which were introduced by the French refugees, are carried on in the marquissate, especially at Berlin and Potsdam; where are also excellent painters, statuaries, and engravers. By means of these manufactures, fabrics, and arts, not only large sums are kept in the country, but also imported from other parts, to which considerable quantities of the manufactures, and natural productions, are exported. For the education of youth, and the advancement of learning, besides Latin schools in several places, and gymnasia, there is an university at Frankfort on the Oder, and an academy of sciences at Berlin. This marquissate, together with the arch-chamberlain's office, and the electoral dignity, was conferred, in 1415, hereditarily on Frederic V. or VI. burgrave of Nuremberg, in whose family it still remains, with the addition of many other territories and dignities. The present king of Prussia and elector of Brandenburg, Frederic III. is one of the greatest and most powerful princes of Europe, as well as one of the most despotic. He hath greatly enlarged his dominions, by the addition of all the lower, together with the greatest part of the upper Silesia, and the county of Glatz. In 1744, he also took possession of east Friesland; but in 1754, disposed of his share of the succession of the late king William, prince of Orange, to the present prince and stadtholder. The qualifications and talents of this prince are great, and he hath performed many singular actions; but his ambition would have proved his ruin, had he not been supported in the last war by the troops and treasures of Great Britain. It is hard to say, whether his subjects have been greater gainers by his encouraging and promoting commerce, manufactures, agriculture, population, order, and the regular distribution of justice; or sufferers by the wars in which his ambition hath involved them, and the prodigious standing army he keeps constantly on foot, to maintain his conquests, and extend them, as opportunity offers. Such an army must be a great burden, besides their labour being lost in a great measure to the country. Among the electors he possesses the seventh place. As arch-chamberlain, he carries the sceptre before the emperor at his coronation, and brings him water in a silver basin to wash with. In the college of princes of the empire, he has five voices. His assent, as elector, is 60 horse and 277 foot, or 1828 florins in lieu of them. To the chamber of Wetzlar, his quota is 811 rix-dollars, 58 kruitzers, each term. As to the orders of the knights of the Black Eagle, and of Merit, it is sufficient here to observe, that the former was instituted by Frederic I. at his coronation, and the other by the present king. For the government of this country and the administration of justice, there are several supreme colleges and tribunals; particularly for the departments of war, foreign affairs, and the finances, there are distinct boards. Here is a supreme ecclesiastical council and consistory for the Lutherans; a supreme directory of the Calvinist church; a supreme medicinal college; a supreme mine-office; a college or board of trade, &c. Those of the French nation, settled in this country, are allowed particular courts of their own. The amount of the yearly revenues of the Mark, arising
